Microsoft Dynamics 365 Supply Chain Management documentation

Discover how to make the most of Dynamics 365 Supply Chain Management with training, docs, and videos covering product capabilities and how-to articles. Learn how to build an adaptable, resilient supply chain that automatically reacts to challenges using real-time visibility, agile planning, and advanced insights.

WHAT'S NEW
What's new

TRAINING
Training

CONCEPT
Troubleshoot

Implement

Guidance

- Security, compliance, and privacy
- Implementation guide
- Implementation tools and samples
- Migrate from on-premises to online
- End-to-end business processes

Try/Buy/Deploy

- Try Dynamics 365 Supply Chain Management
- Buy Dynamics 365 Supply Chain Management
- Deploy Dynamics 365 Supply Chain Management

Set up

- Microsoft Dynamics Lifecycle Services user guide
- Project onboarding
- Set up the Warehouse management module

Administer and develop

Manage environments

- Microsoft Dynamics Lifecycle Services resources
- Continuous delivery
- Upgrades, updates, and hotfixes

Manage data storage

- Data management overview
- Data import and export
- Database movement operations
- Data entities overview

System administration

- System administration overview
- Process automation
- Batch processing overview

Organization administration

- Organization administration overview
- Organizational hierarchies
- Workflow system
- Number sequences overview
- Global address book overview

Manage user access

- Role-based security
- Create users
- Assign users to security roles

Integrate with other products

- Microsoft Office
- Microsoft Power BI
- Microsoft Power Platform
- Microsoft Azure Data Lake
- Third-party apps

Develop integration

- Integration between finance and operations apps and third party apps
- Data management REST API
- Service endpoint overview
- Dual-write overview
- Design principles and best practices for data entities

Platform development

- Develop and customize your environment
- Deploy and access development environments
- Application stack and server architecture

Extend and customize

- Extensibility overview
- Application extensibility roadmap
- Write extensible code
- Integrate with third-party manufacturing execution systems
- Extend warehouse mobile processes

Developer reference

- API references
- X++ language reference
- Open Data Protocol (OData)
- Dual-write mapping reference

Developer tools

- Development tools in Visual Studio
- Version control, metadata search, and navigation
- Build automation using Azure

Develop the user interface

- User interface development home
- General form guidelines
- Build extensible controls

Use

Warehouse management

- Warehouse management overview
- Warehouse configuration overview
- Warehouse handling of inbound loads for purchase orders
- Release outbound orders to the warehouse
- Cycle counting

Warehouse Management mobile app

- Install the mobile app
- Set up mobile devices for warehouse work
- Mobile device user accounts
- Mobile device user settings

Inventory management

- Inbound operations
- Quality assurance
- Inventory activities
- Outbound operations
- Inventory Visibility service

Transportation management

- Transportation management overview
- Transportation management engines
- Plan freight transportation routes
- The load building workbench
- Reconcile freight

Landed cost

- Landed cost overview
- Manage voyages
- Track inbound voyages and shipping container journeys
- Estimate and manage landed costs
- Landed cost reports

Product information management

- Product information overview
- Product configuration
- Product lifecycle states
- Hazardous materials
- Bills of materials and formulas

Engineering change management

- Engineering change management overview
- Release product structures
- Manage changes to engineering products
- Engineering change management feature walkthrough
- Engineering versions and engineering product categories

Procurement and sourcing

- Procurement and sourcing home page
- Procurement and sourcing overview
- Requests for quotation (RFQs)
- Purchase orders
- Supply risk assessment

Master planning

- Master planning home page
- Demand Driven Material Requirements Planning (DDMRP)
- Demand planning home page
- Set up master plans
- Manage planned orders

Manufacturing and production

Asset management

Service management

- Production process overview
- Bills of materials and formulas
- Lean manufacturing
- Catch weight product processing with warehouse management
- How workers use the production floor execution interface

- Assets
- Maintenance requests
- Work orders
- The Asset Management mobile app
- Sensor Data Intelligence

- Service management overview
- Service tasks
- Service objects
- Fulfill service agreements
- Service orders

Sales and marketing

- Sales and marketing overview
- Order promising
- Sales agreements
- Sales returns
- Customer portal

Unified pricing management

- Unified pricing management overview
- Price attributes
- Price component codes
- Price structures
- Discounts

Rebate management

- Rebate management overview
- Rebate deals
- Process, review, and post rebates
- Manage deductions

Cost accounting

- Cost accounting overview
- Cost accounting terminology
- Overhead calculation
- Dimension hierarchy

Cost management

- Cost management overview
- Inventory costing FAQ
- Standard cost conversion overview
- Costing versions overview
- Global Inventory Accounting

Reporting

- Information access and reporting
- Reporting and analytics with Power BI
- Electronic reporting (ER)
- Electronic reporting components

Last updated on 03/23/2026

What's new or changed in Dynamics 365 Supply Chain Management 10.0.49 (September 2026)

This article lists features that are either new or changed in Microsoft Dynamics 365 Supply Chain Management version 10.0.49. This version has a build number of 10.0.2790 and is available on the following schedule:

- **Preview of release:** July 2026
- **General availability of release (self-update):** September 2026
- **General availability of release (auto-update):** October 2026

Features included in this release

The following table lists the features that are included in this release. We might update this article to include features that were added to the build after this article was originally published.

Expand table

Module or feature area	Feature	More information	Enabled by
Accounts payable	Use financial tags in procurement documents	Use financial tags in procurement documents	Feature management: *Enable financial tags for purchase order invoicing*
Master planning	Closed for pickup policy on the transport calendar	Calendars and master planning	Feature management: *Consider open for pickup on transport calendar for planned transfer orders with Planning Optimization*
Master planning	Consider sub-BOM and sub-route in supply forecast reduction	Master planning with supply forecasts	Feature management: *Consider BOM and route in supply- and demand forecast reduction with Planning Optimization*
Master planning	Filter derived requirements by coverage time fence with Planning Optimization	Coverage time fences	Feature management: *Filter derived requirements by*

Module or feature area	Feature	More information	Enabled by
			coverage time fence with Planning Optimization
Procurement and sourcing	Manage supplier relationships with Supplier Engagement	Supplier Engagement overview (preview)	Feature management: *(Preview) Supplier Engagement*
Procurement and sourcing	RFQ bid–driven fixed asset field updates	Purchase requisition overview	Enabled by default
Production control	Enforce same-batch selection for raw materials in production and batch orders	Reserve the same batch for a production order (preview)	Feature management: *(Preview) Use same batch selection for raw materials in production*
Warehouse management	Import inbound ASNs as despatch advice messages	Import inbound ASNs as despatch advice messages	Enabled by default
Warehouse management	Prevent multiple owners in warehouse locations	Prevent multiple owners in warehouse locations	Enabled by default
Warehouse management	Source system inventory status mapping	Source system inventory status mapping	Enabled by default

Feature enhancements added in this release

The following table lists the feature enhancements that were added in this release. Each of these enhancements provides an incremental improvement to an existing feature. Because they're only enhancements, they're not listed in the release plan and might not be mentioned elsewhere in the documentation. To ensure that these enhancements don't conflict with your existing customizations or preferences, most of these features are turned off by default, so you must turn them on in Feature management if you want to use them (unless otherwise noted).

Expand table

Module	Feature name	More information
Inventory and warehouse management	*CAPA case HTML note editor*	Enables the rich HTML note editor on the **CAPA Case Detail** page, replacing the read-only viewer. This feature lets you create and edit formatted notes directly on the CAPA case log.

Module	Feature name	More information
Inventory and warehouse management	*(Preview) Optimized inventory transaction consolidation*	Consolidate financially updated inventory transactions from closed periods into summary records to reduce table size and improve system performance. Consolidation is also a prerequisite for archiving inventory transactions with Dataverse long term retention.
Procurement and sourcing	*Synchronize establishment across the direct delivery chain*	Enables a purchase parameter and an origin prompt to control whether the system synchronizes establishments across the direct delivery chain between sales orders and purchase orders.
Production control	*Prevent shop floor activity after daily registrations are calculated*	Blocks workers from making additional shop floor registrations (such as clock-in, clock-out, job start, or job stop) after the system calculates time registrations for the day. The system displays the following error message: "You can't register any activities now because your registrations are already processed for today. Please contact your supervisor for assistance." When a worker receives this message, their supervisor should go to the **Approve** page and select **Undo calculation** for today for the affected worker.
Production control	*The feature enables batch auto-scale and priority based scheduling for message processor queues.*	Previously, the message queue setup for *Number of processor tasks* was limited to the maximum batch threads for a single batch server. When batch auto-scale is enabled, this feature makes it possible to utilize available capacity beyond a single batch. With priority based scheduling, you can also link message processor queues and batch server groups, use scheduling priority, and use maximum concurrency.
Sales and marketing	*Unified pricing management change tracking*	Enables automatic price change tracking for global Unified pricing management rules, discounts, and trade agreements. This feature writes change tracking rows to `RetailPriceChangeTracking` to notify Azure Product Search of price changes.

Preview features that are now generally available

The following table lists the features that were introduced as public preview features in a previous version and became generally available in version 10.0.49. As with other new features, most of these features are turned off by default, so you must turn them on in Feature management if you want to use them.

Removed and deprecated Supply Chain Management features

The Removed or deprecated features in Dynamics 365 Supply Chain Management article describes features that are removed or scheduled to be removed or deprecated for Supply Chain Management.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature isn't in active development and might be removed in a future update.

Before Microsoft removes any feature from the product, it announces the deprecation notice in the Removed or deprecated features in Dynamics 365 Supply Chain Management article 12 months prior to the removal.

For breaking changes that only affect compilation time but are binary compatible with sandbox and production environments, the deprecation time is less than 12 months. Typically, these changes are functional updates that need to be made to the compiler.

Warehouse management	Automate dynamic work classification with Power FX	Dynamic work classification (production-ready preview)	Feature management: *(production-ready preview) Dynamic work classification*
Warehouse management	Enable precise serial and batch capture in cluster picking	Cluster picking strategy	Enabled by default

Feature enhancements added in this release

The following table lists the feature enhancements that were added in this release. Each of these enhancements provides an incremental improvement to an existing feature. Because they're only enhancements, they're not listed in the release plan. However, to ensure that these enhancements don't conflict with your existing customizations or preferences, each enhancement is turned off by default (unless otherwise noted).

Some of these features aren't visible on your system until you turn them on in feature management by using the name listed here for the *Feature management name* (additional configuration might also be needed). Features that don't show a feature management name are visible by default as of this version of Supply Chain Management, but typically add a new configuration option that you need to set to use the new functionality.

Expand table

Feature enhancement	Description
Module: Inventory and warehouse management **Feature management name:** *Flexible sampling plan - Usability enhancements*	Improves the user experience for defining flexible sampling plans by moving the **Last level** assignment from the header to a checkbox directly in the lines grid. This change makes the action more intuitive and provides contextual confirmation dialogs when users set, change, or clear the last level.
Module: Inventory and warehouse management **Feature management name:** *Quality quick results entry enhancements*	Enhances the information display on the quick results entry page by adding information such as test descriptions and test plan notes. Now you can view test-related information and associated notes directly within the quick results entry workflow.
Module: Product information management **Feature management name:** *Configure Product Lifecycle State business process policies without Engineering change management.*	Lets you configure product lifecycle state business process policies when engineering change management configuration keys aren't enabled. As a result, you can manage product behavior (such as purchasing, sales, and production) based on lifecycle states without relying on engineering change management. If you do use engineering change management, then you don't need this feature because engineering change management provides the required lifecycle-based business process rules. This setup offers flexibility to tailor operations according to a product's lifecycle stage. For example, you can choose to allow a new product to be purchased with a warning that indicates the item is still a prototype; or, for discontinued or end-of-life products, you can choose to allow sales of existing inventory while blocking new purchases or production.
Module: Production control **Feature management name:** *Automatically stop and resume production jobs for indirect activities in production floor execution*	When a worker starts an indirect activity in the production floor execution interface, any production jobs currently in progress are automatically stopped and remembered. When the indirect activity ends, the previously active production jobs are automatically restarted, eliminating the need for workers to manually search for and restart their jobs.
Module: Sales and marketing **Feature management name:** *Enable non-attribute based rebate*	Allows rebate management deals that aren't based on attributes to be considered when using Unified pricing management.

Feature enhancement	Description
management deals for Unified pricing scenario	
Module: Warehouse management **Feature management name:** *(Production ready preview) Optimized 3D packing containerization algorithm*	Introduces a new optimized 3D packing algorithm to warehouse containerization processes.

Features turned on by default in this release

The following table lists the features that became turned on by default in version 10.0.48. You can still turn these features off in Feature management if necessary.

Sales and marketing	Optimize pricing data import and export workflows	Pricing data import and export entities	Feature management: *Unified pricing management pricing rule performance enhancement*

Module or feature area	Feature	More information	Enabled by
Sales and marketing	Pay-by-link payment with the Dynamics 365 Payment Connector for Adyen	Pay-by-link payment with the Dynamics 365 Payment Connector for Adyen (preview)	Feature management: • *Enable unified payments experience in POS* • *Enable Payments Notification feature* • *Enable Pay By Link Payment feature* • *Enable asynchronous payments for sales orders*
Sales and marketing	Simulate prices based on sales order line attributes	*Coming soon*	Enabled by default
Warehouse management	Improve picking efficiency with wrist-mounted scanning devices	Haptic feedback through external wearable devices	Enabled by default

Feature enhancements added in this release

The following table lists the feature enhancements that were added in this release. Each of these enhancements provides an incremental improvement to an existing feature. Because they're only enhancements, they're not listed in the release plan. However, to ensure that these enhancements don't conflict with your existing customizations or preferences, each enhancement is turned off by default (unless otherwise noted).

Some of these features aren't visible on your system until you turn them on in feature management by using the name listed here for the *Feature management name* (additional configuration might also be needed). Features that don't show a feature management name are visible by default as of this version of Supply Chain Management, but typically add a new configuration option that you need to set to use the new functionality.

Expand table

Feature enhancement	Description
Module: Asset Management **Feature management name:** *Add maintenance*	Add maintenance checklist lines from a predefined template directly to work order lines.

Feature enhancement	Description
checklist template lines to work order lines	
Module: Inventory and warehouse management **Enhancement:** *Consolidate inventory transactions* **Feature management name:** *(None)*	Inventory transaction consolidation is a prerequisite for the archiving and long-term retention of inventory transactions. During consolidation, detailed inventory transactions are replaced with summarized receipt and issue transactions. This change significantly reduces the size of the `InventTrans` table, delivering storage savings and improved system performance while preserving the original source transactions in an archive.
Module: Inventory and warehouse management **Feature management name:** *Configure quality associations by product dimensions*	Allows administrators to configure quality associations by product dimensions such as configuration, color, and size. It ensures that quality checks can be applied at a more granular level for specific product variants.
Module: Master Planning **Feature management name:** *(Preview) Exclude blocked transactions from planning if inventory status isn't a coverage plan dimension*	Excludes blocked transactions from planning when inventory status isn't set as a coverage plan dimension. When this feature is turned on, the **Net requirements** page no longer shows blocked transactions as *On-hand* and *Inventory journal* entries that offset each other by inventory blocking. This new behavior is more consistent with that of other planning scenarios. This feature only affects Planning Optimization, not the deprecated planning engine.
Module: Master Planning **Feature management name:** *Consider receipt margins when applying action*	Causes the system to consider receipt margins when applying actions and to adjust receipt and delivery dates accordingly. For a purchase or a production order, receipt and delivery date can be set in the past. However, for a transfer order, the receipt date must always be after the ship date. In situations where scheduling backwards from the requirement date results in a transfer order with a ship date that's in the past, the system applies the receipt margin only partially or not at all because transfer orders can't have ship dates in the past.
Module: Transportation management **Enhancement:** *Performance-optimized pro number generation*	If your high-volume processes (such as release to warehouse) run slowly when you're using pro numbers, the new *Performance optimized* pro number generation option can help improve throughput. Learn more in Transportation management number sequence.

Feature enhancement	Description
Feature management name: *(None)*	
Module: Warehouse management **Enhancement:** *Archive load related records with long-term retention* **Feature management name:** *(None)*	Adds the ability to archive or remove historical load and work-related data. This ability helps reduce index size, improve long-term database health, and can accelerate scenarios such as refreshing sandbox environments from production. The existing archiving framework is extended to support the following tables: • `WHSLOADTABLE` • `WHSLOADLINE` • `WHSSHIPMENTTABLE` • `WHSWORKTABLE` • `WHSWORKLINE` • `WHSWORKINVENTTRANS` • `WHSWORKTRANS`
Module: Warehouse management **Enhancement:** *Hand-free glove-mounted scanning support* **Feature management name:** *(None)*	The Warehouse Management mobile app now supports wrist-mounted, hands-free glove scanners, enabling faster and more ergonomic warehouse operations. Developed in collaboration with ProGlove and validated on Mark 2, Mark Basic, and LEO devices, the solution connects glove scanners to an Android-powered device running the native Warehouse Management mobile app, providing real-time feedback and intent-based scanning. Hands-free scanning reduces unnecessary motion, lowers cognitive load, and improves throughput and accuracy in high-volume picking and packing scenarios. The capability is device-agnostic, so you can choose supported glove scanners based on your operational needs. Requires Warehouse Management mobile app version 4.0.29.0 or higher.
Module: Warehouse management **Enhancement:** *License plate consolidation performance improvements* **Feature management name:** *(None)*	Enhances how warehouse inventory transactions are used during license plate consolidation, which improves system performance.
Module: Warehouse management **Enhancement:** *Packed container picking performance enhancements*	Enhances how warehouse inventory transactions are used when picking from a packed container, which improves system performance.

Feature enhancement	Description
Feature management name: *(None)*	
Module: Warehouse management **Enhancement:** *Warehouse Management mobile app support for Microsoft Entra Conditional Access* **Feature management name:** *(None)*	The Warehouse Management mobile app now supports Microsoft Entra Conditional Access, enabling organizations to apply modern, enterprise-grade security policies that control how and when users can sign in. IT administrators can enforce requirements such as multifactor authentication, device trust validation, and risk- or location-based access controls. The solution makes use of brokered authentication and aligns with the same Zero Trust security standards used across Microsoft 365 and Dynamics 365 applications. Microsoft Entra Conditional Access ensures secure access for the right user, on the right device, under the right conditions, without impacting warehouse productivity. Learn more in Use Microsoft Entra Conditional Access with the Warehouse Management mobile app.
Module: Warehouse management **Feature management name:** *Remove Show Closed Button*	Removes the **Show closed** button from warehouse related forms. Instead, you can now use filters and saved views directly on the form. This feature is enabled by default.

Preview features that are now generally available

The following table lists the features that were introduced as public preview features in a previous version and became generally available in version 10.0.47. As with other new features, most of these features are turned off by default, so you must turn them on in Feature management if you want to use them.

Removed and deprecated Supply Chain Management features

The Removed or deprecated features in Dynamics 365 Supply Chain Management article describes features that are removed or scheduled to be removed or deprecated for Supply Chain Management.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature isn't in active development and might be removed in a future update.

Before Microsoft removes any feature from the product, it announces the deprecation notice in the Removed or deprecated features in Dynamics 365 Supply Chain Management article 12 months prior to the removal.

For breaking changes that only affect compilation time, but are binary compatible with sandbox and production environments, the deprecation time is less than 12 months. Typically, these changes are functional updates that need to be made to the compiler.

Features removed or deprecated in the Supply Chain Management 10.0.49 release

Global Inventory Accounting

Expand table

Reason for deprecation or removal	The Global Inventory Accounting (GIA) solution is being retired to bring modernized inventory costing capability with improved architecture.

Replaced by another feature?	Yes, a multi-ledger costing solution will serve as GIA's successor, providing comparable capabilities along with significant improvements. Learn more in the blog post See what's next in financial operations from Microsoft Dynamics 365.
Product areas affected	Dynamics 365 Finance and Dynamics 365 Supply Chain Management
Deployment option	Cloud and on-premises
Status	Deprecated. GIA will reach end of support on July 1, 2027. If you're using GIA, review your usage and take the appropriate action based on your scenario: • If you aren't using GIA in a production environment, no action is required. • If you only installed or enabled GIA in sandbox or test environments, review whether you're actively using it. If you don't need GIA, disable or remove the feature and avoid new implementations that are based on it. • If you're actively using GIA, or if dependencies on it exist, on a production environment, assess your current usage and dependencies. Begin planning a transition to supported costing capabilities, and validate changes in a test environment before July 2027. We recommend that you engage with Microsoft or your implementation partner for transition planning support.

Follow-up questions in the Copilot sidecar (preview)

Expand table

Reason for deprecation or removal	Microsoft decided to discontinue development on this preview feature.
Replaced by another feature?	No
Product areas affected	Microsoft finance and operations applications
Deployment option	Cloud and on-premises
Status	Removed. This preview feature was never made generally available and is now completely removed from all finance and operations applications.

Features removed or deprecated in the Supply Chain Management 10.0.48 release

Asset Management mobile app

Expand table

Reason for deprecation or removal	Microsoft released the Asset Management mobile app source code, so the app is now open source and you can freely customize it. Previously, Power Apps Studio didn't preserve canvas-app customizations across official updates.
Replaced by another feature?	Yes. The app is now available as an open-source sample.
Product areas affected	Supply Chain Management – Asset Management
Deployment option	Cloud and on-premises
Status	Deprecated as of June 1, 2026. The Asset Management mobile app is now available on GitHub as an open-source sample at microsoft/scmsamples-EnterpriseAssetManagement. It provides the same functionality as the original app and is freely customizable. The existing app remains available for installation through Dynamics 365 apps in the Power Platform admin center until November 30, 2026, with critical fixes from Microsoft during this transition period. After that date, the app is no longer distributed through the admin center. Existing installations continue to work in customer tenants. Learn more in Asset Management mobile app open-source release.

Features removed or deprecated in the Supply Chain Management 10.0.46 release

Data Integrator templates for Dynamics 365 Field Service

Expand table

Reason for deprecation or removal	This functionality is scheduled to be replaced by a simpler, more integrated Field Service experience.

Replaced by another feature?	Yes
Product areas affected	Microsoft finance and operations applications
Deployment option	Cloud and on-premises
Status	Deprecated. The Data Integrator templates for Dynamics 365 Field Service will no longer be available after February 28, 2027. This integration works by synchronizing work orders, agreements, inventory, and projects between Field Service and Supply Chain Management. Instead, look to a simpler, more integrated Field Service experience. Learn more in Connect Field Service to finance and operations and Link work orders to projects for unified financials.

Features removed or deprecated in the Supply Chain Management 10.0.45 release

Inventory On-hand mobile app (preview)

Expand table

Reason for deprecation or removal	Microsoft decided to discontinue development and support for this preview feature.
Replaced by another feature?	Yes
Product areas affected	Supply Chain Management – Inventory management
Deployment option	Cloud and on-premises
Status	Removed. The *Inventory On-hand mobile app* preview (previously available on the Power Platform Admin Center) was never made generally available. It's now provided as a sample app that you can download from the scmsamples-InventoryOnHand repository on GitHub and customize as needed. Learn more in Inventory On-hand mobile app.

Features removed or deprecated in the Supply Chain Management 10.0.44 release

Inquire into inventory with Copilot (preview)

Expand table

Reason for deprecation or removal	Microsoft decided to discontinue development on this preview feature.
Replaced by another feature?	No
Product areas affected	Supply Chain Management – Inventory management
Deployment option	Cloud and on-premises
Status	Removed. This preview feature was never made generally available and is now completely removed from the Inventory Visibility service.

SHA1 hashing in the InventDim table

Expand table

Reason for deprecation or removal	To ensure that data in the `InventDim` table is unique and easy to search, the system hashes some of its data. The system previously used SHA1 hashing, which is now outdated, so it's replaced by SpookyHash.
Replaced by another feature?	Yes. SHA1 hashing is replaced by SpookyHash.
Product areas affected	Supply Chain Management – Inventory
Deployment option	Cloud and on-premises
Status	As of Supply Chain Management version 10.0.44, the system uses SpookyHash instead of SHA1 to hash data in the `InventDim` table. When you upgrade to version 10.0.44, the system automatically schedules a batch job that converts all `InventDim` data hashed using SHA1 to instead use SpookyHash. Version 10.0.44 can work with both SHA1 and SpookyHash data, but support for SHA1 will be removed in a future release. Extensibility was never supported for this part of the application, but if you have external code that

	uses SHA1 when creating, updating, or searching data in the `InventDim` table, you must stop using that code before upgrading to Supply Chain Management 10.0.44 because it will corrupt your data.

Rename item number (preview)

Expand table

Reason for deprecation or removal	The item number field is a primary key that's used across multiple systems. The *(Preview) Rename item number* feature allowed users to edit the item number field, but it could cause data inconsistencies in multi-system and apps-integration scenarios, leading to data integrity and data corruption problems. The feature was previously in preview and was never made generally available for use in production environments.
Replaced by another feature?	No
Product areas affected	Supply Chain Management – Product information management
Deployment option	Cloud and on-premises
Status	The *(Preview) Rename item number* feature was removed from the feature management workspace in Dynamics 365 Supply Chain Management version 10.0.44 and is no longer available. The capability is completely removed for all customers. If you need to rename an item number, we recommend that you use alternate methods, such as deleting and creating a new item, renaming attributes, or renaming search names, product names, and other item-related fields.

Features removed or deprecated in the Supply Chain Management 10.0.43 release

The "Work creation number" number sequence is removed

Expand table

Reason for deprecation	The *Work creation number* number sequence could sometimes create problems when the same prefixes were used for other number sequences.

or removal	
Replaced by another feature?	Yes, the *Work creation number* number sequence is replaced by the *Work creation ID* number sequence. The *Work creation ID* number sequence is designed to avoid conflicts with other number sequences.
Product areas affected	Supply Chain Management – Warehouse management
Deployment option	Cloud and on-premises
Status	Previously, there were two number sequences that were used to generate values for the **Work creation number** field for work records (*Work creation ID* and *Work creation number*). The newer *Work creation ID* number sequence has been available as a replacement for *Work creation number* for some time. For all currently available versions of Supply Chain Management (not just version 10.0.43 and later), you should always use the *Work creation ID* number sequence to generate work creation identification numbers. Although the *Work creation number* sequence is still present in the demo data, it's no longer used by the system and production data doesn't include the *Work creation number* number sequence. You can set up the *Work creation ID* number sequence on the **Warehouse management parameters** page.

"Adjustment out" mobile device menu items must now use process guide

Expand table

Reason for deprecation or removal	The process guide framework offers enhanced extensibility support and allows for easier changes in the feature behavior. The framework is now required for all mobile device menu items that use the *Adjustment out* work creation process.
Replaced by another feature?	No. The process guide framework is required for all mobile device menu items that use the *Adjustment out* work creation process. The ability to turn off this option is being removed from the product.
Product areas affected	Supply Chain Management – Warehouse management
Deployment option	Cloud and on-premises
Status	The **Use process guide** setting for mobile device menu items that use the *Adjustment out* work creation process is mandatory starting in Supply Chain Management version 10.0.45. Approximately one year after the release of version 10.0.45, the non-process guide implementation is no longer supported and might eventually be removed from the

	product. Learn more in Set up mobile device menu items for adjustment in and adjustment out.

"Spot cycle counting" mobile device menu items must now use process guide

Expand table

Reason for deprecation or removal	The process guide framework offers enhanced extensibility support and allows for easier changes in the feature behavior. The framework is now required for all mobile device menu items that use the *Spot cycle counting* work creation process.
Replaced by another feature?	No. The process guide framework is required for all mobile device menu items that use the *Spot cycle counting* work creation process. The ability to turn off this option is being removed from the product.
Product areas affected	Supply Chain Management – Warehouse management
Deployment option	Cloud and on-premises
Status	The **Use process guide** setting for mobile device menu items that use the *Spot cycle counting* work creation process is enabled by default in Supply Chain Management version 10.0.45, and it's mandatory in version 10.0.47. Approximately one year after the release of version 10.0.47, the non-process guide implementation is no longer supported and might eventually be removed from the product. Learn more in Set up mobile devices for warehouse work.

Features removed or deprecated in the Supply Chain Management 10.0.42 release

Register material consumption on the production floor execution interface (WMS-enabled) (preview)

Expand table

Reason for deprecation or removal	The *Register material consumption on the production floor execution interface (WMS-enabled)* feature (previously in preview) is replaced by the *Register material consumption as complete and edit dimensions on the production floor execution interface* feature.

Replaced by another feature?	Yes. The *Register material consumption on the production floor execution interface (WMS-enabled)* feature (previously in preview) is replaced by the *Register material consumption as complete and edit dimensions on the production floor execution interface* feature, which also adds the ability to use the production floor execution interface to register material consumption for WMS-enabled items.
Product areas affected	Supply Chain Management – Production control
Deployment option	Cloud and on-premises
Status	Removed. As of Supply Chain Management version 10.0.41, if you never enabled the old *Register material consumption on the production floor execution interface (WMS-enabled)* feature, then you see only the newer *Register material consumption as complete and edit dimensions on the production floor execution interface* feature in feature management. If you previously enabled the old feature, you can still use it, but you'll soon be contacted by Microsoft Support with instructions on how to replace it with the newer feature.

Features removed or deprecated in the Supply Chain Management 10.0.41 release

Pricing management module (preview)

Expand table

Reason for deprecation or removal	The Pricing management module (previously in preview) is replaced by the new Unified pricing management module.
Replaced by another feature?	Yes, the Pricing management module is replaced by the new Unified pricing management module.
Product areas affected	Supply Chain Management – Pricing management
Deployment option	Cloud and on-premises
Status	Deprecated and will be removed in a future release. It is replaced by the Unified pricing management module, which offers nearly all of the same functionality as the deprecated Pricing management module, plus several important enhancements. Both the deprecated pricing management module and the Unified pricing management module use similar or

	identical navigation paths in the Supply Chain Management user interface, so only one of these modules can be active at a time. As of Supply Chain Management version 10.0.41, if you never enabled the deprecated pricing management module in your environment, only the Unified pricing management module is available to you. If you enabled the deprecated pricing management module, you can continue to use it until it's removed, but we recommend that you transition to the Unified pricing management module as soon as possible to take advantage of the new features and enhancements that it offers. For help transitioning from the deprecated pricing management module to the Unified pricing management module, contact Microsoft Support.

Job card terminal

Expand table

Reason for deprecation or removal	The job card terminal is replaced by the new production floor execution interface.
Replaced by another feature?	Yes, the job card terminal is replaced by the new production floor execution interface.
Product areas affected	Supply Chain Management – production control
Deployment option	Cloud and on-premises
Status	Deprecated. Approximately one year after the release of version 10.0.41, the job card terminal is no longer supported and might be removed from the product.

Inventory transactions support for internal warehouse operations

Expand table

Reason for deprecation or removal	Using inventory transactions to track on-hand inventory for internal warehouse operations has well-known performance problems.
Replaced by another feature?	Yes. Warehouse-specific inventory transactions, which have been available since version 10.0.32, replace the older inventory transactions for tracking internal warehouse operations.

Product areas affected	Supply Chain Management – Warehouse management
Deployment option	Cloud and on-premises
Status	Supported until version 10.0.40. As of version 10.0.41, inventory transactions are deprecated for tracking on-hand inventory for internal warehouse operations. Existing customers can continue using this scenario after that version, but new features and bug fixes for this scenario are only implemented for warehouse-specific inventory transactions. Approximately one year after the release of version 10.0.41, support for this scenario is removed and all customers are required to move to warehouse-specific inventory transactions for tracking on-hand inventory for internal warehouse operations.

Release to warehouse page

Expand table

Reason for deprecation or removal	The **Release to warehouse** page has performance problems.
Replaced by another feature?	Yes. The **Release to warehouse** page is split into two new release to warehouse pages, which together provide equivalent functionality with significantly improved performance. The new pages are **Release sales orders to warehouse** and **Release transfer orders to warehouse**.
Product areas affected	Supply Chain Management – Release to warehouse
Deployment option	Cloud and on-premises
Status	Deprecated. The **Release to warehouse** page is now hidden in the app, but you can enable it if necessary by contacting Microsoft Support. We strongly recommend that you instead use the new pages (**Release sales orders to warehouse** and **Release transfer orders to warehouse**) because they provide equivalent functionality with significantly improved performance. The **Release to warehouse** page is removed from the product one year after the release of Supply Chain Management version 10.0.41.

Features removed or deprecated in the Supply Chain Management 10.0.40 release

Scale unit capability for Supply Chain Management

Expand table

Reason for deprecation or removal	The scale unit capability for Microsoft Dynamics 365 Supply Chain Management has been paused for new customers since July 2022 and is now deprecated.
Replaced by another feature?	Yes. Warehouse management only mode replaces some of the functionality planned for scale units and adds many new architectural and integration possibilities.
Product areas affected	Supply Chain Management – Warehouse management Supply Chain Management – Production control
Deployment options	Cloud and on-premises
Status	The scale unit capability for Microsoft Dynamics 365 Supply Chain Management has been paused for new customers since July 2022. The capability is formally deprecated as of Supply Chain Management version 10.0.40 and will be completely removed for all customers one year after the release of that version.

Features removed or deprecated in the Supply Chain Management 10.0.39 release

Load planning workbench

Expand table

Reason for deprecation or removal	The **Load planning workbench** page has performance issues.
Replaced by another feature?	Yes. The **Load planning workbench** page has been split into two new workbench pages, which together provide equivalent functionality with significantly improved performance. The new pages are **Inbound load planning workbench** and **Outbound load planning workbench**.
Product areas affected	Supply Chain Management – Warehouse management Supply Chain Management – Transportation management

Deployment option	Cloud and on-premises
Status	Deprecated. The **Load planning workbench** page is now hidden in the app, but you can enable it if necessary by contacting Microsoft Support. We strongly recommend that you instead use the new pages (**Inbound load planning workbench** and **Outbound load planning workbench**) because they provide equivalent functionality with significantly improved performance. The **Load planning workbench** page will be completely removed from the product one year after the release of Supply Chain Management version 10.0.39.

Features removed or deprecated in the Supply Chain Management 10.0.37 release

Service-based authentication methods for the Warehouse Management mobile app

Expand table

Reason for deprecation or removal	Support for service-based authentication methods (certificate and shared secret) is being removed to improve security.
Replaced by another feature?	Yes. Service-based authentication is being replaced by user-based authentication (device code flow), which is more secure.
Product areas affected	Supply Chain Management – Warehouse management
Deployment option	Cloud and on-premises
Status	Removed. As of July 15, 2024, Microsoft discontinued support for using service-based authentication methods (certificate and shared secret) to connect the Warehouse Management mobile app to Supply Chain Management. Service-based authentication has been replaced by user-based authentication (device code flow). Administrators must update all devices to use user-based authentication before July 15, 2024. For more information about device code flow, see User-based authentication FAQ and User-based authentication. Mass deployment with Microsoft Intune isn't yet supported for user-based authentication, but we expect to add support for it soon. For more information and the latest news about

	mass deploying to mobile devices for user-based authentication, see Mass deploy the mobile app with user-based authentication.

Features removed or deprecated in the Supply Chain Management 10.0.35 release

Integration with Outlook for contacts, appointments, and tasks

Expand table

Reason for deprecation or removal	Exchange web service API is transitioning from SOAP to REST.
Replaced by another feature?	No replacement is planned. We recommend that customers integrate with Dynamics 365 Sales.
Product areas affected	Supply Chain Management – sales and marketing
Deployment option	Cloud and on-premises
Status	Deprecated. As of December 1, 2023, Microsoft will discontinue support for synchronizing contacts, appointments, and tasks between Supply Chain Management and Outlook. In addition, security updates will no longer be provided for these features. This functionality is being discontinued because the existing integration is based on SOAP. However, Exchange Web Service (EWS) is transitioning from SOAP to REST and will support only REST going forward. There are no plans to add REST support for Outlook integration in Supply Chain Management. As of May 1, 2024, it will no longer be possible to synchronize the following types of records between Supply Chain Management and Outlook: • Contacts • Appointment activities • Task activities To prepare for this change, redesign any extensions that you've made to any of these capabilities to remove the dependency. To support customer relations management scenarios, consider integrating Dynamics 365 Sales with Outlook and/or using dual-write to synchronize contacts for customer

	accounts between Supply Chain Management and Dynamics 365 Sales. (Learn more in Integrated customer master.)

Features removed or deprecated in the Supply Chain Management 10.0.29 release

Stock transfer orders that have tax on the transfer price

Expand table

Reason for deprecation or removal	The Stock transfer orders that have tax on the transfer price functionality is being replaced by the Stock transfer orders for India functionality.
Replaced by another feature?	Yes, the Stock transfer orders that have tax on the transfer price functionality is being replaced by the Stock transfer orders for India functionality.
Product areas affected	Supply Chain Management – inventory
Deployment option	Cloud and on-premises
Status	Removed. The *Stock transfer orders that have tax on the transfer price* functionality has been removed as of October 2023. Customers must instead use the improved functionality, *Stock transfer orders for India*. Learn more in Stock transfer orders for India.

Features removed or deprecated in the Supply Chain Management 10.0.19 release

Job card device

Expand table

Reason for deprecation or removal	The job card device is replaced by the production floor execution interface.
Replaced by another	Yes, the job card device is replaced by the production floor execution interface.

feature?	
Product areas affected	Supply Chain Management – production control
Deployment option	Cloud and on-premises
Status	Unsupported. As of April 2022, the job card device is no longer supported and customers must use the new production floor execution interface.

Features removed or deprecated in the Supply Chain Management 10.0.18 release

Supply Chain Management- Warehousing (the warehouse app)

Expand table

Reason for deprecation or removal	Effective April 2021, *Supply Chain Management – Warehousing* (the warehouse app) is deprecated and won't be supported after April 2022. It's now replaced by the *Warehouse Management mobile app*, which was released with version 10.0.17 of Supply Chain Management. The new app is a complete replacement but uses same underlying framework, which makes migration easy. For more information about the new Warehouse Management mobile app, see Warehouse Management mobile application and Install the Warehouse Management mobile app.
Replaced by another feature?	Yes, replaced by the new Warehouse Management mobile app.
Product areas affected	Supply Chain Management – warehouse app
Deployment option	Cloud and on-premises
Status	Removed. As of April 2022, the old warehouse app is no longer supported and has been removed from the Microsoft Store and Google Play store. Customers must now use the new Warehouse Management mobile app instead.

Features removed or deprecated in the Supply Chain Management 10.0.15 release

Internet Explorer 11 support for Dynamics 365 is deprecated

Expand table

Reason for deprecation or removal	Effective August 2021, Microsoft Internet Explorer 11 is no longer supported for use with Dynamics 365 products.
Replaced by another feature?	We recommend that customers transition to Microsoft Edge.
Product areas affected	All Dynamics 365 products
Deployment option	All
Status	Removed. Support for Internet Explorer 11 was removed in August 2021.

Use of built-in Supply Chain Management master planning engine for manufacturing scenarios

Expand table

Reason for deprecation or removal	To enhance performance and minimize the SQL database load during master planning runs, the built-in Supply Chain Management master planning engine is being replaced by Planning Optimization. Planning Optimization allows for fast planning runs that can be performed even during office hours. This enables planners to react immediately to changes in demand or planning parameters.
Replaced by another feature?	Yes, Planning Optimization will replace the existing built-in Supply Chain Management master planning engine.
Product areas affected	Supply Chain Management – Master planning
Deployment option	Cloud only. Planning Optimization is not supported with on-premises deployments.
Status	Deprecated. On April 1, 2022, support for manufacturing scenarios was discontinued for the built-in master planning engine for Supply Chain Management. As of that date, Microsoft stopped all active development on manufacturing scenarios for the built-in planning engine, stopped releasing new features, and only released critical bug fixes. Since that date, all companies that require support for manufacturing scenarios have been required to use Planning Optimization for their master planning calculations. Learn more in Deprecated master planning overview.

	Since April 2022, only companies with on-premises deployments of Supply Chain Management have been able to continue using the built-in master planning engine for manufacturing scenarios. However, as of March 2023, Microsoft has now fully discontinued all support for the built-in master planning engine for all types of deployments. Hereafter, Microsoft will only provide support for critical blocking issues (which result in no planned orders being created or the continuous failure of built-in master planning). The built-in master planning engine is now referred to as the *deprecated master planning engine*.

Features removed or deprecated in the Supply Chain Management 10.0.11 release

Use of built-in Supply Chain Management master planning engine for distribution scenarios

Expand table

Reason for deprecation or removal	To enhance performance and minimize the SQL database load during master planning runs, the built-in Supply Chain Management master planning engine is being replaced by Planning Optimization. Planning Optimization allows for fast planning runs that can be performed even during office hours. This enables planners to react immediately to changes in demand or planning parameters.
Replaced by another feature?	Yes, Planning Optimization will replace the existing built-in Supply Chain Management master planning engine.
Product areas affected	Supply Chain Management – Master planning
Deployment option	Cloud only. Planning Optimization isn't supported for on-premises deployments.
Status	Removed. On April 1, 2021, support for distribution scenarios was discontinued for the built-in master planning engine for Supply Chain Management. Since then, customers running distribution scenarios have been required to use Planning Optimization for master planning calculations. Learn more in Deprecated master planning overview. Since April 2021, only companies with on-premises deployments of Supply Chain Management have been able to continue using the built-in master planning engine for distribution scenarios. However, as of March 2023, Microsoft has now fully discontinued all support for the built-in master planning engine for all types of deployments. Hereafter, Microsoft will only provide support for critical blocking issues (which result in no planned

	orders being created or the continuous failure of built-in master planning). The built-in master planning engine is now referred to as the *deprecated master planning engine*.

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> This article is no longer updated. To see a current list of features that are removed or deprecated from Finance and Operations apps, search for **"Removed or deprecated features"** content that relates to the app you're using.

This article describes features that Microsoft removed or deprecated from Dynamics 365 for Finance and Operations and previous releases of that product.

- A *removed* feature is no longer available in the product.
- A *deprecated* feature isn't in active development and might be removed in a future update.

Use this list to help you consider these removals and deprecations for your own planning.

You can find detailed information about objects in Finance and Operations apps in the Technical reference reports. To learn about objects that changed or were removed in each version of Finance and Operations apps, compare the different versions of these reports.

Finance 10.0.7 with Platform update 31

Chinese voucher types without Account groups selection

Expand table

Reason for deprecation or removal	Changed to the feature with account groups selection.

Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By December 1, 2020, Microsoft plans to no longer support Chinese voucher types set up without Account groups selection.

Finance and Operations 10.0.6 with Platform update 30

DimensionHash.getHash(str _message)

Expand table

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in Windows Enforcement of SHA1 Certificates.
Replaced by another feature?	Yes
Product areas affected	Application
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class **HasFunction**.

Hash.ComputeSHA1Hash(string message)

Expand table

Reason for deprecation/removal	Windows is deprecating the use of SHA1, as documented in Windows Enforcement of SHA1 Certificates.
Replaced by another feature?	Yes

Product areas affected	Platform
Deployment option	All
Status	Deprecated: By April 1, 2020, developers must use the platform APIs found in the class **HasFunction**.

FormDateTimeControl.setUtcString()

Expand table

Reason for deprecation/removal	We're retiring the **setUtcString()** method, because a better replacement method is available.
Replaced by another feature?	Yes
Product areas affected	Platform
Deployment option	All
Status	Deprecated: By October 1, 2020, we plan to no longer support the **setUtcString()** method. Developers should use the **setUtcDateTime()** method instead.

Block list report (IT) – Feature reference IT-00001

Expand table

Reason for deprecation or removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, support ends for this report.

Domestic tax report – Feature reference IT-00003

Expand table

Reason for deprecation or removal	Not legally required.
Replaced by another feature?	No
Product areas affected	Italian localization
Deployment option	All
Status	Deprecated: By October 1, 2020, support ends for the **Domestic tax report – Feature reference IT-00003**.

October 2019 deprecation announcement

Flowchart diagrams in Business process modeler

Expand table

Reason for deprecation/removal	Microsoft is deprecating the flowchart diagrams component in Business process modeler (BPM), because the legacy design caused low usage.
Replaced by another feature?	No
Areas affected	Business process modeler
Status	Deprecated: The flowchart diagrams component in BPM is expected to be removed in 2020. The following functionality is unavailable: All flowcharts are read-only and unavailable for editing. The shape properties that are associated with flowchart activities are also unavailable. These flowcharts include both the default flowcharts that are automatically generated and customized flowcharts that are modified based on those default flowcharts. The process steps are read-only and unavailable for editing. The legacy fit/gap analysis feature is unavailable. Therefore, no gap list is automatically created or available for export. **Note:** This feature was previously deprecated and replaced by Microsoft Azure DevOps integrations. The version history of the flowchart is unavailable.

Finance and Operations 10.0.5 with Platform update 29

US Payroll tax updates

Expand table

Reason for deprecation/removal	Microsoft is retiring tax updates for the US Payroll functionality due to low usage and enhanced functionality that's now offered via strategic integrations.
Replaced by another feature?	Yes
Product areas affected	Payroll
Deployment option	All
Status	Deprecated: By July 31, 2024, Microsoft plans to no longer provide tax updates to US Payroll customers. The functionality remains in the product, but Microsoft won't provide enhancements to keep the functionality up to date. Microsoft will evaluate any product defects on a case-by-case basis.

> **Note**
>
> This change affects the original discontinuation date of October 1, 2021. For more information, see Tax updates being retired for US Payroll feature in Microsoft Dynamics 365 for Finance and Operations.

Data management staging clean up

Expand table

Reason for deprecation/removal	Doesn't meet the core requirements for scheduling periodic cleanup.
Replaced by another feature?	Yes, the job history cleanup feature. It meets the scenarios holistically.
Product areas affected	Data management
Deployment option	All

Status	Deprecated: Target timeframe for removal is December 2020.

Finance and Operations 10.0.4 with Platform update 28

France: FEC Accounting data export in XML

Expand table

Reason for deprecation/removal	Replaced by TXT format. You can access the **French FEC audit file** through **General ledger** > **Periodic tasks** > **Data export**.
Replaced by another feature?	Yes
Product areas affected	General ledger
Deployment option	All
Status	Deprecated. Target timeframe for removal is July 2020.

Legacy navigation bar

Expand table

Reason for deprecation/removal	Header alignment with other Dynamics and Office products. For more information, see Updated navigation bar that aligns with the Office header.
Replaced by another feature?	Starting in Platform update 24, a restyled navigation bar that features search was introduced.
Product areas affected	Web client
Deployment option	All
Status	Deprecated: Starting in April 2020, the legacy navigation bar isn't available. Until that point, customers can revert to the legacy navigation bar through the **Client performance options** page.

Finance and Operations 10.0.2 with Platform update 26

Legacy default action behavior

Expand table

Reason for deprecation/removal	The legacy behavior for default actions in grids results in an unexpected column having the default action link after grid columns are reordered through personalization. The new sticky default action feature corrects this. For more information, see Sticky default actions in grids.
Replaced by another feature?	Starting in Platform update 21, a feature for "sticky default actions" was introduced. You can enable this feature on the **Client performance options** page.
Product areas affected	Grids in the web client
Deployment option	All
Status	Deprecated: Starting in April 2020, sticky default actions are the default behavior, without a mechanism to revert to the legacy behavior.

Legacy "is one of" filtering experience

Expand table

Reason for deprecation or removal	The "is one of" filtering experience underwent a redesign in Platform update 22. This change aims to make the updated version the only "is one of" filtering experience.
Replaced by another feature?	Starting in Platform update 22, an improved "is one of" filtering experience is available on the **Client performance options** page. For more information, see Optimized is one of filtering experience.
Product areas affected	Web client
Deployment option	All
Status	Deprecated: Starting in April 2020, the improved "is one of" experience is the default behavior, without a mechanism to revert to the legacy behavior.

Parameter to enable sales orders with multiple project contract funding sources

Support for creating project-based sales orders where the project contract has multiple funding sources is enabled by using the **Project management parameters** setting **Allow sales orders for project with multiple funding sources**. By default, this parameter isn't enabled.

Expand table

Reason for deprecation or removal	The functionality is always enabled after the parameter is removed.
Replaced by another feature?	No. The functionality to support project-based sales orders with multiple funding sources is always enabled.
Product areas affected	The **Allow sales orders for projects with multiple funding sources** parameter will be removed. The following methods are modified when the parameter is removed: **ctrlSalesOrderTable** method in **ProjStatusType** class, **validate** method for **ProjId** field, and **run** method in **SalescreateOrder** form. The following methods are deprecated when the parameter is removed: **IsSalesOrderAllowedForMultipleFundingSources** in **ProjTable** table file, **IsAllowSalesOrdersForMultipleFundingSourcesParamEnabled** method in **ProjTable** table file, **AllowSalesOrdersForMultipleFundingSources** data field in **ProjParameters** form and **ProjParameterEntity** files, **IsAssociatedToMultipleFundingSourcesContract** private method in **ProjTable** table file.
Deployment option	All
Status	Deprecation is planned for the April 2020 release wave.

Legacy workflow reports for tracking and instance status

Expand table

Reason for deprecation or removal	The legacy workflow reports for tracking and instance status are deprecated because they're no longer referenced from the navigation. The report names are WorkflowWorkflowInstanceByStatusReport and WorkflowWorkflowTrackingReport.
Replaced by another feature?	Use the workflow history form instead.

Product areas affected	Web client
Deployment option	All
Status	Deprecated: Target timeframe for removal is April 2020.

Finance and Operations 10.0.1 with Platform update 25

Deprecated APIs and potential breaking changes

Deriving from internal classes is deprecated

Expand table

Reason for deprecation/removal	Before Platform update 25, you could create a class or table that derives from an internal class or table that's defined in another package or module. This practice isn't safe. As of Platform update 25, the compiler displays a warning.
Replaced by another feature?	The compiler warning is replaced by an error in Platform update 26. This change is backward compatible at runtime, which means that you can deploy Platform update 25 or newer on any sandbox or production environment without needing to modify custom code. This change only affects development and compile time.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning becomes a compilation error in Platform update 26.

Overriding internal methods is deprecated

Expand table

Reason for deprecation/removal	Before Platform update 25, you could override an internal method in a derived class that's defined in another package or module. This practice isn't safe. As of Platform update 25, the compiler displays a warning.
Replaced by another feature?	This warning is replaced by a compile error in Platform update 26. This change is backward compatible at runtime, which means that you can deploy Platform update 25 or newer on any sandbox or production environment without needing to modify custom code. This change only affects development and compile time.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning becomes a compilation error in Platform update 26.

Finance and Operations 10.0.0 with Platform update 24

Renaming released products

Expand table

Reason for deprecation or removal	When you use the **Rename primary key** function to change the ItemId of a released product, the system updates only direct foreign key references. Any other references to the released product, such as references from production orders, keep the old ItemId. This inconsistency can block business processes.
Replaced by another feature?	No.
Product areas affected	Product information management
Deployment option	All
Status	Removed as of Finance and Operations 10.0.0 with Platform update 24.

Finance and Operations 8.1.3 with Platform update 23

SQL Server Reporting Services ReportViewer Control

Customers can use the **Export** action provided by the embedded SQL Server Reporting Services (SSRS) ReportViewer control to download documents produced by Finance and Operations applications. This HTML-based presentation of the report offers users a non-paginated preview of the document.

Expand table

Reason for deprecation or removal	The non-paginated nature of the HTML-based preview experience doesn't deliver fidelity with the physical documents that Finance and Operations ultimately produces. By fully embracing PDF as the standard format for business documents, users can take advantage of a modern viewing experience with improved performance when producing application reports.
Replaced by another feature?	Going forward, Finance and Operations renders reports as PDF documents by default.
Product areas affected	This change doesn't impact customer scenarios where reports are distributed electronically or sent directly to printers.
Deployment option	All
Status	Deprecated: A removal date hasn't been set for this feature. The functionality to automatically preview application reports by using an embedded PDF viewer is planned for the May 2019 Platform update.

Client KPI controls

A developer can model embedded key performance indicators (KPIs) in Visual Studio, and an end user can customize them.

Expand table

Reason for deprecation or removal	The native client controls used to define KPIs have low customer uptake and rely on a developer to add trackable metrics.
Replaced by another feature?	PowerBI.com service delivers world-class tooling for defining and managing KPIs based on data from external sources. In an upcoming release, we plan to enable you to embed solutions hosted on PowerBI.com in application workspaces.

Product areas affected	This update prevents developers from introducing new KPI controls in Visual Studio designer.
Deployment option	All
Status	Deprecated: A removal date hasn't been set for this feature.

Deprecated APIs and future breaking changes

Field groups containing invalid field references

Expand table

Reason for deprecation or removal	Table metadata definitions can have field groups that contain invalid field references. If you deploy these definitions, they can cause runtime failures in Financial Reporting and SQL Server Reporting Services (SSRS). This issue is currently categorized as a *compiler warning* rather than an *error*, which means that you can create and deploy the deployable package without fixing the issue. To fix this issue: 1. Remove the invalid field reference from the table field group definition. 2. Recompile. 3. Ensure you address any warnings or errors.
Replaced by another feature?	This warning will be replaced by a compile error in the future.
Product areas affected	Visual Studio development tools
Deployment option	All
Status	Deprecated: The warning is a compile-time error with platform updates for version 10.0.11 of Finance and Operations apps.

Complete list

To access the full list of APIs that are being deprecated, see Deprecation of methods and metadata elements.

Finance and Operations 8.1 with Platform update 20

Batch transfer rules for subledger journal account entries

The General ledger parameters currently include a synchronous transfer mode that is deprecated. This mode is replaced by asynchronous and scheduled batch only, which already exist as options for transfer. For more information, see the General Ledger Parameters – Batch transfer rules blog.

Expand table

Reason for deprecation/removal	The synchronous option causes a performance impact on the system.
Replaced by another feature?	Use asynchronous and scheduled batch options instead of synchronous.
Product areas affected	General Ledger, Accounts payable, Accounts Receivable, Procurement, Expense
Deployment option	All
Status	Deprecated: Target timeframe for removal is the 10.0 version.

Electronic reporting for Russia

Feature for configuring .txt and .xml file formats of declarations.

Expand table

Reason for deprecation/removal	Replaced by Electronic reporting.
Replaced by another feature?	Yes.
Product areas affected	General Ledger
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Financial reports generator for Russia

A tool for setting up data collection for accounting and tax reports, and to export data to XLS and DOC report templates. The removed functional parts include exporting data to XLS and DOC report templates, queries, and fixed requisites.

Expand table

Reason for deprecation/removal	Removed parts are replaced by Electronic reporting.
Replaced by another feature?	Yes. Use the Financial reports setup user interface to set up data collection rules by GL accounts or tax registers. Use Electronic reporting to export data to various file types, and to configure fixed requisites and query-like data collection rules.
Product areas affected	General ledger.
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Integration with external providers for sending electronic reporting through communication channels for Russia

A feature that exports generated electronic files of declarations to a folder for further sending to official providers of electronic reporting, and imports state back.

Expand table

Reason for deprecation/removal	Replaced by electronic messages configurable feature.
Replaced by another feature?	Yes.
Product areas affected	General Ledger, Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Profit tax register wizard

Feature for creating templates for new profit tax registers. This feature creates X++ objects for new registers, which you can use as templates for adding the appropriate calculation logic.

Expand table

Reason for deprecation/removal	Feature isn't compatible with the Finance and Operations extensibility model.
Replaced by another feature?	No
Product areas affected	Tax
Deployment option	All
Status	Removed as of Finance and Operations 8.1 with Platform update 20.

Payroll and Human Resources for Russia

Russian country/region specific module for managing staff administration information, timesheet details for employees, payroll accounting, and creating pay statements.

Expand table

Reason for deprecation/removal	Payroll isn't included in the global strategic focus of the Dynamics 365 portfolio. Partners and ISVs are best positioned to provide payroll functionality that is compliant with local regulations and tax updates.
Replaced by another feature?	No
Product areas affected	Russian Payroll and Human Resources Management
Deployment option	All
Status	Deprecated: Target timeframe for the functionality to be removed is one of future updates of the 10.0 version.

Finance and Operations 8.0 with Platform update 15

This release doesn't remove or deprecate any features. Platform update 15 is cumulative and contains new or changed features from Platform update 13, Platform update 14, and Platform

update 15.

Finance and Operations, Enterprise edition 7.3 with Platform update 12

Personalized product recommendations

Starting February 15, 2018, retailers can't display personalized product recommendations on a point of sale (POS) device. For more information, see Product recommendations overview.

Expand table

Reason for deprecation or removal	Microsoft is removing the current version of the product recommendation service to redesign this feature with a better algorithm and newer retail-oriented capabilities.
Replaced by another feature?	No. However, after spring 2018, Microsoft plans to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This change affects customers running Dynamics 365 for Operations 1611 and later.

Extension of the list of Electronic reporting (ER) functions

The product no longer supports introducing custom functions to use in the ER expression builder. For more information, see Extend the list of Electronic reporting (ER) functions. Due to changes in the ER APIs, the API to call built-in functions from the ER expression builder is internal and can't be extended.

Expand table

Reason for deprecation or removal	Code sealing initiative

Replaced by another feature?	None. Whenever you need a new built-in function, submit a new extension request to the ER framework team. As a temporary workaround while the requested function is under development by the ER team, you can program the required logic as a method of a custom application class. You can access this method in an ER expression as a property of the added ER data source of the **Application\Class** type that refers to that custom application class.
Product areas affected	Electronic reporting framework
Deployment option	All
Status	Removed as of Finance and Operations, Enterprise edition 7.3.

Inventory by item group and Inventory by inventory dimension aging reports

Finance and Operations no longer supports these two reports. Instead, use the **Inventory aging** report to improve the user experience.

Expand table

Reason for deprecation	Duplicate functionality
Replaced by another feature?	Yes. The two reports have been replaced by the **Inventory aging** report.
Product areas affected	Inventory management, Cost management
Deployment option	All
Status	Deprecated: The product removes the menu items for the two reports in version 7.3. However, the product retains the code for the reports. The plan is to remove the code in a future release.

Power BI content packs available on Marketplace

Product updates in Microsoft Power BI deprecate the **Cost management**, **Financial performance**, and **Retail channel performance** content packs that are available on the Microsoft Marketplace site. Finance and Operations also deprecates system administration forms that you use to deploy these content packs to PowerBI.com.

Expand table

Reason for deprecation/removal	Product updates in Microsoft Power BI.
Replaced by another feature?	Analytical applications which allow for solution integrations at the database level replace the **Cost management**, **Financial performance**, and **Retail channel performance** content packs that are available on the Marketplace site. For more information about analytical applications, see Embedded Power BI in workspaces.
Product areas affected	Cost management, Finance, and Retail
Deployment option	Cloud only (Integration with PowerBI.com is not supported in on-premises deployments.)
Status	Deprecated: Target timeframe for the functionality removal is Q2 2018.

Standard UI in data management workspace

The standard UI in data management is the legacy UI. It's the default UI that users see when they visit the data management workspace.

Expand table

Reason for deprecation or removal	Investments are focused on providing new user experiences in the new UI.
Replaced by another feature?	The new UI called *Enhanced views* replaces the old UI.
Product areas affected	Data management workspace
Deployment option	All
Status	Deprecated: Target timeframe for removal is Q2 2018.

Excise, sales tax, service tax for India

These taxes are subsumed into Indian GST.

Expand table

Reason for removal or deprecation	These taxes are subsumed into Indian GST.
Replaced by another feature?	Indian GST
Product areas affected	Tax
Deployment option	All modules
Status	Deprecated: A removal date isn't set for this feature.

File Validation Utility (FVU) for India

Expand table

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

TDS/TCS certificate for India

Users can download this certificate from the government portal.

Expand table

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Indian withholding tax
Deployment option	All modules

Status	Deprecated: A removal date hasn't been set for this feature.

Export/import (EXIM) incentive scheme for India

Expand table

Reason for removal or deprecation	Lack of customer usage
Replaced by another feature?	No
Product areas affected	Import and export
Deployment option	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

Dynamics 365 for Retail 7.2

Personalized product recommendations

Starting February 15, 2018, retailers can't display personalized product recommendations on a point of sale (POS) device. For more information, see Product recommendations overview.

Expand table

Reason for deprecation or removal	Microsoft is removing the current version of the product recommendation service to redesign this feature with a better algorithm and newer retail-oriented capabilities.
Replaced by another feature?	No. However, after spring 2018, Microsoft plans to bring back this feature to leverage a new recommendation service.
Product areas affected	Personalized product recommendations in POS.
Deployment option	All
Status	Removed as of February 15, 2018. This change affects customers running Dynamics 365 for Retail 7.2 and later.

Finance and Operations, Enterprise edition July 2017 with Platform update 8

Currency conversion for accounting and reporting currencies

Currency conversion for accounting and reporting currencies was introduced when the euro was introduced.

Expand table

Reason for deprecation or removal	Limited usage and addition of the Copy legal entity functionality as a replacement.
Replaced by another feature?	No, but the Copy legal entity and Configurations features were added to make it easier to move to a company that has changing core requirements.
Product areas affected	Financial management
Status	Deprecated: A removal date hasn't been set for this feature.

Warehouse mobile devices portal

Warehouse mobile devices portal (WMDP) was a standalone component that you intended to self-deploy on-premises. Finance and Operations no longer supports this component. A native app that improves the user experience replaces the functionality of WMDP.

Expand table

Reason for deprecation or removal	Duplicate functionality.
Replaced by another feature?	Yes. Finance and Operations - Warehousing replaces this feature. For more information about setup and prerequisites, see Install and configure the Warehousing app overview.
Product areas affected	Warehouse management, Transportation management
Deployment option	Warehouse mobile devices portal (WMDP) was a standalone component that you

	intended to self-deploy on-premises.
Status	Deprecated: Target timeframe for the functionality to be removed is Q4 2019.

Advanced bank reconciliation matching rule for manual matching

Use this matching rule to select and mark a bank document when you manually match documents in the reconciliation worksheet.

Expand table

Reason for deprecation/removal	Limited usage.
Replaced by another feature?	No. Use column filtering capabilities to find documents for reconciliation.
Product areas affected	Cash and bank management
Deployment option	All
Status	Removed as of July 2017.

Dynamics 365 for Operations 1611 with Platform update 3

AEB payment formats for Spain

Use the Consejo Superior Bancario payment formats to send remittance files to the bank for customer payments and vendor payments. The Asociación Española de Banca determines the content of these formats. It covers Cuaderno 19, 32, 58, 34.

Expand table

Reason for deprecation/removal	The payment formats are no longer used.

Replaced by another feature?	Yes, ISO20022 Credit transfer and Direct debit payment formats for Spain
Product areas affected	Accounts payable, Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Bank payments transfer for Lithuania

Use the Payment transfer (LT) export format to generate and print bank payment transfers for Lithuania. In 2005, the Lithuanian market started using LITAS, the unified electronic banking system.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Yes, ISO20022 Credit transfer payment format for Lithuania
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

BBS Direkte Remittering payment formats for Norway

BBS Direkte Remittering payment formats include customer payment collection export (direct debit) and return message import.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Use the AvtaleGiro customer payment format for Norway to generate direct debit messages. Return message import will be implemented in future releases.
Product areas affected	Accounts payable, Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Chart of Accounts tool for Spain

Use this tool when you need to make major changes to a chart of accounts in Spain. You can import a new chart of accounts in Microsoft Excel or text format, and you can also import financial statements.

Expand table

Reason for deprecation or removal	Limited usage
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date hasn't been set for this feature.

Dom80 payment format for Belgium

Legacy Belgian payment format for payment collection (direct debit).

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Belgium
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

DTA/EZAG payment formats for Switzerland

The DTA and EZAG formats are part of the ESR system because they support the reference number. Since the reference number isn't mandatory, you can use these formats to process any vendor payments. Companies that use these formats typically have a bank account at a bank other than PostFinance.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Yes, ISO 20022 Credit transfer payment format for Switzerland
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

EDIFACT-DIRDEB payment format for Austria

The EDIFACT-DIRDEB payment format supports payment collection through direct debit.

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Direct debit payment format for Austria
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

EDIVAT for Belgium

EDIVAT is an obsolete Belgian standard for electronic declaration via secure mail. Dynamics AX 2012 retains the read-only solution to enable access to the historical data.

Expand table

Reason for deprecation or removal	The functionality is no longer used.
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date hasn't been set for this feature.

eGiro EDIFACT CREMUL payment import format for Norway

eGiro is based on the international UN EDIFACT CREMUL (Multiple Credit Advice Message) standard that banks use for automatic posting of customer payments. In Dynamics AX, you implement eGiro as a customer payment import format.

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

External inventory for Poland

Evidence of goods that you take from a vendor for sales without purchase. Goods that you handle in external inventory don't affect standard inventory, and you can sell and then purchase them automatically. This process creates real inventory movements.

Expand table

Reason for deprecation or removal	Replaced by another feature
Replaced by another feature?	Yes, the core Inbound consignment functionality
Product areas affected	Accounts payable, Inventory management
Status	Deprecated: A removal date hasn't been set for this feature.

Financial reports generator for Eastern Europe

A tool that you use to set up data collection for accounting and tax reports, and to export data to XLS and DOC report templates.

Expand table

Reason for deprecation or removal	Limited usage

Replaced by another feature?	No. The tool will be replaced by Electronic reporting configurations in future releases.
Product areas affected	General Ledger
Status	Deprecated: A removal date hasn't been set for this feature.

Import of customer payment transactions for Finland

You can select an import format for Finnish payments to import customer payment transactions from an external file that the bank provides.

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Import of payment transactions into a general ledger journal for Finland

A format that's specific to Finland is used to import accounting transactions into the general ledger.

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.053 bank statement import by using Advanced Bank Reconciliation.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Integration with Isabel synchronized (CIS) for Belgium

Isabel is the framework for electronic banking in Europe and is a de facto standard in Belgium.

Expand table

Reason for deprecation or removal	Integration with Isabel client is discontinued.
Replaced by another feature?	No. The payment formats that are no longer used are replaced by ISO 20022 Credit transfer payment format for Belgium.
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Modifications in the chart of accounts and accounting rules for Spain

This feature is used for changes in the chart of accounts and accounting rules in Spain. It maps accounts to help transform the old chart of accounts into the new chart of accounts, and compares the previous fiscal year with the new fiscal year, even if they were posted to different account numbers.

Expand table

Reason for deprecation or removal	Limited usage
Replaced by another feature?	No
Product areas affected	General ledger
Status	Deprecated: A removal date hasn't been set for this feature.

Pagamento Fornittori vendor payment format

Legacy Italian payment format for credit transfers.

Expand table

Reason for deprecation or removal	The payment format is no longer used.
Replaced by another feature?	Yes, ISO 20022 Credit transfer payment format for Italy
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Payment export formats for Estonia

The Telehansa and Teleservice formats are used for bank payment export.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Yes, ISO 20022 Credit transfer payment format for Estonia
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Payment file archive for Norway

When you generate payment files, the file archive automatically archives all created files, even files that you previously wrote or read.

Expand table

Reason for deprecation or removal	Replaced by another feature
Replaced by another feature?	Yes, Electronic reporting archived jobs
Product areas affected	Accounts payable, Accounts receivable, Organization administration
Status	Deprecated: A removal date hasn't been set for this feature.

Payment import formats for Estonia

Use the Telehansa and TeleTeenus formats for bank payment import.

Expand table

Reason for deprecation or removal	The payment formats are no longer used.
Replaced by another feature?	Yes, the ISO20022 Camt.054 bank notification import.
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Payroll information in Human Resources

Human Resources Payroll information

Expand table

Reason for deprecation or removal	Core Payroll and Human Resources pages now provide this functionality.
Replaced by another feature?	**Benefits**, **Earnings**, and other related pages that were previously in US Payroll have been reconfigured. They're now part of the core Human Resources configuration to help support external payroll processing. Use the **Human Resources 1** > **Payroll** configuration key to access this functionality.
Product areas affected	Human Resources, Payroll
Status	Removed as of Dynamics 365 for Operations version 1611.

Performance management goal workflow

Performance management includes goal management and integration with performance reviews.

Expand table

Reason for deprecation or removal	Performance management was redesigned, and the number of goal pages was reduced to simplify the process.

Replaced by another feature?	No. Managers can see goals through the Manager Self Service portal, and they can change and view the goals.
Product areas affected	Human capital management
Status	Removed as of Dynamics 365 for Operations version 1611.

Postgirot and Postgirot Utland payment formats for Sweden

Postgirot and Postgirot Utland payment formats for Sweden.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Yes, by the ISO 20022 credit transfer payment format for Sweden.
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Radio frequency identifier

Radio Frequency Identification (RFID) is a data-collection technology that uses electronic tags to store identification data and a no-line-of-sight requirement reader to capture the identification data.

Expand table

Reason for deprecation or removal	Low customer usage and a limited feature set.
Replaced by another feature?	No
Product areas affected	Inventory management
Status	Removed as of Dynamics 365 for Operations 1611.

Report about state invoices numbering for Latvia

Latvian legislation provides specific rules about the numbering of sales invoices. By using this functionality, you can assign specific numbers to sales invoices based on the user or user group. You can then generate a report or an XML file. You can also print a report about invoice numbers that are used.

Expand table

Reason for deprecation/removal	You no longer need to maintain the state invoice numbering. You no longer need to report about used invoice numbers.
Replaced by another feature?	No
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Set up the names of the manager and general accountant of a company for Lithuania

You can specify the names of the manager and the general accountant of a company in the company information and use them in different local report printouts.

Expand table

Reason for deprecation/removal	Replaced by another feature
Replaced by another feature?	Yes, use the setup of officials for the same purpose.
Product areas affected	Accounts payable, Accounts receivable, Cash and bank management
Status	Deprecated: A removal date hasn't been set for this feature.

Shipping carrier interface

Expand table

Reason for deprecation/removal	Duplicate functionality

Replaced by another feature?	Partially replaced by Transportation management
Product areas affected	Sales and marketing, Inventory management
Status	Removed as of Dynamics 365 for Operations version 1611.

Telepay payment formats for Norway

Telepay payment formats include vendor payment export (credit transfer) and customer payment collection (direct debit).

Expand table

Reason for deprecation/removal	The payment formats are no longer used.
Replaced by another feature?	Yes, ISO 20022 Credit transfer payment format and AvtaleGiro customer payment format for Norway, as well as pain.002 and camt.054 bank notification return files import.
Product areas affected	Accounts payable, Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Vendor payment export formats for Finland

Two formats for exporting payments are available for Finland. Use LM02 (FI) for domestic payments, and use LUM2 (FI) for foreign payments.

Expand table

Reason for deprecation/removal	These payment formats are no longer used.
Replaced by another feature?	Yes, ISO 20022 Credit transfer payment format for Finland
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Warehouse management II

Expand table

Reason for deprecation or removal	The Warehouse management II solution (WMS II) that was available in the **Inventory management** module duplicates functionality that's in the **Warehouse management** module that was released in Dynamics AX 2012 R3.
Replaced by another feature?	The **Warehouse management** module that was released in AX 2012 R3, Dynamics AX 2012 R3 CU8, and Dynamics AX 2012 R3 CU9 replaces the Warehouse management II features. The new module has more advanced features and more flexible warehouse management processes than Warehouse management II.
Product areas affected	Inventory management, Sales and marketing, Procurement and sourcing
Status	Removed as of Dynamics 365 for Operations version 1611.

Worker reminders in Human Resources

Human Resources Payroll information

Expand table

Reason for deprecation/removal	Low usage
Replaced by another feature?	No
Product areas affected	Human resources
Status	Removed as of Dynamics 365 for Operations version 1611

Workflow for creating goals

A workflow for managing the creation of employee goals was one of several workflows that helped coordinate the performance management process.

Expand table

Reason for deprecation/removal	Performance management has been completely redesigned in Finance and Operations.

Replaced by another feature?	The redesigned Performance management feature gives more control over the content of the goals, the measurements that are used to track progress, and the attachment of supporting documentation. Goals can be stored as templates and then reused. This feature can help you set up additional goals for your employees more quickly.
Product areas affected	Human capital management
Status	Removed as of Dynamics 365 for Operations version 1611.

Dynamics AX 7.0

Ability to cancel changes to a vendor invoice

Expand table

Reason for deprecation or removal	Performance enhancement
Replaced by another feature?	No
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

AIF, AxD, and AxBC integrations

In Application Integration Framework (AIF), you can exchange data with external systems through business logic that you expose as services. Dynamics AX includes services that are based on documents and .NET Business Connector (AxBC). You create a document by using XML. The XML includes header information that you add to create a *message* that you can transfer into or out of Dynamics AX. Examples of documents include sales orders and purchase orders. However, you can represent almost any entity, such as a customer, by using a document. Services that are based on documents use the **Axd <Document>** classes.

Expand table

Reason for deprecation or removal	The architecture of AIF and AxDs couldn't scale to a cloud service. There were performance problems around bulk import.

Replaced by another feature?	This feature is replaced by the Data Import/Export framework, which supports recurring bulk import and export. For AxBC, use the actual tables.
Product areas affected	AxDs, AxBCs, and AIF
Status	Removed as of Dynamics AX 7.0.

Billing code rate scripts

Use billing scripts to calculate billing rates for billing codes. You need to custom develop these scripts by using C# or Visual Basic. In the current version of Dynamics AX, billing code rate scripts aren't supported.

Expand table

Reason for deprecation or removal	Dynamics AX doesn't support custom C# or Visual Basic scripts.
Replaced by another feature?	No
Product areas affected	Public sector, Accounts receivable
Status	Removed as of Dynamics AX 7.0.

BOMs without BOM versions

When you disable the **BOM versions** configuration key, the system hides bill of materials (BOM) versions in all forms and enforces a one-to-one relationship between released products and BOMs. In the current version of Dynamics AX, you can't disable the **BOM versions** configuration key.

Expand table

Reason for deprecation or removal	Using a configuration key to control BOM versions doesn't scale in a cloud environment.
Replaced by another feature?	No
Product areas affected	Product information management, Inventory management
Status	Removed as of Dynamics AX 7.0.

Brazilian Bordero

Specific method of payment for Brazilian companies

Expand table

Reason for deprecation or removal	Brazilian localization no longer supports the Brazilian Bordero method of payment.
Replaced by another feature?	No
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

Brazilian Sintegra statement

Federal tax statement for ICMS tax

Expand table

Reason for deprecation or removal	This statement is no longer applicable in some Brazilian states.
Replaced by another feature?	No. Use the Generic Electronic reporting tool to configure the statement if required under specific situations.
Product areas affected	Fiscal books
Status	Deprecated: A removal date hasn't been set for this feature.

Brazilian SCAN contingency mode for NF-e

Use the (SCAN) contingency environment to generate, export, and import the status of a Nota Fiscal eletrônica (NF-e) when the environment of Secretaria da Fazenda (SEFAZ) isn't available.

Expand table

Reason for deprecation/removal	This method of contingency is no longer applicable in all Brazilian states

Replaced by another feature?	No
Product areas affected	Accounts receivable
Status	Deprecated: A removal date hasn't been set for this feature.

Business Analyzer

This mobile application lets users review key business metrics.

Expand table

Reason for deprecation/removal	This functionality has been replaced by another feature.
Replaced by another feature?	The Monitor financial performance content pack for Microsoft Power BI includes key financial metrics that were previously available in Business Analyzer.
Product areas affected	General ledger
Status	Deprecated: The use of Business Analyzer is deprecated.

Business statistics

The setup of business statistics inquiries that you can use to analyze the performance of the organization.

Expand table

Reason for deprecation or removal	Legacy approach to business intelligence (BI), low customer usage, and a limited feature set.
Replaced by another feature?	New BI solutions for the current version of Dynamics AX.
Product areas affected	Procurement and sourcing, Accounts payable, Sales and marketing, Accounts receivable.
Status	Removed as of Dynamics AX 7.0.

Change document date function in Invoice approval journal

Expand table

Reason for deprecation or removal	Low usage.
Replaced by another feature?	Yes. You can change the document date on the posted vendor transaction.
Product areas affected	Accounts payable.
Status	Removed as of Dynamics AX 7.0.

ClieOp03 payment format for the Netherlands

Expand table

Reason for deprecation or removal	This format is no longer applicable in the Netherlands, because it's replaced by SEPA functionality.
Replaced by another feature?	SEPA payments export.
Product areas affected	All modules.
Status	Deprecated: A removal date hasn't been set for this feature.

Compliance Center

The Compliance Center was an enterprise portal site for managing the documentation requirements for compliance initiatives that are related to the Sarbanes-Oxley law.

Expand table

Reason for deprecation or removal	Lack of customer usage. Microsoft SharePoint includes the same capability that was available in the Compliance Center.
Replaced by another feature?	No

Product areas affected	Compliance and internal controls
Status	Removed as of Dynamics AX 7.0.

Connector for Microsoft Dynamics

Use this tool to integrate key data from Microsoft Dynamics CRM to Dynamics ERP applications.

Expand table

Reason for deprecation or removal	This functionality is replaced by another feature.
Replaced by another feature?	Dataverse
Product areas affected	Connector for Dynamics
Status	Removed as of Dynamics AX 7.0.

Container unit and multi dimension on-hand

Expand table

Reason for deprecation/removal	Duplicate functionality
Replaced by another feature?	Yes. Since AX 2012, this functionality has been replaced by the consolidated batch orders feature set. This feature set includes the consolidated on-hand view.
Product areas affected	Product information management, Production control, Inventory management, Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Cue group metadata

Expand table

Reason for deprecation/removal	Cue groups displayed one or more Cues in the FactBox area. There was limited uptake, and there were also performance concerns. A record change in a parent form caused one query per Cue in the Cue group.
Replaced by another feature?	No
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Cue metadata

Expand table

Reason for deprecation/removal	Cue metadata was limited to count or sum information.
Replaced by another feature?	Tile metadata was introduced to provide more flexibility for modeling. For example, you can model current counts, navigation, and key performance indicators (KPIs). Count tile metadata is the direct replacement of the Cue metadata.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

Danish check format

Expand table

Reason for deprecation or removal	Support for the Danish check format layout has been discontinued, and DK localization no longer includes the report.
Replaced by another feature?	No
Product areas affected	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

Data partitions

Data partitions provide a logical separation of data in the Dynamics AX database.

Expand table

Reason for deprecation or removal	Data partitions were introduced in Dynamics AX 2012 R2 to enable data isolation. In a common scenario, a company has subsidiaries, and the data from one subsidiary shouldn't be visible to another subsidiary, even though the same IT department manages both subsidiaries. However, extra scripts and management overhead throughout the program were required to create new partitions, populate them with data, and back up partition data. In the cloud, where you have access to platform as a service (PaaS) database services (Microsoft Azure SQL Database), it's much more efficient to use a database as the isolation container than to do isolation in the program. Regardless of whether data partitioning is required for subsidiaries, for multiple tenants, or just for scale, Finance and Operations can handle these scenarios better through multiple instances.
Replaced by another feature?	Customers using data partitions must use multiple instances of Finance and Operations if database level separation is a critical issue.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Database and file share storage for attachments

Dynamics AX 2012 allowed storage of attachments in the database and in file shares. Both of those options aren't supported anymore.

Expand table

Reason for deprecation or removal	File share storage isn't supported anymore because cloud-hosted environments can't communicate with local file shares. Database storage is deprecated in favor of Azure Blob storage. Azure Blob storage is equivalent to storage in the database, as you can only access documents through Finance and Operations client forms. This storage option provides the added benefit of not negatively affecting the performance of the database. Blob storage is the default storage mechanism for Document Management and works immediately.
Replaced by another	Database storage is deprecated in favor of Azure Blob storage.

feature?	
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Delimitation

Expand table

Reason for deprecation or removal	No use of the functionality was found.
Replaced by another feature?	No
Product areas affected	Time and attendance
Status	Removed as of Dynamics AX 7.0.

Desktop client

Expand table

Reason for deprecation or removal	The Dynamics AX client experience was redesigned to improve usability across multiple platforms and devices.
Replaced by another feature?	The new web client is based on the desktop Form metadata and programming model that are modified to provide a rich web platform.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Direct database connection

In Dynamics AX 2012 R3, Retail Modern POS can connect directly to the Channel DB in a similar way to Enterprise POS. This connection is in addition to the standard communication method where Retail Modern POS communicates through Retail Server.

Expand table

Reason for deprecation or removal	Direct database connectivity requires lower security protocols. Use it primarily to achieve the highest levels of performance. Due to the performance and security enhancements that occurred in Finance and Operations, this functionality now causes more problems than it solves.
Replaced by another feature?	No. Only standard Retail Server communication is now supported.
Product areas affected	Channel DB and Retail Modern POS
Status	Removed as of Dynamics AX 7.0.

Dutch SWIFT MT940

Expand table

Reason for deprecation or removal	Use generic functionality instead of localized functionality.
Replaced by another feature?	Yes, Advanced bank reconciliation functionality.
Product areas affected	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

eBilanz (XBRL for Germany)

This functionality provided eXtensible Business Reporting Language (XBRL) output that's intended specifically for the German eBilanz taxonomy.

Expand table

Reason for deprecation or removal	Lack of customer usage
Replaced by another feature?	This feature isn't replaced by another feature. However, multiple specialized XBRL packages that provide rich XBRL functionality are available for the German market.

Product areas affected	Management Reporter
Status	Deprecated: A removal date hasn't been set for this feature.

Enterprise Portal client

Expand table

Reason for deprecation or removal	A single client platform is provided.
Replaced by another feature?	The new web client is based on the desktop form metadata and programming model. This model is modified to provide a rich web platform.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Environmental sustainability

Expand table

Reason for deprecation or removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	Compliance and internal controls, Accounts payable
Status	Removed as of Dynamics AX 7.0.

Form ActiveX and managed host controls

Expand table

Reason for deprecation/removal	The ActiveX and managed host controls are based on the deprecated desktop client.

Replaced by another feature?	The extensible control framework supports building new controls that are based on HTML, CSS, and JavaScript, and is a first-class control in the Microsoft Visual Studio Tooling environment.
Product areas affected	All modules.
Status	Removed as of Dynamics AX 7.0.

Generate prenotes by using a batch

You can't use a batch to generate prenotes, but a user can still generate them.

Expand table

Reason for deprecation/removal	No form exists to persist and display the resulting prenote file when you generate it by using a batch.
Replaced by another feature?	You can still generate prenotes, and you have control over the location where the file is saved.
Product areas affected	Accounts payable, Accounts receivable, Cash and bank management
Status	Removed as of AX 7.0.

German DTAUS payment export and account statement import (totals and transactions)

Expand table

Reason for deprecation/removal	This format is no longer applicable in Germany, because it's replaced by Single Euro Payments Area (SEPA) functionality.
Replaced by another feature?	Yes, this functionality is replaced by SEPA payment export and advanced bank reconciliation functionality for importing account statements.
Product areas affected	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

German DTAZV payment format in domestic currency

Expand table

Reason for deprecation/removal	The format is no longer applicable in Germany, because SEPA functionality replaced it.
Replaced by another feature?	SEPA payments export
Product areas affected	Accounts payable
Status	Deprecated: A removal date hasn't been set for this feature.

German MT940 import

Expand table

Reason for deprecation or removal	Use generic functionality instead of localized functionality.
Replaced by another feature?	Yes, Advanced bank reconciliation functionality.
Product areas affected	All modules
Status	Deprecated: A removal date hasn't been set for this feature.

German XML EU Sales list

Expand table

Reason for deprecation/removal	The XML format for German EU Sales List reporting is no longer supported. You can only use the ELMA5 text file format to submit the EU Sales List report to the German Tax Office.
Replaced by another feature?	No
Product areas affected	Tax
Status	Deprecated: A removal date hasn't been set for this feature.

GL SSRS reports

Reports that include the following menu items are removed: **Summary trial balance**, **Detailed trial balance**, **Chart of accounts**, **Audit trail**, **Balances**, and **Balance list**.

Expand table

Reason for deprecation or removal	Financial Microsoft SQL Server Reporting Services (SSRS) reports are replaced by Management Reporter capabilities and default reports.
Replaced by another feature?	Management Reporter (labeled **Financial reporting** in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 7.0.

InfoPart and FormPart metadata

Expand table

Reason for deprecation or removal	InfoPart and FormPart metadata enabled the creation of FactBoxes for two different clients.
Replaced by another feature?	InfoPart metadata, which was a simplified form definition, is converted into a Form by upgrade tooling. FormPart metadata, which referenced a Form, is replaced by a more direct reference that is created by upgrade tooling.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Main account list page

A list of accounts for the legal entity and related balance information.

Expand table

Reason for deprecation or removal	The **Trial balance** list page shows balance information by account and dimension.

Replaced by another feature?	The **Main accounts** list page contains the same list of accounts. It also provides a more streamlined grid view.
Product areas affected	General ledger
Status	Removed as of Dynamics AX 7.0.

Malaysia and Singapore bank cash flow report

This feature lets you print a cash flow report that shows transactions and details of the cash inflows and outflows for a specific date range for selected bank accounts.

Expand table

Reason for deprecation or removal	You can get the same information from the **Inquiry bank transaction**.
Replaced by another feature?	The **Inquiry bank transaction**.
Product areas affected	Cash and bank management.
Status	Deprecated: A removal date hasn't been set for this feature.

Mexican CFD electronic invoice

This feature enabled the generation of Mexican electronic invoices by using the Comprobante Fiscal Digital (CFD) method, where the company signs the invoice by requesting the related authorization from the government. This feature also provides a monthly report that includes all electronic invoices that were issued in the period.

Expand table

Reason for deprecation or removal	The method is no longer applicable. The tax authorities deprecated the generation of electronic invoices by using the CFD method and replaced it with the Comprobante Fiscal Digital a través de Internet (CFDI) method, where the signing is delegated to the third-party provider (PAC). The monthly report was removed, and an inquiry option lets users inquire about historical transactions.
Replaced by another	No

feature?	
Product areas affected	Accounts receivable, Project
Status	Deprecated: A removal date hasn't been set for this feature.

Mexico realized and unrealized VAT

Dynamics AX 2012 managed unrealized value-added tax (VAT) by using Mexico-specific functionality for unrealized tax.

Expand table

Reason for deprecation or removal	Duplicate functionality
Replaced by another feature?	Yes, standard conditional sales tax functionality provided by Core replaces this functionality.
Product areas affected	Tax
Status	Deprecated: A removal date hasn't been set for this feature.

Microsoft Outlook integration

Expand table

Reason for deprecation or removal	Microsoft Exchange Server integration replaces this functionality.
Replaced by another feature?	Yes
Product areas affected	Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Private blocking of inventory and warehouse management journals

The inventory and warehouse journals no longer support the ability to mark a journal as private for a selected user. They support only blocking journals as private for user groups and blocking during editing.

Expand table

Reason for deprecation or removal	No use of the functionality was found.
Replaced by another feature?	No
Product areas affected	Inventory management
Status	Removed as of Dynamics AX 7.0.

Product builder

Use product builder to dynamically configure items from a sales order, purchase order, production order, sales quotation, project quotation, or item requirement. Based on a product model that has modeling variables, select values to meet the customer requirements and get a unique product variant that has a BOM and route.

Expand table

Reason for deprecation/removal	Product builder exposed X++ code to end users and isn't supported in the current version of Dynamics AX. Microsoft removed it to avoid duplicate maintenance efforts on overlapping, sizeable codebases.
Replaced by another feature?	Yes. Constraint-based configuration was introduced in Dynamics AX 2012. Microsoft announced the deprecation of product builder in future versions. Select constraint-based configuration technology on the product masters to enable the configuration. To learn more, see Product configuration overview.
Product areas affected	Product information management, Sales and marketing
Status	Removed as of Dynamics AX 7.0.

Production Floor app

This app runs on tablet devices that use Windows 8.1 RT and Windows 8.1 Pro.

Expand table

Reason for deprecation/removal	With the change to a web-based client, you can deliver similar functionality through the native Dynamics AX 7.0 client. The Job Card Device provides a production floor user interface that is optimized for touch and tablet form factors.
Replaced by another feature?	Yes. The Job Card Device, which is a native part of Dynamics AX 7.0.
Product areas affected	Production control
Status	Deprecated: A removal date from the Microsoft store hasn't yet been set for this feature.

Rename product dimension

This feature lets you change the name of one of the three standard product dimensions (size, color, or style) to a name that better suits your business requirements. Renaming includes all the labels where the product dimension name is used.

Expand table

Reason for deprecation/removal	The current version of Dynamics AX doesn't support label changes at run time.
Replaced by another feature?	No
Product areas affected	Product information management
Status	Removed as of Dynamics AX 7.0.

Retail Server connectivity using HTTP

In Dynamics AX 2012 R3, the Retail Server could function by using HTTP communication (non-secured). This option was in addition to the standard communication by using HTTPS.

Expand table

Reason for deprecation/removal	Due to new security requirements, only secured communication by using TLS 1.2 (or above, as available) is now supported. The self-service installer automatically configures the computer for this communication.

Replaced by another feature?	No. Only standard HTTPS communication is now supported.
Product areas affected	Retail Server
Status	Removed as of Dynamics AX 7.0.

Role Center pages

Expand table

Reason for deprecation or removal	Role Center pages were built on the deprecated Enterprise Portal platform. The current version of Dynamics AX replaces Enterprise Portal with the new web client platform.
Replaced by another feature?	The new Workspace form pattern provides users with a process-centered design that provides easy access to commonly used tasks within that process.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0

Sales tax jurisdictions

Expand table

Reason for deprecation or removal	Low customer usage and a limited feature set
Replaced by another feature?	No
Product areas affected	US sales tax
Status	Removed as of Dynamics AX 7.0.

Sites Services

By using Sites Services, you can build websites that extend your business processes to the Internet without IT support.

Expand table

Reason for deprecation or removal	Use the new capabilities in the Microsoft Azure infrastructure that Dynamics AX uses, such as Azure sites.
Replaced by another feature?	No
Product areas affected	HR recruiting, Case management, Request for quotes, Vendor registration, Collaborative workspaces for opportunities and campaigns
Status	Removed as of Dynamics AX 7.0.

SSAS demand forecasting strategy

Expand table

Reason for deprecation/removal	The new cloud architecture can't support the design of this feature.
Replaced by another feature?	Azure Machine Learning demand forecasting strategy
Product areas affected	Master planning
Status	Removed as of Dynamics AX 7.0.

Vendor invoice pool excluding posting details

Expand table

Reason for deprecation/removal	Low usage. This functionality has been replaced by the Invoice journal that has workflow functionality.
Replaced by another feature?	Workflow capabilities of the Invoice journal.
Product areas affected	Accounts payable
Status	Removed as of Dynamics AX 7.0.

Virtual company accounts

Dynamics AX no longer supports the virtual companies feature. By using the virtual companies feature, you could set up tables that a set of companies shared. For a description of the feature, see Company accounts and Virtual company accounts. The feature works by grouping tables into collections that you assign to virtual companies, which are groups of existing "real" companies. You create queries so that all the companies in the virtual company can access the data in the tables of the associated table collections.

Expand table

Reason for deprecation/removal	- You must set up virtual companies before storing data in the tables. Retrofitting virtual companies onto an existing implementation is very difficult. - Because the current version of Dynamics AX uses so much data normalization, it can be difficult to know what to add to the table collections. For example, it's difficult to know which tables to share. You must add all the tables referenced from tables that are in a virtual company. Because of table normalization, even simple master data that is spread across multiple tables must be part of the virtual company. Any mistake that you make here causes functional problems. - When a table is part of a virtual company, it loses information about the origin of the data, and only the virtual company is recorded.
Replaced by another feature?	Use global tables to make tables accessible from all companies. Currently, there is no replacement.
Product areas affected	All modules
Status	Removed as of Dynamics AX 7.0.

Windows 8 tablet app

The Windows 8 tablet app provided functionality for expense entry and approval.

Expand table

Reason for deprecation or removal	Finance and Operations is compatible with tablets. The tablet app is no longer required.
Replaced by another feature?	No.
Product areas affected	Expense management
Status	Removed: This functionality is only available for Dynamics AX 2012 R3.

Workplanner

Expand table

Reason for deprecation or removal	Low usage
Replaced by another feature?	No, but the **Profile relation** page, which you open from the **Profile groups** page, supports the same business scenario as the deprecated **Workplanner** page.
Product areas affected	Time and attendance
Status	The code isn't removed. However, the form, JmgWorkPlanner, wasn't migrated.

X++ financial statements

Expand table

Reason for deprecation or removal	This functionality is replaced by another feature.
Replaced by another feature?	Management Reporter (labeled **Financial reporting** in the current version of Dynamics AX)
Product areas affected	General ledger
Status	Removed as of Dynamics AX 2012

Last updated on 03/18/2026

Capabilities that were postponed from Dynamics AX 2012

This article lists features from Microsoft Dynamics AX 2012 that Microsoft postponed delivery of. In the following table, the **Current status** column indicates whether the feature is available since the version 7.0.

For a detailed list of the release date for each version, see Software lifecycle policy and cloud releases.

Expand table

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
Absence management in Human resources	This feature doesn't include functionality for entering absence transactions. Additionally, it doesn't include functionality for approving absence transactions as a manager. However, you can access setup capabilities that are required for integration with other modules through the **Human Resources 2** configuration key.	Implemented in Dynamics 365 Human Resources
Alerts	Alerts help users keep track of data changes in the system.	Implemented in Platform update 15
Bank payment order for Latvia and Lithuania	You can print a payment order for Latvia and Lithuania. This feature will be available in a future update.	Not implemented
Bankgirot AP return format for Sweden	The Bankgirot return format is used to import bank return messages. This feature will be available in a future update.	Not implemented
Client drag-and-drop	The web client controls have application programming interfaces (APIs) for drag-and-drop operations, but these APIs are based on the deprecated desktop client technology. They require a redesign so that they work on the new web client platform. APIs that support drag-and-drop operations will be reviewed for inclusion in a future update.	Not implemented
Client right-to-left (RTL) layout	RTL layout is now supported.	Implemented in Platform update 2

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
Cost accounting	The **Cost accounting** module is designed to meet the requirements of internal costs and profitability reports at multiple organizational levels. To define the cost object level, the module depends on a correct mapping of financial dimensions. The module lets you perform advanced allocations of cost origin from expenditures that are registered in the general ledger or budget. It also lets you compare realized costs and budgeted costs.	Implemented in version 1611
Customer self-service (CSS)	CSS lets you create approved customer records. It also allows users to view selected product catalogs, order items, and view the status of invoices. Additionally, CSS lets you create and follow return orders.	Not implemented
Customizable help articles	The ability to create customized help articles hasn't yet been implemented. Custom task guides and custom field help are available. This feature will be available in a future update.	Not implemented
Employee self-service (ESS)	ESS shows employees several tiles that have task-related and career-related information on a single page. Employees can view pending work items and select links that open pages where they can take action on their tasks. ESS pages also show employees the status of their certifications, when their next performance reviews are scheduled, skills, goals, and compensation information, and other information, such as balances for vacation and sick time. Employees can also access a company directory from their ESS page.	Implemented in version 1611
External questionnaire and recruiting functionality	Functionality for externally posting questionnaires and open jobs will be added to Human Resources in a future update.	External questionnaire functionality isn't implemented. Recruiting functionality is available in Microsoft Dynamics 365 Talent: Attract.
Fiscal printers for Poland	Integration with Polish fiscal printers enables the required information to be sent to the fiscal printer in the correct format during invoice posting. Examples of Polish fiscal printers include the Posnet Thermal and Elzab Omega printer types. This feature will be available in a future update.	Not implemented
General budget reservations	The General budget reservations document is sometimes referred to as a commitment. Public sector entities often use this	Implemented in version 8.1

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
	document to set aside or earmark budgeted funds so that they're not available for other purposes.	
Graphics tab on the **Fixed asset value model** and **Depreciation book profile** pages	The chart shows the depreciation, accumulated depreciation, and net book value over time. Users can select the **Data** tab to view more detailed information than the chart shows. This chart will be redesigned in a future update.	Not implemented
Intelligent Data Management Framework (IDMF)	IDMF is an add-on tool that lets system administrators optimize performance. IDMF assesses the health of the application, analyzes current usage patterns, and helps reduce database size.	Not implemented
Microsoft Project client integration	The Microsoft Project client is integrated with projects.	Implemented in version 7.2 (July 2017 update)
Procurement site	In previous versions, the Employee self-service procurement site lets you enter requisitions for employees, view the status of an order (created, received, or receipt confirmed), and request onboarding of a new vendor. You could configure different procurement catalogs to show on the site depending on policy. You could also design procurement catalogs by adding new nodes. In the current version, procurement catalog capabilities are reduced and are used only to limit the products that can be ordered for an organization. The structure is always based on the Procurement categories hierarchy. Additionally, on the procurement site the employee could approve a vendor invoice and confirm receipts in relation to the requisitions and derived purchase orders.	Not implemented
Secure global address book	The ability to help secure the global address book by legal entity and address book isn't available. This feature will be available in a future update.	Not implemented
Specifications for Electronic reporting (ER) payment formats	Currently, you must enter the payment format specifications manually. In a future update, you can select payment format specifications from a list. The following payment specifications are currently supported per payment format.	Not implemented
US Payroll	US Payroll provides gross-to-net processing for employees in the United States. In Payroll, you can set up, enter, and maintain all payroll records and transactions.	Implemented in version 1611

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
Vendor collaboration (Vendor Portal)	Dynamics AX 2012 provided vendor portal capabilities through Enterprise Portal. Financial and Operations also provides these capabilities. In version 7.1 (also known as Dynamics 365 for Operations 1611), a vendor can view and respond to purchase orders. In version 7.3, the vendor can view and respond to RFQs. Vendors can also view and edit selected information from the vendor record such as addresses, contact information, and contact persons, and they can upload documents in relation to their certifications.	Implemented in version 7.3
Vendor requests - external request to become a new vendor	Dynamics AX 2012 provided the ability for an anonymous user to sign up to be a vendor in the system, which could lead to a vendor request for adding a new vendor to the vendor master. In version 7.3, you can import the anonymous request from a prospective vendor via an entity (Data Management/OData), which can lead to inviting the vendor - or the vendor's contact person - to register more details about the prospective vendor. The information provided is included in a new vendor request that can be reviewed and approved via a workflow process. An approval of the vendor request leads to creation of a new vendor account.	Implemented in version 7.3
Vendor requests in general	Dynamics AX 2012 had a concept of vendor requests that served various purposes related to updating vendor-related information, such as requesting new procurement categories for the vendor, internal employees requesting new vendors, or requesting to add a vendor to another company. Only the vendor's request to be added as a vendor was implemented in version 7.3.	Not implemented
[Russia] Tax registers	Legal entities can use registers to disclose their revenues and expenses. The registers track revenue and expense data from the time that primary documents, such as sales invoices and delivery notes, are first entered by using the calculation of cost prices for production. The data from the registers is used to confirm the declared profit of the legal entity. This functionality includes the following features: Current period incomes, Tax expenses, Other expenses of current period, Unrealized expenses of current period, Other unrealized expenses, Accounts receivable debt – inventory, Bad debts reserve calculation, Bad debts reserve movement, Accounts receivable movement, Procedure for writing-off AR bad debts, Accounts payable debt - inventory, Accounts payable debt movement, Procedure for writing-off AP bad debts, Goods cost calculation, FA object information, IA object information, FA depreciation, IA depreciation, FA/IA sale, Depreciation bonus recovery	Implemented in version 8.1.3

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
[Russia] Electronic export/import format for Client-Bank interface and reconciliation procedure	Electronic formats for export of outgoing payments, and import of incoming payments.	Implemented in version 8.1.3
[Russia] VAT declaration	Electronic format of VAT declaration.	Implemented in version 10.0.1
[Russia] Cash flow management	The functionality that obtains a cash flow forecast and performs an analysis, manages payments on a daily basis by using payment schedule journals, controls the company's cash position, and maintains the company's cash flows with centralized control.	Implemented in version 10.0.1
[Russia] Accounting reporting format	Electronic format of the following accounting reports: BalanceSheet, IncomeStatement, CashFlow, EquityStatement, TargetUsageMoney.	Implemented in version 10.0.1
[Russia] Assessed tax reporting	Assessed tax declaration.	Implemented in version 10.0.1
[Russia] Land tax reporting	Land tax declaration. Creation of land tax declaration by separate divisions.	Implemented in version 10.0.1
[Russia] Transport tax reporting	Transport tax declaration.	Implemented in version 10.0.1
[Russia] Indirect tax return (VAT and Excise) on import of goods	Indirect (withholding) tax return (VAT and Excise) on import of goods from state members of Customs union.	Implemented in version 10.0.1
[Russia] Journal of Alcohol sales in Retail	Daily Alcohol journal.	Implemented in version 10.0.1
[Russia] Optional posting of transfer orders to General ledger	Option to post or not post transactions to General ledger when posting a transfer order.	Implemented in version 8.1.2
[Russia] Inventory owner	Inventory dimension used to track owner of inventory, including consignment stock, bailment, tolling, and similar arrangements.	Implemented in version 10.0.1

AX 2012 feature that Microsoft postponed	Description	Current status (as of February 2019)
[Russia] AP/AR - Third-party miscellaneous charges	Register third-party miscellaneous charges and allocate them by the following regimes: inclusion into cost of purchased goods (allocation to invoice lines from other vendors), and redrawing to other parties (reallocation to other expense accounts).	Implemented in version 8.1.1
[Russia] Goods in transit from vendor	Register goods in transit from vendor by using a special posting profile with item type "purchased items en route." Create Act of inventory holdings en route (INV-6).	Implemented in version 8.1.2
[Russia] Goods in transit - sales to customer with postponed passing of property	Post sales invoice with postponed property transfer: no customer debts posted, all outgoing taxes posted, items transferred to transit warehouse. Register passing of property with posting debts and items sale from transit warehouse.	Implemented in version 8.1.2
[Russia] Bailment - accounting at bailee side	Account for inventory receipt for bailment as required by the law and generate primary form MX-1. Account for inventory return from bailment and generate primary form MX-3. Calculate bailment costs from bailee side.	Implemented in version 8.1.2
[Russia] Bailment - accounting at owner side	Account for inventory transfer to bailment and inventory return from bailment on goods owner side under bailment service contract.	Implemented in version 8.1.2
[Russia] Localization of Process Industries solution	Basic localization in two areas: correspondence of accounts for all new general ledger postings, and functional coexistence of Process Industries features and Russian country/region context (no issues when both Process Industries and Russian country/region context are enabled).	Implemented in version 10.0.1
[Russia] Alcohol sales declarations: Application 6, 7, 8 for wholesale. Applications 11, 12 for retail	Keep track of alcoholic beverage types, including producers, units of measure, licenses for retail and wholesale trade. Prepare data for alcoholic beverages activities, including printing declarations and exporting them in XML format through e-reporting.	Implemented in version 10.0.1

Last updated on 08/21/2026

End of mainstream support for Microsoft Dynamics AX 2009, Dynamics AX 2012, Dynamics AX 2012 R2, and Dynamics AX 2012 R3

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Mainstream support for Dynamics AX 2009 Service Pack 1 (SP1), Dynamics AX 2012, and Dynamics AX 2012 R2 ended on October 9, 2018. Security hotfixes were provided for those three versions through the extended support period, which ended on April 12, 2022. For more information, see Microsoft Lifecycle Policy.

Mainstream support for Dynamics AX 2012 R3 ended on October 12, 2021. Only security hotfixes continue to be provided through the extended support period that ends on January 10, 2023. For more information, see Microsoft Lifecycle Policy.

Upgrade to the latest version of finance and operations apps, such as Dynamics 365 Finance, Supply Chain Management, Commerce, and Project Operations:

- Dynamics AX 2009 Service Pack 1 customers should use the migration tool that's available.
- Dynamics AX 2012 and Dynamics AX 2012 R2 customers should upgrade to finance and operations apps through Dynamics AX 2012 R3 using the upgrade tool that's available. For more upgrade information, see Upgrade from AX 2012 to finance and operations apps.

Frequently asked questions

When does the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 end?

Mainstream support ended on October 9, 2018.

When does the mainstream support for Dynamics AX 2012 R3 end?

Mainstream support ended on October 12, 2021.

Was the information of the end date of the mainstream support for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, Dynamics AX 2012 R2, and Dynamics AX 2012 R3 available before?

Yes, it's always been publicly available on the Microsoft Support Lifecycle site at support.microsoft.com.

Can customers on Premier Extended Hotfix Support or on Unified Support Advanced and Performance Levels get a nonsecurity hotfix or regulatory update?

No. Neither nonsecurity hotfixes nor regulatory updates are available for the Dynamics AX products during the Extended Support phase of the product lifecycle (Dynamics AX 2009 SP1, Dynamics AX 2012, Dynamics AX 2012 R2, or Dynamics AX 2012 R3).

While the ability to request a nonsecurity hotfix for select products is included with Unified Support Advanced and Performance Levels, Microsoft determined that it can't provide nonsecurity hotfixes with a *commercially reasonable* effort for these products. As a result, Microsoft doesn't accept requests for nonsecurity hotfixes or regulatory updates.

I knew about the regulatory change before October 9, 2018, but it has the law enforcement date after October 9, 2018. Will I still get a regulatory update for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2?

No, Microsoft only provides regulatory updates for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, and Dynamics AX 2012 R2 for regulatory changes with the law enforcement dates on or earlier than October 9, 2018.

A customer or partner can already download a fix through Lifecycle Services and inspect the code by installing it into a

test Dynamics AX 2012 R3 environment. Is there any difference with the approach that you proposed?

No, there's no difference.

How are binary hotfixes handled for Dynamics AX 2009 Service Pack 1, Dynamics AX 2012, Dynamics AX 2012 R2, and Dynamics AX 2012 R3?

If a hotfix is needed for a part of the system where Microsoft doesn't provide the source code and it's not a security bug, Microsoft doesn't provide the hotfix.

Can I access information about upcoming legislation changes in supported countries/regions?

Yes, all legislation changes regardless of source (such as vendors, Microsoft research, or the localization community) are stored in the Lifecycle Service alerting project. To access the Lifecycle Services alerting project, follow these steps:

1. **Sign up**: Send an email request to join the localization community (under NDA) at DynRegW@microsoft.com.
2. **Access**: Sign in to the Lifecycle Services project **Regulatory Alerts - Worldwide** (available only for companies with NDA or individuals who signed up for the Insider Program).
3. **Alerting guide**: Inform Microsoft about country/region regulation alerts and track the status of regulatory features. For more information, see Submit alerts about country/region-specific regulatory features.

The Lifecycle Services alerting project includes all identified and reported legislation changes (alerts) but not actual Microsoft plans.

Can I get visibility into Microsoft plans for releases of new regulatory features?

Yes, in Lifecycle Services Issue Search, Microsoft publishes information about upcoming regulatory updates for Dynamics 365 Finance, Supply Chain Management, Commerce, and Project Operations.

Are details about released regulatory features available?

Yes, for larger features, Microsoft publishes this information in Globalization resources.

Can I view and try actual regulatory features in Dynamics 365 before a release?

Yes, you can try these features if you purchase cloud licenses for Dynamics 365. All service updates are available for preview through the Shared Asset Library in Lifecycle Services. For regulatory changes specified by authorities early, the features are available in Preview before the law-enforced date (or latest date for first filing).

Can I access the code and configurations for regulatory features before a release?

Yes, starting with version 10.0.26, Microsoft makes preview packages for every service update available to all customers through the Shared Asset Library in Lifecycle Services, under **Software deployable package**.

Configurations are available in the Global repository. For more information, see Download ER configurations from the Global repository of Configuration service.

Last updated on 03/26/2026

Service description for finance and operations apps

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the **Request access to Finance and Operations Viva Engage Community** form and choose the community you want to join.

Finance and operations apps are enterprise resource planning (ERP) software as a service (SaaS) offerings that are built on and for Microsoft Azure. The finance and operations service provides organizations with ERP functionality that supports their unique requirements and helps them adjust to constantly changing business environments, without requiring that they manage infrastructure. Finance and operations apps can include one or more of the following solution areas:

- Dynamics 365 Finance
- Dynamics 365 Human Resources
- Dynamics 365 Supply Chain Management
- Dynamics 365 Commerce
- Dynamics 365 Project Operations

Together with business intelligence, infrastructure, compute, and database services, these apps enable organizations to run industry-specific and operational business processes. Customers, supported by their implementation partner, determine the configuration of the business application logic that best suits their unique business processes. Functionality and business processes can be augmented or extended through one or a combination of the following solutions:

- Built in personalization experience
- Microsoft Power Platform tools
- Visual Studio–based finance and operations software development kit (SDK) and Azure DevOps build automation
- Independent software vendor (ISV) solutions from Marketplace

Based on requirements, customers choose their solution approach. They work with their implementation partner to define, develop, and test their solution by using the tools and best practices that are provided in Microsoft Dynamics Lifecycle Services. There are four common scenarios:

- Standard finance and operations apps "out of the box" configuration (no extensions)
- Finance and operations apps configuration that includes one or more ISV solutions
- Finance and operations apps configuration that includes one or more customer-specific extensions
- Finance and operations apps configuration that includes a combination of customer-specific extensions and one or more ISV solutions

Organizations can match their business growth by easily adding users and business processes through a simple, transparent subscription model. For more information, see the Dynamics 365 Licensing Guide.

Operating model

The operating model of finance and operations apps defines specific roles and responsibilities for the customer, implementation partner, and Microsoft throughout the lifecycle of the service. For more information, see Cloud operations and servicing.

Customer activities

Customers work with their partner and Microsoft FastTrack following the Dynamics 365 Implementation Guide, the Success by Design framework, and the tools and best practice templates provided in Lifecycle Services to implement their solution. Common activities include:

- User identity and security management
- Define, develop, and operate business processes
- Define, develop, test, and operate extensions
- Monitor and manage nonproduction deployments
- Manage application updates and validate extensions
- Manage ISV solutions and third party integrations

Microsoft responsibilities

Microsoft manages the finance and operations service by deploying, actively monitoring, and servicing customer sandbox and production environments in the Microsoft SaaS subscription. This management includes allocating the required system infrastructure to run the service and proactively communicating with customers about the service's health. Responsibilities include:

Infrastructure management

- Security and isolation

- Operating systems and virtualization
- Servers, storage, and networking
- Data center power, networking, cooling

Application platform management

- 24/7 application monitoring and notifications
- Diagnostics, platform updates, patches, service updates
- Application routing, load balancing, site replication
- Environment provisioning and management
- Database management, high availability (HA)/disaster recovery (DR), scale, operations
- Compute deployment, scale up, scale down

System configuration

Finance and operations apps scale according to the transaction volume and user load. Each customer implementation produces a unique solution that consists of the following elements:

- **Data composition** – A unique set of parameters that control behavior, the layout of the organization, the structure of master data (such as financial and inventory dimensions), and the granularity of transaction tracking.
- **Extension and configuration** – Extension mechanisms that use code extensions, ISV solutions, and unique configurations that include workflows, integrations, and report configurations.
- **Usage patterns** – A unique combination of online and batch usage, together with the ability to integrate with upstream and downstream systems for unified data flow and the ability to differentiate based on the information views that customers use in their business processes.

Microsoft configures customer production environments that are sized to handle the transaction volumes and user concurrency. Microsoft is responsible for the following tasks:

- Correctly allocating the resources of production environments, based on the customer's profiling information in the Lifecycle Services Subscription estimator
- Continually monitoring and diagnosing the service availability of production environments
- Analyzing and troubleshooting system performance issues with finance and operations apps

To ensure that an implementation is configured for high performance, customers must complete these tasks:

- Provide accurate usage information about the finance and operations implementation in the Lifecycle Services Subscription estimator.
- Build and test extensions for performance and scale.
- Appropriately test data configurations for performance.
- Ensure scalability by doing performance testing) before go-live.

Onboarding and implementation

The following table shows typical onboarding and implementation events.

Expand table

Request	Expected Microsoft action	Expected customer or implementation partner action
Initial offer purchase	Microsoft creates a Lifecycle Services project after the purchase of the offer, based on an event that the customer triggers.	Go through the Enterprise Agreement (EA) or Cloud Solution Provider (CSP) commercial process. The partner creates a tenant for the customer, if applicable.
Add-on purchase	Microsoft grants the customer access to the add-on that the customer selects during implementation.	Not applicable
Implementation planning and analysis	Microsoft provides relevant tools in Lifecycle Services, such as Business process modeler (BPM) and interoperability with Azure DevOps.	Do project planning, set up Azure DevOps, complete system onboarding, and set up admin accounts.

For more information, see Onboarding an implementation project.

Globalization

Finance and operations apps are served from several Azure regions around the world. Finance and operations apps provide functionality to support different countries or regions and native languages. For more information, see Localization and regulatory features.

Country or region-specific considerations

- Customers in regulated industry or commercial organizations that do business with entities in France that require local data residency should review Finance and operations in France.

- Customers that have operations in China should review Azure China Playbook and Finance and operations operated by 21Vianet in China.
- Customers that have operations in Russia should review the Russian personal data localization law.

Privacy laws and regulations

For finance and operations apps, Microsoft acts as a processor. As a data processor, finance and operations apps provide processes and features that help customers comply with privacy obligations as a data controller. For more information, see Privacy overview.

Environment and data management

This section describes some typical environment and data management events that occur in the service.

Environment and data management events for production instances

Lifecycle Services provides self-service tools and database movement operations that you use to perform environment and data management tasks. Here are some examples:

Event: Requesting a production instance

- Complete the Go-live readiness review, and submit it to the Microsoft FastTrack team.
- Complete the Lifecycle Services Subscription estimator before you request a production instance.
- Complete all the implementation tasks that are specified in the Lifecycle Services methodology.

Event: Copying a sandbox database to a production instance

- Perform this operation for a mock go-live or an actual go-live cutover.

Event: Maintenance mode

1. Turn on maintenance mode in Lifecycle Services.
2. Complete the required maintenance.
3. Turn off maintenance mode in Lifecycle Services.

Environment and data management events for nonproduction instances

Lifecycle Services provides self-service provisioning and database movement operations that you use to perform environment and data management tasks. Here are some examples:

Event: Deploying a new sandbox instance

- Make sure that you plan all required instances and purchase the applicable add-on offers.
- Run the deployment process in Lifecycle Services.
- Complete all tasks that are specified in the Lifecycle Services checklists.

> **Note**
>
> A development sandbox environment is a virtual machine (VM) that is deployed to the customer's Azure subscription and managed by the customer.

Event: Copying a golden configuration database from sandbox to production

- Perform this operation for a mock go-live or an actual go-live cutover.

Event: Restoring a production point-in-time backup to a nonproduction instance

- Run the Refresh database option in Lifecycle Services.
- Post-copy: Delete or obfuscate sensitive data via scripts, adjust environment-specific application configurations (such as integration endpoints), and enable or add users. Apply these changes by using a data package.

Event: Nonproduction instance database point-in-time restore

- Accept that the process can't be undone.
- Run the point-in-time restore operation in Lifecycle Services.

Event: Copying a Tier 2 sandbox database to a development sandbox for troubleshooting and debugging

- Run the database export operation in Lifecycle Services on the Tier 2 sandbox environment.
- Import and update the database in the development environment.

Data backup and retention

The SaaS subscription automatically backs up databases for finance and operations environments. For production environments, automatic backups are available for 28 days, unless Microsoft initiates a rollback. For sandbox (Tier 2+) environments, automatic backups are available for seven days. If a failure occurs during any planned maintenance update, Microsoft can roll back the production environment.

For more information about automatic backups, see Automated backups - Azure SQL Database & SQL Managed Instance.

Service activity responsibilities

The following table describes some typical scenarios and activities for the service. It also indicates whether Microsoft, the customer, or both Microsoft and the customer are responsible for the activities.

Expand table

Activity	Responsibility of Microsoft	Responsibility of the customer
Provisioning initial tenants		
Size the projected load in Lifecycle Services by using the Subscription estimator tool, and request that specific environments be provisioned.		X
Provision all production instances and nonproduction instances.	X	
Validate the deployed production instances and nonproduction instances.		X
Service updates		
Apply service updates to designated nonproduction and production instances.	X	
Manually apply service updates from Lifecycle Services to sandbox instances. Define, develop, test the update, and provide the code update package back to Lifecycle Services.		X
Request and schedule extension updates be applied to the production instance.		X
Create a code and data backup for the production instance before any updates are applied.	X	

Activity	Responsibility of Microsoft	Responsibility of the customer
If there's any failure, roll back the production instance to the code and data backup.	X	
Data management (backup, restore, and update)		
Back up the database.	X	
Determine high availability and a disaster recovery plan.	X	
Monitor performance of the production instance database.	X	
Tune the production instance database for performance.	X	
Perform production instance database point-in-time refresh to a nonproduction instance.		X
Updating the infrastructure		
Schedule regular infrastructure updates.	X	
Scaling up and down (users, storage, and instances)		
Purchase additional users and nonproduction add-ons.		X
Update usage changes in the Lifecycle Services Subscription estimator tool.		X
Report any significant performance issues that affect use of the service.		X
Proactively manage the resources that are required for the applicable service.	X	
Investigate and troubleshoot incidents.	X	
Security (user access)		
Provide user access to the service.		X
Provide Lifecycle Services project access for the management and operation of instances that were deployed through Lifecycle Services.		X
Monitoring production instances		
Monitor production instances 24/7.	X	
Proactively notify the customer about incidents that involve the production instance.	X	

Activity	Responsibility of Microsoft	Responsibility of the customer
Managing and monitoring nonproduction instances		
Manage nonproduction instances by using Lifecycle Services.		X
Monitor nonproduction instances.		X

Service update strategy

In accordance with the software lifecycle policy, finance and operations apps follow the Microsoft Modern Lifecycle Policy, which covers products that are continuously serviced and supported.

Microsoft releases four service updates to finance and operations apps every year in the following months:

- February
- April
- July
- October

> **Note**
>
> April and October are major feature release waves. You can pause an individual service update for up to one update cycle.

For more information, see the following topics:

- One Version service updates overview
- Configure service updates through Lifecycle Services
- Pause service updates through Lifecycle Services
- Get notified about service updates through Lifecycle Services
- Regression testing tools to validate service updates
- Dynamics 365 roadmap and release waves

Security and administrative access

Administrative access to a finance and operations production environment is strictly controlled and logged. Handle customer data in accordance with the Microsoft Online Services Terms.

Customer administrative access

The customer's tenant administrator can access production instances or nonproduction instances, as described in the following table:

Expand table

Environment type	Purpose	Level of customer access
Nonproduction Tier 1 sandbox	A nonproduction environment that customers deploy for development, demonstration, or training purposes.	A Tier 1 sandbox (also referred to as a cloud-hosted environment) is a customer-managed VM that you deploy to your Azure subscription from Lifecycle Services. Because it's a VM in your Azure subscription, you have full administrative access to the environment via Remote Desktop.
Nonproduction Tier 2 (or higher) sandbox	A nonproduction environment that customers deploy for user acceptance testing, integration testing, training, staging, or any other preproduction scenario.	Tier 2 and higher sandboxes are deployed to the finance and operations SaaS subscription. You grant access to Azure SQL databases that are associated with the nonproduction environment via just-in-time access. Remote Desktop access isn't available.
Production	A production environment is deployed when the project is ready for initial go-live.	Production environments are deployed to the SaaS subscription. All access is through the browser, service endpoints, or Lifecycle Services.

Microsoft administrative access

The following table shows the different levels of access for different Microsoft administrators:

Expand table

Administrator	Customer data
Operations responses team (Limited to key personnel only)	Access is granted through a support ticket. Access is audited and limited to the duration of the support activity.
Microsoft Customer Support Services (CSS)	No direct access. Customer can use screen sharing to work with support staff to debug issues.
Engineering	No direct access. The Operations response team can use screen sharing to work with engineering to debug issues.
Others in Microsoft	No access.

Monitoring

Microsoft provides an extensive toolset to monitor and diagnose production instances. Microsoft monitors production environments 24 hours a day, 7 days a week. For more information, see Production support and monitoring.

Expand table

Microsoft responsibilities	Customer responsibilities
• Monitor availability of the service. • Continuously monitor and alert through health metrics and watchdogs for critical components such as Application Object Server (AOS), Batch, Data Import/Export Framework (DIXF), Commerce, and Management Reporter. • Monitor for performance degradation that infrastructure services cause (such as Microsoft Entra [Microsoft Entra] and Azure SQL). • If Microsoft determines that a single process or batch job is causing aberrations, Microsoft terminates that process or job after communication with the customer.	• Monitor changes to application configurations and extensions that can cause functional and performance problems. • Use the monitoring tools to diagnose application errors and user-reported performance problems. • Inform Microsoft if you expect system load beyond projected peak usage. • If the applicable service is unavailable in the production instance, use Lifecycle Services to report a production outage.

By submitting support requests online through Lifecycle Services, you enable Microsoft to deliver fast and deep technical expertise in the most effective and efficient manner. Although a phone option is available, use it only if the online option isn't available. For more information, see Phone support options.

Incident management

Microsoft responds to and fixes incidents based on severity levels. Microsoft can change the incident severity levels during the initial assessment of the incident, and as more information about the impact and scope becomes available. If the incident is mitigated, the incident severity remains unchanged.

For more information about severity levels, see this severity table.

Business continuity through high availability and disaster recovery

Microsoft provides business continuity and disaster recovery for production instances of finance and operations apps in the event of Azure region–wide outages. For more information, including service Recovery Time Objective (RTO) and Recovery Point Objective (RPO), see Business continuity and disaster recovery.

- **High availability** – High availability (HA) functionality provides ways to prevent downtime that a failure of a single node in an Azure datacenter causes. Each service's cloud architecture uses Azure availability sets for the compute tier to prevent single-point-of-failure events. Azure SQL HA features provide HA for databases.

- **Disaster recovery** – Azure disaster recovery features protect each service against outages that broadly affect an entire Azure datacenter. Here are some of these features:
  - Azure SQL active-geo replication for the primary database (business database).
  - Geo-redundant copies of Azure Blob Storage (which contains document attachments) in other Azure regions.
  - Secondary region for the Azure SQL and Azure Blob Storage replications.

If you use disaster recovery to recover your production instance, you and Microsoft meet your incident management responsibilities.

Microsoft regularly examines its disaster recovery plans and procedures through System and Organization Controls (SOC) audits. Compliance audits attest to the technical and procedural process of Microsoft's disaster recovery, including Dynamics 365 finance and operations apps. SOC compliance audit reports and all other Compliance Reports are available on Microsoft Trust Center Compliance Offerings.

Finance and operations support offerings

Technical support is available in markets where finance and operations services are offered. Support experiences are provided in Lifecycle Services or finance and operations apps. Here are some examples:

- Issue search in Lifecycle Services
- Integrated technical support in finance and operations apps
- Cloud-powered support in Lifecycle Services

Microsoft offers finance and operations customers three support plans: Premier, Professional Direct, and the support that is included in the subscription. The level of support differs per plan. The following table shows a comparison of the three plans.

Expand table

Support feature	Premier	Professional Direct	Subscription
Unlimited break/fix incident submission	Yes	Yes	Yes
24/7 access via Lifecycle Services	Yes	Yes	Yes
Incident response time	Less than one hour	Less than one hour	Next business day
Advisory hours	Pools are acquired per agreement.	No	No
Dedicated support account manager	Yes	No	No
Dedicated support engineer	Engaged under a separate agreement	No	No

For more information, see Support overview.

Process to engage support

If incidents involve finance and operations apps, customers can submit support tickets to Microsoft through Lifecycle Services. CSS handles the incidents, based on the customer's support plan and the severity of the incident as designated by CSS.

Service level agreement

Microsoft is committed to an availability rate of 99.9 percent per month of the service. If Microsoft doesn't achieve and maintain the service level for the applicable service as described in the service level agreement (SLA), the customer might be eligible for a credit toward a portion of its monthly service fees for that service. For information about how to initiate a service credit, see the "Claims" section of the SLA.

Important resources

- **Trust Center** – Get information about where your finance and operations data is stored, plus additional information about privacy, compliance, and security procedures.
- **Licensing terms and documentation** – Quickly access licensing terms, conditions, and supplemental information that is relevant to the use of products and services that are

licensed through Microsoft volume licensing and Microsoft commercial licensing programs.

- **Microsoft Lifecycle Policy** – This page provides consistent and predictable guidelines for the availability of support throughout the life of a product.
- **Licensing guide** – Use this guide to learn more about how to license Dynamics 365.
- **Customer support** – Get industry-leading support for your Dynamics 365 apps.
- **Dynamics Lifecycle Services** – Manage your application lifecycle, and move towards predictable, repeatable, high-quality implementations.
- **Dynamics 365 Implementation Guide** - The Dynamics 365 Implementation Guide documents time-tested Success by Design principles and provides prescriptive guidance to architect, build, test, and deploy Dynamics 365 solutions.

Definitions

Azure region

A geographical region where one or more Azure datacenters exist. Examples include US and Europe.

Business process modeler (BPM)

A tool in Lifecycle Services that helps complete a fit-gap analysis for a given implementation by using business process definitions from American Productivity & Quality Center (APQC) that are supported in finance and operations apps.

Cloud solution provider

A partner that is part of the Microsoft Cloud Solution Provider (CSP) program, and that provides customers with value-added cloud services, support, one invoice, and customer management at scale.

Customer

A business entity that consumes finance and operations apps and is represented by a tenant in Office 365.

Development environment

A nonproduction sandbox environment that you use to develop extensions. Deploy this environment to your own Azure subscription from Lifecycle Services. You can also use this environment for demonstration, training, or other testing tasks. It's also known as a Tier 1 sandbox.

Downtime

Any period when users can't sign in or access their active tenant because of a failure in the unexpired platform or the service infrastructure, as Microsoft determines from automated health monitoring and system logs. Downtime doesn't include scheduled downtime, the unavailability of service add-on features, the inability to access the service because of your modifications to the service, or periods where the scale unit capacity is exceeded.

Implementation partner

The partner that you select to customize, configure, implement, and manage your finance and operations solutions.

Incident

An issue that you encounter while using the finance and operations service, and that you submit a ticket for via Lifecycle Services.

Microsoft Customer Support Services (CSS)

The Microsoft global support team that's dedicated to providing quality service for finance and operations apps.

Microsoft Dynamics Lifecycle Services

The administrative portal for lifecycle management of finance and operations apps from trial, to implementation, to post-production management and support. For more information, see Lifecycle Services Resources.

Nonproduction instance

Any of the following instances of a service that you use to validate extensions and perform other development tasks:

- **Sandbox Tier 1** – Developer instance (customer-hosted)

- **Sandbox Tier 2** – Standard Acceptance Testing instance
- **Sandbox Tiers 3–5** – Add-on sandboxes

For more information about Tiers 2 through 5, see Selecting the correct Tier-2 or higher environment.

Production instance

A finance and operations environment that you use to manage your "live" daily transactions and business processes.

Sandbox environment

A nonproduction environment that you use for demonstration, training, user acceptance testing, validation of extensions, and other testing tasks.

Service

Any of the core services that are included in finance and operations apps.

Service level agreement (SLA) for Microsoft online services

The SLA applies to Microsoft online services. For more information, see Service Level Agreements.

Service update

Microsoft services finance and operations environments on consistent basis through service updates. Customers set their own service update calendar, based on their business needs. For more information, see One Version service updates.

Success by Design

Success by Design is the framework that systematically guides an implementation through a series of assessments at critical stages. It helps ensure optimal architecture, security, performance, and user experience for a Dynamics 365 solution.

User

A single person who uses finance and operations environments and is associated with a customer's tenant.

Last updated on 03/28/2026

Before you buy

New to Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce? Use the following step-by-step guidance whether you're still evaluating or ready to make a purchase.

Step one: Try out finance and operations free for 30 days

You can try Dynamics 365 for Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce for 30 days through a simple email signup. The trial version of finance and operations applications includes Getting started task guides that provide step-by-step instructions that allow you to view specific scenarios in action. You can explore the product and exercise scenarios, but you can't customize it. Demo data is included to ease the use of the product and to make the experience more meaningful. A reminder email is sent three days before the trial expires. For more information, see Sign up for preview subscriptions.

Step two: Choose a deployment option

You can now deploy finance and operations applications in the cloud or on-premises. Cloud deployments offer an ERP service that Microsoft fully manages, while on-premises deployments are deployed locally within a customer's data center.

Consider the following factors when you choose on-premises as a deployment option:

- Regulatory and compliance needs that aren't available in the cloud certifications.
- Disconnected business process with intermittent internet connectivity required to access Microsoft Dynamics Lifecycle Services for application lifecycle management.
- Comparison of cloud and on-premises features.
- System requirements for on-premises deployments.

> **Important**
>
> On-premises deployments aren't supported on any public cloud infrastructure, including Microsoft Azure. However, they're supported to run on Microsoft Azure Stack HCI and Microsoft Azure Stack Hub.

For more information, see Deployment options.

Step three: Buy and manage a subscription

To explore subscription options, go to the Dynamics 365 pricing page. This page includes several different plans to fit your organization's needs.

You can buy a subscription in many ways:

- Buy through a Cloud solution provider (cloud only).
- Buy through a partner, and use volume licensing (cloud or on-premises).
- Buy through a partner from the Dynamics price list (on-premises only).

Buy through a Cloud solution provider (cloud-only)

A Microsoft Cloud Solution Provider can work closely with you to understand the needs of your business or organization. Use the Microsoft Partner Center portal to find a partner to fit your needs.

Buy through a Dynamics partner (on-premises)

You must work with a partner to purchase Finance + Operations (on-premises). For more information, see Buy Finance + Operations (on-premises).

Buy through volume licensing (cloud or on-premises)

If your organization has 250 or more Dynamics 365 users, you might be interested in a Volume licensing agreement.

In volume licensing, finance and operations applications are available through:

- Enterprise Agreement
- Enterprise Agreement Subscription
- Enrollment for Education Solutions (under the Campus and School Agreement)
- Microsoft Products and Services Agreement (MPSA)

Choose your support option

Microsoft provides flexible, industry-leading support, services, and resources that enable you to quickly address technical issues and maximize return on your Dynamics 365 investment. Choose a plan that best meets your business requirements.

For more resources, see:

- Dynamics 365 Support
- Quick Start Guide for Microsoft Dynamics Cloud Service Support Benefits (PDF)

Step four: Learn about FastTrack and plan your deployment

Microsoft FastTrack for Dynamics 365 is a customer success service designed to help you move to Dynamics 365 smoothly and confidently, so you can realize business value faster. When you participate in the FastTrack program, you receive guidance on best practices and how to plan for successful rollouts. You also learn ways to enable new users and expand capabilities – all at your own pace. Additionally, you have access to Microsoft engineering resources committed to making your experience with Dynamics 365 a success. For more information, see Microsoft FastTrack.

If you're upgrading from Dynamics AX 2012 or migrating from AX 2009

If you're upgrading from Microsoft Dynamics AX 2012 or migrating from Microsoft Dynamics AX 2009, you might be eligible for a longer trial. Contact daxcf@microsoft.com for more information.

Last updated on 06/26/2026

Sign up for preview subscriptions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to subscribe to the preview or partner offer and deploy an environment. The subscription that you create gives you a Microsoft Online Services test tenant and a Microsoft Dynamics 365 Lifecycle Services project where you can deploy an environment. This article also helps you set up additional users in your Microsoft Online Services tenant and gain experience with service administration capabilities. Here are the skills that you learn:

- Subscribe and create a new Microsoft Online test tenant.
- Navigate to Lifecycle Services projects.
- Use various features of Lifecycle Services.
- Add users to Microsoft Entra and the client.
- View resources in your subscription email.

Key terms

- **Microsoft Online Services tenant** – A tenant is the group of all subscriptions and users for your organization. You create the tenant at the same time as your first subscription in Microsoft Online Services.
- **Subscription** – A subscription gives you an online cloud environment and experience. It also lets you see how customizations that you develop can be deployed to the cloud.
- **Microsoft Entra ID** – The cloud environment includes Microsoft Entra ID. Microsoft Entra helps you manage users, groups, security roles, and licenses for online applications, much as you manage them for on-premises environments.
- **Users** – You manage users of the services that your organization subscribes to in Microsoft Entra ID. You can add any users in your tenant and assign them to security roles.

- **Developers and administrators** – Developers and administrators are users who also have access to Lifecycle Services that lets them manage projects and environments. These users are also end users.

- **Organizational account** – Users receive Microsoft Entra credentials. These credentials are separate from other desktop or corporate credentials. The Microsoft Entra credentials are used to sign in to Microsoft 365 and other Microsoft cloud services. Users sign in by using their organizational account.

  > **ⓘ Important**
  >
  > For this release, don't use any existing credentials that are associated with other online services, such as Microsoft 365 or Microsoft Dynamics CRM Online.

- **Microsoft account** – Microsoft accounts were formerly known as Passport accounts or Windows Live ID accounts. Currently, you can't use Microsoft accounts with finance and operations applications, Microsoft Dynamics 365 Commerce, or other Microsoft Online Services. However, Microsoft accounts are still required for Microsoft Connect and other Microsoft Business Solutions sites, such as Information Source and Microsoft Dynamics Community. You continue to use your Microsoft account to access these services.

- **Microsoft 365 admin center** – Microsoft 365 admin center is the subscription management portal that Microsoft 365 provides for administrators. Use Microsoft 365 admin center to provide management functions for users and subscriptions.

- **Environments** – You can deploy as many single instances of a virtual machine (VM) as you require. These instances are called *environments*.

Prerequisites

1. You receive an email that invites you to participate in the preview.
2. If your company has an organizational account with Microsoft Online Services and you're signed in, sign out before you continue. Alternatively, use **InPrivate Browsing** mode.
3. If you're not sure whether you're signed in, delete your browser cookies, and then close your browser before you continue.

Subscribe

> **Important**
>
> Only one person (tenant administrator) in an organization must perform this task. If you're not the person who is subscribing to this release, wait until your organization is signed up and you receive your user credentials. Then continue with the procedure.

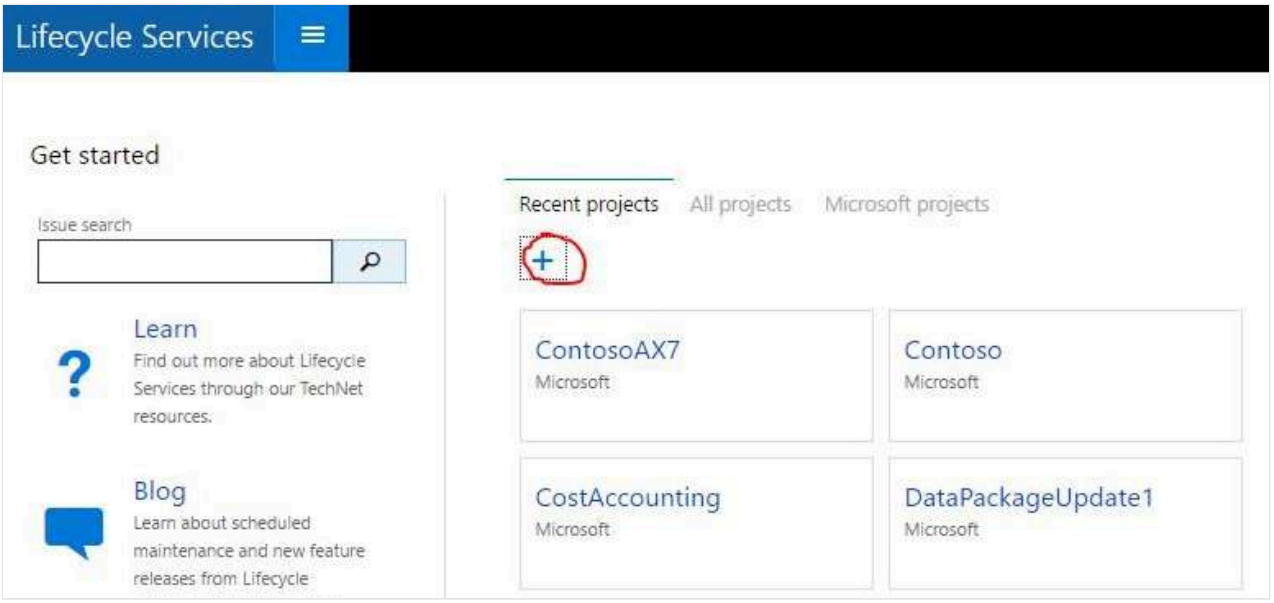
1. Finance and operations applications and Retail are available only to existing Microsoft Dynamics 365 channel partners and customers who are currently enrolled in the Business Ready Enhancement Plan (BREP) service plan. To subscribe, visit PartnerSource Business Center.
2. On the **Account setup** page, in the **Country or region** field, select the country or region.
3. Follow the wizard and prompts to complete the sign-up, until you reach the last step.

Start a new project in Lifecycle Services

> **Note**
>
> Prospect projects are available only in Global Lifecycle Services (https://lcs.dynamics.com). The preview license isn't available in Local Lifecycle Services. For more information about Lifecycle Services in local geographies, see Dynamics 365 Finance, Supply Chain Management, and Commerce in local geographies.

To use Lifecycle Services to manage your environments, you must create a new project.

1. Go to https://lcs.dynamics.com/Logon/Index.
2. Select **Sign in**.
3. Sign in by using the account that you used to subscribe.
4. Select the plus sign (+) to create a new project.

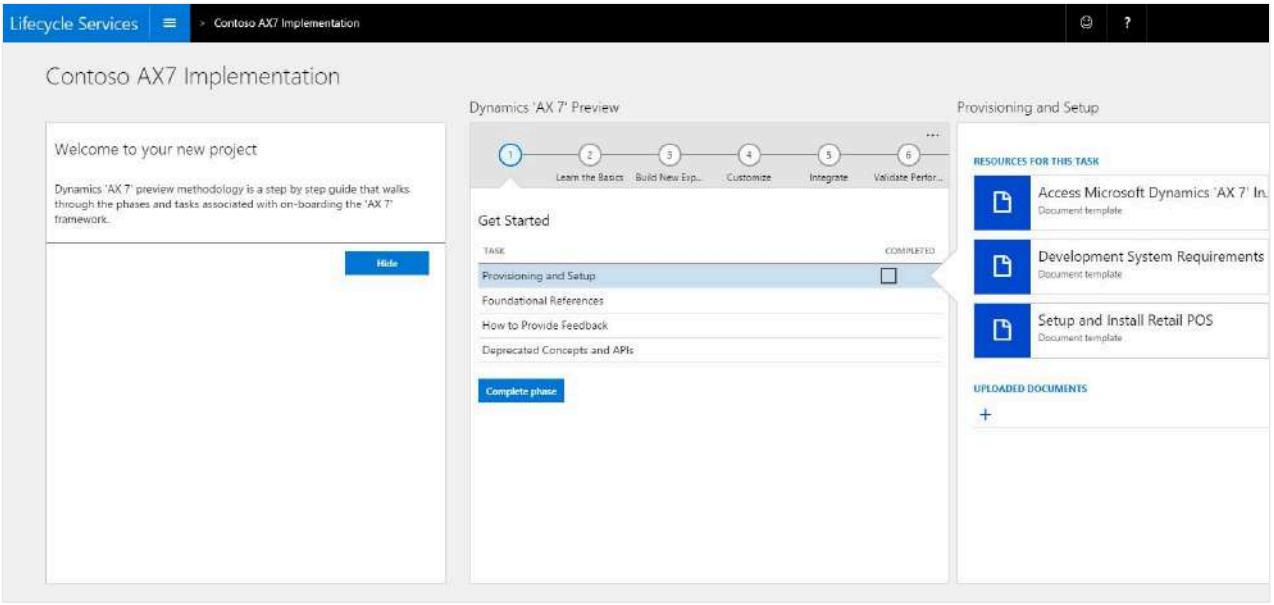


5. Select the project type.

6. Enter the project information, and then select **Create**.

   If you plan to evaluate Commerce, be sure to select **Microsoft Dynamics 365 Commerce** in the **Product name** field.

   The new project for managing your instance is created.



Add users to Lifecycle Services

You're already set up as a user of your Lifecycle Services project. If you add other Microsoft 365 users, you must add them to this project. Other administrators and developers can then deploy their own environments. These Lifecycle Services users are team members who actively work on

the implementation. Don't confuse them with end users. Start on the project page in Lifecycle Services.

1. Scroll to the right, and then, in the **More tools** section, select the **Project users** tile.
2. In the upper left, select the plus sign (+) to add a new user.
3. In the **Email** field, enter the email address of the user that you're adding. This email address should be the Microsoft 365 organization email address that you created earlier.
4. In the **Project role** field, select **Project Owner**.
5. Select **Invite**.
6. Repeat steps 2 through 5 for all users in your organization.

Deploy environments

Deploy environments to an existing Azure subscription.

> **Note**
>
> Each developer of an environment must deploy their own system to Azure. However, only the first project user needs to set up the Azure subscription for deployment.

You can create environments in two ways:

- Deploy to Microsoft cloud services (Azure).
- Download a local virtual hard disk (VHD).

Start on the project page in Lifecycle Services.

1. In the **Environments** section, select the plus sign (+). The **Microsoft Azure setup** dialog box appears.

2. Enter your Azure subscription ID. You can find your Azure subscription ID in Azure Portal (https://ms.portal.azure.com/), under **Settings** in the lower left.

3. Select **Next**.

4. Download the Azure Management Certificate to a local folder on your computer, and then upload it to Azure Management Portal by going to **Settings** > **Management Certificates**. This certificate enables Lifecycle Services to communicate with Azure on your behalf.

5. Return to Lifecycle Services, and select **Next**.

6. Select the Azure region to deploy in. The **West US** region has the fastest deployments, but it's important that you select a data center that is close to where you plan to use this system.

7. Select **Connect**.

8. In the list of available topologies, select the topology to deploy. You can select either the **Download** link to download the VHD or **Next** to deploy on Azure. Azure is the preferred path.

9. Enter the name of the environment.

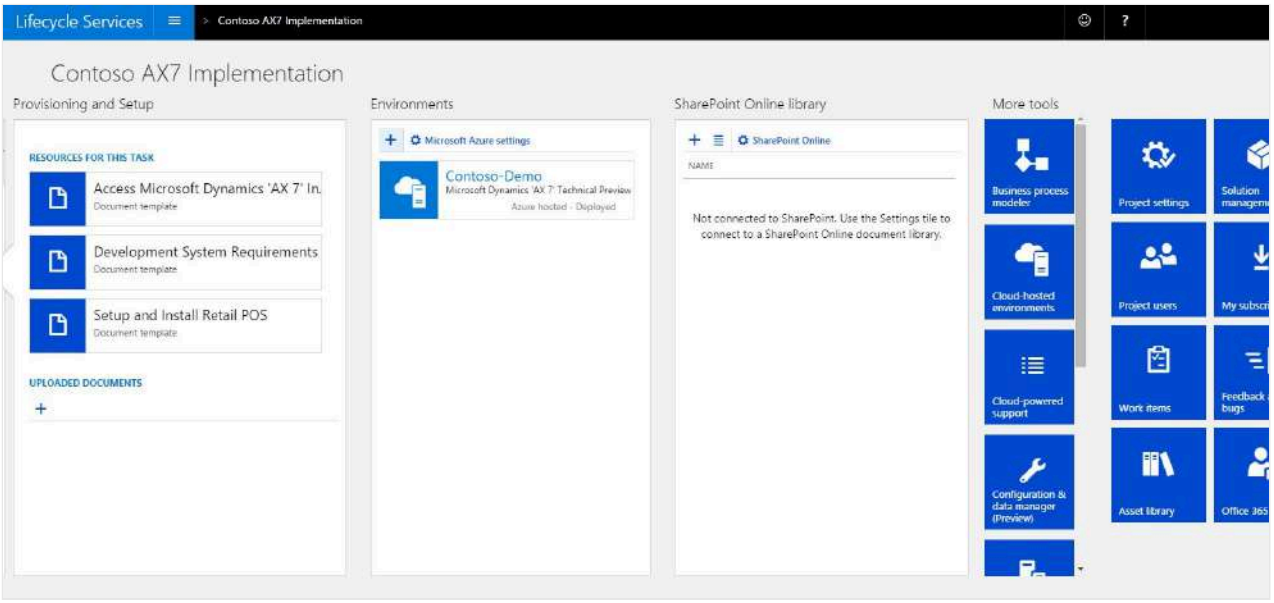
10. Read the pricing and licensing terms, and then select the check box to indicate that you understand them.

11. Select **Next**.

12. Confirm the details, and then select **Deploy**.

    > **Note**
    >
    > Developers and administrators who use their own environments must sign in and repeat these steps.

    After you deploy your environment, it's available in the **Environments** section.



13. Select the environment to view details about the deployment status. The first deployment requires a few hours, but each subsequent deployment is much faster.

14. When the deployment status changes to **Deployed**, select **Login** to connect to the client, or select the name of the VM to connect to the development machine by using Remote Desktop. After the deployment is completed, you can find the base URL and the information that you require to connect to the environment via Remote Desktop.

Use the features of Lifecycle Services

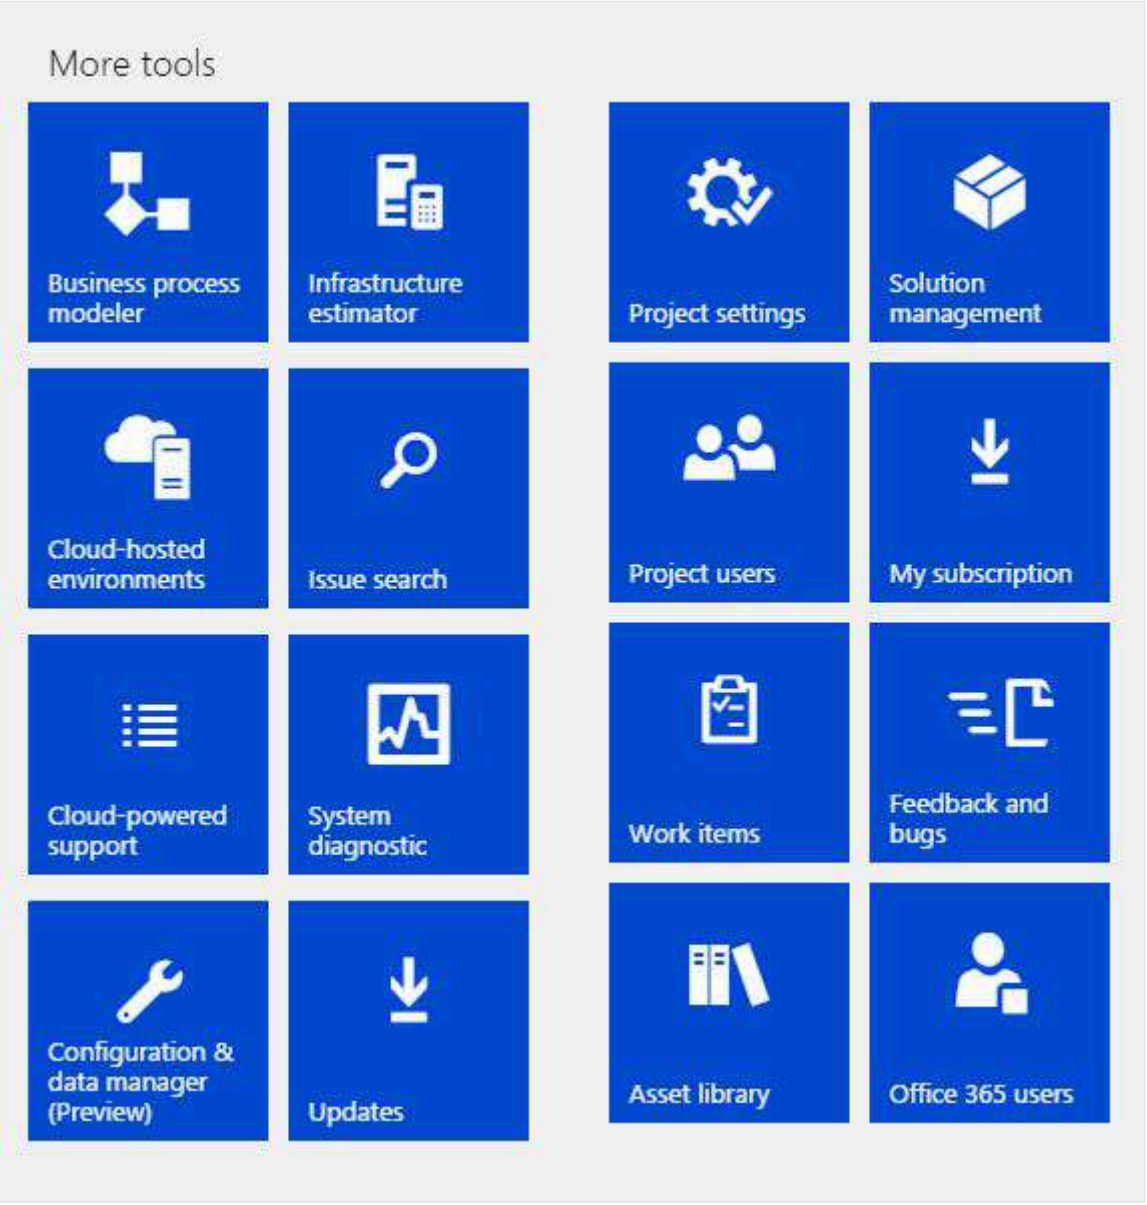
Lifecycle Services is the starting point for performing online administrative activities. Here are some of these activities:

- Deploy VMs on Azure.
- Access materials.
- Access downloads of tools and resources.

Explore the Lifecycle Services project

1. Review the methodology, and complete the tasks and phases as you progress through the life cycle. The phases and task information lets you view tools and resources that are available throughout your enterprise resource planning (ERP) experience.

2. Scroll to the right, and review the tiles.



The available tiles include various tools and services in Lifecycle Services. They also include the following additional tiles:

- **My subscription** – The Microsoft 365 subscription management portal is where you can view and work with your online subscriptions. By selecting **User and Groups** in the left navigation section of the page, you can also manage your online users.
- **Feedback and bugs** – This tile opens the **General Feedback** page in Microsoft Connect. Use this page to record bugs, and to design change requests, feature requests, and suggestions.
- **Microsoft 365 users** – This tile opens the **Users and groups** page in Microsoft 365 admin center. You can add, update, and remove users, reset passwords, and assign licenses for other services.

One Version service updates overview

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

The following set of topics provide information that is related to service updates for Microsoft Dynamics 365 for Finance and Operations version 8.1 (October 2018) and later. This is applicable for cloud releases only.

- Service update availability – This article provides information about the release cadence and release process.
- Software lifecycle policy and cloud releases – This article provides information about the service updates, availability, and end of service.
- One Version service updates FAQ – This article answers questions about the update process, tools, planning, and Retail service updates.

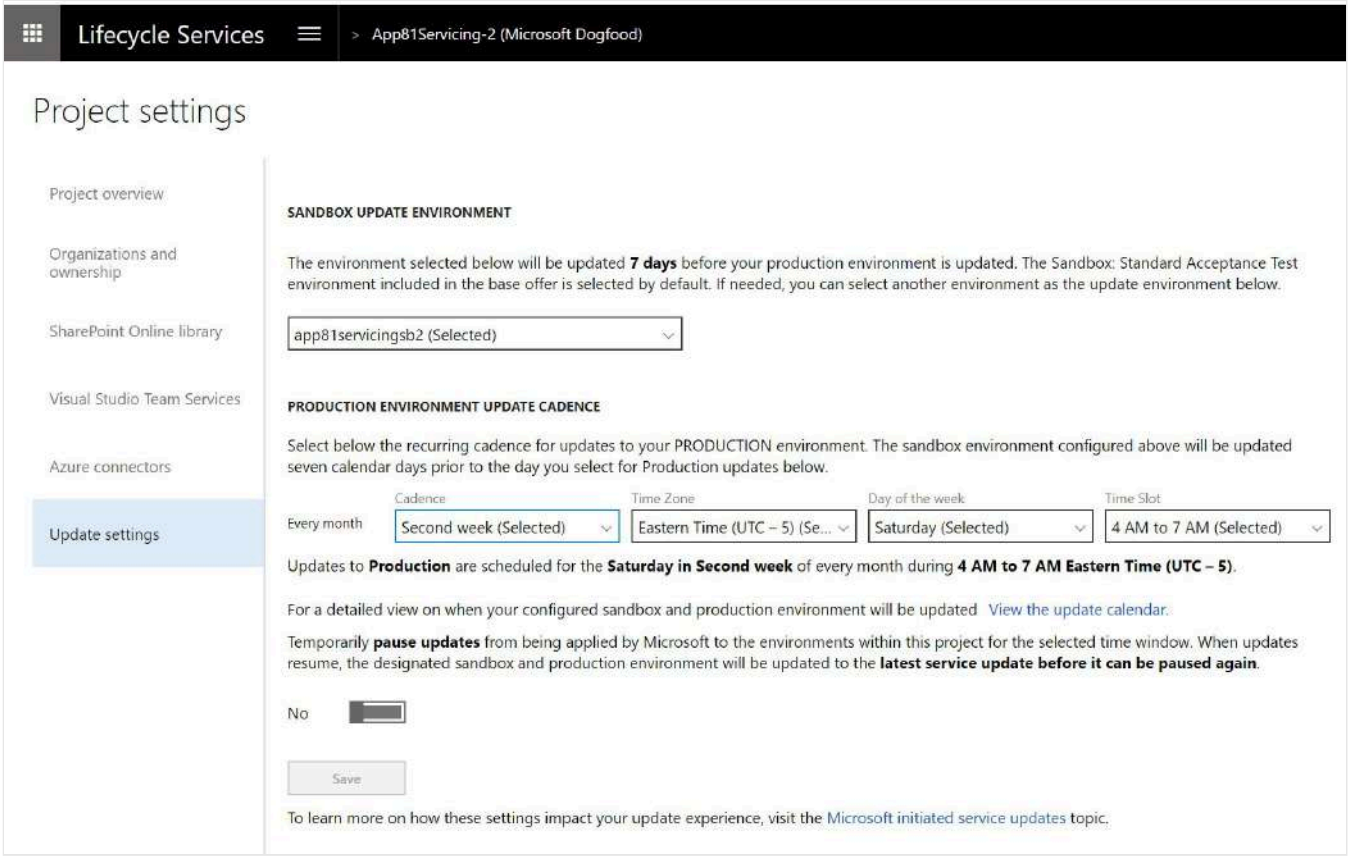
The experience for service updates consists of four distinct steps:

1. Configure
2. Notice
3. Update
4. Validate

The rest of this article describes each step and provides links to related topics.

Configure

Customers can select a maintenance window, based on their business constraints. In Microsoft Dynamics Lifecycle Services, use the fields in the **Production environment update cadence** section on the **Update settings** tab of the **Project settings** page, as shown in the following image. A calendar of upcoming updates is available to help you plan ahead.

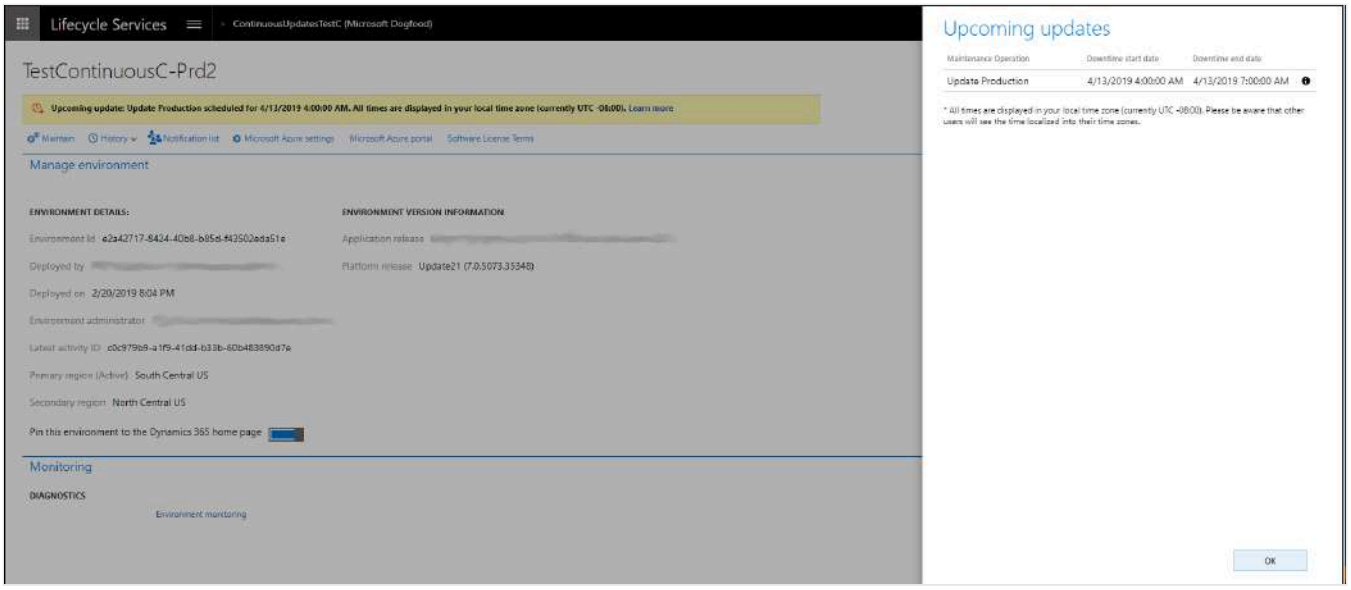


Users must opt in to new features and turn them on. All updates are applied first to the user acceptance testing (UAT) environment and then to the production environment. Therefore, customers have time to do any validation that is required. Customers can select the environment that is updated. They can also pause for a maximum of one consecutive service update.

Notice

Release plans will be available to help you plan ahead and understand what is changing. You can learn about upcoming features up to three months in advance. The What's new topics provide details about the updates for specific months.

Additionally, a notification email will be sent five days in advance, and a notification will appear in Lifecycle Services just before an update, as shown in the following illustration.

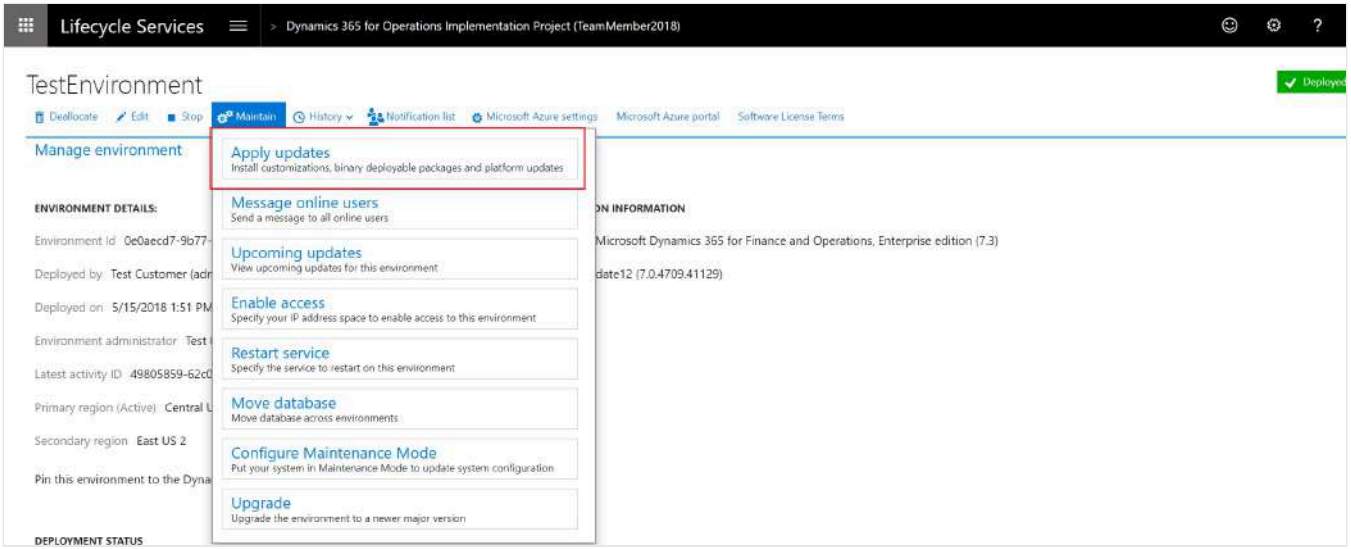


Update

After notifications have been sent, Microsoft will apply the update (**auto update**) during the designated maintenance window. After this operation is completed, a notification email will be sent to indicate the status of the update. Customers will also be able to **self-update** by using the standard update experience in Lifecycle Services. For more information, see Apply updates to cloud environments.

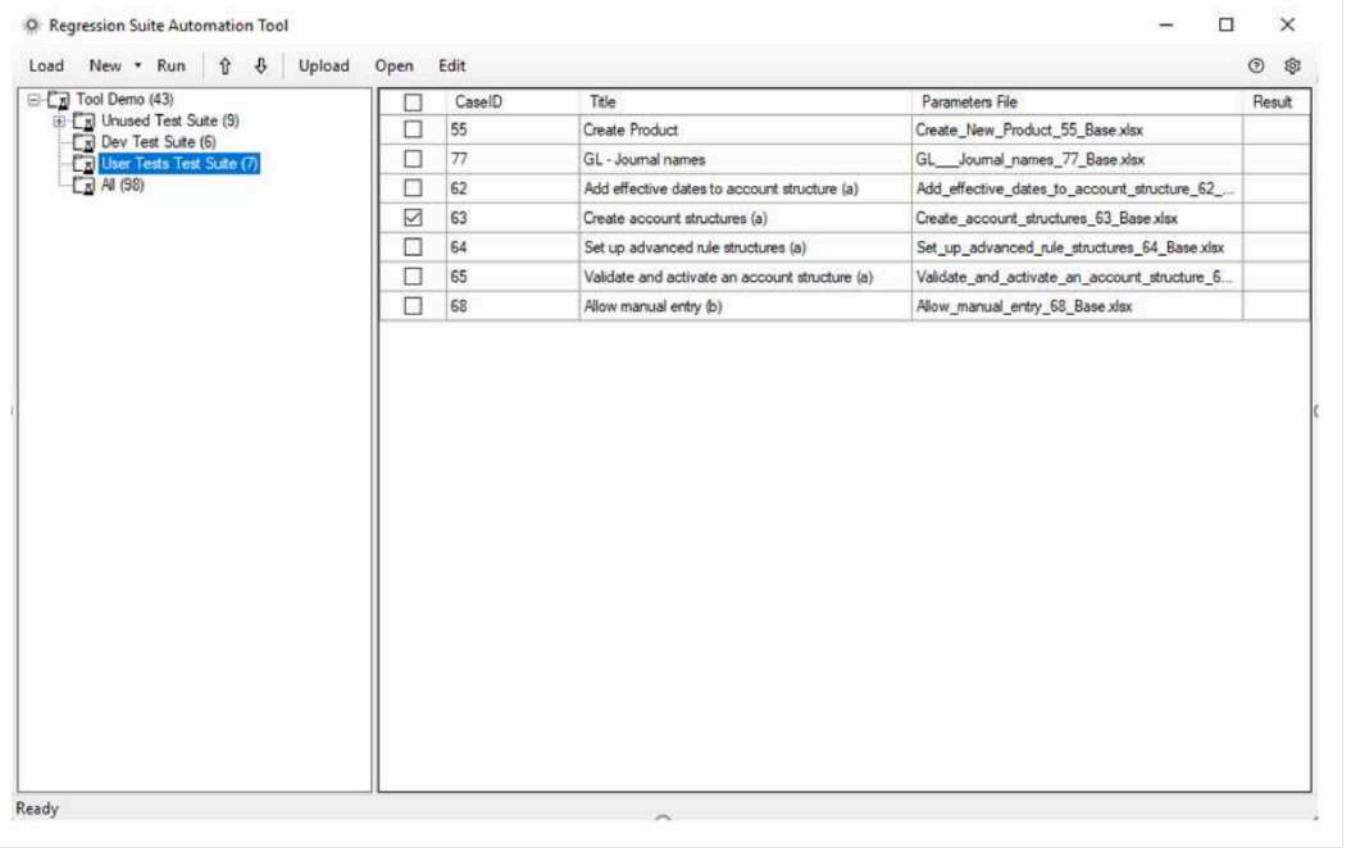
Customers who participate in the First release program will have an opportunity to update their sandbox environment and other environments before general availability. To sign up for the First release program, go to https://aka.ms/FirstReleaseFnO.

Customers will also be able to **self-update** by using the standard update experience in Lifecycle Services, as shown in the following illustration.



Validate

After an update is completed in the UAT environment, a basic business process test can be executed to validate the environment. To support this effort, a no-code automation test tool for business process testing is available, as shown in the following illustration. For more information, see Create and automate user acceptance tests.



Some customers have both external data integrations and internal data integrations. We recommend that these customers use the Data task automation tool for testing.

One Version service updates FAQ

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This FAQ is intended to provide clarity about the service updates, processes, and tools that you can use to prepare for the change. We continue to add information to this article as required.

For more information about One Version service updates, see One Version service updates overview.

> **Important**
>
> The number of service updates that are released annually is now reduced from seven to four. This change affects the preview availability, general availability (self-update), and end-of-service dates for version 10.0.38, and it went into full effect as of version 10.0.39 (the "April" 2024 release).

What's changing with the new release cadence?

The following changes are being implemented:

- Service updates are released only in February (December self-update), April, July, and October. The May, August, and November releases are no longer available for self-update or autoupdate.
- The lifecycle of each release is substantially extended. It now lasts 404 to 414 days.
- The preview period is extended. Every release now includes one scheduled update to the preview build.
- The autoupdate and feedback phase of the First Release program is extended by two weeks.
- The servicing window of every release is substantially extended. It now lasts 186 to 214 days, and there's improved overlap between releases.
- The maximum number of consecutive updates that can be paused is reduced from three to one. However, because release durations are extended, the same minimum of two

service updates per year is maintained.
- We're introducing another autoupdate window for each service update, starting with version 10.0.39. For more information, see the FAQ for autoupdate section in this article.

Is the change from the maximum of three pauses to one already in effect?

Yes. Beginning with 10.0.39 (the April'24 release) you're only able to pause a maximum of one update. See the Targeted release schedule for GA (self-update) and autoupdate dates by version.

The following table shows the allowed pauses through the transition based on your installed versions, starting 10.0.35, 10.0.36, and 10.0.37, which are noncompliant since the release of 10.0.39. For more information about how to pause service updates, see Pause service updates through Lifecycle Services).

> **Note**
>
> If your Lifecycle Services project has environments older, noncompliant versions like 10.0.35, 10.0.36, or 10.0.37, pausing the upcoming autoupdate (for example, 10.0.39 the May 2024 autoupdate) isn't supported. To comply, update all environments to the current version (10.0.39) in the next autoupdate window. You can also self-update to a compliant version (for example, 10.0.38 as of April 22, 2024) to pause an upcoming autoupdate. Microsoft can't make exceptions for projects with environments on noncompliant versions. Upgrade to a supported version to use the pause functionality.

Expand table

On 10.0.35	On 10.0.36	On 10.0.37	On 10.0.38	On 10.0.39
10.0.36 release can be paused.	10.0.37 release can be paused.	10.0.38 release can be paused.	10.0.39 release can be paused.	10.0.40 release can be paused
10.0.37 release can be paused.	10.0.38 release can be paused.	Must take 10.0.39 release in one of the two autoupdate windows.	Must take 10.0.40 release in one of the two autoupdate windows.	Must take 10.0.41 release in one of the two autoupdate windows.

	pausing not applicable.			
Must take 10.0.39 release autoupdate windows for pausing not applicable.				

What can I expect with the new (autoupdate) cadence?

Beginning version 10.0.39, the service update autoupdate window is divided into two windows that are separated by approximately a four-week gap. This change provides customers with greater flexibility in scheduling their autoupdates. Autoupdate Window one closely resembles the historical approach of OneVersion service updates. Autoupdate Window two allows you to schedule your update for four weeks later. Autoupdates continue to function as before, with UAT sandbox updates occurring seven days prior to production. Note that if your LCS project has environments on older, noncompliant versions like 10.0.35, 10.0.36, or 10.0.37, pausing the upcoming autoupdate (for example, 10.0.39 May autoupdate) isn't supported. To comply, update all environments to the current version (10.0.39) in the next autoupdate window. You can also self-update to a compliant version (for example, 10.0.38 as of April 22, 2024) to pause an upcoming autoupdate. Microsoft can't make exceptions for projects with environments on noncompliant versions. Upgrade to a supported version to use the pause functionality.

Does the new release schedule affect when I can schedule autoupdates?

Yes, with version 10.0.39, there are two autoupdate windows to choose from for every service update. Customers can then select a weekend for the second autoupdate, which commences one month after the first autoupdate instance. There isn't a change in how autoupdates are scheduled in Microsoft Dynamics Lifecycle Services and when those autoupdates occur. The only change is which service updates are released each year.

As an example, let's say you have opted for the 10.0.39 ("April") release through autoupdate. Microsoft makes this release generally available for self-update by all customers on March 15, 2024. If you've enabled autoupdates through Lifecycle Services, you'll start receiving production updates two weeks after the public availability date, which is March 15. This occurs during the first autoupdate window, starting either on April 5, April 12, depending on your chosen configuration. Alternatively, if you've selected the second autoupdate window, your updates begins on May 3, May 10. Opting for the second window gives you four more weeks

between general availability and the final broadcast weekend, extending beyond the standard six-week timeframe.

In the example above, if a customer opts out of both autoupdate windows for the 10.0.39 release, they can only opt out of the first autoupdate window for the next release, 10.0.40 ("July"). This is because skipping a release is no longer possible due to a previous pause under the new pause policy. For more information about how to pause service updates, see Pause service updates through Lifecycle Services (LCS).

> **Important**
>
> Customers are explicitly required to pause both autoupdate windows to pause a release if they are eligible to do so, based on the pause policy. Pausing the first autoupdate window will not auto pause the second window.

When does the new service update release cadence take effect?

Version 10.0.38 (the "February" release) is revised to act as a transition release. Version 10.0.39 (the "April" release) is the first service update that's released under the new cadence.

Is the published 10.0.38 schedule affected by the new service update release cadence?

Yes. To enable version 10.0.38 to act as a transition release, some release milestones were adjusted for alignment with the new release cadence.

- Preview availability was pushed out by two weeks, from October 13 to October 27, 2023.
- An update to the preview was added and released on November 3, 2023.
- Customers who participate in the First Release program receive their autoupdates a month earlier, in December 2023.
- General availability for self-update occurs a month earlier, on December 22, 2023.
- There's no change to the general availability broadcast (autoupdate) dates.
- The servicing window is extended from April 12 to August 9, 2024.

How does this change affect pausing updates for noncompliant versions like 10.0.35, 10.0.36, and 10.0.37?

If your Lifecycle Services project has any environment (default or sandbox or production) on noncompliant versions like 10.0.35, 10.0.36, or 10.0.37, pausing 10.0.39 isn't supported. To

comply, update all environments to the current version (10.0.39) in the next autoupdate window. You can also self-update all environments to 10.0.38 to pause 10.0.39. See the autoupdate policy change for details.

Is it possible to stop the 10.0.39 autoupdate from happening even though I'm on a version that isn't compliant (see related question above)?

At this time Microsoft can't make exceptions for projects that have environments on versions that are out of compliance. Upgrade to a supported version to use the pause functionality.

Can the updates be delayed? What's the policy?

Yes, customers can pause, delay, or opt out of an update by using the update settings in Lifecycle Services projects. As of the April 2024 autoupdate, customers can choose to pause one update. Before April 2024, the number of pauses that are available to a customer depends on that customer's release version relative to the latest version. For more information, see **Is the change from the maximum of three pauses to one already in effect** in this FAQ. For more information on the twice autoupdate window we're introducing starting 10.0.39 see **What can I expect with the new (autoupdate) cadence** in this FAQ.

For information about how to pause an update, see Pause service updates through Lifecycle Services (LCS).

How does the timing for general availability of a release work?

The release package is made generally available to all customers for self-update before autoupdates. The timing of the package release for self-update relative to the production autoupdates varies. To determine the timing of self-update and autoupdates for upcoming releases, see Targeted release schedule (dates subject to change).

Sandbox updates are always scheduled one week before the update. Production autoupdates for releases are scheduled for the first, second, and third weeks of the month. Updates are received during the selected week based on the configuration set up in Lifecycle Services.

> **ⓘ Important**
>
> Starting with version 10.0.39, customers can choose between two autoupdate windows that occur four weeks apart for every service update. There isn't a change in how the

broadcast occurs between the first and second windows. See **What can I expect with the new (autoupdate) cadence** in this FAQ.

Customers can always choose to apply the update earlier than the suggested times in Lifecycle Services, or at a time that's more convenient. If a customer is already on the latest version, the automatic update is canceled.

Service updates

What product versions are affected by service updates?

Expand table

Version	Description
10	All customers are scheduled for automatic service updates. The updates are combined application and platform updates. As of February 2024, you can pause only one update before you're required to take the next update. For information about how to pause an update, see Pause service updates through Lifecycle Services (LCS).

What do the service updates contain?

Service updates contain application and platform changes that are critical to the service, including regulatory updates. Service updates are backward compatible, and new experiences are configurable. The update is represented by a single version.

> **Note**
>
> Add-in components, Power Apps, and Dataverse are updated independently of the service update package and process for finance and operations apps.

What's a regulatory update?

A regulatory update is a new feature, or a change to an existing feature, that's required by law, usually for a specific country or region. A regulatory update is always required by a specific law enforcement date (LED) and should be enabled by that date or earlier.

How can I determine what's changed in a service update?

The "What's new or changed" documentation is the primary source for the details of each service update. The release plans are the primary source of information for new features and changes for a future release. Features are also documented on Microsoft Learn as needed.

> **Note**
>
> To view the specific fixes included in a major release version, such as Dynamics 365 Finance 10.0.XX: Go to LCS, search for **version 10.0.XX**. This displays **Version 10.0.XX of Finance and Operations apps**. The fixes included in that release are listed.

What's the upcoming schedule of updates?

Each year, four service updates are released. You have the option to apply them at a time that's convenient for you, or you can let Microsoft automatically apply them, based on the selected maintenance window. You're required to use an update that's no more than one update behind the current update.

To view the targeted release schedule for upcoming releases, see Service update availability.

Are there any major differences between the updates?

There are two major updates each year: the April update and the October update. New experiences can be enabled in these updates. Major updates don't require code or data upgrade. Breaking changes are communicated 12 months in advance, so that customers can plan accordingly. Breaking changes are introduced only during major updates.

What does it mean for an update to be backward compatible?

Backward compatibility covers binary and functional compatibility.

- **Binary compatibility** means that you can apply an update in any runtime environment without having to recompile, reconfigure, or redeploy customizations. It also means that, in a development environment at design time, X++ public and protected APIs and metadata aren't modified or deleted. If Microsoft must break compatibility by removing obsolete APIs, the change is communicated 12 months in advance and follows a deprecation schedule.
- **Functional compatibility** refers to the user experience. All new experiences are available on an opt-in basis for a 12-month period.

Backward compatibility doesn't include non-X++/metadata APIs. Microsoft reserves the right to update versions of any dependencies that the product uses, and to remove dependencies,

without early warning. Microsoft doesn't commit itself to maintaining backward compatibility of dependent software libraries unless this commitment is expressly stated.

For more information about deprecation guidelines, and deprecated methods and metadata elements, see Deprecation of methods and metadata elements.

What's the process for deprecation?

The deprecation notice is announced in the product documentation 12 months before Microsoft removes a feature from the app.

For breaking changes that only affect compilation time, but that are binary compatible with sandbox and production environments, the deprecation time is less than 12 months. Typically, these changes are functional updates that must be made to the compiler.

If I'm not doing active development/recompilation of my code, how can I learn if there's a deprecated feature that affects me?

Deprecated features are documented for each release. For more information, see Removed or Deprecated features.

Can I update just the platform? Similarly, can I update just the application?

No, only combined application and platform update packages are released for both service updates and quality updates.

Service updates for on-premises deployments

Both cloud deployments and on-premises deployments have the policy and schedule for service updates. For example, the option to delay one service update applies to both types of deployment. However, the process for applying each of these updates remains slightly different. For more information, see Apply updates to on-premises deployments.

Process

How does Microsoft ensure the quality of releases?

Ensuring the quality of releases is a fundamental principle that's enabled through a series of progressive, rigorous, automated validations, as described in Service update availability.

Can I select the day and time of the update?

You can configure the day and maintenance time windows in Lifecycle Services. The service update, which is based on your update settings, starts within 15 minutes. If you opt in to receive Lifecycle Services notifications, you receive an email that includes update instructions. You can select the designated Tier-2/user acceptance testing (UAT) sandbox for the update. You have seven calendar days to do testing and validation before the production environment is updated. All other sandboxes are automatically updated on the same day as the production environment. For more information, see Configure service update.

You can optionally apply the update earlier to all environments through Lifecycle Services. The production-ready deployable package is available to all customers via the Action Center in Lifecycle Services by the general availability (self-update) date. For the targeted release schedule of upcoming releases, see Service update availability.

A service update was applied to the environment. In Lifecycle Services, what does the number on the tile for this environment represent?

Microsoft automatically applies the same service update to all customers. Microsoft continues to service the update until the end-of-service date for that release is reached. In Lifecycle Services, the available updates tile for the environment represents the cumulative quality update package that's available to be applied to your environment. There are two numbers on the tile. The top number is the release version, and the bottom number is the build number of the latest quality update package. The build number is always larger than the number of the service update that was applied to your environment, either through self-update or autoupdate. Because Microsoft automatically applies the same version to all customers, you're responsible for applying the cumulative hotfix package if it's required.

> ⓘ **Note**
>
> If your environment version is earlier than the latest release version, a tile appears under **Available updates** to remind you to apply the latest service update by using self-update.

How do I update to the latest version?

You can self-update to the latest version by using the tile on the **Environment details** page. After an update is released by Microsoft, the tile shows the available update. You can choose to apply the update by going through the update experience in your sandbox and production environments. For more information, see Apply updates to cloud environments and Apply updates to on-premises deployments.

How do I update the production environment to the same version after Microsoft updates the sandbox environment?

When Microsoft updates a sandbox environment, the package that's used for the update is saved in the project's Asset library. The name of the package is prefixed with the words "Service Update." Because the package was already applied to the sandbox environment, you can mark it as a release candidate. You can then go to the production environment and schedule to apply the package, just as you might schedule any other update.

What's the expected downtime during an autoupdate?

The expected downtime for a successful update is approximately 15 minutes. However, Microsoft asks for three hours of downtime in case issues occur while the update is being applied.

Can I delay an update?

Yes, you can pause, delay, or opt out of an update by using the update settings in Lifecycle Services projects. However, this option is unavailable if any of your sandbox and production environments are more than one version behind the latest available update. After the delay, Microsoft schedules and automatically applies an update. The update experience for a delayed update incurs more downtime.

Can I delay an update for longer than the one permitted skipped service update because of seasonal activity or other business reasons?

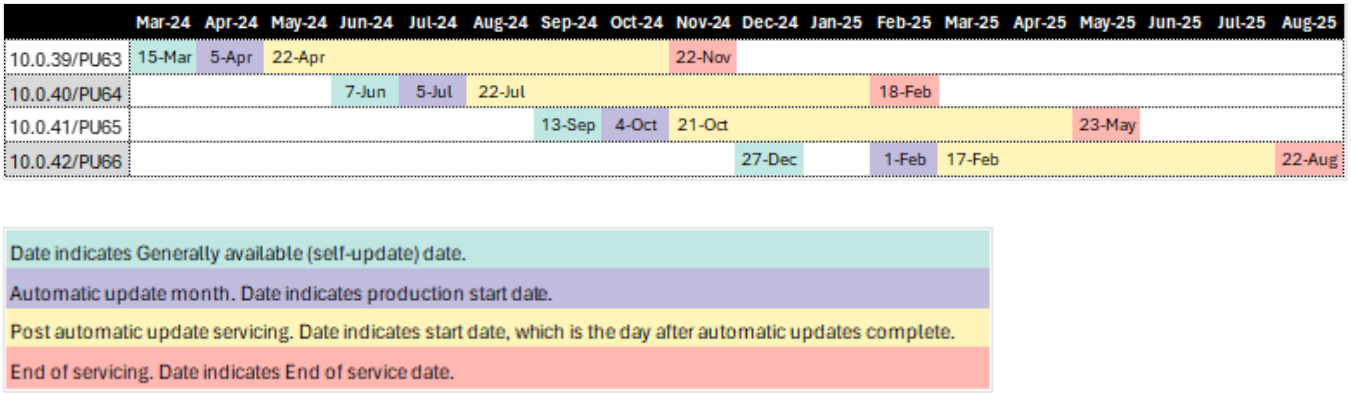
No, after your environment version is more than one version older than the latest version, Microsoft automatically applies the latest service update to the default Tier-2 sandbox. Seven days later, the update is applied to all other sandbox environments and production environments that are also more than one version older than the latest version. You can pause only one update before you must take the next service update. Therefore, in effect, a minimum of two service updates are required annually. For example, a customer is running version 10.0.39 and chooses to pause update 10.0.40. In this case, service update 10.0.41 is

automatically applied first to the Tier-2 sandbox environment, and then later to all other sandbox environments and production environments.

What does it mean for a release to be "in service"?

A release is a service update version that has been made available to customers. A release is "in service" from the day when it's made available to customers for production use through its end-of-service date. For release milestones by release, see Targeted release schedule (dates subject to change).

A release in post-update servicing reaches its end-of-service date about one month after autoupdates are completed for the latest version. Therefore, customers who chose to pause have time to complete their required update before the servicing window for their version is closed. The following illustration shows the staggered release rollout and servicing model.



> **Important**
>
> The Support team at Microsoft can't accept cases for issues that are reported from versions that are at their end of service. You must first update to the latest service update and then apply the latest quality update. At that point, if the issue persists, you can report it.

What happens to an environment that's running a finance and operations app version that's no longer supported?

For environments that are running a finance and operations apps version that's no longer supported, a warning message appears at the top of the **Environment details** page in Lifecycle Services.

For all Microsoft-managed environments, and for sandbox and production environments in on-premises implementation projects, some Lifecycle Services functionality might not be available

when an environment is running a finance and operations apps version that's no longer supported. This functionality includes the ability to complete the following actions:

- Enable maintenance mode.
- Use all capabilities that are provided for moving databases within an environment or across environments.
- Enable firewall access to SQL Server databases.
- Download Regression suite automation tool (RSAT) certificates.
- Regenerate RSAT certificates.

After you apply a service update for a supported version, this functionality becomes available in the affected environment.

How do the automatic updates affect my Microsoft-managed additional sandbox environments in my Lifecycle Services implementation project?

All additional sandbox environments are updated during the same update window as your production environment, and they're updated to the same release version that's used for the production update. The update is also applied to additional sandbox environments that are on versions that haven't reached their end of service.

What happens during an update when my additional sandboxes are on different versions than the default sandbox and production environments, which are scheduled to receive the latest service update?

All environments are updated to the current version that's being used for autoupdates.

What if the default sandbox environment is manually updated to the same version as, or a newer version than, the automatic update version?

Automatic updates for the production environment and all additional sandbox environments are updated to the current version that's being used for autoupdates.

Updates for the default sandbox environment are canceled.

What if the default sandbox environment is manually updated to an older version than the automatic update version?

The default sandbox environment, the production environment, and all additional sandbox environments are updated to the current version that's being used for autoupdates.

What if the production environment is manually updated before the production environment email is sent?

Automatic updates for the production environment and all additional sandbox environments are canceled.

What if the production environment is manually updated after the production environment email is sent?

Automatic updates for the production environment are canceled, but all additional sandbox environments are updated to the current version that's being used for autoupdates.

What if I find an issue during the sandbox update?

If you find an issue while you're doing validations in a sandbox environment, you can request to skip the update directly through Lifecycle Services, by providing a valid support ticket number and a business justification. For more information, see Pause service updates through Lifecycle Services (LCS).

What if I find a critical issue during sandbox testing, but I can't pause the production automatic update?

Critical issues should always be submitted to the Support team via Lifecycle Services as soon as they're identified. The Support team works with you to fix the critical issue.

How much time do I have for validation?

You have seven calendar days for validation after the update is applied to your sandbox environment. If you need more time, you can access the deployable package via the Action Center in Lifecycle Services and apply it to your environments. In this way, you get more time to test the update before a production roll-out.

What happens when the service update is completed?

After the service update is applied by Microsoft, you receive a notification that indicates whether the update was successful, or whether it couldn't be applied. An update might not be applied for the following reasons:

- **Pending Package Sign off** – If a package is pending sign off, Microsoft won't apply the service update to production.
- **Deployment Failure** – If there was a deployment failure, the environment is rolled back to the original state.

Can an environment be brought back to its previous state if there are issues after a service update is applied?

As with other code promotions, rollbacks can't be done after a service update is applied. Microsoft uses flighting and features to help mitigate the risk of updates and enable rapid enabling and disabling of new functionality. For more informatoin, see Feature management and flighting.

If there's a failure, can I reschedule the update to be automatically applied?

No, you can't reschedule the update. However, you can apply the package when it's convenient, just as you might schedule any other update.

Will critical hotfixes be automatically applied to my sandbox/production environment during automatic update?

The service update that's generally available to all customers for self-update and autoupdate contains hotfixes and new functionality. If a critical issue is reported and fixed after the service update was applied, you can pull the latest cumulative quality update from the tile in Lifecycle Services.

How do my ISVs stay current?

Service updates to customer environments are backward compatible, and no action by the independent software vendors (ISVs) is required. ISVs develop on the minimum required platform release that their code depends on. Breaking changes have a 12-month lead time, so that ISVs can include them and do validation. Microsoft recommends that ISVs take advantage of the preview release for each service update. In this way, they can get early access to the platform code and validate their solutions against the update before it's made generally available. Microsoft encourages both ISVs and customers to join the Preview Early Access

community on Microsoft Viva Engage. This Viva Engage group provides a forum where participants can receive preview and release-related announcements, and collaborate with others in the finance and operations apps community.

What about new features?

All new features are available on an opt-in basis for a 12-month period. They don't require any change management until you enable them.

Are batch jobs suspended during a service update?

Batch jobs are suspended during the maintenance windows and resume when the maintenance is completed.

For information about how to pause an update, see Pause service updates through Lifecycle Services (LCS).

Tools

How can I get early access to updates that haven't yet been released?

As of version 10.0.26, the preview package for all service updates is made available to all customers through the Shared asset library in Lifecycle Services, under **Software deployable package**. Preview packages can be deployed to development or test environments. However, they can't be used in production environments. You agree to the program terms at the time of installation. Sign-up for access to preview packages (formerly known as the Preview Early Access Program [PEAP]) is no longer required.

To be in the first group of customers to take service updates to production, you can join the First Release program. While you're enrolled in First Release, Microsoft keeps your system current with the latest updates. First Release customers receive updates to all sandbox and production environments, and are always updated before general availability.

Is any tooling available to support testing of the latest release?

UAT is typically required before you take a Microsoft application update or apply custom code and configurations in your production environment. The Regression suite automation tool (RSAT) is available now and significantly reduces the time and cost of UAT.

RSAT lets functional power users record business tasks by using the Task recorder and then convert them into a suite of automated tests, without having to write source code. Test libraries are stored and distributed in Lifecycle Services by using the Business process modeler (BPM) libraries. They're fully integrated with Azure DevOps for test execution, reporting, and investigation. Test data parameters are decoupled from test steps and stored in Excel data files.

How can I test and validate that the integrations continue to work?

Data task automation lets you easily repeat many types of data tasks and validate the outcome of each task. You can also do automated testing of data entities by using task outcome validation. For more information, see Data task automation.

Preparing for One Version

How can I log an extensibility request?

Extensibility requests can be logged in Lifecycle Services. For more information, see Extensibility requests.

What does "end of service" mean?

Microsoft doesn't provide any fixes for issues on versions that have reached their end of service. If you encounter an issue on a version that has reached its end of service, you must apply the latest update and then report the issue if it persists. For end-of-service dates by version, see Service update availability.

All environments continue to be operated by Microsoft. In addition, all automatic processes that involve your environments, such as monitoring or self-healing, continue as-is for supported versions.

Are individual hotfixes supported?

Individual hotfixes aren't supported after version 8.1. To apply a fix, you must update to the latest cumulative update available. Critical fixes are also applied via cumulative update and are available through the Lifecycle Services servicing experience.

Will you notify me about critical hotfixes that are released for the monthly update that I'm on?

For every preview and general availability release, a searchable summary list of customer-reported issues is published to Issue search in Lifecycle Services. To find the list by title search, use the pattern "Version 10.0.xx of Finance and Operations apps." You can sign up to be notified when an open issue is resolved.

Commerce service updates

What options are available to help minimize the impact on my Commerce cloud components?

Commerce cloud components require the same downtime as Dynamics 365 headquarters. In an upcoming release, the Retail Cloud Scale Unit (RCSU) is available to reduce and further schedule updates to your deployment. For more information about RCSU, see the published release information on our documentation and release notes sites.

Will there be options to take individual hotfixes for my Commerce solution components?

All fixes and updates for Commerce components are cumulative.

What are the maintenance downtime requirements that might affect channel operations?

For retailers that have a business need for redundancy, Modern POS offline capability enables core point of sale (POS) operations to be available while the system is disconnected from the internet or the cloud environment is being updated. In addition, stores that use Commerce Scale Unit continue to operate and support core POS operations during cloud maintenance windows. For more information, see Online and offline point of sale (POS) operations.

When will I have to update my in-store components?

To maintain support, all in-store components must be running released software that's less than one year old. Customers are responsible for updating self-hosted components (such as components that are installed in stores or in privately managed datacenters). They're also responsible for ensuring that the installed versions of those components are actively supported.

Will there continue to be backward compatibility for the in-store components?

Updates to components that are hosted in the cloud continue to preserve backward compatibility with component versions that are self-hosted by the retailer for 12 months after the release date for that version. (These components include components that are installed in stores or in privately managed datacenters: Modern POS, Commerce Scale Unit, or Hardware Station.) Self-hosted components don't have to be updated at the same time as cloud-hosted components. They can be updated on a separate cadence, so that there's time to roll updates out to stores.

What options are available for updating in-store components across my organization?

Customers can choose to manually update self-hosted components at each store, or they can use mass update tools such as Microsoft System Center Configuration Manager and Microsoft Intune.

What options do I have to slowly enable new functionality across my channels?

Microsoft provides several mechanisms for progressively rolling out and enabling functional enhancements across stores, devices, and users.

- **Screen layout designer** – Most visual elements in POS are configured and centrally managed by an administrative user in the customer organization. Therefore, new POS operations don't automatically appear in POS unless they're explicitly configured for inclusion in corresponding screen layouts. Screen layouts are configured by using Screen layout designer. They can be specific to a store or a POS device. For more information, see Screen layouts for the point of sale (POS).
- **Functionality profiles, POS permissions, and Commerce parameters** – Significant elements of functionality in POS are typically configurable by the user. These elements can be configured through functionality profiles, POS permissions, Commerce parameters, or other controls that allow for device-level, register-level, store-level, or user-level control over functionality in applicable scenarios.
- **Modern POS and Commerce Scale Unit** – Because Modern POS and Commerce Scale Unit are self-hosted by the retailer, topologies that include either of these components enable updates to be rolled out at a separate (and slower) cadence and in a more granular fashion than cloud-only topologies.

Manage finance and operations updates and your custom code lifecycle

This article describes application lifecycle use cases for finance and operations implementations. It's focused on the following scenarios:

- Managing your source code development branches
- Applying the next version of a Microsoft service update
- Applying a new version of your custom code

This article applies to Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Human Resources, Dynamics 365 Commerce, and Dynamics 365 Project Operations.

The main goal is to show how to complete the following tasks:

- Stay up to date and manage Microsoft service updates (or quality updates) for finance and operations apps (including Dynamics 365 Commerce) in incremental phases, independently of the lifecycle of your own customization. This approach simplifies the update process, and reduces the cost and risk of regressions that are associated with all-in-one upgrade projects.
- Take advantage of source code branches for version control of your custom code. By using version control, you can isolate the rollout of critical changes and hotfixes from the development of new features and capabilities.

This article doesn't explain how to use the different tools in Azure DevOps and Microsoft Dynamics Lifecycle Services (LCS). Instead, it's focused on processes and best practices. The Apply the next version of a Microsoft service update and Apply a new version of your custom code sections contain both an overview of the phases and the steps of the process.

This article includes the following sections:

- Environments
  - Environments that run your current release
  - Environments that run the next version of your custom code
- Manage source code branches
- Apply the next version of a Microsoft service update
  - Backward compatibility of Microsoft updates
    - Runtime compatibility
    - Design-time compatibility

    - Phase 1: Update the finance and operations implementation
        - Track 1: Update your runtime environments
            - Update Test 1
            - Update UAT
            - Update Prod
        - Track 2: Update your development environments
        - Error situations
            - Case 1
            - Case 2
            - Case 3
    - Phase 2: Update CSU to version 10.0.11
        - Phase 2 prerequisites
        - Track 1: Update your CSU runtime environments
            - Update Test 1
            - Update UAT
            - Update Prod
        - Track 2: Update your development environments
    - Phase 3: Update POS to version 10.0.11
        - Phase 3 prerequisites
        - Update your Commerce development environment
        - Option 1: Store component updates that include only runtime changes
        - Option 2: Store component updates that include runtime and custom changes
        - Update Process
            - Update Test 1
            - Update UAT
            - Update Prod
- Apply a new version of your custom code
    - Create a hotfix of your code
    - Update your custom code from release N to release N+1
- Upload, update, and deploy store components

Environments

This section describes the collection of finance and operations environments that the application lifecycle management (ALM) scenarios in this article rely on. This configuration is typical for organizations that have implementations that rely on custom code (extensions). This custom code includes customizations that independent software vendors (ISVs) provide.

Environments that run your current release

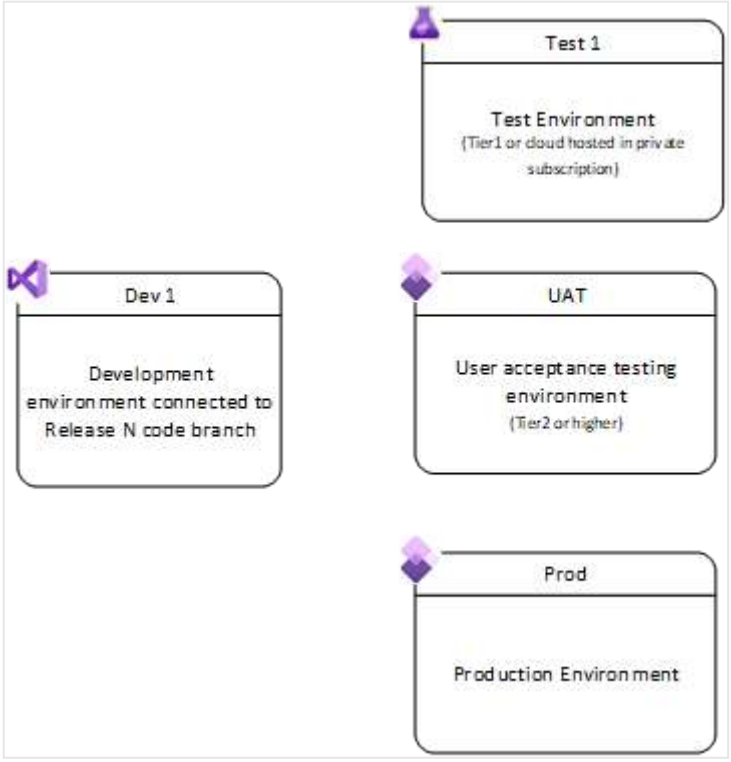
The following environments run your current release:

- **Dev 1** – A development environment that runs the same version of finance and operations apps as the production environment. The Dev 1 environment uses Azure DevOps for version control of custom code. It's connected to the current release branch of your custom code. For more information, see the Manage source code branches section.
  - Many options are available for development environments, both cloud and on-premises. For more information, see Deploy and access development environments.
  - For build automation, use the new Azure DevOps Hosted Agents functionality. For more information, see Build automation that uses Microsoft-hosted agents and Azure Pipelines.

- **Test 1** – A Tier-1 test environment that you use for functional and configuration testing. The Test 1 environment runs the same version of finance and operations apps as the production environment. It also runs the latest release version of your custom code extensions.

- **UAT** – A pre-production environment that you use for user acceptance testing. The UAT environment is a Tier-2 (Standard Acceptance Test) or higher environment. It runs the same version of finance and operations apps as the production environment. It also runs the latest release version of your custom code extensions. You typically connect this environment to a copy of the production database.

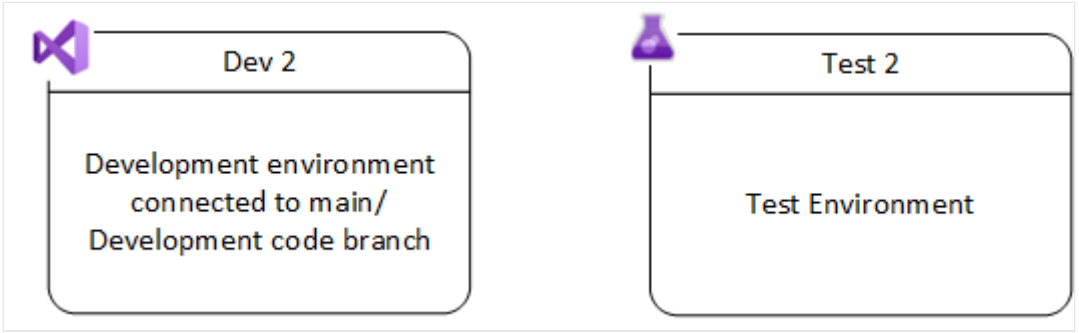
- **Prod** – Your live production environment that runs on your production database.



Environments that run the next version of your custom code

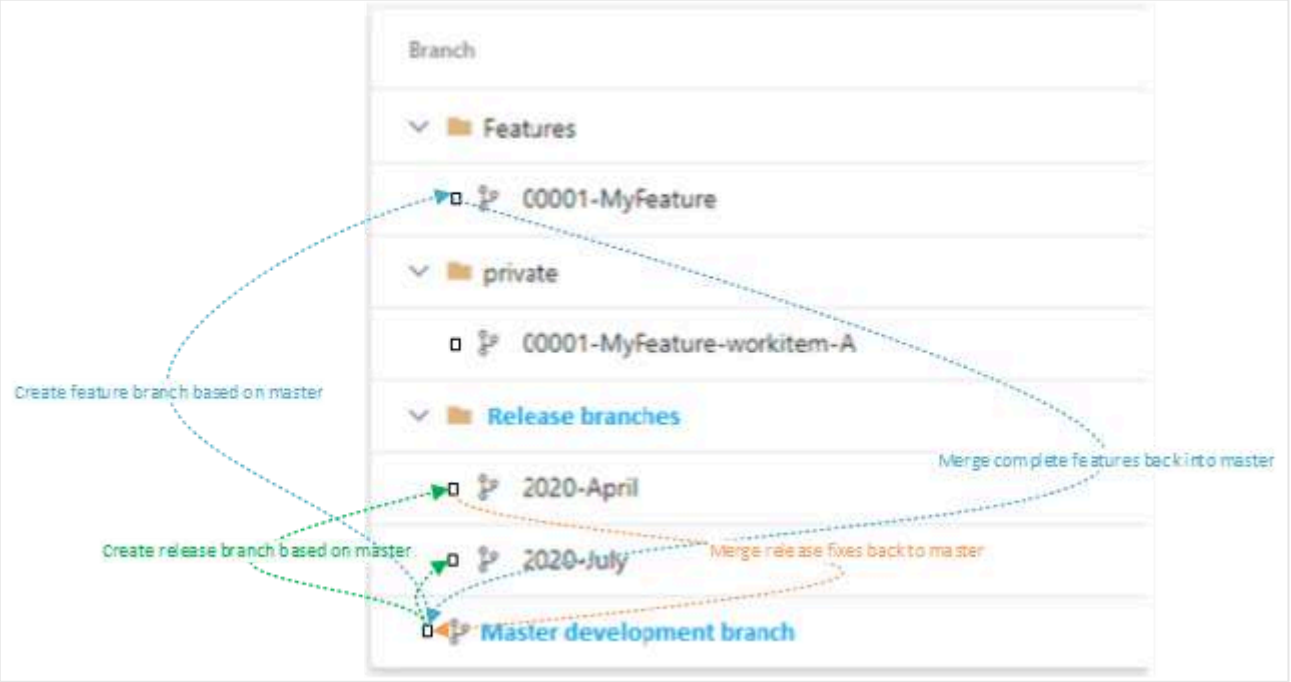
The following environments run the next version of your custom code:

- **Dev 2** – A development environment that you use for development of the next version of your custom code extensions. It uses Azure DevOps for version control of custom code. It's connected to the development branch (**main** branch) of your custom code. For more information, see the Manage source code branches section.
- **Test 2** – A functional test environment that you use for testing of the next version of your custom code extensions.



Manage source code branches

It's important to follow best practices when you manage branches of custom code. By following these practices, you help minimize cost and ensure the quality of your releases and updates.



The **main** branch (development branch) contains the latest functioning version of the next release of your code.

When you work on new features, create a new feature branch from the **main** branch. Then, when you complete the feature work, integrate the feature branch back into the **main** branch.

The release branches contain the code base of your official releases. In the preceding illustration, the assumption is that you have only one release branch, **release/2020-April**. **2020-April** isn't a build. It's a source code branch. Because you probably create hotfixes for your release, you make changes and produce builds from this release branch.

- Don't use release branches to develop new features. Use them only for critical fixes or changes that are required in your live environment.
- After you make a change in a release branch, integrate the branch back into the **main** branch. By using this approach, you ensure that your next release also contains the fix.
- Among the example environments that were described earlier, the Dev 1 environment connects to the **release/2020-April** branch.

When you're ready to release a new version of your custom code, create a new release branch from the **main** branch. For this example, create a new release branch from **main** and name it **2020-July**.

You might have private branches that individual developers work in while they work on a specific work item that's based on a specific branch of your code. Merge private branches back into their parent branch when the work is completed. For more information, see Learn about branching strategies for Team Foundation Version Control (TFVC) and how to select an effective strategy.

Apply the next version of a Microsoft service update

By using a phased approach, you help maximize the efficiency of service updates. Each phase updates one component of your implementation.

1. **Phase 1** – Update your finance and operations environments.

   Your current version of Commerce Scale Unit (CSU) and Point of Sale (POS) works correctly with the new finance and operations update. For example, version 10.0.7 of CSU is compatible with version 10.0.11 of finance and operations apps.

2. **Phase 2** – Update CSU.

3. **Phase 3** – Update POS.

When you take a Microsoft update, you don't need to update your custom code to the next version. By taking Microsoft updates without bundling them with custom code updates, you help simplify the update process. You also help reduce the cost and risk of regressions that are associated with all-in-one upgrade projects.

Backward compatibility of Microsoft updates

It's important that you understand what Microsoft means by *backward compatibility of service updates*, so that you have context for the next sections of this article. Service and quality updates are *runtime* backward-compatible. However, they're not always *design-time* (*compile-time*) backward-compatible.

Runtime compatibility

All Microsoft updates are intended to be runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations that exist in production and sandbox environments continue to work after Microsoft service updates are deployed to those environments. Those updates include service updates and quality updates. Runtime compatibility also means that Microsoft updates are backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backward only. You can compile a customization on an older application version and platform version, and deploy it to an environment that's running a later version. However, you can't deploy code to an environment that's running a version that is earlier than the version that you compiled on.

> **Important**
>
> Runtime compatibility covers personalizations, so they continue to work after Microsoft service updates are deployed to these environments. Because of this, reimporting all personalizations after a service update (or at any other time) is unnecessary and highly discouraged.

Design-time compatibility

Design-time (compile-time) backward compatibility means that developers can apply updates to their development environments and successfully compile their code without having to make any changes.

Microsoft aims for design-time compatibility. However, some updates might include changes that aren't compatible at design time, but that are binary-compatible. Therefore, after an update is applied, new errors or warnings might occur when you compile your code. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help prevent unsafe coding practices.

All these changes might require work on your solution. Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice. These breaking changes are documented for each service update. For more information, see What's new and changed in Platform updates.

Phase 1: Update the finance and operations implementation

This section summarizes the process that you use to update your finance and operations implementation to the latest service update. An update from version 10.0.7 to version 10.0.11 is used as an example.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you're live on version 10.0.11, unless you encounter one of the error situations that are described in the Error situations section.

Track 1: Update your runtime environments

By completing track 1, you essentially complete your finance and operations update to version 10.0.11, because your production environment is live on version 10.0.11. You don't have to recompile your custom code as part of this track.

Update Test 1

The Test 1 environment runs version 10.0.7 together with the latest released version of your custom extension. Although an update of Test 1 isn't a prerequisite in this flow, it's recommended, because it adds another level of functional verification and predictability. Complete this update before you update the UAT environment. The sooner that you update Test 1 and validate on it, the more predictable your "real" update (that is, the update of the UAT and Prod environments) is.

1. Apply version 10.0.11 of finance and operations apps to Test 1.
2. Sign off on functional scenarios. You can use the Regression Suite Automation Tool to automate user acceptance testing on test and UAT environments.
3. If you encounter regressions, see the Error situations section.

Update UAT

The UAT environment runs version 10.0.7 together with a released version of your custom extension. The UAT environment is the same as the Prod environment.

1. Apply version 10.0.11 of finance and operations apps to UAT.

   You might configure your UAT environment so that Microsoft automatically updates it. However, you can always pull the update as soon as it's available.

2. Complete user acceptance testing, and sign off.

3. If you encounter regressions, see the Error situations section.

Update Prod

1. Apply version 10.0.11 of finance and operations apps to Prod.

   You might configure your Prod environment so that Microsoft automatically updates it. However, you can always pull the update as soon as it's available.

2. Sign off.

Track 2: Update your development environments

The purpose of track 2 is to update the Dev 1 environment to version 10.0.11. Dev 1 is your **main** development environment that is connected to the current release branch of your custom code. It runs version 10.0.7 of finance and operations apps. By completing track 2, you ensure that Dev 1 runs version 10.0.11 together with your latest release, and that it's ready for any future hotfixes that are required for your code.

1. Apply version 10.0.11 of finance and operations apps to Dev 1.
2. Compile your custom code, and run tests.
3. Make any required changes to your custom code.
4. Check code changes into the release branch.
5. If you have more than one development environment, follow these steps for each environment:
   a. Apply version 10.0.11 of finance and operations apps to the development environment.
   b. Sync and compile your latest custom code from the target code branch.

Error situations

Case 1

During track 1, you find a bug that requires a Microsoft quality update. If Microsoft releases the update in a timely manner, use the new Microsoft update instead of the original service update to complete track 1.

Case 2

During track 1, you find a bug that requires a Microsoft service update. However, Microsoft can't release the update in a timely manner.

As a workaround for this issue, Microsoft proposes a change to your custom code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes into the release branch.
3. Create a new deployable package from the release branch.
4. Apply the new deployable package to Test 1 and/or UAT.

> ⓘ **Note**

You can deploy custom code that is compiled on version 10.0.7 to any runtime environment that's running version 10.0.7 or later. Therefore, you don't need to update Dev 1 to version 10.0.11 yet. However, you might already update Dev 1 as part of track 2.

Case 3

During track 1, you find a bug that requires a change to your custom code. This bug might be in either your code or the ISV code.

1. Modify your code in Dev 1 (in the release branch), and test your updates.
2. Check code changes into the release branch.
3. Create a new deployable package from the release branch.
4. Apply the new deployable package to Test 1 and/or UAT.

Phase 2: Update CSU to version 10.0.11

This section summarizes the process that you use to update your Commerce Scale Units to the latest service update. An update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) is used as an example.

Phase 2 prerequisites

Before you update your CSUs, update the Commerce headquarters environments (in the finance and operations app) to the same release or a later release. For this example, use release 10.0.11.

This phase is divided into two tracks. These tracks can occur in parallel.

- **Track 1** – Update your CSU runtime environments.
- **Track 2** – Update your development environments.

After you complete track 1, you're live on release 10.0.11 (Commerce version 9.21), unless you encounter one of the error situations that were described for phase 1.

Track 1: Update your CSU runtime environments

When you complete track 1, you complete your CSU update to version 10.0.11. Your production environment is live on version 10.0.11. You don't need to recompile your custom code as part of this track.

Update Test 1

The software as a service (SaaS) components of Commerce aren't currently supported in tier-1 environments (development/test environments). A copy of Retail Server runs locally in each tier-1 environment, and you deploy both Microsoft code for Retail Server and retail customizations through the previous system. You apply application binary packages and retail deployable packages against the infrastructure as a service (IaaS) instance.

Update UAT

The UAT environment runs CSU that corresponds to release 10.0.7, together with the same version of your retail extension that the production environment is running.

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see Phase 2: Update CSU to version 10.0.11.
2. Complete user acceptance testing, and sign off.
3. If you encounter regressions, see the Error situations section.

Update Prod

1. Update the Commerce Scale Unit. Select **9.21 (10.0.11)** as the target version. For more information, see Phase 2: Update CSU to version 10.0.11.
2. Sign off.

Track 2: Update your development environments

1. Get the latest version of the Retail software development kit (SDK).
   a. Apply the finance and operations service update for release 10.0.11 to Dev 1.
   b. Get the updated version of the Retail SDK from **%ServiceDrive%\RetailSDK\Update\<newest directory>**.

2. In your **main** (development) branch, update the Retail artifacts from the new version of the Retail SDK.

3. Compile. The new version should be backward-compatible and shouldn't require any changes to your code.

4. Commit the change that includes the Retail SDK update.

5. Make any required changes to your custom code.

6. Commit code changes to the target branch.

7. Optional: If you have more than one development environment, merge the latest changes from step 4, and compile the latest custom code.

Phase 3: Update POS to version 10.0.11

This section summarizes the process that you use to update your store components, such as Modern POS (Store Commerce in the newer versions) and Hardware Station, to the latest service update. This section uses an update from release 10.0.7 (Commerce version 9.17) to release 10.0.11 (Commerce version 9.21) as an example.

Unlike updates for Commerce headquarters (in the finance and operations app) and CSU, updates for store components are delivered in the same packages. After you update Commerce headquarters and CSU, you have the following options:

- **Option 0 (no operation is required)** – Leave the store components in their previous release if the version is supported and in-policy.
- **Option 1** – Update the store components runtime (Microsoft code) so that it matches the same release as CSU.
- **Option 2** – Update the store components runtime (Microsoft code) and customization together.

In the rest of this section, the assumption is that you want or need to update the store components (option 1 or option 2).

After you complete this phase, you're live on release 10.0.11 (Commerce version 9.21) for store components, unless you encounter one of the error situations that are described for phase 1.

Phase 3 prerequisites

Phase 3 has the following prerequisites:

- You updated the Commerce headquarters components (in the finance and operations app) to the same release or a later release before you updated the CSUs. In this example, the version is 10.0.11.
- You updated the CSUs to the same release as, or a later release than, the store components. In this example, the release is 10.0.11.

Update your Commerce development environment

Follow the steps in the Track 2: Update your development environments section.

Option 1: Store component updates that include only runtime changes

This option generates a new retail deployable package that contains your store components. It includes changes only from the Microsoft code.

1. Update your release branch, which has the code that is currently used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the steps in the Track 2: Update your development environments section.
2. Generate a new build for the retail deployable package. This build contains the same set of customizations that is currently in the production environment, plus version 10.0.11 (9.21) of the Microsoft code.

Option 2: Store component updates that include runtime and custom changes

This option generates a new retail deployable package that contains your store components. It includes changes from both the Microsoft code and customizations.

1. Update your release branch, which has the code that is currently used in the production environment, to the Retail SDK that matches your target release. In this example, the version is 10.0.11 (9.21). Follow the steps in the Track 2: Update your development environments section.
2. Commit changes.
3. Update custom code for store components, or update references to ISV-updated components.
4. Generate a new build for the retail deployable package. This build contains updated custom code plus version 10.0.11 (9.21) of the Microsoft code.

Update process

Update Test 1

The SaaS components of Commerce aren't currently supported in development or test one-box environments. A copy of Retail Server runs locally in each development or test one-box environment, and the deployment of both Microsoft code for Retail Server and retail customizations is done through the previous system, where application binary packages and retail deployable packages are applied against the IaaS instance.

The Test 1 environment runs version 10.0.11 of Commerce headquarters and a local version of CSU from previous phases. An update of Test 1 isn't a prerequisite in this flow. Because there's no CSU in this environment, this step is mostly for verification.

1. Upload, update, and deploy the store components. For more information, see the Upload, update, and deploy store components section.
2. Sign off on functional scenarios.

3. If you encounter regressions, see the Error situations section.

Update UAT

Clients that point to the UAT environment run applications (for example, Modern POS) for release 10.0.7 (the same version that is currently running in the production environment).

1. Upload, update, and deploy the store components. For more information, see the Upload, update, and deploy store components section.
2. Sign off on functional scenarios.
3. If you encounter regressions, see the Error situations section.

Update Prod

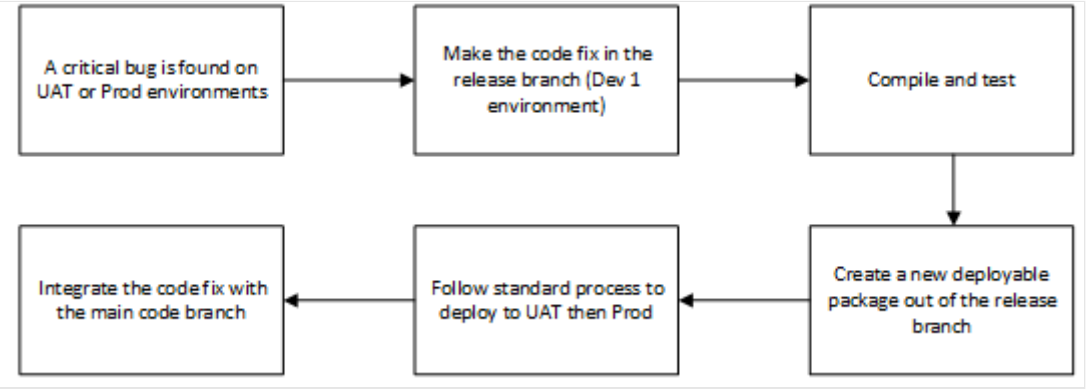
1. Upload, update, and deploy the store components.
2. Sign off.

Apply a new version of your custom code

This section describes the recommended flow for two use cases that require that you update your UAT and production environment with a new build of your custom extension.

Create a hotfix of your code

When you find a critical bug in the UAT or production environment, fix the bug in the release branch (not in the **main** or development branch). Then, use the standard process to apply a deployable package to UAT and production.

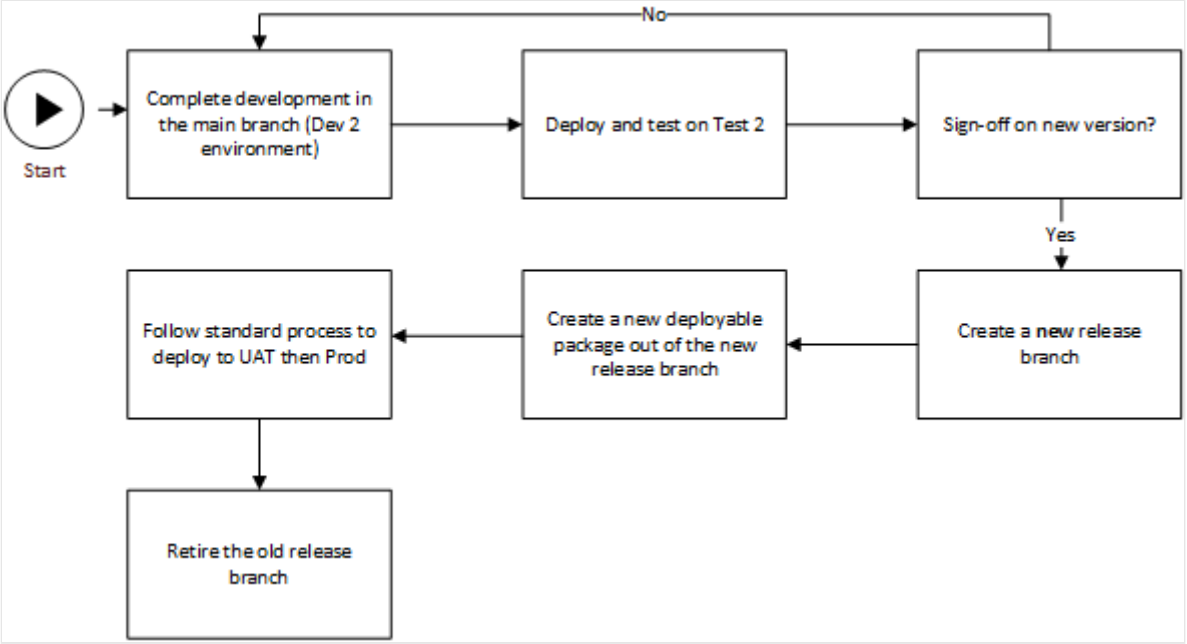


1. In Dev 1, make the code fix in the release branch. If the required fix is in ISV code, ask the ISV to send you a new build of the current release, not the next version of the solution.
2. Compile and test.
3. Create a new deployable package from the release branch.

4. Deploy on Test 1, and sign off if sign-off is required.
5. Use the standard process to deploy custom code first to UAT and then to production.
6. Integrate the code fix with your **main** code branch.

Update your custom code from release N to release N+1

When you're ready to release the next version of your custom code, use the following process to create and deploy the new release.



1. In the Dev 2 environment, or another environment that is connected to the **main** branch, complete development in the **main** branch.
2. Deploy and test on Test 2.
3. Repeat steps 1 through 2 until you get sign-off on the new version.
4. Create a **new** release branch.
5. Create a new deployable package from the **new** release branch.
6. Use the standard process to deploy custom code first to UAT and then to production.
7. Retire the old release branch.

Upload, update, and deploy store components

1. Upload the retail deployable package to LCS.

2. Update Application Object Server (AOS) with the latest client.

3. Upload the retail deployable package to your Asset library:

    - **Older deployments (earlier than version 10.0.11):** Software deployable package
    - **New deployments (version 10.0.11 and later):** Retail self-service installers

4. Update Commerce headquarters with the new self-service installers for store components:

    - **Older deployments (earlier than version 10.0.11):** Deploy the retail deployable package to Commerce headquarters via LCS.
    - **New deployments (version 10.0.11 and later):** In Commerce headquarters, on the **Commerce parameters** form, on the **Channel deployment** tab, select **Check for package updates**. This update brings in the packages that are available on the **Retail Self-service package** tab in the LCS Asset library.

5. Assign the client versions to your devices.

6. Download the installers for the desired client type and device.

7. Install in target device.

8. Test and validate.

Software lifecycle policy and cloud releases

This article outlines the lifecycle and support policies for the finance and operations online service.

Modern Lifecycle Policy

The finance and operations online service is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy covers products and services that Microsoft continuously services and supports. For more information about this policy, see Modern Lifecycle Policy. Licensed customers must stay current with updates to the finance and operations online service in accordance with the following servicing and system requirements:

- Customers who purchase subscriptions of finance and operations apps experience continuous updates that Microsoft manages. Customers can postpone one consecutive service update.
- Platform versions maintain backward compatibility with the application versions that the platform release supports within the application support lifecycle. For more information about platform versions, see What's new or changed in Platform updates.
- Critical fixes and noncritical updates are handled in the following way:
  - **Critical fixes** – Critical fixes include security fixes and any fixes that are required to adhere to the availability service level agreement (SLA) that the service supports. The latest service update provides critical fixes. In addition, to help protect customers and the online service, Microsoft might apply critical fixes directly to a customer's environment. If a critical fix must be applied, Microsoft notifies the customer about the required downtime window (if there's any downtime) and applies the fix to the applicable environment. The critical fix updates the system to the latest update version.
  - **Non-critical updates** – Service updates and quality updates provide noncritical updates.

> **Important**
>
> Microsoft doesn't investigate, troubleshoot, or provide any fixes to issues on versions that reached their end of service. For end-of-service dates by release, see Targeted release schedule (dates subject to change).

The Microsoft Support team can't take cases that are related to versions that reached their end of service. You must first update to the latest service update and then apply the latest quality update. At that point, if the issue persists, you can report it. For more information, see What happens to an environment that's running a finance and operations app version that's no longer supported.

Microsoft operates all environments. All automatic processes that involve your environments, such as monitoring or self-healing, are as-is for supported versions.

Dates and versions for application and platform releases

For details about dates and versions for releases, see the What's new or changed in finance and operations apps home page.

Note

- Service updates are cumulative and might include updates for some or all of the following components: platform, application, Financial Reporting, Commerce, and operating system updates.
- You can pause, delay, or opt out of a service update by using the update settings in Microsoft Dynamics Lifecycle Services projects. However, this option isn't available if any of your sandbox and production environments are more than one version behind the latest available update. For more information, see Can the updates be delayed? What's the policy?

Downloadable virtual hard drive releases

For finance and operations apps, updates to the downloadable virtual hard drive (VHD) are released twice per year, concurrently with the major releases in April and October. Because the VHD is bundled with the latest service update, its release always follows the release of the associated service update for production use. You can expect the VHD update to be released after the generally available (self-update) date of the service update. For finance and operations release dates, see Targeted release schedule (dates subject to change).

Use of the VHDs is subject to the Software license terms.

Software Lifecycle Policy for Microsoft Dynamics 365 Finance + Operations (on-premises)

08/20/2025

This article outlines the lifecycle and support policies for Microsoft Dynamics 365 Finance + Operations (on-premises) releases.

Modern Lifecycle Policy

Finance + Operations (on-premises) software is covered by the Modern Lifecycle Policy. The Modern Lifecycle Policy rules products and services that are serviced and supported continuously. For more information about this policy, see Modern Lifecycle Policy.

Licensed customers must regularly update their deployment of the Finance + Operations (on-premises) software. The servicing policy requires that you maintain the Software Assurance (SA) or the Enhancement Plan and it requires that you deploy the update releases provided through the continuous service updates. To check for the most up to date status on the lifecycle of the product, you can check the lifecycle page Dynamics 365 for Finance + Operations (on-premises).

> **Note**
>
> If you want to use the Fixed Support Lifecycle Policy (5+5), you must downgrade to Microsoft Dynamics AX 2012 R3. If you instead lapse on your SA or the Enhancement Plan, you'll only be eligible for the perpetual license rights to Microsoft Dynamics AX 2012 R3 and must uninstall Microsoft Dynamics 365 for Finance + Operations (on-premises).

On-premises software update policies

As a customer, you are in full control of your on-premises deployments and must actively follow this policy. You are in control of installing updates in your on-premises environments.

Microsoft supports your deployment of Finance + Operations (on-premises) software only if you keep the deployed software current according to this policy.

Critical fixes and noncritical updates are handled in the following way:

- **Critical fixes** – Critical fixes include security fixes and any fixes that are required to support reliability and availability. Critical fixes are made available in the latest platform update version.
- **Non-critical updates** – Customers must update to the most current Finance + Operations platform and financial reporter version to deploy noncritical updates.

Finance + Operations (on-premises) release dates

Continuous service updates

Since November 2018, on-premises service updates are released continuously. For more information about version numbers and availability dates, see Software lifecycle policy and cloud releases. For more information about One Version service updates, see One Version service updates FAQ.

Every service update release has a specific expiration date after which the release isn't entitled to receive support.

Continuous combined releases (Application and Platform)

With Continuous service updates, application and platform are released together. The One Version schedule specifies the dates for early access, public release, and expiration of the release.

Expand table

Product	Deployment options	Application version	Release or expiration dates
Finance + Operations	Base deployment + Service update	10.0.49	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.48	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.47	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.46	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.45	One Version schedule

Product	Deployment options	Application version	Release or expiration dates
Finance + Operations	Base deployment + Service update	10.0.44	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.43	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.42	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.41*	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.40*	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.39*	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.38*	One Version schedule
Finance + Operations	Service update	10.0.37*	One Version schedule
Finance + Operations	Service update	10.0.36*	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.35*	One Version schedule
Finance + Operations	Service update	10.0.34*	One Version schedule
Finance + Operations	Service update	10.0.33*	One Version schedule
Finance + Operations	Base deployment + Service update	10.0.32*	One Version schedule
Finance + Operations	Service update	10.0.31*	One Version schedule
Finance + Operations	Service update	10.0.30*	One Version schedule

* Expired version. All customers must be on the latest version of Finance + Operations according to the Modern Lifecycle Policy.

Older application releases

> **Note**
>
> Older platform releases passed the expiration date are no longer supported. Extension requests can't be logged since January 1, 2019.
>
> Customers who aren't following the Modern Lifecycle Policy and the Continuous service updates may not be entitled to receive support after the expiration date of the deployed application version. Expired versions are removed from Lifecycle Services at some point where after servicing and deployment of such versions from Lifecycle Services may not be possible.

Expand table

Product	Application version	Public availability	Expiration date
Finance + Operations (on-premises)	10.0 (10.0.8)	Mar 2019	Jun 2019
Finance + Operations (on-premises)	8.1 (8.1.136)	Nov 2018	Apr 2019
Finance + Operations, Enterprise edition (on-premises)	7.3 (7.3.11971)	Mar 2018	Apr 2020*
Finance + Operations, Enterprise edition (on-premises)	July 2017 (7.2.11792)	Jun 2017	Apr 2019

* All customers must be on the latest version of Finance + Operations. The deadline for this requirement was April 30, 2019. In the transition to Continuous service updates, we gave exemptions for customers who had unfulfilled extension requests that were submitted to Microsoft. Those customers could stay on version 7.3 until April 2020. For more information, see One Version service updates FAQ.

Older platform releases

> **Note**
>
> Older platform releases passed the expiration date are no longer supported. Extension requests can't be logged since January 1, 2019.

Expand table

Platform release	Build Number	Availability	Expiration date
Platform update 20	7.0.5030	November 2018	February 2019
Platform update 15	7.0.4841	June 2018	September 2018
Platform update 12	7.0.4709.41182	March 2018	June 2018
Platform update 11	7.0.4679.35176	October 2017	April 2018
Platform update 10	7.0.4641.16233	August 2017	April 2018
Platform update 9	7.0.4612.35162	August 2017	April 2018
Platform update 8	7.0.4565.1612	July 2017	April 2018

Service update availability

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Microsoft is committed to delivering predictable service updates. These service updates are made generally available for self-deployment before Microsoft automatically applies them. The timing of the package release for self-update relative to the production autoupdates varies. Customers can choose from two autoupdate windows that are four weeks apart for each service update. Organizations can select the update window that better accommodates their validation process and operational schedules. To determine the timing of self-update and autoupdates for upcoming releases, including the second autoupdate window see, Targeted release schedule (dates subject to change). To learn more about twice autoupdate window options, see One Version service updates FAQ.

Customers can take up to four service updates per year and are required to take a minimum of two per year. Customers can choose to pause one update at a time. A pause of a service update can apply to the designated user acceptance testing (UAT) sandbox environment, the production environment, or both environments. After the pause window ends, if the customer hasn't self-updated to a supported service update, Microsoft automatically applies the latest update, based on the configuration in Microsoft Dynamics Lifecycle Services. To learn more about how to pause service updates, see Pause service updates through Lifecycle Services.

> **Note**
>
> Service updates are provided four times annually. Autoupdates occur in February, April, July, and October.

Targeted release schedule (dates subject to change)

> **Important**

Microsoft releases four service updates annually, in February, April, July, and October. The maximum number of consecutive updates that can be paused is one and taking a minimum of two service updates per year is required. For answers to common questions about how these changes affect the release process, see One Version service updates FAQ.

> **Note**
>
> A sandbox autoupdate occurs seven days before the production update.

In the following table:

- An asterisk (*) in the "Release version" column denotes a major release.
- The "autoupdate schedule production start date" column refers to the autoupdate schedule that's configured in the update settings in Lifecycle Services. See Configure service updates through Lifecycle Services.
- The "End of service" column indicates the date when no new cumulative service updates are provided.

Expand table

Release version	Preview availability	Preview latest possible update	General availability (self-update)	First autoupdate schedule for production start date	Second autoupdate schedule for production start date	End of service
CY27Q2: 10.0.51*	January 25, 2027	February 15, 2027	March 12, 2027	April 2, 2027	April 30, 2027	November 19, 2027
CY27Q1: 10.0.50	October 23, 2026	November 17, 2026	December 22, 2026	January 31, 2027	February 28, 2027	August 20, 2027
CY26Q4: 10.0.49*	July 27, 2026	August 17, 2026	September 11, 2026	October 2, 2026	November 1, 2026	May 21, 2027
CY26Q3: 10.0.48	April 24, 2026	May 11, 2026	June 5, 2026	July 3, 2026	July 31, 2026	February 16, 2027
CY26Q2: 10.0.47*	January 26, 2026	February 16, 2026	March 13, 2026	April 3, 2026	May 1, 2026	November 20, 2026
CY26Q1: 10.0.46	October 24, 2025	November 17, 2025	December 26, 2025	February 1, 2026	March 1, 2026	August 21, 2026

Release version	Preview availability	Preview latest possible update	General availability (self-update)	First autoupdate schedule for production start date	Second autoupdate schedule for production start date	End of service
CY25Q4: 10.0.45*	July 28, 2025	August 8, 2025	September 12, 2025	October 3, 2025	October 31, 2025	May 22, 2026

> **Note**
>
> The Software lifecycle policy applies to customers who are enrolled in the First Release program and to the date when the service update is made generally available.
>
> ### Release naming convention as of the 10.0.38 release
>
> The first half of the release label refers to the calendar year and quarter when the auto update production start date is scheduled. The second part is the product version as it appears in Lifecycle Services. An asterisk (*) at the end of the label indicates a major release. For example: **CY25Q4: 10.0.45*** is product version 10.0.45 that's made available for autoupdate in the fourth quarter of 2025. It's a major update (the "October" release).
>
> Previews and preview updates are available as a deployable package in the Shared asset library in Lifecycle Services. For more information, see One Version service updates FAQ.

Service update overview

Service updates are continuous, touchless updates that provide new features and functionality. They eliminate the need to do expensive upgrades every few years. Because service updates maintain backward compatibility, there's no need to "merge your code." We recommend that you use tools such as the Regression suite automation tool (RSAT) for regression testing.

You're in control and manage how your organization receives these updates. For example, you can sign up for the First Release program so that your organization receives updates first. You can manually apply the updates to any of your environments (self-update). Alternatively, you can remain on the default release schedule and receive the autoupdates when you schedule them by using Lifecycle Services.

Service updates contain both application changes and platform changes that are critical to the service, including regulatory updates. For more information, see Service updates.

Release processes

The Dynamics 365 team designs, develops, and validates each new release. Extensive testing is done on various test topologies. A compatibility checker also runs tests to ensure backward compatibility.

All customers who take advantage of the preview have early access to the upcoming service update. The preview service update is used to validate customizations, learn about new features, and provide feedback to Microsoft. During the preview phase, customers must deploy the service update in a development/test environment. The preview release can't be used in production. After release, customers can download the package from the Shared Asset Library in Lifecycle Services. Customers must agree to the program terms at the time of installation. Sign up for access to preview packages is no longer required. One scheduled update to the preview build is included as standard with every release.

The First Release program is available to all finance and operations apps customers. There are two ways to participate:

- **Microsoft Managed Update**s: Fill out the First Release Program: Microsoft Dynamics 365 Finance and Operations applications form and receive a service update that Microsoft automatically deploys, first in a UAT sandbox and then in production after seven days. It isn't possible to pause these updates.
- **Customer Initiated Updates**: Customers can pull the First Release build into their UAT sandbox from Lifecycle Services for testing and into production, without autodeployment from Microsoft.

Typically, the First Release build is the same as the generally available (GA) build. However, if critical issues arise that can't be fixed with a hot fix, a new First Release build is declared, and customers are informed through various communication channels, including Viva Engage and Lifecycle Services. Microsoft restarts the sandbox and production environments and deploy any newly declared First Release build for customers that receive Microsoft managed updates. Customers that initiate updates should deploy newly declared First Release builds that are available on Lifecycle Services.

The service update is made generally available through the Action Center in Lifecycle Services. When the service update is available, customers can manually apply it to all environments, including production. If the service update isn't applied to the designated sandbox or production environment, Microsoft automatically applies it, based on the update settings for the Lifecycle Services project. To learn more, see Configure service updates through Lifecycle Services.

Last updated on 06/04/2026

Apply updates to cloud environments

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to use Microsoft Dynamics Lifecycle Services to automatically apply updates to cloud environments.

> **Important**
>
> Apply updates by using deployable packages. Applying updates causes system downtime. All relevant services stop, and you can't use your environments while the package is being applied. Plan accordingly.

Supported environments

All customer-managed and Microsoft-managed environments deployed through Lifecycle Services are supported. For more information about self-service environments, see Update an environment.

> **Note**
>
> If you have a build environment, you can only use Lifecycle Services to apply binary updates and data upgrade packages. You can't use Lifecycle Services to apply an application deployable package.

For other environments (listed in the following section), you must use Remote Desktop Protocol (RDP) to connect to the environment and install from the command line. For information about manual package deployment, see Install deployable packages from the command line.

- Local development environments (Downloadable virtual hard disk [VHD])
- Multibox dev/test environments in Microsoft Azure (Partner and trial projects)

Key concepts

Before you begin, you should understand *deployable packages*, *runbooks*, and the *AXInstaller*. A deployable package is a unit of deployment that you can apply in any environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package. The AXInstaller creates a runbook that enables installing a package. Learn more in Packages, runbooks, and the AXUpdateInstaller in depth at the end of this article.

Supported package types

- **AOT deployable package** – A deployable package that's generated from application metadata and source code. You create this deployable package in a development or build environment.
- **Application and Platform Binary update package** – A deployable package that contains dynamic-link libraries (DLLs), other binaries, and metadata that the platform and application depend on. Microsoft releases this package. You can get it from the **All binary updates** tile in Lifecycle Services.
- **Platform update package** – A deployable package that contains DLLs, other binaries, and metadata that the platform depends on. Microsoft releases this package. You can get it from the **Platform binary updates** tile in Lifecycle Services.
- **Commerce deployable package** – A combination of various packages that are generated after the Commerce code is combined.
- **Merged package** – A package that you create by combining one package of each type. For example, you can merge one binary update package and one AOT package, or one AOT package and one Commerce deployable package. You merge the packages in the Asset library for the project in Lifecycle Services.

> **Note**
>
> You can't include a binary package and a Commerce deployable package in the same merged package.
>
> For information about how to download an update from Lifecycle Services and what you see in the tiles based on your environment version, see Download updates from Lifecycle

Services.

If your environment is on an application version 8.1 or later, the **Platform Update package** doesn't apply to your environment. Starting with 8.1 and later releases, **Application and Platform Binary update package** applies since application and platform are combined into a single cumulative package and is released by Microsoft. You don't apply granular X++ hotfixes and get all application and platform updates together. On the **Environment details** page, clicking on **View detailed version information** doesn't show details on the granular hotfixes or KBs applied as there's no way to apply them.

Prerequisite steps

- **Make sure that the package you want to apply is valid** - When you upload a package to the Asset library, the system doesn't analyze it. If you select the package, the package status appears in the right pane as **Not Validated**. A package must pass validation before you can apply it in an environment by using the following procedures. The Asset library updates the status of the package to indicate whether the package is valid. Validation helps ensure that production environments aren't affected by packages that don't meet the guidelines.

  There are three types of validations:
  - Basic package format validations
  - Platform version checks
  - Types of packages

- **Make sure that you apply the package in a sandbox environment before you apply it in the production environment.** To help ensure that the production environment is always in a good state, test the package in a sandbox environment before you apply it in the production environment. Therefore, before you request that the package be applied in your production environment, make sure that it is applied in your sandbox environment by using the automated flows.

- **If you want to apply multiple packages, create a merged package that you can apply first in a sandbox environment and then in the production environment.** Application of a single package in an average environment requires about five hours of downtime. To avoid more hours of downtime when you must apply multiple packages, create a single combined package that contains one package of each type. If you select a binary package and an application deployable package in the Asset library, a **Merge** button becomes

available on the toolbar. By selecting this button, you can merge the two packages into a single package and therefore reduce the total downtime by half.

- **Make sure that you apply the application binary update package to your dev/build environment AFTER you apply it to your sandbox and production environment** - If you apply the application binary package on your dev/build environment and this action raises the platform build version to be higher than your target sandbox or production environment, you're blocked from applying any AOT packages that are produced from this dev/build environment. To apply AOT packages produced from a dev/build environment, your dev/build instance must be equal to or lower than your target environments.

Apply a package to a nonproduction environment by using Lifecycle Services

> ⓘ **Note**
>
> For self-service type environments, see Update an environment.

Before you begin, verify that you uploaded the deployable package to the Asset library in Lifecycle Services.

1. For a binary update, upload the package directly to the Asset library. For information about how to download an update from Lifecycle Services, see Download updates from Lifecycle Services. For an application (AOT) deployable package that results from an X++ hotfix, or from application customizations and extensions, create the deployable package in your development or build environment, and then upload it to the Asset library.
2. Open the **Environment details** view for the environment where you want to apply the update.
3. Select **Maintain** > **Apply updates** to apply an update.
4. Select the package to apply. Use the filter at the top to find your package.
5. Select **Apply**. The status in the upper-right corner of the **Environment details** view changes from **Queued** to **In Progress**, and an **Environment updates** section now shows the progress of the package. You can refresh the page to check the status.
6. Continue to refresh the page to see the status updates for the package application request. When the package is applied, the environment status changes to **Deployed**, and the servicing status changes to **Completed**.

Apply a package to a production environment by using Lifecycle Services

In a production environment, schedule a downtime for when you want the update to be applied. For self-service type environments, see Update an environment.

> **Important**
>
> An important prerequisite for applying a package to a production environment is that you successfully apply the package to at least one sandbox environment in the same project.

Troubleshoot package deployment failures

If package deployment fails, see Troubleshoot package application issues.

Applying updates and extensions

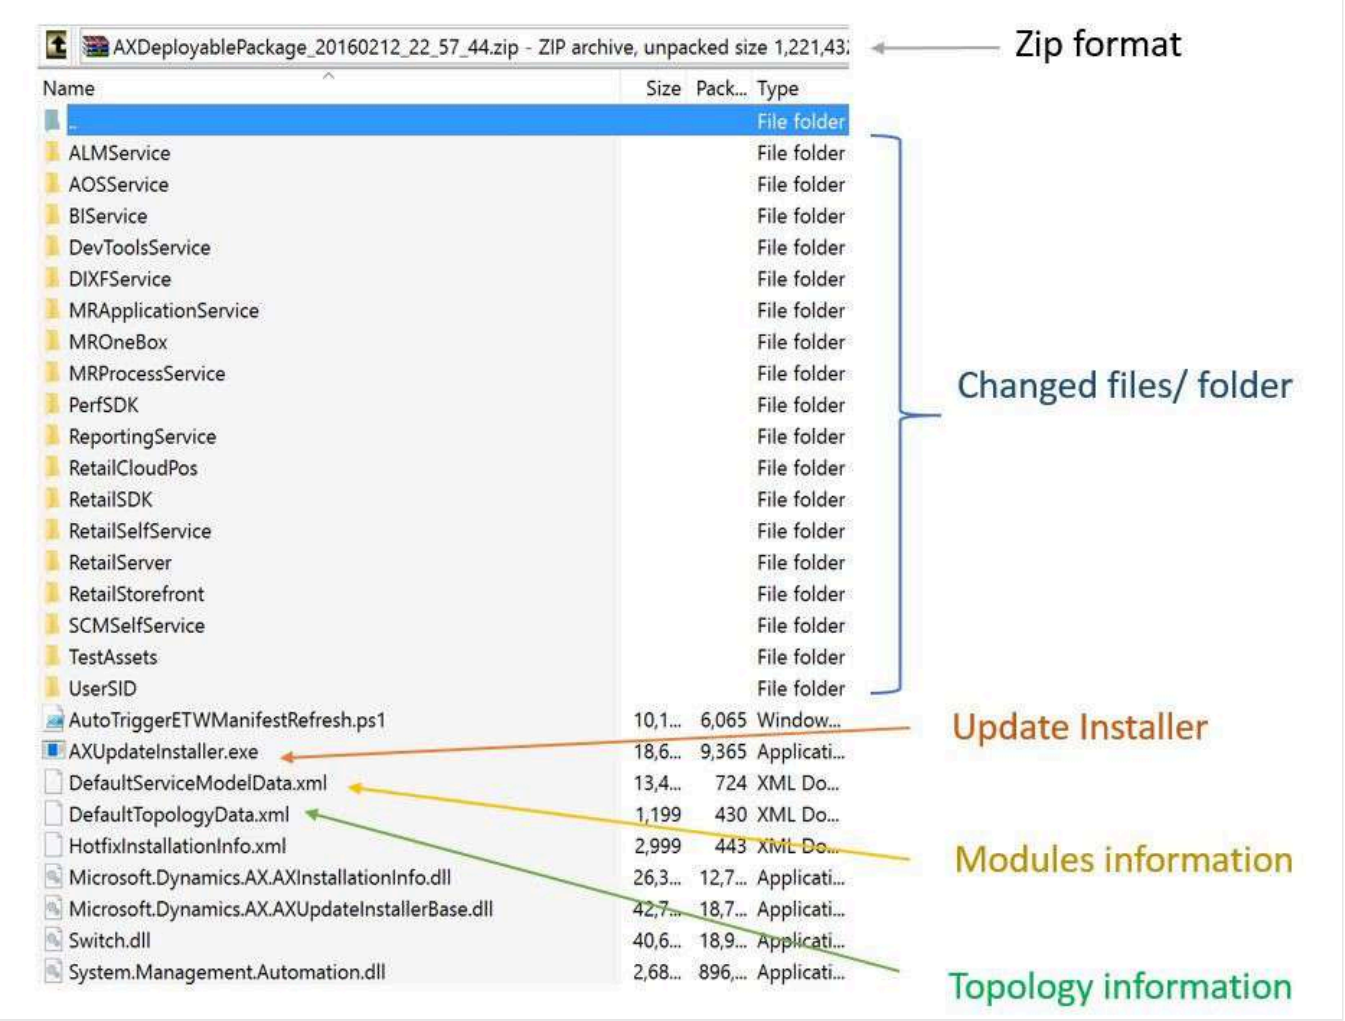
If you're updating a Tier-2 Sandbox or Production environment on application version 8.1.2.x or newer and you initialized Cloud Scale Unit, you also need to update Commerce channel components. For more information, see Update Retail Cloud Scale Unit.

If you're using components such as Modern POS, after you apply updates and extensions in your environment, you must also update your in-store components. For more information, see Configure, install, and activate Modern POS (MPOS).

Packages, runbooks, and the AXUpdateInstaller in depth

Use deployable packages, runbooks, and the AXUpdateInstaller to apply updates.

Deployable package – A deployable package is a unit of deployment that you can apply in an environment. A deployable package can be a binary update to the platform or other runtime components, an updated application (AOT) package, or a new application (AOT) package.



Runbook – The deployment runbook is a series of steps that the system generates to apply the deployable package to the target environment. Some steps are automated, and some steps are manual. AXUpdateInstaller lets you run these steps one at a time and in the correct order.

AXUpdateInstaller – When you create a customization package from Microsoft Visual Studio or a Microsoft binary update, the installer executable is bundled together with the deployable package. The installer generates the runbook for the specified topology. The installer can also run steps in order, according to the runbook for a specific topology.

Apply updates to on-premises deployments

This article explains how to apply supported updates to Dynamics 365 Finance + Operations (on-premises). All updates to on-premises environments are done through Microsoft Dynamics Lifecycle Services.

Search for and download updates

For more information about how to find the updates that you can apply to your on-premises environment, see Issue search in Lifecycle Services. For information about how to download updates from the tiles in the **Updates** section of the **Environment details** page in Lifecycle Services, see Download updates from Lifecycle Services.

Update an on-premises deployment

You can apply updates to an on-premises environment either during deployment or after the deployment is completed.

While an on-premises environment is being deployed, you can select to deploy a custom package in the **Advanced** settings. For more information about how to apply customizations or application X++ updates, see Develop and deploy custom models to on-premises environments.

> **Note**
>
> Merged packages, which include platform/application code and custom code, are restricted to use during quality updates only. They can't be utilized when updating to a newer service update. For instance, if you are updating from Dynamics 365 Finance + Operation (on-premises) version 10.0.41 to 10.0.42, the service update must be applied before using a merged package.

To apply updates to an on-premises environment after it's deployed, follow these steps:

1. In Lifecycle Services, open the **Environment details** page for the environment.
2. Under **Maintain**, select **Apply updates**.

> **Note**

The environment must also have the latest version of the local agent available in Lifecycle Services. For more information, see Update the local agent.

Apply platform update package updates through Lifecycle Services

You can use the following steps to apply platform update packages.

> **Important**
>
> The application of updates requires downtime for your environment. Therefore, no business transactions can be performed in the environment during the update. When you complete the following steps, verify that the system isn't being used, and that an official downtime notice has been communicated to all system users.

Prerequisites

- Before you begin, complete a full backup of the Management Reporter (MR), Microsoft Dynamics AX, and Microsoft SQL Server Reporting Services (SSRS) databases. Although the code is restored through Lifecycle Services, the database must be manually restored to help ensure that no data loss occurs.
- Update the local agent to the latest version. For more information, see Update the local agent.
- Depending on the type of update, complete the following steps to generate a deployable package:
  - **Platform update packages** – Download or save the update directly to the Asset library in Lifecycle Services by following the steps in Download updates from Lifecycle Services.
  - **Customizations** – Follow the steps in Develop and deploy custom models to on-premises environments.

Update a sandbox environment

1. In Lifecycle Services, open the on-premises implementation project, and then, on the project menu, select **Asset library**. In the Asset library, ensure that the platform update package or custom deployable package appears on the **Software deployable packages** tab.

2. In the on-premises implementation project, open the **Environment details** page of the environment to update.

3. Under **Maintain**, select **Apply updates**. A dialog box shows the updates that were uploaded to the Asset library. Note that only packages that are marked as **Valid** in the Asset library appear.

4. Select the update, and then select **Prepare** to prepare your on-premises environment for servicing.

   > ⓘ **Note**
   >
   > While the environment is being prepared for servicing, its state is **Deployed**. However, the **Deployment status** field shows the progress of the preparation. During preparation, actions such formatting the package and downloading the package are performed.
   >
   > Because the environment isn't directly touched during preparation, there is no downtime at this point. Users can continue to use the system during preparation.

5. After preparation is completed, **Abort** and **Update Environment** buttons appear. To start to apply the update, select **Update environment**. If preparation fails, see the Resolve a failed update application section later in this article.

6. In the confirmation message that appears, select **Yes**. The servicing operation now begins on the environment. This point is the start of the downtime on your environment.

   The environment state is changed from **Deployed** to **Deploying**.

   After the update is completed, the environment state is changed back to **Deployed**. If application of the update fails, the environment state is changed to **Failed**. For information about what to do if package application fails, see the Resolve a failed update application section later in this article.

   > ⓘ **Note**
   >
   > During the update, the database is synchronized to update any changes to table definitions. This action can take some time for larger databases. Additionally, all reports are deployed again to the SSRS nodes.

7. Open the **History** and **Environment details** pages to view the operations that were performed on the environment. You can view a record of major actions that were performed on the environment, such as deployments, servicing, and rollbacks.

Update a production environment

Before you update a production environment, you must successfully complete the package application update on a sandbox environment.

1. In the project for the sandbox environment that you applied the package to, open the Asset library, and then, on the **Software deployable packages** tab, select the package, and mark it as a **Release candidate**.
2. On the **Environment details** page, under **Maintain**, select **Apply updates**. The dialog box that appears shows only packages that are marked **Release candidate**.
3. Select the **Release candidate** package to apply to the production environment.

The rest of the update flow is the same as the flow for a sandbox environment.

Resolve a failed update application

When preparation fails, the environment state is **Deployed**. When the application of an update fails, the environment state is **Failed**. The first step is to determine why there is a failure. The location of the logs varies, depending on the stage where the failure occurred:

- **Preparation stage** – If the operation fails during the **Preparation** stage, the logs are uploaded to Lifecycle Services. In the log files, select **Download logs** to download the log files. If the package has any merge issues, the error is included in the log file.
- **Deploying stage** – If the operation fails during the **Deploying** stage, the logs are located in the on-premises environment. Sign in to the environment, and then access the logs and event viewer.

For more information about how to use the troubleshooting logs, see Troubleshoot on-premises deployments.

After you review the logs and determine the cause of the failure, complete one of the following operations to restore the environment to a healthy state. No actions can be performed on an environment that is in a **Failed** state. The environment must first be restored to a healthy state.

- **Retry failed operation** – If update application fails, select **Retry** to recover from the failed operation.

- **Abort failed operation** – Because there is no change made to the on-premises environment, if the preparation fails, you have the option to cancel the operation. Select **Abort** to cancel the preparation.

- **Roll back the update** – To roll back the update that failed, select **Rollback**. Before you start the rollback, you must restore the database to the last known good state. When you select **Rollback**, the environment is restored to the last known good state. The environment state is then changed to **Preparation**, then to **Deploying**, and then to either **Deployed** or **Failed**.

  > ⓘ Note
  >
  > The **Rollback** button doesn't roll back the database. You're responsible for restoring the database to the last known backup that was made before update application. This step is critical to help guarantee that there is no data loss.

- **Refresh the state** – If update application fails during the **Preparation** stage, the failure is on the Lifecycle Services side, and update application hasn't yet started. Therefore, the on-premises environment is in a good state. To restore the Lifecycle Services environment state to **Deployed**, on the project dashboard page, select **Refresh**.

- **Delete and redeploy an environment** – If the retry and rollback options don't work, you must delete and redeploy the environment. To delete the environment, on the project dashboard page, select **Delete**. You then see the option to configure the environment.

  > ⓘ Important
  >
  > This option should **not** be used on a production environment. However, it can be used on a sandbox deployment to restore the environment to a healthy state.
  >
  > Because this option requires that you do a fresh deployment of the environment, you lose any updates that were previously applied. Any customizations and binary updates must be reapplied to the environment.

Configure service updates through Lifecycle Services

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

In Microsoft Dynamics Lifecycle Services, you can specify how and when you receive service updates from Microsoft for your environments.

> **Important**
>
> This feature is available only to customers who are using **version 8.1 and later** or are using **version 7.3**, and who are **not** part of the First release program. Microsoft is working to make the feature available to First release customers. For customers who are on versions 7.1, 7.2, or 8.0, you can take the update manually by using the regular servicing flows.

Only users (customers or partners) assigned to the **Project owner** role in Lifecycle Services can configure updates. Additionally, you can configure updates only for **implementation projects**.

Follow these steps to change your update settings.

> **Note**
>
> These settings apply only to service updates. They have no effect on the operating system–level security updates that are applied to your environments every month.

1. In Lifecycle Services, in your implementation project, open the **Project settings** page.

   This page has a new tab named **Update settings**.

2. On the **Update settings** tab, set the following configuration options as you require:

   - **Default Sandbox Update environment** – Select an alternate sandbox environment that should be updated before the production update.

     By default, Microsoft first updates the Tier 2 Standard Acceptance Test (sandbox) environment that is included in the base offer. It then applies the update to the production environment. If you purchased Tier 2 and higher sandbox add-on environments and want a different sandbox to be updated, use this field to change the default environment to an alternate environment.

     > **Important**
     >
     > The environment that you select here's updated seven calendar days before the update cadence that you select for the production environment.

   - **Production environment update cadence** – Select a recurring cadence for updates to your production environment. The sandbox environment that you select in the **Default Sandbox Update environment** field is updated seven calendar days before the selected cadence. The remaining additional sandboxes are updated on the same cadence as the production environment. The following options are available:
     - **Select the cadence** – Select whether to receive updates in the first, second, or third week of the month.
     - **Select one of the three time-zones** – Select the time zone that the production environment should be updated in: Eastern Time (UTC – 5), Hong Kong Time (UTC + 8), or Greenwich Mean Time (UTC + 0).
     - **Select a day of the week:** Select the day in the week when you want to receive updates.
     - **Select a time slot:** Select the time slot when you want to receive updates.

     > **Important**
     >
     > Currently, only a few options are available for the day of the week and time slot options. Microsoft adds more options soon, such as weekdays for customers.

     > If the above time slots don't meet your needs, you always have the option to do a self-update at a time that is convenient to you by taking the update and

> applying it to your environments by using the regular servicing flows.

3. When you finish setting the configuration options, select **Save**.

After you set the update environment and update cadence, Microsoft generates an update calendar for the next six months. This calendar shows exactly when the configured sandbox and production environments are updated. Therefore, you know when to expect each update. To view the calendar, select **View the update calendar**.

> **Important**
>
> After you save the settings, you can change them at any time. However, if there's an ongoing rollout, the new settings aren't used to update the existing rollout timings. Instead, they start to be used in the next rollout. An ongoing rollout is defined by the 14-day period between the date when the email notification about the update of the sandbox environment is sent and the date when the production environment is updated.

For more information about how to pause updates to configured sandbox and production environments, see Pause service updates through Lifecycle Services.

For more information about One Version and Microsoft-managed service updates, see One Version service updates FAQ.

Canceled updates

A scheduled update can be canceled for various reasons. Here are some common reasons that cause Microsoft to cancel a scheduled update.

- An error is found during update preparation. The update preparation process starts approximately four hours before the update to ensure that the environment is in a healthy state. If the environment is in a failed state or maintenance mode, the scheduled update is canceled before it starts.
- An error is found while updating the environment. If there are problems during the update, the scheduled update is canceled and the environment rolls back to the previous state.
- The environment is already running on the latest version. There's no need to apply the update again, so the scheduled update is canceled before it starts.
- The target environment isn't found. If the designated sandbox is deleted or the production environment isn't deployed, the scheduled update is canceled before it starts.
- You're enrolled in the First Release program. The First Release program has a different release cadence, so previously scheduled updates are canceled.

You can find the canceled updates through the **View recent canceled updates** in the update settings. It shows all canceled updates, if any, within the last two scheduled updates.

Additional sandbox environments

In addition to the default sandbox environment and the production environment, if you deploy additional sandbox environments in your Lifecycle Services implementation project, the One Version service update also auto-updates the additional sandbox environments.

Update additional sandbox environments

You update the additional sandbox environments on the same cadence as your production environment, based on your update settings. If you have additional sandbox environments, you schedule them for update together.

If you don't deploy the production environment, none of the additional sandbox environments are auto-updated.

If you update the production environment **before** you send the email about the production update, the production environment and all additional sandbox environments **aren't** updated. If you update the production environment **after** you send the email about the production update, the production environment update **is** canceled, but additional sandbox environments are updated.

If there's any update failure on the production environment or any of the additional sandbox environments, it doesn't interfere with the remaining updates. That is, if the production update fails, the additional sandbox update continues. Similarly, if you have additional sandbox environments and one of them fails during the update, the others continue.

You can self-update any of your environments prior to the scheduled service update. If you self-update to the latest version on an environment, the scheduled service update doesn't apply an update on that environment again.

Change the default sandbox environment

If you already have selected a default sandbox environment, and want to change it with one of the additional sandbox environments, the change will take effect in the next scheduled service update.

Pause service updates

Additional sandbox environments can't be paused independently. However, if you pause the default sandbox environment, then both the production environment and additional sandbox environments will be paused automatically. If you pause the production environment, then additional sandbox environments will also be paused.

The current pause service updates policy still applies.

Email notifications

If your additional sandbox environments are scheduled for an update, you'll receive reminder email notifications 6 days prior to the scheduled service update. After the update completes, you'll also receive email notification regarding the update result for each environment.

Last updated on 03/06/2026

Preservicing and post-servicing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

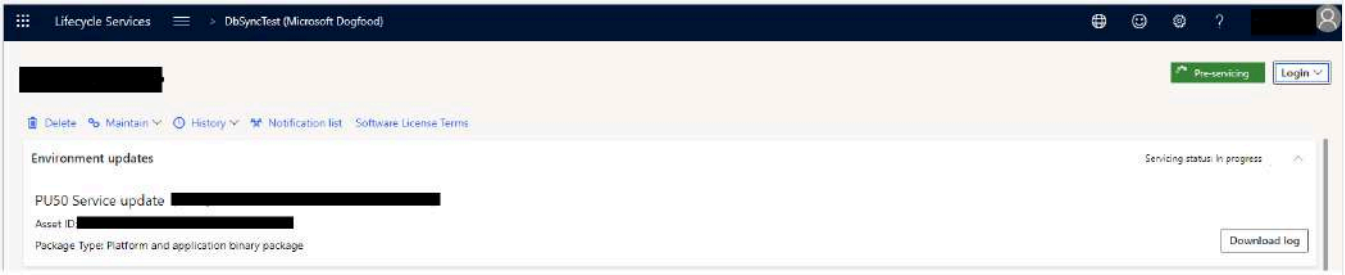
This article explains new changes that Microsoft introduced for the servicing process.

Microsoft introduced new steps for the servicing pipeline preservicing and post-servicing to enable database synchronization precheck and index creation on tables to occur outside offline servicing. Therefore, the environment remains up and running, and accessible so that users can perform regular activities. However, servicing can't be done, because all servicing operations are restricted during preservicing and post-servicing. The main benefit of the change is it helps reduce the overall servicing downtime.

Preservicing

For service updates, the preservicing step runs when you trigger the servicing operation. During this step, Microsoft Dynamics Lifecycle Services shows the environment state as **Pre-servicing**. This status indicates that the environment is online and accessible, but no other service operations are allowed.

The preservicing step identifies the predefined set of errors that cause servicing to fail. Precheck failure immediately triggers a soft rollback, without point-in-time recovery (PITR), and the environment is brought back to a deployed state. By fetching precheck errors from the environment history logs, you can apply the required mitigation before you retrigger the update.

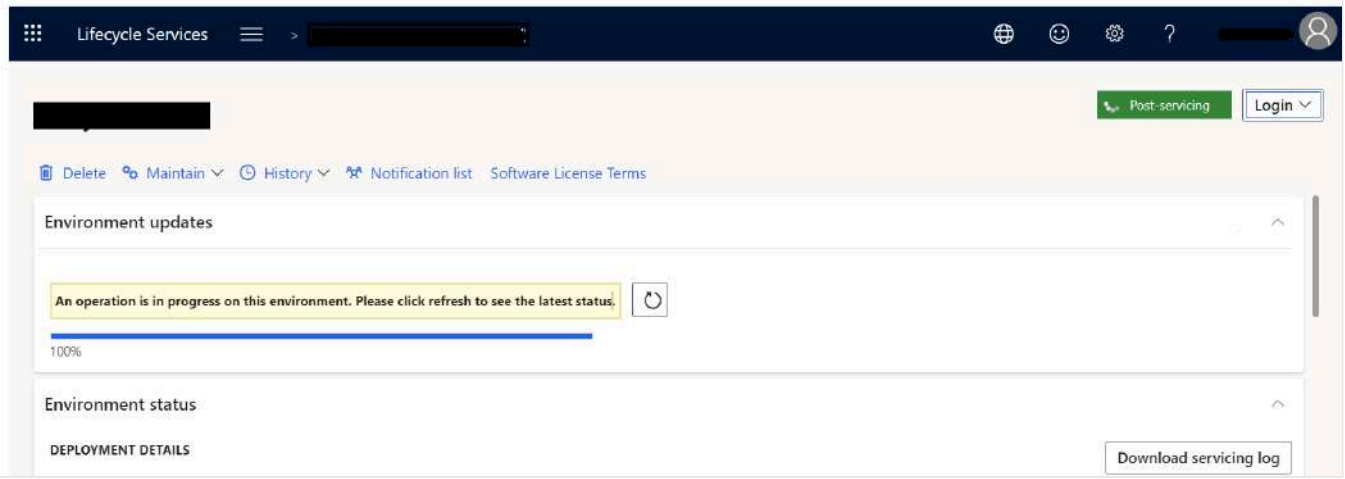


When pre-servicing succeeds, the environment state is updated to **Servicing**. During the servicing step, the system goes offline and remains inaccessible until the environment state is

updated to **Post-servicing**. After the servicing step is completed, email notifications are sent to environment admins.

Post-servicing

While the post-processing step is occurring, after offline servicing is completed, Lifecycle Services shows the environment state as **Post-servicing**. During this time, the index creation and modification that weren't done during offline servicing steps are done in online mode. The environment remains accessible so that users can perform regular activities. However, performance might be degraded for the changes that are involved in the update package. During post-servicing, users can't cancel existing service requests or trigger new service requests. There's an option to download the logs to check the process.



If any failure occurs during the post-servicing step, Lifecycle Services shows the environment state as **Post-servicing failed**. During this time, the environment remains accessible so that users can perform regular activities. However, performance might be degraded for the specific table where the index change failed. If the issue isn't resolved in 24 hours, contact Microsoft Support.

Recommended best practices for reduced servicing downtime

Restrict table schema changes to support faster schema synchronization. Eventually, this synchronization can be done online. All the schema change operations that are described in this section either require that an index be dropped and recreated, or require a considerable amount of downtime and therefore a longer servicing window.

Field property changes

- You change the **Scale** property for a field of the **Real number** type.
- You change the **Size** property from **(Memo)** to a fixed size *n*, or from a fixed size *n* to **(Memo)**, for a field of the **String** type.

Index-related changes

- You change the **Primary Index** property of a table.
- You change the **Clustered Index** property of a table.
- You add or remove fields from the columnstore index.
- You add or remove fields from the primary index.

Common failures

This section provides troubleshooting and mitigation guidance for the most common issues faced during preservicing or that are caused due to custom integrations. Review the logs of a service action from the environment's Lifecycle Services portal. Go to the environment history and select target service action to download the logs. After you download the logs, in zip format containing multiple files, locate the file that starts with "dbsyncadhoc_precheck_error". This file provides precheck failure logs. If there are multiple files with the same name, select any one for troubleshooting.

Precheck servicing can fail for various reasons. The following list describes common issues. If you see any of the following errors in the error file, the servicing deployment doesn't succeed unless you fix either the package or database issues. See the following list for the most common reasons for failures and recommended actions to perform before retrying servicing.

- Error message contains **"Database execution failed: The CREATE UNIQUE INDEX statement terminated because a duplicate key was found for the object name 'Table name' and the index name 'Index name' ".** This error occurs when a user attempts to create a unique index, but more than one row in the table contains duplicate values. If there are duplicates, the Dbsync fails and the error logs contain the details about the failed index.

Recommended action: Connect to the environment's database axDB and remove duplicate values in the unique index columns from [table name] found in error logs and the retry.

- Error message contains **"Package deployment failed with error like 'Converting Field XXX of Type 'AxTableFieldXXX' to 'AxTableFieldXXX' is not supported. Drop the original field, sync the table and add new field with same name if needed'**. This error occurs when a user creates a table and changes the column type to one that isn't supported.

Recommended action: Specific field type conversion isn't supported and the table in question is a customer created table. Fix the issue by converting the field type to the original type and then retry the servicing.

- Error message contains **"The enum value 'XXX' on the extension 'YYY.ZZZ' already exists. This extension can't be applied to the base element."** This error occurs if an ISV or a user adds an enumeration value to an extensible enum, and then a subsequent addition to the same extensible enumeration with the same name from the Microsoft-shipped application collides with it. The naming guidelines require that ISV and customer extensions are prefixed in order to avoid this type of collision. For more information, see Naming guidelines for extensions.

Recommended action: If this error occurs, rename the customer or ISV enumeration value to follow naming guidelines and avoid collision with the new application value.

FAQ

What are the most common errors that cause pre-servicing to fail?

The following list shows some common errors that cause pre-servicing to fail. Review the environment history logs before you retrigger the update.

- The `CREATE UNIQUE INDEX` statement terminated because of a duplicate key.
- Drop the original field, sync the table.
- Extension can't be applied to the base element.
- Missing dependencies.

Pause service updates through Lifecycle Services

This article explains how to pause updates to your sandbox and production cloud environments by using Microsoft Dynamics Lifecycle Services. This article doesn't apply to on-premises environments.

Microsoft updates your configured sandbox and production environments to the latest service update that Microsoft releases. Microsoft notifies you about upcoming updates to your environments via email and through notifications in Lifecycle Services. At that point, if you can't proceed with the update for some reason, you can pause it through Lifecycle Services.

> **Important**
>
> As of February 19, 2024, the maximum number of consecutive updates that you can pause is reduced from three to one. However, because the service update cadence is also reduced, from seven to four releases, the same minimum of two service updates per year is maintained. For more information, see One Version service updates FAQ. For information about how to change the configured sandbox environment and set the production update cadence, see Configure service updates through Lifecycle Services.
>
> Microsoft is giving customers more flexibility in their update schedules. Beginning with the 10.0.39 release, customers can choose from two auto-update windows that are four weeks apart for each service update. Organizations can select the update window that better accommodates their validation process and operational schedules. For more information about how this change affects pause policy, see the **Who can pause service updates** section later in this article.

Who can pause service updates?

Only users (customers or partners) assigned the **project owner** role in Lifecycle Services can pause updates. You can pause updates only for **implementation projects**.

Staying current with service updates helps guarantee that customers always run on the latest set of fixes that Microsoft releases, so they have the best service experience. Therefore, Microsoft doesn't allow updates to be paused indefinitely.

Starting February 19, 2024, the maximum number of consecutive updates that you can pause is reduced from three to one. Therefore, customers must take a minimum of two service updates annually.

You can't use Lifecycle Services to pause a release if any sandbox and production environments in your project are more than two updates behind the latest release. This rule applies even in the case of two autoupdate windows now available with 10.0.39 release. For example, if Microsoft's latest released version is 10.0.39, customers with version 10.0.38 can pause one or both autoupdate windows to completely pause the 10.0.39 release. Customers with version 10.0.37 can pause only the first autoupdate window and must take the 10.0.39 release in the second update window. If environments are two releases behind the latest release (older than 10.0.37 in this example), none of the autoupdate windows are applicable as no pause is allowed.

If any sandbox or production environment is too far behind, you receive the following error message if you try to pause updates in Lifecycle Services:

> One or more sandbox and/or production environment isn't compliant with Microsoft's service update policy. All your environments need to be compliant before you can pause updates.

> **ⓘ Important**
>
> To pause a release, customers must pause both autoupdate windows if they're eligible to do so, based on the pause policy. Pausing the first autoupdate window doesn't automatically pause the second window.

What updates can I pause?

If you decide to pause updates, you have these options:

- Pause updates only to your production environment.
- Pause updates to both your sandbox environment and your production environment.
- Pause updates to other sandbox environments by pausing updates to your production environment.

> **ⓘ Note**
>
> If you pause updates to the production environment, all updates to other sandbox environments are paused too.

You can pause a maximum of one consecutive update at a time. For example, if you're using version 10.0.39, you can pause the update to version 10.0.40. However, you can't pause the update to version 10.0.41. You must take at least two updates per year.

> **Important**
>
> There's no way to pause more than one consecutive service update by using Lifecycle Services. Microsoft grants additional pauses beyond the standard pause allowance only when it confirms an update-blocking Microsoft product bug or regression and no viable workaround exists.
>
> Customers are expected to test service updates in sandbox environments as early as possible and report potential Microsoft issues immediately to support. Microsoft must have sufficient time to investigate and validate the issue before an exception can be considered. Requests submitted too close to a scheduled or mandatory update date are rejected if there's insufficient time to complete the investigation.
>
> An open support request alone doesn't qualify for an additional pause. If Microsoft determines that a viable workaround is available, the update isn't paused.
>
> Issues in third-party solutions, ISV applications, partner customizations, or other non-Microsoft components aren't eligible for additional pause approvals. Customers are responsible for working with the applicable solution provider to obtain a fix and validate compatibility before the scheduled update date.
>
> If you pause updates to a sandbox environment, updates are automatically paused for the corresponding production environment because Microsoft always updates configured sandbox environments before production environments.

Can I pause updates to my additional sandbox environments only?

No, you can't pause updates to additional sandbox environments only.

What if the update to the default sandbox environment is paused?

If you pause the update to the default sandbox environment, the updates to the production environment and all additional sandbox environments are also paused.

How do I pause updates?

To pause updates, follow these steps:

1. In Lifecycle Services, in your implementation project, open the **Project settings** page.

   This page has a new tab named **Update settings**.

2. In the **Pause Updates** section, on the **Update settings** tab, select **Pause upcoming update**.

3. In the dialog box that appears, select whether you want to pause updates to your production environment only, or to both your sandbox environment and your production environment.

4. Select **Next**.

5. Select your reason for pausing updates. If you select **Issue found during validations**, enter a valid support ticket number. You can add any other details that help Microsoft understand why you want to pause updates.

6. When you finish, select **Confirm**.

You can also edit an existing pause to cancel it so that updates resume. To edit a pause, select **Pause upcoming update**. The maximum of one update pause still applies. Therefore, you can't edit the pause to extend its duration past one update.

Whenever you pause an update or edit an existing pause, a notification appears at the top of the **Update settings** tab. This notification shows what version was paused. All stakeholders (the project owner and environment manager) also receive an email to inform them that a service update for the selected environments was paused. If someone cancels an existing pause and resumes updates, the notification disappears, and an email is sent to inform the stakeholders the paused update resumed.

> **Important**
>
> You can pause an update through Lifecycle Services up to four hours before the start of the downtime window.

You can cancel a pause and resume updates up to seven days before the start of the downtime date. If there are fewer than seven days before your downtime starts, you can't cancel a pause.

What happens after the pause duration expires?

Cumulative service updates help guarantee that customers always run on the latest set of fixes that Microsoft releases, so they get the best service experience. Therefore, you can't pause updates indefinitely.

You can cancel a pause and resume updates in two ways:

- Someone manually cancels a pause, as explained in the previous section.
- The duration that you set for the pause expires, and updates to the configured environments automatically resume.

In both cases, the system sends an email to inform the stakeholders.

For more information about service updates, see One Version service updates FAQ.

Last updated on 08/04/2026

Get notified about service updates through Lifecycle Services

This article explains how you can stay up to date about service updates from Microsoft.

Microsoft uses service updates to update your configured sandbox and production environments to the latest released version. Microsoft notifies you about upcoming updates to your environments by email and through notifications in Microsoft Dynamics Lifecycle Services.

Here are the different types of notifications that you receive:

- **Notification when an update is available:** When a new release is available, Microsoft surfaces a notification in your implementation projects' action center. You can then save that update in your projects' asset library if you want to apply the update to your environments before Microsoft does an automatic update. When Microsoft does an automatic update, it also saves a copy of the update in your projects' asset library.
- **Notification that is sent five days before the update:** Microsoft notifies you five days before it updates your environment. After you configure your update cadence, you receive notifications about upcoming updates five days before they occur. These notifications take three forms:
    - **Email notification:** Project owners, environment managers, and users who are listed as additional stakeholders for an environment are notified by email about the upcoming update.
    - **Notification bar on the environment details page:** A notification that appears on the environment details page in Lifecycle Services informs the customer about the upcoming update.
    - **Upcoming update reflects the update:** On the environment details page in Lifecycle Services, select **Maintain** > **Upcoming Update** to open a dialog box that contains details about the upcoming update.

      > **ⓘ Important**
      >
      > Notifications for Product quality updates (PQU) aren't delivered this way. For more information on PQUs, see:

[Proactive quality updates overview]

[Release schedule for proactive quality updates]

- **Notification that is sent one hour before the update:** One hour before the start of the downtime window, users in the application receive a notification. This notification asks users to save their work, because the environment is taken down for an update.
- **Notification that is sent when the update is completed:** After Microsoft finishes updating your configured environment, it notifies you by email about the outcome of the update. This email is always sent, regardless of whether the update was successfully applied. It's sent to project owners, environment managers, and users who are listed as the additional stakeholders for the environment. If Microsoft can't start the update for some reason, the email includes a reason to explain why the update wasn't started.

After you receive a notification, if you can't proceed with the update for some reason, you can pause it. For more information about how to pause updates to configured sandbox and production environments, see Pause service updates through Lifecycle Services.

For more information about One Version and Microsoft-managed service updates, see One Version service updates FAQ.

Proactive quality updates overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about proactive quality updates (PQUs). It explains what they are and why they're used, and describes some of their benefits.

What are PQUs?

PQUs are cumulative builds of hotfixes that Microsoft delivers with near-zero downtime. PQUs follow a push model, where Microsoft applies updates to a Microsoft Dynamics Lifecycle Services environment in the background with minimal impact on customers. Microsoft deploys every PQU region by region, following a "safe deployment process" that tracks problems found within each region during deployment. The safe deployment process helps identify and fix problems before the PQU is deployed to more regions. PQUs are fully automated and contain important bug fixes and high-priority product features that are ready after the service update is generally available.

Why is Microsoft introducing PQUs?

Before the introduction of PQUs, most customers didn't receive fixes for service problems until they deployed their next service update. Therefore, businesses could be unnecessarily affected by service problems that a fix was already available for. PQUs get fixes to customers more quickly.

What investments is Microsoft making to enable safe deployments of PQUs?

Microsoft invested in the following technologies and processes to make the PQU process nondisruptive:

- **Higher-quality concise payloads** – The changes that PQU payloads contain are limited to bug fixes and regulatory changes that flighting supports. Microsoft applies extra diligence

when backporting changes into a PQU, to further reduce the risk of unintended regressions.

- **Safe deployment rollout process** – Deployment of PQUs follows a safe deployment process. Microsoft first delivers each PQU to a single region that contains a small group of customers who have the highest tolerance for risk. Then, if no regressions are identified, the process continues through a broader group of customers, based on geographies (stations), until all customers are using the new version. Microsoft uses this deployment model across its online services to help build confidence in an update as it's delivered to more customers, and to help minimize the impact if unforeseen problems are detected.
- **Fallback via flighting** – Flighting is used to enable or disable changes that PQUs introduce. If a change must be turned off after a PQU deployment, the flight system can turn it off to help reduce the impact.

Release schedule for proactive quality updates

This article provides the release schedule for proactive quality updates (PQUs).

The detailed schedule for each PQU train and its corresponding build app version number is published five days before the start of the PQU train. Five days before the start of release train, Microsoft sends a notification to customers who use the environments that receive the update.

Station 1 is the first release station. It consists of customers who opt in to have their sandbox environments receive the update before all other stations. More details are published after this functionality is made generally available in May 2023.

To determine when your Microsoft Dynamics Lifecycle Service environment is updated, find the region and the station-to-region mapping. Cross-reference the region and station-to-region mapping information with the upcoming PQU train for a service update.

For information about the maintenance windows for each region, see What are the planned maintenance windows by region?

Station-to-region mapping

Expand table

Station	Regions
Station 1	Only for opted-in environments
Station 2	Canada Central, Canada East, France Central, India Central, Norway East, Switzerland West

> 1. The PQU build for every train is typically published to Lifecycle Services after the change cutoff date that shows in the following high-level PQU train schedule. In this way, customers can download and self-apply the build as needed, to frontload any testing requirements.
> 2. Standard performance test (tier-4) sandbox environments, Premium performance test (tier-5) sandbox environments, and production environments receive PQUs on weekends. If a PQU of production environment, Standard performance test (tier4) sandbox, or Premium performance test (tier5) sandbox didn't complete on the scheduled weekend then the operation gets rescheduled to the next weekend.
> 3. Standard performance test (tier-4) sandbox environments, Premium performance test (tier-5) sandbox environments opted-in for the First release program (station 1) receive updates on the following weekend of the station 1 schedule.

High-level PQU train schedule

The following table shows the high-level train schedule. It includes a description of the service update that pertains to the train, the cutoff date after which new changes are no longer accepted, and the development duration for the PQU train.

Expand table

PQU release train	Change cutoff date	PQU train duration	Status	Application Version	Platform Version
10.0.46 PQU-1	February 4, 2026	February 9, 2025 to March 14, 2026	Completed	10.0.2428.95	7.0.7778.45
10.0.46 PQU-2	March 4, 2026	March 9, 2026 to April 11, 2026	Completed	10.0.2428.114	7.0.7778.56
10.0.46 PQU-3	April 1, 2026	April 6, 2026 to May 9, 2026	Completed	10.0.2428.139	7.0.7778.76
10.0.46 PQU-4	April 29, 2026	May 4, 2026 to June 6, 2026	Completed	10.0.2428.169	7.0.7778.104

PQU release train	Change cutoff date	PQU train duration	Status	Application Version	Platform Version
10.0.46 PQU-5	May 27, 2026	June 1, 2026 to July 5, 2026	Completed	10.0.2428.188	7.0.7778.118
10.0.46 PQU-6	June 24, 2026	June 29, 2026 to August 1, 2026	Completed	10.0.2428.205	7.0.7778.137
10.0.46 PQU-7	July 22, 2026	July 27, 2026 to August 29, 2026	Completed	10.0.2428.220	7.0.7778.145
10.0.46 PQU-8	August 21, 2026	August 31, 2026 to October 3, 2026	In-Progress	10.0.2428.236	7.0.7778.149
10.0.47 PQU-1	April 8, 2026	April 8, 2026 to May 2, 2026	Completed	10.0.2527.78	7.0.7858.54
10.0.47 PQU-2	April 22, 2026	April 22, 2026 to May 16, 2026	Canceled	-	-
10.0.47 PQU-3	May 6, 2026	May 6, 2026 to May 30, 2026	Completed	10.0.2527.109	7.0.7858.96
10.0.47 PQU-4	May 20, 2026	May 20, 2026 to June 13, 2026	Completed	10.0.2527.116	7.0.7858.102
10.0.47 PQU-5	June 3, 2026	June 3, 2026 to June 27, 2026	Completed	10.0.2527.130	7.0.7858.111
10.0.47 PQU-6	June 17, 2026	June 17, 2026 to July 11, 2026	Completed	10.0.2527.142	7.0.7858.121
10.0.47 PQU-7	July 1, 2026	July 1, 2026 to July 25, 2026	Completed	10.0.2527.152	7.0.7858.132
10.0.47 PQU-8	July 15, 2026	July 15, 2026 to August 8, 2026	Completed	10.0.2527.160	7.0.7858.134
10.0.47 PQU-9	July 29, 2026	July 29, 2026 to August 22, 2026	Completed	10.0.2527.174	7.0.7858.145
10.0.47 PQU-10	August 12, 2026	August 12, 2026 to September 5, 2026	Completed	10.0.2527.187	7.0.7858.152
10.0.47 PQU-11	August 26, 2026	August 26, 2026 to September 19, 2026	In-Progress	10.0.2527.197	7.0.7858.163
10.0.47 PQU-12	September 9, 2026	September 9, 2026 to October 3, 2026	In-Progress	10.0.2527.208	7.0.7858.166

10.0.49 PQU-17	May 26, 2027	May 26, 2027 to June 19, 2027	Not Started		

> **Note**
>
> Any new finance and operations apps environment that is provisioned after August 17th, 2023 is automatically signed up to receive PQUs per the schedule as applicable. Canceled* - PQU will occur only on Station-1. Releases for other stations have been canceled due to the holiday deployment freeze, and the build will be available for manual uptake. For environments configured with a weekday update schedule, updates are applied on the selected weekday following the published rollout schedule.

Important

At least five days in advance, Microsoft updates the preceding schedule and send a notification for the set of environments that are scheduled to receive these quality updates. The preceding schedule is applicable only to environments that are notified about an upcoming update. For information on the dark hours for each region, see What are the planned maintenance windows by region?.

For each region group, or *station*, where a quality update is currently scheduled to roll out, the schedule shows a range of four days. Quality updates start with only sandbox environments. Then, as the percentage of successfully deployed sandboxes increases, deployment to production environments begins with advance notifications to customers.

Quality updates always occur in a rolling manner that enables us to target a set of environments per schedule and complete all the sets by the end of the fourth day for a station. However, this doesn't mean that an environment update spans four days. It just means that we can't predetermine which set of environments is updated on a given day within the four-day range. All updates are done during dark hours, with near-zero downtime. Updates definitively end within the dark-hour window of a given region.

Proactive quality updates (PQU) - FAQ

This article provides answers to frequently asked questions about proactive quality updates (PQUs), new biweekly proactive quality updates, and the optional weekday update schedule.

> **Note**
>
> The weekday update schedule option isn't supported in sovereign cloud environments at this time.

What is the biweekly cadence for PQU?

The biweekly cadence introduces a more frequent release cycle for proactive quality updates.

Starting with version **10.0.47**, PQUs move from the previous 28-day schedule to a **two-week cadence**, helping customers receive fixes and improvements sooner while maintaining a predictable update rhythm.

Each biweekly cycle includes:

- A release cut of the latest platform and application updates
- Deployment to all stations - Trail, OnlineDev, Sandbox, and Live environments

You can view the upcoming rollout calendar here: PQU Release Calendar.

Why is the rollout schedule changing from 28 days to a biweekly cadence?

This change ensures that customers receive fixes and improvements faster. A biweekly cadence helps:

- Reduce waiting time for important fixes.
- Provide more frequent validation cycles in Sandbox.
- Improve service stability through faster delivery.
- Keep customer environments closer to the most reliable build.

What does "weekday schedule" mean for PQU?

Previously, Live environments received PQUs only during weekend maintenance windows. By using the new enhancement, you can now opt to receive updates on weekdays as well.

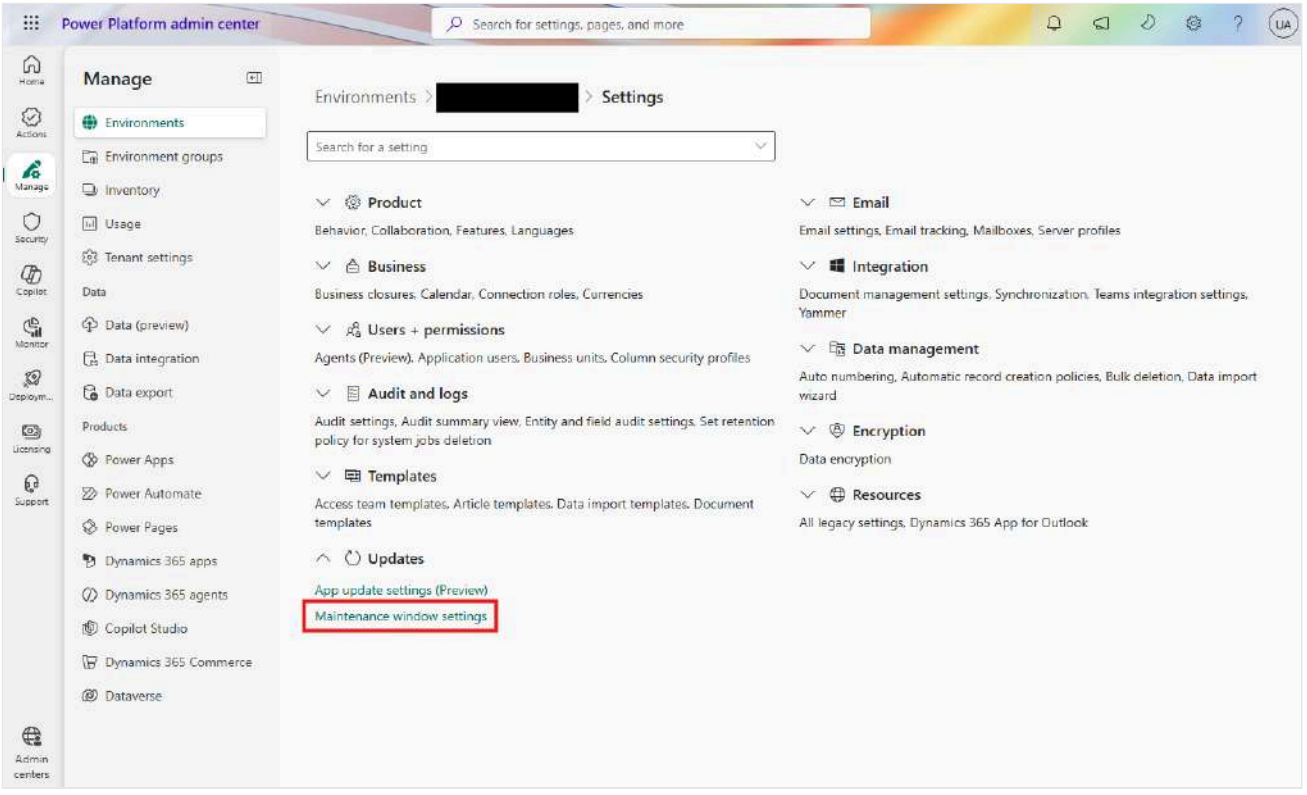
Benefits of combining the biweekly cadence with weekday scheduling include:

- Greater flexibility in selecting maintenance windows.
- More buffer time to validate PQU updates in Sandbox.
- Better alignment with internal release and testing cycles.
- Improved control over update timing.

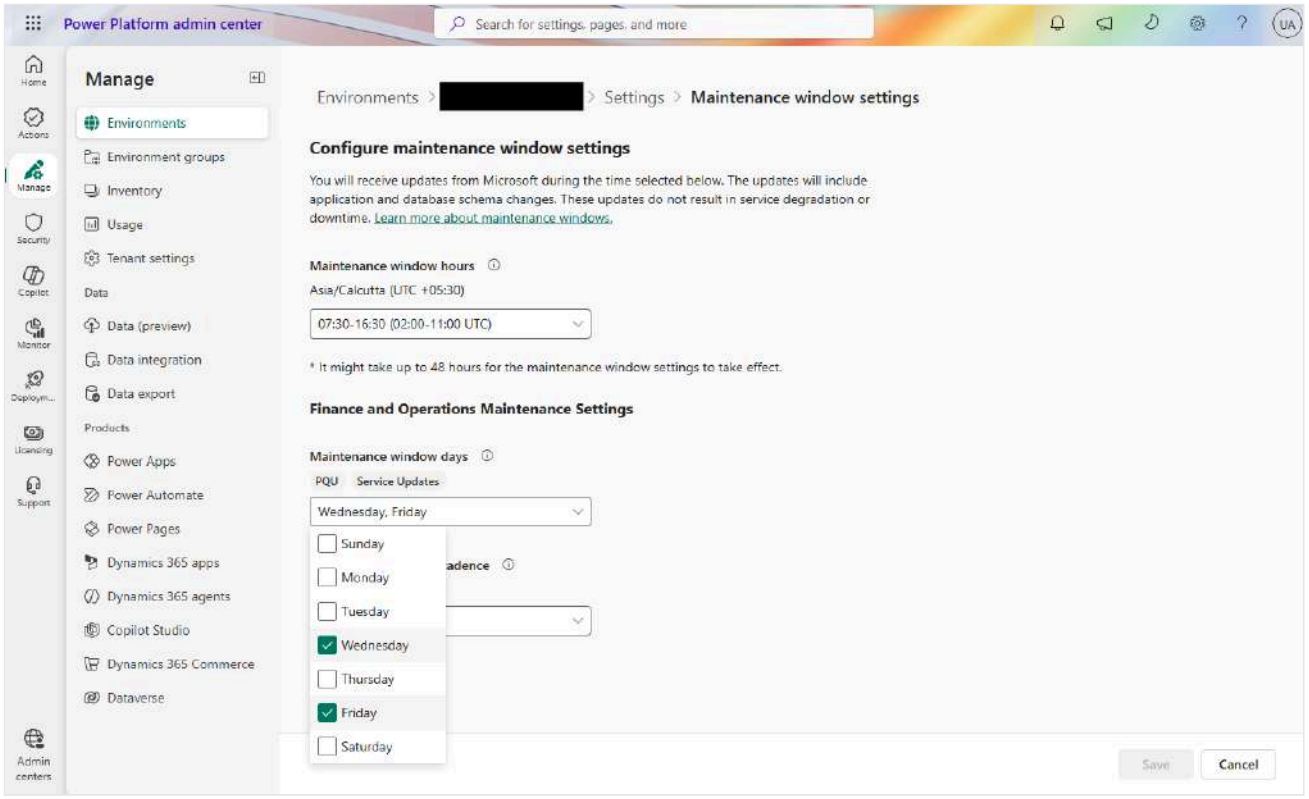
How do I configure my production environment to receive PQU updates on weekdays?

Follow these steps in the Power Platform Admin Center (PPAC):

1. Sign in to PPAC.
2. Select your production environment.
3. Select **Settings**.
4. In the **Updates** section, select **Maintenance Settings**.



5. Choose your preferred days to receive PQUs by updating **Maintenance window days** under **Finance and Operations Maintenance Settings** section.



6. Select **Save**.

> **Note**
>
> Production environments always receive updates at least five days after sandbox environments. This process remains unchanged under the biweekly cadence.

Which day should I choose for receiving PQU updates?

Choose any day that aligns with your organization's internal operations and testing cycles.

> **Tip**
>
> Selecting multiple weekdays ensures greater flexibility and reduces the risk of delays if one maintenance window is missed.

What's the minimum timeline between sandbox and production under the biweekly cadence?

The process always maintains a minimum five-day gap between when the PQU is applied to sandbox (UAT) and when it becomes eligible for live (production).

You expect this version difference. It doesn't affect your ability to deploy custom packages, as long as you follow compatibility best practices.

Can customers request exclusions from the new biweekly cadence?

No. Exclusions aren't supported. The standardized biweekly cadence ensures consistent servicing, predictable timelines, and compliance with platform servicing requirements.

How does the biweekly cadence work? Can you provide an example?

Yes. Consider this example: If PQU-1 rolls out to Station-2 on April 13–14, 2026: For customers using the default weekend-only schedule:

- PQU applied on April 13 → Live receives the update on April 18, 2026 (sandbox + 5 days)
- PQU applied on April 14 → Live receives the update on April 19, 2026 (sandbox + 5 days)

For customers who enabled weekday updates: Live receives the update on the next available selected weekday, starting after the required 5-day minimum window. Example: For a PQU applied on April 13, the earliest eligible date is April 18, 2026, and the system selects the next chosen weekday from your maintenance settings.

How are the maintenance windows handled for customers who have one finance and operations apps instance but are active in multiple time zones?

Aside from the currently supported maintenance windows, there are no special schedules for cases where an instance of finance and operations apps exists, because the rollout of PQUs involves a minimally disruptive manner that involves near-zero downtime.

Can customers delay, reschedule, or pause a PQU?

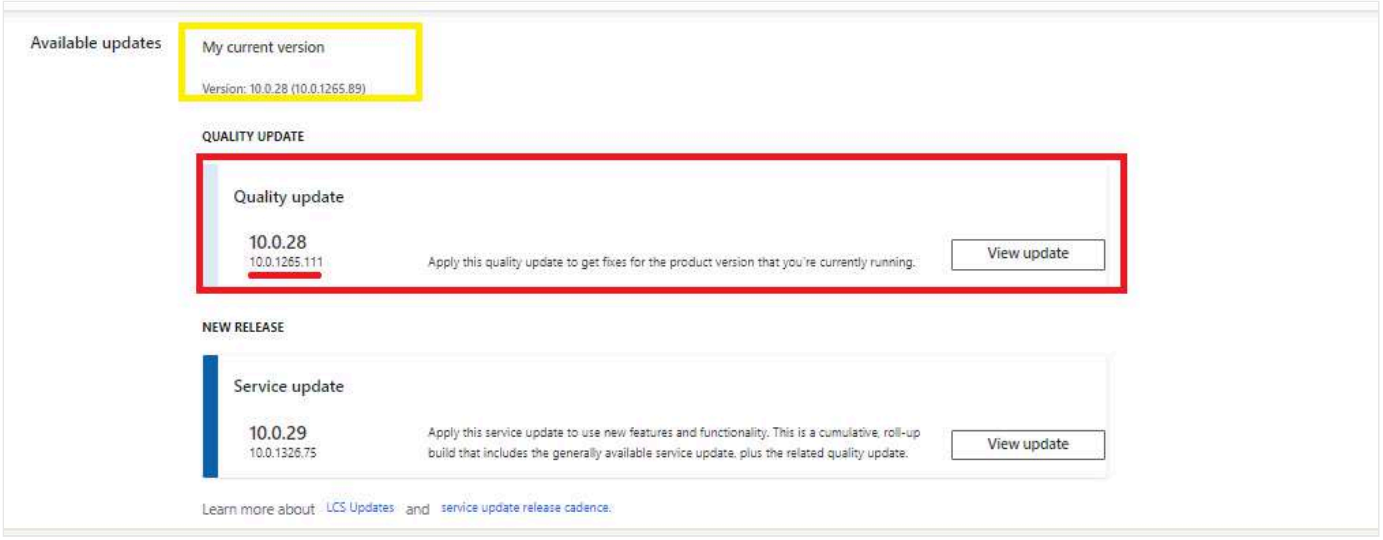
No. PQUs help ensure that fundamentals such as security, privacy, reliability, availability, and performance continuously improve for customers.

How do I know what set of changes a PQU includes?

To identify the changes that a PQU includes, follow these steps. This example uses the 10.0.28 PQU train and related app version 10.0.1265.89.

1. In Microsoft Dynamics Lifecycle Services, open the **Environment details** page for your sandbox environment.
2. In the **Available Updates** section, select **View Update** for the latest quality update build.
3. Export the build to a comma-separated values (CSV) or Excel file.
4. In the exported file, filter for and select the build version that's less than or equal to build number 10.0.1265.89. You can now review the delta payload.

> **Note**
>
> You must export to a CSV or Excel file before you update the environment. Otherwise, you can follow the preceding steps for an environment that has a similar configuration but doesn't have the update installed.



What's the process if a critical issue is found after a PQU?

A critical issue is one or more events that cause multiple customers to have a degraded experience with one or more of Microsoft's services. These problems can cause unplanned downtime, including unavailability, performance degradation, and interference with service management. If an issue with a PQU causes customer impact, Microsoft stops the rollout of that PQU until it can communicate and fix the problem. Typically, the next PQU includes the fix that's required to resume the rollout.

If the problem affects only one customer environment, contact Microsoft support to open a support ticket. Based on the justification, Microsoft stops the rollout of the PQU to other customer environments in that project until the issue is mitigated.

How do I see notifications about a PQU?

You can see notifications for PQUs in the message center in Microsoft 365 admin center. For more information, see Track new and changed features in the Microsoft 365 Message center.

Can customers manually apply hotfix updates from Lifecycle Services?

Yes. To ensure ongoing parity in the way that hotfixes work, customers can still apply hotfix updates to their environments in Lifecycle Services. PQUs are cumulative builds and continue to be available on Lifecycle Services as they're published. PQUs are published to Lifecycle Services for manual application according to the change cutoff schedule.

Hotfixes that are deployed as part of a PQU go through a rigorous safe deployment practice before the update is deployed. Because PQUs are more reliable, and involve minimal disruption and reduced downtime, use a PQU instead of manually applying an update.

Can customers proactively install a PQU ahead of the schedule?

Yes. You can proactively install a PQU. Microsoft skips the update if the environment's current build version is equal to or more than the PQU that's being deployed. If you apply the PQU manually the customers AOT package will also be promoted.

Under what circumstances does the system skip a PQU?

- If a service update is scheduled within seven days of a scheduled PQU, the system skips the PQU. For example, a PQU is scheduled on January 28 for a production environment, and a service update is scheduled on February 4 for the same environment. In this case, the system skips the PQU on January 28.
- If a sandbox environment has the same build version as the scheduled PQU, or if it has a later version, the system skips the PQU.
- If a production environment has the same build version as the scheduled PQU, or if it has a later version, the system skips the PQU.
- If a sandbox environment has the same build version or a later version because of a PQU or a manual update to the production environment, the production environment still receives the scheduled version of the PQU.
- If any Lifecycle Services environment or project is under exemption, the system skips PQUs.
- The system skips PQUs for a production environment if the update failed or was skipped in other sandbox environments in the Lifecycle Services project.

If an environment has an upcoming scheduled action, and a PQU is scheduled within the same maintenance window, does the environment still receive the PQU?

If there's a conflict with a prescheduled action, such as a point-in-time restore (PITR), the system reschedules the PQU for the next available maintenance window (within four days).

Can you restore an environment to its previous state if there are problems after a PQU is applied?

As with other code promotions, you can't roll back after a PQU is applied. For information about how flighting can help mitigate an issue, see What investments is Microsoft making to enable safe deployments of PQUs?

What's the guidance for customers who are subject to U.S. Food and Drug Administration (FDA) regulatory requirements and "good practice" (GxP) quality regulatory requirements?

The plan for customers who are subject to U.S. Food and Drug Administration (FDA) validation and regulations is still evolving. Expect more updates in this space soon. Until Microsoft makes those updates, customers who are subject to FDA regulations and "good practice" (GxP) quality regulations are exempt from the PQU process. Customers who are subject to these regulations and don't have an exemption must open a support ticket and provide justification that's related to the regulatory requirement for FDA/GxP to receive an exemption for their Lifecycle Services projects. If Microsoft already confirmed an exemption for these customers, no further action is required at this time. For more information about FDA and GxP regulations, see Microsoft Azure GxP Offering.

What's the guidance for customers who are subject to Sarbanes-Oxley (SOX) requirements?

Microsoft commissions a full System and Organization Controls (SOC) 1 Type II and SOC 2 Type II examination of Dynamics 365 online services two times each year. Dynamics 365 Finance, Dynamics 365 Project Operations, Dynamics 365 Human Resources, and other Dynamics 365 online services are detailed in the Microsoft Azure (including Dynamics 365) SOC 1 Type II report. This report and others are available in the Microsoft Service Trust Portal. Customers can use the Microsoft Azure (including Dynamics 365) SOC 1 Type II report when they're pursuing their own financial compliance requirements, such as Sarbanes-Oxley (SOX).

Which versions of service updates are supported for PQUs?

The PQU process includes all environments on a supported version.

Typically, finance and operations apps deployments that include Retail components require more work, and Retail Modern Point of Sale (MPOS) must be redeployed. How do these PQUs affect the Retail SDK?

Because the nature of the hotfix itself doesn't change in the PQU payload, you don't currently anticipate any additional impact on Retail components.

Are PQUs applied to customer-managed environments (also known as cloud-hosted environments)?

Customer-managed environments are out of scope for PQUs, because they're outside the purview of Microsoft.

Are there any integration issues with Dataverse?

There are no known integration issues for the use of PQUs with Dataverse.

What's the purpose of Station 1 or the First Release Program for PQUs?

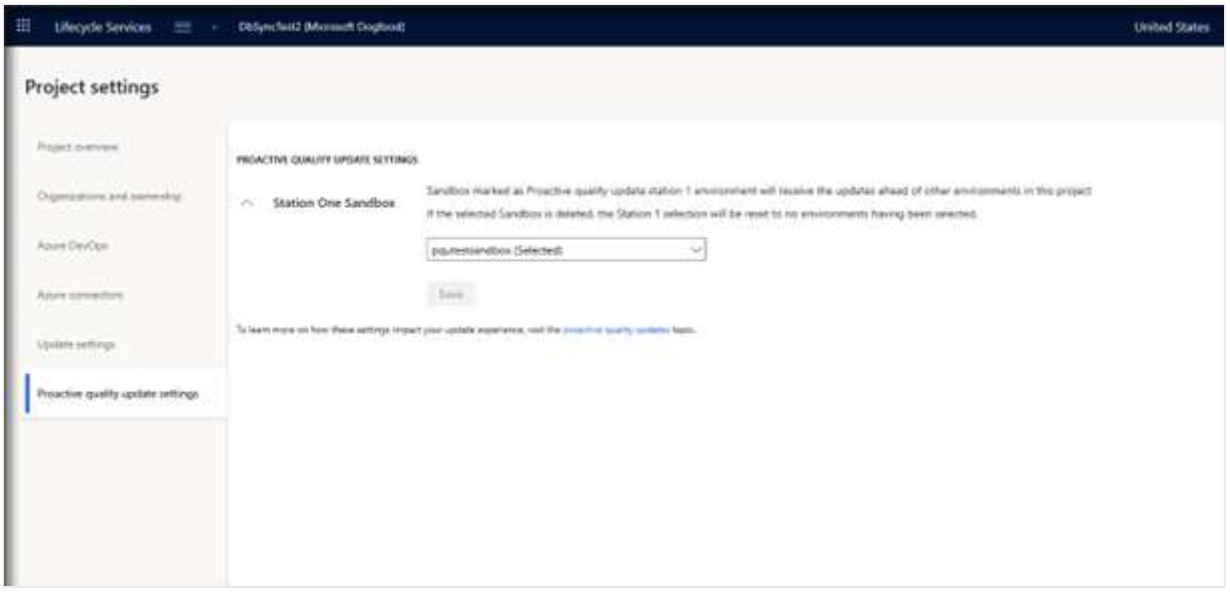
The First Release Program (FRP) for PQUs (also known as Station 1) gives all finance and operations apps customers an opportunity to receive PQUs ahead of the other stations. This program is optional and is open to all customers. Customers can take advantage of it by signing up a sandbox environment of their choice to receive PQUs. They can then provide early feedback so that Microsoft can address it before the PQUs are rolled out to the other stations. Customers who participate in the FRP for PQUs are the first select group of customers to receive a PQU in a sandbox environment of their choice. They have the benefit of a shorter feedback cycle and fast response before the rollout to other stations.

How do I join the First Release Program for PQUs?

The program is always open to all finance and operations apps customers. Only sandbox environments qualify for selection. Anyone who has a **Project owner** security role for the Lifecycle Services project can select a sandbox environment in the project.

To select a sandbox environment for the FRP for PQUs, follow these steps:

1. In Lifecycle Services, select the project.
2. Select **Project Settings** for the project.
3. On the **Proactive quality update settings** tab, in the drop-down list, select a sandbox environment. Then select **Save**.



Can customers revert or change the selection for Station 1?

After a selection, you can modify it at any time. However, if a PQU is already scheduled, the new selection isn't honored for the upcoming PQU. The selection is honored for subsequent PQUs.

What does Microsoft expect from customers who participate in the First Release Program for PQUs?

1. Participants provide feedback about the PQU and receive direct support from Microsoft Dynamics product teams for any problems that the PQUs encounter.
2. If a critical problem is found, participants might have to take an additional PQU on short notice.
3. Participants shouldn't delay or pause a PQU on the sandbox environment that they selected to receive a PQU in Station 1 or the FRP.
4. If there's a critical problem, participants should open a support ticket with Microsoft Support to get faster response and action.

How soon does a sandbox environment receive a PQU after it's selected for Station 1?

To learn when the group of sandbox environments in the FRP receive a PQU, see the release schedule for Station 1.

Data task automation

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Data task automation makes it easy to repeat many types of data tasks and validate the outcome of each task. Data task automation is very useful for projects that are in the implementation phase. For example, you can automate the creation and configuration of data projects. You can also automate the configuration and triggering of import/export operations, such as the setup of demo data and golden configuration data, and other tasks that are related to data migration. You can also create automated testing of data entities by using task outcome validation.

> **Important**
>
> Data task automation isn't currently supported for on-premises environments. The user who executes data task automation must be in the same tenant as the application environment and Lifecycle Services project.

Use the following approach for data task automation.

1. Identify the data-related tasks that benefit from automation.

   Review your configuration management plan and data migration plan to identify potential data tasks for automation. Also identify data entity test cases.

2. Define tasks.

   Define tasks in an XML manifest. Keep your manifest under source control as part of configuration management in your application lifecycle management (ALM) strategy.

3. Put the data packages that are related to data task automation in the Shared asset library of Microsoft Dynamics Lifecycle Services. You can also use a specific Lifecycle Services project as you require.

Data task automation manager can consume packages from any sandbox and production environment that is related to the Lifecycle Services project.

> **Important**
>
> - The user account that runs Data task automation manager must have access to Lifecycle Services and to the Lifecycle Services project that the manifest references for data packages.
> - Although you can run data task automation in any environment in the cloud, don't run any import/export tasks that use integration application programming interfaces (APIs) in a production environment. Use data task automation that involves integration APIs only for automated testing.

4. Run the data tasks, and then review the outcomes.

   Data task automation manager provides the success or failure outcome for each task. It also provides insights into the reason why a task failed.

   > **Important**
   >
   > Although you can run data task automation in any environment in the cloud, don't run any import/export tasks that use integration APIs in a production environment. Use data task automation that involves integration APIs only for automated testing.

The following video is a 55-minute TechTalk that walks you through an early release of Task automation framework.

Task manifest

Define a task in an XML manifest. This section describes the manifest. For guidance about how to name and design the manifest, see the "Best practices for manifest design" section later in this article.

Manifest root

The <**TestManifest**> element is the root of the manifest. All other elements are children of this element.

XML

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
    <SharedSetup />
        <JobDefinition ID='ImportJobDefinition_1' />
        <EntitySetup ID='Generic' />
    </SharedSetup>
    <TestGroup />
</TestManifest>
```

Expand table

Element	Element Cardinality	Attributes	Attribute description
<TestManifest>	1..1	name	The *name* helps to identify the purpose of the manifest.

Shared setup

The **Shared setup** section defines general task parameters and behaviors for all tasks in the manifest.

Expand table

Parent element	Element	Element Cardinality	Attributes	Attribute description
<TestManifest>	<SharedSetup>	1..1	-	This element takes no attributes.

Data files

<DataFile> elements define the data packages and data files that the tasks in the manifest use. The data files must be either in the Lifecycle Services asset library of your Lifecycle Services project or in the Shared asset library.

XML

```
<DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared'
assetType='Data package' lcsProjectId=''/>
<DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS'
assetType='Data package' lcsProjectId=''/>
<DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH'
assetType='Data package' lcsProjectId=''/>
<DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB'
assetType='Data package' lcsProjectId=''/>
```

Expand table

Parent element	Element	Element Cardinality	Attributes	Attribute description
<SharedSetup>	<DataFile>	1..n	-	-
	<DataFile>	-	ID	
	<DataFile>	-	name	Name of the asset that represents the data file.
	<DataFile>	-	assetType	The asset type in Lifecycle Services asset library that stores the data file. This is the asset type name as shown in Lifecycle Services asset library.
	<DataFile>	-	lcsProjectId	The Lifecycle Services project that has the data file in its asset library. If the project ID is specified as '' then, it indicates the Shared asset library.

Data project definition

The **<JobDefinition>** element defines the data project definition. A manifest can contain more than one job definition.

XML

```
<JobDefinition ID='ImportJobDefinition_1'>
    <Operation>Import</Operation>
    <ConfigurationOnly>No</ConfigurationOnly>
    <Truncate></Truncate>
    <Mode>Import async</Mode>
    <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
    <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
    <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
    <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
    <SupportedDataSourceType>Package</SupportedDataSourceType>
    <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
    <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
    <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
    <LegalEntity>DAT</LegalEntity>
    <PackageAPIExecute>true</PackageAPIExecute>
    <PackageAPIOverwrite>false</PackageAPIOverwrite>
    <PackageAPIReexecute>false</PackageAPIReexecute>
    <DefinitionGroupID>TestExport</DefinitionGroupID>
    <PackageName>TestExportPackage</PackageName>
</JobDefinition>
```

Expand table

Parent element	Element	Element cardinality	Attribute	Description
<SharedSetup>	<JobDefinition>	1..n	ID	Use the job definition ID in the tasks to reference the definition for the data project.
<JobDefinition>	<Operation>	1..1	-	Specify the operation to perform by using the following values: - Import - Export
	<Truncate>	1..1	-	This Boolean field has possible values of Yes or No. This field is applicable only when operation is set to *Import*.
	<Mode>	1..1	-	The mode specifies the method to use for the operation. The possible values are: - Import async - Export async - Recurring batch: This value uses the enqueue API. Dequeue API isn't supported yet. Package API supports both export and import.
	<ConfigurationOnly>	0..1	-	This Boolean field has possible values of Yes or No. Set this value to Yes if the task is only to configure the data project but not to perform the specified operation.
	<BatchFrequencyInMinutes>	1..1	-	This value specifies the frequency in which the batch must

Parent element	Element	Element cardinality	Attribute	Description
				be scheduled. This value is applicable only when mode is set to *recurring batch*.
	<NumberOfTimesToRunBatch>	1..1	-	Set a limit to how many times the scheduled batch should run. This value is applicable only when mode is set to *recurring batch*.
	<UploadFrequencyInSeconds>	1..1	-	This value controls the rate at which a file is uploaded to the recurring batch job for import. Use this value only for automated testing of recurring integrations in non-production environments. This value is applicable only when mode is set to *recurring batch* and operation is set to *Import*.
	<TotalNumberOfTimesToUpload>	1..1		This value controls the total number of times the file should be uploaded to the recurring batch. Use this value only for automated testing of recurring integrations in non-production environments. This value is applicable only when mode is set to *recurring batch* and operation is set to *Import*.
	<SupportedDataSoureType>	1..1		Use this value to specify if a file is being sent to the recurring

Parent element	Element	Element cardinality	Attribute	Description
				batch or a package. This value is only applicable when mode is set to 'recurring batch'.
	<ProcessMessagesInOrder>	1..1		This Boolean field has possible values of Yes or No. This field is applicable only when mode is set to *recurring batch* and operation is *Import*.
	<PreventUploadWhenZeroRecords>	1..1		This Boolean field has possible values of Yes or No. This field is applicable only when mode is set to *recurring batch* and operation is *Export*.
	<UseCompanyFromMessage>	1..1		This Boolean field can be set to Yes or No. This field is applicable only when mode is set to *recurring batch* and operation is *Import*.
	<LegalEntity>	1..1		Use this value to specify the legal entity in which the import/export job must be executed.
	<PackageAPIExecute>	1..1		Refer to package API documentation to understand this parameter. This Boolean field takes 'true' or 'false'.
	<PackageAPIOverwrite>	1..1		Refer to package API documentation to understand this parameter. This Boolean field takes 'true' or 'false'.

Parent element	Element	Element cardinality	Attribute	Description
	<PackageAPIReexecute>	1..1		Refer to package API documentation to understand this parameter. This Boolean field takes 'true' or 'false'.
	<DefinitionGroupID>	1..1		Refer to package API documentation to understand this parameter. This string field.
	<PackageName>	1..1		Refer to package API documentation to understand this parameter. This string field.

Entity setup

The **Entity setup** section defines the characteristics of an entity that a task in the manifest uses. You can include more than one definition, with each definition corresponding to an entity that the tasks in the manifest use.

XML

```
<EntitySetup ID='Generic'>
    <Entity name='*'>
        <SourceDataFormatName>Package</SourceDataFormatName>
        <ChangeTracking></ChangeTracking>
        <PublishToBYOD></PublishToBYOD>
        <DefaultRefreshType>Full push only</DefaultRefreshType>
        <ExcelWorkSheetName></ExcelWorkSheetName>
        <SelectFields>All fields</SelectFields>
        <SetBasedProcessing></SetBasedProcessing>
        <FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
        <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
        <DisableEntity>No</DisableEntity>
        <SkipStaging>Yes</SkipStaging>
        <ParallelProcessing>
            <Threshold></Threshold>
            <TaskCount></TaskCount>
        </ParallelProcessing>
        <MappingDetail StagingFieldName='RoundingRulePrices' AutoGenerate='Yes'
AutoDefault='No' DefaultValue='' IgnoreBlankValues='No' TextQualifier='No'
UseEnumLabel='No'/>
```

```
        </Entity>
</EntitySetup>
```

Expand table

Parent element	Element	Element cardinality	Attribute	Description
<SharedSetup>	<EntitySetup>	1..n	ID	An identification that tasks use to reference an entity definition.
<EntitySetup>	<Entity>	1..1	name	The entity element is identified by the entity's name. To facilitate easy manifest definition, this element also supports * as a wildcard which means all entities used in a task. This support comes in very handy when using data packages with hundreds of entities in a task.
<Entity>	<SourceDataFormatName>	1..1	-	The file format to use for the entity.

Parent element	Element	Element cardinality	Attribute	Description
	<ChangeTracking>	1..1	-	A Boolean field with possible values of Yes or No. It enables or disables change tracking on the entire entity.
	<PublishToBYOD>	1..1	-	A Boolean field with possible values of Yes or No.
	<DefaultRefreshType>	1..1	-	Sets the default refresh rate on the entity. The possible values are *Incremental push only* or *Full push*.
	<ExcelWorkSheetName>	1..1	-	Specifies the worksheet to use for the entity.
	<SelectFields>	1..1	-	Specifies the fields to include in the template for an export operation.
	<SetBasedProcessing>	1..1	-	A Boolean field with possible values of Yes or No. It enables or disables set

Parent element	Element	Element cardinality	Attribute	Description
				based processing on an entity.
	<FailBatchOnErrorForExecutionUnit>	1..1	-	A Boolean field with possible values of Yes or No. It enables or disables failure at execution unit level on an entity.
	<FailBatchOnErrorForLevel>	1..1	-	A Boolean field with possible values of Yes or No. It enables or disables failure at execution level on an entity.
	<DisableEntity>	1..1	-	A Boolean field with possible values of Yes or No. It enables or disables an entity in a data project.
	<SkipStaging>	1..1	-	A Boolean field with possible values of Yes or No. It skips staging table for an entity during exports.

Parent element	Element	Element cardinality	Attribute	Description
	<ParallelProcessing>	1..1	-	Defines the parallel processing set up for an entity. The task deletes these settings if they already exist at the beginning of the task and it deletes the created settings at the end of its execution.
<ParallelProcessing>	<Threshold>	1..1	-	Specifies the threshold for the parallel processing rule.
	<TaskCount>	1..1	-	Specifies the number of parallel tasks to use for parallel processing.
<Entity>	<MappingDetail>	0..n	-	Allows you to configure the *auto generate*, *auto default*, and other settings on the mapping for an entity.
	<MappingDetail>	-	StagingFieldName	Identifies the entity column for which to

Parent element	Element	Element cardinality	Attribute	Description
				specify the settings.
	<MappingDetail>	-	AutoGenerate	A Boolean field with possible values of Yes or No for enabling or disabling auto generate option.
	<MappingDetail>	-	AutoDefault	A Boolean field with possible values of Yes or No for enabling or disabling auto default option.
	<MappingDetail>	-	DefaultValue	The default value to use if auto defaulting is enabled.
	<MappingDetail>	-	IgnoreBlankValues	A Boolean field with possible values of Yes or No for enabling or disabling this option.
	<MappingDetail>	-	TextQualifier	A Boolean field with possible values of Yes or No for enabling or disabling this option.

Parent element	Element	Element cardinality	Attribute	Description
	<MappingDetail>	-	UseEnumLabel	A Boolean field with possible values of Yes or No for enabling or disabling this option.

Test groups

Use test groups to organize related tasks in a manifest. A manifest can contain more than one test group.

XML

```
<TestGroup name='Set up Financials'>
    <TestCase Title='Import shared set up data package' ID='3933885' RepeatCount='1'
TraceParser='off' TimeOut='20'>
        <DataFile RefID='SharedSetup' />
        <JobDefinition RefID='ImportJobDefinition_1' />
        <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Import financials for HQUS' ID='3933886' RepeatCount='1'
TraceParser='off' TimeOut='20'>
        <DataFile RefID='FinancialsHQUS' />
        <JobDefinition RefID='ImportJobDefinition_1'>
            <LegalEntity>HQUS</LegalEntity>
        </JobDefinition>
        <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Import financials for PICH' ID='3933887' RepeatCount='1'
TraceParser='off' TimeOut='20'>
        <DataFile RefID='FinancialsPICH' />
        <JobDefinition RefID='ImportJobDefinition_1'>
            <LegalEntity>PICH</LegalEntity>
        </JobDefinition>
        <EntitySetup RefID='Generic' />
    </TestCase>

    <TestCase Title='Import financials for PIFB' ID='3933888' RepeatCount='1'
TraceParser='off' TimeOut='20'>
        <DataFile RefID='FinancialsPIFB' />
        <JobDefinition RefID='ImportJobDefinition_1'>
            <LegalEntity>PIFB</LegalEntity>
        </JobDefinition>
```

```
        <EntitySetup RefID='Generic' />
    </TestCase>
</TestGroup>
```

Expand table

Parent element	Element	Element Cardinality	Attributes	Description
<TestManifest>	<TestGroup>	1..n	-	-
	<TestGroup>	1..1	Name	The name for the group that identifies its functional reason.
<TestGroup>	<TestCase>	1..n	-	Defines the task. The task can refer to the shared set up to inherit task parameters and task behavior. The task can also override parameters and behavior at its level, which simplifies the management of the manifest.
	<TestCase>	-	Title	The title for the task.
	<TestCase>	-	ID	The ID for the task. This value can be alphanumeric with a maximum character limit of 10.
	<TestCase>	-	RepeatCount	A placeholder for a future functionality. However, you must specify this value as *1*.
	<TestCase>	-	TraceParser	A placeholder for a future functionality. However, you must specify this value as *off*.
	<TestCase>	-	Timeout	The maximum duration that the task automation manager monitors a task. If the task is still active beyond the timeout specified, the manager proceeds to the next task in the manifest.
<TestCase>	<DataFile>	1..n	-	Defines the file or data package to use by the task. This element can reference an already declared file or a data package in the shared section of the manifest. A task can have more than one data file specified for recurring batch import scenarios only. For other

Parent element	Element	Element Cardinality	Attributes	Description
				scenarios, even if you specify more than one file, the task uses the first file.
	<JobDefinition>	1..1	-	Defines the data project to use by the task. This element can reference an already declared job definition in the shared section of the manifest. The task can override elements of job definition to a new value that you define in the shared set up.
	<EntitySetup>	1..1	-	Defines the entity set up for entities used by the task. This element can reference an already declared entity set up in the shared section of the manifest. The task can override elements of entity setup to a new value that you define in the shared set up.

Best practices for manifest design

You can define a manifest in many ways. Consider the following pointers when you design a manifest.

Granularity

Determine the granularity of your manifest as a functional decision. Your team must decide whether it wants to manage many manifests or manage changes in a single manifest.

- Start with as many manifests as your team thinks you logically need. Later, when the team actually starts to run the manifests, it might find that it uses fewer manifests than it expected, and it might want to merge them. In this case, you can merge manifests.
- Consider separation of duties. For example, you might have one manifest for the setup of demo data and another manifest for the setup of the golden configuration for your environment. By using this approach, you make sure that team members use only the manifests that they're supposed to use.
- Consider user access to Lifecycle Services. For example, larger and globally distributed implementation teams might have multiple instances of the application or multiple Lifecycle Services projects.

Inheritance

The manifest schema supports inheritance of common elements that apply to all tasks in the manifest. A task can override a common element to define a unique behavior. The **Shared setup** section minimizes repetition of configuration elements by reusing elements as much as possible. This approach keeps the manifest concise and clean, improving maintenance and readability.

Source control

Store manifests that all members of an implementation team must use in source control in the Application Object Tree (AOT). This approach not only provides the benefits of source control, but also enables a process to distribute or make manifests available to all users in a consistent manner. This approach also enables configuration management for data projects that are related to data management, if manifests are used for configuration.

Number of job definitions and entity definitions

For most use cases, one job definition in a manifest is enough, because you can use inheritance to change the behavior at the task level. This principle also applies to entity definitions.

Validations

Data task automation manager performs validations based on the setup of a task. If a task fails, you can quickly determine the reason for the failure by viewing the validations after the task completes. The level of information that Data task automation manager provides is optimized to facilitate initial discovery. For detailed investigation, you must look at the corresponding data project and its execution details.

The following data validations are currently supported:

- **Job status** – This validation checks whether the job was successful.
- **Batch status** – This validation checks whether the batch was successful.
- **Message status** – If the test is about integrations, this validation checks the message status.
- **Truncation** – If truncation is enabled, this validation checks whether truncation occurred.
- **Skip staging** – If **Skip staging** is enabled on a test, this validation checks whether staging was skipped.

Example 1: Configuration management for data projects

Use the <**ConfigurationOnly**> element to create configuration tasks for data projects. When you set ConfigurationOnly to Yes, the data projects are only created but not executed. This setting allows you to manage data projects across environments in an automated manner.

XML

```
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
    <SharedSetup>
        <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB'
assetType='Data package' lcsProjectId=''/>

        <JobDefinition ID='ImportJobDefinition_1'>
            <ConfigurationOnly>Yes</ConfigurationOnly>
            <Operation>Import</Operation>
            <Truncate>No</Truncate>
            <Mode>Import async</Mode>
            <BatchFrequencyInMinutes>1</BatchFrequencyInMinutes>
            <NumberOfTimesToRunBatch >2</NumberOfTimesToRunBatch>
            <UploadFrequencyInSeconds>1</UploadFrequencyInSeconds>
            <TotalNumberOfTimesToUploadFile>1</TotalNumberOfTimesToUploadFile>
            <SupportedDataSourceType>Package</SupportedDataSourceType>
            <ProcessMessagesInOrder>No</ProcessMessagesInOrder>
            <PreventUploadWhenZeroRecords>No</PreventUploadWhenZeroRecords>
            <UseCompanyFromMessage>Yes</UseCompanyFromMessage>
            <LegalEntity>DAT</LegalEntity>
        </JobDefinition>

        <EntitySetup ID='Generic'>
            <Entity name='*'>
                <SourceDataFormatName>Package</SourceDataFormatName>
                <ChangeTracking>No</ChangeTracking>
                <PublishToBYOD>No</PublishToBYOD>
                <DefaultRefreshType>Full push only</DefaultRefreshType>
                <ExcelWorkSheetName></ExcelWorkSheetName>

                <SetBasedProcessing>No</SetBasedProcessing>

<FailBatchOnErrorForExecutionUnit>No</FailBatchOnErrorForExecutionUnit>
                <FailBatchOnErrorForLevel>No</FailBatchOnErrorForLevel>
                <FailBatchOnErrorForSequence>No</FailBatchOnErrorForSequence>
                <ParallelProcessing>
```

```
                    <Threshold></Threshold>
                    <TaskCount></TaskCount>
                </ParallelProcessing>
            </Entity>
        </EntitySetup>
    </SharedSetup>

    <TestGroup name='Set up import jobs for Financials'>
        <TestCase Title='Set up import job for shared set up data package'
ID='3933885' RepeatCount='1' TraceParser='off' TimeOut='20'>
            <DataFile RefID='SharedSetup' />
            <JobDefinition RefID='ImportJobDefinition_1' />
            <EntitySetup RefID='Generic' />
        </TestCase>

        <TestCase Title='Set up import job for financials HQUS' ID='3933886'
RepeatCount='1' TraceParser='off' TimeOut='20'>
            <DataFile RefID='FinancialsHQUS' />
                <JobDefinition RefID='ImportJobDefinition_1'>
                    <LegalEntity>HQUS</LegalEntity>
                </JobDefinition>
                <EntitySetup RefID='Generic' />
        </TestCase>

        <TestCase Title='Set up import job for financials PICH' ID='3933887'
RepeatCount='1' TraceParser='off' TimeOut='20'>
            <DataFile RefID='FinancialsPICH' />
                <JobDefinition RefID='ImportJobDefinition_1'>
                    <LegalEntity>PICH</LegalEntity>
                </JobDefinition>
                <EntitySetup RefID='Generic' />
        </TestCase>

        <TestCase Title='Set up import job for financials PIFB' ID='3933888'
RepeatCount='1' TraceParser='off' TimeOut='20'>
            <DataFile RefID='FinancialsPIFB' />
                <JobDefinition RefID='ImportJobDefinition_1'>
                    <LegalEntity>PIFB</LegalEntity>
                </JobDefinition>
                <EntitySetup RefID='Generic' />
        </TestCase>
    </TestGroup>
</TestManifest>
```

Example 2: Automated setup of demo data

The following manifest shows the setup of demo data for three legal entities when the demo data packages are stored in the Shared asset library. The difference in this example from the previous example is the actual execution of the data projects to set up the demo data. For consistency of the manifest, don't use the `ConfigurationOnly` option or set it to `No`.

XML

```xml
<?xml version='1.0' encoding='utf-8'?>
<TestManifest name='Data management demo data set up'>
    <SharedSetup>
        <DataFile ID='SharedSetup' name='Demo data-7.3-100-System and Shared'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsHQUS' name='Demo data-7.3-200-Financials-HQUS'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsPICH' name='Demo data-7.3-200-Financials-PICH'
assetType='Data package' lcsProjectId=''/>
        <DataFile ID='FinancialsPIFB' name='Demo data-7.3-200-Financials-PIFB'
assetType='Data package' lcsProjectId=''/>

        <JobDefinition ID='ImportJobDefinition_1'>

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

Thanks to One Version, new updates are now automatically broadcast, downtime is minimal, and customers enjoy the benefits of staying current with recent features and fixes without having to go through expensive upgrades.

By using feature management, customers control when new features are applied. Therefore, as an independent software vendor (ISV) partner, you can innovate together with Microsoft to take advantage of new features without having to handle the waiting times that come with long release cycles. When all your customers run on current versions, you have fewer versions to maintain. You can focus instead on building quality into the solutions that you provide for your customers.

The process of servicing current versions is also more seamless and safer than it was in earlier versions. Previously, patching required that individual fixes be combined and merged into a customer environment.

Extensibility allows for deployment of side-by-side solutions that give customers more choices about how they configure their solutions.

In the One Version model, customer user acceptance testing (UAT) environments and production environments are updated several times a year. It's critical that updates don't cause problems. However, Microsoft acknowledges that both technical problems and functional problems might arise when environments are updated.

- Technical problems include breaking changes in application programming interfaces (APIs) that customizations in your solutions use.
- Functional problems that customers experience can be caused by the untimely introduction of new features. Microsoft puts any new functionality that might affect existing processes under feature management. In this way, customers can control when they adopt new functionality. Therefore, they have time to validate, document, and train their users about the new features.
- Functional problems might also be unintended changes that cause functional regressions.

Preventing technical and functional problems is difficult and requires close coordination between Microsoft and you as an ISV partner. The Microsoft goal is that you adopt practices that resemble Microsoft practices. This article explains how you and Microsoft can achieve this goal together. Over the next several months, Microsoft releases new practices and tools to help you. This article is updated as the tools and practices evolve.

This article includes the following sections:

- Servicing customers
- Compatibility
  - Runtime compatibility
  - Design-time compatibility
- Developing new releases
  - Designing for extensibility
  - Data upgrade
  - Feature exposure
- Branches and builds
- Testing
- Deploying updates
- ISV solutions as part of One Version automated deployment
- Should I release binaries or source code?

Servicing customers

Dynamics 365 finance and operations apps run on Microsoft Azure. Therefore, they're a solution that runs as a service. Microsoft services companies 24/7, either proactively from alerts that report unusual behavior, or from support tickets that customers or their partners submit. Microsoft has a range of tools to help support the services that are running. These tools

include usage data that the services collect. To help safeguard customer data, Microsoft is also careful about who can access customer systems.

When Microsoft analyzes an issue, it might determine that the issue is related to your ISV solution. Microsoft reports this type of issue to you, so that you can follow up offline.

Companies can opt out of updates for two consecutive service updates before the next service update is applied to their environments. Therefore, at any time, Microsoft can expect that companies are running one of the last three monthly updates.

When Microsoft resolves an issue that requires a code fix, it generally includes that code fix in the next monthly update. However, critical issues that are reported, such as production outage, might require that a fix be provided for the version that customers are currently running.

Similar policies apply to your ISV solution, and you might also have to provide a code update. For your solution to be binary-compatible with all your customers, it must be built on the oldest platform release that you want to support. All new updates that Microsoft releases are intended to be binary backward-compatible. This compatibility gives you the option of maintaining only one servicing version of your solution that is based on the oldest of the three most recent updates. Therefore, you must maintain just one released solution. You can then use that solution to update all your customers, regardless of which of the three most recent updates they're running. As your customers adopt new Microsoft updates, you can rebase your maintained solution to a newer release to remain current with the three most recent updates.

This recommendation applies to servicing and maintaining your released solution. You use a different approach to develop new releases of your solution. For more information, see the Developing new releases section of this article.

Compatibility

Microsoft diligently tries to guarantee compatibility with existing customizations. To achieve this goal, Microsoft uses strict practices in its engineering processes, together with tool and automation support that helps identify API contracts that are unintentionally broken. Telemetry lets Microsoft engineers determine customizations that reference or extend a Microsoft API.

Updates to finance and operations apps that Microsoft applies to customer environments are intended to be functionally compatible and binary-compatible with existing customizations. This compatibility covers not only APIs, but also functionality and the user experience. Customers must explicitly opt in to all new experiences.

Any deprecation or breaking change in binary or functional compatibility is announced 12 months in advance. Therefore, you have enough time to align your customizations with an alternative design. You must pay attention to the monthly updates to Microsoft

documentation, and you must review the APIs that are marked as obsolete (deprecated) or internal. In this way, you can manage changes in a timely manner.

The following sections define and describe the aspects of backward compatibility: runtime compatibility and design-time compatibility.

Runtime compatibility

All new updates are runtime backward-compatible. This compatibility covers both binary compatibility and functional compatibility. Runtime compatibility means that customizations in production and sandbox environments continue to work after new updates are deployed in those environments. These updates include both service updates and quality updates.

Runtime compatibility also means that changes Microsoft makes to the platform are backward-compatible with customizations that were compiled on an earlier platform.

Binary compatibility is backward only. You can compile a customization on an older platform and deploy it to a customer environment that has been updated to a later version. You can't deploy code compiled on a later version than the one running on the environment you deploy to.

Design-time compatibility

Design-time backward compatibility (that is, compile-time compatibility) means that developers can apply updates to their development environments and successfully compile their code without making any changes.

You must be aware of how APIs in your solution are used in your customers' implementations, and how you can use these APIs without causing breaking changes. As part of this effort, pay careful attention to what is changed and rely on engineering best practices. For examples of changes that you should avoid, see Breaking changes.

Try to meet a bar that resembles the bar that Microsoft sets. In that way, both you and Microsoft can help avoid creating regressions.

All Microsoft updates are binary (runtime) compatible, and Microsoft also aims for design-time compatibility. However, one category of required changes isn't design time–compatible but remains binary-compatible. After an update is applied, new errors or warnings might occur when your code is compiled. Here are some examples of these changes:

- Microsoft makes an enumeration extensible.
- Microsoft marks an API as obsolete or internal.
- Microsoft introduces a new compiler error to help avoid unsafe coding practices.

All these changes might require work on your solution.

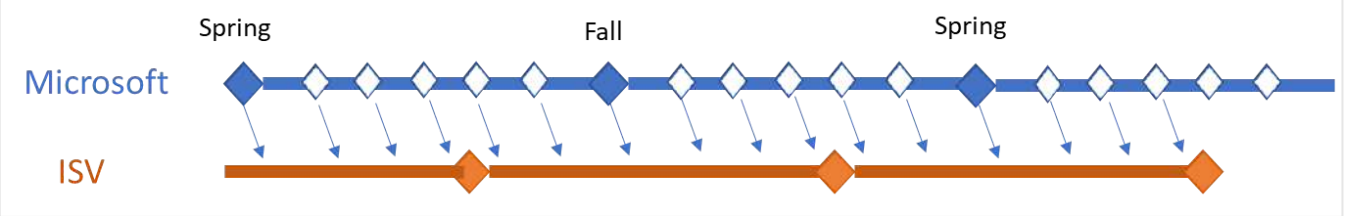
Design-time breaking changes that are binary-compatible don't require a 12-month deprecation notice.

Developing new releases

Together, One Version and the fact that the finance and operations apps run as a service provide a great vehicle for collecting feedback. Feedback is useful, because it helps Microsoft decide which new features it should add to upcoming updates. Historically, the Microsoft approach was to release major versions that include many new features. However, the new model encourages a different approach. Microsoft now releases a series of continuous updates that gradually build on the available capabilities of the system. In many cases, one update contains an initial small feature that Microsoft then enriches in later updates. In some cases, Microsoft must provide staging for new features, and must use feature exposure to hide the new features or control modifications to them.

Follow a similar approach for your ISV solutions. You benefit from quicker integration and extension of new standard features.

As the following illustration shows, the frequency of your new releases can be independent of Microsoft releases. Consider adopting a strategy for source code branching, as described in the Branches and builds section of this article.



The quality of every update that you release is essential. Although testing helps guarantee quality, you must also build quality during the design and implementation phases. In the One Version model, consider some new dimensions, as described in the following sections.

Designing for extensibility

To design your solution for extensibility, consider not only how you customize by extending the standard application, but also how you enable customization of your ISV solutions by your customers and partners.

Make sure that customizations are additive instead of intrusive, and follow the guidance on the Extensibility home page.

Don't be too creative about the way that you build your customization. Otherwise, you might extend an API that's questionable and increase the risk that later updates break your solution. Instead, log an extensibility request, and ask that Microsoft creates a more explicit API that is more resilient to breakage.

Design solutions that are extensible. For inspiration, see Write extensible code.

Design for backward compatibility to avoid breaking customer implementations. A good strategy is to be explicit about what you offer for hooking and wrapping extension code. The way that you decorate your methods gives you lots of control over which methods you enable extensions for. For more information, see Attributes that make methods extensible.

Data upgrade

Earlier versions of Dynamics 365 Finance and Operations supported different types of data upgrade jobs. These jobs aren't supported in the current version. Microsoft made this change to minimize downtime while updating a production environment.

Database synchronization still runs during upgrade. It supports basic operations such as adding new tables, fields, and indexes.

To prevent downtime, Microsoft is introducing new ways of driving data upgrade that are run asynchronously. For example, data upgrade is sometimes triggered when a feature is turned on through a feature flag. This new approach for data upgrade differs significantly from earlier approaches and becomes available in upcoming updates. Documentation resources will also be available.

Feature exposure

In the One Version model, updates are managed by Microsoft and pushed to customer environments. Pushed updates should not require that customers adjust to functional changes, or that they train their users about new or changed features every month. Pushed updates also should not cause customers to delay updates to their environment.

Feature management is a new concept that puts customers in control of deciding when new or changed features are used. Customers can review, validate, and document new or changed features before they are adopted. They can also train users before new or changed processes are adopted, to reduce the impact on daily operations.

Feature management will be released in upcoming monthly updates.

You should consider using feature management with your ISV solution to let customers control when new features are adopted.

Branches and builds

As an ISV, you should plan on a minimum of two source code branches: a servicing branch and a development branch.

Servicing branch

The servicing branch is used to produce bug fixes for your ISV solution. As the ISV, you specify the frequency of releases from the branch and distribution of the releases. The expectation is that these releases from the servicing branch will be binary cumulative releases.

The base Microsoft version that you use to build your ISV solution should match the oldest version that customers use with the solution. In the One Version model, that version starts with version 8.1 and is a maximum of three months old.

Development branch

Use the development branch to develop new capabilities for the ISV solution. As the ISV, you determine the frequency of releases from the development branch. You don't need to synchronize your releases with the monthly Microsoft releases. The best approach might be to decouple your release schedule from the Microsoft release schedule and deliver releases less often. A quarterly or biannual cadence is a good starting point.

The base Microsoft version in the development branch should be either the latest released version that is available or the released version that you plan to use for servicing when your new release goes out. The goals are that you innovate together with Microsoft by staying as current as is feasible, and that your development model allows for uptake of recent feature work.

Testing

Microsoft includes several checks and balances in its development process to help guarantee functional and binary compatibility. ISV solutions must be validated with each Microsoft release to help guarantee this compatibility. Validate this compatibility during the Preview phase of each release.

Provide quick turnaround for feedback, so that you have time to fix any problems before the monthly updates are deployed in customer environments.

Test automation is important for quick validation of new updates. Microsoft plans to release the test framework and libraries to support you as you build your test automation.

Microsoft has an extensive suite of tests that support its validation. You, as an ISV, should create your own suites of automated tests.

In addition to the SysTest automation framework that's aimed at developers, the Regression Suite Automation Tool (RSAT) enables automation of business processes without requiring that code be written. Functional users can use the RSAT to record their critical tests and automate part of their UAT. You can also use the RSAT as you start to build your test automation.

Recently, Microsoft released the Acceptance test library resources and accompanying libraries. This framework is aimed at developers and lets them build tests that are more comprehensive than unit tests. The libraries that accompany the framework help make it a seamless way to build suites of tests.

Currently released products – Testing binary and functional compatibility

Test the currently released product that the servicing branch maintains for binary and functional compatibility. Run your suite of automated developer tests, automated functional tests, and manual tests for your ISV solution on an environment that has the new version from Microsoft and your existing ISV solution. Because this test run is testing for binary and functional compatibility, don't recompile the ISV solution.

If the testing is successful, this step validates that a customer installation of the current version of your ISV solution doesn't need to be updated when Microsoft broadcasts the new release to the customer.

If the testing isn't successful, immediately notify Microsoft through the Preview communication process. This process uses Microsoft Viva Engage and an issue notification process. The issue requires either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

Currently released products – Testing design-time compatibility

Next, test design-time compatibility for the currently released product that's maintained in the servicing branch. To perform this testing, compile the solution against a deployment of the new Microsoft release. Although Microsoft aims to minimize design-time compatibility issues, they might occur in some situations. One example is when Microsoft makes an enumeration extensible, and the solution uses it in a manner that assumes an underlying integer

representation (for example, it uses the enumeration value in a logical comparison or mathematical function). Although the code continues to work in a customer deployment because the underlying values are maintained, a compiler error is generated and addressed in future releases. Another example of a design-time compatibility issue is when Microsoft introduces a new compiler error to protect against unsafe coding patterns. For more information about categories of design-time compatibility issues, see Breaking changes.

Run your suite of automated developer tests, automated functional tests, and manual tests on an environment that has the new version from Microsoft and your compiled ISV solution.

If the testing is successful, this step validates that your ISV solution doesn't need to be updated even if source code is supplied to the customer and the customer recompiles the ISV solution.

If the testing isn't successful, and the issue isn't one of the categories that are described in Breaking changes, you, as the ISV, must immediately notify Microsoft through the Preview communication process. This process uses Microsoft Viva Engage and an issue notification process. The issue requires either a fix from Microsoft or a fix in your ISV solution. A fix in your solution might, in turn, require that customers be updated from the servicing branch. In both cases, Microsoft must know about the issue, so that it can become more proactive in its processes for future releases.

Currently released products – Updating the base build

As Microsoft updates your customers to new releases, periodically update the base build so that it matches the oldest version that customers use when running your ISV solution.

Solutions that are in development

Validate your new solution development on either the latest released version or the released version that you plan to use for servicing when your new release goes out. However, in both cases, consider doing validation on the most current version. This validation helps with early discovery of issues or uptake work that you must do.

If an unexpected break occurs, then you, as the ISV, must immediately notify Microsoft through the Preview communication process. This process uses Microsoft Viva Engage and an issue notification process.

Deploying updates

For Microsoft standard platform and application updates, One Version servicing includes a process for automated updates of customer environments. However, this automation isn't

currently available for ISV solutions. For more information, see ISV's as part of One Version service updates.

Manually update ISV solutions, and control your release cadence. The binary backward compatibility allows for safe updates of the standard platform and application.

The update process includes database synchronization (for example, the addition of new fields and indexes).

ISV solutions as part of One Version automated deployment

Although Microsoft doesn't currently plan to release ISV solutions as part of the One Version automated deployment process, this option might become available. However, Microsoft must first align engineering processes to make this option feasible.

Here are some areas where alignment is required:

- **Feature management** – The user must be able to control when a new feature is turned on.
- **Backward compatibility and compliance** – Compliance with API customization usage is required.
- **Feature deprecation** – Advanced notice about deprecation of features or APIs must be provided.
- **Test automation suite**
- **Testing during the preview phase**
- **ISV solution sign-off and upload**
- **Automated deployment scripts**
- **Zero downtime** – Deployment of updates must be instantaneous.
- **Data migration without downtime**
- **Support for on-call duty, for servicing of critical production issues**

Should I release binaries or source code?

Binary compatibility is supported, as long as you don't recompile. We recommend that you don't compile your ISV solution in customer environments. Instead, deploy precompiled binaries that you prepare and validate. You can create your solution binaries from your servicing branch, based on an earlier version, when this approach is practical.

If an implementation partner or customer compiles your solution in an updated environment, new warnings and errors might occur, as mentioned in the Design-time compatibility section of

this article. Therefore, implementation partners shouldn't compile your solution. However, this recommendation doesn't mean that you shouldn't share your source code to help support debugging, for example. Consider taking steps to avoid compilation of your code, so that implementation partners aren't exposed to design-time issues.

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

Use Task recorder and Business process modeler (BPM) to create user acceptance test libraries. Task recorder is a powerful tool to record test cases and organize them by business process using BPM. As a Microsoft partner, use BPM to distribute test libraries to your customers via Lifecycle Services and Lifecycle Services solutions. If you're a customer, use BPM to author and distribute test libraries across different projects and teams.

Because you can synchronize BPM with Azure DevOps (formerly known as Visual Studio Team Services), you can automatically create test cases (including test steps) in your Azure DevOps project. Azure DevOps can then serve as your test configuration and test management tool where you can create targeted test plans and test suites, manage the execution of tests, and investigate results. For more information about testing with Azure DevOps, see What are test plans, test suites, and test cases?

This article walks through the process of creating and executing acceptance test suites to use for manual or automated testing.

Create a Scenario Acceptance Testing BPM library

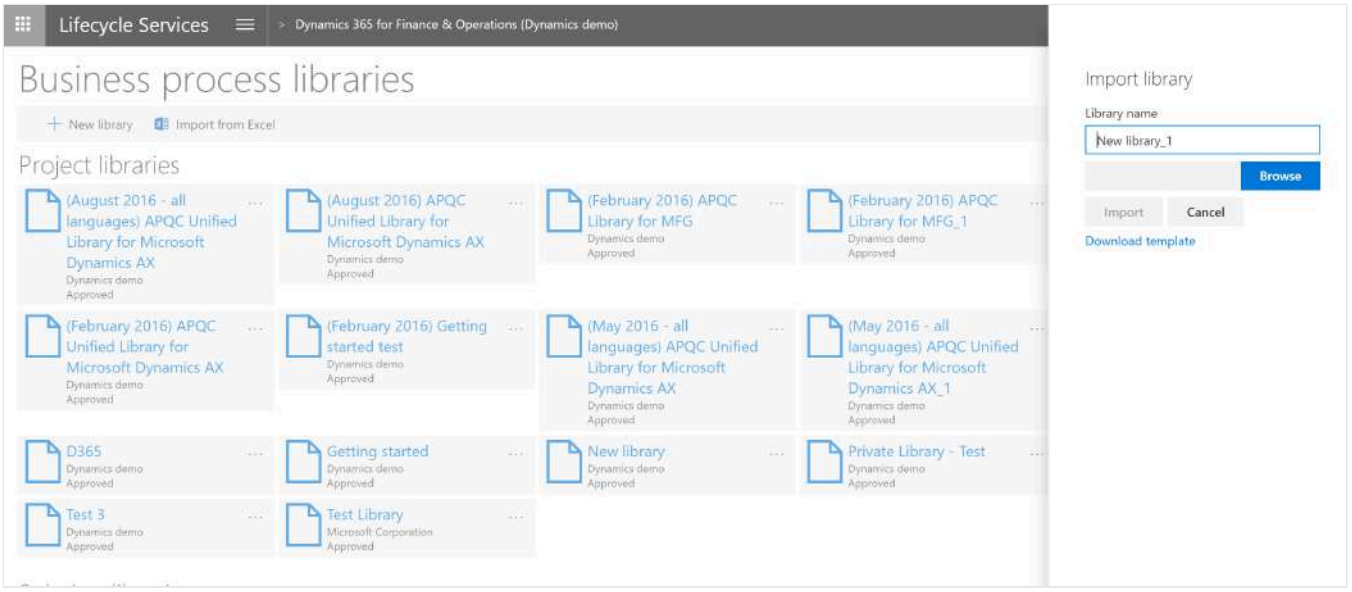
BPM is a great Lifecycle Services tool to describe a hierarchy of business processes and user tasks. Lifecycle Services also allows Microsoft partners and customers to author and distribute

BPM libraries across Lifecycle Services projects via the Asset library. This section describes how to take advantage of BPM to define your acceptance test library.

Create a BPM library

You can create a Business process modeler (BPM) library in several ways. For more information about how to create libraries in BPM, see Create, edit, and browse Business process modeler (BPM) libraries.

For illustration purposes, this article uses a library that contains common business processes, such as create an expense report and approve order requests. The article uses the Excel import functionality to create the library.



Record test cases and save to BPM

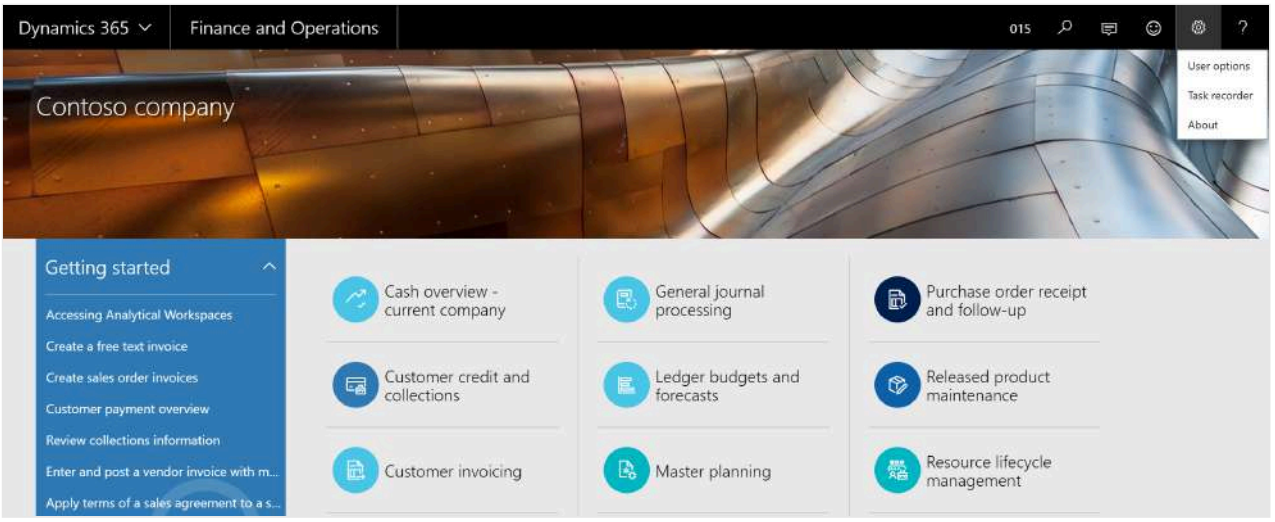
After you create a BPM library, use Task recorder to create your test cases and then upload the cases to BPM. You can use several methods to do this.

If you're using a BPM library that already has all of the necessary task recordings (test cases) attached, you can skip this step. Otherwise, follow the instructions in this section to create new task recordings.

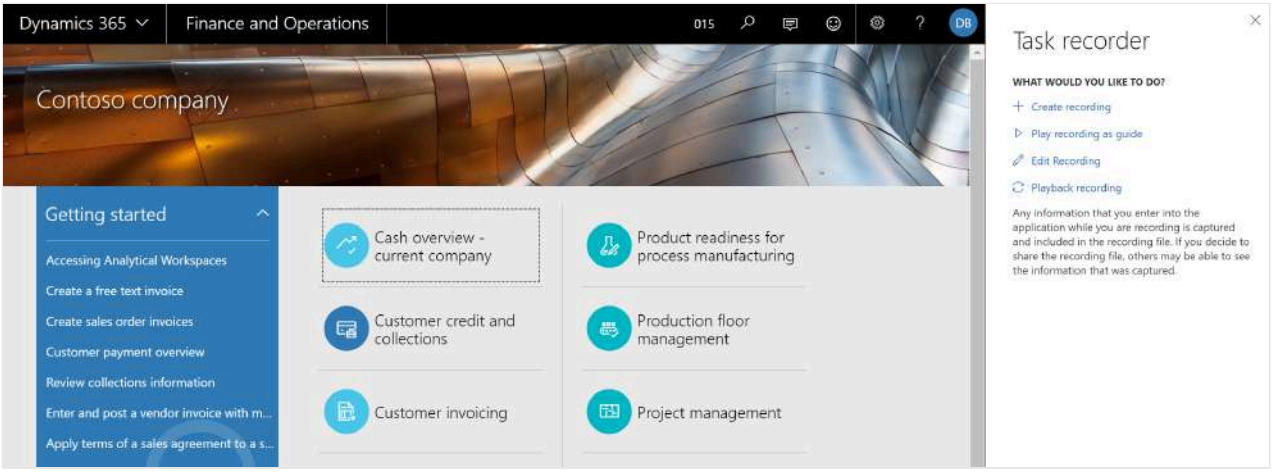
Create and save a new task recording

> **Note**
>
> Starting in January 2026, you can only create, edit, or use Task Recordings in Sandbox and Production environments. Cloud-hosted environments no longer have this capability.

1. Open the client and sign in.
2. Select the company that you want to use while recording.
3. Go to **Settings** > **Task recorder**.



4. Select **Create a new recording**.
5. Enter a name for the recording, and then select **Start**. Recording begins the moment that you select **Start**.
6. When the recording is complete, in the Task recorder pane, select **Stop**.
7. To save the task recording to an attached BPM, select **Save to Lifecycle Services**.



8. Select the library that you want to save the recording to, and then select **Save**. Otherwise, select **Save to Disk** and follow the steps in the next section, "Upload an AXTR file to BPM."

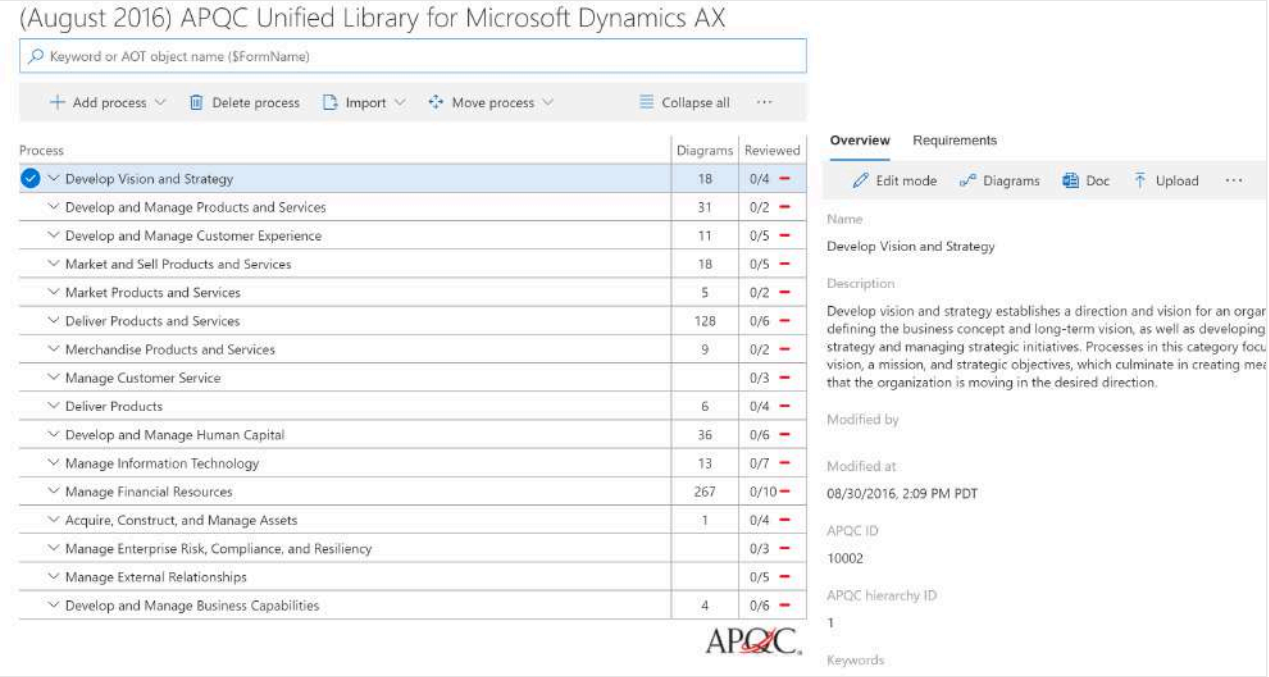
> ⓘ **Note**

To enable the effective execution of your tests using automation tools, make sure all of your task recordings start on the main dashboard of your application. For end-to-end processes that are performed by more than one user, divide your task recordings into user-specific tasks. This approach simplifies the maintenance of test cases and allows you to execute test cases in the context of security roles, which is a best practice.

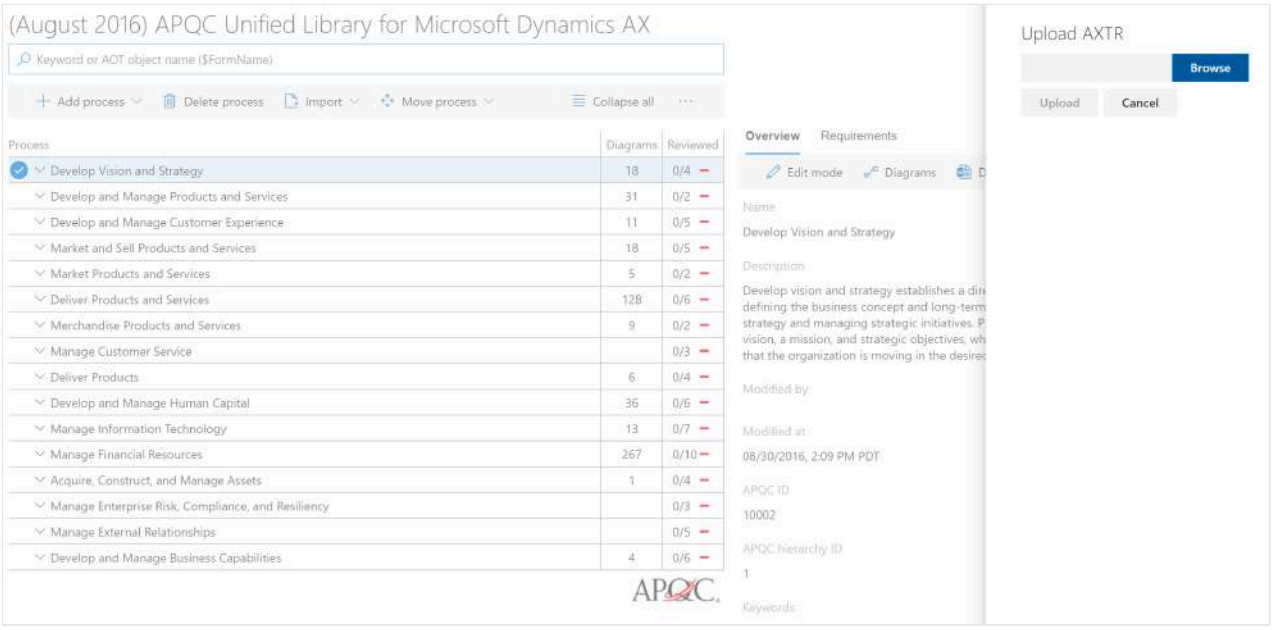
Upload an AXTR file to BPM

If you save your recordings (AXTR files) to disk, follow these steps to upload them to BPM.

1. In Lifecycle Services, in your project, on the **Business process libraries** page, select the library to upload the task recording to.
2. Select **Author and edit** and in the lines, locate and select the process to upload the task recording to.
3. In the right pane, select **Upload**.



4. Select **Browse** to find and select the file to upload, and then select **Upload**.



Save an existing task recording to BPM

> **Note**
>
> Starting in January 2026, you can only create, edit, or use Task Recordings in Sandbox and Production environments. Cloud-hosted environments no longer have this capability.

1. To attach an existing task recording, sign in to the client.
2. Go to **Settings** > **Task recorder**.
3. Select **Edit Task Recording** and attach the file by either saving directly to Lifecycle Services or downloading the AXTR and then uploading to BPM.

Guidelines for recording test cases

Follow these guidelines when authoring and recording your test cases, especially if you're planning to automate test execution. The process and tools described in this article apply to business process acceptance tests. They aren't meant to replace component and unit testing that is typically owned by developers.

- Author a limited number of test cases that, when combined, cover complete end-to-end processes.
- Focus on business processes that have been customized.
- An individual test case (recording) should cover one or two business tasks only, typically executed by one person. This simplifies task recording maintenance. Don't combine a complete end-to-end business process such as "Procure to Pay" or "Order to Cash" into one large task recording. For example, instead of having RFQ > Purchase Order > Product Receipt > Vendor Invoice > Vendor Payment as one test case, divide the process into

three or four test cases. You'll have the opportunity to combine these tests into an ordered test suite later.
- A test case should have at least one validation. Try to validate critical fields that cover the impact of other fields. For example: Validation of totals on sales or purchase orders cover the unit price/quantity/discount/tax ...etc.
- Avoid printing a report in a test case. If a test case needs to print a report, it should be selected on screen.
- 80+% of test cases should be of transactions or source documents. Master data should be limited to up to 20% of test cases only.

Synchronize and configure your test plan in Azure DevOps

An acceptance test library is your starting point. It typically contains all test cases (task recordings) of a particular application organized by business process. During a particular test pass, you usually don't need to execute all test cases. What test cases you select depends on the phase of your implementation or the nature of the update you're planning to apply to your production environment. Azure DevOps enables you to organize your test cases in test plans and test suites. A test plan contains one or more test suites (A subset of your test library); test cases can belong to more than one test suite.

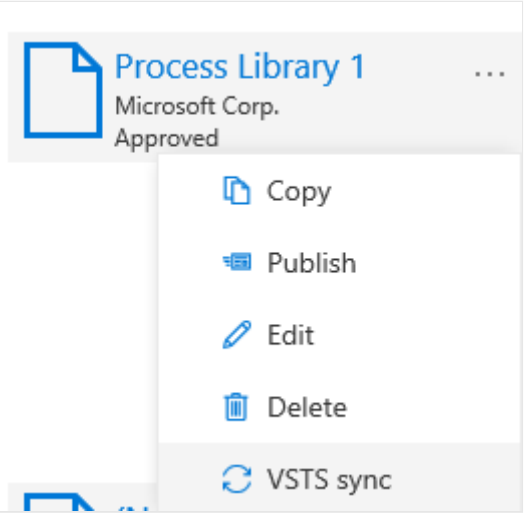
Once you have selected your acceptance testing BPM library, synchronize it with Azure DevOps and create your test plan and test suites.

Sync with Azure DevOps

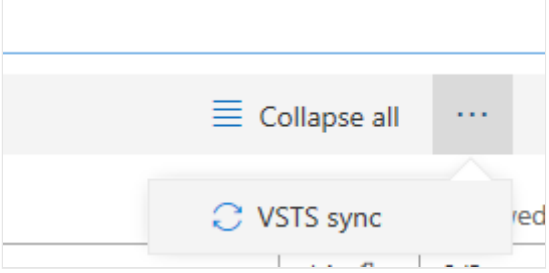
Synchronize your BPM library with your Azure DevOps project. For more information, see Synchronize BPM libraries with Azure DevOps.

After configuration is complete, synchronize the BPM library with an Azure DevOps project.

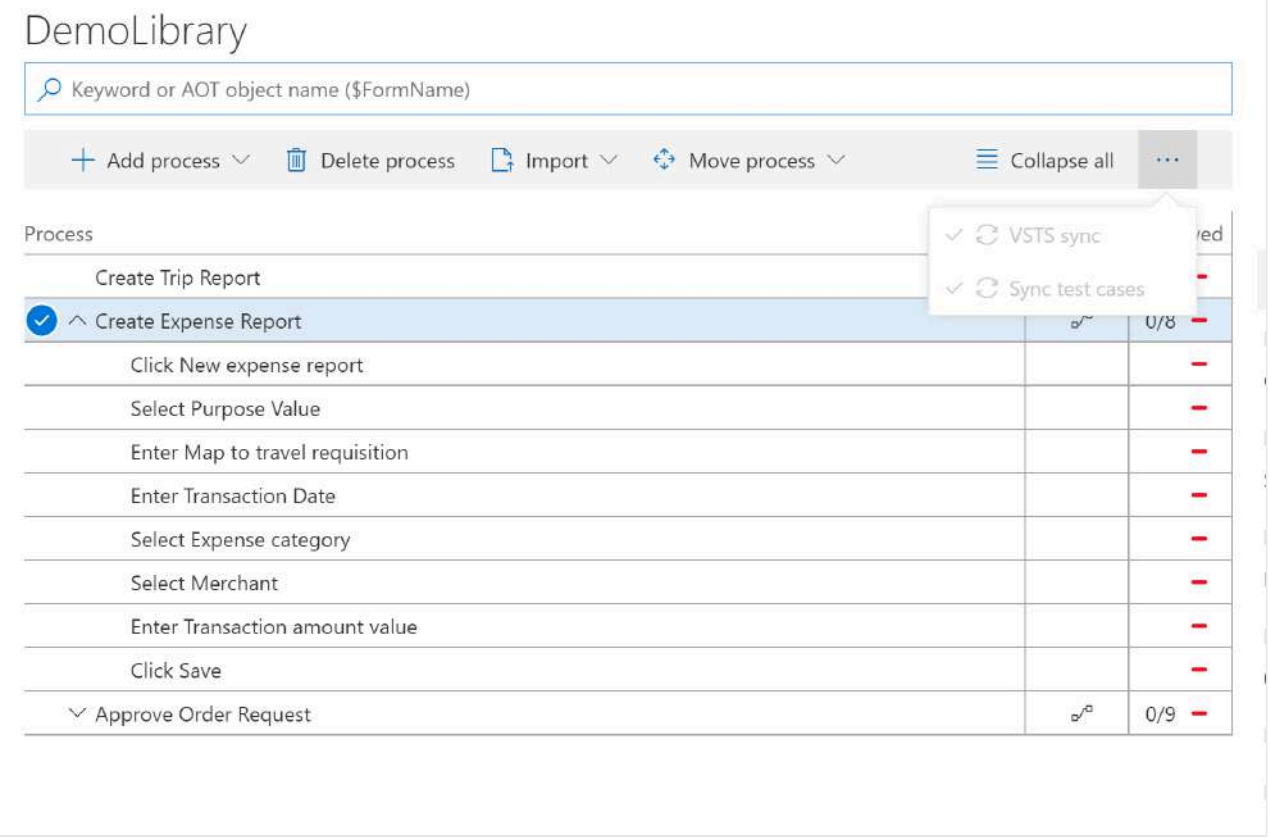
1. On the **Business process libraries** page, on the tile for the library that you want to synchronize, select the ellipsis button (...), and then select **Azure DevOps sync**.



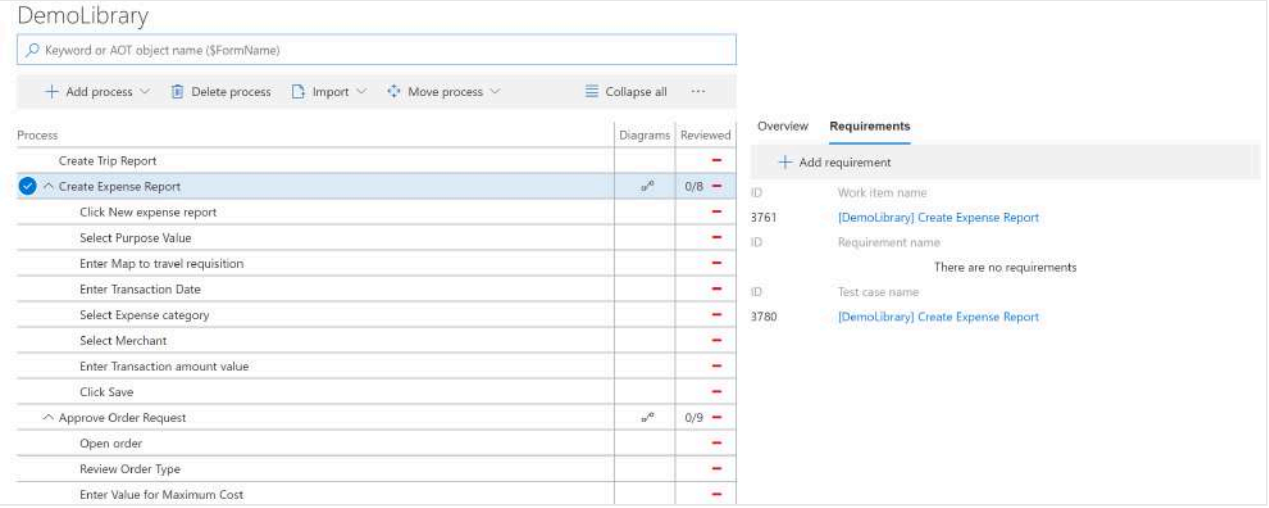
You can also start Azure DevOps synchronization from the toolbar in a BPM library. Select the ellipsis button (...), and then select **Azure DevOps sync**.



2. After Azure DevOps synchronization is complete, select the ellipsis button (...), and then select **Sync test cases**.



3. When this step is complete, your task recordings become test cases in Azure DevOps, and a link appear under the **Requirements** tab.

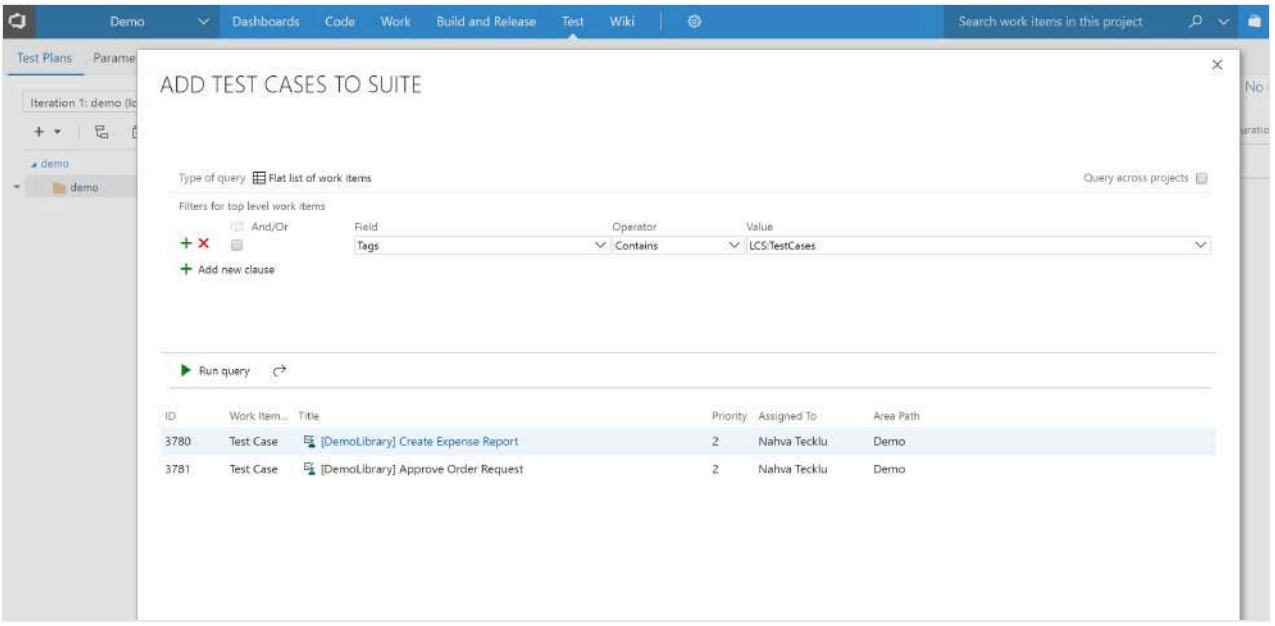


In addition to the test steps, the task recording XML file is attached to the Azure DevOps test case. This file is needed if you want to automate test execution.

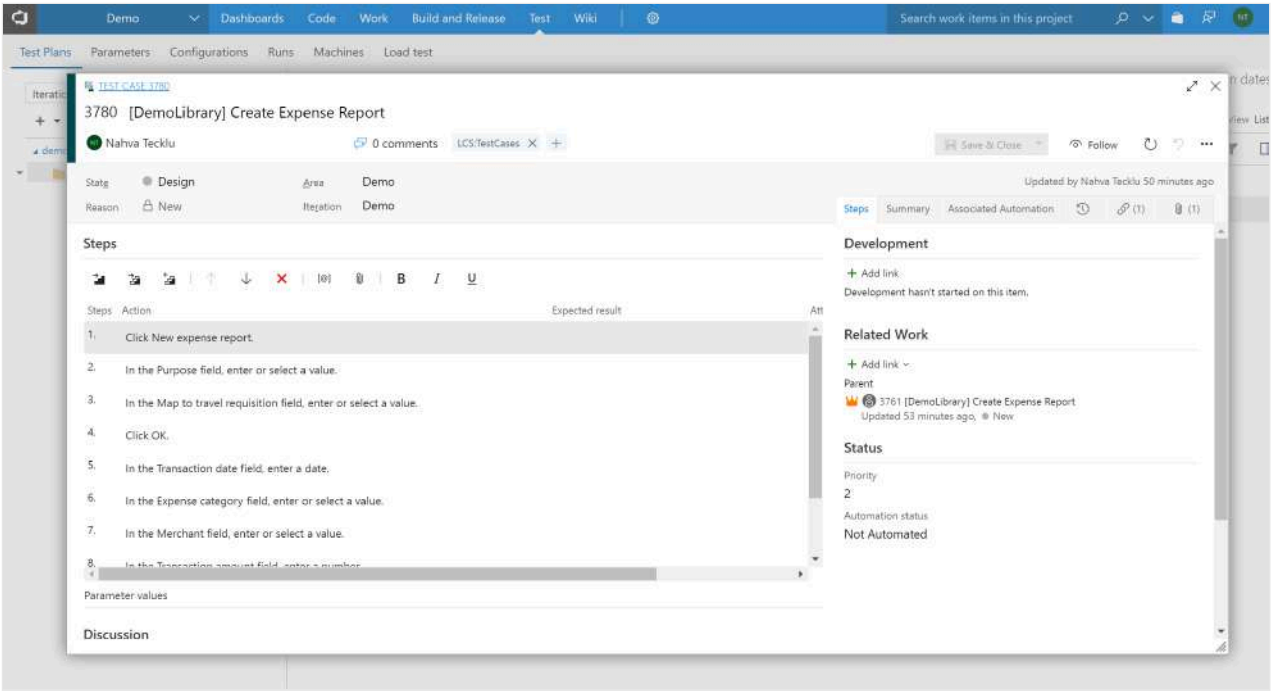
Create a test suite in Azure DevOps

Next, you need to create a test plan and test suite in Azure DevOps. This allows you to execute an ordered suite of test cases and easily manage, investigate, and track the results.

1. Sign in to Azure DevOps and select the project and test plan that you want to test in.
2. On the toolbar, select **Test** > **Test Plans**.
3. In the left pane, select **+**, and then select **Static suite**.
4. Enter a name for the suite.
5. Select **Add existing** and query the tag **Lifecycle Services:Test Cases**.
6. Select **Run** > **Add test cases**.



7. Select the test case to view details and the attached XML file.

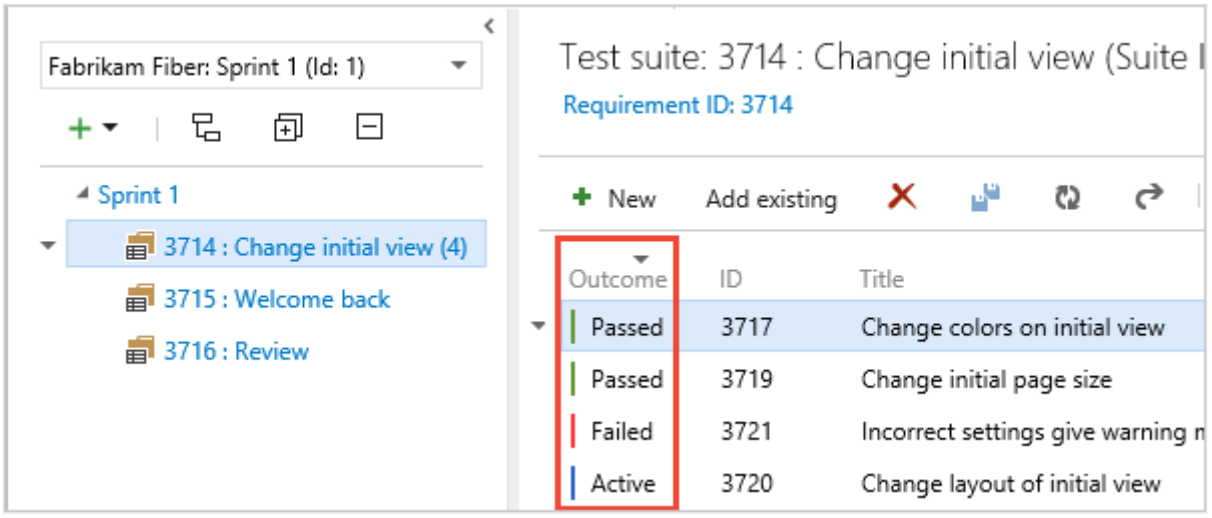


> **Note**
>
> This example shows how to create one comprehensive acceptance test suite with all test cases added. Instead, you should create various test suites under the same test plan and then use custom queries to add specific test cases to a test suite. A test case can belong to more than one test suite.

Execute your tests

Run manual test cases

After you have a test suite, you are ready to use it for regression testing after updates have been made to your application in a sandbox or test environment. You can run the test cases in your test suite manually or play the task recordings that are part of the test suite and use Azure DevOps to mark the test cases as passed or failed.



Azure DevOps also provides a tool, **Test Runner**, to manage manual test case execution. For more information about using Test Runner, see Run manual tests.

We recommend that you take advantage of Azure DevOps as it provides a rich set of management features not only for testing, but result management and mitigation.

Run automated test cases

The platform for finance and operations provides developers with tools to author test cases based on task recordings and use Azure DevOps to manage the automated execution of these test cases.

Developers can use the build and test automation capabilities of **build and test** environments. For details, see the Continuous delivery home page.

Functional power users can automate the execution of their test cases using the **Regression suite automation tool**. For more information, download the tool and read the Regression suite automation tool.

Investigate test runs

Once an automated run is complete, on the Azure DevOps toolbar, select **Test** > **Runs** (or **Test Plans** > **Runs**) to investigate your test run. Select the desired test run to investigate test case failures and errors. You can also go to your test suite in Azure DevOps to see the latest results associated with your test cases. For more information on testing and test management in Azure DevOps, see the Azure DevOps documentation.

Deploy a demo environment

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to deploy a demo environment on Microsoft Azure by using Microsoft Dynamics Lifecycle Services. This article applies to deploying a demo environment for:

- Dynamics 365 Finance
- Dynamics 365 Supply Chain Management
- Dynamics 365 Human Resources
- Dynamics 365 Commerce

Prerequisites

Before you begin your deployment, make sure you meet the following prerequisites:

- Verify that you have an Azure subscription and that you're a co-administrator on it.
- Verify that you have access to an Lifecycle Services project and permissions to deploy an environment.
- Verify that you connected your Azure subscription to your Lifecycle Services project by using the information in the Complete the Azure Resource Manager (ARM) onboarding process article.

Deploy a demo environment

Use this procedure to deploy a demo environment on Azure by using Lifecycle Services.

1. In Lifecycle Services, open your project. In the **Environments** section, select the plus sign (+).
2. Select the Azure environment topology, and then select **Demo**.
3. Select a topology.

- For finance and operations, select the most recent Azure Resource Manager (ARM) topology for finance and operations.
- For Commerce, select **Dynamics 365 for Commerce - Demo**.

4. In the **Deploy environment** dialog box, enter the name of the environment. This name should be unique in the Azure subscription. To make environments easy to identify, consider forming an acronym by using the user's name and the topology.

5. Select the size of the virtual machine (VM). You must use **Ev5-series sizes** for finance and operations workloads. Use **Ev5**. If you experience allocation failures, see the Azure troubleshooting guide.

6. Set the **Instances** field to 1.

   > **Note**
   >
   > The size of the VM and the number of instances affect the cost of your subscription. For more information, see Azure pricing.

7. Select **Advanced settings** to add customizations to your deployment. For the demo environment, keep the default settings.

8. Agree to the licensing and pricing terms, and then select **Next**.

9. In the **Confirm** message box, select **Deploy**.

10. Open the **Cloud hosted environments** page to view the status of the deployment. After the deployment is successfully completed, the environment is ready.

Sign in to your demo environment

To sign in to your demo environment, complete the following steps:

1. In Lifecycle Services, open the **Cloud-hosted environments** page, and select the demo environment that you just deployed.

2. Scroll to the right. In the **Environment details** pane, under **Cloud services**, select the appropriate link:

   - **Log on to finance and operations**
   - **Log on to Commerce**

Deployment options

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can deploy finance and operations apps in the cloud or on-premises. Cloud deployments offer an ERP service that Microsoft fully manages, while on-premises deployments are deployed locally within a customer's data center.

> **Important**
>
> On-premises deployments aren't supported on any public cloud infrastructure, including Azure. However, they support running on Microsoft Azure Stack HCI and Microsoft Azure Stack Hub.

The following table provides a comparison of the capabilities provided by the two deployment options.

Dynamics 365 deployment options

Capability	Cloud	On-premises
Infrastructure and data location	• Full Microsoft managed cloud service • Microsoft managed data centers	• Customer or partner managed infrastructure • Disconnected data center • Local data residency
Data trustee	• Microsoft	• Customer
Application lifecycle management (ALM)	• Managed by Microsoft • Customer access to ALM and telemetry using Lifecycle Services (LCS)	• Managed by customer or partner with cloud-based ALM and telemetry using LCS
Cloud capabilities	• High availability and disaster recovery included • Sandbox environments	• Automated deployment and telemetry using LCS
Intelligence and analytics	• Author and publish Power BI reports • Ready-made Analytical workspaces • Pinning tiles and Reports from PowerBI.com	• Author and publish PowerBI reports
Updates, health monitoring	• Provided through LCS	• Provided through LCS
Licensing	• Subscription	• License with Software Assurance/Business Ready Enhancement Plan, or subscription

Why cloud

Cloud deployments provide a cloud service that you can easily scale up or down as needed, as well as data centers that Microsoft fully manages. You can significantly shorten the time spent implementing finance and operations apps, require fewer customizations, and lower the costs of IT hardware and infrastructure.

Cloud deployments include high availability, disaster recovery, sandbox environments, and application lifecycle management combined with cloud-based systems of intelligence, infrastructure, compute, and database services in a single offering. When needed, data failover in the cloud, automated deployment and continuous updates, and elastic compute capacity are available. A cloud deployment also provides data aggregation, financial reporting, and intelligence.

The cloud service provides customers with the greatest value, the broadest range of functionality, the best application lifecycle experience, the easiest and broadest integration with Microsoft Azure services, the best option for business insights and intelligence, and the most value for customers' technology investments.

Why on-premises

By using an on-premises deployment, you can leverage your existing data center investments. You can also configure your enterprise preferences to meet the regulatory and compliance needs of your business, comply with data sovereignty rules in regions where there are no Azure Data Centers, or ensure business continuity in areas with limited public infrastructure.

Your business data and processes are disconnected from the cloud and are stored and run locally in your data center or your partner's data center. Some connectivity is required for system management and updates, which Microsoft Dynamics Lifecycle Services, a cloud-based application lifecycle management service, enables. You might store customer data that relates to the configuration and application customization in the cloud.

For customers who choose to run finance and operations apps in their own data center, the on-premises deployment option has a similar user interface and application functionality as other deployment options. However, you must take on the following responsibilities:

- Stand up your own infrastructure.
- Configure your own high-availability and disaster recovery solutions.
- Stand up sandbox environments.

- Manage your infrastructure, including scheduling operating system updates.

The additional costs to deploy and manage these capabilities might lead to higher deployment costs and a greater total cost of ownership (TCO). Partners and customers can use Lifecycle Services to access tools for deploying the finance and operations apps and updates. Unlike the cloud deployment option, Advanced Analytics and Azure Machine Learning aren't included in the on-premises deployment option.

Comparison of cloud and on-premises features

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article shows a comparison of features available in cloud versus on-premises versions for the following applications:

- Dynamics 365 Finance
- Dynamics 365 Supply Chain Management
- Dynamics 365 Commerce
- Dynamics 365 Human Resources

The article also includes information about the development and administration features.

The following tables list the application areas. The tables show cloud and on-premises support for each feature. When specific features differ from the overall area, the tables list those features on a separate line in the Feature column.

All Dynamics 365 finance and operations apps

Expand table

Area	Feature	Cloud	On-premises
AI and Copilot features	Generative Help and Guidance	Yes	No
	Any copilot capabilities	Yes	No
	Summary generations	Yes	No
	AI Agents	Yes	No

Dynamics 365 Finance

Cloud deployment overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To work with Microsoft to deploy finance and operations apps in the cloud, you need to understand the environment and subscription that you're deploying to, who can perform which tasks, and the data and customizations that you need to manage. Sign up for the Full Microsoft FastTrack for Dynamics 365 to help speed your deployment and implementation. This program provides training and consulting to help you realize business value faster. For more information, see Microsoft FastTrack. If you choose to use the Essentials FastTrack program instead, use the Implementation Project Methodology in Microsoft Dynamics 365 Lifecycle Services to help you manage your implementation project.

Customer lifecycle, subscriptions, and environment types

Microsoft assumes that all customers follow a lifecycle similar to the following for all cloud deployments, and therefore need different environment topologies at each phase.

- Evaluate
- Develop customizations, if needed.
- Curate a "golden configuration" environment that contains only module configurations without master or transactional data. This environment serves as the baseline for your data migration testing and eventual go live.
- Install and test customizations and partner solutions on a tier-1 sandbox (Development or test environment).
- Test customizations, partner solutions, and data configuration on a tier-2 sandbox environment.
- Deploy customizations and data configurations to a production environment with high availability.

At some phases of a project, you might have all of the environments live at once. For more information about the default licenses and tiers that are available, see the Dynamics 365 Licensing Guide.

You might notice the terms cloud hosted or Microsoft subscriptions. A *cloud hosted subscription* means that the customer or partner brings their own Azure subscription and deploys finance and operations apps to it, for evaluation and development purposes only. The customer or partner pays for the resources deployed to their Azure subscription based on the Azure price list. A *Microsoft subscription* means that the customer purchases finance and operations licenses, which then allow them to deploy environments to an Azure subscription that Microsoft manages. Therefore, the customer has no separate Azure billing.

Each Enterprise offer includes two environments by default:

- One Tier 2 sandbox (multibox environment) for user acceptance testing (UAT).
- One production environment with high availability (HA).

You can purchase additional environments as add-ons. For information about licensing and what is included in Microsoft Dynamics 365, see the Dynamics 365 Licensing Guide.

Here's how the lifecycle maps to the available environments. If you already have environments deployed in your Lifecycle Services project, you can find the Environment Type and Environment Sub type on each environment's details page.

Expand table

Lifecycle phase	Environment tier	Subscription	Environment types	Environment sub-type
Evaluation and analysis	Tier 1 sandbox	Cloud hosted	Customer-managed	Demo
Customize	Tier 1 sandbox	Cloud hosted or VHD	Customer-managed	Develop
Golden configuration	Tier 1 sandbox	Cloud hosted	Customer-managed	Develop
User acceptance testing (UAT)	Tiers 2-5 sandbox	Microsoft	Microsoft-managed or self-service	Not applicable
Go live	Production	Microsoft	Microsoft-managed or self-service	Not applicable

Tiers 2-5 can be purchased to increase performance of the environment. The higher the tier, the more compute and database capacity is reserved for your use. For more information about Self-service environment types, see Self-service deployment overview.

> **Important**
>
> Starting in November 2020, Microsoft no longer manages tier 1 sandbox environments. For demo, build, and develop purposes, you can deploy the tier 1 environments on a customer's Azure subscription directly from Lifecycle Services.

Environment lifecycle operations

Users with the Environment Administrator or Project Owner roles in Lifecycle Services can perform various lifecycle operations on their environments. These operations often involve downtime on the environment until the task finishes. You can find each of these operations under or next to the **Maintain** button on each environment details page.

Expand table

Lifecycle operation	Description	Learn more
Apply software	Install Microsoft updates, ISV solutions, or your own customization packages.	Apply updates to cloud environments
Enable access	Allow list your IP for Remote Desktop or database access.	See the Remote Desktop section later in this article.
Restart services	Restart components of your environment.	Restart environment services
Move database	Full data lifecycle management.	Database movement operations
Maintenance mode	Change configuration with only admin access.	Maintenance mode
Upgrade	Upgrade code and data from 7.x to the latest version.	Process for moving to the latest update
Deallocate	Turn off an environment that isn't being used, or to troubleshoot a failed action.	Not applicable
Start	Turn on an environment for use.	Not applicable
Delete	Delete an environment that you previously deallocated.	Not applicable

Security and compliance

Finance and operations apps are PA-DSS 3.1 certified, which means that all communications between components are secured automatically.

All finance and operations front-end virtual machines in Microsoft Azure are configured during deployment to accept only TLS 1.2.

> **ⓘ Important**
>
> Customers who have administrator access to Microsoft-managed sandboxes, including any add-on sandboxes purchased, must follow these guidelines:
>
> - By default, automatic Windows update is enabled for all Tier 1 - 5 sandboxes and you shouldn't disable it. This setting ensures that any time Microsoft pushes security or critical infrastructure updates to your environment, your environment receives the latest set of updates and is updated each month with the operating system fixes that Microsoft releases.
> - Don't change admin passwords on these environments. Microsoft flags environments when admin passwords are changed. Microsoft reserves the right to reset the admin password, and it will do so.
> - Don't add new user accounts to any Microsoft-managed VM. Microsoft reserves the right to remove the newly added user accounts without providing notice.
>
> Finance and operations isn't covered by a FedRAMP ATO at this time. If you provision finance and operations in the United States, all customer data at rest is stored in data centers located in the United States. Finance and operations doesn't support any other Dynamics 365 US Government or Microsoft 365 GCC compliance attributes (for example, access by US screened personnel, and support for CJIS and IRS 1075).

Remote Desktop

Microsoft-managed environments

> **⚠ Warning**
>
> Microsoft is removing the use of Remote Desktop by customers and partners. Each environment first loses administrator access but still allows non-administrator access to

the virtual machines. After this step, all access is removed. For each step of this phased removal, an email notification is sent to the notification list set up for each environment. Microsoft removes all Remote Desktop access by November 2020.

To connect to virtual machines (VMs) through Microsoft Remote Desktop (RDP), you need to complete additional setup. This setup applies to all Microsoft-managed environments, including Tier 1 through Tier 5 sandboxes and add-ons. To connect to Tier 1 through Tier 5 sandbox environments, you must explicitly enable access (allow list) from your organization's IP address space. A Lifecycle Services user with access to the **Environment** page (**Maintain** > **Enable Access**) can enter the IP address space that you use to connect to the virtual machines through Remote Desktop. Access rules are either a single IP address (example: 10.10.10.10) or an IP address range (example: 192.168.1.0/24). You can add multiple entries at once as a semicolon (;) separated list (example: 10.10.10.10;20.20.20.20;192.168.1.0/24). These entries configure the Azure Network Security Group that is associated with your environment's virtual network. For more information, see Security rules.

ⓘ Important

You need to ensure that RDP endpoints are secured through explicit IP allow list rules as mentioned earlier. The IP allow list rules must adhere to the following conditions.

- Don't use asterisk or zero in IP allow list rules.
- Don't use wide IP address ranges.
- Restrict IP address ranges to your organization's CORPNET.
- If you use computers outside your organization's CORPNET (such as a home office) to connect to sandbox environments, add only the specific IP addresses of the computers used to connect to the sandbox environments.
- Don't add Azure Datacenter IP address ranges.
- Don't add public IP addresses, such as a coffee shop location.
- Remove IP allow list rules when not in use. Periodic review of environment IP allow list rules is recommended.

Microsoft runs periodic tests on the Microsoft-managed environments to validate that the environments are sufficiently restricted. Microsoft reserves the right to remove any IP address allow list rules that violate the preceding guidelines, immediately and without providing notice.

Customer-managed/Tier-1 environments

By default, Remote Desktop is enabled for all environments that aren't managed by Microsoft. Restrict access to any environments that belong to your subscriptions. You can restrict access by configuring Network Security Group rules on the environments directly in Azure portal.

Windows Remoting (WinRM)

Windows Remoting (WinRM) is disabled on all environments. Although you can enable WinRM on environments that belong to your subscriptions through the Azure portal, don't enable it.

> ⚠ **Warning**
>
> Microsoft doesn't grant exceptions to enable WinRM for any Microsoft-managed environments.

Availability

The guaranteed uptime for finance and operations apps is 99.9%. Planned downtime occurs once a month and lasts no longer than eight hours. Because the work completed during the downtime doesn't always take eight hours, the estimated amount of time that your environments are down is always communicated. For more information, see Get support for finance and operations apps or Lifecycle Services.

High-availability features

To ensure service availability, all production environments use default Azure high availability (HA) features. HA functionality provides ways to avoid downtime caused by the failure of a single node within a datacenter, and DR features protect against outages that broadly impact an entire datacenter. Azure availability sets prevent single-point-of-failure events. For more information about Azure availability sets, see Use availability zones to protect from datacenter level failures. High availability for databases is supported through Azure SQL. For more information, see Overview of business continuity with Azure SQL Database.

Database backup retention

For Microsoft-managed or self-service Tiers 2-5 environments, Azure SQL takes automated backups every few minutes. You can restore these backups by using Lifecycle Services point-in-

time restore capability up to 14 days in the past. For production type environments, you can restore backups up to 28 days in the past. For Tier 1 or customer-managed environments, database backups aren't automatic and need to be taken manually as often as required.

Disaster recovery features

Production environments are configured with Azure disaster recovery support that includes the following features:

- Azure SQL active-geo replication is configured for the finance and operations database of the production environment. For more information about SQL replication, see Compare geo-replication with failover groups.
- Geo-redundant copies of Azure blob storage (containing document attachments) in other Azure regions. For more information, see Azure Storage redundancy.
- Same secondary region for the Azure SQL and Azure blob storage replication.

Only primary data stores are supported by replication. The Financial reporting services and Entity store database use transformed data from the primary database and must be generated after the recovery site is set up and the finance and operations service starts.

Service availability in Azure regions

You can deploy finance and operations apps to a subset of Microsoft Azure datacenters by using Dynamics Lifecycle Services. Azure is generally available in datacenters and geographical locations around the world. By using finance and operations apps, you can specify the region or datacenter where you want to store your customer data. Microsoft might replicate data to other regions for data durability, but it doesn't replicate or move customer data outside the geographical location. For more details, see Service description for finance and operations apps.

> **ⓘ Important**
>
> Regardless of where customer data is stored, Microsoft doesn't control or limit the locations from which customers or their end-users can access it. For more information, see the following articles:
>
> - Dynamics 365 Finance, Supply Chain Management, and Commerce in local geographies

- Dynamics 365 Finance, Supply Chain Management, and Commerce in US Government Community Cloud (GCC)
- Dynamics 365 Finance, Supply Chain Management, and Commerce operated by 21Vianet in China

Frequently asked questions

Why does the status display 'Maintenance' on my environment in Lifecycle Services?

To provide the best experience and performance, Microsoft performs maintenance operations on your environment. During some of these maintenance operations, your environment status might display one of the following statuses:

- Preparing for maintenance
- Prepared for maintenance
- Maintenance in progress

While your environment is in this state and until the status returns to 'Deployed', you can't perform any lifecycle operations, such as package applications. There's no impact to finance and operations apps. Users can continue with normal operations without any service interruption. You receive an email notification before any maintenance operation puts your environment in this state.

How do I connect to the SQL database on my sandbox environment?

To connect to the SQL database in your sandbox environment, follow the steps in Enable just-in-time access.

How do I access a development instance?

For information about how to access development instances, configure on-premises development VMs, and find configuration settings for developers and administrators, see Deploy and access development environments.

How do I deploy a demo environment?

A demo environment includes only Microsoft demo data. Use a demo environment to explore default features and functionality. For more information, see Deploy a demo environment.

How do I move my customizations between environments?

To move customizations from a development environment to a sandbox or production environment, see Create deployable packages of models.

Can I bring my own domain name?

You can bring your own domain name if it's running Microsoft Entra ID, and the administrator of your Microsoft Entra instance enables the finance and operations apps within their Microsoft Entra ID. This configuration is usually done through the office email, after you buy a license. When you click the link to accept the offer, Microsoft Entra ID is set up for you.

Can I add guest Microsoft Entra accounts as users?

You can add guest Microsoft Entra accounts if you correctly configure them within Microsoft Entra and enable the finance and operations apps within your Microsoft Entra.

Why am I no longer able to see the Private AOS machines in one or more of my Tier 2 through Tier 5 sandbox environments?

The Private AOS VMs were part of your environment configuration as they secured communication between the AOS and BI machines. With recent updates, all communication between AOS and BI machines is secure directly and no longer needs the intermediary Private AOS machines. Therefore, Microsoft is in the process of rolling out removal of the Private AOS machines. As the removal process rolls out in batches, you might notice that only some of your environments have the Private AOS machines removed. This change doesn't impact functionality or security in any way and is transparent to you.

Why can't I use Remote Desktop to connect to one or more of my Tier 1 through Tier 5 Microsoft-managed sandbox environments?

Microsoft-managed Tier 1 through Tier 5 sandbox environments require Remote Desktop management endpoints to be restricted to specific IP address sets (allow list). Microsoft regularly validates that the environments are sufficiently restricted. Microsoft reserves the right

to remove any IP address allow list rules that violate the preceding guidelines without notice. You might not be able to use Remote Desktop to connect to your environment for one of these reasons:

- Your current IP address isn't in the allow list.
- Your IP address changed from the IP address listed in the allow list.
- Microsoft deleted the rule containing your IP address from the allow list because it violated a guideline.

To regain access to the environment, add the IP address of the computer you're connecting from. To do this, complete the steps in the Remote Desktop section earlier in this article.

When does the availability of reduced regions go into effect for new onboarding?

Starting August 1, 2020, onboard new projects for finance and operations to the following regions:

- East US
- West US
- Central US

  > **Important**
  >
  > Central US is no longer an option for self-service migrations starting April 1, 2021.

- East US2
- West US2
- West Central US
- North Central US
- South Central US

This change doesn't affect any environments that store their data in the deprecated regions before August 2020. In the near future, there's a transition plan to move customers in the deprecated regions into the reduced regions.

I can't redeploy an environment after deleting it because the environment slot is missing

This issue happens when your license expires. You no longer have the minimum required licenses to get an environment slot. Review your subscription status and reactivate the expired license to enable the redeployment.

What does it mean when some deployment regions options are marked as Data resident region

If you select a region that isn't **Data resident**, you see a warning that the selected region for environment deployment isn't the same as where Lifecycle Services stores the project data.

For example, when you use the global Lifecycle Services endpoint, the project data is stored in the United States. The available regions that show Data Resident include:

- brazilsouth
- uscentral
- useast
- uswest

> **Note**
>
> Brazil South is only included in this list due to business and disaster recovery scenarios. Environments deployed to Brazil South might fail over to US Central in the event of a disaster. Environments deployed in US regions only fail over to other US regions in the event of a disaster.

For information about migrating Lifecycle Services project data to a different geography, see Project migration manager.

Last updated on 04/03/2026

System requirements for cloud deployments

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article lists the system requirements for the current version of finance and operations apps. Verify that your system meets or exceeds the minimum network, hardware, and software requirements.

Supported web browsers

Users can access the apps by using the most recent versions of these popular browsers:

- Microsoft Edge (recommended: Chromium-based Microsoft Edge)
- Google Chrome
- Apple Safari
- Internet Explorer 11 (deprecated, not recommended)

To find the latest release for each web browser, go to the software manufacturer's website.

> **Note**
>
> For optimal performance and an optimal experience, use the latest version of a modern browser, especially Microsoft Edge.
>
> **Version 10.0.21 and later:** Users of old versions of Microsoft Edge and Google Chrome (version 83 and earlier) receive prompts to update their browser to the latest version.

Internet Explorer deprecation

Support for Internet Explorer 11 was deprecated in December 2020, and support for the browser ended in August 2021. For more information, see Internet Explorer deprecation announcement.

Starting in version 10.0.20, users accessing finance and operations apps with Internet Explorer see notifications about the end of support for that browser. Before August 17, 2021, Internet Explorer users saw an informational message that Internet Explorer support was soon ending. After that date, Internet Explorer users saw a warning that support officially ended. Organizations should keep these notifications on unless Internet Explorer is mandated for your users. If Internet Explorer is mandated, you can choose to suppress these notifications by disabling the **Internet Explorer end-of-support notifications** feature and relying on internal processes for migrating your user base to Microsoft Edge or another modern browser.

Starting in version 10.0.25, the use of Internet Explorer 11 is blocked in finance and operations apps. If your organization wants to block Internet Explorer earlier, and you're using version 10.0.21 or later, contact Microsoft Support.

To prepare organizations and users for the upcoming block of Internet Explorer, in January 2022, Internet Explorer users started to receive a non-dismissible error message that states that Internet Explorer support will soon be blocked. This error message is **not** controlled by the **Internet Explorer end-of-support notifications** feature. Customers must contact Microsoft Support if this message must be suppressed for their organization.

Special considerations

- To enable Task Recorder to capture screenshots and include them in Microsoft Word documents that it generates, you must install a prerelease Chrome extension.
- The Workflow Editor and Report Designer for Financial reporting start as ClickOnce applications. They require a 64-bit-compatible operating system. Only Microsoft Edge and Internet Explorer (on a supported version of Microsoft Windows) support ClickOnce applications out of the box. If you're using Chrome, you must install a ClickOnce extension, such as Meta4 to use ClickOnce applications. If you use Chrome in incognito mode, make sure that the ClickOnce extension is also enabled for incognito mode.
- To preview PDF files, use browsers such as Microsoft Edge (latest publicly available version) on Windows 10, or Google Chrome (latest publicly available version) on Windows 10, Windows 8.1, Windows 8, Windows 7, or Google Nexus 10 tablet.

Network requirements

- The app is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the Microsoft Azure datacenter that hosts the app. Test network latency at AzureSpeed.com.
- Bandwidth requirements for the app depend on your scenario. Most typical scenarios require a bandwidth that is more than 50 kilobytes per second (KBps). However, you need

more bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization.

In general, the app is optimized for the internet. The number of round trips from a browser client to the Azure datacenter is very small, and the whole payload is compressed.

> ⚠ **Warning**
>
> Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. If you're concerned about bandwidth requirements, use a preview version of the app.

.NET Framework requirements

The app requires the Microsoft .NET Framework version 4.6.2 for all ClickOnce applications, such as the document routing agent. For installation instructions, see Install the .NET Framework for developers.

Supported Microsoft Office applications

The following Microsoft Office applications are supported in the cloud:

- To run the Microsoft Excel and Word add-ins, you must have Microsoft Office 2016 for Windows installed. For more information about version requirements, see Troubleshoot the Office integration.
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

Requirements for development on local VMs

For information about the requirements for development on local virtual machines (VMs), see VM that is running locally.

Database collation

The only supported collation for application databases in the cloud is **SQL_Latin1_General_CP1_CI_AS**. Make sure that your SQL Server and database collations in

development environments are set to this collation. Also ensure that any configuration environments that you publish to Sandbox use this same collation.

On-premises deployment home page

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can deploy Dynamics 365 Finance + Operations (on-premises). When you choose an on-premises deployment type, the system requirements, hardware sizing, and functionality differ from a cloud deployment. This article provides links to content that contains information specific to on-premises deployments.

Get started

- On-premises deployment overview
- Plan and prepare for on-premises deployments
- System requirements for on-premises deployments
- Microsoft Dynamics 365 Finance + Operations (on-premises), Microsoft Dynamics 365 Finance, and Microsoft Dynamics 365 Supply Chain Management supported software
- Hardware sizing requirements for on-premises environments
- Buy Finance + Operations (on-premises)
- Comparison of cloud and on-premises features

Onboard

- Set up on-premises projects in Lifecycle Services
- Configure the infrastructure scripts for your Finance + Operations (on-premises) deployment
- Set up and deploy on-premises environments (Application 10.0.32 and later)
- Set up and deploy on-premises environments (Platform update 41 through 55)
- Install network printer devices in on-premises environments
- Configure SQL Server Reporting Services for on-premises deployments
- Develop and deploy custom models to on-premises environments

Work in your on-premises deployment

- Configure high availability for SQL Server Reporting Services (SSRS) nodes
- Configure document management
- Import Electronic reporting (ER) configurations
- Document generation, publishing, and printing in on-premises deployments
- Configure proxies for on-premises environments
- Set up technical support for finance and operations apps
- Client internet connectivity
- Apply updates to on-premises deployments
- Redeploy on-premises environments
- Reuse the same AD FS instance for multiple environments

Commerce

- Commerce capabilities that are available in on-premises deployments
- Installation steps for Retail channel components in an on-premises environment
- Configure, install, and activate Modern POS (MPOS)
- Configure and install Commerce Scale Unit

Upgrade

- In-place upgrade process for on-premises environments

Other resources

- Troubleshoot on-premises deployments
- Scripts for resolving issues in on-premises environments
- Certificate rotation
- On-premises diagnostics
- Removed or deprecated features for finance and operations
- Software lifecycle policy and on-premises releases

Last updated on 04/02/2026

System requirements for on-premises deployments

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article lists the system requirements for the current version of Microsoft Dynamics 365 Finance + Operations (on-premises) deployments. Verify that the system that you're working with meets or exceeds the minimum network, hardware, and software requirements.

> **Important**
>
> Dynamics 365 Finance + Operations (on-premises) is not supported on any public cloud infrastructure, including Microsoft Azure Cloud services. However, it is supported to run on Microsoft Azure Stack HCI and Microsoft Azure Stack Hub.

Network requirements

Dynamics 365 Finance + Operations (on-premises) can work on networks that use Internet Protocol Version 4 (IPv4) or Internet Protocol Version 6 (IPv6). Consider the network environment when you plan your system, and use the following guidelines.

Network response time

The following table lists the minimum network requirements for the connection between the web browser and Application Object Server (AOS), and for the connection between AOS and the database in an on-premises system.

Expand table

Value	Web browser to AOS	AOS to database
Bandwidth	50 kilobytes per second (KBps) per user	100 megabytes per second (MBps)
Latency	Less than 250–300 milliseconds (ms)	Less than 1 ms (local area network [LAN] only). AOS and the database must be co-located.

- Finance + Operations is designed for networks that have a latency of 250–300 milliseconds (ms) or less. This latency is the latency from a browser client to the datacenter that hosts Finance + Operations.
- Bandwidth requirements depend on your scenario. Typical scenarios require a bandwidth of more than 50 KBps between the browser and the server. However, we recommend higher bandwidth for scenarios that have high payload requirements, such as scenarios that involve workspaces or extensive customization. The specific amount of bandwidth depends on use.

Deployments where AOS and the Microsoft SQL Server database are in different datacenters aren't supported. AOS and the SQL Server database must be co-located.

In general, Finance + Operations is optimized to reduce browser-to-server round trips. The number of round trips from a browser client to the datacenter is either zero or one for each user interaction, and the payload is compressed.

> ⚠ **Warning**
>
> Don't calculate bandwidth requirements from a client location by multiplying the number of users by the minimum bandwidth requirements. The concurrent usage of a given location is very difficult to calculate. We recommend that you use a real-life simulation against a non-production environment as the best gauge of performance for your specific case.

LAN environments

In LAN environments, Microsoft Remote Desktop in Microsoft Windows Server isn't required in order to connect to Finance + Operations. However, Remote Desktop might be required for servicing operations on the virtual machines (VMs) that make up the server deployments.

WAN environments

In wide area network (WAN) environments, Remote Desktop in Windows Server isn't required in order to connect to Finance + Operations.

Internet connectivity requirements

Finance + Operations doesn't require internet connectivity from user workstations. However, some features won't be available if there is no internet connectivity.

Expand table

Browser client	An intranet scenario without internet connectivity is a design point for the on-premises deployment option. Some features that require cloud services won't be available, such as Help and Task guide libraries in Microsoft Dynamics Lifecycle Services.
Server	The orchestrator node types must be able to communicate with Lifecycle Services for deployment and servicing operations. The on-premises browser-based client doesn't require internet access.
Telemetry	Telemetry data might be lost if there are long interruptions in connectivity. Interruptions in connectivity to Lifecycle Services don't affect the on-premises application functionality.

Telemetry data transfer to the cloud

Most telemetry data is stored locally and can be accessed by using Event Viewer in Microsoft Windows. A small subset of telemetry events are transferred to the Microsoft telemetry pipeline in the cloud for diagnostics. Customer data and user-identifiable data aren't part of the telemetry data that is sent to Microsoft. VM names are sent to Microsoft to help with environment management and diagnostics from the Lifecycle Services portal.

Domain requirements

Consider the following domain requirements when you install Finance + Operations:

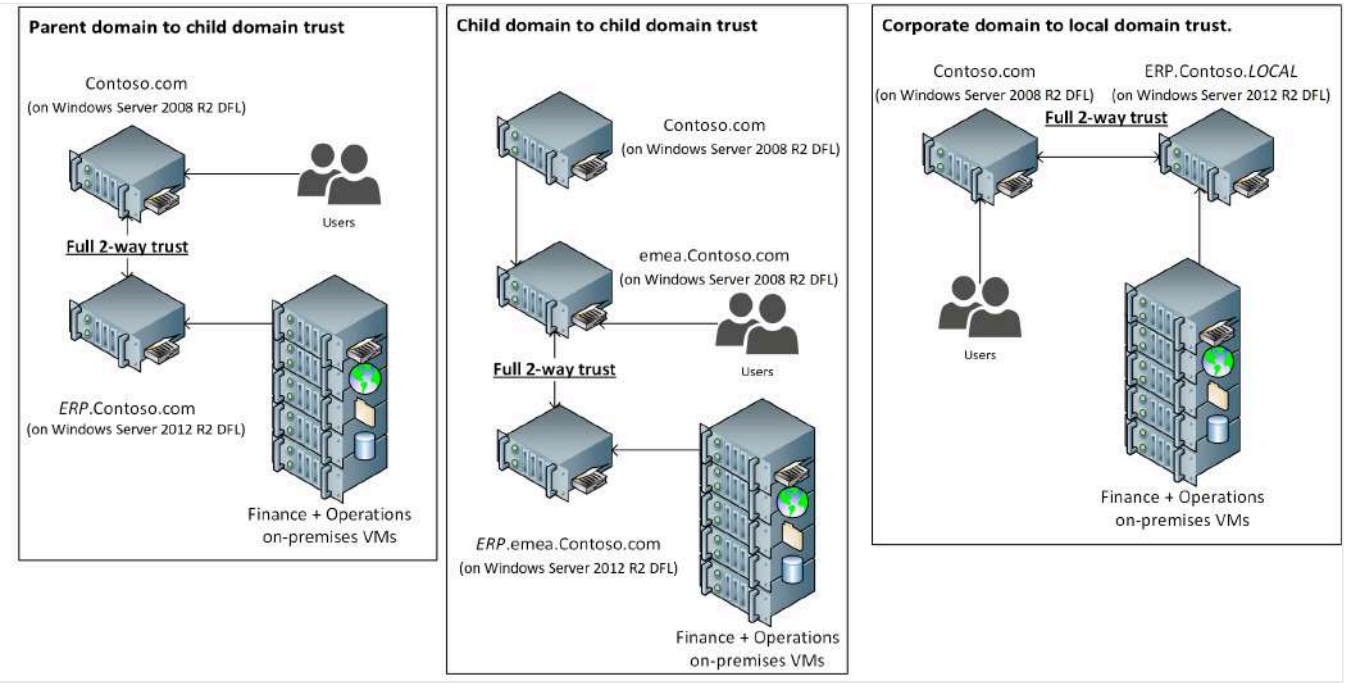
- VMs that host Finance + Operations components must belong to an Active Directory domain. Active Directory Domain Services (AD DS) must be configured in native mode.
- VMs that run Finance + Operations components must have access to each other. This access is configured in AD DS.
- The domain controller must be Microsoft Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more.

Full 2-way trust

For compatibility with corporate domain controllers on Windows Server 2008 R2 domain functional level (DFL), a full 2-way trust between the Windows Server 2008 R2 DFL user domain and the Windows Server 2012 R2 DFL Finance + Operations service domain is supported.

This means that users of the Finance + Operations (on-premises) application will come from the Windows Server 2008 R2 DFL domain, and the resources and service accounts hosting the Finance + Operations (on-premises) infrastructure and services will come from the Windows Server 2012 R2 DFL domain.

Examples for a full 2-way trust setup could be.



Known limitations with using the full 2-way trust setup

- Import of security groups from the Windows Server 2008 R2 user domain is not supported.

Hardware requirements

This section describes the hardware that is required in order to run Finance + Operations.

The actual hardware requirements vary, based on the system configuration, the data composition, and the features that you decide to use. Here are some of the factors that can affect the choice of appropriate hardware:

- The number of transactions per hour

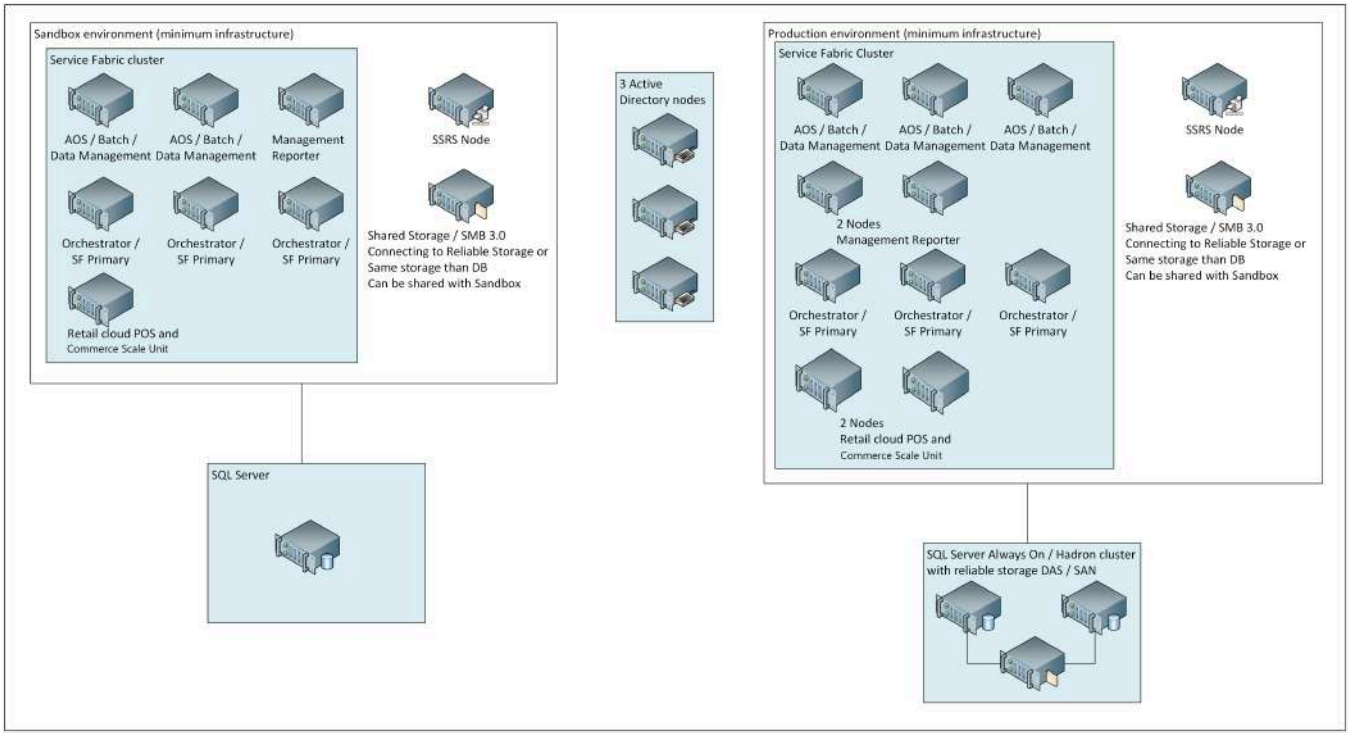
- The number of concurrent users
- Integration loads

Minimum infrastructure requirements

Finance + Operations uses Service Fabric to host the AOS, Batch, Data management, SQL reporting, Management reporter, and Environment orchestrator services.

SQL Server must have a high-availability HADRON setup that has at least two nodes for production use.

The following illustration shows the minimum number of nodes that is recommended for your Service Fabric cluster.



Processor and RAM requirements

The following tables list the number of processors and the amount of random-access memory (RAM) that are required for each role that is required in order to run this deployment option. For more information, see the recommended minimum requirements for a Service Fabric standalone cluster in Plan and prepare your Service Fabric cluster.

> **Note**
>
> If other Microsoft software is installed on the same computer, the system must also comply with the hardware requirements for that software. If other server applications are

installed on the same computer as AOS, we recommend that you limit those server applications 1 gigabyte (GB) of RAM.

Sizing by role and topology type

Expand table

Topology	Role (node type)	Recommended processor cores	Recommended memory (GB)
Production	AOS, Data management, Batch	8	24
	SSIS	4	16
	Management Reporter	4	16
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32
Sandbox	AOS, Data management, Batch	4	24
	SSIS	4	16
	Management Reporter	4	16
	SQL Server Reporting Services	4	16
	Orchestrator	4	16
	SQL Server	8	32

Minimum sizing estimates for production and sandbox deployments

Expand table

Topology	Role	Number of instances
Production	AOS (Data management, Batch)	3
	SSIS	2

Topology	Role	Number of instances
	Management Reporter	2
	SQL Server Reporting Services	1
	Orchestrator**	3
	SQL Server	2
Sandbox	AOS, Data management, Batch	2
	SSIS	1
	Management Reporter	1
	SQL Server Reporting Services	1
	Orchestrator	3
	SQL Server	1
Summary for production and sandbox topologies		*22*

* The recommended hardware sizes are general guidelines only. Actual hardware requirements may vary based on specific customer processes, customizations, transaction volumes, and workloads. We strongly recommend that customers conduct thorough testing of any proposed configurations as part of a comprehensive performance evaluation exercise.

** Orchestrator is designated as the primary node type and will also be used to run the Service Fabric services.

Initial estimates for the back-end SQL Server and AD DS

I was unable to convert this HTML table due to its complexity (use of rowspan and colspan attributes). You can try converting it with another AI model.

Expand table

	Role	VMs/instances	Cores	Total cores	Memory per instance (GB)	Total memory (GB)
Shared infrastructure	SQL Server*	2	8	16	32	64

	Role	VMs/instances	Cores	Total cores	Memory per instance (GB)	Total memory (GB)
	File server/Storage area network/Highly available storage	The back-end storage must be based on solid-state drives (SSDs) on a runtime storage area network (SAN). Size and input/output operations per second (IOPS) throughput is based on the size of the workload.				
	Active Directory	3	4	12	16	48
Summary for shared infrastructure		*5*		*28*		*112*

* SQL Server sizes are highly dependent on workloads. For more information, see Hardware sizing requirements for on-premises environments. Separate SQL Server machines for sandbox and production environments must be used. However, SQL Server can be shared in all sandbox environments.

Storage

- **AOS & SSIS** – Finance + Operations uses a Server Message Block (SMB) 3.0 share to store unstructured data. For more information, see Storage Spaces Direct in Windows Server 2016.
- **SQL** – The following options are viable:
  - A highly available SSD setup
  - A SAN that is optimized for online transaction processing (OLTP) throughputs
  - High-performance direct-attached storage (DAS)
- **SQL Server and data management IOPS** – The storage for both data management and SQL Server should have at least 2,000 IOPS. Production IOPS depends on many factors. For more information, see Hardware sizing requirements for on-premises environments.
- **VM IOPS** – Each VM should have at least 100 write IOPS.

Virtual host requirements

When you set up the virtual hosts for an environment, see the guidelines in Plan and prepare your Service Fabric cluster and Describing a service fabric cluster. Each virtual host should have enough cores for the infrastructure that is being sized. Multiple advanced configurations are

possible, where SQL Server resides on physical hardware but everything else is virtualized. If SQL Server is virtualized, the disk subsystem should be a fast SAN or the equivalent. In all cases, make sure that the basic setup of the virtual host is highly available and redundant. In all cases, when virtualization is used, no VM snapshots should be taken.

> **Important**
>
> Do not use Dynamic Memory for your virtual hosts.

Finance + Operations falls under Microsoft's standard support policy regarding operation on non-Microsoft virtualization platforms – specifically VMware. For more information, read Support policy for Microsoft software. In short, we support our products in this environment, but if we are asked to investigate an issue, we may ask the customer to first reproduce the problem without the virtualization platform or on the Microsoft virtualization platform.

Software requirements for all server computers

The following software must be present on a computer before any Finance + Operations components can be installed:

- The Microsoft .NET Framework. See Deployment setup for version information.
- Service Fabric

For more information about Service Fabric, see Plan and prepare your Service Fabric cluster.

> **Note**
>
> For supported versions, see Microsoft Dynamics 365 Finance + Operations (on-premises), Microsoft Dynamics 365 Finance, and Microsoft Dynamics 365 Supply Chain Management supported software.

Software requirements for database servers

For the hardware requirements for SQL Server, see Hardware and Software Requirements for Installing SQL Server. |

- Only 64-bit versions of SQL Server are supported.
- Only **SQL_Latin1_General_CP1_CI_AS** is valid for the server and database collation. For more information about how to select a collation for a SQL Server database, see the SQL

Server documentation.

- In a production environment, we recommend that you install the latest cumulative update (CU) for the version of SQL Server that you're using.

Software requirements for Application Object Server (AOS)

- [Optional] SQL Server Integration Services (SSIS)
  - If you are using a dedicated SSIS node, you don't need to install SSIS on the AOS nodes.

Software requirements for Reporting Server (BI)

- SQL Server Reporting Services (SSRS)

Software requirements for SQL Server Integration Services (SSIS)

- SQL Server Integration Services (SSIS)

Software requirements for client computers

Users can access Finance + Operations by using the most recent versions of these popular browsers:

- Microsoft Edge (recommended: Chromium-based Edge)
- Google Chrome
- Apple Safari

> **Note**
>
> For optimal performance and an optimal experience, we recommend that you use the latest version of a modern browser, especially Microsoft Edge.

Special considerations

- To enable Task Recorder to capture screenshots and include them in Microsoft Word documents that are generated, you must install a pre-release Chrome extension.
- The Workflow Editor and Report Designer for Financial reporting are started as ClickOnce applications. They require a 64-bit-compatible operating system. Only Microsoft Edge

and Internet Explorer (on a supported version of Microsoft Windows) support ClickOnce applications out of the box. If you're using Chrome, you must install a ClickOnce extension, such as Meta4 to use ClickOnce applications. If you use Chrome in incognito mode, make sure that the ClickOnce extension is also enabled for incognito mode.
- To preview PDF files, we recommend that you use browsers such as Microsoft Edge (latest publicly available version) on Windows 10, or Google Chrome (latest publicly available version) on Windows 10, Windows 8.1, Windows 8, Windows 7, or Google Nexus 10 tablet.

Software requirements for Active Directory Federation Services

Active Directory Federation Services (AD FS) on Windows Server is required.

The domain controller must be Windows Server 2012 R2 or later, and the domain functional level must be 2012 R2 or more. For more information about domain functional levels, see the following pages:

- What Are Active Directory Functional Levels
- Understanding Active Directory Domain Services Functional Levels
- Full 2-way trust

Supported Microsoft Office applications

The following Microsoft Office applications are supported in on-premises deployments:

- To run the Microsoft Excel and Microsoft Word add-ins, you must have Microsoft Office 2016 for Windows (or newer) installed. For more information about version requirements, see Troubleshoot the Office integration.
- To view documents that are generated by the Export to Excel or Export to Word functionality, you must have Microsoft Office 2007 or later installed.

Hardware and software requirements for Commerce components

Currently, Finance + Operations doesn't include the Commerce components.

Last updated on 04/10/2026

Buy Finance + Operations (on-premises)

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Microsoft Dynamics 365 Finance + Operations (on-premises) offers various license types to best suit the needs of your organization. To better understand how Finance + Operations (on-premises) is licensed, work with your partner, who can access the Licensing guide. When you're ready to purchase licenses for your organization, work with your partner to follow the steps that are outlined in this article.

> **Important**
>
> On-premises environments aren't supported on any public cloud infrastructure, including Azure. However, they support running on Microsoft Azure Stack HCI and Microsoft Azure Stack Hub.

Purchase a Dynamics 365 cloud subscription license

Thanks to the dual use rights that are mentioned in the Licensing guide, you can use a Dynamics 365 cloud subscription license to deploy Finance + Operations (on-premises).

For information about how to purchase a subscription, see Buy and manage a subscription. After you have a subscription, follow these steps to create your on-premises implementation project.

Get started with Lifecycle Services

When you purchase a subscription, you assign it to your Microsoft Online Services ID. You need the Microsoft Online Services ID to provision and register Microsoft Dynamics 365 applications. Use the Microsoft Online Services ID to provision a Microsoft Dynamics Lifecycle Services project that contains the necessary artifacts for on-premises environments. Lifecycle Services is the service where you provision on-premises environments, create and upload business

process models, make hotfixes available, enter and manage support cases, validate subscriptions, and so on.

Before you can create your Lifecycle Services project and begin creating on-premises environments, follow the Provisioning guide to obtain an on-premises license.

If you have an existing Microsoft Online Services trial or paid subscription, you already have a Microsoft Online Services ID that you created at the time of sign-up. When you sign in to Lifecycle Services, select to use this account for sign-in if you want to use the same Microsoft Entra tenant for the on-premises environment.

After you sign in to Lifecycle Services, a cloud project is automatically provisioned for you. However, you need an on-premises project. To create a new on-premises project, follow the Start a new Lifecycle Services project guide and select the **On-premises implementation** project type. The Lifecycle Services project lets you deploy an on-premises environment. For more information about how to get started with your Lifecycle Services project, see Set up on-premises projects in Lifecycle Services.

Purchase a Dynamics 365 Finance + Operations (on-premises) license

Purchase client access licenses

To run on-premises environments, you must obtain the proper number of client access licenses (CALs) for your organization per the licensing guide. The CAL you purchase for an individual user determines the functionality that the user has the rights to use. You can purchase user CALs from the Microsoft Volume Licensing Service Center.

Purchase server licenses

You need a server license for every server that runs Finance + Operations (on-premises). After you purchase your server licenses, work with your partner to download a license file from the PartnerSource Business Center. Keep this license file handy, because you use the details that it contains when you set up your Lifecycle Services project.

Partners can download a customer's Finance + Operations (on-premises) license file from the PartnerSource Business Center by using these steps:

1. Sign in to the PartnerSource Business Center.
2. Enter the customer name or account number in the **Find A Customer** field, and then select **Search**.

3. Select the company name of the customer. The **Customer Summary** page opens.
4. Under **Registered Products**, select **Registration Keys**.
5. Select **version 07** in the **Request and Display License Keys For Version** field.
6. Select **Display License Keys**.
7. On the **Request License Keys** page, select **Download Current License/Registration Key**.
8. Select **Save As** in the **File Download** dialog box, select the folder where you want to download the license file to in the **Save As** dialog box, and then select **Save**.

> **Note**
>
> If you can't see registration keys in PartnerSource Business Center, make sure that **Can See Registration Keys** is set to **Yes** in your PartnerSource Business Center profile.

Get started with Lifecycle Services

To purchase Finance + Operations (on-premises), you must have a Microsoft Online Services ID. Use the Microsoft Online Services ID to provision a Lifecycle Services project that contains the necessary artifacts for on-premises environments. In Lifecycle Services, you can provision on-premises environments, create and upload business process models, make hotfixes available, enter and manage support cases, submit license key serial number activations, and more.

You need a Microsoft Online Services ID to provision and register Finance + Operations (on-premises) into entity-owned hardware and environment. See the Provisioning guide to complete the provisioning and registration process. If a Microsoft Online Services ID already exists, the tenant administrator must complete the process. If you're creating a Microsoft Online Services ID for the first time, you're the tenant administrator.

If you have an existing Microsoft Online Services trial or paid subscription, you already have a Microsoft Online Services ID that you created at the time of sign-up. Choose to sign in with this account if you want to use this same Microsoft Entra ID tenant for the on-premises environment. For details, see the Provisioning guide.

After you sign in to Lifecycle Services, a project is automatically provisioned for you. The Lifecycle Services project lets you deploy an on-premises environment. For more information about how to get started with your Lifecycle Services project, see Set up on-premises projects in Lifecycle Services.

Help system

Summarize this article for me

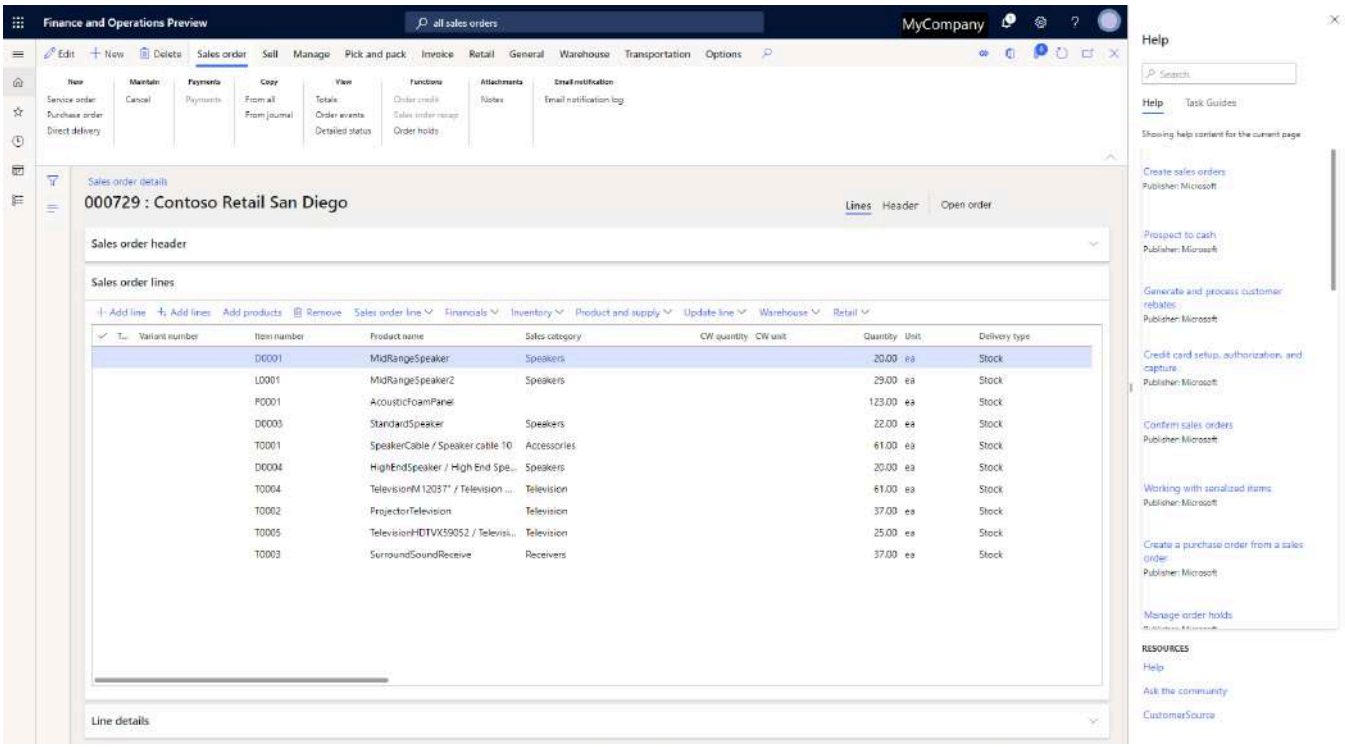
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

Users of the following apps can access context-sensitive Help and other content that is based on the same Help system:

- Dynamics 365 Commerce
- Dynamics 365 Finance
- Dynamics 365 Human Resources
- Dynamics 365 Supply Chain Management

In all these apps, you can access product-specific Help from the **Help** pane.



Help on Microsoft Learn

Microsoft publishes content for the Dynamics 365 apps on the Microsoft Learn site. Get an overview at Microsoft Dynamics 365 documentation. This site offers the following features:

- **Access to the most up-to-date content** – The site gives Microsoft a faster and more flexible way to create, deliver, and update product documentation. Therefore, you have easy access to the latest technical information.
- **Content that is written by experts** – Content on the site is open to contributions by community members both inside and outside Microsoft.

You can find content on Microsoft Learn by using any search engine. For the best results, we recommend that you use a site search, such as **site:learn.microsoft.com dynamics 365 "search term"**.

Find other content

If you land on an article that doesn't answer your question, you can find other content in two ways on Microsoft Learn:

- Use the **Filter by title** field in the table of contents on the left side of the website

  This way, you can filter by words used in the titles of the various articles. For example, type *invoice*, and then choose one of the offered links, such as Apply a payment schedule to the invoice journal or Vendor invoices overview.

Underneath each link, you can see where that article is in the table of contents. That way, you can easily see if the article is in the *Accounts payable* section or in the section for *accounts receivable*, for example.

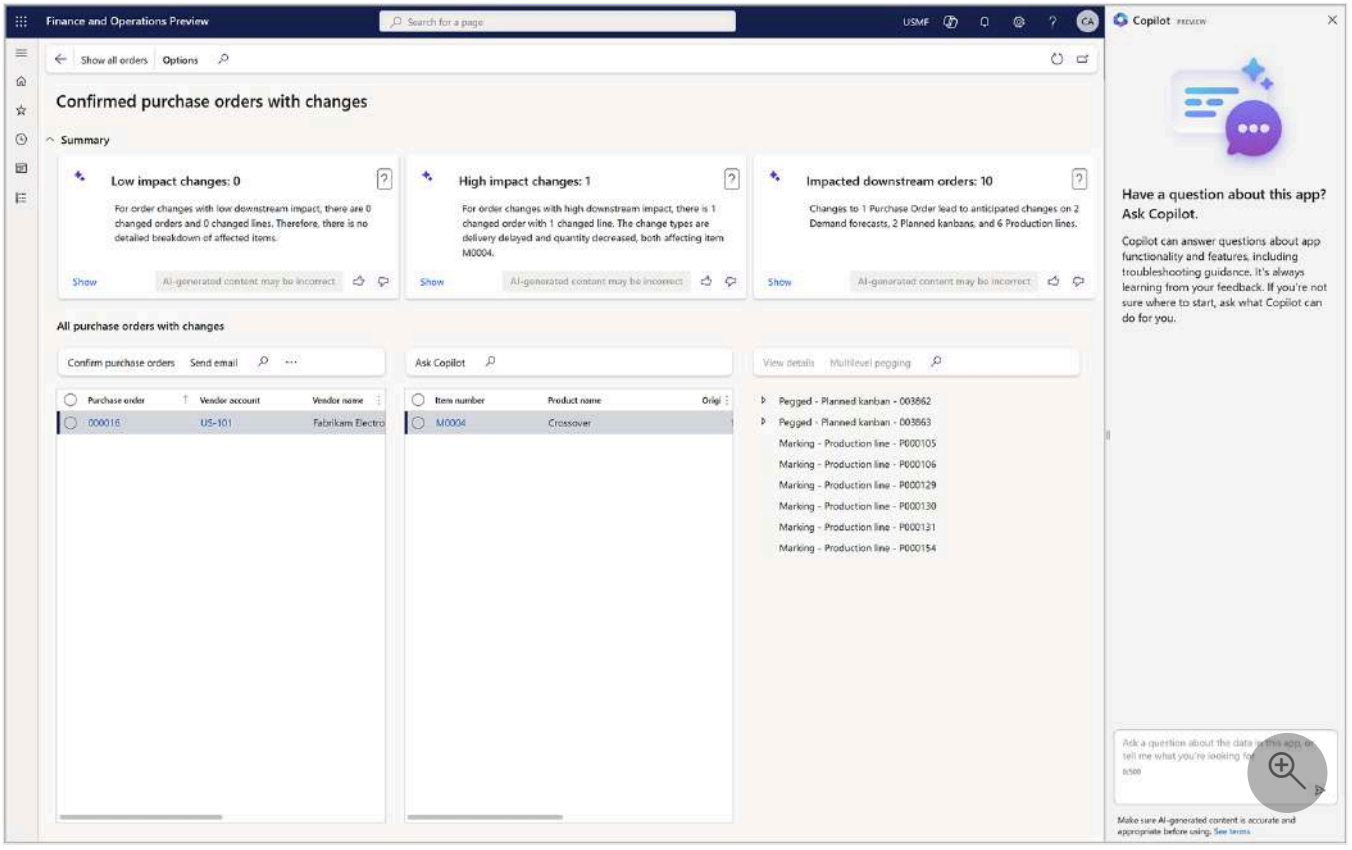
- Use the **Search** field in the top-right corner of the website

  This way, you can search for any term, and you can choose to search for that term in the documentation for a different Dynamics 365 app, for example. The site then searches all the content for that term or expression. Search for *invoice* again, and scroll through the list of hundreds of articles that uses that word somewhere in the text.

Generative help and guidance with Copilot

Generative help and guidance with Copilot provides a conversational guide that's always nearby and ready to help. Users can ask questions in natural language. Copilot then identifies the relevant content in the documentation and composes a targeted response to the question.

After generative help and guidance with Copilot is enabled for your system, users can open the Copilot sidecar by using the **Copilot** button at the top of the page.



For more information, see Generative help and guidance with Copilot.

Get notified about changes through an RSS feed

To subscribe to an RSS feed of all updates made to the content on Microsoft technical documentation across the finance and operations apps, use the following link:

RSS feed

> **Note**
>
> The RSS feed returns a list of the 100 topics most recently updated. The list is sorted by date, but it can take up to a week before the most recently updated articles make it to the list.

Alternatively, you can subscribe to an RSS feed by app:

- Commerce
- Finance
- Human Resources
- Supply Chain
- Talent

Leave us feedback

On the *learn.microsoft.com* website, each documentation article encourages you to provide feedback. We've changed the mechanism a couple of times based on, well, feedback. Currently, we ask you to choose the **Feedback** action below the article's title. You can give the article a rating, and write a comment if you want to. The feedback goes straight to the article's author and the team that owns the docs.

Contribute to the documentation

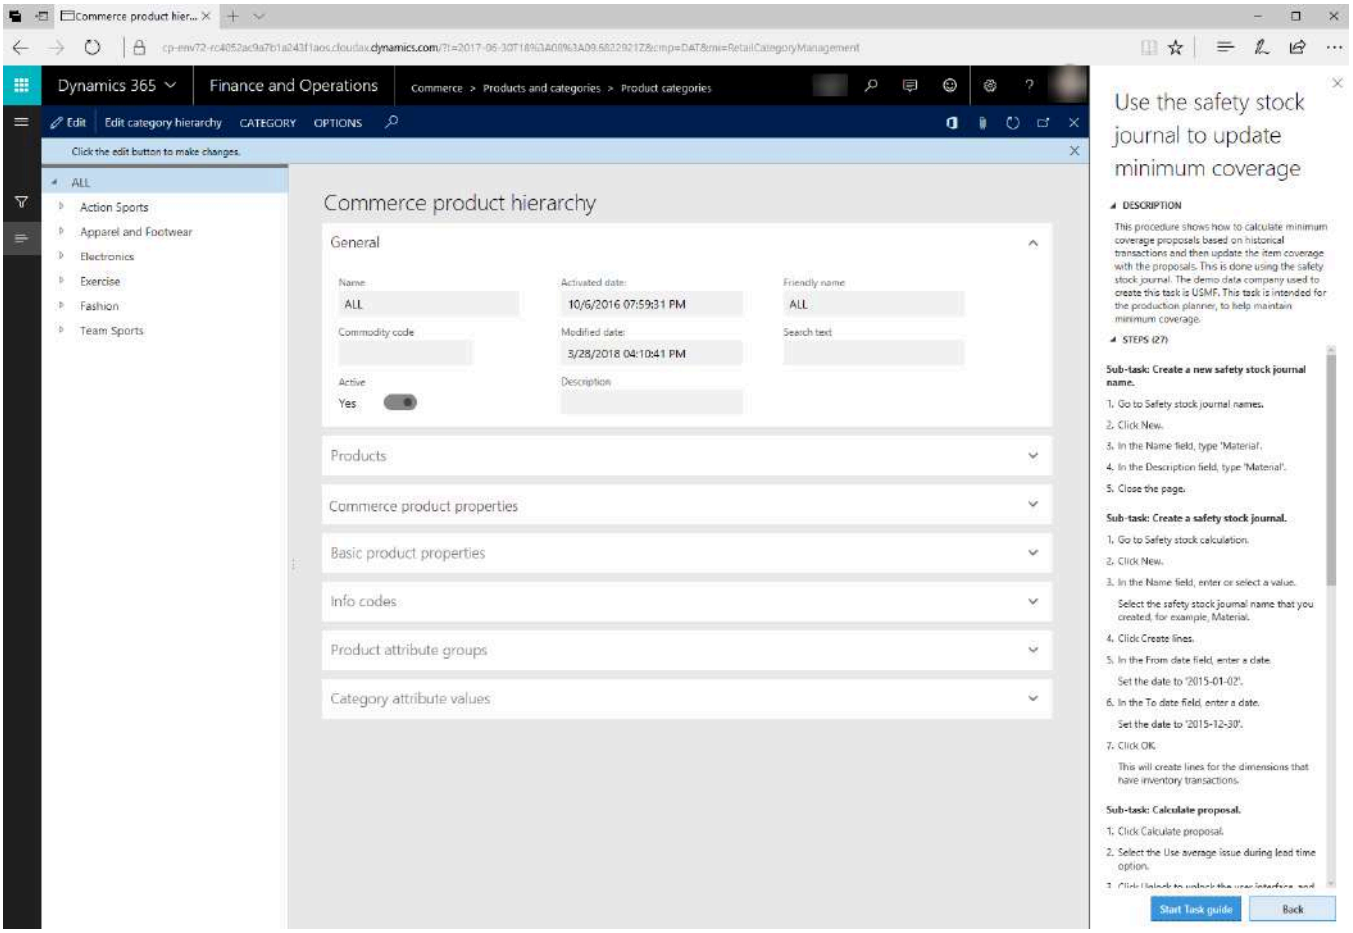
You can contribute and make edits to the documentation. To get started, select the **Edit** button (pencil symbol) on an article. Learn more in the article Contribute to Dynamics 365 documentation.

> **Note**
>
> We only accept contributions to our English content at this time.

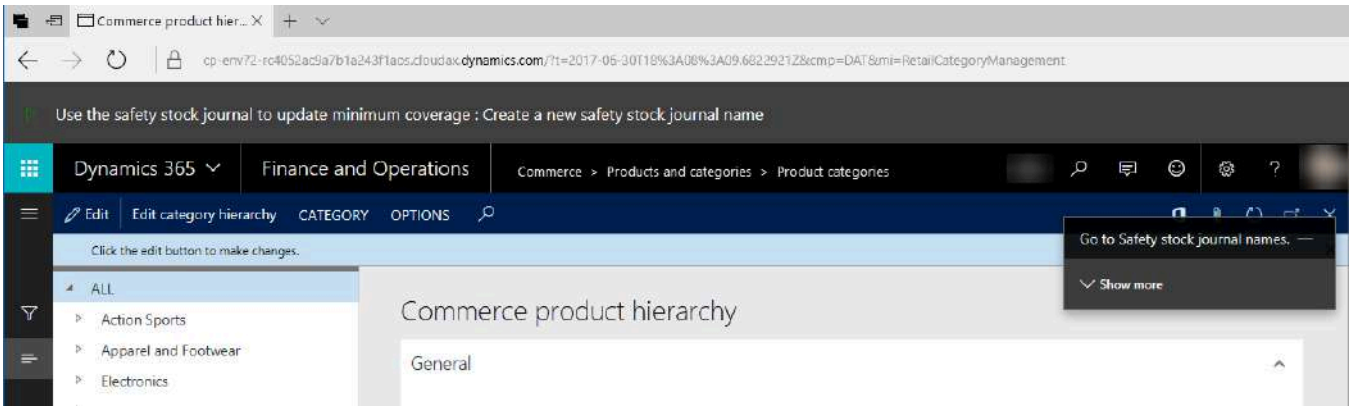
Task guides

A task guide is a controlled, guided, interactive experience that leads you through the steps of a task, or business process. You can open (play) a task guide from the **Help** pane. When you first select a task guide, the **Help** pane will show the step-by-step instructions for the task. Localized task guides are available.

Microsoft released task guide libraries for product versions through the December 2017 release of Dynamics 365 Finance and Operations. The Accessing task guides from the Help pane section of this article explains how to find the correct task guides for your product.



To begin the guided, interactive experience, select **Start task guide** at the bottom of the **Help** pane. A black pointer shows you where to go first. Follow the instructions that appear in the user interface (UI), and enter data as directed.



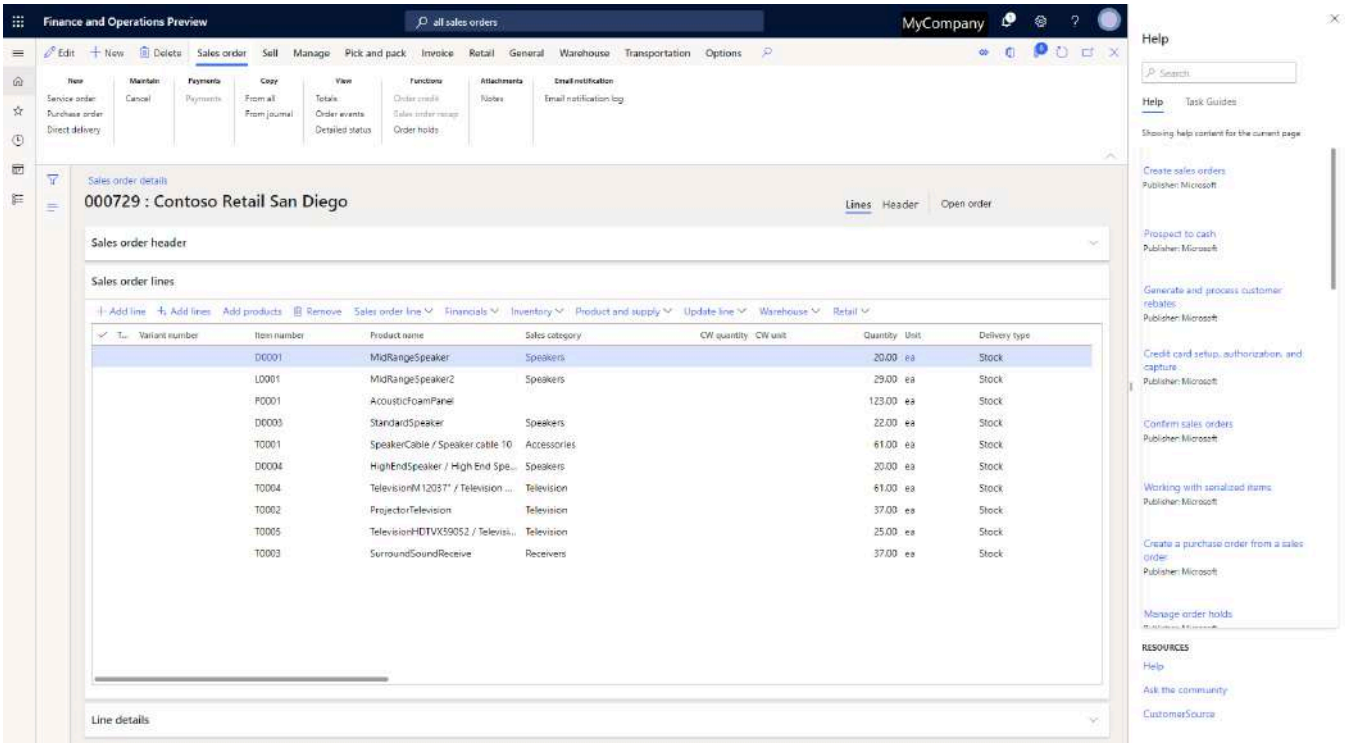
> **ⓘ Important**
>
> The data that you enter when you play a task guide is real. If you're in a production environment, the data will be entered in the company that you're currently using.

You can use Task recorder to create your own custom task guides. For more information, see Create documentation or training with Task Recorder.

In-product Help

Some fields have field descriptions to help users get unblocked when they are uncertain about the data that the field contains, for example. Additionally, the in-product **Help** pane provides context-sensitive access to content that can help users get started, get unblocked, and learn more.

To access Help content, select the **Help** button (**?**), and then select **Help**. Alternatively, press **Ctrl+Shift+?**. In both cases, the **Help** pane appears. From the **Help** pane, you can access conceptual topics or task guides that are relevant to the area of the product that you're currently in.



Accessing Help topics from the Help pane

From the **Help** pane, you can access topics that apply to the client. When you first open the **Help** pane, the **Help** tab shows the topics that apply to the page that you're currently on. If no

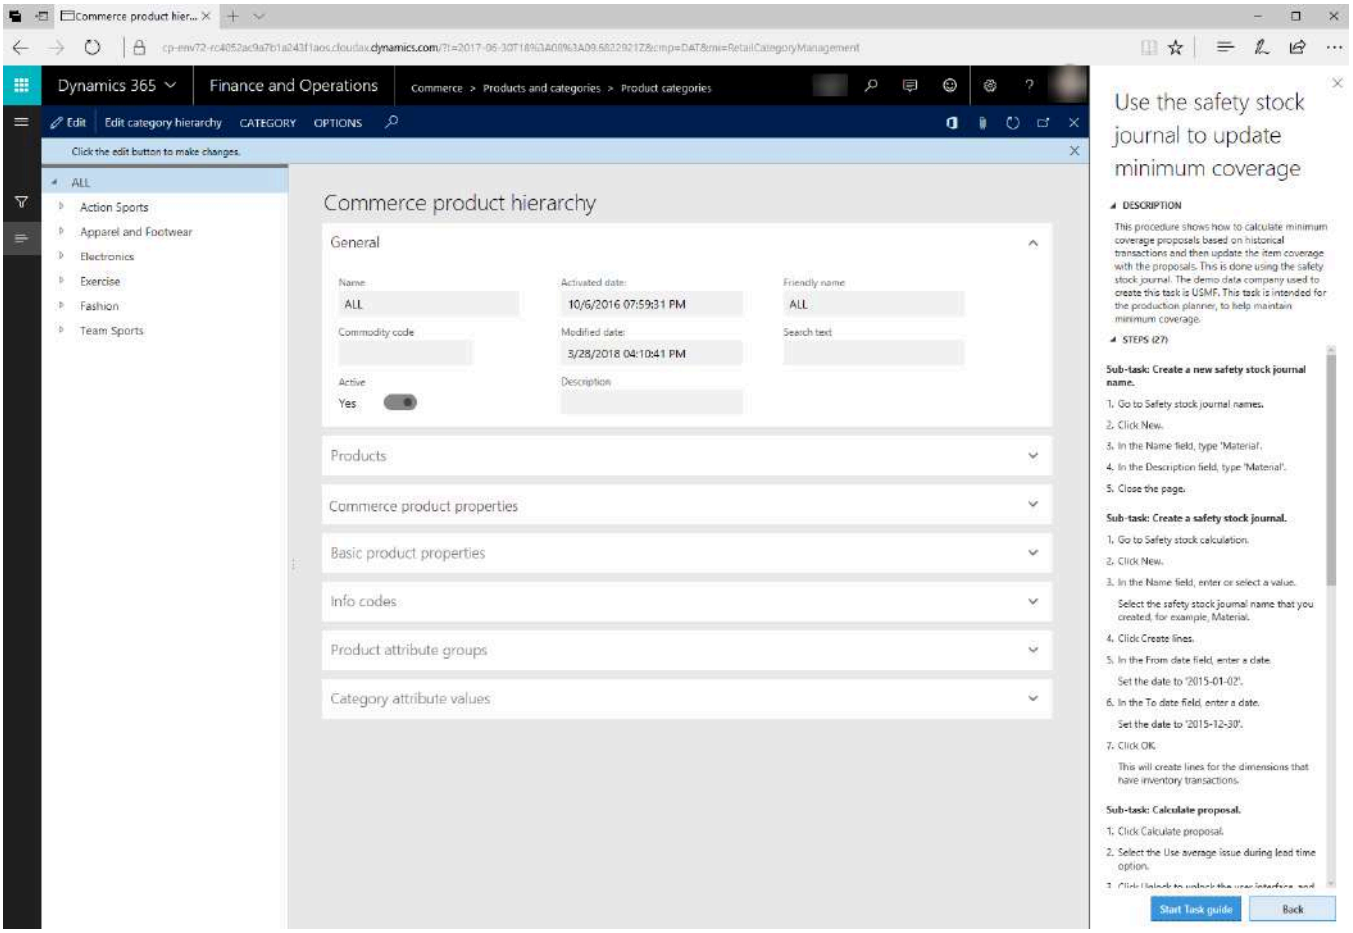
topics are found, you can enter keywords to refine your search. When you select an article in the **Help** pane, it's opened on a new tab in your browser.

> **Important**
>
> This section does not apply to Dynamics 365 Human Resources. The Help system for Human Resources is automatically connected to task guides for the product. Also, you cannot create custom task guides for Human Resources.

Accessing task guides from the Help pane

Before you can access task guides from the **Help** pane, a system admin must configure some settings on the **System parameters** page in Finance, Supply Chain Management, or Commerce. For more information, see Adding task guides.

After a System administrator has completed these steps, you can open the **Help** pane and select the **Task guides** tab. You'll now see the task guides that apply to the page that you're currently on. If no task guides are found, you can enter keywords to refine your search. After you select a task guide in the **Help** pane, the **Help** pane shows the step-by-step instructions, and you can play the task guide.



Where are the translated task guides for Microsoft libraries?

Translated task guides are released in libraries that have "All languages" in the title. To view localized task guide Help, make sure that you're connected to an appropriate library. Each user can change the language that a task guide appears in by changing the language settings under **Options** > **Preferences**.

- If a task guide has been translated, when you open that task guide all the text of the task guide will appear in your selected language.
- If a task guide has not yet been translated, when you open it, only the text of the controls will appear in your chosen language.

Creating custom Help

You can create Help for your users by creating custom task guides or connecting your own website to the **Help** pane. For more information, see the following topics:

- Task recorder resources
- Custom Help overview

Additional resources

The following table lists our websites. Sites that have an asterisk (*) next to the name require that you sign in by using an account that is associated with a service plan.

Expand table

Site	Description
Microsoft Dynamics 365 documentation	This site hosts or links to all product documentation for Dynamics 365.
Microsoft Learn training	This site is the free Microsoft eLearning site.
Microsoft Dynamics Lifecycle Services (LCS) *	This site provides a cloud-based collaborative workspace that customers and partners can use to manage projects from pre-sales to implementation and operations. It's useful in all phases of an implementation.
Previous versions	This site hosts content from previous releases.
Dynamics Community	This site hosts blogs, forums, and videos.
Microsoft.com/dynamics365	This site provides evaluation and sales information.

Site	Description
The Dynamics 365 guidance hub	This site hosts or links to resources that can help with Dynamics 365 implementation projects.

Last updated on 03/10/2026

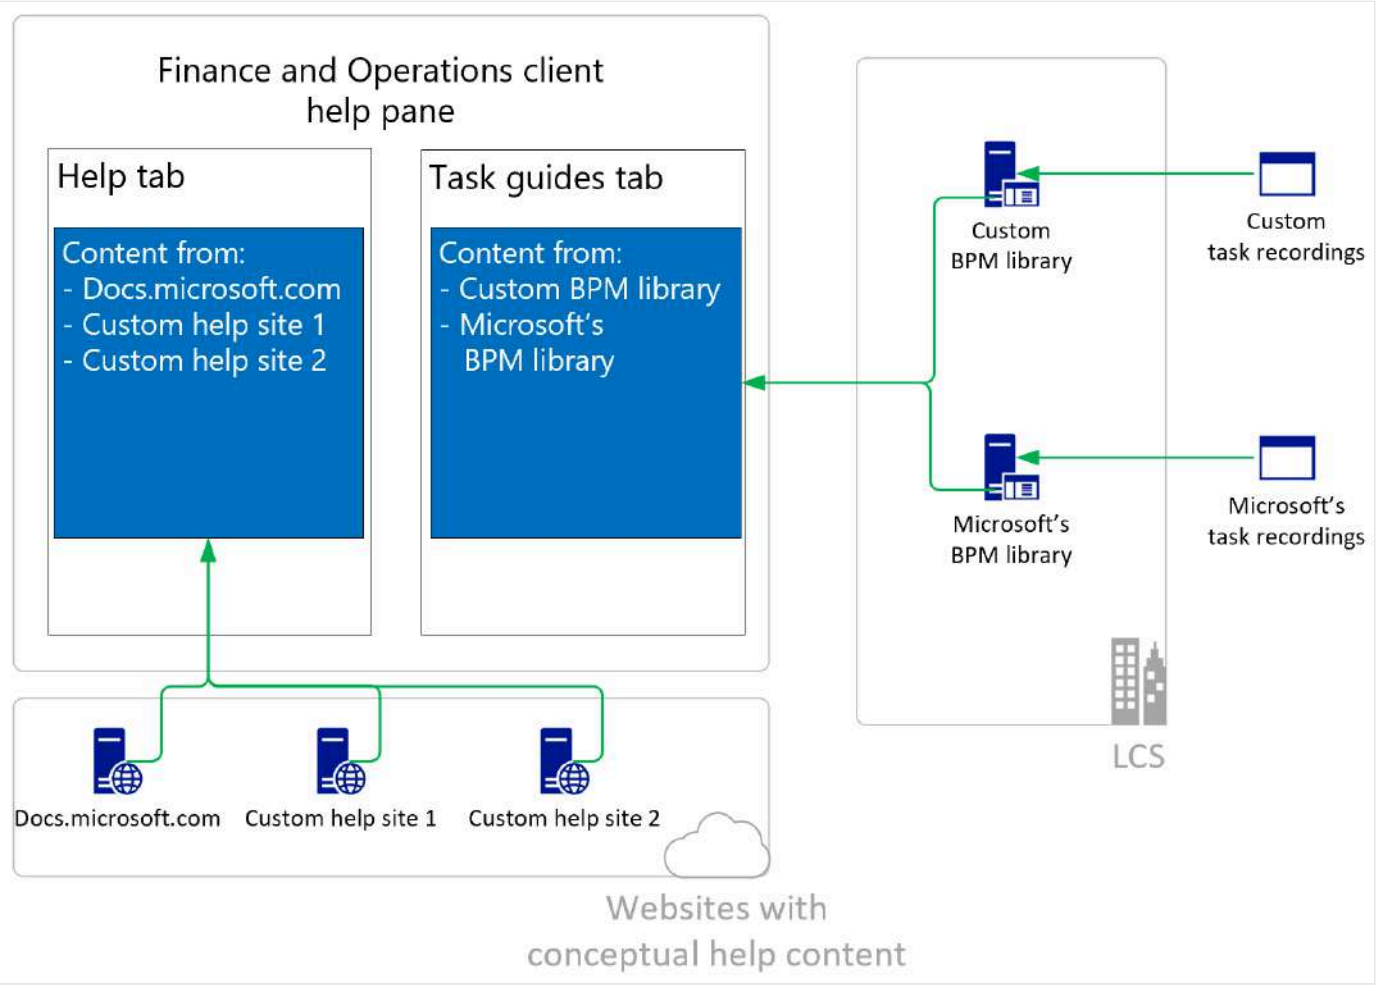
Configure the Help experience for finance and operations apps

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

This article provides an overview of the components of the Help system for solutions with Dynamics 365 Finance, Dynamics 365 Supply Chain Management, Dynamics 365 Commerce, or Dynamics 365 Human Resources. The article also explains how to connect these components.

Help architecture

Finance and operations apps include conceptual overviews and other articles that are published to the Microsoft Learn site. You can access this content from the in-product **Help** pane. The following illustration shows the parts of the Help system.



The in-product Help system pulls articles from Microsoft Learn and other connected websites. It also pulls in task guides that are stored in Business process modeler (BPM) in Microsoft Dynamics Lifecycle Services.

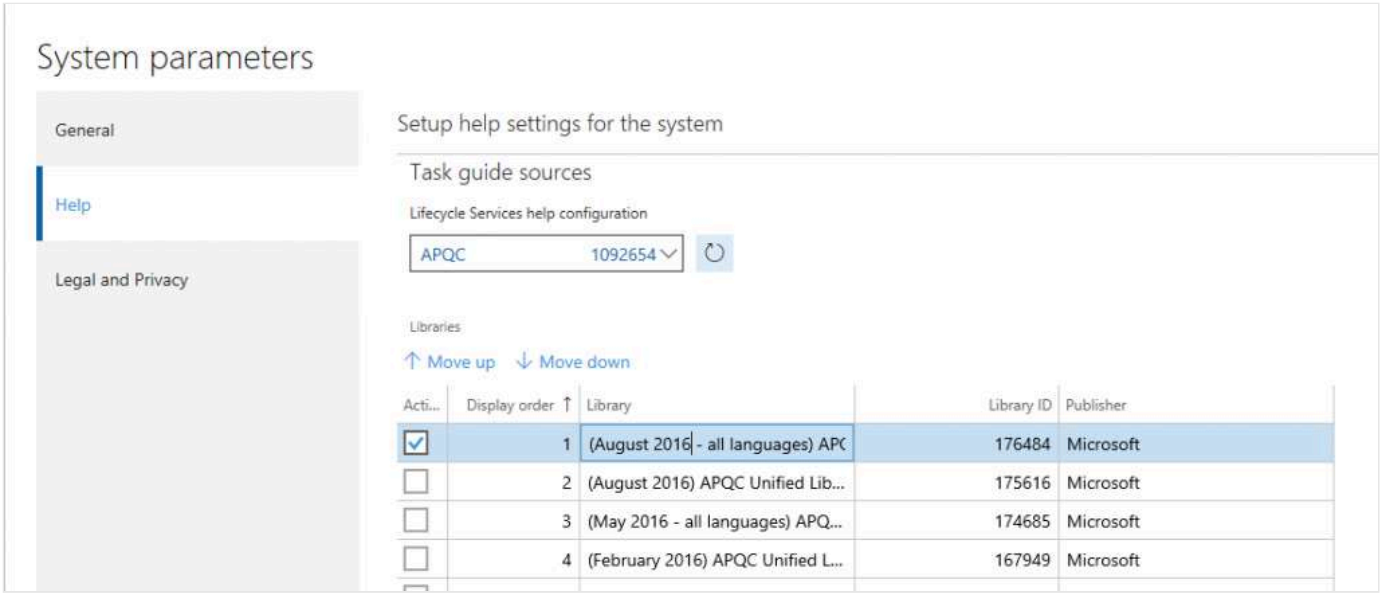
Adding task guides

> ⓘ Note
>
> The **Task guides** tab isn't currently available in Human Resources or Commerce. However, the task guides in the Getting Started experience in Human Resources remain available to cover basic functionality. For both Human Resources and Commerce, procedural Help is available on the Microsoft Dynamics 365 documentation site.

On the **System parameters** page, system admins can configure access to the relevant task guide libraries for an implementation.

> ⓘ Note

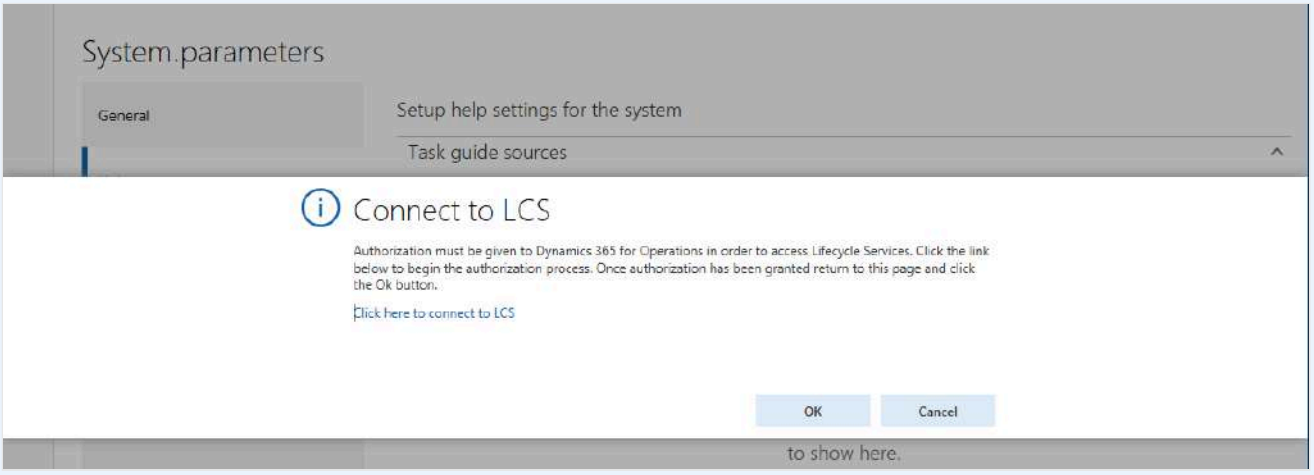
- To configure Help, you must sign in by using an account in the same tenant as the tenant where the app is deployed.
- You can't connect an Lifecycle Services library from an instance of the app that runs on a local virtual hard drive (VHD).



To configure task guides for a solution, follow these steps on the **System parameters** page.

Important

The first time that you open the **Help** tab, you must connect to Lifecycle Services. Be sure to select the link in the middle of the form, wait for the connection, close the dialog box, and then select **OK** to get to the **System Parameters** page.



1. Select the Lifecycle Services project to connect to.
2. Select the BPM libraries (within the selected project) to retrieve task recordings from.

3. Set the display order of the BPM libraries. The display order defines the order in which task recordings from the libraries appear in the **Help** pane.

After you complete these steps, you can open the **Help** pane and select the **Task guides** tab. You see the task guides that apply to the page that you're currently on in finance and operations apps. If no task guides are found, you can enter keywords to refine your search.

Showing translated task guides

Translated task guides were first released in the May 2016 APQC Unified Library and in the Getting Started library. To view localized task guide Help, make sure that your Dynamics 365 solution is connected to the May 2016 library. Users can change the language that a task guide appears in by changing the language settings under **Options** > **Preferences**.

> ⓘ **Note**
>
> Although many task guides are translated, the client doesn't currently show the translated task guide names. Additionally, in the May 2016 library, translations are available only for the task guides that were released in February 2016. Microsoft releases an updated library that includes more translations.
>
> - If a task guide is translated, when you open that task guide all the text of the task guide appears in your selected language.
> - If a task guide isn't yet translated, when you open it, only some of the text (the text of the controls) appears in your selected language.

Adding custom Help

You can use task guides to create custom Help, or you can connect a custom Help website to the **Help** pane.

Create custom Help by using task guides

You can create custom Help for the supported apps by creating task recordings that reflect your implementation and then saving them to a Business process library in Lifecycle Services. You can't create custom task guides for Human Resources.

If you're a partner, and you promote a library to a corporate library and include it in a solution, it becomes available to your customers. You can also make a copy of the APQC Unified Library,

then open the task recordings in the copy, edit them, and save your changes. For more information, see Task recorder resources.

Connect a custom Help site

Finance and operations apps are rarely used in their out-of-box form. Instead, the solution is customized and extended to fit the organization's needs. You can also customize and extend the Help experience. For example, you can add custom Help to the in-product **Help** pane.

Microsoft provides a toolkit to help you deploy and connect custom Help to the **Help** pane. Learn more at Custom Help overview.

Custom Help overview

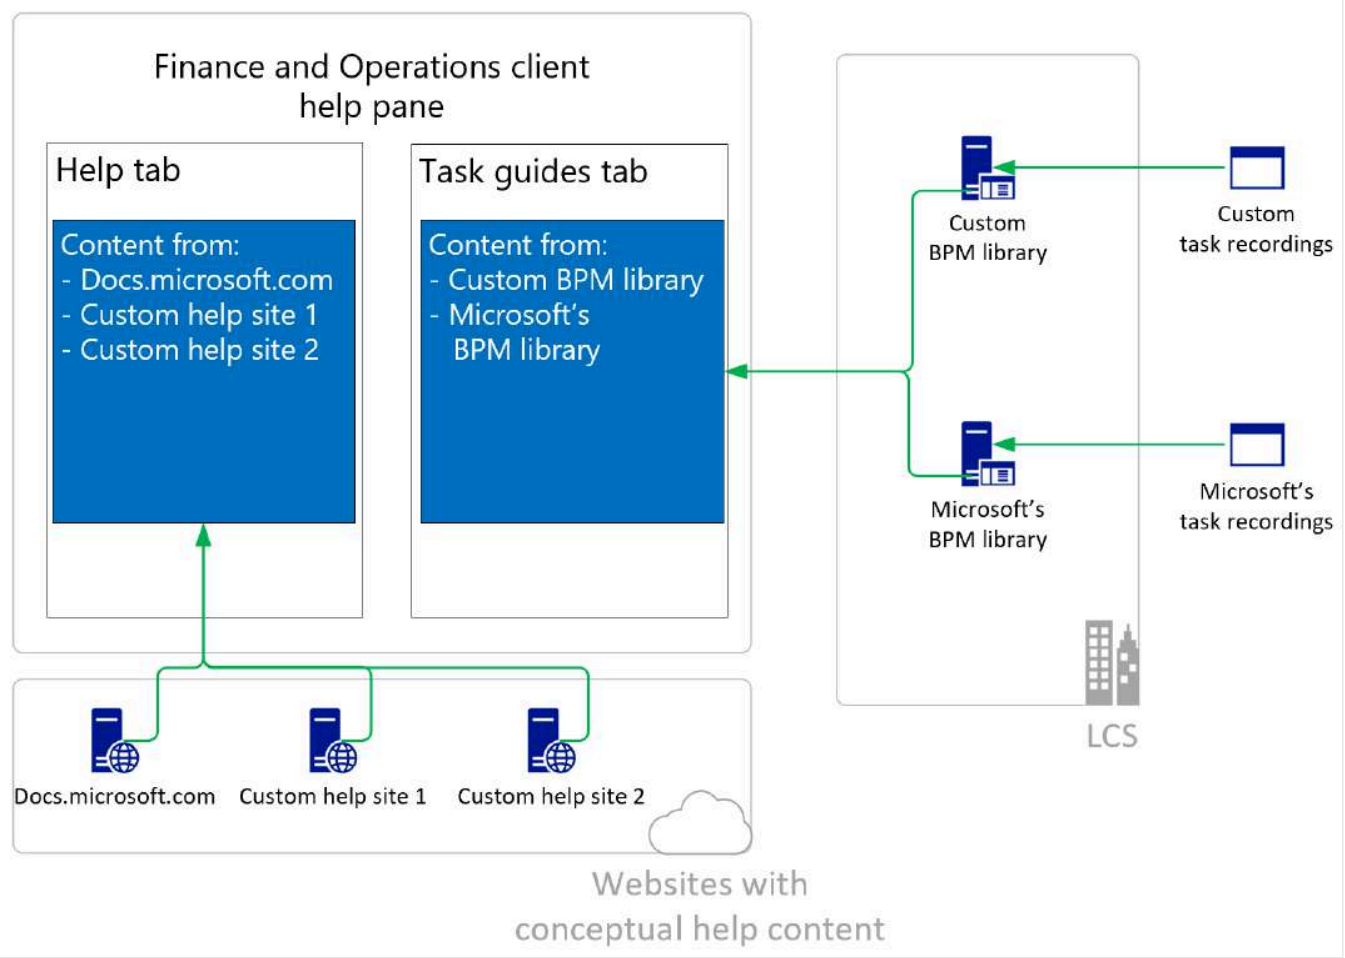
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

Organizations often customize and extend finance and operations apps to fit their needs. If your solution is based on Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, or Dynamics 365 Commerce, you can connect solution-specific and customer-specific Help content to the Help pane in the finance and operations client. This article describes the main steps and decision points.

> **Note**
>
> Users of finance and operations apps can create custom task guides to supplement conceptual content that describes the functionality of their solution. Microsoft, partners, and an organization itself can provide these conceptual descriptions, which are also referred to as Help. For more information, see Help system.

The following illustration, and this article in general, use the term *Help* for conceptual descriptions that either include or exclude how-to guides. The term *task guides* refers to in-product task guides.



Custom Help content

Custom Help content typically comes from one of three sources:

- Microsoft documentation repositories (repos)

  Microsoft's content in the various GitHub repos is optimized for the learn.microsoft.com site and the tools that are used for this site. It's not intended to be customized directly but to be supplemented by articles on your local website. However, depending on your solution, you might need a copy of Microsoft's content.

- Existing customized Dynamics AX content

  You can convert Dynamics AX custom Help content so that you can use it in Dynamics 365.

- HTML files that you create specifically for your solution

  Learn more about the metadata that must be added to your HTML files for context-sensitive Help and search to work correctly in the Metadata requirements for custom Help files section.

Process

The end-to-end process depends on the customer's solution and the users' expectations. A typical process involves the following steps:

1. Create the custom Help content.
2. Publish the content on a website.
3. Index the content by using a search service.
4. Connect the custom **Help** pane to the website and the search service.

Microsoft provides sample tools and scripts that can help you convert content and configure the Help pane to include your custom Help. Find the samples at https://github.com/microsoft/dynamics365f-o-custom-help/ .

The following table outlines the main objectives that admins typically have for configuring the Help experience.

Expand table

Objective	Learn more
I want to give my users a customized in-product Help experience that reflects their actual solution.	Go to the Custom Help websites section of this article and Create documentation or training with Task Recorder.
I want to add my content to the **Help** pane.	Go to Connect a custom Help website to the Help pane.
I want to reuse content that was originally created for Dynamics AX.	Go to the Reuse Dynamics AX 2012 content section.
I want to reuse content in one language for another, related language.	Go to the Language and locale descriptors in Help article.
I want to contribute to the Microsoft Help content.	Go to Contribute to the Help.

Custom Help websites

Before the product can connect to your Help content, you must customize the in-product **Help** pane so that it shows your content. For more information, see Connect a custom Help website to the Help pane.

The following conditions must be met:

- Your content must be available on a website.

You can deploy your content to an existing website, or you can set up a dedicated website to host your content. The website can be private or public, but don't require users to sign in to access your content.

- A search service must index your content.

  Learn more in the Generate JSON files for the search service section.

- The content must include the right metadata properties.

  Learn more in the section.

Metadata requirements for custom Help files

To ensure context-sensitive Help and full-text search return results, include the following metadata in your topics.

Expand table

Property	Description
title	The value for full-text search from the **Help** pane.
description	The value for full-text search from the **Help** pane.
ms.search.form	The value contains the Application Object Tree (AOT) name of a page and is used for context-sensitive search from the **Help** pane.
ms.locale	The value indicates the language of the article. It's mapped against the current browser locale when the **Help** pane searches the content. You can configure language fallback for the target custom Help website. For more information, see Language and locale descriptors in the product and in Help.
ms.search.scope	The value determines which client the Help article shows in. You can specify one or more values. Values include **Core**, **Operations**, **Retail**, and **Human Resources**.

The following table describes the values that you can specify for the **ms.search.scope** property. You can specify one or more values. The values determine which client a Help article shows in.

Expand table

Value	Description
Core	If this value is present, the article appears in the **Help** pane. Otherwise, the article doesn't appear in the **Help** pane. This value is set for the part of the Microsoft content that must always be available in the **Help** pane, for all users across all supported Dynamics 365 solutions.

Value	Description
Operations	This value applies to solutions that are based on Finance or Supply Chain Management.
Retail	This value applies to solutions that are based on Commerce.
Human Resources	This value applies to solutions that are based on Dynamics 365 Human Resources.

Non-required metadata

The following properties are reserved for future use:

- **ms.search.region** – Eventually, this property might be used to limit the content that is shown to content that is tagged either as global or for the region of the implementation.
- **ms.search.validFrom** – Eventually, this property might be used to limit the content that is shown to content for a product that was released on a given date or earlier.
- **ms.dyn365.ops.version** – Eventually, this property might be used to limit the content that is shown to content for a specific version of a product or earlier.
- **ms.search.industry** – Eventually, this property might be used to limit the content that is shown to content for a specific industry.

Generate JSON files for the search service

The **ConvertHtmlToJson** tool transforms HTML files into JSON files. You can then add the JSON files to the Microsoft Azure Search service, which generates context-sensitive links to your Help content. Find the tool at https://github.com/microsoft/dynamics365f-o-custom-help/.

The JSON files include metadata that the indexer uses to identify the form and language that the target Help page is intended for.

Here's the syntax for running ConvertHtmlToJson.exe.

```
ConvertHtmlToJson.exe --h <path> -j <path> --v <true|false>
```

The following table explains the parameters.

Expand table

Parameter	Description
h	Specify the path of the HTML files to process.
j	Specify the folder to save the JSON files to. The folder must already exist.
v	Set this parameter to **true** to turn on verbose logging. Otherwise, set it to **false**.

The following example generates JSON files without verbose logging.

```
ConvertHtmlToJson.exe --h D:\D365-Operations\d365F-O\supply-chain\de -j D:\D365-Operations\json\supply-chain\de
```

Reuse Dynamics AX 2012 content

If you have content from Dynamics AX 2012, you can reuse it for Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and Dynamics 365 Commerce. However, you must first transform the HTML files so that you can use them in the custom Help environment.

The **run_ax2012.ps1** Windows PowerShell script transforms AX 2012 HTML files so that you can use them in the custom Help environment. The script makes the following changes to the AX 2012 HTML files:

- Replaces the **Microsoft.Help.F1** metadata name with **ms.search.form**.
- Replaces the **Title** metadata name with **title**.
- Changes the file name extension from **.htm** to **.html**.
- Adds the following metadata.

HTML

```
<meta name="ms.search.region" content="Global" />
<meta name="ms.search.scope" content="Operations, Core" />
<meta name="ms.dyn365.ops.version" content="AX 7.0.0" />
<meta name="ms.search.validFrom" content="2016-05-31" />
<meta name="ms.search.industry" content="cross" />
```

Run the script

Run the following command from a Command Prompt window, or directly in Windows PowerShell.

PowerShell

```
PowerShell.exe -File run_ax2012.ps1 "Original file location" "New file location"
```

The following metadata is used, or it's reserved so that it can be used during indexing.

HTML

```
<meta name="title" content="Title of file" />
<meta name="ms.locale" content="locale" />
<meta name="ms.search.form" content="FormAOTName" />
<meta name="description" content="Description of file" />
<meta name="ms.search.region" content="Global" />
<meta name="ms.search.scope" content="Operations, Core" />
<meta name="ms.dyn365.ops.version" content="AX 7.0.0" />
<meta name="ms.search.validFrom" content="2016-05-31" />
<meta name="ms.search.industry" content="cross" />
```

For a description of the required metadata, go to the Metadata requirements for custom Help files section.

Convert HTML content to Markdown

To convert your content to Markdown, use a third-party tool. Microsoft doesn't provide a tool that can convert HTML to Markdown.

After you've converted your content to Markdown, use an open-source tool to generate content for your website. Markdown gives you access to a wide range of open-source tools. For more information, go to Contribute to the Help.

View and export field descriptions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

This article describes how to view field descriptions and how to use the **Field descriptions** page to export descriptions.

Some of the more complex fields have field descriptions. These descriptions appear when you hover over a field. You can also view and export descriptions on the **Field descriptions** page.

Not all pages have field descriptions. They're available only for the more complex fields, not where the use of the field is obvious. Therefore, only the complex pages have a lot of field descriptions. The remaining pages either have a few field descriptions or none.

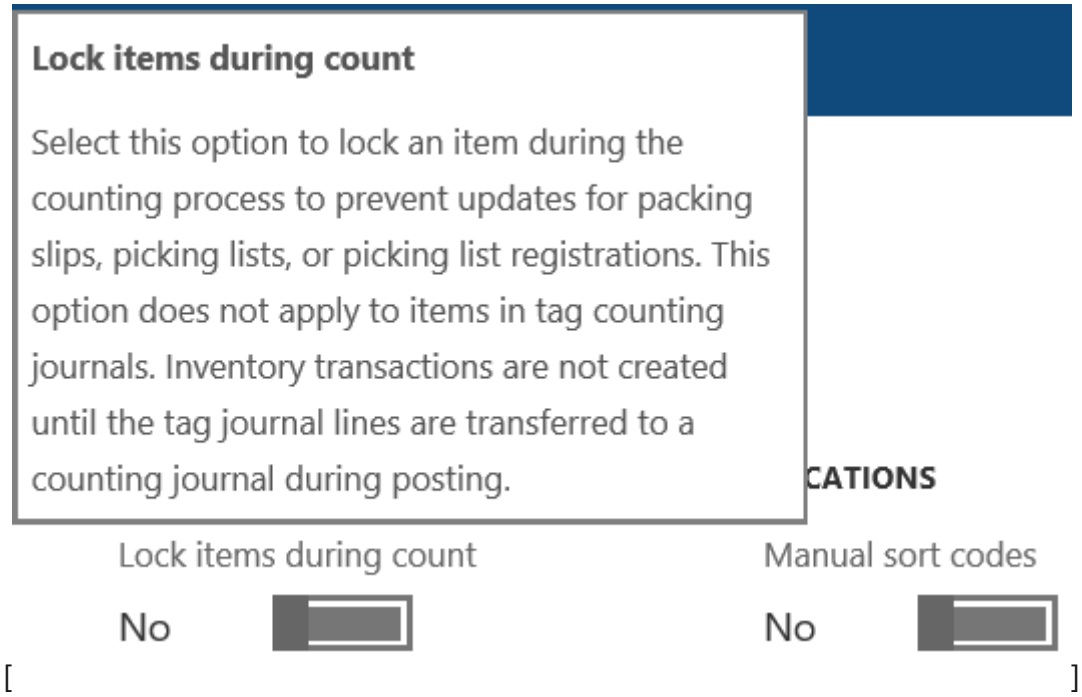
If you have access to the development environment, you can add new field descriptions and customize existing descriptions. For example, you can add company-specific information to a field description. For more information, see Customize field descriptions.

See field descriptions in the user interface

You can view field descriptions by hovering over a field. If no description is available, you see the field name when you hover over the field.

> **Note**
>
> In Dynamics AX 7.0 (February 2016), you can view field descriptions only on the **Field descriptions** page.

The following illustration shows the field description that appears when you hover over the **Lock items during count** field.



[ ]

Use the Field descriptions page to view and export field help

The **Field descriptions** page lets you view and export field descriptions. You can see the descriptions that are available for one page at a time.

View the descriptions for a page

To view the descriptions for a page, follow this step.

- In the **Select a page** field, type the name of the page. Alternatively, select the arrow to open a list of all the pages, and then browse or filter the list.

You can use either the name of the page that appears in the user interface (UI) (for example, **Customers**) or the code name (AOT name) that's available when you right-click a page (for example, **CustTable**).

For information about the various ways to filter the list of pages, see the "Searching for a page" section later in this article.

If you set the **Include fields without a description** option to **Yes**, the page shows all the fields, even if they don't have a field description.

Export the descriptions for a page

To export the descriptions for a page, follow these steps:

1. In the **Select a page** field, select a page.
2. Select the **Open in Microsoft Office** button in the upper-right corner, and then select **FieldDescriptionTmp**.

Searching for a page

You can search for a page in the **Select a page** field in several ways. In many cases, you need to select the arrow in the **Select a page** field to open the drop-down list, and then select from a filtered list of pages.

- Type part of the name, and then open the drop-down list to select from a filtered list of pages.
- Open the drop-down list, and then select either the **Page name** heading at the top of the list or the **Page AOT name** heading. A dialog box appears, where you can use advanced filtering options, such as **Page name begins with**.
- Type the full name of the page. When you use this option, it's best to open the drop-down list and see what else is in the list, even if field descriptions are shown.
  - If there's a single exact match to the name, the field descriptions for that page are shown.
  - If there are multiple exact matches, no descriptions are shown. You need to open the drop-down list and select the page that you want.
  - If the name that you typed is part of the name of another page, you see the descriptions for your page. However, if you open the drop-down list, you see additional pages that contain that name.

For example, no descriptions are shown when you type **Counting** in the **Select a page** field. You open the drop-down list, and see that there are two pages that have the name **Counting** and several pages that contain the word "Counting" in the name. If you select the page that has the AOT name **InventJournalCount**, the field descriptions are shown for that page. However, if you open the drop-down list again, the list now contains all pages that have "InventJournalCount" as part of their AOT name.

Troubleshooting

This section provides information to help you troubleshoot issues that you might encounter when you use field descriptions.

I can't find a field description

The product team is in the process of adding descriptions for the more complex fields. If you require help for a particular field, add a comment for this article.

The field description isn't helpful

Add a comment for this article. If you can, describe the additional information that you require.

I can't find a field on the Field descriptions page

To show all the fields on a page, set the **Include fields without a description** option to **Yes**. Select the **Select a page** field to verify that you selected the correct page. If the name that you typed is part of another field name, you might have selected the page that has the longer name.

I can't find a page on the Field descriptions page

For information about the various ways to find pages, see the "Searching for pages" section earlier in this article. If you type the exact name of the page, the field descriptions might not show if more than one page has the same name. Select the arrow in the **Select a page** field to open a filtered list of the available pages.

Task recorder resources

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

This article describes how to use Task recorder to record business processes.

> **Important**
>
> Starting in January 2026, you can only create, edit, or use Task Recordings in Sandbox and Production environments. Cloud-hosted environments no longer support this capability.

Overview

Task recorder

Task recorder for finance and operations apps is a utility that lets users record business processes for several different use cases. Here are some examples:

- Step-by-step guided tours of a specific business process in the application itself
- Documentation of a business process as a Microsoft Word document that can optionally include screenshots
- Regression tests for a business process
- Automatic playback of a business process in the application

Task recorder for finance and operations apps offers high responsiveness, a flexible extensibility application programming interface (API), and seamless integration with consumers of business process recordings. Task recorder also integrates with the Business process modeler (BPM) tool in Microsoft Dynamics Lifecycle Services (LCS), so that users can continue to organize their recordings. However, users can no longer produce business process diagrams from recordings.

Task recorder can automatically generate application regression tests from business process recordings and play back previously recorded processes. These features also include test-specific gestures that let users take full advantage of Task recorder.

Architecture

Task recorder can record user actions in the client with exact fidelity, because every control is instrumented to notify Task recorder about the execution of user actions. The control notifies Task recorder that an event occurred and passes all the relevant information about the corresponding user action in real time. From this information, Task recorder can capture the type of user action (for example, a button select, value entry, or navigation) and any data that is related to the user action (for example, the input data value and type, form context, or record context). Task recorder persists the information with enough detail to ensure that a playback of the recording can run the recorded actions exactly as they were performed by the user.

Basic configuration

Every finance and operations app includes task recorder. After users open the client for the first time, they can immediately start recording business processes.

Start a new recording

The following steps show how to use Task recorder to start a new recording.

1. Open the product, and sign in. It's a good practice to refresh the browser before each new recording. A refresh creates a new user session and restarts Task recorder. Therefore, it provides the most stable recording experience.

2. Select the company that you want to use while recording. If this is your first time using Task recorder, you can follow along as this tutorial creates a sample recording based on a Fleet Management business process. You need to load the Fleet demo data to follow along:
   a. Go to **Dashboard** > **Fleet Management** > **Fleet setup**.
   b. Select **Load demo data**.
   c. When the data finishes loading, select **Close**.
   d. Go back to the **Dashboard** by selecting the product name in the navigation bar.

3. Go to **Settings** > **Task recorder**.

4. The **Task recorder** pane opens. Select the **Close** button (**X**) in the upper-right corner to close the **Task recorder** pane before you begin a new recording. You can reopen the pane by

following the previous steps.

5. Select **Create recording**.

6. Enter a name for the recording and select **Start**. Recording begins the moment **Start** is selected. For the Fleet example in this tutorial, use the name "Create a new rental reservation."

   While you're recording, you can select the **Close** button (**X**) in the upper-right corner to hide the **Task recorder** pane without stopping the recording. You can reopen the pane by selecting the **Task recorder** button that appears at the top of the page. This button appears only while recording is in progress.

   > ⓘ **Note**
   >
   > If the Saved views feature is turned on, create recordings by using either published views or the standard view, to ensure that recordings work reliably for users.

7. Task recorder enters **recording mode**. The pane shows information and controls that are related to the process of recording.

Now you're ready to record a business process by using Task recorder. If you're following this guide as a first-time user, you might complete the following Fleet Management scenario as an example. Otherwise, you can record your own application scenario.

Record a Fleet Management scenario

1. In the **Task recorder** pane, select **Start subtask**.
2. Set **Name** to "Create a new rental customer". Leave the **Comment** field blank.
3. Select **OK**. The task is added to the step list.
4. Go to **Dashboard** > **Fleet Management** > **Reservation Management**.
5. Go to **All customers** under the **Summary** tab.
6. In the Action Pane, select **New**.
7. Enter a first and last name for the customer.
8. Select **Save**.
9. In the **Task recorder** pane, select **End subtask**.
10. Return to the **Reservation Management** workspace by selecting the browser back button twice.

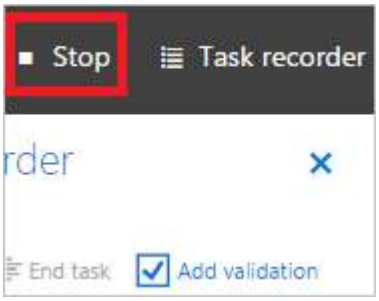
11. In the **Task recorder** pane, select **Start subtask**. Name the task "Rent a vehicle to the new customer". Select **OK**.
12. Select (+) **Rental** under **Summary**.
13. Under **Information**, select a "1975 Litware McKinley" as the vehicle.
14. Under **Information**, set the customer to the one just created.
15. Expand the **Discounts** section.
16. Select **Add** under **Discounts** and add the Frequent Customer discount. Select **OK**.
17. In the Action Pane, select **Start Rental**.
18. Set the return date to some date in the future.
19. Select **OK**.
20. In the **Task recorder** pane, select **End subtask**.
21. Select **Stop** at the top of the page.

Recording a business process

After you start your recording, you can perform your business process just as you would typically perform it by using the web client. As you interact with the product, new steps are added to the step list in the **Task recorder** pane. In this section, you learn about other actions that you can perform while you're recording a business process, to take full advantage of Task recorder's capabilities.

Stop

Use **Stop** to end the recording session. Before you select **Stop**, make sure that the recording is complete, because this action isn't reversible. When you select **Stop**, you're taken to the download options screen.



Start/End subtask

Start/End subtask lets you specify the beginning and end of a set of grouped steps in a recording. Select the **Start subtask** button to add a "Subtask" step to the end of the current list of recorded steps. The subtask includes all steps that you perform from this point until you select

the **End subtask** button. When you select the **End subtask** button, an "End subtask" step is also added to the list of recorded steps.

> **Note**
>
> You must start a subtask before you perform or record the steps that you want to include in the task. Then, after you perform or record all the steps that you want to include in the task, you must end the subtask.

Subtasks are purely an organization tool, and consumers of business process recordings can interpret the task groupings in useful ways. Because tasks can be nested inside other tasks, they provide the flexibility to organize long and complex business processes.

Delete/Restore step

Delete/Restore step enables a user to remove steps from the recording, or undo the removal of a step from the recording. You must first select the step in the Steps list that you want to delete/restore, and then select the **Delete/Restore step** button.

> **Note**
>
> The behavior of the **Delete** button changes when you play back a recording. In playback mode, a deleted step can't be restored after playback has passed the point where it would have run the deleted step. For example, you load a recording that contains three steps, and then you delete step 2 before you start playback. You can restore step 2 only as long as playback hasn't run step 3. After you start playback, and playback has "skipped" step 2 (because you deleted it) and run step 3, you won't be able to restore step 2. Because step 2 wasn't run and therefore wasn't recorded, it can't be retroactively added back into the recording at its previous position.

Add developer placeholder

Add developer placeholder lets the user add a placeholder step to the list of recorded steps. This placeholder step doesn't appear when the task guide is viewed, and it isn't run during maintenance of a recording. It's used only by the Regression suite automation tool (RSAT) or the X++ code generator that enables an X++ test to be created from a task recording. When the code generator creates an X++ test, it automatically adds a method stub to the generated code. The developer can then add X++ code into this method stub. The automated code calls the

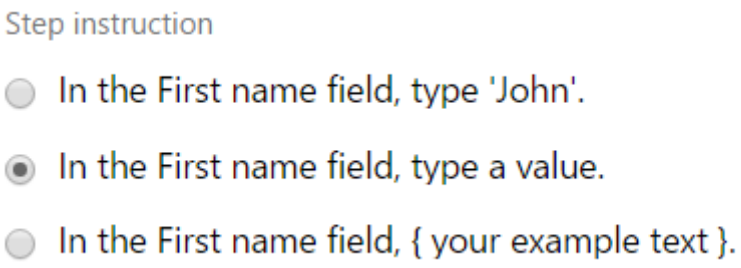
validation when the generated test is run at the point in the recording where this placeholder was added.

Enriching steps in a recording

There are various options for enriching a step in a recording. For example, you can adjust the text that is associated with a step and add information about a specific step. This section describes the step enrichment capabilities that are available. To access these options, select the **Edit step** button on a specific step of a recording.

Step instruction

The **Step instruction** is the primary text that is displayed for this step in the task guide. There are usually 2-3 alternative options for step instructions, and they appear in the following order when editing the annotation.



This image shows the annotation options for changing a step.

- **Preferred value instruction** This type of instruction directs the user to enter the same data that was used when the step was recorded. *Example*: In the First name field, enter 'John'.
- **Example value label** This type of instruction directs the user to enter their own data, indicating that the data that was used when the step was recorded was only *Example* data. *Example*: In the First name field, enter a value.

  If users select the **See more** button on this step when they play the recording as a task guide, they're able to see the data that was used when the step was recorded. This recorded data value is labeled as an *Example* data value.

  > ⓘ **Note**
  >
  > Steps that aren't related to fields, such as selecting buttons, opening forms, or selecting records from a lookup, don't set *Example value label* as an option when annotating.

- **User-supplied value label** This step instruction contains placeholder text, which the author can fill in with their own text. For steps which have an **Example value label** option, the placeholder allows substituting the text which normally specifies the data to enter. This is useful for scenarios where neither the **Preferred value label** nor the **Example value label** sufficiently express the data that should be used for this step.
  - *Example label*: In the First name field, enter *{your example text}*.
  - *Example label after supplying the placeholder text*: In the First name field, enter the customer's name.

  For steps which don't have an **Example value label** option, the placeholder allows substituting all of the label text. Steps associated with buttons, for example, don't have **Example value labels**, so you may replace the entire label text with your own text.
  - *Example label before replacement*: Select Post.
  - *Example label after replacement*: To post the order, select Post.

Titles and notes

Titles and notes provide places for user-specified text to be associated with a step in a task guide.

- **Title** – The title lets you specify the text that appears above the step instruction for this step in the task guide. The title a good place to put text that you want users to read before they complete the action that is indicated by the step instruction.
- **Note** – You can use a note to specify text that appears in the expandable section of the popup for this step in the task guide. A note is a good place to put optional reading material or other information that might be useful to users, but that they aren't required to read to complete the action that is indicated by the step instruction.

Change recorded values

Starting in version 10.0.12, you can adjust the values that are recorded in basic input controls (for example, simple text, numeric, date, and picklist fields), without having to re-record those steps. Lookup controls and reference groups aren't currently supported.

Hide from task guide

The **Hide this step** option lets the author prevent specific steps from appearing in the task guide. This option is useful for hiding steps that are required for the task recording to run in playback mode, but that shouldn't be seen by users. Examples of these steps include copy steps, system-

generated steps, and data clean-up steps. If you hide a subtask, all the steps that are recorded inside that subtask are also hidden.

Using control gestures

The basic recording capability lets a user record an end-to-end business process by using Task recorder, but without adding overhead to the process. In some circumstances, more advanced recording features can be used to create even richer business process recordings. Each of the following gestures is found under the **Task recorder** option on the shortcut menu (also known as a right-click menu or context menu) for a control and causes a step to be added to the recording. If the gesture isn't supported for a control, it doesn't appear on the shortcut menu for that control.

Copy

The **Copy** gesture lets you copy the value for the current control to the Task recorder "clipboard." That value can then be used later as part of a **Paste** or **Validate** gesture. Because values from multiple controls might have to be pasted, the Task recorder clipboard maintains a list of all control values that are copied in the recording.

Paste

The **Paste** gesture lets you paste a value from a previous **Copy** gesture in the same recording. The Task recorder Paste function works like the standard paste function that users might be familiar with, but it has an additional benefit when it's used during recordings. Because Task recorder will replay the recorded **Copy** and **Paste** commands during playback, if the copied control has a different value than it had during recording, Task recorder pastes the current value instead of the value that the copied control had during recording. This feature is useful in scenarios where the copied control has a value that can change between environments (for example, recID values or number sequences).

There's an additional benefit from using the **Copy** and **Paste** gestures when test code is generated. For any control where the value is set via the **Paste** command, Task recorder doesn't have to create a parameterized input variable for that control's value, because it's based on another control's value. This feature can be useful in scenarios where an entity such as a customer is created, and an identifier for that entity is frequently entered during the recording. Instead of manually re-entering the customer name or ID throughout the scenario, and causing Task recorder to generate a parameterized input variable for each entry, the user can copy the customer name or ID one time, and then repeatedly paste it. In this case, Task recorder generates

a single parameterized input variable to represent the customer name or ID. This feature can make it much easier to change the input data for a generated test.

Validate

The **Validate** gesture lets you insert a step that validates the value of the targeted control. This gesture always uses equality to validate the control value. *Validations aren't currently run during recording playback*. Instead, they're run only when the generated test code is run. Two kinds of validation are available:

- **Current value validation** captures the targeted control's value at the time of recording and use it to generate an assertion in the test code. In the list of validation options on the shortcut menu, **Current value** is always first.
- **Reference value validation** uses the value of a previously copied control when generating an assertion in the test code. This allows creating assertions that are resilient to changes in the data, since the value isn't hardcoded into the test code. In the list of validation options on the shortcut menu, **Reference value validation** follows the format [AOT name of copied control: current copied value].

Additional options are available in version 10.0.13 and later. Here are some examples:

- **Enabled/Disabled** validates that the targeted control's state is enabled (or disabled), and then uses that validation step to generate an assertion in the test code.
- **Read-only/Editable** validates that the targeted control's state is read-only (or editable), and then uses that validation step to generate an assertion in the test code.

Add info step

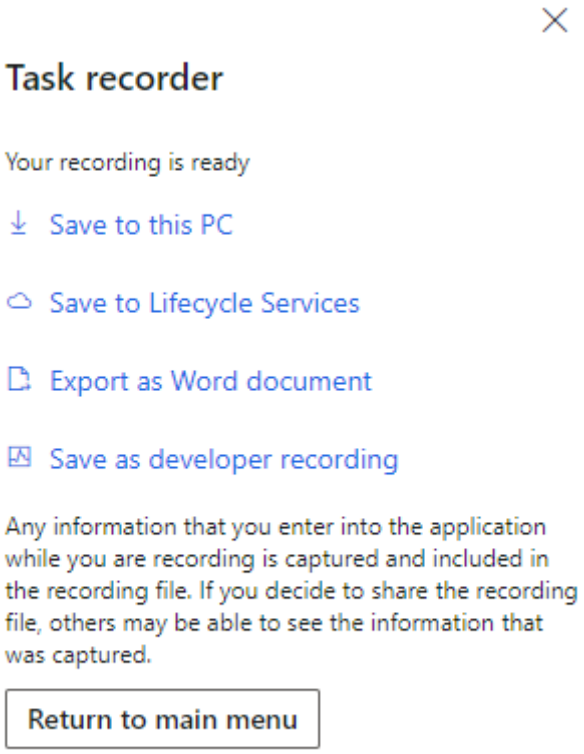
The **Add info step** gesture lets you insert a step and supply your own text for it. This feature is useful primarily for creating task guides. An **informational step** (or **info step** for short) is a task guide step where the instruction text for the step is user-specified. Info steps are useful for describing actions that are a part of the scenario but must occur outside the client. For example, a scenario might require the user to search for item inventory or check an email for information.

You can specify where an info step should appear in the task guide. The info step can point to a control on the page, if the step is associated with the control. Alternatively, the info step can appear in the upper right of the page, if the step is external to the client, or if it's an explanation that applies to the whole page.

> **Note**
>
> Because info steps are manually specified steps and aren't automatically recorded by Task recorder when the user takes an action on a control, the info step doesn't have the capability to automatically progress when a user completes the step in the task guide. Because the info step isn't associated with taking an action in the client, there's no action for a task guide to detect that the user has completed in order to automatically progress to the next step.

Options after a recording is completed

After you select **Stop** to end your recording session, several options are shown so that you can save the files that are related to the completed recording. Select **Save to this PC**, and save the task recording package to your desktop. You'll use this file later.



Save to this PC

One option after you finish your recording is to download the task recording package (an .axtr file) to your computer. This file can be loaded later via the **Task recorder** pane, so that the recording can be played as a task guide or edited.

Save to Lifecycle Services (LCS)

When you save your recording to an LCS library, it's published on the specified business process in a BPM library. If the selected LCS library is set as a Help library, you're able to find the task guide for the recording by searching the **Help** menu.

> ⓘ **Note**
>
> To be able to save a recording to an LCS library, the user must be in the Microsoft Entra tenant that the environment was deployed from.

Export as Word document

The Microsoft Word document for your recording contains the recorded steps and any screenshots that were captured.

Save as developer recording

The raw recording file (developer recording) is useful for developer scenarios, such as test code generation and scenarios where RSAT is used.

Playing back a recording

The **playback** functionality of Task recorder can automatically run the steps of an existing recording by using the pages and values that were originally recorded. Playback mode can be used to update an existing recording if changes were made to the underlying application, and those changes altered the business process steps that are required for the scenario. It's important to remember that, in this mode, Task recorder simultaneously re-records the steps and plays them back. When the playback is completed, a new recording is produced that reflects both the steps that were run from the existing recording and any new steps that the user manually performed. Any steps that aren't run either by the user or automatically by Task recorder aren't included in this new recording.

To play back an existing recording, follow these steps:

1. Refresh the browser tab.

   > ⓘ **Note**
   >
   > It's a good practice to refresh the browser before each new recording.

2. Open the **Task recorder** pane.
3. Select **Playback recording**.
4. Select **Open from this PC** to load a recording from a previously downloaded Task recorder package (.axtr file).
    - If you're reading this guide for the first time and following along, choose the "Create a new rental reservation" file that you downloaded previously.
5. Select **Start**.

When you play back a recording, additional actions are available in the **Task recorder** pane.

Play next pending step

Play next pending step runs the next step in the recording. This action is useful because it gives you more control over the playback speed when you want to analyze the effects of a single step. This action has a side-effect that it's important to be aware of. When you select **Play next pending step**, any open lookups, drop-down dialog boxes, or Action Pane tabs might be dismissed, because this action removes focus from those elements. For these situations, we recommend that you use **Play all pending steps** instead.

Play all pending steps

Play all pending steps begins sequential execution of the remaining steps in the recording, and continues until either playback is paused or all steps are run. During playback, the **Play all pending steps** button is replaced by a **Pause** button that can be used to pause playback. If playback can't successfully run a step for any reason (for example, because it can't find a button that has been renamed), Task recorder skips that step, and playback is automatically paused. In this way, the user has an opportunity to replace the obsolete step by completing the new steps in the client. Task recorder records the new steps and ignore the step that was skipped. The user can then select **Play all pending steps** to continue playback for the remaining steps. After the recording is completed, the user can download the updated recording. This recording contains all the steps of the original recording, but excludes any skipped steps and includes any new steps.

Play to selected step

Play to selected step behaves like **Play all pending steps**, but it lets you play only a subset of the steps instead of all the steps. In the list, select the step that you want playback to stop at, and

then select **Play to selected step**. Task recorder begins to run the steps in the list and stops after it runs the step that you selected.

Editing a recording

Although you can edit a recording through the playback functionality, there's also a mode that lets you make simple edits to a recording without having to replay the whole recording. To access this feature, select **Edit recording** after you open the **Task recorder** pane. You can use this feature to make the following edits:

- Insert steps into a recording without re-recording the whole file.
- Move steps under a subtask without re-recording the whole file.
- Adjust the name and description of the recording.

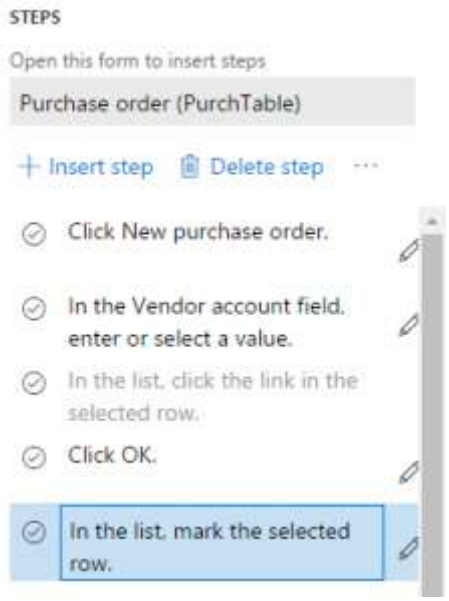
Insert steps without re-recording the entire file

You can add a step anywhere in a task recording without playing back or re-recording the whole file.

1. Select the step after which you want the new step to be inserted. Make sure the step is highlighted.

   In order for task recorder to insert a step, you must have the correct page open. The correct page is the page on which the new step occurs. Task recorder has a mechanism that determines what the active page is, and disables the functionality if the correct page isn't open.

   
   When you're on the correct page, **Insert step** becomes available.



2. Select **Insert step**.

   When you select **Insert step**, Task recorder switches to recording mode. Any action that is performed in the user interface (UI) is now recorded and inserted into the recording as steps.

3. Select **Stop**.

   Recording mode is stopped, and you can now continue to edit the recording. For example, you can repeat this process to insert steps in other places in the recording, or you can move subtasks as described in the next section.

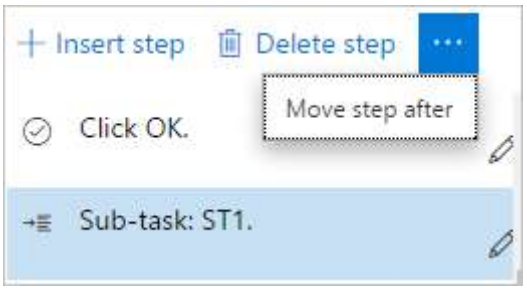
4. When you finish editing the task recording, select **Done editing**, and then select one of the options to save or publish the recording.

Move steps under a subtask without re-recording the entire file

You can move steps under a subtask without playing back or re-recording the entire file. You can also move the subtask step or the end subtask step if you want to group an existing block of steps.

1. Select the step or subtask step that you want to move. Make sure that the step is highlighted.

2. Select **Move step after**. To access this command, you might have to select the ellipsis (**...**) button.



3. Select the step or subtask step that you want to move the step or subtask step after. Task recorder moves the step.

4. To move the end subtask step, select it, select **Move step after**, and then select the step that you want the end subtask step to be after.

   If you want the first step in the task guide to be within a subtask, create a subtask step as the second step, and then move the first step into it. You can add or move as many steps or subtasks as needed.

5. When you've finished editing the task recording, select **Done editing**, and then select one of the options to save or publish the recording.

Adjust the recording name and description

You can adjust values of the **Recording name** and **Recording description** fields. If you want to see more steps in the Task recorder editing pane, you can also collapse the section that shows the recording name and description.

Playing a task guide

A **task guide** is a user-focused experience that lets the user follow a guided step-by-step set of instructions to complete a business scenario by using a task recording. The user is instructed to

complete each step through an animated popup prompt that moves across the page and point to the UI element that the user should interact with. The prompt also tells the user how to interact with the element. For example, it might state, "Select here" or "In this field, enter data." Each step that the user is instructed to complete is based on a step originally recorded in the task recording. Because the task recording file contains the data that describes the step that was originally recorded, the task guide can automatically determine when the user completes the step as expected. It then automatically moves on to the next step.

> **Note**
>
> One way that the task guide determines that a user completes a step is by detecting when the value in a field has changed. Although the task guide doesn't require that a specific value be set, it does require that the field value be changed in order to determine that the step was completed. The user must change the field value, and then press the **Tab** key or select in an area outside the UI element. Only at that point does the client detect that the field value has changed, and it can then proceed to run any required application validation or business logic. Therefore, before the task guide can determine that the step was completed by the user, it relies on the client to detect that the field value has changed.

What can a task guide allow a user to do?

When a user is completing a task guide, the client behaves in the same manner, with the same data, security, and validation rules as it does when the user isn't completing a task guide. There's no difference of behavior in the client that would allow a user to take an action that they can't otherwise take when they're not completing a task guide. When a user is completing a task guide:

- Any data the user enters is subject to the same data validation rules as when not playing the task guide.
- Any data the user enters may be saved, and the user may modify data according to the same restrictions and rules as when not playing the task guide.
- Any security mechanisms the user encounters behave the same as when the user isn't playing the task guide.
- Any forms or controls the user accesses are subject to the same security and access mechanisms as when the user isn't playing the task guide.

The "On-rails" feature of task guides

By default, when a user begins a task guide, they're placed "on-rails". These "rails" prevent the user from *selecting* on elements other than the element the task guide is pointing to. When the user tries to select on something outside of the UI element that the task guide is pointing to, the task guide popup becomes animated to let the user know that they can't progress until they complete the current step of the task guide.

While a user is prohibited from *selecting* on other elements, the user isn't prevented from tabbing through the other controls on the form, and the user isn't prevented from using keyboard shortcuts. This is by design, as the "on-rails" feature is designed for and targeted at first-time users, who are expected to primarily use the mouse as they become familiar with the application.

More advanced or experienced users can turn off the "on-rails" feature when they complete a task guide. At any point during the task guide, these users can turn off the rails by selecting the **Unlock** button that appears on the Task recorder toolbar at the top of the page. This button can also be used to restore the rails at any point during the task guide. In some situations, the task guide might automatically turn off the "on-rails" feature. When the rails are turned off, the user can select UI elements just as they do when the task guide isn't running. The "on-rails" feature might be automatically turned off in the following situations:

- The user is being directed to go to a page by using the navigation pane or navigation search.
    - Because the user can use either entry point, the task guide doesn't point to a specific entry point, and it doesn't prevent the user from using either entry point.
- The task guide enters an error state (see the next section for a list of error states).
- The task guide is showing an info step.

Error detection

An *error state* occurs when the task guide isn't able to point to the UI element that is associated with the current step because the UI element isn't visible on the screen. When the task guide detects that the current step requires the user to interact with a UI element that isn't visible, then the task guide popup moves to the upper-right side of the screen. These causes of an error state can be simplified into two categories.

The control isn't visible on the form

This error state usually occurs when the user has opened or closed the incorrect tab, FastTab, collapsible section, FactBox, or pop-out menu.

Because the UI element that is needed for the current step is somewhere on the current form, but it isn't visible on the screen, the task guide popup moves to the upper-right side of the screen while displaying the same instruction that informs the user of the action they need to take.

Because the task guide can't find the UI element on the screen, the user must manually determine what is causing the UI element to be hidden and then make the element visible on the screen. The task guide popup automatically detects that the UI element is visible and repositions itself so that it's pointing at the now-visible element.

The control isn't on the form

This error state usually occurs when the user is on the wrong form, either by navigating to the wrong form or by leaving the correct form.

Because the UI element isn't visible on the screen, the task guide popup moves to the upper-right side of the screen. In addition, when the task guide detects the user is on the wrong form, the task guide popup text changes to inform the user of the form they should navigate to.

In some cases, the task guide popup doesn't mention the form by name. This is because the user may need to navigate to a dynamic form. A dynamic form is a form that isn't modeled, frequently known as a runtime-generated form. These sorts of forms don't have a proper name. Some examples of runtime-generated forms include simple and custom lookups. The way for a user to navigate to a lookup form is to reopen the lookup.

Next step and Previous step

The **Next step** and **Previous step** buttons appear in the task guide popup and let a user manually control the flow of the task guide. When these buttons are selected, the task guide proceeds to the next or previous step. The task guide doesn't verify that the user completes a step before it goes to the next or previous step.

The task guide **never** automatically completes any step for the user, even when the **Next step** and **Previous step** buttons are used. Use of these buttons can cause an error state if the previous or next step refers to a UI element that isn't on the current page. When the user is completing an info step, the only way to proceed is to use the **Next step** button. This action is required because an info step doesn't represent an action that was recorded on any UI element. Because no action was recorded in the task recording, the task guide doesn't have the necessary information to determine what action it should expect the user to complete.

The See more button

When the **See more** button is selected, the task guide popup expands to show additional information that is related to the step. The additional information is often optional reading material that isn't required for the user to successfully complete the step. The following information might be included:

- An **Example** value
  - The Example value is the value that was originally used when the task recording was created.
  - Example values appear only for steps that use nonlookup fields. These fields include text fields, number fields, date fields, combo boxes, and check boxes.
- A **Note**
  - A Note may contain scenario-specific information that helps provide context to the user about the current step of the task guide.

Taking screenshots in Task recorder

By using a **prerelease** Chromium browser extension that works for both the new (Chromium-based) Microsoft Edge browser and Google Chrome, Task recorder can take screenshots of the browser as a user records a business process. After the user completes the recording, Task recorder can use these screenshots to generate Microsoft Word documents. To turn on this functionality, follow these steps to install the prerelease Chromium extension that enables Task recorder to take screenshots during recording.

1. Download the **FMLabTaskRecorderScreenshot** folder that contains the extension from GitHub, at https://github.com/Microsoft/FMLab.

2. **On-premises deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace <hostname> with the base URL for your environment.

   JSON

   ```
   ...
   "content_scripts": [
       {
           "matches": ["https://*.dynamics.com/*", "<hostname>"],
           "js": ["screenshot.js"]
       }
       ...
   ```

3. **21Vianet in China deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace **.com** with **.cn**

JSON

```
...
"content_scripts": [
    {
        "matches": ["https://*.dynamics.cn/*"],
        "js": ["screenshot.js"]
    }
    ...
```

4. US Government Community Cloud (GCC) **deployments only:** Adjust the manifest for the extension so that it matches the following code. Replace **dynamics.com** with **microsoftdynamics.us**

JSON

```
...
"content_scripts": [
    {
        "matches": ["https://*.microsoftdynamics.us/*"],
        "js": ["screenshot.js"]
    }
    ...
```

5. **Multiple deployments:** Add additional string values to the matches clause, separating them with a comma.

JSON

```
...
"content_scripts": [
    {
        "matches": ["https://*.dynamics.com/*",
"https://*.microsoftdynamics.us/*"],
        "js": ["screenshot.js"]
    }
    ...
```

6. Open the latest Microsoft Edge browser or Google Chrome.
7. Select **Settings and more** > **Extensions** in Microsoft Edge (or **Customize and control Google Chrome** > **More tools** > **Extensions** in Google Chrome).
8. Select **Developer mode**.
9. Select **Load unpacked extension**.

10. Browse to the folder that contains the Task recorder extension by using the path **FMLab-master** > **FMLab** > **TaskRecorderScreenshot**, and then select **Select Folder**.

11. Make sure that **Enabled** is selected so that extension is turned on.

12. Restart the browser.

Task recorder then takes screenshots of the tab where the client is running. If needed, you can regenerate the screenshots by playing the task recording again.

Task recorder doesn't capture screenshots from other tabs or of the user's desktop.

Generating tests from a recording

After a business process recording is completed using Task recorder, a developer can import the raw developer recording file (.xml file) into Visual Studio to create an X++ test. The import tool generates a human-readable X++ test from the recording, and translates any control gestures, validations, or tasks into the appropriate test code.

Import a recorded test

1. Open Visual Studio by using the finance and operations development tools.

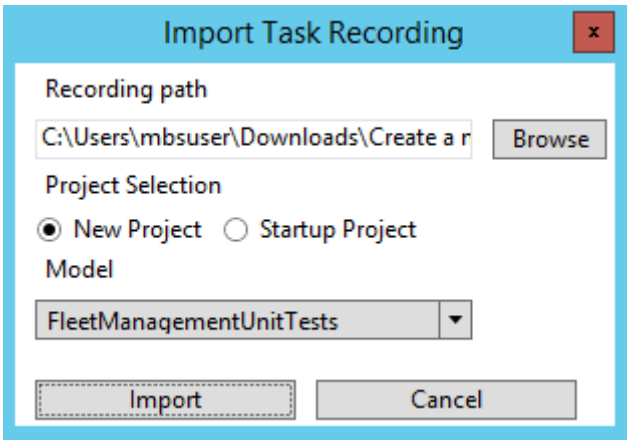
2. Go to **Dynamics 365** > **Addins** > **Import task recording**.

3. In the **Import task recording** menu, use the **Browse** button to locate a previously downloaded recording file.

4. Optionally, choose to have the generated test code be added to the startup project. This requires that a solution containing a project is set as the startup project. This places the generated X++ test into the same model as the project.

5. If you're creating a new project, select the model for the project. The generated X++ test is put in this model. For the generated test to be successfully built, the model must have references to the **TestEssentials** model.

6. Select **Import**.



7. In the **New Project** dialog box, provide a name for the project.

8. After the project is created, the user can open and inspect the generated code.

9. To run the test, build the project.

10. Go to **Test** > **Windows** >**Test Explorer**.

Appendix

Controls that are known to have incomplete support for Task recorder

- Table
- Filter pane, which is the filter that pops out from the left side
  - When you add filters to the filter pane, the steps are delayed. The steps don't get recorded until the user selects "Apply" on the Filter pane.
- Enhanced previews
  - No planned support for recording gestures inside of enhanced previews. While you're recording, enhanced previews are disabled.
- No extensible controls are supported out of the box, except Segmented Entry.
  - Extensible control owners need to individually build support for Task recorder.

Controls that can be recorded, but have limited support for the Copy/Paste/Validate gestures

- Date/Time
  - Doesn't support copy/pasting "Never" as a value.
- Image
  - No ability to copy/paste/validate an image value.

- Filter pane
  - Copy/Paste works, but the UI doesn't show the pasted data. You can proceed as if it pasted correctly.
- Message box
  - You can't validate the text in the message box.

Controls that are known to have incomplete support for being used in a task guide

- Quick Filter, which is the filter control that appears above lists.
  - Doesn't support displaying a "generic value" during the task guide. Currently displays the value that was used during recording.
- Filter pane, which is the filter that pops out from the left side
  - The task guide doesn't point to the individual elements within the Filter pane that need to be selected on.

Create documentation or training with Task Recorder

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Customers using Human Resources, the functionality noted in this article is currently available in both the stand-alone Dynamics 365 Human Resources and the merged Finance infrastructure. Navigation might be different than noted while we make updates. If you need to find a specific page, you can use Search.

This article explains what Task recorder and task guides are, how to create task recordings, and how to customize Microsoft task guides and include them in your Help.

> **Important**
>
> You can record your own task guides for Dynamics 365 Human Resources, but you can't save them to a Business Process Modeler (BPM) library or open them from the Help pane. You can save them locally or to a network location, and then open and replay them by using Task recorder.

Learn about Task recorder

Task recorder is a tool that you can use to record actions that you take in the product user interface (UI). When you use Task recorder, it captures all of the events that you perform in the UI that are executed against the server—including adding values, changing settings, and removing data. The steps that you record are collectively called a *task recording*. You can use task recordings in many ways:

- **Play task recordings as task guides** - Task guides are an integral piece of the Help experience. A task guide is a controlled, guided, interactive experience through the steps of a business process. The user is instructed to complete each step by way of a pop-up prompt, which animates across the UI and points to the UI element that the user should interact with. The pop-up prompt also provides information about how to interact with the element, such as **Click here** or **In this field, enter a value.** A task guide runs against the user's current data set and the data that is entered is saved in the user's environment.
- **Save task recordings as Word documents** - By saving task recordings as Word documents, you can easily produce printable training guides.

You can create your own task recordings, play task recordings provided by Microsoft, or modify Microsoft-provided task recordings to reflect your configuration. For more information about Task recorder, see Task recorder.

Plan your task recording

Whether you're creating a new task recording or basing your recording on a Microsoft task recording, keep the following information in mind.

- Plan your recording like you would a video.
- Walk through the business process once or twice without recording it to understand the steps.
- When you walk through the process before you record, notice where you use shortcut keys or the **Enter** key, so that you can avoid using them during the actual recording.
- Do you want to group steps together into subtasks? Subtasks visually set apart sections of a process. For example, if you're creating a recording for creating and releasing a product, you might want to group together the steps that are required to create a product, and then group together the steps that are required to release the product. Subtasks make longer processes easier to read.
- Do you want to add annotations? See **Understand the different types of annotations** below for more information.
- What values do you add in the various fields as you complete the steps of the business process?

Write your description and annotations ahead of time

- At the beginning of each task recording, there's a description field where you can enter an introduction to the recording. Write and save the description ahead of time in a separate document so you can copy and paste it into the task recording when you are recording. Cutting and pasting the text makes the recording process go more quickly and smoothly.

- For each step in a task recording, you can create annotations. During playback of a task guide, annotations appear as notes above or below the text for the step. When viewed as text in the Help pane, annotations appear as text inline in the step. Write and save your annotations in a separate document. When you're recording the task recording, cut and paste the annotations in from that document.

Understand the different types of annotations All annotations are optional. Only add them if they provide helpful information to the user.

- **Title**: A title annotation appears before the step text that task recorder automatically generates. In the task guide, the title annotation appears above the automatically generated text. Use this type of annotation to explain why the user is doing the step or to give context.
- **Notes:** A notes annotation appears after the step text that task recorder automatically generates. In the task guide, it'll only be visible if the user clicks **Show more** in the task guide bubble. Use this type of annotation to describe anything that a user needs to know to complete the step.
- **Info step**: Create these annotations by right-clicking on a control or anywhere on a form, and then selecting **Task recorder** > **Add info step**. Info steps appear as a numbered step at whatever point you insert it, even though no action was recorded in the UI. You can add a form-level info step or an info step associated with a control. When an info step is associated with a page, the task guide **bubble** appears someplace on the page, with no pointer, when the task guide is played. When an info step is associated with a control, the task guide **bubble** points to the control when the task guide is played. In the Help pane, an info step annotation appears as a numbered step with whatever text you entered. Use info steps to prepare the user for the next steps, to describe steps that need to be done outside of the application, or to refer to other recordings.

Determine how long to make your recording

- Users either read or play the recording from start to finish, so don't combine steps or tasks that are better done separately.
- Try not to record a long scenario that spans multiple sub-processes. For example, **Operate in-store customer service desk** is too broad; break it up into shorter tasks such as **Accept returns** and **Add to gift card**.
- If a task can be carried out as part of several different business processes, create a separate recording for it, and you can refer to it in the other recordings.
- If the process involves multiple tasks that the person likely does all at once, you can keep the tasks in one recording, for example, **Set up and assign functionality profiles**.
- If it's something someone does once (such as configuration) and then another task that they can do immediately afterward but might do repeatedly, and on its own, break them up into two task recordings.

Decide where, in the UI, to start a recording The page that you're on when you start recording a task recording affects which page the task guide is displayed for. For example, if you want your task recording to be listed in the Help pane when a user clicks Help on the **General ledger parameters** page, start your recording on the **General ledger parameters** page. **Save recordings as .axtr files** When you're done creating or editing a task recording, you see several options for how you want to download or save the recording. You can download the file as a task recording package (.axtr), download it as a raw recording file (.xml), download it as a Word document, or save the file to an LCS library. Always save your task recording as a task recording package file (.axtr). This practice helps make maintenance of the file easier if procedures or annotations need to change later. If you want to download the file as a Word document, also save it as a task recording package file.

Create your task recording

For detailed walk-through steps, see Task recorder resources.

Copy and customize Microsoft's task recordings

You can download and edit Microsoft's task recordings to use them for your own help documentation or training materials. To download a Microsoft task recording, follow these steps:

1. Open Task recorder. Task recorder is located in the **Settings** menu.
2. In the Task recorder pane, select **Maintain a recording**.
3. Under **Where is the recording**, select **It is in an LCS library**.
4. Select **Select the LCS library**.
5. Select the Microsoft global library.
6. In the tree, select the business process library node that the task recording is associated with.
7. Select **OK**.
8. Select **Start**.
9. Step through the recording, changing any steps as you go to re-record it. **Note**: If you only need to change the text of a recording, you can open the recording in **Edit a recording's annotations** mode, and then save it.
10. After the recording plays to the end, select **Stop** in the task recorder bar at the top of the screen.
11. Choose how you want to save the task recording.

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

On the Microsoft Dynamics 365 YouTube channel, you can find videos created by Microsoft that demonstrate a wide range of business solutions for Dynamics 365 products. This section lists the "how-to" videos for finance and operations apps that are hosted on the channel.

> **Note**
>
> Some of the videos listed were published under a previous product name, but they're still applicable.

Videos for finance and operations development and administration

Data integration

- Synchronize a work order between Dynamics 365 for Field Service and finance and operations apps

Data management

- Use data entities and data packages

Development

- Optimization advisor
- Setting up a development branch and build
- Setting up a development machine
- Azure DevOps integration with Lifecycle Services

Intelligence

- How to edit an embedded report in an analytical workspace
- How to embed PowerBI.com reports in finance and operations apps
- Bring your own database (BYOD) to finance and operations apps
- How to use cost management Power BI content in Dynamics 365

Lifecycle Services

- Asset library in Lifecycle Services
- Cloud-hosted environments
- Creating support tickets from Dynamics 365 for Operations
- Deploying environments
- Getting started with Lifecycle Services
- Deploying code to a sandbox environment
- Deploying code to a production environment
- Implementation projects in Lifecycle Services
- Manage the code upgrade and tool process
- Managing business process libraries in Lifecycle Services
- Methodologies in Lifecycle Services
- Request a production environment
- Refreshing data in a production environment
- Uptake a new platform release after Platform update 3
- Use telemetry to monitor key performance counters in Dynamics Lifecycle Services

Regression suite automation tool (RSAT)

- How to use task recorder to create a test case for the Regression suite automation tool (RSAT)
- How to create a test plan in Azure DevOps to use with the Regression suite automation tool (RSAT)
- How to use the Regression suite automation tool (RSAT)
- The improved Excel experience in Regression Suite Automation Tool (RSAT) 2.0

Videos for Dynamics 365 Finance

Business document management

- Create a new business document using Business Document Management

Customize the app

- Add custom fields
- Embed Power Apps

Financial reporting

- Find the version of Report designer

Help system

- How to contribute to the Microsoft Dynamics 365 documentation

Office integration

- Create an Excel template for header and line patterns

Organization administration

- Document management

Revenue recognition

- How to use revenue recognition

Tax engine

- Tax engine overview

Videos for Dynamics 365 Supply Chain Management

Business document management

- Create a new business document using Business Document Management

Costs

- Cost control mobile workspace
- Get started with Cost accounting
- Use Excel for cost analysis

Customer portal

- Overview of the Customer portal template
- Invite customers to register and use your customer portal

Help system

- How to contribute to the Microsoft Dynamics 365 documentation

Master planning

- Master planning setup wizard

Office integration

- Create an Excel template for header and line patterns

Organization administration

- Document management

Procurement and sourcing

- Approve purchase orders on a mobile device
- Onboard a new vendor

Product information management

- Change management capabilities

Production control

- Batch balancing
- Enhancements to the production order release process
- Visual scheduling with Gantt chart for production and batch orders

Warehouse management

- Release production picking to the warehouse in batch
- Use warehouse template to copy configuration

FastTrack Tech Talks

FastTrack Tech Talks focus on providing technical depth and best practices that give customers and partners detailed knowledge that's specific to the subject areas.

User interface elements

Article • 01/03/2025

This article describes the user interface (UI) elements used in the app. Before users can navigate the interface, it's important to know the names and functions of the elements that make up the interface.

- **Action Pane** - The bar beneath the navigation bar. Here, you can select tabs to change records shown in the page. You can edit and save the records here.
- **FactBox** - You can see information and follow the activities of certain records in this pane.
- **FactBox pane** Here, you can scroll through different aspects of a record to view in the FactBox.
- **Filter pane** - On some pages, you can select **Show filters** to open this pane. It allows you to narrow the results visible to you on the page.
- **Navigation bar** - The bar at the top of the interface. It contains the **Dynamics 365 portal**, **Search**, **company picker**, **Action center**, **Settings**, **Help & Support**, and the user profile.
- **Navigation list** - On some pages, you can scroll through this pane to find a specific record. When selected, the details of the record will appear in the page.
- **Navigation pane** - The left-most pane. From here, you can find any page in the product.
- **Page** - The central focus of the interface. Selections made on the other UI components will affect what records are shown here.
- **Pane** - The right-most pane. This will open in some cases when aspects of a record need to be changed and saved.
- **Tab** - When referring to the Action Pane, it's a menu of options that appears when you select a given option in the Action Pane.

Tabs, fields, and sections

A *tab* is a selection made on the page that opens a different aspect of a record on the same page. Often, it will allow you to change certain *fields*, or UI elements that allow typed input.

A *FastTab* is a tab with the added benefit of allowing multiple tabs to be visible at the same. You can expand a FastTab by selecting the downward-pointing arrow on the right end of it.

A *section* is similar to a tab. The word "section" is often used to describe any area of a page that organizes a specific category of information. "Summary", "Orders and favorites", and "Links" are all examples of sections.

Dialogs and drop-down menus

A *dialog* is a pane that opens when certain selections are made to change or create a record. Dialogs contain fields that allow you to enter typed input. Sometimes, a given field will allow you to select a downward facing arrow that opens a list of options to choose from. This is called a *drop-down menu*.

In some cases, a dialog will open near a given button when you select it. This is called a *drop-down dialog*.

Notifications

Certain changes to the objects you oversee will appear as *notifications*. Notifications may notify you when a specific customer's information has been changed, or it may alert you when the system can't accept inputs you've added in certain fields. You can learn how to customize what you receive notifications about in the Alerts overview.

Notifications appear in a variety of ways.

- **Feature callout** - This will appear next to a field, tab, or other button to offer an explanation of what the feature is used for.
- **Action center** - A box that contains the notification will appear next to the Action center button on the navigation bar. You can see details about the notification by selecting **Action center**.
- **Message bar** - This will appear beneath the Action Pane.
- **Message box** - This will appear over the interface and must be interacted with before you can continue to use the product.

Toolbars, grids, and lists

A *toolbar* contains tools, such as the ability to add fields or remove records. Sometimes, a toolbar will appear on the page above a *grid*. This area, grid, is a name given to rows of records with various columns of data. Not all grids have toolbars above them.

A *list* is the name given to a collection of records that you can scroll through. You can bring these records into the page by selecting them. Often, this will open a grid.

Feedback

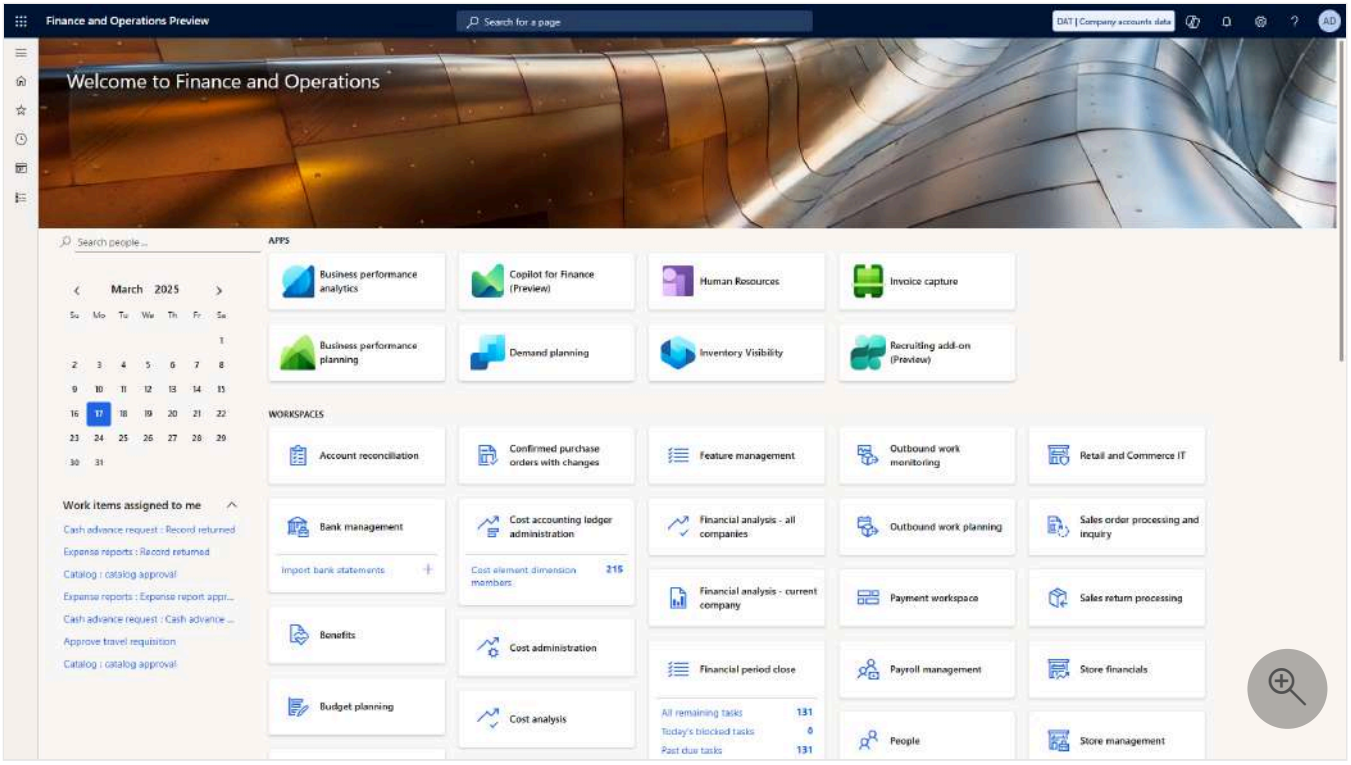
Default dashboard

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the purpose and use cases for the default dashboard, its content (such as app tiles and workspaces), and how to personalize it.



The default dashboard is a dashboard page that is set as each user's initial page by default. It comes preconfigured with a set of useful components that help you navigate to workspaces and other useful pages in the application. You'll only see components, such as workspaces and apps, that you have permission to access.

The default dashboard can be customized to show additional information or hide components. You can also personalize it to match your own preferences.

Out-of-the-box components in the default dashboard

The components that are included by default on the default dashboard are:

- A page header representing the current legal company.
- An **Apps** area that provides quick access to apps.
- A **Workspaces** area that provides quick access to workspaces.
- A search field for finding people.
- A calendar where you can set the current session date.
- A list of workflow work items assigned to you.

Page header

The page header presents, by default, the name of the current legal entity and the default dashboard image. You can change the dashboard image to a different banner or a logo.

Related apps

The **Apps** area shows tiles for finance and operations apps available to you so you can launch them quickly. It can also show links to documentation about how to set up the application.

Workspaces

The **Workspaces** area shows one tile for each workspace that's available to you. Workspace tiles can also highlight information that you have pinned to the dashboard. To pin information to the dashboard, open the relevant workspace, right-click on a tile in the workspace, select **Personalize: <tile name>** and then select the **Pin to dashboard** checkbox (clear this checkbox to remove the information from your Immersive Home).

People search

The **Search people** field helps human resource workers quickly find and access details about personnel in the **People** workspace of the Dynamics 365 Human Resources app.

Session date picker

The session date picker lets you quickly change the current session date, which is relevant for many financial transaction functions. The picker component is a quick alternative to using the Session date and time module.

Assigned workflow items

The **Work items assigned to me** area presents a view of all work items that were generated and assigned to you from a workflow. The list provides an overview and links to the relevant pages where you can take action.

Learn more in the Workflow system overview.

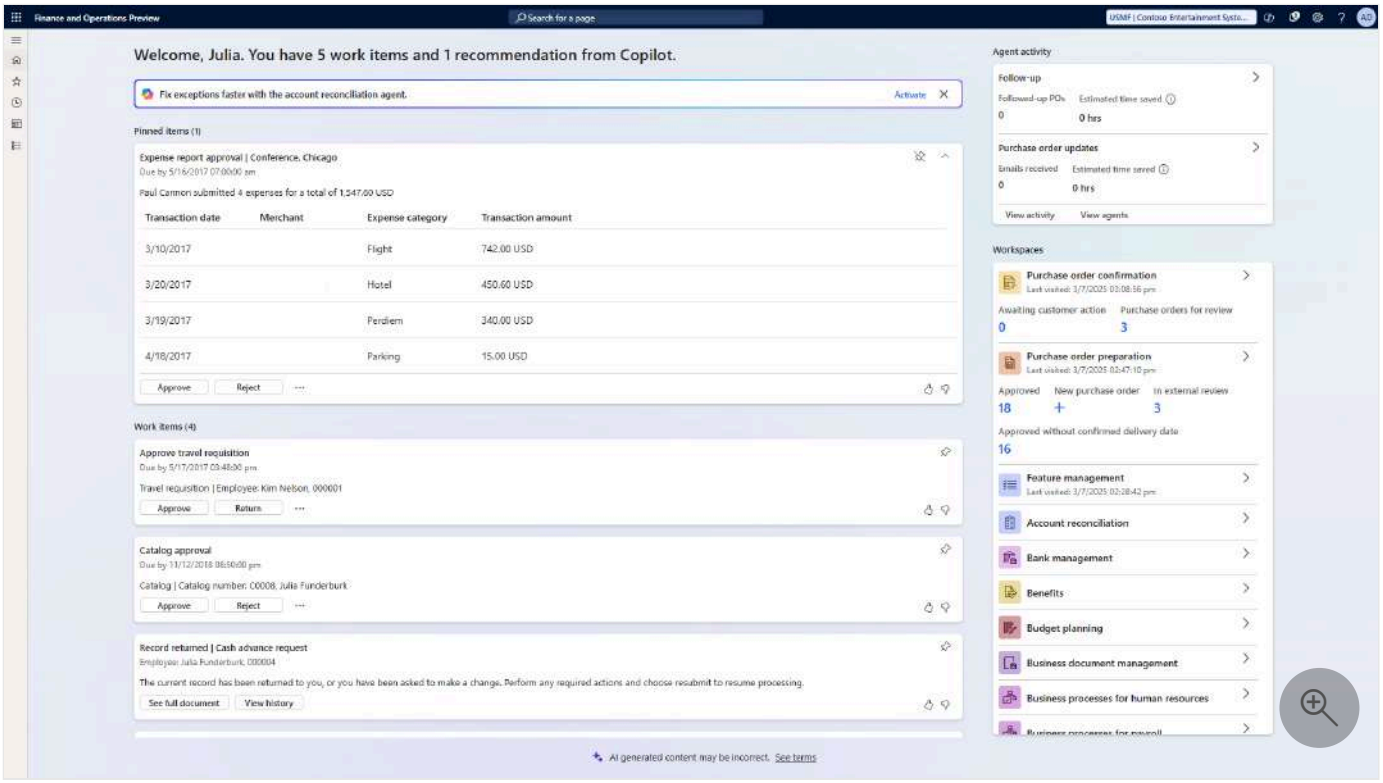
Last updated on 07/11/2025

Immersive Home overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes Immersive Home, how it helps you work hand in hand with AI agents and focus on the most important work items assigned to you.

Immersive Home is a modern, AI-first landing page that adapts to your most important work, aids decision making, and reduces the need to navigate elsewhere to complete common tasks. It's a modern option for the initial page in finance and operations apps and links to tools for enabling, monitoring, teaching, and interacting with AI agents.



Prerequisites

System requirements

To use Immersive Home, your system must meet the following requirements:

- You must be running version 10.0.44 or later of your Microsoft finance and operations apps.
- The feature that is named *Immersive Home* must be turned on in feature management.

Required user privileges

Each user that requires access to Immersive Home must be assigned the *View immersive home* privilege, which is typically assigned through the duty with the same name. By default, this duty is assigned to the *System User* security role.

The components of Immersive Home

Immersive Home consists of a new library of controls for adaptive experiences in Microsoft business applications following the Fluent design patterns. Adaptive experiences aim not only to modernize user experiences but also to bring dynamic approaches that move away from static forms toward experiences that bring relevant work directly to your attention.

Immersive Home features a greeting and work summary, suggestions related to AI agents, and a central focus on work items. It also includes agent activity overviews and a ranked view of spaces, including the classic workspaces in finance and operations apps.

Greeting and summary

The greeting at the top of the page welcomes you by name and provides a concise summary of relevant work items and suggestions for what to address. This provides a quick overview of the immediate tasks at hand.

Suggestions area

The suggestion area presents relevant callouts, such as to suggest that you enroll an agent skill into service for a specific task or provide additional instructions to make an agent's service in a task more beneficial.

Each suggestion typically provides an action that guides you to follow the suggestion and take the necessary steps.

The work items area

The **Work items** area hosts a list of priority-ranked activity cards. Each card reflects a step that is part of an action plan to complete a task. Multiple similar work items can be collapsed into one activity card, allowing you to move the action plan forward for multiple tasks of the same kind. Examples include expense approvals, catalog requests that need approval, cash forward requests awaiting approval, and other workflow-generated work items.

Other examples include activities from agent-generated action plans, such as when an agent prepares a reminder email for a vendor (asking them to confirm purchase orders) that you need to review it before sending. The **Work items** area might also announce that an agent identified a vendor email that references a purchase order, and prepares a resulting confirmation or change request ready for your review.

In most cases, the activity card allows you to complete an action without navigating away from Immersive Home. To achieve this, action cards show relevant information that allows you to take action, which you can expand as needed. Alternatively, you can navigate to the activity-specific experience for more complex tasks.

If you have activities that you need to work on for some time and track until completion, you can add them to the **Pinned items** list.

Once you complete an activity, it disappears from Immersive Home.

Activity cards show:

- The type of activity as the title
- A description summary with relevant information
- Action buttons to complete the activity
- A navigation link to the activity-related task or workspace

> **Note**
>
> Activity cards include a feedback mechanism. You can use it to share feedback about your experience using Immersive Home directly with Microsoft (provided an administrator enables user feedback for Copilot and related experiences).
>
> Learn more about how the Microsoft in-product feedback system works in **Learn about Microsoft feedback for your organization**.

Learn more about how to enable user feedback for Copilot and related experiences in finance and operations apps in Enable enhanced user feedback for Copilot and related experiences.

The agent activity area

The **Agent activity** area is only shown when AI agents are enabled in your environment. For each activated agent, this area shows a section where the agent presents its key activity metrics. This could be the number of cases processed, number of emails sent, or metrics such as estimated time saved.

Typically, agents provide a dedicated task space where you can go into more detail on what the agent has been doing, work hand in hand with the agent, and configure or teach the agent. The chevron at the top right of each agent activity card navigates to the specific agent task space.

At the bottom of the **Agent activity** area, you can navigate to agent lifecycle management-related views. The **View activity** button opens a holistic tracing list of all agent activities. The **View agents** button opens a repository of all currently running agents and the library of all agents available for activation.

The workspaces area

The **Workspaces** area shows a list of ranked tiles for each workspace. The ranking considers how recently you last used a workspace. Favorite workspaces rank at the top.

Workspace tiles highlight information that you pin to the dashboard. To pin information to the dashboard, open the relevant workspace, right-click on a tile in the workspace, select **Personalize: <tile name>** and then select the **Pin to dashboard** checkbox (clear this checkbox to remove the information from your Immersive Home).

Set the preferred initial page for each user

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set the initial page shown to a user when they open the application. The initial page can be different for each user. Each user can choose their own initial page at any time, and admins can set the initial page for any user.

By default the initial page is set to the default dashboard.

To set the initial page for another user (as system administrator), follow these steps:

1. Go to **System administration** > **Users** > **Users**.
2. In the list, find and select the user you want to set up.
3. On the Action Pane, select **User options**.
4. Open the **Preferences** tab.
5. On the **Startup** FastTab, set the **Initial page** field to your preferred initial page.
6. Select **Save**.

To set your own initial page (as a user), follow these steps:

1. Open the **Settings** menu (gear icon) in the top navigation bar.
2. Select **User options**.
3. Open the **Preferences** tab.
4. On the **Startup** FastTab, set the **Initial page** field to your preferred initial page.
5. Select **Save**.

Last updated on 03/05/2026

Accessibility features

This article describes the functionality that is designed to help users who have various disabilities use this app. For example, there are features for people who use sight-assistive technologies such as Microsoft Windows Narrator.

Windows Narrator and keyboard-only access

Every field and control has a label and a description of applicable shortcuts. A screen reader can read the label and description.

Shortcuts for the most frequently performed actions

For most users, everyday system use involves lots of data entry and keyboard interaction. To enhance the user experience, we have created shortcuts to help you "jump" around the screen and shortcuts for specialized actions. For more information, see Keyboard shortcuts.

Navigation search

Any page that is accessed by using the Navigation pane menu, the left-most pane, is also available from the **Search** box. Press Alt+G to move focus to the **Search** box, and then type the name or description of the page.

For more information, see Navigation search.

> **Note**
>
> You can navigate directly to top-level pages only. Secondary pages rely on information or context from their parent page.

Action search for keyboard-only users or for heads-down data entry

Every action that is provided on a page can be accessed from a keyboard, via the tab sequence. Information about the tab sequence is provided later in this article. To run actions more directly, you can use the action search functionality.

Example

You want to run the **Email notification log** action that appears in the **Email notification** group on the **Sales order** tab on the Action Pane.

One option is to use your keyboard. Press Ctrl+F6 to move focus to the Action Pane, and then press Tab repeatedly to move through all the tabs and actions, until the **Email notification log** action has focus.

However, you can also run the action more directly. From anywhere on the page, press Ctrl+Apostrophe (') to show the search box for actions.

In the search box, type words that describe the action. The action is made available to you, and you can run it directly. For example, by typing **email**, **notific** (a partial word), or **log**, you can "jump" to the Email notification log functionality.

When you've finished, you can press Ctrl+Apostrophe again to return focus to the field that you were working with before you ran the action search.

For more information, see Action search.

Tab sequence

In everyday system use, not every field is required in order to perform typical tasks. Therefore, by default, the tab sequence is "optimized." Tab stops are set only on those fields that are essential for typical scenarios.

However, you might find that some fields that you often use to perform tasks aren't included in the default tab sequence. In this case, if you use Windows Narrator, you can use Windows Narrator's keyboard actions to access those fields and inspect their content. Alternatively, you can turn on the **Enhanced tab sequence** option on the **Options** page. This option makes all editable and read-only fields part of the tab sequence. You can then use page personalization to create a custom tab sequence and omit fields that don't have to be part of the tab sequence. For more information about personalization, see Personalize the user experience.

Form patterns

Almost 90 percent of the pages in the app are based on a small set of patterns. These patterns are referred to as *form patterns*. Each form pattern is used to provide the actions that are most often performed on the page. A form pattern helps guarantee familiarity and ease of

understanding, because frequently used actions and data are always presented in the same location on different pages. Because of the small number of form patterns, users can easily learn the system, regardless of the number of pages in it, and can confidently use it after they recognize the form patterns.

To learn more about form patterns, see Form styles and patterns.

Responsive layout

The product is designed to work on various devices and form factors, from the smallest screens to large screens that have the highest resolution. Our responsive layout engine lets users zoom in to a magnification level of 200 percent (or, in some scenarios, more than 200 percent).

On smartphones and other small screens, the controls and the form layout will responsively adapt to ensure that the core data is favored. These responsive behaviors can also include reducing the number of columns in groups and tabs to a single column, hiding shell elements, and collapsing the Action Pane.

Guidance to help developers and customers incorporate accessible thinking in their customizations

To learn more about Microsoft best practices for enabling accessibility, see Accessibility in forms, products, and controls.

Last updated on 06/26/2026

Feature management overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Features are added and updated in every release. The Feature management experience provides a workspace to view a list of features delivered in each release. You can then use the workspace to view feature documentation, and to enable or disable features.

The Feature management workspace

You can open the **Feature management** workspace by selecting the appropriate tile on the dashboard. You see a page that shows a list of features for all releases supported by the Feature management experience.

The feature list includes the following information:

- **Name** – A description of the feature that was added.
- **Status** – A symbol indicates whether a feature is turned on (check mark), is turned off (blank), scheduled to be turned on (clock), is mandatory (lock), requires attention before you turn it on (warning symbol), or can't be turned on (X). The setting that's shown is used for all legal entities. When a feature has been turned on, it's still controlled by security. Therefore, the feature is only available to users who have access to it based on their security role. It's also only available in legal entities that the user has access to.
- **Enable date** – The date when the feature was turned on or scheduled to be turned on.
- **Added** – The date when the feature was added to your environment. This date is automatically entered when you update your environment during the monthly release cycles.
- **Feature state** – The current lifecycle state of the feature: **Preview**, **Released** (shown as blank), **On by default**, and **Mandatory**. The states are covered in more details later in this article.
- **Module** – The module that is affected by the new feature.
- **Type** – The type of the feature and can be **Feature** or **Hotfix**. A **Hotfix** is a subtype of a feature, and has a shorter life-cycle.

When you select a feature, more information appears in the details pane to the right of the feature list. At the top of the pane, you see the feature name, the date when the feature was

added, the module that's affected by the feature, and a **Learn more** link. Select this link to view the documentation for the feature. If documentation isn't available, you're taken to a temporary page. The details pane also includes a **Comments** field where you can add your own comments about the feature.

The **Feature management** workspace also has several tabs, each of which shows a list of features.

- **New** – This tab shows all features that have been added since the last monthly update. If you've skipped any monthly updates, the tab shows all the new features that have been added since the last time that you updated. The newest features appear at the top of the list. The total number of new features is also shown on a tile at the top of the page.
- **Not enabled** – This tab shows all features that aren't turned on. The newest features appear at the top of the list. In addition, a tile at the top of the page shows the total number of new features that are currently off.
- **Scheduled** – This tab shows all features scheduled to be turned on in the future. The features that have the earliest scheduled date appear at the top of the list. In addition, a tile at the top of the page shows the total number of scheduled features.
- **All** – This tab shows all features. The newest features appear at the top of the list.

Feature recommendation notifications

Starting in Dynamics 365 finance and operations version 10.0.35, users may start to see notifications informing them about recommended features. Users can review a recommended feature and request it be enabled by an administrator. The request triggers a notification to be sent to administrators. They can assess the suggested feature and decide if it should be enabled for their organization.

Feature states

Features can transition between several states, from being introduced in Feature management to eventually becoming mandatory in the product. This section describes the valid feature states.

Preview features (optional)

Product teams can decide to initially start a new feature as a preview feature. Preview features aren't enabled by default, and they're optional. The owning product team updates features to released after they've completed a successful preview period.

> **Note**
>
> Preview features are subject to specific preview terms and conditions.

Released features (optional)

The **Feature state** column for these features is blank. Features that are initially added as released aren't turned on by default, and enabling them is optional. Features that are updated from preview keep their enablement status.

On by default features (optional)

Features that are updated to **On by default** are turned on by default, but can be disabled. After features that can be disabled have been in the **Released** state for at least six months, they're expected to move to this state in the next major release. Features that transition to **On by default** are expected to be communicated in the What's new article for the release. The update is initiated by the owning product team.

> **Note**
>
> Because these features are enabled automatically, it's important that you determine whether your organization is ready to uptake these features, or if more time is required. If more time is required, it might be necessary to temporarily disable these features. The transition of a feature to **On by default** is typically done in the major release before the feature is targeted to become **Mandatory**. At that point, you don't have the option to disable the feature.

Mandatory

Mandatory is the expected final state for features. It indicates that the features are turned on, and you can't disable them without contacting Microsoft. Optional features are expected to become mandatory after two major releases. Critical features can, by exception, be introduced as mandatory.

Example of expected feature lifecycle

Features that can be disabled, and that were added as released and optional before or as part of the April release, are expected to transition to **On by default** in the following October release. They're then expected to become **Mandatory** in April of the following year.

Features that can't be disabled, and that were added as released and optional before or as part of the April release, are expected to transition to **Mandatory** in April of the following year.

Hotfix states

Hotfixes have a shorter transition through the states than features. Hotfixes are introduced by Product quality updates, and eventually become fully integrated in the product and no longer appear in Feature management. For each hotfix, use the **Learn more** link to get detailed information about availability. This section describes the valid hotfix states.

Released (optional)

The **Feature state** column is blank. Hotfixes are initially added as released, and aren't turned on by default, and enabling them is optional.

Fully integrated

The hotfix doesn't appear in Feature management, the hotfix is turned on, and can't be disabled without contacting Microsoft.

Example of expected hotfix lifecycle

Hotfixes are added in a Product quality update for the April release, are expected to be **Fully integrated** in the next upcoming release. For versions already released, the hotfix is provided in Product quality updates, and remains as **Released**. For example, a hotfix released in August, is available in Product quality updates for the April and July releases, and **Fully integrated** in the October release.

Enable a feature

If a feature hasn't been turned on, an **Enable now** button appears in the details pane. You can use this button to enable the feature.

Some features can't be disabled after you enable them. If the feature that you're trying to turn on can't be enabled, you receive a warning. Select **Cancel** to cancel the operation and leave the feature disabled. However, if you select **Enable**, you won't be able to disable it later.

Some features display a message that provides additional information before you enable them. These features are indicated by a yellow warning symbol. You should read the additional

information carefully, to ensure that you understand what happens when the feature is enabled. However, you can still select **Enable** to enable the feature.

Some features display a message that the feature can't be enabled until an action is taken. These features are indicated by a red X symbol. You must take the actions described in the description before the feature is enabled. For example, if you can't use a feature until a configuration key is disabled, then you must disable the configuration key first and then return to Feature management to enable the feature.

After a feature is enabled, a message appears below the **Learn more** link in the details pane. This message states either that the feature was enabled or indicates the future date when the feature is scheduled to be enabled. It appears every time that you select the feature in the feature list.

Features scheduled to be enabled in the future appear on the **Scheduled** tab. A batch process enables them at midnight on the specified date, based on the time zone that's represented by the system date.

Reschedule a feature

If a feature is scheduled to be enabled in the future, a **Schedule** button appears in the details pane. Use this button to change the **Enable date** value to a different date.

1. Select the scheduled feature to reschedule, and then, in the details pane, select **Schedule**.
2. In the dialog box that appears, in the **Enable date** field, specify the new date when the feature should be enabled.
3. Select **Enable** to reschedule the feature or **Disable** to cancel the schedule.

Disable a feature

If a feature has been enabled, a **Disable** button appears in the details pane. Use this button to disable the feature. The **Disable** button isn't available if the feature can't be disabled.

After a feature is disabled, a message appears below the **Learn more** link in the details pane. This message states that the feature hasn't been enabled. It appears every time that you select the feature in the feature list. Features that haven't been enabled appear on the **Not enabled** tab.

Features that must be enabled

Sometimes, a critical feature is delivered that must be enabled automatically when you do an update. These features are enabled automatically on the date that is specified in the **Enable date** field. For these features, a message appears below the **Learn more** link in the details pane. This message either states that the feature was enabled or indicates the future date when the feature will be enabled. It appears every time that you select the feature in the feature list.

Enable all features

You can enable all features by selecting the **Enable all** button.

When you select **Enable all**, an option appears where you must provide the following information:

- A list of all features that require confirmation before they can be enabled. If you want to enable the features in the list, select **Yes** for the **Enable features requiring confirmation** button.
- A list of all features that can't be enabled will be shown. Those features won't be enabled.

All features that can be enabled are enabled. If a feature is already scheduled to be enabled in the future, the schedule doesn't change.

Enable all features automatically

If you want to automatically enable all new features, you can use the drop-down list under the workspace title to change what occurs when new features are added.

- Select **Enable new features automatically** to automatically enable all new features when they're added to your environment.
- Select **Do not enable new features automatically** if all applicable new features should be off by default when they're added to your environment.

When you enable all features automatically, it enables all of the features that would be enabled when you click the **Enable all** button. It won't enable the features that require confirmation or the features that can't be enabled until an action is taken.

Check for updates

Features are added to your environment after each update. However, you can manually check for updates by clicking on the **Check for updates** button. Any feature that was added to the system after the update is added to the list of features. For example, if a flighted feature is enabled after a release, then you can check for updates and the feature is added to your list.

Assigning roles

The **Feature management** workspace can be opened by system administrators, and also by users who are assigned to the Feature manager role or the Feature viewer role. These two roles were created to support the Feature management experience. Users in the Feature manager role can turn any feature on or off. They can also update the **Comments** field for the feature. Users in the Feature viewer role can only view the **Feature management** workspace. They can't turn features on or off.

The Feature manager role and Feature viewer role don't override the existing security that a user has. They just control whether the user can turn features on and off. They don't provide access to the features themselves.

Features that use configuration keys

If a feature uses a configuration key, but the configuration key isn't turned on, the **Feature management** workspace doesn't show the feature in the list of available features. After you turn on the configuration key, update the feature list by using the **Check for update** menu item. The feature then appears in the feature list.

If you turn off the configuration key, the feature isn't removed from the feature list.

Data entities

A data entity that is named **Feature management** lets you export the Feature management settings from one environment and then import them into another environment. This entity updates only existing features. The business logic in the entity also helps guarantee that the same rules that are used on the **Feature management** workspace are applied when the import is done. For example, you can't override a mandatory feature setting by removing the date during import.

The following examples describe what occurs when you use the **Feature management** entity to import data.

- If you change the value of the **Enabled** field to **Yes**, the feature is enabled, and the **Enable date** field is set to the current date.
- If you change the value of the **Enabled** field to **No** or leave the **EnableDate** field blank, the feature is disabled, and the **Enable date** field is cleared. You can't disable a mandatory feature or a feature that can't be disabled after it's enabled.
- If you change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.

- If you change the value of the **Enabled** field to **Yes** and change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If you change the value of the **Enabled** field to **No**, but you also change the value of the **EnableDate** field to a future date, the feature is scheduled for that date.
- If a feature is enabled, and you add an **EnableDate** field that is set to a future date, the feature remains enabled. To reschedule the feature, you must change the value of the **Enabled** field to **No**.

Feature management and flighting

Feature management lets you control the features that are delivered in each release. Flighting lets Microsoft teams release features to a limited number of customers, so that those features can be tested and validated without affecting all customers. **Feature management** doesn't control the flighting of any features.

Using Feature management to turn on ISV features or custom features

Feature management is currently unavailable for features from independent software vendors (ISVs) and custom features. However, Microsoft is adding more functionality to enhance **Feature management**. After those enhancements are completed, Microsoft makes **Feature management** available to all features and provide instructions for updating your features to use it.

Frequently asked questions (FAQ)

When are features added, removed, or changed?

Features are added, removed, and changed through code changes by the owning product teams. Environments must be updated to receive those changes.

Does a feature become mandatory automatically?

No, a feature doesn't become mandatory automatically. The owning product team must make a code change.

Why isn't there a specific 'mandatory-enabled date'?

Update release timing is variable, environment update timing is variable, and customers can opt to skip some updates. As a result, specific dates are difficult to determine.

Where's the documentation for features that are mandatory?

This documentation comes from each Dynamics 365 application team. Often, these features are mentioned in Updates to client feature states or Removed or deprecated features.

Is there an in-product notification or signal that a feature is going to be mandatory-enabled?

A notification mechanism related to making a feature mandatory doesn't exist today.

Do features ever get enabled without the customer knowing about it?

Yes, features can be enabled without the customer's knowledge in the following situations:

- A feature is moved to **On by default**. In this state, the feature can be disabled.
- A feature is updated to **Mandatory**. This change only occurs in combination with a major release. Critical features might, by exception, be moved to **Mandatory** at any update.

What is feature flighting and how does it relate to feature management?

Feature flights are real-time on or off switches that Microsoft controls. They're separate from the customer control provided by Feature Management.

- Private preview features aren't listed in **Feature management** until they're flighted on. In production, the customer needs to agree to be part of a special program for that to occur.
- Public preview and released (generally available) features are listed in **Feature management** unless they're flighted off. Flighting a feature off is considered as a last resort option for product teams if a critical issue is found and would usually be a per customer operation.

Do features ever get flighted off without the customer knowing about it?

Yes, if a feature is impacting the functioning of an environment that doesn't have a functional impact then they can be enabled by default.

How can feature enablement be checked in code?

Use the **isFeatureEnabled** method on the **FeatureStateProvider** class, passing it an instance of the feature class. Example:

X++

```
if
(FeatureStateProvider::isFeatureEnabled(BatchContentionPreventionFeature::instance()
))
```

How can feature enablement be checked in metadata?

The **FeatureClass** property can be used to indicate that some metadata is associated with a feature. The class name used for the feature should be used, such as **BatchContentionPreventionFeature**. This metadata is visible only in that feature. The **FeatureClass** property is available on menus, menu items, enum values, and table/view fields.

What is a feature class?

Features in **Feature management** are defined as *feature classes*. A feature class **implements IFeatureMetadata** and uses the feature class attribute to identify itself to the **Feature management** workspace. There are numerous examples of feature classes available that can be checked for enablement in code using the **FeatureStateProvider** API and in metadata using the **FeatureClass** property. Example:

X++

```
[ExportAttribute(identifierStr(Microsoft.Dynamics.ApplicationPlatform.FeatureExposur
e.IFeatureMetadata))]
internal final class BankCurrencyRevalGlobalEnableFeature implements
IFeatureMetadata
```

What is the IFeatureLifecycle implemented by some feature classes?

IFeatureLifecycle is a Microsoft-internal mechanism for indicating the feature lifecycle stage. Features can be:

- `PrivatePreview` - Needs a flight to be visible.
- `PublicPreview` - Shown by default but with a warning that the feature is in preview.
- `Released` - Fully released.

Client FAQ

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides answers to frequently asked questions about the finance and operations client.

Why aren't symbols loaded?

The security settings on your browser might prevent the symbols from being loaded correctly. To resolve this issue, try the following steps:

- If you're experiencing this issue in Internet Explorer, click **Tools**, and then click **Internet Options**. In the Internet Options dialog box, on the **Privacy** tab, click **Custom level**, and make sure the **Font download** option is selected.
- Otherwise, you might have to add the app site to the list of trusted sites.

I miss the ribbon from Dynamics AX 2012. Can I keep Action Pane tabs open all the time?

We are planning to implement this feature soon. Users will then be able to choose to keep the tabs on Action Panes open all the time. Otherwise, the tabs will be collapsed when they aren't being used, to gain more screen space for the page.

Why do I sometimes see different shortcut menus when I right click?

If you right-click in an editable field (or if text is selected), the browser's shortcut menu is displayed. This menu gives you access to the **Cut**, **Copy**, and **Paste** commands. We can't embed these commands into the shortcut menus because, for security reasons, browsers don't allow us to programmatically access the system clipboard.

If you right-click a field label or the value of a read-only control, you'll see the shortcut menu.

To make keyboard access easier, we plan to implement a keyboard shortcut in the future that will open the shortcut menu.

Where is the View details functionality?

The **View details** option is available in a couple of ways:

- If a control has **View details** capabilities, and if the control has a value, that value is displayed as a hyperlink. You can click the hyperlink to open a page that contains additional details.
- **View details** is also an option on shortcut menus. For more information about when shortcut menus are displayed when you right-click, see the previous section.

Action search

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the action search functionality. Action search will help you find and run actions on a page.

Introduction

Pages primarily expose commands on Action Panes, both the standard Action Pane that appears at the top of a page and the toolbars that appear in various sections of the page. In previous versions, a Key Tips feature let you quickly access any button on an Action Pane by pressing the Alt key and then a series of letters.

The action search feature replaces Key Tips, which are no longer available. This feature lets you quickly search for and run a button from any visible Action Pane.

Using action search

To use the action search feature, follow these steps:

1. On the Action Pane, click in the **Action search** field. (The **action search** field contains a magnifying glass icon.)
2. Type all or part of the name of the button that you want to run. You can also search by using words from the button's "path." (For more information, see the next section of this article.) Typically, a button appears near the top of the results list after you've typed two to four characters.
3. Find and run the button in the results list (by using your mouse or keyboard).

After the button is run, the focus is returned to your last position on the page, so that you can continue to work.

You can also start action search by pressing Ctrl+/ or Alt+Q. Press the keyboard shortcut again to return the focus to your last position on the page.

Understanding the results list

Often, you must know both the location and the context of a button to fully understand the purpose of that button. Therefore, the results list shows additional information to help you understand exactly which buttons appear in the list. In particular, the "path" of the button is shown. This path might include the labels of the following UI elements, as relevant:

- Action Pane tab
- Button group
- Menu button (if the button is inside a menu button)
- Menu separator (if the button is inside a named group inside a menu button)
- Group or tab on the page (for example, the name of a FastTab)

For example, you typed **tot** in the **Action search** field and are now examining the results list. The first entry, for a button that is named **Totals**, is highlighted. A button path of **Sales order** > **View** is also shown. The **Sales order** part of the path corresponds to the **Sales order** tab on the Action Pane, and the **View** part of the path corresponds to the **View** group on that tab. Similarly, the path of the **Total discount** button (**Sell** > **Calculate**) informs you that this button is located in the **Calculate** group on the **Sell** tab of the Action Pane. Therefore, this information helps you understand exactly which button will be triggered by action search (if you select that button in the results list).

In the previous example, action search showed results from the standard Action Pane at the top of a page. However, action search also shows results from visible toolbars that are in other places on the page. For example, you're searching for the **On-hand inventory** button that is on the **Sales order lines** FastTab. In this case, the button path in the results list (**Sales order lines** > **Inventory** > **View**) informs you that this button is under the **View** heading on the **Inventory** menu button on the **Sales order lines** FastTab.

> ⓘ **Note**
>
> There are some buttons that do not show up in Action search. These include drop dialog buttons and buttons from subforms.

Action search vs. Navigation search

Whereas action search is intended to find and run actions on a page, there is a separate search mechanism for finding and navigating to pages. For more information about that feature, see the Navigation search article.

Advanced filtering and query syntax

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the filtering and query options that are available when you use the Advanced filter/sort dialog or the **matches** operator in the filter pane or grid column header filters.

Advanced query syntax

Expand table

Syntax	Character description	Description	Example
value	Equal to the value that is entered	Type the value to find.	**Smith** finds "Smith".
!*value* (exclamation point)	Not equal to the value that is entered	Type an exclamation point and then the value to exclude.	**!Smith** finds all values except "Smith".
from-value..to-value (double period)	Between the two values that are separated by double periods	Type the from-value, then two periods, and then the to-value.	**1..10** finds all values from 1 through 10. However, in a string field, **A..C** finds all values that start with "A" and "B", and values that are exactly equal to "C". For example, this query won't find "Ca". To find all values from "A" *through* "*C*", type **A..D**.
..*value* (double period)	Less than or equal to the value that is entered	Type two periods and then the value.	**..1000** finds any number that is less than or equal to 1000, such as "100", "999.95", and "1,000".
value.. (double period)	Greater than or equal to the value	Type the value and then two periods.	**1000..** finds any number that is greater than or

Syntax	Character description	Description	Example
	that is entered		equal to 1000, such as "1,000", "1,000.01", and "1,000,000".
>*value* (greater than sign)	Greater than the value that is entered	Type a greater than sign (>) and then the value.	**>1000** finds any number that is greater than 1000, such as "1000.01", "20,000", and "1,000,000".
<*value* (less than sign)	Less than the value that is entered	Type a less than sign (<) and then the value.	**<1000** finds any number that is less than 1000, such as "999.99", "1", and "-200".
*value** (asterisk)	Starting from the value that is entered	Type the starting value and then an asterisk (*).	**S*** finds any string that starts with "S", such as "Stockholm", "Sydney", and "San Francisco".
**value* (asterisk)	Ending with the value that is entered	Type an asterisk and then the ending value.	***east** finds any string that ends with "east", such as "Northeast" and "Southeast".
value (asterisk)	Containing the value that is entered	Type an asterisk, then a value, and then another asterisk.	***th*** finds any string that contains "th", such as "Northeast" and "Southeast".
? (question mark)	Having one or more unknown characters	Type a question mark at the position of the unknown character in the value.	**Sm?th** finds "Smith" and "Smyth".
value,*value* (comma)	Matching the values that are separated by commas	Type all your criteria, and separate them by using commas.	**A, D, F, G** finds exactly "A", "D", "F", and "G". **10, 20, 30, 100** finds exactly "10, 20, 30, 100".
"" (two double quotes)	Matching a blank value	Type two consecutive double quotes to filter for blank values in that field.	Two consecutive double quotes ("") finds rows with no value for the current column.
(Finance and operations query) (finance and	Matching a defined query	Type a query as an SQL statement	**((AccountNum LIKE "US*") && (DirPartyTable.Name**

Syntax	Character description	Description	Example
operations query between parentheses)		between parentheses using the finance and operations query language.	**LIKE "Cont*"))** as an example of syntax for a filter condition on a field from the root datasource as well as a field from a different datasource (for the All customers page)
T	Today's date	Type **T**.	**T** matches today's date.
(methodName(parameters)) (**SysQueryRangeUtil** method between parentheses)	Matching the value or range of values that are specified by the parameters of the **SysQueryRangeUtil** method	Type a **SysQueryRangeUtil** method that has parameters that specify the value or range of values.	1. Click **Accounts receivable** > **Invoices** > **Open customer invoices**. 2. Press Ctrl+Shift+F3 to open the **Inquiry** page. 3. On the **Range** tab, click **Add**. 4. In the **Table** field, select **Open customer transactions**. 5. In the **Field** field, select **Due date**. 6. In the **Criteria** field, enter **(yearRange(-2,0))**. 7. Click **OK**. The list page is updated and lists the invoices that match the criterion that you entered. For this example, invoices that were due in the previous two years are listed. See the table in the next section for additional details about **SysQueryRangeUtil** date methods, and several examples.

Advanced date queries that use SysQueryRangeUtil methods

Expand table

Method	Description	Example
Day (_relativeDays=0)	Find a date relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	• **Tomorrow** – Enter **(Day(1))**. • **Today** – Enter **(Day(0))**. • **Yesterday** – Enter **(Day(-1))**.
DayRange (_relativeDaysFrom=0, _relativeDaysTo=0)	Find a range of dates relative to the session date. Positive values indicate future dates, and negative values indicate past dates.	• **Last 30 days** – Enter **(DayRange(-30,0))**. • **Previous 30 days and next 30 days** – Enter **(DayRange(-30,30))**.
GreaterThanDate (_relativeDays=0) GreaterThanUtcDate (_relativeDays=0)	Find all dates after the specified relative date.	• **More than 30 days from now** – Enter **(GreaterThanDate(30))**.
GreaterThanUtcNow ()	Find all date/time entries after the current time.	• **All future date/times** – Enter **(GreaterThanUtcNow())**.
LessThanDate (_relativeDays=0) LessThanUtcDate (_relativeDays=0)	Find all dates before the specified relative date.	• **Less than seven days from now** – Enter **(LessThanDate(7))**.
LessThanUtcNow ()	Find all date/time entries before the current time.	• **All past date/times** – Enter **(LessThanUtcNow())**.
MonthRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on months relative to the current month.	• **Previous two months** – Enter **(MonthRange(-2,0))**. • **Next three months** – Enter **(MonthRange(0,3))**.
YearRange (_relativeFrom=0, _relativeTo=0)	Find a range of dates, based on years relative to the current year.	• **Next year** – Enter **(YearRange(0, 1))**. • **Previous year** – Enter **(YearRange(-1,0))**.

Configure and filter workspaces

Article • 01/24/2025

This article provides an overview about how to configure and filter workspaces.

Configuring a workspace

You can change the appearance and behavior of some workspaces by updating settings that apply to the whole workspace. When a workspace can be configured, the Action Pane includes a button that instructs you to click it to make configuration changes.

When you click the button, a dialog appears, where you can modify the predefined settings for the workspace. The specific settings that you see in this dialog vary by workspace, and depend on the specific controls and business data that are available in the workspace.

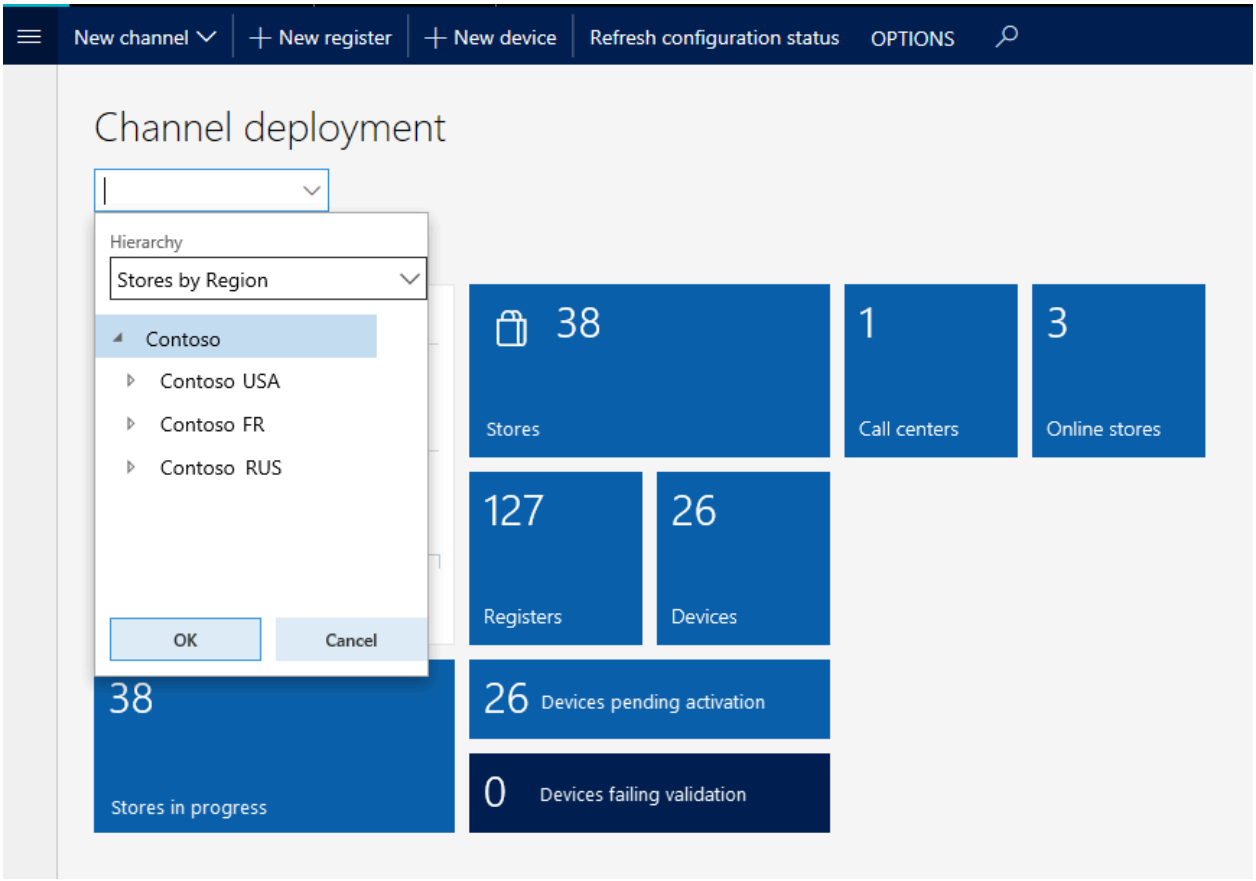
Filtering a workspace

Many workspaces let you filter the content that appears in them. The controls that are available might let you filter all the content in the workspace or only the content in a specific section of the workspace. The filters on workspaces can be lookups, combo boxes, free-form text fields, or other types of controls. However, every type of filter has the same effects, as described in the following sections.

Workspace-wide filters

You can filter the whole workspace by using a workspace-wide filter. A workspace-wide filter appears in the upper-left corner of the workspace. When you select a specific value in the drop-down list, the contents of the workspace are filtered based on that selection.

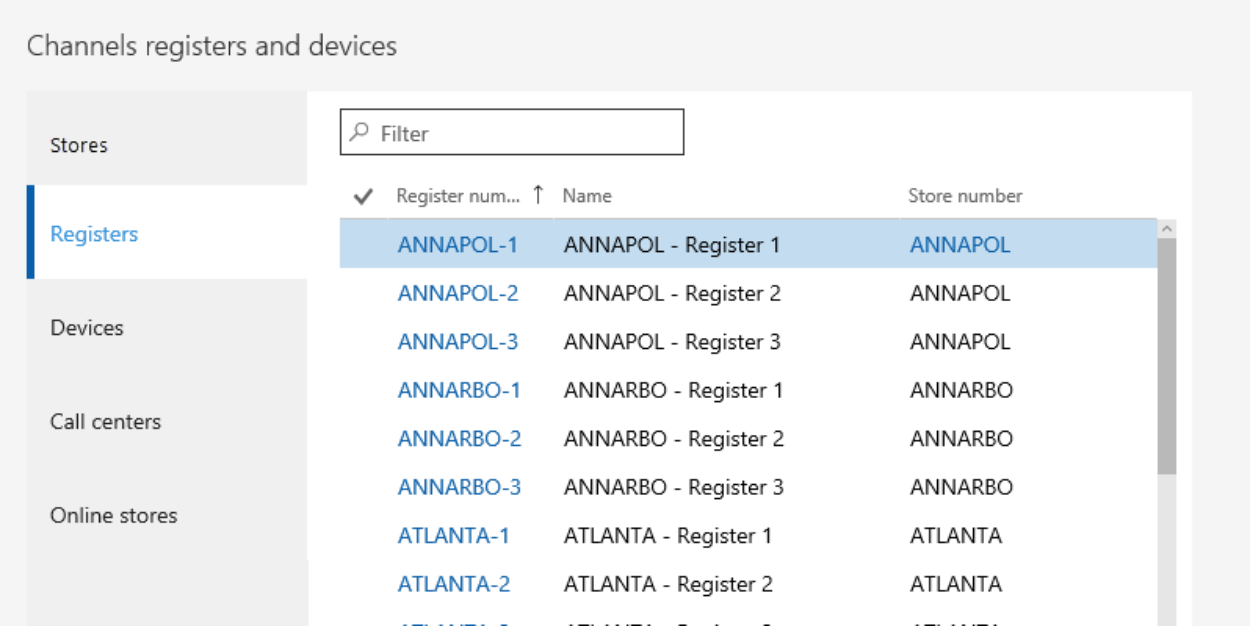
When you click to open the filter, you're presented with several options.



Select an option to filter the workspace based on that option.

Workspace section filters

If individual sections of the workspace have filters, you can filter each section separately. In the following illustration, the filter (the field that contains the text "Filter") is an example of a free-form text field filter.



As with a workspace-wide filter, select or enter a value in the field to filter the contents of the section.

Show pages side-by-side using the Open in new window feature

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to display pages side by side.

You may want to view multiple pages side by side to complete tasks quickly. As an example, you might want to validate or enter lines in more than one journal. Typically, to validate or enter lines in more than one journal you would have to go back and forth between the page that displays a list of journals, and the page that displays lines for a given journal. However, the **Open in new window** feature enables you to display these pages side-by-side so that you can perform your tasks quickly.

Clicking the **Open in new window** icon opens the lines page in a new, pop-up browser, and then navigates the original browser back in history to the page that displayed the list of journals. You can then display both pages side by side. After viewing a journal, you can change the selected journal on the journal list page, and the lines page in the pop-up window will automatically display the lines of the newly selected journal.

The dynamic linking and refreshing happens due to the relations that exist between the data that is backing these pages. If the system is not aware of the relation between the data, the pop-up window will not refresh automatically in response to a change in the window it originated from.

Some pages have multiple views such as the Grid view, Header view, and Details view. The **Open in new window** icon causes the entire page to open in the new browser window. Therefore, you cannot keep two views of the same page side by side using the **Open in new window** feature. Almost all such pages have a navigation list that you can use to switch between records and achieve a similar experience.

Before using the **Open in new window** feature, you should configure your browser's pop-up blocker to allow pop-ups from the URL of the site. As an example, you could allow pop-ups from "*.dynamics.com".

The **Open in new window** feature is only available when there is more than one page open in the window. Also, the pop-up window automatically closes when there are no more pages

open (that is, when you close the last page in that window). The system also closes open pages when you navigate to a different area in the application. Therefore, if you have pop-up windows open and navigate to a different area in the application, the pop-up windows close automatically because the system closed the pages in those windows.

The top bar in the pop-up windows displays information about the company the page was opened in and is read-only. The pop-up windows also rely on the main browser window. If the main window is closed or refreshed, all open pop-up windows will become read only. If this situation occurs, you can still view the information in these windows, but you will not be able to interact with it.

Keyboard shortcuts

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Keyboard shortcuts can help you quickly and efficiently enter data in finance and operations apps.

> **Note**
>
> The keyboard shortcuts described here refer to the United States keyboard layout. Keys on other keyboard layouts might not correspond exactly to the keys on a US keyboard.

Some of the shortcuts on this page are *key chords*, meaning they require two consecutive sets of key combinations (separated by a comma) that need to be independently pressed to trigger the required action. For example, the shortcut "Alt+M,A" requires the user to first press "Alt+M", release the keys, and then press "A".

Finding a shortcut

Users can discover currently available shortcuts directly from the user interface. Simply right-click on a control and select **View shortcuts**. This opens a dialog box showing the shortcuts you can use based on where you are on the page. Alternatively, you can press Alt+Shift+K to open this dialog box (and press Alt+Shift+K a second time to see all currently available shortcuts for the page).

Action shortcuts

Expand table

To do this	Press
Open action search	Ctrl+' or Alt+Q

To do this	Press
Move to the standard Action Pane	Alt+M, A, or Ctrl+F6
Open a tab on the Action Pane or a menu	Enter or Space or Alt+Down arrow
Move to next/previous option in a menu	Down arrow / Up arrow
Close a tab on the Action Pane or a menu	Esc
Simulate a right-click	Shift+F10
Open the context menu	Ctrl+F10
Execute the default button on a page/dialog box	Alt+Enter
Click a button or tile	Enter or Space
View refresh information for a count tile	Alt+Up arrow
View currently available shortcuts	Alt+Shift+K

Date picker shortcuts

Expand table

To do this	Press
Open the date picker	Alt+Down arrow
Move between dates in the date picker	Ctrl+Arrow keys
Move to the next/previous month	Page down / Page up
Move to the next/previous year	Ctrl+Shift+Page down / Ctrl+Shift+Page up
Move to today	Ctrl+Home
Pick today's date	T
Clear the selected date	C
Pick Never (or the max date)	N

FactBox shortcuts

Expand table

To do this	Press
Open the FactBox pane (or move focus to the FactBox pane if it is already open)	Alt+M, B, or Ctrl+F2
Close the FactBox pane (with focus in the FactBox pane)	Esc
Move to the next/previous FactBox (with focus in the FactBox pane)	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FactBox (with focus in the FactBox pane)	Alt+<n> (<n> = 1-9)
Expand a FactBox (with focus on the FactBox header)	Space or Enter
Collapse the current FactBox	Alt+0

Filtering shortcuts

Expand table

To do this	Press
Open grid filtering for the current column	Ctrl+G
Close grid filtering for the current column	Esc
Open the Filter pane (or switch focus between the Filter pane and the main page if the Filter pane is already open)	Alt+M, F, or Ctrl+F3
Close the Filter pane (with focus in the Filter pane)	Esc
Open advanced filtering/sort	Ctrl+Shift+F3
Apply the Quick Filter (when focus is in Quick Filter)	Enter
Apply the grid filter (when focus is in the filter field of the column header)	Enter

Page shortcuts

Expand table

To do this	Press
Create a new record	Alt+N
Delete a record	Alt+Del or Alt+F9

To do this	Press
Save record	Alt+S or Ctrl+S
Revert (restore)	Ctrl+Shift+F5
Data refresh	Shift+F5
Move to the visible first field on the page	Ctrl+Shift+F
Toggle edit mode	F2
Attach a document	Ctrl+Shift+A
Export to Excel	Ctrl+Shift+E
Move to the previous record (outside a grid)	Ctrl+Up arrow
Move to the next record (outside a grid)	Ctrl+Down arrow
Move to the first record (outside a grid)	Ctrl+Home
Move to the last record (outside a grid)	Ctrl+End
Close the page (select the **Back** button) **Note:** If any popup window (tooltip, date picker, or drop-down control) is open, the first use of the **Esc** key will dismiss it.	Esc
Close the page with explicit save	Shift+Esc
Close the page discarding any unsaved changes	Alt+Shift+Q

Page navigation shortcuts

Expand table

To do this	Press
Move to the next/previous field	Tab / Shift+Tab
Move to the next/previous tab	Alt+Shift+Right arrow / Alt+Shift+Left arrow
Move to the <n>th tab	Alt+Shift+<n> (<n> = 1-9)
Move to the next/previous FastTab	Alt+Shift+Down arrow / Alt+Shift+Up arrow
Move to the <n>th FastTab	Alt+<n> (<n> = 1-9)

To do this	Press
Move to the next/previous blade (vertical tab)	Alt+Shift+Right arrow / Alt+Shift+Left arrow
Move to the <n>th blade (vertical tab)	Alt+Shift+<n> (<n> = 1-9)
Expand a FastTab (with focus on the FastTab header)	Space or Enter
Collapse the current FastTab	Alt+0
Switch to grid view	Ctrl+Shift+G
Switch to details view	Ctrl+Shift+D
Switch to header view	Ctrl+Shift+H
Switch to lines view	Ctrl+Shift+L

Grid shortcuts

Expand table

To do this	Press
Vertical scrolling	Mouse wheel
Horizontal scrolling	Shift + Mouse wheel
Move to the next/previous column	Tab / Shift+Tab
Move to the next/previous row	Down arrow / Up arrow
Move to the next/previous row without selecting **Note:** This shortcut applies to multi-select scenarios only.	Ctrl+Up arrow / Ctrl+Down arrow
Select/clear the current row **Note:** This shortcut applies to multi-select scenarios only.	Ctrl+Space / Ctrl+Click
Add the next/previous row to the selected set **Note:** This shortcut applies to multi-select scenarios only.	Shift+Space
Add a range of rows to the selected set **Note:** This shortcut applies to multi-select scenarios only.	Shift+Click
Go to the next/previous page of data	Page up / Page down

To do this	Press
Create a new row at the bottom of the grid	Down arrow (from the last row)
Move to the first record	Ctrl+Home
Move to the last record	Ctrl+End
Select or clear all rows	Ctrl+Shift+M
Move to the first marked row	Alt+Shift+M, F
Move to the next marked row	Alt+Shift+M, L
Move to the previous marked row	Alt+Shift+M, P
Moved to the last marked row	Alt+Shift+M, N
Execute the default action in a grid **Note:** This shortcut is enabled when focus is on a cell containing a hyperlink and all cells in that column have hyperlinks.	Enter
Toggle focus between the selected row and the header row	Alt+T,H or Alt+Shift+H
Make the current column larger/smaller (with focus in the header row)	Right arrow / Left arrow
Move the current column to the next/previous position (with focus in the header row)	Ctrl+Shift+Right arrow / Ctrl+Shift+Left arrow
Open grid filtering for the current column (with focus in the header row)	Enter
Resize the current column to fit the contents (with focus in the header row)	A (or double click on the column sizing handle)
Open the grid options menu*	Alt+T, O
Change the type of calculated value for the current column*	Alt+T, V
Show/hide the grid footer*	Alt+T, F
Group/ungroup the current column*	Alt+T, G
Freeze/unfreeze the current column*	Alt+T, P
Go to the row in an invalid or paused state (when using fast data entry)*	Alt+T, A
Revert changes in a newly created but unsaved row*	Ctrl+Shift+F5
Delete the current row*	Alt+Del

> **Note**
>
> Shortcuts that are marked with an asterisk (*) are available only in version 10.0.32 and later.

Input control shortcuts

Expand table

To do this	Press
Open the hyperlink	Ctrl+Enter
Open the hyperlink (when focus is on a read-only control) **Note:** This shortcut only applies when the **Standardize keyboard interaction for combo box and lookup controls** feature is enabled.	Enter
Enter the session date in a date field	D
Enter the current date in a date field	T
Open lookup, combo box, date picker, drop dialog box	Alt+Down arrow Enter (when the **Standardize keyboard interaction for combo box and lookup controls** feature is enabled).
Close lookup, combo box, date picker, drop dialog box	Esc
Move focus into a lookup (when the lookup is already open)	Alt+Down arrow
Open the control's enhanced preview	Alt+Up arrow
Select text in the current field	Ctrl+A
Enter/leave the text area in an HTML editor control	Alt+Down arrow / Alt+Up arrow
Switch focus between the text area and the toolbar in an HTML editor control	F6

Messaging shortcuts

Expand table

To do this	Press
Go to the Message Center	Ctrl+Shift+F7
Go to the Message Bar	Ctrl+F7

Navigation shortcuts

Expand table

To do this	Press
Go to the dashboard	Alt+Shift+Home
Move to the navigation bar	Alt+M, N, or Alt+Shift+F1
Move to the company picker	Ctrl+Shift+O
Search for a page	Ctrl+/ or Alt+G
Open the help pane	Ctrl+?
Open the trace parser	Alt+Shift+T
Toggle the navigation pane between open, pinned open, and closed	Alt+F1
Add/remove page as a favorite (with focus on a page in the navigation pane)	Shift+F
Move to the standard Action Pane	Alt+M, A, or Ctrl+F6
Move to the Filter pane (which may include opening it)	Alt+M, F, or Ctrl+F3
Move focus to the page content (with focus in the Filter pane)	Alt+M, M, or Ctrl+F3
Move to the navigation list (which may include opening it)	Alt+M,S or Ctrl+F8
Move focus to the page content (with focus in the navigation list)	Alt+M,M or Ctrl+F8
Close the navigation list (with focus in the navigation list)	Esc
Move to the main page content (with focus in another pane)	Alt+M,M
Move to the FactBox pane (which may include opening it)	Alt+M,B, or Ctrl+F2
Move to the next feature callout	Alt+M,C

Note

The **Streamline tabbing behavior in full-page forms** feature, introduced in version 10.0.26, allows users to tab through all regions of a page without requiring the mouse or a dedicated keyboard shortcut to move between regions. You can still use the existing keyboard shortcuts (such as Alt+M key chord shortcuts) to move quickly between the regions on a page.

Personalization shortcuts

Expand table

To do this	Press
Transition the page into personalization mode	Ctrl+Shift+P
Use the Select tool (when in personalization mode)	S
Open the selected control's quick personalization dialog box (when using the Select tool)	Space or Enter
Use the Move tool (when in personalization mode)	M
Select the current control as the one to move (when using the Move tool and no control has been selected to move yet)	Space or Enter
Clear the control to move (when using the Move tool)	Esc
Move the selected control to the next position (when using the Move tool)	Tab or Right arrow or Down arrow
Move the selected control to the previous position (when using the Move tool)	Shift+Tab or Left arrow or Up arrow
Use the Hide tool (when in personalization mode)	H
Switch whether the current control is visible or hidden (when using the Hide tool)	Space or Enter
Use the Skip tool (when in personalization mode)	K
Switch whether the current control is in the tab sequence (when using the Skip tool)	Space or Enter
Use the Edit tool (when in personalization mode)	E
Switch whether the current control is editable or read-only (when using the Edit tool)	Space or Enter
Use the Summary tool (when in personalization mode)	U

To do this	Press
Switch whether the current control is a summary field in the current fast tab (when using the Summary tool)	Space or Enter
Use the Add tool (when in personalization mode)	A
Select the control whose container is used to insert the new fields (when using the Add tool)	Space or Enter
Import a personalization (when in personalization mode)	I
Export a personalization (when in personalization mode)	X
Clear this page's personalizations (when in personalization mode)	Ctrl+C
Move focus between the personalization toolbar and the page (when in personalization mode)	T
Exit personalization mode (when in personalization mode)	Esc

Segmented entry shortcuts

Expand table

To do this	Press
Open the drop-down list (when the drop-down list is closed)	Alt+Down arrow
Move focus into the input field for the current segment in the drop-down list (when the drop-down list is already open)	Alt+Down arrow
Close the drop-down list	Alt+Up arrow
Close/open the right portion of the drop-down list	Alt+Left arrow / Alt+Right arrow
Switch between "Show valid" and "Show all" modes	Alt+W
Select the value from drop-down list and move to the next segment	Enter
Move to the next/previous control on the page (when focus is in input control)	Tab / Shift+Tab
Move to the next/previous input field in the flyout (when focus is in the drop-down list)	Tab / Shift+Tab
Move up/down a row in the lookup	Up arrow / Down arrow
Move up/down a page in the lookup	Page up / Page down

To do this	Press
Move to the top/bottom of the lookup	Home / End

Task recorder shortcuts

Expand table

To do this	Press
Stop the recording (while recording)	Alt+R,S
Toggle the visibility of the Task recorder pane (while recording)	Alt+R,T
Toggle Rails mode (while playing a task guide)	Alt+R,L
Go to the previous step (while playing a task guide)	Alt+R,P
Go to the next step (while playing a task guide)	Alt+R,N
Toggle focus between the page and the animated pop-up prompt (while playing a task guide)	Alt+R,F
Expand/collapse the animated pop-up prompt (while playing a task guide)	Alt+R,C
Show more/less information in the animated pop-up prompt (while playing a task guide)	Alt+R,M

Focus management

Focus management describes how user focus is handled in an application. Finance and operations apps have specialized focus behaviors that are intended to optimize user productivity, especially for data entry scenarios. Specialized focus behaviors include the following:

- When a page is loaded, the first editable input control on the page has focus and can accept user input immediately. If there is no editable input control on the page, the fallback option for initial focus is the first input control on the page followed by the first, focusable control on the page.
- Typically when a button is selected, the action is processed and focus may return to the page. When this happens, focus tends to return to the button control that was selected. This is true in finance and operations apps **except** when the button is located in the Action Pane or on a toolbar. In these cases, when the action completes, focus returns to the last control *outside* of the Action Pane (or toolbar) that had focus before the button was selected.

- When a user opens a column header dropdown, the filter field receives focus initially. This facilitates an optimal flow for filtering by allowing the user to immediately type a value and hit Enter to apply the filter.

Change the banner or logo

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The following procedure lists the steps that system administrators can use to update the banner or logo image that is displayed for a legal entity. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane** > **Modules** > **Organization administration** > **Organizations** > **Legal entities**.
2. In the list on the left, select the legal entity for which you want to update the banner or logo. If it is already selected, go to the next step.
3. Expand **Dashboard image** tab.
4. Select **Change**.

   The ideal resolution for a banner image is 1920 x 281 pixels. The ideal width for a logo image is 350 pixels.
5. Select **Save**.
6. Go to **Navigation pane** > **Modules** > **Common** > **Common** > **Default dashboard**. You should see the new banner or logo image on the dashboard.

   You may need to change your company, using the company picker, to the one you uploaded the banner for.

Navigation search

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to use the search functionality to navigate to pages.

The application includes many areas and pages to help you perform various tasks. To quickly find the pages that you need to complete your tasks, use the navigation search feature.

To use this feature, click the **Search** icon to display the **Search** box. You can then type one or more words in the box. The system instantly searches for relevant pages in the application that match the words that you entered. For example, you could type "vendor invoice" as the input, and then the system displays results that match that input.

> **Note**
>
> The **Search** box helps you find and navigate to pages. The **Search** box doesn't help you find specific data or actions.

Quickly navigate to a particular page

The navigation search feature also serves as a great way for you to quickly navigate to a particular page. For example, if you are an accounts payable clerk who frequently uses the **Payment journal** page, you could enter "payment journal" in the **Search** box. Because the input is an exact match for the page title, the page is listed at the top of the search results, and you can quickly navigate to it.

The search results list displays the page title and the navigation path and helps you differentiate between two or more similar pages in the results.

When you search for a page, your input is matched against the page title andd its navigation path. For example, if you enter "receivable" in the **Search** box, you see results for the pages available to you in the Accounts receivable area – even though the page titles do not include the word "receivable."

Quickly navigate to a page based on the technical form name

The navigation search functionality also includes a much-requested feature for power users: the ability to quickly navigate to a page based on the technical form name. Many users are so familiar with the system that they know the exact form names they work with. If you are one of these users, you can enter **form:** followed by the name of the form you are looking for. For example, if you enter **form: vendinvoice**, the search results show all pages where the form name starts with **vendinvoice**.

Administration and security

From an administration and security perspective, the navigation search functionality only surfaces two types of results:

- Pages that are enabled in the current configuration (via configuration keys).
- Pages that the user has access to based on the user's role.

The list of search results is limited to 10 items. If you do not find what you're looking for in the results, you should try refining or updating the input.

Development

From a development perspective, the navigation search functionality is easy to use because the delay between the deployment of menu items and their appearance in search results is minimal. As long as the menu items are linked to from either the navigation pane or the dashboard, they will automatically become searchable.

Personalize the user experience

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how you can personalize the app and covers the following subjects:

- **System-wide options** – These personalization options are made on a setup page and are available to all users. Examples include the color theme and time zone.
- **Restricted personalization access** – At this access level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. For example, the app stores the width of grid columns if you adjust them, and the expanded or collapsed state of FastTabs.
- **Full personalization access** – At this access level, users have access to all personalization capabilities in the app. In particular, they have access to the **Personalization** toolbar.
- **Sharing personalizations** – Users who have full personalization access can export their page personalizations and share them with other users.
- **Administration of personalizations** – Privileged users can access the **Personalization** administration page to manage all personalizations at an organizational level.

System-wide options for the current user

The **User options** page contains several system-wide settings for the current user. These options are available to all users, even users who aren't given any access to personalization. To open the **User options** page, select the **Settings** button on the navigation bar, and then select **User options**. The **User options** page has four tabs that contain various user settings:

- **Visual** – Select a color theme and the default size of elements on pages.
- **Preferences** – Select default values that are used every time that you open the system. These values include the default company, the initial page, and the default view/edit mode. (The view/edit mode determines whether a page is locked for viewing or opened for editing every time that you open it.) This tab also includes options for the language, the time zone, and date, time, and number formats. Finally, this tab includes several miscellaneous preferences that vary from release to release.
- **Account** – View or adjust your user name and other account-related options.
- **Workflow** – Select workflow-related options.

In addition to changing your user settings, you can also view and delete your usage data and personalizations from the **User options** page. To see your usage data, select **Usage data** on the Action Pane. On the **Personalization** tab, you can view and manage the personal changes that you made to pages in the system. On this tab, you can also reset feature callouts (the pop-up windows that introduce new system features). You are then alerted again about previously encountered features.

Restricted personalization access (formerly implicit personalizations)

At the **restricted personalization access** level, user actions that are associated with typical page usage are automatically saved by the app and restored the next time that you visit the page. No explicit save action is required.

Here's a list of the actions that fall under typical page usage and are covered by restricted personalization access:

- **Grid column widths** – You can adjust the width of a column in a grid by selecting the sizing bar to the left or right of the column header, and then sliding it left or right until the column is the desired width. The app stores the width that you set for a column. Then, the next time that you open that page, the column will be resized to that width.
- **Grid footer and column totals** – *(Available only when the new grid control is turned on)* You can decide whether a total should be shown at the bottom of any numeric column in a grid, and whether the grid footer should be visible. The app stores these preferences and applies them the next time that you open the page. For more information, see Grid capabilities.
- **FastTabs** – Some pages have expandable sections that are known as *FastTabs*. The app stores information about the FastTabs that you expanded or collapsed. The next time that you open the page, the same FastTabs will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance by collapsing a FastTab, because the app doesn't have to retrieve the information for FastTabs until they're expanded. As is explained later in this article, you can also change the order of the FastTabs on a page.
- **FactBoxes** – Some pages have a **Related information** pane that shows read-only information that is related to the current subject of the page. Each section in the **Related information** pane is known as a *FactBox*. You can expand or collapse the **Related information** pane, and you can also expand or collapse individual FactBoxes. The app stores these preferences. The next time that you open the page, the **Related information** pane and the individual FactBoxes will be either expanded or collapsed, based on your last interaction with the page. In some cases, you can help improve system performance

by collapsing the **Related information** Pane or a FactBox, because the app doesn't have to retrieve the information for FactBoxes until they're expanded.

- **Action Panes** – An *Action Pane* appears near the top of most pages. The Action Pane contains buttons for many of the actions that you can perform on the current page. These buttons are often organized on tabs. You can *pin* the whole Action Pane open, or you can collapse it by default. The next time that you open the page, the Action Pane will be either open or collapsed, based on your last interaction with the page. If you pinned the Action Pane open, the last tab that you were using is displayed.
- **QuickFilters** – A *QuickFilter* appears above many grids. The QuickFilter lets you filter the grid based on a single column that you select. The app stores the column that you filtered on. Then, the next time that you open that page, the grid will use that same column for filtering by default. However, you can still select a different column to filter the grid on.
- **Column header filters** – When you filter a grid by using *column header filters*, you can change the filter operator as you require to find the data that you want. For example, you can change the operator from **begins with** to **is exactly**. Every time that you use a column header filter and change the filter operator, the app stores the change. Then, the next time that you filter on that column, the filter operator will be restored.
- **Navigation pane** – You can open the *navigation pane* by selecting the **Expand the navigation pane** button in the upper left of any page. (This button is sometimes referred to as the ***Menu*** *button*, *hamburger*, *hamburger menu*, or *hamburger button*.) You can pin the navigation pane open, or you can collapsed it by default. After you pin the navigation pane open, the app will keep it open until you collapse it.

Full personalization access (formerly explicit personalizations)

At the **full personalization access** level, users have access to all the personalization capabilities that the app provides. Because different people and companies have different needs when they interact with the app, especially in terms of utilized fields, personalization provides tools that let users and organizations tailor the way that information is ordered and interacted with in the app. These capabilities are key to providing simplified, optimized experiences in the app that are tailored to you and your organization.

For pages with saved views, an explicit save is required to persist any user changes to the user experience for the current view. For pages without saved views, these changes are saved automatically.

The following sections cover the extent of personalization capabilities that are available to users at the **full personalization access** level. Here are some of these capabilities:

- Shortcut menu options

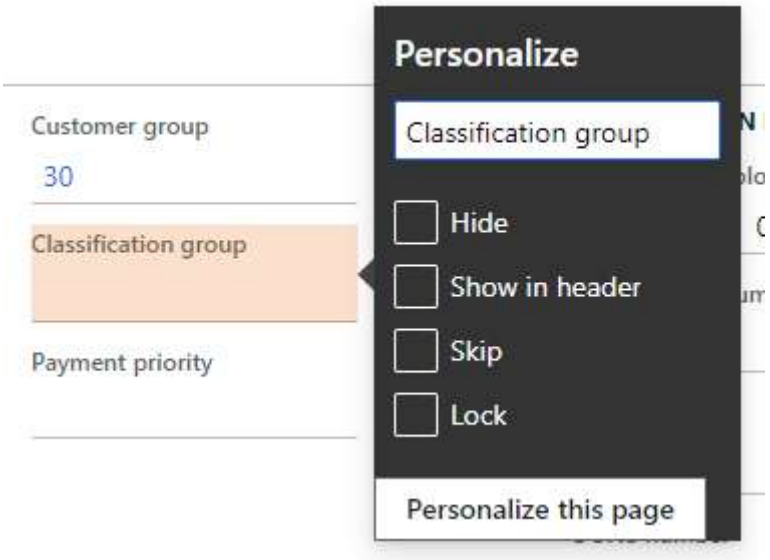
- The **Personalization** toolbar
- Adding tiles, lists, and links to workspaces
- Adding a summary from a workspace to a dashboard
- Personalizing the dashboard

Shortcut menu options

Shortcut menus provide one way to change a page's interface so that it better meets your requirements or the requirements of your organization. (A shortcut menu is also known as a *right-click menu* or a *context menu*.)

Some of the most typical and important changes that can be made to a page are available directly as options on a shortcut menu. For example, if you want to add or hide columns in a grid, just right-click a column header, and then select **Insert columns** or **Hide this column**.

Additionally, the most basic types of personalizations are available by right-clicking an element and then selecting **Personalize**. Not all elements on your page can be personalized. When you use this personalization method, the element's *property window* appears.



You can use the property window to personalize an element in the following ways:

- Change the element's label.
- Hide the element so that it isn't shown on the page. The data in the field isn't deleted or modified. The information just isn't shown on the page any longer.
- Include the information in the FastTab's summary section (if the element is on a FastTab).
- Skip the field so that it never receives focus when you tab through the page.
- Prevent data in the field from being edited (for any record).
- Designate a field to be required for data entry. If no value is entered in this field, it appears with a red border and an asterisk to indicate this state.

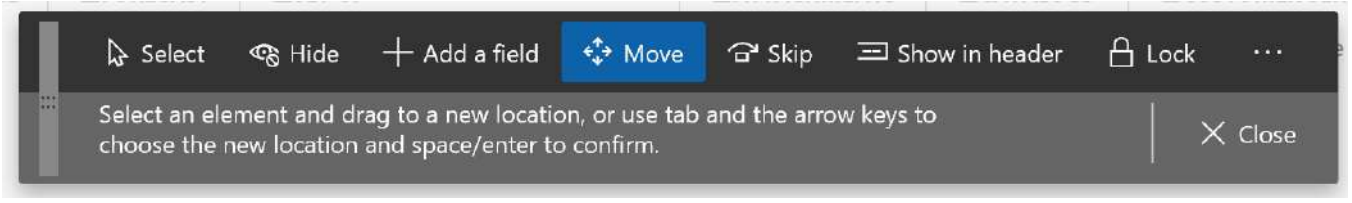
The property window might include other personalization capabilities, depending on the element. For example, the property window for a tile might let you promote that tile to a dashboard, and property windows for elements on the default dashboard might let you create a new custom workspace.

Personalization toolbar

If you want to make multiple changes to a page, or changes that aren't available through other mechanisms (for example, if you want to reorder elements), you can use the **Personalization** toolbar. To open the **Personalization** toolbar, follow one of these steps:

- Select **Ctrl+Shift+P** from any element on the page.
- Select **Personalize this page** in an element's property window.
- Select **Personalize this page** in the **Personalize** group on the **Options** tab of any page's Action Pane.
- Select the **Settings** button (the gear symbol) on the navigation bar, and then select **Personalize**.

[



]

Navigate the page

When the **Personalization** toolbar is open, the underlying page is read-only (in other words, you can't edit data), but it's still interactive. Specifically, you can expand or collapse the **Related information** pane, switch tabs, and expand or collapse sections, just as you would usually perform those actions on the page. To apply a personalization to a collapsible section or tab (for example, to hide a FastTab), you just have to select the button that appears next to that section or tab when it gains keyboard focus or when you hover over it.

Personalization tools

The following tools are available on the **Personalization** toolbar:

- Use the **Select** tool to select and change the properties of an element. To use this tool, select the **Select** button on the toolbar, and then select the desired element. The element's property window appears, where you can change any of the properties of that

element. You can repeat the process for other elements that can be personalized on the page. Some personalization properties might not be available in some scenarios. For example, you can't lock a field that is required.

- Use the **Hide** tool to hide an element on the page. To use this tool, select the **Hide** button on the toolbar, and then select the element to hide. When you use the **Hide** tool, all elements that are currently hidden are made visible, but they're shown in a shaded container. You can then make an element visible by selecting it. To see how the page looks when elements are hidden, switch to another personalization tool or close the personalization toolbar.

- Use the **Add fields** tool to add fields to your page. When you use this tool, you can only add fields that are part of the page definition. For information about how to create new fields that aren't part of the current page definition, see Create and work with custom fields. After you select the **Add fields** button on the toolbar, you must first select the grid or section where you want to add a field. A dialog shows the list of fields that are related to the selected grid or section. In the dialog, select one or more fields to add from either the **Recommended fields** or **All fields** list. After you select the desired fields, select **Update**. To remove a field that you previously added, repeat the process, but clear the selection of the field in the dialog.

  The **Recommended fields** list shows fields that were previously added by other users in your organization. This list of fields is updated based on the recurrence frequency of the **Recommendation batch job**. A similar experience exists when adding new filter fields using the **Filter** pane on a page.

- Use the **Move** tool to move an element to a different location in the current group of elements. You can't move an element outside its parent group. To use this tool, select the **Move** button on the toolbar, and then select the element to move. When you select an element, the app determines the locations where the element is allowed to be moved. These locations are known as *drop zones*. As you drag the element around in the current group, each drop zone is shown as a colored, bold line next to the area where the element can be dropped.

- Use the **Skip** tool to remove an element from the page's keyboard tab sequence. When you select the **Skip** button on the toolbar, all elements that are currently skipped are shown in a shaded container. You can interactively remove or add fields to the tab sequence.

- Use the **Show in header** tool when you want a field to appear in the FastTab's summary section. When you select the **Show in header** button on the toolbar, all fields that are selected as summary fields are shown in a shaded container. You can interactively add

fields to the FastTab summary and remove fields from the summary by selecting the fields.

- Use the **Require** tool to designate an element as required for data entry. When you select the **Require** button on the toolbar, all elements that are personalized to make them required are shown in a shaded container. You can then make them not required again.
- Use the **Lock** tool to mark an element as either editable or noneditable. When you select the **Lock** button on the toolbar, all elements that are currently noneditable are shown in a shaded container. You can then make them editable again. Some fields are required and can't be made noneditable. A padlock symbol appears next to those fields.
- Use the **Add an app from Power Apps** tool to embed an app that was created by using Microsoft Power Apps into the page. This option is available only when the Saved views feature is turned off.
- Use the **Add an app** button to embed an app into the page. This app can either be an app created from Microsoft Power Apps or a [third-party](embed-website.md] app.
- Use the **Clear** tool to reset the page to its default state. This action applies to the current view for pages that support saved views and to all personalizations on the current page for pages that don't support saved views. You can't undo this action, so only use this tool if you're sure that you want to reset the view or page.
- Use the **Import** tool to load a personalization from a file that you or someone else previously created. The imported personalizations then become a view on the page. If the view already exists, you have the option to skip the import, replace the current view that has the same name, or rename the imported view.
- Use the **Export** tool to save the current view for the page to a file with which you can share your personalizations with other users. Users can then import the file that contains your personalizations for the page.
- Select the **Close** button to close the **Personalization** toolbar and return the page to its previous interactive state.

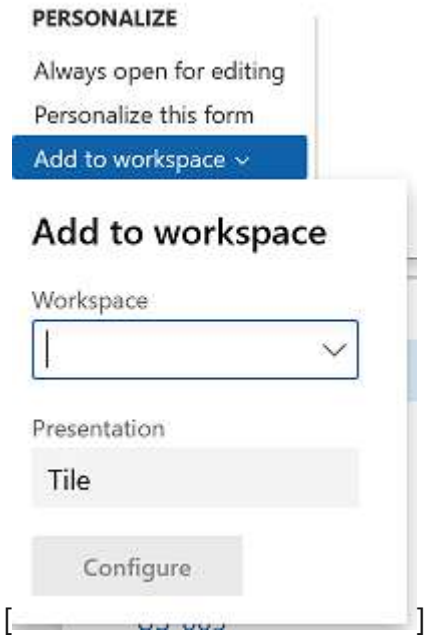
When you use the **Personalization** toolbar, you must explicitly save personalizations to a view for them to be persisted.

In some cases, when you select a tool, a padlock symbol appears next to an element. This symbol indicates that you can't modify the element properties that are related to the selected tool, because changes to those properties can prevent the page from working correctly.

Add tiles, lists, and links to a workspace

For some pages that include lists, the **Add to workspace** personalization feature is available in the **Personalize** group on the **Options** tab of the Action Pane. This feature lets you push relevant information from the current list to a specific workspace. The information that appears in the workspace can be based on either the whole list, or a filtered and sorted version of the list. You can also specify whether the information appears in the workspace as a list, a summary tile that can show the number of items in the list, or a link.

> **Note**
>
> If the Saved views feature is turned on, the content that you push to a workspace is directly linked to a view. The view's query is used to retrieve data into the workspace, and the corresponding tile or link in the workspace opens the page to that view, so that the view's query and personalizations are applied to it. If the view is updated, the corresponding workspace elements will be adjusted to the new view definition.



- To add a list to a workspace, first sort or filter the list on the page so that it displays the information as you want it to appear in the workspace. Save it to a view if the current page has a large view selector. After you select **Add to workspace**, select a workspace and then select **List** in the **Presentation** field. After you select **Configure**, select the columns that should appear in the list and specify the label to be used for the list in the workspace.
- To add a tile to a workspace, first filter the list on the page so that it displays the data that should be summarized or that you want quick access to (and save it to a view if the current page has a large view selector). After you select **Add to workspace**, select a workspace and then select **Tile** in the **Presentation** field. After you select **Configure**, you can specify the label that should be used for the tile in the workspace, choose whether

the tile should show a count, and select from one of four available tile sizes. (You can change the tile size directly from the workspace later.).

- To add a link to a workspace, first filter the list on the page so that it displays the data that you're interested in (and save it to a view if the current page has a large view selector). After you select **Add to workspace**, select a workspace and then select **Link** in the **Presentation** field. After you select **Configure**, you can specify the label that should be used for the link and also optionally a label for the section on the workspace where this link is to be placed. If that section doesn't exist, a new section is created.

> ⓘ **Note**
>
> If the **Saved views for workspaces** feature is enabled, when you configure your list, tile, or link you also have to select the workspace view to which you want to add the element. The available workspace views appear in the **Workspace options** section of each **Configure** dialog.

After you add a list, tile, or link to a workspace, you can open that workspace and rearrange the elements within it as you want.

Promote a tile from a workspace to a dashboard

Some workspaces contain count tiles (that is, tiles that have numbers on them), and you might want those tiles to appear on your dashboard too. In a workspace, right-click a count tile, select **Personalize**, and then, in the tile's property window, select **Pin to dashboard**. The next time that you open and refresh the dashboard, the count will appear below the navigation tile for that workspace. You can select that count to go directly to the data that it represents.

Change the size of a tile

Users can modify the size of any non-KPI tile via personalization. In a workspace, right-click a tile, and then select **Personalize**. In the tile's property window, select the desired size from the **Tile size** options. After you select a size, the tile size adjusts immediately. If the **Saved views support for workspaces** feature is enabled, you can save this personalization to a workspace view.

Personalize your dashboard

The dashboard is often the first page that you see when you open the app. It can be personalized like any other page in the system, by using the same mechanisms that are described earlier in this article.

One unique personalization capability that is available on the dashboard is the ability to add tiles.

- If the **Full-page apps** feature is turned off, you add a new tile by right-clicking an element on the dashboard and then selecting **Add a workspace**. A new workspace tile is created at the bottom of the dashboard. You can rename this new workspace tile to whatever you want.
- If the **Full-page apps** feature is turned on, you add a new tile by right-clicking an element on the dashboard and then selecting **Add an app**. In the dialog, select whether you want to add a tile for a new workspace or a tile that has content from Power Apps or a website. Then follow the steps to configure the option that you selected. A new tile is then created at the bottom of the dashboard.

Share personalizations

After you personalize a page, there are a few methods that you can use to share your personalizations with other users. In the following list, the methods are arranged in order from most recommended to least recommended.

1. Publish views to users.
2. Copy views or personalizations to users.
3. Export and import views or personalizations.

Publish views to users

If the page supports saved views, the best way to share personalizations with other users is to publish the view to users who have one or more security roles. For more information, see Publishing views.

Copy views or personalizations to users

If the page doesn't support views, the recommended way to share personalizations is to copy them between users. This method is available only to privileged users (for example, system administrators) who can look up a specific user's personalization in the system (including the users' personal views) and copy the configuration to other users.

To copy personalizations between users, follow these steps:

1. Go **System administration** > **Setup** > **Personalization**.

2. To copy personal views, follow these steps:
   a. Select **Personal views**.

b. Select the desired views in the list.
c. Select **Copy to users**.
d. Select the users to distribute the views to.

3. To copy personalizations on pages that don't support views, follow these steps:
   a. Select **User settings**.
   b. Select the user who has the personalization that you want to distribute.
   c. Select **Manage all personalizations**.
   d. Select the desired personalizations in the list.
   e. Select **Copy to users**.
   f. Select the users to distribute the personalizations to.

Export and import views or personalizations

Another way to share personalizations is via export and import. Individual users, or an admin who acts on their behalf, can use this method to export their personalizations or views, and then give the exported file to other users to import. Alternatively, users can give their exported personalizations to a user who has admin privileges, and that user can then use the **Personalization** administration page to apply the personalization file to many users at the same time.

> **Important**
>
> As personalizations persist across updates, re-importing all personalizations after a service update or at any other time is unnecessary and highly discouraged.

Export views or personalizations

In general, you can export one of your own views or personalizations by opening the appropriate page, opening the **Personalization** toolbar, and then selecting **Export**. For more information about the toolbar, see the Personalization toolbar. Alternatively, you can go to **Settings** > **User options** > **Personalization** to view a list of all your personalizations in the system. From there, you can select the views or personalizations to export, and then select **Export**.

Additionally, admins can export other users' personalizations by following these steps.

1. Go to **System administration** > **Setup** > **Personalization**.
2. On the **Users** tab, select the desired user.
3. Find and select the view or personalization that you're interested in.
4. Select **Export**.

Import views or personalizations

To import a view or personalization, you can just open the **Personalization** toolbar and select **Import**. Additionally, admins can import a file and immediately give it to one or more users.

If saved views are enabled, follow these steps:

1. Go to **System administration** > **Setup** > **Personalization**.
2. On the Action Pane, select **Import views** > **User views**.
3. Select the import mode:
    - **Select specific users** – Give the view or personalization to selected users.
    - **Import as-is** – Import the view or personalization to the same user who exported it.
4. Select **Browse**, and find and select the personalization to import.
5. Select **Next**.
6. If you selected **Select specific users** in step 3, select the users to import the personalization to.
7. Select **Import**.
8. Resolve conflicts as required.

Administer personalizations

The **Personalization** page is the central hub for managing personalizations at an organizational level. For more information, see Managing views globally.

Service updates and personalization

Personalization data doesn't need to be cleared or reset when moving to a new version of the product. Personalizations and saved views data continue to work across updates. Exceptions include changes to the form itself that invalidate a personalization (such as a removed control) or changes to the form's base query that changes its data source subtree so that it no longer matches the data source subtree associated with the view query.

Personalize inventory dimensions

When you personalize the setup of inventory dimensions on a page, consider the settings that have been created by using the **Display dimension** option. For example, you use

personalization to hide a column for the Batch number inventory dimension, but the column appears the next time that the page is opened. This behavior occurs because the **Dimension display** settings control the inventory dimension columns that are shown. The **Dimension display** settings apply across all pages and override any personalized setup of inventory dimension fields on individual pages.

Therefore, in the preceding example, if you don't want the column for the Batch number inventory dimension to appear on a page, you must clear that dimension as part of the **Display dimensions** option for that page.

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Personalization plays an important role in allowing users and organizations to optimize the user experience to meet their needs. For more information on personalization, see Personalize the user experience.

Traditional personalization allows users to only have one set of personalizations per page. *Saved view* features expand on personalization in several important ways:

- Views permit users to have multiple named sets of personalizations per form that they can quickly switch between as needed. This feature allows a user to create multiple optimized views of a page, where each view is tailored to fit the needs of performing a particular business task.
- Views created for particular page types can also include user-added filters or sorts, which allows users to quickly return to commonly filtered datasets. For more information, see What pages support views.
- You can publish views to users in specific security roles and specific legal entities. Therefore, any user who has a specified role and access to a specified legal entity can access and use that view, even if that user doesn't have permission to personalize. This publish capability lets organizations define corporate, standard views that are optimized for their business. For more information, see the Managing personalizations at an organizational level with views section.
- Unlike traditional personalization, views aren't automatically saved when a user performs personalizations or filters a list. Explicit saves are required to give users the flexibility to create a view before or after the changes that are associated with that view are made. This requirement also ensures that view definitions aren't unintentionally changed by filters or personalizations that aren't intended for long-term use. Items that the system automatically stores as part of typical page usage (for example, column widths, or the expanded or collapsed state of sections) are saved per view.
- You can add views to workspaces as tiles, lists, or links. Therefore, a filtered data set can be surfaced in a workspace, and users can associate a set of personalizations that is relevant to that data set with a tile or link.

Switching between views

After you make views available for an environment, the top of any page that supports views includes a collapsed view selector control that shows the name of the current view.

The view selector comes in two size variations:

- **Large view selectors** – Pages that prominently feature a list use a larger view selector. Most importantly, the larger view selector indicates the pages where the view can include user-defined filters and sorts. Because filters and sorts are included in the views, the larger selector size is also warranted as the view names is often the best description of the data that is shown on the screen and the expectation is that users switch between views more often on these page types. Grouping in a grid can also be saved to views on a page with large view selectors.
- **Small view selectors** – All other full-screen pages (except workspaces and the dashboard) use a smaller view selector that appears next to the page caption. Views on these pages include only personalizations, not user-defined filters. On these pages, the caption or record title is often the most important information at the top of the page. The smaller size of the view selector also reflects the lower frequency of view switching that is expected on these pages.

If you select the view name, the view selector opens and shows the list of available views for the page in up to two sections. The first section shows any views that are specific to the current legal entity, and the second section shows views that are available to all legal entities. The first section is only visible if there are legal entity–specific views for the page.

- **Standard view** – The **Standard** view is the out-of-box view of the page, where no personalizations are applied.
- **Personal views** – The views without padlocks represent your personal views. These views are ones that you created or that an administrator provides to you.
- **Locked views** – Some views, such as the **Standard** view and any views that are published to your role, have a padlock symbol next to them in the view selector. This symbol indicates that you can't edit those views. However, changes that reflect page usage are automatically saved. These changes include changes to the width of a grid column, and changes to the expanded or collapsed state of a FastTab. Nevertheless, if you have personalization privileges, you can use the **Save as** action to make a personal view that is based on a locked view.
- **New views** – Published views that you didn't open have a spark symbol to the left of the view name.

To switch to a different view, open the view selector and then select the view that you want to load.

Creating and modifying views

Unlike traditional personalization, the system doesn't automatically save views when you personalize the page, apply a filter to a list, or sort a list. You must take explicit action to save these changes to a view. This requirement gives you the flexibility to create a view before or after you make the changes that are associated with that view. It also ensures that one-time filters or personalizations don't unintentionally change view definitions. Typical page usage items, such as column widths or the expanded or collapsed state of sections, automatically save to the current view, even for locked views.

To ensure that the system knows the current state of the view, when you start to change a view by personalizing or filtering it, an asterisk (*) appears next to the current view name. This symbol indicates that you're looking at an unsaved, modified version of that view.

If you want to save those changes, follow these steps:

1. Select the view name to open the view selector.
2. To modify the existing view, select **Save**. This action isn't available for locked views.
3. To create a new view:
   a. Select **Save as**.
   b. In the **Save view as** pane, enter a name and, optionally, a description for the view.
   c. If you want this view to be your default view, select **Pin as default**. For more information about default views, see Changing the default view.
   d. (Optional) Select whether you want this view to be available for just a subset of legal entities. By default, views are saved as global views.
   e. Select **Save**.

Change the default view

The default view is the view that the system tries to open when you first open the page. Set the default view to the view that you expect to use most often.

To change the default view for a page, follow these steps:

1. Switch to the view that you want to use as the default.
2. Select the view name to open the view selector.
3. Select **More** and then **Pin as default**.

> ⓘ **Note**

- If the view is specific to one or more legal entities, it becomes the default view for those legal entities.
- If the view is global, it becomes the default view for legal entities that don't have a legal-entity specific default view defined.

Alternatively, when you create a new view (by using the **Save as** action), make that new view the default view by setting the **Pin as default** option before you save the view.

> ⚠ **Warning**
>
> In some cases, the query that is associated with the default view doesn't run when you first open a page. For example, if you open the page through a tile, the tile's query runs, regardless of the query that is associated with the default view. Additionally, if you open a page that has a **standard** view that already has a defined query, the original query runs instead of the default view's query. In this case, you receive an informational message when the view loads with an embedded action that lets you load the default view's query directly. If you switch views after the page loads, the view query runs as expected.

Managing personal views

The **Manage my views** dialog box provides basic maintenance capabilities for your personal views and the order of views in the view selector. To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

The **My views** section of the **Manage my views** dialog shows the available views for the page in sections. Any views that are specific to the current legal entity are displayed in their own section. The **Global views** section is always displayed so you can manage the available views for the page in all legal entities.

For a list of available views for that page, the following set of actions are available.

- **Change the default view** – Use the **Pin as default** action to make the currently selected view the default view for the page. When you take this action on a view in the **Global views** section, you can choose to make the view the default view for either the current legal entity or all legal entities.
- **Reorder your views** – Use the **Move up** and **Move down** actions to rearrange your views in a specific order.
- **Rename a view** – Use the **Rename** action to change the name of the currently selected personal view. This action is turned off for locked views.

- **Delete a view** – Use the **Delete** action to permanently delete the currently selected view from the page. There's no way to recover a view after you remove it.

Any changes you make in this dialog box take effect after you select the **Update** button.

Managing personalizations at an organizational level with views

To help you understand how saved views help improve management of personalizations at an organizational level, this section describes some differences in personalization management for pages that do and don't support saved views.

When views aren't available, administrators can apply a set of personalizations for a page to a user or a group of users via the **Personalization** page. However, administrators can't prevent users from further personalizing the page, which means the organization can't ensure that its users have a consistent user interface on that page. If new users are hired into an organization, administrators must manually load a set of personalizations for each new user because there's no automatic mechanism for specifying that a certain set of personalizations should be available for users in that role.

> ⓘ **Note**
>
> If the administrator applies personalizations to a user without personalization rights, the personalizations aren't applied and don't impact the user interface.

With saved views, organizational management of personalizations is easier because you can publish views to groups of users. After a view is published, any user who has one of the defined security roles and access to one of the specified legal entities can see and use the view, even if that user doesn't have access to personalization. These published views can't be edited by users, although users with personalization rights can create their own personal views starting from a published view definition. If new users are assigned to roles in legal entities to which views were published, they automatically see the views associated with their roles and legal entities. No additional action is required by the administrator. Likewise, if users change roles in an organization or are given access to different legal entities, they might no longer be able to access the views that were previously published to them. Again, no additional action is required by the administrator.

You can easily distribute updates to a published view to users by republishing the view to the appropriate security roles and legal entities.

The publish capability allows organizations to define corporate standard views that are optimized for their business, targeted at users in specific security roles.

Publishing views

During the publishing process, assign views to one or more security roles for one or more legal entities. Any user who has access to a legal entity and is assigned to one of those roles can access and use the views. However, the user can't edit the views. By default, system admins have access to the **Publish** action in the view selector drop-down menu. However, other trusted users in your organization can also be given access to view publishing via the new **Saved views administrator** role.

To publish a view, follow these steps:

1. Create and save a personal copy of the view that you want to publish.
2. With that view currently loaded, select the view name to open the view selector drop-down menu.
3. Select the **More** button and then select **Publish**. The **Publish** dialog box opens.
4. Enter a name for the view. The name that you enter is the name that users who receive this view see in their view selectors. The names of published views for a page must be unique. No duplicate names are allowed, even if the list of roles or legal entities that the views are applied to differ.
5. (Optional) Add translations for your view name in as many languages as your organization requires by selecting the **Translations** button next to the **Name** field. The view name is then shown to users in their current language. You can also set the default language to specify the translation that is shown to users who are running languages that no translation is defined for.
6. (Optional) Enter a description for the view, so that users who receive this view can understand its purpose.
7. Determine whether the view should be published as the default view for the selected users. When you make a view the default view, users see it the next time that they open the target page. However, users can still change their default view after publishing occurs.

   > ⓘ **Note**
   >
   > Be aware of the following behavior when you publish a view as the default view:

- If you publish the view as the default for all legal entities, this action overrides any legal entity default view a user previously set.
- If you publish the view to a subset of legal entities, the default view for those legal entities changes for every targeted user.
- If a user has roles where multiple views are published as the default view, the last view that you published is used as the user's default view.
- Publishing doesn't work for role assignments made using Microsoft Entra groups.

8. Add the security roles that correspond to the users who are being targeted by this view.
9. Determine whether you want to publish the view to the child roles of each security role that you select. If you do, select the **Include child roles** checkbox in the row for the appropriate security roles. This checkbox isn't available for roles that don't have child roles.
10. Add the legal entities that this view should be available for.
11. Select **Publish**.

In some environments, it might take up to an hour before users see the published view.

> ⓘ **Note**
>
> Published workspace views don't appear in the view selector for the original workspace. Instead, published workspace views follow the pattern of published embedded apps and appear as new tiles on the dashboard.

Modifying a published view

After you publish a view, you might want to change it. Although you can't make live changes to a published view, because these views are locked for editing for all users (including publishers), you can republish a view to update it.

If the changes that you want to make to a published view only involve the publish parameters (the name and description of the view, or the security roles the view is published to), follow these steps:

1. Switch to the published view for the parameters that you want to update.
2. On the view selector drop-down menu, select **Republish**. If you're using version 10.0.12 or earlier, you must select **Publish** and then **Yes** to update the existing view.

3. Update the name, description, security roles, and legal entities for the view.
4. Select **Publish**. If you originally selected this published view as the default view, it becomes the default view for users again after you republish it.

If the changes to the published view involve modifications of the personalizations or filters that are associated with the view, follow these steps:

1. Load the published view that you want to change.
2. Make the required changes to the local draft.
3. On the view selector drop-down menu, select **Republish**.
4. Select **Yes** to indicate that you want to publish the view together with its unsaved changes.
5. Adjust any publishing parameters that require adjustment, and then select **Publish**.

Managing published views

Like managing personal views, the **Manage my views** dialog box gives users with publish privileges basic maintenance capabilities over that page's published views (in addition to their own personal views). To open this page, select the view name to open the view selector drop-down menu, select **More**, and then select **Manage my views**.

Although all users have a **My views** tab that shows their personal views, users who have publish privileges also have an **Organization views** tab that shows all the published and unpublished views for that page. Because several users might be publishing views, it's important that you can manage the full list of published views, even if you're not the user who published a given view.

For the list of all published views for the page, the following set of actions are available:

- **Republish** – Use the **Republish** action to republish a view after publishing parameters (name, description, security roles, or legal entities) change.
- **Publish** – Use the **Publish** action to publish a view that is currently unpublished.
- **Unpublish** – Use the **Unpublish** action to make a view inactive. The view is still available in the system, but users don't see it in the view selector until the view is published again.
- **Save as personal** – Use the **Save as personal** action to create a personal draft copy of the published view. This capability can help you understand the contents of a view that wasn't published to you or that wasn't published. You can also use it to edit and then republish a view.
- **Delete** – Use the **Delete** action to permanently delete a published or unpublished view. This action also removes the view for all users in the system. The removal of published views takes effect after the **Save** button is selected. After a view is deleted, it can't be recovered.

Managing views globally

Although some management capabilities are surfaced on every page, as indicated in this article, **system administrators** and **saved view administrators** can manage views more holistically for the system via the **Personalization** page. In particular, this page has the following sections and capabilities:

- **Published views** – This section lists all views that are published for your organization. From here, you can republish a view after you adjust the security roles or legal entities that the view targets. You can also export, delete, or unpublish views. Use the **Save as personal** action to create a personal copy of a view, so that you can update the view or gain a better understanding of its contents.
- **Unpublished views** – This section lists all the organization views in your system that aren't currently published. These views most often come into the system through the import capability. You can publish, export, or delete these views. The **Quick publish** action that was added in version 10.0.12 enables multiple views from this section to be published in one action, by using the existing security role and legal entity configurations. Use the **Save as personal** action to create personal copies of these views, so that you can gain a better understanding of their contents.
- **Personal views** – This section lists all views created by users in the system. From here, you can publish a personal view to the organization, or copy one or more of these views to other users. You can also export or delete these views as required.
- **User settings** – Select a user to view, or adjust the user's ability to use personalization either for the whole system or for specific pages that the user visited. You can view and interact with the user's personalizations in the system. You can also delete all personalizations for that user or reset feature callouts for the user. If you reset feature callouts, any pop-up windows that introduced new features and that the user previously dismissed appear again the next time that the user encounters those features.
- **System settings** – You can temporarily turn off personalization for all users in the system. In this case, no personalizations are applied for any user, and all pages are reset to their default state. If you turn personalization back on later, all personalizations are reapplied. You can also permanently delete all personalizations for all users in the system. Deleted personalizations can't be recovered. Therefore, before you perform this task, be sure to export any personalizations that you might want later.

Users who have access to the **Personalization** page can also import personal or organization views by using the **Import views** button on the Action Pane. For organization views, you can select **Publish immediately** to make the views available to users without an additional explicit publish.

Frequently asked questions

What pages support views?

Most pages support views, but not all. Specifically, all full-screen pages support views, except for dashboards. The **Saved views support for workspaces** feature provides view support for workspaces. Most pages that aren't full screen, such as drop-down dialogs, lookups, and enhanced previews, don't support views.

Who can publish views?

Only system admins and users assigned to the **Saved views administrator** role can publish views.

Why can't I save filters with this view?

A filter might not save with a view for a few reasons:

- The page might not support saving filters as part of the view definition. Only pages with large view selectors support saving personalizations and query modifications as part of the view.
- The page might not properly support views. It might ignore the view query completely or operate on a temporary table whose data isn't persistent.

What data do I see when I visit a page?

For pages that have small view selectors (only personalizations can be saved to the view), you see the same data as you always see when you visit the page.

For pages that have large view selectors (both personalizations and queries can be saved to the view), you typically see the data that is linked to the query associated with your default view. Two main exceptions exist:

- If you go to a page from a tile, the tile query executes regardless of the query associated with the default view. If you created that tile after views are enabled, selecting a tile opens the page with the view associated with that tile.
- If you go to a page and that entry point includes a query, the original query executes instead of the default view's query. An informational message when the view is loading alerts you when this occurs. You can also confirm by switching to this view after the page loads, as that action should allow the view query to execute regardless.

Standard saved views for Supply Chain Management

07/10/2025

Microsoft Dynamics 365 Supply Chain Management includes several saved views that you can enable and use as needed. Some of these standard saved views are optimized and named for a specific role or task (for example, "Quality control" or "Receiving"). Others are optimized so that they include only the fields and settings that Microsoft usage statistics indicate are most often used by customers. These saved views are typically referred to as *simplified* views. This article describes the standard saved views that are available, and explains how to enable and customize them.

For complete details about how to work with saved views, including the standard saved views, after you enable them, see Saved views.

Customizing the standard saved views

You can customize the standard saved views, just as you can customize your own saved views. However, when you customize a standard saved view, we strongly recommend that you save your custom version under a new name. Otherwise, your customizations could be overwritten when you update Supply Chain Management.

For more information about how to customize and rename saved views, see Saved views.

Saved views for the Inventory management module

The following table describes the saved views available for the Inventory management module.

Expand table

Page	View name	View description
On-hand list	Financials	This simplified view lets you focus on financial information while you manage on-hand inventory.
On-hand list	Quality control	This simplified view lets you focus on quality control while you manage on-hand inventory.
On-hand list	Receiving	This simplified view lets you focus on receiving operations while you manage on-hand inventory.

Page	View name	View description
On-hand list	Shipping	This simplified view lets you focus on shipping operations while you manage on-hand inventory.
Transactions	Simplified	This simplified view lets you review inventory status without being distracted by financial information and other fields that are used less often.
Transfer orders	Shipping	This simplified view lets you focus on shipping operations while you manage transfer orders.
Transfer orders	Receiving	This simplified view lets you focus on receiving operations while you manage transfer orders.
Transfer orders	Quality control	This simplified view lets you focus on quality control while you manage transfer orders.
Transfer orders	Financials	This simplified view lets you focus on financial information while you manage transfer orders.

Saved views for the Master planning module

The following table describes the saved views available for the Master planning module.

Expand table

Page	View name	View description
Planned orders: Planned order details page	Simplified	This simplified view includes only the fields that are most often used to work with the details of a single planned order. In this way, it provides a quicker overview and a streamlined work process.
Planned orders: Planned orders list page	Simplified	This simplified view includes only the fields that are most often used to work with the list of planned orders. In this way, it provides a quicker overview and a streamlined work process.

Saved views for the Procurement and sourcing module

The following table describes the saved views available for the Procurement and sourcing module.

Expand table

Page	View name	View description
Purchase order details	Order creation	This simplified view is optimized for creating new purchase orders.
Purchase order details	Inventory management	This simplified view is optimized for performing inventory-related activities, such as following up on inventory that has been received, receiving inventory, checking net requirements, and adjusting order quantities.
Purchase order details	Financial management	This simplified view is optimized for performing finance-related activities, such as invoicing and checking prices, totals, and charges.
Purchase order details	Order approval	This simplified view is optimized for approving purchase orders.

Saved views for the Product information management module

The following table describes the saved views available for the Product information management module.

Expand table

Page	View name	View description
Released products list	Product creation	A simplified page view that only includes the fields most often used when creating products.
Released product details	Product creation	A simplified page view that only includes the fields most often used when creating products.
Released product details	Logistical information management	A simplified page view that only includes the fields most often used when managing logistical information for products.
Released product details	Purchase information management	A simplified page view that only includes the fields most often used when managing purchase information for products.
Released product details	Sales information management	A simplified page view that only includes the fields most often used when managing sales-related information for products.

Saved views for the Production control module

The following table describes the saved views available for the Production control module.

Expand table

Sales quotation	Quote creation	This simplified view includes only the fields that are most often used to create sales quotations.

Saved views for the Warehouse management module

The following table describes the saved views available for the Warehouse management module.

Expand table

Page	View name	View description
All loads	Inbound processing	This simplified view includes only the fields that are most often used to process inbound loads.
All loads	Outbound processing	This simplified view includes only the fields that are most often used to process outbound loads.
All shipments	Inbound processing	This simplified view includes only the fields that are most often used to process inbound shipments.
All shipments	Outbound processing	This simplified view includes only the fields that are most often used to process outbound shipments.
All waves	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.
Load planning workbench	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.
Work details	Simplified	This simplified view includes only the fields that are most often used. In this way, it provides a quicker overview and a streamlined work process.

Grid capabilities

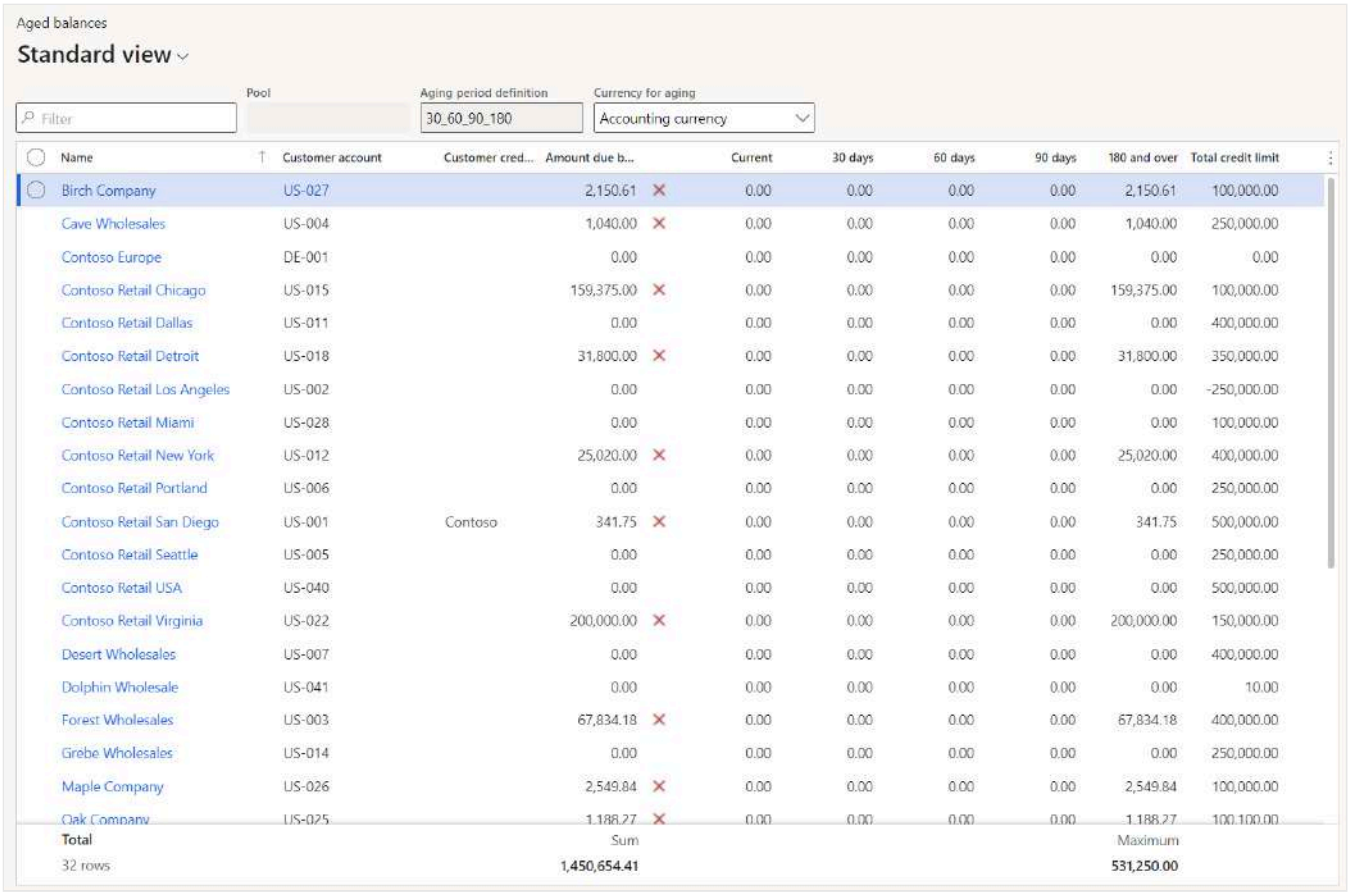
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The new grid control provides several useful and powerful capabilities that you can use to enhance user productivity, construct more interesting views of your data, and get meaningful insights into your data. This article will cover the following capabilities:

- Showing calculated values
- Typing ahead of the system
- Evaluating math expressions
- Grouping tabular data (enabled separately by using the **Grouping in grids** feature)
- Freezing columns (enabled separately by using the **Freezing columns in grids** feature)
- Autofit column width
- Stretchable columns

Showing calculated values

In finance and operations apps, users can view a calculated value for each numeric column in a grid. A footer section at the bottom of the grid shows these calculated values.



Name	Customer account	Customer cred...	Amount due b...	Current	30 days	60 days	90 days	180 and over	Total credit limit
Birch Company	US-027		2,150.61	0.00	0.00	0.00	0.00	2,150.61	100,000.00
Cave Wholesales	US-004		1,040.00	0.00	0.00	0.00	0.00	1,040.00	250,000.00

Contoso Retail Virginia	US-022		200,000.00	0.00	0.00	0.00	0.00	200,000.00	150,000.00
Desert Wholesales	US-007		0.00	0.00	0.00	0.00	0.00	0.00	400,000.00
Dolphin Wholesale	US-041		0.00	0.00	0.00	0.00	0.00	0.00	10.00
Forest Wholesales	US-003		67,834.18	0.00	0.00	0.00	0.00	67,834.18	400,000.00
Grebe Wholesales	US-014		0.00	0.00	0.00	0.00	0.00	0.00	250,000.00
Maple Company	US-026		2,549.84	0.00	0.00	0.00	0.00	2,549.84	100,000.00
Oak Company	US-025		1,188.27	0.00	0.00	0.00	0.00	1,188.27	100,100.00
Total			Sum					Maximum	
32 rows			1,450,654.41					531,250.00	

In versions before 10.0.29, the total is the only supported calculated value. However, as of version 10.0.29, if your organization has enabled the **Extended grid aggregation capabilities** feature, users can select among the following four calculated values:

- Minimum
- Maximum
- Total
- Average

A single column can show only one type of calculated value. However, each column in the grid can be configured to show a different type of calculated value.

If more than one row is selected in the grid, the calculated value for the column is updated based on the values in the selected rows.

Showing the grid footer

There is a footer area at the bottom of every tabular grid in finance and operations apps. The footer can show valuable information that is related to the data that appears in the grid. Here are some examples of this information:

- The number of selected rows in the table (when you select more than one record)
- Calculated values at the bottom of configured, numeric columns (for example, grand totals)

- The number of rows in the dataset

This footer is hidden by default, but you can turn it on. To show the footer for a grid, select the **Grid options** button in the grid header, and then select the **Show footer** option. After you turn on the footer for a particular grid, that setting will be remembered until the user chooses to hide the footer. To hide the footer, select **Hide footer** on the **Grid options** menu.

Specifying columns with calculated values

Currently, no columns show calculated values by default. Instead, the setup is considered a one-time activity, like adjusting the widths of columns in grids. After you specify that you want to view a calculated value for a column, that setting will be remembered the next time that you visit the page.

There are two ways to configure a column to show a calculated value:

- Select and hold (or right-click) in the column that you want to view a calculated value for. If the **Extended grid aggregation capabilities** feature is enabled, select **View column totals**, and then select the desired calculated value. If that feature isn't enabled, select **Total this column**. This action causes three events to occur:

    1. The grid footer becomes visible.
    2. Your preference for viewing a calculated value for the column is saved.
    3. The desired calculation is initiated for the column and any other columns that you previously configured to show a calculated value. The time that is required to show the calculated values depends on the size of the dataset.

- After the footer is visible, select **Show total** (or **Select calculated value** if the **Extended grid aggregation capabilities** feature is enabled) in the footer area at the bottom of the column that you want to view a calculated value for. If there are no configured columns, that button will be available in the footer in all numeric columns.

    After at least one column is configured to show a calculated value, the **Show total** (or **Select calculated value**) button will be available only on hover or focus. The action of selecting the button just saves your preference for viewing a calculated value in the column, so that the preference is applied during future visits to the page. In the footer, this state is indicated by a dash that appears in the column. (Note that the calculated value will appear immediately if the dataset is small enough.)

If you make a mistake and no longer want to view a calculated value in a specific column, select and hold (or right-click) in the column, and then select **Hide total** (or **View column totals** > **None** if the **Extended grid aggregation capabilities** feature is enabled). Alternatively, select

Hide total (or **Hide calculated value**) in the footer in that column. This preference will also be saved for future visits to the page.

Calculating aggregate values

When you go to a page where the footer is visible and columns are already configured to show calculated values, those values might not be shown in the footer. The behavior depends on the size of the dataset on the page. If the dataset is small enough, the calculated values will be shown automatically, together with the number of rows in the dataset. If there are dashes in the footer under the columns that you configured, the dataset is too large for the system to show calculated values immediately. In this case, explicit action is required to calculate the values. To calculate the values, select the **Calculate** button in the footer. Alternatively, select and hold (or right-click) in a column that you want to view the total for, and then select **Total this column** (or **View column totals** and then the desired calculated value if the **Extended grid aggregation capabilities** feature is enabled).

If the calculation takes a long time to be completed, you can cancel the operation at any time by selecting **Cancel**. Sometimes, the dataset will be too large to calculate aggregate values (a limit that is imposed by your organization). In this case, you will instead be notified to filter your data more.

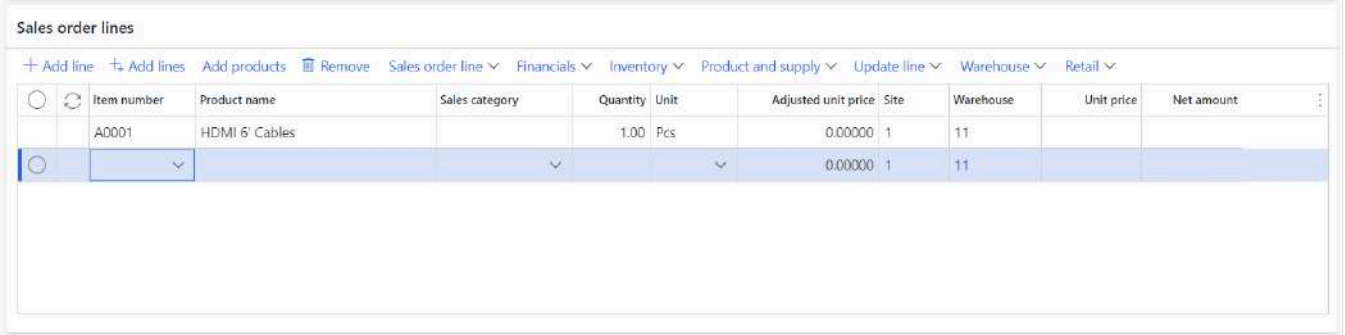
> ⓘ **Note**
>
> System administrators can modify the limit for the number of records that are available for calculating aggregates by adjusting the **Maximum number of local records for each grid** parameter on the **Client performance options** page. The default value is 25,000 records. Administrators should be careful when they adjust this value, because a value that is too large can exhaust the available memory on the user's machine. We recommend that the value not exceed 50,000 records.

Calculated values will be automatically updated as you update, delete, or create rows in the dataset.

Typing ahead of the system

In many business scenarios, the ability to quickly enter data into the system is very important. Before the introduction of the new grid control, users could change data only in the current row. Therefore, after they made changes in a row, users could not switch to a different row or create a new row until the system successfully validated the changes in the current row and (in the case of row creation) ran all the logic that is associated with the creation of a new row. To

help reduce the time that users spend waiting for these operations to be completed, and to help improve user productivity, the new grid adjusts these actions so that they are asynchronous. Users can create new rows or move to other rows to make changes while previous row validations and row creation logic are pending.



To support this new behavior, a new column for the row status has been added to the right of the row selection column when the grid is in edit mode. This column indicates one of the following statuses:

- **Blank** – No status image indicates that the row has been successfully saved by the system.
- **Processing pending** – This status indicates that the changes in the row haven't yet been saved by the server but are in a queue of changes that must be processed. Before you take action outside the grid, you must wait for all the pending changes to be processed. Additionally, the text in these rows is italicized to indicate the unsaved status of the rows.
- **Invalid state** – This status indicates that some warning or message was triggered during the processing of the row, and it might have prevented the system from saving the changes in that row. In the old grid, if the save operation was unsuccessful, you were forced back into the row to fix the issue immediately. However, in the new grid, you're notified that a validation issue was encountered, but you can decide when you want to fix any issues in the row. When you're ready to fix an issue, you can manually move focus back to the row. Alternatively, you can select the **Fix this issue** action. This action immediately moves focus back to the row that has the issue, and lets you make edits inside or outside the grid. Note that the processing of subsequent pending rows is stopped until this validation warning is resolved.
- **Paused** – This status indicates that processing by the server is paused because validation of the row triggered a pop-up dialog box that requires user input. Because the user might be entering data in some other row, the pop-up dialog box isn't immediately presented to that user. Instead, it will be presented when the user chooses to resume processing. This status is accompanied by a notification that informs the user about the situation. The notification includes a **Resume processing** action that will trigger the pop-up dialog box.

Differences when entering data ahead of the system

When you enter data ahead of the place where the system is processing, you can expect a few changes in the data entry experience:

- You will notice that there are no lookup drop-down lists, field values aren't validated after you move to a different column in the same row, and columns don't initially show default values. This behavior occurs when you create or update ahead of the system. However, after the system catches up to the place where you're currently editing, the standard experience will resume. If you made changes to a field that typically receives a default value, your changes override the default field value when the server starts to process the row.
- If you create a new row by using the **Down arrow** key, all columns in the grid will appear as editable. By default, the focus will be put in the first column in the new row. This column might not be the same column that received the initial focus in the legacy grid, or the same column that receives focus after you select a **New** button. Your organization can customize the system and change the column that receives the initial focus when the **Down arrow** key is selected. For more information, see the Specifying the column that receives the initial focus when new rows are created by using the Down arrow key section. Regardless, you can use personalization to optimize each grid for data entry. Specifically, you can reorder fields so that the first column is the column that you want to start to enter data in. You might also want to reorder fields in general for data entry, to reduce tab stops and hide any fields that aren't required for data entry in this particular view.

Editing multiple rows simultaneously (bulk edit)

In version 10.0.38 and later, users can update multiple selected rows in a single action by using the **Bulk editing in grids** feature, which can be enabled through Feature management.

To use this feature, follow these steps:

1. In the grid, select the rows that you want to update.
2. Select **Grid options** > **Edit selected rows**.
3. In the **Edit rows** dialog box that appears, select the columns that you want to update, and provide the new values. Only columns that are backed by editable fields in the grid can be selected for update. The **Edit rows** dialog box defines the order that columns will be updated in (from top to bottom). This order can affect field-level validations that are triggered during the save process. After you've finished specifying the columns and values that you want to update, select **Apply**.

As when you paste from Excel (as described in the next section), the grid shows the updated contents in italic as a preview of the data changes. Select **Discard** to cancel the bulk editing or **Save** to initiate the save process. During the save process, the system uses the **Typing ahead of the system** save model to submit the updates one row at a time. This approach ensures that all

form and field validations are run for each row. Monitor the progress and results of each validation by checking the row status at the beginning of the row.

Pasting from Excel

Users have always been able to export data from grids in finance and operations apps to Microsoft Excel by using the **Export to Excel** mechanism. However, the ability to enter data ahead of the system enables the new grid to support copying tables from Excel and pasting them directly into grids in finance and operations apps. The grid cell that the paste operation is initiated from determines where the copied table begins to be pasted in. The contents of the grid are overwritten by the contents of the copied table, except in two cases:

- If the number of columns in the copied table exceeds the number of columns that remain in the grid, starting from the paste location, the user is notified that the extra columns have been ignored.
- If the number of rows in the copied table exceeds the number of rows in the grid, starting from the paste location, the existing cells are overwritten by the pasted content, and any extra rows from the copied table are inserted as new rows at the bottom of the grid.

> ⓘ **Note**
>
> Currently, this functionality can't be used in specific situations. For example, in grids using the segmented entry control like General journal lines.

Copying from a grid in the product

Grids in finance and operations apps support a range selection capability that resembles the corresponding feature in Excel. This capability enables users to use the keyboard to select a range of cells (multiple rows and columns), which can then be copied and pasted as required.

Evaluating math expressions

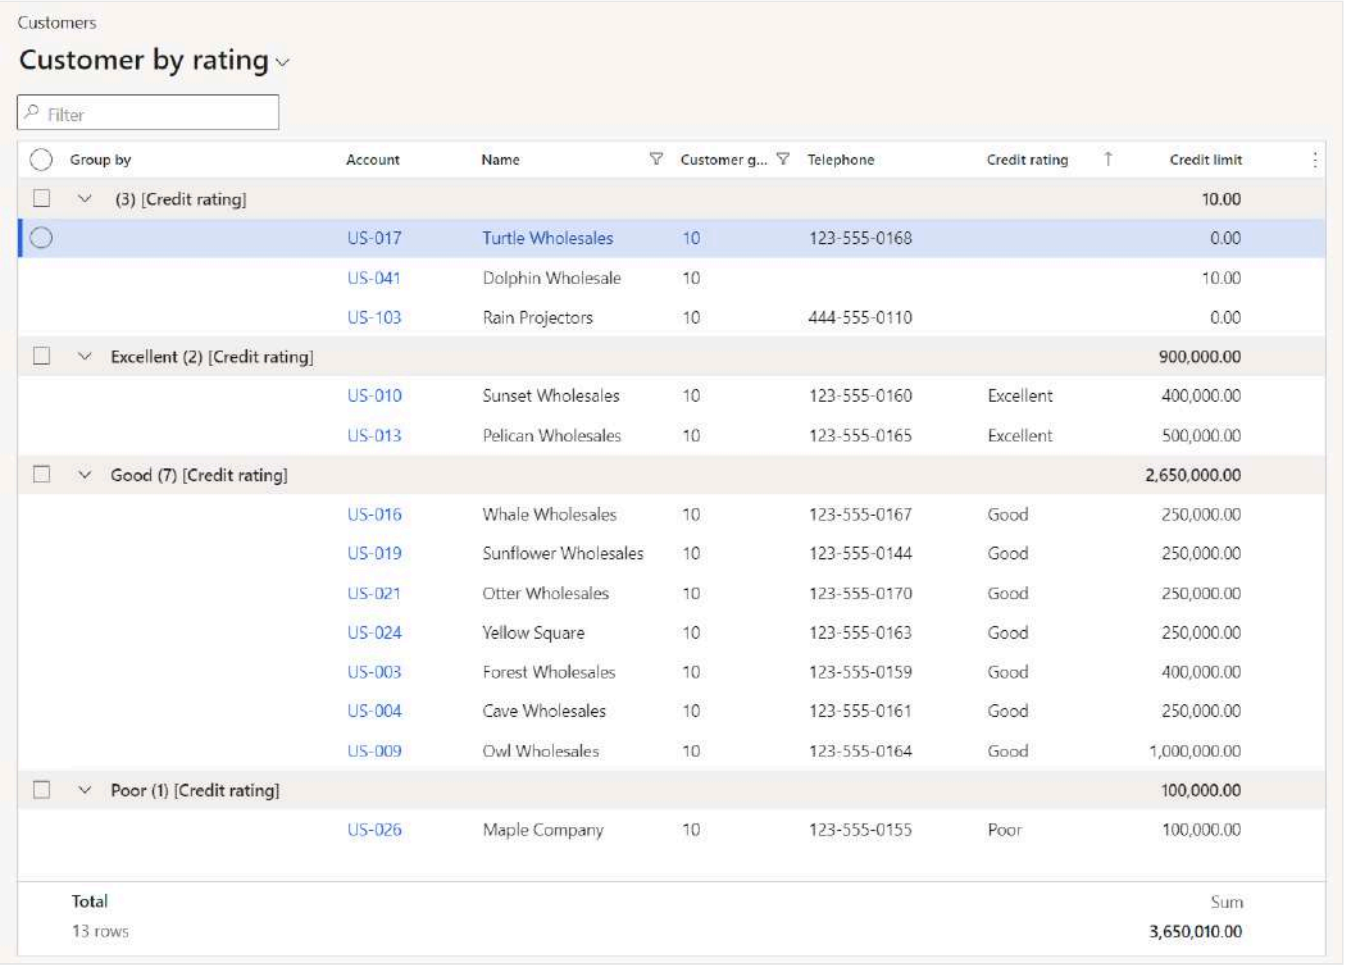
As a productivity booster, users can enter mathematical formulas in numeric cells in a grid. They don't have to do the calculation in an app outside the system. For example, if you enter **=15*4** and then press the **Tab** key to move out of the field, the system will evaluate the expression and save a value of **60** for the field.

To make the system recognize a value as an expression, start the value with an equal sign (=). For more information about the supported operators and syntax, see Supported math symbols.

> **Note**
>
> The ability to evaluate math expressions in numeric controls is available outside the grid.

Grouping tabular data

Business users often have to perform ad-hoc analysis of data. Although this analysis can be done by exporting data to Microsoft Excel and using pivot tables, the **Grouping in grids** capability lets users organize their tabular data in interesting ways within finance and operations apps. Grouping works together with the **Calculated values** capability to let you gain meaningful insights into the data by showing calculated values (for example, subtotals) at the group level.



Group by	Account	Name	Customer g...	Telephone	Credit rating	Credit limit
(3) [Credit rating]						10.00
	US-017	Turtle Wholesales	10	123-555-0168		0.00
	US-041	Dolphin Wholesale	10			10.00
	US-103	Rain Projectors	10	444-555-0110		0.00
Excellent (2) [Credit rating]						900,000.00
	US-010	Sunset Wholesales	10	123-555-0160	Excellent	400,000.00
	US-013	Pelican Wholesales	10	123-555-0165	Excellent	500,000.00
Good (7) [Credit rating]						2,650,000.00
	US-016	Whale Wholesales	10	123-555-0167	Good	250,000.00
	US-019	Sunflower Wholesales	10	123-555-0144	Good	250,000.00
	US-021	Otter Wholesales	10	123-555-0170	Good	250,000.00
	US-024	Yellow Square	10	123-555-0163	Good	250,000.00
	US-003	Forest Wholesales	10	123-555-0159	Good	400,000.00
	US-004	Cave Wholesales	10	123-555-0161	Good	250,000.00
	US-009	Owl Wholesales	10	123-555-0164	Good	1,000,000.00
Poor (1) [Credit rating]						100,000.00
	US-026	Maple Company	10	123-555-0155	Poor	100,000.00
Total						Sum
13 rows						3,650,010.00

To use this capability, right-click the column that you want to group by, and select **Group by this column**. This action will sort the data by the selected column, add a new **Group by** column to the beginning of the grid, and insert "header rows" at the beginning of each group. These header rows provide the following information about each group:

- Data value for the group
- Column name (this information is especially useful when you have multiple levels of grouping)
- Number of data rows in this group
- Calculated values for any configured column (for example, subtotals if the column is configured to show a total)

With Saved views enabled, you can save grouping as part of a view on pages that allow queries to be saved to views. For example, those with large view selectors. See the Switching between views section for more details.

Multiple levels of grouping

After you've grouped data by a single column, you can group the data by a different column by selecting **Group by this column** on the desired column. This process can be repeated until

you have 5 nested levels of grouping, which is the maximum supported depth. At this point, you will no longer be able to group by additional columns.

At any point, you can remove the grouping on any column by right-clicking that column and selecting **Ungroup**. You can also remove the grouping from all columns by selecting **Grid options** and then **Ungroup all**.

Sorting grouped data

After you group data by one or more columns, you can change the sort direction for any grouping column through the corresponding column header.

If you sort on a non-grouped column, the grouping remains intact. The data is sorted inside each group, based on the selected column.

Expanding and collapsing groups

The initial grouping of data will have all groups expanded. You can create summarized views of the data by collapsing individual groups, or you can use group expanding and collapsing to assist in navigating through the data. To expand or collapse a group, select the chevron (>) button in the corresponding group header row. Note that the expand/collapse state of individual groups is **not** saved in personalization.

Selecting and unselecting rows at the group level

In the same way that you can select (or unselect) all rows in the grid by selecting the check box at the top of the first column in the grid, you can also quickly select (or unselect) all the rows in a group by selecting the check box in the corresponding group header row. The check box in the group header row will always reflect the current selection state of rows in that group, regardless of whether all rows are selected, no rows are selected, or only some rows are selected.

Hiding column names

When grouping data, the default behavior is to show the column name in the group header row. You can choose to suppress the column name in group header rows by selecting **Grid options** > **Hide group column name**.

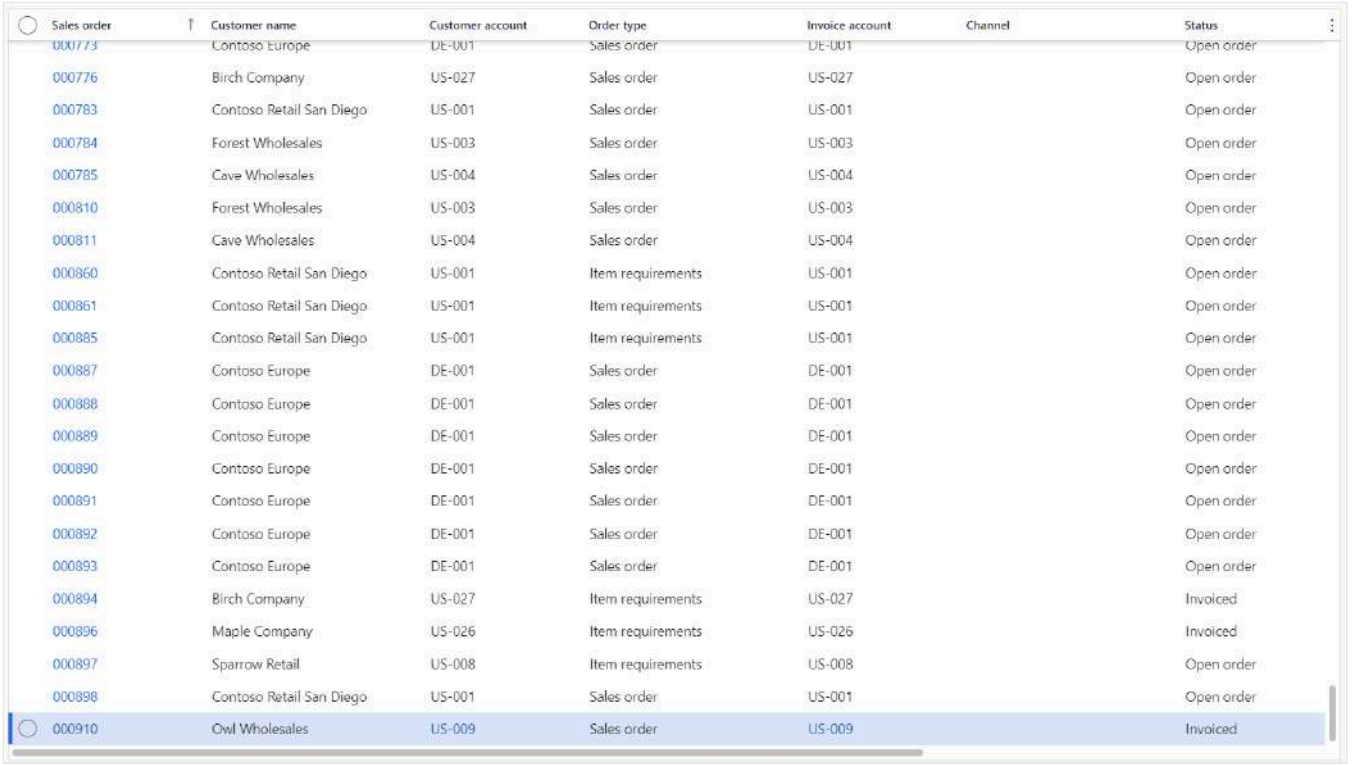
Grouping on date and time columns

When you group on Date or DateTime fields, you have the option to group by year, month, or day. The group "value" in the corresponding header row will match the format from that field. Additionally, for DateTime and Time fields, you can group by hour, minute, or second.

> **ⓘ Important**
>
> Users can't currently add a grouping column after they group on a segment of a date or time column.

Freezing columns

Some columns in a grid might be important enough for context that you don't want them to scroll out of view. Instead, you might want the values in those columns to always be visible. The **Freezing columns in grid** capability provides this flexibility to users.



Sales order	Customer name	Customer account	Order type	Invoice account	Channel	Status
000773	Contoso Europe	DE-001	Sales order	DE-001		Open order
000776	Birch Company	US-027	Sales order	US-027		Open order
000783	Contoso Retail San Diego	US-001	Sales order	US-001		Open order
000784	Forest Wholesales	US-003	Sales order	US-003		Open order
000785	Cave Wholesales	US-004	Sales order	US-004		Open order
000810	Forest Wholesales	US-003	Sales order	US-003		Open order
000811	Cave Wholesales	US-004	Sales order	US-004		Open order
000860	Contoso Retail San Diego	US-001	Item requirements	US-001		Open order
000861	Contoso Retail San Diego	US-001	Item requirements	US-001		Open order
000885	Contoso Retail San Diego	US-001	Item requirements	US-001		Open order
000887	Contoso Europe	DE-001	Sales order	DE-001		Open order
000888	Contoso Europe	DE-001	Sales order	DE-001		Open order
000889	Contoso Europe	DE-001	Sales order	DE-001		Open order
000890	Contoso Europe	DE-001	Sales order	DE-001		Open order
000891	Contoso Europe	DE-001	Sales order	DE-001		Open order
000892	Contoso Europe	DE-001	Sales order	DE-001		Open order
000893	Contoso Europe	DE-001	Sales order	DE-001		Open order
000894	Birch Company	US-027	Item requirements	US-027		Invoiced
000896	Maple Company	US-026	Item requirements	US-026		Invoiced
000897	Sparrow Retail	US-008	Item requirements	US-008		Open order
000898	Contoso Retail San Diego	US-001	Sales order	US-001		Open order
000910	Owl Wholesales	US-009	Sales order	US-009		Invoiced

To freeze a column, right-click in the column's header, and then select **Freeze column**. The first time that you complete this step, the selected column becomes the first column and will no longer scroll out of view. Any subsequent column that you freeze will be added to the right of the last frozen column. You can use the standard Move functionality to reorder frozen columns as you require. However, frozen columns can't be moved so that they appear among the set of unfrozen columns. Likewise, unfrozen columns can't be moved so that they appear among the set of frozen columns.

To unfreeze a column, right-click in the frozen column's header, and then select **Unfreeze column**.

Note that the row selection and row status columns in the new grid are always frozen as the first two columns. Therefore, when these columns are included in a grid, they will always be visible to users, regardless of the horizontal scroll position in the grid. These two columns can't be reordered.

Autofit column width

As in Excel, users can force a column to be automatically resized based on the content that is currently shown in it. Just double-tap (or double-click) the sizing handles in the column. Alternatively, put the focus in the column header, and then select the **A** key (for autofit).

Developer topics

[Developer] Opting out individual pages from using the new grid

If your organization discovers a page that has some issues utilizing the new grid, an API is available to allow an individual form to use the legacy grid control while still permitting the rest of the system to utilize the new grid control. To opt out an individual page from the new grid, add the following call post `super()` in the `run()` method for the form.

```
this.forceLegacyGrid();
```

This API will eventually be deprecated to allow for removal of the legacy grid control. However, it will remain available for at least 12 months after its deprecation is announced. If any issues require that this API be used, report them to Microsoft.

Forcing a page to use the new grid after previously opting out the grid

If you have opted out an individual page from using the new grid, you might want to later re-enable the new grid after the underlying issues were solved. To do this, you simply need to remove the call to `forceLegacyGrid()`. The change will not take effect until one of the following occurs:

- **Environment redeployment**: When an environment is updated and redeployed, the table that stores the pages that have opted out of the new grid (FormControlReactGridState) is automatically cleared.
- **Manual clearing of the table**: For development scenarios, you will need to use SQL to clear the FormControlReactGridState table and then restart the AOS. This combination of actions will reset the caching of pages that have opted out of the new grid.

[Developer] Opting individual grids out of the Typing ahead of the system capability

Some scenarios have arisen that don't lend themselves to working well with the *Typing ahead of the system* capability of the grid. (For example, some code that is triggered when a row is validated causes a datasource research to be triggered, and the research can then corrupt uncommitted edits on existing rows.) If your organization discovers such a scenario, an API is available that lets a developer opt an individual grid out of asynchronous row validation and revert to the legacy behavior.

When asynchronous row validation is disabled in a grid, users can't create a new row or move to a different existing row in the grid while there are validation issues on the current row. As a side effect of this action, tables can't be pasted from Excel into finance and operations grids.

To opt an individual grid out of asynchronous row validation, add the following call after `super()` in the `run()` method of the form.

```
<gridControl>.allowPreemptiveClient(false);
```

> ⓘ **Note**
>
> - This call should be invoked only in exceptional cases and should not be the norm for all grids.
> - We don't recommend that you toggle this API at runtime after the form loads.

[Developer] Size-to-available-width columns

If a developer sets the **WidthMode** property to **SizeToAvailable** for columns inside the new grid, those columns initially have the same width that they would have if the property were set to **SizeToContent**. However, they stretch to use any extra available width inside the grid. If the property is set to **SizeToAvailable** for multiple columns, all those columns share any extra available width inside the grid. However, if a user manually resizes one of those columns, the column becomes static. It will remain at that width and will no longer stretch to take up extra available grid width.

[Developer] Specifying the column that receives the initial focus when new rows are created by using the Down arrow key

As was discussed in the Differences when entering data ahead of the system section, if the "Typing ahead of the system" capability is enabled, and a user creates a new row by using the **Down arrow** key, the default behavior is to put the focus in the first column in the new row. This experience might differ from the experience in the legacy grid or when a **New** button is selected.

Users and organizations can create saved views that are optimized for data entry. (For example, you can reorder columns so that the first column is the one that you want to start to enter data in.) In addition, as of version 10.0.29, organizations can adjust this behavior by using the **selectedControlOnCreate()** method. This method lets a developer specify the column that should receive the initial focus when a new row is created by using the **Down arrow** key. As input, this API takes the control ID that corresponds to the column that should receive the initial focus.

[Developer] Handling grids with non-React extensible controls

When a grid is loading, if the system encounters an extensible control that is not React based, the system will force the legacy grid to render instead. When a user first encounters this situation, a message will be shown indicating the page needs to be refreshed. Afterwards, this page will load the legacy grid automatically without any further notifications to users until the next system update.

To overcome this situation permanently, extensible control authors can create a React version of the control for use in the grid. Once developed, the X++ class for the control can be decorated with the **FormReactControlAttribute** attribute to specify the location of the React bundle to load for that control. See the `SegmentedEntryControl` class as an example.

Create and work with custom fields

Article • 12/31/2024

While there's an extensive set of fields out-of-the-box for managing a broad range of business processes, sometimes there's a need for a company to track additional information in the system. While programmers can be used to add those fields as extensions in the developer tools, the custom fields feature allows fields to be added directly from the user interface, allowing you to tailor the application to fit your business using your web browser.

Only users with special permissions have access to this feature.

This video shows how easy it's to add a custom field to a page: Adding custom fields.

Creating custom fields

After you've identified additional information to track in the application, you can create the custom field on the appropriate table and expose that new field on a page.

The following steps describe the process for creating a custom field and placing that field on a page.

1. Navigate to the page where the new field is needed.
2. Because the end goal is to expose the custom field on a form, the entry point for creating custom fields exists inside the personalization experience. Open the personalization toolbar by selecting **Options**, and then **Personalize this form**.
3. Click **Insert** and then **Field**.
4. Select the region of the form where you want to expose the new field. After selection, the **Insert fields** dialog box will display a list of existing fields that can be inserted into the selected region of the page.
5. Confirm that the field you're interested in doesn't already exist in the list. If it does, you can simply select that field in the list and click **Insert**.
6. Click the **Create new field** button above the list to initiate the process of creating a custom field. This will open the **Create new field** dialog box.

   If you don't see the **Create new field** button, you do not have the necessary permissions to use this feature.

7. In the **Create new field** dialog box, enter the following information.

    a. Select the database table where this field should be added. Note that only tables that support custom fields will appear in the drop-down list. See the section below for technical details on supported tables.

    b. Select the data type for the new field. The available data types are checkbox, date, date time, decimal, number, picklist, and text.

        - If you choose the text data type, you can also specify the maximum length of the text that can be entered in this field.
        - If you choose the picklist data type, you can also select the set of valid values for the field.

    c. Provide a name, label, and help text for the field. The name corresponds to the physical field name in the database, whereas the label and help text are the text used to represent this field in the user interface.

8. If this is the only field that you need to create for this page, click **Save**. If you need to create additional fields, click **Save and new** and go back to step 7.

> ⓘ **Note**
>
> Currently, there's a limit of **20 custom fields per table**.

9. Leaving the **Create new field** dialog box will return you to the **Insert fields** dialog box. Any custom fields that were just added will be automatically marked in the field list to be inserted into the page.
10. Click **Insert** to insert the marked fields into the selected region of the page.
11. **Optional:** Enable **Move** mode from the personalization toolbar to move the new fields to their desired location in the selected region. See Personalize the user experience for more information about how to use the various personalization capabilities to optimize a form for your personal usage.

> ⚠ **Warning**
>
> The ability to enter values in a custom field added to a page is dependent on whether the table associated with the custom field is editable or read only. When the associated table is read only, all fields linked to that table, including any custom fields, will also be read only.

Sharing custom fields with other users

After you've created a custom field and exposed it on a page, you might want to provide this updated page view that includes the new field to other users in the system. This can be accomplished in two different ways using the personalization capabilities of the product:

- The recommended route is to **publish a saved view** with the custom field added to the page to the appropriate set of users. If the saved views feature isn't enabled, the system administrator can apply the personalization to the desired users from the **Personalization** page. For more information, see Personalize the user experience.
- Alternatively, you can export your changes (called *personalizations*), send them to one or more users, and have each of those users import your changes. The **Manage** option on the personalization toolbar enables you to export and import personalizations.

Managing custom fields

Management of all the custom fields can be accomplished through the **Custom fields** page in the System administration module. This page allows users access to many capabilities, including:

- Viewing a list of all custom fields in the system.
- Limited editing of existing custom fields.
- Deleting custom fields.
- Exposing custom fields on data entities.
- Providing translations of custom field labels and help text.

Viewing all custom fields

The **Custom fields** page provides visibility to all the custom fields that have been defined in the system. Select the table that you are interested in, and the page will update to show a list of the custom fields associated with that table. Choosing a custom field from the list will allow you to view all the details about the field.

Editing custom fields

After a custom field has been created, only certain pieces of information about the custom field can be modified on the **Custom fields** page.

You *can* modify these attributes:

- Label
- Help text
- Length, for Text fields

You *can't* edit the following attributes:

- Field name
- Data type

Additionally, for picklist fields, the set of valid values for the custom field can be reordered, and new values can be added; however, existing values for the picklist field can't be removed. Click **Apply changes** when you're done editing fields for a particular table so the changes are saved.

Exposing custom fields on data entities

It may also be important to allow custom fields to be visible on data entities. Data entities are utilized in the Office integration overview feature, and for data import/export scenarios.

Follow these steps to expose a custom field on a data entity:

1. Select the custom field on the **Custom fields** page.
2. Expand the **Entities** section to view the set of relevant entities.
3. Click the **Edit** button.
4. Modify the **Enabled** field to be selected for each entity that should expose this field.
5. Click **Apply changes** to save your selections.

Allowing custom fields to be displayed in other languages

Because custom fields may need to be accessed by users in a variety of languages, the **Custom fields** page provides a mechanism to allow the label and help text for a custom field to be translated into other languages.

The following steps describe the process for translating custom fields in other languages:

1. Select the custom field on the **Custom fields** page.

2. Select the **Translations** button in the Action Pane. This will open a drop-down menu with existing translations for this field.

3. The **Language** drop-down menu shows the set of languages for which translations have already been provided.

   If you want to edit an existing translation, select the language from the menu and modify the values for the label and help text.

   Otherwise, click the **Add language** button, select the desired language from the menu, and then provide translated values for the label and help text.

4. Click **OK** when you are finished.

Deleting custom fields

When you decide that a custom field is no longer needed, a system administrator can choose to delete the field from the **Custom fields** page. To delete a custom field, select the field to delete, click **Delete**, click **Yes** to confirm the deletion, and finally click **Apply changes**.

> ⓘ **Note**
>
> This action can't be undone, and will result in the data associated with the field being permanently deleted from the database.

Appendix

Why can't I enter a value in my custom field?

If you can't type a value into the custom field when the page is in **Edit** mode, this may be because the table that the field was added to is currently read only. All fields in a table become read only if the backing table is currently configured as read only on the page.

Who can create custom fields?

Only system administrators are able to create custom fields by default. However, those power users whom the organization deems necessary can be given rights to create custom fields by a system administrator using the **Runtime customization power user**

security role. Users without this security role will not be able to create custom fields, but will still be able to see and interact with custom fields added by other users in the system.

What tables support custom fields?

For performance and technical reasons, only tables that meet the following conditions currently allow custom fields to be added.

- The table must be tagged as one of these groups:
  - Group
  - WorksheetHeader
  - Main
  - Miscellaneous
  - Parameter
  - Reference
  - TransactionHeader
- The table can't extend another table.
- The table can't be marked as a system table.
- The table can't be a temporary table.

Can I reference custom fields from the developer tools?

Custom fields can only be managed through the user interface and can't be referenced by code.

Can I transfer the custom field to the table as an extension field while keeping the values?

Custom field data can be transferred to the table as extension fields. To use the custom X++ scripts to get and map the corresponding data from a custom field, follow these steps:

1. Get the field name of the custom field.
2. Use the `.getFieldValue(_fieldName)` method to get a value on the source table.

You can use the `TableExtensionManagerFactory::CreateExtensionManager()` extension manager to create the `.GetRuntimeExtension(_tableName, SysCustomFieldConstants::ExtensionName)` extension build object on the

Microsoft.Dynamics.Ax.Xpp.MetadataExtensions library to get more information about the type/metadata of the extension field.

> **Note**
>
> Exclude records with default values from your query when transferring data for all records between a custom field and a new extension field. Use the **update statement** of the SysDa framework for better performance.

How can I move custom fields between environments?

The current recommendation for moving custom fields between environments is to manually re-create the custom fields in the target environment. To see the full list of custom fields on a particular table:

1. Go to the **Custom fields** page, select that table from the dropdown.
2. In the target environment, follow the process described earlier in this article to recreate each field.
3. Once all the fields have been created, click **Apply changes**.
4. Move all the personalizations containing custom fields by exporting those personalizations from the original environment and importing them into the target environment.

Embed canvas apps from Power Apps

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Microsoft Power Apps is a service that lets developers and nontechnical users build custom business apps for mobile devices, tablets, and the web without writing code. Finance and operations apps support integration with Power Apps. Canvas apps that you, your organization, or the broader ecosystem develop can be embedded into finance and operations apps to augment the product's functionality. For example, you might build a canvas app from Power Apps to supplement a finance and operations app with information that is retrieved from another system.

To learn more about embedding canvas apps, watch the short How to embed canvas apps video.

Adding an embedded canvas app from Power Apps to a page

Before you embed a canvas app from Power Apps into the client, you must find or build an app that has the desired visuals or functionality. This article doesn't include a detailed description of the process for building apps. If you're new to Power Apps, see the Power Apps documentation.

There are three ways to embed a canvas app into a finance and operations app. You can use the approach that best fits your scenario.

- Embed the canvas app into the **Power Apps** button on the standard Action Pane of a page. Apps that you add in this way appear as items on the **Power Apps** menu button, and the apps open in side panes.
- Embed the canvas app directly on an existing page as a new tab page (pivot tab, FastTab, blade, or workspace section).
- Create a new full-page experience for the canvas app from the dashboard.

When you configure your embedded canvas app, you can select a single field that you want to send as context to the app. This step enables the app to be responsive, based on the data that you're currently viewing.

> **Note**
>
> You can't use this mechanism to embed model-driven apps.

Embedding a canvas app on an existing page

The following procedure shows how to embed a canvas app on an existing page from Power Apps.

1. Go to the page where you want to embed the canvas app. This page contains any data that must be passed to the app as input.
2. Open the **Add an app from Power Apps** pane:
    - If the app will be embedded directly on the page, select **Options** > **Personalize this page** > **More**. Select **Add a page**, and then select the region on the page where you want to add the app. To embed the app into the **Power Apps** menu button, on the Action Pane select **Power Apps**. To embed the app directly on the page, select the appropriate tab, FastTab, blade, or section (if you're on a workspace). Then, in the **Add an app** pane, select **Power Apps**.
    - If the app will be accessed by using the **Power Apps** menu button, you can select the **Power Apps** menu button on the standard Action Pane and then select **Add an app**.
3. Configure the embedded app. For more information, see the Configuring a canvas app section later in this article.
4. After you confirm that the configuration is correct, select **Insert**. Remember to save the view for the change to be persisted if you're adding the app to a page that supports views.

Embedding a canvas app as a full-page experience from the dashboard

You might want to embed a canvas app from the dashboard if the app isn't related to an existing page, or if you just want to surface the app as a full-page experience inside the finance and operations app.

1. Open the dashboard.
2. Select and hold (or right-click) the page, select **Personalize**, and then select **Add a page**.
3. In the **Add a page** pane, select **Power Apps**.

4. Configure the embedded app. For more information, see the Configuring a canvas app section later in this article.
5. Select **Save** to add the app to the dashboard as a new tile.
6. Select the new tile on the dashboard, and confirm that the canvas app appears as expected.

Configuring a canvas app

When you embed a canvas app, you must set the following parameters:

- **Name** – Enter the text that should be shown for the button or tab that contains the embedded app. Often, you might want to repeat the name of the app in this field.
- **App ID** – Specify the globally unique identifier (GUID) for the canvas app that you want to embed. To retrieve this value, find the app on make.powerapps.com, and then look in the **App ID** field under **Details**.
- **Input context for the app** – You can optionally select the field that contains the data that you want to pass to the app as input. For information about how the app can access the data that is sent from finance and operations apps, see Building an app that leverages data sent from finance and operations apps.

  The current legal entity is also passed to the canvas app as context, via the **cmp** URL parameter.
- **Application size** – Select the type of app that you're embedding. Select **Thin** for apps that are built for mobile devices or **Wide** for apps that are built for tablets. This parameter ensures that enough space is allotted for the embedded app.

Sharing an embedded app

After you embed a canvas app on a page and confirmed that it's working correctly, you might want to share the app with other users in the system.

To share an embedded canvas app, follow these steps:

1. Share the canvas app in Power Apps with the appropriate users, so that they can access the app directly in Power Apps.
2. Share the personalizations that are associated with the embedded app with the desired users. You can use either of the following approaches:

- **Publish the view (Recommended):** For pages that support views, the recommended and preferred approach is to create a view that includes the embedded canvas app, and then publish that view to the desired users. This approach ensures that all users who have the security roles that are targeted by the published view see the canvas app on the page.

  You can also publish a canvas app that is embedded as a full-page experience from the dashboard. On the dashboard, select and hold (or right-click) the tile that is associated with the app, select **Personalize**, and then select **Publish page**. An experience that resembles the *Publishing views* experience is shown, and you can select the security roles and legal entities to publish to.

- For pages that don't support views, the system administrator can implement a personalization that provides the canvas app to the appropriate set of users via the **Personalization** page. Alternatively, you can export your page's personalizations and send them to one or more users. Each of those users can then import the personalization. The personalization toolbar has buttons that let you export and import personalizations.

> ⓘ **Note**
>
> If the canvas app has been shared with external users, those users can't use the embedded app inside finance and operations apps. However, they can access the app directly inside Power Apps. External users include guests and users who don't belong to the Microsoft 365 Azure Directory where the finance and operations app is deployed.

For more information about the personalization capabilities in the product and how to use them, see Personalize the user experience.

Building a canvas app that uses data that is sent from finance and operations apps

When you build a canvas app that will be embedded in a finance and operations app, one important part of the process is to use the input data from that finance and operations app. From the Power Apps development experience, the input data that is passed from a finance and operations app can be accessed by using the **Param("EntityId")** variable. The current legal entity is also passed to the canvas app via the **Param("cmp")** variable.

For example, in the OnStart function of the app, you could set the input data from finance and operations apps to a variable like this:

Power

```
If(!IsBlank(Param("EntityId")), Set(FinOpsInput, Param("EntityId")),
Set(FinOpsInput, ""));

If(!IsBlank(Param("cmp")), Set(FinOpsLegalEntity, Param("cmp")),
Set(FinOpsLegalEntity, ""));
```

Viewing a canvas app

To view an embedded canvas app on a page in finance and operations apps, just go to a page that has an embedded app. Remember that apps can be accessed by using the **Power Apps** button on the standard Action Pane. Alternatively, they can appear directly on the page as a new tab, or FastTab, or blade, or as a new section in a workspace. When users first try to load an app on a page, they are prompted to sign in. This step ensures that the users have the appropriate permissions to use the app.

Editing an embedded app

After an app is embedded on a page, you may need to make some changes to the configuration of the app. For example, you may want to modify the label that is associated with the embedded app, or a new version of the app is released and you need to update the App ID to point to the latest version.

Follow these steps to edit the configuration of an embedded app:

1. Go to the **Edit the app** pane.

    - If the embedded app is accessed through the Power Apps menu button, select and hold (or right-click) the Power Apps menu button and select **Personalize**. Select the app that you want to configure from the **Select an app** drop-down menu.
    - If the embedded app appears directly on the page, select **Options**, and then select **Personalize this page**. Using the **Select** tool, click the embedded app.
    - If the embedded app was added from the dashboard, open the dashboard, select and hold (or right-click) the tile that is associated with the canvas app, select **Personalize**, and then select **Edit page**.

2. Make the needed modifications to the app configuration, and then click **Save**.

3. Resave or republish the view. If you leave the page without explicitly saving the view, none of the actions that you performed in the **Edit website** pane are maintained. This step isn't needed for pages that don't support views.

Removing an app

After an app is embedded on a page, there are a few ways to remove it if needed:

- Go to the **Edit an app** pane using the instructions from the Editing an embedded app section earlier in this article. Confirm that the pane displays information for the embedded app that you would like to remove, and then click the **Delete** button.
- If the embedded app was added from the dashboard, open the dashboard, select and hold (or right-click) the tile that is associated with the canvas app, select **Personalize**, and then select **Remove page**.
- Because the embedded app is saved as personalization data, clearing your page's personalization also removes any embedded apps on that page. Clearing the page's personalization is permanent and can't be undone. To remove your personalizations on a page, select **Options**, select **Personalize this page**, and then select the **Clear** button. After you refresh your browser, all previous personalizations for the current view (or the entire page if the page doesn't support views) are removed. For more information about how to optimize pages using personalization, see Personalize the user experience.

Appendix

[Developer] Modeling a canvas app on a form

While this article focuses on embedding canvas apps through personalization, developers also have the option to add a canvas app to a form using the Visual Studio development experience by adding a PowerAppsHostControl to the form. The metadata properties available on the control provide the same capabilities as the personalization experience.

[Developer] Specifying where an app can be embedded

By default, users can embed apps on any page, either under the Power Apps menu button or directly on the page as a tab, FastTab, blade or as a new section in a workspace. However, if necessary developers can also configure this feature to only allow embedding of apps on certain pages by implementing the following methods:

- **isPowerAppPersonalizationEnabled** – If this method returns false for a specific page, then the Power Apps menu button isn't shown, and users aren't able to embed apps anywhere on this page, including as a tab.
- **isPowerAppTabPersonalizationEnabled** – If this method returns false for a specific page, then users aren't able to embed apps directly on the page as a tab, FastTab, or panorama

section. Users are still able to embed apps through the Power Apps menu button if embedding is allowed on the page.

The following example shows a new class with the two methods needed to configure where apps can be embedded.

powerapps

```
[ExtensionOf(classStr(FormRunConfigurationPowerAppsConfiguration))]

public final class ClassTest_Extension
{

Embed third-party apps

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Many customers use a range of applications to run their businesses. Some of those applications are third-party web apps that work with finance and operations apps. To provide a more seamless user experience, you can embed third-party apps directly into your finance and operations apps (if the third-party apps support embedding). By using this approach, users can access the websites and apps they require without having to switch tabs or windows.

Use one of the following methods to embed a third-party app or website. These methods are similar to the methods that you use to embed canvas apps from Microsoft Power Apps into finance and operations apps.

- Embed the app or website on an existing page as a new tab page (pivot tab, FastTab, blade, or workspace section).
- Create a new full-page experience for the app or website from the dashboard.

Embed a website on an existing page

Use this procedure to supplement an existing page in the system with an embedded app.

1. Open the page where you want to embed the app.
2. Open the **Add an app** pane:
   a. Select **Settings** and then **Personalize** to open the **Personalization** toolbar.
   b. Select **More** > **Add an app**.
3. Select the region of the page where you want to add the app. This region must be a *tab container* for a pivot tab, FastTab, blade, or workspace section.
4. Select **Website**.
5. Configure the embedded app:

- **Name** – Enter the text that appears for the tab that contains the embedded app. Often, you want this text to be the name of the app.
- **URL** – Specify the location of the app.

> **Important**
>
> - For security reasons, the URL must use Hypertext Transfer Protocol Secure (HTTPS).
> - The app or website must be configured to allow itself to be embedded.

6. Select **Save** to embed the app on the page. The app is added as the last tab or section in the group.
7. Confirm that the app appears as expected. If the app isn't rendered, see the Troubleshooting section later in this article.
8. Open the view selector, and select either **Save** (if the app should be associated with the current view) or **Save as** (to save the app to a different view). If the page doesn't support views, you can skip this step.

Embed a website as a full-page experience from the dashboard

Use this procedure if the app that you want to embed isn't related to an existing page, or if you want a full-page experience for the app inside the finance and operations app.

1. Open the dashboard.
2. Select and hold (or right-click) on the dashboard, select **Personalize**, select **Add a page**.
3. In the **Add a page** pane, select **Website**.
4. Configure the embedded app:

   - **Name** – Enter the text that appears on the tile for the embedded app on the dashboard. Often, you want this text to be the name of the app.
   - **URL** – Specify the location of the app.

> **Important**
>
> - For security reasons, the URL must use HTTPS.

- The app or website must be configured to allow itself to be embedded.

5. Select **Save** to add the app to the dashboard as a new tile.
6. Select the new tile on the dashboard, and confirm that the app appears as expected. If the app isn't being rendered, see the Troubleshooting section later in this article.

Sharing embedded apps

After you embed an app by using one of the methods that are described in the previous sections, you might want to share the view with other users in the system. To share an embedded app, use one of the following methods:

- **Publish the view (Recommended):** If you save the embedded app to a view, publish the view to users who have the appropriate security roles in the targeted legal entities. In this case, only the desired users see the embedded app on that page. For more information about how to publish a view, see Publishing views.

  You can also publish an app that you embedded as a full-page experience from the dashboard. On the dashboard, select and hold (or right-click) the tile that is associated with the app, select **Personalize**, and then select **Publish page**. An experience that resembles the *Publishing views* experience is shown, and you can select the security roles and legal entities to publish to.

- **Copy the personalization:** For pages that don't support views, you can copy the personalization to the appropriate users. For more information, see Sharing personalizations.

Viewing embedded apps

To view an embedded app on a page in finance and operations apps, open the page that has the embedded app. On some pages, you can access embedded Power Apps by using the **Power Apps** button on the standard Action Pane. Alternatively, any embedded app might appear directly on the page as a new tab, FastTab, or blade, or as a new section in a workspace.

Editing or removing embedded apps

After you embed an app on a page, you might need to edit its configuration, such as changing the section label or the URL. Or, you might need to remove the app from the page. Use one of the following procedures to edit the configuration of an embedded app or remove it.

Apps that you embed on existing pages

1. Open the page where you embedded the app.
2. Select **Settings** and then **Personalize** to open the **Personalization** toolbar.
3. Select the **Select** tool, and then select the embedded app.
4. To edit the app, make the required changes to its configuration, and then select **Save**.

   To remove the app, select **Delete**.
5. Resave or republish the view. If you leave the page without explicitly saving the view, you don't maintain any of the actions that you performed in the **Edit website** pane.

Apps that you embed from the dashboard

1. Open the dashboard.
2. Select and hold (or right-click) the tile that's associated with the embedded app, and then select **Personalize**.
3. To edit the app, select **Edit page**. In the **Edit website** pane, make the required changes to the app configuration, and then select **Save**.

   To remove the app, select **Remove page**.

Appendix

Troubleshooting

If a website doesn't render correctly after you embed it in a finance and operations app, or if you receive an error message that states that the URL denied a connection, the website is probably configured to prevent itself from being embedded in an iframe. Follow these steps to determine whether you can embed the website.

1. Open the developer tools for the browser that you're using.
2. On the **Network** tab, find and select the response from the embedded site.
3. On the **Headers** tab, under **Response Headers**, look for **x-frame-options**. If **x-frame-options** exists in the response headers, and has a value of **DENY** or **SAMEORIGIN**, you can't currently embed the website. You need to work with the owner of the app to enable it to be safely embedded.

[Developer] Modeling a website on a form

Although this article focuses on embedding third-party apps or websites through personalization, developers can also embed them in a form by using the Visual Studio development experience. Just add a **WebsiteHostControl** control to the form. The metadata properties that are available for the control provide the same capabilities as the personalization experience.

Find information by using lookups

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Many fields have lookups that can help you easily find the correct or desired value. Several enhancements have been added to lookups that make these controls more usable and make users more productive. In this article, you will learn about these new lookup features and receive some helpful tips to get the optimal use out of lookups in the system.

Responsive lookups

In previous versions, when interacting with a lookup control, users would have to take an explicit action to open the drop-down menu. This may have been by typing an asterisk (*) in the control to filter the lookup based on the current value of the control, clicking the drop-down button, or by using the **Alt**+**Down arrow** keyboard shortcut. Lookup controls have been modified in the following ways to better align with current web practices:

- Lookup drop-down menus now open automatically after a slight pause in typing, with the drop-down menu contents filtered based on the lookup control's value.

  Note that the old behavior of automatic opening of the dropdown after typing an asterisk (*) has been deprecated.

- After the lookup drop-down menu has opened, the following occurs:
  - The cursor stays in the lookup control (instead of focus moving into the drop-down menu) so you can continue to make modifications to the control's value. However, the user can still use the **Up arrow** and **Down arrow** to change rows in the drop-down menu, and enter to select the current row in the drop-down menu.
  - The contents of the drop-down menu adjusts after any modifications are made to the lookup control's value.

For example, consider a lookup field called **City**.

When focus is in the **City** field, you can start looking for the city that you want by typing a few letters, like "col." After you stop typing, the lookup will open automatically, filtered to those cities that begin with "col".

At this point, the cursor is still in the lookup field. If you continue typing so the value is "colum," the lookup contents adjust automatically to reflect the latest value in the control.

Even though focus is still in the lookup control, you can also use the **Up arrow** or **Down arrow** keys to highlight the row that you want to select. If you press **Enter** the highlighted row will be selected from the lookup and the control's value will be updated.

Typing in more than IDs

When entering data, it's natural for users to attempt to identify an entity, such as a customer or vendor, in terms of the name rather than an identifier representing the entity. Many (but not all) lookups now allow contextual data entry. This powerful feature allows the user to type the ID or the corresponding name into the lookup control.

For example, consider the **Customer account** field when creating a sales order. This field shows the **Account ID** for the customer, but a user would typically prefer to enter an **Account name** instead of an **Account ID** for this field when creating a sales order, such as "Forest Wholesales" instead of "US-003."

If the user started to enter an **Account ID** into the lookup control, the drop-down menu would automatically open as described in the previous section.

However, the user can now enter the beginning of an **Account name** as well. If this is detected, the **Name** column is moved to be the first column in the lookup, and the lookup is sorted and filtered based on the **Name** column.

Using grid column headers for more advanced filtering and sorting

The lookup enhancements discussed in the previous two sections greatly improve a user's ability to navigate the rows in a lookup based on a "begins with" search of the **ID** or **Name** field in the lookup. However, there are situations in which more advanced filtering (or sorting) is needed to find the correct row. In these situations, the user needs to use the filtering and sorting options in the grid column headers inside the lookup. For example, consider an employee entering a sales order line who needs to locate the right "cable" as the product. Typing "cable" into the **Item number** control isn't helpful, as there are no product names that begin with "cable."

Instead, the user needs to clear the value of the lookup control, open the lookup drop-down menu, and filter the drop-down menu using the grid column header. A mouse (or touch) user can simply click (or touch) any column header to access the filtering and sorting options for

that column. For a keyboard user, the user simply needs to press **Alt**+**Down arrow** a second time to move focus into the drop-down menu, after which the user can tab to the correct column, and then press **Ctrl**+**G** to open the grid column header drop-down menu.

After the filter has been applied, the user can find and select the row as usual.

Change the date for a session

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to change the date for a session. By default, the current date is used when you enter and post journal entries or source documents. You can change the date for your current session. Use this feature to back-date journal entries or source documents, as necessary.

1. In the navigation pane, go to **Modules** > **Common** > **Common** > **Session date and time**.
2. In the **Date** field, enter a date.
3. Select **OK**.

Set a user's preferred time zone

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The following article explains how a user in the System Administrator role can set the time zone for a user.

1. Go to **Navigation pane** > **Modules** > **System administration** > **Users** > **Users**.
2. In the list, find and select the desired record.
3. Select **User options**.
4. Select the **Preferences** tab.
5. In the **Time zone** field, select an option from the drop-down list.
6. Select **Save**.

Lifecycle Services for finance and operations apps customers

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article is for customers who sign up for the current versions of finance and operations apps. Partners who work with customers to help them move through the lifecycle of their Microsoft Dynamics 365 Lifecycle Services project also find this information useful.

Lifecycle Services workspace for the current versions of the finance and operations apps

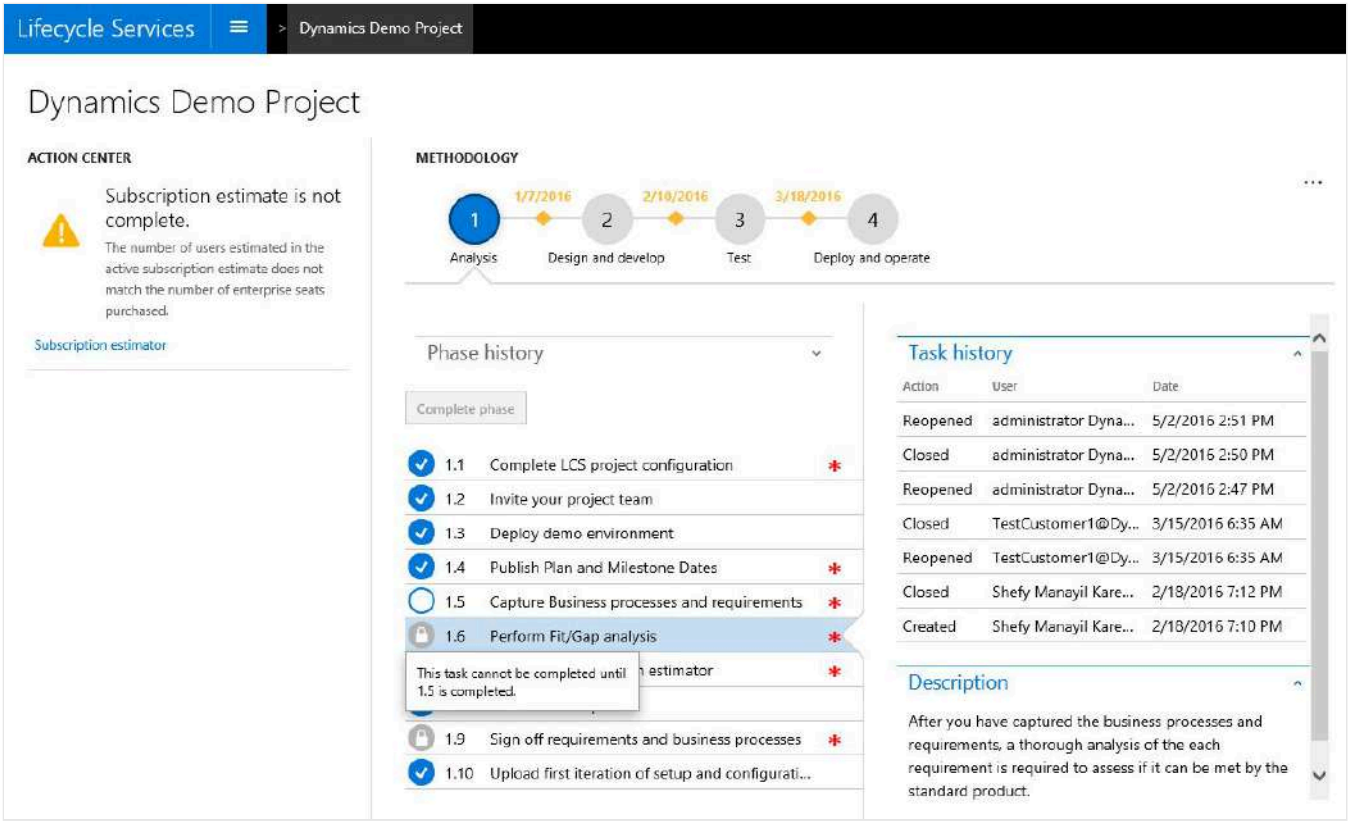
When you sign up for the current versions of finance and operations apps, your subscription includes an Implementation project workspace. After you activate the service, the tenant administrator must sign in at the preferred Lifecycle Services endpoint by using the tenant account. The project workspace is automatically created for your organization. The workspace includes the following elements:

- Enabled features, based on the offer that you selected
- Environments that Microsoft deploys and manages
- Guidance that the Action center provides to help you complete required actions
- A new methodology experience that includes tasks that lock as you move through the implementation
- A more complete history that specifies who completed each methodology phase and task

- Milestones that you can use to track critical project dates
- Various services to help you with your implementation

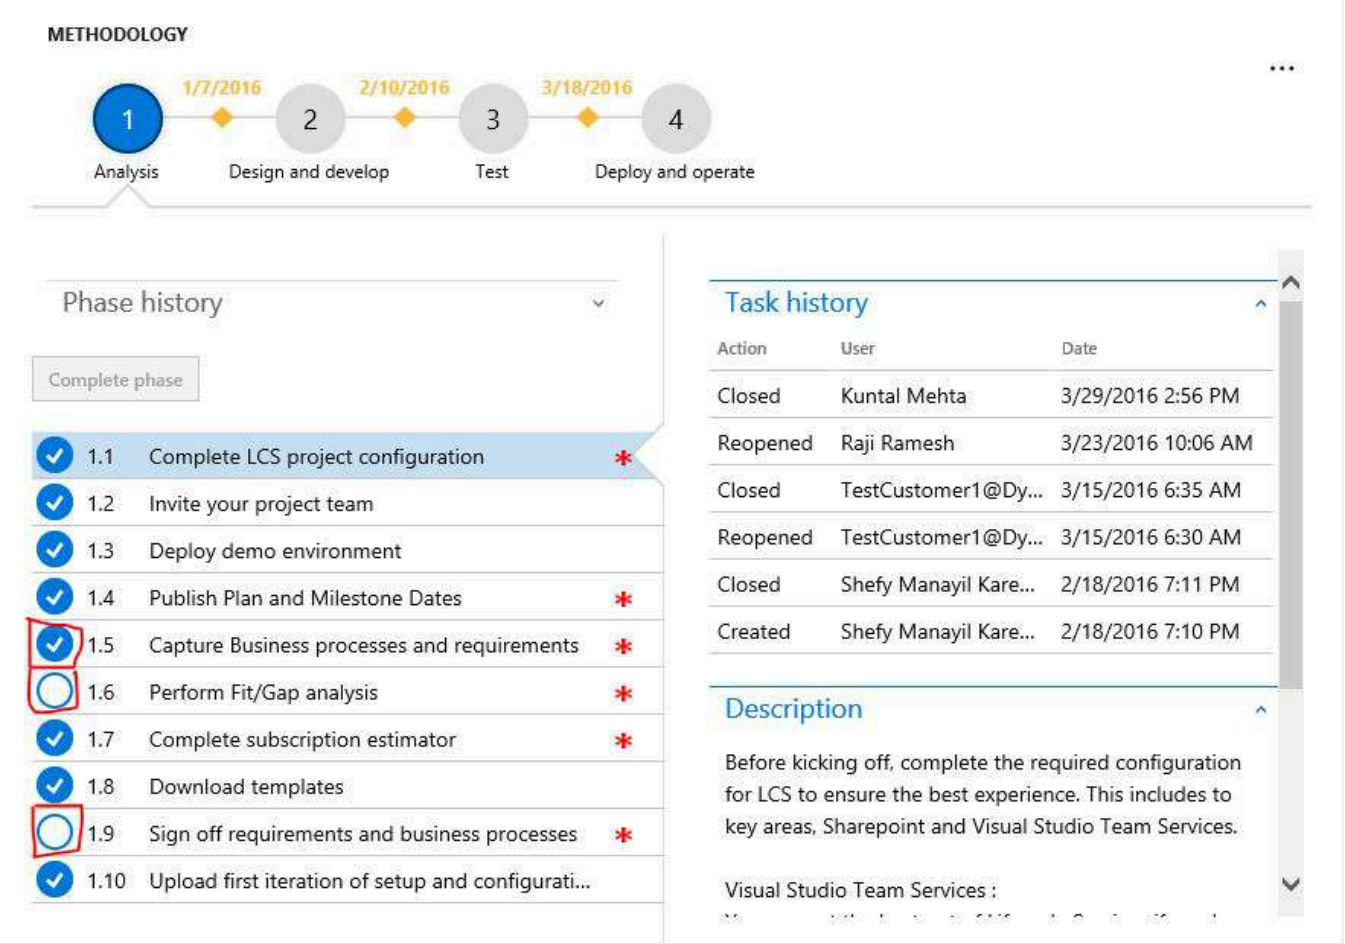
Methodologies

As a customer, you must complete the steps that the methodology outlines to gain access to the production environment. Before you can mark a phase as completed, you must complete the specified mandatory tasks. Locked tasks, such as tasks 1.6 and 1.9 in the following screenshot, unlock after you complete the required actions. To learn which actions must be completed before a specific task can be unlocked, select the lock icon for that task.



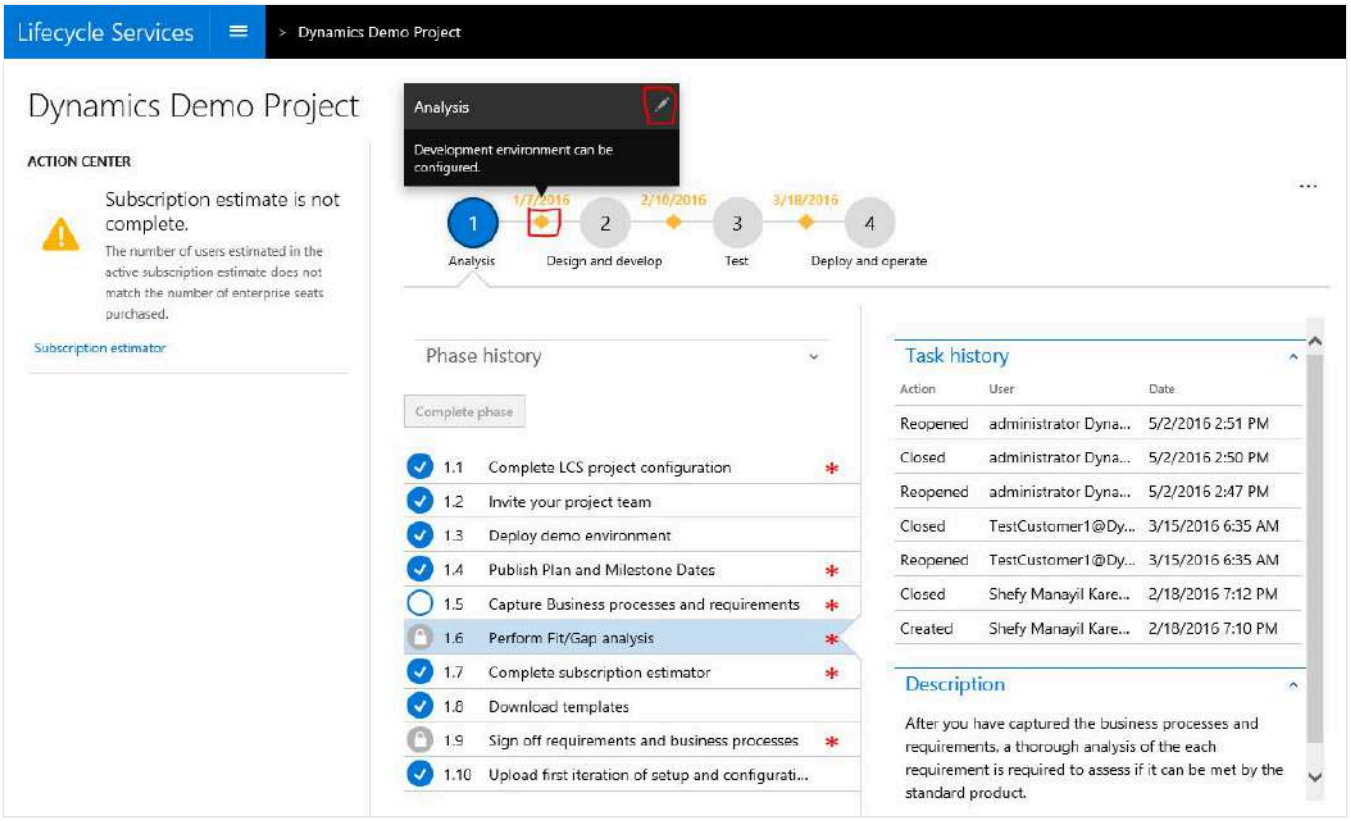
In the case of prerequisites, after you complete the required tasks, you can mark the dependent tasks as completed. For example, in the following screenshot, tasks 1.6 and 1.9 depend on task 1.5. Because task 1.5 is now completed, the two dependent tasks can be

marked as completed.

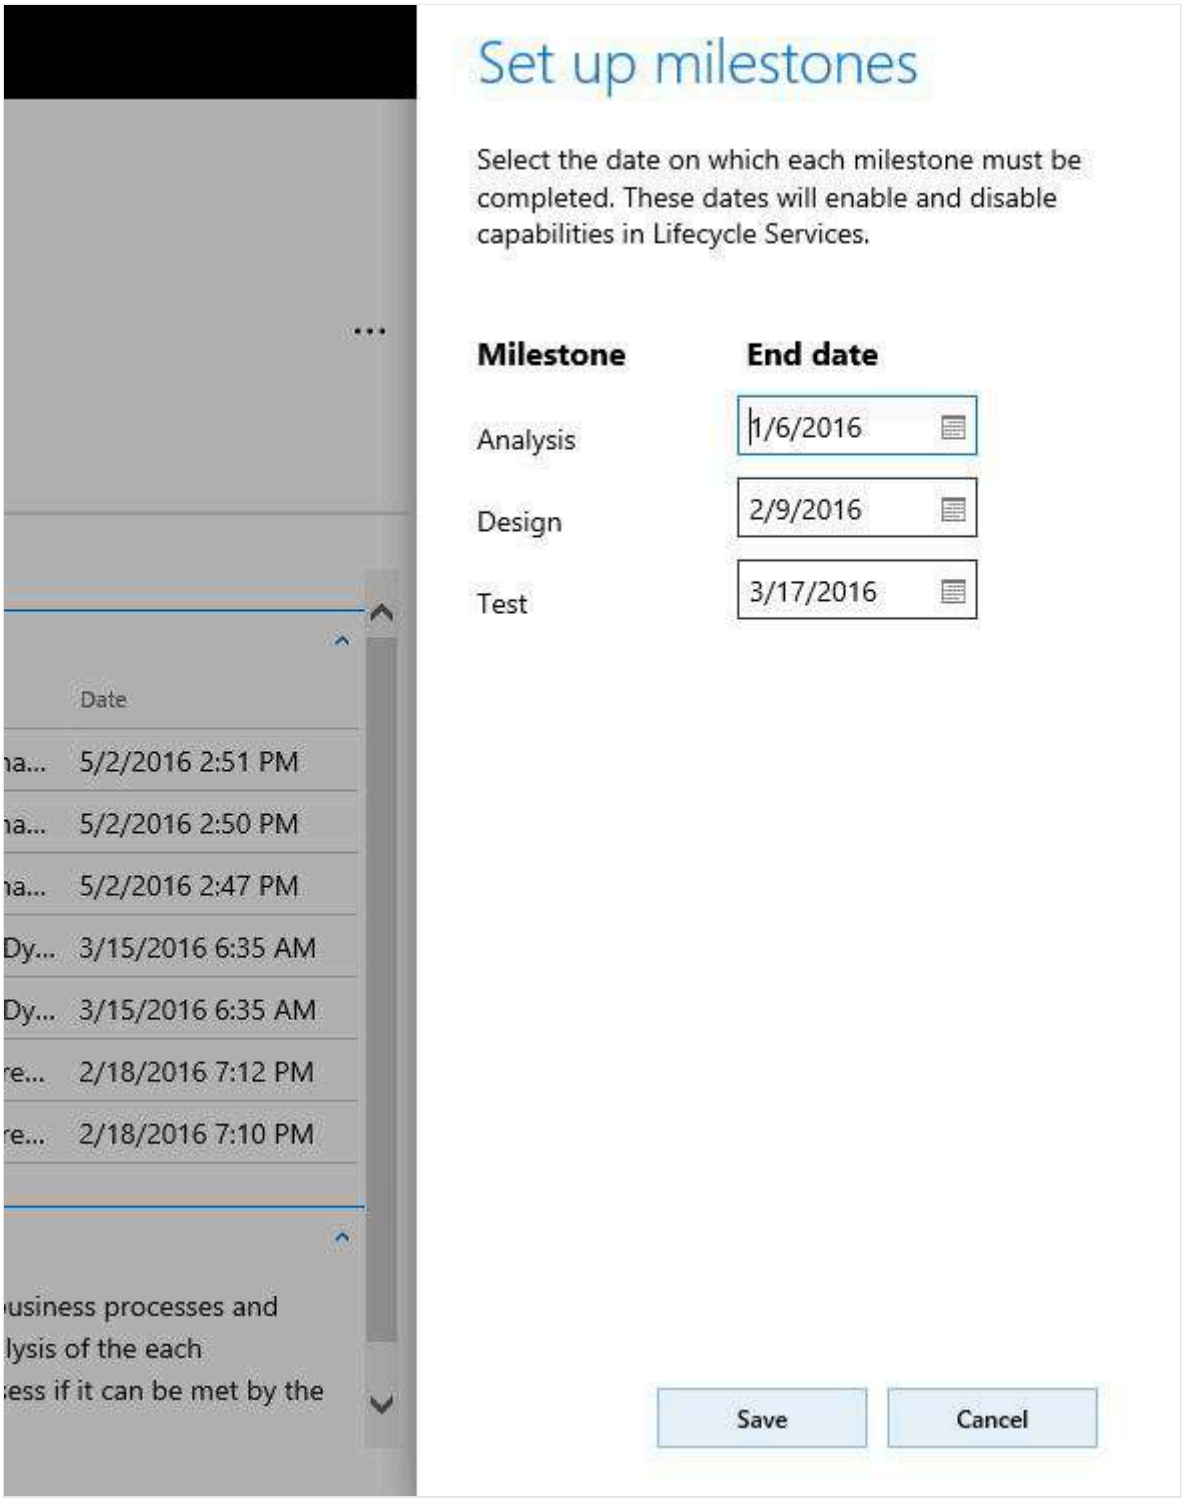


Milestones

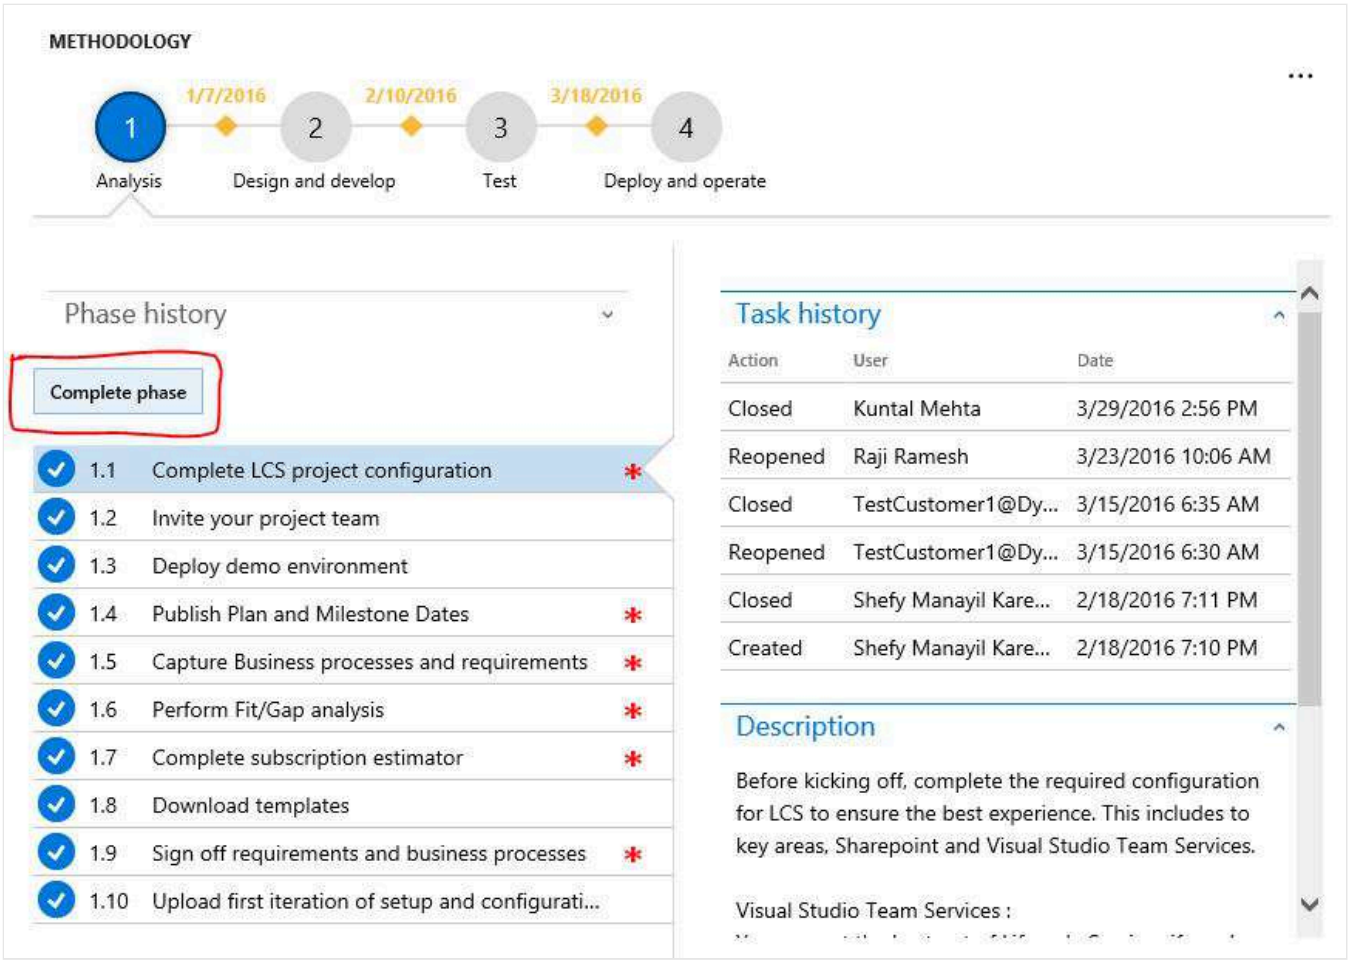
Define high-level milestones for your project. Milestones help you track the deliverables that you must complete and your progress toward the milestone goals. Color indicators help you quickly see whether you're behind schedule. For example, in the following screenshot, the milestones are yellow. To enter or update the milestone dates, select the diamond shape in the methodology, and then select the **Edit** button (pencil icon). You can change milestone dates at any time.



When you finish entering milestones, the **Publish plan and milestone** task opens, and you can mark it as completed.

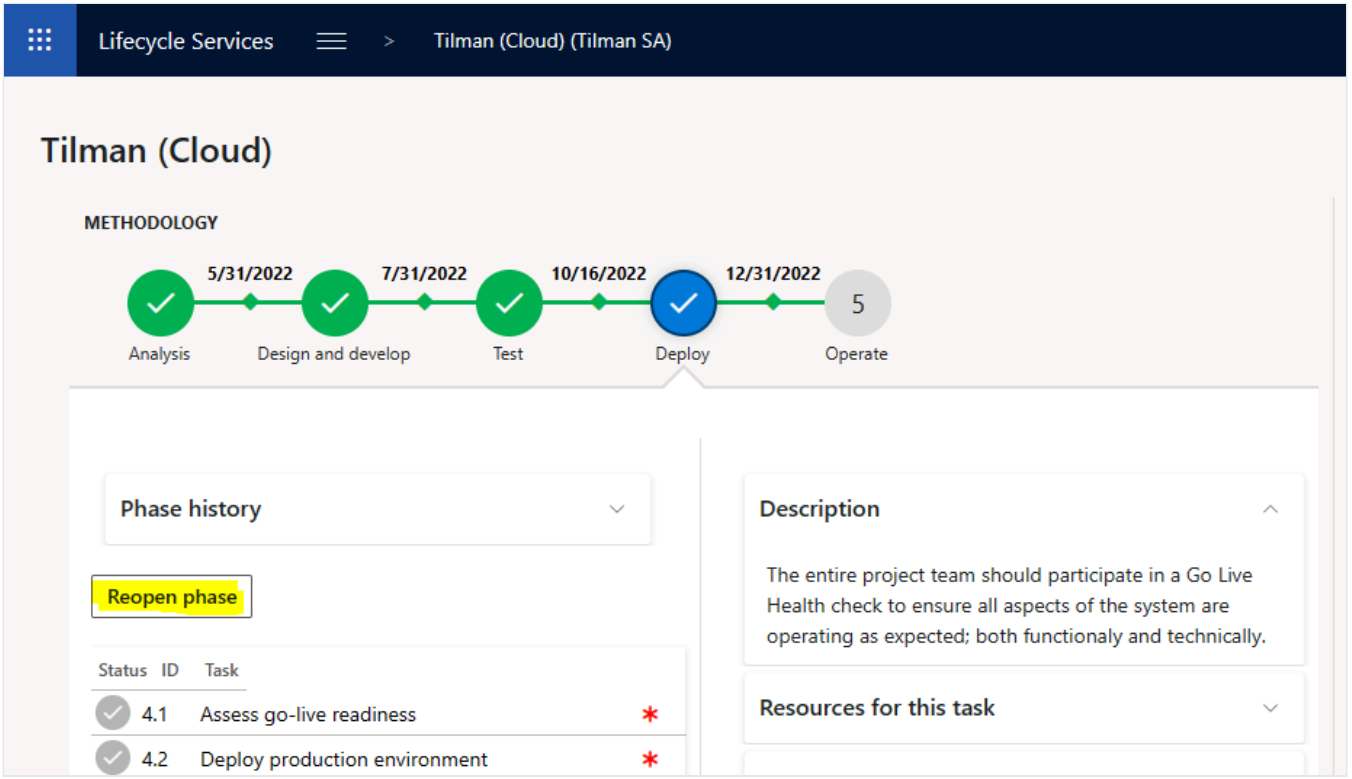


When you complete all the required tasks in a phase, select **Complete phase** to mark the phase as completed. After you mark a phase as completed, next steps become available in Lifecycle Services.



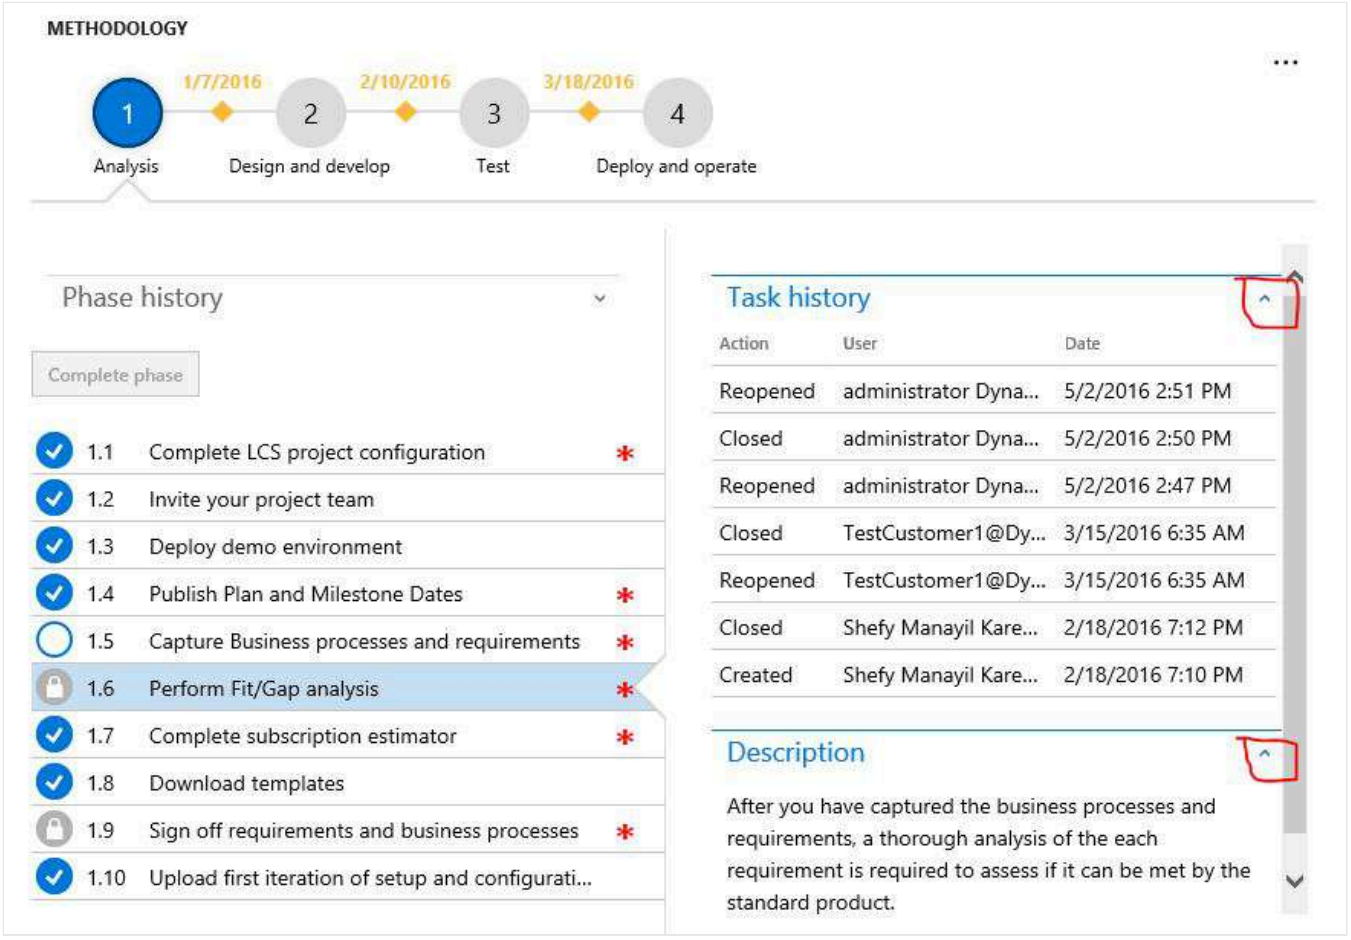
Reopen a completed milestone

If you need to make any changes to your completed milestone tasks or dates, select the **Reopen phase** button on a prior milestone. You can then make edits and complete it again.



Methodology description and history

Descriptions can help you understand what is expected of you for a specific methodology task or phase. You can expand the methodology description to learn more about each task, and then collapse the description when you've finished. The task and phase history can tell you when a task or phase was completed or reopened. If you're a project manager, this information can help you stay on top of the high-level tasks that are required for your implementations.



Subscription estimator

Use the Subscription estimator tool to evaluate your subscription requirements for the current versions of the finance and operations apps. To use Subscription estimator, download the usage profile, which is a Microsoft Excel workbook. Then, in the workbook, complete the following worksheets:

- Deployment details
- Instance Characteristics
- Retail & Commerce

After you complete the worksheets, enter the data from the summary sheet into Subscription estimator by selecting + **New estimate**. You must make one estimate the active estimate. Make sure that the estimate that you mark as active is the same as the offer that you bought through the VL or CSP channel.

New deployment experience

To provision your environment, you must complete a configuration checklist. As you make progress through the methodology, environments become available to you. Select **Configure** to add deployment information.

Because the information that you enter determines your experience, carefully review your input. After you enter all the required information, sign out is required for the deployment request. The user who completes the sign out becomes the system administrator on the instance. Verify that the correct user completes the sign out for the deployment. After the sign out is completed, the Microsoft site reliability engagement team reviews the request. After the team reviews the information that you entered, it initiates the provisioning. If the information isn't correct, the team contacts you. After the provisioning is completed, the status is updated to indicate that the environment is deployed, as shown in the following screenshot. If the provisioning takes longer than expected, the Microsoft site reliability engagement team reviews the status and takes appropriate actions. These actions might include contacting you. After the environment is provisioned, select **Full details** to open the **Detailed environment** page, where you can sign in to the system, view the monitoring status, or view relevant updates.

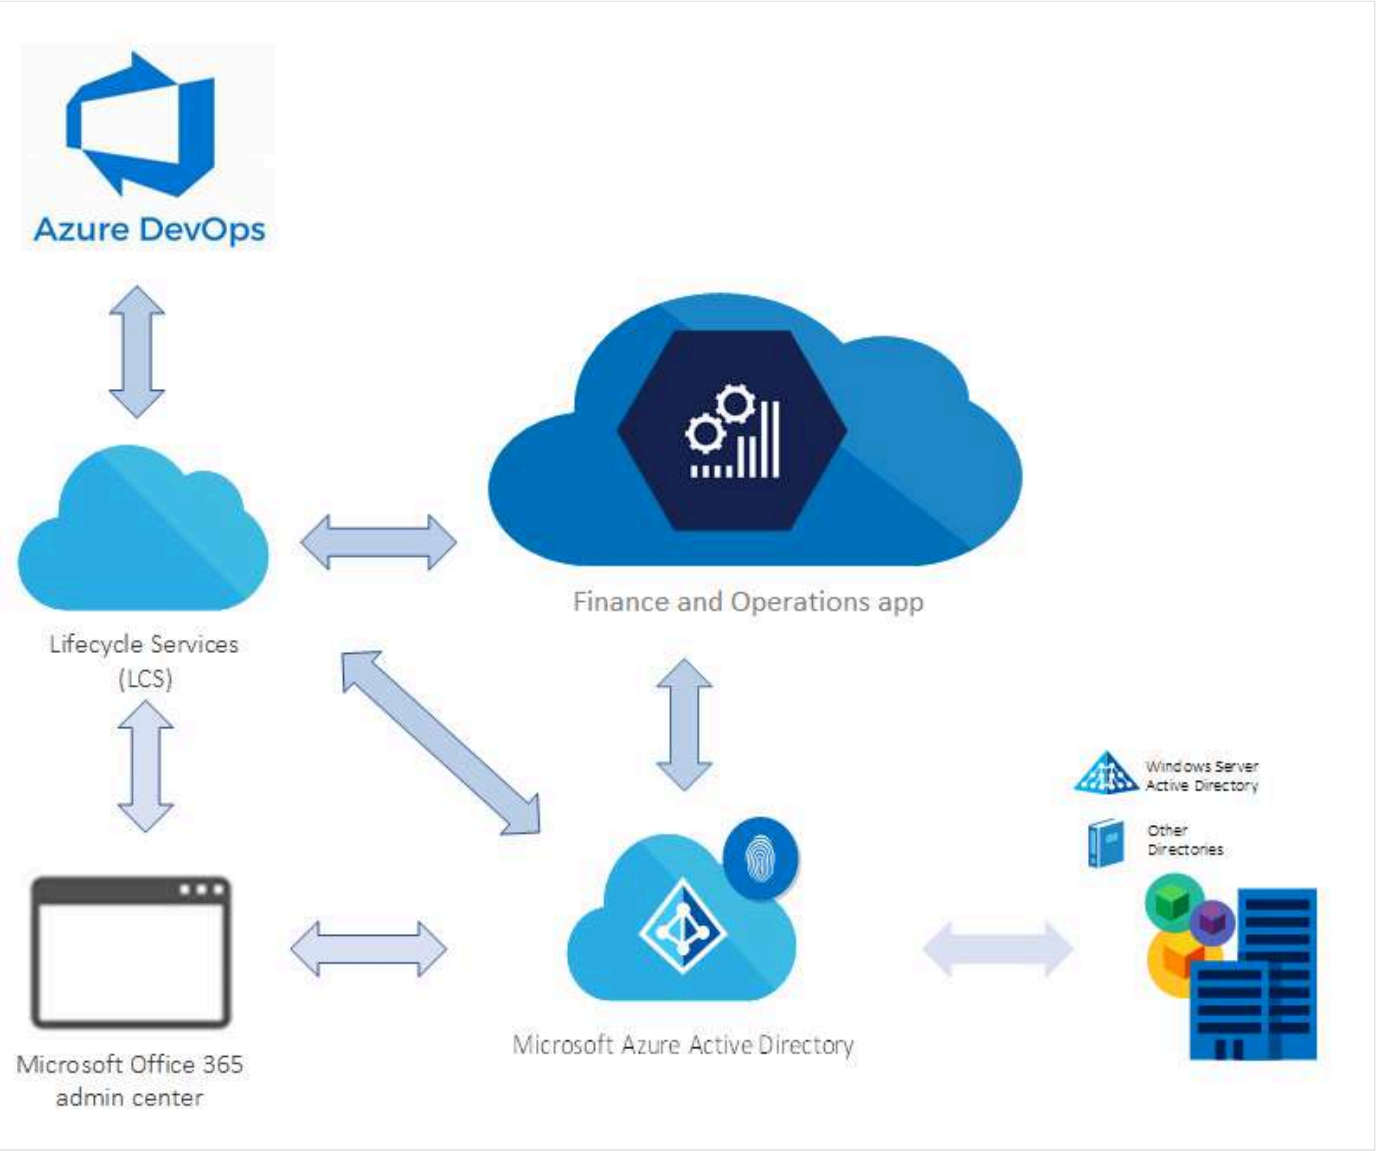
Finance and operations application architecture

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

The finance and operations application cloud architecture contains all the elements that are common to all Microsoft cloud offerings, as described in Subscriptions, licenses, accounts, and tenants for Microsoft's cloud offerings. Beyond this architecture, it also includes services that automate software deployment and provisioning, operational monitoring and reporting, and seamless application lifecycle management.



The cloud architecture consists of these conceptual areas:

- **Subscription** – A subscription to finance and operations apps gives you an online cloud environment (or multiple environments) and experience.
- **Licenses** – Customers must purchase subscription licenses (SLs) for their organization, or for their affiliates' employees and on-site agents, vendors, or contractors who directly or indirectly access finance and operations apps. These apps are licensed through Microsoft Volume Licensing and the Microsoft Cloud Solution Provider (CSP) program. For more information, download the latest Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing.
- **Tenant** – In Microsoft Entra ID (Microsoft Entra ID), a tenant represents an organization. It's a dedicated instance of the Microsoft Entra service that an organization receives and owns when it creates a relationship with Microsoft (for example, by signing up for a Microsoft cloud service, such as Azure, Microsoft Intune, or Microsoft 365). Every Microsoft Entra

tenant is distinct and separate from other Microsoft Entra tenants. For more information about Microsoft Entra tenants, see How to get a Microsoft Entra Tenant.

A tenant houses the company's user information. This information includes passwords, user profile data, permissions, and related information. The tenant also contains groups, applications, and other information that pertains to an organization and its security.

The tenant is created when customers sign up for their first subscription to any Microsoft online service, such as Microsoft 365, Microsoft Dynamics 365, or Azure. Any later subscriptions to the same online services or other online services can be grouped within the same tenant.

An organization can have multiple Microsoft Entra tenants. If there are multiple tenants, make sure that any subscriptions for finance and operations apps are associated with the correct tenant.

- **Microsoft Entra ID (Microsoft Entra ID)** – Microsoft Entra ID is the multitenant, cloud-based directory, and identity management service from Microsoft that combines core directory services, application access management, and identity protection in a single solution. For more information, see Microsoft Entra ID. Finance and operations apps use Microsoft Entra ID as the store for identity. Access to Microsoft Entra ID is provided as part of a subscription to finance and operations apps.

- **Microsoft 365 admin center** – Microsoft 365 admin center is the subscription management portal that Microsoft 365 provides for administrators. Use it to provide management functions for users (Microsoft Entra ID) and subscriptions. As part of these management functions, it provides information about service health. For more information, see About the Microsoft 365 admin center.

  > **Note**
  >
  > You don't need a Microsoft 365 license to deploy finance and operations apps. However, you might require a license for specific Office integration scenarios. For more information, see Office integration overview.

- **Microsoft Dynamics Lifecycle Services (LCS)** – LCS is a collaboration portal that provides an environment and a set of regularly updated services that can help you manage the application lifecycle of your implementations. For more information, see Lifecycle Services resources. After you purchase and activate a subscription for a finance and operations app,

an **Implementation project** workspace is provisioned in LCS when the tenant administrator signs in for the first time.

> **Note**
>
> An implementation project is an LCS project for the cloud service. As a Microsoft partner, you can also provision nonimplementation LCS projects for your own purposes. For more information, see **Lifecycle Services (LCS) for finance and operations apps partners**.

- **Finance and operations apps** – Deploy finance and operations apps through LCS. Various topologies are available: development/test/build, acceptance test, performance test, and high-availability production. For more information about the various topologies, download the latest Microsoft Dynamics 365 Licensing Guide from Dynamics 365 pricing.

- **Microsoft Azure DevOps** – Use Azure DevOps primarily for code version control, development, and to deploy a build environment. Use Azure DevOps to track support incidents, such as work items in Azure DevOps that are submitted to Microsoft through Cloud-powered support, and to integrate the Business process modeler (BPM) library hierarchy into your Azure DevOps project as a hierarchy of work items. Use Azure DevOps during code upgrade.

"Under the hood," finance and operations apps use many features of the Azure platform, such as Azure Storage, networking, monitoring, and Azure SQL Database, to name just a few. Shared services put into operation and orchestrate the application lifecycle of the environments for participants. Together, Azure functionality and LCS offer a robust cloud service.

> **Note**
>
> Although many features of the Azure platform are used, you don't need an Azure subscription to deploy finance and operations apps in the Microsoft-managed cloud. You must have an Azure subscription only if you want to deploy finance and operations apps cloud-hosted environments in your own Azure subscription.

What is FastTrack for Dynamics 365?

Welcome to Microsoft FastTrack for Dynamics 365, our customer success service designed to help your customers implement and go live so they can realize business value faster. It's an onboarding program run by the product engineering team that offers best practices, tools, resources, and expert advice. Your customer gains valuable insights with solution implementation, onboarding, and continued education.

FastTrack for Dynamics 365 represents our strong commitment to fostering the business success of our customers. When an organization participates in the FastTrack program, they receive ongoing guidance on best practices and how to plan for successful rollouts. FastTrack program participants receive emails with implementation guidance and communications about their active FastTrack engagement. In addition to proactive guidance and ongoing workshops, FastTrack customers also learn ways to enable new users and expand capabilities—all at their own pace.

What to expect when working with FastTrack

The FastTrack solution architects have a unique role in a customer implementation. Even though we have no formal role on the project and we don't design or develop a solution for the customer, we're committed to the success of the program and the timely onboarding of users. Success by Design is our delivery framework for FastTrack customers. It provides a structure for the FastTrack solution architects to effectively engage with customers and partners in a timely and consistent manner to help them successfully onboard onto our Dynamics 365 platform.

Timely engagement

With the Success by Design framework, the FastTrack solution architects engage with project teams through a set of strategic workshops that align to key project stages with clear goals, actions, and deliverables. During the workshops, the solution architects assess if the project follows best practices, and they identify and highlight issues or potential risks that could derail the program. Timely engagement with the solution architects through workshops ensures that Microsoft experts have an opportunity to provide input into your architectural design decisions, helping you align with product direction and best practices for performance and scalability.

Information sharing

The project team, including the customer and partners, should provide the information needed to run the workshops and keep us updated on any design changes that the FastTrack solution architect needs to review. The quality and depth of the information directly impacts the recommendations from the FastTrack solution architect. The more engaged and open the team is to sharing information with the FastTrack solution architect, the more value we deliver in return.

Time investment

Running the workshops with the FastTrack solution architect requires a time investment from the project team, based on the complexity and number of apps being deployed. This can vary from project to project. Fundamentally, don't consider time spent with FastTrack on workshops as overhead. It's an opportunity to revisit your decisions with a stakeholder from the product team who can help identify potential risks and issues. FastTrack engagements help save time and effort in the long term and greatly improve your chances of success and adoption.

Communication, feedback, and survey

When working with FastTrack, you can expect:

- Email communications, conference calls, and in-person sessions with the product group.
- Feedback surveys on the product, and your experiences and interest in new capabilities.
- Invitations to exclusive product group events, advisory boards, and table talks with product managers.
- Executive engagement opportunities with senior product and engineering leaders at Microsoft.
- Requests for joining our reference program to share your success story and experiences with other customers and analysts.

For questions regarding FastTrack, reach out to your partner or Microsoft account team.

Implementation portal

Dynamics 365 Implementation Portal helps you manage implementation projects. Learn more at Dynamics 365 Implementation Portal.

Onboard an implementation project

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article describes how to onboard a finance and operations project by using Microsoft Dynamics Lifecycle Services (LCS).

Microsoft 365 Admin Center

After your organization purchases a subscription to a finance and operations app, a tenant administrator must activate the service on your organization's Microsoft Entra tenant. For more information about Microsoft Entra roles, see Understand roles in Microsoft Entra ID.

The tenant administrator must complete the following steps:

1. Open an InPrivate or Incognito browser session and go to the Microsoft 365 Admin Center.

2. Sign in by using your tenant administrator credentials.

3. Go to **Billing** > **Products & services** and confirm that there's an active subscription for the application that you want to deploy.

   > ⓘ **Note**
   >
   > If you don't see an active subscription, consult with your licensing partner to confirm the status of the subscription transaction. It's important to confirm that you purchased the subscriptions for the correct Microsoft Entra tenant. By default, all Microsoft online services run on the same Microsoft Entra tenant. The most frequent cause for onboarding delays is that subscriptions are inadvertently placed on an incorrect Microsoft Entra tenant.

4. If the subscription is active, proceed to the next step by signing in to LCS to trigger the implementation project creation flow.

5. Open another private browser tab and go to Lifecycle Services. Select **Login** to access LCS by using your current tenant administrator credentials.

   > ⓘ **Note**
   >
   > Connection endpoints might be different for Government Community Cloud (GCC) and other local cloud deployment options. For more information, see Sovereign and local cloud deployment options for Dynamics 365 Finance and Dynamics 365 Supply Chain Management.

6. Accept and confirm any other prompts displayed to complete the implementation project provisioning.

7. The tenant administrator is assigned the Project Owner security role in the provisioned implementation project.

   > ⓘ **Note**
   >
   > If the tenant administrator won't be a participant in the implementation, assign at least one additional Project Owner to the implementation project.

For an overview of LCS user management, including the security roles that you can assign to users, see Configure Lifecycle Services (LCS) security.

LCS implementation project workspace

After the tenant administrator finishes the finance and operations subscription activation and adds extra project users as needed, those team members can access the **Implementation project** workspace.

The first step to complete in LCS is **Project onboarding**. This step is required for all LCS implementation projects that are created **on or after August 22, 2019, PST**, before deploying any of the Microsoft-managed environments. You can access the **Project onboarding** feature by using the action center notification or the LCS Implementation project menu. You must be assigned to the Project owner security role to access **Project onboarding** in LCS.

To get started with LCS, see Lifecycle Services (LCS) for finance and operations apps customers.

FastTrack onboarding services

After the LCS **Implementation project** workspace is provisioned, the Microsoft FastTrack team monitors your onboarding progress. If you don't complete project onboarding within a few weeks after creating an LCS **Implementation project**, the FastTrack team sends a reminder to the project team.

For more information about the FastTrack program and the services it provides, see Microsoft FastTrack.

For more information about LCS project onboarding, see LCS project onboarding.

> **Note**
>
> All onboarding-related emails from the FastTrack team come from Dynamics 365 Onboarding (ond365@microsoft.com). Make sure your spam blocker or filter allows email from this address.

Key data to keep current in LCS

Add key project members, such as project managers, from the customer and partner teams to the LCS implementation project. Include each person's work email address. By keeping this

information current, you help us work best with you and help ensure that project members don't miss important communication from us.

Keep the milestone dates in your LCS project current. By keeping these dates up to date, you help us connect with you at different project stages. When you're closer to your go-live date, we contact you for a project Go-live assessment before we deploy your production environment.

LCS stores milestone dates in the implementation methodology. For more information, see the Methodologies section of the *LCS for Customers* article.

Environment planning

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article provides an overview of various aspects that you must consider while you plan for your project's environment. To help guarantee a successful cloud implementation, discuss and plan your environment early in the project.

Environment planning overview

To begin, consider these important concepts:

- **Environment purpose** – The reasons why the environment exists. Examples include development, system testing, user acceptance testing (UAT), and operations.
- **Environment topology** – The composition of the environment and the purpose. Examples include **Develop** and **Build and Test** for Tier-1 environments.

- **Environment tier** – The type or category of the environment. Examples include Tier-1 environments and Tier-2 environments.

For more information about the various environments and tiers, see Cloud deployment overview and download the latest *Microsoft Dynamics 365 Licensing Guide* from Dynamics 365 pricing.

Environment types

You can use the following environment types for your project:

- **Standard** – This environment is included in the standard offer and Microsoft manages it in a Microsoft subscription. Standard environments include the production environment and a Tier-2 Standard Acceptance Test environment.
- **Add-on** – The add-on environments are in a Microsoft-managed subscription that you purchase in addition to the standard offer. For example, an add-on environment might be an additional Tier-4 environment for performance testing.
- **Cloud-hosted** – You can add cloud-hosted environments that you manage in a customer or partner Microsoft Azure subscription. A cloud-hosted environment can include a Tier-1 demo environment, or it can be used for Development and Build. See Deploy and use a continuous build and test automation environment.
- **Environment image (VHD)** – These additional Tier-1 environments are hosted on-premises by using a virtual hard disk (VHD) that you can download from Microsoft Dynamics Lifecycle Services (LCS).

> **Important**
>
> In a *customer or partner Azure subscription*, the customer or partner brings its own Azure subscription, and deploys environments to that subscription for evaluation and development purposes only. The customer or partner pays for the resources that are deployed to its Azure subscription. The amount that the customer or partner pays is based on the Azure price list. By contrast, in a *Microsoft subscription*, the customer purchases licenses that allow the customer to deploy environments to an Azure subscription that Microsoft manages. Therefore, the customer has no separate Azure billing.

Tier 1 vs. Tier 2 and higher

Expand table

Tier 1	Tier 2 and higher
Single-box environment	Multi-box environment
All components are installed on the same server. These components include Application Object Server (AOS), the database, Dynamics 365 Commerce, and Management Reporter.	Components are installed on multiple servers.
Microsoft SQL Server is used.	Azure SQL Database is used.
The architecture differs from the architecture of the production environment to maximize efficiency and cost of the development team.	The architecture is the same as the architecture of the production environment, even though this type of environment has a different sizing and isn't enabled for disaster recovery.
The environment can be cloud-hosted, or it can be deployed as an environment image (VHD).	The environment can be deployed only as a standard environment or an add-on environment. It can't be cloud-hosted.
The environment isn't suitable for UAT or performance testing.	The environment is suitable for UAT and performance testing.

Standard cloud offer

The standard cloud offer includes two environments:

- **Tier 2 environment: Standard Acceptance Testing** – One Standard Acceptance Testing (UAT) instance is provided for the duration of the subscription. This instance is a non-production multiserver instance that customers can use for UAT, integration testing, and training. You can purchase additional sandbox or staging instances separately as an optional add-on.

- **Production environment** – One production instance is provided per tenant. The production multiserver instance includes disaster recovery and high availability. It provisions when the implementation approaches the Operate phase, after the required activities in the Microsoft Dynamics Lifecycle Services (LCS) methodology and a successful go-live assessment are completed. Additionally, the offer includes some file storage and database storage:
  - **File storage:** Every customer receives a certain amount of file/Azure blob cloud storage for files and binary data. You can purchase additional file/blob storage.
  - **Database storage:** Every subscription includes a certain amount of Azure SQL Database storage per customer at no extra charge. Additional storage capacity is provided at no charge as an organization increases the number of user and device service licenses. For more information about the various environments and the various types of storage, as

well as the currently included free file and storage capacity, download the latest *Microsoft Dynamics 365 Licensing Guide* from Dynamics 365 pricing.

> **Important**
>
> Microsoft promises service and data high availability as well as minimal servicing downtime guarantees as part of the Dynamics 365 software license agreement (SLA) for production environments. The SLA goals don't apply to non-production environments.

Provisioning of standard environments

You provision the standard environments at different times. The following table shows the suggested timing for the environments in the standard cloud offer.

Expand table

Environment	When does provisioning occur?	Is it self-service?
Tier-2 Standard Acceptance Test	Immediately after project onboarding is complete in LCS	Yes
Production	At production system readiness	Complete a Go-live assessment before you configure the production deployment request in LCS.

> **Important**
>
> Always deploy environments by using an **unnamed** account. This account must be from the customer domain, such as `dynadmin@customer.com` or `dynadmin@customer.onmicrosoft.com`. Use the same dedicated environment admin account on all environments. You must issue ISV licenses to the domain of the account you use for environment deployment. If you use both `dynadmin@customer.com` and `dynadmin@customer.onmicrosoft.com` on different environments, you can encounter problems with ISV licenses.

Production system readiness

You can deploy the production environment when the project is ready for the initial go-live. For more information, see Prepare for go-live.

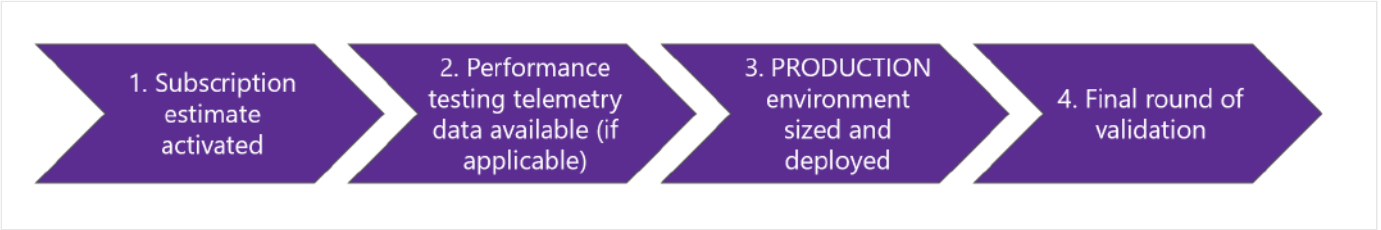
Production system readiness includes, but isn't limited to, the following conditions:

- An up-to-date subscription estimate is activated, as described in Subscription estimator in Lifecycle Services (LCS).
- Code, configuration, and data are ready for cutover.
- An engineering process is in place to manage critical fixes.
- The customer signs off on the solution and UAT.
- A cutover plan is in place.

Use the production environment to **operate** the solution, not build it. The production environment is sized to run your business. The sizing is based on the subscription estimate and diagnostic data from performance testing. After deployment, you can and should do a mock cutover and a final round of validation on the production environment. Before the final cutover, you can request a point-in-time restore to restore the production environment to a clean snapshot (maximum 28 days in the past).

To select the appropriate data center for the production environment, consider the latency from the geographic locations where the business operates. Use tools such as PsPing to test latency to Azure data centers.

The following illustration shows the environment planning process.



Additional environments

You can purchase additional environments as add-ons or deploy them as cloud-hosted environments. The following illustration shows a *sample* overview of standard and additional environments, based on the complexity of the implementation.

Environment purpose	Tier	Standard project	Medium complexity project	Complex project
Build	1	X	X	X
Test (e.g. system integration testing or UAT)	2	X	X	X
Production	Based on the **sizing**	X	X	X
Development	1	X	X	X
Golden configuration	1 or 2		X	X
Pre-production / data migration	2		X	X
Performance testing	4 or 5			X
Training	2 or 3			X
System integration testing	2 or 3			X
Other / ad-hoc	...			X

> **Important**
>
> Always deploy environments by using an **unnamed** account, such as `dynadmin@customer.com`. Assign the environments an owner who is responsible for their status and maintenance. Use the same dedicated environment admin account on all environments. After go-live, if you plan to work on new releases, get an additional Tier-2 or higher environment to support production.

Deployment considerations for development environments

For development environments, use one of the following deployment options:

- **Cloud-hosted** – You manage the environments in your Azure subscription.
- **Environment image (downloadable VHD)** – You host the environments on-premises.

> **Note**
>
> You must allocate one development environment per developer.

The following table compares the deployment options.

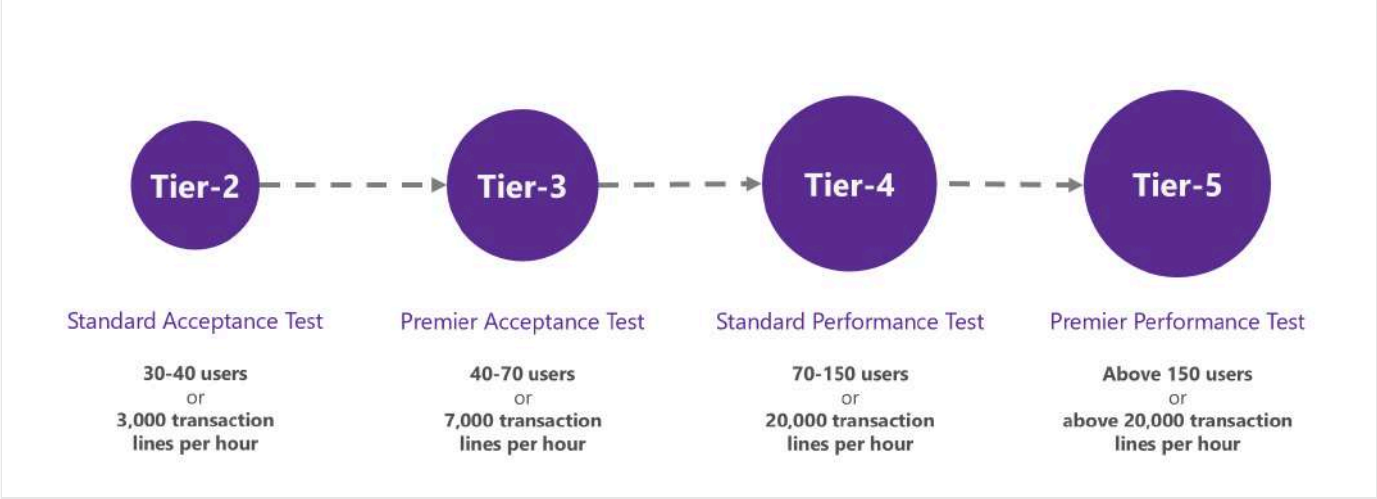
Expand table

Capability	Cloud-hosted	Environment image
Public URL	✓	Not supported

Capability	Cloud-hosted	Environment image
Integration development	✓	Extra setup is required. (For example, run the admin user provisioning tool.)
Azure DevOps	✓	Extra setup is required. (For example, rename the computer.)
Applying deployable packages from LCS	Automated	Command line runbooks (AxUpdateInstaller.exe tool)
Deploying data packages from LCS	✓	Not supported
Maintenance	Managed by you	Managed by you
Cost model	Pay as you go (If the environment is on for eight hours, you pay for eight hours.). Cost is based on selected Virtual Machine size, disk size and settings, and premium storage settings	Hardware-related
Limitations	None. You have full control over VM specs, disk size and storage settings. You have administrator access to the VM.	None

Selecting the correct Tier 2 or higher environment

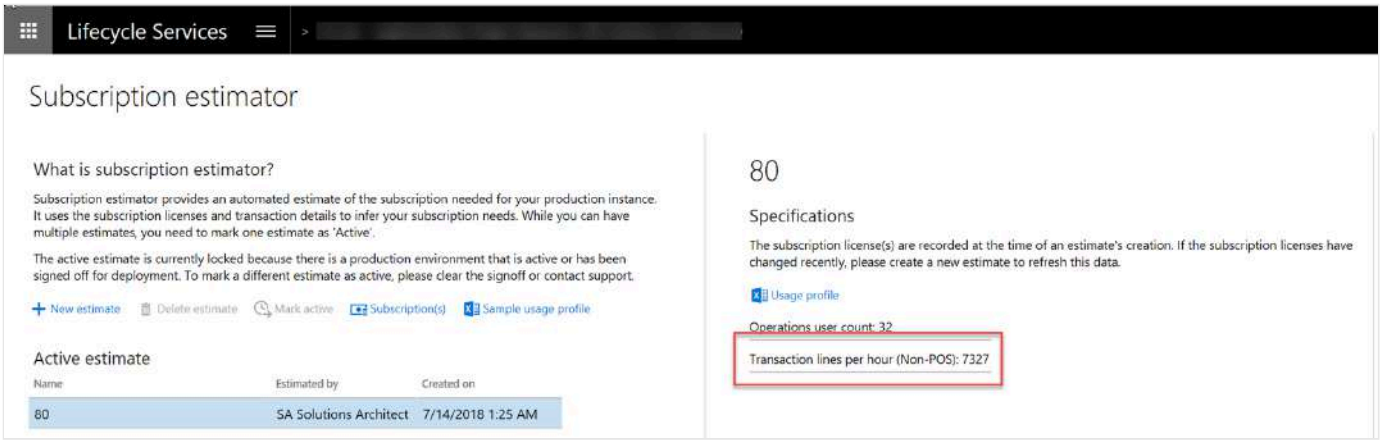
Select the correct Tier 2 or higher environment based on the purpose of the environment.



> **Important**
>
> The provided values are for reference only. Work with your implementation partner to adjust this guidance based on your specific business scenarios and factors such as type of users,

complexity, and volumes.

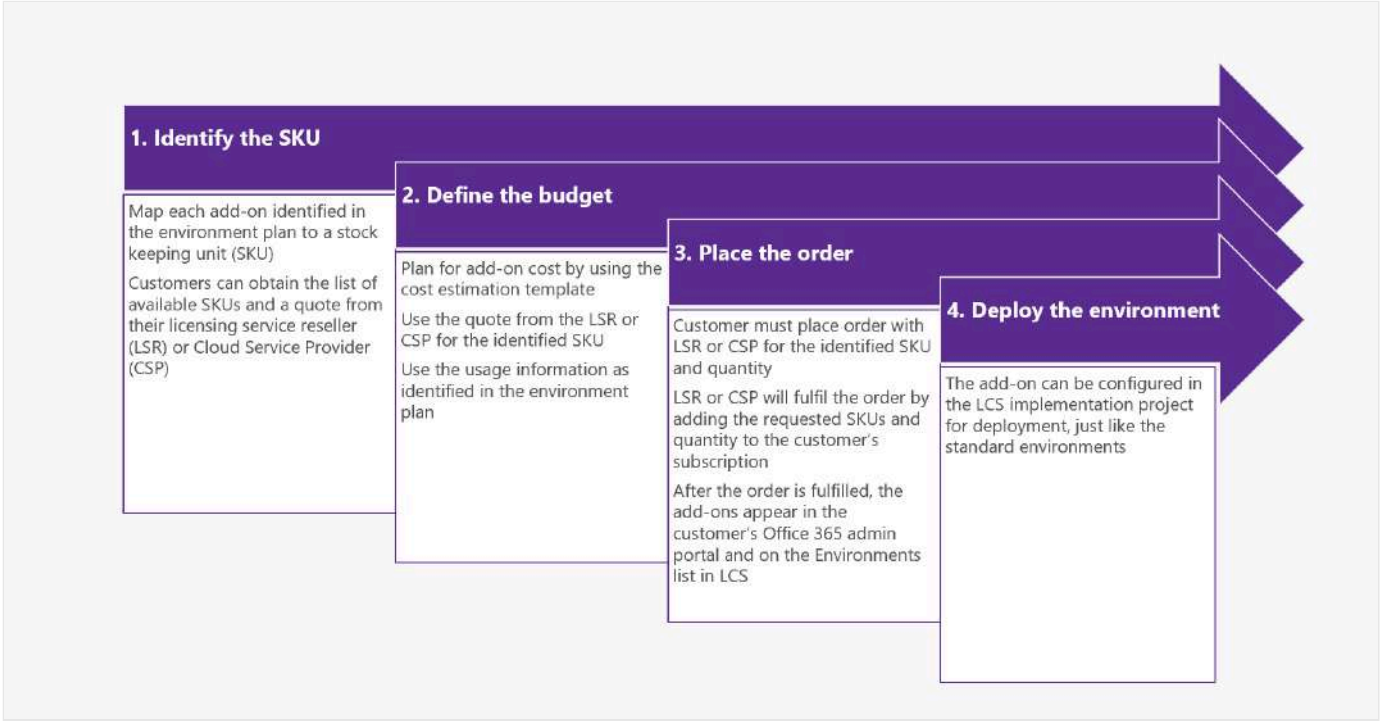
Use the LCS Subscription estimator to get an indication of the transaction lines per hour in LCS for a volume check, as shown in the following illustration.



Purchasing add-on environments

If you want to purchase add-on environments, work closely with your Cloud Solution Provider or License Service Reseller. Consider the potential lead time that occurs between the time when you place the order and the time when the environment is deployed.

The following illustration shows the process for purchasing add-on environments.



ⓘ Important

If you have a Microsoft Volume Licensing agreement, you can subscribe to add-on environments on a monthly basis through the Microsoft Products and Services Agreement (MPSA) licensing program. Alternatively, you can subscribe to them through the Microsoft Cloud Solution Provider (CSP) program. For more information about the various environments and tiers, download the latest *Microsoft Dynamics 365 Licensing Guide* from Dynamics 365 pricing.

Environments plan

Create the environments plan early in your implementation.

1. Identify the project activities that require an environment. These activities include, but aren't limited to, development of customizations and maintenance of golden configuration data.
2. Determine the *activities lifecycle* to determine the *environments lifecycle*. Here are some examples of the questions that you should ask during this step:
    - When and for how long do you require the environment?
    - Do you require the environment before or after go-live?
3. Determine the type and topology of the required environments.
4. Summarize the list of required environments in a matrix.

After you identify the environments, use the environments plan to structure the Application Lifecycle Management (ALM) flows. For example, after you finalize your environments plan, you can define the flows for building and moving the code and the data across environments.

Prepare for go-live

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article provides guidance about how to prepare for the go-live for finance and operations apps in Lifecycle Services if you already have a project there.

To ensure that the production environment is used for live operations, Microsoft provisions the production instance when the solution is ready and after project readiness is validated as part of the Go-live Readiness Review with Microsoft. For more information about the environments in your subscription, see the Licensing guide.

> **Note**
>
> Most projects are **required** to use the **FastTrack for Dynamics 365 implementation portal** for their Go-live Readiness Review with Microsoft. If you have a Microsoft FastTrack Solution

Architect assigned to your implementation project, reach them before creating a new project to avoid duplicate projects or reviews. The Microsoft FastTrack Solution Architect can work with you on the Go-Live review and guides you on the process to follow.

For answers to common questions about go-live, see the Go-live FAQ.

The following table lists the key steps in the go-live process.

Expand table

Step	Duration/When	Who	Notes
Validation of prerequisites	A project is close to the end of the testing phase, and you're planning the go-live review.	Customer/Partner	For more information, see the Go-live Readiness Review prerequisites section.
Go-live Readiness Review with Microsoft	No later than four weeks before the go-live	Customer/Partner submits answers to review questions in the FastTrack for Dynamics 365 implementation portal. Microsoft FastTrack provides a review report.	For more information, see the Go-live Readiness Review with Microsoft section.
Go-live review workshop with Microsoft (only for eligible projects)	The workshop is part of the Go-live Readiness Review.	Microsoft FastTrack together with the project team	This step applies only to eligible projects that have FastTrack engagement. For more information about the workshop, see Go-live Readiness workshops.
Production deployment	Production deployment can be initiated as soon as the Go-live Readiness Review is completed. After deployment is triggered, production deployment takes approximately 30 minutes.	Customer/Partner triggers the deployment in Microsoft Dynamics Lifecycle Services.	After the go-live review is successfully completed, the **Configure** button is enabled for the production environment. Selection of this button triggers the production deployment.
Deployable package installation	An average of 30 minutes	Customer/Partner	Follow the instructions in Promote an update to production environments. The packages must contain all the models and binaries consolidated into

Step	Duration/When	Who	Notes
			all-in-one deployable packages.
Data migration to production	The duration/time depends on the method that is used.	Customer/Partner	
Cutover activities	The duration/time depends on the project.	Customer/Partner	
Go-live		Customer/Partner	

Go-live Readiness Review prerequisites

The project team should validate solution readiness. Before you initiate the Go-live Readiness Review with Microsoft, ensure that the following prerequisites are met. You can deploy the production environment after you successfully complete the Go-live Readiness Review with Microsoft.

- User acceptance testing (UAT) and performance testing are complete or almost complete in a Tier-2 (or higher) environment. Don't use Tier-1 environments for UAT or performance testing. For more information, see Tier-1 vs. Tier-2 and higher. For information about how to identify the correct sandbox environment tier, based on your transaction volumes, see Selecting the correct Tier-2 or higher environment.

  During the UAT phase, test all the business processes that you implemented and any customizations that you made.

  - Test cases should cover the entire scope of requirements.
  - Use migrated data for testing. This data should include master data and opening balances, even if they aren't yet final.
  - Use the correct security roles for testing, including default roles and custom roles that you assign to users.
  - Make sure that the solution complies with any company-specific and industry-specific regulatory requirements.
  - Obtain approval from the customer.

    Performance testing is a crucial part of validating the readiness of your solution. For detailed guidance about the recommended practices, review the Performance Testing

Techtalks.

- The environment version that you plan for the go-live complies with the Software lifecycle policy. If you use Commerce Scale Units (CSU), the CSU version must be in sync with the environment version. For more information, see Component dependencies.
- Add key customer team members to the Lifecycle Services project.*
- Add a generic service account that's used to deploy the production environment to Lifecycle Services.
- Purchase all licenses that are required for go-live in the correct tenant.
- After you purchase all licenses, upload and activate the final subscription estimator in Lifecycle Services. For more information, see Subscription estimator in Lifecycle Services.*
- Run the Customization analysis report (CAR) and address critical issues. For more information, see Customization Analysis Report (CAR).
- The go-live date in Lifecycle Services correctly represents the go-live date that you're targeting. This date is the date when end users start live operations, not cutover activities.*
- Complete all relevant tasks and phases in the Lifecycle Services methodology. You can deploy production only after all phases, including the Test phase, are complete*. To complete a phase in Lifecycle Services, first complete every required step in that phase. When all the steps in a phase are complete, you can complete the whole phase. You can always reopen a phase later if you must make changes. The process of completing a step has two parts:
    - Do the actual work, such as a fit-gap analysis or UAT.
    - Mark the corresponding step in the Lifecycle Services methodology as you complete it.

      Complete the steps in the methodology as you make progress with the implementation. Don't wait until the last minute.

You must complete all steps that are marked with an asterisk (*) before you submit the project for review in the portal. The project shows as blocked for review until you mark those steps as completed. When you update a setting in Lifecycle Services, it takes about 15 minutes before the status of review readiness changes.

Go-live readiness review with Microsoft

Before you deploy production environments, the implementation project in Lifecycle Services must complete a go-live readiness review with the Microsoft FastTrack for Dynamics 365 team. The main purpose of the review is to assess project readiness and help you have a smooth and successful go-live experience. Lifecycle Services project users receive an email reminder about the go-live readiness review, based on the go-live date in Lifecycle Services. For most projects, you complete the go-live readiness review in the Dynamics 365 implementation portal. To learn more, see What is the Dynamics 365 Implementation Portal?.

If a project opts in for an AI review when you submit the request for review, the review process is autonomously managed by AI. The review process completes on the same day, and the stakeholders are notified by email. Any risks or issues are highlighted and shared in the Dynamics 365 Implementation Portal. The customer stakeholders added to the project can review the risks and mitigate them, and the production slot is automatically released in Lifecycle Services within few minutes.

For projects that opt out of the AI review, the familiar manual review process follows. The manual reviews can take up to three business days for the initial report, plus more time for any risk mitigation that is required. Determine an appropriate time to start this review, so that you can meet the go-live timeline.

> ⓘ **Note**
>
> There are **four exceptions** that don't use the FastTrack for Dynamics 365 implementation portal:
>
> 1. **GCC, GCC High, and Department of Defense projects** - Projects that are in the United States (US) Government Community Cloud (GCC) or **US Government Community Cloud High (GCC High)** or **US Department of Defense (DoD)**. - Download the Go-live checklist, fill in all necessary details, and send it via email to d365fogccglr@microsoft.com to start the Go-Live process. Always include a key stakeholder from the customer and the implementation partner on the email. Microsoft FastTrack reviews the project and follows up.
> 2. **Tenant moves** - For projects that are already live, but planning to move the live solution to a new tenant if the solution is not changing, completing a new Go-live Readiness review is not necessary. Follow the steps described in Move your production environment to the new tenant to get the production slot enabled on the new tenant.
> 3. The following steps apply to Lifecycle Services projects. These steps do no apply to implementations that you manage in the Power Platform admin center.

Initiate the go-live readiness review in the portal

> **Note**
>
> If a Microsoft FastTrack Solution Architect is assigned to your implementation project, contact them before creating a new project by using the following steps in the portal. This approach helps you avoid creating duplicate projects or reviews. The Microsoft FastTrack Solution Architect can work with you on the go-live review and guide you on the process to follow.

Self-service create or join the project

Partners and customers can submit the go-live readiness review in the Dynamics 365 Implementation portal without involving Microsoft. The Onboarding Wizard in the Implementation portal simplifies the steps to create the project, add the admin and users, and submit the go-live review for self-service.

1. Create the project in Implementation portal. For more information about creating and joining the project, see Create or join a project in the Implementation Portal.
2. Ensure that the project admin on the project is from the **customer** organization. This user from the customer organization can then add more users and serve as the key participant in the go-live readiness review. For more information about adding users, see Admin section.

Initiate the review

1. Once the project is created, the project team can create and perform the go-live readiness review in the portal by using the guidance in the Portal Help article. All users who register on portal can access this article.
2. Read the prerequisites and proceed to the next step to add the customer team members and key stakeholders to the review. The customer stakeholders must belong to the same tenant linked to the project.

> **Note**
>
> If you encounter any issue with the portal, contact the portal Support team by selecting **Contact us** in the upper-right corner of the portal or sending an email to the Support team. In the email, specify the ID of your project in Lifecycle Services, and provide details that describe the issue.

Submit the review

- The project team should answer all questions in the review. The review process in the portal supports multi-user scenarios. Multiple team members can provide details for the go-live review at the same time.
- When you answer all the questions in the Go-live Readiness Review, submit the review to Microsoft by selecting **Submit for review**.
- If you meet all the prerequisites, choose the key review participants and submit the review. The key review participant must be from the customer organization and their authentication must belong to the same tenant linked to the project.
    - In this dialog box, there's an option to opt out of the AI review. If you choose this option, a manual review process follows, and the corresponding SLA (three days) applies.
    - If you don't choose to opt out, the autonomous AI review process starts so that the review completes on the same day.

> **Note**
>
> The key review participant must belong to the same tenant linked to the project. Only then can they see the **Resolve/Mitigate all risks** button in the portal if the AI review process is opted.

After you submit the review in the portal

Manual review process (opted out of AI review)

- Microsoft FastTrack reviews the project and provides a report that describes the potential risks, best practices, and recommendations for a successful go-live of the project. **The review might take up to three business days for the initial report, plus more time for any risk mitigation that is required.**
- Users who are selected as **Review participants** in the portal receive email communication that provides updates about the review.
- When all critical risks are addressed and the review is completed, Microsoft enables the production environment slot in the Lifecycle Services project. The customer or partner can then trigger the production environment deployment.

Automated review process (not opted out of AI review)

- An AI system conducts the review. When the review completes, users who are selected as **Review participants** in the portal receive an email that provides updates about the review. The review completes within a few minutes after you submit the project for review.
- The stakeholders can use the link in the email to access the Implementation Portal where they can review any potential risks, best practices, and recommendations for a successful go-live of the project. It's highly recommended to take corrective action on all the risks and issues for a successful go-live.
- Only the people who are added to the review as key participants (belonging to the same tenant) get a button with the label **Resolve/Mitigate all risks** in the Implementation Portal. If they choose that button, they confirm the mitigation of the relevant risks.
- When all critical risks are mitigated or accepted by the stakeholder in the Implementation Portal, the review is marked as completed, and the production environment slot in the Lifecycle Services project becomes available in 15 minutes. A person from the organization or the implementation partner can then choose the **Configure** button in Lifecycle Services to configure the production environment.

Production environment deployment

> **Note**
>
> Use the production environment exclusively to run your business operations. Don't use it for testing, demo, or training purposes. You can do the cutover, and mock the cutover (if a mock cutover is planned), in production. To test the solution, use an appropriate sandbox environment that includes all the elements and services that are required for testing.

Select a service account for environment deployment. For example, select a generic user account as the admin user of the environments that you deploy. If you select a named user account, you might not be able to access an environment if that user is unavailable. Here are some examples of scenarios where the admin user must access an environment:

- **First sign-in to any environment after initial deployment** – The admin user is the only user who can access the environment.
- **First sign-in to a sandbox environment after a database refresh from the production environment** – No user accounts except the admin account can sign in.

Deploy the production environment to the same datacenter where your sandbox environments are deployed, and where UAT and performance testing were done. For information about network requirements and how to do latency testing, see Network requirements.

Production deployment takes approximately 30 minutes. When deployment is completed, an email notification is sent to the environment administrator.

The production environment is sized based on the number of licenses that are allocated to the Lifecycle Services project and the transaction volumes in the Subscription estimator.

After you deploy production, the project team can apply the deployable package by following the instructions in Promote an update to production environments and then migrate the data. For data migration, prepare and validate data in a nonproduction environment and then copy the sandbox database to production.

FAQ

Who can create the project in the portal?

The customer users or partner users (on behalf of the customer) can create the project in the portal. Ensure you give the right tenant ID to link to the project.

I'm facing issues or errors while creating the project

Send an email with the details and screenshot of the error to Support team.

Why can't I submit the review?

To submit the review, you must answer all the questions, add at least one key customer stakeholder from the same tenant linked to the project, set the Subscription estimator to **Active** in the Lifecycle Services Project, and set the Lifecycle Services Phase to **Deploy** (or ahead). If you don't meet these conditions, you can't submit the review. Update these settings in the Lifecycle Services project and retry after 15 minutes.

I'm a customer and I was added as a key stakeholder in the project review. I received the email to sign off on risks but I don't see the "Resolve/Mitigate all risks" button in the portal

The button is only visible for users who belong to the same domain as that of the tenant linked to the project. The system validates the domain name (for example, @contoso.com) and compares it with the tenant linked to the project. If they don't match, the button isn't visible. If you identify the mismatch after submission of review, please reach d365fogl@microsoft.com with the details to get it updated.

I resolved the risks but the production "Configure" button isn't enabled in Lifecycle Services

It might take about 15 minutes for the button to be enabled. If the button stays disabled even after 15 minutes, send an email to d365fogl@microsoft.com for assistance.

Go-live for implementation projects FAQ

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article lists frequently asked questions about how to go live with an implementation project.

When can I configure and request my production environment?

Typically, you deploy a production environment after all customizations are code-complete, you complete user acceptance testing (UAT), you sign off on the solution, there are no blocking issues for go-live, and you successfully complete a **Go-live Readiness Review** with Microsoft. To understand the process, see Prepare for go-live.

Use your production environment exclusively for running your business operations. Don't use it for testing or training purposes. You can perform the cutover, and if planned, you can mock the

cutover in production. To test the solution, use a sandbox environment, which is designed with the necessary elements and services for testing.

What are the prerequisites to deploy a production environment?

For a list of prerequisites, see Prepare for go-live.

What is a Go-live Readiness Review and why is it required?

The Go-live Readiness Review is aimed to assess project readiness and help you have a smooth and successful go-live. To understand the process, see Prepare for go-live.

You must complete this review for every implementation project before you can deploy a production environment.

I want to request my production environment. Who do I contact for a Go-live Readiness Review?

To understand how to initiate the Go-live Readiness Review, see the guidance in the Prepare for go-live article.

The Production button isn't available in LCS. How do I request my production environment?

The **Production** button in LCS becomes available only after you complete the **Analysis**, **Design & develop**, and **Test** phases of the LCS implementation methodology and complete a **Go-live Readiness Review** with Microsoft. For more information, see Prepare for go-live.

For more information about how to complete methodology phases in LCS, see Lifecycle Services (LCS) for finance and operations apps customers.

My sandbox environment is currently on an update that is set to expire in two months. Can I request a production environment that has the latest update?

Deploy the production environment with the same version used in the acceptance testing environment, which should be the version you plan to go live with. Don't go live on a version different from the version you tested on because it can lead to unexpected behavior and unforeseen issues that can negatively impact the go-live experience.

Go live on a version that isn't near end of service, so that you can apply quality updates for some time after the go-live, if needed. Carefully plan the version on which you're conducting the User Acceptance Test (UAT), and keep it as up-to-date as possible.

For more information, see Software lifecycle policy and cloud releases and Service update availability.

Our sandbox environments are deployed in a different datacenter from where we want our production environment to be deployed. Can I select a different datacenter for my production environment?

Deploy the production environment in the same datacenter used in the acceptance testing environment, which should be the datacenter you plan to go live with. By using the same datacenter, you help ensure that you're validating latency as well as support for all services under production-like conditions. Don't go live on a datacenter different from the one you tested on because it can lead to unexpected performance issues and unforeseen functionality gaps that can negatively impact the go-live experience.

For information that can help you select the correct datacenter, see the Network requirements section of the "System requirements" article.

How is my production environment sized?

The current user license count and the information in the subscription estimate that is active when you request the production environment determine the size of your production environment.

> **Note**
>
> If you submit a new subscription estimate, your production environment might need to be resized, depending on the number of users, the type of user licenses, and the expected peak transaction volume. After the new estimate is processed, the next servicing operation on the

environment applies the update automatically within three days. Alternatively, you can create a support ticket to request a specific time to apply the changes.

I submitted the request for a production environment, but I made a mistake. Can I still change it?

No. Production environment deployment starts as soon as you submit the request. Wait until the deployment finishes, and then log a support ticket to delete the production environment so you can redeploy it.

How long does it take to deploy my production environment?

After the go-live readiness review with Microsoft is complete, the production environment slot in LCS is enabled, and the project team (customer or partner) can trigger the environment deployment. The deployment process takes approximately 30 minutes.

What level of access do I have in my production environment? Can I sign in to the VM?

No. Access to the production environment is limited. You can't access the virtual machine (VM) or Microsoft Internet Information Services (IIS). You also can't access the database through Microsoft SQL Server Management Studio.

How often is my production database backed up?

Automatic backups protect databases. Full database backups are done weekly, differential database backups are done hourly, and transaction log backups are done every five minutes. Automatic backups are retained for 28 days.

For more information, see Learn about automatic SQL Database backups.

Can I request a copy of the backup of my production database?

No. However, you can copy your production database to your Tier 2 or higher sandbox environment. After the copy operation finishes, you can back up your sandbox environment. For

more information, see Database refresh.

My golden configuration database is in a Tier 1 sandbox environment. How can I copy and restore it to my production environment?

To copy and restore your database, follow the instructions in the article Golden configuration promotion.

> **Note**
>
> If your golden configuration is in data packages, you must manually import the data packages to the production environment.

After go-live, can I apply new code changes to the production environment?

Yes.

For more information, see Apply updates to cloud environments.

What should I do if my production environment is down?

To report a production outage, follow the process described in the article, Report a production outage.

Last updated on 06/18/2026

Submit service requests to the Dynamics Service Engineering team

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

A service request is a ticket that you use to request that the Dynamics Service Engineering (DSE) team perform a predefined set of tasks on your environments.

> **Note**
>
> Service requests are only required for environments that are **Microsoft-managed**. Most environments are self-service. For more information about environment types, see Cloud deployment overview.

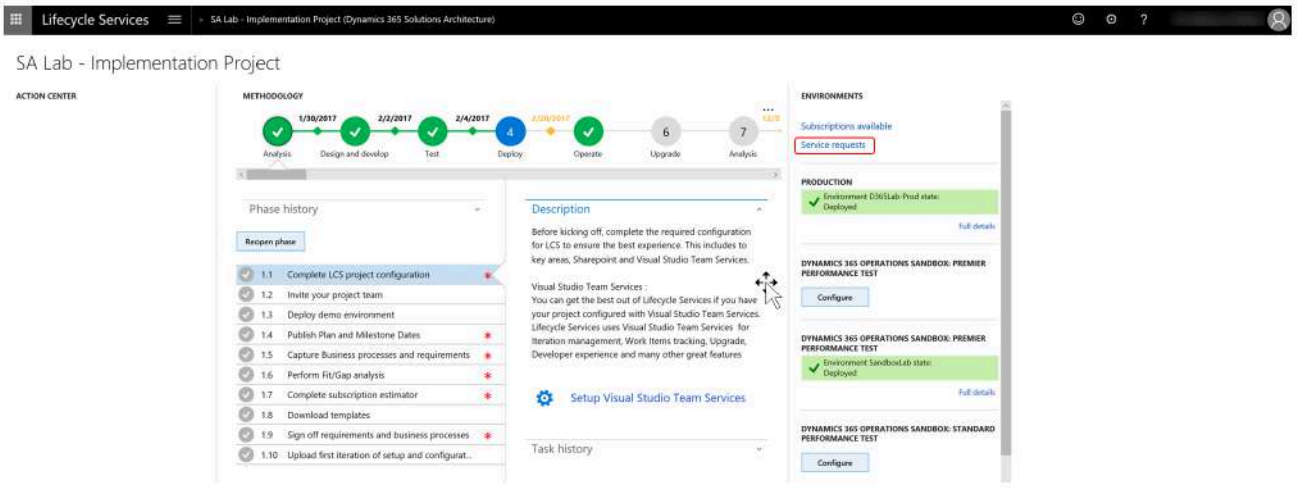
> Do not use service requests for product issues. If you encounter a situation that doesn't fit into any of the tasks that are described in this article, submit a support ticket instead. For more information about support tickets, see Get support for finance and operations apps or Lifecycle Services.

You can use Microsoft Dynamics Lifecycle Services to submit service requests directly to the DSE team. You can also view which requests have been submitted, executed, and canceled for your environments.

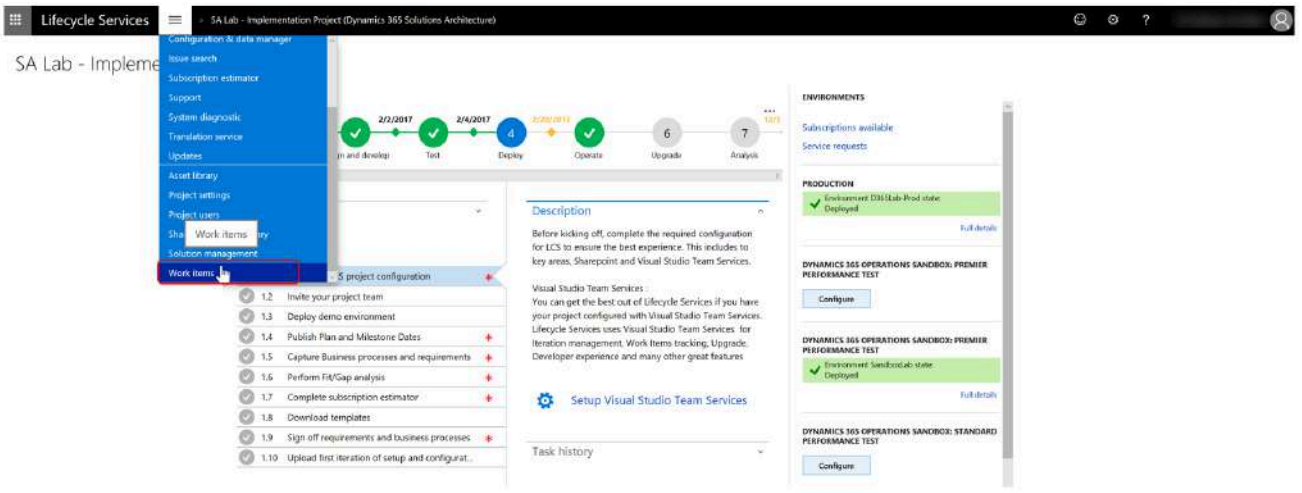
View service requests

There are two ways to view service requests:

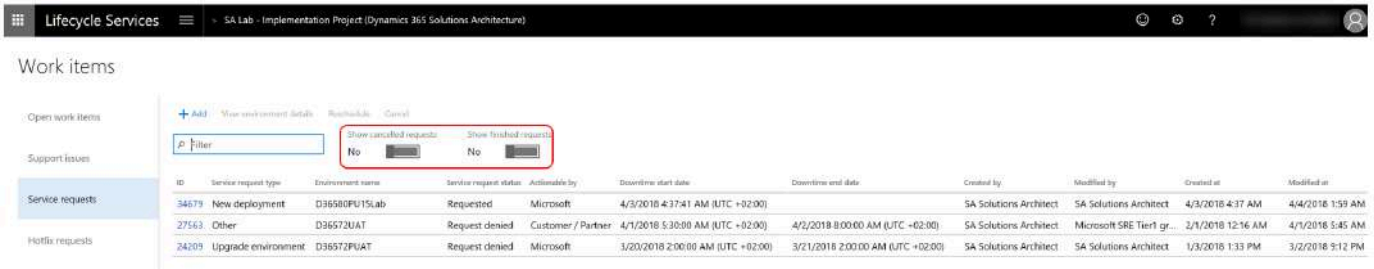
- On the project dashboard, in the **Environments** section, select **Service requests**.



- Select the **Menu** button and select **Work items**. On the **Work items** page select the **Service requests** tab.



By default, the **Service requests** tab on the **Work items** page lists all requests that are currently active and requests that have been denied. However, you can use the filter options to show canceled and finished requests too.



After you submit a request, it has a status of **Requested**. Before the DSE team acts on the request, it might ask for clarification by entering a comment in the **Comment** field. For example, you might receive a comment from the DSE team if you request deployment of a production environment, but the data center differs from the data center where your sandbox environments are deployed. Carefully review the comments, and provide any required clarification in your own

comment. To view the details of a specific request, or to submit comments for a service request, select the request ID.

If you signed up for Lifecycle Services notifications, you receive an email when the status of a service request changes or a comment is entered.

If you submit a service request to the DSE team, and the action is outside the team's scope, the service request will be denied. In this case, the reason for the denial and suggestions for further action are provided. For some typical examples of service requests that the DSE team will deny, see the "Denied service requests" section later in this article.

Create service requests

There are two ways to create a service request: automatically and on demand.

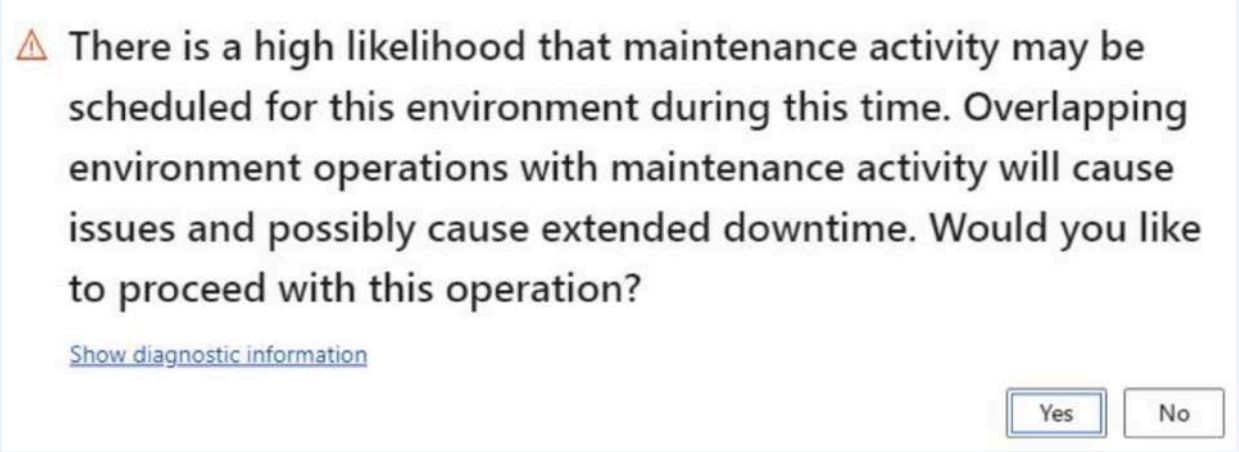
- **Automatically** – A service request is automatically created when you request deployment of an environment, or an application of a package.
- **On demand** – A service request is manually created when you enter a request for a database point-in-time restore, and some other services.

Automatically create a service request

- **Environment deployment** – To set up deployment options and submit a request to the DSE team to deploy a new environment, in the **Environments** section, select **Configure**.

- **Package application** – To apply a package to the production environment, on the **Environment details** page, select **Maintain**, select the package to apply, and then select **Schedule**. For more information, see Apply updates to cloud environments.

  > **Important**
  >
  > If your scheduled time overlaps with a planned maintenance window, you will receive the following warning message.



If you choose to continue deploying the package, the package deployment operation will be rolled-back in the event of conflict, as planned maintenance takes priority.

This restriction is appliable to **Microsoft-managed IAAS environments** only.

Create a service request on demand

Service requests that are created on demand aren't explicitly accepted by the DSE team. They will be addressed during the specified downtime window unless the DSE team has entered a comment in the request or has had to deny the request. For details, review the comments in the service request.

Microsoft frequently reviews all incoming service requests. By selecting the correct type of service request for your scenario, you help the DSE team handle the request in a timely manner.

1. On the **Work items** page, on the **Service requests** tab, select **Add**.
2. In the **Create request** dialog box, select the type of service request to create. The options on the page then reflect the specific type of request that you selected.

    - **Sandbox point-in-time restore request** – Select this request type to restore a *non-production* database to a specific point in time. For more information, see Database movement operations home page.

        > ⓘ Note
        >
        > If you need to restore a *production* database to a previous point-in-time during the cutover phase, select the **Production point-in-time restore request** type. If you need to restore a production database when you're already live in operations, submit a support ticket through Lifecycle Services.

- **Database refresh request** – Select this request type to refresh a database from a production environment to a sandbox environment, or from one sandbox environment to another. For more information, see Refresh database. *This request type is being retired on January 31, 2019.*

  > ⓘ **Note**
  >
  > If you need to refresh a database from a sandbox environment to a production environment during the cutover phase, select the **Sandbox to Production** type.

- **Sandbox to Production** - Perform a database refresh of your configuration data to a production environment during the cutover phase. For more information, see Database movement operations home page.

- **Other request** – You need to use the **Other request** type exactly as described here. If you word a request in a way that isn't clear to the DSE team, the team will enter a comment to ask for clarification, and your request will be delayed. If you use the **Other request** type for any request that isn't listed below, the request will be denied. Select this request type to request that the DSE team perform one of the following actions:

  - Turn on maintenance mode in a production environment. For more information, see Maintenance mode.

  - Tenant move of a live Production environment. Request the Microsoft Service Engineering team to move the Production database and Azure Blob Storage from the old tenant to the new tenant if you are moving tenant on a live Production environment. Make sure that you only request this service when you are ready with all prerequisites. For more details, see Move Lifecycle Services implementation projects to different Microsoft Entra tenants.

  - Define explicit Internet Protocol (IP) safe list rules in a production environment.

    > ⓘ **Note**
    >
    > Support for explicit safe list rules is deprecated for self-service environments. For more information, see Removed or deprecated platform features.

  - Request that Microsoft Power BI Embedded be activated in a sandbox environment, Standard Acceptance Test environment, or production environment if you receive

the following message: "Power BI embedded isn't enabled. Please contact your system administrator."

Commonly denied service requests

Here are some typical examples of service requests that will be denied:

- You submit a request of the **Other request** type for one of the following actions, but you should have submitted a support ticket instead:
  - You want to activate a new subscription estimate after you're live in production or after you've requested a production environment.
  - You want to reset the Financial reporting data mart in a release that is earlier than Microsoft Dynamics 365 for Finance and Operations Financial reporting release 7.2.6.0.
  - You want to restore a production database after go-live.
  - You encountered an issue after the DSE team did an application upgrade.
- You submit a request of the **Other request** type for an action that you should have requested through a different request type. Examples include a database refresh in a non-production environment.
- You submit a request of the **Other request** type for an action that you should perform yourself. Examples include a database upgrade in a development environment.

Service request types and SLAs

Expand table

Service request type	Applicable environments	Requested service	Lead time	Downtime
Environment deployment	Any	Environment deployment	Service level agreement (SLA): within two business days	
Package application	Production	Deployable package application	Five hours	Five hours
Sandbox point-in-time restore	Any Tier 2 or higher sandbox	Database point-in-time restore	Five hours	Four hours

Service request type	Applicable environments	Requested service	Lead time	Downtime
Production point-in-time restore	Production	Database point-in-time restore	Based on data volume	Based on data volume
Sandbox to Production	Tier 2 or higher sandbox to Production	Sandbox to Production	Five hours	Four hours
Other	Production	Maintenance mode	Five hours	Not applicable, because the customer indicates in the service request when the environment should be taken out of maintenance mode again
	Production	IP safe list rules	Five hours	Two hours
	Production	Power BI Embedded	Five hours	Two hours

Subscriptions, Lifecycle Services projects, and Microsoft Entra tenants FAQ

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

When customers subscribe through a Microsoft Volume Licensing agreement or a Microsoft Cloud Solution Provider (CSP) agreement, they usually have one Microsoft Microsoft Entra tenant, one Microsoft Dynamics Lifecycle Services Implementation project, and any number of sandbox environments that are deployed to one data center of the customer's choice, and one production environment. For more information about these core concepts, see finance and operations application architecture. Although this setup works well for most projects, more advanced scenarios are sometimes required, or changes during the implementation lifecycle must be accommodated.

This article provides answers to frequently asked questions about subscriptions and licenses, Microsoft Entra tenants, and Lifecycle Services Implementation projects.

For more information, see the following topics:

- Move environments between data centers
- Move licenses between agreement types
- Move Lifecycle Services implementation projects to different Microsoft Entra tenants
- Multiple Lifecycle Services projects and production environments on one Microsoft Entra tenant

Do I have to move Microsoft Entra tenants when I move from a CSP agreement to a Volume Licensing agreement?

No. You can keep the existing Microsoft Entra tenant, but you must make sure that the Volume Licensing subscriptions are purchased against the same Microsoft Entra tenant as the CSP subscriptions.

Do I get a new Lifecycle Services Implementation project when I move from a CSP agreement to a Volume Licensing agreement?

No. The Lifecycle Services project remains the same.

Can I keep the existing Lifecycle Services Implementation project when I move to different Microsoft Entra tenant?

No. A new Lifecycle Services project is created.

How long does it take to move from a CSP agreement to a Volume Licensing agreement?

For a Volume Licensing purchase, it can take a few days for the order to process and the subscriptions to activate. Redeployment of add-on environments has a service level agreement (SLA) of two business days. It takes a few hours to deallocate and delete old add-on environments.

What if I forget to delete the existing environments before I suspend the existing subscription?

If you don't deallocate and delete the existing environments before you suspend the subscriptions, the environments stay in a **Deployed** state. However, if you try to access the full details of these environments, you receive an error message.

Can I have a CSP agreement and a Volume Licensing agreement in parallel?

Yes. However, you must maintain the minimum required number of licenses under each program.

How can I find the Tenant name and Tenant ID within Lifecycle Services?

1. Go to the project home page in Lifecycle Services.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you find the **Tenant name** and the **Tenant ID**.

How can I find the subscription status?

1. Go to the project home page in Lifecycle Services.
2. In the **Environments** section, select **Subscriptions available**.
3. On the **Subscriptions available** page, you see all **Service plans** available to the tenant.
4. The **Assigned date** indicates the date that service plan status changed.

How does the subscription status affect the environment?

The subscription status can affect some of the environment operations:

- **Active** - Your subscription is active. You can perform all environment operations.
- **In Grace Period** - Your subscription expired, but is still within the grace period. Renew your subscription soon. The subscription status doesn't affect your license quantity, ability to deploy a new environment, or ability to perform environment operations.
- **Suspended** - Your subscription expired and is beyond the grace period. This subscription status might reduce the license quantity, affect your ability to deploy a new environment, or affect your ability to perform environment operations.
- **Deleted** - Your subscription is deleted. This status affects your ability to deploy a new environment or perform environment operations.

Geo to geo migration overview

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

To support data residency, Microsoft Dynamics 365 finance and operations apps and Microsoft Dynamics Lifecycle Services are generally available in specific geographies. You can migrate your workload from one geography to another. This article provides an overview of the process and the considerations.

Movement between geographies involves two separate processes:

- Finance and operations apps environment migration – Use this feature to move your finance and operations apps environments between geographies.
- Lifecycle Services project migration manager – Use this feature to move your Lifecycle Services project data between geographies.

To start planning for the migration, assess whether you want to migrate only environments, only Lifecycle Services projects, or both.

General considerations

Before migrating environments and data from one geography to another, consider the following aspects.

Feature parity

Review the availability of features in the selected target geography before you decide which geography to deploy in. If any features aren't available in the target geography, associated functionality won't work in that geography after migration. Therefore, plan the migration activity accordingly.

Dynamics 365 Commerce isn't available in all target geographies. If you enable Commerce components, your Lifecycle Services project migration isn't scheduled if you're migrating to one of the target geographies where Commerce isn't available.

Sovereign data resident geographies

Migrations into or out of a sovereign cloud environment (for example, US Government Community Cloud [GCC] and China) aren't supported.

Lifecycle Services project migration considerations

For more information, see Lifecycle Services project migration manager - Considerations.

Environment migration considerations

For more information, see Finance and operations apps environment migration - Considerations.

Move licenses between agreement types

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

Sometimes, a customer who originally purchased subscriptions through a Microsoft Cloud Service Provider (CSP) agreement decides to change to a Microsoft Volume Licensing agreement with Microsoft after the Microsoft Dynamics Lifecycle Services Implementation project is created. The customer can make this change even after the project goes live in production.

Less often, a customer who originally purchased the subscriptions through a Volume Licensing agreement with Microsoft decides to change to a CSP agreement. In this case, the change must align with the renewal date of the Volume Licensing agreement.

Moving subscriptions from one type of agreement to another is primarily a commercial process. The technical implications for the Lifecycle Services Implementation project are minimal.

> **Note**
>
> Moving subscriptions between agreement types isn't the same as moving a Microsoft Entra tenant. If the contractual changes in the agreements require that you change the **Microsoft Entra tenant** on the subscriptions, you must also follow the process described in Move Lifecycle Services implementation projects to different Microsoft Entra tenants.

Subscriptions come with two standard environments:

- A **production** environment
- A **Tier-2 Standard Acceptance Test** environment

The movement of subscriptions between agreement types doesn't affect these environments. You see impact in Lifecycle Services only if the customer has additional **add-on environments**. In this case, the partner or customer doesn't need to take any explicit action related to the add-on environments. However, during the time when both CSP and Volume Licensing agreements are active or in a grace period, Lifecycle Services shows additional slots for the add-on environments. You should simply ignore these slots, as they disappear as soon as the redundant licensing agreement expires. You must **not** deploy these additional slots as this action would violate the licensing agreement.

Commercial activities

When a customer changes the licensing agreement through which they obtained their subscriptions, consider this change a *commercial transaction* that requires working with external parties who sell the subscriptions to Dynamics 365 services. The goal is to maintain uninterrupted access to the service during that time of transition.

Use the following steps to complete the commercial transaction.

1. The customer places the order for subscriptions under the new agreement with the Volume Licensing reseller or the CSP.

   > **Important**
   >
   > Make sure that you purchase the subscriptions against the same Microsoft Entra tenant that you used on the original agreement.

2. The customer activates the subscriptions.

3. In Microsoft 365 Admin Center, the customer verifies that both the new and the existing subscriptions are active for all user and device licenses, as well as for the add-on environment subscriptions.

4. When the new subscriptions are active, the customer requests that the Volume Licensing reseller or the CSP suspend the existing subscriptions. Typically, there's an overlap to help guarantee continuity and avoid disruption of service.

The customer only has default environments

If the customer has only the two standard environments that come with the Microsoft-managed subscription, and didn't purchase any add-on environments through the original CSP agreement or Volume Licensing agreement, no changes appear in Lifecycle Services.

The customer has add-on environments

If the customer purchased add-on environments through the original CSP agreement or Volume Licensing agreement, those environments continue to function without any disruption. For each add-on environment that the customer ordered on the old agreement, as well as on the new licensing agreement, they now see two slots in Lifecycle Services. Typically, the slot from the old agreement is deployed, while the slot from the new agreement shows up as a new undeployed **DYNAMICS 365 OPERATIONS SANDBOX** slot in **Configure** state. Customers must not deploy more environments in total than they purchased on the new licensing agreement, as the environment slots disappear when the old licensing agreement expires.

It's important that customers verify that they have the desired number of add-on environments on the new licensing agreement. Customers can verify the number of purchased add-on environments on the **Subscriptions available** page in Lifecycle Services, or in the Microsoft 365 admin center under **Billing** > **Your products**.

> ⓘ **Note**
>
> Lifecycle Services displays the aggregate number of subscriptions across all licensing agreements. During the transition period, while the old and new license agreement are active, the numbers are probably higher than the desired number of subscriptions after the old licensing agreement expires.

Last updated on 06/18/2026

Move Lifecycle Services implementation projects to different Microsoft Entra tenants

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Note**
>
> Moving into or out of a sovereign cloud environment (for example, US Government Community Cloud [GCC] and China) isn't supported.

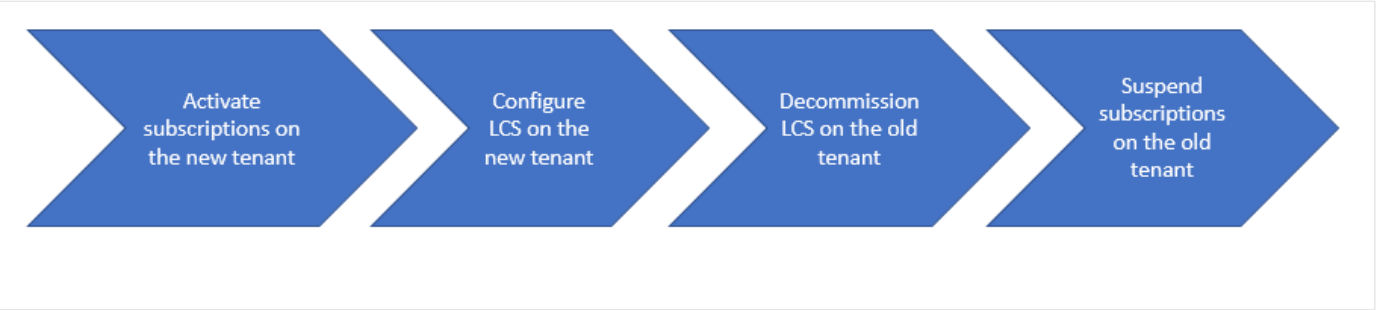
You can move your subscriptions and your Microsoft Dynamics 365 Lifecycle Services implementation project to a different Microsoft Microsoft Entra tenant. Here are some scenarios where this move might be required:

- You accidentally purchase subscriptions against the wrong Microsoft Entra tenant.

  > **Note**
  >
  > If you're a cloud service provider, and you sell subscriptions for finance and operations apps to an existing customer, you must request a reseller relationship with that customer to put the subscriptions on the customer's existing Microsoft Entra tenant. If you create a new customer record for the customer in Microsoft Partner Center, you create a new Microsoft Entra tenant for the customer.

- The customer changes the structure of the Microsoft Entra tenant after the subscription is purchased.

The process for moving your subscriptions and all related artifacts has four main steps, as shown in the following illustration.



Activate subscriptions on the new tenant

Work with your cloud service provider or volume license reseller to activate the subscriptions against the new Microsoft Entra tenant. Activate all subscriptions for users, and for add-on environments.

Cloud service provider

If you're licensed through a Microsoft Cloud Solution Provider (CSP) agreement, purchase the required subscriptions against the new tenant from your cloud service provider. If the new tenant already exists, the cloud service provider must request a reseller relationship. Alternatively, in Partner Center, the cloud service provider must create a new customer that has the desired default domain name, ***.onmicrosoft.com** (for example, **contoso.onmicrosoft.com**).

Ask the cloud service provider not to suspend the existing subscriptions at this time.

Volume Licensing

If you licensed through a Microsoft Volume Licensing agreement, call the Volume Licensing support center and ask them to remap the subscriptions from the old tenant to the new tenant. You can contact Volume Licensing Support through Microsoft 365 admin center. Request a grace period, when the subscriptions are active on both tenants. Because of customer privacy concerns, the customer must make this request. Have the following information available:

- Public customer number.
- Enrollment number.
- The current tenant domain that the subscriptions are currently provisioned on.
- The destination tenant domain that the customer wants the subscriptions provisioned under.
- A detailed explanation of why the customer must migrate its Volume Licensing subscriptions to a different tenant.

- The total number of paid subscriptions that must be moved to the new tenant, together with the subscription type and seat count.

> **Important**
>
> It's crucial that the subscriptions are active on both tenants in parallel for a few weeks, until you finish decommissioning Lifecycle Services on the old tenant.

Configure Lifecycle Services on the new tenant

On the new tenant, you get a new Lifecycle Services project that you must initiate and set up.

1. Complete the Project Onboarding wizard. For more information, see Lifecycle Services project onboarding. When completing the wizard, indicate on the **Project overview** page that you're **Moving existing Lifecycle Services project from another tenant** and provide the source Lifecycle Services project ID.
2. Fully configure Lifecycle Services. As part of this configuration, you must:
3. Upload and activate a subscription estimator. If you're already live in the source Lifecycle Services project, you need to ensure that the estimates match.
4. Add your deployable package to the asset library.
5. Update your Business process modeler (BPM) library.

> **Important**
>
> During this period, you have two parallel Lifecycle Services projects. You can verify the name and ID of the Microsoft Entra tenant that is associated with an Lifecycle Services project on the **Subscriptions available** page in Lifecycle Services.

Move your sandbox environments to the new tenant

1. Deploy the nonproduction environments in the new Lifecycle Services project.

2. Apply the required code packages to the environments. Make sure that the target is running the same application version as the source. Use All-in-one deployable packages and include any ISV licenses, if applicable.

3. Upload data to the environments. You can move the data through data packages or by restoring the database. If you restore the database, you need to remap some properties to

the new tenant.

a. This script is only required if you are performing a database restore. Before doing the export, update the placeholders with your old and new tenant details and execute the SQL command on the source environment.
   i. This takes the backup of SYSCONFIG table and updates the value of the tenant with target tenant information.
   ii. Once the export is done, you'll need to recover this table to get back the source tenant information. Use the script below:

```
  -- ============================================
   -- Script: Update AAD Tenant in SYSCONFIG
   -- Purpose: Updates the AAD tenant domain and tenant ID
   --          in the SYSCONFIG table after a tenant migration.
   -- ============================================

   DECLARE @NewTenantDomain VARCHAR(255)
   DECLARE @NewTenantId VARCHAR(255)
   DECLARE @OldTenantDomain VARCHAR(255)
   DECLARE @OldTenantId VARCHAR(255)

   SET @NewTenantDomain = '<new-tenant-domain>' -- New AAD tenant domain (e.g.,
contoso.onmicrosoft.com)
   SET @NewTenantId = '<new-tenant-id>'         -- New AAD tenant ID (GUID)
   SET @OldTenantDomain = '<old-tenant-domain>' -- Current AAD tenant domain
   SET @OldTenantId = '<old-tenant-id>'         -- Current AAD tenant ID (GUID)

   -- Back up SYSCONFIG before making changes
   PRINT 'Backing up SYSCONFIG table...'
   SELECT * INTO SYSCONFIG_BKP FROM SYSCONFIG

   -- Update tenant domain
   IF EXISTS (SELECT VALUE FROM SYSCONFIG
              WHERE CONFIGTYPE = 0 AND ID = 0 AND VALUE = @OldTenantDomain)
   BEGIN
       PRINT 'Updating tenant domain to: ' + @NewTenantDomain
       UPDATE SYSCONFIG
       SET VALUE = @NewTenantDomain
       WHERE CONFIGTYPE = 0
         AND ID = 0
         AND VALUE = @OldTenantDomain
   END
   ELSE
   BEGIN
       PRINT 'No tenant domain update required.'
   END

   -- Update tenant ID
   IF EXISTS (SELECT VALUE FROM SYSCONFIG
```

```
                WHERE CONFIGTYPE = 1 AND ID = 0 AND VALUE = @OldTenantId)
    BEGIN
        PRINT 'Updating tenant ID to: ' + @NewTenantId
        UPDATE SYSCONFIG
        SET VALUE = @NewTenantId
        WHERE CONFIGTYPE = 1
          AND ID = 0
          AND VALUE = @OldTenantId
    END
    ELSE
    BEGIN
        PRINT 'No tenant ID update required.'
    END
```

```
-- Restore SYSCONFIG to original values after export
 DELETE FROM SYSCONFIG
 INSERT INTO SYSCONFIG SELECT * FROM SYSCONFIG_BKP
 DROP TABLE SYSCONFIG_BKP
```

4. Update your user information.

5. Remove all user accounts except the admin user.

6. Fix the admin user record in USERINFO.

SQL

```
       UPDATE USERINFO
       SET SID='mysid', NETWORKALIAS='myalias/email',
NETWORKDOMAIN='https://sts.windows.net'
       WHERE ID = 'Admin'
       ```
1. Reimport all other users that have the correct security identifier (SID) and
identity provider.
1. Run the following commands to update the tenant ID in the appropriate tables. You
can verify the Microsoft Entra tenant ID that is associated with an Lifecycle Services
project on the **Subscriptions available** page in Lifecycle Services.

```sql
Update POWERBICONFIG set TENANTID = 'newtenantid' where TENANTID = 'oldtenantid'
Update PROVISIONINGMESSAGETABLE set TENANTID = 'newtenantid' where TENANTID =
'oldtenantid'
Update B2BINVITATIONCONFIG set TENANTID = 'newtenantid' where TENANTID =
'oldtenantid'
Update RETAILSHAREDPARAMETERS set TENANTID = 'newtenantid' where TENANTID =
'oldtenantid'
```

1. Fully configure the environments. As part of this step, configure the integration endpoints.

2. Perform smoke tests on the user acceptance testing (UAT) environment in the new Lifecycle Services project. These tests should focus on user sign-in, integrations, workflows, printing, reporting, and similar processes that depend on configuration and user information.

Depending on your solution and scope, you might have to perform more steps on the new Microsoft Entra tenant. These steps might include registering applications (for recurring integrations and warehouse management), adding domains, and setting up directory synchronization to enable single sign-on (SSO).

Calls to web services are allowed only from the **home** tenant for the environment. For example, the original tenant was companya.com, and integration ran as `services\@companya.com`. In this case, when you switch tenants to companyb.com, you can't use `services\@companya.com` for web service calls, even if you update **userInfo.networkdomain** to `https://sts.windows.net/companyb.com`.

> **Important**
>
> On your sandbox environments, you lose any document handling attachments that are stored in Azure Blob storage. Microsoft moves Blob storage only for production environments.

Move your production environment to the new tenant

If you don't already have a production environment deployed on the old tenant, you can skip this section.

> **Important**
>
> You can only perform tenant migration if the **source and target production environments are in the same region**. If the source environment is in a different region, you need to move the environment to the same region as the target. For more information about moving an environment, see Finance and operations apps environment migration.

> **Important**
>
> Tenant-to-tenant migration isn't supported when Customer lockbox is enabled. You must disable Customer lockbox to move an environment to another tenant. You can re-enable

Customer lockbox after the migration is completed. For more information, see [Securely access customer data by using Customer Lockbox Known Issues](#).

If you already have a production environment deployed on the old tenant, Microsoft moves your database and Azure Blob storage from your old production environment to the new one. As a prerequisite, complete the following steps after you finish moving all the sandbox environments and complete UAT. The process of moving a production environment to a new tenant requires downtime of up to 48 hours.

Before requesting the production environment, ensure that you complete all prerequisites:

1. Get all required licenses that are needed to correctly license all users on the production environment.
2. When the licenses are in place, upload a subscription estimator to the new Lifecycle Services project. It should match the subscription estimator that is active in the source Lifecycle Services project, and it must correctly reflect peak transaction volumes.
3. Send an email to Dynamics 365 FO Go-Live (d365fogl@microsoft.com) stating that your new Lifecycle Services project is ready for Microsoft to move your production database and Azure Blob Storage. To ensure that the process runs smoothly, provide the following details in the email. Copy the following list to your email, and then answer all of the information line by line.

Lifecycle Services

- Provide the Lifecycle Services IDs (number in the Lifecycle Services project URL) for source and target Lifecycle Services project.
- Confirm that the go-live date is set correctly in the target Lifecycle Services project.
- Confirm that the update schedules are set in the target Lifecycle Services project (**Lifecycle Services** > **Menu** > **Project settings** > **Update settings**).
- Confirm if you're using Azure Blob Storage for document attachments.
- Confirm that your project is identified as a tenant move in the Project Onboarding wizard.
- Confirm that your deployable package is marked as a release candidate in the target Lifecycle Services project.

  Environment region

- Confirm that the target production environment is deployed to the same region as the source production environment.

  > **ⓘ Important**
  >
  > You can only perform tenant migration if the **source and target production environments are in the same region**. If the source environment is in a different region, you need to move the environment to the same region as the target. For more information about moving an environment, see [Finance and operations apps environment migration].

  Testing

Confirm that the smoke testing is completed on the sandbox environment (Tier-2 or higher) in the target Lifecycle Services project.

Code Management

- Share which environment version you plan to deploy your new production environment.
- List the ISV solutions you're using.
- Confirm which version your old production environment is running on.
- Confirm that nonstandard code to be applied in the new production environment is exactly the same as the nonstandard code present in the old production environment to prevent database copy issues.
- Confirm if there were any non-typical actions taken on your old production environment that need to be considered on the new production environment, like installation of a custom font or environment upscale.

  Cutover and timeline

- Describe how you'll conduct your cut over.
- Confirm the dates when the source Lifecycle Services environments and project are deallocated and deleted.

1. The Dynamics 365 FO Go-Live team replies to you within two business days and a FastTrack team works with you on the assessment of the project readiness for production deployment.

2. When the tenant move assessment is successfully completed, the FastTrack team enables production environment slot in Lifecycle Services.
3. Deploy production environment in Lifecycle Services.

- You can't select the same name for the new production environment, as it's in use for your old production environment. Choose a new environment name so that a new URL is generated.
- Make sure you select the same application version that is used by your current production environment.
- In the **Production configuration** wizard, select a generic user account, not a named user, as Environment administrator.

1. After the production environment is deployed, verify that source and target environments have exactly the same code, otherwise migration fails. If necessary, install deployable packages on the target production environment.
2. Request to copy database and blob storage from the old production environment to the new production environment. Submit a support ticket requesting a copy of the database and blob storage, if applicable, from the old production environment to the new production environment. Be sure to include Lifecycle Services IDs and environment IDs from source and target projects in the support ticket.

- This process requires interaction between Microsoft and the implementing project team. Ensure that you follow the email notifications or notifications directly in the service request.
- After Microsoft completes the tenant migration activity and informs you to continue with the next steps, you need to reimport all users from the new Microsoft Entra tenant.
- You need to validate the new production environment to ensure that all business processes are successful.
- If you encounter an issue after the migration, file a support ticket.

Tear down the Lifecycle Services project on the old tenant

After the new Lifecycle Services project on the new Microsoft Entra tenant is fully functional, you must stop, deallocate, and delete the environments on the old Lifecycle Services project. When you've finished, the **Configure** button becomes available for each environment. If you already had a production environment on the old tenant, you must open a support ticket to have it deleted.

You should save any remaining artifacts from the Asset library that you might require later.

After all environments have been deleted and all artifacts saved, an Organization administrator on the old tenant must delete the Lifecycle Services project. Microsoft reserves the right to disable the customer's account and delete the customer data after the service has been suspended for an extended period.

Suspend subscriptions on the old tenant

After all the environments have been deleted, and you've saved the Lifecycle Services artifacts that you require, work with your cloud service provider or Volume Licensing Support to suspend all the licenses on the old Microsoft Entra tenant.

- **Cloud service provider** - Suspend the existing subscriptions against the old tenant.
- **Volume Licensing Support** - Call Volume Licensing Support to confirm that you've completed the work and that the subscriptions can now be suspended against the old tenant.

Last updated on 08/28/2026

Move Lifecycle Services implementation projects from on-premises to the cloud

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article explains how to move your Microsoft Dynamics 365 Finance + Operations (on-premises) environments that are hosted on your own infrastructure to the Azure cloud.

Background

Previous migrations to the cloud used SQLPackage to create and restore a .bacpac file to move the on-premises database into the cloud. That approach is no longer supported. The current approach uses the Data Migration Toolkit version 1.0.8 (or later).

Cloud subscription licenses

If you don't already have cloud subscription licenses, work with your cloud service provider or volume license reseller to get and activate the required subscriptions on your Microsoft Entra tenant. All subscriptions for users and add-on environments must be activated.

Configure Lifecycle Services cloud implementation project

If no finance and operations cloud-named user subscription licenses have previously been activated on the Microsoft Entra tenant, a new Microsoft Dynamics Lifecycle Services cloud implementation project is automatically provisioned. Otherwise, you must open a support request to have a Lifecycle Services cloud implementation project created. For more information, see Multiple LCS projects and production environments on one Microsoft Entra tenant.

After your Lifecycle Services cloud implementation project has been created, you must fully configure it. As part of this configuration, you must complete the following steps (and others):

- Add users.
- Add an Azure DevOps association.
- Add subscription estimates.
- Fill in the Asset library.
- Add Business process modeler (BPM).

Complete development and testing of updated integrations

You have to make some changes to the integration design patterns that you used for interfaces with your Finance + Operations (on-premises) environment. These changes can be substantial, and a detailed discussion of them is beyond the scope of this article. Nevertheless, you must evaluate all your interfaces and make the appropriate changes to them.

You should consider developing your updated interfaces in such a way that they can coexist in the same code base as the original interfaces. This approach simplifies management of the code lifecycle during the period of your transition from on-premises to cloud. If this approach isn't possible, you must manage a new development branch through your cloud go-live. To simplify management of this new branch during the transition period, we recommend that you freeze other code changes as much as you can. Additionally, in your detailed cut-over plan, you should carefully document the steps for inactivating your old interfaces and activating the new interfaces.

Prerequisites

1. Deploy a Tier-2 sandbox (UAT) self-service environment.

2. Apply the same code package that is applied in your on-premises production environment (or, as appropriate, in the current build from the cloud integration development branch that was discussed in the previous section). This code package

should be a single, complete deployable package that includes any independent software vendor (ISV) solutions and licenses.

> **Note**
>
> - The local business data (LBD) migration process is for finance and operations sandbox (UAT) self-service environments only. It can never be run against a production environment. A gold copy refresh is done to move the migrated data into production.
> - Make sure that you download the latest version of the Data Migration Toolkit for Dynamics 365 from Lifecycle Services.
> - Don't deploy or use the linked Power Platform environment for the migration. The Power Platform environment can be deployed and used after the data upgrade is completed.

3. Download the Data Migration Toolkit for Dynamics 365 version 1.0.8 (or later) from Lifecycle Services. In the Shared asset library, select **Model** as the asset type, and then select the model file.

4. Download and install the .NET Framework version 4.7.1 if it isn't already installed.

5. Make sure that the replication feature is installed and enabled for the source SQL Server instance. To determine whether replication is enabled, run the following SQL script.

   SQL

   ```
   -- If @installed is 0, replication must be added to the SQL Server
   installation.
   USE master;
   GO
   DECLARE @installed int;
   EXEC @installed = sys.sp_MS_replication_installed;
   SELECT @installed;
   ```

   If the replication components aren't installed, follow the steps in Install SQL Server replication to install them.

6. SQL Server authentication must be set to **SQL Server and Windows Authentication mode**. (This change requires a restart of the SQL Server service.) The toolkit uses native SQL logins only.

7. Enable and start the SQL Server Agent on the source database server.

> ⓘ Note
>
> A user should have the **DB_Owner** privilege in the source database, and should have access to the master database and the source database.

Data Migration Toolkit setup

1. Extract the zip file for the Data Migration Toolkit for Dynamics 365 version 1.0.x that you downloaded from Lifecycle Services into a folder of your choice.

   > ⓘ Note
   >
   > To ensure that the zip file is correctly extracted, select and hold (or right-click) the download, and then clear the **Unblock** checkbox.

2. In the folder where you extracted the zip file, open the **DataMigrationTool.exe.config** file, and follow these steps:

   a. Find the following line:

   ```XML
   <add key="isD365OnPrem" value="false" />
   ```

   b. Change the value from **false** to **true**, as in the example below:

   ```XML
   <add key="isD365OnPrem" value="true" />
   ```

3. Optional: If you don't want some of the source database tables to be replicated in the target database, you can specify them in the **IgnoreTables.xml** file. Likewise, if you don't want some of the functions to be replicated, you can specify them in the **IgnoreFunctions.xml** file. Additionally, if you want to put specific tables in publications outside the main publications, you can use the **SpecialTables.xml** file.

   - **Path of the IgnoreTables.xml file:** Data\IgnoreTables.xml
   - **Path of the IgnoreFunctions.xml file:** Data\IgnoreFunctions.xml
   - **Path of the SpecialTables.xml file:** Data\SpecialTables.xml

   The following examples show how to specify tables and functions in the XML files.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<IgnoreTables>
    <Name>
        <Table>NON_AOT_TABLE1</Table>
        <Table>NON_AOT_TABLE2</Table>
        <Table>NON_AOT_TABLE3</Table>
    </Name>
</IgnoreTables>
```

> **Note**
>
> The tables that you add to the ignore list shouldn't exist in the Dynamics 365 Application Object Tree (AOT). If tables that exist in the AOT are included, an error will occur during the data upgrade. These tables won't be replicated to the target database.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<IgnoreFunctions>
    <Name>
        <Function>if_WHSInventReserveUnionDelta</Function>
    </Name>
</IgnoreFunctions>
```

> **Important**
>
> The functions that are specified in the IgnoreFunctions.xml file won't be replicated to the target database.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<SpecialTables>
    <Name>
        <Table></Table>
    </Name>
</SpecialTables>
```

> **Important**

Tables that are specified in the SpecialTables.xml file will be added to a dedicated publisher. The number of special table publishers is based on the **NumberOfPublishers** parameter. For more information, see the next step. Special table handling can be useful for very large tables that you might have to manually start the replication on during downtime hours.

4. Optional: To optimize the replication latency/performance, you can update the following distributor parameters in the **App.config** file:

   - **MaxBcpThreads** – By default, this parameter is set to **6**. If the machine has fewer than six cores, update the value to the number of cores. The maximum value that you can specify is **8**.
   - **NumberOfPublishers** – By default, this parameter is set to **4**. The recommendation is to use this value. However, there might be situations where you want to increase the number of publishers, to distribute smaller numbers of tables to each publisher. This change, with the manual snapshot start, lets you run smaller initial snapshots, which can be useful if you have limited maintenance windows and must split the startup of the replication over several.
   - **snapshotPostPublication** – This option will add a five-minute delay between starts of the automatic snapshot processes. This delay can help with loads on the source server. The toolkit also allows for manual snapshot starts. If you use that approach, you don't have to set this parameter.

   > ⓘ **Note**
   >
   > Don't set up or configure replication during peak times when system resource usage, memory usage, and disk IO operations are high.
   >
   > When resources are being used to the maximum extent (that is, more than 90 percent is already consumed), the replication might be delayed as the system tries to find available resources. We recommend that you start the replication during off hours, when the system resources are at minimum usage (that is, during off-peak time).
   >
   > For a go-live cutover, we recommend that you start the replication the previous weekend.

Migration process

Run the DataMigrationTool.exe application

> **ⓘ Important**
>
> Before you begin the migration process, ensure that the environment is in a **Deployed** state.

1. Run the **DataMigrationTool.exe** application.

   A console window will appear, where you can provide the cloud environment type.

   - **Public:** lcs.dynamics.com
   - **GCC:** gov.lcs.microsoftdynamics.us
   - **UAE:** [uae.lcs.dynamics.com]

2. After you enter the cloud environment, you're prompted to sign in. Provide the credentials that are used to sign in to Lifecycle Services.

3. After you're successfully authenticated, in the console window, provide the **Project-Id** value and then the **Environment-Id** value.

   To validate the given values, you must sign in by using the credentials that are used to sign in to Lifecycle Services.

   > **ⓘ Note**
   >
   > You can find the **Project-Id** and **Environment-Id** values on the **Manage environment** page in Lifecycle Services. You can also find the **Environment-Id** value on the **Environment details** page.

Complete the data replication and migration

After the validation is successful, the application presents a set of menu options that correspond to the steps in the data upgrade process. To complete the data replication and upgrade, you should perform the steps in the following order.

1. **Environment preparation: Environment setup activity**

   This step prompts you for the following information:

   - Details of the source database:
     - Source server (in the format *servername**serverinstance*)
     - Source database name
     - User name

    - Password
- IP address of the source database server (for the allowlist)
- Distribution database path (for example, **D:\SQLServer\Data**)
- Replication snapshot path (for example, **D:\SQLServer\Snapshot**)

> **Important**
>
> You must use SQL Server authentication. You can't use a domain sign-in.
>
> You must use the SQL server (NetBIOS) name, and not the fully qualified domain name (FQDN). If you have a SQL cluster, you must use the server name of the active primary node.
>
> If you have an issue connecting with the SQL Server (NetBIOS) name, ensure that the certificate used for SQL encryption has the server's name registered as an DNS entry in the Subject Alternative Names property. The SQL encryption certificate should have NetBIOS as well as FQDN entries for all SQL server nodes, and the listener if a cluster.
>
> The specified distribution database and replication snapshot paths should have enough space. We recommend that the amount of space be at least the size of the source database. If you've used compression in your Dynamics 365 database, more space will be required, because the snapshot is uncompressed. The paths should be on the local disk of the machine. (Avoid using shared paths.)
>
> We recommend that you have a static IP address for the virtual machine (VM) or machine (for the allowlist in step 1). In this way, you help prevent connection issues with the target database.

This step performs the following actions:

- It validates the connection to the source database.
- It validates the version of the Dynamics 365 LBD database.
- It authorizes the source IP address.
- It validates the target databases.

2. **Environment preparation: Prepare the target environment for the data upgrade**

   This step changes the state of the Lifecycle Services environment from **Deployed** to **Ready for replication**.

3. **Replication: Cleanup Target Database**

   This step performs the following actions:
   a. It changes the state of the Lifecycle Services environment from **Ready for replication** to **Replication in progress**.
   b. It deletes all Dynamics AX product tables, views, stored procedures, and user-defined functions in the target database.

4. **Replication: Setup Distributor**

   This step creates a distribution database under the **System Databases** folder on the source server. This distribution database is used for replication.

5. **Replication: Setup Publication for Primary Key (PK) Tables**

   This step creates publications for primary key tables under the **Replication** folder on the source server and replicates them in the target database. If any **ignore-table** entries were specified, the specified tables are exempted from replication. Any **special-table** entries that were added, these will be added to additional special tables publications.

   > ⓘ **Note**
   >
   > Snapshots must be manually started in SQL Management Studio.
   > a. Open the replication monitor, and select your SQL Server instance.
   > b. On the **Agents** tab, select and hold (or right-click) the publisher that you want to start, and select **Start**.
   >
   > Start one snapshot at a time, and wait for the replication of that snapshot to be completed. In the replication monitor, check the **Distributor to subscriber** history until you receive a message that resembles the following example: "Delivered snapshot from the \unc\server\folder."
   >
   > For more information about how to monitor the replication, see Monitor replication for the Data migration toolkit.
   >
   > You must manually start the publisher snapshots for steps 6 and 7.
   >
   > Older versions of the Data Migration Toolkit have automatic and manual starts. We recommend that you migrate to the latest version of the toolkit.

   Created publisher names: AX_PUB_PkTable_[*]

   > ⓘ **Note**

> After this replication configuration step is completed, actual data replication will occur as a SQL job that runs in the background. This job takes some time to complete. You can view the status of the replication by providing the **'rs'** option. For more information about the **'rs'** option, see the Reporting section of the application section later in this article.

6. **Replication: Setup Publication for Other Objects (functions)**

   This step creates a publication for other objects (functions) and replicates them in the target database. If you don't want some of the functions to be replicated, you can specify them in the IgnoreFunctions.xml file.

   Created publisher names: AX_PUB_OtherObjects

   > ⓘ **Note**
   >
   > The replication takes some time to be completed. You can view the replication status by providing the **'rs'** option. If there are no functions to replicate, the publication won't be created. Don't move on to the next step until the **DataReplicationStatus** property for this step is shown as completed.

7. **Cutover: Setup Publication for Non PK Tables**

   This step creates two publications: one used to replicate non-primary key tables, and the other one used to replicate locked tables.

   > ⓘ **Note**
   >
   > If there are no locked tables, then the publication won't be created.

   Publication names: AX_PUB_NoPKTable, AX_PUB_TABLE_LockedTable

   If AX Service acquires a schema lock during creation of the primary key publication, those tables are ignored from the publication. They are added to temporary tables and marked for replication during creation of the cutover publication.

   > [IMPORTANT] Don't move on to the next step until the **DataReplicationStatus** property for this step is shown as completed.

   > ⓘ **Note**

You can validate the replicated data by using the **'dv'** option. If there are mismatched tables, this step lets you create publications for them. If you want to exclude any mismatched tables for replication, close the app, and add those tables in **Data/IgnoreTables.xml**. Then rerun the app, and use the **'dv'** option.

To learn more about the **'dv'** option, see the Reporting section of the application section later in this article.

8. **Cutover: Remove replication setup**

   This step deletes all the publications that were created in the source database, the distribution database, and the replication snapshot.

   > ⓘ **Note**
   >
   > To remove the **Snapshot** folder without causing an exception, run the following script in the source database. Even if you don't run this script, you can ignore the exception message that you receive.

   ```SQL
   EXEC master.dbo.sp_configure 'show advanced options', 1
   RECONFIGURE WITH OVERRIDE
   EXEC master.dbo.sp_configure 'xp_cmdshell', 1
   RECONFIGURE WITH OVERRIDE
   ```

9. **Post-replication: Update environment state to Replicated**

   This step changes the state of the Lifecycle Services environment from **Replication in progress** to **Replication completed**.

10. **Data synchronize: Trigger transformation**

    This step triggers a servicing step in Lifecycle Services that will update the database for the cloud. When the action is successful, the state of the Lifecycle Services environment changes from **Replication completed** to **Data upgrade in progress**.

    If data migration is successful, the environment will be set to a **Deployed** status in Lifecycle Services.

11. **Data synchronize: Trigger rollback**

    This step triggers a rollback of the data upgrade. This action rolls back the data to the point before the transformation was triggered and sets the Lifecycle Services environment

state to **Replicated**. These actions will change the environment from **Failed** to the **Replicated** state.

At this point, you have only triggered the rollback. To view the rollback status, use the '**rbs**' option. To learn more about this option, see the Reporting section of the application section later in this article.

If rollback is successful, the '**rbs**' option is shown as **D365 upgrade topology(LCS) status: Replicated**.

If rollback fails, the '**rbs**' option is shown as **D365 upgrade topology(LCS) status: Failed**.

Reporting section of the application

You can use the following options to review the reports of the replication validation, replication status, data upgrade status, and rollback data upgrade status.

- **dv) Report** – Validate the replication.

  This option compares the number of tables and records in the source server database and the target server database, and then shows the report. You should use this option only after step 7 is completed.

  If there are mismatched tables, this step lets you create a publication for them. If you want to exclude any mismatched tables for replication, close the app, and add those tables in the **Data/IgnoreTables.xml** file. Then rerun the app, and use the '**dv**' option.

  You can find the report data at **output/PostValidationInfo.csv**.

- **rs) Report** – Get the replication status.

  This option shows the report of the replication process for the publications that were created. You should use this option only after step 5 is started (during the replication process for any publication).

- **rbs) Report** – Get the rollback status.

  This option shows the report of the rollback process. You should use this option only after step 11 is started.

Tooling section of the application

- **Reset-rep** – Reset the replication setup by removing all the replication configurations. Publications and the distribution database are deleted. The status of all **Replication** and

Cutover menu options is reset from **Completed** mode to **Reset** mode to help you redo the replication from the beginning.

- **Reset-all** – Reset all the menu options, and remove the replication configurations. The status of all the options is changed to **Reset**.
- **Clear** – Clear the environment setup activity. All information is cleared from the cache, such as the **project-Id** value, the **Environment-Id** value, and source database details.
- **Help** – Show the data upgrade migration options with the updated status.
- **Exit** – Close the application.
- **Set-failed** – If you want to delete the environment, and if the environment is in the **PreparingForReplication**, **ReadyForReplication**, or **Replicating & Replicated)** state, use this option to set the environment state to **Failed**. The environment can then be deleted from Lifecycle Services.

Post-migration tasks

1. If necessary, reimport all other users, and assign the appropriate security roles. Users must now be assigned to Microsoft Entra accounts.
2. Direct printing in a cloud environment is done by using the Document routing agent (DRA). Set up sandbox DRAs as described in Install the Document routing agent to enable network printing, so that regression testing can include your printing scenarios.
3. Copy document handling attachments to the cloud. Document handling attachments aren't stored in the database. If they must be preserved, you must move them separately. For more information, see the Migrate document handling attachments to your sandbox section in this article.
4. Run a complete regression test cycle. This cycle should include testing of integrations.
5. Fix any issues that are discovered during testing. For each issue, document and keep track of the correcting adjustments that you make in the sandbox, and repeat those adjustments in the on-premises source. If any change must **not** be made in the on-premises environment, because it's incompatible with the correct functioning of that environment, we recommend that you create a DMF data package for it instead of manually applying it for each iteration of the migration process.
6. Repeat steps 2 through 10 until all tests have been passed, and no further changes are being made to code or the configuration.

Repeat the migration to production

Follow all previous steps to migrate data, and then follow the instructions in Golden configuration promotion - Copy the sandbox database to production.

1. Deploy the new production environment. Note that the regular prerequisites apply. For example, you must have an active subscription estimator, complete the Lifecycle Services methodology phases before the operate phase, and complete the FastTrack readiness review. For more information, see Prepare for go-live.
2. Apply the final version of the software deployable package to production.
3. Stop making data changes to the on-premises production environment.
4. Repeat steps 3 through 6 in the Do a trial migration and resolve issues section to copy the final/up-to-date on-premises production database to the cloud sandbox.
5. Repeat step 8 in the Do a trial migration and resolve issues section to copy the final/up-to-date document handling attachments to the cloud sandbox.
6. Request a database refresh from sandbox to production. (The process is the same as the process that is used to promote a golden configuration database to production.)
7. Open a support request to have Dynamics Support Engineering copy the document handling attachments from the sandbox storage account to the production storage account and update the references in the production database's DocuValue and DocuDeletedValue tables. After the request has been completed, validate that the attachments are available for a sample of document handling records.

> ⓘ **Note**
>
> The support request for copying the document handling attachments **must be submitted 72 hours in advance** for scheduling. Requests made without advance notice cannot be honored.

8. Set up DRAs for production. If you're reusing any of the DRAs that were previously installed as part of your trial migration, remember to update their configuration so that they connect to the production URL instead of the sandbox URL.
9. Reconcile your cloud and on-premises production environments, as detailed in your cut-over plan.
10. Obtain sign-off for the go-live.
11. Activate cloud production interfaces, batch jobs, and so on.
12. Start to transact in your cloud production environment.

Migrate document handling attachments to your sandbox

Document handling attachments for Finance + Operations (on-premises) environments are stored in a file share. However, the cloud version doesn't support this file share. You can use the following procedure to copy the attachments to the Azure storage account for your sandbox environment and update the corresponding metadata in the database. For

subsequent promotion to production, you can request that Dynamics Support Engineering copy the attachments from your sandbox to production.

1. Upload a copy of the document handling attachment files from the on-premises production file share to a temporary folder on one of the sandbox instances of Application Object Server (AOS). For example, you can upload a zip file of the attachments and unpack it on the target. If you don't have remote desktop access (for example, for a self-service environment), you can use a different virtual machine (VM) instead. For reasonable conversion performance, this VM should be in the same Azure datacenter as the target sandbox. If you aren't using the AOS instance, you must add the VM to an allow list for access to the sandbox's SQL database instance.

2. Open a support request to get the name of the sandbox Azure storage account and a time-limited shared access signature (SAS) token for the documents container. Update the corresponding placeholders in the Windows PowerShell script that is run in the next step. Also update the placeholders for your temporary folder, and for your finance and operations transactional database, by using the environment details in Lifecycle Services.

3. Run the following Windows PowerShell script on the sandbox AOS instance or other VM to upload the document handling files to the storage account and create the required metadata for each file.

PowerShell

```
#Upload F&O on-prem document handling attachments to Azure storage account
#
$filesPath = "<TEMP_ATTACHMENTS_FOLDER_PATH>"
$dBHostName = "<DATABASE_SERVER>.database.windows.net"
$dBName = "<DATABASE_NAME>"
$dBUsername = "<DATABASE_USER>"
$dBPassword  = "<DATABASE_PASSWORD>"
# Note! - The storageAccountName should be set without the
".blob.core.windows.net", e.g. $storageAccountName = wxxtst4xx5bfxx
$storageAccountName = "<STORAGE_ACCOUNT_NAME>"
# Note! - The sasToken starts with "sv=20"
$sasToken = "<SAS_TOKEN>"

[Reflection.Assembly]::LoadWithPartialName("System.Security.Cryptography")
#Load crypto
$cryptoObj = [System.Security.Cryptography.SHA256]::Create()
$StorageContext = New-AzStorageContext -StorageAccountName $storageAccountName
-SasToken $sasToken
foreach ($file in Get-ChildItem $filesPath)
{
    try
    {
        $blob = (Set-AzStorageBlobContent -Context $StorageContext -Container
documents -File $file.FullName -Blob "$($file.Name)" -Force).ICloudBlob
```

```
    }
    catch
    {
        Write-Host "Could not upload $($file.Fullname) to blob"
        Write-Host $_
    }
    if($blob)
    {
        #Write-Host "Processing $($file.Fullname)..."
        #FileHash:
        $fileBytes = [System.IO.File]::ReadAllBytes($file.FullName)
        $hashBytes = $cryptoObj.ComputeHash($fileBytes)
        $encodedHash = [System.Convert]::ToBase64String($hashBytes)
        #FullFileName:
        $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME FROM
DOCUVALUE WHERE FILEID = '$($file.Name)'" -ServerInstance $dBHostName -
Database $dBName -Username $dBUsername -Password $dBPassword).ORIGINALFILENAME
        if ($origFileName.Length -eq 0)
        {
            $origFileName = (Invoke-Sqlcmd -Query "SELECT ORIGINALFILENAME
FROM DOCUDELETEDVALUE WHERE FILEID = '$($file.Name)'" -ServerInstance
$dBHostName -Database $dBName -Username $dBUsername -Password
$dBPassword).ORIGINALFILENAME
        }
        if ($origFileName.Length -eq 0)
        {
            Write-Host "Missing DOCUVALUE $($file.Name)"
        }
        else
        {
            $nameBytes  = [System.Text.Encoding]::UTF8.GetBytes($origFileName)
            $encodedName =  [System.Convert]::ToBase64String($nameBytes)
            #Write-Host "Base64 encoded original filename $encodedName."
            $blob.Metadata["FileHash"] = $encodedHash
            $blob.Metadata["FileSize"] = $file.Length
            $blob.Metadata["FullFileName"] = $encodedName
            $blob.SetMetadata()
            Write-Host "Uploaded $($file.Fullname)"
        }
    }
}
```

4. In SSMS, run the following T-SQL commands to update the DocuValue and DocuDeletedValue records so that they reference the target storage location.

SQL

```
update DOCUVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION,
'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'),
STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
```

```
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'

update DOCUDELETEDVALUE
set ACCESSINFORMATION = replace(ACCESSINFORMATION,
'file://<SOURCE_PREFIX>/documents/',
'https://<STORAGE_ACCOUNT>.blob.core.windows.net/documents/'),
STORAGEPROVIDERID = 1
where STORAGEPROVIDERID = 4 --4 for LBD filesystem, 1 for Azure blob
and ACCESSINFORMATION like 'file://<SOURCE_PREFIX>/documents/%'
```

5. Test a sample of the document handling attachments to make sure that they can now be accessed in the sandbox environment.

Troubleshooting

For troubleshooting information, see Troubleshoot upgrades to Dynamics 365 finance and operations self-service environments.

Learn about the replication configuration and status via SSMS

In SSMS, if Object explorer includes a **Replication** folder, the replication feature is installed on the server and available.

After step 3 of the data upgrade process is completed, you should find the publisher configured under the **Replication** folder. To learn the replication status, select and hold (or right-click) the **Replication** folder, and then select **Launch replication monitor**.

- In the replication monitor, you can view all the publishers that have been created for replication.
- On the **Snapshot** tab, you can view the status of the snapshot.
- To view the detail log/transaction, double-tap (or double-click) a grid item.
- To view the data replication to the target, on the **All subscription** tab, double-tap (or double-click) the subscription from the grid item.

Multiple Lifecycle Services projects and environments on one Microsoft Entra tenant

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> As part of the One Dynamics One Platform work effort, some Microsoft Dynamics 365 Lifecycle Services (LCS) features have been deprecated. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

For any new cloud project, you instantiate one Microsoft Dynamics Lifecycle Services implementation project on a Microsoft Entra tenant that provides access to one production instance. In rare cases, to handle the requirements of a specific implementation, you might require multiple production instances that run in parallel. By creating multiple Lifecycle Services projects against the same Microsoft Entra tenant, you can have multiple production instances. Here are the most common scenarios where you might need multiple production instances:

- A global implementation's requirements for data residency, latency, or data volume can't be met by one instance.

- Different business units in an organization are implementing the product separately as independent applications.

Licensing requirements

Every Lifecycle Services implementation project that runs on the same Microsoft Entra tenant must satisfy the minimum licensing requirements. For example, if there are three Lifecycle Services implementation projects on the same Microsoft Entra tenant, a customer must purchase no less than three times the minimum number of subscription licenses. Currently, the minimum license requirement is 20 full user licenses. Therefore, to run three Lifecycle Services implementation projects on the same Microsoft Entra tenant, the customer must purchase at least 60 licenses.

Because the licenses are associated with the Microsoft Entra tenant, the **Subscriptions available** page for every Lifecycle Services project shows the total number of licenses, even though a given Lifecycle Services project can use only the portion of licenses allocated to it. The allocation of licenses to Lifecycle Services projects is described in Edit the licenses allocated to projects.

For more information about licensing, download the Licensing guide.

Disadvantages of multiple Lifecycle Services projects

Here are some of the disadvantages to having multiple Lifecycle Services projects:

- Master data isn't shared.
- Intercompany transactions aren't supported.
- Integrations must be configured in each Lifecycle Services project.
- Each Lifecycle Services project requires a separate Bring your own database (BYOD) instance.
- User acceptance testing (UAT) must be done on each instance, even if the code is the same. UAT is required on each instance, because differences can occur across the Lifecycle Services projects, even if they share a code base. One source of differences can be the integration setup and BYOD configuration that must be done separately in each Lifecycle Services project and therefore must be tested in each Lifecycle Services project. There might be data variations, different application configurations per region might affect functionality, and different data centers might support a different set of Azure services.
- Microsoft Azure DevOps must be configured in each Lifecycle Services project. When customizations and code are shared, it makes sense to use the same Azure DevOps project.

Advantages of multiple Lifecycle Services projects

Having multiple Lifecycle Services projects offers several advantages. Here are some of them:

- You can select data centers for each Lifecycle Services project to provide the best latency experience.
- You can select data centers for each Lifecycle Services project to satisfy statutory requirements for data residency.
- You get more flexibility to schedule servicing operations, such as code deployments and upgrades.
- You can have different stakeholders for the different Lifecycle Services implementation projects.

Create multiple Lifecycle Services projects

Follow these steps to create another implementation project in your existing organization.

1. On the Lifecycle Services home page, select the plus sign (+) button.
2. Select the desired product for the new project.
3. Select **Implementation** as the project type.
4. Enter information about the new implementation project.
5. Select **Create** to finish creating the project. If you already have an existing implementation project in your organization, a message box might prompt you to confirm that you want to create another implementation project. If you receive an error message, your organization might not have the required total license count to support another implementation project.

The newly created implementation project is shown, and you're the owner of it.

Edit the licenses allocated to projects

Determine how you want to assign licenses across the implementation projects in your organization. Make sure that the number of licenses assigned across all projects doesn't exceed the total license count that you purchased.

After you determine the allocation, open the Subscription estimator tool for each implementation project. Edit the active subscription estimate to apply the desired license allocation for that project.

Online deployments in China sovereign cloud

If your implementation includes China deployment or rollout, see finance and operations apps - operated by 21Vianet in China. This deployment is designed to comply with regulatory requirements in China. The services include a physically separated instance of a cloud service that has a different tenant (Microsoft Entra ID) that 21Vianet operates and transacts.

In this case, a single organization exists in multiple clouds with a different tenant (Microsoft Entra ID). The previously described advantages and disadvantages of multiple Lifecycle Services projects or production environments still apply. However, the licensing requirements and request procedures differ. If you need process assistance, work with your Microsoft account executive or your implementation partners.

Supply Chain Management troubleshooting and FAQs

Troubleshooting articles

For a large collection of troubleshooting articles, see the following site provided by Microsoft Support:

- Microsoft Dynamics 365 Supply Chain Management troubleshooting

These articles explain how to determine, diagnose, and fix issues that you might encounter when you use Supply Chain Management. The articles are organized by feature area and each article focuses on a specific issue and how to solve it.

Frequently asked questions

Collections of frequently asked questions (FAQs) are integrated into the Supply Chain Management documentation. Each of these articles includes multiple FAQs for a specific feature area.

The following FAQ articles discuss issues specific to Supply Chain Management:

- Inventory costing FAQ
- Engineering change management FAQ
- Improve master planning performance
- Improve scheduling engine performance
- Procurement FAQ
- Product-related translations FAQ
- Calculations for product configuration models FAQ
- Sales order FAQs
- Schedule sales history data cleanup
- DDMRP FAQ
- User-based authentication FAQ

The following FAQ articles discuss issues related to the platform shared by all finance and operations apps, including Supply Chain Management:

- Address books FAQ
- Client FAQ
- Electronic Invoicing FAQ
- Go-live for implementation projects FAQ

- One Version service updates FAQ
- Open in Excel experiences FAQ
- Subscriptions, LCS projects, and Microsoft Entra tenants FAQ
- Workflow FAQ

Other support resources

The following Microsoft support and community resources are also available, where you can discuss and solve issues, browse Blogs, request features, and more:

- Microsoft Dynamics 365 Blog
- Dynamics 365 Community
- Supply Chain Management ideas portal
- Dynamics 365 support

AI summaries with Copilot

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

AI summaries with Microsoft Copilot are available on many of the most-used pages in Dynamics 365 Supply Chain Management. These summaries provide a quick overview of the most important information that's related to the page, personalized for the current user. Summaries can include information such as the number of lines on a purchase order, the number of items in a warehouse, or the number of overdue invoices for a vendor.

The information that Copilot provides depends on the current page and user context. For example, the information can vary based on the other pages that the user works with the most, and it's limited based on the user's security roles and permissions.

> **Tip**
>
> Users can provide feedback to Copilot by selecting the thumbs-up or thumbs-down buttons shown under the summaries. You can add support for written feedback by turning on enhanced user feedback for Copilot. This feedback helps improve the quality of the summaries that Copilot generates.

TechTalk video

For a video overview of all of the features described in this topic, watch Copilot Capabilities in Dynamics 365 Finance and SCM | Dynamics 365 TechTalk.

Prerequisites

Before you can use AI summaries with Copilot, your system must meet the following requirements:

- You must be running one of the following versions of Supply Chain Management:
  - Version 10.0.39 with proactive quality update 3 (PQU-3) or later
  - Version 10.0.40 with PQU-1 or later
  - Any build of version 10.0.41 or later

- Power Platform Integration must be enabled for your environment. Usually, all the components that are required to use Copilot summaries are automatically deployed when Power Platform Integration is enabled. However, if they don't work as expected, see Enable Copilot capabilities in finance and operations apps for more detailed requirements.

- To use Workload insights with Copilot in the Warehouse Management mobile app, you must be running Warehouse Management mobile app version 2.3.2.0 or later.

Turn AI summaries with Copilot on or off

Admins can control which AI summaries are shown in your system by searching for the following features in Feature management:

- Workload insights with Copilot in the Warehouse Management mobile app – *Context-aware worker summary screen in WMA*
- Product hover summaries – *Product summary when hovering on item*
- Released product details summary – *Product details summary*
- Purchase order summary – *Purchase order summary*
- Sales order summary – *Sales order summary*
- Vendor summary – *Vendor summary*

All of these features are turned on by default, but you can turn any or all of them off if you don't want to see them.

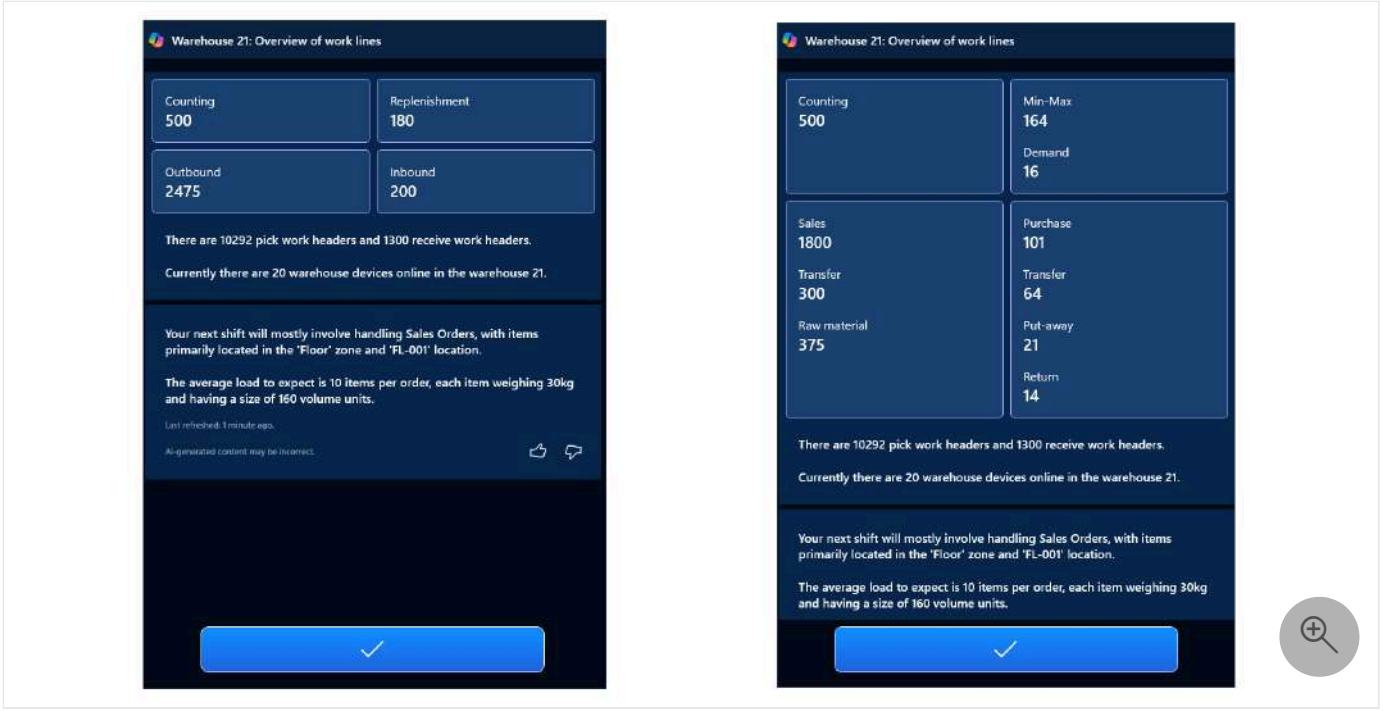
Workload insights with Copilot in the Warehouse Management mobile app

The Warehouse Management mobile app provides a *workload* page that shows work summaries and AI-generated insights to help warehouse workers better plan their shift. The information can include the following details:

- The number of pick and receive work headers or work lines.
- The number of active warehouse mobile app sessions in the warehouse.
- Insights into the available work types.
- The current workload. This information can be shown either as work headers or work lines.

- Details of the available work per work type.
- More information about the available work. Microsoft Copilot generates this information in natural language.

The following illustration shows an example of the workload page in the Warehouse Management mobile app. When workers first open the page, it shows an overview of unstarted tasks that are scheduled for the current warehouse, together with a natural-language summary that Copilot generates (left). Workers can then tap any tile to view detailed information about open work by type (right). This information helps them quickly grasp their objectives for the day.



Learn more in Workload insights with Copilot in the Warehouse Management mobile app.

Product hover summaries

On most pages that show an item number, users can hover over the item number to view a Copilot-generated summary of the item.

Released product details summary

The **Released product details** page includes a **Summary by Copilot** FastTab that shows a product summary based on the current user's most-used pages and context.

Vendor summary

The **All vendors** details page includes a **Summary by Copilot** FastTab that shows status information and insights for the selected vendor. The information that's provided can include the vendor currency, accounting currency, vendor hold status, number of purchase orders, posted vendor invoices, payment status, and more. It can also include the number of overdue vendor invoices, purchasing agreements, and active rebates agreements.

Purchase order summary

The **All purchase orders** details page includes a **Summary by Copilot** FastTab that shows an overview of the selected purchase order's status. For example, it shows the number of partially or fully confirmed, received, and invoiced lines. The FastTab also shows other selected insights, such as a summary of order lines that are overdue or nearly overdue.

Status summary for purchase orders

For purchase orders that aren't canceled, invoiced, or finalized, the **Status** section of the **Summary by Copilot** FastTab for purchase orders provides status details that apply across all order lines. The section provides insights into the progression of order lines in each of the following categories:

- **Not fully received** – Lines where the quantity hasn't been fully registered or received.
- **Fully received, not fully invoiced** – Lines where the quantity has been fully registered or received, but not yet fully invoiced.
- **Fully invoiced** – Lines where the quantity has been received and fully invoiced.

As appropriate, the **Status** section provides buttons that let you filter the order lines according to their status. Use the filters to quickly find relevant order lines so that you can take appropriate action. Each filter is shown only when at least one order line has the indicated status. The following filter buttons might be shown:

- **Not fully received** – Show only order lines where the quantity hasn't been fully registered or received.
- **Fully received, not fully invoiced** – Show only order lines where the quantity has been fully registered or received, but not yet fully invoiced.

Insight summary for purchase orders

For purchase orders that aren't canceled, received, invoiced, or finalized, the **Insights** section of the **Summary by Copilot** FastTab for purchase orders provides two more insights that apply across all order lines:

- **Overdue or nearly overdue lines** – The number of order lines that are awaiting receipt and have an expected receipt date (requested or confirmed) that's after the current date.
- **Lines without confirmed receipt dates** – The number order lines that are awaiting receipt or haven't been fully received, and don't have a confirmed receipt date.

As appropriate, the **Insights** section provides buttons that let you filter the order lines according to their status. Use the filters to quickly find relevant order lines so that you can take appropriate action. Each filter is shown only when at least one order line has the indicated status. The following filter buttons might be shown:

- **Overdue or nearly overdue lines** – Show only order lines that are overdue or nearly overdue.
- **Lines without confirmed receipt dates** – Show only order lines that are awaiting receipt or haven't been fully received, and don't have a confirmed receipt date.

Sales order summary

The **Sales order details** page includes a **Summary by Copilot** FastTab that shows an overview of the selected sales order's status. For example, it shows the number of partially or fully confirmed, received, and invoiced order lines. The FastTab also shows other selected insights, such as a summary of order lines that are overdue or nearly overdue.

Status summary for sales orders

For sales orders that aren't canceled or invoiced, the **Status** section of the **Summary by Copilot** FastTab for sales orders provides status details that apply across all order lines. The section provides insights into the progression of order lines in each of the following categories:

- **Not fully picked** – Lines where the quantity hasn't been fully picked.
- **Not fully shipped** – Lines where the quantity has been picked (or doesn't require picking) but not fully shipped.
- **Not fully invoiced** – Lines where the quantity has been completely shipped but not yet fully invoiced.

The **Status** section provides a quick overview of the progression of all sales order lines. Unlike purchase order status summaries, sales order status summaries groups order lines into categories that are forward looking. In other words, instead of focusing on what already happened, the categories focus on what is expected to happen from a fulfillment perspective.

As appropriate, the **Insights** section provides buttons that let you filter the order lines according to their status. Use the filters to quickly find relevant order lines so that you can take appropriate action. Each filter is shown only when at least one order line has the indicated status. The following filter buttons might be shown:

- **Filter to lines not fully picked** – Show only order lines that haven't been fully picked.
- **Filter to lines not fully shipped** – Show only order lines that have been picked (or don't require picking) but not fully shipped.

Insight summary for sales orders

For sales orders that aren't canceled, delivered, or invoiced, the **Insights** section of the **Summary by Copilot** FastTab for sales orders provides two more insights that apply across all order lines:

- **Overdue or nearly overdue lines** – The number of order lines that waiting to be shipped (packing slip posted) and have an expected ship date (requested or confirmed) that's after the current date.
- **Lines without confirmed ship dates** – The number of order lines that aren't fully shipped (packing slip posted) and don't have a confirmed ship date.

As appropriate, the **Insights** section provides buttons that let you filter the order lines according to their status. Use the filters to quickly find relevant order lines so that you can take appropriate action. Each filter is shown only when at least one order line has the indicated status. The following filter buttons might be shown:

- **Overdue or nearly overdue lines** – Show only order lines that are overdue or nearly overdue.
- **Lines without confirmed ship dates** – Show only order lines that aren't fully shipped (packing slip posted) and don't have a confirmed ship date.

Traceability summaries

The Traceability Add-in for Dynamics 365 Supply Chain Management lets you collect business and industry-specific data across the product value chain, which can be used for regulation audits and compliance process. The Traceability app in Power Apps provides two types of Copilot-generated summaries: activity summaries and where-used summaries.

Traceability activity summaries

Traceability collects activity events across the supply chain and product lifecycle, but it isn't always easy for users to get a quick picture of a tracked object's history. Copilot analyzes the many activity events associated with a selected tracked object and then provides a natural-language summary that helps you quickly understand the object's history. This summary is shown at the top of the full list of activity events.

Traceability where-used summaries

Traceability provides a comprehensive where-used insight report, which lets you track the usage of items across various processes. Copilot offers detailed where-used summaries at both the item-number and quantity levels, allowing for precise analysis.

Globalization Studio overview

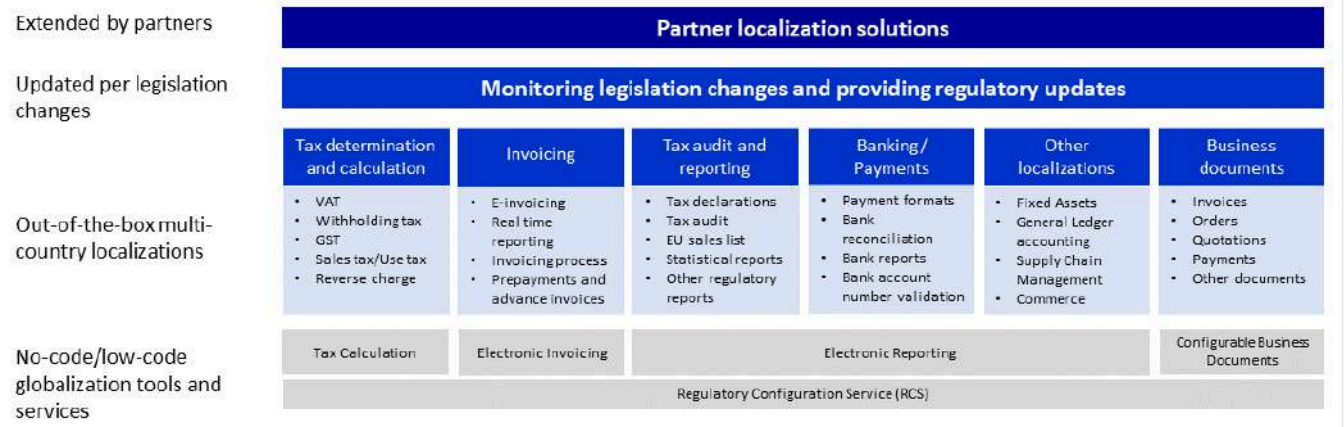
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To run their businesses globally, customers must meet multiple country/region-specific requirements for tax compliance and local business practices. This concept is referred to as *localization*. The requirements are complex and are frequently changed by local governments. They often have very tight law enforcement dates.

The Globalization Studio addresses these challenges by providing the following features:

- **No-code/low-code globalization tools and services** – These flexible, easy-to-use tools and services make localization easier for Microsoft. They also make it easier for partners and customers to create, extend, automate, and maintain the product.
- **Out-of-the-box multi-country/region localization content** – This Microsoft-provided content is continuously monitored and updated by Microsoft, and can be extended by partners.

Together, these features let you operate the solution in over 200 countries and regions, and help you meet multiple requirements for tax compliance and local business practices.



The Globalization Studio consists of the following tools and services:

- Regulatory Configuration Service (RCS) is a standalone designer and lifecycle management service for no-code and low-code globalization functionality.
- Electronic Reporting (ER) is a configurable tool that helps create and maintain regulatory electronic reporting, payment formats, and other features in a no-code or low-code format.

- Configurable business documents are built on top of the ER framework and enable business users to edit business document templates by using a Microsoft Dynamics 365 service or appropriate Microsoft Office desktop application.
- Tax Calculation is a hyper-scalable multitenant service that significantly enhances the core tax determination and calculation capabilities of Dynamics 365 finance and operations apps with a more flexible and fully configurable engine.
- Electronic Invoicing is a hyper-scalable multitenant service that extends the existing electronic invoicing capabilities to more countries and regions, and enables configurable processing of electronic invoices and configurable electronic document exchange.
- Out-of-the-box multi-country/region localizations and regulatory updates are provided by Microsoft and updated per legislation changes in the supported countries and regions.
- Partner localization solutions that partners publish on Microsoft Marketplace or provide directly.

Globalization resources

Summarize this article for me

Local and regional deployments

If government regulations require you to store or service data differently, consider country/region requirements during deployment. Consider the following resources that might be relevant to you:

Finance and operations apps operated by 21Vianet in China

Localization and regulatory features

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the **Request access to Finance and Operations Viva Engage Community** form and choose the community you want to join.

Finance and operations apps include functionality for the countries and regions documented in the Product localization and translation availability guide. Enable this functionality based on the primary address of the active legal entity.

This article includes lists of resources that can help you:

- Learn more about developing country/region-specific solutions.
- Get country/region specific updates.
- Submit and review regulatory alerts.
- Learn how to use country/region specific functionality.

Developing localized solutions

The following resources provide guidance and information that can help developers and ISVs who are creating country/region-specific customizations or are creating a solution for a country/region that Microsoft doesn't support.

- Separation of localization models
- Apply country/region context
- Regulatory certification information in feature titles

- Classification of localization features
- Country/region Codes - ISO 3166

Regulatory updates and communication

The following resources provide information about planned and new localization features.

Regulatory updates

- Regulatory updates
- Issue search in Lifecycle Services (Updated daily)

Communication and alerts

- Regulatory watch and communication of regulatory updates
- Submit alerts about country/region-specific regulatory features

Dynamics 365 release plans

The Dynamics 365 release plans provide descriptions of new and enhanced capabilities that are planned for Dynamics 365 business applications and application platforms.

Finance and operations apps what's new

The What's new or changed in finance and operations home page lists the features that are included in specific releases of the finance and operations apps.

Electronic reporting

By using the Electronic reporting (ER) tool, you can configure formats for electronic documents that meet the legal requirements of various countries or regions. ER lets you manage these formats throughout their lifecycle. For more information, see one of the following topics:

- Electronic reporting (ER) overview
- Manage the Electronic reporting (ER) configuration lifecycle
- Create Electronic reporting (ER) configurations
- Extend the list of Electronic reporting (ER) functions
- Electronic reporting (ER) destinations
- Download Electronic reporting configurations from Lifecycle Services
- Import Electronic reporting (ER) configurations

- Configure Electronic reporting (ER) to pull data into Power BI
- Generate electronic documents and update application data by using ER

Task guides

You can access task guides from the product help pane. These guides provide a guided walk-through of key business processes. You can open a task guide to read the steps of a business process, or you can play a task guide to walk through a business process and enter data.

To find task guides, go to a page in the application and select **Help**. The help pane lists task guides that use the page. You can also use the help pane to search for task guides by title.

To learn more, see Help system.

Regulatory updates

This article lists the regulatory updates that are planned and released in Dynamics 365 Finance supported localizations. Delivery timelines might change, and projected functionality might be different or might not be released. For more information, see Microsoft policy.

Regulatory updates are features that support new or changed country/region-specific legislation. For more information about planned and released country/region-specific features, see Dynamics 365 and Power Platform release plans.

Microsoft strives to implement new regulatory requirements as early as possible. The actual delivery date depends on the law announcement date, availability of the requirement details from the local authorities, the availability of the validation tools, and on the size and complexity of the change.

Regulatory updates are planned for delivery in One Version service updates that are released in time for customers to update and be ready for the enforcement date (for transactional regulatory updates), or for the first mandatory reporting deadline (for regulatory updates related to reporting). Customers and partners can preview the new regulatory updates in the preview package provided for each service update.

If there are late announcement dates, late availability of requirement details or validation tools, or exceptionally large and complex changes, it might not be possible to make a regulatory update available by the General Availability date of a monthly update. In these cases, the regulatory update is shipped as hot fixes for relevant available monthly updates.

Regulatory updates that are released as part of the monthly updates are indicated by release version only. Regulatory updates that are delivered either as hot fixes or as part of a release preview can be identified through the abbreviations HF and Preview, respectively.

For the latest regulatory update plans, refer to the following table.

Switzerland	June 2026	10.0.49, also available in prior versions	Updated VAT declaration for Switzerland - Version 2.0.0.
Netherlands	June 2026	10.0.49, also available in prior versions	Updated EU sales list for Netherlands - Taxonomy NT20.
Malaysia	April 2026	10.0.48, also available in prior versions	Updated SST-02 declaration for Malaysia - Sections 13d, 18c (points 1, 2, 3), and subsequent sections (18d, 18e).
Brazil	April 2026	10.0.47, also available in prior versions	Regulatory update to extend NFS-e support for project-based invoicing scenarios, enabling compliant XML generation for São Paulo and Federal NFS-e formats. Includes NBS field, service location attributes, tax estimation percentages, and updates to ER configurations for fiscal document mapping.
Italy	March 2026	10.0.48, also available in prior versions	Updated Unique certification (Certificazione Unica) form aligned with the provision of January 15, 2026 (Prot. n. 9454/2026) for tax year 2025.
Lithuania	March 2026	10.0.48, also available in prior versions	New VMI VAT codes PVM58, PVM59, and PVM60 for i.SAF reporting, effective from January 1, 2026, aligned with the updated 12% VAT rate classification.

Country/region	Release date	Release version	Regulatory update
Lithuania	March 2026	10.0.48, also available in prior versions	Updated VAT declaration (FR0600) with a new field 29A to support the 12% VAT rate, effective from January 1, 2026.
Spain	March 2026	10.0.48, also available in prior versions	Updated Declaration 347 annual informative return for fiscal year 2025.
Spain	February 2026	10.0.48, also available in prior versions	Updated VAT declaration Model 303 registry design for fiscal year 2026.
Germany	January 2026	10.0.48, also available in prior versions	Support for generating the EU Sales list for Germany in XML file format.
Netherlands	December 2025	10.0.47, also available in prior versions	Regulatory update to support version 4.0 of Audit file (XML Auditfile Financieel, XAF).
Poland	December 2025	10.0.47, also available in prior versions	Regulatory update to support version (3) of VAT declaration for Poland, JPK-V7, effective from February 1, 2026.
United Kingdom	November 2025	10.0.47, also available in prior versions	Regulatory update to support Statistics on payment practices report the Reporting on Payment Practices and Performance (Amendment) Regulations 2025.
Germany	November 2025	10.0.47, also available in prior versions	EU Sales list for Germany in CSV format. EU Sales list for Germany
Indonesia	August 2025	10.0.46, also available in prior versions	Regulatory update to support generating the e-Bupot file (Withholding tax report for Indonesia) for reporting periods starting from 2025 based on the withholding tax transactions.
Indonesia	August 2025	10.0.46, also available in prior versions	Regulatory update to support generating the SPT Masa PPN (Pajak Pertambahan Nilai) VAT declaration in Excel format for reporting periods starting from 2025.
Estonia	July 2025	10.0.46, also available in prior versions	Regulatory update to support changes in VAT declaration format for Estonia 2025. VAT declaration for Estonia
Australia	May 2025	10.0.45, 10.0.44HF,	Regulatory update to support changes in Payment times reporting schema (PTRS) required for Australian

Country/region	Release date	Release version	Regulatory update
		10.0.43HF, 10.0.42HF	legal entities for periods from July 1, 2024. Payment times reporting schema
Austria	April 2025	10.0.45, also available in prior versions	Regulatory update to support changes in EU Sales list for Austria - summary report (ZM). EU sales list for Austria
Czech Republic	May 2025	10.0.45, also available in prior versions	Regulatory update to support changes in VAT declaration format for Czech Republic 2025. VAT declaration - Czech Republic
Hungary	April 2025	10.0.45, also available in prior versions	Regulatory update to support changes in VAT declaration format for Hungary 2024-2025. VAT declaration (Hungary).
Mexico	March 2025	10.0.44, 10.0.43HF, 10.0.42HF, 10.0.41HF	DIOT declaration statement regulatory update to support new rules for DIOT 2025. DIOT declaration statement
Italy	February 2025	10.0.44, 10.0.43HF, 10.0.42HF, 10.0.41HF	Unique certification - 2025
Poland	November 2024	10.0.40HF, 10.0.41HF, 10.0.42HF, 10.0.43	SAF Accounting Books Income Tax - JPK_KR_PD
Japan	September 2024	10.0.39HF, 10.0.40HF, 10.0.41HF, 10.0.42	Japan consumption Tax return report layout change - 2024 for periods after October 1, 5th year of Reiwa. Japan consumption tax report
Norway	August 2024	10.0.39HF, 10.0.40HF, 10.0.41HF, 10.0.42	Standard Audit File for Tax (SAF-T) for Norway version 1.30 required from January 1, 2025.
France	March 2024	10.0.40	VAT declaration - 2024
Japan	March 2024	10.0.37HF, 10.0.38HF, 10.0.39HF, 10.0.40	Japan consumption Tax return report layout change - 2024. Japan consumption tax report

Country/region	Release date	Release version	Regulatory update
Italy	February 2024	10.0.40	Unique certification - 2024
Spain	February 2024	10.0.40	VAT declaration - Modelo 303 - 2023. VAT declaration
Estonia	January 2024	10.0.36HF, 10.0.37HF, 10.0.38HF, 10.0.39	Estonia - VAT return form, structure and specifications change 2024. VAT declaration for Estonia
Denmark	August 2023	10.0.37	Accounting basis (Regnskab Basis) electronic report for Denmark
Switzerland	July 2023	10.0.36	VAT declaration - 2024
Poland	July 2023	10.0.36	SAF VAT Invoices - JPK-FA project advance invoice handling
Poland	July 2023	10.0.36	VAT declaration - JPK-V7 - supplementary package based on ideas
United Arab Emirates	June 2023	10.0.36	FTA VAT Audit File (AE) redesign to "SAF-T General model mapping" and SAF-T feature
France	June 2023	10.0.36	VAT declaration - 2023
Italy	June 2023	10.0.35HF, 10.0.36	Modello 770 - 2023
Denmark	May 2023	10.0.35	Standard Audit File for Tax (SAF-T) for Denmark
Germany	March 2023	10.0.31HF, 10.0.32HF, 10.0.33HF, 10.0.34HF, 10.0.35	VAT declaration - 2023
Italy	March 2023	10.0.31HF, 10.0.32HF, 10.0.33HF, 10.0.34	Yearly VAT communication - Dichiarazione Iva annuale - 2023
Italy	February 2023	10.0.30HF, 10.0.31HF, 10.0.32HF, 10.0.33	Unique certification - 2023

Country/region	Release date	Release version	Regulatory update
Brazil	February 2023	10.0.33HF	Record E115 of EFD ICMS IPI for SC becoming mandatory as of May 1, 2023
Brazil	March 2023	10.0.32HF, 10.0.33HF, 10.0.34HF	Exclusion of ICMS from the PIS/COFINS CREDITS calculation base (MP 1.159/23, IN 2121/22)-sales tax
Brazil	March 2023	10.0.32HF, 10.0.33HF, 10.0.34HF	Exclusion of ICMS from the PIS/COFINS CREDITS calculation base (MP 1.159/23, IN 2121/22)-withholding tax
Denmark	November 2022	10.0.32	VAT declaration preview report update for 2022
Italy	October 2022	10.0.32	The new type of TD28 document to communicate the purchase of goods from San Marino
Italy	February 2023	10.0.34	Changes in the SEPA Payment tracings - Urgent Wire Transfers and Foreign Payments - Address and BIC fields
Japan	March 2023	10.0.34	New Qualified Invoice System requirements in Japan from October 1, 2023
Poland	April 2023	10.0.34	Updates Payment terms in commercial transactions report (PL-00053) in accordance to D20222414L
Saudi Arabia	November 2022	10.0.32	Retail - Electronic invoicing in Saudi Arabia - Phase 2

Globalization Studio workspace features

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Regulatory Configuration Service (RCS) will be deprecated. All new RCS provisioning is stopped as of 10.0.39 GA. If provisioning is required, please register a support ticket. We will be providing tools and required support for migration from RCS to the **Globalization Studio** workspace. We plan to fully shut down RCS by August 1, 2024. For more information about migration to **Globalization Studio** workspace, see Regulatory Configuration Service merge to the Globalization Studio workspace

By using Globalization Studio, you can create Globalization features for use in the following Globalization services: Electronic Invoicing and Tax Calculation. You can:

- Define related components of a feature.
- Manage the feature lifecycle through a feature's status.

To use a Globalization feature, you must first import it from a Dataverse repository and create your own version of it. You can add Globalization features by:

- Adding a derived feature based on an existing feature that's published or shared.
- Adding a new feature that you created from scratch.

Feature component overview

Globalization features include several components:

- **Version** – This component supports feature lifecycle management. It lets you manage the status of different versions of the feature.
- **Configurations** – This component lets you manage, view, and edit related Electronic reporting (ER) formats and format mappings.
- **Setups** – This component lets users of Globalization services, such as an e-invoicing service, manage the setup of the related feature version. Therefore, it supports the flexible construction of communication and responses rules.

Import Electronic reporting (ER) configurations from Dataverse

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Regulatory Configuration Service (RCS) will be deprecated. All new RCS provisioning is stopped as of 10.0.39 GA. If provisioning is required, please register a support ticket. We will be providing tools and required support for migration from RCS to the **Globalization Studio** workspace. We plan to fully shut down RCS by August 1, 2024. For more information about migration to **Globalization Studio** workspace, see Regulatory Configuration Service merge to the Globalization Studio workspace

This article explains how to import Electronic reporting (ER) configurations from Microsoft Dataverse.

Set up integration with Dataverse

To use this functionality, you need a Dataverse environment that's connected to your Dynamics 365 Finance environment. For more information, see the following articles:

- Enable Power Platform Integration
- Connect finance and operations apps with a new Microsoft Dataverse instance
- Connect finance and operations apps with an existing Microsoft Dataverse instance

You should also add a security role to access tables in Dataverse by following these steps:

1. Create a new security role as described in Create or edit a security role.
2. In that security role, add **Create, Read, Write, Delete, Append, Append to, Assign, Share** permissions for **Organization** to the following tables: **Electronic Reporting Configuration**

File, Electronic Reporting Configurations Index File, Globalization Feature File, and Globalization Features Index File.

3. Assign the created security role to users as described in Assign security roles.

Import the Globalization solution

This functionality uses the Microsoft Dataverse Web API.

Import the Globalization solution by following these steps:

1. Go to Globalization Solution for Microsoft Dynamics 365 Finance on Marketplace.
2. Select **Get it now**.
3. Fill in the required data.
4. Select an environment, and then select **Install**.

Import configurations from Dataverse

This solution adds a new type of repository for getting ER configurations in Dynamics 365 Finance. This repository is known as the Dataverse configuration repository. It provides the same user interface (UI) that Dataverse provides. Therefore, you can import single and filtered configurations.

> **Note**
>
> To use the Dataverse configuration repository, make sure that the **Dataverse repository** feature is enabled in the **Feature management** workspace of the Dynamics 365 Finance app. The feature is enabled by default since the service update 10.0.39. However, it might be disabled in your environment.

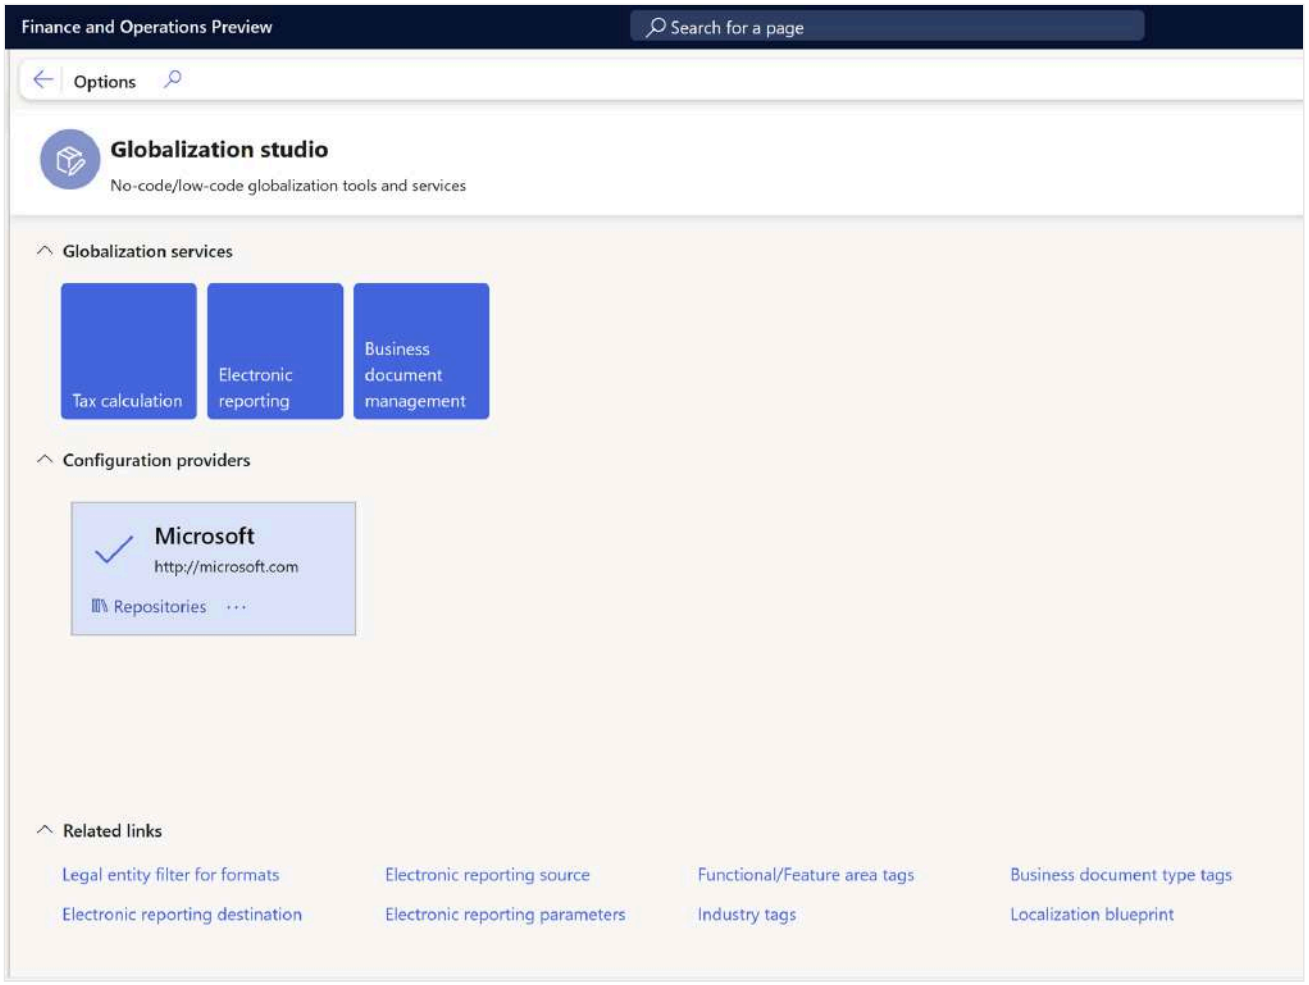
Open the Dataverse configuration repository

To open the Dataverse configuration repository, follow these steps:

1. Sign in to the Dynamics 365 Finance app by using one of the following roles:
   - Electronic reporting developer
   - Electronic reporting functional consultant
   - System administrator
2. Go to **Organization administration** > **Workspaces** > **Globalization studio**.

3. In the **Configuration providers** section, select the **Microsoft** tile.

4. On the **Microsoft** tile, select **Repositories**.



5. On the **Configuration repositories** page, in the grid, select the existing repository of the **Dataverse** type. If this repository doesn't appear in the grid, follow these steps:
   a. Select **Add** to add a repository.
   b. Select **Dataverse** as the repository type, and then select **Create repository**.
   c. If you're prompted for authorization, follow the on-screen instructions.
   d. Enter a name and description for the repository, and then select **OK** to confirm the new repository entry.
   e. In the grid, select the new repository of the **Dataverse** type.

6. Select **Open** to view the list of ER configurations for the selected repository.

Import a single configuration

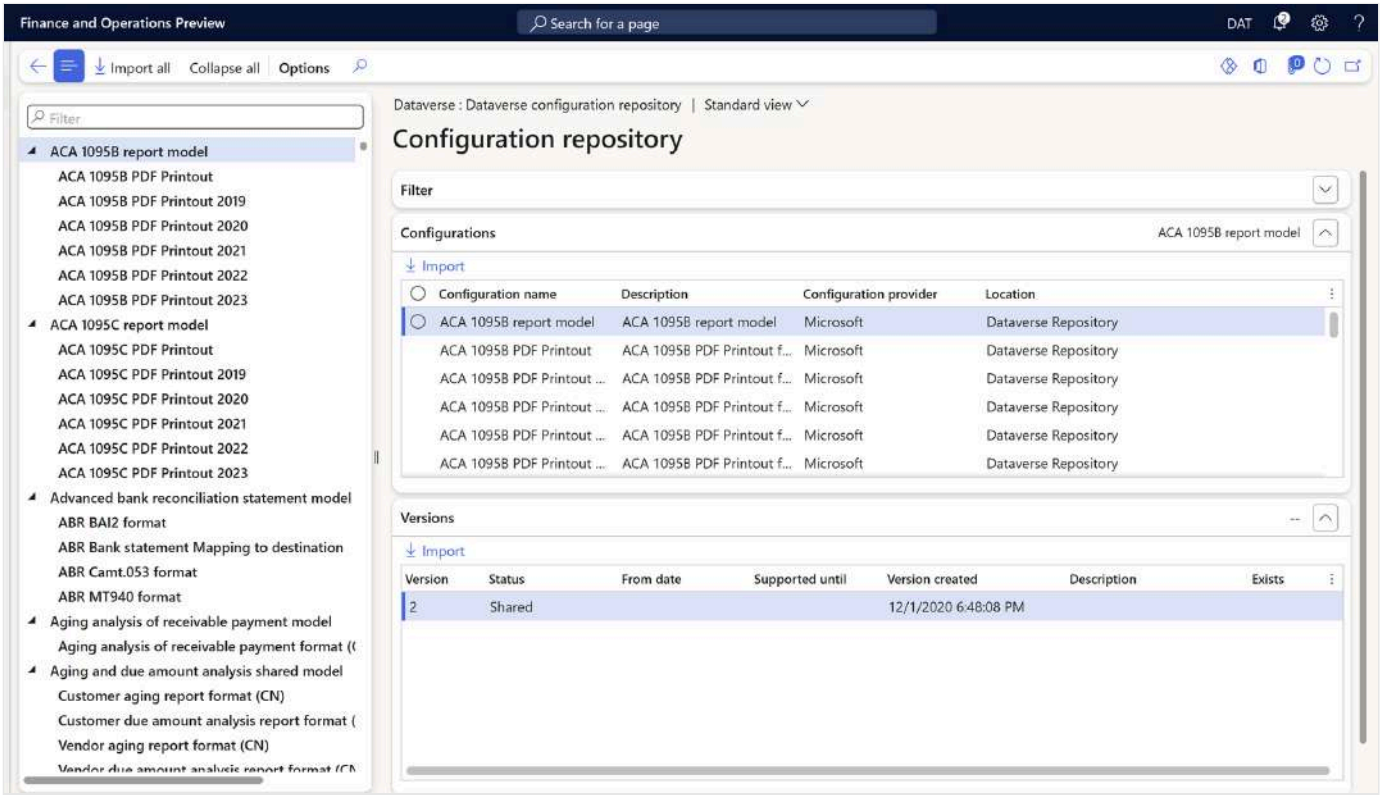
> ⓘ **Note**

It can take up to two weeks for a new ER configuration released by Microsoft or a new version of an ER configuration released by Microsoft to appear in the Dataverse configuration repository. If you expect a configuration update but don't see it in the Dataverse configuration repository, or if auto-updates are disabled in your environment, you can manually trigger the update of the Globalization solution package in your Power Platform admin center portal. To learn more about updating solutions in Power Platform admin center, see Manage Dynamics 365 apps.

To import a single configuration, follow these steps:

1. On **Configuration repository**, in the configurations tree, select the ER configuration that you want.
2. On the **Versions** FastTab, select the required version of the selected ER configuration.
3. Select **Import** to download the selected version from the Dataverse to the current Dynamics 365 Finance instance.

> **Note**
>
> The **Import** button is unavailable for ER configuration versions that are already present in the current Dynamics 365 Finance instance.



Review configuration prerequisites before import

Starting in version 10.0.47 of Dynamics 365 Finance apps, before you import an ER configuration version, you can review its prerequisites and verify that your environment meets all requirements. This process helps you identify potential issues, such as missing dependent configurations or an incompatible application version, before you start the import.

View prerequisites for a configuration version

To view the prerequisites for a specific configuration version, follow these steps:

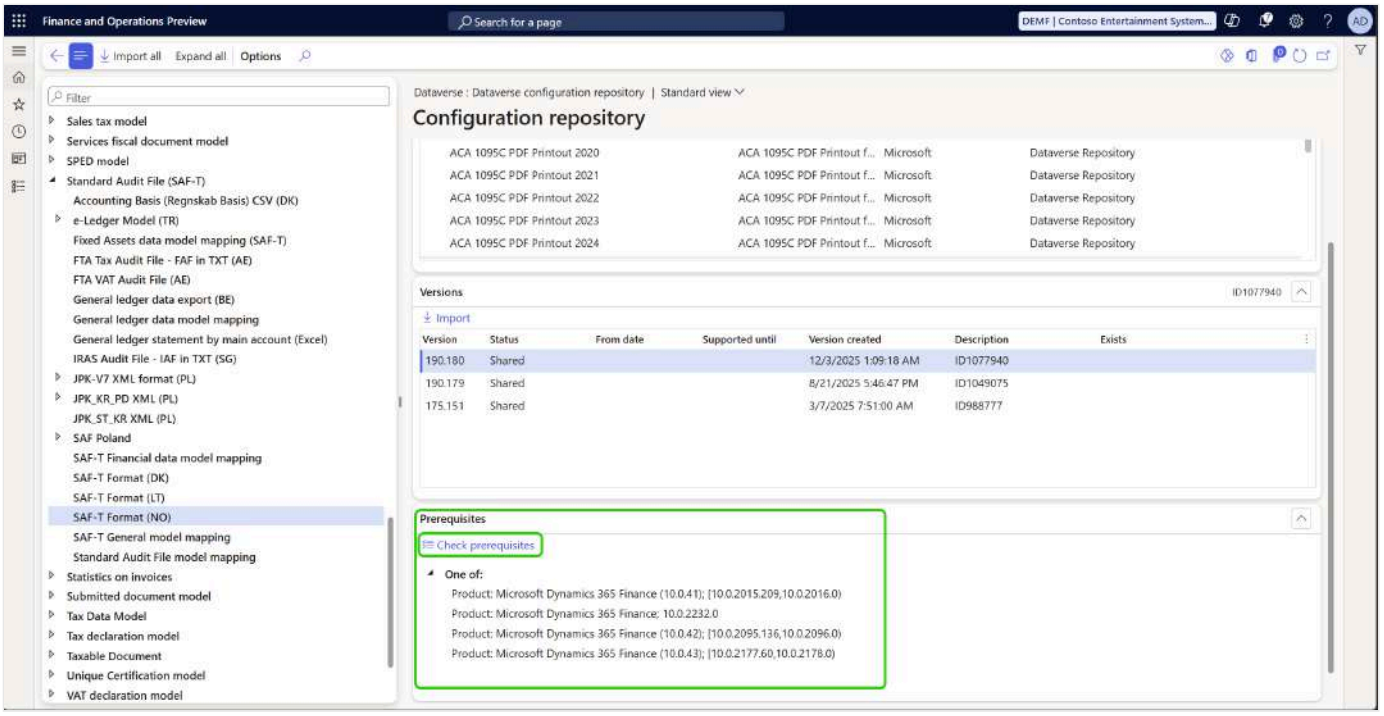
1. On **Configuration repository**, in the configurations tree, select the ER configuration that you want.

2. On the **Versions** FastTab, select the required version of the selected ER configuration.

3. On the **Prerequisites** FastTab, review the list of prerequisites for the selected configuration version.

   The **Prerequisites** FastTab shows the following types of requirements:

   - **Configuration** – Other ER configurations that must be present in the current Dynamics 365 Finance instance before you can import the selected version. Prerequisites might be organized into groups:
     - **All of** – All configurations in the group must be available.
     - **One of** – At least one configuration in the group must be available.
   - **Product** – The minimum Dynamics 365 Finance application version that is required.



Check prerequisites before import

To proactively validate that your environment meets all prerequisites for a configuration version, follow these steps:

1. On **Configuration repository**, in the configurations tree, select the ER configuration that you want.

2. On the **Versions** FastTab, select the required version of the selected ER configuration.

3. Select **Check prerequisites**.

   The system validates the following requirements:
   a. The required Dynamics 365 Finance application version is installed.
   b. All required ER configuration dependencies are available in the current instance.

   If any prerequisite isn't met, the validation results show the specific gaps and provide guidance about how to resolve them.

> **Tip**
>
> By checking prerequisites before you import, you can avoid failed imports and reduce troubleshooting time, especially in environments where configuration updates are applied regularly.

Error messages for failed imports

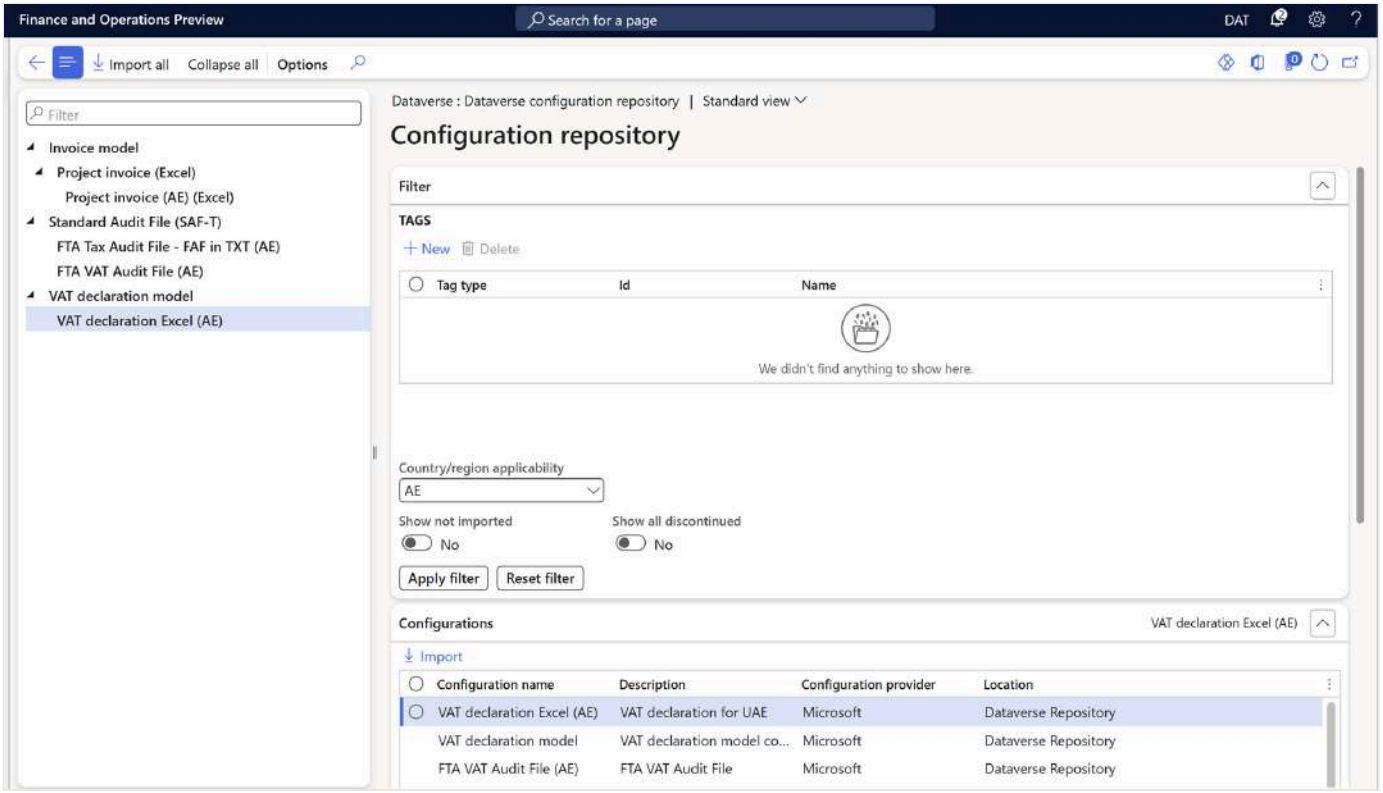
If you import a configuration version that has unmet prerequisites, the system provides an error message that explicitly identifies the missing prerequisites. The error message includes:

- The name and version of the missing prerequisite configuration.
- The required application version or platform build, if applicable.

Import filtered configurations

To import filtered configurations, follow these steps:

1. On **Configuration repository**, on the **Filter** FastTab, in the **Tags** grid, add any needed tags.
2. In the **Country/region applicability** field, select the appropriate country/region codes.
3. Select **Apply filter**.
4. The **Configurations** FastTab shows all the configurations that satisfy the specified selection conditions. Select **Import** to download the filtered configurations from Dataverse to the current Dynamics 365 Finance instance.
5. Select **Reset filter** to remove the specified selection conditions.



> **Note**
>
> - Depending on the ER settings, the system validates configurations after you import them. You might see a notification about any inconsistency problems that it finds. You

must fix these problems before you can use the imported configuration version. For more information, see the list of related resources for this article.

- You can configure ER configurations as dependent on other configurations. Therefore, when you import a selected configuration, the system might automatically import other configurations. For more information about configuration dependencies, see Define the dependency of ER configurations on other components.

Upload ER configurations and Globalization features as a Dataverse solution

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Regulatory Configuration Service (RCS) will be deprecated. All new RCS provisioning is stopped as of 10.0.39 GA. If provisioning is required, please register a support ticket. We will be providing tools and required support for migration from RCS to the **Globalization Studio** workspace. We plan to fully shut down RCS by August 1, 2024. For more information about migration to **Globalization Studio** workspace, see Regulatory Configuration Service merge to the Globalization Studio workspace

You can use Microsoft Dataverse solutions for Application Lifecycle Management (ALM) scenarios. For example, you can move Electronic reporting (ER) configurations to other environments or share them with other tenants via Marketplace.

You can also export and import specific versions as a file by using the export and import buttons on the page (existing functionality).

Prerequisites

- Install PowerShell 7. For more information, see Installing PowerShell on Windows.
- Install Microsoft Power Platform CLI. For more information, see What is Microsoft Power Platform CLI?
- Get the **Generate-GlobalizationDataverseSolution.ps1** script from the Shared asset library/Data package files in Microsoft Dynamics Lifecycle Services (<<Asset type:, Asset name:>>).

Step 1: Export your artifacts

To export your artifacts, follow these steps:

1. Create a folder, such as **C:\DvArtifactsSrc**.
2. Export the .xml files of any ER configurations and the .json files of any Globalization features to the new folder.

   > **ⓘ Important**
   >
   > Don't include Microsoft configurations.

Step 2: Create a Dataverse solution

To create a Dataverse solution, follow these steps:

1. Create a solution in Dataverse, and export it. For more information, see Create a solution and Export solutions.
2. Extract the new solution by using the **pac solution unpack** command. Here's an example:

   command

   ```
   pac solution unpack --zipfile C:\SampleEmptySolution.zip --folder
   C:\SampleSolutionUnpacked
   ```

   For more information, see pac solution unpack.

Step 3: Run the script

- Run the **Generate-GlobalizationDataverseSolution.ps1** script in PowerShell 7. Specify the following parameters:
  - **DvArtifactsSrcFolder** – Specify the working folder.
  - **SolutionFolder** – Specify the solution folder.
  - **ConfigurationsIndexRowName** – Specify the name of the Dataverse table record that has the index file for configurations. Use only alphanumeric characters and spaces. If you change the name later, the corresponding row in the Dataverse table has a different globally unique identifier (GUID), and index files are duplicated. If you don't have any ER configurations, you can omit this parameter. Here's an example.

    command

```
Contoso Electronic Reporting Configurations Index
```

- **FeaturesIndexRowName** – Specify the name of the Dataverse table record that has the index file for features. Use only alphanumeric characters and spaces. If you change the name later, the corresponding row in the Dataverse table has a different GUID, and index files are duplicated. If you don't have any Globalization features, you can omit this parameter. Here's an example.

  command

  ```
  Contoso Globalization Features Index
  ```

  Here's an example of the full PowerShell 7 command line.

  command

  ```
  pwsh -ExecutionPolicy RemoteSigned -File C:\Generate-
  GlobalizationDataverseSolution.ps1 -DvArtifactsSrcFolder C:\DvArtifactsSrc -
  SolutionFolder C:\SampleSolutionUnpacked -configurationsIndexRowName
  "Contoso Electronic Reporting Configurations Index" -featuresIndexRowName
  "Contoso Globalization Features Index"
  ```

Step 4: Pack the solution

- Pack the solution by using the **pac solution unpack** command. Here's an example.

  command

  ```
  pac solution pack --zipfile C:\SampleSolutionWithContents.zip --folder
  C:\SampleSolutionUnpacked --packagetype Both
  ```

  For more information, see pac solution unpack.

> **Note**
>
> Check the size of the generated .zip file. If it exceeds 90 megabytes (MB), you must split your source files into multiple Dataverse solutions.

Step 5: Import the solution into Dataverse

1. Import the solution back into Dataverse. For more information, see Import solutions.

You can also use the pac solution import command.

> **Note**
>
> After you import the solution into Dataverse, there's no way to remove it together with the content. Although you can remove the solution, all inserted table records remain and must be manually cleaned up.

2. Publish your app on Marketplace. For more information, see Publish your app on Marketplace.

Create a Dataverse solution using Upload into repository

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Starting with version 10.0.40, instead of manually creating a Dataverse solution as described in Upload ER configurations and Globalization features as a Dataverse solution, you can use the **Upload into repository** functionality to upload one or all of your custom Electronic reporting (ER) configurations and Globalization features.

To use this functionality, you need a Dataverse environment that's connected to your Dynamics 365 Finance environment. You also need to add a security role to access tables in Dataverse by following these steps:

1. Create a new security role as described in Create or edit a security role.
2. In that security role, add **Create, Read, Write, Delete, Append, Append to, Assign, Share** permissions for the **Organization** to the following tables: **Solution, Publisher, Electronic Reporting Configuration File, Electronic Reporting Configurations Index File, Globalization Feature File, and Globalization Features Index File**.
3. Assign the created security role to users as described in Assign security roles.

The process of creating a Dataverse solution by using **Upload into repository** has three phases:

1. Create a Dataverse configuration repository.
2. Export configurations to Dataverse.
3. View configurations as a Dataverse solution.

The following sections describe each phase.

Create a Dataverse configuration repository

Create a Dataverse configuration repository for your active configuration provider.

To create a Dataverse configuration repository, follow these steps:

1. Sign in to the Dynamics 365 Finance app by using one of the following roles:

- Electronic reporting developer
- Electronic reporting functional consultant
- System administrator

2. Go to **Organization administration** > **Workspaces** > **Globalization studio**.

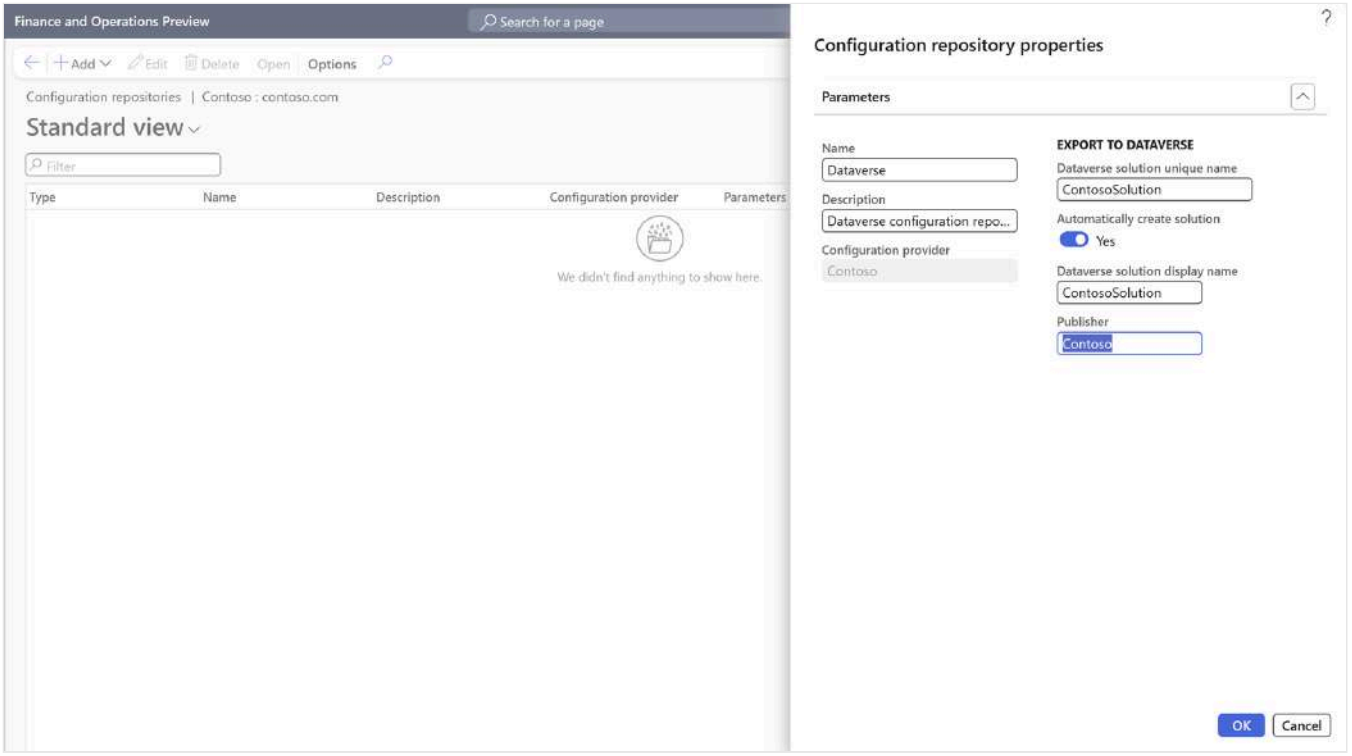
3. In the **Configuration providers** section, select the tile that has your provider (for example, Contoso).

4. On the **Contoso** tile, select **Repositories**.

5. Select **Add**.

6. In the **Configuration repository properties** dialog box, set up parameters for the Dataverse solution that is associated with the new repository.

   If you set the **Automatically create solution** option to **Yes**, the system creates the solution for you. If you leave the **Publisher** field blank, a default publisher is used.



Export configurations to Dataverse

After you create the repository, you can export configurations to Dataverse.

To export configurations to Dataverse, follow these steps:

1. To upload a single configuration version that has a status of **Completed**, use the **Upload into repository** button on the **Versions** FastTab of the **Electronic reporting**

Configurations page. The system uploads all parent configuration versions to make the solution independently deployable.

2. To upload all the latest **Completed** configuration versions with the active provider, select **Upload all configurations into repository** on the **Configurations** tab on the Action Pane of the **Electronic reporting Configurations** page. Then use the **Upload into repository** dropdown dialog box.

View configurations as a Dataverse solution

If you set the **Automatically create solution** option to **Yes** when you create a Dataverse repository for your configuration provider, after you upload your configurations, a new solution appears in the Power Apps maker portal.

When you upload additional configuration versions, the system adds the new configuration versions to the same solution as the files.

Electronic invoicing service overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Electronic invoicing for Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management is a hyper-scalable multitenant service that enables configurable processing of electronic invoices and configurable electronic document exchange. You can fully configure the processing and integration rules, and the service runs the logic outside Finance and Supply Chain Management. The service mainly targets processing electronic invoices in various scenarios. However, you can configure it for other scenarios and different types of documents.

Electronic invoicing can help you achieve the following goals:

- Fast and easy adoption of country/region-specific requirements
- Standardized implementations of an electronic invoicing solution
- Enhanced traceability of document history
- A shorter implementation cycle
- Reduced total cost of ownership (TCO)
- Easily adjustable configurations that don't require code changes
- Simplified configuration packaging
- Built-in export, import, and integration, and easy extensibility in the processing of electronic invoice documents
- Easy reuse of the same export, import, and integration configurations across companies

Service availability

Currently, Finance and Supply Chain Management customers can use the electronic invoicing functionality. For more information, see the license terms and conditions for your application.

Because functionality that addresses country/region-specific requirements might be limited at different phases of the release, always review the most up-to-date documentation that highlights the coverage and scope of supported country/region-specific solutions.

You can deploy electronic invoicing in the following Azure geographies:

- United States
- Europe

- United Kingdom
- Asia
- Japan
- Switzerland
- Brazil
- United Arab Emirates
- Australia
- Canada
- France
- India
- Norway
- South Africa

> **Note**
>
> Electronic invoicing doesn't support on-premises deployments.

Feature highlights

- Out-of-box integration with Finance and Supply Chain Management
- A consistent user experience for the configuration and monitoring of the electronic invoice process for all countries and regions
- Faster, easier, and less expensive adoption of electronic invoicing solutions in new countries or regions
- Configuration of the service through the setup of Globalization features in the Globalization Studio workspace
- Transformation of business data into multiple electronic invoice formats (XML, JSON, TXT, and CSV) by using Electronic reporting (ER) format configurations
- Configurable submission of electronic invoices to external web services, including certification handling through digital signatures
- Handling of responses from web services, including configurable handling of exception messages
- Support for electronic signatures (for example, electronic signatures that use the XMLDSig signing algorithm)
- The capability to send documents to emails and store them in SharePoint
- Batch processing of electronic invoice messages
- Configurable transformation of incoming documents and processing of those documents in Finance and Supply Chain Management
- The capability to receive incoming documents from channels such as email and SharePoint

Privacy notice

Enabling and using electronic invoicing might require sending limited data, such as your organization's tax registration ID. The system transmits this data to third-party agencies that the tax authorities authorize to send electronic invoices in the predefined formats required for integration with government web services. Data imported from these external systems into this Dynamics 365 online service is subject to our privacy statement. For more information, see the "Privacy notice" section in country/region-specific feature documentation.

Electronic invoicing components

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an overview of the administration and integration components for Electronic invoicing. It includes information about their roles in the setup and operation of Electronic invoicing.

Microsoft Azure

Set up a storage account and create secrets for an Azure Key Vault in your Azure subscription. You fully own and manage these resources.

A storage account is a mandatory component of the Electronic Invoicing service. Use it to store all electronic files that Electronic invoicing processes or generates. Here are some examples of these files:

- Business data from Dynamics 365 Finance and Dynamics 365 Supply Chain Management in a unified structure (JavaScript Object Notation [JSON] format)
- Files that are generated during file generation and transformation
- Incoming external data, such as responses from external web services
- Inbound electronic invoices

A key vault is another mandatory component for working with Electronic invoicing. Use it to store the following items:

- The shared access signature (SAS) token of your storage account. Microsoft supports a high level of security and data privacy. Therefore, store your SAS token as a secret in Azure Key Vault instead of using it directly.
- Secrets, accounts, and passwords that you use in different scenarios.
- Certificates that have secrets for digital signing and for establishing a trusted connection with external web services.

Microsoft Dynamics Lifecycle Services

Use Microsoft Dynamics Lifecycle Services to enable the Electronic invoicing add-in for your Lifecycle Services deployment project.

> **Note**
>
> Installation of add-ins in Lifecycle Services requires at least a Tier 2 environment. For more information about environment planning, see **Environment planning**.

Finance and Supply Chain Management

Currently, Microsoft supports out-of-the-box integration with Finance and Supply Chain Management as the main billing system that works with the Electronic Invoicing service to generate and submit electronic invoices (*outbound electronic documents*), and to receive electronic invoices from vendors (*inbound electronic documents*).

Finance and Supply Chain Management generate business data in a unified structure and then submit it, together with additional metadata (*context*), to Electronic invoicing. They then request the status of the documents that Electronic invoicing is processing.

The detailed results come as a log that's linked to the generated electronic files or other data that's related to the submitted documents. Depending on the scenario, the system updates Finance and Supply Chain Management data. For example, it updates the invoice status or externally provided universally unique identifiers (UUIDs) of invoices that are registered with the tax authority.

For more information about Electronic invoicing components and how to set them up, see Set up Electronic invoicing.

Electronic invoicing configuration

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an overview of the process for setting up and configuring Electronic invoicing. Complete the setup steps in the order specified here. If you skip a mandatory step, the functionality won't work correctly, and multiple failures occur during subsequent steps or when you use the functionality.

Install the add-in for Electronic invoicing microservices

The Electronic Invoicing service is a set of microservices that's hosted in Microsoft datacenters. By default, customers of Dynamics 365 Finance and Dynamics 365 Supply Chain Management don't have access to the Electronic Invoicing service. You must install it as an add-in in Microsoft Dynamics Lifecycle Services. When you install the add-in, you register your Finance or Supply Chain Management environment in the register of applications that are allowed to connect to the Electronic Invoicing service.

To register an environment, follow these steps:

1. Sign in to your Lifecycle Services account.
2. On the project dashboard, select a Lifecycle Services project.
3. In the project, on the **Environments** dashboard, select your deployed environment. The environment that you select must be running.
4. On the **Power Platform Integration** tab, in the **Environment add-ins** section, select **Install a new add-in**.
5. Select **Electronic Invoicing**.
6. In the **AAD application ID** field, enter the fixed value **091c98b0-a1c9-4b02-b62c-7753395ccabe**. This value is always fixed. Make sure that you enter only a globally unique identifier (GUID). Don't include any other symbols, such as spaces, commas, periods, or quotation marks.
7. In the **AAD tenant ID** field, enter the Microsoft Entra ID tenant ID of your Azure subscription account.
8. Review the terms and conditions, and then select the checkbox.

9. Select **Install**. After a few minutes, the status changes from **Installing** to **Installed**. You might have to refresh the page to see this change.

> ⓘ **Note**
>
> Companies usually have several Finance or Supply Chain Management environments. These environments include production environments, user acceptance testing (UAT) environments, and development (sandbox) environments. You must complete the preceding procedure for all environments that you want to connect to Electronic invoicing.

Enable Electronic invoicing integration

To enable communication between Electronic invoicing and Finance or Supply Chain Management, you must enable the **Electronic Invoicing integration** feature.

1. In the **Feature management** workspace, on the **All** tab, search for the **Electronic invoicing integration** feature. If this feature doesn't appear on the page, select **Check for updates**.
2. Select the feature, and then select **Enable now**.

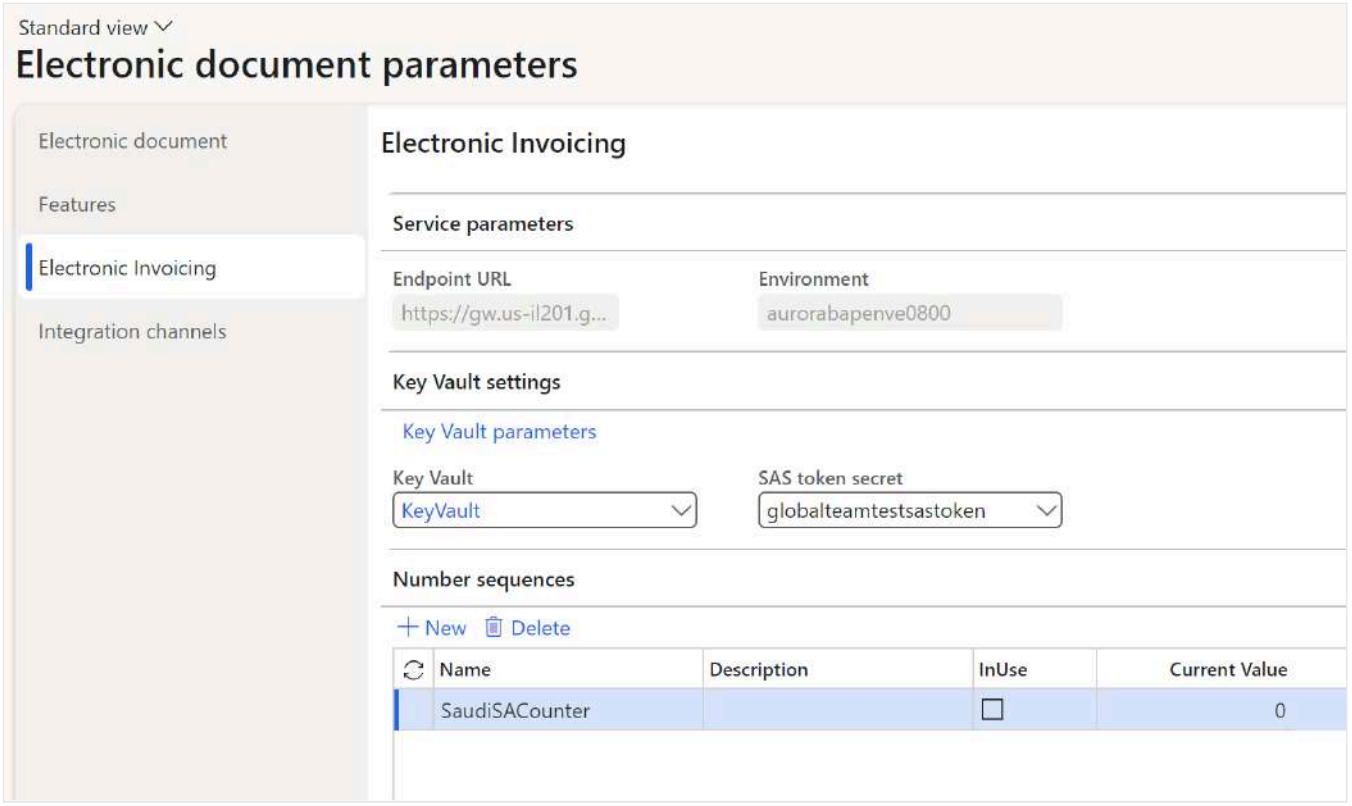
> ⓘ **Note**
>
> Before you work with Globalization features, the **E-Invoicing designer workspace** feature is enabled by default. However, after the Electronic Invoicing service add-in is installed, there's a delay of 45 minutes before the feature is enabled.

Service environment configuration

> ⓘ **Note**
>
> The following procedure is required if the Regulatory Configuration Service (RCS) experience was previously used to configure the Electronic Invoicing service. If you're doing the initial configuration of the Electronic Invoicing service through Globalization Studio, you can skip this procedure.

1. Identify one of the previously deployed service environments. This environment is the only one that you configure in the Globalization Studio and then use by the Electronic Invoicing service.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. On the **Electronic invoicing** tab, on the **Service parameters** FastTab, in the **Environment** field, enter the name of the environment that you identified in step 1.



> **Important**
>
> After the initial configuration of **Electronic document parameters**, the field for the service environment name becomes unavailable. Therefore, you must finalize the name of the relevant service environment in advance.

Configure the Azure resources for Electronic invoicing

Set up the Azure resources that Electronic invoicing requires to do its work. For more information, see Set up Azure resources for Electronic invoicing.

Configure Globalization features

Implement different scenarios for processing electronic documents by using Globalization features. A Globalization feature is a set of components that define the rules for data transformation and further processing of electronic documents, such as sending them to or receiving them from external channels. You can use Globalization features that Microsoft

provides, or you can create your own. For more information about how to work with Globalization features, see Globalization feature components.

> **Note**
>
> If your scenarios require integration with email or SharePoint to process inbound electronic documents, see **Process incoming electronic documents** for information about how to set up and use those channels.

Configure Electronic invoicing parameters

For additional configuration steps related to Electronic invoicing, see Configure Electronic invoicing parameters.

Last updated on 12/18/2025

Configure Electronic invoicing parameters

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Import ER configurations from the repository

To submit electronic documents to the Electronic invoicing service, you need to generate a message in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. This message must follow a unified structure that matches the structure of the Electronic reporting (ER) invoice model and metadata (*context*). Because ER generates the message, you can customize and flexibly adjust its structure.

Before you can submit documents to Electronic invoicing and process responses, you must import ER configurations from the repository and define them in parameters.

> **Note**
>
> Most of the ER configurations mentioned in the following procedure are automatically imported when you import related Globalization features. For more information, see Import features from the repository. If you need to reimport configurations, use the following procedure.

To set up, adjust, or review electronic documents directly in your Finance or Supply Chain Management environment, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile.
2. In the **Configuration providers** section, select the **Microsoft** configuration provider, and then select **Repositories**.
3. Select the repository of the **Dataverse** type, and then, on the Action Pane, select **Open**.

4. Import the following ER configurations:

    - **Customer invoice context model**
    - **Invoice model**
    - **Fiscal documents** (for Brazilian scenarios, if required)
    - **Retail channel data** (for Saudi Arabian retail-specific scenarios, if required)
    - **Invoices Communication Model** (for Malaysian and Indonesian batch submission scenarios, if required)
    - **Response message model**
    - **Invoice model mapping**
    - **Fiscal documents mapping** (for Brazilian scenarios, if required)
    - **Advance invoice model mapping** (for Polish scenarios, if required)
    - **Retail fiscal document mapping** (for Saudi Arabian retail-specific scenarios, if required)
    - **Pending vendor invoice model mapping** (for Danish responses scenarios, if required)
    - **Invoices communication model mapping (ID)** (for Indonesian batch submission scenarios, if required)
    - **Consolidated Invoice Model Mapping (MY)** (for Malaysian batch submission scenarios, if required)
    - **Invoice status model mapping** (for French lifecycle statuses scenarios, if required)
    - **AR response context** (for French lifecycle statuses scenarios, if required)
    - **AP response context** (for French lifecycle statuses scenarios, if required)

Set up Electronic document parameters

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

2. On the **Electronic document** tab, above the **Electronic reporting** grid, select **Add**.

3. Depending on the scenarios that you want to support, enter the following information in the grid, and then save your changes.

Expand table

If you derive a configuration from the configuration that's mentioned in the preceding table, define the new configuration.

> **Note**
>
> By default, configured Electronic document parameters apply to all legal entities. To activate a configuration for specific legal entities, enable the **Electronic documents configuration per legal entities** feature in Feature management. For more information, see Feature management overview.

To set up the rules to process responses from the Electronic Invoicing service, and to update Finance and Supply Chain Management data based on invoices that are processed by the service, set up response types. In most scenarios, this setup is country/region-specific. Therefore, we recommend that you follow the country/region-specific instructions. For more information, see Availability of Electronic Invoicing Service features by country or region.

Create a Key Vault reference

1. On the **Electronic document parameters** page, on the **Electronic Invoicing** tab, on the **Key Vault settings** FastTab, select **Key Vault parameters**.

2. On the **Key Vault parameters** page, select **New** to create a Key Vault reference.

3. In the **Name** field, enter the name of the Key Vault reference.

4. In the **Description** field, enter a description.

5. In the **Key Vault URI** field, paste the Key Vault URI from the key vault (`https://<your key vault>.vault.azure.net/`). For more information, see Create an Azure Key Vault in the Azure portal.

6. In the **Certificates** section, select **Add**.

7. In the **Name** field, enter the name of the storage account secret or certificate. This name should match the name of the Key Vault secret that holds the shared access signature (SAS) token of the storage account. For more information, see Create an Azure storage account in the Azure portal.

8. In the **Description** field, enter a description.

9. In the **Type** field, select either **Secret** or **Certificate**, depending on what you're configuring.

> **Note**
>
> In some scenarios, you must use public certificates that have the .cer file name extension. However, Key Vault doesn't support importing and storing certificates of this type as Key Vault certificates. In these scenarios, save the .cer file as a Base-64-encoded X.509 (.CER) string. Then, in a Key Vault secret, store the string that appears between the **BEGIN CERTIFICATE** line and the **END CERTIFICATE** line in the file. In the service environment, you should still create a reference to the Key Vault record and set the **Type** field to **Certificate**.
>
> Alternatively, use the following PowerShell script to generate a Base-64 string of the .cer certificate file.

PowerShell

```
$FilePath = ''
$Cer = New-Object -TypeName
System.Security.Cryptography.X509Certificates.X509Certificate2($FilePath)
$BinCert = $Cer.GetRawCertData()
```

```
$Base64Cert = [System.Convert]::ToBase64String($BinCert)
echo $Base64Cert
```

10. If your specific scenarios require a chain of certificates to apply digital signatures or establish a secure (Secure Sockets Layer [SSL]) connection to external web services, create a chain of certificates where the certificates are in the following order: *Root certificates* > *Intermediate certificates* > *End-user certificates*. Root certificate authorities (CAs) are a trusted source of certificates. Intermediate CA certificates are bridges that link the end-user certificates to the root CA certificates. To create and set up a chain of certificates, follow these steps:
    a. On the Action Pane, select **Chain of certificates**.
    b. Select **New** to create a chain of certificates.
    c. In the **Name** field, enter the name of the chain of certificates.
    d. In the **Description** field, enter a description.
    e. In the **Certificates** section, select **Add** to add a certificate to the chain.
    f. Use the **Up** or **Down** button to change the position of the certificate in the chain. Keep the CA root certificate at the top of the list and the end-user certificate at the bottom.
    g. Save the data, and close the **Chain of certificates** page.

11. Save the data, and close the **Key Vault parameters** page.

12. In the **Key Vault** field, select the key vault that you created in previous steps.

13. In the **Storage SAS token secret** field, select the name of the storage account secret that must be used to authenticate access to the storage account.

Configure number sequences

If your scenarios require number sequences, such as in file names, use number sequences that work across globalization features or number sequences for a specific globalization feature. After you define a number sequence, use it in variables and processing pipelines. To track the use of a number sequence, check the **Current Value** field and the selected **In use** checkbox on the **Number sequences** FastTab on the **Electronic Invoicing** tab of the **Electronic document parameters** page.

To create a number sequence, select **New** on the **Number sequences** FastTab. Then enter a name and description.

To delete a number sequence, select **Delete**.

Inactivate legacy Electronic invoicing functionality

To deactivate old (legacy) ER functionality for some features, and to activate additional functionality in Finance and Supply Chain Management for some country/region-specific scenarios, enable the corresponding feature on the **Features** tab of the **Electronic document parameters** page.

When you enable a feature in the list, the legacy functionality is deactivated for the corresponding country or region and feature name.

Last updated on 04/29/2026

Configure Azure resources for Electronic invoicing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The process for setting up Microsoft Azure resources for Electronic invoicing has three steps. The first two steps, "Create an Azure Key Vault in the Azure portal" and "Create an Azure storage account in the Azure portal," are mandatory. The third step, "Configure a SharePoint connection," is optional. These steps can be completed by using any of the following methods:

- Use the Azure portal user interface (UI).
- Run an Azure PowerShell script.
- Deploy an Azure Resource Manager (ARM) template.

If you prefer to use the Azure portal UI, continue with this article. If you prefer to use the PowerShell script or an ARM template, see Create Azure resources using Azure PowerShell or ARM templates.

Create an Azure Key Vault in the Azure portal

Create a key vault in your Azure subscription. Create a separate key vault for Electronic invoicing, and don't combine secrets with other applications. Create as many secrets and certificates as you require for your scenarios for electronic documents. You must create at least one secret to store the shared access signature (SAS) token of the Azure storage account that you create in the next step.

For information about how to complete this step, see Create an Azure Key Vault in the Azure portal.

Create an Azure storage account in the Azure portal

You own all the electronic documents and files that the Electronic Invoicing service generates or that enter the service. Store those documents and files in an Azure storage account that you

create in your Azure subscription. The service accesses your storage account by using the SAS token that's taken from your Key Vault secret.

For information about how to complete this step, see Create an Azure storage account in the Azure portal.

Configure a SharePoint connection

In some scenarios, you need to save electronic files to SharePoint and retrieve them from SharePoint. To ensure that the Electronic Invoicing service can access your SharePoint folders, configure access to SharePoint.

For information about how to complete this step, see Configure a SharePoint connection.

Last updated on 03/21/2026

Configure an Azure Key Vault in the Azure portal

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

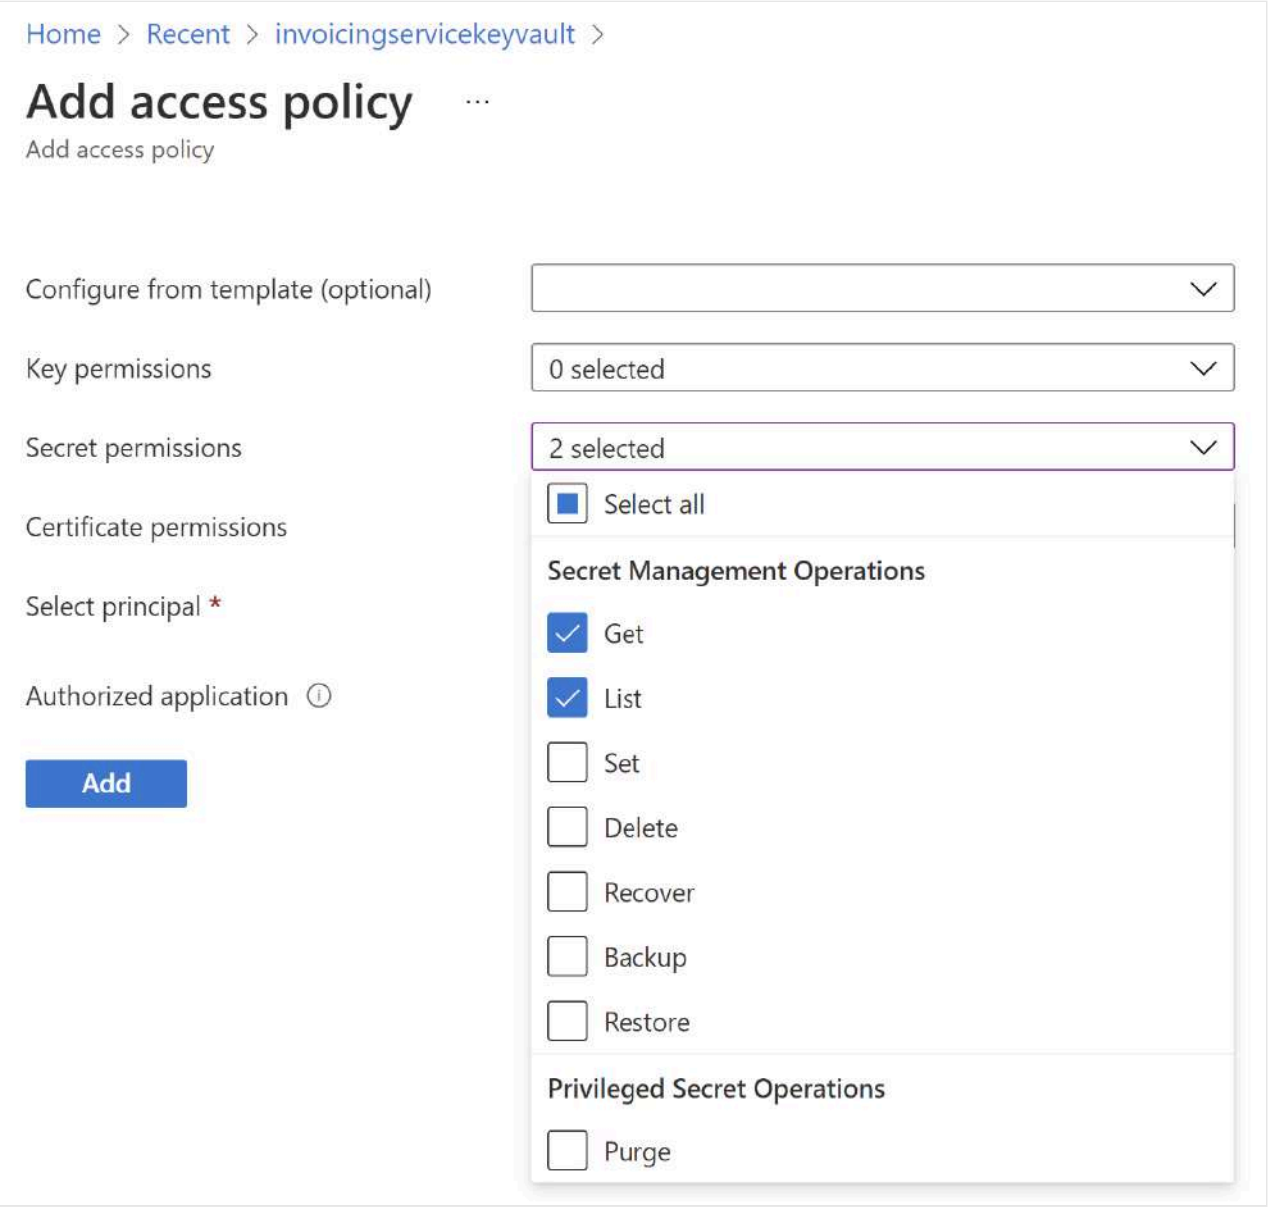
All the secrets and certificates that are used in the Electronic Invoicing service must be stored in a Microsoft Azure Key Vault. This approach helps ensure that you don't work directly with the secrets, and that the secrets are securely stored. When you must use digital signing or secure a connection to external web services, set the reference to the Key Vault secrets and certificates instead of using the secrets and certificates directly.

1. Create a key vault in the tenant that you use for the Dynamics 365 Finance environment. For more information, see Create a key vault using the Azure portal.

   Next, set up the access policy to grant the Electronic Invoicing service the correct level of secure access to the secret that you created.

2. Go to **Settings** > **Access policies**, and select **Add Access Policy**.

3. In the **Secret permissions** field, select the **Get** and **List** operations.



4. In the **Certificate permissions** field, select the **Get** and **List** operations.

5. In the **Select principal** field, select **None selected**.

6. In the **Principal** dialog box, select the principal by adding **e-Invoicing Service**.

> **Note**
>
> If **e-Invoicing Service** isn't in the list of principals in your tenant, run the following command in the Azure portal.
>
> ```
> New-AzureADServicePrincipal -AppId "ecd93392-c922-4f48-9ddf-10741e4a9b65"
> ```

7. Select **Add**, and then select **Save**.

8. On the **Overview** page, copy the value of the Domain Name System (DNS) name for the key vault. Use this value during the setup of Electronic invoicing parameters in Finance

and refer to it as the **Key Vault URI** value. For more information about how to set up Electronic invoicing parameters, see Configure Electronic invoicing parameters.

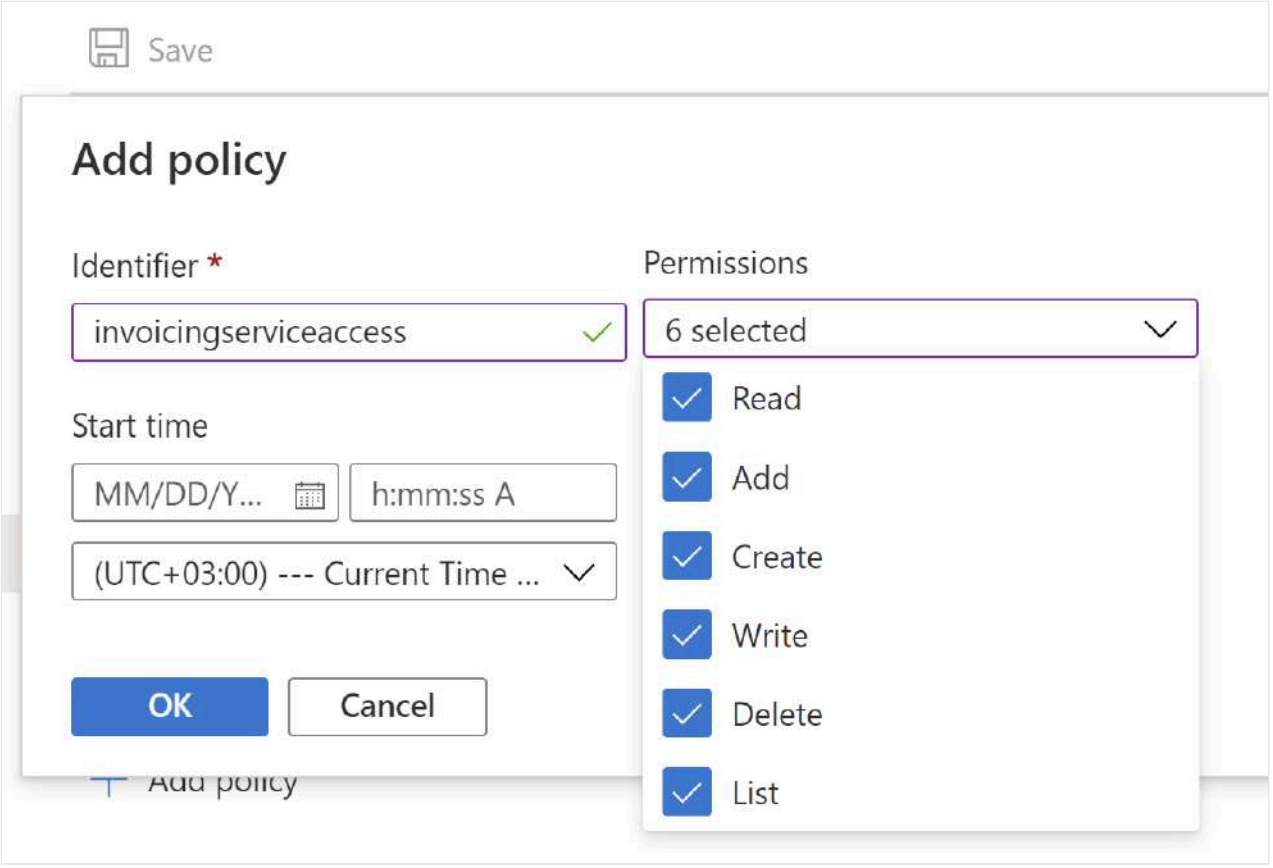
Configure an Azure storage account in the Azure portal

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Electronic Invoicing service stores all electronic files it generates or processes in containers within your Microsoft Azure storage account. To ensure that the Electronic Invoicing service can access these containers, you must provide the shared access signature (SAS) token of the storage account to the service. To keep the token secure, don't provide the SAS token directly. Instead, store it in an Azure Key Vault and provide a Key Vault secret.

1. Open the storage account that you plan to use with the Electronic Invoicing service.
2. Go to **Settings** > **Configuration**, and make sure that the **Allow Blob public access** parameter is set to **Enabled**.
3. Go to **Data storage** > **Containers**, and create a container.
4. Enter a name for the container, and set the **Public access level** field to **Private (no anonymous access)**.
5. Open the new container, and go to **Settings** > **Access policy**.
6. Select **Add policy** to add a stored access policy.
7. Set the **Identifier** field as appropriate.
8. In the **Permissions** field, select all permissions.



9. Enter the start and end dates. The end date should be in the future.
10. Select **OK** to save the policy, and then save your changes to the container.
11. Go to **Settings** > **Shared access tokens**, and set the field values.
12. Enter the start and end dates. The end date should be in the future.
13. In the **Permissions** field, select the following permissions:
    - Read
    - Add
    - Create
    - Write
    - Delete
    - List
14. Select **Generate SAS token and URL**.
15. Copy and store the value of the **Blob SAS URL** field. You'll use this value later in this procedure and refer to it as the *shared access signature URI*.
16. Open the key vault that you intend to use with Electronic invoicing.
17. Go to **Settings** > **Secrets**, and select **Generate/Import** to create a secret.

18. On the **Create a secret** page, in the **Upload options** field, select **Manual**.
19. Enter the name of the secret. Use this name during the setup of the service in Dynamics 365 Finance and refer to it as the *key vault secret name*. For more information about how to set up Electronic invoicing parameters, see Configure Electronic invoicing parameters.
20. In the **Value** field, enter the shared access signature URI that you copied earlier.
21. Select **Create**.

Create an Azure file share in the Azure portal

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Electronic documents that the Electronic Invoicing service generates can be stored in a Microsoft Azure file share that is provisioned under a storage account. To ensure that Electronic invoicing can access the file share, you must provide the connection string to the Electronic Invoicing service. In addition, to ensure that the connection string is securely stored, don't provide it directly. Instead, store it in an Azure Key Vault, and provide an Azure Key Vault secret.

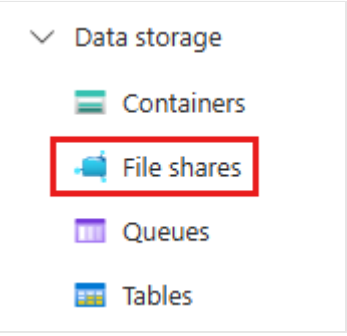
Prerequisites

Before you begin the procedures in this article, create an Azure storage account. To learn more, see Configure an Azure storage account in the Azure portal.

Create an Azure file share

To create an Azure file share, follow these steps:

1. Select the storage account from your dashboard.
2. On the service menu, under **Data storage**, select **File shares**.



3. At the top of the **File shares** page, select **File share**.
4. On the **New file share** page, in the **Name** field, enter a name for the new file share.

> **Note**
>
> File share names can contain only lowercase letters, numbers, and hyphens. However, they can't contain two or more consecutive hyphens. In addition, they must begin and end with either a lowercase letter or a number.

5. To create the Azure file share, select **Review + create**, and then select **Create**.

To get the connection string, follow these steps:

1. Go to the Azure portal with your subscription, and find the corresponding Storage account resource.
2. Go to **Security + Networking** > **Access keys**.
3. Under **key1**, copy the value in the **Connection string** field.

4. Store the **Connection string** value in a Key Vault secret. To learn how to set up Key Vault, see Configure an Azure Key Vault in the Azure portal.
5. Refer to the Key Vault secret in Key Vault parameters. To learn more, see Configure Electronic invoicing parameters.

> **Important**
>
> Don't confuse the **Connection string** value with the **Storage shared access signature (SAS)** token.

Create a SharePoint connection

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Electronic Invoicing service can read files from Microsoft SharePoint folders and upload files to SharePoint. To ensure that the Electronic Invoicing service can access a specific SharePoint site, you must provide the site credentials to the Electronic Invoicing service. To ensure secure storage of the credentials, don't provide them directly. Instead, store them in an Azure Key Vault, and provide a Key Vault secret.

Grant access to a SharePoint folder

1. Create an app registration in the tenant where you installed the Dynamics 365 Finance environment.
   a. Sign in to the Azure portal.
   b. Go to **App registrations**.
   c. Select **New registration**.
   d. Enter a name, such as **SharePoint App for Electronic Invoicing**, and complete the registration.
   e. Select the new app registration.
   f. On the **Authentication** tab, enable the **Allow public client flows** option.
   g. On the **Certificates & secrets** tab, select **New client secret** to create a client secret.
   h. Copy the value of the secret that you created.

   Follow these guidelines:

   - Don't use the same app registration for different services.
   - Follow the password policy recommendations.
   - Set up rotation of passwords. During rotation, create a new client secret for the app registration, update the key vault, and then delete the old secret.

2. Save the **App Registration secret** and **Application (client) ID** values as two new secrets in the key vault in the setup of your Electronic invoicing parameters.

3. Add the secrets that you created to the Key Vault parameters in the setup of your Electronic invoicing parameters. For more information, see Configure Electronic invoicing

parameters.

4. In the Azure portal, grant access to SharePoint. The tenant administrator should complete this step.

   a. Select the app registration that you created.

   b. On the **API permissions** tab, select **Add a permission**.

   c. Select **Microsoft graph (Application permissions)** > **Sites.Selected**.

   d. Select **Grant admin consent for** <***user name***>.

   e. Review the **Status** field to make sure that permissions are granted.

   f. Open Graph Explorer, and sign in.

   g. In the left pane, on the **Sample queries** tab, under **SharePoint Sites**, select **get SharePoint site based on relative path of the site**.

   h. Fill in the **{host-name}** and **{server-relative-path}** parameters. For example, fill in `<domain>.sharepoint.com` for **{host-name}** and `sites/<siteName>` for **{server-relative-path}**.

> **Note**
>
> For the default website, leave the **{server-relative-path}** parameter blank.

   i. Select **Run query**, and save the result.

   j. Configure the following query.

```
POST https://graph.microsoft.com/v1.0/sites/{site-id}/permissions
```

   In this query, **{site-id}** is the value of the **id** node from the previous query response.

   Here's the request body.

```
JSON
```

```
{
    "roles": [
        "read",
        "write"
    ],
    "grantedToIdentities": [
        {
            "application": {
                "id": "{app-id}",
                "displayName": "{app-name}"
            }
        }
    ]
}
```

In this request body, **{app-id}** is the **Application (client) ID** value, and **{app-name}** is the **Application name** value.

k. On the **Modify permissions** tab, select **Open the permissions panel**, and then select **Sites** > **Sites.FullControl.All** > **Consent**.

l. Select **Run query**.

The Electronic Invoicing service now has access to your SharePoint site.

Configure Azure resources for Electronic invoicing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The process for setting up Microsoft Azure resources for Electronic invoicing has three steps. The first two steps, "Create an Azure Key Vault in the Azure portal" and "Create an Azure storage account in the Azure portal," are mandatory. The third step, "Configure a SharePoint connection," is optional. These steps can be completed by using any of the following methods:

- Use the Azure portal user interface (UI).
- Run an Azure PowerShell script.
- Deploy an Azure Resource Manager (ARM) template.

If you prefer to use the Azure portal UI, continue with this article. If you prefer to use the PowerShell script or an ARM template, see Create Azure resources using Azure PowerShell or ARM templates.

Create an Azure Key Vault in the Azure portal

Create a key vault in your Azure subscription. Create a separate key vault for Electronic invoicing, and don't combine secrets with other applications. Create as many secrets and certificates as you require for your scenarios for electronic documents. You must create at least one secret to store the shared access signature (SAS) token of the Azure storage account that you create in the next step.

For information about how to complete this step, see Create an Azure Key Vault in the Azure portal.

Create an Azure storage account in the Azure portal

You own all the electronic documents and files that the Electronic Invoicing service generates or that enter the service. Store those documents and files in an Azure storage account that you

create in your Azure subscription. The service accesses your storage account by using the SAS token that's taken from your Key Vault secret.

For information about how to complete this step, see Create an Azure storage account in the Azure portal.

Configure a SharePoint connection

In some scenarios, you need to save electronic files to SharePoint and retrieve them from SharePoint. To ensure that the Electronic Invoicing service can access your SharePoint folders, configure access to SharePoint.

For information about how to complete this step, see Configure a SharePoint connection.

Last updated on 03/21/2026

Globalization feature components

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A Globalization feature is a set of components that define the rules for data transformation in Electronic reporting (ER) configurations. These components include instructions for processing electronic documents and then sending them to or receiving them from external channels. They also include conditions that define when a feature should run for the incoming business data.

All the components depend on each other. Globalization features make it easy to create and maintain this dependency, and to support lifecycle management and versioning of the set of components.

Access Electronic invoicing feature components

In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.

Globalization features have several components. The **Electronic invoicing features** page includes a separate tab for each component.

- **Version** – This component supports lifecycle management of the feature. Use it to manage status for different versions of the feature.
- **Configurations** – Use this component to manage, view, and edit related ER format and format mapping configurations that are used in the processing pipeline.
- **Setups** – Use this component to manage the setup of the related feature version for users of Globalization services, such as an e-invoicing service. Therefore, it supports the flexible construction of communication and responses rules.
- **Tags** – Use this component to tag features that you can use in the Globalization blueprint for the reference.

Import features from the repository

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Dataverse repository contains electronic invoicing features that you can share with your configuration provider. Microsoft shares all electronic invoicing features with all companies. You automatically get access to all the electronic invoicing features that Microsoft releases and publishes to the Dataverse repository.

To start working with electronic invoicing features that you can share with your configuration provider, import them into your Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management environment from the Dataverse repository. Then, review the feature details, such as the Electronic reporting (ER) configurations and processing pipelines.

Set up integration with Dataverse

To use this functionality, you need a Dataverse environment that's connected to your Dynamics 365 Finance environment. For more information, see the following articles:

- Enable Power Platform Integration
- Connect finance and operations apps with a new Microsoft Dataverse instance
- Connect finance and operations apps with an existing Microsoft Dataverse instance

Also, add a security role to access tables in Dataverse by following these steps:

1. Create a new security role as described in Create or edit a security role.
2. In that security role, add **Create, Read, Write, Delete, Append, Append to, Assign, Share** permissions for **Organization** to the following tables: **Electronic Reporting Configuration File, Electronic Reporting Configurations Index File, Globalization Feature File, and Globalization Features Index File**.
3. Assign the created security role to users as described in Assign security roles.

Import a feature from the Dataverse repository

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. Select **Import** to open the **Import feature from Dataverse repository** lookup.

3. Select **Synchronize** to sync your organization's Finance or Supply Chain Management environment and browse the Electronic invoicing features that are available for a specific configuration provider in the Dataverse repository. After synchronization is completed, the list of available Electronic invoicing features is updated from the Dataverse repository. This update might take a few minutes.
4. Select the feature to import, and then select **Import**.

To view the imported Electronic invoicing feature, make sure that the correct configuration provider is selected. By default, the portal filters out features that the active configuration provider created. You can adjust the filter to view features that other configuration providers created, such as Microsoft.

> **Note**
>
> It can take up to two weeks for a new Electronic invoicing feature released by Microsoft or a new version of a feature released by Microsoft to appear in the Dataverse repository. If you expect a feature update but it doesn't appear in the Dataverse repository, or if auto-updates are disabled in your environment, you can also manually trigger the update of the Globalization solution package in your Power Platform admin center portal. To learn more about how to update solutions in Power Platform admin center, see Manage Dynamics 365 apps.

You can now work with the imported feature. You can review its details and create a new feature by using the imported feature as a template.

> **Note**
>
> You can modify a feature only if the active configuration provider created it. You can create a new feature by using the original feature as a base. You can then make the required changes or set up the parameters.

Additional information

Import Electronic reporting (ER) configurations from Dataverse

---

Last updated on 03/21/2026

Create Globalization features

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can create an Electronic invoicing feature from scratch, or you can base it on an existing feature. When you create a feature from scratch, you must manually add Electronic reporting (ER) configurations and other components, such as the feature setup and application setup details. When you create a feature based on an existing feature, the new feature inherits all the base feature's configurations and parameters. You can review what's copied from the base feature to the new feature.

Create a feature based on an existing feature

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. In the **Configuration provider** field, make sure that you select your active configuration provider. By using this configuration provider, the new Electronic invoicing feature appears in the list after you create it. If you don't select your active configuration provider, the new feature is filtered out of the list.
3. Select **Add**, and then, in the dropdown dialog box, select the **Based on existing version** option.
4. Enter a name and description for the feature.
5. In the **Base feature** field, select the base version of the feature.
6. Select **Create feature**. The feature is created and has a status of **Draft**.
7. Review the feature components to determine whether updates are required:
    - Review the configurations in case you need to customize the ER formats and their binding with format mappings for the feature version.
    - Review the setup in case you need to customize the **Actions** tab, **Applicability rules** tab, or **Variables** tab for the feature version.
8. Complete the setup, and deploy the Electronic invoicing feature. For more information, see Complete and deploy a Globalization feature.

Create a feature from scratch

This section explains how to create an Electronic invoicing feature when the Global repository doesn't include a Globalization feature for your business scenarios.

To create an Electronic invoicing feature, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. Select **Add**, and then, in the dropdown dialog box, select the **New feature** option.
3. Enter a name and description for the Electronic invoicing feature.
4. Select **Create feature**. The first version of the new feature appears on the right side of the page and has a status of **Draft**.

   Next, you must add ER configurations and feature setups. Before you add new or existing ER format configurations, make sure that they exist in your Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management environment.
5. Select the Electronic invoicing feature that you're working on.
6. On the **Configurations** tab, select **Add**.
7. In the **Configurations** grid, browse to and select the format configurations that are required for the processing pipeline (for example, to generate electronic invoice files or process responses from external web services).
8. Select **OK**. You can now use the configurations in actions of the processing pipeline. For more information, see Work with configurations.
9. To add an Electronic invoicing feature setup, create it on the **Setups** tab of the **New feature** page. For more information, see Work with feature setups.
10. Complete the setup, and deploy the Electronic invoicing feature to the service environment. For more information, see Complete and deploy a Globalization feature.

Create file format configurations that are derived from the existing invoice model

You can skip this section if you don't need to create ER configurations but can reuse existing versions as a base.

This procedure shows how to create the file format configurations required for the new Electronic invoicing feature that you want to create. Create the electronic invoice file format

configuration and any other file format configurations that your new Electronic invoicing feature requires.

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. Select **Invoice model** or, for Brazilian scenarios, **Fiscal model**.
3. Select **Create configuration**, and then, in the dropdown dialog box, select the **Format based on data model Invoice** option.
4. Enter a name and description for the format configuration.
5. In the **Format type** field, select the file extension type.
6. In the **Data model definition** field, select the root structure to map your format to. For example, **InvoiceCustomer** is used for the customer invoice formats.
7. Select **Create configuration**.
8. Select the new format configuration.
9. Select **Designer**, and use the Format designer tool to configure the file layout so that it meets the file format specifications.
10. Close the page.
11. On the **Versions** tab, select **Change status** > **Complete**.

Last updated on 03/18/2026

Delete Globalization features

You can delete an Electronic invoicing feature.

To delete an Electronic invoicing feature, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. Select the feature you want to delete from the feature list.
3. Select the **Delete** button. The **Delete** button is located in the workspace toolbar and is only enabled when deletion is allowed for the selected feature.
4. Confirm the deletion when prompted.

> ⓘ **Note**
>
> If you attempt to delete a feature with deployed versions, you receive the following error: `Feature cannot be deleted as it has deployed version. Undeploy version and retry.`

Other Considerations

Feature Relationships

Consider the following before deleting a feature:

Derived Features: If other features are derived from (inherit from) the feature you want to delete, check if those relationships are affected.

- Features can have a base feature relationship tracked in the `Base` field.

Active Provider: You can only delete features owned by the active configuration provider.

- The active provider is set in the ER parameters.

Draft Versions: Features with only draft versions (not deployed) can be deleted freely.

Best Practices

- **Check Dependencies**: Before deleting, verify that no other features depend on this feature as a base.

- **Export Configuration**: Consider exporting the feature configuration to JSON as a backup before deletion.
- **Verify Deployments**: Always double-check that all deployments are properly removed.

Last updated on 02/04/2026

Work with Electronic reporting (ER) configurations

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Electronic reporting (ER) configurations are one of the main sets of components of Electronic invoicing features. An ER configuration contains the setup of the file structure and a set of transformation rules for transforming data in two ways:

- **Export ER format configuration** – This configuration transforms data from the unified internal structure (ER model) to the electronic file format.
- **Import ER format configuration** – This configuration transforms data from the electronic file format to the unified internal structure (ER model).

In addition to generating outbound electronic files in the predefined format, you can use ER configurations to parse incoming messages from external web services as responses. This functionality helps you build configurable logic to get the results of communication with external channels, convert those results (codes, messages, and logs) to a user-readable structure, and then pass that information to the client application.

To start using ER configurations in your Electronic invoicing feature, link them to the feature and make them available on the **Configurations** tab for the current feature version. You can work with a linked ER configuration by selecting **Add**, **Delete**, **Edit**, or **View**.

Before you can add a link to an ER configuration, the configuration must exist in your Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management environment. To review the available ER configurations, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile.
2. In the **Configurations** section, select the **Reporting configurations** tile.

For information about how to create a new ER configuration or import an existing ER configuration from the Global repository, see Electronic reporting.

To adjust a linked ER configuration, select **Edit** on the **Configurations** tab for the current Electronic invoicing feature. The system automatically creates a version of the ER configuration. If the active configuration provider created the current version, the system creates a new

version. If the active configuration provider didn't create the current version, the system creates a derived version that uses your configuration provider. In both cases, you can modify the created version and then automatically make all required updates.

Last updated on 03/21/2026

Configure feature setups

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To set up the generation of electronic files and other processing steps (such as digitally signing files, submitting them to the government web service and receiving a response, or storing them), set up the processing pipeline, applicability rules, and variables for Electronic invoicing features.

Combine the setup information in the *feature setup* concept. You can create, delete, and adjust feature setups. You can also view the setup information for completed versions of Electronic invoicing features.

Create as many feature setup items as you need to define different scenarios for generating, processing, and receiving electronic files. Although these feature setup items have independent processing actions and conditions for execution, they belong to a single Electronic invoicing feature and inherit its lifecycle and deployment process.

Add a feature setup

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. On the **Electronic invoicing features** page, select an Electronic invoicing feature version that has a status of **Draft**.
3. On the **Setups** tab, select **Add**.
4. In the **Create feature setup** dropdown dialog box, in the **New** field group, select one of the following options:
    - **Custom setup** – Create a new feature setup that has empty channels, an empty processing pipeline list, an empty section for applicability rules, and a default set of variables, depending on the setup type.
    - **From feature setup** – Create a copy of another feature setup in the scope of the current Electronic invoicing feature.

5. If you selected the **Custom setup** option in the last step, enter a name and description for the feature setup item. Then, in the **Setup type** field group, select one of the following options:

    - **Processing pipeline** – Select this option to generate and process outbound electronic documents. For this setup type, the system creates an empty processing pipeline list, an empty section for applicability rules, and a default set of variables. You can't work with the channels for inbound electronic documents.
    - **Import channel** – Select this option to set up the process of receiving inbound electronic documents from one of the defined channels and passing them directly to Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management without additional actions. For this setup type, the system creates a predefined list of parameters for the data channels, an empty section for applicability rules, and a set of default variables. You can't add any actions in the processing pipeline.
    - **Import channel and processing pipeline** – This setup type resembles the **Import channel** setup type. However, before an inbound electronic document is passed to Finance or Supply Chain Management, you can set up additional actions in the processing pipeline.
    - **Export channel and processing pipeline** – You can set up additional actions in the processing pipeline for outbound electronic documents that are submitted from Finance or Supply Chain Management.

6. If you selected the **Import channel**, **Import channel and processing pipeline**, or **Export channel and processing pipeline** option in the last step, in the **Select data channel** field, select the channel to integrate with.

7. Select **Create**.

After you create a feature setup, select **Edit** to configure it.

Edit a feature setup

Depending on the type of feature setup, you can configure the process of generating outbound electronic files and submitting them to external channels, or the process of receiving inbound documents and passing them to your Finance or Supply Chain Management application.

Import channel

An *import channel* either processes the electronic file or passes it directly to Finance or Supply Chain Management. This option isn't available for feature setups of the **Processing pipeline** type.

To set up an import channel, enter the name of the channel. Then define the parameters based on the selected channel type. The import channel identifier must refer to the variable that's created specifically to identify the import channel. Finance or Supply Chain Management uses it as a reference.

On the **Attachments filter** tab, define a set of filters to get specific files from the channel. You can create several lines if you expect that files will have different file name extensions or if files must be processed differently depending on the file name. Here are the main parameters:

- **Name** – Enter the name of the file that the system refers to during processing. In the Finance and Supply Chain Management applications, the files appear in the submission log.
- **Filter** – Define the filter to select files.
- **Optional** – If you clear this checkbox, the file is required. In this case, the system shows an error message if the channels don't contain files that correspond to the filter. This parameter is applicable to emails.

If the channel is a mailbox, and an inbound email contains several attachments, you can configure rules to define how the service should handle the attachments. The service can consider each attachment a separate electronic invoice, or it can treat one attachment as a main invoice and all other attachments as additions.

Processing pipeline

A *processing pipeline* is a set of *actions* that run sequentially until they finish successfully. Use a processing pipeline to set up the process for generating electronic files and performing other steps, such as digitally signing files, submitting them to external web services and parsing the response, and receiving and processing inbound documents.

The list of actions is predefined. Use the **New** and **Delete** buttons to specify the combination of actions that logically defines the required process for submitting or receiving documents.

The order of actions is important. Use the **Up** and **Down** buttons to adjust the order.

Each action has a set of parameters that you can configure or adjust. The specific set of parameters depends on the type of action.

- **Action** – Select the type of action.
- **Action name** – Enter the name of the action. This name appears in submission logs, and in messages in Finance and Supply Chain Management applications.
- **Description** – Provide more details about the purpose of the action in the process.

- **Enable retry** – If you select this checkbox, you can select an action in the **Retry action** field and configure additional parameters on the **Retry parameters** tab.

  By using the retry functionality, you can configure the service's behavior if it can't run a specific action. For example, if the external web service that you're trying to connect to doesn't respond, you can specify how many times the system should reattempt the connection, at what interval, and from what action in the processing pipeline.

- **Export results** – Select this checkbox for *one* action in the processing pipeline. You can export the electronic file that the action produces in the Finance or Supply Chain Management application from the **Electronic documents submission log** page.

Applicability rules

Applicability rules are configurable clauses that provide context for running Electronic invoicing features through the Electronic Invoicing capability set. Business documents that Finance or Supply Chain Management submits to Electronic invoicing don't carry an explicit reference that enables the Electronic Invoicing capability set to call a specific version of an Electronic invoicing feature and a specific feature setup item to process the submission. However, when you correctly configure a business document, it contains the required elements that enable Electronic invoicing to determine which Electronic invoicing feature version and processing pipeline to select and run.

By using applicability rules, the Electronic Invoicing service can find the exact Electronic invoicing features it needs to process a submission. To find the correct features, the service matches the **Context** fields from the submitted business document against clauses from the applicability rules.

You can work with applicability rules in the following ways:

- Select **New** to add a new clause to a set of applicability rules.
- Select **Delete** to delete a clause.
- Select several records, and then use the **Group** or **Ungroup** button to create a combination of items or logical statements. For example, select the lines that you want to group, and then select **Group clause**. When you group clauses, the grid adds a new column. This column specifies the logical operator for the grouped clause. The following operators are supported:
  - Equal
  - Not equal
  - Greater than
  - Less than

- Greater than or equal to
- Less than or equal to
- Contains
- Begin with

> **Note**
>
> When you ungroup a clause, always start from the innermost grouping level.

Variables

Variables give you more flexibility when you set up a processing pipeline and the data flow among actions. You can refer to a variable in some action parameters to temporarily store data or files. Some variables pass data between the Finance or Supply Chain Management application and the Electronic Invoicing service.

The system creates some variables by default. For example, the **BusinessDocumentDataModel** variable contains business data in a JavaScript Object Notation (JSON) structure. This data comes in the call from the Finance application during the submission process.

The following types of variables are available:

- **Constant** – The variable is a container for storing temporary data that's used in processing pipeline actions.
- **From client** – The variable content is acquired from the Dynamics 365 client when the submission process runs.
- **To client** – The variable content is made available for import by the Dynamics 365 client when the submission process runs.
- **Data type** – Select the data type of the information that's stored in the variable.

Parameters

Use the **Disable business data reduction** option to optimize the structure of the business data payload that comes from the Finance or Supply Chain Management application during electronic document submission. Optimization helps reduce the data that goes into the Electronic Invoicing service for further transformation into the required electronic file. The default value is **No**.

- **Yes** – Finance or Supply Chain Management sends a JSON file of the **Invoice Model** or, for Brazil, **Fiscal Model** structure that's defined in the **Electronic reporting** module. All elements of the model are filled with business data on the application side, regardless of

the structure of the final electronic file. Models usually contain more business data than the target file structure requires, and generating this data in the application can take more time. Set this option to **Yes** in the rare event where you want to generate different output files in one Electronic invoicing feature and feature setup. A value of **Yes** is useful when you troubleshoot your scenarios, the structure of the electronic files, and completeness of the business data.

- **No** – Finance or Supply Chain Management makes the first call to the service without any business data. The purpose of this call is to get information about the Electronic reporting (ER) configuration that the processing pipeline uses for electronic file transformation. This information returns to the application, which uses it to determine the subset of business data that should be included in the JSON file of the **Invoice Model** or, for Brazil, **Fiscal Model** structure. A value of **No** helps reduce the volume of business data that the application submits to the service, because the application can submit only the business data that's required to successfully generate an electronic file.

Validate a feature setup

You can run validation to check the consistency of the whole configuration. For example, if you leave a mandatory parameter for an action blank, validation detects this inconsistency and you receive a warning message.

- On the **Feature version setup** page, on the action bar, select **Validate**.

Delete a feature setup

1. On the **Electronic invoicing features** page, select an Electronic invoicing feature version that has a status of **Draft**.
2. On the **Setups** tab, select **Delete**.
3. In the message box, select **Yes** to confirm that you want to delete the feature setup.

Last updated on 03/21/2026

Complete and deploy a Globalization feature

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Electronic invoicing feature versions

Electronic invoicing features are versioned. When a new version is created, the version number is automatically incremented.

Electronic invoicing feature versions follow a lifecycle that has up to two statuses:

- **Draft** – When a feature version has this status, you can edit its configuration attributes and its artifacts (for example, file format configurations).
- **Completed** – This status indicates that you finished editing the feature version and don't intend to make any more updates to it. When a feature version has this status, you can no longer edit it or any of its components.

Specify an **Effective from** date for any new version of an Electronic invoicing feature. By using this date, you can define a default version that the deployment uses or a version that it overwrites.

To change the status of an Electronic invoicing feature version, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. On the left side of the **Electronic invoicing features** page, select the Electronic invoicing feature.
3. On the **Versions** tab on the right side of the page, select the version.
4. Select **Change status**, and then select **Complete**.
5. In the message box, select **Yes** to confirm the request.

You can track the status in the **Feature version status** column on the **Versions** tab.

Deploy feature versions

Use the **Deploy** command to deploy a version of an Electronic invoicing feature to the Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management environment.

1. On the left side of the **Electronic invoicing features** page, select the Electronic invoicing feature.
2. On the **Versions** tab on the right side of the page, select the version to deploy. The selected version must have a status of **Completed**.
3. Select **Deploy**, and then select the date when the feature version becomes effective.

Remove feature versions

Select **Cancel deployment** to remove a specific version of an Electronic invoicing feature from the service, if you deployed it there. The **Deployed to the service** column indicates whether a version is deployed to the service.

Rebase Electronic invoicing features

When one Electronic invoicing feature is derived from another feature, select **Rebase** to update the derived feature with the changes that you made in the original (parent) feature.

To rebase a derived version of a feature that you created, follow these steps:

1. Get the latest version of the feature by importing it from the Global repository. For more information, see Import features from the repository.
2. In the list of features, select the feature to rebase.
3. On the **Versions** tab, select **New** to create a draft version.
4. Select **Rebase**.
5. In the **Rebase** dialog box, select the version of the feature to rebase to.
6. Select **OK**.
7. Review the feature components, and make any required changes.
8. Select **Change status** to complete the rebased feature. When the rebase is completed, you can perform additional actions.

Get a specific version of Electronic invoicing features

When you create a new version of an Electronic invoicing feature, the system copies the latest feature version. To use an earlier version of the feature as the base for a new version, select the version, and then select **Get this version**. The system creates a new draft version of the feature that's a copy of the selected version.

Usage management dashboard

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the **Usage management** dashboard to monitor your usage of the Electronic Invoicing service. This dashboard helps your organization stay compliant with monthly usage requirements. It calculates compliance by comparing your submission volume with your acquired volume of submissions.

The dashboard includes the following indicators:

- One cost indicator to monitor consumption for licensing compliance:
  - Usage per month (export)
- Three operational indicators to track usage of the Electronic Invoicing service for management purposes:
  - Usage by feature
  - Usage by environment
  - Usage per month (import)

Measurement scope

- Unit of measure:

  The **Usage management** dashboard counts the submission of business documents and imported electronic invoices.

- Organization:

  The dashboard summarizes counts by the tenant ID of your organization, regardless of the number of instances of Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management, or the number of legal entities where you enable the Electronic Invoicing service.

Indicator: Usage per month (export)

This indicator shows details about the electronic invoices that your organization issues during a defined period.

Scope

- The number of business documents that Finance and Supply Chain Management submits to the Electronic Invoicing service, regardless of the number of lines that those business documents contain.
- The number of submitted business documents that the Electronic Invoicing service processes successfully. A document is considered successfully processed when the flow of actions defined in the feature setup is completed.

> **Note**
>
> When you submit an electronic invoice to an external web service, counting is independent of the results of web service processing (accepted, rejected, or schema validation error). If the web service receives and responds to the request from the Electronic Invoicing service, the submission is considered a valid counting.

- **Exception:** The system doesn't count business documents if Finance and Supply Chain Management resubmits them to the Electronic Invoicing service. This exception applies to scenarios where you need to resubmit the same business document to change the status of the electronic invoice. For example, the system counts the issuance of a Brazilian electronic invoice (fiscal document) as valid, but it doesn't count the cancellation request for it.

Calculation

Calculate the balance as follows:

Balance = Free + Purchased – Used

Where:

- Free:

  A free volume of business documents you can submit each month. It includes a package of 100 business documents that you can submit to the Electronic Invoicing service. The free volume isn't cumulative, and you can't roll over any remaining balance to the next period.

- Purchased:

A package of 1,000 business documents that you can submit to the Electronic Invoicing service. You must acquire this package for your organization on a monthly basis. The purchased volume isn't cumulative, and you can't roll over any remaining balance to the next period.

- Used:

  The count of business document submissions to the Electronic Invoicing service according to defined criteria.

> **Important**
>
> - If your organization plans to exceed the monthly volume of 100 free submissions, purchase the peak volume to ensure that you remain compliant with the Microsoft licensing policy for the Electronic Invoicing service.
> - Currently, you must manually enter the purchased volume, according to the date of acquisition, as multiple packages of 1,000 submissions.

Indicator: Usage by feature

This indicator shows the usage of electronic invoicing features for issuing electronic invoices during a defined period.

- Calculation:

  Used = The count of how many times each electronic invoicing feature was used during the submission of business documents to the Electronic Invoicing service.

Indicator: Usage by environment

This indicator shows the usage of electronic invoicing service environments during a defined period.

- Calculation:

  Used = The count of how many times each electronic invoicing service environment was used during the submission of business documents to the Electronic Invoicing service.

Indicator: Usage per month (import)

This indicator shows the volume of imported electronic invoices by the Electronic Invoicing service into Finance and Supply Chain Management during a defined period.

- Scope:

  Electronic invoices that are imported into Finance and Supply Chain Management, regardless of the number of lines that those electronic invoices contain.

- Calculation:

  Received = The count of imported electronic invoices into Finance and Supply Chain Management.

Functions

Purchase

On the **Usage per month (export)** tab, select **Purchase** to manually register the amount of acquired submissions.

For a given date, select **New** and enter the number of **Packages** acquired for that date.

The **Quantity** is calculated as:

Quantity = Packages * 1,000

The calculated **Quantity** appears in the **Purchased** section of the **Usage per month (export)** indicator.

Update

On the action pane, select **Update** to refresh the calculation and update the data shown on the page and in the chart.

Reset history data

On the action pane, select **Reset history data** to refresh the database from where the indicators are calculated.

> ⓘ **Note**

The **Usage management** dashboard doesn't show monetary amounts. Instead, it shows only the volume of counted submissions and imported documents.

Process incoming electronic documents

You can import and process incoming electronic documents, such as vendor electronic invoices, in two ways:

- Retrieve files from external channels and pass them directly to your connected application. In the connected application, files undergo additional transformation before you import them into the database.
- Preprocess files in the Electronic Invoicing service before passing them to your connected application.

Electronic invoicing supports two channels for incoming documents: email and Microsoft SharePoint folders.

Use two setup types to specify whether documents undergo preprocessing or are passed directly to your connected application:

- **Import channel** – The system passes the document directly to the connected application.
- **Import channel with processing pipeline** – Set up additional actions that run before the document is passed to the connected application.

For information about how to set up the scenarios for processing incoming electronic documents for the different channels, see Configure an email channel and Configure a SharePoint channel.

Last updated on 06/26/2026

Configure email channels

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

If the Electronic invoicing feature that you created imports electronic vendor invoices from attached files that you receive by email, configure an email account channel.

1. Select the Electronic invoicing feature that you created. Select the version that has a status of **Draft**.
2. On the **Setups** tab, select **Add**.
3. In the **Create feature setup** drop-down dialog box, in the **New** field group, select the **Custom setup** option.
4. In the **Setup type** field group, select the **Data channel** option.
5. In the **Select data channel** field, enter **Incoming e-mail**.
6. Select **Create**.
7. Select the line that you created, and then select **Edit**.
8. On the **Data channel** tab, in the **Parameters** section, set the following required fields.

Expand table

Field	Description
Data channel	Enter a unique name to identify the data channel. The name can have a maximum of 10 characters. The system references it in applicability rules and in connected applications during the communication process.
Server address	Enter the server address of the email account provider for Internet Message Access Protocol (IMAP). For example, the server address for the `https://outlook.live.com` provider is imap-mail.outlook.com.
Server port	Enter the number of the port that the email account provider uses. For example, the server port for the `https://outlook.live.com` provider is 993.

Field	Description
User name secret	Enter the name of the Microsoft Azure Key Vault secret that contains the ID of the email user account. Create this secret in Key Vault and set it up in your service environment.
User password secret	Enter the name of the Key Vault secret that contains the password of the email user account.
Timeout	Enter the maximum time limit, in milliseconds (ms), that the system should wait for a response. The default value is 10,000 ms (10 seconds).
Main folder	Specify the email import source, or the folder that the service should process emails from.
Archive folder	Specify the folder where processed emails should be stored. If you don't specify this folder, the system automatically creates it.
Error folder	Specify the folder that the system should move emails to if the processing fails. If you don't specify this folder, the system automatically creates it.
Max message size	Enter the maximum size, in bytes, of a single message that is processed. The default value is 20,000,000 bytes.
Max message number	Enter the maximum number of messages to process for a single action. If you don't want to limit the number of messages, set the value to **0** (zero).
From filter	Enter a string to filter by sender address. Only emails where the sender address matches the filter are processed. This field is optional. To specify multiple sender addresses, use semicolons (;) as separators.
Subject filter	Enter a string to filter by subject. Only emails where the subject matches the filter are processed. This field is optional. A simple mask such as ***smth*.ext** is supported, where each asterisk (*) represents zero or more occurrences of any character.
Date filter	Specify a date to define the maximum age, in days, of messages that are processed. This field is optional. The default value is 30 days.
Processing mode	Select one of the following options to specify whether the system can process all the attachments in an email together or whether it should process each attachment separately: • **By attachment** – The system creates a new electronic document for each attachment in the email. For example, if one email includes several files that contain e-invoice data, each file is considered a new e-invoice in the system. • **By email** – One attachment is considered a base attachment, and one electronic invoice is created in the system. Other attachments can be used as supporting files.

9. In the **Attachments filter** section, add the file filtering information. The system processes only attachments that satisfy the defined filter. For example, ***.xml** filters for attachments that have the .xml file name extension. Use the name of the attachment in Dynamics 365 Finance or Dynamics 365 Supply Chain Management during setup.

    - If you set the **Processing mode** field to **By email** in the previous step, you can add multiple filters. The name identifies the specific document.
    - If you set the **Processing mode** field to **By attachment**, you can add only one filter.

10. On the **Applicability rules** tab, review and update the criteria as required. The value of the **Channel** field must equal the value that you entered in the **Data channel** field in step 8.

11. Select **Save**, and close the page.

Last updated on 03/14/2026

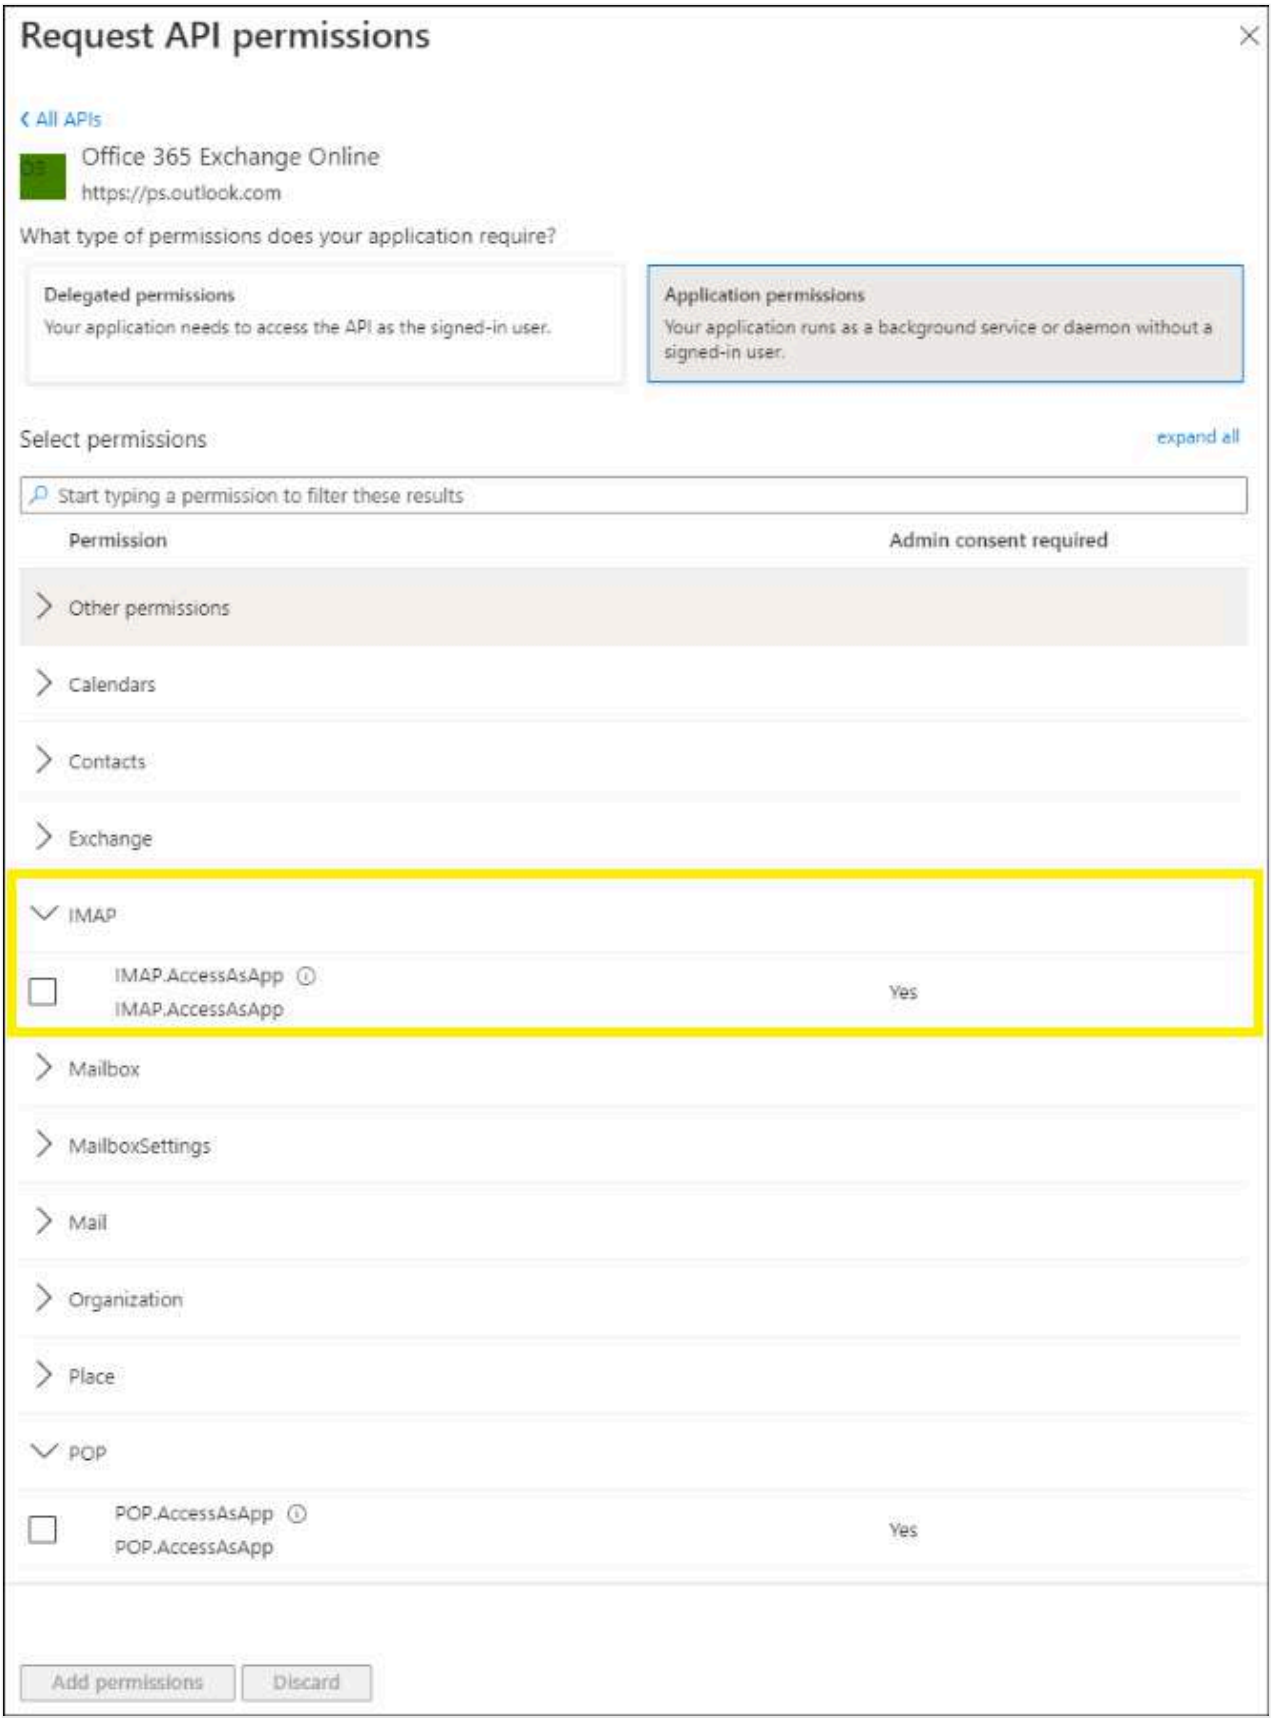
Configure an email channel for Office 365 Exchange Online

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

If you create the Electronic invoicing feature that imports electronic vendor invoices from attached files received in email, configure an email account channel.

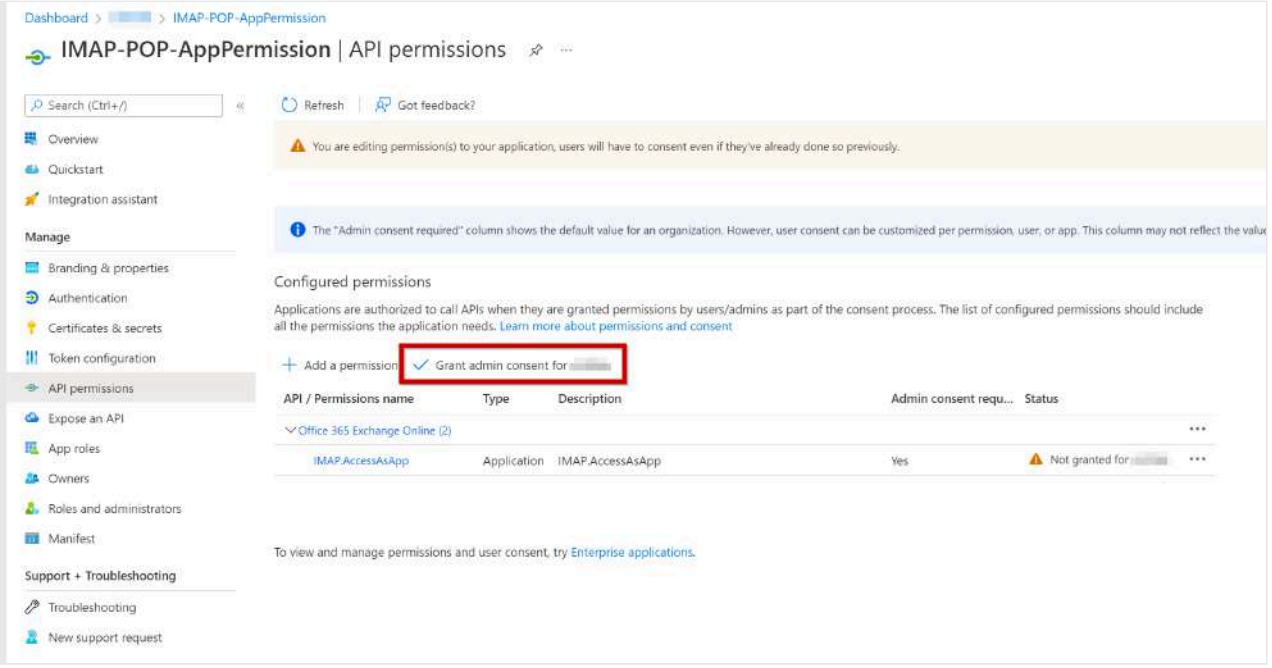
Add the IMAP permissions to your Microsoft Azure AD application

1. In the Microsoft Azure portal, select the **App registrations** service.
2. Select **New registration** to create an app registration.
3. Enter a name.
4. In the **Supported account types** section, select the **Accounts in this organizational directory only** option.
5. After the app registration is created, select **API Permissions**.
6. Select **Add permission**.
7. On the **APIs my organization uses** tab, search for **Office 365 Exchange Online**.
8. Select **Application permissions**.
9. For Internet Message Access Protocol (IMAP) access, select the **IMAP.AccessAsApp** permission.



10. Select **Add permissions**.

11. To access Exchange mailboxes through IMAP, your Azure Active Directory (Azure AD) application must get tenant admin consent for each tenant. For more information, see Introduction to permissions and consent.
    a. In the management view for your Azure AD application, select **API Permissions**.
    b. Under **Configured permissions**, select **Grant admin consent for <*name*>**.



12. Select **Overview**.
13. Copy the **Application (client) ID** and **Directory (tenant) ID** values.
14. Select **Certificates & secrets**.
15. On the **Client secrets** tab, select **New client secret**, and notice the value in the **Expiration** field. When a secret expires, it can't be used anymore, and you must create a new secret.
16. After you create a secret, copy the **Value** and save it in the Azure Key Vault that's associated with the Electronic Invoicing Service service environment.
17. Add a link to this secret in the Regulatory Configuration Service (RCS) service environment. For more information, see Customer certificates and secrets.
18. Save the **Application (client) ID** as a secret in the same key vault, and add a link to this secret in the Electronic Invoicing Service service environment in RCS.
19. In the Azure portal, select the **Enterprise Applications** service.
20. Find the application that has the same name as the app registration that you created in step 2.
21. Select **Overview**.
22. Copy the **Object ID** value.

Register service principals in Exchange

After a tenant admin consents to your Azure AD application, they must register the application's service principal in Exchange by running a series of PowerShell snippets through Exchange Online PowerShell. Some of these snippets use values that you copied in the previous procedure:

- <**ORGANIZATION_ID**> is the **Directory (tenant) ID** value that you copied.
- <**APPLICATION_ID**> is the **Application (client) ID** value that you copied.
- <**OBJECT_ID**> is the **Object ID** value that you copied.

Follow these steps to register service principals in Exchange.

1. Install the **ExchangeOnlineManagement** module.

   PowerShell

   ```
   Install-Module -Name ExchangeOnlineManagement -allowprerelease
   Import-module ExchangeOnlineManagement
   ```

   > ⓘ Note
   >
   > You only need to install the **ExchangeOnlineManagement** module once on the Exchange administrator's machine.

2. Connect to Exchange Online.

   PowerShell

   ```
   Connect-ExchangeOnline -Organization <ORGANIZATION_ID>
   ```

3. The following example shows how to register the Azure AD application's service principal in Exchange.

   PowerShell

   ```
   New-ServicePrincipal -AppId <APPLICATION_ID> -ServiceId <OBJECT_ID> -
   Organization <ORGANIZATION_ID>
   ```

   > ⓘ Note
   >
   > If you receive an error when you run the **New-ServicePrincipal** cmdlet, you probably don't have sufficient permissions in Exchange Online to perform the operation. Alternatively, you're trying to use a guest account to perform the operation.

4. The following example shows how to give the application's service principal access to one mailbox.

```
PowerShell
Add-MailboxPermission -Identity "john.smith@contoso.com" -User <OBJECT_ID> -
AccessRights FullAccess
```

Create a feature setup in RCS

1. In RCS, select the Electronic invoicing feature that you created. Select the version that has a status of **Draft**.
2. On the **Setups** tab, select **Add**.
3. In the **Create feature setup** dropdown dialog box, in the **New** field group, select the **Custom setup** option.
4. In the **Setup type** field group, select the **Data channel** option.
5. In the **Select data channel** field, enter **Incoming e-mail on Exchange**.
6. Select **Create**.
7. Select the line that you created, and then select **Edit**.
8. On the **Data channel** tab, in the **Parameters** section, set the following required fields.

Expand table

Field	Description
Data channel	Enter a unique name to identify the data channel. The name can have a maximum of 10 characters. It's referenced in applicability rules and in the Dynamics 365 Finance application during the communication process.
Server address	Enter the server address of Exchange Online. For example, the default value for Office 365 Exchange Online is **outlook.office365.com**.
Server port	Enter the number of the port that the email account provider uses. For example, the default value for Office 365 Exchange Online is **993**.
User name secret	Enter the name of the Key Vault secret that contains the ID of the email user account. You must create this secret in Key Vault and set it up in your service environment.

Field	Description
Client Id	Enter the name of the Key Vault secret that contains the **Application (client) ID** value for the app registration.
Client Secret	Enter the name of the Key Vault secret that contains the **Value** value of the app registration client secret.
Timeout	The maximum time limit, in milliseconds (ms), that the system should wait for a response. The default value is 10,000 ms (10 seconds).
Main folder	Specify the email import source, or the folder that the service should process emails from.
Archive folder	Specify the folder where processed emails should be stored. If you don't set a value, the service automatically creates a folder.
Error folder	Specify the folder that emails should be moved to if the processing fails. If you don't set a value, the service automatically creates a folder.
Max message size	Enter the maximum size, in bytes, of a single message that's processed. The default value is 20,000,000 bytes.
Max message number	Enter the maximum number of messages to process for a single action. If you don't want to limit the number of messages, set the value to **0** (zero).
From filter	Enter a string to filter by sender address. Only emails where the sender address matches the filter are processed. This field is optional. To specify multiple sender addresses, use semicolons (;) as separators.
Subject filter	Enter a string to filter by subject. Only emails where the subject matches the filter are processed. This field is optional. A simple mask such as ***smth*.ext** is supported. Here, each asterisk (*) represents zero or more occurrences of any character.
Date filter	Specify a date to define the maximum age, in days, of messages that are processed. This field is optional. The default value is 30 days.
Processing mode	Select one of the following options to specify whether you can process all the attachments in an email together, or whether you should process each attachment separately: • **By attachment** – A new electronic document is created for each attachment in the email. For example, if one email includes several files that contain e-invoice data, each file is considered a new e-invoice. • **By email** – One attachment is considered a base attachment, and one electronic invoice is created. Other attachments can be used as supporting files.

9. In the **Attachments filter** section, add the file filtering information. Only attachments that satisfy the defined filter are processed. For example, ***.xml** filters for attachments that have the .xml file name extension. You use the name of the attachment in Dynamics 365 Finance or Dynamics 365 Supply Chain Management during setup.

    - If you set the **Processing mode** field to **By email** in the previous step, you can add multiple filters. The name identifies the specific document.
    - If you set the **Processing mode** field to **By attachment**, you can add only one filter.

10. On the **Applicability rules** tab, review and update the criteria as required. The value of the **Channel** field must equal the value that you entered in the **Data channel** field in step 8.

11. Select **Save**, and close the page.

Last updated on 03/21/2026

Configure SharePoint channels

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Before you configure a Microsoft SharePoint channel to process incoming documents, complete the steps described in Configure a SharePoint connection.

After you complete those steps, you can use the SharePoint channel to import electronic vendor invoices from files that are stored in your SharePoint folders.

1. On your SharePoint site, create the following folders:
    - **Main folder** – The folder that the service processes files from.
    - **Archive folder** – The folder where processed files are stored.
    - **Error folder** – The folder that the system moves files to if the processing fails.
2. Select the Electronic invoicing feature that you created. Make sure that you select the version that has a status of **Draft**.
3. On the **Setups** tab, select **Add**.
4. In the **Create feature setup** drop-down dialog box, in the **New** field group, select the **Custom setup** option.
5. In the **Setup type** field group, select the **Data channel** option.
6. In the **Select data channel** field, select **SharePoint folder**.
7. Select **Create**.
8. Select the line that you created, and then select **Edit**.
9. On the **Data channel** tab, in the **Parameters** section, set the required fields.

Expand table

Field	Description
Data channel	Enter a unique name to identify the data channel. The name can have a maximum of 10 characters. The communication process references this name in the

Field	Description
	applicability rules and in connected applications.
SharePoint address	Enter the SharePoint URL. For example, enter `<domain>.sharepoint.com`.
Application Id	Enter the name of the Azure Key Vault secret that contains the ID of the SharePoint user account. You must create this secret in Key Vault and set it up in your service environment. The value is the **Application (client) ID** value from Configure SharePoint connection.
Application secret	Enter the name of the Key Vault secret that contains the password of the SharePoint user account. The value is the **App Registration secret** value from Configure SharePoint connection.
Site name	Enter the name of the SharePoint site.
Document library name	Enter the name of the SharePoint document library.
Timeout	Enter the maximum time, in milliseconds (ms), that the system should wait for a response. The default value is 10,000 ms (10 seconds).
Main folder	Specify the file import source, or the folder that the service processes files from.
Archive folder	Specify the folder where processed files are stored.
Error folder	Specify the folder that the system moves files to if the processing fails.
Max file size	Enter the maximum size, in bytes, of a single file that is processed. The default value is 20,000,000 bytes.
Max files number	Enter the maximum number of files to process for a single action. If you don't want to limit the number of files, set the value to **0** (zero).
File filter	Enter a string to filter by file name. This field is optional. A simple mask such as ***smth*.ext** is supported, where each asterisk (*) represents zero or more occurrences of any character. For example, enter ***.pdf** to configure the channel to read PDF files.
Custom file name	Enter the custom file name from the client.

10. On the **Applicability rules** tab, review and update the criteria as required. The value of the **Channel** field must equal the value that you entered in the **Data channel** field in the previous step.

11. Select **Save**, and close the page.

Use the electronic invoicing service to import vendor invoices

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with importing vendor invoices by using the Electronic Invoicing service. It guides you through the configuration steps that you must complete in the **Globalization studio** workspace in Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management to receive electronic vendor invoices from vendors.

Set up vendor invoice import in the Electronic Invoicing service

To set up vendor invoice import in the **Globalization studio** workspace, follow these steps:

1. Consult the list of generally available Electronic invoicing features.
2. Select and import the Electronic invoicing feature. For more information, see Import features from the repository.
3. Create an Electronic invoicing feature for your organization. For more information, see Create Globalization features.

Configure an email account channel

Configure an email account channel if the Electronic invoicing feature you created imports electronic vendor invoices from attached files that you receive by email.

1. In the **Globalization studio** workspace, select the Electronic invoicing feature that you created. Make sure that you select the version with a status of **Draft**.

2. On the **Setups** tab, in the grid, select a feature setup, and then select **Edit**.

3. On the **Data channel** tab in the **Parameters** field group, enter the name of the channel in the **Data channel** field. The channel name can't be more than ten characters.

4. In the **Server address** field, enter the email account provider. For example, the server address for **https://outlook.live.com/** is **imap-mail.outlook.com**.

5. In the **Server port** field, enter the port used by the email account provider. For example, the server port for **https://outlook.live.com/** is **993**.

6. In the **User name secret** field, enter the name of the Key vault secret that contains the ID of the email user account. Create this secret in Azure Key Vault and set it up in your service environment.

7. In the **User password secret** field, enter the name of the Key vault secret that contains the password of the email user account.

8. (Optional) Enter values in the **From filter**, **Subject filter**, and **Date filter** fields.

9. Enter the names of the mailbox folders where mails are:

    - Imported from: **Main folder**
    - Saved after successful processing: **Archive folder**
    - Saved after not successful processing: **Error folder**

    You don't need to create these folders in the mailbox. The folders are created automatically after the first e-invoice import and processing.

10. In the **Attachments filter** field group, add the file filtering information. Only attachments that satisfy the defined filter are processed. For example, you can set up "*.xml" for attachments with an XML extension. Use the name of the attachment in Dynamics 365 Finance or Dynamics 365 Supply Chain Management during setup.

11. On the **Applicability rules** tab, review and update the criteria as necessary. The value of the **Channel** field must equal the **Data channel** value that you provided earlier. For more information, see Applicability rules.

12. Select **Save** and close the page.

Configure a Microsoft SharePoint channel

Configure a Microsoft SharePoint channel if the Electronic invoicing feature imports electronic vendor invoices from files placed in SharePoint folders.

1. In the **Globalization studio** workspace, select the Electronic invoicing feature that you created. Make sure that you select the version that has a status **Draft**.
2. On the **Setups** tab, in the grid, select a Feature setup and then select **Edit**.
3. On the **Data channel** tab, in the **Parameters** field group, select **SharePoint address** and enter the SharePoint URL.

4. Select **Server port** and enter the port used by the email account provider.
5. Select **Application Id** and enter the name of the Key vault secret that contains the ID of the SharePoint client.
6. Select **Application secret** and enter the name of the Key vault secret that contains the password of the SharePoint client.
7. Select **File filter** and review and update the mask to filter the files that contain the electronic vendor invoice to import.
8. On the **Applicability rules** tab, review and update the criteria as necessary. For more information, see Applicability rules.
9. Select **Save** and close the page.

Deploy an Electronic invoicing feature

To deploy the Electronic invoicing feature, see Complete and deploy a Globalization feature.

Set up vendor invoice import in Finance or Supply Chain Management

Complete the steps in the following section to set up a PEPPOL-type vendor invoice import as an example.

Import PEPPOL electronic vendor invoices

1. Go to the **Electronic reporting** workspace and select **Reporting configurations**.
2. Select **Customer invoice context model**, and then select **Create configuration** > **Derive from Name: Customer invoice context model, Microsoft** to create a derived configuration.
3. On the **Draft** version, select **Designer** and in the **Data model** tree, select **Map model to datasource**.
4. In the **Definitions** tree, select **DataChannel** and then select **Designer**.
5. In the **Data sources** tree, expand the **$Context_Channel** container.
6. In the **Value** field, select **Edit** > **Edit formula**, and enter the name of the channel as it's given in the configuration of the data channel for the Electronic invoicing feature in Globalization studio.
7. Select **Save** and close the page.
8. Close the page.
9. Select the derived configuration you just created from the **Customer invoice context model**, and on the **Versions** FastTab, select **Change Status** > **Completed**.
10. Go to **Organization administration** > **Setup** > **Electronic document parameters** and on the **Features** tab, make sure that **PEPPOL Global electronic invoices** is selected.

11. On the **External channels** tab, in the **Channels** field group, select **Add**.
12. In the **Channel** field, enter the data channel name and in the **Description** field, enter a description.
13. In the **Company** field, select the legal entity.
14. In the **Document context** field, select the new derived configuration from **Customer invoice context model**. The mapping description should be **Data channel context**.
15. In the **Import sources** field group, select **Add**.
16. In the **Name** field enter **Attachments filter name** and in the **Data entity name** field, select **Vendor invoice header**.
17. In the **Model mapping** field, select **Vendor invoice imprt - Import vendor invoice**.
18. Select **Save** and then close the page.

Receive electronic invoices

The Electronic Invoicing service performs two steps during invoice import from the data channels:

1. Accesses the mailbox and reads the emails.
2. Processes the emails.

To perform these two steps, the client must call the service manually for each step. However, set up a batch for receiving electronic documents.

To receive electronic invoices, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK** and then close the page.

View receive logs for electronic invoices

To view the receive logs for electronic invoices, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**. If you don't see successfully processed invoices, remove the table filter.

Last updated on 03/14/2026

Electronic Invoicing service ISV last-mile connector

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The independent software vendor (ISV) last-mile connector complements the standard Electronic Invoicing service functionality when no direct integration with government electronic invoicing platforms or final electronic invoice recipients is supported out of the box. In these scenarios, Microsoft Dynamics 365 Finance is used to generate electronic documents in legally required formats. The documents are then passed to the ISV last-mile connector for further communication. In the case of incoming electronic documents, the ISV last-mile connector is used as a source of inbound documents, which are then handled by Finance.

This article explains how to configure and use the Electronic Invoicing service ISV last-mile connector.

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met:

- Your company must have a separate signed service agreement with an ISV that will provide electronic document delivery service. Additionally, you must obtain the required credentials to enable integration of the Electronic Invoicing service with the ISV last-mile connector.
- Become familiar with Electronic invoicing functionality. For more information, see Electronic invoicing overview.
- Consult the list of available country/region-specific Electronic invoicing features. The capability to use the ISV last-mile connector for submission complements this list.

Integration with Edicom

> **Note**
>
> The integration of the Electronic Invoicing service with the ISV last-mile connector is described based on **Danish electronic invoicing** example. For other countries/regions please refer to the respective section in the **Country/region-specific scenarios implemented via Edicom** chapter.

You can configure and use the Electronic Invoicing service ISV last-mile connector's integration with the Global e-Invoicing Platform that Edicom provides. For more information refer to: Edicom integration with Microsoft Dynamics 365.

To enable the integration of the Electronic Invoicing service with the ISV last-mile connector, you must obtain the following required credentials from Edicom:

- **Service ID** – The service ID number is used to identify the company to Edicom.
- **Group** – The group code is used for internal routing within the Edicom infrastructure.
- **Token** – The token is used to grant authorization to access the Edicom services.

The token that you obtain must be uploaded to the secret that you created in the Azure Key Vault that your company manages. For more information, see Customer certificates and secrets. The secret is used as a parameter in the related Electronic Invoicing feature pipeline actions.

> **Note**
>
> With this integration, you are able to submit generated e-invoices' files either in the **OIOUBL** format to the Danish electronic invoicing infrastructure, **NemHandel**, or in the **PEPPOL** format to the PEPPOL Delivery Network. The format of a submitted file will be dynamically analyzed by Edicom and routed correspondingly.

Electronic invoice submission

The following pipeline actions are introduced or updated to enable outbound document submission via the ISV last-mile connector.

- **Integrate with Edicom** – This new action submits electronic documents that were generated by using preceding actions to Edicom. You must configure the parameters for this action as described in the following table.

Expand table

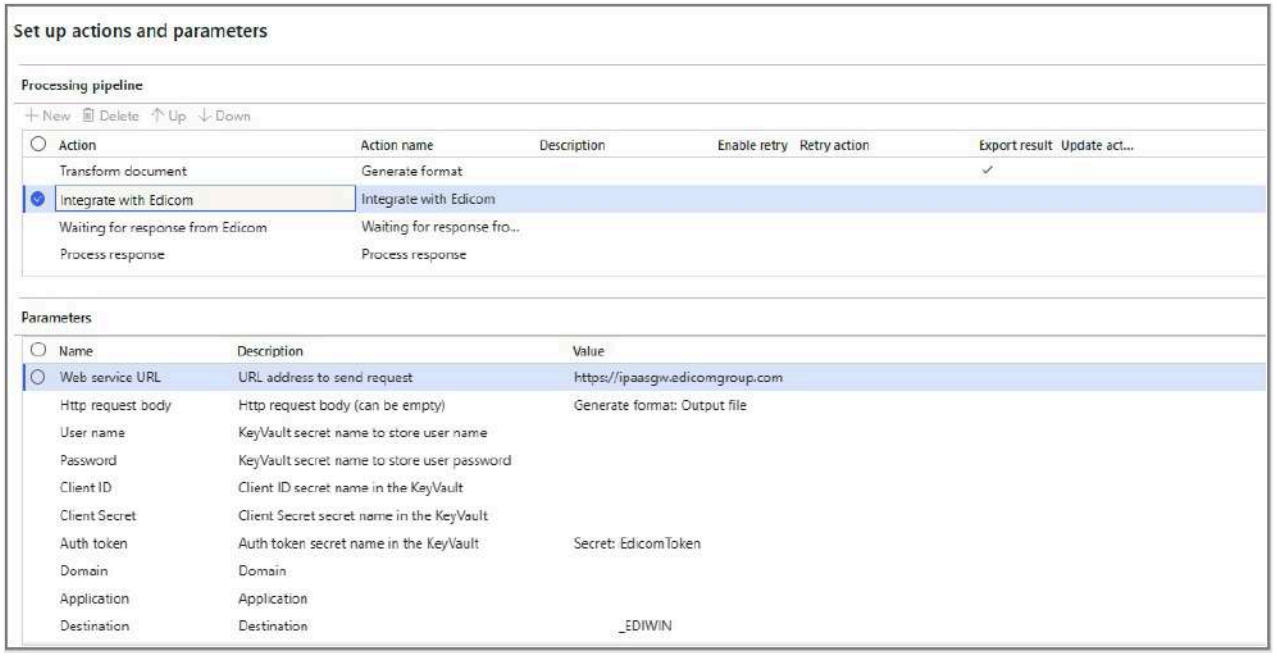
Parameter	Description
Domain	Enter the service ID number that Edicom provided.
Application	Enter the same service ID number.
Destination	Enter the service ID number concatenated with the string **_EDIWIN**. For example, if the service ID number is **123456**, enter **123456_EDIWIN**.
Group	Enter the group code that Edicom provided.
Auth token	Select the name of the secret that you created for the token that Edicom provided.

The following parameters are Edicom-specific. You can leave them set to the default values that Microsoft provides in related Globalization features.

Expand table

Parameter	Description
Web service URL	Default value for Edicom: `https://ipaasgw.edicomgroup.com`.
Http request body	Default value: **Generate format: Output file**.
Schema	Default value for Edicom: **OUTBOUND_DOCUMENT_MICROSOFT_DK**.

You can leave all remaining parameters blank.



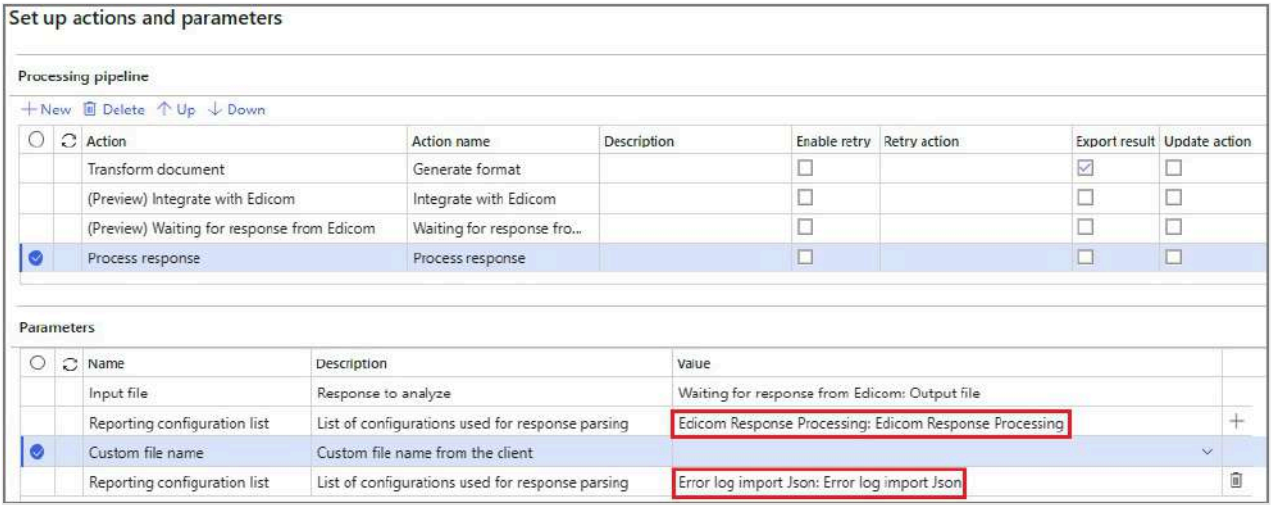
- **Waiting for response from Edicom** – This new action waits for the response from Edicom. No specific parameters must be configured.

- **Process response** – For this existing action, two new Electronic reporting (ER) configurations, **Edicom Response Processing** and **Error log import Json**, were created to handle the response that the **Waiting for response from Edicom** action receives from Edicom.

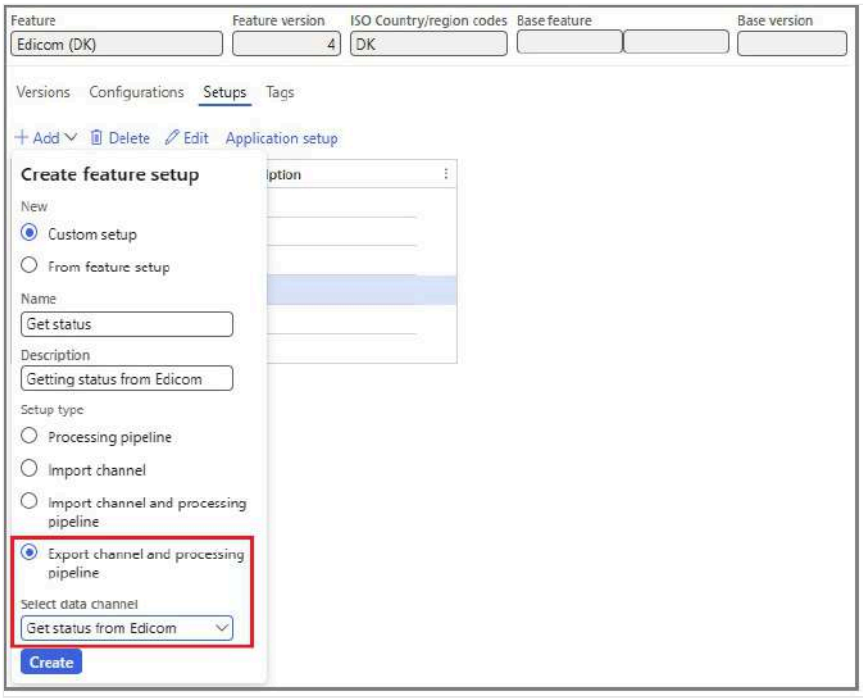
  The following parameters are Edicom-specific. You can leave them set to the default values that Microsoft provides in related Globalization features.

  Expand table

Parameter	Description
Input file	Default value for Edicom: **Waiting for response from Edicom: Output file**.
Reporting configuration list	The first new ER configuration. Default value for Edicom: **Edicom Response Processing: Edicom Response Processing**.
Reporting configuration list	The second new ER configuration. Default value for Edicom: **Error log import Json: Error log import Json**.



A new data channel type, **Get status from Edicom**, is implemented for feature setups of the **Export channel and processing pipeline** type. You must create a new feature setup where you select **Get status from Edicom** as the data channel.



Configure the export channel's parameters as described in the following table.

Expand table

Parameter	Description
Domain	Enter the service ID number that Edicom provided.
Application	Enter the same service ID number.
Data channel	Enter the name of the export channel to use. Enter the same name in each of the following places: • In the applicability rules of the parent's feature setup • In the value of the **$Context_Channel** variable in the **DataChannel** definition in the **Customer invoice context model** ER configuration that's used • At **Organization administration** > **Setup** > **Electronic document parameters** > **Integration channels** in Finance
Group	Enter the group code that Edicom provided.
Auth token	Select the name of the secret that you created for the token that Edicom provided.

You can leave the following parameters set to the default values that Microsoft provides in related Globalization features.

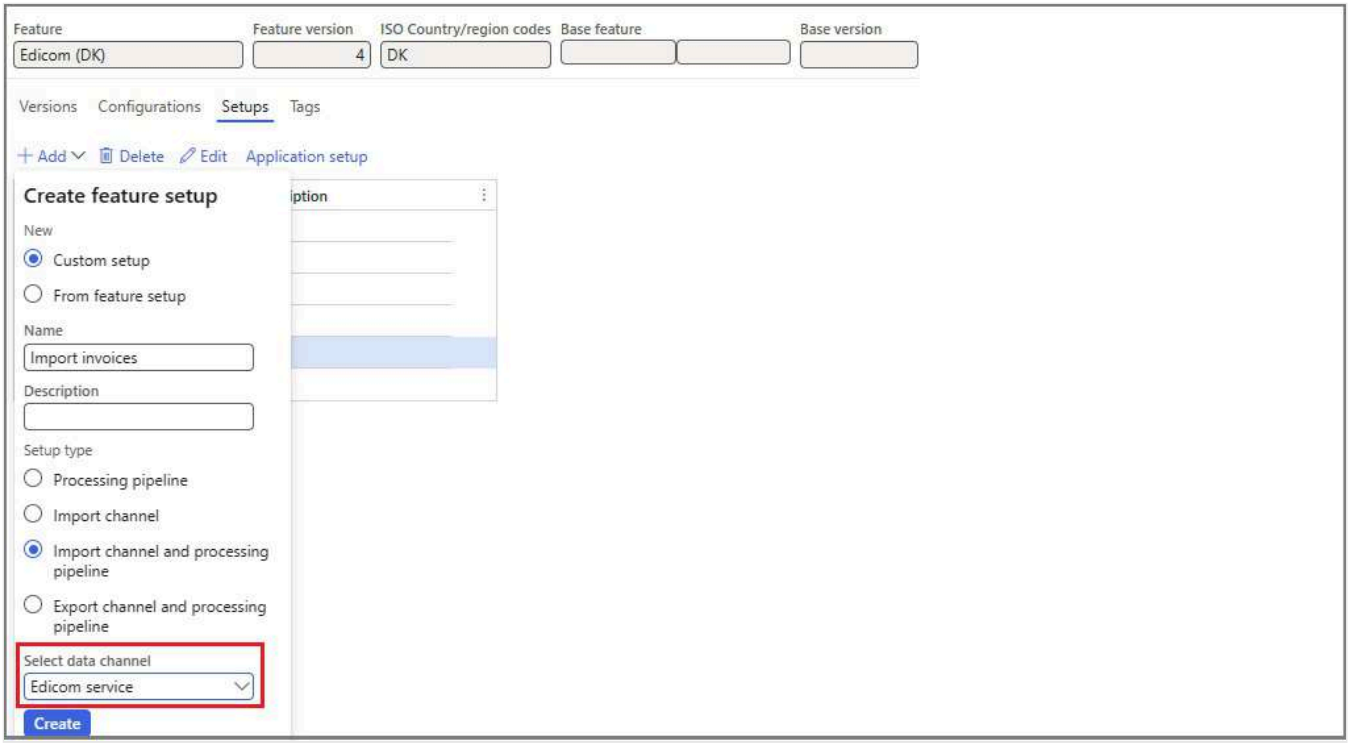
Expand table

Parameter	Description
Web service URL	Default value: `https://ipaasgw.edicomgroup.com`.
Document limit	Default value: **100**.
Schema	Default value: **IN_DOCUMENT_STATUS_MICROSOFT_DK**.

You can leave all remaining parameters blank.

Electronic invoice receipt

A new data channel type, **Edicom service**, is implemented for feature setups of the **Import channel** or **Import channel and processing pipeline** type. You must create a new feature setup where you select **Edicom service** as the data channel.



Configure the import channel's parameters as described in the following table.

Expand table

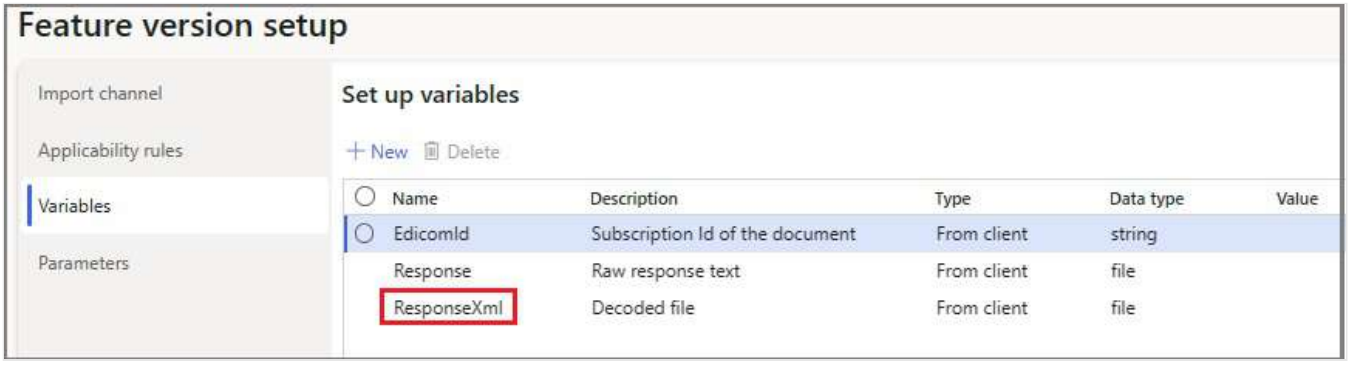
Parameter	Description
Domain	Enter the service ID number that Edicom provided.
Application	Enter the same service ID number.
Data channel	Enter the name of the import channel to use. Enter the same name in each of the following places:

Parameter	Description
	• In the applicability rules of the parent's feature setup • In the value of the **$Context_Channel** variable in the **DataChannel** definition in the derived version of the **Customer invoice context model** ER configuration that's used for the import scenario. **Important:** The derived configuration must differ from the configuration that's used for the invoice *submission* setup. • At **Organization administration** > **Setup** > **Electronic document parameters** > **Integration channels** in Finance
Group	Enter the group code that Edicom provided.
Auth token	Select the name of the secret that you created for the token that Edicom provided.

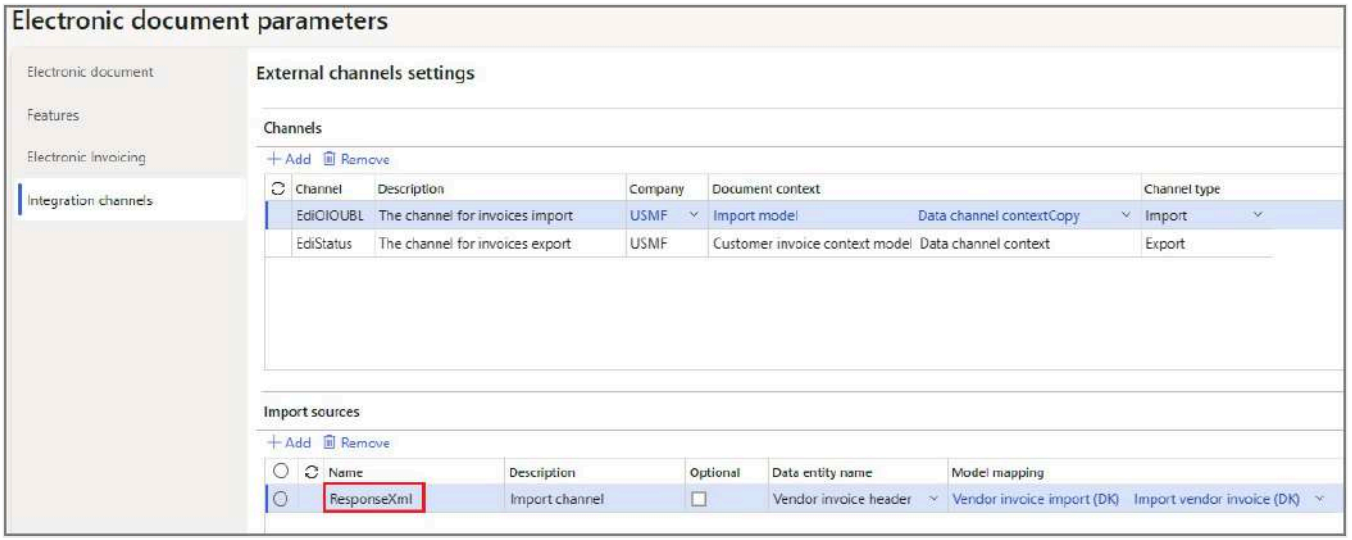
You can leave all remaining parameters set to the default values that Microsoft provides in related Globalization features.

Additionally, you must configure the following feature setup variable to use for the decoded file:

- **Name:** ResponseXml
- **Description:** Decoded file
- **Type:** From client
- **Data type:** file



The name of this variable must be used as the name of the import source for the import channel on **Integration channels** tab of the **Electronic document parameters** page in Finance.



Country/region-specific scenarios implemented via Edicom

Submit electronic documents

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Submitting electronic documents creates a single point of communication between Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management and Electronic invoicing. During each submission event, communication flows in both directions:

- **From Finance or Supply Chain Management to Electronic invoicing** – Finance or Supply Chain Management sends the financial data to Electronic invoicing in a unified structure. As required, it also sends the contents of variables that were configured as part of the electronic invoicing features.
- **From Electronic invoicing to Finance or Supply Chain Management** – Depending on the electronic invoicing features, Finance or Supply Chain Management receive updates from Electronic invoicing about the processing results of invoices that were previously submitted. It also receives the contents of variables that were configured as part of the electronic invoicing features.

To submit electronic documents to Electronic invoicing from Finance or Supply Chain Management, go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.

The starting point is a posted invoice. This invoice can come from different origins. For example, it can come from sales orders, project invoices, or free text invoices.

You can run the submission process manually or in the background.

- **Manual** – In the **Submit electronic documents** dialog box, on the **Records to include** FastTab, select **Filter** to define the range of documents that must be submitted. In the **Inquiry** dialog box, you can configure your own query to select the posted invoices that must be submitted. After you make your selection, manually start execution of the processing, and wait for it to finish running. When the processing is completed, a message in the Action center shows the number of electronic documents that are successfully submitted.
- **Background** – Background execution doesn't require that you be signed in or keep the **Submit electronic documents** dialog box open. You can schedule the process to run, and you can define the execution frequency.

> **Note**
>
> In some specific scenarios, the standard submission procedure that was described earlier only generates electronic invoices and stores them on the service side. The invoices aren't submitted. Submitting electronic invoices requires that you complete the following additional steps.

To submit the generated electronic invoices in batch mode, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
2. In the **Channel** field, select the export channel, and then select **OK**. You must create the export channel in advance.

You can inquire about the results of the submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. For more information, see Work with Electronic document submission log.

Last updated on 03/14/2026

Work with Electronic document submission log

07/30/2025

In Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management, you can use the submission log to view the results of the processing of submissions to Electronic invoicing.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** to open the log.
2. In the **Document type** field, select a value to filter the type of invoices that the log shows.

There are possible submission statuses:

- **Scheduled** – Electronic invoicing received the submission from Finance or Supply Chain Management, and scheduled it for further processing by the related electronic invoicing feature.
- **Executing** – Electronic invoicing started processing according to the applicable electronic invoicing feature's pipeline.
- **Pending** – Electronic invoicing is waiting for the response from external web-services involved into the related pipeline action's processing.
- **Completed** – Electronic invoicing successfully processed the electronic invoicing feature in the way that it was configured to process it.
- **Failed** – Electronic invoicing encountered an error or was stopped by an exception while it was processing the electronic invoicing feature.
- **Canceled** – The submission has been explicitly cancelled by a user from Finance or Supply Chain Management using the **Cancel submissions** functionality. For more information, refer to Cancel submissions.

> **Important**
>
> The submission status refers to the processing status of the electronic invoicing feature by Electronic invoicing. It doesn't refer to the final status of the electronic invoice itself. For example, if an electronic invoice must be submitted to an external web service for approval, the submission status might be **Completed**, but the status of the electronic invoice might be **Rejected**. In this case, Electronic invoicing was able to successfully process the electronic invoicing feature as it was configured to process that feature. However, the electronic invoice was rejected because it didn't meet the criteria that the web service established for invoice approval.

The submission status is updated only when you send a request to the Electronic invoicing service by submitting new electronic documents, or by submitting functions and inquiries.

The submission log includes the following additional commands:

- **Functions** > **Cancel submissions** – This function enables a special submission process when the electronic invoice must be approved by an external web service. It instructs Electronic invoicing to send the web service a specific message that is intended to cancel the status of an approved electronic invoice in the web service database.

  > ⓘ **Note**
  >
  > The cancellation functionality is controlled by the **BusinessDocumentEnableCancelForCompleteSubmissionFlight** flight which is disabled by default. The flight must be intentionally enabled per request to activate the functionality.

- **Functions** > **Resubmit document** – Resubmit an electronic document that has already been submitted to Electronic invoicing. A new log is created on the **Submission details** page. In this case, no data is sent to the Electronic invoicing service. Instead, the Electronic invoicing service reruns the processing of previously submitted data.

- **Functions** > **Send related submission** – Send the same document from Finance or Supply Chain Management.

- **Inquiries** > **Submission details** – View the details of the main submission. The visualization shows the complete execution log of the actions that are configured in the electronic invoicing feature. You can download the files that are created as a result of each action during the processing. When the invoice must be approved by an external web service, you can view the status of the invoice.

  Processing data contains variables that are sent to the Electronic invoicing service or returned from it. You can review the value of these variables. For example, the **BusinessDocumentDataModel** variable contains financial data that is submitted to the Electronic invoicing service in a unified structure (JavaScript Object Notation [JSON] format). You can use this information to troubleshoot the correctness of the data that was passed for further processing.

- **Inquiries** > **Related submissions** – View the details of child submissions or the submission of related documents.

- **Electronic document** > **Download file** – For a single electronic document or a selected range of the documents, download a ZIP archive that contains generated electronic files.

Because the processing pipeline of the electronic invoicing feature might contain several actions that generate different files, set the **Export result** parameter for a specific action to ensure that the result of that action is exported.

Receive electronic documents

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management, follow these steps to receive electronic invoices.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

Use the receipt log to view the results of processing incoming documents.

To open the log, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

> **Note**
>
> By default, the system sets a filter for the **Submission status** value so that you see only failed receipt submissions. In-progress and successful receipt submissions aren't shown. However, you can adjust the filter to fit your needs.

There are three possible submission statuses:

- **Scheduled** – Electronic invoicing received the submission from Finance or Supply Chain Management, and is currently processing the electronic invoicing feature.
- **Completed** – Electronic invoicing successfully processed the electronic invoicing feature in the way that it was configured to process it.
- **Failed** – Electronic invoicing encountered an error or was stopped by an exception while it was processing the electronic invoicing feature.

The system updates the receipt status only when you send a request to the Electronic invoicing service to receive and process new electronic documents, or to receive and process functions and inquiries.

The receipt log includes the following additional commands:

- **Functions** > **Cancel submissions** – This function enables a special submission process when the electronic invoice must be approved by an external web service. It instructs Electronic invoicing to send the web service a specific message that is intended to cancel the status of an approved electronic invoice in the web service database.
- **Functions** > **Resubmit document** – Resubmit the request to the Electronic invoicing service to run the receipt process. A new log is created on the **Submission details** page.
- **Inquiries** > **Submission details** – View the details of the main submission. The visualization shows the complete execution log of the actions that are configured in the electronic invoicing feature. You can download the files that are created as a result of each action during the processing. When the invoice must be approved by an external web service, you can view the status of the invoice.

Processing data contains variables that are sent to the Electronic invoicing service or returned from it. You can review the value of these variables.

To view successfully received invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

Electronic invoicing coverage for supported and planned countries and regions

This article describes the current geographical coverage for electronic invoicing in Microsoft Dynamics 365 Finance. It also describes known plans for upcoming electronic invoicing implementations.

Electronic invoicing, or e-invoicing, is the process of sending and receiving invoices in a digital format. E-invoicing is rapidly becoming an important part of business processes and an essential part of compliance with the global and country/region-specific regulatory requirements for both buyers and suppliers.

E-invoicing has several advantages over traditional paper-based invoicing. Here are some examples:

- It reduces errors and disputes by eliminating manual data entry and validation.
- It increases cash flow and visibility by speeding up the invoice approval and payment cycle.
- It lowers operational costs by saving time, paper, postage, and storage space.
- It improves customer satisfaction and retention by offering convenience and flexibility.
- It supports environmental sustainability by reducing paper waste and carbon footprint.

Microsoft monitors changes to legislative requirements in the e-invoicing area for all supported countries and regions, and delivers regulatory updates in a timely manner. When Microsoft extends geographical coverage, the company prioritizes e-invoicing as one of the most important requirements.

The next section contains detailed information about out-of-box e-invoicing functionality for countries and regions that are already supported. It includes information about upcoming regulatory changes and plans for new country/region implementations.

Electronic invoicing coverage

> **Note**
>
> Delivery timelines for planned implementations that are mentioned in the following table might change. In addition, projected functionality might not be released at all, for various reasons. For more information, see Microsoft policy.

Expand table

Country/region	Description	Availability
Argentina	Generation of electronic documents in the predefined XML formats and direct submission through WebServices to the Argentinian Tax Authority (ARCA).	Planned for 2026 release wave 1 or later
Australia	Generation of electronic invoices for sales and project invoices and credit notes in the Australian extension of the **PEPPOL** format. Learn more: Electronic invoicing for Australia	Available
Austria	Generation of electronic invoices for sales and project invoices and credit notes in the **PEPPOL** format.	Available
Belgium	Generation of electronic invoices for sales and project invoices and credit notes in the **PEPPOL** format and submission to the PEPPOL Delivery Network via the "last-mile" third-party connection to Edicom. Import of vendor electronic invoices. Learn more: Electronic invoicing for Belgium	Available
Bolivia	Generation of electronic invoices with the right to fiscal credit, invoices without the right to fiscal credit, and adjustment documents in XML format. Direct submission to the Bolivian Tax Authority (SFV).	Planned for 2026 release wave 1 or later
Brazil	**2026 Tax Changes in Electronic Invoicing for Brazil** The update includes the revision of the NF-e format and its transition to Electronic Reporting to ensure compliance with updated tax rules and classifications. It also introduces the National (Federal) NFS-e and São Paulo city NFS-e formats for service invoices. **New:** Support for project-based service invoicing scenarios has been added. NFS-e XML can now be generated from project service invoices, including project invoice proposals and journals (Hour, Fee, Expense, Item). The implementation enables NBS codes and operation indicator codes across project-related processes, including project categories, journal lines, on-account transactions, and invoice proposals. This ensures that NFS-e XML is generated with the required service classification and operation context. All formats are generated using the Electronic Reporting framework. NF-e continues to be submitted to SEFAZ in the same way as previously (in the code in Finance).	Available

Country/region	Description	Availability
	NFS-e (Federal and São Paulo) isn't submitted out of the box, and the XML isn't digitally signed. Integration with a third-party solution or customization is required to submit and sign service fiscal documents. The solution supports only generation of the DPS (Documento Preliminar de Serviços). The official NFS-e fiscal document is issued by the municipal or federal authority after processing, and the access key must be handled via customer or partner solutions / extensions. Inbound vendor service invoices aren't currently in scope for NBS classification. Learn more: • NF-e process overview • Brazil Tax Reform setup • NFS-e service invoices • NFS-e service invoices for Projects	
Chile	Generation of electronic tax documents (DTE) in a country/region-specific format for invoices, debit notes, credit notes, export invoices, export debit notes, export credit notes, and packing slips. Import of vendor electronic invoices (inbound flow). Submission to the Chilean Tax Authority (SII) via a third-party "last mile" connection to Edicom. Learn more: • Get started with Electronic invoicing for Chile • Vendor electronic invoice import in Chile	Available
China	Invoice reporting (fapiao) support. File upload integration with Golden Tax System via BaiWang and Asino software. Learn more: Golden tax system integration	Available
Colombia	Generation of electronic invoices in the standard XML format based on UBL V2.1 and adopted by DIAN. Submission to the Colombian Tax Authority (DIAN) via a third-party "last mile" connection to Edicom. Learn more in Electronic invoicing for Colombia.	Available
Costa Rica	Generation of e-documents for invoices, credit notes, debit notes, vendor invoices (self-invoices), and payment in the country/region-specific format: version 4.4. Submission to the Costa Rican Tax Authority (Ministerio de Hacienda) via a third-party "last mile" connection to Edicom.	Available

Country/region	Description	Availability
	Learn more: Electronic invoicing for Costa Rica	
Denmark	Generation to NemHandel or to the Peppol network of electronic invoices for sales and project invoices and credit notes in the **OIOUBL** or **PEPPOL** formats and submission to NemHandel or to the PEPPOL Delivery Network via the "last-mile" third-party connection to Edicom. Import of vendor electronic invoices. Learn more: Use electronic invoicing for Denmark	Available
Dominican Republic	Generation of electronic fiscal vouchers (e-CF) in the XML format based on the UBL standard. Submission to the Dominican Republic Tax Authority (DGII) via a third-party "last mile" connection to Edicom.	Planned for 2026 release wave 1 or later
Ecuador	Generation of electronic receipts in XML format that comply with the legal and regulatory requirements of the SRI. Submission to the Ecuadorian Tax Authority (SRI) via a third-party "last mile" connection to Edicom.	Planned for 2026 release wave 1 or later
Egypt	Generation and direct submission to the Egyptian Tax Authority of electronic invoices for sales and project invoices, credit notes, and debit notes in the country/region-specific format. Learn more: Electronic invoicing in Egypt	Available
Estonia	Generation of electronic invoices for sales and project invoices and credit notes in the country/region-specific format. Learn more: Export of customers electronic invoices in Estonia	Available
Finland	Generation of electronic invoices for sales and project invoices and credit notes in the **Finvoice** format. Learn more: Export of customers electronic invoices in Finland	Available
France	Generation and submission to Chorus Pro of B2G electronic invoices for sales and project invoices and credit notes in the **PEPPOL** format. Import of vendor B2G electronic invoices. Learn more: Electronic invoicing via Chorus Pro	Available
	Generation, submission, and reception of domestic B2B electronic invoices for sales and project invoices and credit notes in the French-specific UBL-based format to/from	Available

Country/region	Description	Availability
	Edicom acting as a certified Platform Agent. Support of documents mandatory life-cycle statuses. Learn more: Electronic invoicing via EDICOM	
Germany	Generation of electronic invoices for sales and project invoices and credit notes in the **xRechnung** format. Import of vendor electronic invoices in the **xRechnung** format. Learn more: • Customer electronic invoices in Germany • Use vendor electronic invoices import in Germany	Available
Guatemala	Generation of electronic invoices in a file structured in the country/region-specific XML format. Submission to the Guatemalan Tax Authority (SAT) via a third-party "last mile" connection to Edicom.	Planned for 2026 release wave 1 or later
Hungary	Generation and submission to the governmental Real-time invoice reporting (RTIR) platform of required data in the country/region-specific format. Learn more: Online invoicing system	Available
India	Generation and submission to the governmental Invoice Registration Portal (IRP) of electronic invoices for sales and project invoices and credit notes in the country/region-specific format. Learn more: Electronic invoices in India	Available
Indonesia	Generation and file upload integration with the tax authorities' software of electronic invoices for sales and project invoices, credit notes, and debit notes in the country/region-specific format. Import of vendor electronic invoices. Learn more: Get started with electronic invoicing for Indonesia	Available
Italy	Generation and direct submission to the SDI system of electronic invoices for sales and project invoices and credit notes in the **FatturaPA** format. Import of vendor electronic invoices. Learn more: • Customer electronic invoices • Vendor electronic invoices	Available

Country/region	Description	Availability
	• Import of vendors electronic invoices • Get started with Electronic invoicing for Italy	
Malaysia	Generation and direct submission to IRBM of electronic invoices for sales, project, and self invoices, credit notes, and debit notes. Learn more: Get started with electronic invoicing for Malaysia	Available
Mexico	Generation and submission of CFDI electronic documents to PAC Interfactura. Import of vendor electronic invoices. Learn more: Electronic invoices (CFDI)	Available
Netherlands	Generation of electronic invoices for sales and project invoices and credit notes in the **UBL-OHNL** format.	Available
New Zealand	Generation of electronic invoices for sales and project invoices and credit notes in the New Zealand extension of the PEPPOL format. Learn more: Electronic invoicing for New Zealand	Available
Norway	Generation of electronic invoices for sales and project invoices and credit notes in the **EHF** format. Learn more: Customer electronic invoices in Norway	Available
Oman	Generation of electronic invoices in the PEPPOL format and submission to the PEPPOL Delivery Network via the "last mile" third party connection. This will be enforced by August 2026 for the 100 largest tax paying companies in the country/region with following adoption for other groups of taxpayers by year 2028.	Planned for 2026 release wave 2 or later
Panama	Generation of e-documents for invoices in the country/region-specific format. Submission to the Panamanian Tax Authority (DGI) via a third-party "last mile" connection to Edicom. Learn more: Electronic invoicing for Panama	Available
Paraguay	Generation of electronic documents and electronic tax documents in the standardized country/region-specific XML format. Submission to the Paraguayan Tax Authority (SET) via a third-party "last mile" connection to Edicom. Learn more in Electronic invoicing for Paraguay.	Available

Country/region	Description	Availability
Peru	Generation of electronic invoicing documents in the standard XML format based on UBL V2.1 and adopted by SUNAT, also known as CPE (Electronic Payment Vouchers). Submission to the Peruvian Tax Authority (SUNAT) via a third-party "last mile" connection to Edicom.	Planned for 2026 release wave 1 or later
Poland	Generation and direct submission to the governmental KSEF system of electronic invoices for sales, project, and advance invoices and credit notes in a country/region-specific format. Import of vendor electronic invoices. Learn more: Get started with electronic invoicing for Poland	Available
Saudi Arabia	Generation and direct submission to ZATCA of electronic invoices for customer prepayments, sales and project invoices, credit notes, and debit notes in the country/region-specific format. Learn more: Electronic invoicing in Saudi Arabia	Available
Singapore	Generation of electronic invoices in the Peppol International (PINT) format and submission to the "InvoiceNow" network via the "last mile" 3rd-party connection to Edicom. Learn more: Electronic invoicing for Singapore	Available
Spain	Generation of electronic invoices for sales and project invoices and credit notes in the **FacturaE** format.	• Available • B2B mandate is expected in 2027
Spain	Generation and submission to the governmental SII system of required data in the country/region-specific format. Learn more: Immediate Supply of Information on VAT (SII)	Available
Türkiye	Generation of e-invoices for customer invoices in the format mandated by Turkish Revenue Administration to meet e-invoicing obligations.	Available in Public preview. General availability is planned for 2025 release wave 2
United Arab Emirates	Generation of electronic invoices in the Peppol International (PINT) format and submission to the PEPPOL Delivery Network via the "last mile" third party connection. To be enforced by 01 January 2027.	Planned for 2026 release wave 2
Uruguay	Generation of electronic fiscal receipts (CFE) based on the XML standard, with a syntax defined and maintained by the	Available

Country/region	Description	Availability
	DGI. Submission to the Uruguayan Tax Authority (DGI) via a third-party "last mile" connection to Edicom. Learn more: Electronic invoicing for Uruguay	
PEPPOL	Generation of electronic invoices for sales and project invoices and credit notes in the **PEPPOL** format. This country/region-independent functionality can be used "as is" if no country/region-specific amendments are supposed, or it can be used as the basis for further modifications. Learn more: • Export of customers electronic invoices in PEPPOL BIS 3 format • Import vendor electronic invoices in PEPPOL format	Available

Availability of Electronic Invoicing Service features by country or region

The availability of Electronic Invoicing Service globalization features depends on the country or region where you're located. Although some features are generally available, others are still in preview.

> **Note**
>
> This article relates only to the globalization features introduced in the scope of the Electronic Invoicing Service. It doesn't cover other approaches for supported e-Invoicing capabilities for some countries or regions that are designed based on built-in X++ code and the Electronic Messaging framework. For more information, see Electronic Invoicing and Electronic messaging.

Generally available features

The following table shows the Electronic invoicing globalization features that are generally available.

Expand table

Country or region	Globalization feature name	Business documents
Australia	Electronic invoicing for Australia and New Zealand	Sales invoices and project invoices
Austria	Austrian electronic invoices (AT)	Sales invoices and project invoices
Belgium	Belgian electronic invoice (BE)	Sales invoices and project invoices
Chile	Chilean electronic invoice (CL)	Sales invoices, project invoices, and packing slips
Chile	Chilean electronic invoice (CL)	Import vendor invoices
Colombia	Colombia Electronic Invoice (CO)	Sales invoices and project invoices

Country or region	Globalization feature name	Business documents
Costa Rica	Costa Rica electronic invoice (CRI)	Sales invoices and project invoices
Denmark	Danish electronic invoice (DK)	Sales invoices and project invoices
Egypt	Egyptian electronic invoice (EG)	Sales invoices and project invoices
Estonia	Estonian electronic invoice (EE)	Sales invoices and project invoices (format generation only)
Europe	PEPPOL electronic invoice	Pan-European Public Procurement Online (PEPPOL) sales invoices and project invoices (format generation only)
Europe	PEPPOL vendor invoice import	PEPPOL import vendor invoices
Finland	Finnish electronic invoice (FI)	Sales invoices and project invoices (format generation only)
France	French Chorus Pro submission (FR)	Sales invoices and project invoices
France	French Chorus Pro vendor invoice import (FR)	Import vendor invoices
France	French electronic invoice (FR)	Sales invoices and project invoices via EDICOM
Germany	German electronic invoice (DE)	Sales invoices and project invoices (format generation only)
Indonesia	Indonesian electronic invoice (ID)	Sales invoices, project invoices, and vendor invoices
Italy	Italian FatturaPA (IT)	Sales invoices and project invoices, and vendor invoices
Malaysia	Malaysian electronic invoicing (MY)	Sales invoices, project invoices, and self invoices
Netherlands	Dutch electronic invoice (NL)	Sales invoices and project invoices
New Zealand	Electronic invoicing for Australia and New Zealand	Sales invoices and project invoices
Norway	Norwegian electronic invoice (NO)	Sales invoices and project invoices (format generation only)
Panama	Panama Electronic Invoice (PA)	Sales invoices and project invoices
Paraguay	Paraguay Electronic Invoice	Sales invoices, project invoices, and packing slips

Country or region	Globalization feature name	Business documents
	(PY)	
Poland	Polish electronic invoice (PL)	Sales invoices, project invoices, and advance invoices
Saudi Arabia	Saudi Arabian Zatca submission (SA)	Sales invoices and project invoices
Saudi Arabia	Saudi Arabian Zatca compliance check (SA)	Onboarding process
Singapore	Singaporean electronic invoice (SG)	Sales invoices and project invoices
Spain	Spanish electronic invoice (ES)	Sales invoices and project invoices
Uruguay	Uruguay Electronic Invoice (UY)	Sales invoices, project invoices, and packing slips

Important

Microsoft planned to transition NF-e/NFS-e and CFDI to the Electronic Invoicing service. For quite a while, the features and formats for NF-e/NFS-e were in preview in Brazil, and those for CFDI were in preview in Mexico. However, because of a lack of interest in adoption and transition to the new approach, Microsoft is still evaluating the timing of the switch to the Electronic Invoicing service platform in those countries or regions. The format of these documents doesn't contain the latest compliance changes that were published since the preview release. In the meantime, continue to use the built-in X++ implementations in Brazil and Mexico. **These implementations are kept up to date with the legislation.** For more information, see Brazil NF-e process overview and Electronic invoices (CFDI).

Note

Electronic invoicing capabilities for Brazil (NF-e for goods and NFS-e for services) are implemented in Dynamics 365 Finance by using Electronic Reporting (ER) configurations and country-specific localization features.

As part of the Brazil tax reform updates, the generation of NF-e and NFS-e XML formats was transitioned to the Electronic Reporting framework to support evolving tax rules and classifications.

NF-e documents continue to be submitted to SEFAZ by using existing integration mechanisms in Finance, while NFS-e (Federal and São Paulo formats) are generated as XML files that require integration or a third-party solution for submission and digital signature.

For Brazil, don't use the Electronic Invoicing Service. Instead, use the built-in localization and ER-based configurations for compliant electronic invoice generation.

Preview features

The following table shows the Electronic invoicing Service globalization features that are currently in preview.

Expand table

Country or region	Globalization feature name	Business documents
Brazil	Brazilian NF-e (BR)	Fiscal document model 55, correction letters, cancellations, and discards
Brazil	Brazilian NFS-e ABRASF Curitiba (BR)	Service fiscal documents
Brazil	Brazilian NF-e import from e-mail (BR)	Fiscal document model 55
Mexico	Mexican CFDI Interfactura (MX)	Sales invoices, packing slips, inventory transfers, payment complements, and cancellations

Get started with Electronic invoicing for Australia and New Zealand

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Regulatory Configuration Service (RCS) will be deprecated. All new RCS provisioning is stopped as of 10.0.39 GA. If provisioning is required, please register a support ticket. We will be providing tools and required support for migration from RCS to the **Globalization Studio** workspace. We plan to fully shut down RCS by August 1, 2024. For more information about migration to **Globalization Studio** workspace, see Regulatory Configuration Service merge to the Globalization Studio workspace

This article helps you get started with Electronic invoicing for Australia and New Zealand. It guides you through the configuration steps that depend on the country or region in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps described in Set up Electronic invoicing.

After you configure Electronic invoicing, you can generate XML files of electronic invoices by using the Pan-European Public Procurement Online (PEPPOL) format specification with the Australian and New Zealand extension.

> **Note**
>
> The electronic invoicing approach described in this article is implemented by using an invoicing service that's applicable only to cloud deployments of Finance or Supply Chain Management. For on-premises deployments, see Customer electronic invoices in Australia and New Zealand.

Prerequisites

Before you begin the procedures in this article, make sure the following prerequisites are met:

- You're familiar with Electronic invoicing as described in Electronic invoicing overview.
- You complete the common part of Electronic Invoicing service configuration as described in Set up Electronic invoicing.

Country/region-specific configuration for the Electronic invoicing for Australia and New Zealand feature

Some parameters in the **Electronic invoicing for Australia and New Zealand** Electronic invoicing feature have default values. Before you deploy this feature to the service environment, review the default values, and update them as needed to better reflect your business operations.

1. Import the latest version of the **Electronic invoicing for Australia and New Zealand** Globalization feature as described in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it. For more information, see Create a Globalization feature.

   > **Note**
   >
   > Microsoft provides the **Electronic invoicing for Australia and New Zealand** feature. It's ready to use and requires no additional configuration. For information about how to configure invoicing features if you must apply changes, see **Work with feature setups**. For example, you can filter specific legal entities so that they're processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Australia or New Zealand.

3. Always create the copy of the feature as a **Draft** version. Regardless of whether you made changes, complete and deploy the feature as described in Complete and deploy a Globalization feature.

Finance configuration

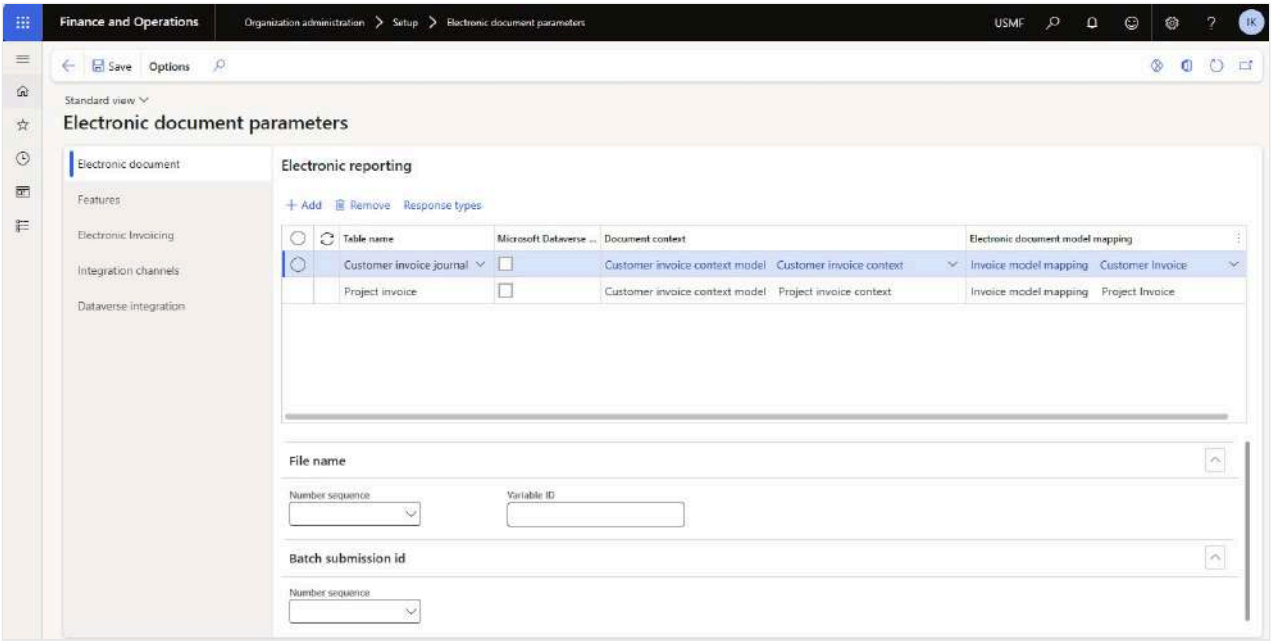
You must configure some additional parameters directly in Finance.

1. Make sure that the country/region-specific Electronic reporting (ER) configurations for the document context and electronic document model mapping that are required for

Australia and New Zealand are imported. For more information, see Set up Electronic invoicing parameters.

> **Note**
>
> After you import the **Electronic invoicing for Australia and New Zealand** Electronic invoicing feature, electronic documents are configured by default. Follow the remaining steps of this procedure if you must make changes.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. On the **Electronic document** tab, add records for the **Customer Invoice journal** and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.



5. Save your changes, and close the page.

Finance business data configuration

Prerequisites

The primary address of the legal entity must be in Australia or New Zealand.

Configure legal entity data

1. Go to **Organization administration** > **Organizations** > **Legal entities**, and select a legal entity.
2. On the **Addresses** FastTab, add a valid primary address for the legal entity.
3. On the **Tax registration** FastTab, in the **Tax registration number** field, enter a valid tax registration number for the legal entity.

Configure customer data

1. Go to **Accounts receivable** > **Customers** > **All customers**, and select a customer.
2. On the **Addresses** FastTab, add a valid address for the customer.
3. On the **Invoice and delivery** FastTab, in the **Tax exempt number** field, enter a valid tax registration number for the customer.
4. On the **Sales demographics** FastTab, in the **Primary contact** field, select a person who is the buyer's contact.

> ⓘ **Note**
>
> Define all available contact persons for this customer.

Configure units of measure

1. Go to **Organization administration** > **Setup** > **Units** > **Units**.
2. Select a unit ID in the list, and then select **External codes**.
3. On **External codes**, in the **Overview** section, enter a code in the **Code** field that corresponds to the selected unit ID.
4. In the **Value** section, enter the external code in the **Value** field to use as the units of measure code for international trade.

> ⓘ **Note**
>
> When no specific units of measure are assumed, the default value **EA** (each) is used.

Configure sales tax codes

1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.

2. Select a sales tax code. On the Action Pane, on the **Sales tax code** tab, in the **Sales tax code** group, select **External codes**.
3. In the **Overview** section, create a line for the selected unit. Enter the sales tax code in the **External code** field that you selected in step 2.
4. In the **Value** section, enter an external code in the **Value** field to use for the selected sales tax code, according to the required codification.

Customer requisition

When you register free text invoices, invoices that are based on sales orders, or project invoices, enter a customer requisition. You can also add an optional customer reference.

Free text invoices

1. Go to **Accounts receivable** > **Invoices** > **All free text invoices**.
2. Create a new invoice, or select an existing invoice.
3. In the **Header** view, on the **Customer** FastTab, in the **References** section, enter values in the **Customer requisition** and **Customer reference** fields.

Sales orders

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Create a new sales order, or select an existing sales order.
3. In the **Header** view, on the **General** FastTab, in the **References** section, enter values in the **Customer requisition** and **Customer reference** fields.

Project invoices

1. Go to **Project management and accounting** > **Projects** > **Project contracts**.
2. Create a new project contract, or select an existing project contract.
3. On the **Funding sources** FastTab, select or create a funding source of the **Customer** type, and then select **Details**.
4. On the **Funding source details** page, on the **Other** FastTab, in the **References** section, enter default values for the contract in the **Customer requisition** and **Customer reference** fields.

Issue electronic invoices

After you complete all the required configuration steps, you can generate electronic invoices for posted invoices. For more information about how to generate electronic invoices, see Issue

electronic invoices in Finance and Supply chain management.

You can check the results of a submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** and selecting the required document type.

To download the XML files of electronic invoices for successfully processed invoices, select **Electronic document** > **Download file**.

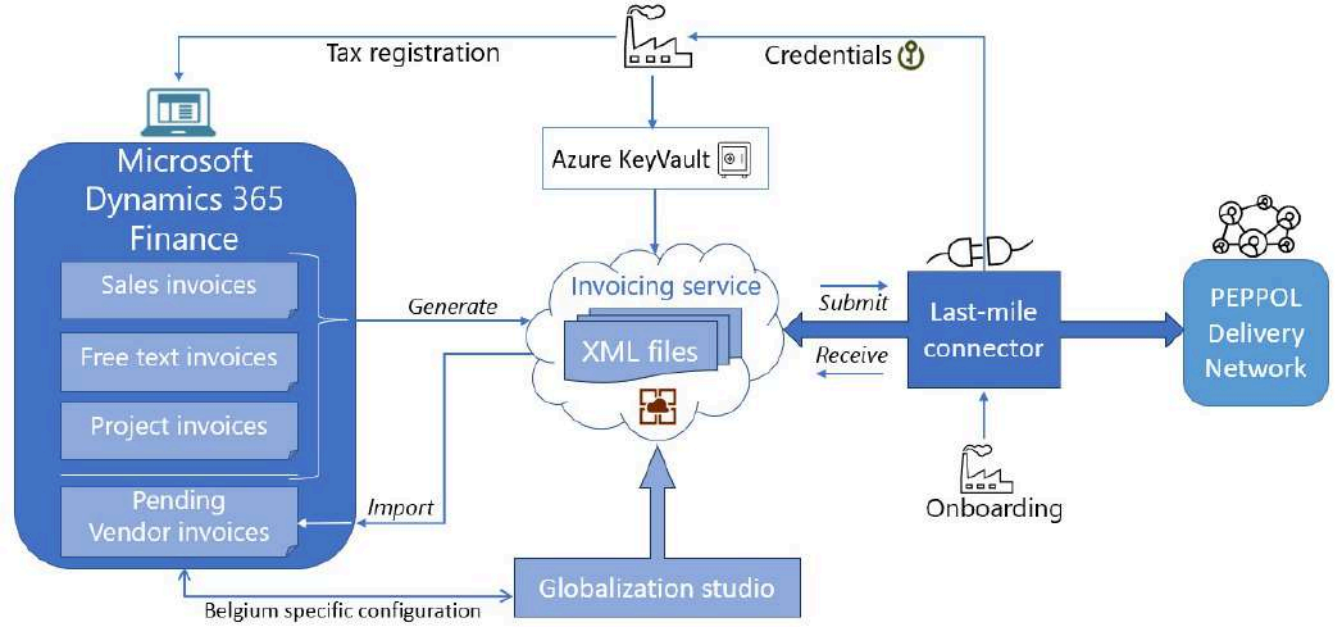
Electronic invoicing for Belgium

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with Electronic invoicing for Belgium. It explains how to configure the system so that you can use the last-mile connector to generate, submit, and receive electronic invoices in the Pan-European Public Procurement Online (PEPPOL) format in Microsoft Dynamics 365 Finance.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that's applicable only to cloud deployments of Dynamics 365 Finance.

Watch the following overview of the Belgian electronic invoicing implementation in Finance.

https://learn-video.azurefd.net/vod/player?id=d21698ae-599e-4895-9a45-e19226a852ab&locale=en-us&embedUrl=%2Fdynamics365%2Ffinance%2Flocalizations%2Fbelgium%2Femea-bel-e-invoices

Prerequisites

Before you begin the procedures in this article, meet the following prerequisites:

- The company must be a registered taxpayer in Belgium.
- The company must have a signed agreement with the provider of electronic document delivery service that secures electronic document interchange in the **PEPPOL** format.
- Among the registered profile IDs, the company should have the **urn:fdc:peppol.eu:2017:poacc:billing:01:1.0** profile. Finance uses this profile for the interchange of documents in the **PEPPOL** format.
- The company must obtain, from the service provider, the required credentials to enable integration of the Electronic Invoicing service with the Electronic Invoicing service independent software vendor (ISV) last-mile connector.

  > **Note**
  >
  > The current implementation assumes **Edicom** as the Electronic Invoicing ISV last-mile connection service provider. Learn more in **e-Invoicing Integration with Microsoft Dynamics 365**).

- Become familiar with Electronic invoicing as it's described in Electronic Invoicing service overview and Electronic invoicing components.
- Complete the common part of Electronic Invoicing service configuration as described in Electronic invoicing components.

Create the Azure Key Vault configuration

Create an Azure key vault to store the required secrets that are issued for your company. Learn more in Configure Azure resources for Electronic invoicing.

In the key vault, add the secret for the token that grants authorization to access the Edicom services. You must obtain this token from Edicom before you begin, as described in the prerequisites.

Configure electronic invoicing Key Vault parameters

To configure electronic invoicing Key Vault parameters, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, in the **Key Vault settings** section, in the **Key Vault** field, select the reference to the key vault that you created in the previous section of this article.
3. In the **SAS token secret** field, select the name of the storage account secret URL that you use to authenticate access to the storage account.
4. Select **Key Vault parameters**.
5. On the **Key Vault parameters** page, in the **Certificates** section, select **Add** to create a **token** element of the **Secret** type for the secret that is described in the previous section.

   > ⓘ Note
   >
   > The value in the **Name** column should match the name of the secret that is described in the previous section.

Import the electronic invoicing feature

1. Go to **Globalization Studio**, and select the **Electronic invoicing** tile. Then import the latest version (**5** or later) of the **Belgian electronic invoice (BE)** Globalization feature as described in Import features from the repository.
2. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, make sure that the following Electronic reporting (ER) configurations are successfully imported when you import the **Belgian electronic invoice (BE)** Globalization feature:

   - Invoice model
   - Invoice model mapping
   - PEPPOL Sales e-invoice
   - PEPPOL Sales e-credit note
   - PEPPOL Project e-invoice
   - PEPPOL Project e-credit note
   - Customer invoice context model
   - Response message model
   - Edicom Response Processing
   - Error log import Json

   > ⓘ Note

If the preceding ER configurations aren't imported for some reason, manually import them as described in Import Electronic reporting (ER) configurations from Dataverse.

3. On the **Reporting configurations** tile, import the latest versions of the following ER configurations. These configurations are required for the receipt of incoming vendor invoices.

    - Vendor invoice import
    - Vendor invoice Mapping to destination
    - Import invoice context model

Configure the electronic invoicing feature

The **Belgian electronic invoice (BE)** electronic invoicing feature includes some parameters with default values. Before you deploy the electronic invoicing feature to the service, review the default values, and update them as needed to better reflect your business operations.

To review and update the configuration of the **Belgian electronic invoice (BE)** electronic invoicing feature, follow these steps:

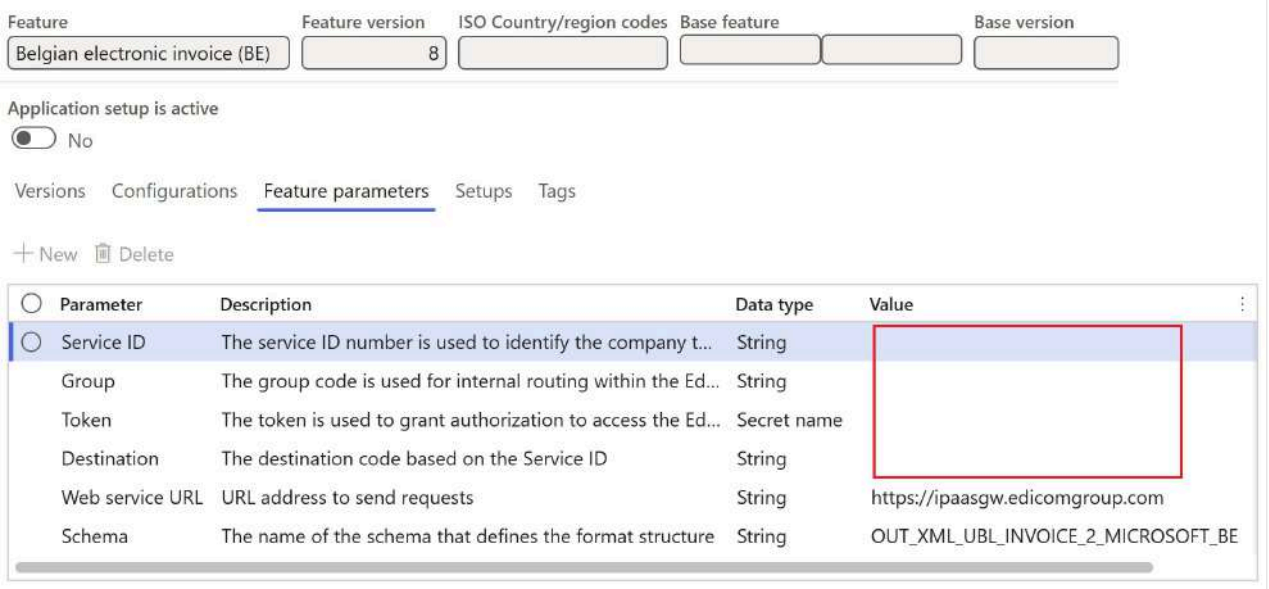
1. Go to **Globalization Studio**, and select the **Electronic invoicing** tile. Then import the **Belgian electronic invoice (BE)** Globalization feature as described in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it, as described in Create Globalization features.

3. On the **Versions** tab, verify that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters. These parameters are required for interoperation with Edicom services.

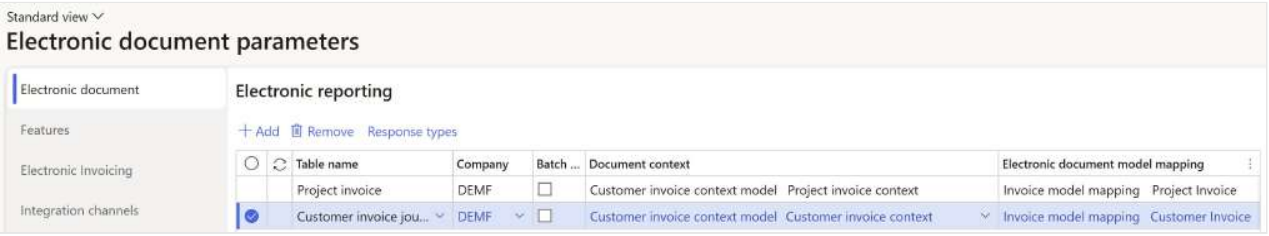
    - **Service ID** – Enter the service ID (domain) number that you obtained from Edicom. This value is used for company identification.
    - **Group** – Enter the group code. This value is used for internal routing within the Edicom infrastructure.
    - **Destination** – Enter the destination, which you construct by concatenating the service ID number and the string **_EDIWIN**. For example, if the service ID number is **123456**, enter **123456_EDIWIN**.
    - **Token** – Select the name of the token that you previously created.



5. The copy of the feature is always created as a **Draft** version. Complete and deploy the feature as described in Complete and deploy a Globalization feature.

Configure electronic document parameters

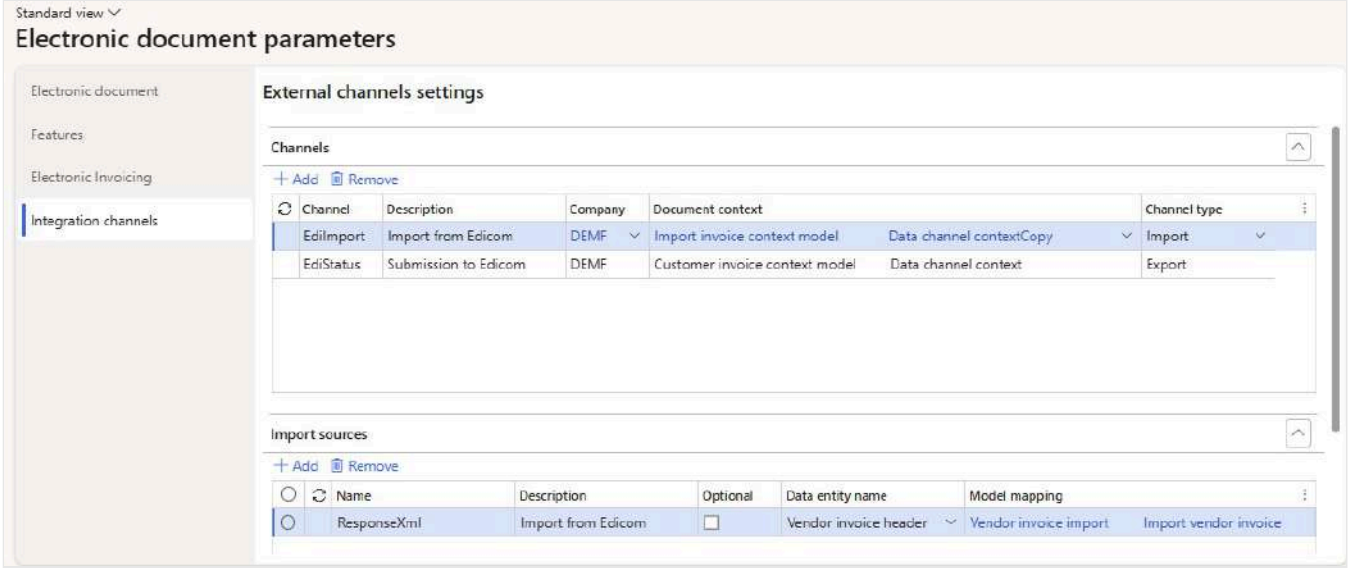
1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic document** tab, add records for the **Customer Invoice journal** and **Project invoice** table names.
3. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with Set up Electronic document parameters.



> **Note**
>
> If you create derived analogs of the previously mentioned ER configurations, use them instead of the standard ones.

4. On the **Integration channels** tab, in the **Channels** section, select **Add** to create a channel.
5. In the **Channel** field, enter **EdiStatus**. Enter the value exactly as it appears here. The system uses this channel to submit outgoing electronic invoices.
6. In the **Company** field, select a required legal entity.

7. In the **Document context** field, select the **Data channel context** mapping from the **Customer invoice context model** configuration.
8. In the **Channel type** field, select **Export**.
9. In the **Channels** section, select **Add** to create another channel.
10. In the **Channel** field, enter **EdiImport**. Enter the value exactly as it appears here. The system uses this channel to import incoming electronic invoices.
11. In the **Company** field, select a required legal entity.
12. In the **Document context** field, select the **Data channel context** mapping from the **Import invoice context model** configuration.
13. In the **Channel type** field, select **Import**.
14. In the **Import sources** section, select **Add** to create an import source.
15. In the **Name** field, enter **ResponseXml**. Enter the value exactly as it appears here.
16. In the **Data entity name** field, select the **Vendor invoice header** entity.
17. In the **Model mapping** field, select the **Import vendor invoice** mapping from the **Vendor invoice import** configuration.
18. Select **Save**, and close the page.



> **Note**
>
> If you must use other integration channels besides **EdiStatus** and **EdiImport**, you must do extra configuration of the feature and context.

Configure the address structure

To configure the structure of the postal address and define all required elements, follow these steps:

1. Go to **Organization administration** > **Global address book** > **Addresses** > **Address setup**.

2. Make sure that at least the following mandatory elements are configured:

    - Country/region code
    - Postal code
    - City name
    - Street

Configure legal entity data

Enter the address

To enter the address, follow these steps:

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity.
3. On the **Addresses** FastTab, add a valid primary address for the selected legal entity.

Verify the seller's identification

To identify a company by its value-added tax (VAT) number, follow these steps:

1. Go to **Organization administration** > **Organizations** > **Legal entities**.

2. On the **Foreign trade and statistics** FastTab, in the **INTRASTAT** section, in the **VAT exempt number export** field, make sure that a valid VAT number is entered for the legal entity.

    The VAT number is entered in the **Invoice\cac:AccountingSupplierParty\cac:Party\cbc:EndpointID** element in the electronic invoice XML file that is generated. You use it as the seller's identification during the submission process.

> ⓘ **Note**

The contact information for the legal entity is automatically retrieved from the related **Person** record that is associated with the current user in Finance.

Configure customer data

Enter the address

To enter the address, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Addresses** FastTab, add a valid address for the selected customer.

Enter the contact person

To enter the contact person, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Sales demographics** FastTab, in the **Primary contact** field, select the person who is considered as the buyer's contact.

   > ⓘ **Note**
   >
   > You must already define all available contact persons for the selected customer. Make sure that the selected contact person has a valid email address and phone number.

Verify the buyer's identification

The buyer's EndpointID determination uses the following hierarchy of built-in Registration numbers.

- If you define the Global Location Number (GLN), also known as a European article numbering (EAN), for the customer as an active Registration Number with the **EAN** Registration category, the system uses it as the customer's EndpointID and uses the **0088** constant (EAN Location Code) as the EndpointID **schemeID** attribute's value.

- If you don't define the EAN registration number, the system uses the customer's active Registration Number of the **Enterprise ID** Registration category as the customer's EndpointID and dynamically determines the EndpointID **schemeID** attribute's value depending on the country/region from the Buyer's address. For example, **0208** for Belgium, **0002** for France, etc.

- If you don't define the EAN and Enterprise ID registration numbers, the system uses the customer's active Registration Number of the **VAT ID** Registration category as the customer's EndpointID and dynamically determines the EndpointID **schemeID** attribute's value depending on the country/region from the Buyer's address. For example, **9925** - Belgium VAT number, **9957** - French VAT number, etc.

- If you don't define the VAT ID registration number, the system uses the **Tax exempt number** defined in customer's master data.

  The resulting Endpoint ID value populates the **Invoice\cac:AccountingCustomerParty\cac:Party\cbc:EndpointID** element in the generated electronic invoice XML file and is used as the buyer's identification during the submission process.

> ⓘ **Note**
>
> If the built-in registration numbers aren't sufficient, you can redefine the default schema by following the configuration steps for the **Buyer** identification in the next section. You can define any schema from the list of allowed values Electronic Address Scheme (EAS). Otherwise, skip ahead to the Configure units of measure section.

Configure identification schemas

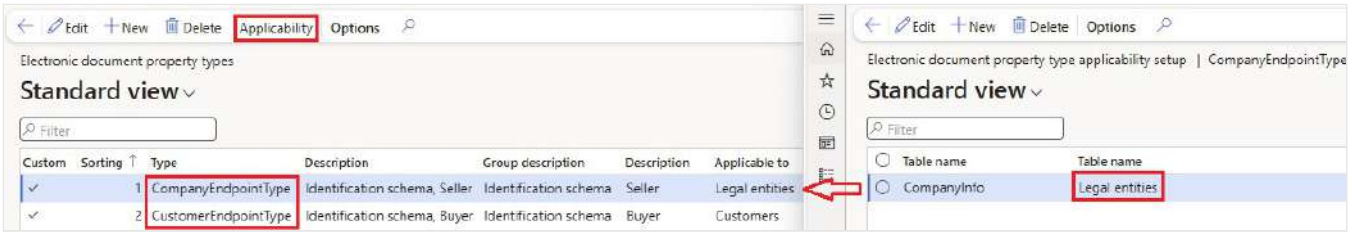
Follow the configuration steps in this section only if you need to redefine the default identification schemas for sellers and buyers.

Configure electronic document properties

To configure electronic document properties, follow these steps:

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.
2. In the **Type** field, enter **CompanyEndpointType**. Enter the value exactly as it appears here. This value is used for the Seller identification schema definition.
3. Select **Applicability** to add an applicable table.

4. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **Legal entities** table name.
5. Save your changes, and return to the **Electronic document property types** page.
6. Select **New** to create another electronic document property type.
7. In the **Type** field, enter **CustomerEndpointType**. Enter the value exactly as it appears here. This value is used for the Buyer identification schema definition.
8. Select **Applicability** to add an applicable table.
9. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **Customers** table name.
10. Save your changes, and return to the **Electronic document property types** page.
11. Save your changes, and close the page.



Enter the Seller schema code

To enter the Seller schema code, follow these steps:

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity then on the Action Pane, select **Electronic document properties**.
3. In the **Value** column, enter the required Seller schema code.

> **Note**
>
> For the seller's identification, schema **9925** (Belgium VAT number) is used by default if you don't define another schema. Schema codes that you define through electronic document property types take priority over the default **9925** schema code. The value of the **EndpointID** is always retrieved from the seller's VAT exempt number export field regardless of the schema value redefined in the seller's **CompanyEndpointType** parameter.

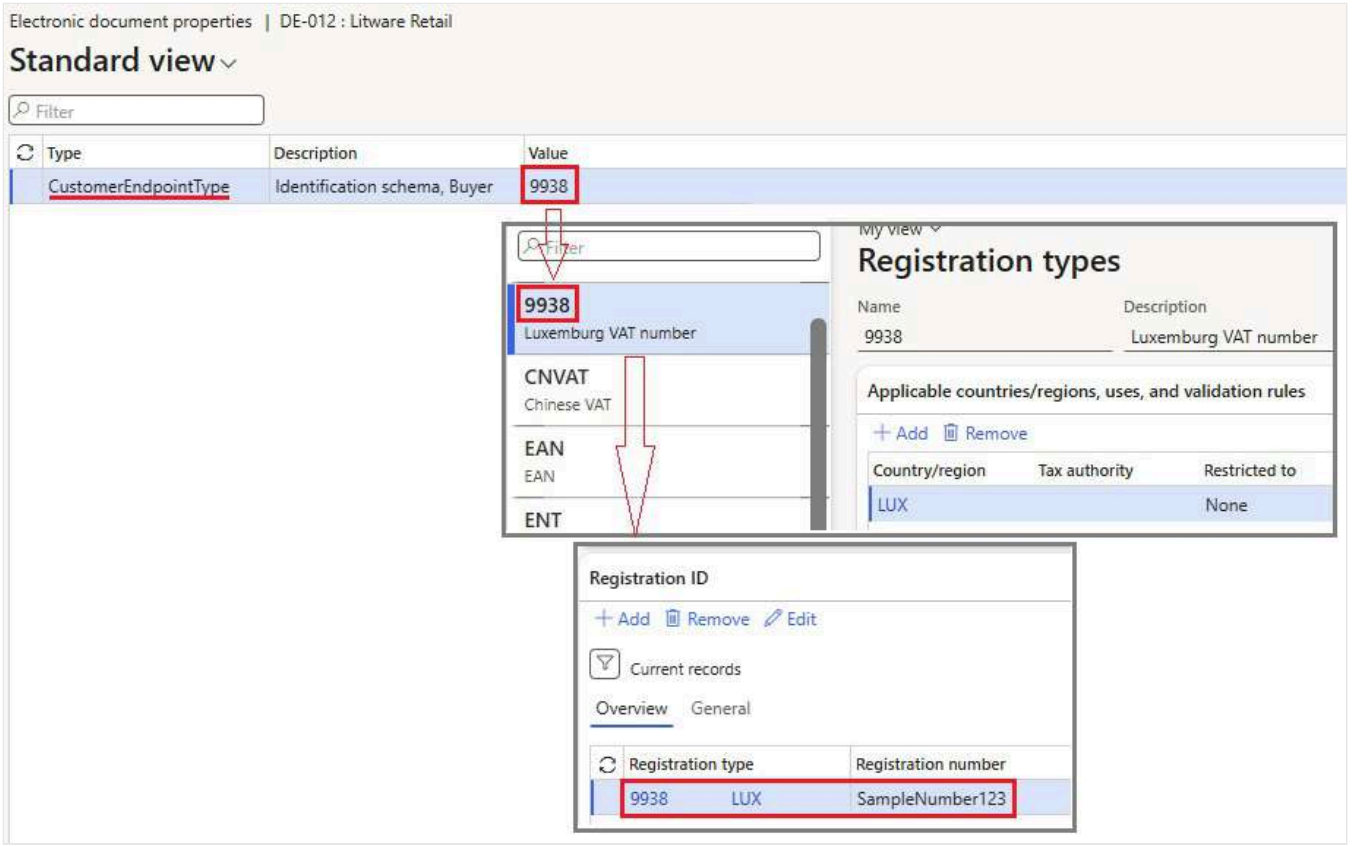
Enter the Buyer schema codes

To enter the Buyer schema codes, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.

2. Select a specific customer in the list then on the Action Pane, on the **Customer** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter the required Buyer schema code.

> **Note**
>
> For the buyer's identification, schema **9925** (Belgium VAT number) is used by default if you don't define another schema. Schema codes that you define through electronic document property types take priority over the other built-in **0088**, **0208**, or **9925** schema codes. The value of the **EndpointID** is retrieved from the buyer's active registration number, which you must create with the type that exactly matches the value of the buyer's **CustomerEndpointType** parameter.



Configure units of measure

To configure units of measure, follow these steps:

1. Go to **Organization administration** > **Setup** > **Units** > **Units**.
2. Select a unit ID, then select **External codes**.
3. On the **External codes** page, in the **Overview** section, in the **Code** column, enter a code that matches the selected unit ID.

4. In the **Standard code** column, select the checkbox.
5. In the **Value** section, in the **Value** field, enter the external code according to the required codification.

> **Note**
>
> For scenarios where no specific units of measure are assumed, the default value **EA** is used.

Configure sales tax codes

1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.
2. Select a sales tax code then on the Action Pane, on the **Sales tax code** tab, in the **Sales tax code** group, select **External codes**.
3. In the **Overview** section, create a line for the selected unit. In the **External code** field, enter the sales tax code you selected in step 2.
4. In the **Value** section, in the **Value** field, enter an external code to use for the selected sales tax code, according to Duty or tax or fee category code (Subset of UNCL5305).

Buyer reference

According to PEPPOL requirements, when you register free text invoices, invoices that are based on sales orders, or project invoices, you must enter either a customer reference or a customer requisition.

Free text invoices

1. Go to **Accounts receivable** > **Invoices** > **All free text invoices**.
2. Create a new invoice, or select an existing invoice.
3. In the **Header** view, on the **Customer** FastTab, in the **References** section, enter values in the **Customer requisition** and/or **Customer reference** fields.

Sales orders

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Create a new sales order, or select an existing sales order.
3. In the **Header** view, on the **General** FastTab, in the **References** section, enter values in the **Customer requisition** and/or **Customer reference** fields.

Project invoices

1. Go to **Project management and accounting** > **Projects** > **Project contracts**.
2. Create a new project contract, or select an existing project contract.
3. On the **Funding sources** FastTab, select or create a funding source of the **Customer** type, and then select **Details**.
4. On the **Funding source details** page, on the **Other** FastTab, in the **References** section, enter default values for the contract in the **Customer requisition** and/or **Customer reference** fields. Alternatively, you can enter project-specific values in the corresponding fields on the **E-invoice** FastTab.
5. To enter customer requisition and/or reference values directly on the project invoice proposal, follow these steps:
   a. Go to **Project management and accounting** > **Projects invoices** > **Project invoice proposals**.
   b. Create a new invoice proposal, or select an existing invoice proposal.
   c. On the **Invoice proposal header** FastTab, in the **e-Invoice** section, enter values in the **Customer requisition** and **Customer reference** fields.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. Learn more about how to generate electronic invoices in Submit electronic documents.

> ⓘ **Important**
>
> In current implementations, the standard submission procedure that was described earlier only generates electronic invoices and stores them on the service side. The procedure doesn't submit the invoices. To submit electronic invoices, you need to complete the following additional steps.

To submit the generated electronic invoices, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
2. In the **Channel** field, select the export channel that you previously created. Then select **OK**.

You can check the results of the submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. Learn more in Work with Electronic document submission log.

> **Note**
>
> Submitted electronic invoices are also available in the Outbound folder and its subfolders in your **Ediwin** portal. There, you can monitor further processing of the documents.

The following types of invoices are processed during the submission.

- Invoices based on Sales orders - electronic invoices of **380** type are generated.
- Credit notes based on Sales orders - electronic invoices of **381** type are generated.
- Free text invoices - electronic invoices of **380** type are generated.
- Free text credit notes - electronic invoices of **381** type are generated.
- Project invoices - electronic invoices of **380** type are generated.
- Project credit notes - electronic invoices of **381** type are generated.
- Customer prepayment invoices created using Customer prepayment invoices functionality - electronic invoices of **386** type are generated.
- Customer prepayment credit notes that created as reversals of initial prepayment invoices after a final invoice is issued - electronic invoices of **381** type are generated.

Receive incoming electronic invoices

Before you can import incoming invoices, you must configure some other parameters directly in Finance.

You must configure the following types of master data to provide a match for incoming electronic invoices:

- Vendors
- Products
- Units

Follow the configuration steps in Import vendor electronic invoices. Start from the Configure vendor data section.

Receive electronic invoices

After you complete all the required configuration steps, you can receive incoming electronic invoices in the **PEPPOL** format.

> **Note**
>
> You can review incoming electronic invoices in the Inbound folder and its subfolders in your Ediwin portal.

To receive electronic invoices, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

To view the receipt logs for processed electronic invoices, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

To view successfully received invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

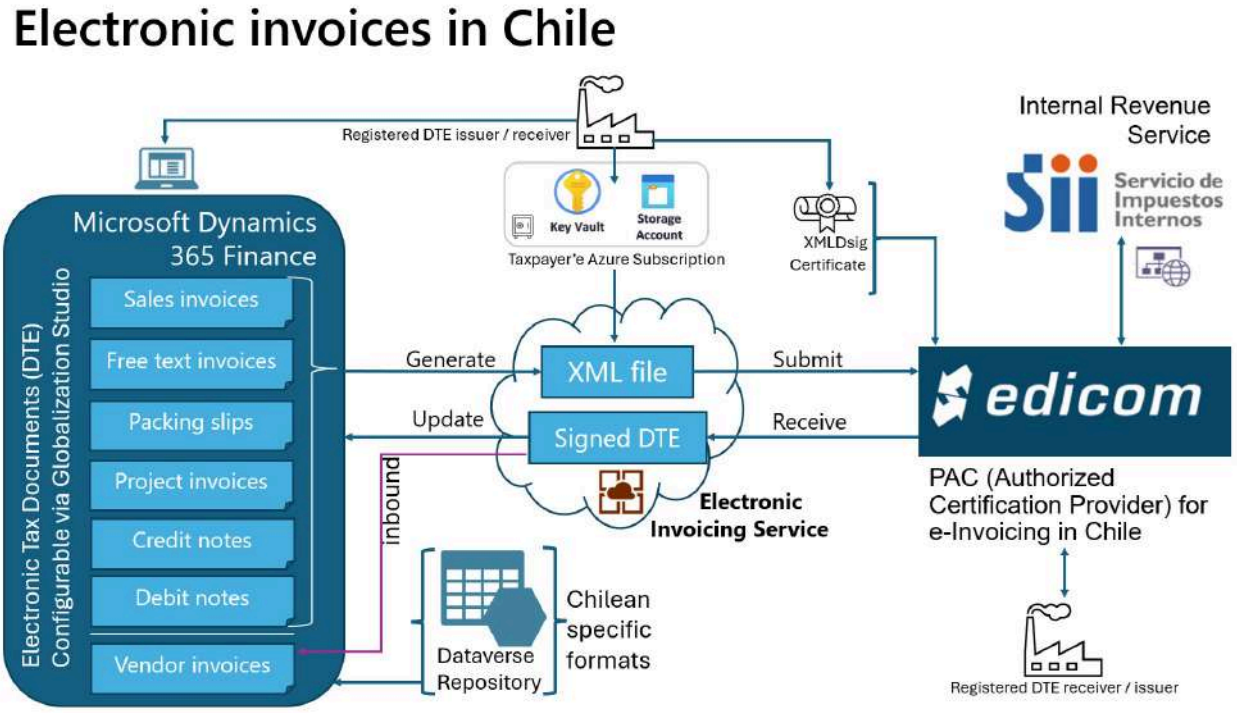
Get started with Electronic invoicing for Chile

06/24/2025

This article provides information to help you get started with Electronic invoicing for Chile. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup. For the last-mile integration with the Chilean Tax Authorities, Microsoft is partnering with Edicom.

After you configure Electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Chile.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that is applicable only to cloud deployments of Finance or Supply Chain Management.

> **Important**

The new Electronic invoicing Globalization feature for Chile (outbound flow) requires that you run Finance version 10.0.40. Specifically, you must run build number 10.0.1935.60 or later. The feature can only be imported into the new Globalization Studio. It isn't supported in Regulatory Configuration Service (RCS).

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met:

1. Ensure that the settings for the Chilean legal entity are in place. For more information, see Set up legal entity and tax information for Chile.
2. Configure electronic invoice parameters for Chile.
3. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic Invoicing service overview.
4. Do the common part of Electronic Invoicing service configuration as it's described in Electronic invoicing configuration.
5. You must enable the following features in Feature management:
    - Electronic invoicing integration
    - Electronic invoicing integration resubmit document from failed action
    - Execute update actions for submitted documents
6. Make sure that the following Electronic reporting (ER) format configurations are imported. For more information, see: Import Electronic reporting (ER) configurations from Dataverse, Import Electronic reporting (ER) configurations.
    - Customer invoice context model
    - Inventory e-invoice (CL)
    - Inventory Export e-Invoice (CL)
    - E-shipping guide (CL)
    - Project e-invoice (CL)
    - Project Export e-Invoice (CL)
    - Edicom source file response import format
    - Edicom response processing (CL)
    - Edicom response error log import

    Note

These formats are based on the corresponding **LATAM** format configurations that use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. All required additional configurations are automatically imported.

Configure the Electronic invoicing feature

The **Chilean electronic invoice (CL) "E-Invoicing for Chile: ISV last-mile connector with Edicom"** feature represents an outbound flow for issuing the following sales documents:

Expand table

Name	Code	Original name
Invoice	33	Factura Electrónica
Untaxed Invoice	34	Factura no afecta Electrónica
Packing slip (e-shipping guide)	52	Guía de Despacho Electrónica
Debit note	56	Nota de Débito Electrónica
Credit note	61	Nota de Crédito Electrónica
Export invoice	110	Factura de Exportación
Export debit note	111	Nota de Débito de Exportación
Export credit note	112	Nota de Crédito de Exportación

Some parameters of the feature are published with default values. Before you deploy the Electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review the default values, and update them as required, so that they better reflect your business operations.

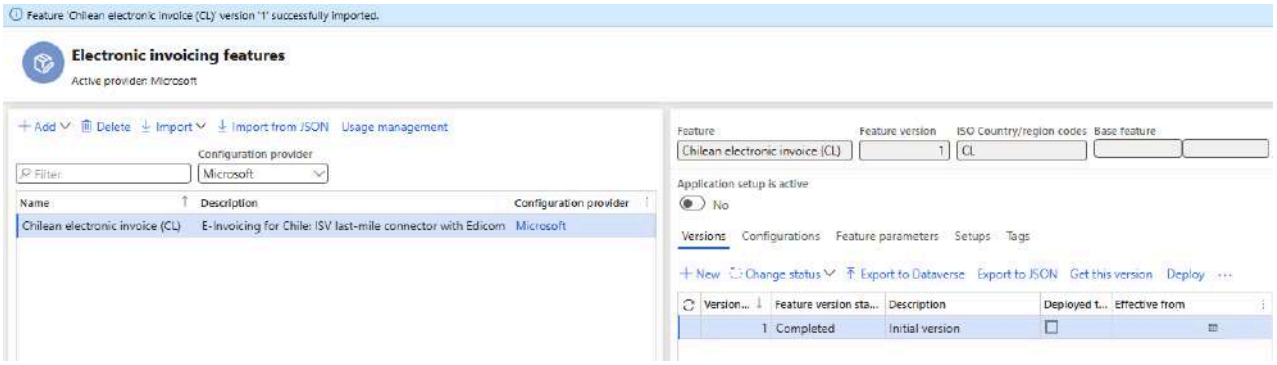
For Chile, there are at least three interactions with Edicom in the pipeline: first to submit the invoice, then to fetch the signed XML, and finally to fetch the status of the submitted invoice. Each interaction requires common parameters, such as Edicom connection details and the authentication token that Edicom provides. These common parameters are reused in the feature setup for all document types. Edicom provides the values when a company is onboarded.

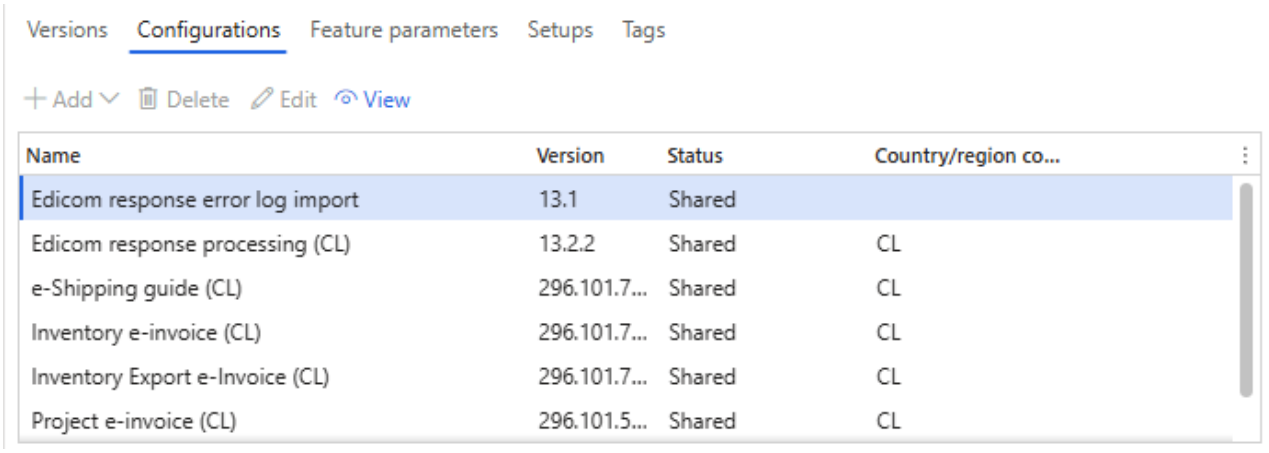
Note

The configuration of common parameters is simplified. You no longer have to go to each action and feature setup, and repeatedly specify the common connection parameters. Use of the **Feature parameters** tab is available only as of version 10.0.41.

> **Important**
>
> The **Chilean electronic invoice (CL)** feature is provided by Microsoft. Before it can be used, additional configuration is required, as described in this article. For information about how to configure invoicing features and apply changes, see Work with feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they are processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Chile.

1. Import the latest version of the **Chilean electronic invoice (CL)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.





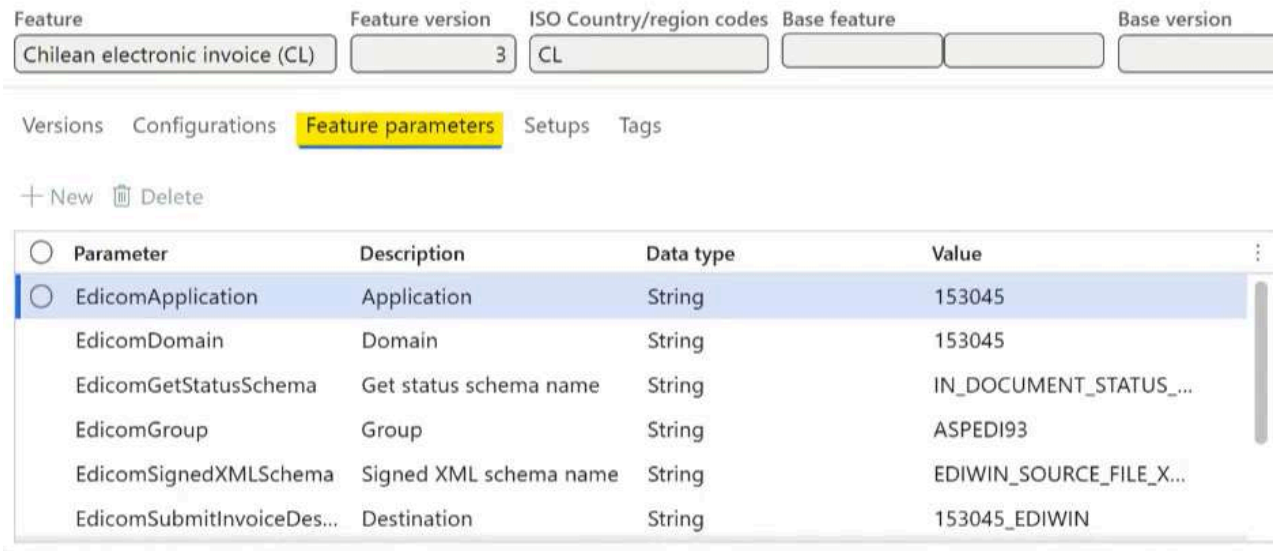
2. Create a copy of the imported Globalization feature, and select your configuration provider. For more information, see Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API:

    - Select **Application**, and then enter the service ID number that you obtained.
    - Select **Domain**, and then enter the same service ID number.
    - Select **Get status schema name**, and then enter the schema name.
    - Select **Group**, and then enter the group code that you obtained.
    - Select **Signed XML schema name**, and then enter the schema name.
    - Select **Destination name**, and then enter the service ID number concatenated with the string "_EDIWIN." For example, if the service ID number is 123456, enter **123456_EDIWIN**.
    - Select **Submit invoice schema name**, and then enter the schema name.
    - Select **Auth token**, and then select the name of the secret that you created for the token.
    - Select **Web service URL**, and confirm the web address.

    The following illustration shows these feature parameters set to the values that Edicom provided to Microsoft for testing purposes. The values that you enter will differ. Edicom provides these values to you when you're onboarded.



5. The copy of the feature is always created as a **Draft** version. Regardless of whether you made changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

To review the processing pipeline, on the **Setups** tab, go to **Feature setup**, select the derived document type that you want, and then select **Edit**. The outbound flow consists of the following actions:

1. **Transform document** – Generate a format that can be sent to Edicom.
2. **Integrate with Edicom** – Submit the generated invoice to Edicom.
3. **Get status from Edicom for an invoice** – Fetch the signed XML from Edicom. This document might not be immediately available, because the PAC needs time to generate it.

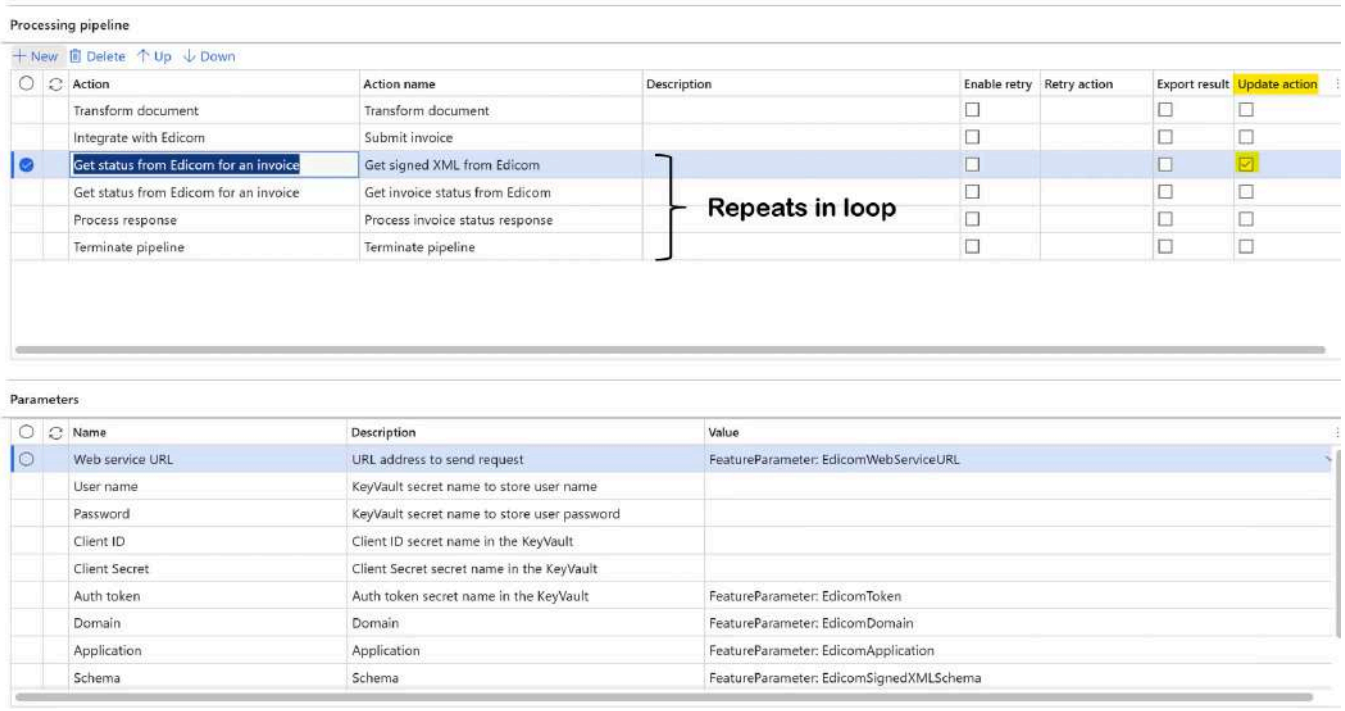
   > ⓘ **Note**
   >
   > At this point in the flow, the concept of *update actions* comes into play. Notice that the **Update action** checkbox is selected for this step. Therefore, this step and all subsequent steps run in a loop until the system determines that a terminal state has been reached.

4. **Get status from Edicom for an invoice** – Fetch the status of the submitted invoice from Edicom.
5. **Process response** – Process the received response to determine whether a terminal state has been reached.

   - If the status response indicates a failure, the pipeline is terminated, and the submission is marked as failed.
   - Even if the status response indicates successful submission to the Chilean Internal Revenue Service (SII), the pipeline can't be completed yet, because customers or buyers in Chile can reject invoices for up to eight days. During this time, the pipeline is kept on hold in a **Pending execute update action** state. If a response is received that indicates customer rejection of the invoice, it's detected during the **Process response** step, and the pipeline is marked as failed.

6. **Terminate pipeline** – Wait the specified number of days, and then terminate the pipeline. In the out-of-box default setup, the pipeline is terminated with a **Completed** status if more than nine days pass since the invoice was submitted. If there are no rejections, the **Terminate pipeline** step marks the pipeline as completed.

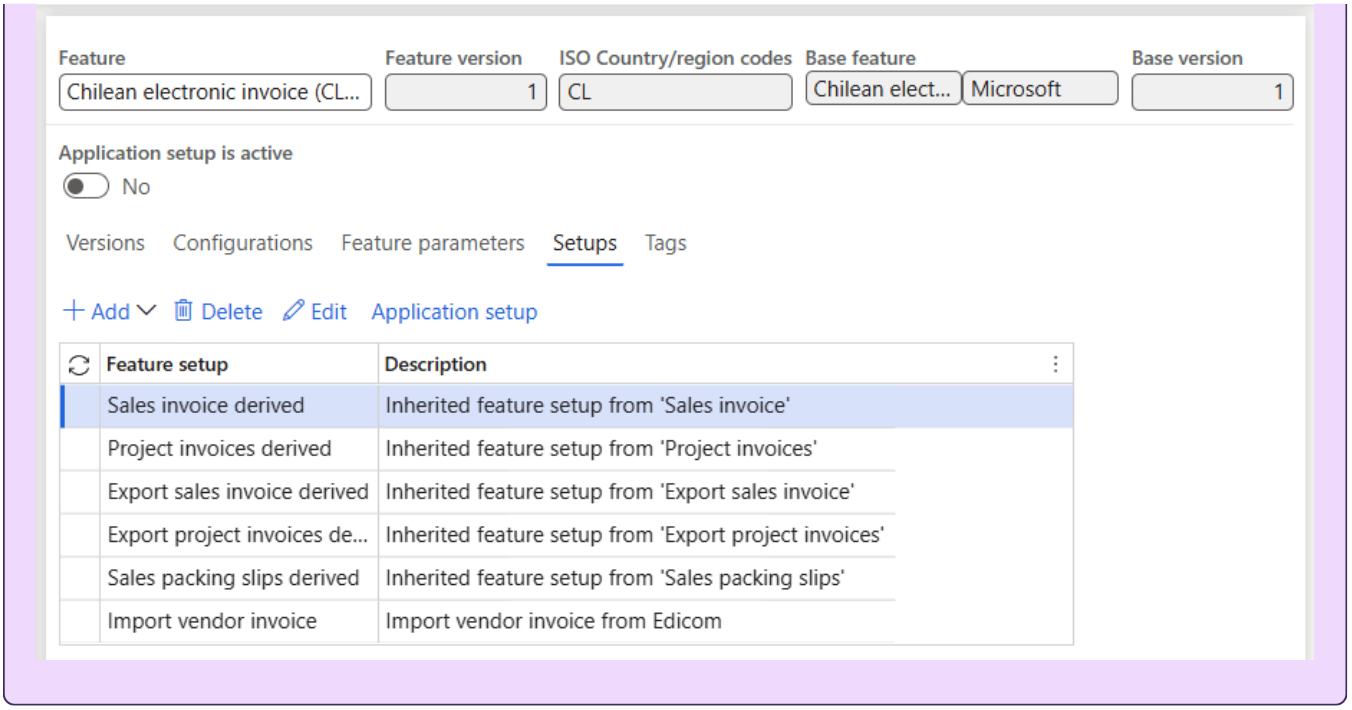
Set up actions and parameters



ⓘ Note

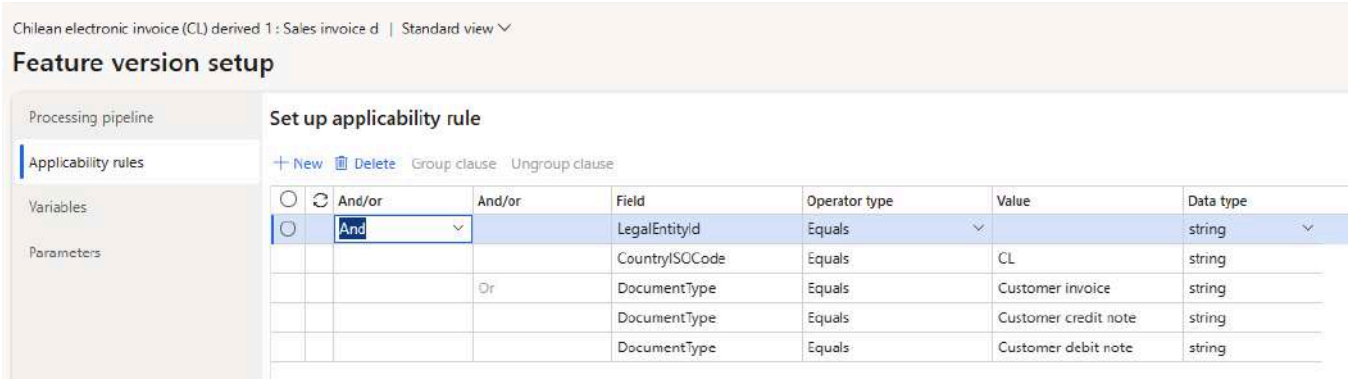
There is a similar setup for each format that is included in the **Chilean electronic invoice (CL)** feature. For Chile, there are six setups: five for sales documents (outbound flow) and one for import vendor invoices (inbound flow).

- Sales invoice derived
- Project invoices derived
- Export sales invoice derived
- Export project invoices derived
- Sales packing slips derived
- Import vendor invoice



Applicability rules

Applicability rules must be correctly configured to provide context, so that the exact Electronic invoicing Globalization feature that must run in Electronic Invoicing service can be found. Applicability rules are provided out of the box by checking the legal entity in the International Organization for Standardization (ISO) country/region code. This particular feature setup supports all three types of invoices: customer invoices, debit notes, and credit notes.

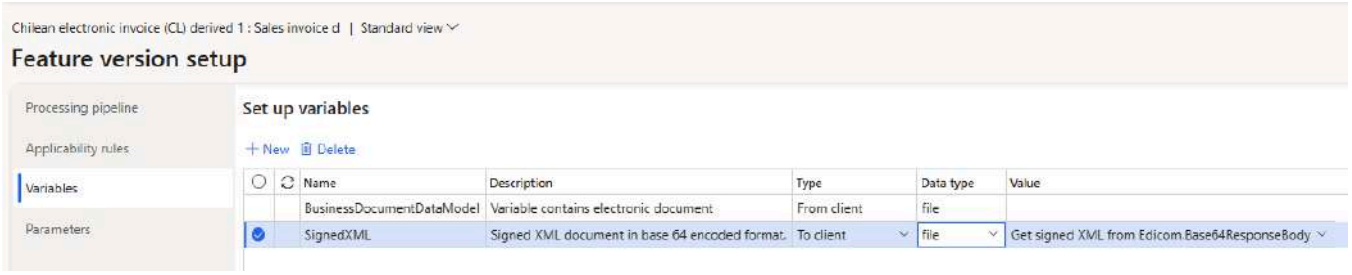


Variables

The following variables are used in the outbound data flow actions of the Chilean feature. (These variables are provided out of the box.)

- **BusinessDocumentDataModel** – The Business Document Data model variable that is received from Finance or Supply Chain Management and transformed into the format that is required for submission.
- **SignedXML** – The signed XML variable that is sent back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get**

Signed XML from Edicom step. It's used in the response types to save the signed XML that is obtained from Edicom as an attachment to the invoice journal. It's also used to generate printable reports through QR codes.



After you import the **Electronic invoicing for Chile** feature that includes the out-of-box default feature setup, follow the steps in the next section to configure electronic documents.

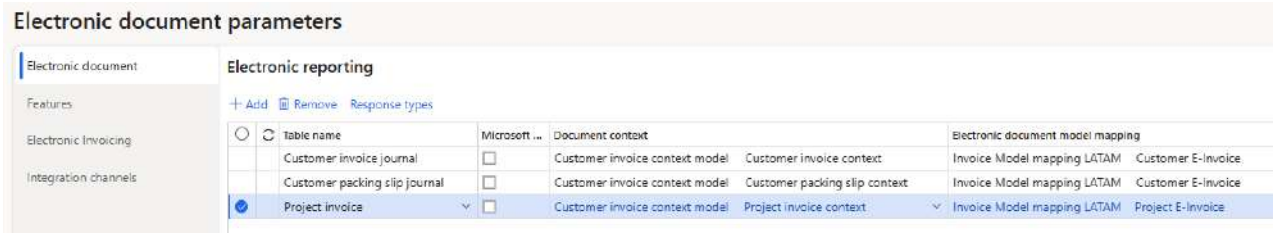
Configure electronic document parameters

1. Make sure that the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Chile are imported. For more information, see Set up Electronic document parameters.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. In the **Electronic document** section, add records for the **Customer Invoice journal**, **Customer packing slip journal**, and **Project invoice** table names.

4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.



5. Save your changes, and close the page.

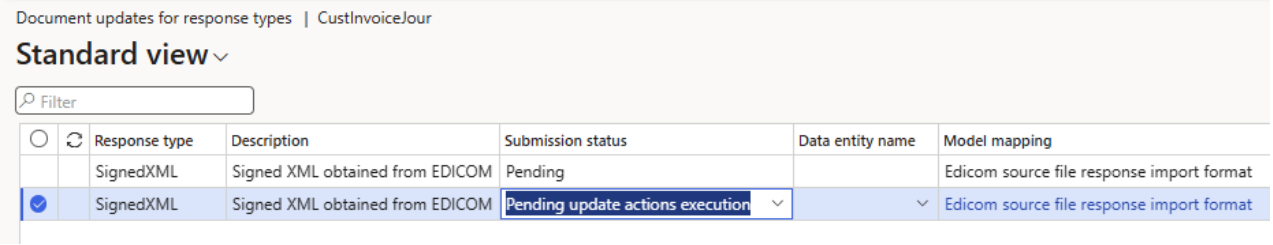
6. For each table name, follow these steps:

   a. Select **Response types**, select **New** to create a response type that you will get from the back end, and enter the following values:

      - In the **Response type** field, enter **SignedXML** (the default value). (See the Variables section of this article.)
      - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.

- In the **Submission status** field, select **Pending**.
- In the **Model mapping** field, select **Edicom source file response format**.

b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. In this way, you can run a subset of the actions in the processing pipeline in a loop to continuously pull updated statuses and other information for the submitted documents from the tax authority.



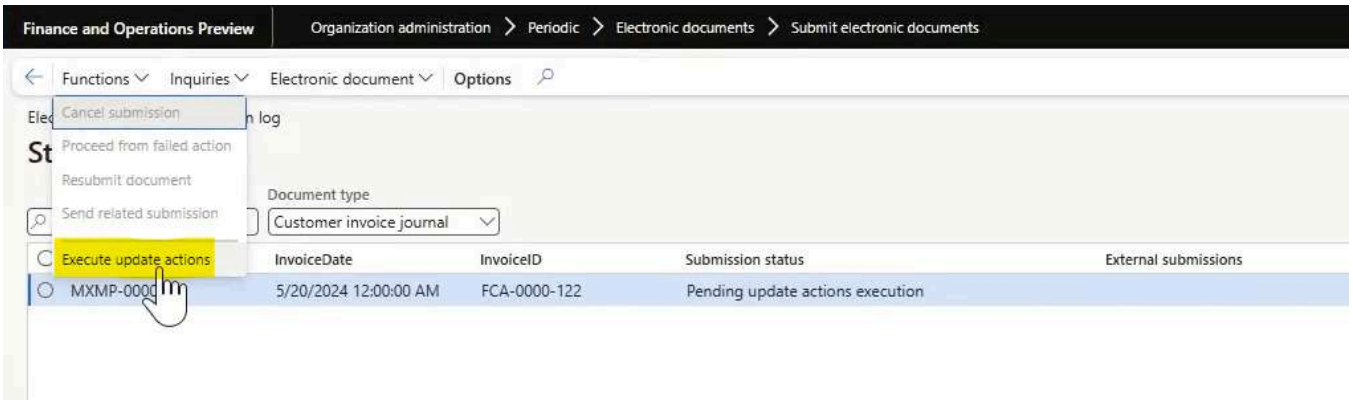
> **Note**
>
> The response includes the signed XML that is obtained from Edicom. This signed XML is stored in the system as an attachment to the corresponding invoice journal. It will eventually be used to generate printable invoices through QR codes.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

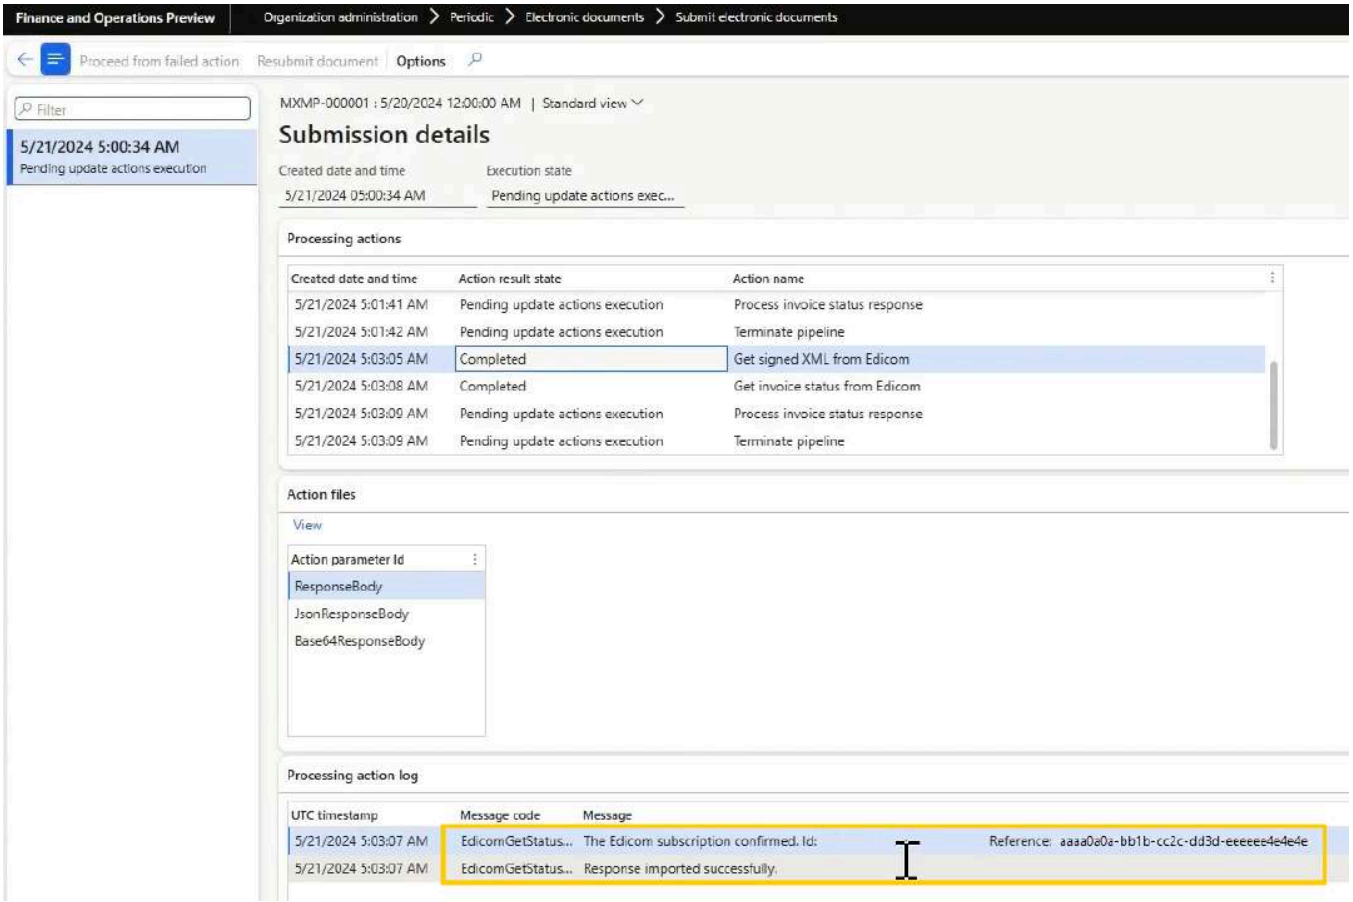
To inquire about the results of a submission, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Chile, after you submit the invoice, the submission status is set to **Pending update actions execution**. The response body is probably empty for the signed XML and the call to get the invoice status. An empty response body indicates that the XML wasn't available immediately after submission. To address the pending status, a function that is named **Execute update actions** is used. This function resumes the pipeline from the action that is marked as an update action, and then runs all subsequent actions in the pipeline in a loop. The status should change to **Executing** again. Then, after a few seconds, it reverts to **Pending update actions execution**.

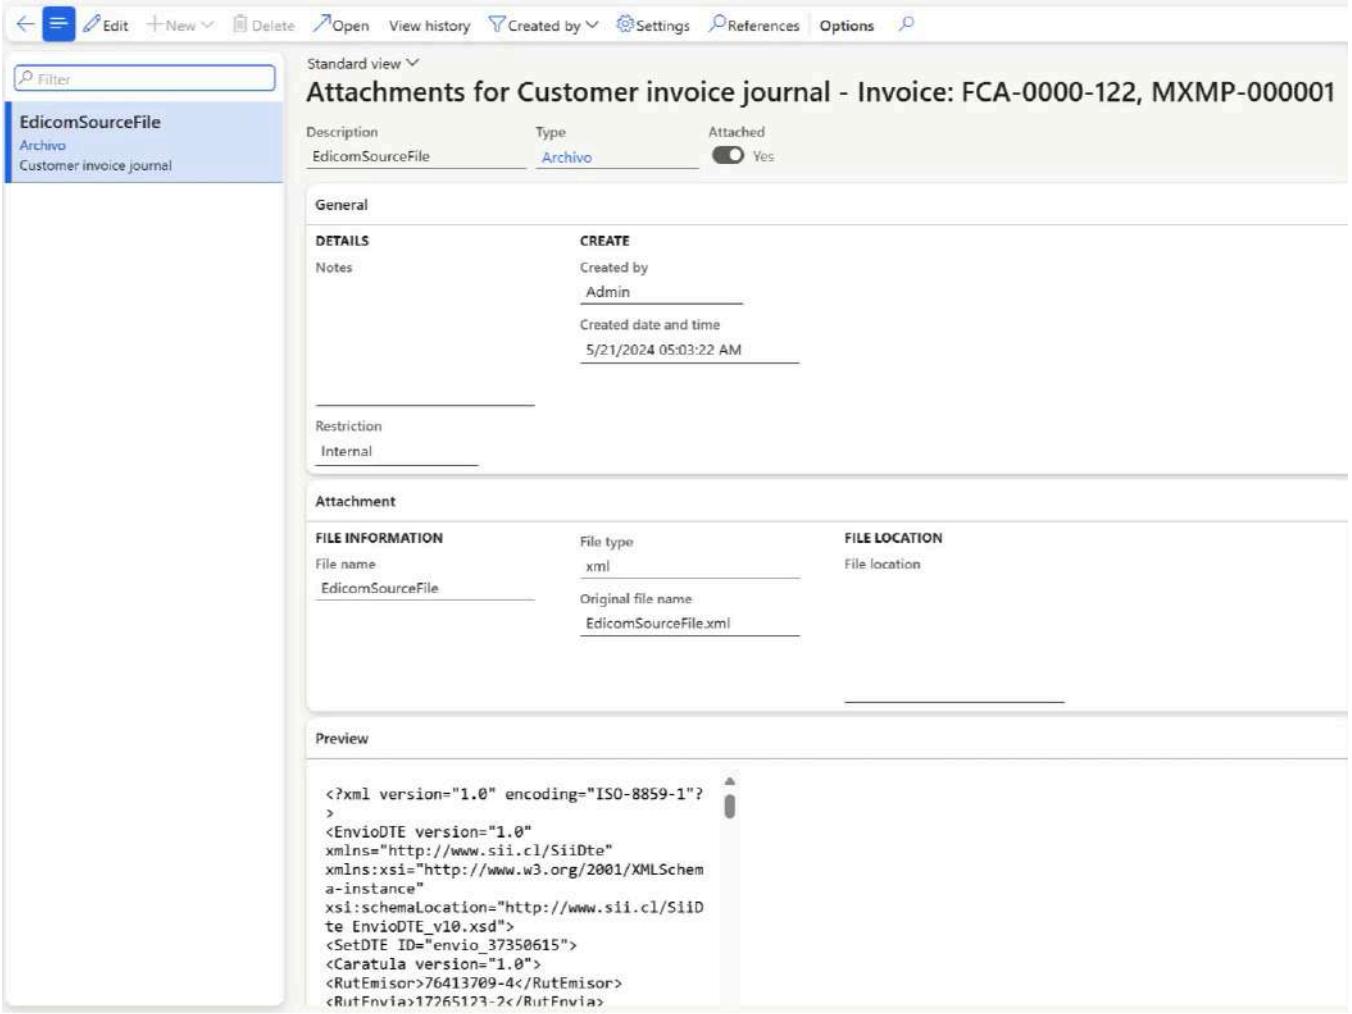


> **Note**
>
> By setting a recurrence schedule, you can configure the **Execute update actions** function to run in batch mode on a periodic basis.

When you review the submission details, you should notice that the steps run again. This time, the signed XML is received.



As a result of the completed outbound flow, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



If no business rejection or acceptance is received from the buyer after nine days, the **Terminate pipeline** action completes the pipeline.

Vendor electronic invoice import in Chile

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure and use vendor electronic invoice import for Chile from the country-specific XML format in Microsoft Dynamics 365 Finance.

Prerequisites

Before you complete the tasks in this article, the following prerequisites must be met:

1. The primary address of the legal entity must be in Chile.
2. Ensure that the settings for the Chilean legal entity are in place. For more information, see Set up legal entity and tax information for Chile.
3. Configure electronic invoice parameters for Chile.
4. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic invoicing overview.
5. Do the common part of Electronic Invoicing service configuration as it's described in Electronic invoicing configuration.
6. The **Enable application response for vendor invoices** feature must be enabled in Feature management.
7. Ensure that the following Electronic reporting (ER) format configurations are imported:
    - Customer invoice context model
    - Inventory e-invoice (CL) XML Import
    - Vendor Invoice Mapping to Destination LATAM
    - Application response (CL)
    - Pending vendor invoice model mapping

> **Note**
>
> The ER format is based on the **Invoice model LATAM** configuration and uses the **Vendor Invoice Mapping to Destination LATAM** configuration. All additional configurations that are required are automatically imported.

Configure the Electronic invoicing feature

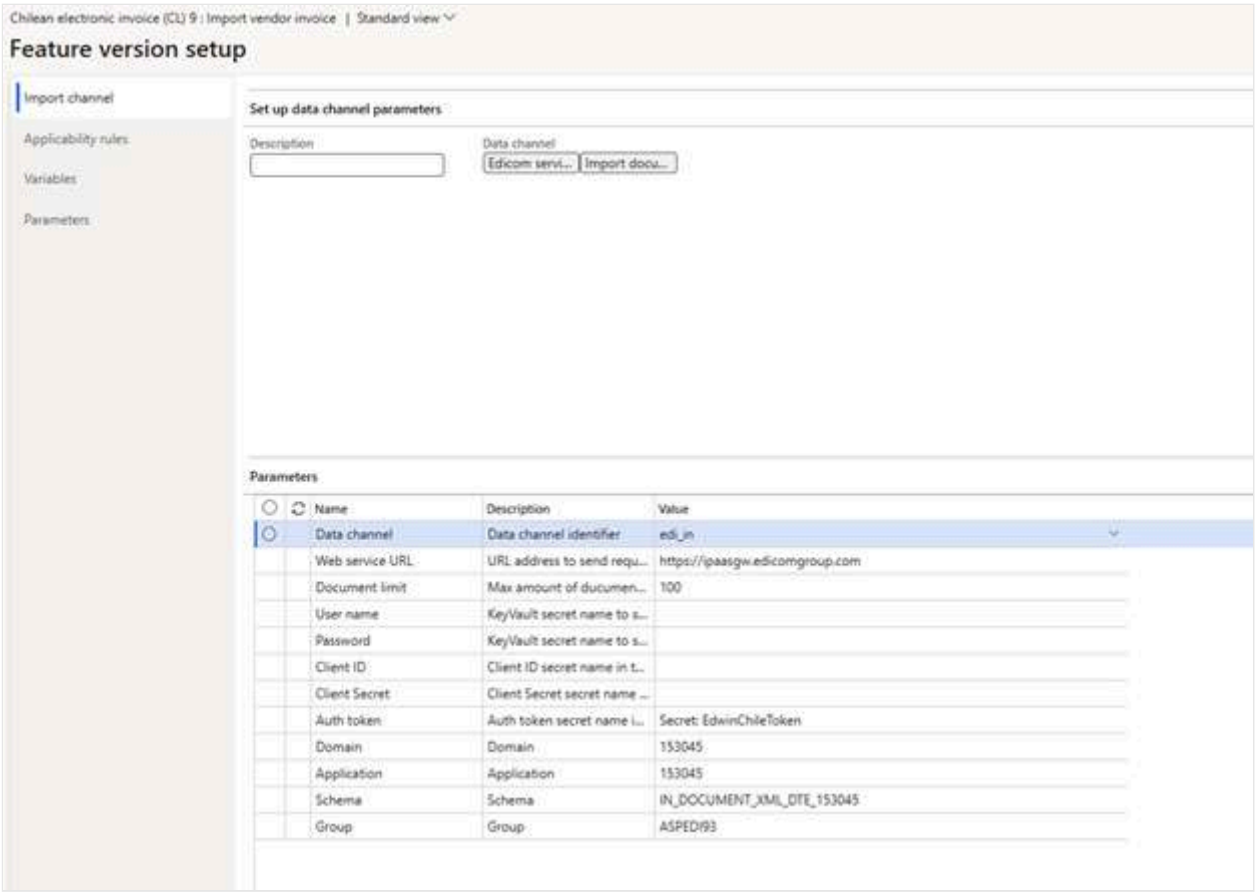
> **Important**
>
> The inbound flow of the Electronic invoicing Globalization feature for Chile requires that you run Finance version 10.0.41 or later. It can be configured only in the new Globalization Studio. It isn't supported in Regulatory Configuration Service (RCS).

Import channel

To enable an inbound flow, you must create a feature setup of the **Import channel** type for the **Chilean electronic invoice (CL) "E-Invoicing for Chile: ISV last-mile connector with Edicom"** Globalization feature.

1. Select the **Setups** tab of the derived feature.
2. Select **Add**, and then select **Custom setup**.
3. Enter a name and description for the feature setup.
4. Select **Import channel** as the setup type and **Edicom service** as the data channel.
5. Select **Create**.
6. Select the feature setup that is created for vendor invoice import.
7. Select **Edit**.
8. On the **Import channel** tab, set the import channel parameters.

   The following illustration shows the parameters for the feature setup set to the values that Edicom provided to Microsoft for testing purposes. The values that you enter will differ. Edicom provides these values to you when you're onboarded.

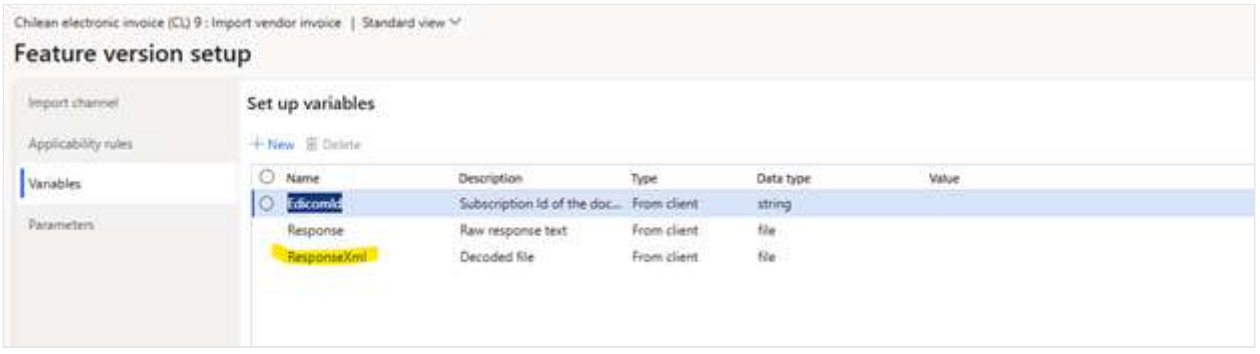


Applicability rules

Applicability rules must be correctly configured to provide context, so that the exact Electronic invoicing Globalization feature that must run in the Electronic Invoicing service can be found. Create a new applicability rule for the same channel name that you specified for the import channel configuration in the previous section. For example, add an applicability rule that has an **And** clause for the **Channel** field when its value equals the "edi_in" string.

Variables

Out of the box, variables are provided with the specific feature setup to support the `EdicomId`, `Response`, and `ResponseXML` variables, as shown in the following illustration.



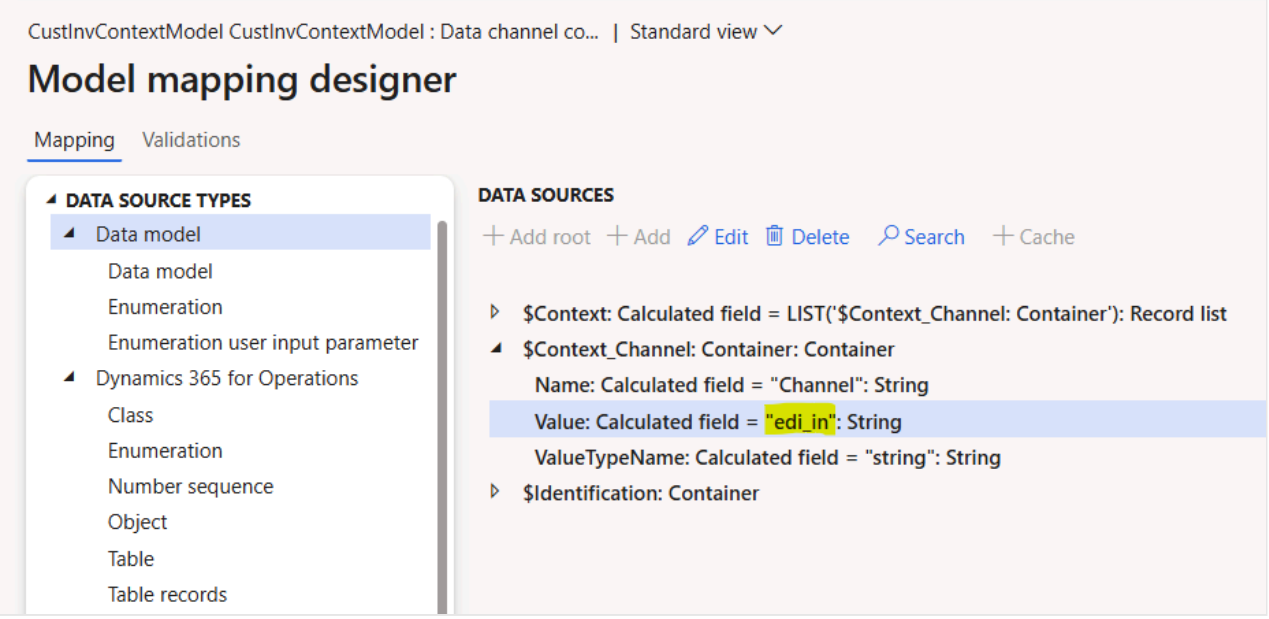
> ⓘ Note

After the feature setup is completed, save, complete, and deploy the version.

Configure ER

1. Go to the **Electronic reporting** workspace, and open **Reporting configurations**.
2. Derive a configuration from **Customer Invoice Context Model**.
3. In the new configuration, go to **Designer** > **Map model to datasource** > **Data channel** > **Designer**.
4. Point to the Data model source type under the **Mapping** tab on the left.
5. To set up the data channel context, expand the **$Context_Channel** container and update the **Value** calculated field with your channel name.
6. Save your change.

   The following illustration shows an example of the change.



7. Return to **Reporting configurations**.
8. Select the **Vendor invoice Mapping to destination LATAM** configuration.
9. Set the **Default for model mapping** option to **Yes**.

Configure parameters

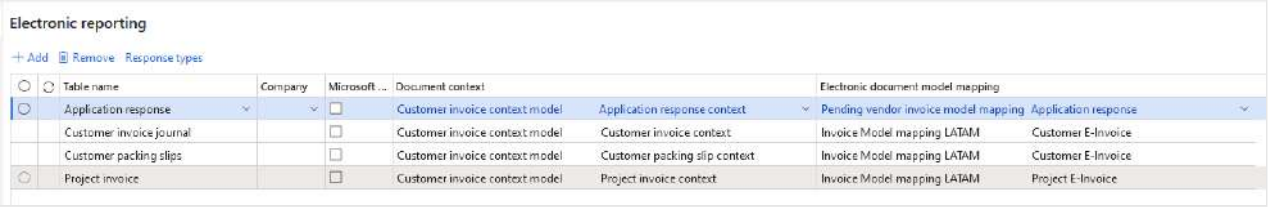
Configure electronic document parameters

1. Make sure that the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Chile are imported. For more information, see Set up Electronic document parameters.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. On the **Electronic document** tab, add a record, and set the following values for it:

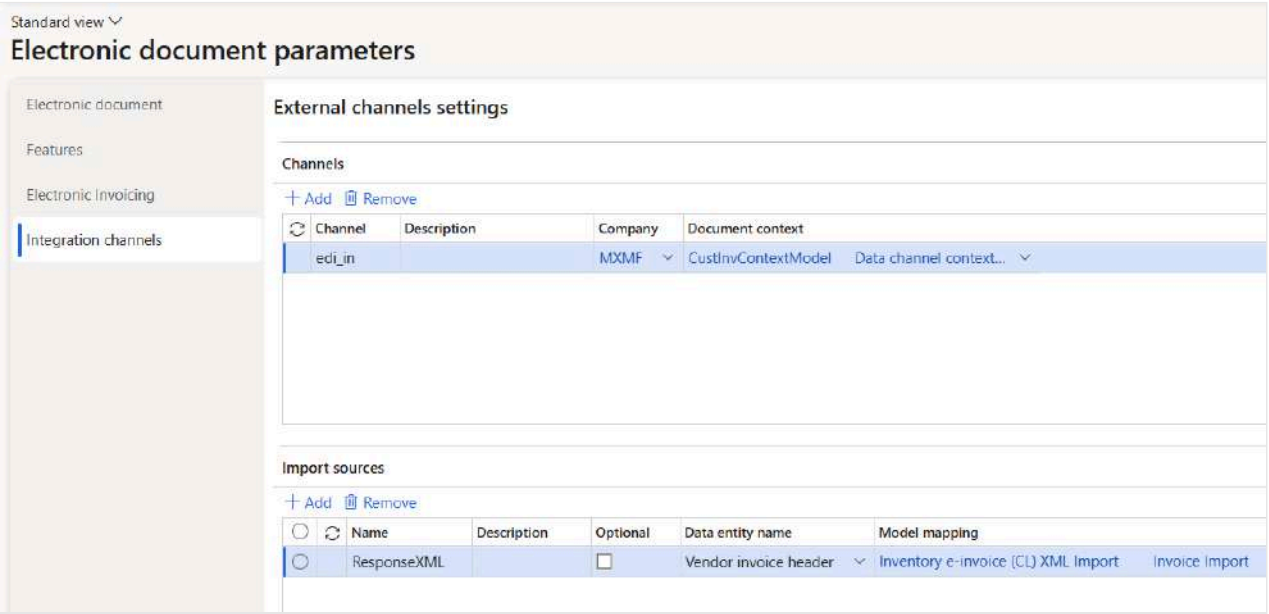
    - **Table name:** Application response
    - **Document context:** Customer invoice context model - Application response context
    - **Electronic document model mapping:** Pending vendor invoice model mapping - Application response



4. On the **Integration channels** tab, create records. Specify a channel name of the **Import** type, and specify the document context configuration for every required company.

5. For each channel, add an import source, and set the following values for it:

    - **Name:** Enter the response format.
    - **Data entity name:** Select **Vendor invoice header**.
    - **Model mapping:** Specify the model mapping for the invoice import.



6. Save your changes, and close the page.

Configure vendor data

During the import process, vendors are identified by their tax exempt number. To enable correct vendor identification, follow these steps:

1. Go to **Accounts payable** > **Vendors** > **All vendors**, and select a vendor.
2. On the **LATAM** FastTab, in the **Country identification number** field, enter a valid identification number of the country for the vendor. This number is used to identify the vendor during import, by matching it to the value of the **DTE\Documento\Encabezado\RUTEmisor** element in the import XML file.

Configure products

During the import process, products are identified by their external descriptions. These descriptions are usually vendor-specific. To enable correct product identification, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select a product, and then, on the **Purchase** menu, in the **Related information** section, select **External item description**.
3. Create a new external description for the selected product.
4. In the **Account code** column, select **Table** to define an external product description for a specific vendor.
5. In the **Vendor relation** column, select a vendor.
6. In the **External item number** column, enter an external product code. This code is used to identify the product during import, by matching the code to the value of the **DTE\Documento\Detalle\NmbItem** element in the import XML file.

> ⓘ **Note**
>
> If there must be non-stocked items, the system expects that these products belong to an item model group where the **Stocked product** checkbox is cleared on the **Inventory policy** page.
>
> If no related **Non-stock** products exist, the system tries to import invoice lines by referring to a default item. The default item must be configured in the system as a released product where the code is defined exactly as **DEFAULT_ITEM**, and the product must belong to an item model group where the **Stocked product** checkbox is cleared on the **Inventory policy** page.

Import vendor electronic invoices and send application responses

To run the import vendor electronic invoices, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. In the **Receive electronic documents** dialog box, specify the parameters as required.
3. Select **OK** to immediately start the import process or to schedule the import to run in the background.

Import process description

Here is an overview of the steps in the import process and the order that they occur in.

1. Vendors are identified by using the country identification number that is defined in the vendor record. If no vendor matches the data that is being searched, the import process fails, and a related error message is shown.
2. Products that are used on invoice lines are identified by using an external item number, which might be vendor-specific. If no product matches the external description, the import process fails, and a related error message is shown.
3. If an incoming import file contains the information about purchase orders and its lines in the **DTE\Documento\Referencia\FolioRef** elements, the numbers are used for invoice matching with purchase orders and lines that are entered in the system.
4. If no order or line references are defined in an incoming file, the system tries to automatically match incoming vendor invoices with existing purchase orders.
5. If no purchase order is found, the system raises a warning but continues the import. It now considers products on invoice lines **Non-stock** items. The system expects that these products belong to an item model group where the **Stocked product** checkbox is cleared on the **Inventory policy** page.
6. If no related **Non-stock** products exist, the system tries to import invoice lines by referring to a default item. The default item must be configured in the system as a released product where the code is defined exactly as **DEFAULT_ITEM**, and the product must belong to an item model group where the **Stocked product** checkbox is cleared on the **Inventory policy** page. If no default item is configured in the system, the import process fails, and a related error message is shown.

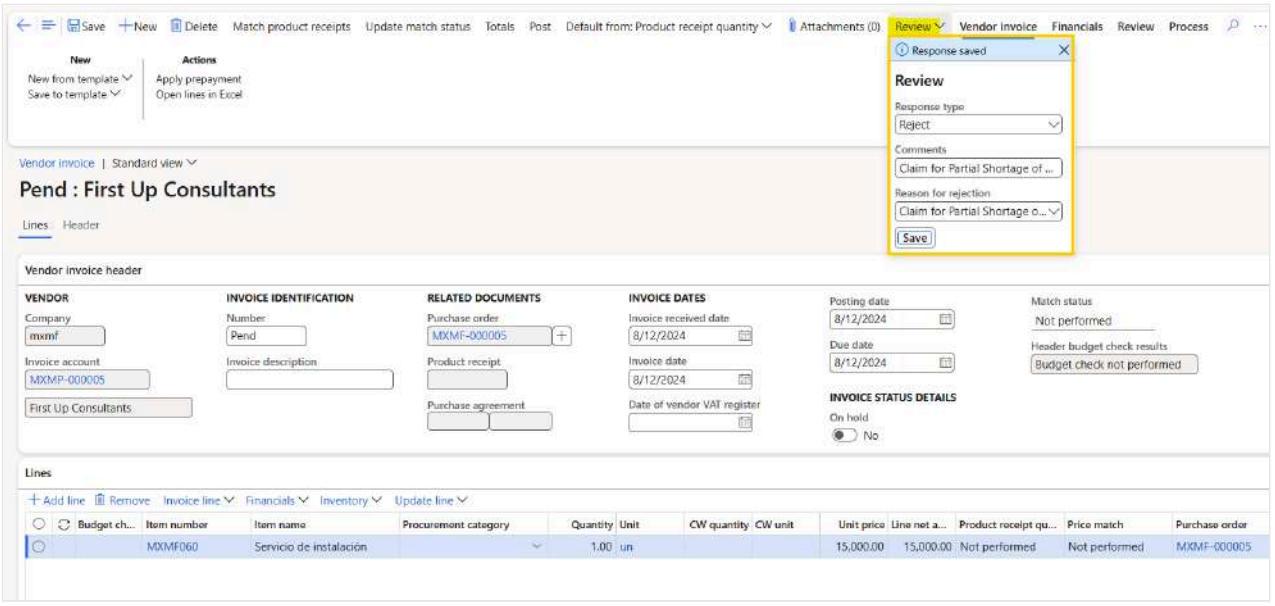
Successfully imported vendor electronic invoices are shown in the system as pending invoices. To review imported invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

Application response

After the imported vendor electronic invoice is reviewed on the **Pending vendor invoices** page (**Accounts payable** > **Invoices** > **Pending vendor invoices**), an application response can be saved and submitted. The application response indicates either acceptance or rejection of the invoice. If the invoice is either accepted with discrepancies or rejected, the response includes comments. If the invoice is rejected, the response also includes the reason for the rejection.

To fill in the application response, follow these steps:

1. Open the **Pending vendor invoices** page in edit mode for the desired invoice.
2. On the Action Pane, select **Review**.
3. In the dropdown dialog box, in the **Response type** field, select one of the following values, as required:
    - Accept
    - Accept with discrepancies
    - Reject
4. If you selected either **Accept with discrepancies** or **Reject** as the response type, enter comments in the **Comments** field.
5. If you selected **Reject** as the response type, select one of the following values in the **Reason for rejection** field:
    - Claim to the content of the document
    - Claim for Partial Shortage of Goods
    - Claim for Total Shortage of Goods
6. Select **Save**.



7. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.
8. On the **Records to include** FastTab, select **Filter**.
9. On the **Joins** tab, add vendor invoices to the join for the application response.
10. On the **Range** tab, add a criterion for the invoice number to the **Vendor invoices** table.
11. Submit the application response.

> **ⓘ Important**
>
> After the application response is submitted, it can't be modified.
>
> Application responses must be sent before the pending vendor invoices are posted. The application response capability isn't available for posted invoices.

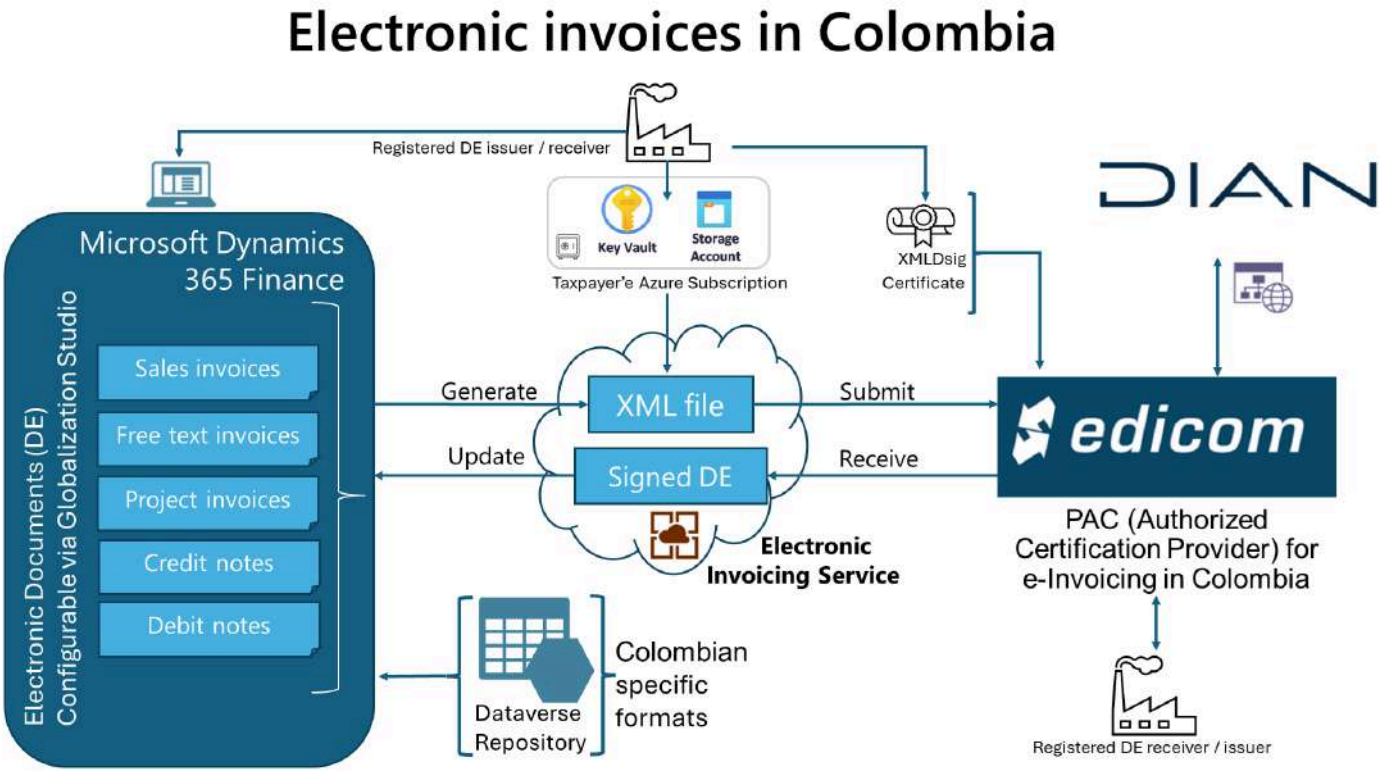
This article provides information to help you get started with Electronic invoicing for Colombia. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup. For the last-mile integration with the Colombian Tax Authorities, Microsoft is partnering with Edicom.

After you configure Electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Colombia.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that is applicable only to cloud deployments of Finance or Supply Chain Management.

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met.

1. Ensure that the settings for the Colombian legal entity are in place. For more information, see Set up a legal entity and tax information for Colombia.
2. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic invoicing overview.
3. Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
4. You must enable the following features in Feature management:
    - Electronic invoicing integration
    - Electronic invoicing integration resubmit document from failed action
    - Execute update actions for submitted documents

5. Ensure that the following Electronic reporting (ER) format configurations are imported. For more information, see: Import Electronic reporting (ER) configurations from Dataverse, Import Electronic reporting (ER) configurations.

    - Customer invoice context model
    - Edicom response error log import
    - Edicom Response Processing CO
    - Edicom source file response import format
    - Inventory e-Invoice (CO)
    - Inventory e-DebitNote (CO)
    - Inventory e-CreditNote (CO)
    - Project e-Invoice (CO)
    - Project e-DebitNote (CO)
    - Project e-CreditNote (CO)

    > ⓘ **Note**
    >
    > These formats are based on the corresponding **LATAM** format configurations that use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. All other required configurations are automatically imported.

[!IMPORTANT] **Colombia – Referencing another document using CUFE or CUDE**

For Colombia, whenever a document must reference another one — for example:

- Credit Notes that cancel or correct an invoice
- Invoices that cancel Credit Notes or Debit Notes
- Debit Notes that cancel or correct a document The relationship is established only through the CUFE (Unique Electronic Invoice Code) or CUDE (Unique Electronic Document Code) of the original document.

Therefore, the referenced document must have been previously submitted and approved by the DIAN, so that the CUFE or CUDE is available in the official signed XML. If the referenced document has not been approved by the DIAN, this information will not be available and cannot be included in the document being processed.

Configure the electronic invoicing feature

The **Colombia Electronic Invoice (CO) Edicom integration for Colombia**" feature represents an outbound flow to issue the following sales documents.

Expand table

Name	Code	Original name
Electronic sales invoice	01	Factura electrónica de venta
Export Invoice	02	Factura de exportación
Credit Note	91	Nota de Crédito
Debit Note	92	Nota de Débito

Some parameters of the feature are published with default values. Before you deploy the Electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review the default values, and update them as required, so that they better reflect your business operations.

Edicom Interactions for Colombia

For Colombia, there are at least three core interactions with Edicom in the base flow:

1. **Invoice submission**
2. **Signed XML retrieval**
3. **Status retrieval of the submitted invoice**

Additional Interactions (Conditionally Triggered)

In addition to the base flow, up to three extra interactions may occur depending on the response from the receiver:

1. **Status 30 – Invoice reception**
   The receiver acknowledges that the invoice was received.

2. **Status 32 – Good or service reception**
   The receiver confirms receipt of the goods or services described in the invoice.

3. **One of the following may follow**:

- **Status 31 – Reclaim**
  The receiver issues a formal complaint or disagreement regarding the invoice or delivered goods/services.
- **Status 33 – Express acceptance**
  The receiver explicitly accepts the invoice and its content.
- **Status 34 – Tacit acceptance**
  If no response is received from the receiver within the legal timeframe, the sender may generate this status to indicate automatic acceptance.

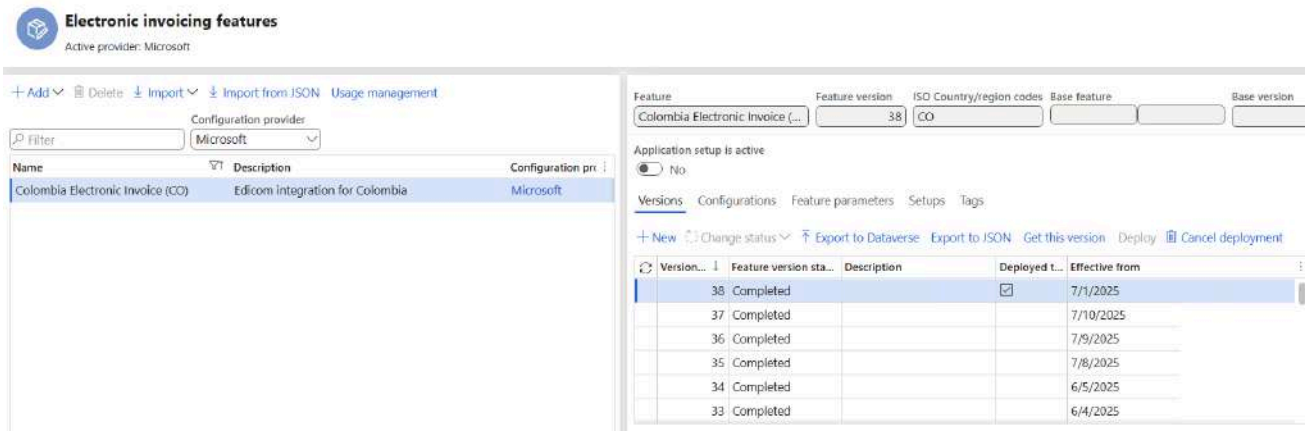
> **Note:** Status codes **30**, **31**, **32**, and **33** are generated by the **receiver**, while status **34** will be returned automatically by Edicom after 72 hours if status 31 or 33 are not received.

Each of these interactions requires common parameters, such as Edicom connection details and the authentication token provided by Edicom. These parameters are reused across the feature setup for all document types. Edicom supplies these values during the company's onboarding process.

Colombia Electronic Invoice (CO) Edicom integration for Colombia

> ⓘ **Important**
>
> The **Colombia Electronic Invoice (CO)** feature is provided by Microsoft. Before it can be used, it requires additional configuration, as described in this article. For information about how to configure invoicing features and apply changes, see **Work with feature setups**. For example, in addition to the connection parameters, you can filter specific legal entities so that they are processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Colombia.

1. Import the latest version of the **Colombia Electronic Invoice (CO)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.



If you go to the **Configuration** tab, as shown in the previous screenshot, you should see a page displaying information similar to the following table:

Expand table

Name	Version	Status	Country/region code
Edicom response error log import	13.2	Completed	
Project e-CreditNote (CO)	296.141.21.22	Completed	CO
Project e-DebitNote (CO)	296.141.21.17	Completed	CO
Project e-Invoice (CO)	296.141.21.14	Completed	CO
Inventory e-CreditNote (CO)	296.142.39.27	Completed	CO
Inventory e-DebitNote (CO)	296.142.39.23	Completed	CO

> **Note**
>
> The version numbers may change if the formats have been updated. The table is for illustrative purposes only.

2. Create a copy of the imported Globalization feature, and select your configuration provider. For more information, see Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API.
   These parameters are general-purpose and will be used across the different actions in the setups, so you only need to configure them once in this section.

> **Tip**
>
> The following table provides **example values** for each feature parameter, so you can see the type of data that should be entered for each one. These values are **illustrative only** and were provided by Edicom to Microsoft for testing purposes. When you are onboarded, Edicom will provide you with your own unique values to use in your configuration.

Expand table

Parameter	Description	Data type	Value
EdicomApplication	Application	String	<ID_PROVIDED_EDICOM>
EdicomDomain	Domain	String	<ID_PROVIDED_EDICOM>
EdicomGetStatusSchema	Get status schema name	String	IN_DOCUMENT_STATUS_MICROSOFT_CO
EdicomGroup	Group	String	<GROUP_ID>
EdicomSignedXMLSchema	Signed XML schema name	String	EDIWIN-SOURCE-FILE_SIGNED_<ID_PROVIDED_EDICOM>
EdicomSubmitInvoiceDestination	Destination name	String	<ID_PROVIDED_EDICOM>_EDIWIN
EdicomSubmitInvoiceSchema	Submit invoice schema name	String	OUTBOUND_DOCUMENT_MICROSOFT_CO
EdicomToken	Auth token	Secret name	EdiwinColombiaToken
EdicomWebServiceURL	Web service URL	String	https://ipaasgw.edicomgroup.com

> **Tip**
>
> When configuring the feature parameters for Edicom integration, follow these steps:

- Select **Application**, and enter the service ID number you obtained from Edicom.

- Select **Domain**, and enter the same service ID number.
- Select **Get status schema name**, and enter the provided schema name.
- Select **Group**, and enter the group code you received.
- Select **Signed XML schema name**, and enter the appropriate schema name.
- Select **Destination name**, and enter the service ID number concatenated with "_EDIWIN". For example, if your service ID is 123456, enter **123456_EDIWIN**.
- Select **Submit invoice schema name**, and enter the schema name.
- Select **Auth token**, and choose the name of the secret you created for the token.
- Select **Web service URL**, and verify the web address is correct.

5. The copy of the feature is always created as a **Draft** version. Regardless of whether you made changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

There are six electronic invoice formats for Colombia included in the **Colombia Electronic Invoice (CO)** feature. Each format requires its own setup and configuration. The formats are:

- **Project e-Invoice (CO)**
- **Project e-CreditNote (CO)**
- **Project e-DebitNote (CO)**
- **Inventory e-Invoice (CO)**
- **Inventory e-CreditNote (CO)**
- **Inventory e-DebitNote (CO)**

In the following sections, you will find guidance on the general configuration steps that apply to all six formats. Additionally, specific considerations and requirements for each individual format will be explained, so you can ensure that each one is configured correctly according to its unique needs.

Electronic invoice feature

Setups-View

After importing the feature, in the second screenshot, you will see five tabs: **Versions**, **Configuration**, **Feature parameters**, **Setups**, and **Tags**. Select the **Setups** tab, and then click **View**. This opens the page **Feature version setup**:

Feature version setup

These page allows you to review and configure the details of the feature setup for Colombia. On the left side of this page, you will see four sections: **Processing pipeline**, **Applicability rules**, **Variables**, and **Parameters**.

Processing pipeline

The Setup Actions and Parameters section is located on the right-hand side of the screen and is divided into two distinct grids:

Top Right – Processing Pipeline

The **Processing pipeline** grid should look like the following table:

Expand table

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Transform document	Generate invoice XML file					
Integrate with Edicom	Submit invoice					
Get status from Edicom for an invoice	Get signed XML from Edicom					**Checked**
Get status from Edicom for an invoice	Get invoice status from Edicom					
Process response	Process invoice status response					

> **Note**
>
> The **Get status from Edicom for an invoice** action is crucial in the flow, as it is marked with the **Update action** checkbox. This designation means that this specific step—and all steps following it—will repeatedly execute in a loop. The system continues this process until the invoice reaches a final, terminal status, ensuring that the latest status from Edicom is always retrieved and processed.

Bottom Right – Parameters

The lower grid shows the Parameters associated with the selected processing action. These parameters allow for fine-tuning of the selected step's behavior. Each entry includes a parameter name, description, data type, and value, enabling users to configure processing logic according to their business requirements.

Transform document parameters

Expand table

Name	Description	Value
Input file	Source file provides to the action the data to be executed.	Variable: BusinessDocumentDataModel
Direction	Direction describes which format will be used: import or export	export
Configuration	Configuration describes format which will be executed	Inventory e-Invoice (CO): Inventory e-Invoice (CO)
Configuration Integration point	Source file provides data to the reporting runtime	InvoiceCustomer
Custom file name	Custom file name from the client	

Linking the correct format in Transform document parameters

When configuring the **Transform document** action in the processing pipeline, ensure the following:

- **Configuration**: Set this to the exact name of the feature format you are configuring.
  - For example: - `Inventory e-Invoice (CO)` -> Configuration: `Inventory e-Invoice (CO)`
    - `Inventory e-DebitNote (CO)` → Configuration: `Inventory e-DebitNote (CO)`
    - `Inventory e-CreditNote (CO)` → Configuration: `Inventory e-CreditNote (CO)`
    - `Project e-Invoice (CO)` → Configuration: `Project e-Invoice (CO)`
    - `Project e-DebitNote (CO)` → Configuration: `Project e-DebitNote (CO)`
    - `Project e-CreditNote (CO)` → Configuration: `Project e-CreditNote (CO)`
- **Configuration Integration Point**:
  - Use `InvoiceCustomer` for inventory-related formats (`Inventory e-Invoice (CO)`, `Inventory e-CreditNote (CO)`, `Inventory e-DebitNote (CO)`).

- Use `InvoiceProject` for project-related formats (`Project e-Invoice (CO)`, `Project e-CreditNote (CO)`, `Project e-DebitNote (CO)`).

> **Tip**
>
> If the feature name contains "Project", use `InvoiceProject`. If it contains "Inventory", use `InvoiceCustomer`. Incorrect settings will result in empty XML or missing required data.

Integrate with Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
Http request body	Http request body (can be empty)	Generate invoice XML file: Output file

User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	

Name	Description	Value
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinColombiaToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Schema	Schema	FeatureParameter: EdicomGetStatusSchema
Group	Group	FeatureParameter: EdicomGroup
ERP UUID	Reference Id of the document submitted to Edicom	Submit invoice: ExternalID

Process response parameters

Expand table

Name	Description	Value
Input file	Response to analyze	Get invoice status from Edicom: Output file
Reporting configuration list	List of configurations used for response parsing	Edicom Response Processing CO: Edicom Response Processing CO
Custom file name	Custom file name from the client	
Reporting configuration list	List of configurations used for response parsing	Edicom response error log import: Edicom response error log import

> **Note**
>
> - If the status response indicates a failure, the pipeline is terminated, and the submission is marked as failed.
> - If the response indicates successful submission to the Colombian Tax Authorities (DIAN), the process is completed when acknowledgment receipts **31, 33, or 34** are received.

Applicability Rules and Feature Setup Scope

Applicability rules must be correctly configured to provide context, so that the exact Electronic Invoicing Globalization feature that must run in the Electronic Invoicing service can be found. These applicability rules are provided out of the box by checking the legal entity's International Organization for Standardization (ISO) country/region code.

Applicability rules for Colombian electronic invoice formats

Below are the applicability rules for each electronic invoice format for Colombia. Replace `<Legal Entity ID>` with the actual ID of your legal entity.

Inventory e-Invoice (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string
Or	DocumentType	Equals	Customer invoice	string
	DocumentType	Equals	Export Customer invoice	string

Inventory e-CreditNote (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string
	DocumentType	Equals	Customer credit note	string

Inventory e-DebitNote (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string

And/Or	Field	Operator type	Value	Data type
	DocumentType	Equals	Customer debit note	string

Project e-Invoice (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string
Or	DocumentType	Equals	Project invoice	string
	DocumentType	Equals	Project Export invoice	string

Project e-CreditNote (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string
	DocumentType	Equals	Project credit note	string

Project e-DebitNote (CO)

Expand table

And/Or	Field	Operator type	Value	Data type
And	CountryISOCode	Equals	CO	string
	LegalEntityId	Equals	`<Legal Entity ID>`	string
	DocumentType	Equals	Project debit note	string

Variables

The following variables are used in the outbound data flow actions of the Colombian feature. (These variables are provided out of the box.)

- **BusinessDocumentDataModel** – The Business Document Data model variable that is received from Finance or Supply Chain Management and transformed into the format that is required for submission.
- **SignedXML** – The signed XML variable that is sent back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get Signed XML from Edicom** step. It's used in the response types to save the signed XML that is obtained from Edicom as an attachment to the invoice journal. It's also used to generate printable reports through QR codes.

Name	Description	Type	Data type	Value
BusinessDocumentDataModel	Contains the electronic document from the client	From client	file	
SignedXML	Signed XML document in base64-encoded format	To client	file	Get signed XML from Edicom.Base64ResponseBody

After you import the **Electronic invoicing for Colombia** feature that includes the out-of-box default feature setup, follow the steps in the next section to configure electronic documents.

Setups-Application Setup

To configure the mapping between Dynamics 365 Finance source tables and electronic document formats, go to the **Setups** tab within the **Electronic invoice feature** section, and then select **Application Setup**. This step lets you define how data from Finance is linked to the correct electronic invoice formats for Colombia.

> **Note**
>
> Although this configuration is not set at the general feature level, it acts globally for the selected feature setup. You do not need to repeat these steps for each individual format or feature—one configuration is sufficient for all supported document types within the feature.

The following grid defines the link between the source table in Dynamics 365, the document context model, and the mapping configuration used for electronic invoicing:

Table name	Context model / Context	Electronic document mapping	Mapping name	Description
Customer invoice journal	Customer invoice context model / Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice	Maps customer invoices from the CustInvoiceJour table to the LATAM invoice model for electronic submission.
Project invoice	Customer invoice context model / Project invoice context	Invoice Model mapping LATAM	Project E-Invoice	Maps project invoices to the LATAM invoice model for electronic submission.

> **Tip**
>
> Ensure that the Context and Mapping name match the document type. Incorrect mappings will cause errors in XML generation or submission to DIAN.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Make sure that the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Colombia are imported. For more information, see Set up Electronic document parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

the Electronic Document Parameters page in Dynamics 365 Finance and Operations. Shows on the left-hand navigation pane, we can see the following options:

- Electronic Document
- Features
- Electronic Invoicing
- Integration Channels

For the Electronic Document option on the right-hand side, the section labeled Electronic Reporting is displayed.

Within Electronic Reporting, a grid is presented which lists the electronic document configurations. This grid includes important associations between:

- The source table name
- The document context model and context
- The electronic document model mapping
- The final mapping name used for generating the electronic invoice.

This configuration is essential for determining how Dynamics 365 maps internal data models to external electronic formats for submission to tax authorities or service providers.

Configure the grid as follows:

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Customer invoice journal	No	Customer invoice context model	Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice
Project invoice	No	Customer invoice context model	Project invoice context	Invoice Model mapping LATAM	Project E-Invoice

1. Save your changes, and close the page.
2. For each table name, follow these steps:

    a. Select **Response types**, select **New** to create a response type that you will get from the back end, and enter the following values:

    - In the **Response type** field, enter **SignedXML** (the default value). (See the Variables section of this article.)
    - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.
    - In the **Submission status** field, select **Pending**.
    - In the **Model mapping** field, select **Edicom source file response format**.

    b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. In this way, you can run a subset of the actions in the processing

pipeline in a loop to continuously pull updated statuses and other information for the submitted documents from the tax authority. In the standard view, you should see a table similar to the following:

Response type	Description	Submission status	Data entity name	Model mapping
SignedXML	Signed XML obtained from EDICOM	Pending		Edicom source file response import format
SignedXML	Signed XML obtained from EDICOM	Pending update actions execution		Edicom source file response import format

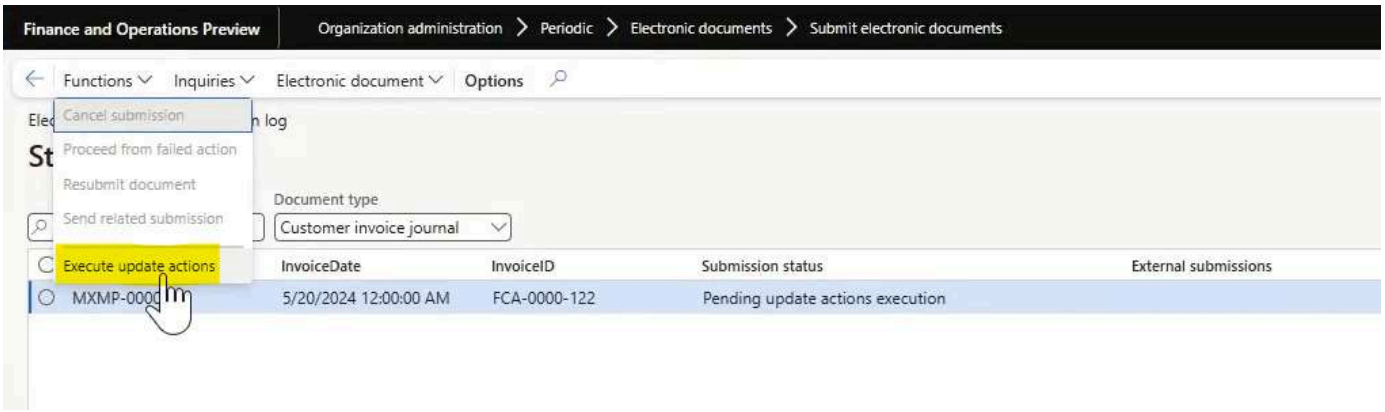
> **Note**
>
> The response includes the signed XML that is obtained from Edicom. This signed XML is stored in the system as an attachment to the corresponding invoice journal. It will eventually be used to generate printable invoices through QR codes.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

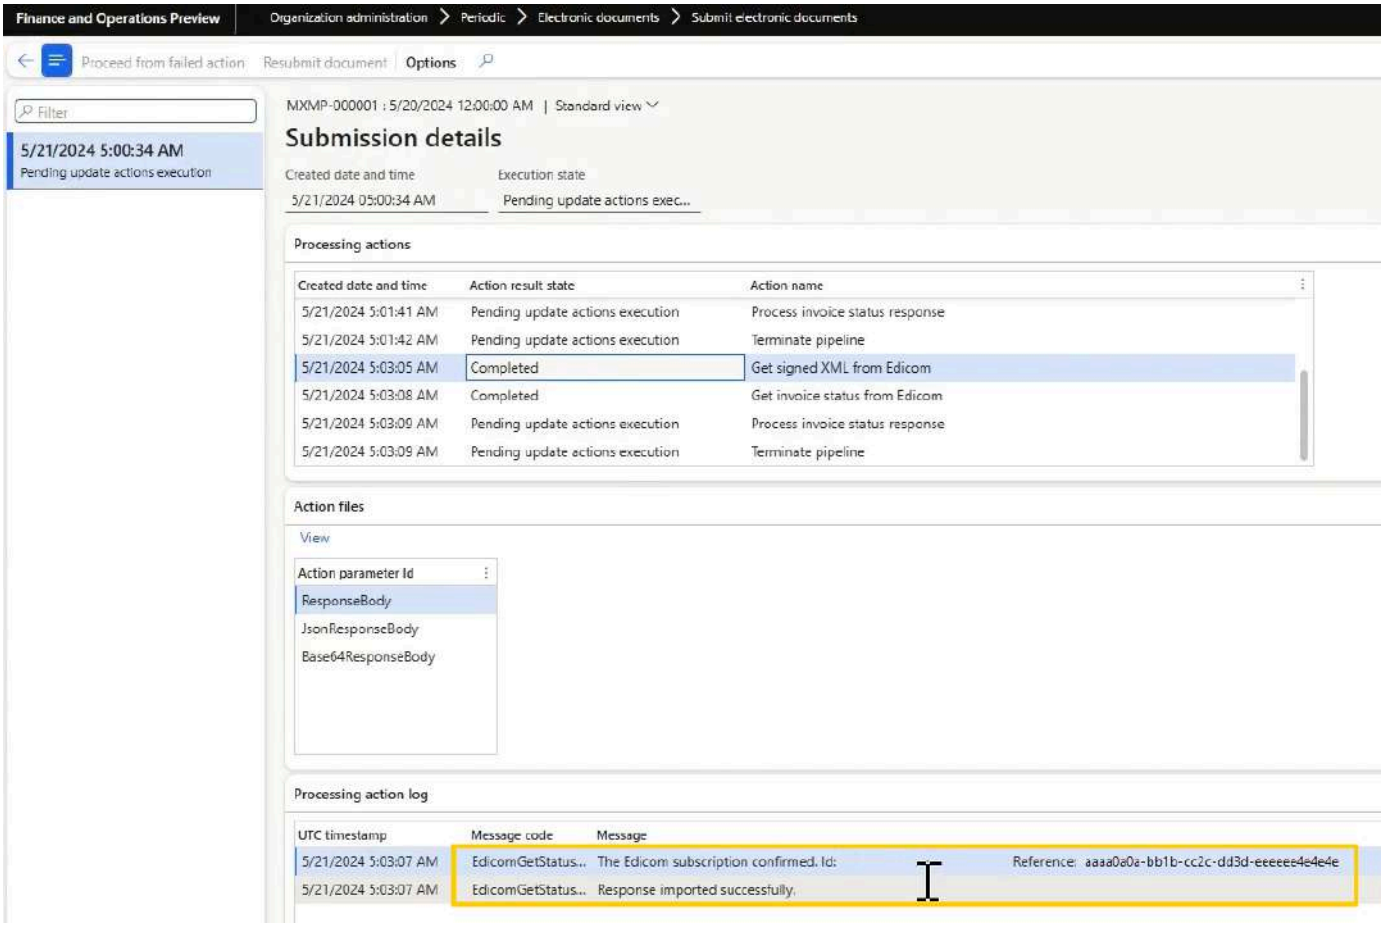
To inquire about the results of a submission, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Colombia, after you submit the invoice, the submission status is set to **Pending update actions execution**. The response body is probably empty for the signed XML and the call to get the invoice status. An empty response body indicates that the XML wasn't available immediately after submission. To address the pending status, a function that is named **Execute update actions** is used. This function resumes the pipeline from the action that is marked as an update action. It then runs all subsequent actions in the pipeline in a loop. The status should change to **Executing** again. Then, after a few seconds, it reverts to **Pending update actions execution**.

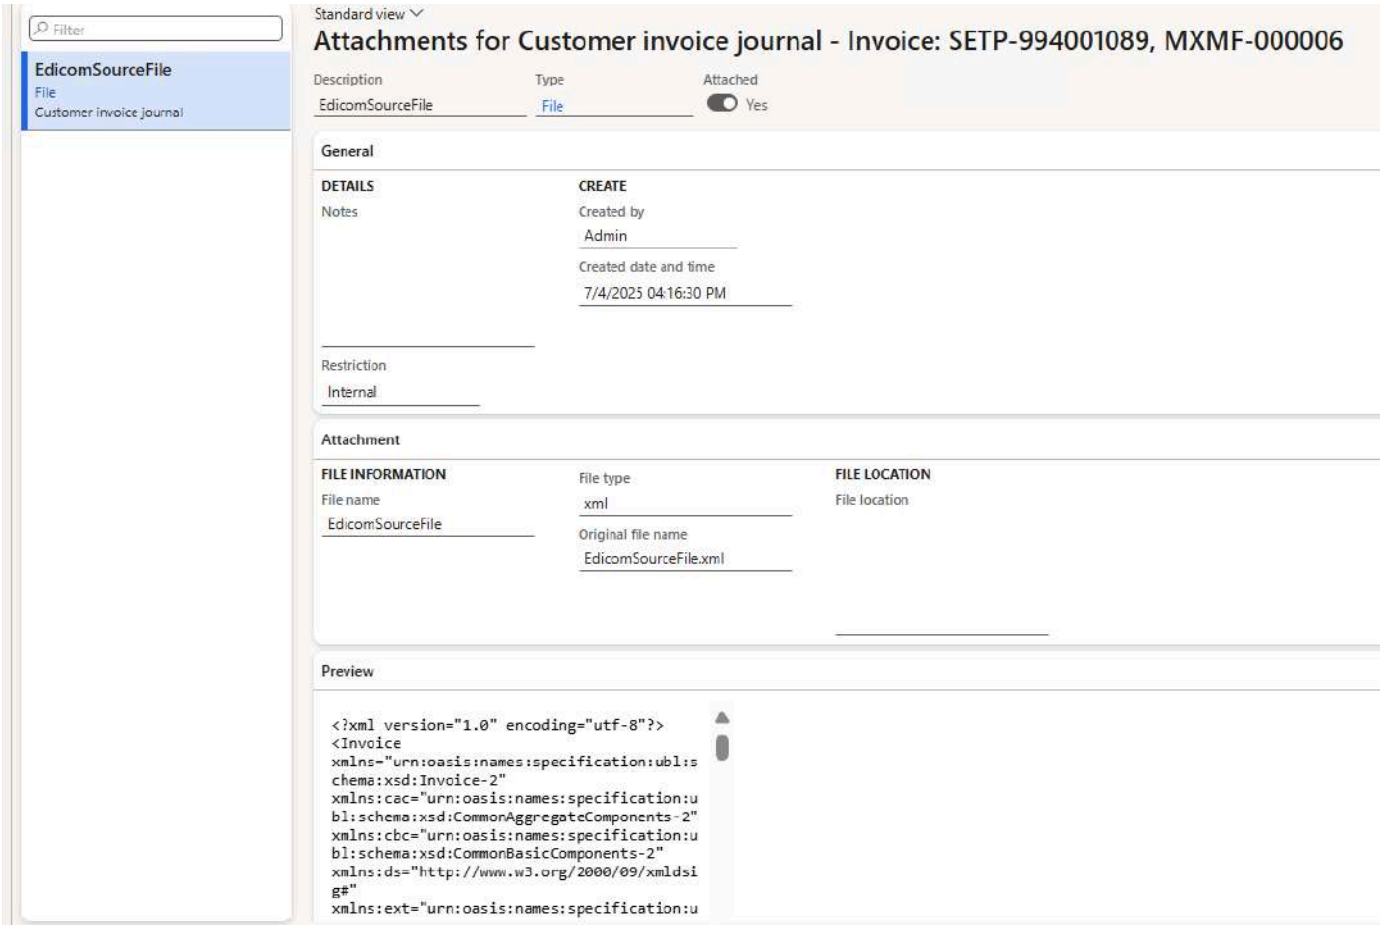


> **Note**
>
> By setting a recurrence schedule, you can configure the **Execute update actions** function to run in batch mode on a periodic basis.

When you review the submission details, you should notice that the steps run again. This time, the signed XML is received.



As a result of the completed outbound flow, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



For Colombia, the **Process response** action completes the pipeline after a few minutes.

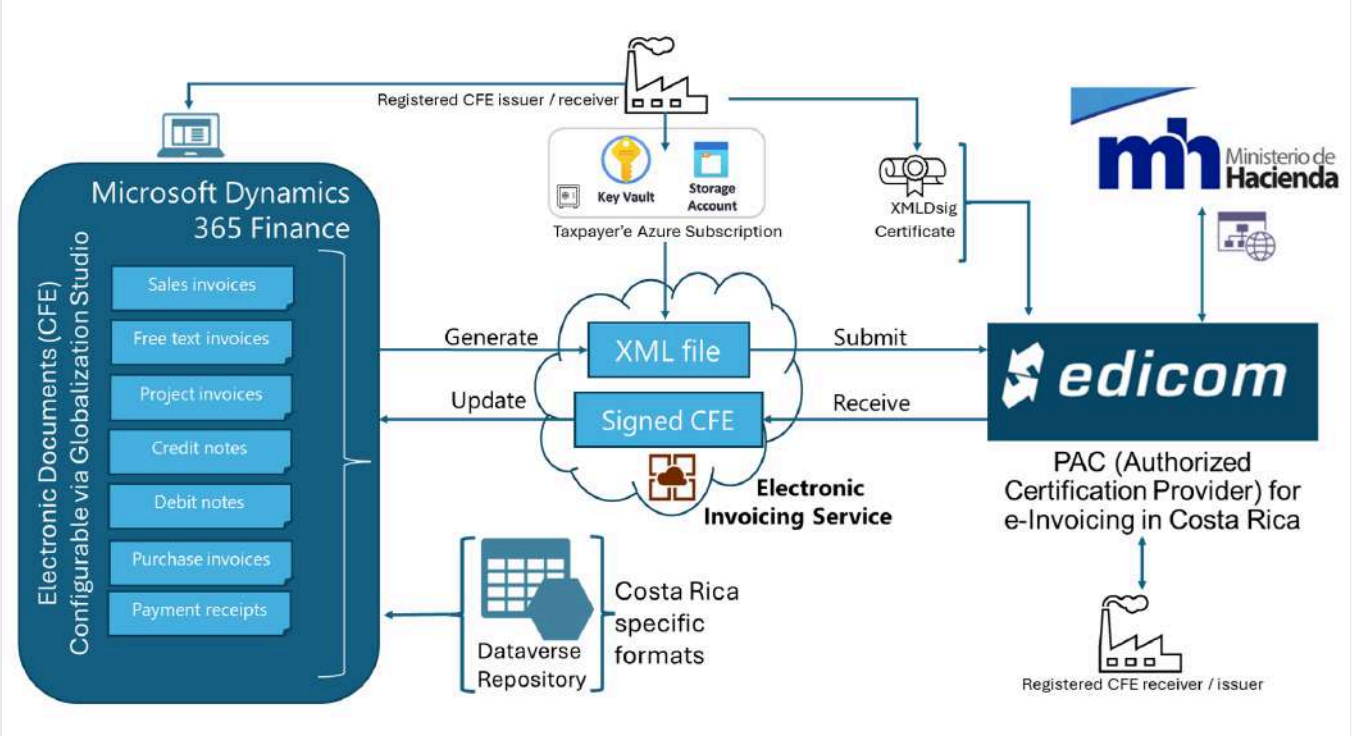
Get started with Electronic invoicing for Costa Rica

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with Electronic invoicing for Costa Rica. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Microsoft Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup. For the last-mile integration with the Costa Rican Tax Authorities, Microsoft partners with Edicom.

After you configure Electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Costa Rica.



> **Note**
>
> The electronic invoicing approach that this article describes uses an invoicing service that's applicable only to cloud deployments of Finance or Supply Chain Management.

Prerequisites

Before you begin the procedures in this article, complete the following prerequisites:

1. Ensure that the settings for the Costa Rican legal entity are in place. For more information, see Set up legal entity and tax information for Costa Rica.

2. Configure electronic invoice parameters for Costa Rica.

3. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic Invoicing service overview.

4. Complete the common part of Electronic Invoicing service configuration as it's described in Electronic invoicing configuration.

5. Enable the following features in Feature management:

    - Electronic invoicing integration
    - Electronic invoicing integration resubmit document from failed action
    - Execute update actions for submitted documents

6. Make sure that the following Electronic reporting (ER) format configurations are imported. For more information, see: Import Electronic reporting (ER) configurations from Dataverse, Import Electronic reporting (ER) configurations.

    - Inventory e-invoice (CR)
    - Inventory Credit Note (CRI)
    - Inventory Debit Note (CRI)
    - Inventory Export e-Invoice (CRI)
    - Project e-invoice (CR)
    - Project Credit Note (CRI)
    - Project Debit Note (CRI)
    - Project Export e-Invoice (CRI)
    - Purchase e-invoice (CRI)
    - Payment Receipt (CRI)
    - Customer invoice context model
    - Edicom source file response import format
    - Edicom Response Processing LATAM
    - Edicom Response Processing CR
    - Edicom response error log import

    > **Note**

These formats are based on the corresponding **LATAM** format configurations that use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. All other required configurations are automatically imported.

Country/region-specific configuration for Electronic invoicing for Costa Rica

The **Costa Rica electronic invoice (CRI) "E-Invoicing for Costa Rica: ISV last-mile connector with Edicom"** feature represents an outbound flow for issuing the following sales documents:

Expand table

Name	Code	Original Name
Invoice	01	Factura Electrónica
Debit note	02	Nota de Débito Electrónica
Credit note	03	Nota de Crédito Electrónica
Purchase invoice	08	Factura electrónica de compras
Export invoice	09	Factura de Exportación
Payment receipt	10	Recibo Electrónico de Pago

Some parameters of the feature are published with default values. Before you deploy the Electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review the default values, and update them as required, so that they better reflect your business operations.

Edicom Interactions for Costa Rica

For Costa Rica, the base flow includes at least three core interactions with Edicom:

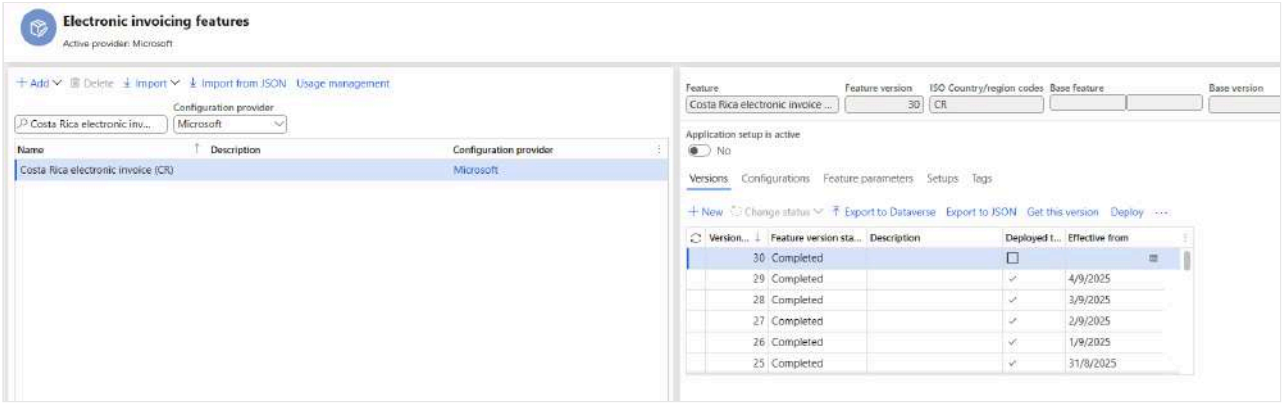
1. **Invoice submission**
2. **Signed XML retrieval**
3. **Status retrieval of the submitted invoice**

Each of these interactions requires common parameters, such as Edicom connection details and the authentication token provided by Edicom. The feature setup for all document types reuses these parameters. Edicom supplies these values during the company's onboarding process.

Costa Rica Electronic Invoice (CR) Edicom integration for Costa Rica

> **Important**
>
> Microsoft provides the **Costa Rica Electronic Invoice (CR)** feature. Before you can use it, you need to configure it as described in this article. Learn how to configure invoicing features and apply changes in Work with feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they are processed in applicability rules. By default, the feature applies to all legal entities that have a primary address in Costa Rica.

1. Import the latest version of the **Costa Rica Electronic Invoice (CR)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.



If you go to the Configuration tab, as shown in the previous screenshot, you see a page that displays information similar to the following table:

Expand table

Name	Version	Status	Country/region code
Edicom Response Processing LATAM	13.2.5	Completed	
Edicom response error log import	13.3	Completed	
Payment Receipt (CRI)	296.152.5	Completed	CR
Purchase e-invoice (CRI)	296.152.14	Completed	CR
Inventory Credit Note (CRI)	296.152.55.41	Completed	CR
Inventory Debit Note (CRI)	296.152.55.41	Completed	CR
Inventory e-invoice (CR)	296.152.55.46	Completed	CR
Inventory Export e-Invoice (CRI)	296.152.55.29	Completed	CR

Name	Version	Status	Country/region code
Project Credit Note (CRI)	296.152.27.22	Completed	CR
Project Debit Note (CRI)	296.152.27.21	Completed	CR
Project e-invoice (CR)	296.152.27.22	Completed	CR
Project Export e-Invoice (CRI)	296.152.27.6	Completed	CR

> **Note**
>
> The version numbers might change if the formats are updated. The table is for illustrative purposes only.

2. Create a copy of the imported Globalization feature, and select your configuration provider. For more information, see Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API.
   These parameters are general-purpose and are used across the different actions in the setups, so you only need to configure them once in this section.

   > **Tip**
   >
   > The following table provides **example values** for each feature parameter, so you can understand the type of data that you should enter for each one. These values are **illustrative only** and were provided by Edicom to Microsoft for testing purposes. When you're onboarded, Edicom provides you with your own unique values to use in your configuration.

Expand table

Parameter	Description	Data type	Value
EdicomApplication	Application	String	<ID_PROVIDED_EDICOM>
EdicomDomain	Domain	String	<ID_PROVIDED_EDICOM>
EdicomGetStatusSchema	Get status schema name	String	IN_DOCUMENT_STATUS_MICROSOFT_UY
EdicomGroup	Group	String	<GROUP_ID>

Parameter	Description	Data type	Value
EdicomSignedXMLSchema	Signed XML schema name	String	EDIWIN-SOURCE-FILE_XML_CFE_ADENDA_<ID_PROVIDED_EDICOM>
EdicomSubmitInvoiceDestination	Destination name	String	<ID_PROVIDED_EDICOM>_EDIWIN
EdicomSubmitInvoiceSchema	Submit invoice schema name	String	OUTBOUND_DOCUMENT_MICROSOFT_UY
EdicomToken	Auth token	Secret name	EdiwinCosta RicaToken
EdicomWebServiceURL	Web service URL	String	https://ipaasgw.edicomgroup.com

> **Tip**
>
> When configuring the feature parameters for Edicom integration, follow these steps:
>
> - Select **Application**, and enter the service ID number you obtained from Edicom.
> - Select **Domain**, and enter the same service ID number.
> - Select **Get status schema name**, and enter the provided schema name.
> - Select **Group**, and enter the group code you received.
> - Select **Signed XML schema name**, and enter the appropriate schema name.
> - Select **Destination name**, and enter the service ID number concatenated with "_EDIWIN". For example, if your service ID is 123456, enter **123456_EDIWIN**.
> - Select **Submit invoice schema name**, and enter the schema name.
> - Select **Auth token**, and choose the name of the secret you created for the token.
> - Select **Web service URL**, and verify the web address is correct.

5. The copy of the feature is always created as a **Draft** version. Regardless of whether you make changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

The **Costa Rica Electronic Invoice (CR) feature** includes 10 electronic invoice formats for Costa Rica. Each format requires its own setup and configuration. The formats are:

- **Inventory e-invoice (CRI)**

- **Inventory Credit Note (CRI)**
- **Inventory Debit Note (CRI)**
- **Inventory Export e-Invoice (CRI)**
- **Payment Receipt (CRI)**
- **Project e-invoice (CRI)**
- **Project Credit Note (CRI)**
- **Project Debit Note (CRI)**
- **Project Export e-Invoice (CRI)**
- **Purchase e-invoice (CRI)**

The following sections provide guidance on the general configuration steps that apply to all 10 formats. They also explain specific considerations and requirements for each individual format, so you can ensure that each one is configured correctly according to its unique needs.

Electronic invoice feature

Setups-View

After you import the feature, the second screenshot shows five tabs: **Versions**, **Configurations**, **Feature parameters**, **Setups**, and **Tags**. Select the **Setups** tab, then select **View**. This action opens the **Feature version setup** page:

Feature version setup

This page allows you to review and configure the details of the feature setup for Costa Rica. On the left side of this page, you see four sections: **Processing pipeline**, **Applicability rules**, **Variables**, and **Parameters**.

Processing pipeline

The Setup Actions and Parameters section contain two distinct grids:

Top Right – Processing Pipeline

The **Processing pipeline** grid is similar to the following table:

Expand table

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Transform document	Generate invoice XML file					

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Integrate with Edicom	Submit invoice					
Get status from Edicom for an invoice	Get signed XML from Edicom					**Checked**
Get status from Edicom for an invoice	Get invoice status from Edicom					
Process response	Process invoice status response					

> **Note**
>
> The **Get status from Edicom for an invoice** action is crucial in the flow, as it's marked with the **Update action** checkbox. This designation means that this specific step—and all steps following it—repeatedly execute in a loop. The system continues this process until the invoice reaches a final, terminal status, ensuring that the latest status from Edicom is always retrieved and processed.

Bottom Right – Parameters

The lower grid shows the Parameters associated with the selected processing action. These parameters allow for fine-tuning of the selected step's behavior. Each entry includes a parameter name, description, data type, and value, enabling you to configure processing logic according to your business requirements.

Transform document parameters

Expand table

Name	Description	Value
Input file	Source file that provides the action with the data to execute.	Variable: BusinessDocumentDataModel
Direction	Direction describes which format is used: import or export	export
Configuration	Configuration describes the format that's executed	Inventory e-Invoice: Inventory e-Invoice
Configuration Integration point	Source file that provides data to the reporting runtime	InvoiceCustomer

Name	Description	Value
Custom file name	Custom file name from the client	

Linking the correct format in Transform document parameters

When configuring the **Transform document** action in the processing pipeline, ensure the following:

- **Configuration**: Set this value to the exact name of the feature format you're configuring.
  - For example:
    - Inventory e-invoice (CR) → Configuration: Inventory e-invoice (CR)
    - Inventory Credit Note (CRI) → Configuration: Inventory Credit Note (CRI)
    - Inventory Debit Note (CRI) → Configuration: Inventory Debit Note (CRI)
    - Inventory Export e-Invoice (CRI) → Configuration: Inventory Export e-Invoice (CRI)
    - Project e-invoice (CR) → Configuration: Project e-invoice (CR)
    - Project Credit Note (CRI) → Configuration: Project Credit Note (CRI)
    - Project Debit Note (CRI) → Configuration: Project Debit Note (CRI)
    - Project Export e-Invoice (CRI) → Configuration: Project Export e-Invoice (CRI)
    - Payment Receipt (CRI) → Configuration: Payment Receipt (CRI)
    - Purchase e-invoice (CRI) → Configuration: Purchase e-invoice (CRI)
- **Configuration Integration Point**:
  - Configuration Integration Point:
    - `InvoiceCustomer` — Inventory e-invoice (CRI), Inventory Debit Note (CRI), Inventory Credit Note (CRI), Inventory Export e-Invoice (CRI)
    - `InvoiceProject` — Project e-invoice (CRI), Project Debit Note (CRI), Project Credit Note (CRI), Project Export e-Invoice (CRI)
    - `CustomerPrepayment` — Payment Receipt (CRI)
    - `EInvoiceVendor` — Purchase e-invoice (CRI)

> **Tip**
>
> If the feature name contains "Project", use `InvoiceProject`. If it contains "Inventory," use `InvoiceCustomer`. Incorrect settings result in empty XML or missing required data.

Integrate with Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL

Name	Description	Value

Reporting configuration list	List of configurations used for response parsing	Edicom Response Processing LATAM: Edicom Response Processing LATAM
Custom file name	Custom file name from the client	
Reporting configuration list	List of configurations used for response parsing	Edicom response error log import: Edicom response error log import

> **Note**
>
> - If the status response indicates a failure, the pipeline terminates, and the submission is marked as failed.

- If the status response indicates successful submission to the Costa Rican Tax Authorities (MH), the pipeline completes automatically.

Applicability rules and feature setup scope

You must correctly configure applicability rules to provide context, so that the Electronic Invoicing service can find the exact Electronic Invoicing Globalization feature to run. The system provides these applicability rules out of the box by checking the legal entity's International Organization for Standardization (ISO) country/region code.

Applicability rules for Costa Rican electronic invoice formats

The following table lists the applicability rules for each electronic invoice format for Costa Rica. Replace `<Legal Entity ID>` with the actual ID of your legal entity.

Inventory e-invoice (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Customer invoice	string

Inventory Credit Note (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Customer credit note	string

Inventory Debit Note (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Customer debit note	string

Inventory Export e-Invoice (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Customer Export invoice	string

Project e-invoice (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Project invoice	string

Project Credit Note (CRI)

Expand table

		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Payment	string

Purchase e-invoice (CRI)

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	CR	string
		LegalEntityId	Equals	CRMF	string
		DocumentType	Equals	Self invoice	string

Variables

The outbound data flow actions for the Costa Rican feature use the following variables. The system provides these variables.

- **BusinessDocumentDataModel** – The Business Document Data model variable that Finance or Supply Chain Management sends. The system transforms this variable into the format required for submission.
- **SignedXML** – The signed XML variable that the system sends back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get Signed XML from Edicom** step. The response types use this variable to save the signed XML that the system gets from Edicom as an attachment to the invoice journal. The system also uses this variable to generate printable reports through QR codes.

Expand table

Name	Description	Type	Data type	Value
BusinessDocumentDataModel	Contains the electronic document from the client	From client	file	
SignedXML	Signed XML document in base64-encoded format	To client	file	Get signed XML from Edicom.Base64ResponseBody

After you import the **Electronic invoicing for Costa Rica** feature that includes the default feature setup, follow the steps in the next section to configure electronic documents.

Setups-Application Setup

To configure the mapping between Dynamics 365 Finance source tables and electronic document formats, go to the **Setups** tab within the **Electronic invoice feature** section, and then select **Application Setup**. This step lets you define how data from Finance is linked to the correct electronic invoice formats for Costa Rica.

> **Note**
>
> Although you don't set this configuration at the general feature level, it acts globally for the selected feature setup. You don't need to repeat these steps for each individual format or feature - one configuration is sufficient for all supported document types within the feature.

The following grid defines the link between the source table in Dynamics 365 Finance, the document context model, and the mapping configuration used for electronic invoicing:

Expand table

Table name	Context model / Context	Electronic document mapping	Mapping name	Description
Customer invoice journal	Customer invoice context model / Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice	Maps customer invoices to the LATAM invoice model for electronic submission
Project invoice	Customer invoice context model / Project invoice context	Invoice Model mapping LATAM	Project E-Invoice	Maps project invoices to the LATAM invoice model for electronic submission
Vendor invoice journal	Customer invoice context model / Self invoice context	Invoice Model mapping LATAM	Vendor E-Invoice	Maps vendor invoices to the LATAM invoice model for electronic submission
Customer transactions	Customer invoice context model / Payment invoice	Invoice Model mapping LATAM	Customer Payments	Maps customer payments to the LATAM invoice model for electronic submission

> **Tip**
>
> Ensure that the Context and Mapping name match the document type. Incorrect mappings cause errors in XML generation or submission to DGI.

Configure electronic document parameters

To configure electronic document parameters, follow these steps.

1. Make sure that you import the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Costa Rica. For more information, see Set up Electronic document parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

The Electronic Document Parameters page in Dynamics 365 Finance. Shows on the left-hand navigation pane, you can see the following options:

- Electronic Document
- Features
- Electronic Invoicing
- Integration Channels

For the Electronic Document option on the right-hand side, the section labeled Electronic Reporting is displayed.

Within Electronic Reporting, a grid is presented which lists the electronic document configurations. This grid includes important associations between:

- The source table name
- The document context model and context
- The electronic document model mapping
- The final mapping name used for generating the electronic invoice.

This configuration is essential for determining how Dynamics 365 Finance maps internal data models to external electronic formats for submission to tax authorities or service providers.

Configure the grid as follows:

Expand table

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Customer invoice journal	No	Customer invoice context model	Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice
Customer transactions	No	Customer invoice context model	Payment invoice	Invoice Model mapping LATAM	Customer Payments
Project invoice	No	Customer invoice context model	Project invoice context	Invoice Model mapping LATAM	Project E-Invoice

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Vendor invoice journal	No	Customer invoice context model	Vendor invoice journal	Invoice Model mapping LATAM	Vendor E-Invoice

1. Save your changes, and close the page.

2. For each table name, follow these steps:

   a. Select **Response types**, select **New** to create a response type that you get from the back end, and enter the following values:

   - In the **Response type** field, enter **SignedXML** (the default value). (See the Variables section of this article.)
   - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.
   - In the **Submission status** field, select **Pending**.
   - In the **Model mapping** field, select **Edicom source file response format**.

   b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. In this way, you can run a subset of the actions in the processing pipeline in a loop to continuously pull updated statuses and other information for the submitted documents from the tax authority. In the standard view, you should see a table similar to the following:

Expand table

Response type	Description	Submission status	Data entity name	Model mapping
SignedXML	Signed XML obtained from EDICOM	Pending		Edicom source file response import format
SignedXML	Signed XML obtained from EDICOM	Pending update actions execution		Edicom source file response import format

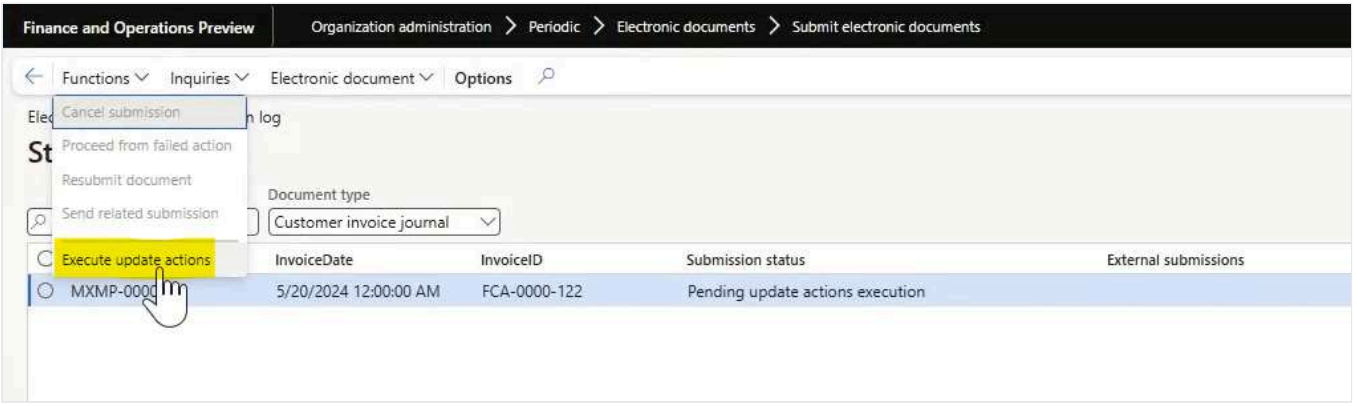
> **Note**
>
> The response includes the signed XML that you get from Edicom. The system stores this signed XML as an attachment to the corresponding invoice journal. You can use it later to generate printable invoices through QR codes.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

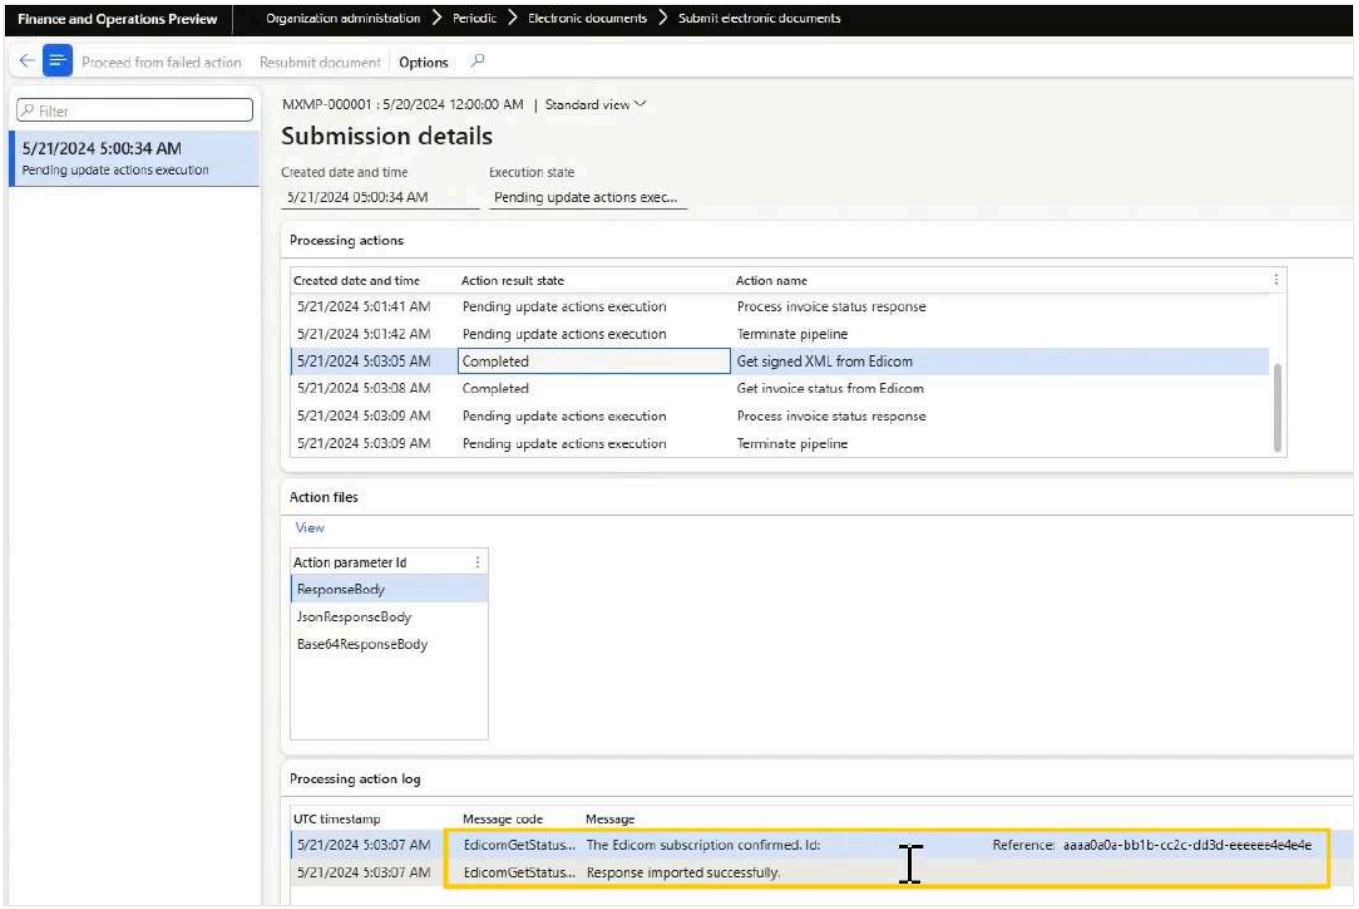
To check the results of a submission, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Costa Rica, after you submit the invoice, the submission status is set to **Pending update actions execution**. The response body is probably empty for the signed XML and the call to get the invoice status. An empty response body indicates that the XML isn't available immediately after submission. To address the pending status, use a function named **Execute update actions**. This function resumes the pipeline from the action that is marked as an update action. It then runs all subsequent actions in the pipeline in a loop. The status should change to **Executing** again. Then, after a few seconds, it reverts to **Pending update actions execution**.

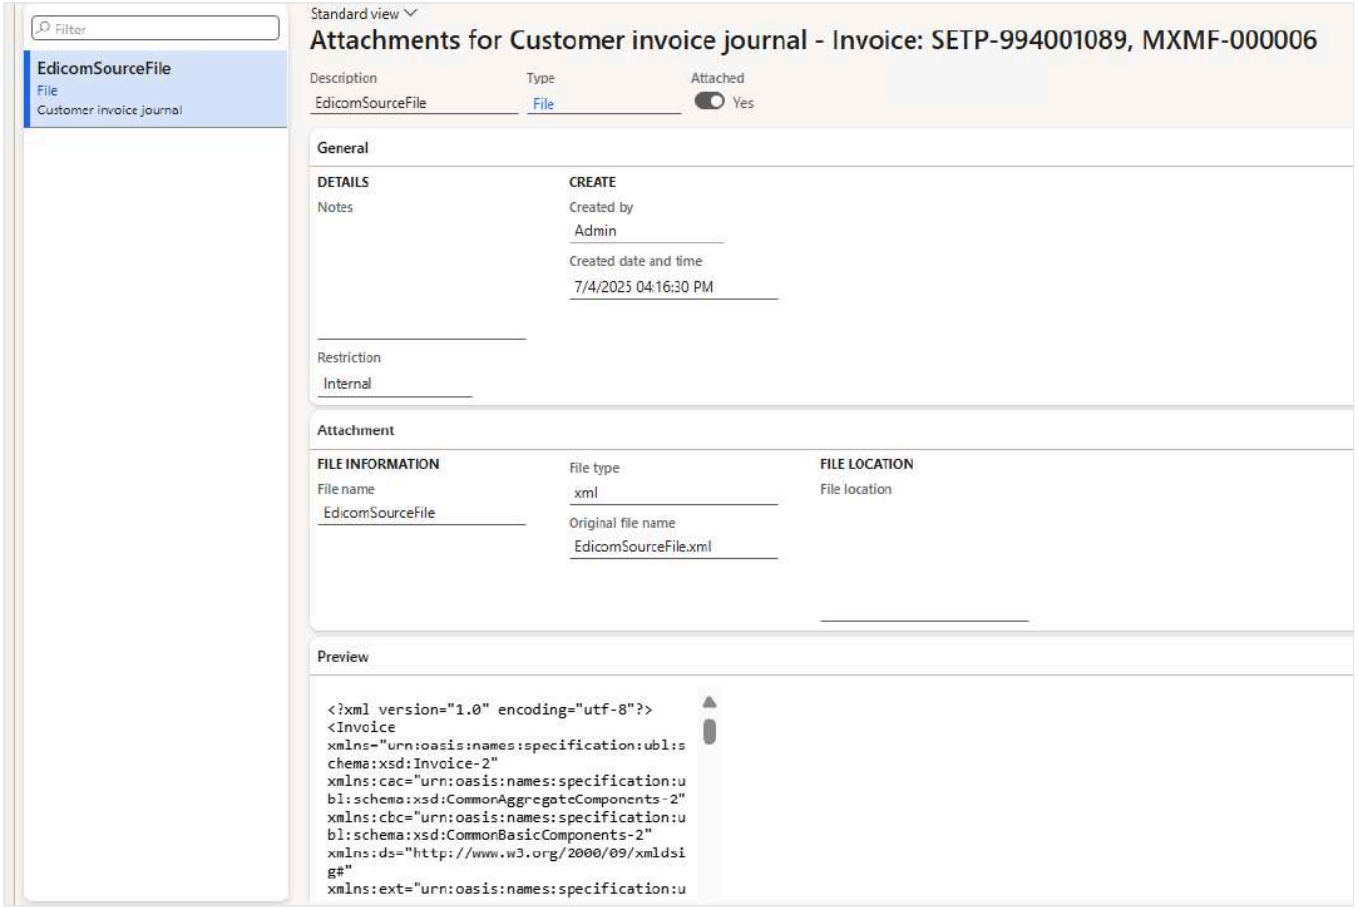


> **Note**
>
> By setting a recurrence schedule, you can configure the **Execute update actions** function to run in batch mode on a periodic basis.

When you review the submission details, you should notice that the steps run again. This time, the signed XML is received.



As a result of the completed outbound flow, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



For Costa Rica, the **Process response** action completes the pipeline after a few minutes.

Use electronic invoicing for Denmark

07/30/2025

This article provides information to help you get started with Electronic invoicing for Denmark. It includes information about how to configure the system so that you can generate, submit, and receive electronic invoices in the Denmark-specific OIOUBL format and, if necessary, in Pan-European Public Procurement Online (PEPPOL) format.

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met:

- The company must be registered in the Danish Central Business Register (CVR) and in the Danish electronic invoicing infrastructure, NemHandel.
- The company must have a signed agreement with the provider of electronic document delivery service that secures electronic document interchange in OIOUBL and PEPPOL formats.
- Among the registered profile IDs, the company should have the following profiles that Microsoft Dynamics 365 Finance uses for electronic document interchange:
  - **Procurement-BilSim-1.0** – This profile is used to interchange documents in OIOUBL format.
  - **urn:fdc:peppol.eu:2017:poacc:billing:01:1.0** – This profile is used to interchange documents in PEPPOL format.
- The company must obtain, from the service provider, the required credentials to enable integration of the Electronic Invoicing service with the Electronic Invoicing service independent software vendor (ISV) last-mile connector.
- Become familiar with Electronic invoicing as it's described in Electronic Invoicing service overview and Electronic invoicing components.
- Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
- In the key vault, create a secret for the token that grants authorization to access the infrastructure of the provider of electronic document delivery service, and set up Azure Key Vault as described in Configure Azure resources for Electronic invoicing.

Use the country-specific configuration for the Danish electronic invoice (DK) feature

Some parameters for the **Danish electronic invoice (DK)** electronic invoicing feature have default values. Before you deploy the feature to the service environment, review the default values, and update them as required, so that they better reflect your business operations.

To review and update the parameters for the **Danish electronic invoice (DK)** electronic invoicing feature, follow these steps.

1. Import the latest version of the **Danish electronic invoice (DK)** Globalization feature. Learn more in Import features from the repository.

> **Note**
>
> **Version 3** of the OIOUBL format is implemented starting from the **version 6** of the of the **Danish electronic invoice (DK)** Globalization feature.

1. Create a copy of the imported Globalization feature, and select your configuration provider for it. Learn more in Create Globalization features.
2. On the **Versions** tab, verify that **Draft** is selected.
3. On the **Setups** tab, in the grid, select the **Sales invoice OIOUBL** feature setup, and then select **Edit**.
4. On the **Processing pipeline** tab, in the **Processing pipeline** section, select **Integrate with Edicom**.
5. In the **Parameters** section, select **Domain**, and then enter the service ID number that you obtained.
6. Select **Application**, and then enter the same service ID number.
7. Select **Destination**, and then enter the service ID number concatenated with the string "_EDIWIN." For example, if the service ID number is **123456**, enter **123456_EDIWIN**.
8. Select **Group**, and then enter the group code that you obtained.
9. Select **Auth token**, and then select the name of the secret that you created for the token.
10. Select **Save**, and close the page.

11. Repeat steps 4 through 11 for each of the following feature setups if your business process assumes the involvement of the related types of documents:

    - Sales credit note OIOUBL
    - Project invoice OIOUBL
    - Project credit note OIOUBL
    - Sales invoice PEPPOL
    - Sales credit note PEPPOL
    - Project invoice PEPPOL
    - Project credit PEPPOL

12. On the **Setups** tab, in the grid, select the **Get status** feature setup, and then select **Edit**.

13. On the **Export channel** tab, in the **Parameters** section, select **Auth token**, and then select the name of the secret that you created for the token.

14. Select **Domain**, and then enter the service ID number that you obtained.

15. Select **Application**, and then enter the same service ID number.

16. Select **Group**, and then enter the group code that you obtained.

17. Select **Data channel**, and then enter the name of the integration channel that is configured on the **Electronic document parameters** page in Finance.

18. Select **Save**, and close the page.

Finance configuration

Some additional parameters must be configured directly in Finance.

To configure the additional parameters directly in Finance, follow these steps.

1. In the **Feature management** workspace, make sure that the **Export channels for electronic invoicing integration** feature is enabled. Learn more in Feature management overview.
2. Make sure that the country/region-specific **Document context** and **Electronic document model mapping** Electronic reporting (ER) configurations that are required for Denmark are imported. Learn more in Set up Electronic document parameters.
3. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
4. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.
5. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

6. In the **Integration channels** section, add a record for the channel that is used for electronic invoice submission in batch mode.
7. In the **Channel** column, enter **EdiStatus**. This channel name is used by default, but you can use a different channel name as you require. In this case, you must enter the same name in the value of the **$Context_Channel** variable in the **DataChannel** definition in the **Customer invoice context model** ER configuration. You must also enter it in the parameters and applicability rules of the related feature setup.
8. In the **Company** column, select a required legal entity code.
9. In the **Document context** column, refer to the **Customer invoice context model** configuration by using the **Data channel context** definition.
10. In the **Channel type** column, select **Export**.
11. Save your changes, and close the page.

Finance business data configuration

Follow the configuration steps in Customer electronic invoices in Denmark. Start from the Configure parameters section.

Seller identification

Companies that submit electronic invoices can be identified by their CVR number or their Global Location Number (GLN). The GLN is also known as a European article numbering (EAN) location number.

To identify a company by its CVR number, follow these steps.

1. Go to **Organization administration** > **Organizations** > **Legal entities**.

2. On the **Bank account information** FastTab, in the **Codes** section, in the **Routing number** field, make sure that a valid CVR number is entered for the legal entity.

   The CVR number is entered in the **Invoice\cac:AccountingSupplierParty\cac:Party\cbc:EndpointID** element in the electronic invoice XML file that is generated. It's used as the seller's identification during the submission process.

To identify a company by its GLN, follow these steps.

1. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.

2. Define a new registration type for Denmark that has the name **EAN**. You must enter the name exactly as it appears here.

3. Go to **Organization administration** > **Organizations** > **Legal entities**, and select **Registration IDs** on the Action Pane.
4. On the **Registration ID** FastTab, add the **EAN** registration type that you created.
5. In the **Registration number** field, enter a valid GLN.

   The GLN is entered in the **Invoice\cac:AccountingSupplierParty\cac:Party\cbc:EndpointID** element in the electronic invoice XML file that is generated. It's used as the seller's identification during the submission process.

   > ⓘ **Note**
   >
   > The GLN has higher priority than the CVR number. If both numbers are configured at the same time, the GLN is used.

Buyer identification

1. Go to **Accounts receivable** > **Customers** > **All customers**, and select a customer.
2. On the **Invoice and delivery** FastTab, in the **EAN** field, make sure that a valid GLN is entered for the customer.

   The GLN is entered in the **Invoice\cac:AccountingCustomerParty\cac:Party\cbc:EndpointID** element in the electronic invoice XML file that is generated. It's used as the buyer's identification during the submission process.

   > ⓘ **Note**
   >
   > If no GLN is defined, the customer's tax exempt number is used.

Configure the output format type

By default, all outgoing electronic invoices are generated in OIOUBL format for all customers. However, by using configurable electronic document property types, you can configure electronic invoices so that they are generated in PEPPOL format for specific customers.

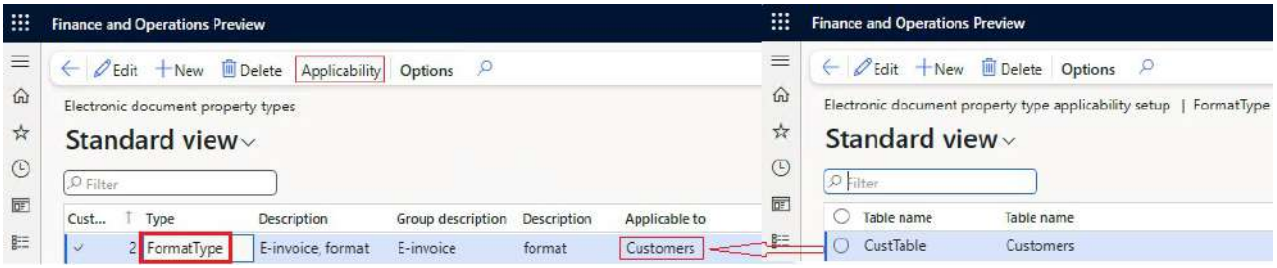
> ⓘ **Note**

Follow the configuration steps in this section only if you must also generate electronic invoices in PEPPOL format. If you generate them only in OIOUBL format, you can skip these steps.

Configure electronic document properties

To configure electronic document properties, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.
2. In the **Type** field, enter **FormatType**. You must enter the value exactly as it appears here.
3. Select **Applicability** to add an applicable table.
4. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **Customers** table name.
5. Save your changes, and return to the **Electronic document property types** page.

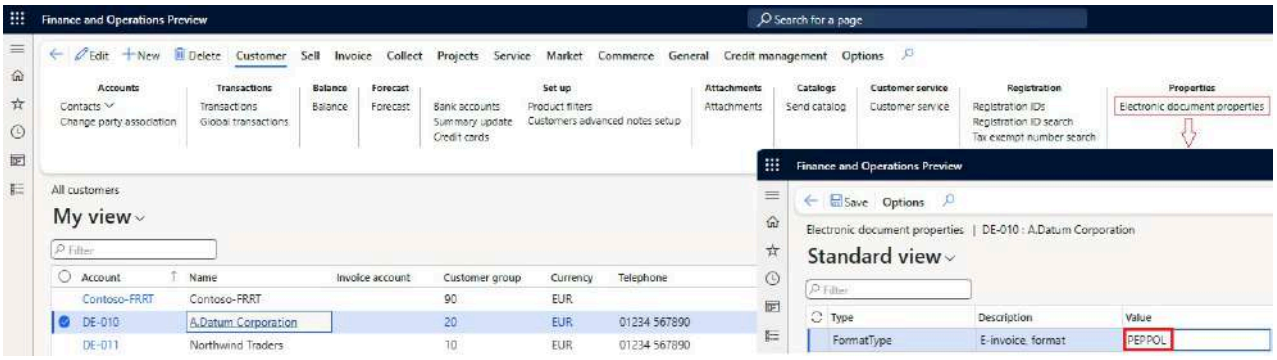


Enter the type of format

To enter the type of format for specific customers, follow these steps.

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a specific customer in the list, and then, on the Action Pane, on the **Customer** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter **PEPPOL**. You must enter the value exactly as it appears here.

> **Note**
>
> The system generates electronic invoices in PEPPOL format only if you enter the value **PEPPOL** here. If you enter a different value, or no value, electronic invoices are generated in the default OIOUBL format.



Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. Learn more about how to generate electronic invoices in Submit electronic documents.

> **Important**
>
> In current implementations, the standard submission procedure that was described earlier only generates electronic invoices and stores them on the service side. The invoices aren't submitted. Submission of Danish electronic invoices requires that you complete the following additional steps.

To submit the generated electronic invoices in batch mode, follow these steps.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
2. In the **Channel** field, select the export channel that you previously created, and then select **OK**.

You can inquire about the results of the submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. Learn more in Work with Electronic document submission log.

Receive incoming electronic invoices

To import incoming invoices in OIOUBL and PEPPOL formats, follow these additional configuration steps for the same version of the **Danish electronic invoice (DK)** electronic invoicing feature that is used for outgoing invoice submission.

1. Import the latest version of the **Danish electronic invoice (DK)** Globalization feature. Learn more in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it. Learn more in Create Globalization features.
3. On the **Versions** tab, verify that **Draft** is selected.
4. On the **Setups** tab, in the grid, select **Incoming OIOUBL**, and then select **Edit**.
5. On the **Import channel** tab, in the **Parameters** section, select the **Data channel** parameter. Then, in the **Value** field, define the name of the data channel. Alternatively, leave the default value unchanged. For the OIOUBL format, the default channel name is **EdiOIOUBL**. For the PEPPOL format, it's **EdiPEPPOL**. In both cases, make a note of the value, because you must use it in later configuration steps.
6. Select the **Service ID** parameter, and then select the name of the secret that contains the service ID number.
7. Select the **Group** parameter, and then select the name of the secret that contains the group code.
8. Select the **Token** parameter, and then select the name of the secret that you created for the token.
9. On the **Applicability rules** tab, in the **Channel** field, make sure that the **Value** column contains the same import channel name that you defined earlier.
10. Select **Save**, and close the page.
11. If an import in PEPPOL format is also required, repeat steps 4 through 10 for the **Incoming PEPPOL** feature setup.
12. Complete and deploy the configured version of the **Danish electronic invoice (DK)** electronic invoicing feature.

Finance configuration

Some additional parameters must be configured directly in Finance.

To configure the additional parameters directly in Finance, follow these steps.

1. Make sure that the latest version of the **Vendor invoice import (DK)** ER configuration is imported.

   > **Note**
   >
   > The **Vendor invoice import (DK)** format configuration is used for import invoices in OIOUBL format. It's based on the parent **Vendor invoice import** format configuration that implements invoice import in PEPPOL format. The formats use the **Invoice model** and **Vendor invoice Mapping to destination** configurations. All additional configurations that are required are automatically imported.

2. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, select **Customer invoice context model**.

3. Select **Create configuration**, and then, in the dropdown dialog box, select **Derive from Name: Customer invoice context model, Microsoft** to create a derived configuration.

   > **Note**
   >
   > The derived configuration must differ from the configuration that is used for the invoice *submission* setup.

4. Open the derived configuration to edit it in the designer, and then select **Map model to datasource**.

5. Open the **DataChannel** definition to edit it in the designer.

6. In the **Data sources** tree, expand the **$Context_Channel** container.

7. In the **Value** field, select **Edit**, and then enter the import channel name.

8. Save your changes, and complete the derived configuration.

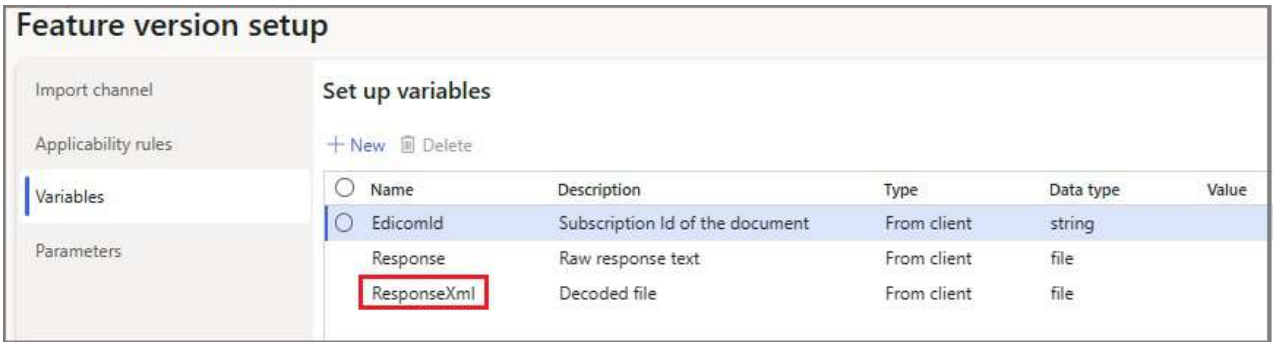
9. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

10. On the **Integration channels** tab, in the **Channels** section, in the **Channel** field, enter the import channel name that you created earlier.

11. In the **Channels** section, in the **Company** field, select a required legal entity.

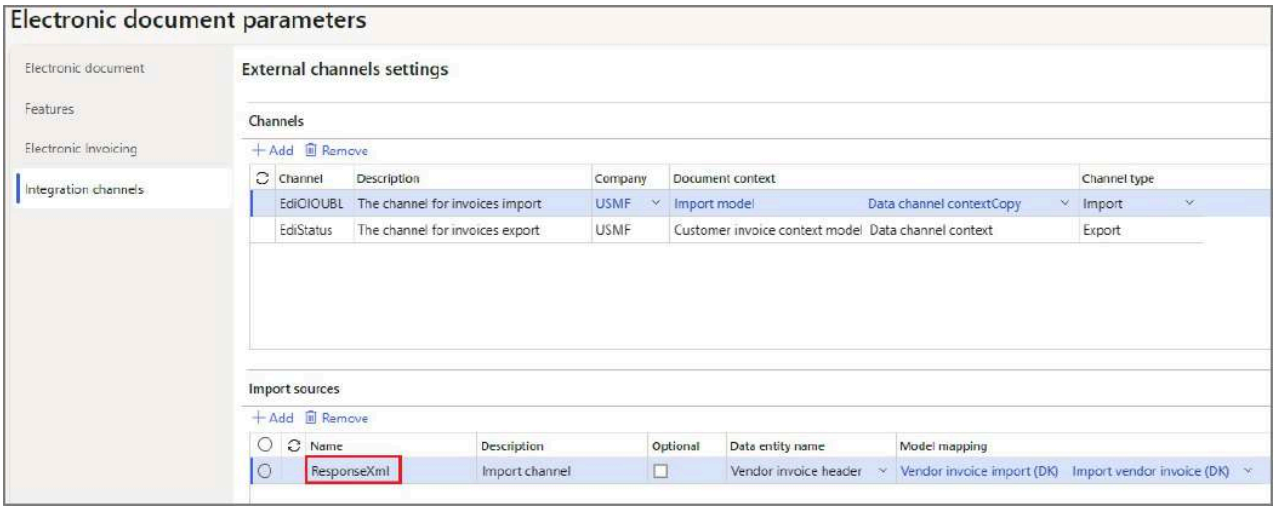
12. In the **Document context** field, select the **Customer invoice context model** configuration.

13. In the **Import sources** section, in the **Name** field, enter the same **ResponseXml** name that is used in the variable for **Decoded file** in the import feature setup.



14. In the **Data entity name** field, select **Vendor invoice header**.

15. In the **Model mapping** field, reference the **Vendor invoice import (DK)** configuration.



16. If import in PEPPOL format is also required, create another import channel, and repeat steps 3 through 15 for it. In step 15, reference the **Vendor invoice import** configuration.

17. Select **Save**, and close the page.

Configure Finance business data

You must configure the following types of master data to provide a match for incoming electronic invoices:

- Vendors
- Products
- Units

Follow the configuration steps in Vendor electronic invoice import in Denmark. Start from the Configure vendor data section.

Receive electronic invoices

To receive electronic invoices, follow these steps.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

To view the receipt logs for electronic invoices, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

To view successfully received invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

Send responses for received electronic invoices

After incoming vendor invoices are successfully received, you can respond to invoice issuers about the decision to accept or reject the received invoices. Rejection responses can be sent for both incoming invoice formats, OIOUBL and PEPPOL. Acceptance responses aren't assumed. If no rejection response is sent during an agreed-on time, the invoices are considered automatically accepted.

For the PEPPOL format, a receipt acknowledgement message can also be sent. This message is a technical confirmation of invoice receipt. The invoices can still be rejected later from a business perspective.

Configure responses

Responses can be configured by using electronic document property types in the same manner as format types.

Configure electronic document properties

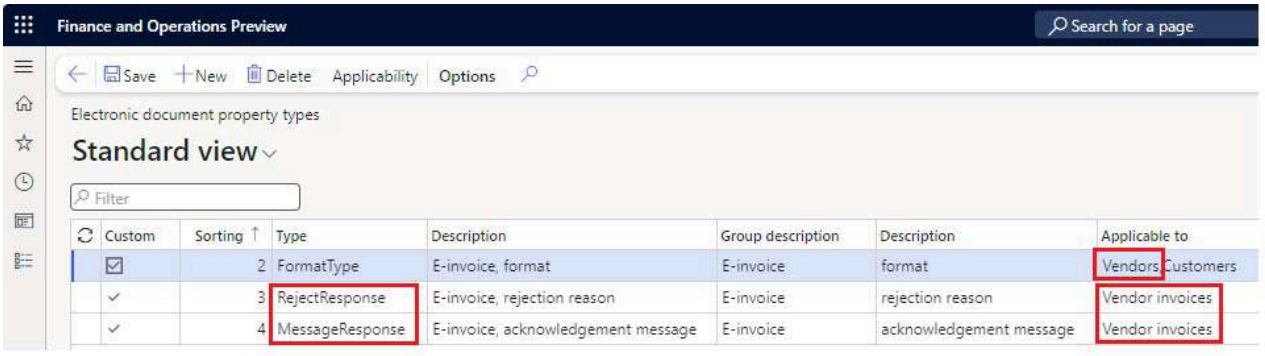
To configure electronic document properties, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.
2. In the **Type** field, enter **RejectResponse**. You must enter the value exactly as it appears here.
3. Select **Applicability** to add an applicable table.
4. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **VendInvoiceInfoTable** table name.
5. Save your changes, and return to the **Electronic document property types** page.
6. Select **New** to create another electronic document property type.
7. In the **Type** field, enter **MessageResponse**. You must enter the value exactly as it appears here.
8. Select **Applicability** to add an applicable table.
9. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **VendInvoiceInfoTable** table name.

10. Save your changes, and return to the **Electronic document property types** page.
11. Select the existing FormatType electronic document property type.
12. Select **Applicability** to add an applicable table.
13. On the **Electronic document property type applicability setup** page, in the **Table name** field, select the **Vendors** table name.

> **Note**
>
> The same electronic document property type is used to determine which response type is generated for a specific vendor: **OIOUBL application response** or **PEPPOL invoice level response**.

14. Save your changes, and return to the **Electronic document property types** page.



Define responses formats

To identify which response format type is used for a specific vendor, follow these steps.

1. Go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select a specific vendor in the list, and then, on the Action Pane, on the **Vendor** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter **PEPPOL**. You must enter the value exactly as it appears here.

> **Note**
>
> The system generates invoice-level responses in PEPPOL format only if you enter the value **PEPPOL** here. If you enter a different value, or no value, application responses are generated in the default OIOUBL format.

Enter responses

To enter responses for specific pending vendor invoices, follow these steps.

1. Go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.
2. Select a specific pending vendor invoice in the list, and then, on the Action Pane, on the **Vendor invoice** tab, in the **Properties** group, select **Electronic document properties**.
3. Select the **RejectResponse** type.
4. In the **Value** column, enter the rejection reason. This text is sent back to the invoice issuer as justification for the rejection. **OIOUBL application response** or **PEPPOL invoice level response** messages are generated and sent only if you enter a non-empty value.
5. Select the **MessageResponse** type.
6. In the **Value** column, enter any text that should be used as an acknowledgement message. This text is sent back to the invoice issuer as confirmation of invoice receipt. **PEPPOL message level response** messages are generated and sent only if you enter a non-empty value.

Configure electronic invoicing feature setups

Some parameters for the **Danish electronic invoice (DK)** electronic invoicing feature have default values. Before you deploy the feature to the service environment, review the default values, and update the authorization credentials that are required for response submission via the ISV last-mile connector.

To review and update the authorization credentials, follow these steps.

1. Import the latest version of the **Danish electronic invoice (DK)** Globalization feature, **version 5** or later. Learn more in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it. Learn more in Create a feature based on an existing feature.

3. On the **Versions** tab, verify that **Draft** is selected.

4. On the **Setups** tab, in the grid, select the **Application Response OIOUBL** feature setup, and then select **Edit**.

5. On the **Processing pipeline** tab, in the **Processing pipeline** section, select **Integrate with Edicom**.

6. In the **Parameters** section, select **Domain**, and then enter the service ID number that you obtained.

7. Select **Application**, and then enter the same service ID number.

8. Select **Destination**, and then enter the service ID number concatenated with the string "_EDIWIN." For example, if the service ID number is **123456**, enter **123456_EDIWIN**.
9. Select **Group**, and then enter the group code that you obtained.
10. Select **Auth token**, and then select the name of the secret that you created for the token.
11. Select **Save**, and close the page.
12. Repeat steps 4 through 11 for each of the following feature setups if your business process assumes that responses are sent in PEPPOL format:
    - Invoice Response PEPPOL
    - Message Response PEPPOL

Configure electronic document parameters

To configure electronic document parameters, follow these steps.

1. Make sure that the latest country/region-specific **Document context** and **Electronic document model mapping** ER configurations that are required for Denmark are imported. Learn more in Set up Electronic document parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. In the **Electronic document** section, add a record for the **VendInvoiceInfoTable** table name.
4. Set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.
5. In the **Company** column, you can select a legal entity code to limit the applicability of this electronic document type. If you don't select a value, electronic documents of this type are processed in all legal entities.
6. Save your changes, and close the page.

Send responses

To generate and submit responses, follow these steps.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. Learn more in Submit electronic documents.
2. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
3. In the **Channel** field, select the export channel that you previously created, and then select **OK**.

You can inquire about the results of the submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. In the **Document type** field, select **Vendor invoices** to filter only responses submissions. Learn more in Work with Electronic document submission log.

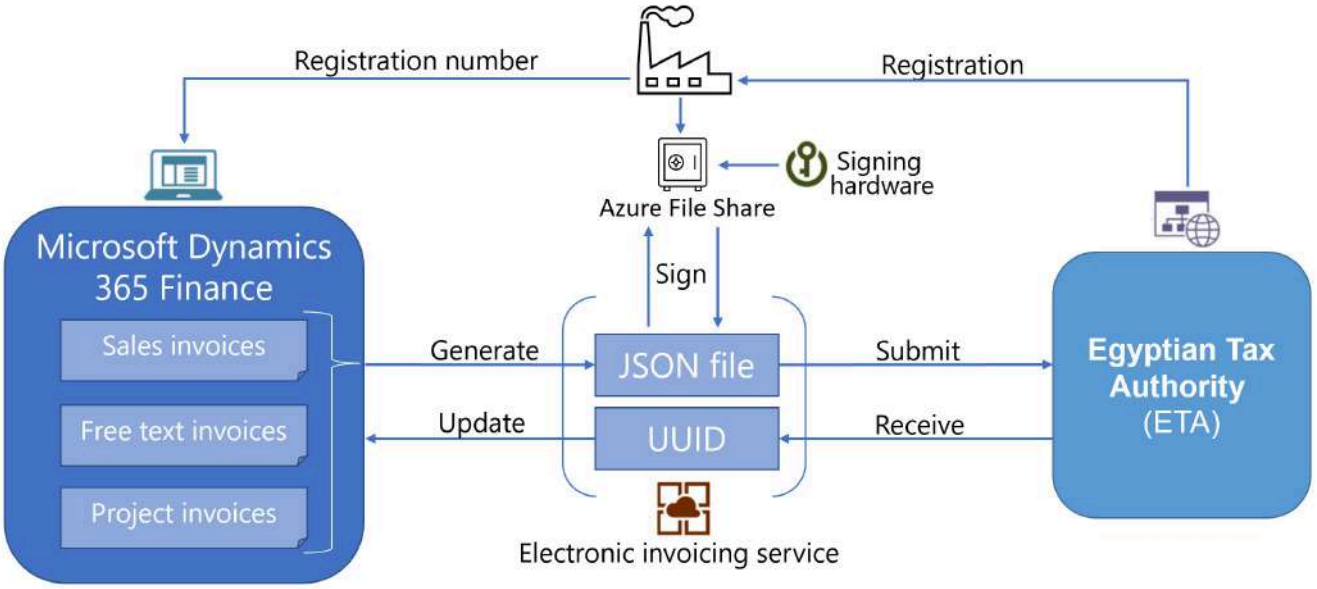
Electronic invoicing in Egypt

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with Electronic invoicing for Egypt. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing configuration.

After you configure Electronic invoicing, you can generate JavaScript Object Notation (JSON) files of electronic invoices in the Egypt-specific format and submit them to the Egyptian tax authority.



> **Note**
>
> Egyptian authorities provide the certificate for digital signing with the required key. They provide this certificate only as a hardware token device that can't be added to an Azure key vault. However, Dynamics 365 Finance enables files to be written to and read from an Azure file share, and that file share can be configured to enable external signing of electronic

documents. To learn more, go to the Egyptian tax authority's website by using the link that is provided in Egyptian eInvoicing & eReceipt SDK – Frequently asked questions.

Prerequisites

Before you begin the procedures in this article, complete the following prerequisites:

- Become familiar with Electronic invoicing as it's described in Electronic Invoicing service overview.
- Complete the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
- The primary addresses of the legal entities must be in Egypt.
- Your company must be a registered taxpayer in Egypt and must have the required registration numbers.
- Obtain **Client ID** and **Client secret** values from the Egyptian regulatory authorities. These values serve as credentials that are used to establish a secure connection to the authorities' portal.

Azure resources configuration

Complete the common part of Azure resources configuration as described in Configure Azure resources for Electronic invoicing.

Configure an Azure file share

- Configure an Azure file share as described in Create an Azure file share in the Azure portal.
- Create the following Azure file share directories:
  - The directory that generated electronic invoices for digital signing should be written to.
  - The directory that digitally signed electronic invoices should be read from.

> **Note**
>
> We don't recommend that you create a hierarchical structure of subfolders. Instead, create the required folders at the same level, and distinguish them through their names. For example, name the folders **SalesInvoices_BeforeSigning** and **SalesInvoices_Signed**.

Configure the Azure key vault

Add the following required elements in the key vault:

- The secret for the **Client ID** value that the regulatory authorities provided.
- The secret for the **Client secret** value that the regulatory authorities provided.
- The secret for the **Connection string** value of the Azure file share that you configured in the previous section.

> **Important**
>
> Don't confuse the **Connection string** value with the **Storage shared access signature (SAS)** token that is used in the parameters in the next section.

Configure electronic invoicing Key Vault parameters

To configure electronic invoicing Key Vault parameters, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, in the **Key Vault settings** section, in the **Key Vault** field, select the reference to the key vault that you configured in the previous section.
3. In the **SAS token secret** field, select the name of the storage account secret URL that must be used to authenticate access to the storage account.
4. Select **Key Vault parameters**.
5. On the **Key Vault parameters** page, in the **Certificates** section, select **Add** to create an element of the appropriate type for each secret that is described in the previous section.
    - A **Client ID** element of the **Secret** type
    - A **Client secret** element of the **Secret** type
    - A **Connection string** element of the **Secret** type

> **Note**
>
> The values in the **Name** column should match the names of the secrets that are described in the previous section.

Configure the electronic invoicing feature

Some of the parameters from the **Egyptian electronic invoice (EG)** electronic invoicing feature are published with default values. Before you deploy the electronic invoicing feature, review the default values, and update them as required, so that they better reflect your business operation.

> ⓘ **Note**
>
> Only the parameters that are mentioned in this section require modification. If you also modify other parameters to meet your needs, you're responsible for ensuring that the feature continues to work correctly.

To configure the electronic invoicing feature, follow these steps:

1. Ensure that the latest version, **20** or later, of the **Egyptian electronic invoice (EG)** Globalization feature is imported as described in Import features from the repository.

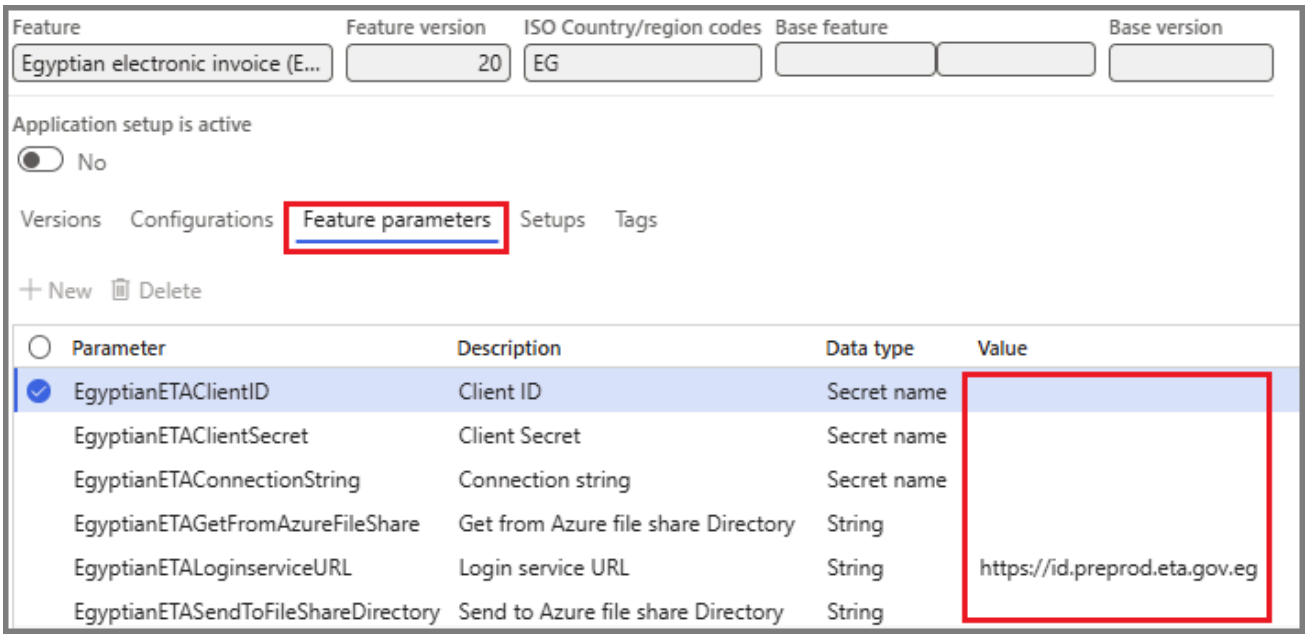
2. Create a copy of the imported Globalization feature, and select your configuration provider for it. Learn more in Create Globalization features.

3. On the **Versions** tab, verify that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters. These parameters are required for interoperation with Egyptian tax authority's services.

    - **EgyptianETAClientID** – Select the secret for the client ID that you configured in the parameters.
    - **EgyptianETAClientSecret** – Select the secret for the client secret that you configured in the parameters.
    - **EgyptianETAConnectionString** – Select the secret for the connection string to the Azure file share that you provisioned and configured in the parameters.
    - **EgyptianETASendToFileShareDirectory** – Enter the name of the Azure file share directory that invoices for digital signing should be written to.
    - **EgyptianETAGetFromAzureFileShare** – Enter the name of the Azure file share directory that digitally signed invoices should be read from.
    - **EgyptianETALoginserviceURL** – Enter the URL of the Egyptian tax authority's login service. The feature that Microsoft released points to the **pre-production** endpoint.

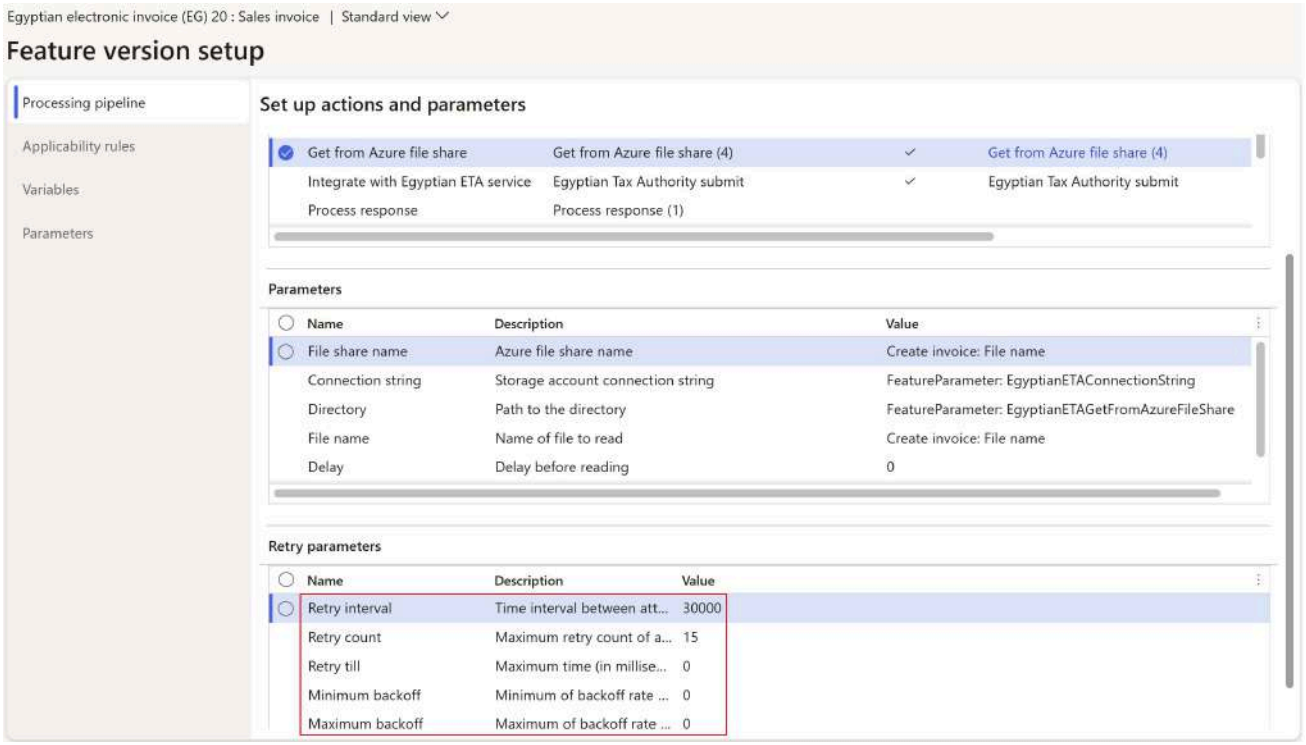
- **EgyptianETAWebserviceURL** – Enter the URL of the Egyptian tax authority's web service. The feature that Microsoft released points to the **pre-production** endpoint.



> ⓘ Note
>
> Because external signing is involved, features that Microsoft publishes repeatedly check the availability of signed invoices until a maximum limit is reached. You can reconfigure the retry parameters as you require by following the next two steps.

5. To reconfigure the retry parameters, on the **Setups** tab, select the **Sales invoice** or **Project invoice** setup, depending on the scenario. Then select **Edit**.

6. On the **Processing pipeline** tab, select the **Get from Azure file share** action, and then, in the **Retry parameters** section, configure the required values.



7. Complete your version of the **Egyptian electronic invoice (EG)** feature, and deploy it to the service. Learn more in Complete and deploy a Globalization feature.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Make sure that the country/region-specific Electronic reporting (ER) configurations for the document context and electronic document model mapping that are required for Egypt are imported. Learn more in Set up Electronic document parameters.

2. In addition to the ER configurations that are mentioned in step 1, import the Egypt-specific **Egypt response data import format (EG)** configuration from the repository. Learn more in Import Electronic reporting (ER) configurations from Dataverse.

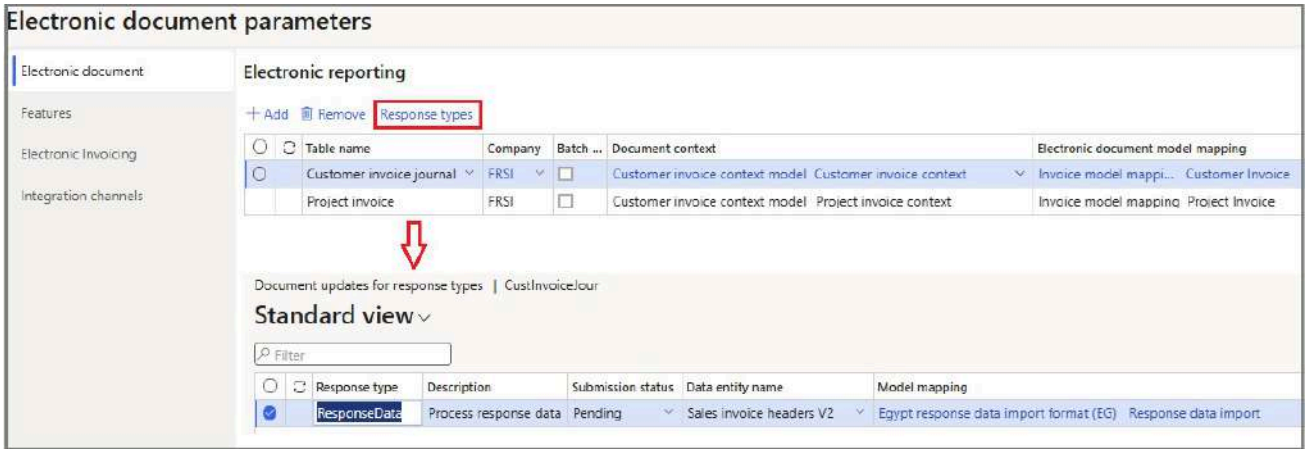
   > **Note**
   >
   > After you import the **Egyptian electronic invoice (EG)** electronic invoicing feature, electronic documents are configured by default. Follow the remaining steps of this procedure if you must make changes. Otherwise, consider them informational only.

3. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

4. On the **Electronic document** tab, add records for the **Customer Invoice journal** and **Project invoice** table names.

5. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

6. For each table name, select **Response types**, and then follow these steps:
   a. On the **Response types** page, select **Add** to create a response type.
   b. In the **Response type** field, enter **ResponseData**.
   c. In the **Description** field, enter **Process response data**.
   d. In the **Submission status** field, select **Pending**.
   e. In the **Data entity name** field, select **SalesInvoiceHeaderV2Entity**.
   f. In the **Model mapping** field, select **Response data import**. The configuration is **Egypt response data import format (EG)**.
   g. Select **Save**, and then close the **Response types** page.



7. Select **Save**, and then close the **Electronic document parameters** page.

Finance business data configuration

Follow the configuration steps in Customer electronic invoices in Egypt.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. Learn more about how to generate electronic invoices in Submit electronic documents.

> ⓘ **Note**
>
> The submission process involves manual steps for digitally signing the generated electronic invoices files that are stored in the dedicated Azure file share folder, and then moving the

signed files to another Azure file share folder. After those manual steps are completed, the automatic submission process is resumed.

You can inquire about the results of a submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** and selecting the required document type. Learn more in Work with Electronic document submission log.

Privacy notice

Enabling the **Egyptian electronic invoice (EG)** feature might require that limited data is sent. This data includes the organization's tax registration ID. The data will be transmitted to third-party agencies that the tax authority authorized to send electronic invoices to it in the predefined format that is required for integration with the government's web service. An administrator can enable and disable the feature by going to **Organization administration** > **Setup** > **Electronic document parameters**. On the **Features** tab, select the row that contains the **Egyptian electronic invoice (EG)** feature, and then make the appropriate selection. Data that is imported from external systems into this Dynamics 365 online service is subject to our privacy statement. For more information, see the "Privacy notice" section in country/region-specific feature documentation.

Last updated on 05/04/2026

Electronic invoicing for France

This article helps you get started with electronic invoicing for France. Set up the system to generate, submit, and receive electronic invoices and other related documents in the required format in Microsoft Dynamics 365 Finance through a certified service provider acting as an Approved Platform (*Platform Agréée* - **PA**).

> ⓘ **Note**
>
> This electronic invoicing approach uses an invoicing service that's applicable only to cloud deployments of Microsoft Dynamics 365 Finance.

Watch the overview of the French electronic invoicing implementation in Finance.

https://learn-video.azurefd.net/vod/player?id=45223d9e-5e49-42dc-895c-7d9ccb08b17a&locale=en-us&embedUrl=%2Fdynamics365%2Ffinance%2Flocalizations%2Ffrance%2Femea-fra-einv-ereport

System configuration

> ⓘ **Note**
>
> You can also find all the configuration steps described in the next chapters in the tutorial video in the **Appendix** section.

Prerequisites

Before you start, make sure you have the following prerequisites:

- The company is a registered taxpayer in France.
- The company has a signed agreement with the selected Approved Platform and obtained the credentials required for establishing a secure connection to the Approved Platform's infrastructure.

  > ⓘ **Note**

> This implementation assumes Edicom is the selected certified Approved Platform (PA). For more information, see Edicom integration with Microsoft Dynamics 365.

- Install the **Electronic invoicing add-in** as described in Install the add-in for Electronic invoicing microservices.
- Activate **Electronic invoicing integration** with Finance or Supply Chain Management as described in Enable Electronic invoicing integration.
- Configure the common part of the **Electronic document parameters**.

  > **Note**
  >
  > You need to configure the service environment only if you previously used the Regulatory Configuration Service (RCS) experience to configure the Electronic Invoicing service. Otherwise, keep the **Environment** parameter empty. The system assigns it automatically and makes it read-only. For more information, see Service environment configuration.

- In the **Feature management** workspace, on the **All** tab, enable the following features. If these features don't appear on the page, select **Check for updates**. Select the features, and then select **Enable now** for each of them. For more information, see Feature management overview.
  - **E-Invoice Document Status Lifecycle Management**
  - **E-Invoice Document Response Submission**
  - **Export channels for electronic invoicing integration**
  - **Execute update actions for submitted documents**

  And **disable** the following feature.
  - **Simultaneous globalization features completion and deployment** (*to activate the possibility of the **Application setup** copying*).

Create the Azure Key Vault configuration

Configure the common part of the Azure resources required for Electronic invoicing functioning. For more information, see Configure Azure resources for Electronic invoicing.

Add the following element to the key vault:

- Add the secret for the **token** that authorizes access to Edicom services.

Set up electronic invoicing Key Vault parameters

Set up electronic invoicing Key Vault parameters.

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, in **Key Vault settings**, in **Key Vault**, select the key vault reference you created earlier.
3. In **SAS token secret**, select the storage account secret URL used to authenticate access to the storage account.
4. Select **Key Vault parameters**.
5. On the **Key Vault parameters** page, in **Certificates**, select **Add** and create an element of the appropriate type for each secret described earlier.
    - Add the **token** element of type **Secret**.

> ⓘ **Note**
>
> Match the value in the **Name** column to the secret name described earlier.

For more information, see Create a Key Vault reference.

Synchronization of the Electronic invoicing service with Finance

After you complete all the configuration steps described in the previous chapters, validate the configuration.

1. In Dynamics 365 Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. Select the **Electronic invoicing** tab and select the **Save** menu button.
3. If the configuration is correct, the system shows the *Synchronization with the e-invoicing service was successful* information message. You can continue with the next chapters.
4. If there are synchronization errors, address the errors to achieve successful synchronization.

Import the electronic invoicing feature

1. Go to **Globalization Studio** and select the **Electronic invoicing** tile. Import the latest versions of the following globalization features as described in Import features from the repository.

    - **French electronic invoice (FR)**
    - **French electronic invoice status (FR)**

2. All the required Electronic Reporting configurations are automatically imported as a result of the globalization features import. You can review imported Electronic Reporting configurations in the **Electronic reporting** workspace, on the **Reporting configurations** tile. The full list of the required Electronic Reporting configurations can be found in the **List of Electronic Reporting configurations** section of the **Appendix** chapter.

> ⓘ **Note**
>
> If some of the configurations aren't imported, import them manually as described in Import Electronic reporting (ER) configurations from Dataverse.

> ⓘ **Important**
>
> Make sure that the **Vendor invoice Mapping to destination** and **Response message model mapping to destination (FR domestic)** Electronic Reporting configurations are marked as **Default for model mapping**.

Configure the electronic invoicing features

The **French electronic invoice (FR)** and **French electronic invoice status (FR)** features publish some parameters with default values. Before you deploy the features, review the default values and update them so they reflect your business operations.

Review and update the **French electronic invoice (FR)** feature configuration:

1. Go to **Globalization Studio** and select the **Electronic invoicing** tile. Import the globalization feature as described in Import features from the repository.

2. Copy the imported **French electronic invoice (FR)** globalization feature and select your configuration provider, as described in Create a Globalization feature.

3. On the **Versions** tab, check that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify these required **Edicom** connection and integration parameters:

    - **Domain** – Use the domain number (can be also referred to as **Service ID**) from Edicom to identify the company.
    - **Group** – Use the group code for internal routing within the Edicom infrastructure.
    - **Destination** – Construct the destination by appending **_EDIWIN** to the Domain/Service ID number. For example, if the Domain number is **123456**, enter **123456_EDIWIN**.
    - **Token** – Select the name of the token you created earlier.

5. Each copy starts as a **Draft** version. Complete and deploy the feature as described in Complete and deploy a Globalization feature.

    > ⓘ **Note**
    >
    > While deploying the feature, toggle the **Activate application setup** checkbox in the **APPLICATION** section. In this case, the system automatically preconfigures the significant part of the **Electronic document parameters** in Finance. You can review and change the preconfigured parameters, as described in the next chapter.

6. Repeat steps 2 through 5 for the **French electronic invoice status (FR)** feature.

Configure electronic document parameters

The system preconfigures electronic documents when you deploy the globalization features to the service and select the **Activate application setup** option during deployment. This section provides information about the setup, or if you decide to amend the standard system setup. If no amendment is required, go to the **Configure integration channels** chapter.

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic document** tab, add records for the following views.

    - **Customer invoice journal - Domestic B2B transactions (France)**
    - **Project invoice journal - Domestic B2B transactions (France)**
    - **Customer invoice response**
    - **Pending vendor invoice response**

3. For each electronic document, set the **Document context** and **Electronic document model mapping** fields as described in Set up electronic invoicing parameters.

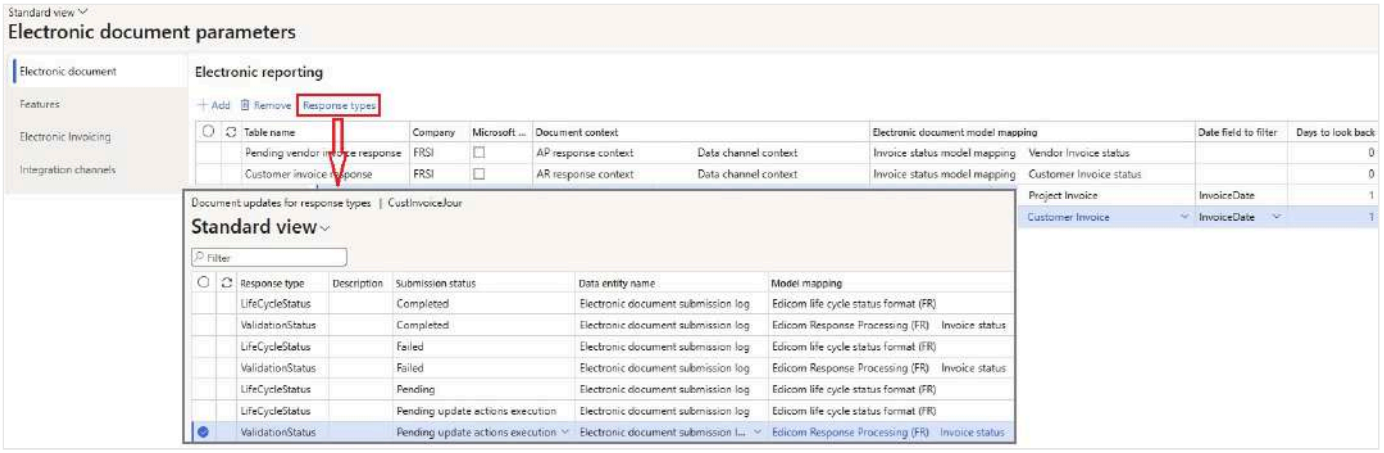
> **Note**
>
> To minimize the risk of accidental massive submissions, the system implements default filtering by document dates. In the **Date filed to filter** column, specify the exact selected table's field for filtering. In the **Days to look back** column, define the number of days to subtract from the current date to determine the earliest date for document processing. If you don't configure the **Date filed to filter** and **Days to look back** columns, the **Invoice date** equal to the current date is used by default.

1. For the **Customer invoice journal - Domestic B2B transactions (France)** and **Project invoice journal - Domestic B2B transactions (France)** electronic documents, select **Response types**.
2. Select **New** to create a new response type.
3. In the **Response type** column, enter **LifeCycleStatus**. Enter the value exactly as shown.
4. In the **Submission status** column, select the **Completed** value.
5. In the **Data entity name** column, select the **Electronic document submission log** entity.
6. In the **Model mapping** column, select the **Edicom life cycle status format (FR)** configuration.
7. Repeat steps 2 through 6 for the following values in the **Submission status** column.

    - **Failed**
    - **Pending**
    - **Pending update actions execution**

8. Select **New** to create a new response type.
9. In the **Response type** column, enter **ValidationStatus**. Enter the value exactly as shown.
10. In the **Submission status** column, select the **Completed** value.
11. In the **Data entity name** column, select the **Electronic document submission log** entity.
12. In the **Model mapping** column, select the **Edicom Response Processing (FR)** configuration and the **Invoice status** mapping name.
13. Repeat steps 8 through 12 for the following values in the **Submission status** column.

    - **Failed**
    - **Pending update actions execution**



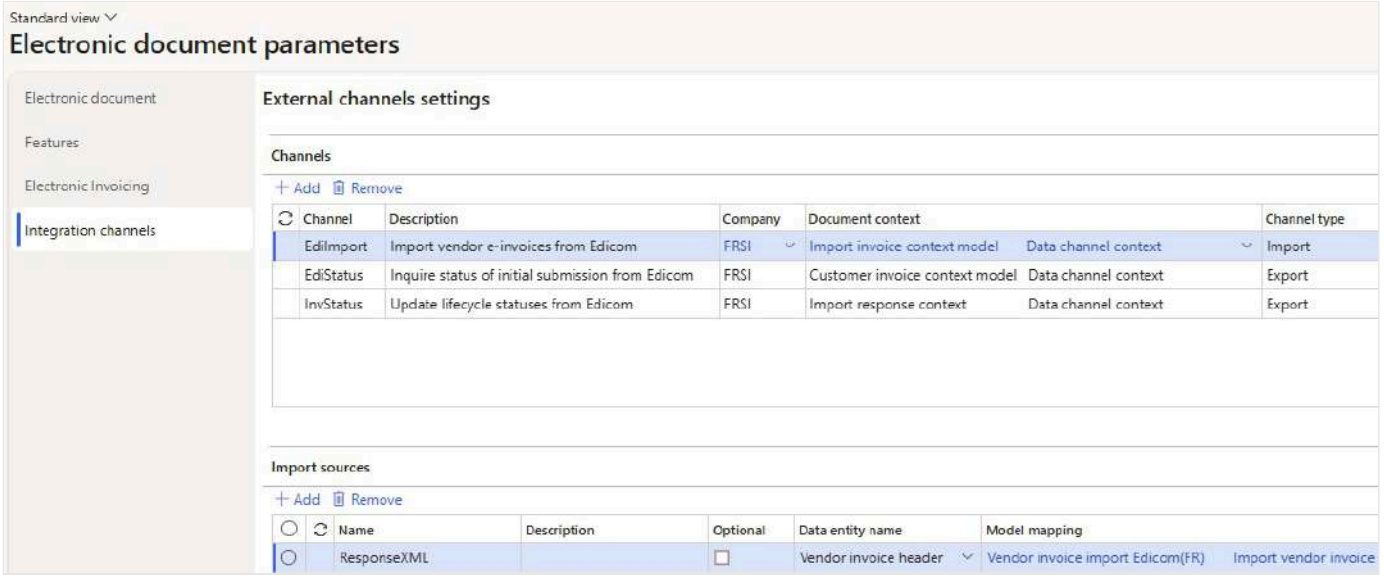
1. For the **Customer invoice response** electronic document, select **Response types**.
2. Select **New** to create a new response type.
3. In the **Response type** column, enter **Response**. Enter the value exactly as shown.
4. In the **Submission status** column, select the **Completed** value.
5. In the **Data entity name** column, select the **Electronic document submission log** entity.
6. In the **Model mapping** column, select the **Edicom Cust App Response Processing** configuration.
7. Repeat steps 2 through 6 for the **Pending** value in the **Submission status** column.
8. Select **Save**, and then close the page.
9. For the **Pending vendor invoice response** electronic document, select **Response types**.
10. Select **New** to create a new response type.
11. In the **Response type** column, enter **Response**. Enter the value exactly as shown.
12. In the **Submission status** column, select the **Completed** value.
13. In the **Data entity name** column, select the **Electronic document submission log** entity.
14. In the **Model mapping** column, select the **Edicom Vend App Response Processing** configuration.
15. Repeat steps 10 through 14 for the **Pending** value in the **Submission status** column.
16. Select **Save**, and then close the page.

> ⓘ **Note**
>
> If you created derived equivalents of the earlier Electronic Reporting configurations, use them instead of the standard configurations.

Configure integration channels

1. On the **Integration channels** tab, in the **Channels** section, select **Add** to create a new channel.

2. In the **Channel** field, enter **EdiStatus**. Enter the value exactly as shown. The system uses it to submit outgoing electronic invoices.
3. In the **Company** field, select the legal entity.
4. In the **Document context** field, select the **Data channel context** mapping from the **Customer invoice context model** configuration.
5. In the **Channel type** field, select **Export**.
6. In the **Channels** section, select **Add** to create another channel.
7. In the **Channel** field, enter **InvStatus**. Enter the value exactly as shown. The system uses it to update lifecycle statuses for previously submitted invoices.
8. In the **Company** field, select the legal entity.
9. In the **Document context** field, select the **Data channel context** mapping from the **Import response context** configuration.
10. In the **Channel type** field, select **Export**.
11. In the **Channels** section, select **Add** to create another channel.
12. In the **Channel** field, enter **EdiImport**. Enter the value exactly as shown. The system uses it to import incoming electronic invoices.
13. In the **Company** field, select a required legal entity.
14. In the **Document context** field, select the **Data channel context** mapping from the **Import invoice context model** configuration.
15. In the **Channel type** field, select **Import**.
16. In the **Import sources** section, select **Add** to create an import source.
17. In the **Name** field, enter **ResponseXml**. Enter the value exactly as shown.
18. In the **Data entity name** field, select the **Vendor invoice header** entity.
19. In the **Model mapping** field, select the **Import vendor invoice** mapping from the **Vendor invoice import Edicom (FR)** configuration.
20. Select **Save**, and then close the page.



> ⓘ Note
>
> If you use integration channels names other than **InvStatus**, **EdiStatus**, and **EdiImport**, or import source name other than **ResponseXml**, you need to make related changes in the involved context configurations and invoicing feature setups' applicability rules and variables.

Set up registration numbers

If these registration types and categories already exist and are configured accordingly, skip this procedure.

Set up SIREN number

> ⓘ Note
>
> When you generate the output files for electronic invoices, the system uses registration numbers from the **Enterprise ID (COID)** category as *Système d'identification du répertoire des entreprises* numbers (**SIREN**). If the **Enterprise ID (COID)** registration category already exists and is assigned to a registration type, skip this procedure.

To configure the **SIREN** registration number, follow these steps.

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.
2. Create a registration type.
3. In the **Country/region** field, select **FRA - France**.
4. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**.
5. Create a registration category.
6. In the **Registration types** field, select the registration type that you created in step 2.
7. In the **Registration categories** field, select **Enterprise ID (COID)**.

Set up SIRET number

To configure the *Système d'identification du répertoire des établissements* (**SIRET**) registration number, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.
2. Create a registration type.
3. In the **Country/region** field, select **FRA - France**.
4. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**.
5. Create a registration category.
6. In the **Registration types** field, select the registration type that you created in step 2.
7. In the **Registration categories** field, select **SIRET**.

Set up VAT number

Optionally, to configure the tax-exempt number, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.
2. Create a registration type.
3. In the **Country/region** field, select **FRA - France**.
4. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**.
5. Create a registration category.
6. In the **Registration types** field, select the registration type that you created in step 2.
7. In the **Registration categories** field, select **VAT ID**.

Set up Branch ID

If you configure Branch IDs, the system uses them as electronic addresses for routing documents. To configure the Branch ID, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.
2. Create a registration type.
3. In the **Country/region** field, select **FRA - France**.
4. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**.
5. Create a registration category.
6. In the **Registration types** field, select the registration type that you created in step 2.
7. In the **Registration categories** field, select **Branch ID**.

> **Note**
>
> If you can't use branches as electronic addresses, you can alternatively configure electronic addresses through electronic document properties as described in the Configure electronic addresses chapter. In this case, only one electronic address per invoice party is supported.

Additional configuration of registration numbers

To support scenarios when companies have multiple subsidiaries with their own registration numbers such as SIREN, SIRET, VAT ID, and Branch ID as an electronic address, you need to activate and configure the **Establishments** functionality. For more information, see the following articles:

- Invoice party applicability rules for registration categories
- Establishments in France
- Registration numbers setup for France

> **Note**
>
> In the current implementation of Electronic invoicing, multiple registration numbers are supported only for Buyers.

Set up address structure

Set up the postal address structure.

1. Go to **Organization administration** > **Global address book** > **Addresses** > **Address setup**.
2. Ensure that at least the **Country/Region code** element is configured.

Configure legal entity data

Enter the address

Add the primary address.

1. Go to **Organization administration** > **Organizations** > **Legal entities**, and select a legal entity.
2. On the **Addresses** FastTab, add the primary address for the legal entity.

Seller identification

Add the registration numbers.

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. On the Action Pane, select **Registration IDs**.
3. On the **Registration ID** FastTab, select **Add**, set **Registration type** to the SIREN type you created earlier, and enter the SIREN number in the **Registration number** column.
4. Select **Add**, set **Registration type** to the SIRET type you created earlier, and enter the SIRET number in the **Registration number** column.
5. Define the Tax exempt (VAT) number whatever way is used in your company.

> **Note**
>
> If you don't define the registration number with the **VAT** registration category, the value from **Organization administration** > **Organizations** > **Legal entities** > **Foreign trade and statistics** > **INTRASTAT** > **VAT exempt number export** is used.

Configure customer data

Enter the address

To enter the address, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Addresses** FastTab, add a valid address for the selected customer.

> **Note**
>
> Each address links to one set of registration numbers, including the Branch ID (electronic address). If a customer has several electronic addresses, you need to create several location addresses to ensure a one-to-one relation.

Buyer identification

To enter the registration numbers, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.

2. On the Action Pane, on the **Customer** tab, in the **Registration** group, select **Registration IDs**.
3. Select the **Address** that the registration numbers belong to. Make sure that the **Purpose** of the selected address contains the **Delivery** and **Invoice** values.
4. On the **Registration ID** FastTab, select **Add** to create a registration ID.
5. In the **Registration type** field, select the SIREN registration type that you created earlier.
6. Select **Add**, and in the **Registration type** field, select the SIRET registration type that you created earlier.
7. Select **Add** to create another registration ID, if necessary.
8. In the **Registration number** field, enter a valid Branch ID for the specific address of the selected customer.
9. Select **Add** to create another registration ID, if necessary.
10. In the **Registration number** field, enter a valid VAT number for the selected customer.

> **Note**
>
> If you don't define the registration number with the **VAT** registration category, the value from **Accounts receivable** > **Customers** > **All customers** > **Invoice and delivery** > **SALES TAX** > **Tax exempt number** is used.

Configure electronic addresses

> **Note**
>
> Follow the steps in this section only if you don't use registration numbers of the **Branch ID** category. Electronic addresses that you configure through electronic document properties take priority and overwrite registration numbers of the **Branch ID** category when generating e-invoices XML files.

Follow these steps to configure electronic addresses for sellers or buyers that you use as **EndpointIDs** for document routing.

Configure electronic document properties

Set up electronic document properties.

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.

2. In the **Type** field, enter **SellerElectronicAddress**. Enter the value exactly as shown. It's used for the **Seller** identification schema definition.
3. Select **Applicability** to add an applicable table.
4. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Legal entities**.
5. Save your changes and return to the **Electronic document property types** page.
6. Select **New** to create another electronic document property type.
7. In the **Type** field, enter **BuyerElectronicAddress**. Enter the value exactly as shown. It's used for the **Buyer** identification schema definition.
8. Select **Applicability** to add an applicable table.
9. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Customers**.
10. Save your changes, and return to the **Electronic document property types** page.
11. Save your changes, and close the page.

Enter the seller electronic address

To enter the Seller schema code, follow these steps:

1. Go to **Organization administration** > **Organizations** > **Legal entities** and select a legal entity.
2. Select **Electronic document properties** from the Action Pane.
3. In the **Value** column, enter the required seller electronic address.

Enter the buyer electronic address

To enter the Buyer schema codes, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a specific customer in the list. On the Action Pane, on the **Customer** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter the required buyer electronic address.

Configure the electronic address handling

For both Seller and Buyer identification, the system uses the electronic address you define as the **EndpointID** value with the **schemeID** attribute set to **0225** (FRCTC ELECTRONIC ADDRESS) by default, according to the Electronic Address Scheme (EAS).

You can change the code of the electronic address scheme to any value that better fits your business processes by configuring the **CompanyEndpointType** and **CustomerEndpointType** electronic document properties types for sellers and buyers respectively. The values defined via these electronic document properties have higher priority and overwrite the default **0225** value.

You can also control the interpretation of the Buyer's **Branch ID** value. By default, the system considers it as an entire electronic address. Alternatively, you can configure the **ElectronicAddressSuffix** electronic document property to force the system to interpret the Branch ID value only as a *SUFFIX* part of the electronic address. The whole electronic address is generated as the concatenation of the Buyer's **SIREN_**, **SIRET_**, and the **SUFFIX**.

> ⓘ **Note**
>
> To learn more about the full list of the electronic document properties used during the generation of electronic invoices XML files, refer to the following Appendix chapter List of electronic document properties.

Configure mandatory notes

According to French requirements, each individual electronic invoice must contain three mandatory **Note** elements in the header with the **following** predefined prefixes:

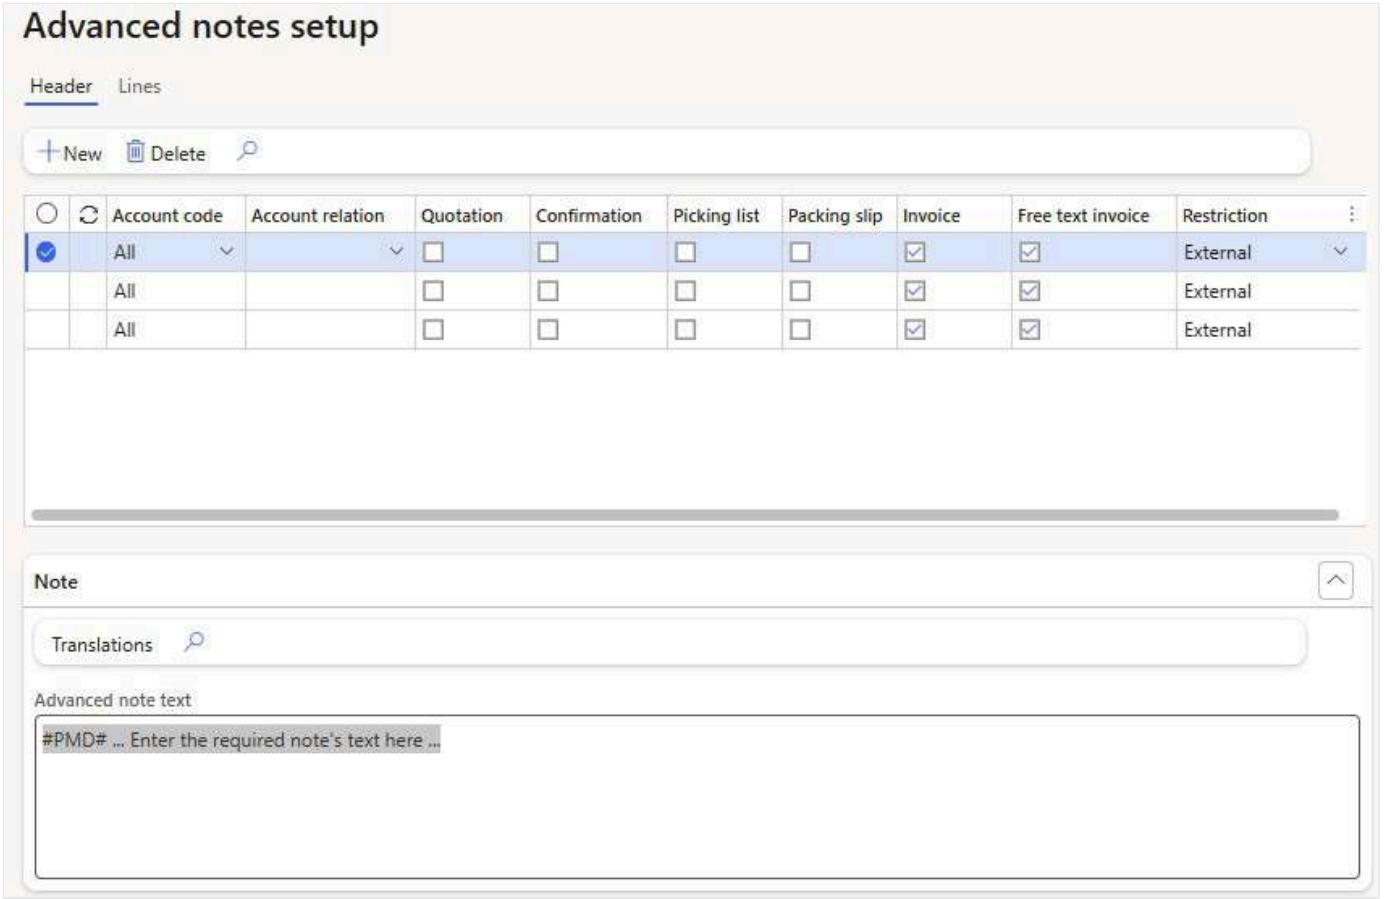
- **#PMD#** *the text of the first note related to payment/settlement information*
- **#PMT#** *the text of the second note related to payment instructions*
- **#AAB#** *the text of the third note related to payment terms*

> ⓘ **Note**

Optionally, you can add one more note with the predefined **#ADN#** prefix that is the indication for EDICOM to treat a submitted invoice that contains this note as representing **B2G** communication.

Configure mandatory notes for Sales and Free text invoices

To automate the creation of notes, see Advanced notes management. Configure at least three external header-level notes with the mandatory prefixes for the required documents, for all or selected customers. When you configure these notes, the system automatically adds them to the applicable documents upon creation.

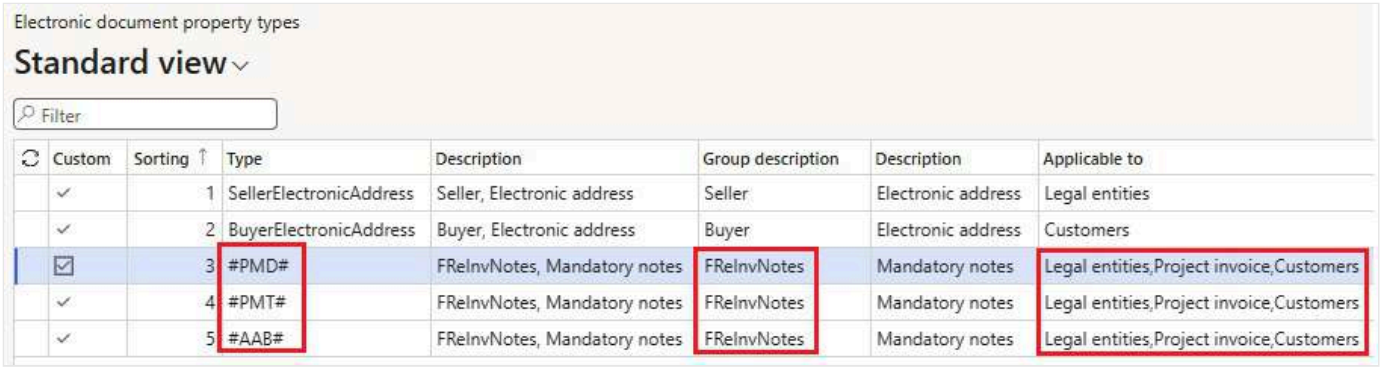


Configure mandatory notes for Project invoices

For Project invoices, the functionality of Advanced notes doesn't apply. Follow the steps described in this section to configure the mandatory notes for Project invoices.

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.
2. In the **Type** field, enter the required notes codes at least, **#PMD#**, **#PMT#**, and **#AAB#**.
3. In the **Group description** field, enter **FReInvNotes**. Enter the value exactly as shown.
4. Select **Applicability** to add an applicable table.

5. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Legal entities**, **Customers**, and **Project invoices**.
6. Save your changes and return to the **Electronic document property types** page.
7. Save your changes, and close the page.



Custom	Sorting	Type	Description	Group description	Description	Applicable to
✓	1	SellerElectronicAddress	Seller, Electronic address	Seller	Electronic address	Legal entities
✓	2	BuyerElectronicAddress	Buyer, Electronic address	Buyer	Electronic address	Customers
☑	3	#PMD#	FRelnvNotes, Mandatory notes	FRelnvNotes	Mandatory notes	Legal entities,Project invoice,Customers
✓	4	#PMT#	FRelnvNotes, Mandatory notes	FRelnvNotes	Mandatory notes	Legal entities,Project invoice,Customers
✓	5	#AAB#	FRelnvNotes, Mandatory notes	FRelnvNotes	Mandatory notes	Legal entities,Project invoice,Customers

Enter the Legal Entity mandatory notes

To enter the Legal Entity mandatory notes, follow these steps.

1. Go to **Organization administration** > **Organizations** > **Legal entities** and select a legal entity.
2. Select **Electronic document properties** from the Action Pane.
3. In the **Value** column, enter the required note text for each of the mandatory notes.

Enter the Customers mandatory notes

To enter the Customers mandatory notes, follow these steps.

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a specific customer in the list. On the Action Pane, on the **Customer** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter the required note text for each of the mandatory notes.

Enter the Invoices mandatory notes

To enter the Invoices mandatory notes, follow these steps.

1. Go to **Project management and accounting** > **Project invoices** > **Project invoices**.
2. Select a specific project invoice in the list, and then, on the Action Pane, on the **Project invoice** tab, in the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter the required note text for each of the mandatory notes.

> ⓘ **Note**

Invoice-level notes have higher priority than Customer-level notes and Legal Entity-level notes. Use them if you need to enter specific notes for a particular invoice. Customer-level notes have higher priority than Legal Entity-level notes. Use them when you need to have similar notes for all invoices issued to a specific customer. Use Legal Entity-level notes for the same notes for all invoices issued from the Legal Entity for all customers.

Set up units of measure

Set up units of measure.

1. Go to **Organization administration** > **Setup** > **Units** > **Units**.
2. Select a unit ID, and then select **External codes**.
3. On **External codes**, in **Overview**, enter the unit ID in the **Code** column.
4. Select the check box in the **Standard code** column.
5. In the **Value** section, enter the external code from the UNECE Recommendation 20 code list in the **Value** field.

   > **Note**
   >
   > If no specific unit of measure applies, the system uses the default value **EA**.

Configure sales tax codes

1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.
2. Select a sales tax code. On the Action Pane, on the **Sales tax code** tab, in the **Sales tax code** group, select **External codes**.
3. In the **Overview** section, create a line for the selected unit. Enter the sales tax code from step 2 in the **External code** field.
4. In the **Value** section, enter an external code according to the Duty or tax or fee category code (Subset of UNCL5305) in the **Value** field.
5. Go to **Tax** > **Setup** > **Sales tax** > **Sales tax exempt codes**.
6. Define exempt codes that you use for nontaxable, zero-rated, or exempted operations.

> **Note**

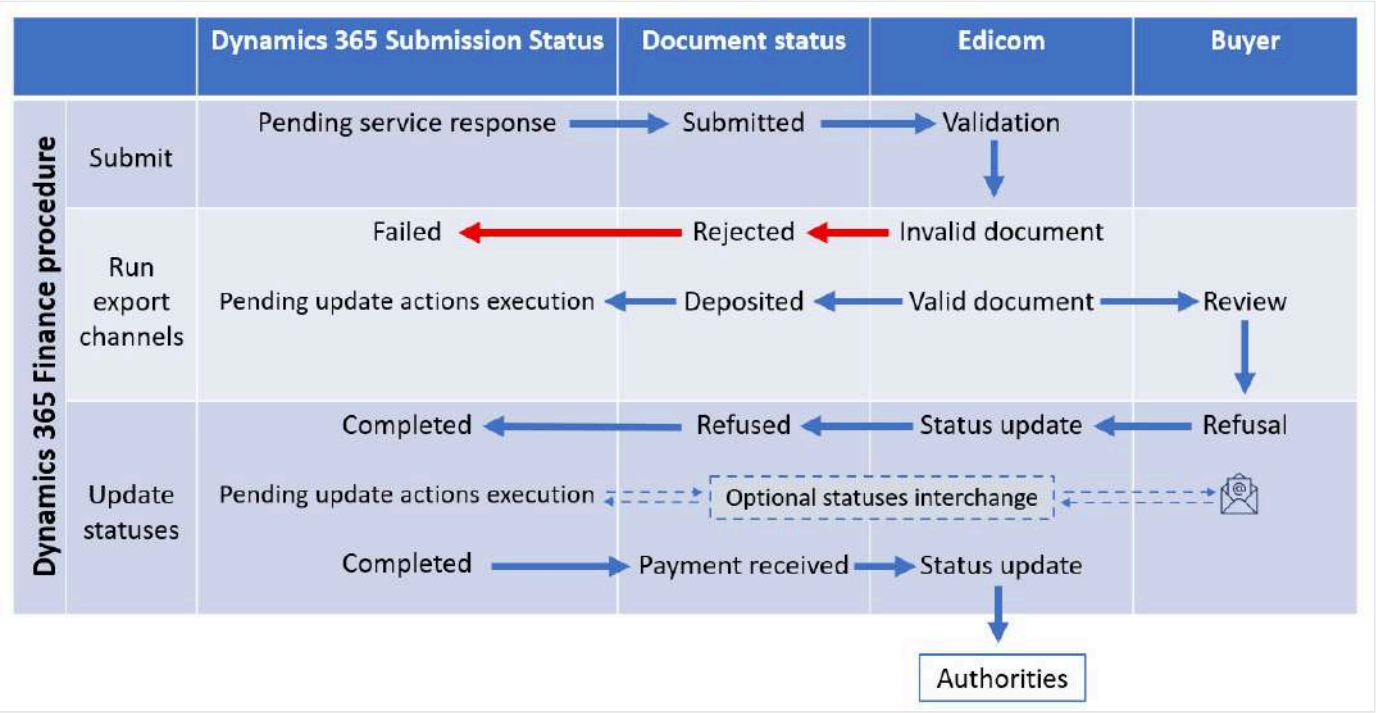
The exempt codes can have any value that your company uses internally, but the **Description** field must contain the standardized tax exemption code according to the official categorization introduced in France, such as *VATEX-FR-298SEXDECIESA*. The value from the **Description** field is used as **Tax Exemption Reason** when generating the output XML files for electronic invoices.

Issue electronic invoices

> ⓘ **Important**
>
> **Electronic invoicing scope**
>
> The scope of **E-Invoicing** individual submissions *includes* only invoices issued for customers with a nonempty **SIREN** registration number defined for the French country/region code (**FRA**). All other invoices are *excluded* from **E-Invoicing** and considered for **E-Reporting**.

After you complete the required configuration steps, generate and submit electronic invoices for posted invoices. The submission process consists of three major steps.

- **Submission of e-invoices to Edicom** - at this stage, the system generates the XMLs of e-invoices and submits them to Edicom.
- **Inquiring statuses of submitted e-invoices** - at this stage, the system inquires the initial status of submitted e-invoices from Edicom. The submission status can be **Failed** if the submitted invoice is **Rejected** by Edicom due to various reasons, or **Pending update actions execution** if the submitted invoice is successfully validated by Edicom and the system is ready for further processing.
- **Update statuses of submitted e-invoices** - at this stage, Dynamics 365 and Edicom can intercommunicate exchanging different e-invoices statuses until the concluding status is reached or due to preconfigured timeout.



Submission of e-invoices to Edicom

To start the electronic invoice submission process, go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information, see Submit electronic documents.

> **Note**
>
> During this stage, the system performs the first two actions from the **French electronic invoice (FR)** feature for the related invoice: it generates the XML file of the electronic invoice in the required format and, if the first action is successful, submits the generated XML file to Edicom.

Check the submission results at **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. For more information, see Work with Electronic document submission log. The documents can have either **Failed** submission status, if there were either Electronic Reporting run-time errors or Edicom portal is unreachable, or **Pending service response** submission status, when ready for further processing.

The following types of invoices are processed during the submission.

- Invoices based on Sales orders - electronic invoices of **380** type are generated.
- Credit notes based on Sales orders - electronic invoices of **381** type are generated.
- Free text invoices - electronic invoices of **380** type are generated.

- Free text credit notes - electronic invoices of **381** type are generated.
- Project invoices - electronic invoices of **380** type are generated.
- Project credit notes - electronic invoices of **381** type are generated.
- Customer prepayment invoices created using Customer prepayment invoices functionality - electronic invoices of **386** type are generated.

Inquiring statuses of submitted e-invoices

To check the initial status of the submitted electronic invoices from Edicom, follow these steps:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
2. In the **Channel** field, select the **EdiStatus** export channel or the channel you created for invoices, and then select **OK**.

Check the results at **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. The documents can be in either **Failed** status if Edicom rejects them due to syntactical, or other validation errors, or **Pending update actions execution** if Edicom successfully validates them and they're ready for further processing.

> ⓘ **Note**
>
> You can also view submitted electronic invoices in the Ediwin portal in the **Outbound** folder and its subfolders, where you can monitor further processing.

Update statuses of submitted e-invoices

As part of the document lifecycle, some buyer responses for successfully submitted invoices might come later. These responses can affect the statuses of submitted documents. To keep document statuses up to date, run the following procedure.

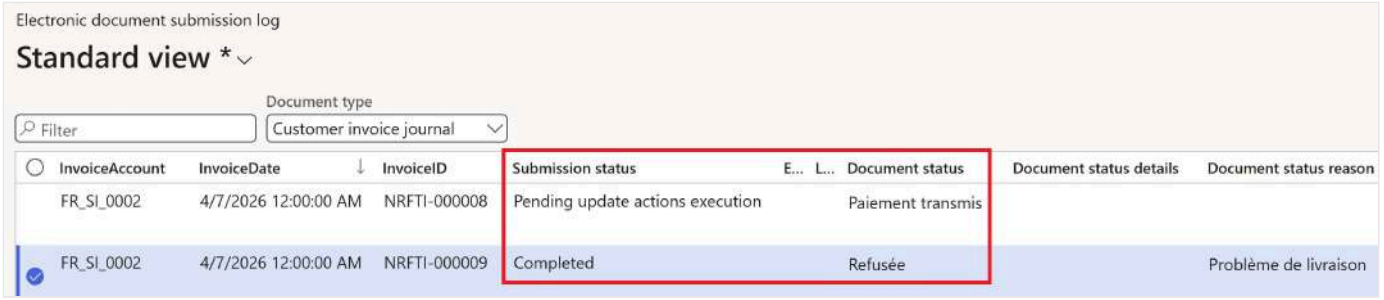
1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**.
2. Select any document and run **Functions** > **Execute update actions** from the menu.
3. The procedure runs for all documents in the **Pending update actions execution** submission status. If necessary, define additional filtering, and then select **OK**.

> ⓘ **Note**

You can also configure periodic running of this procedure in the background to avoid manual intervention.

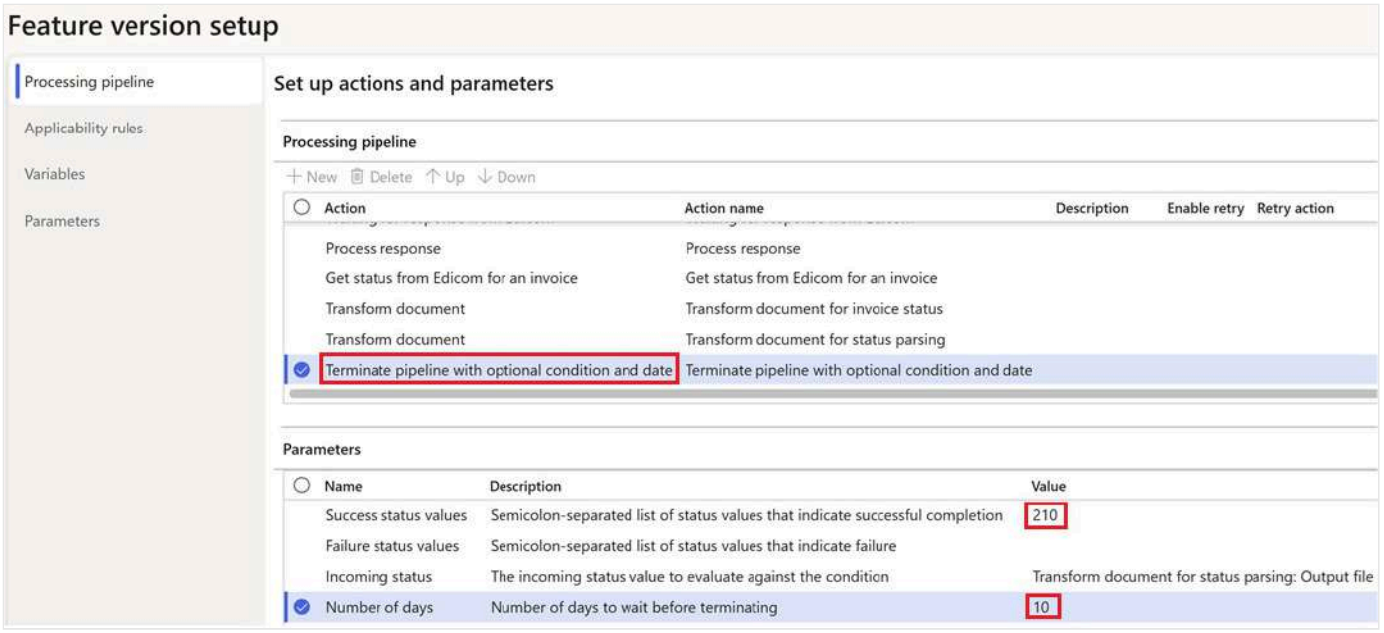
You can run the procedure multiple times to retrieve various lifecycle document statuses from Edicom until it reaches a **termination** status code or a predefined **timeout**.

If the procedure reaches any termination document status code, it updates the related document's submission status to **Completed** - this status concludes the lifecycle of the document. All other, nontermination, document statuses are for information only and keep the **Pending update actions execution** submission status intact.



You can configure the status codes for successful or unsuccessful termination and the timeout period in days in the related feature setup parameters. To configure the parameters, follow these steps.

1. In the **Globalization Studio** workspace, the **Electronic invoicing** tile, select the **French electronic invoice (FR)** globalization feature.
2. On the **Versions** tab, check that the **Draft** version is selected. Create a new draft version of the feature if necessary.
3. On the **Setups** tab, select the feature setup for a required document.
4. In the **Processing pipeline** section, select the last, **Terminate pipeline with optional condition and date** action.
5. In the **Parameters** grid, select the **Success status values** parameter. In the **Value** column, enter status codes separated by comma. These statuses are used for the pipeline processing termination when reached. To learn more about the available statuses, see the List of lifecycle status codes section of the **Appendix** chapter.
6. Select the **Number of days** parameter. In the **Value** column, enter the number of days after which the pipeline terminates regardless of the processing document status.
7. Complete and deploy the feature.



Receive incoming electronic invoices

Set more parameters in Microsoft Dynamics 365 Finance to import incoming invoices.

Configure these master data types to match incoming electronic invoices:

- vendors
- products
- units

Follow the steps in Import vendor electronic invoices, starting at Configure vendor data.

Receive electronic invoices

After you complete the configuration, receive incoming electronic invoices in the French-specific UBL-based format.

> **Note**
>
> Review incoming electronic invoices in the **Inbound** folder and its subfolders in your Ediwin portal.

Receive electronic invoices:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

View receipt logs for processed electronic invoices: go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

View successfully received invoices: go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

Send electronic invoice responses

Some business scenarios assume sending responses for either incoming or outgoing electronic invoices. The responses result in assigning mandatory document statuses that conclude the electronic invoices lifecycle.

Send responses for Customer and Project invoices

The current implementation allows sending only *payment reception confirmation* responses to your Buyers. To enter responses, follow these steps.

1. Go to **Accounts receivable** > **Inquires and reports** > **Invoices** > **Invoice journal** for Sales and Free text invoices or to **Project management and accounting** > **Project invoices** > **Project invoices**.

2. Select a specific invoice in the list. On the Action Pane, on the **Invoice** / **Project invoice** tab, in the **Document** group, select **Add response**.

3. In the **Response code** field, select the required value from the list. The **Amount paid** field is automatically populated based on payments settled against this invoice.

4. Select **OK**, and then close the page.

   > ⓘ **Note**
   >
   > You can also use a dedicated procedure in **Organization administration** > **Periodic** > **Electronic documents** > **Generate payment responses** for mass generation of payment responses for eligible invoices. These invoices must be already submitted to EDICOM and fully paid in Dynamics 365 Finance.

5. After you manually enter or automatically generate payment responses, go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.

6. In the **Record to include** section, make sure that the required **Customer invoice response** records are selected.

7. Select **OK** to start the responses submission process.

> ⓘ Note
>
> At this stage, the **French electronic invoice status (FR)** globalization feature, **Send AR response** feature setup runs for responses processing.

8. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.

9. In the **Channel** field, select the **InvStatus** export channel or the channel you created for responses, and then select **OK**.

10. Check the responses submission results at **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. Select **Customer invoice response** document type.

Send responses for pending vendor invoices

The current implementation only supports sending *refusal* responses to your sellers. To enter responses, follow these steps:

1. Go to **Accounts payable** > **Invoices** > **Pending vendor invoice**.

2. Select a specific invoice in the list. On the Action Pane, on the **Vendor invoice** tab, in the **Actions** group, select **Add response**.

3. In the **Response code** field, select the required value from the list.

4. In the **Reason code** field, select the required value from the list.

5. Select **OK**, and then close the page.

> ⓘ Note
>
> You can add refusal responses only to vendor invoices that you receive by using the **Receive electronic documents** procedure and that have related records in the **Electronic document receipt log** in Dynamics 365 Finance.

6. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.

7. In the **Record to include** section, make sure that the required **Pending vendor invoice response** records are selected.

8. Select **OK** to start the responses submission process.

   > **Note**
   >
   > At this stage, the **French electronic invoice status (FR)** globalization feature, **Send AP response** feature setup runs for responses processing.

9. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.

10. In the **Channel** field, select the **InvStatus** export channel or the channel you created for responses, and then select **OK**.

11. Check the responses submission results at **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. Select **Pending vendor invoice response** document type.

Appendix

List of lifecycle status codes

The list of mandatory status codes supported in electronic invoicing for Microsoft Dynamics 365 Finance.

Expand table

Code	Status	Requirement	Description
200	Deposited	**Mandatory**	An e-invoice is transmitted to the PA, which certifies that the invoice is validated and compliant.
210	Refused	**Mandatory**	The recipient refuses the invoice.
212	Payment received	**Mandatory**	The invoice is fully paid by the recipient.
213	Rejected	**Mandatory**	The invoice is rejected by either issuer's or receiver's PA.

> **Note**
>
> The electronic invoicing functionality in Microsoft Dynamics 365 Finance isn't limited to the statuses listed in the preceding table. The system can receive any valid status from your buyers' PAs through Edicom. At the same time, the current implementation supports sending only refusal responses to your sellers and payment reception confirmation responses to your buyers. You can find the full list of statuses in the Specifications and standards for electronic invoicing.

  - Edicom response error log import

List of electronic document properties

The following configurable electronic document properties are used during the generation of electronic invoices XML files.

Expand table

Type	Applicability	Description
CompanyEndpointType	Legal entities	Defines the code of the electronic address *scheme* for **sellers**. If you set this property, it overwrites the default 0225 value.
CustomerEndpointType	Customers	Defines the code of the electronic address *scheme* for **buyers**. If you set this property, it overwrites the default 0225 value.
SellerElectronicAddress	Legal entities	Defines the electronic address for **sellers**. It has the highest priority and overwrites any other electronic address value.
BuyerElectronicAddress	Customers	Defines the electronic address for **buyers**. It has the highest priority and overwrites any other electronic address value.
#PMD#	Legal entities Customers Project invoices	Project invoices mandatory note prefix about payment/settlement information.
#PMT#	Legal entities Customers Project invoices	Project invoices mandatory note prefix about payment instructions.
#AAB#	Legal entities Customers Project invoices	Project invoices mandatory note prefix about payment terms.
#ADN#	Customers	Optional note prefix determining buyers for B2G communication.
ElectronicAddressSuffix	Legal entities	If you set any non-empty value for this parameter, the Buyer's electronic address is constructed as **SIREN_SIRET_BranchID**. Otherwise, only the Branch ID is used as the whole electronic address.

- Electronic invoicing coverage by country and region

Last updated on 08/06/2026

Get started with electronic invoicing for France

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Learn more about how to get started with electronic invoicing for France. This article guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps described in Electronic invoicing configuration.

> **Important**
>
> As of September 2024, you can import all electronic invoicing Globalization features only into the **Globalization studio** workspace, because Regulatory Configuration Service (RCS) is decommissioned. For more information about migration to Globalization Studio, see Regulatory Configuration Service merge to the Globalization Studio workspace.

Country/region-specific configuration for the French Chorus Pro submission (FR) electronic invoicing feature

You need to complete some steps to configure the **French Chorus Pro submission (FR)** electronic invoicing feature. The configuration publishes some parameters with default values. Review and update these values so that they better reflect your business operations.

Prerequisites

Before you begin the procedures in this article, complete the following prerequisites:

- Become familiar with electronic invoicing. For more information, see Electronic Invoicing service overview.

- Complete the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
- Your organization must be registered to operate with Chorus Pro. Microsoft provides integration with Chorus pro in OAuth2 Mode via an application programming interface (API). For detailed information about Chorus Pro registration and application activation, see the official documentation.

  Follow these steps to register with Chorus Pro.

  1. Go to the PISTE portal to start your registration.
  2. Register an application, and activate Open Authorization (OAuth) credentials. For more information, see Set up a client ID and a client secret.
  3. Copy and save the client ID of the OAuth credentials and the secret key. You'll use this information in later steps.
  4. Go to the Chorus Pro portal to register.
  5. Create a technical account for API access. For more information, see Creation of a technical account for API access in production.
  6. Copy the user ID of the technical account and the password. You'll use this information in later steps.

Country/region-specific configuration of the application setup for the French Chorus Pro submission (FR) electronic invoicing feature

Some of the parameters for the **French Chorus Pro submission (FR)** electronic invoicing feature are published with default values. Before you deploy the electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review and update the default values as required, so that they better reflect your business operations.

For France, there are at least three interactions with Chorus Pro in the pipeline: first to submit the invoice, then to fetch the status, and finally to get the details of the submitted invoice. Each interaction requires common parameters, such as Chorus Pro connection and authentication details. You reuse these common parameters in the feature setup for all document types. Chorus Pro provides the values when a company is onboarded.

> **Note**
>
> The configuration of common parameters is simplified. You no longer have to go to each action and feature setup, and repeatedly specify the common connection parameters. The

Feature parameters tab is available only as of version 10.0.41 or later.

> **ⓘ Important**
>
> Microsoft provides the **French Chorus Pro submission (FR)** feature. Before you can use it, you must complete additional configuration, as described in this article. For information about how to configure invoicing features and apply changes, see Configure feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they're processed in applicability rules. By default, the feature applies to all legal entities that have a primary address in France. Additionally, **out of the box**, the feature is configured to connect to the **sandbox environment of the PISTE service**.

1. Import the latest version of the **French Chorus Pro submission (FR)** globalization feature as described in Import features from the repository.
2. Create a copy of the imported globalization feature, and select your configuration provider. For more information, see Create Globalization features.
3. On the **Versions** tab, verify that the **Draft** version is selected.
4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Chorus Pro's API:
    - In the **Client ID secret name in the KeyVault** field, select the secret name that you created for the client ID in the key vault.
    - In the **Client Secret secret name in the KeyVault** field, select the secret name you created for the client secret in the key vault.
    - In the **Login service URL** field, specify the service URL to connect to.
    - In the **Technical account login secret name in the KeyVault** field, select the secret name that you created for technical account sign-in in the key vault.
    - In the **Technical account password secret name in the KeyVault** field, select the secret name that you created for the technical account password in the key vault.
    - Select **URL address to send request**, and confirm the web address.
5. On the **Setups** tab, in the grid, select the **UBL Sales invoice derived** feature setup.
6. Select **Edit**, and then, on the **Processing pipeline** tab, in the **Processing pipeline** section, select the **Integrate with French Chorus Pro** action that has the action name **French Chorus Pro submit**.
7. On the **Processing pipeline** tab, in the **Processing pipeline** section, select the **Integrate with French Chorus Pro** action that has the action name **French Chorus Pro request**

status.

8. Review the **Parameters** sections of the pipeline's steps, and make any adjustments that are required.
9. Select **Save**, and then close the page.
10. Repeat steps 6 through 10 for the **UBL Project invoice derived**, **UBL Sales Credit Note derived**, and **UBL Project Credit Note derived** feature setups.

Finance configuration

Prerequisites

- The primary address of the legal entity must be in France.
- The following features must be enabled in **Feature management**:
  - Electronic invoicing integration
  - E-Invoicing service workspace designer
  - (France) Electronic invoicing integration with Chorus Pro

> ⓘ **Note**
>
> To track the status of submitted documents in Chorus Pro, enable two additional features in the **Feature management** workspace: **Extended document identification in submission log** and **Execute update actions for submitted documents**.

Configure legal entity data

Enter a legal entity's address

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity, and then, on the **Addresses** FastTab, add a valid French primary address for the legal entity. Make sure that the following mandatory address elements are defined:
   - Country/region code
   - ZIP/postal code
   - City
   - Building number

Enter a legal entity and a customer Siret number

Use the information in NAF codes and siret numbers and FR-00003 NAF codes and Siret numbers to set up NAF codes and Siret numbers. Alternatively, you can use registration IDs to set up Siret numbers.

Set up the project manager account

When you submit work invoices, use the **Project manager** party. Before you use it, set up the new party type as a customer account. You can then use it when you post invoices.

Follow these steps to enable the project manager for a project invoice.

1. Go to **Project management and accounting** > **Projects** > **Project contracts**.
2. On the **Funding sources** tab, in the **Project manager** field, select a customer account. Then select **Project contracts** > **Project contracts** > **Project contracts**.

> ⓘ **Note**
>
> The **Project manager** field is available only when the funding type is **Customer**.

Set up Chorus Pro electronic document parameters

You can enable SIRET numbers and service code validation before you post and invoice documents.

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Chorus Pro** tab, add the following information:

    - Web service URL
    - Login service URL
    - Client ID
    - Client secret
    - Technical user name
    - Technical user password

> ⓘ **Note**
>
> Use Azure Key Vault storage to store the secrets. For more information, see Set up the Azure Key Vault client.

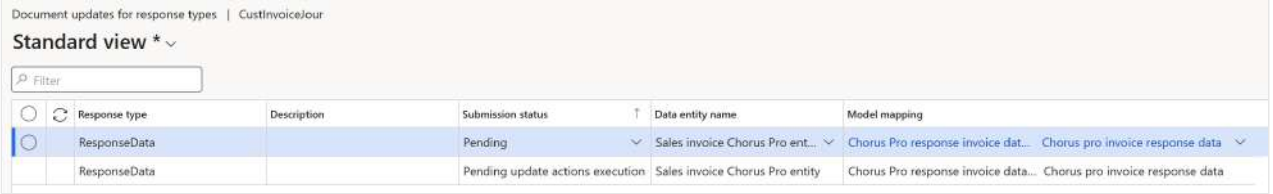
3. Enable the **SIRET and service code validation during invoice posting** parameter.
4. In the **Report format** field, select the configurable business document to use when a submission report is printed.

> **Note**
>
> To create a new submission report instead of customizing a default report, use the **DocumentSubmitted** model name and the **SubmittedInvoice** mapping name for the integration point.

To obtain the latest processing details for the invoice from Chorus Pro in the submission log, you must configure the response types in Finance.

Follow these steps to complete the configuration.

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic document** tab, add records for the **Customer Invoice journal** and **Project invoice** tables.
3. For each table name, set the **Document context** and **Electronic document model mapping** fields as specified in Set up Electronic document parameters.
4. In the **Customer Invoice journal** table name field, select **Response types**.
5. Create a new response type that has the same name that was defined for the related variable in the corresponding feature setups.
   a. In the **Submission status** field, select **Pending**.
   b. In the **Data entity name** field, select **Sales invoice Chorus Pro entity**.
   c. In the **Configuration** field, select **Chorus Pro response invoice data import format (FR)**.
6. Create another new response type that has the same name that was defined for the related variable in the corresponding feature setups.
   a. In the **Submission status** field, select **Pending update actions execution**.
   b. In the **Data entity name** field, select **Sales invoice Chorus Pro entity**.
   c. In the **Configuration** field, select **Chorus Pro response invoice data import format (FR)**.



Define electronic invoice frameworks

1. Go to **Accounts receivable** > **Setup** > **Electronic invoice frameworks**.
2. In the **Type** field, enter the electronic invoicing framework.

   If you don't configure an electronic invoice framework, the system sends all invoices as **A1 - simple invoice**. Use the following codes for the invoice framework to attribute work invoices: A4, A7, A8, A9, A10, A12, A13, A14, and A22. For more information, see Invoicing framework and transmission modes.
3. If you enable **SIRET and service code validation during invoice posting**, set up the following options to have more granular control over the validations that run in the invoice posting process:

   a. Go to **Accounts receivable** > **Setup** > **Electronic invoice frameworks**.

   b. Add the required setup lines to allow users to enable or disable validation per document and party type.

   > **Note**
   >
   > Where relevant (Project invoice proposal, Free text invoice, Sales order), the system runs **only enabled validations** after selecting the Invoicing framework and during posting when **SIRET and Service code validation during invoice posting** is enabled. When validation for the Service code is enabled, it validates **only** when the MOE/MOA SIRET structure requires it, not indiscriminately.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices. For more information about how to generate electronic invoices, see Issue electronic invoices in Finance and Supply chain management.

In France, you can add extra information before you run the standard invoice posting procedure. To add extra information for invoices, follow these steps in the applicable business process.

For sales orders or free text invoices

1. Go to **Accounts receivable** > **Orders** > **All sales orders** or **Accounts receivable** > **Invoices** > **All free text invoices**.

2. Switch to the **Header** view, and select the following information:

    - Electronic invoice framework type
    - Invoice account service code

      > ⓘ **Note**
      >
      > If you enabled the **SIRET and service code validation during invoice posting** parameter in the previous section, you get the list of available service codes from Chorus Pro.

    - Project manager

For project invoices

1. Go to **Project management and accounting** > **Project invoices** > **Project invoice proposals**.
2. Open an existing invoice proposal, or create a new one.
3. Switch to the **Header** view, and select the following information:

    - Electronic invoice framework type
    - Funding source service code
    - Project manager
    - Project manager service code

To view the submission results, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and then select **Electronic document** > **Generate report** to generate a submission report.

Receive electronic invoices

To import documents from Chorus Pro, go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**. After the import process finishes, you can find the received documents in the **Pending vendor invoice** workspace. You can add more attributes to these documents as needed. Some of the attributes you can add include:

- Electronic invoice framework type
- Invoice account service code
- Project manager
- Project manager service code

For more information, see Use the electronic invoicing service to import vendor invoices.

Get started with Electronic invoicing for Indonesia

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information that will help you get started with Electronic invoicing for Indonesia. It describes the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance. It guides through the steps that you must follow in Finance to export sales invoices through the service, and to review the processing results and the status of invoices.

Prerequisites

- Become familiar with electronic invoicing as it's described in Electronic Invoicing service overview.
- Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.

Configure Electronic invoicing features

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. Import the latest version of the **Indonesian electronic invoice (ID)** Globalization feature as described in Import features from the repository.

   > **Note**
   >
   > If the feature doesn't appear in the list, select **Synchronize**, and then repeat step 2.

Create a new version of the Indonesian electronic invoice (ID) feature

When you import the **Indonesian electronic invoice (ID)** feature from the repository, all the feature settings are imported. These settings include the configurations, actions of the processing pipeline, and applicability rules. If a new feature version is required, you can create it by using your configuration provider.

1. Create a copy of the imported Globalization feature, and select your configuration provider for it. For more information, see Create Globalization features.
2. On the **Versions** tab, verify that the **Draft** version is selected.

Update the configurations versions

Review the format configurations that are required to generate and export sales invoices.

1. In the **Globalization features** workspace, select the **Electronic Invoicing** tile.
2. On the **Electronic invoicing features** page, on the **Configurations** tab, select **Add** or **Delete** to manage the configuration versions.

When you create a new version, all configurations are inherited from the imported version of the Electronic invoicing feature. The following configurations are required to process invoices:

- Invoices issued (ID)
- eInvoice import (ID)

In the list, select a configuration version, and then select **Edit** or **View** to open the **Format designer** page, where you can edit or view the configuration.

You can review the configuration and customize it as you require. Use the **Format designer** page to edit and view the Electronic reporting (ER) format file configurations. For more information, see Create Electronic reporting (ER) configurations.

Configure the application-specific parameters

Before you begin, make sure that the **Invoices issued (ID)** ER format configuration is imported.

Follow these steps to begin the configuration.

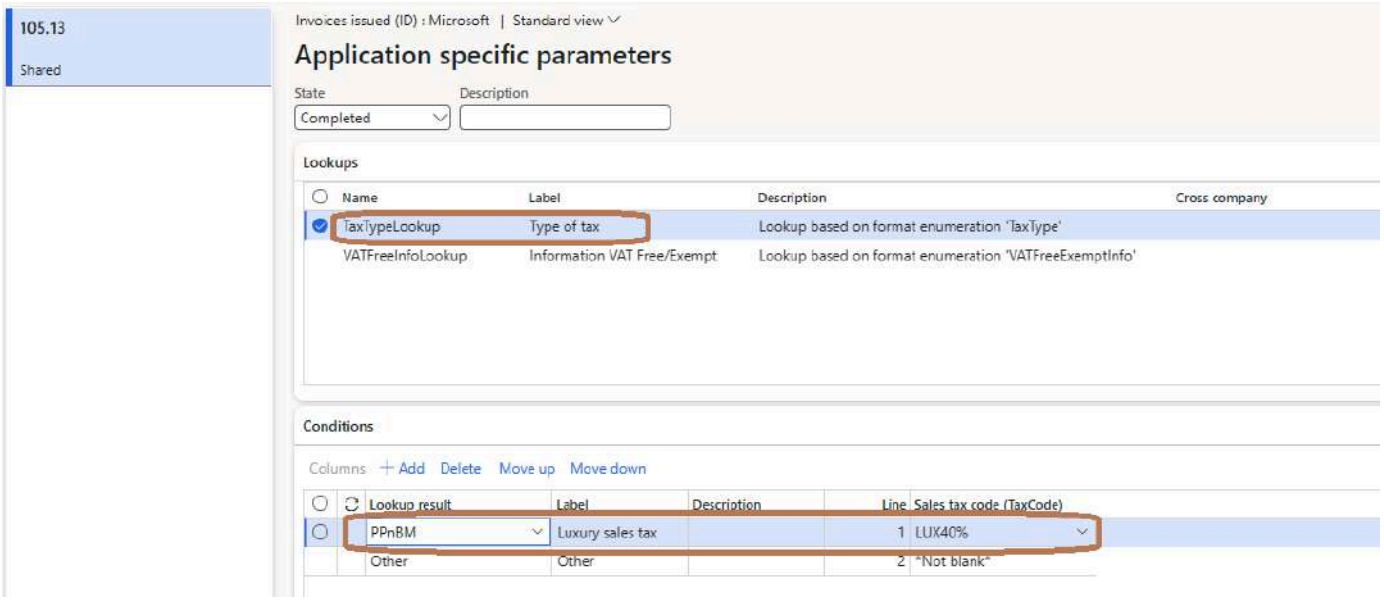
1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.
2. On the **Configurations** page, select the **Invoices issued (ID)** format configuration.
3. On the **Configurations** menu, in the **Application specific parameters** section, selected **Setup**.

To enable the system to determine which sales tax code in Finance corresponds to the tax code for luxury goods (PPnBM) when invoices are exported, follow these steps to set the application-specific parameters for luxury sales tax.

1. In the **Lookups** grid, select the row for **TaxTypeLookup**.
2. In the **Conditions** grid, on the first line, set the **Lookup result** field to **PPnBM** and the **Sales tax code (TaxCode)** field to the sales tax code that's used for luxury tax in Finance.

   > **Note**
   >
   > You can set up several sales tax codes for PPnBM and have several lines for them in the **Conditions** grid.

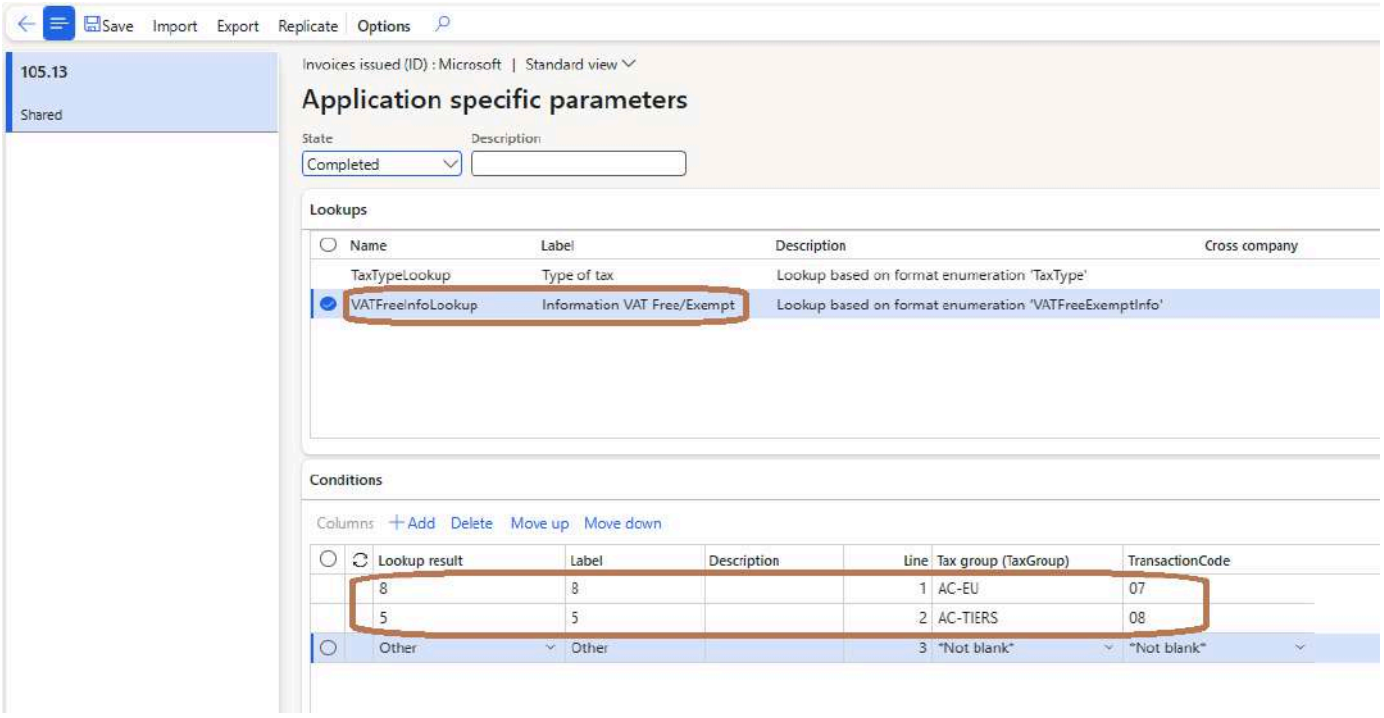
3. On the last line, set the **Lookup result** field to **Other** and the **Sales tax code (TaxCode)** field to ***Not blank***. These settings specify that all other sales tax codes should not be considered as luxury tax by the system..



To enable the system to determine which sales tax group in Finance corresponds to VAT-free reasons (transaction code 07, reasons 1 through 8) or VAT-exempt reasons (transaction code 08, reasons 1 through 5) when invoices are exported, follow these steps to set the application-specific parameters for those reasons.

1. In the **Lookups** grid, select the row for **VATFreeInfoLookup**.
2. In the **Conditions** grid, on the first line, set the **Lookup result** field from **1** through **8** for transaction code **07** and from **1** through **5** for transaction code **08**.

3. Set the **Tax group (TaxGroup)** field to the sales group that's used for exemption operations in Finance.
4. On the last line, set the **Lookup result** field to **Other** and the **Tax group (TaxGroup)** field to ***Not blank***. These settings specify that all other sales tax groups should not be considered exemption groups by the system.



After you define specific conditions for each application-specific parameter, save your changes.

Manage the Electronic invoicing feature setup

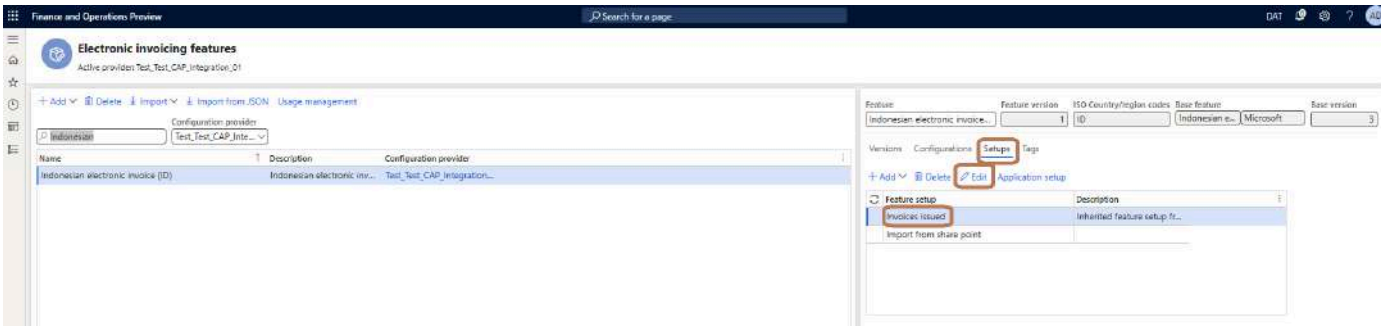
Review or configure the actions in the processing pipeline that support the sales invoice export and import scenarios.

1. In the **Globalization Studio** workspace, select the **Electronic Invoicing** tile.
2. On the **Electronic invoicing features** page, on the **Setups** tab, select **Add**, **Delete**, or **Edit** to manage the Electronic invoicing feature setup.

Configure the Sales invoice feature setup

To generate the comma-separated values (CSV) file for a sales invoice, you must set up the Sales invoice feature.

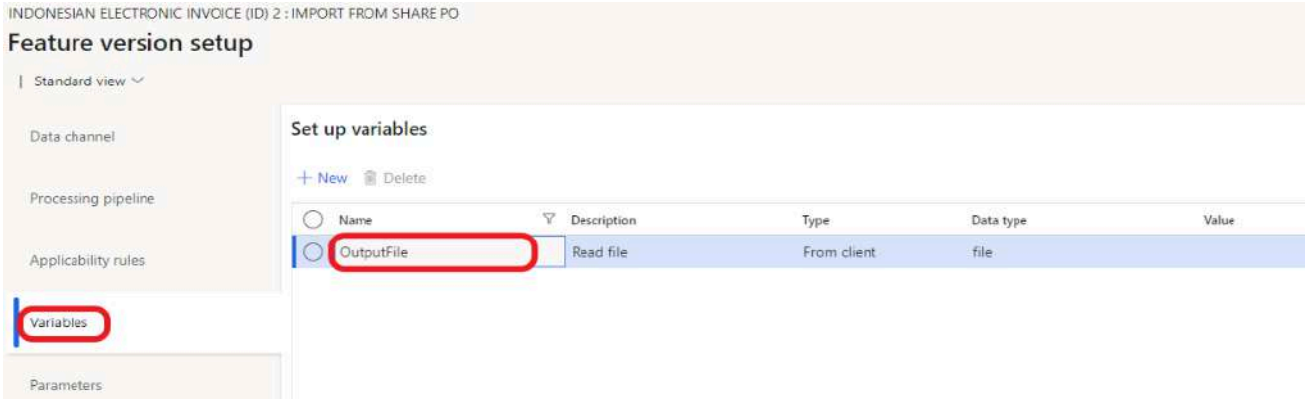
1. On the **Electronic invoicing features** page, on the **Setups** tab, in the **Feature setup** column, select the **Invoice issued** record.
2. Select **Edit** to review or configure the actions, applicability rules, and variables.



Configure the Vendor invoice feature setup

Before you configure the Vendor invoice feature setup, you should create a draft version of the feature that you'll work with for this procedure.

1. On the **Electronic invoicing features** page, on the **Setups** tab, in the **Feature setup** column, select the **Import from share point** record.
2. Select **Edit** to review or configure the actions, applicability rules, and variables.
3. On the **Feature version setup** page, on the **Data channel** tab, in the **Parameters** list, in the **Data channel** record, in the **Value** field, enter **$Context Channel** from the derived configuration.
4. Set the other parameters for SharePoint.
5. In the **Custom file name** record, set up a filter for the file names of vendor invoices.
6. On the **Applicability rules** tab, in the record that has a **Channel** field, in the **Value** field, enter **$Context Channel** from the derived configuration.
7. On the **Variables** tab, create or validate the record. From client variable **OutputFile** is included by default, which represents the **import source** to be configured in Finance.



Change the version status and deploy the feature

Complete and deploy the Electronic invoicing feature for export sales invoices and import vendor invoices.

1. On the **Electronic invoicing features** page, on the **Versions** tab, select the version of the Electronic invoicing feature that has a status of **Draft**.
2. Select **Change status** > **Complete**.
3. Select **Deploy**, and then, in the **Effective from** field, select the date when the feature should become effective.
4. Select **OK**.

For more information, see Complete and deploy a Globalization feature.

Set up Electronic invoicing integration in Finance

Import the ER data model, ER data model mapping, and context configurations for invoices

1. Sign in to your Finance environment.
2. In the **Electronic reporting** workspace, in the **Configuration providers** section, select the **Microsoft** tile. Make sure that this configuration provider is marked as **Active**. For information about how to mark a provider as active, see Create configuration providers and mark them as active.
3. Select **Repositories**.
4. Select **Global resource** > **Open**.
5. Import the following configurations:
    - Customer invoice context model
    - Invoices Communication Model
    - Vendor invoice Mapping to destination
    - Vendor invoice import (ID), Vendor invoice import XML (ID)

Enable Finance features for processing Indonesian electronic invoices

1. In the **Feature management** workspace, disable the **Electronic Invoicing integration using Microsoft Dataverse** feature if it's enabled. Then enable the **Electronic document batch submission** feature.

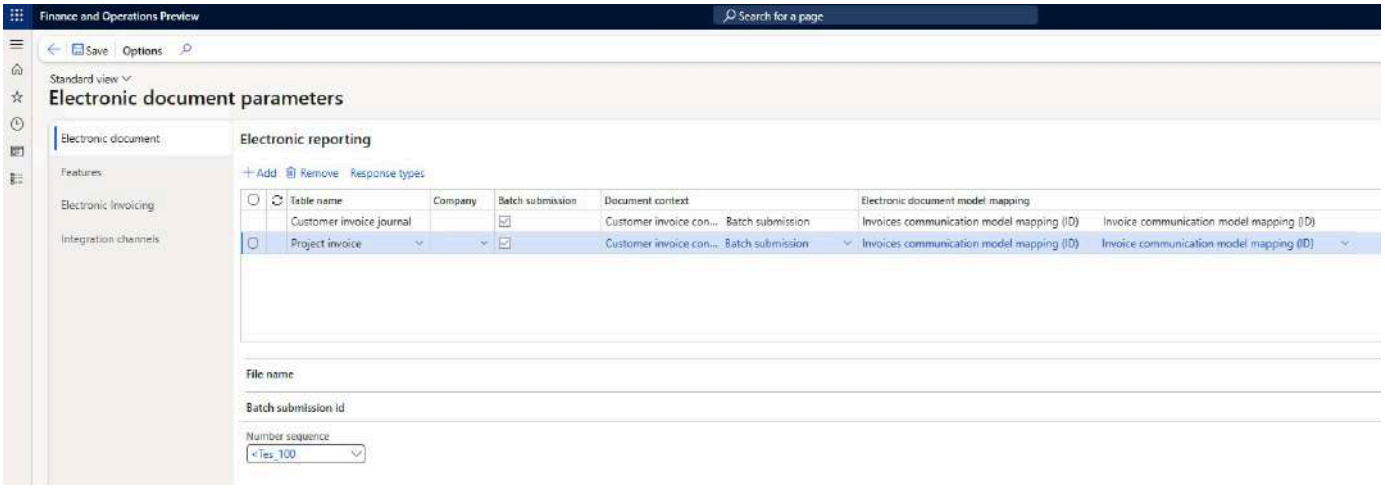
> **Important**
>
> The **Electronic document batch submission** feature can't be enabled if the **Electronic Invoicing integration using Microsoft Dataverse** feature is already enabled.

2. If you want to be able to configure Electronic document parameters on a legal entity basis, enable the **Electronic documents configuration per legal entities in Electronic Invoicing** feature.

3. To enable electronic invoice integration for Indonesia, go to **Organization administration** > **Setup** > **Electronic document parameters**. On the **Features** tab, in the row for the **Indonesian electronic invoice** feature, select the **Enable** checkbox.

Set up the processing for Indonesian electronic sales invoices

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic document** tab, select **Add**, and enter the customer invoice journal.
3. Optional: Select **Add** again, and enter the project invoice journal.
4. Select the **Batch submission** checkbox.
5. In the **Batch submission ID** section, add a number sequence. The selected number sequence should be continuous. This number sequence is used to number the invoice batches when the system exports them.
6. Select **Save**.



Set up the processing for Indonesian electronic vendor invoices

1. In the **Electronic reporting** workspace, select **Reporting configurations**.

2. Select **Customer invoice context model**, and then select **Create configuration**.

3. Select **Derive from Name: Customer invoice context model, Microsoft** to create a derived configuration.
4. In the **Draft** version, select **Designer**.
5. In the **Data model** tree, select **Map model to datasource**.
6. In the **Definitions** tree, select **DataChannel**, and then select **Designer**.
7. In the **Data sources** tree, expand the **$Context_Channel** container.
8. In the **Value** field, select **Edit**, and enter the name of the data channel. The name should have a maximum of 10 characters. It's the name that's given in the configuration of the data channel for the Electronic invoicing feature.
9. Select **Save**, and close the page.
10. Close the page.
11. Select the derived configuration that you just created from **Customer invoice context model**, and then, on the **Versions** FastTab, select **Change Status** > **Completed**.

    > ⓘ **Note**
    >
    > You can create several derived configurations that have different **$Context Channel** values. In this way, you can import vendor invoices from different sources. For example, you might want to import vendor invoices for different legal entities.

12. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
13. On the **External channels** tab, set up the import of vendor invoices.
14. On the **Channels** FastTab, select **Add**.
15. In the **Channel** field, enter **$Context Channel**.
16. In the **Description** and **Company** fields, enter a value.
17. In the **Document context** field, select the new configuration that you derived from **Customer invoice context model**. The mapping description should be **Data channel context**.
18. On the **Import sources** FastTab, select **Add**.

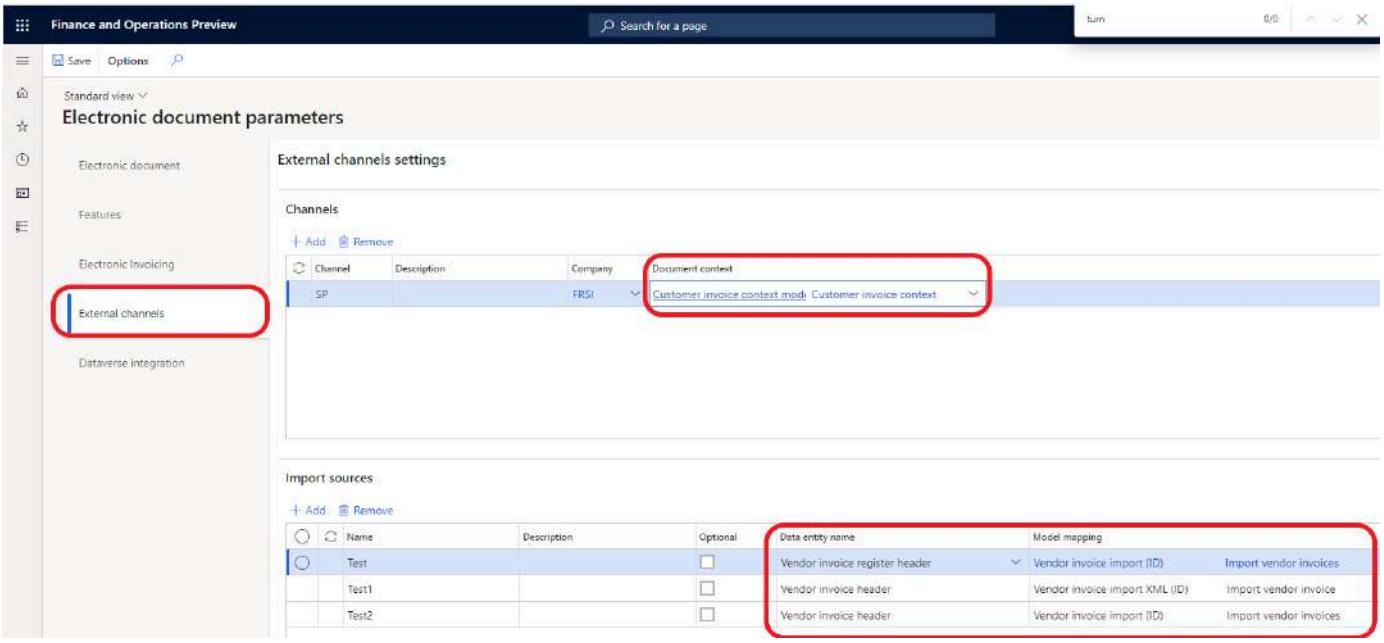
19. In the **Name** field, enter the value from the **Variables** tab on the **Feature version setup** page.

20. In the **Description** field, enter a value.

21. In **Data entity name** field, select **Vendor Invoice register header** if you want to import vendor invoices into the Invoice register. If you want to import them into pending vendor invoices, select **Vendor invoice journal**. You can have only one import source, **Vendor Invoice register header** or **Vendor invoice journal**.

22. In the **Model mapping** field, select **Vendor invoice import (ID)** to import the invoice header into the Invoice register or pending vendor invoices. Select **Vendor invoice import XML (ID)** to import the invoice header and lines into pending vendor invoices.

    > **Note**
    >
    > Before you import vendor invoices from XML files, you must set up an external item description for vendors. The system can then match an item name in the XML file with line items in sales orders.



If you must import vendor invoices into a different legal entity, for example, create a new channel record that has the new document context.

Process electronic invoices in Finance

When issued invoices or imported vendor invoices are processed through Electronic invoicing, you can complete the following tasks:

- Submit or export issued invoices, and import vendor invoices.
- View the electronic document submission and receipt logs.

Submit or export issued invoices

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.
2. To export invoices in a batch, set the **Submit document batch** option to **Yes**. The first time that you submit a document, always set the **Resubmit documents** option to **No**. If you must resubmit a document through the service, set this option to **Yes**.
3. On the **Records to include** FastTab, select **Filter** to open the **Inquiry** dialog box, where you can build a query to select documents for export.

View submission logs

You can view the submission logs for all exported documents.

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**.

2. Select **Update status**. An invoice batch can have the following statuses:

    - Scheduled
    - Completed
    - Failed

3. On the Action Pane, select **Inquiries** > **Submission details** to view the details of the submission execution logs. The information in the logs is divided among three FastTabs:

    - **Processing actions** – This FastTab shows the execution log for the actions that are configured in the feature version. The **Status** column shows whether the action was successfully run.
    - **Action files** – This FastTab shows the intermediate files that were generated during execution of the actions. Select **View** to download and view the file.
    - **Processing action log** – This FastTab shows the results of the submission of electronic invoices.

4. On the Action Pane, select **Inquiries** > **Batch submission invoices** to view the invoices that were submitted in one batch.

Import vendor invoices and view the electronic document receipt log

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.

   > **Note**
   >
   > For the first receipt of any document, always set the **Re-import documents** option to **No**. If you must re-import a document through the service, set this option to **Yes**. This job can be run in batch mode.

2. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

3. On the Action Pane, select **Inquiries** > **Submission details** to view the details of the submission execution logs.

Privacy notice

Enabling the **Indonesian electronic invoice** feature might require that limited data be sent. This data includes the organization's tax registration ID. An administrator can enable or turn off the **Indonesian electronic invoice** feature by going to **Organization administration** > **Setup** > **Electronic document parameters**, and then, on the **Features** tab, selecting the rows that contain the **Indonesian electronic invoice** feature and making the appropriate selection. Data that's imported from these external systems into this Dynamics 365 online service are subject to our privacy statement. For more information, see the "Privacy notice" section in country/region-specific feature documentation.

Get started with Electronic invoicing for Italy

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Electronic invoicing for Italy might not currently support all the functions that are available for electronic invoices in Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management.

This article provides information to help you get started with Electronic invoicing for Italy in Finance and Supply Chain Management. It guides you through the configuration steps that you must complete to enable the generation of electronic invoices in the Italy-specific format, **FatturaPA**, and to exchange electronic invoices with the Italian Revenue Agency's e-invoicing exchange system, SDI (Sistema di Interscambio).

> **Note**
>
> The solution for direct integration with SDI supports digital signing of documents only through separately stored certificate files that can be uploaded to the key vault. The solution doesn't support the use of qualified digital signatures, which require additional hardware involvement or an online connection to certification service providers.

Prerequisites

Before you complete the steps in this article, the following prerequisites must be met:

- Obtain SDICoop service channel accreditation in the Exchange system (SDI) government portal.
- Complete the steps in Electronic invoicing configuration.

- Import the **Italian FatturaPA (IT)** Electronic invoicing feature (version 5 or later) from the repository. Learn more in Import features from the repository.
- Configure Azure resources to store required certificates, including the Certificate authority (CA) certificate and Clients certificate. Learn more in Create a Key Vault reference.
- Optional: You can use the Digital signature certificate only for non-qualified signatures.

Country/region-specific configuration for the Italian FatturaPA (IT) Electronic invoicing feature

Complete the following procedures before you deploy the feature to Finance.

This section complements the common part of Electronic Invoicing service configuration that is described in Electronic invoicing configuration.

Create a new number sequence for ProgressivoInvio

To create a new number sequence for ProgressivoInvio, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, on the **Number sequences** FastTab, select **New** to add a record.
3. Enter a name for the new sequence (for example, **ProgressivoInvio**), and then select **Save**.

Create a new chain of certificates

To create a new chain of certificates, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, on the **Key Vault settings** FastTab, select **Key Vault parameters**.
3. In the **Certificates** section, select **Add** to add the following certificates:
    - **CAentrate.cer** (and **CAEntratetest.cer** in the case of a test environment)
    - **CAActalisOV.cer** (in the case of a production environment)
    - Client identity certificate

    > ⓘ Note

    - Usually, the client identity certificate is generated while the user registers the SDICoop service channel. It's named **SDI-<*VatNumber*>**, where <*VatNumber*> is a company's 11-digit value-added tax (VAT) number.
    - The client identity certificate has an expiration date. Review this date, and arrange to obtain a new certificate when the current one is about to expire. Learn how to establish proper rotation of the certificates that are used for this integration in the Rotate certificates section of this article.

- Certificate for digital signature (optional)

4. On the Action Pane, select **Chain of certificates**.
5. Select **New**, and enter a name (for example, **SDIChainProd** or **SDIChainTest**).
6. In the **Certificates** section, add the following certificates in the order that they are listed in here:
   a. **CAentrate.cer** (and **CAEntratetest.cer** in the case of a test environment)
   b. **CAActalisOV.cer** (in the case of a production environment)
   c. Client identity certificate
7. Save your changes, and close the page.

Create a new feature

To create a new feature, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile.
2. In the **Configuration providers** section, mark your company's configuration provider as active.
3. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
4. On the **Electronic invoicing features** page, select **Add** > **Based on existing feature**.
5. Under the **Microsoft** configuration provider, select **Italian FatturaPA (IT)** as a base feature, enter a name, and then select **Create feature**.

Align Electronic reporting configurations

The following procedures must be completed for both Electronic reporting (ER) format configurations that are used in the feature: **Sales invoice (IT)** and **Project invoice (IT)**.

Set up payment method substitution

To set up payment method substitution, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.
2. On the **Configurations** page, select the **Sales invoice (IT)** format configuration.
3. In the **Versions** section, verify that the **Draft** version is selected.
4. On the Action Pane, select **Designer**.
5. On the **Mapping** tab, select **$PaymentMethodSubstitution**, and then select **Edit** > **Edit formula**.
6. Align the formula with the payment methods that are configured in Finance.
7. Save your changes, close the formula designer, and then select **OK**.
8. Save the whole **Sales invoice (IT)** format configuration, and then close the **Designer** page.
9. In the **Versions** section, select **Change status** > **Complete** to complete the **Sales invoice (IT)** format configuration.
10. Repeat steps 2 through 9 for the **Project invoice (IT)** format configuration, as required.

Set up application-specific parameters

To set up application-specific parameters, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.

2. On the **Configurations** page, select the **Sales invoice (IT)** format configuration.

3. On the menu, select **Configurations** > **Application specific parameters** > **Setup**.

4. In the **Lookups** section, make sure that the **List of Natura reverse charge subcategories** lookup is selected.

5. In the **Conditions** section, select **Add**.

6. Add specific conditions for each subcategory that is defined in the system.

   > ⓘ **Note**
   >
   > In the **Name** column, you can select the ***Blank*** or ***Not blank*** placeholder value instead of a specific value.

7. Change the **State** value to **Completed**, save your changes, and then close the page.

8. Repeat steps 2 through 7 for the **Project invoice (IT)** format configuration, as required.

Configure a processing pipeline for export

To configure a processing pipeline for export, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. On the **Electronic invoicing features** page, select the feature that you created based on the **Italian FatturaPA (IT)** feature.
3. On the **Setups** tab, select **Sales invoice**, and then select **Edit**.
4. In the **Processing pipeline** section, go through the actions, and set the required fields:
    - **Get next number sequence value** – In the **Parameters** section, select the **Number sequence** parameter. Then, in the **Value** field, select the number sequence that you previously defined for ProgressivoInvio.
    - **Submit** – In the **Parameters** section, in the **URL address** field, enter or select a value. In the **Certificates** field, enter or select a chain of certificates that you added earlier in this article (**SDIChainProd** or **SDIChainTest**).
    - **Sign document** – In the **Certificate name** field, specify the Digital signature certificate (optional).
5. In the **Applicability rules** section, go through the clauses, and review or set the required fields. As part of this step, review the **LegalEntityID** clause, and update it with the correct value from your legal entity.
6. Select **Validate** to ensure that all required fields are set.
7. Save your changes, and close the page.
8. On the **Setups** tab, select **Project invoices**, and then select **Edit**.
9. Repeat steps 3 through 7 for **Project invoice**, **Sales invoice PA**, and **Project invoice PA** setups, if required.

Configure a processing pipeline for import

To configure a processing pipeline for import, follow these steps:

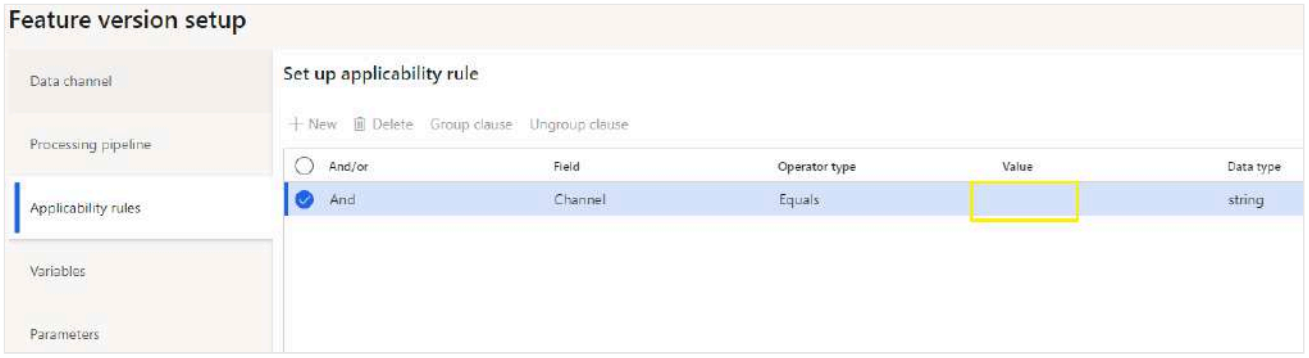
1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.

2. On the **Electronic invoicing features** page, select the feature that you created based on the **Italian FatturaPA (IT)** feature.

3. On the **Setups** tab, select **Import invoices**, and then select **Edit**.

4. On the **Import channel** tab, in the **Data channel** section, on the **Parameters** tab, in the **Data channel** field, enter a string value.

5. On the **Applicability rules** tab, set the fields for the setup. To use the default **Channel** clause, pass the value that you set for the **Data channel** field in the previous step to the **Value** field.



6. Select **Validate** to ensure that all required fields are set.

7. Save your changes, and close the page.

Deploy the feature

Complete and deploy the feature as described in Complete and deploy a Globalization feature.

Configure Electronic document parameters

To configure Electronic document parameters, follow these steps:

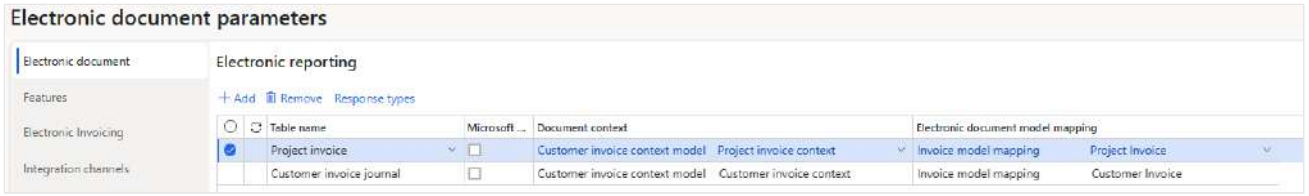
1. Import the **Customer invoice context model** (version 54 or later) and **Vendor invoice import (IT)** ER configurations from the repository. Learn more in Import Electronic reporting (ER) configurations from Dataverse.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. On the **Features** tab, find and select the **Italian electronic invoice** feature, and then select **Enable**.

4. On the **Electronic document** tab, make sure that the fields for **Customer invoice journal** and **Project invoice** are set according to the information in Set up Electronic document

parameters.



Set up vendor invoice import

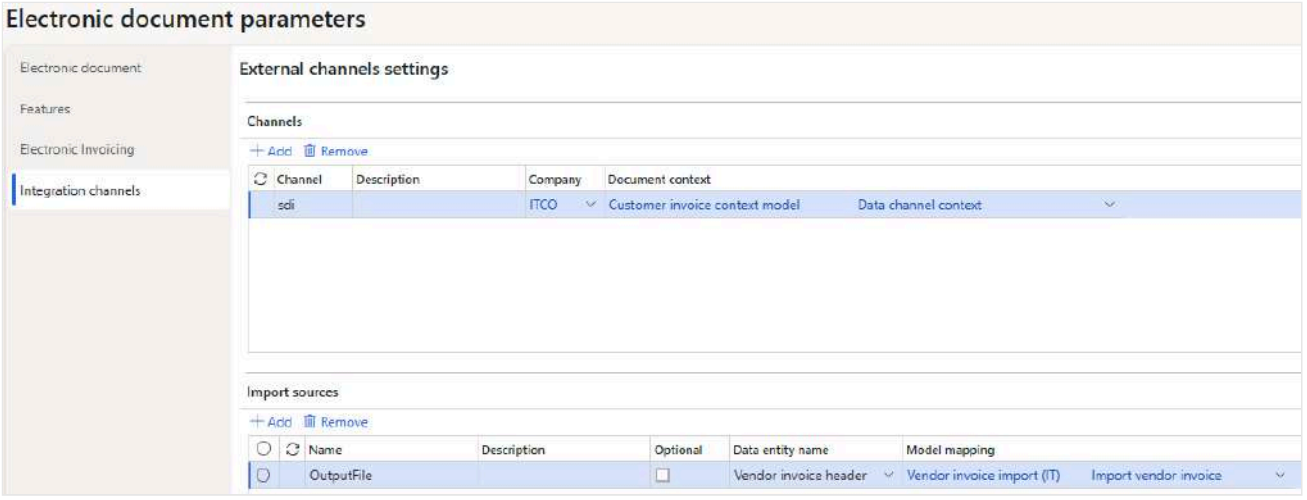
To set up vendor invoice import, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.
2. Select **Customer invoice context model**, and then select **Create configuration**.
3. Select **Derive from Name: Customer invoice context, Microsoft** to create a derived configuration.
4. Select the derived configuration, and then select **Designer** to open it for editing.
5. Select **Map model to datasource**.
6. In the **Definitions** tree, select **DataChannel**, and then select **Designer**.
7. In the **Data sources** tree, expand the **$Context_Channel** container.
8. In the **Value** field, select **Edit**.
9. Enter the name of the data channel. The name should have a maximum of 10 characters. It should match the value of the **Data channel** parameter of the data channel for the Electronic invoicing feature.
10. Save your changes, and close the form.
11. In the **Versions** section, select **Change status** > **Complete** to complete the derived context configuration.
12. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
13. On the **Integration channels** tab, in the **Channels** section, select **Add**.
14. In the **Channel** field, enter the **$Context Channel** value.
15. Enter values in the **Description** and **Company** fields.

16. In the **Document context** field, select the new configuration that you derived from **Customer invoice context model**. The mapping name should be **Data channel context**.

17. On the **Import sources** tab, select **Add**, and set the following values:

    - **Name:** OutputFile
    - **Data entity name:** Vendor invoice header (**Data entity:** VendorInvoiceHeaderEntity)
    - **Model mapping:** Vendor invoice import (IT)



> ⓘ **Note**
>
> If you have import vendor invoices from different sources, you can create several channels and several derived configurations that have different **$Context Channel** values. For example, you might want to import vendor invoices for different legal entities.

Finance business data configuration

Follow the configuration steps in Customer electronic invoices. Start from the Electronic invoice currency section.

Proxy server setup

This section provides information to help you set up and configure the proxy service for communication between the Exchange system (SDI) and the Electronic Invoicing service.

> ⓘ **Note**
>
> This section is provided solely for illustrative purposes. It offers a high-level overview of the steps involved in the process of **Proxy server** configuration. It isn't a comprehensive guide

for design, configuration, implementation, maintenance, or ongoing support of the Proxy server. All responsibilities related to this area, including but not limited to detailed technical execution, troubleshooting, and system upkeep, lie with the customer's team. Users are advised to consult appropriate technical resources or engage qualified professionals for full implementation and support needs.

Create an app registration

To create an app registration, follow these steps:

1. Use the following Windows PowerShell script to create a self-signed certificate for service-to-service (S2S) authentication.

   > **Note**
   >
   > The certificate is set to expire in 12 months. You can extend this period by modifying the value of the **NotAfter** parameter. Learn how to establish proper rotation of the certificates that are used for this integration in the Rotate certificates section of this article.

   PowerShell

   ```
   $certOutputLocation = "C:\certs\proxytest"
   $certName = "sdiProxyClientS2SCert"
   $certPassword = "123"

   $certCerFile = Join-Path $certOutputLocation "$certName.cer"
   $certPfxFile = Join-Path $certOutputLocation "$certName.pfx"

   $securePassword = ConvertTo-SecureString $certPassword -AsPlainText -Force

   $cert = New-SelfSignedCertificate -KeyLength 2048 -KeyExportPolicy Exportable -
   FriendlyName "CN=$certName" -CertStoreLocation Cert:\CurrentUser\My -Subject
   $certName
   -Provider "Microsoft Enhanced RSA and AES Cryptographic Provider" -NotAfter (Get-
   Date).AddMonths(12)

   Export-Certificate -Cert $cert -FilePath $certCerFile -type CERT | Out-Null
   Export-PfxCertificate -Cert $cert -FilePath $certPfxFile -Password
   $securePassword | Out-Null
   ```

2. Save the .pfx certificate file to the key vault. This certificate is referred to later as the *App Registration Certificate*.

3. Sign in to the Azure portal as an administrator.

4. Create an app registration for the SDI Proxy service:

   a. Go to **App registrations**, create a registration, and set the following values for it:

      - **Name:** SDI Proxy Client
      - **Supported account types:** Accounts in this organizational directory only (Single tenant)

   b. Select **Register**, and then select the app registration that you just created.

   c. Go to **API permissions**, and select **Grant admin consent**.

   d. Go to **Certificates & secrets**, select **Upload certificate**, and upload the App Registration Certificate .cer file for S2S authentication.

   e. Go to **Enterprise applications**, and select the app that you created.

   f. Save the **Application ID** (client ID) and **Object ID** values for the app.

   g. The Invoicing Service team must grant the app access to the service. Open a support ticket that has the theme **Electronic invoicing service integration with SDI. Application allow-listing**. Provide the following information:

      - Microsoft Entra tenant ID
      - Microsoft Dynamics Lifecycle Services environment ID
      - Application ID
      - Object ID

      > **Note**
      >
      > The object ID for an application differs on the **App registrations** and **Enterprise applications** pages. Use the **Object ID** value from the **Enterprise applications** page.

Create an Azure virtual machine

To create an Azure virtual machine (VM), follow these steps:

1. In the Azure portal, go to **Virtual machines**, and select **Create new**.

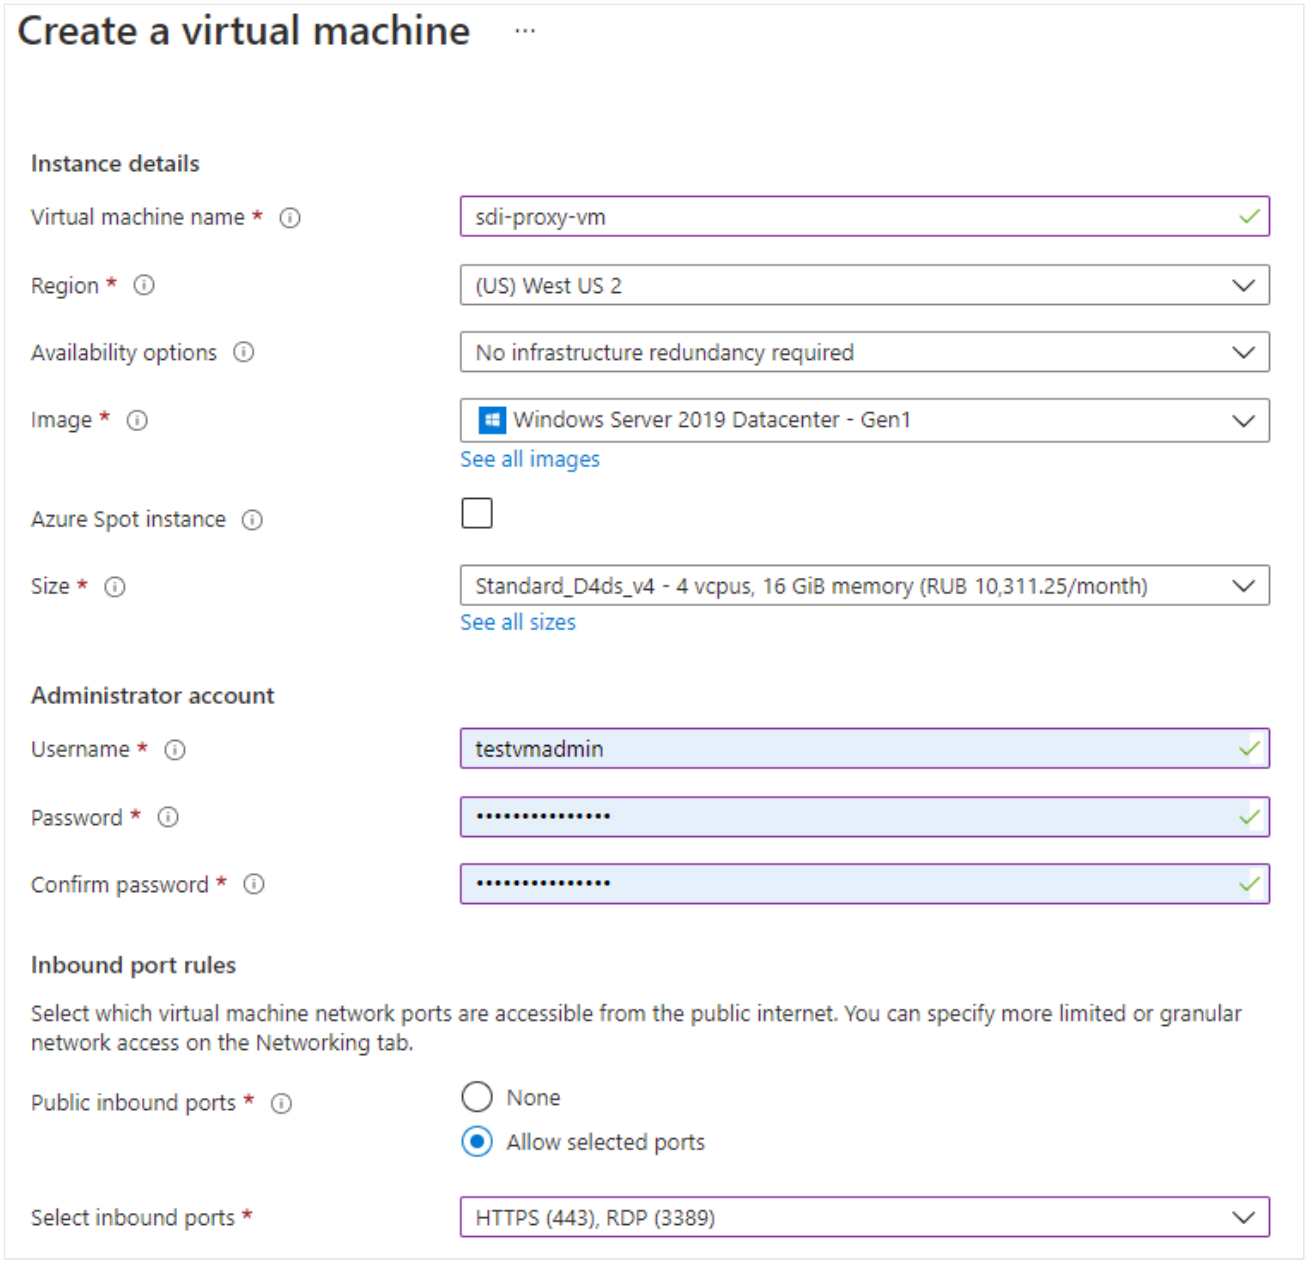
2. On the **Basics** tab, select the subscription and resource group. The values should be the subscription and resource group where your key vault and Blob storage are located.

3. Select the region. The value should be the region where your Finance environment is deployed.

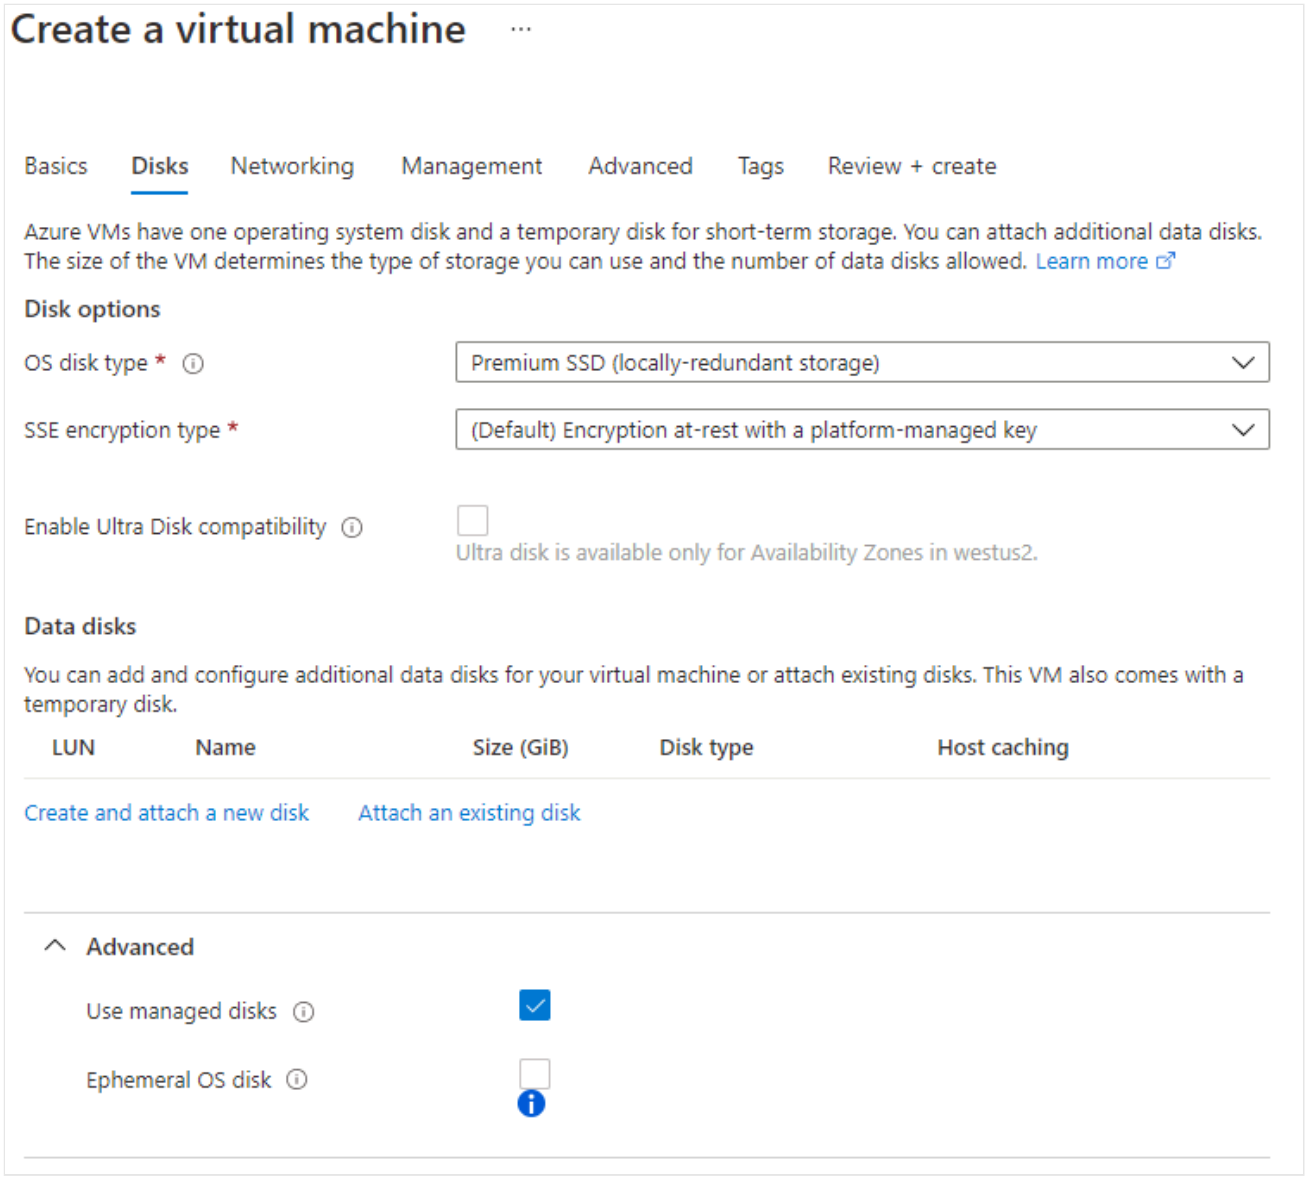
4. Add the administrator's user name and password, and save them to the key vault.

5. In the **Select inbound ports** field, select **HTTPS (443)** and **RPD (3389)**.

> ⓘ **Note**
>
> We recommend that you disable the **RDP (3389)** port when the system goes to production. You can reenable it if you must connect to the VM for troubleshooting purposes.
>
> We also recommend that you use the Windows Server 2019 Datacenter operating system (OS). The proxy application sample might have issues if it runs on another type of OS.



6. On the **Disks** tab, on the **Advanced** FastTab, select the **Use managed disks** checkbox. Leave the **Ephemeral OS disk** checkbox cleared.



7. On the **Networking** tab, under the **Public IP** field, select **Create new**.
8. In the **Create public IP address** dialog box, in the **SKU** field group, select the **Standard** option. In the **Assignment** field group, select the **Static** option.
9. On the **Management** tab, clear the **Auto-shutdown** checkbox to disable automatic shutdown.
10. Set the **Guest OS updates** field to **Manual**, and set any other policies.
11. Review and create the VM.
12. In the new VM, go to **Identity** > **System assigned**, and set the **Status** option to **On**.
13. Grant the VM access to the key vault:

    a. In the key vault, go to **Access control (IAM)** > **Role assignments**.

    b. Select **Add role assignment**, and follow these steps:

i. In the **Role** field, specify **Key Vault Secrets User**.
ii. In the **Assign access to** field, specify **Virtual machine**.
iii. In the **Subscription** field, specify your subscription.
iv. In the **Select** field, specify your VM.

c. Go to **Access policies**.

d. Select **Add Access Policy**, and follow these steps:
i. In the **Selected principal** field, select your VM.
ii. In the **Certificate** section, select **List** and **Get** permissions.
iii. In the **Secret** section, select **List** and **Get** permissions.

14. In the Azure portal, go to **Public IP addresses**, and select the IP address that was created in the VM.

15. Go to **Configuration**, and set the Domain Name System (DNS) name.

Prepare the proxy service environment

To prepare the proxy service environment, follow these steps on the machine where the proxy service is hosted.

1. Connect to the VM by using Remote Desktop Connection.

2. Open the Local Machine Certificate snap-in. Learn more in How to: View certificates with the MMC snap-in.

3. Import the **caentrate.cer** certificate into the Trusted Root Certification Authorities store.

4. Import the **CAEntratetest.cer** certificate into the Trusted Root Certification Authorities store (only for a test environment).

5. Import the **SistemaInterscambioFatturaPA.cer** certificate for production and the **SistemaInterscambioFatturaPATest.cer** certificate for testing into the Trusted People store.

6. In Control Panel, open **Turn Windows features on or off**, or go to **Server Manager** > **Add Roles and Features** for the server OS, and turn on the following Internet Information Services (IIS) features:

   - Web Management Tools
     - IIS Management Console

   - World Wide Web Services

    - Application Development Features
        - .NET Extensibility 4.7 (or 4.8)
        - ASP
        - ASP.NET 4.7 (or 4.8)
        - CGI
        - ISAPI Extensions
        - ISAPI Filters
    - Common HTTP Features
        - Default Document
        - Directory Browsing
        - HTTP Errors
        - Static Content
    - Health and Diagnostics
        - HTTP Logging
        - Tracing
    - Performance Features
        - Static Content Compression
    - Security
        - Request Filtering
- .NET Framework 4.7 Features
    - WCF Services
        - HTTP Activation

Set up the SDI Proxy service in IIS

To set up the SDI Proxy service in IIS, follow these steps:

1. In Lifecycle Services, go to the Shared asset library, and select **Data package** as the asset type.
2. Find **Electronic Invoicing Service Sdi Proxy v1.1**, and download it to the VM.
3. Configure the service:

    a. Unzip the **Electronic Invoicing Service Sdi Proxy** archive folder that you downloaded.

b. In the **src\FattureService** folder, open the **appsettings.json** file, and set the following parameters:

- **KeyVaultUri** – Specify the address of the key vault that stores the client certificate for the invoicing service.
- **TenantId** – Specify the globally unique identifier (GUID) of the customer's tenant.
- **EnvironmentId** – Specify the ID of the Lifecycle Services environment.
- **ClientId** – Specify the app ID of the intermediate services app registration in the customer's tenant.
- **ClientCertificateName** – Specify the name of the App Registration Certificate in the key vault.
- **SecurityServiceClientOptions.Endpoint** – Specify the URL of the security service.
- **SecurityServiceClientOptions.Resource** – Specify the scope to obtain the token for.
- **InvoicingServiceClientOptions.Endpoint** – Specify the endpoint of the invoicing service. (You can obtain this value from the **Endpoint URL** field in the **Service parameters** section on the **Electronic Invoicing** tab of the **Electronic document parameters** page in Finance.), after copying remove **/** at the end.
- **InvoicingServiceClientOptions.ServiceEnvironmentId** – You can leave the default value, **ServiceEnvironment**, because Microsoft plans to deprecate this field in future releases.
- **NotificationsFolder** – Specify the folder to save incoming notification files in (for example, **C:\\Files**).

> **Tip**
>
> You can copy the **InvoicingServiceClientOptions.Endpoint** and **InvoicingServiceClientOptions.ServiceEnvironmentId** values from the **Electronic Invoicing** tab of the **Electronic document parameters** page in finance and operations apps (**Organization Administration** > **Setup** > **Electronic document parameters**).

c. In the **src\Clients** folder, open the **Constants.cs** file, and set the following parameters:

- **ApiVersion** – Update the value to **2.0**.
- **InvoicingServiceResumePath** – Update the value to **/businessdocumentsubmission/resume**.
- **InvoicingServiceCreateIncomingPath** – Update the value to **/incomingdocuments/{0}**.

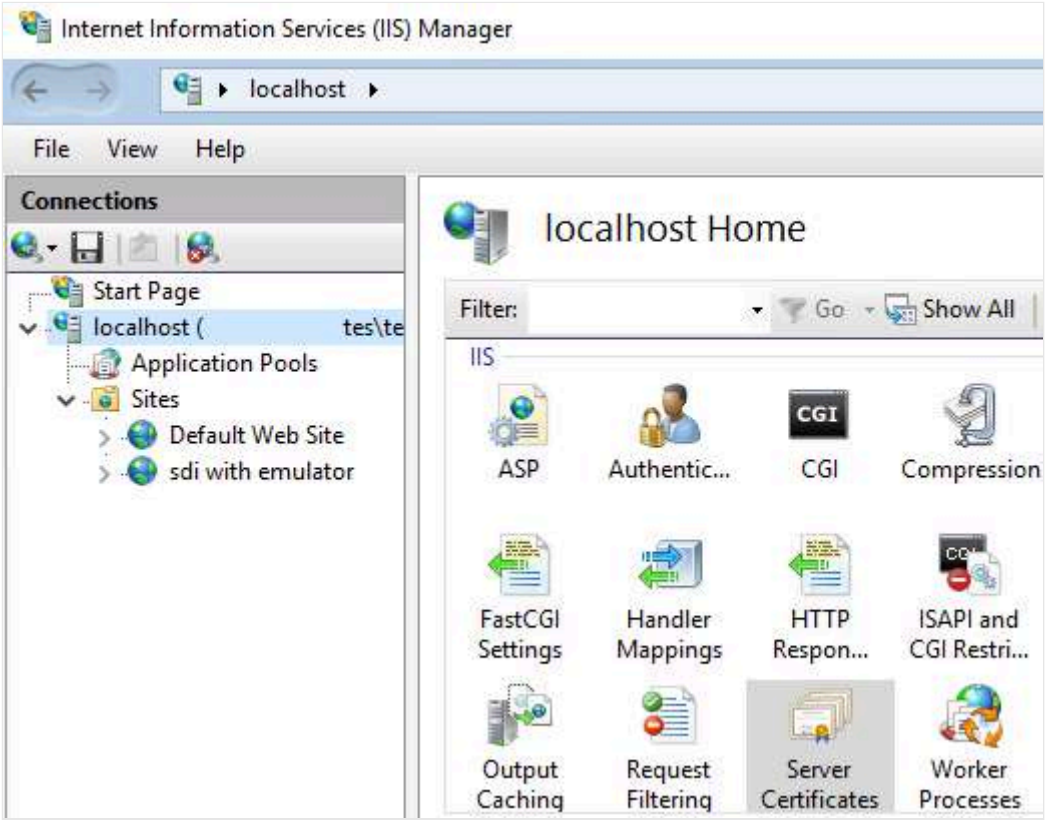
d. In the **web.config** file, find the following line, and add the thumbprint of the proxy server certificate.

```
<serviceCertificate findValue="[certificate thumbprint]"
storeLocation="LocalMachine" storeName="My" x509FindType="FindByThumbprint">
```

> **Tip**
>
> When the system goes to production, you can change some values in the web.config file to help reduce the amount of log information that is collected and help save disk space. In the **<system.diagnostics><source>** node, change the value of **switchValue** to **Critical,Error**. Learn more in Service Trace Viewer Tool (SvcTraceViewer.exe).

e. Build the solution.

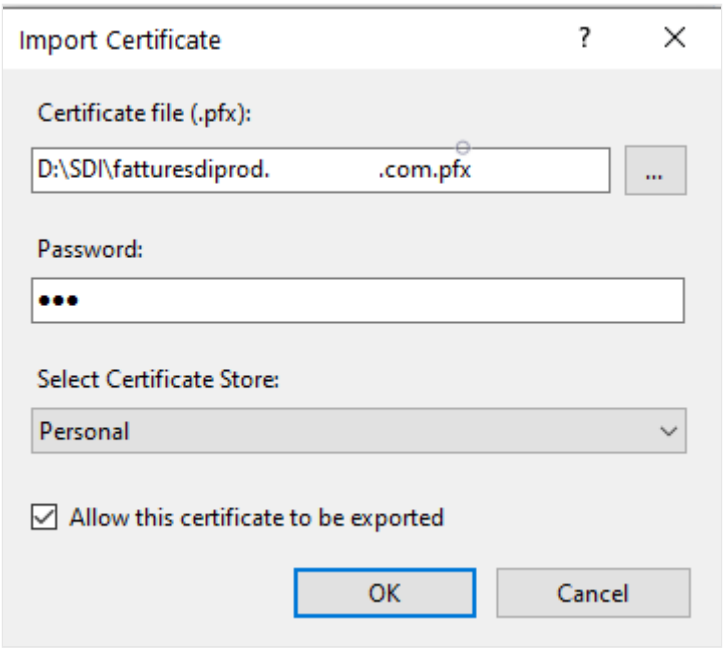
4. Open IIS Manager. In the tree on the left, remain in the root node. On the right, select **Server Certificates**.



5. Open the menu, and select **Import**.

6. In the **Import Certificate** dialog box, in the **Certificate file (.pfx)** field, specify the path of the .pfx file for the proxy server certificate. Usually, this file is generated while you register the

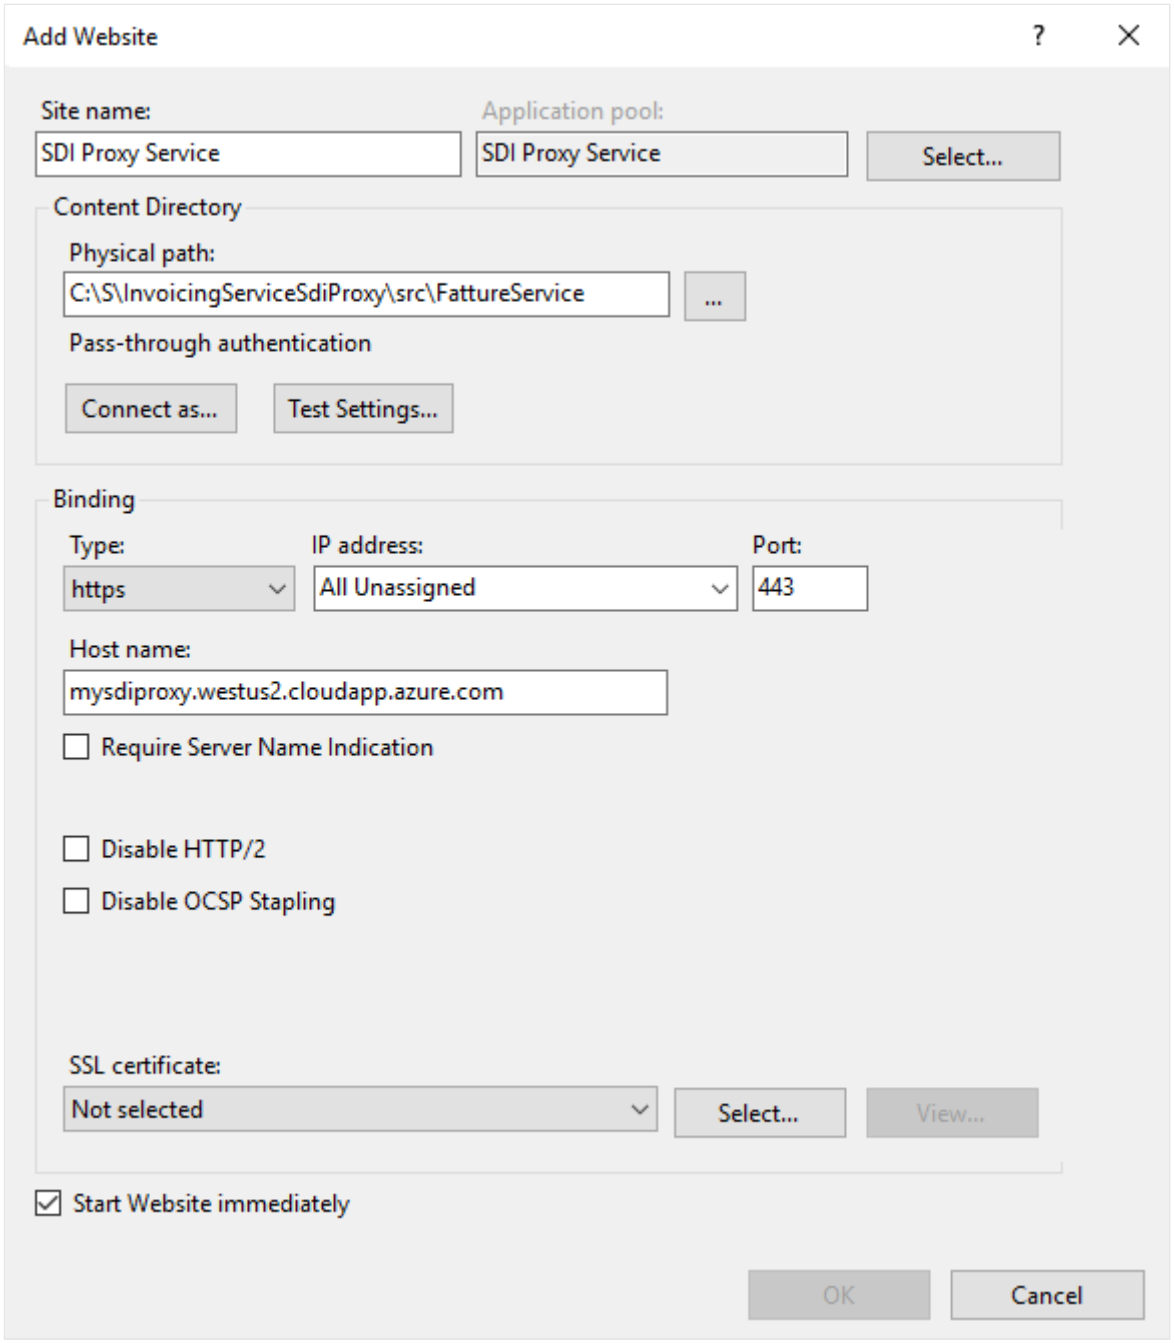
SDICoop service channel. It's named **sdiproxy.com.pfx**, where **sdiproxy.com** is a DNS that is assigned to the proxy VM.



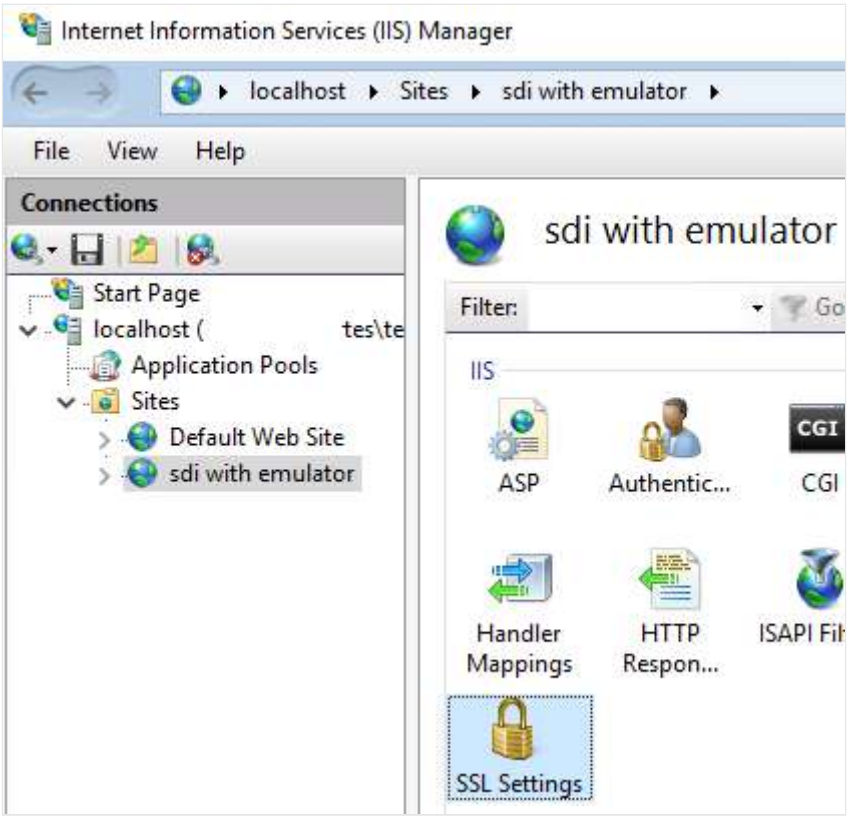
> ⓘ **Note**
>
> The server certificate has an expiration date. Review this date, and arrange to obtain a new certificate when the current one is about to expire. Learn how to establish proper rotation of the certificates that are used for this integration in the Rotate certificates section of this article.

7. Select and hold (or right-click) **Sites**, and then select **Add website**.
8. In the **Add Website** dialog box, in the **Site name** field, enter a name for the site.
9. In the **Physical path** field, point to the **src\FattureService** folder.
10. In the **Binding** section, in the **Type** field, select **https**.
11. In the **Host name** field, specify the host name.
12. Leave the **IP address** and **Port** fields set to the default values.
13. Make sure that the **Require Server Name Indication** checkbox is cleared, because SDI doesn't support that technology.
14. In the **SSL certificate** field, select the proxy server certificate that you imported.

15. In the **Application pool** field, specify a pool for the site, and make a note of its name (for example, **SdiAppPool**).



16. After you finish creating the website, open the menu for **SSL Settings**.



17. Select the **Require SSL** checkbox.

18. In the **Client certificates** field group, select the **Require** option.

19. Open **Directory Browsing**, and select **Enable**.

20. Open the Configuration Editor, and select **system.webServer** > **serverRuntime**.

21. Modify the **uploadReadAheadSize** and **maxRequestEntityAllowed** values to at least 10 megabits.

22. In any web browser, go to **serverDNS/TrasmissioneFatture.svc**. A standard page about the service must appear, or you might receive a server error, such as "403 - Forbidden." This step is required to ensure that **serverDNS** is accessible, and that it isn't hidden by a firewall or something else.

23. Create the following folders to store logs and files:

    - **C:\Logs** – Store log files here. These files can be viewed by using Service Trace Viewer Tool.
    - **C:\Files** – Store all the response files here.

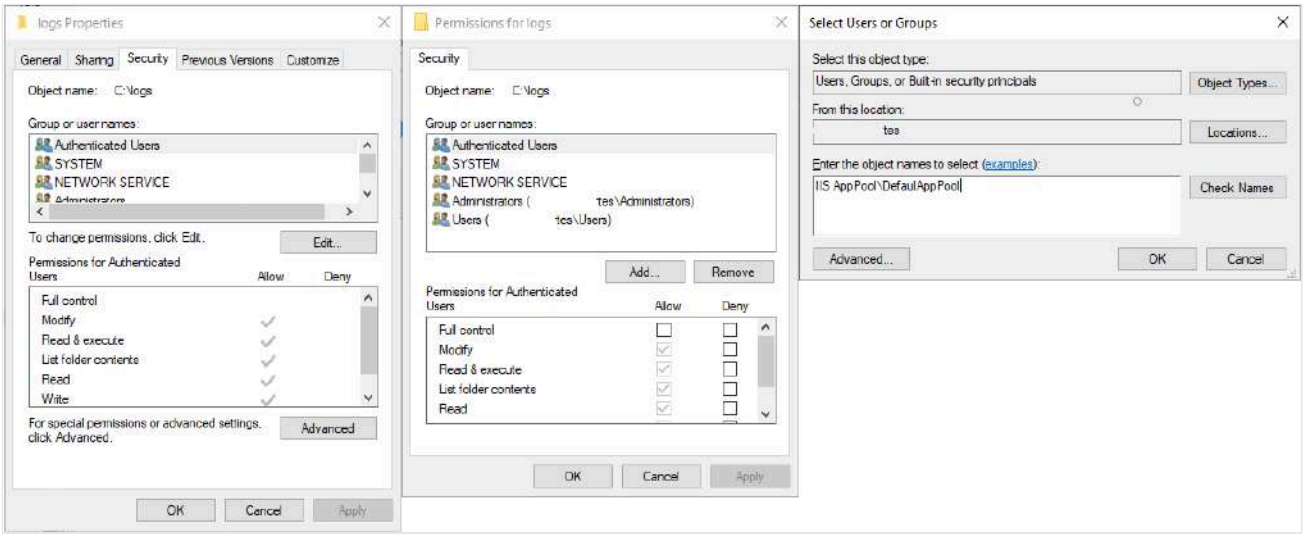
24. In File Explorer, grant **NETWORK SERVICE** and **IIS AppPool\SdiAppPool** (or **IIS AppPool\DefaultAppPool** if you're using the default pool) access to the **Logs** and **Files** folders:

    a. Select and hold (or right-click) one of the folders, and then select **Properties**.

    b. In the **Properties** dialog box, on the **Security** tab, select **Edit**.

    c. Add the users if they aren't listed.

    d. Repeat steps 1 through 3 for the other folder.



25. Enable client certificate renegotiation:

    a. Run Windows PowerShell as an administrator.

    b. Run the following command to open Network Shell (netsh).

    ```
    PowerShell
    netsh
    ```

    c. Run the following command to view the current binding parameters.

    ```
    PowerShell
    http show sslcert ipport=0.0.0.0:443
    ```

    d. Copy the **Certificate hash** value from the output, and ensure that it equals the server certificate thumbprint.

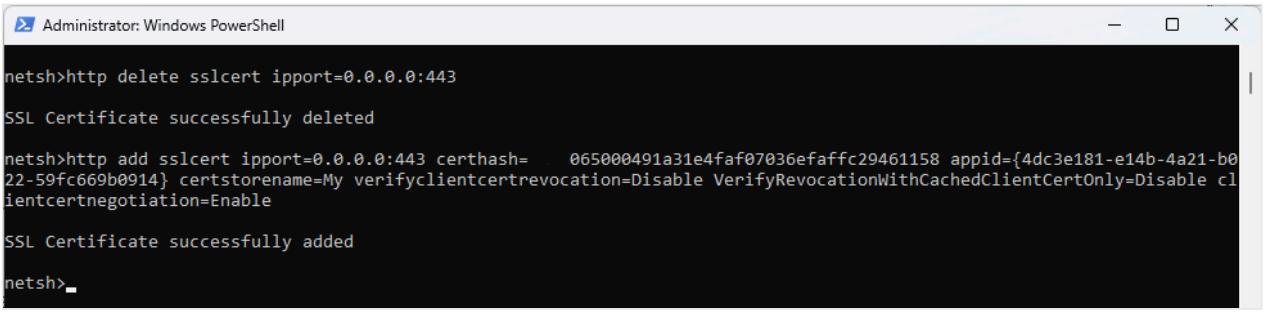
    e. Run the following command to remove the current binding.

    ```
    PowerShell
    http delete sslcert ipport=0.0.0.0:443
    ```

    f. Run the following command to add a new binding that has the same certificate but different parameters. Substitute the **CertificateThumbprint** placeholder in the command with the **Certificate hash** value from previous commands, but remove any spaces or other symbols.

    ```
    PowerShell
    ```

```
http add sslcert ipport=0.0.0.0:443 certhash=CertificateThumbprint appid=
{4dc3e181-e14b-4a21-b022-59fc669b0914} certstorename=My
verifyclientcertrevocation=Disable
VerifyRevocationWithCachedClientCertOnly=Disable clientcertnegotiation=Enable
```



g. Run the following command to restart IIS.

PowerShell

```
exit
iisreset
```

Rotate certificates

To rotate certificates, follow these steps:

1. Rotate the app registration S2S authentication certificate:
   a. Generate a new certificate by running the PowerShell script from the Create an app registration section of this article.
   b. In the Azure portal, go to **App registrations**, and find the app that was created for S2S.
   c. Go to **Certificates & secrets**, select **Upload certificate**, and upload the .cer file for S2S authentication.
   d. Go to Azure Key Vault, and select the certificate that you previously uploaded, and that was referred to as the *App Registration Certificate*. Select **New Version**.
   e. Select **Method of certificate creation** = **Import**, specify the path of the .pfx file and the password, and then select **Create**.

2. Rotate the proxy server certificate:

a. Request a new server certificate from the tax authority portal.

b. Install the .pfx certificate file into **Local Machine\Personal storage**.

c. Open IIS Manager. In the tree on the left, select the proxy website. On the right, select **Bindings**.

d. Select the existing binding, and then select **Edit**.

e. In the **SSL certificate** field, select the newly added certificate. Then select **OK**.

f. In the **web.config** file, find the following line, and add the thumbprint of the proxy server certificate.

```
<serviceCertificate findValue="[certificate thumbprint]"
storeLocation="LocalMachine" storeName="My" x509FindType="FindByThumbprint">
```

g. Complete the Enable client certificate renegotiation step in the Set up the SDI Proxy service in IIS section of this article.

3. Rotate the client identity certificate:
   a. Request a new client certificate from the tax authority portal.
   b. In the Azure portal, go to **Key Vaults**, and find the key vault that is linked to the service.
   c. In the **Certificates** section, find and select the client identity certificate. Then select **New Version**.
   d. Select **Method of certificate creation** = **Import**, specify the path of the .pfx file and the password, and then select **Create**.

Privacy notice

Enabling the **Italian electronic invoice** feature might require that limited data is sent. This data includes the organization's tax registration ID. An administrator can enable and disable the **Italian electronic invoice** feature. To disable the feature, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Features** tab, select the rows that contain the **Italian electronic invoice** feature, and then select **Disable now**.

Data that is imported from these external systems into this Dynamics 365 online service are subject to our privacy statement. For more information, go to the "Privacy notice" section in country/region-specific feature documentation.

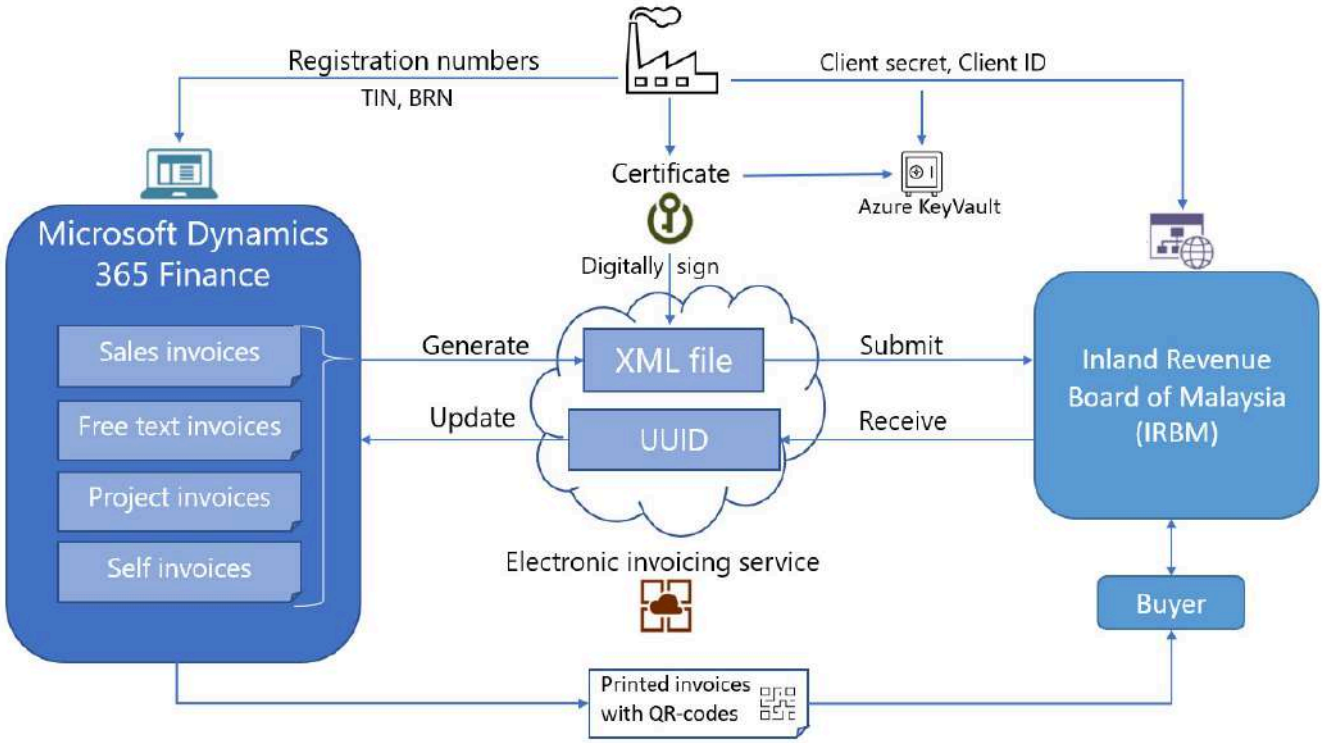
Get started with electronic invoicing for Malaysia

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with electronic invoicing for Malaysia. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management.

After you configure electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices according to the regulatory requirements in Malaysia.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that's applicable only to cloud deployments of Finance or Supply Chain

Management.

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met:

- The primary address of the legal entity must be in Malaysia.
- Your company must be a registered taxpayer in Malaysia and must have the following registration numbers: **Tax Identification Number (TIN)** and **Business Registration Number (BRN)**.
- Obtain **Client ID** and **Client secret** values in the Inland Revenue Board of Malaysia (IRBN) (Lembaga Hasil Dalam Negeri Malaysia [LHDN]). These values serve as credentials that are used to establish a secure connection to the IRBN portal.
- Obtain a digital signature certificate from one of the Malaysian certification authorities. This certificate is used for digital signing of generated electronic invoices.
- Become familiar with electronic invoicing as it's described in Electronic Invoicing service overview.
- Do the common part of electronic invoicing service configuration as described in Electronic invoicing configuration.

Configure Azure Key Vault

Create an Azure Key Vault to store the required certificates and secrets that are issued for your company. For more information, see Configure Azure resources for Electronic invoicing.

Add the following required elements in the key vault:

- The secret for the **Client secret** value that's used to establish secure communication to IRBN.
- The secret for the **Client ID** value that's used to establish secure communication to IRBN.
- The certificate that's used for digital signing of outgoing electronic invoices.

Configure Key Vault parameters for electronic invoicing

To configure Key Vault parameters for electronic invoicing, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.

2. On the **Electronic invoicing** tab, in the **Key Vault settings** section, in the **Key Vault** field, select the reference to the key vault that you created in the previous section.

3. In the **SAS token secret** field, select the name of the storage account secret URL that must be used to authenticate access to the storage account.

4. Select **Key Vault parameters**.

5. On the **Key Vault parameters** page, in the **Certificates** section, select **Add** to create new elements of the appropriate type for each certificate or secret that's described in the previous section.

    - A **Client secret** element of the **Secret** type
    - A **Client ID** element of the **Secret** type
    - A **Certificate** element of the **Certificate** type

    > ⓘ **Note**
    >
    > The values in the **Name** column should match the names of the certificates or secrets that are described in the previous section.

Configure the electronic invoicing feature

Some of the parameters from the **Malaysian electronic invoicing (MY)** electronic invoicing feature are published with default values. Before you deploy this feature to the service, review the default values, and update them as required, so that they better reflect your business operations.

To configure the electronic invoicing feature, follow these steps:

1. Import the latest version of the **Malaysian electronic invoicing (MY)** Globalization feature as described in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it. For more information, see Create Globalization features.

3. On the **Versions** tab, verify that the **Draft** version is selected.

4. On the **Setups** tab, in the grid, select the **Sales invoice derived** feature setup, and then select **Edit**.

5. On the **Processing pipeline** tab, in the **Processing pipeline** section, select the **Sign document for Malaysia** action.

6. In the **Parameters** section, select the **Certificate name** parameter, and then, in the **Value** field, select the name of the digital certificate that you created.

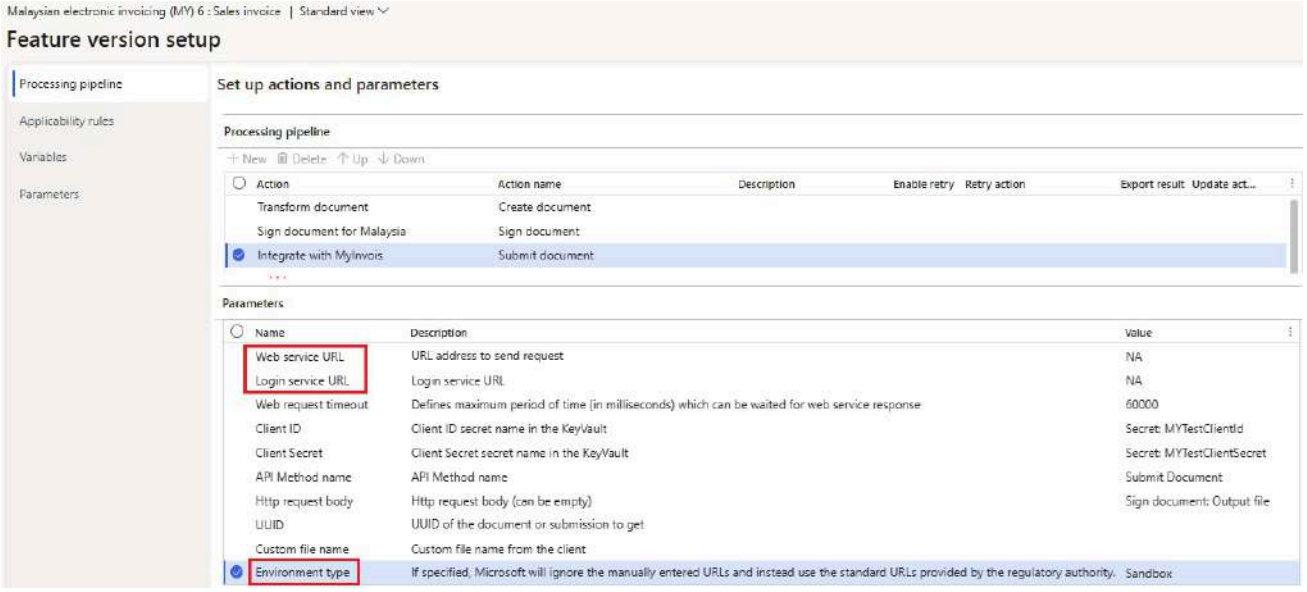
7. In the **Processing pipeline** section, select the **Integrate with MyInvois (Submit document)** action.

8. In the **Parameters** section, select the **Client secret** parameter, and then, in the **Value** field, select the name of the secret that you created.

9. Select the **Client ID** parameter, and then, in the **Value** field, select the name of the client ID that you created.

10. In the **Parameters** section, select the **Web service URL** and **Login service URL** parameters. In the **Value** fields, enter the testing or production URLs, depending on the implementation stage. Review the list of available URLs in MyInvois system environment URLs.

> **Note**
>
> Alternatively, you can leave the **Web service URL** and **Login service URL** parameters blank. Instead, you can select the **Environment type** parameter, and then, in the **Value** field, select the type of the environment, depending on the implementation stage. In this case, the required URLs are automatically constructed. If the **Web service URL** and **Login service URL** parameters are defined, they have higher priority than the **Environment type** parameter.



11. Repeat steps 7 through 10 for the **Integrate with MyInvois (Get document)** action.
12. On the **Processing pipeline** tab, in the **Processing pipeline** section, select the **Generate QR code for Malaysia** action.
13. In the **Parameters** section, select the **Environment type** parameter, and then, in the **Value** field, select the type of the environment, depending on the implementation stage.
14. Select **Save**, and close the page.
15. Repeat steps 4 through 14 for the **Project invoice derived** and **Self invoice derived** feature setups.
16. The copy of the feature is always created as a **Draft** version. Regardless of whether you made changes, complete and deploy the feature as described in Complete and deploy a Globalization feature.

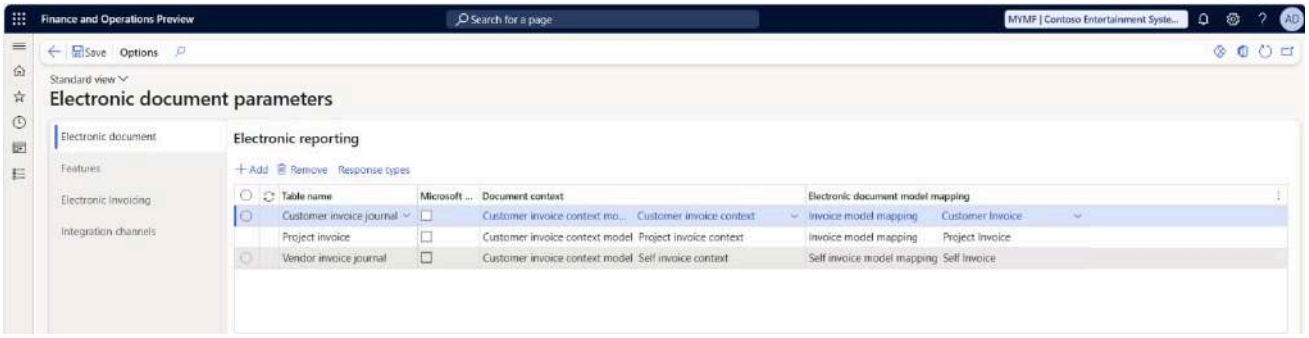
Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Make sure that the country/region-specific electronic reporting (ER) configurations for the document context and electronic document model mapping that are required for Malaysia are imported. For more information, see Set up Electronic document parameters.

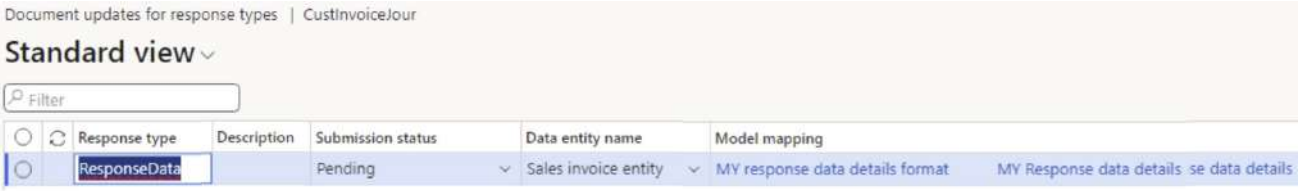
   > **Note**
   >
   > After you import the **Malaysian electronic invoicing (MY)** electronic invoicing feature, electronic documents are configured by default. Follow the remaining steps of this procedure if you must make changes. Otherwise, consider this section informational only.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. On the **Electronic document** tab, add records for the **Customer Invoice journal**, **Vendor Invoice journal**, and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.



5. For each table name, select **Response types**, select **New** to create a response type, and enter the following values:

   - In the **Response type** field, enter **ResponseData** (the default value).
   - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.
   - In the **Submission status** field, select **Pending**.
   - In the **Data entity name** field, select one of the following values, depending on the table name that you're configuring:
     - For the **Customer Invoice journal** table name, select **Sales invoice entity**.
     - For the **Project invoice** table name, select **Project invoice entity**.
     - For the **Vendor Invoice journal** table name, select **Self invoice entity**.
   - In the **Model mapping** field, select **MY response data details format**.



> **Note**
>
> **ResponseData** is the default name of the response type. If you must change it, make sure that the new name matches the name that was defined for the related variable of the **To client** type in the corresponding feature setups. To validate the variable's value, go to **Globalization Studio**, and select the **Electronic invoicing** tile. On the **Electronic invoicing features** page, verify that the **Malaysian electronic invoicing (MY)** feature is selected. On the **Setups** tab, in the grid, select the **Sales invoice derived** feature setup. Then select **Edit** or **View**, depending on the status of the feature version.

6. Select **Save**, and close the page.

> ⓘ Note
>
> The setup described here allows you to submit electronic invoices for the following **posted** source documents:
>
> - Customer invoices that are based on sales orders
> - Free text invoices
> - Project invoices
> - Self invoices that are based on vendor invoices from foreign vendors
> - Credit notes and debit notes for all the previously described invoice types
> - Refund notes, which represent credit notes for already paid invoices.

7. On the **Features** tab, select and enable the **Malaysian electronic invoice** feature.

8. Save your changes on the **Electronic document parameters** page, and then close the page.

> ⓘ Note
>
> Watch the following video about the configuration of Malaysian electronic **Self invoices**.

https://learn-video.azurefd.net/vod/player?id=012f47ed-0472-4e12-a5be-5f7a594c1cb5&locale=en-us&embedUrl=%2Fdynamics365%2Ffinance%2Flocalizations%2Fmalaysia%2Fapac-mys-e-invoices

Configure registration numbers

> ⓘ Note
>
> When the output files of electronic invoices are generated, registration numbers of the **Enterprise ID (COID)** category are used as Business Registration Numbers (BRNs). If the **Enterprise ID (COID)** registration category already exists and has been assigned to a registration type, skip this procedure.

To configure registration numbers, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**.
2. Create a registration type.
3. In the **Country/region** field, select **MYS - Malaysia**.
4. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**.
5. Create a registration category.
6. In the **Registration types** field, select the registration type that you created in step 2.
7. In the **Registration categories** field, select **Enterprise ID (COID)**.

Configure Sales and Service Tax numbers

To configure Sales and Service Tax (SST) numbers, follow the instructions in GST/SST registration number.

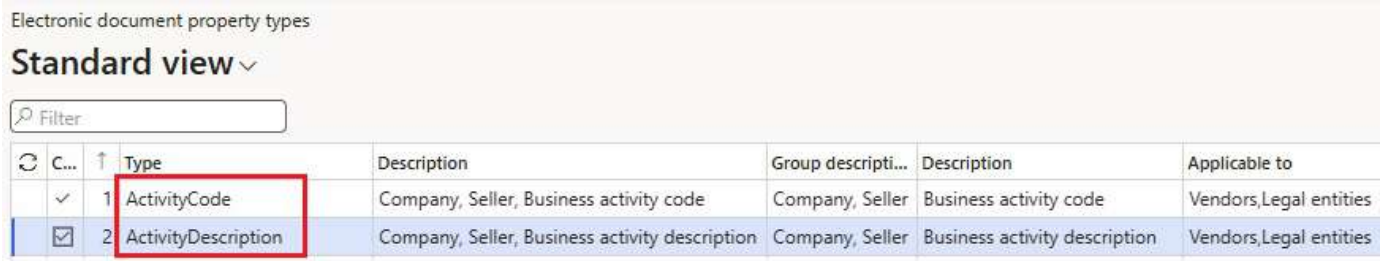
> **Note**
>
> Make sure that the configured SST registration number is in the **VAT ID** registration category.

Configure electronic document property types

To configure the electronic document property type that's required to define the taxpayer activity code, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Setup** > **Electronic document property types**.
2. Select **New** to create an electronic document property type.
3. In the **Type** field, enter **ActivityCode**. You must enter the value exactly as it appears here.
4. On the Action Pane, select **Applicability**.
5. In the **Table name** field, select **CompanyInfo**.
6. Save and close the **Electronic document property type applicability setup** page.
7. Select **New** to create another electronic document property type.
8. In the **Type** field, enter **ActivityDescription**. You must enter the value exactly as it appears here.
9. On the Action Pane, select **Applicability**.
10. In the **Table name** field, select **CompanyInfo**.
11. Select **New** to create the record for another applicable table.

12. In the **Table name** field, select **VendTable**.
13. Save and close the **Electronic document property type applicability setup** page.
14. Save and close the **Electronic document property types** page.



C...		Type	Description	Group descripti...	Description	Applicable to
✓	1	ActivityCode	Company, Seller, Business activity code	Company, Seller	Business activity code	Vendors,Legal entities
☑	2	ActivityDescription	Company, Seller, Business activity description	Company, Seller	Business activity description	Vendors,Legal entities

Configure address structure

To configure the structure of the postal address to define all required elements, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Global address book** > **Addresses** > **Address setup**.

2. Make sure that all the following mandatory elements are configured:

    - Country code
    - Postal code
    - City name
    - Street
    - State code

3. For the states, on the **State/province** tab, in the **State code** field, define the official state code according to the published requirements.

Configure legal entity data

Enter the address

To enter the address, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity.
3. On the **Addresses** FastTab, add a valid primary address for the selected legal entity.

Enter the registration numbers

To enter the registration numbers, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity, and then, on the **Tax registration** FastTab, in the **Tax registration number** field, enter the company's TIN.
3. On the Action Pane, select **Registration IDs**.
4. On the **Registration ID** FastTab, select **Add** to create a registration ID.
5. In the **Registration type** field, select the BRN registration type that you created earlier.
6. In the **Registration number** field, enter a valid BRN registration number for the selected legal entity.
7. Select **Add** to create another registration ID, if required.
8. In the **Registration type** field, select the SST registration type that you created earlier.
9. In the **Registration number** field, enter a valid SST registration number for the selected legal entity.

Enter a business activity code and description

To enter a business activity code and description, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity, and then, on the Action Pane, select **Electronic document properties**.
3. Select the line where the **Type** field is set to **ActivityCode**.
4. In the **Value** field, enter the taxpayer business activity code.
5. Select the line where the **Type** field is set to **ActivityDescription**.
6. In the **Value** field, enter the taxpayer business activity description.

> **Note**
>
> The contact information for the legal entity is automatically retrieved from the related **Person** that is associated with the current user in Dynamics 365 Finance.

Configure customer data

Enter the address

To enter the address, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Addresses** FastTab, add a valid address for the selected customer.

Enter the contact person

To enter the contact person, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Sales demographics** FastTab, in the **Primary contact** field, select the person who is considered the buyer's contact.

> ⓘ **Note**
>
> All available contact persons must already be defined for the selected customer. Make sure that the selected contact person has a valid email address and phone number.

Enter the registration numbers

To enter the registration numbers, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer, and then, on the **Invoice and delivery** FastTab, in the **Tax exempt number** field, enter a valid TIN for the customer.
3. On the Action Pane, on the **Customer** tab, in the **Registration** group, select **Registration IDs**.
4. On the **Registration ID** FastTab, select **Add** to create a registration ID.
5. In the **Registration type** field, select the BRN registration type that you created earlier.
6. In the **Registration number** field, enter a valid BRN registration number for the selected customer.
7. Select **Add** to create another registration ID, if required.
8. In the **Registration type** field, select the SST registration type that you created earlier.

9. In the **Registration number** field, enter a valid SST registration number for the selected customer.

> ⓘ Note
>
> For **foreign** customers, actual tax registration numbers aren't always mandatory. If no tax registration numbers are defined for them, the following general numbers are used:
>
> - **EI00000000020** is used as the customer's **TIN**.
> - **NA** is used as the customer's **BRN** and **SST**.

Additional property configuration

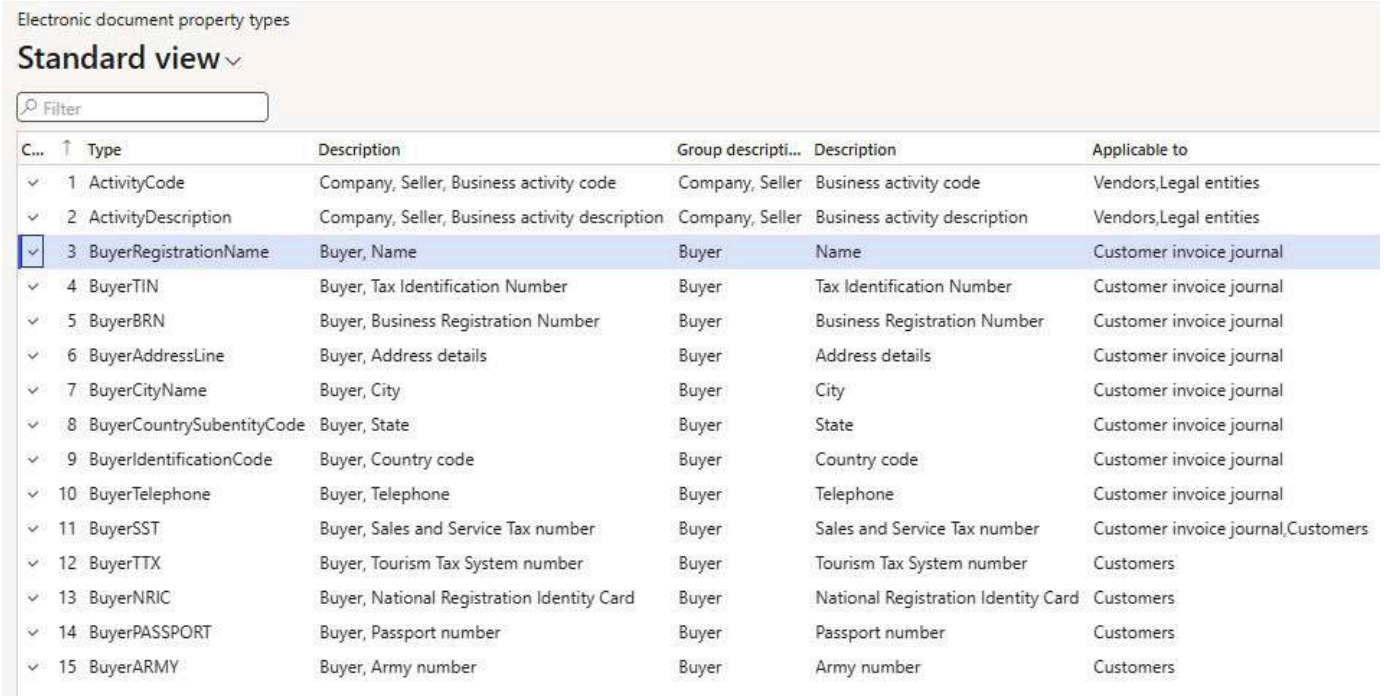
Customizable electronic document property types can be used to extend the properties of legal entities, customers, vendors, and invoice journals. Users can configure them to cover some specific scenarios through configuration only. No coding is required.

To configure additional buyer and journal properties, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Setup** > **Electronic document property types**.
2. Select **New** to create an electronic document property type.
3. In the **Type** field, enter **BuyerRegistrationName**. You must enter the value exactly as it appears here.
4. On the Action Pane, select **Applicability**.
5. In the **Table name** field, select **CustInvoiceJour**.
6. To create the record for another applicable table, select **New**.
7. In the **Table name** field, select **CustTable** as required.
8. Save your changes, and close the **Electronic document property type applicability setup** page.
9. Repeat steps 2 through 8 for the remaining properties:
    - BuyerTIN
    - BuyerBRN

- BuyerAddressLine
- BuyerCityName
- BuyerCountrySubentityCode
- BuyerIdentificationCode
- BuyerTelephone
- BuyerSST
- BuyerTTX
- BuyerNRIC
- BuyerPASSPORT
- BuyerARMY

10. Save your changes, and close the **Electronic document property types** page.



Electronic document property types

Standard view

Filter

C...	Type	Description	Group descripti...	Description	Applicable to
1	ActivityCode	Company, Seller, Business activity code	Company, Seller	Business activity code	Vendors,Legal entities

14	BuyerPASSPORT	Buyer, Passport number	Buyer	Passport number	Customers
15	BuyerARMY	Buyer, Army number	Buyer	Army number	Customers

To enter the values for the previously described electronic document properties at the customer level, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer, and then, on the Action Pane, on the **Customer** tab, select **Electronic document properties**.
3. For each property that must be overridden in the electronic invoice, enter the required value in the **Value** field.

To enter the values for the electronic document properties at the invoice level, follow these steps:

1. In Dynamics 365 Finance, go to **Account receivable** > **Inquiries and reports** > **Invoices** > **Invoice journal**.

2. Select a required invoice, and then, on the Action Pane, on the **Invoice** tab, select **Electronic document properties**.
3. For each property that must be overridden in the electronic invoice, enter the required value in the **Value** field.

> ⓘ Note
>
> - Nonblank values in the previously described electronic document properties override the corresponding default values that are automatically populated from either customer or invoice master data.
> - Values must be entered for the electronic document properties before electronic invoices are submitted to the authorities.

Configure funding sources

If business processes assume that **project invoices** are issued, follow these additional configuration steps.

1. In Dynamics 365 Finance, go to **Project management and accounting** > **Projects** > **Project contracts**.
2. Create a new project contract, or select an existing project contract.
3. On the **Funding sources** FastTab, create or select a funding source of the **Customer** type, and then select **Details**.
4. On the **Funding source details** page, on the **Other** FastTab, in the **Contact** section, in the **Contact ID** field, select a valid contact person.

   > ⓘ Note
   >
   > All available contact persons must already be defined for the selected customer. Make sure that the selected contact person has a valid email address and phone number.

Configure vendor data

If business processes assume that self invoices are issued, you must also configure required vendor data.

Enter the address

To enter the address, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select a vendor.
3. On the **Addresses** FastTab, add a valid address for the selected vendor.

Enter the contact person

To enter the contact person, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select a vendor.
3. On the **Purchasing demographics** FastTab, in the **Primary contact** field, select the person who is considered the buyer's contact.

   > **Note**
   >
   > All available contact persons must already be defined for the selected vendor. Make sure that the selected contact person has a valid email address and phone number.

Enter the registration numbers

To enter the registration numbers, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select a vendor, and then, on the **Invoice and delivery** FastTab, in the **Tax exempt number** field, enter a valid TIN for the vendor.
3. On the Action Pane, on the **Vendor** tab, in the **Registration** group, select **Registration IDs**.
4. On the **Registration ID** FastTab, select **Add** to create a registration ID.
5. In the **Registration type** field, select the BRN registration type that you created earlier.
6. In the **Registration number** field, enter a valid BRN registration number for the selected vendor.

7. Select **Add** to create another registration ID, if required.
8. In the **Registration type** field, select the SST registration type that you created earlier.
9. In the **Registration number** field, enter a valid SST registration number for the selected vendor.

> ⓘ Note
>
> For **foreign** vendors, actual tax registration numbers aren't always mandatory. If no tax registration numbers are defined for them, the following general numbers are used:
>
> - **EI00000000030** is used as the vendor's **TIN**.
> - **NA** is used as the vendor's **BRN** and **SST**.

Enter a business activity code and description

To enter a business activity code and descriptions, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select a vendor, and then, on the Action Pane, on the **Vendor** tab, select **Electronic document properties**.
3. Select the line where the **Type** field is set to **ActivityCode**.
4. In the **Value** field, enter the business activity code.
5. Select the line where the **Type** field is set to **ActivityDescription**.
6. In the **Value** field, enter the business activity description.

> ⓘ Note
>
> A Malaysian Standard Industrial Classification (MSIC) code might not be applicable to foreign vendors. In this case, the fixed value **00000** is used for the activity code, and the value **NA** is used as the activity description.

Configure the application-specific parameters

This setup is required to establish a mapping between sales tax codes that are used in the system and legally required tax types.

Make sure that the following ER format configurations are imported:

- Sales invoice (MY)
- Project invoice (MY)
- Self invoice (MY)

To complete the configuration, follow these steps:

1. In Dynamics 365 Finance, go to **Globalization Studio**.
2. Select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.
3. On the **Configurations** page, select the **Sales invoice (MY)** format configuration.
4. On the **Configurations** menu, in the **Application specific parameters** section, selected **Setup**.
5. In the **Lookups** section, make sure that the **$TaxTypes** lookup is selected.
6. In the **Conditions** section, select **Add** to add a condition.
7. In the **Name** column for the new condition, select the sales tax code that's defined in the application. Then, in the **Lookup result** column, select a tax type code according to the official list of tax type codes.
8. Add specific conditions for each sales tax code that's defined in the system, and save your changes.

   > **Note**
   >
   > In the **Name** column, you can select the ***Blank*** or ***Not blank*** placeholder value instead of a specific sales tax code.

9. In the **State** field, select **Completed**. Then select **Save**.
10. Repeat steps 2 through 8 for the **Project invoice (MY)** and **Self invoice (MY)** format configurations, as required.

Configure sales tax codes

To cover scenarios for non-taxable, zero-rated, or exempted operations, you must define tax exempt codes in the system.

To configure sales tax codes, follow these steps:

1. In Dynamics 365 Finance, go to **Tax** > **Setup** > **Sales tax** > **Sales tax exempt codes**.
2. Add the required exempt codes together with descriptions.
3. Save your changes, and close the page.
4. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax groups**.
5. In the **Setup** section, select the row for a required sales tax code, and then, in the **Exempt** column, mark the sales tax code as exempt.
6. In the **Exempt code** field, reference one of the exempt codes that you created in step 1.
7. Save your changes, and close the page.

Configure units of measure

To configure units of measure, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Setup** > **Units** > **Units**.
2. Select a unit ID, and then select **External codes**.
3. On the **External codes** page, in the **Overview** section, in the **Code** column, enter a code that is equal to the selected unit ID.
4. In the **Standard code** column, select the checkbox.
5. In the **Value** section, in the **Value** field, enter the external code to use as the units according to the required codification.

> **Note**
>
> For scenarios where no specific units of measure are assumed, the default value **EA** is used.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

You can inquire about the results of a submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** and selecting the

required document type. For more information, see Work with Electronic document submission log.

Configure printable invoice layouts

To enable QR code printing in full and simplified invoices, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts receivable** > **Setup** > **Forms** > **Form setup**.
2. Select **Print management**.
3. Select the **Customer invoice** report, and then, in the **Report format** field, reference the **SalesInvoice.ReportFull_MY** or **SalesInvoice.ReportSimplified_MY** layout.
4. Select the **Free text invoice** report, and then, in the **Report format** field, reference the **FreeTextInvoice.ReportFull_MY** or **FreeTextInvoice.ReportSimplified_MY** layout.

If you use project invoices, follow these steps:

1. In Dynamics 365 Finance, go to **Project management and accounting** > **Setup** > **Forms** > **Form setup**.
2. Select **Print management**.
3. Select the **Project invoices without billing rules** report, and then, in the **Report format** field, reference the **PSAProjInvoice.ReportFull_MY** or **PSAProjInvoice.ReportSimplified_MY** layout.
4. Select the **Project invoices with billing rules** report, and then, in the **Report format** field, reference the **PSAContractLineInvoice.ReportFull_MY** or **PSAContractLineInvoice.ReportSimplified_MY** layout.

If you use self invoices, follow these steps:

1. In Dynamics 365 Finance, go to **Accounts payable** > **Setup** > **Forms** > **Form setup**.
2. Select **Print management**.
3. Select the **Vendor invoice** report, and then, in the **Report format** field, reference the **VendInvoiceDocument.ReportMY** layout.

> ⓘ **Note**
>
> The QR code that's shown on the printouts of invoices represents the URL that takes you to the official portal of **MyInvois** system, where you can find the details of the related electronic invoice.

QR codes are printed only for invoices that were successfully submitted, validated, and accepted by the **MyInvois** system.

Batch submission of electronic invoices

In addition to submitting electronic invoices individually, as described in the previous sections, you can submit posted invoices in batches as consolidated electronic invoices.

By default, all invoices that originate from retail operations can be consolidated, but they can't be submitted individually. Nevertheless, you can force specific retail-related invoices to be submitted individually.

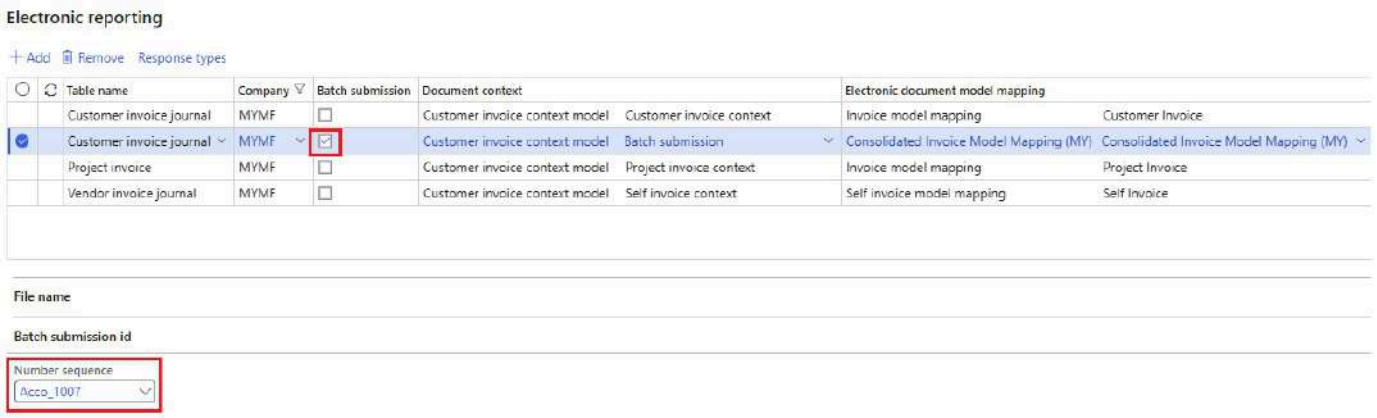
To activate batch submission of invoices, enable the **Electronic document batch submission** feature in Feature management. For more information, see Feature management overview.

Configure electronic document parameters

Before you begin to configure electronic document parameters for batch submission, import the **Consolidated Invoice Model Mapping (MY)** ER configuration from the repository. For more information, see Import electronic reporting (ER) configurations from Dataverse.

To configure electronic document parameters for batch submission, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic document** tab, on the **Electronic reporting** FastTab, add a record for the **Customer Invoice journal** table name.
3. In the **Batch submission** column, select the checkbox.
4. In the **Document context** column, select the **Batch submission** mapping name from the **Customer invoice context model** configuration.
5. In the **Electronic document model mapping** column, select the **Consolidated Invoice Model Mapping (MY)** mapping name from the **Consolidated Invoice Model Mapping (MY)** configuration.
6. On the **Batch submission id** FastTab, in the **Number sequence** field, select the number sequence that should be used to number the batches that are generated. The number sequence that you select must be continuous.



Configure the electronic invoicing feature

To configure the electronic invoicing feature, follow these steps:

1. Import the latest version of the **Malaysian electronic invoicing (MY)** Globalization feature (version **10** or later) as described in Import features from the repository.

   > **Note**
   >
   > Make sure that the **Consolidated invoice (MY)** ER format configuration is imported after you import the **Malaysian electronic invoicing (MY)** Globalization feature. If it isn't imported, manually import it. This format configuration is based on the **Invoices Communication Model** configuration and also on the **Consolidated Invoice Model Mapping (MY)** configuration that you imported in the previous section.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it. For more information, see Create Globalization features.

3. On the **Versions** tab, verify that the **Draft** version is selected.

4. On the **Setups** tab, in the grid, select the **Consolidated invoice derived** feature setup, select **Edit**, and configure the following processing pipeline action parameters.

   > **Note**
   >
   > Configure these parameters just as you configured them for the Sales invoice derived feature setup.

Expand table

Processing pipeline action	Parameters to configure
Sign document for Malaysia	• Certificate name
Integrate with MyInvois (Submit document)	• Client secret • Client ID • Web service URL • Login service URL • Environment type
Integrate with MyInvois (Get document)	• Client secret • Client ID • Web service URL • Login service URL • Environment type

5. Select **Save**, and close the page.

6. Complete and deploy the feature as described in Complete and deploy a Globalization feature.

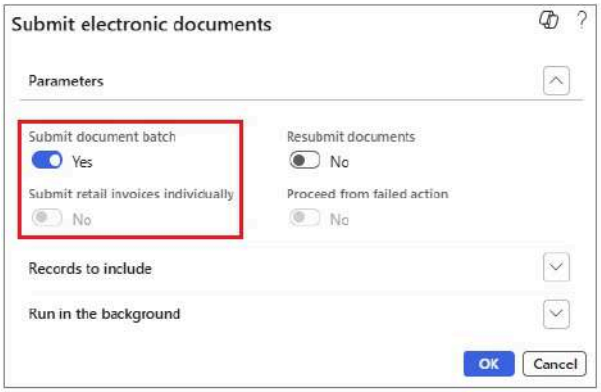
Issue consolidated electronic invoices

To generate and submit electronic invoices in batches for posted Customer invoices, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**.

2. To submit invoices in batches, set the **Submit document batch** option to **Yes**. To submit retail invoices individually, set the **Submit retail invoices individually** option to **Yes**.

> **ⓘ Important**
>
> Batch submission and individual submission are mutually exclusive and can't be run simultaneously. During a given run, only batch submissions or individual submissions can be processed.
>
> If you must submit some retail invoices individually, you must do the individual submission **before** the batch submission. All individually submitted retail invoices will be excluded from batches.



3. On the **Records to include** FastTab, select **Filter** to open the **Inquiry** dialog box, where you can build a query to select only required documents.

4. Select **OK** to start submission.

To inquire about the submission results, follow these steps:

1. In Dynamics 365 Finance, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**.
2. In the **Document type** field, select **Batch submission**.
3. Select a specific batch that has one of the following statuses: **Scheduled**, **Completed**, or **Failed**.
4. On the Action Pane, select **Inquiries** > **Submission details** to view the details of the submission execution logs.
5. On the Action Pane, select **Inquiries** > **Batch submission invoices** to view the invoices that were submitted in the selected batch.

> **Note**
>
> Because of restrictions that the authorities impose on the size of submitted data, the maximum number of invoices that can be included in one batch is 60. If more than 60 invoices are being processed, multiple batches are automatically generated.

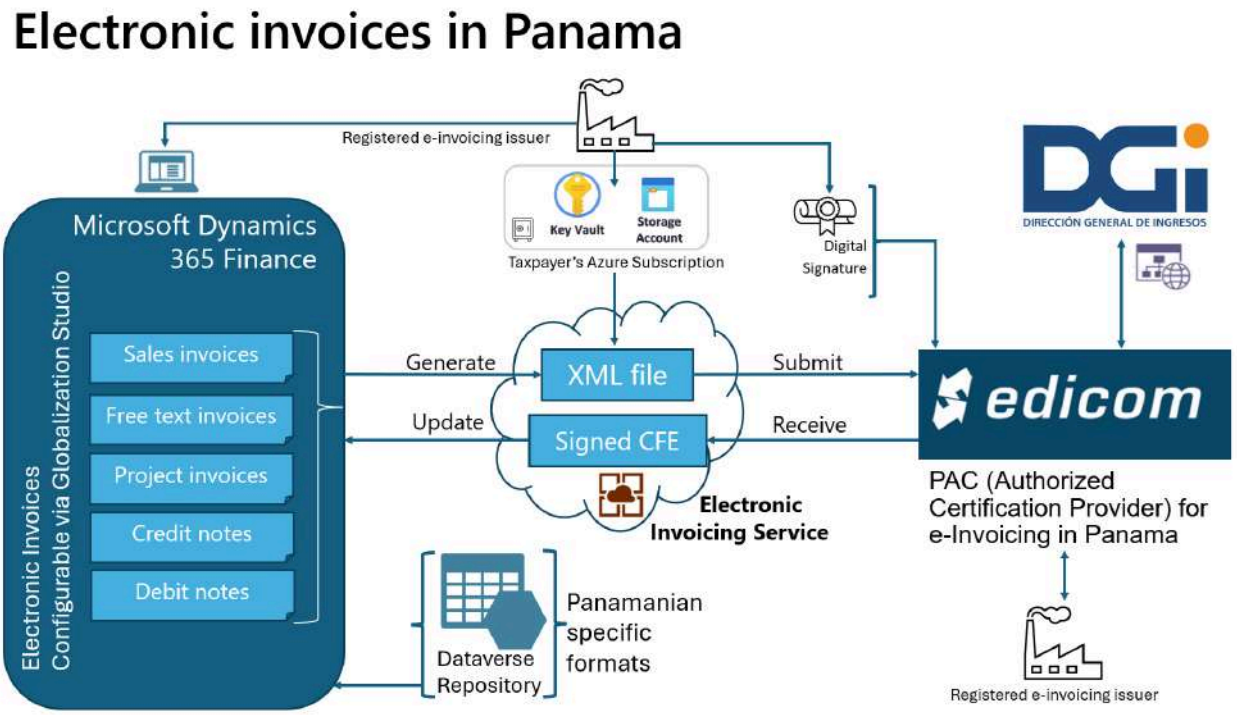
Get started with Electronic invoicing for Panama

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information to help you get started with Electronic invoicing for Panama. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup. For the last-mile integration with the Panamanian Tax Authorities, Microsoft is partnering with Edicom.

After you configure Electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Panama.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that is applicable only to cloud deployments of Finance or Supply Chain Management.

> **Important**
>
> The new Electronic invoicing Globalization feature for Panama (outbound flow) requires that you run Finance version 10.0.40. Specifically, you must run build number 10.0.1935.60 or later. It can be imported only into the new Globalization Studio. It isn't supported in Regulatory Configuration Service (RCS).

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met.

1. Ensure that the settings for the Panamanian legal entity are in place. For more information, see Set up a legal entity and tax information for Panama.
2. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic invoicing overview.
3. Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
4. You must enable the following features in Feature management:
    - Electronic invoicing integration
    - Electronic invoicing integration resubmit document from failed action
    - Execute update actions for submitted documents
5. Ensure that the following Electronic reporting (ER) format configurations are imported. For more information, see: Import Electronic reporting (ER) configurations from Dataverse, Import Electronic reporting (ER) configurations.
    - Customer invoice context model
    - Inventory e-invoice (PA)
    - Project e-invoice (PA)

- Edicom source file response import format
- Edicom response processing LATAM
- Edicom response error log import

> **Note**
>
> These formats are based on the corresponding **LATAM** format configurations that use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. All other required configurations are automatically imported.

Configure the electronic invoicing feature

The **Panama electronic invoice (PA) "E-Invoicing for Panama: ISV last-mile connector with Edicom"** feature represents an outbound flow to issue the following sales documents.

Expand table

Name	Code	Original name
Internal Operation Invoice	01	Factura de operación interna
Export Invoice	03	Factura de exportación
Credit Note referring to one or more Sales Invoices	04	Nota de Crédito referente a una o varias FE
Debit Note referring to one or more Sales Invoices	05	Nota de Débito referente a una o varias FE
Generic Credit Note	06	Nota de Crédito genérica
Generic Debit Note	07	Nota de Débito genérica
Free Zone Invoice	08	Factura de Zona Franca
Foreign Operation Invoice	10	Factura de Operación Extranjera

Some parameters of the feature are published with default values. Before you deploy the Electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review the default values, and update them as required, so that they better reflect your business operations.

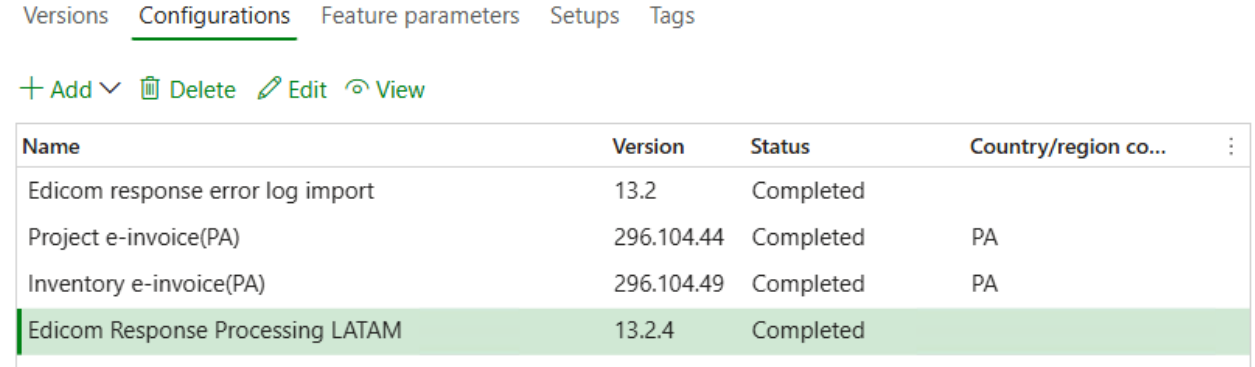
For Panama, there are at least three interactions with Edicom in the pipeline: first to submit the invoice, then to fetch the signed XML, and finally to fetch the status of the submitted invoice.

Each interaction requires common parameters, such as Edicom connection details and the authentication token that Edicom provides. These common parameters are reused in the feature setup for all document types. Edicom provides the values when a company is onboarded.

> **Note**
>
> The configuration of common parameters is now simplified. You no longer have to go to each action and feature setup, and repeatedly specify the common connection parameters. Use of the **Feature parameters** tab is available only as of version 10.0.41.

> **Important**
>
> The **Panama electronic invoice (PA)** feature is provided by Microsoft. Before it can be used, it requires additional configuration, as described in this article. For information about how to configure invoicing features and apply changes, see Work with feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they are processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Panama.

1. Import the latest version of the **Panamanian electronic invoice (PA)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.



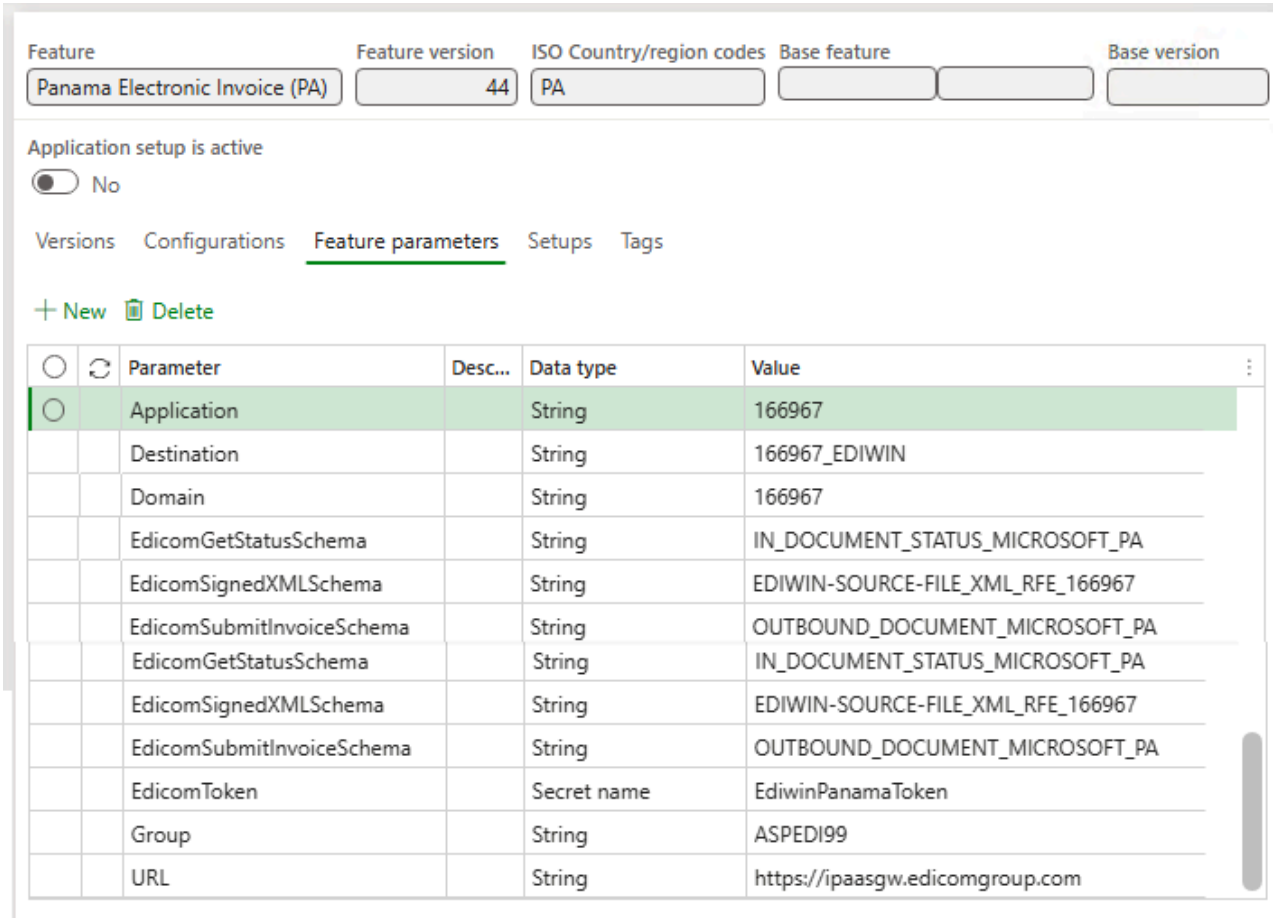
2. Create a copy of the imported Globalization feature, and select your configuration provider. For more information, see Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API:

    - Select **Application**, and then enter the service ID number that you obtained.
    - Select **Domain**, and then enter the same service ID number.
    - Select **Get status schema name**, and then enter the schema name.
    - Select **Group**, and then enter the group code that you obtained.
    - Select **Signed XML schema name**, and then enter the schema name.
    - Select **Destination name**, and then enter the service ID number concatenated with the string "_EDIWIN." For example, if the service ID number is 123456, enter **123456_EDIWIN**.
    - Select **Submit invoice schema name**, and then enter the schema name.
    - Select **Auth token**, and then select the name of the secret that you created for the token.
    - Select **Web service URL**, and check the web address.

    The following illustration shows these feature parameters set to the values that Edicom provided to Microsoft for testing purposes. The values that you enter will differ. Edicom provides these values to you when you're onboarded.



5. The copy of the feature is always created as a **Draft** version. Regardless of whether you made changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

To review the processing pipeline, on the **Setups** tab, go to **Feature setup**, select the derived document type that you want, and then select **Edit**. The outbound flow consists of the following actions:

1. **Transform document** – Generate a format that can be sent to Edicom.
2. **Integrate with Edicom** – Submit the generated invoice to Edicom.
3. **Get status from Edicom for an invoice** – Fetch the signed XML from Edicom. This document might not be immediately available, because the PAC needs time to generate it.

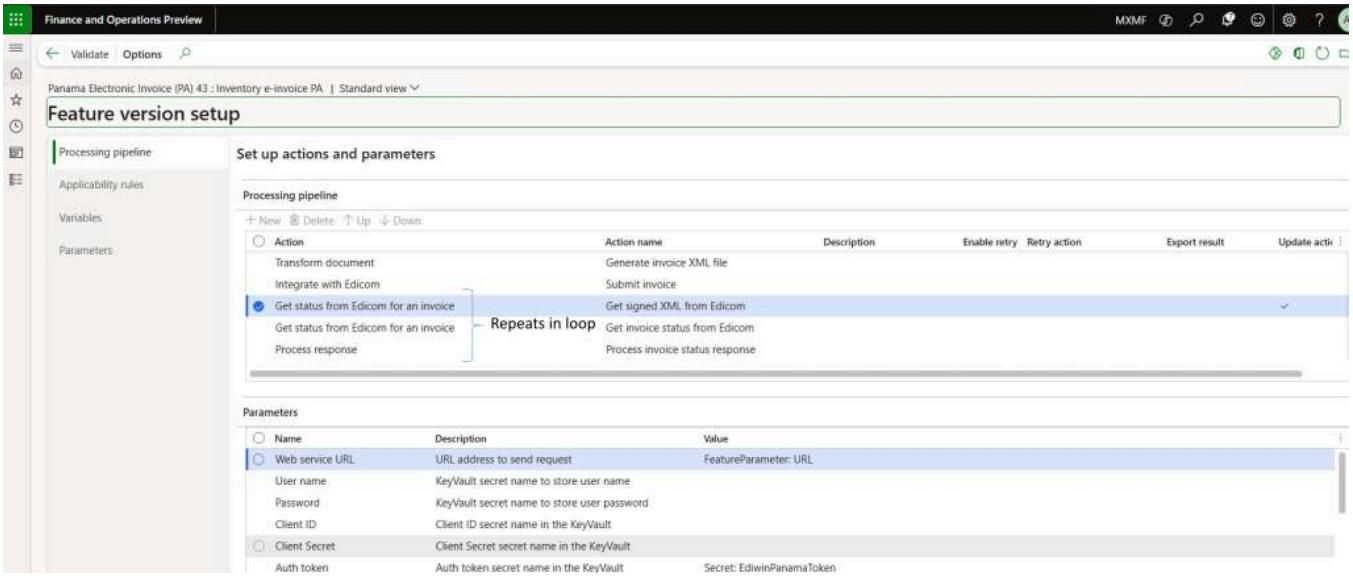
> **Note**
>
> At this point in the flow, the concept of *update actions* comes into play. Notice that the **Update action** checkbox is selected for this step. Therefore, this step and all

subsequent steps run in a loop until the system determines that a terminal state has been reached.

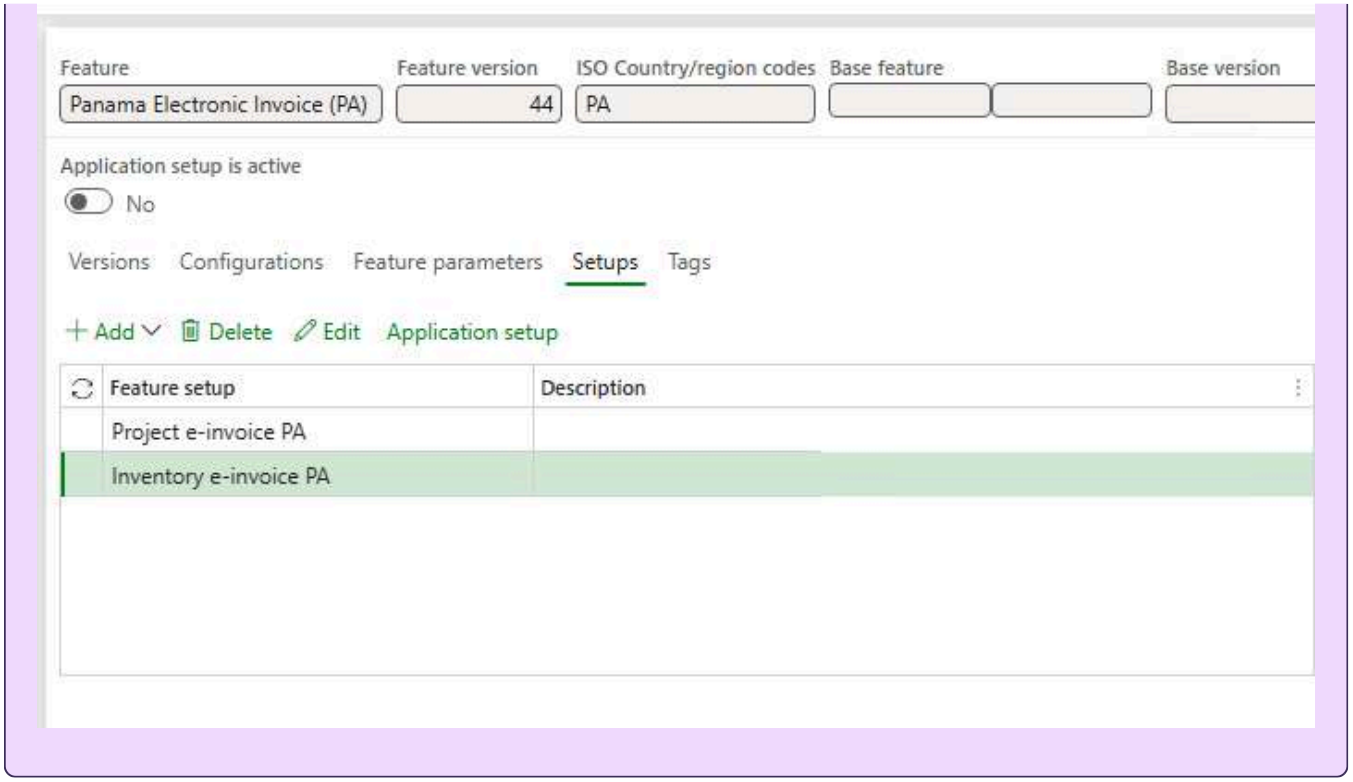
4. **Get status from Edicom for an invoice** – Fetch the status of the submitted invoice from Edicom.

5. **Process response** – Process the received response to determine whether a terminal state has been reached.

    - If the status response indicates a failure, the pipeline is terminated, and the submission is marked as failed.
    - If the response indicates successful submission to the DGI Panamanian Fiscal Authorities, the pipeline is marked as completed.

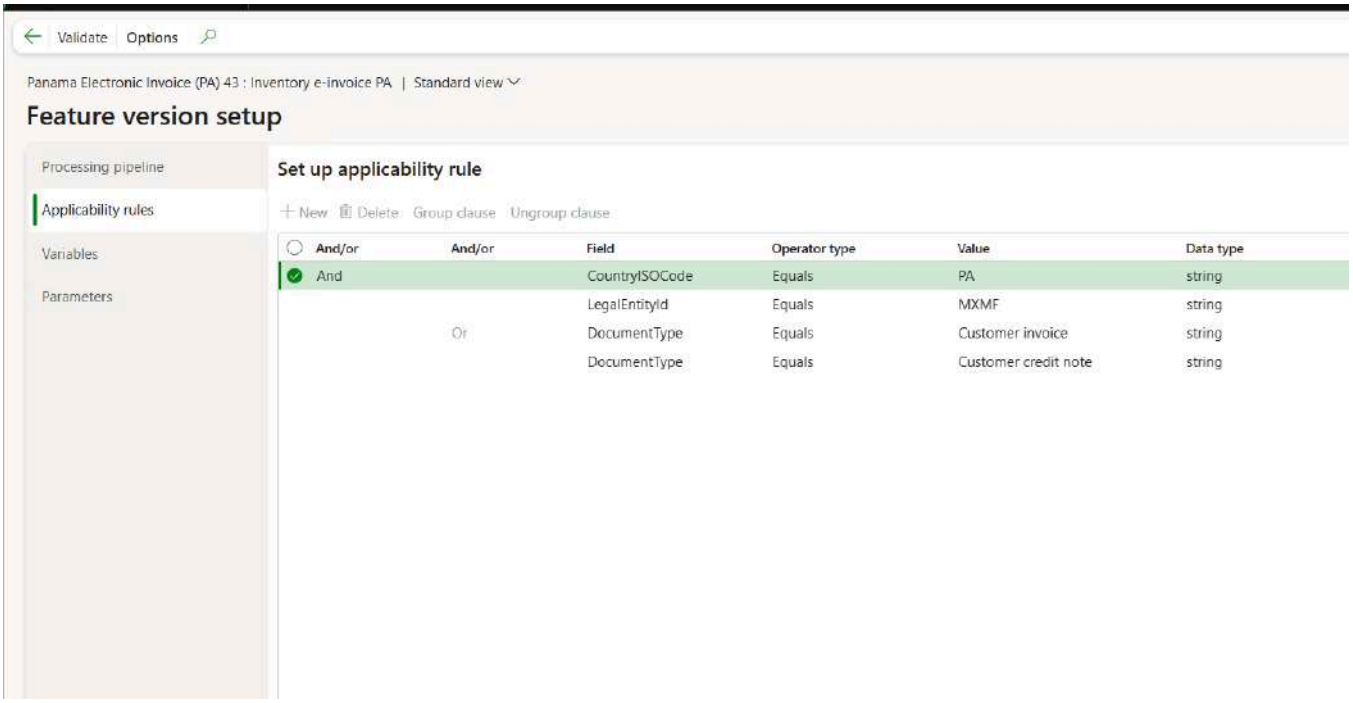


> ⓘ **Note**
>
> There is a similar setup for each format that is included in the **Panama electronic invoice (PA)** feature. For Panama, there are two setups: one for project invoices (**Project e-invoice PA**) and one for inventory and free text invoices (**Inventory e-invoice PA**).



Applicability rules

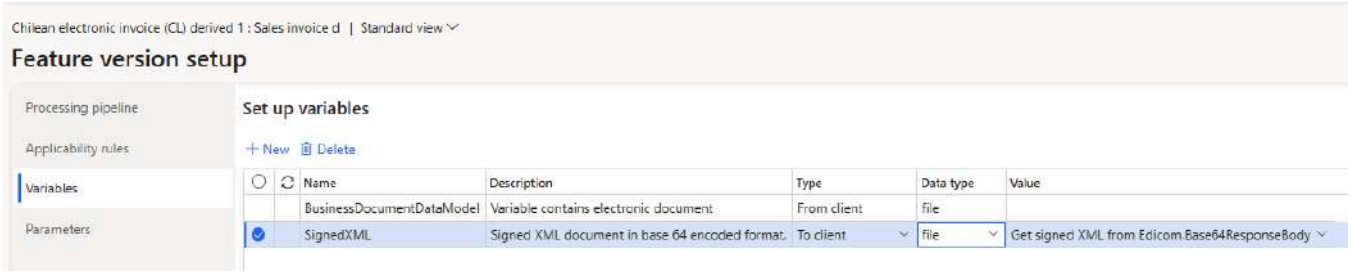
Applicability rules must be correctly configured to provide context, so that the exact Electronic invoicing Globalization feature that must run in the Electronic Invoicing service can be found. Applicability rules are provided out of the box by checking the legal entity in the International Organization for Standardization (ISO) country/region code. This particular feature setup supports all three types of invoices: customer invoices, debit notes, and credit notes.



Variables

The following variables are used in the outbound data flow actions of the Panamanian feature. (These variables are provided out of the box.)

- **BusinessDocumentDataModel** – The Business Document Data model variable that is received from Finance or Supply Chain Management and transformed into the format that is required for submission.
- **SignedXML** – The signed XML variable that is sent back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get Signed XML from Edicom** step. It's used in the response types to save the signed XML that is obtained from Edicom as an attachment to the invoice journal. It's also used to generate printable reports through QR codes.



After you import the **Electronic invoicing for Panama** feature that includes the out-of-box default feature setup, follow the steps in the next section to configure electronic documents.

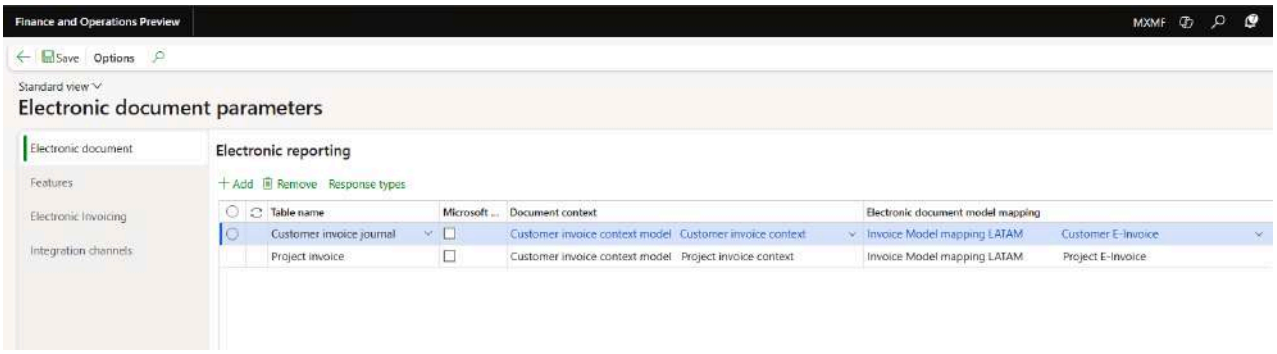
Configure electronic document parameters

1. Make sure that the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Panama are imported. For more information, see Set up Electronic document parameters.

2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.

4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.



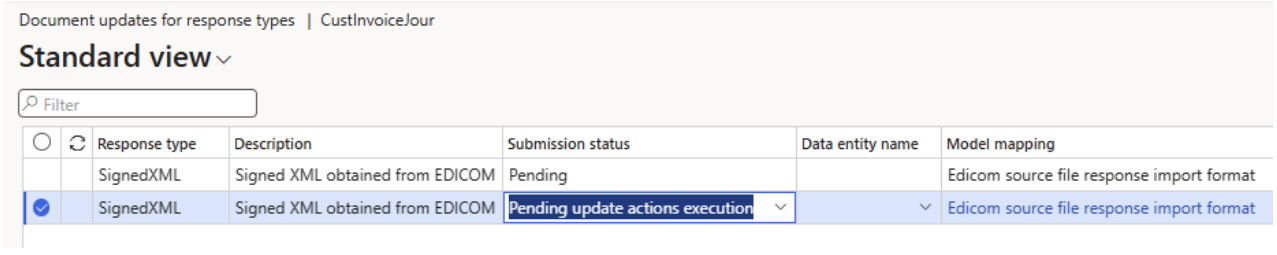
5. Save your changes, and close the page.

6. For each table name, follow these steps:

   a. Select **Response types**, select **New** to create a response type that you will get from the back end, and enter the following values:

      - In the **Response type** field, enter **SignedXML** (the default value). (See the Variables section of this article.)
      - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.
      - In the **Submission status** field, select **Pending**.
      - In the **Model mapping** field, select **Edicom source file response format**.

   b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. In this way, you can run a subset of the actions in the processing pipeline in a loop to continuously pull updated statuses and other information for the submitted documents from the tax authority.



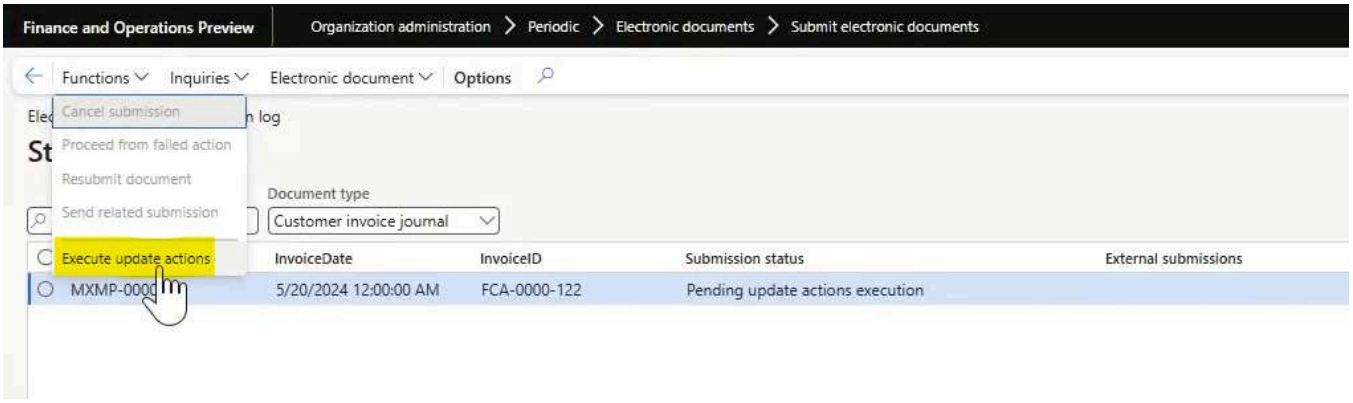
> **Note**
>
> The response includes the signed XML that is obtained from Edicom. This signed XML is stored in the system as an attachment to the corresponding invoice journal. It will eventually be used to generate printable invoices through QR codes.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

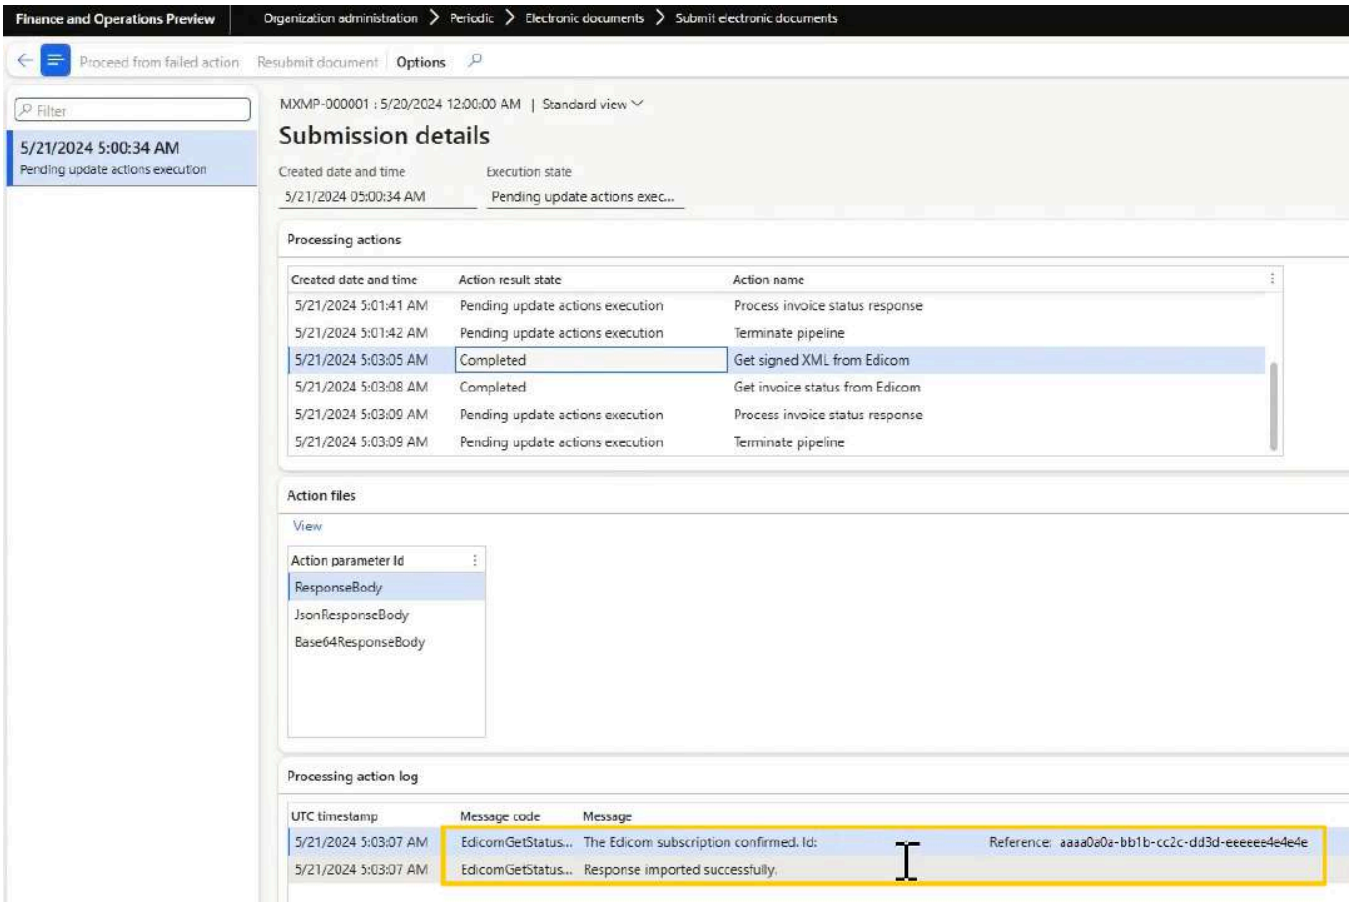
To inquire about the results of a submission, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Panama, after you submit the invoice, the submission status is set to **Pending update actions execution**. The response body is probably empty for the signed XML and the call to get the invoice status. An empty response body indicates that the XML wasn't available immediately after submission. To address the pending status, a function that is named **Execute update actions** is used. This function resumes the pipeline from the action that is marked as an update action. It then runs all subsequent actions in the pipeline in a loop. The status should change to **Executing** again. Then, after a few seconds, it reverts to **Pending update actions execution**.

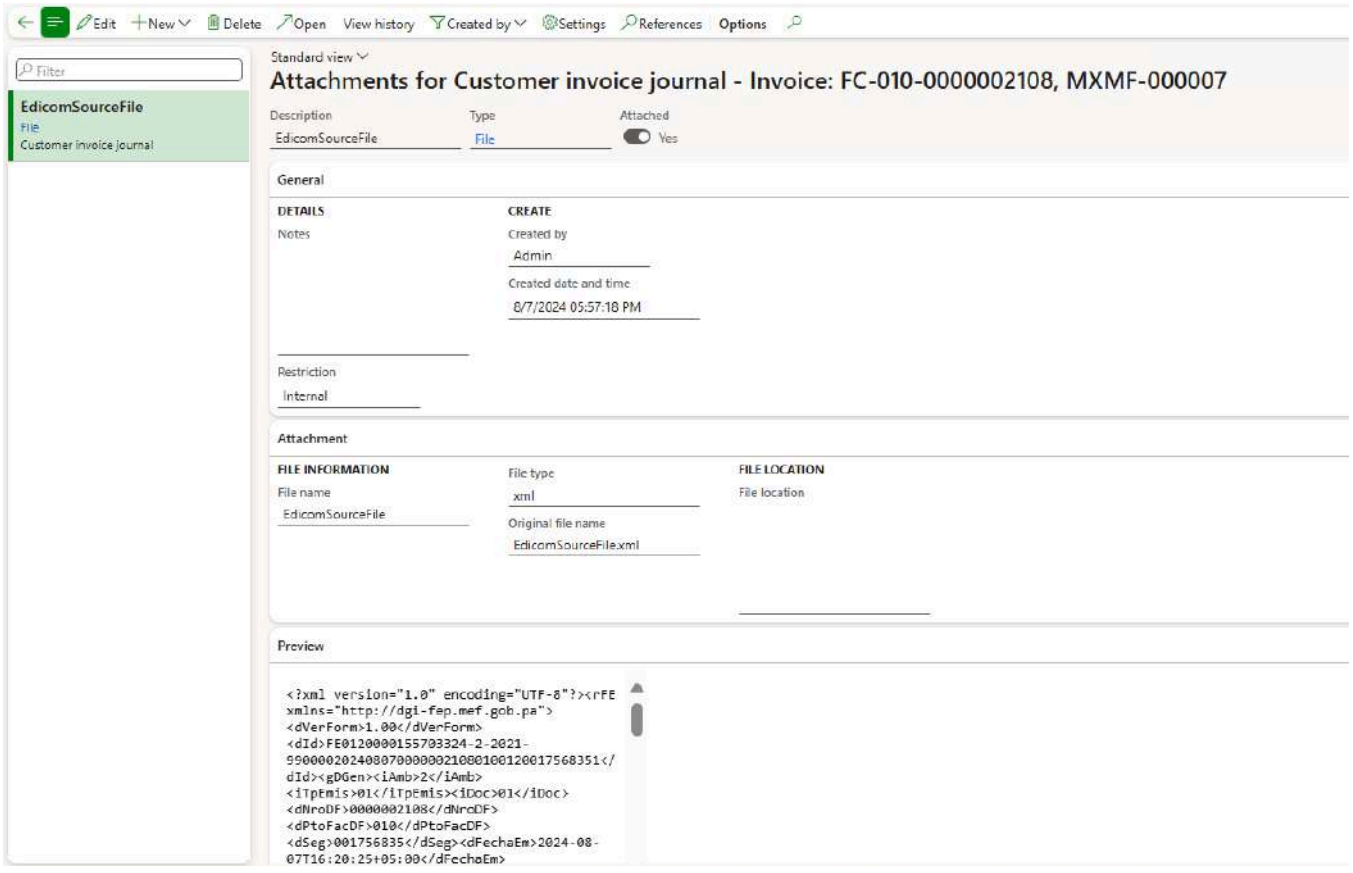


> **Note**
>
> By setting a recurrence schedule, you can configure the **Execute update actions** function to run in batch mode on a periodic basis.

When you review the submission details, you should notice that the steps run again. This time, the signed XML is received.



As a result of the completed outbound flow, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



For Panama, the **Process response** action completes the pipeline after a few minutes.

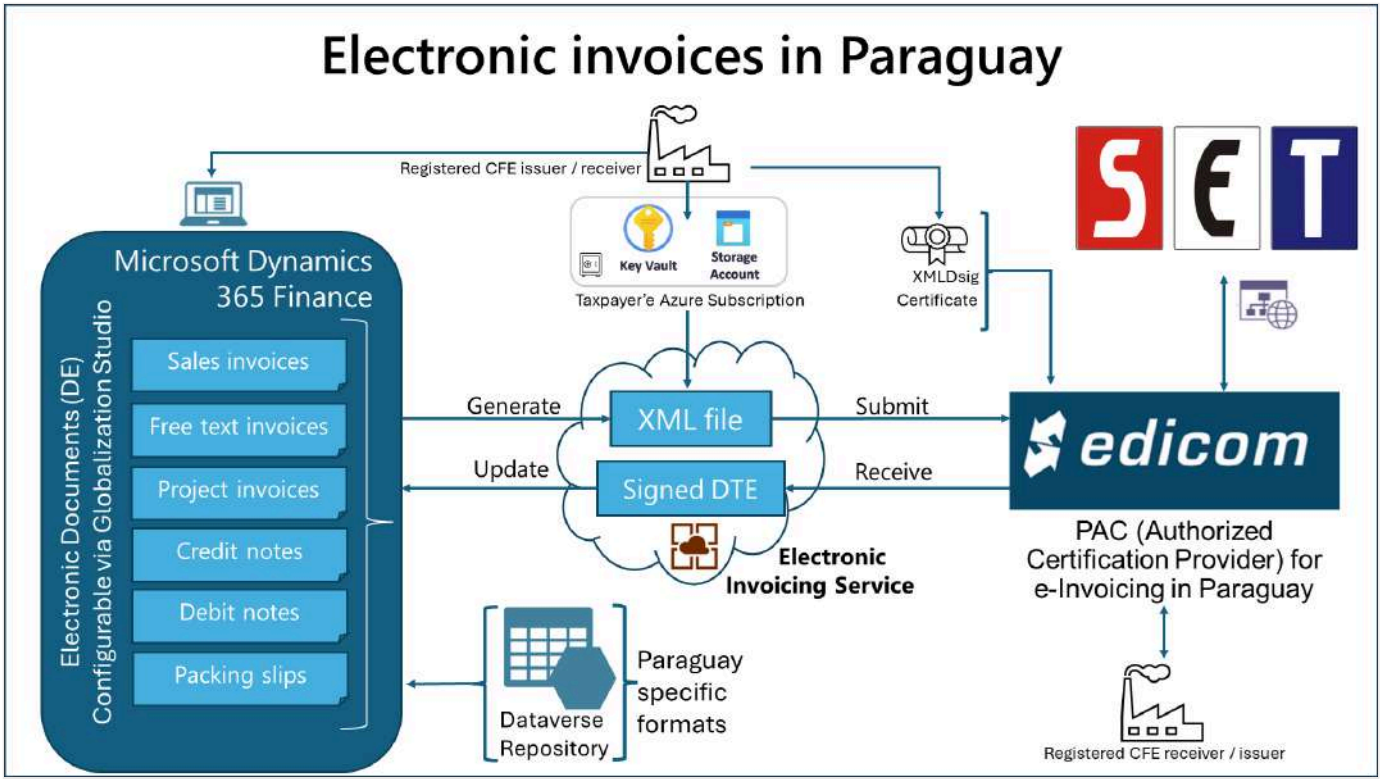
Get started with electronic invoicing for Paraguay

This article helps you set up electronic invoicing for Paraguay. It lists configuration steps that depend on the country or region in Microsoft Dynamics 365 Finance and Microsoft Dynamics 365 Supply Chain Management. These steps supplement Electronic invoicing setup. For last mile integration with the Paraguayan tax authority, Microsoft partners with Edicom.

After you set up electronic invoicing, generate, digitally sign, and submit XML invoice files to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Paraguay.



> **Note**
>
> This electronic invoicing approach uses an invoicing service that's available only in cloud deployments of Finance or Supply Chain Management.

Prerequisites

Before you start, make sure you meet these prerequisites.

1. Set up the Paraguayan legal entity. Learn more in Set up a legal entity and tax information for Paraguay.
2. Review the Electronic invoicing overview.
3. Complete the common Electronic invoicing service configuration described in Electronic invoicing configuration.
4. Enable the following features in Feature management:
    - Electronic invoicing integration
    - Electronic invoicing integration resubmits document from failed action
    - Execute upda1. Import the following Electronic reporting (ER) format configurations. Learn more in Import Electronic reporting (ER) configurations from Dataverse and Import Electronic reporting (ER) configurations.reporting-import-ger-configurations.md).
    - Customer invoice context model
    - Edicom response error log import
    - Edicom Response Processing LATAM
    - Edicom source file response import format
    - Inventory-PY
    - PackingSlip (PY)
    - Project e-invoice (PY)

> **Note**
>
> These formats build on the corresponding LATAM format configurations, which use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. The system imports all other required configurations automatically.

Configure the electronic invoicing feature

The **"Paraguay Electronic Invoice (PY) Edicom integration for Paraguay"** feature is an outbound flow that issues the following sales documents.

Expand table

Name	Code	Original name
Electronic sales invoice	1	Factura electrónica de venta
Credit Note	5	Nota de Crédito
Debit Note	6	Nota de Débito

The feature publishes some parameters with default values. Before you deploy the electronic invoicing feature to the service environment, add a feature that's based on the Microsoft-provided feature and complete the common parameters on the **Feature parameters** tab. Review the default values and update them as needed so they reflect your business operations.

Edicom interactions for Paraguay

Paraguay has three core interactions with Edicom in the base flow:

1. **Invoice submission**
2. **Signed XML retrieval**
3. **Status retrieval of the submitted invoice**

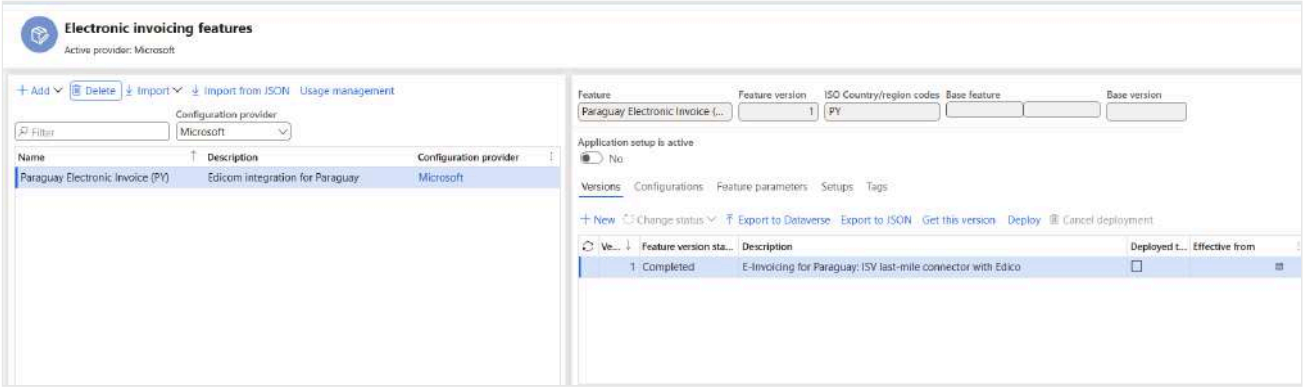
Each of these interactions requires common parameters, such as Edicom connection details and the authentication token provided by Edicom. These parameters are reused across the feature setup for all document types. Edicom supplies these values during the company's onboarding process.

Paraguay electronic invoice (PY) Edicom integration

> **Important**
>
> The **Paraguay Electronic Invoice (PY)** feature is provided by Microsoft. Before it can be used, it requires more configuration, as described in this article. Learn how to configure invoicing features and apply changes in Work with feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they're processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Paraguay.

To integrate Edicom for Paraguay electronic invoices, follow these steps:

1. Import the latest version of the **Paraguay Electronic Invoice (PY)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.



If you go to the Configuration tab, as shown in the previous screenshot, there's a page displaying information similar to the following table:

Expand table

Name	Version	Status	Country/region code
Edicom Response Processing LATAM	13.2.5	Completed	
Edicom response error log import	13.1	Completed	
Inventory (PY)	296.140.32.25	Completed	PY
PackingSlip (PY)	296.140.32.31	Completed	PY
Project e-invoice (PY)	296.140.19	Completed	PY

> **Note**
>
> The version numbers can change if the formats are updated. The table is for illustrative purposes only.

2. Create a copy of the imported Globalization feature, and select your configuration provider. Learn more in Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API.

These parameters are general purpose and apply to all actions, so configure them once here.

> **Tip**
>
> The following table provides **example values** for each feature parameter, so you can understand the type of data that should be entered for each one. These values are **illustrative only** and were provided by Edicom to Microsoft for testing purposes. When you're onboarded, Edicom provides you with your own unique values to use in your configuration.

Expand table

Parameter	Description	Data type	Value
EdicomApplication	Application	String	`<ID_PROVIDED_EDICOM>`
EdicomDomain	Domain	String	`<ID_PROVIDED_EDICOM>`
EdicomGetStatusSchema	Get status schema name	String	IN_DOCUMENT_STATUS_MICROSOFT_UY
EdicomGroup	Group	String	`<GROUP_ID>`
EdicomSignedXMLSchema	Signed XML schema name	String	`EDIWIN-SOURCE-FILE_XML_CFE_ADENDA_<ID_PROVIDED_EDICOM>`
EdicomSubmitInvoiceDestination	Destination name	String	`<ID_PROVIDED_EDICOM>`_EDIWIN
EdicomSubmitInvoiceSchema	Submit invoice schema name	String	OUTBOUND_DOCUMENT_MICROSOFT_UY
EdicomToken	Auth token	Secret name	EdiwinParaguayToken
EdicomWebServiceURL	Web service URL	String	https://ipaasgw.edicomgroup.com

> **Tip**

When configuring the feature parameters for Edicom integration, follow these steps:

- Select **Application**, and enter the service ID number you obtained from Edicom.
- Select **Domain**, and enter the same service ID number.
- Select **Get status schema name**, and enter the provided schema name.
- Select **Group**, and enter the group code you received.
- Select **Signed XML schema name**, and enter the appropriate schema name.
- Select **Destination name**, and enter the service ID number concatenated with "_EDIWIN". For example, if your service ID is 123456, enter **123456_EDIWIN**.
- Select **Submit invoice schema name**, and enter the schema name.
- Select **Auth token**, and choose the name of the secret you created for the token.
- Select **Web service URL**, and verify the web address is correct.

5. The copy of the feature always starts in a **Draft** version. Regardless of whether you made changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

There are three electronic invoice formats for Paraguay included in the **Paraguay Electronic Invoice (PY) feature**. Each format requires its own setup and configuration. The formats are:

- **Inventory (PY)**
- **PackingSlip (PY)**
- **Project e-invoice (PY)**

The following sections provide general configuration steps that apply to all formats. They also explain specific considerations for each format.

Electronic invoice feature

Setups view

After you import the feature, you see five tabs: **Versions**, **Configuration**, **Feature parameters**, **Setups**, and **Tags**. Select **Setups**, then select **View** to open the **Feature version setup** page.

Feature version setup

Use this page to review and set up the feature for Paraguay. The page has four sections: **Processing pipeline**, **Applicability rules**, **Variables**, and **Parameters**.

Processing pipeline

The Set up Actions and Parameters section is divided into two distinct grids:

Top right – processing pipeline

The **Processing pipeline** grid is similar to the following table:

Expand table

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Transform document	Generate invoice XML file					
Integrate with Edicom	Submit invoice					
Get status from Edicom for an invoice	Get signed XML from Edicom					**Checked**
Get status from Edicom for an invoice	Get invoice status from Edicom					
Process response	Process invoice status response					

> **Note**
>
> The **Get status from Edicom for an invoice** action is crucial in the flow, as it's marked with the **Update action** checkbox. This designation means that this specific step—and all steps following it repeatedly execute in a loop. The system continues this process until the invoice reaches a final, terminal status, ensuring that the latest status from Edicom is always retrieved and processed.

Bottom right – parameters

The lower grid shows the parameters for the selected processing action. These parameters fine-tune the step's behavior. Each entry lists a name, description, data type, and value so you can set

processing logic for business needs.

Transform document parameters

Expand table

Name	Description	Value
Input file	Source file provides to the action the data to be executed.	Variable: BusinessDocumentDataModel
Direction	Direction describes which format is used: import or export	export
Configuration	Configuration describes format that is executed	Inventory e-Invoice: Inventory e-Invoice
Configuration Integration point	Source file provides data to the reporting runtime	InvoiceCustomer
Custom file name	Custom file name from the client	

Linking the correct format in Transform document parameters

When configuring the **Transform document** action in the processing pipeline, ensure the following:

- **Configuration**: Set this to the exact name of the feature format you're configuring.
  - For example:
    - `Project e-Invoice (PY)` → Configuration: `Project e-Invoice (PY)`
    - `Inventory e-Invoice (PY)` → Configuration: `Inventory (PY)`
    - `e-Packing Slip (PY)` → Configuration: `PackingSlip (PY)`
- **Configuration Integration Point**:
  - Use `InvoiceCustomer` for inventory formats (`Inventory (PY)`, `PackingSlip (PY)`).
  - Use `InvoiceProject` for project formats (`Project e-Invoice (PY)`).

> **Tip**
>
> If the feature name contains "Project," use `InvoiceProject`. If it contains "Inventory," use `InvoiceCustomer`. Incorrect settings result in empty XML or missing required data.

Integrate with Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
Http request body	Http request body (can be empty)	Generate invoice XML file: Output file
User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinParaguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Destination	Destination	FeatureParameter: EdicomSubmitInvoiceDestination
Schema	Schema	FeatureParameter: EdicomSubmitInvoiceSchema
Duplicates	Duplicates	0
Group	Group	FeatureParameter: EdicomGroup
Custom file name	Custom file name from the client	Generate invoice XML file: File name

Get signed XML from Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
User name	KeyVault secret name to store user name	

Name	Description	Value
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinParaguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Schema	Schema	FeatureParameter: EdicomSignedXMLSchema
Group	Group	FeatureParameter: EdicomGroup
ERP UUID	Reference ID of the document submitted to Edicom	Submit invoice: ExternalID

Get invoice status from Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinParaguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Schema	Schema	FeatureParameter: EdicomGetStatusSchema
Group	Group	FeatureParameter: EdicomGroup
ERP UUID	Reference ID of the document submitted to	Submit invoice: ExternalID

Name	Description	Value
	Edicom	

Process response parameters

Expand table

Name	Description	Value
Input file	Response to analyze	Get invoice status from Edicom: Output file
Reporting configuration list	List of configurations used for response parsing	Edicom Response Processing LATAM: Edicom Response Processing LATAM
Custom file name	Custom file name from the client	
Reporting configuration list	List of configurations used for response parsing	Edicom response error log import: Edicom response error log import

Terminate pipeline parameters

Expand table

Name	Description	Value
Terminal state	Desired state of the pipeline when terminating	complete
Number of days	Number of days to wait before terminating	8

> **Note**
>
> - If the status response indicates a failure, the pipeline is terminated, and the submission is marked as failed.
> - If the response shows successful submission to the Paraguayan Tax Authorities (DGI), the process completes after eight days if no further responses arrive.

Applicability rules and feature setup scope

Configure applicability rules so the service can find the correct Electronic Invoicing Globalization feature. These applicability rules are provided out of the box by checking the legal entity's International Organization for Standardization (ISO) country/region code.

Applicability rules for Paraguayan electronic invoice formats

The following applicability rules for each electronic invoice format for Paraguay. Replace `<Legal Entity ID>` with the actual ID of your legal entity.

Inventory PY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	PY	string
	Or	DocumentType	Equals	Customer invoice	string
		DocumentType	Equals	Customer credit note	string
		DocumentType	Equals	Customer debit note	string

Packing slip PY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	PY	string
		DocumentType	Equals	Customer packing slip	string

Project PY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	PY	string
	Or	DocumentType	Equals	Project invoice	string
		DocumentType	Equals	Project credit note	string
		DocumentType	Equals	Project debit note	string

Variables

The following variables are used in the outbound data flow actions of the Paraguayan feature. (These variables are provided out of the box.)

- **BusinessDocumentDataModel** – The Business Document Data model variable that is received from Finance or Supply Chain Management and transformed into the format that is required for submission.
- **SignedXML** – The signed XML variable that is sent back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get Signed XML from Edicom** step. It's used in the response types to save the signed XML that is obtained from Edicom as an attachment to the invoice journal. It's also used to generate printable reports through QR codes.

Expand table

Name	Description	Type	Data type	Value
BusinessDocumentDataModel	Contains the electronic document from the client	From client	file	
SignedXML	Signed XML document in base64-encoded format	To client	file	Get signed XML from Edicom.Base64ResponseBody

After you import the **Electronic invoicing for Paraguay** feature with the default setup, follow the next steps to set up electronic documents.

Setups > Application setup

To configure the mapping between Dynamics 365 Finance source tables and electronic document formats, go to the **Setups** tab within the Electronic invoice feature section, and then select **Application Setup**. This step lets you define how data from Finance is linked to the correct electronic invoice formats for Paraguay.

> **Note**
>
> Although this configuration isn't set at the general feature level, it acts globally for the selected feature setup. You don't need to repeat these steps for each individual format or feature—one configuration is sufficient for all supported document types within the feature.

The following grid defines the link between the source table in Dynamics 365 Finance, the document context model, and the mapping configuration used for electronic invoicing:

Expand table

Table name	Context model / Context	Electronic document mapping	Mapping name	Description
Customer invoice journal	Customer invoice context model / Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice	Maps customer invoices from the CustInvoiceJour table to the LATAM invoice model for electronic submission.
Project invoice	Customer invoice context model / Project invoice context	Invoice Model mapping LATAM	Project E-Invoice	Maps project invoices to the LATAM invoice model for electronic submission.

> **Tip**
>
> Ensure that the Context and Mapping name match the document type. Incorrect mappings cause errors in XML generation or submission to DGI.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Import the Paraguay-specific ER configurations for the document context and electronic document model mapping. Learn more in Set up Electronic document parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields as in step 1.

On the Electronic Document Parameters page in Dynamics 365 Finance, the navigation pane shows the following options:

- **Electronic Document**
- **Features**
- **Electronic Invoicing**
- **Integration Channels**

For the **Electronic Document** option, the **Electronic Reporting** section appears.

Within **Electronic Reporting**, the grid lists the electronic document configurations. It includes associations between:

- The source table name
- The document context model and context
- The electronic document model mapping
- The final mapping name used for generating the electronic invoice.

This configuration controls how Dynamics 365 Finance maps internal data models to external electronic formats for submission to tax authorities or service providers.

Configure the grid as follows:

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Customer invoice journal	No	Customer invoice context model	Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice
Project invoice	No	Customer invoice context model	Project invoice context	Invoice Model mapping LATAM	Project E-Invoice

1. Save your changes, and close the page.
2. For each table name, follow these steps:

    a. Select **Response types**, then select **New** to create a response type from the back end, and enter these values:

    - In the **Response type** field, enter **SignedXML** (default). See the Variables section.
    - In the **Description** field, enter a meaningful name, or leave it blank.
    - In the **Submission status** field, select **Pending**.
    - In the **Model mapping** field, select **Edicom source file response format**.

    b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. This setting lets you loop a subset of pipeline actions to pull updated statuses and other information for submitted documents from the tax authority.

Response type	Description	Submission status	Data entity name	Model mapping
SignedXML	Signed XML obtained from EDICOM	Pending		Edicom source file response import format
SignedXML	Signed XML obtained from EDICOM	Pending update actions execution		Edicom source file response import format

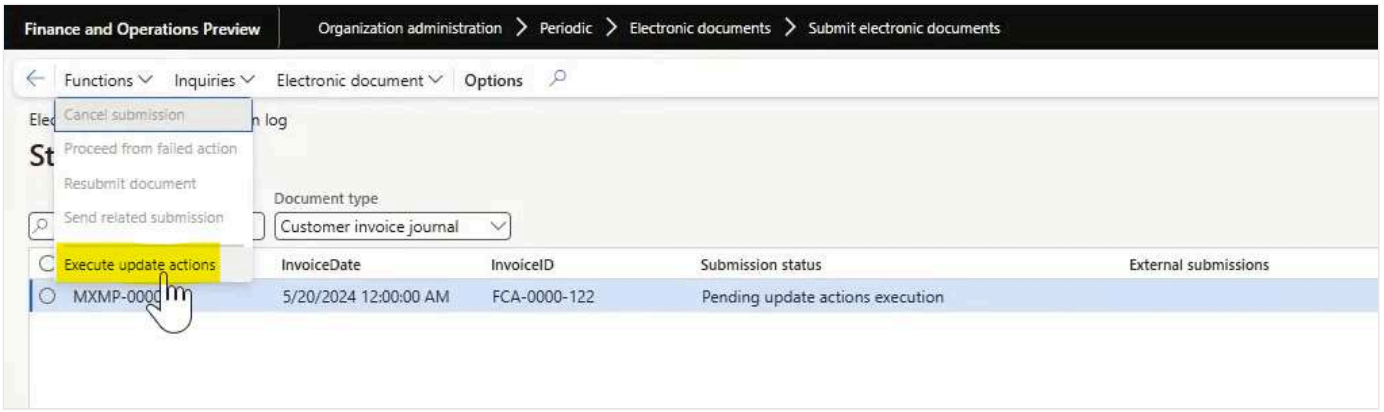
> **Note**
>
> The response includes the signed XML obtained from Edicom. The system stores this signed XML as an attachment to the corresponding invoice journal. The system uses it to generate printable invoices with QR codes.

Issue electronic invoices

After you complete the required configuration steps, generate and submit electronic invoices for posted invoices. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information, see Submit electronic documents.

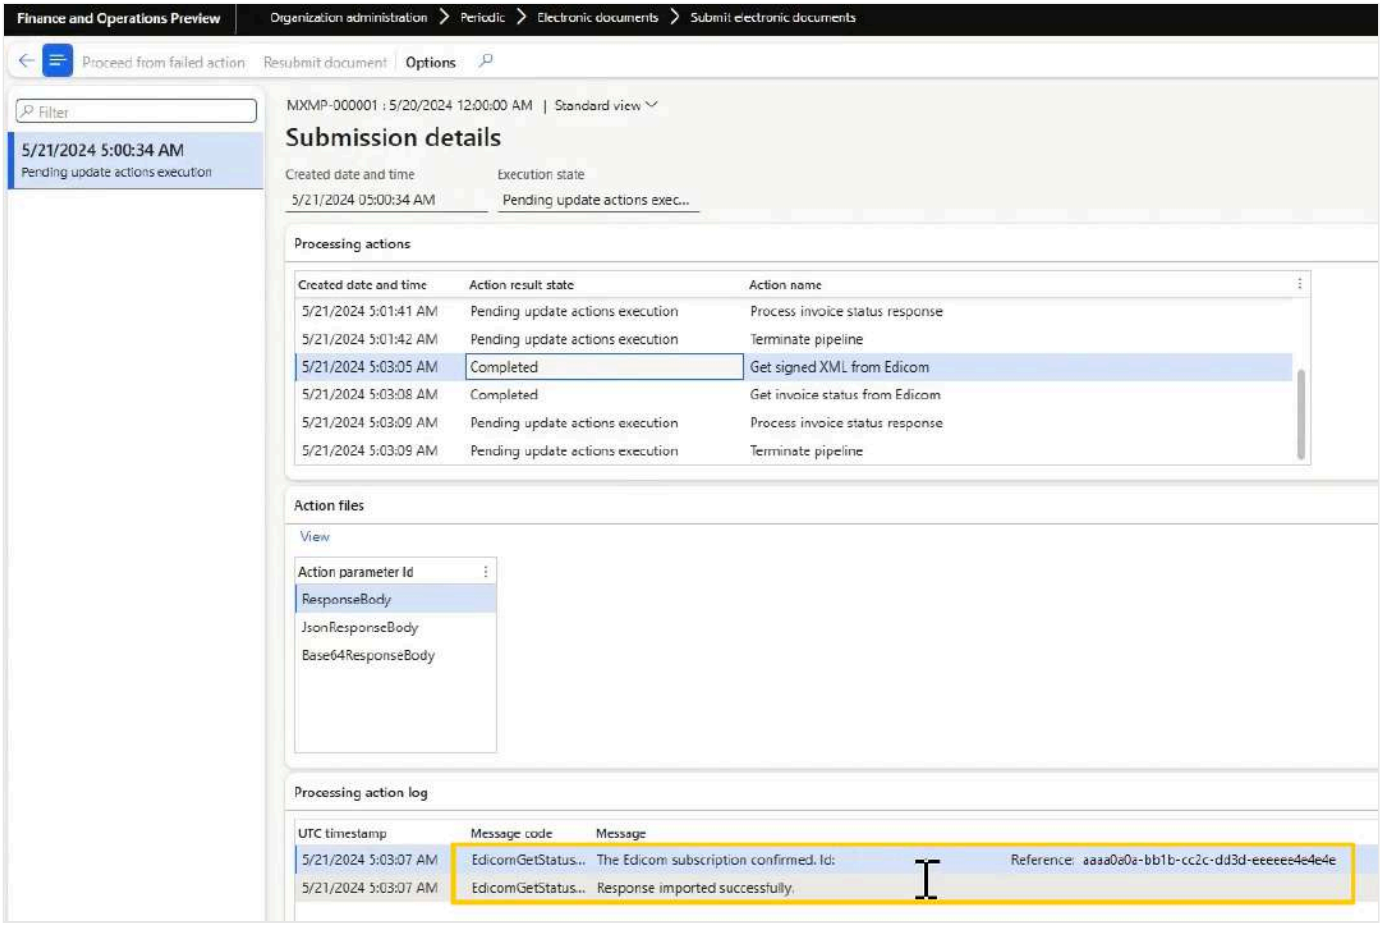
Check submission results. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Paraguay, after you submit the invoice, the submission status changes to **Pending update actions execution**. The response body might be empty for the signed XML and for the call that gets the invoice status. An empty response body indicates the XML isn't available immediately after submission. To address the pending status, use the **Execute update actions** function. This function resumes the pipeline from the action that's marked as an update action. It then runs subsequent actions in a loop. The status changes to **Executing**, and after a few seconds reverts to **Pending update actions execution**.

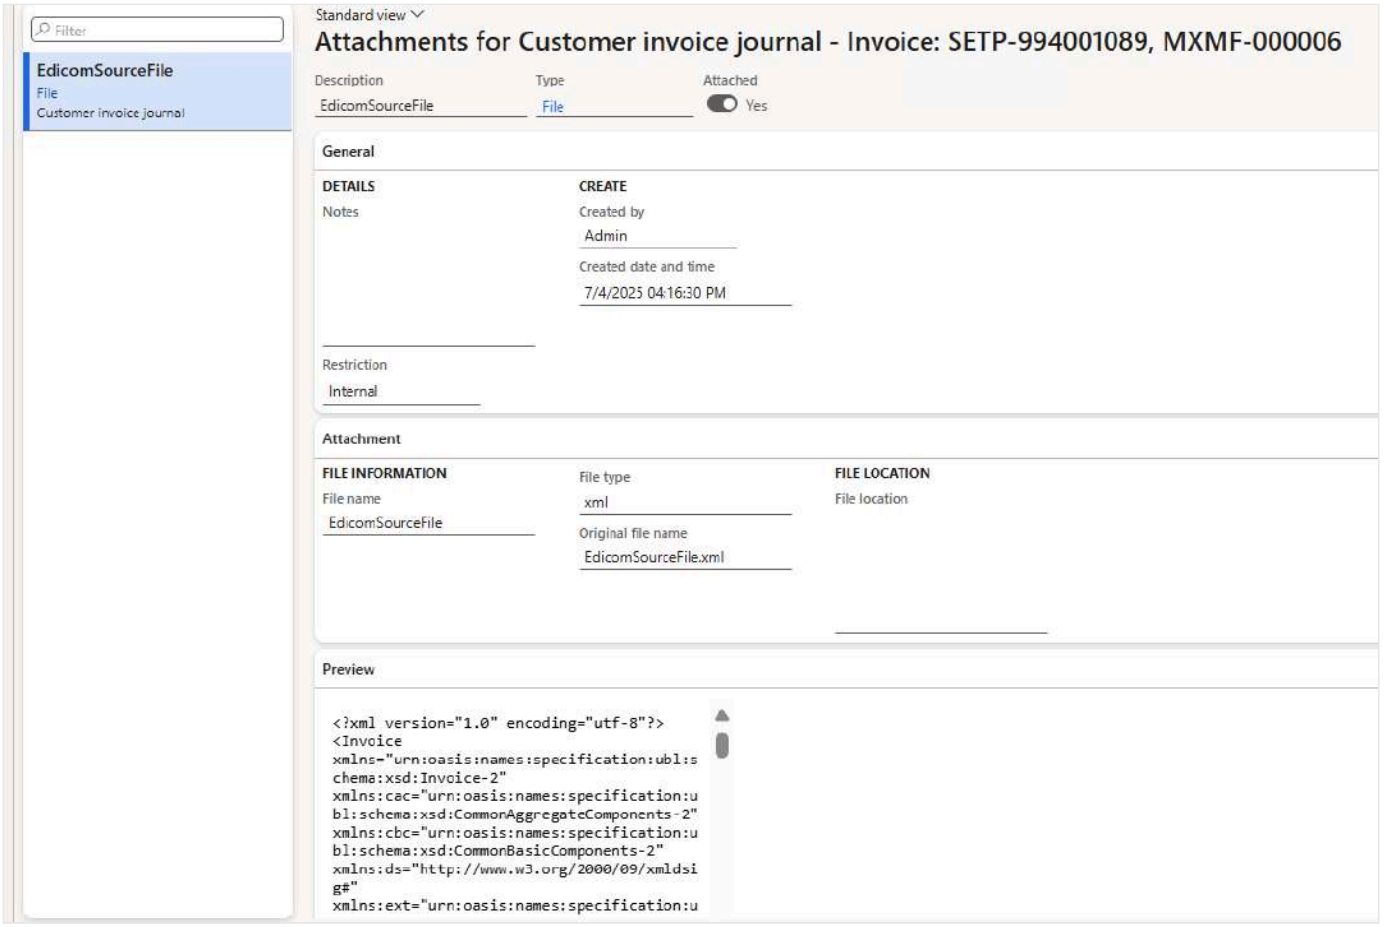


> **Note**
>
> Set a recurrence schedule to run the **Execute update actions** function in batch mode on a periodic basis.

When you review the submission details, you see that the steps run again. This time, the signed XML is received.



After the outbound flow completes, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



For Paraguay, the **Process response** action completes the pipeline after a few minutes.

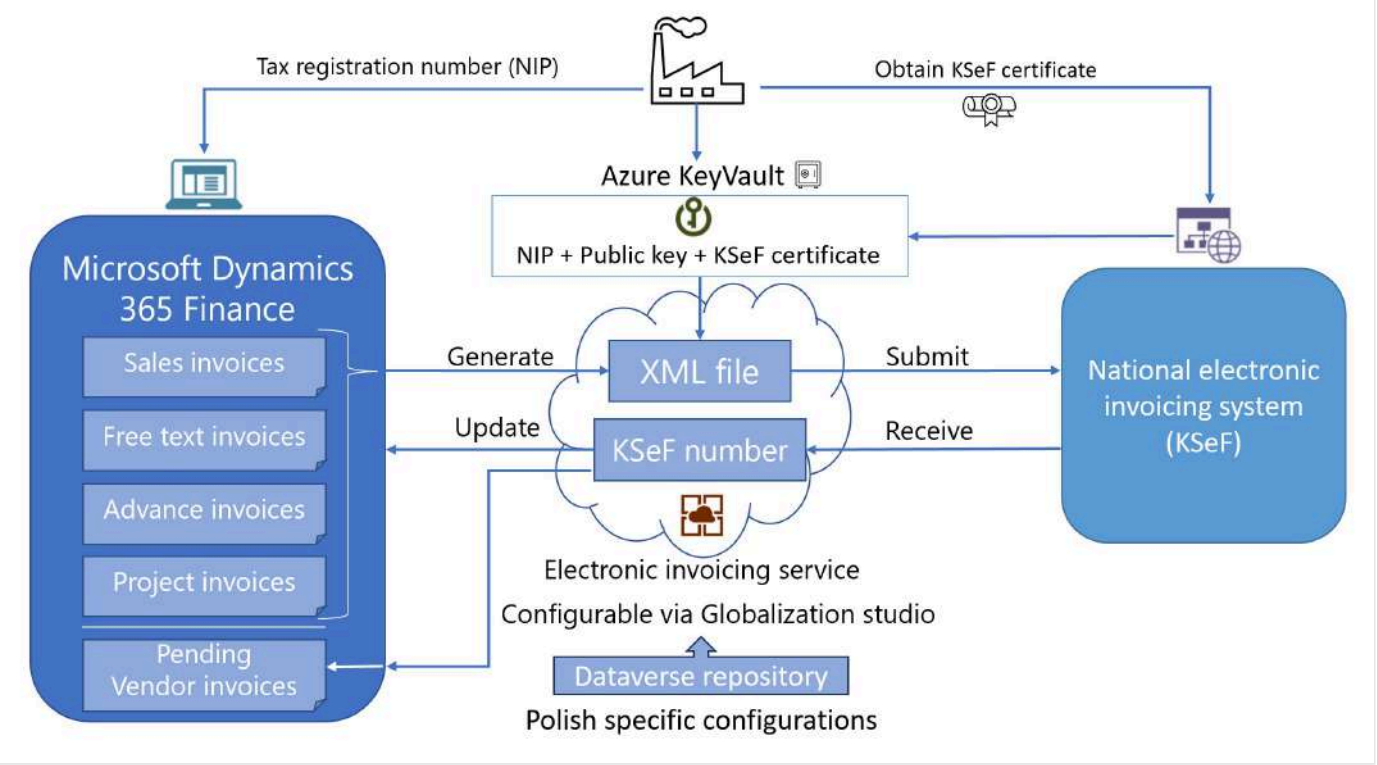
Electronic invoicing for Poland

This article explains how to get started with electronic invoicing for Poland in Microsoft Dynamics 365 Finance.

After you configure electronic invoicing, you can submit and receive the XML files of electronic invoices according to the regulatory requirements in Poland.



> **Note**
>
> The electronic invoicing approach that this article describes uses an invoicing service that's applicable only to cloud deployments of Finance or Supply Chain Management.

Prerequisites

Before you begin the procedures in this article, complete the following prerequisites:

- The primary address of the legal entity must be in Poland.
- The legal entity must be registered as a taxpayer in Poland and must have a valid tax identification number (*Numer identyfikacji podatkowej* [NIP]).

- Sign in to the Polish National system for electronic invoicing (Krajowy System e-Faktur [KSeF]) via a trusted profile, qualified signature, or qualified seal. Obtain the certificate of the **Authentication in KSeF system** type that the Invoicing Service can use to securely communicate with KSeF. For more information, see the video from the Ministry of Finance: Applying for and Managing Certificates.

  During the initial downloading you obtain the pair of files - the **.crt* file with the certificate itself and the **.key* file for the private key.

  > **Note**
  >
  > Store the private key file securely as since it might not be downloadable during the consequent obtaining of the same certificate.

  To process further with the system configuration, you need to convert the obtained pair of files into one **.pfx* certificate file, which is then stored in your Key Vault and used as a parameter in the feature setup.

  You can use any convenient tool for the certificate conversion. As an example, the following Windows PowerShell script can be used for the conversion.

  > **Note**
  >
  > The sample script isn't supported under any Microsoft standard support program or service. The sample script is provided *AS IS* without warranty of any kind. Microsoft further disclaims all implied warranties including, without limitation, any implied warranties of merchantability or of fitness for a particular purpose. The entire risk arising out of the use or performance of the sample scripts and documentation remains with you. In no event shall Microsoft, its authors, or anyone else involved in the creation, production, or delivery of the script be liable for any damages whatsoever (including, without limitation, damages for loss of business profits, business interruption, loss of business information, or other pecuniary loss) arising out of the use of or inability to use the sample script or documentation, even if Microsoft has been advised of the possibility of such damages.

  PowerShell

  ```
  openssl pkcs12 -export -in <your-ksef-certificate>.crt -inkey <your-ksef-
  ```

```
certificate>.key -out <your-ksef-certificate>.pfx
```

Where:

- *<your-ksef-certificate>.crt* - is the certificate file obtained from KSeF the private key will be combined with
- *<your-ksef-certificate>.key* - is the private key file obtained from KSeF to combine with the certificate
- *<your-ksef-certificate>.pfx* - the output file name that is used for uploading to your Key Vault

- Obtain the **public key** these links depending on the type of environment you're configuring: test, demo, or prod. From the response, copy the value from the second *certificate* element with the *SymmetricKeyEncryption* usage type. You use it during Key Vault parameters configuration described in the next chapter. For more information, see the details provided by KSeF.

- Install the **Electronic invoicing add-in** as described in Install the add-in for Electronic invoicing microservices.

- Activate **Electronic invoicing integration** with Finance or Supply Chain Management as it's described in Enable Electronic invoicing integration.

- Configure the common part of the **Electronic document parameters**.

> **Note**
>
> Service environment configuration is required only if the Regulatory Configuration Service (RCS) experience was previously used to configure the Electronic Invoicing service. Otherwise, keep the **Environment** parameter empty. The system assigns it automatically and makes read-only. For more information, see Service environment configuration.

Create the Azure Key Vault configuration

Configure the common part of the Azure resources required for Electronic invoicing functioning. For more information, see Configure Azure resources for Electronic invoicing.

Add the following required elements in the key vault:

- The secret that holds the shared access signature (SAS) token of the storage account.

- The certificate for the obtained **KSeF certificate**.
- The secret for the **client ID**, which must equal the taxpayer's tax identification number (NIP).
- The secret for the obtained **public key**.

> ⓘ Note
>
> The value of the public key must be wrapped in the following commands.
>
> `-----BEGIN CERTIFICATE-----`
>
> ...
>
> `-----END CERTIFICATE-----`

Configure electronic invoicing Key Vault parameters

To configure electronic invoicing Key Vault parameters, follow these steps:

1. In Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, in the **Key Vault settings** section, in the **Key Vault** field, select the reference to the key vault that you created in the previous section of this article.
3. In the **SAS token secret** field, select the name of the storage account secret URL that you use to authenticate access to the storage account.
4. Select **Key Vault parameters**.
5. On the **Key Vault parameters** page, in the **Certificates** section, select **Add** to create new elements of the appropriate type for each secret that is described in the previous section.
    - The secret for the SAS token of the storage account.
    - The **certificate** element of the **Certificate** type.
    - The **Client ID** element of the **Secret** type.
    - The **Public key** element of the **Secret** type.

> ⓘ Note
>
> The values in the **Name** column should match the names of the secrets that are described in the previous section.

For more information, see Create a Key Vault reference.

Synchronization of the Electronic invoicing service with Finance

After you complete all the configuration steps described in the previous chapters, validate the configuration.

1. In Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. Select the **Electronic invoicing** tab and select the **Save** menu button.
3. If the configuration is correct, the system shows the *Synchronization with the e-invoicing service was successful* information message. You can continue with the next chapters.
4. If there are synchronization errors, address the errors to achieve successful synchronization.

Import the electronic invoicing feature

To import the electronic invoicing feature, follow these steps:

1. In Finance, go to **Globalization Studio**, and select the **Electronic invoicing** tile. Then import the latest version of the **Polish electronic invoice (PL)** Globalization feature as described in Import features from the repository.

2. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, make sure that the following Electronic reporting configurations are successfully imported as result of the **Polish electronic invoice (PL)** Globalization feature import.

    - **Invoice model**
    - **Invoice model mapping**
    - **Advance invoice model mapping**
    - **Sales e-invoice (PL)**
    - **Project e-invoice (PL)**
    - **Advance e-invoice (PL)**
    - **Customer invoice context model**
    - **Response message model**
    - **Response message model mapping to destination (PL)**
    - **KSeF response message import (PL)**

    > ⓘ **Note**

If the import process doesn't import these Electronic reporting configurations, import them manually as described in Import Electronic reporting (ER) configurations from Dataverse.

3. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, import the latest versions of the following Electronic reporting configurations required for receiving incoming vendor invoices.

    - **Vendor invoice import (PL)**
    - **Vendor invoice Mapping to destination (PL)**
    - **KSeF number message import (PL)**
    - **KSeF number model mapping to destination (PL)**

Configure application-specific parameters

> ⓘ **Note**
>
> The steps in this article apply only if you use the **Sales e-invoice (PL)** format configuration of **version 329.40** or higher.

To configure application-specific parameters (ASP), follow these steps for the **Sales e-invoice (PL)** Electronic Reporting format configuration.

1. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, select the related format configuration.
2. In the **Configurations** menu, in the **Application specific parameters** section, select **Setup**.
3. In the left pane, select the format version that you use for generating e-invoice XML files.
4. In the **Lookups** grid, make sure that the **$ZeroTaxRate** is selected.
5. In the **Conditions** grid, select **Add** to create a new row.
6. In the **Lookup result** column, select a value from the enumeration list that contains allowed values for a zero tax rate. This value is used for **P_12** XML element population.

    > ⓘ **Note**

Select the **Auto** value to let the system automatically determine which zero tax rate value to use.

7. In the **Code** column, select a related sales tax code value for which the respective **Lookup result** value is used.

   > ⓘ Note
   >
   > Instead of selecting specific sales tax codes, you can use ****Blank**** or ****Not blank**** placeholder values for the mass matching.

8. In the **Lookups** grid, make sure that the **TaxExemptsLookUp** is selected.
9. In the **Conditions** grid, select **Add** to create a new row.
10. In the **Lookup result** column, select a value from the enumeration list that contains allowed values for tax exemptions categories. This value is used for **P_19** XML block and its child elements population.
11. In the **Code** column, select a related sales tax code value for which the respective **Lookup result** value is used.

    > ⓘ Note
    >
    > Instead of selecting specific tax exemptions codes, you can use ****Blank**** or ****Not blank**** placeholder values for the mass matching.

12. In the **State** field, select the **Completed** value to indicate that the configuration is finished.
13. Select **Save**, and close the page.

Configure the import channel

To configure the import channel, follow these steps:

1. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, select the **Customer invoice context model** configuration.
2. Select **Create configuration**, and then select **Derive from Name: Customer invoice context model, Microsoft** in the dropdown dialog. This action creates a derived configuration.

3. Open the derived configuration for editing in the designer, and then select **Map model to datasource**.

4. Open the **DataChannel** definition for editing in the designer.

5. In the **Data sources** tree, expand the **$Context_Channel** container.

6. In the **Value** field, select **Edit**, and then enter the name of the data channel. Make a note of the value, because you use it in later configuration steps.

7. Save your changes and complete the derived configuration.

Configure the electronic invoicing feature

Some parameters for the **Polish electronic invoice (PL)** electronic invoicing feature have default values. Before you deploy the electronic invoicing feature to the service, review the default values, and update them as needed to better reflect your business operations.

To review and update the **Polish electronic invoice (PL)** electronic invoicing feature configuration, follow these steps:

1. In Finance, go to **Globalization Studio**, and select the **Electronic invoicing** tile. Then import the latest version of the **Polish electronic invoice (PL)** Globalization feature as described in Import features from the repository.

2. Create a copy of the imported Globalization feature, and select your configuration provider for it, as described in Create a Globalization feature.

3. On the **Versions** tab, verify that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters. You need these parameters for interoperation with Polish KSEF services.

- **EnvironmentName** – select the type of the environment, depending on the implementation stage: *Test*, *Demo*, or *Prod*.
- **PolishClientID** – select the name of the client ID that you previously created.
- **PolishImportDataChannel** – enter the name of the data channel that you previously defined.
- **PolishPublicKey** – select the name of the public key that you previously created.
- **PolishCertificate** – select the name of the certificate that you previously created.

5. On the **Setups** tab, in the grid, select the **Import vendor invoices derived** feature setup and select **Edit**.

6. On the **Import channel** tab, in the **Parameters** section, in the **Value** field for the **Start Date** parameter, enter the date starting from which the import is to be performed.

7. On the **Applicability rules** tab, in the **Set up applicability rule** section, for the line with the **Channel** field, make sure that the previously defined import channel name is defined in the **Value** field.

8. On the **Variables** tab, make a note of the **OutputFile** name, because you use it in later configuration steps.

9. Select **Save**, and close the page.

10. The copy of the feature is always a **Draft** version. Complete and deploy the feature as described in Complete and deploy a Globalization feature.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

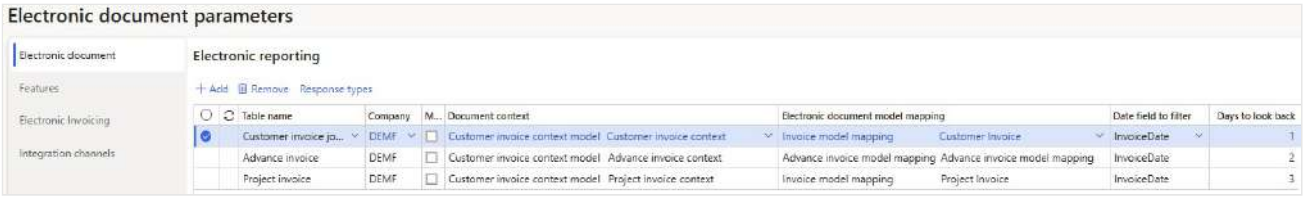
1. In Finance, go to **Organization administration** > **Setup** > **Electronic document parameters**.

2. On the **Electronic document** tab, add records for the **Customer Invoice journal**, **Project invoice**, and **Advance invoice** table names.

3. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with Set up electronic invoicing parameters.

> ⓘ **Note**

If you created the derived analogs of the mentioned above Electronic Reporting configurations, use them instead of standard ones.



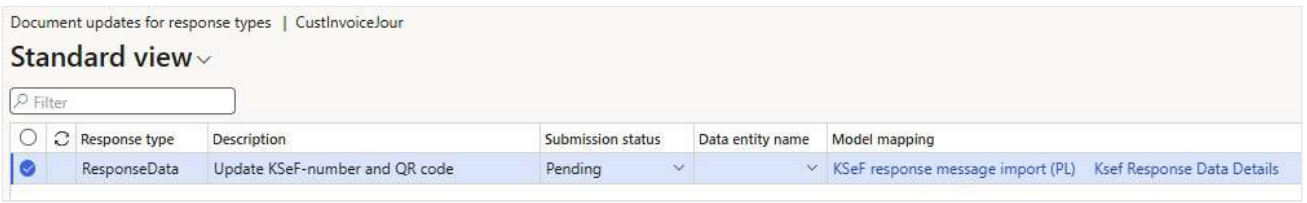
> ⓘ **Note**
>
> To minimize the risk of accidental massive submissions, the system implements default filtering by document dates. In the **Date filed to filter** column, specify the exact selected table's field for filtering. In the **Days to look back** column, define the number of days to subtract from the current date to determine the earliest date for document processing. If you don't configure the **Date filed to filter** and **Days to look back** columns, the **Invoice date** equal to the current date is used by default.

4. For the **Customer Invoice journal** table name, select **Response types**.

5. Select **New** to create a response type, and enter the following values:

   - In the **Response type** field, enter **ResponseData** (the default value).
   - In the **Submission status** field, select **Pending**.
   - In the **Model mapping** field, select **KSeF response message import (PL)**.

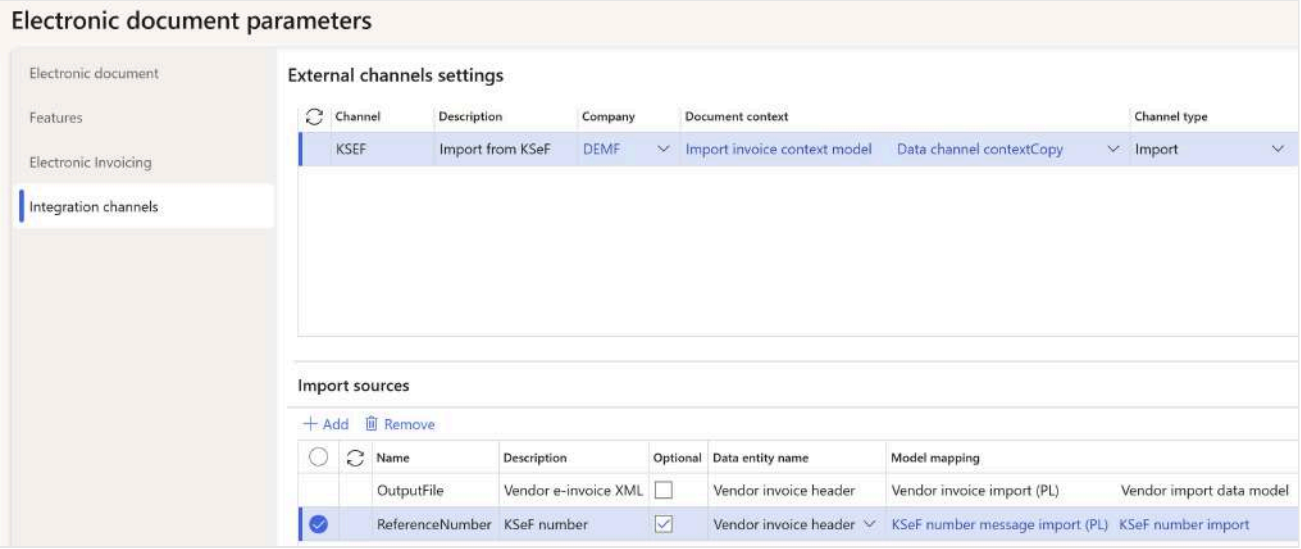
   > ⓘ **Important**
   >
   > Make sure that the **Response message model mapping to destination (PL)** Electronic Reporting configuration is marked as **Default for model mapping**.



> ⓘ **Note**

ResponseData is the default name of the response type. If you change it, make sure that the new name matches the name that you defined for the related variable of the **To client** type in the corresponding feature setups. To validate the variable's value, go to **Globalization Studio**, and select the **Electronic invoicing** tile. On the **Electronic invoicing features** page, verify that the **Polish electronic invoice (PL)** electronic invoicing feature is selected. On the **Setups** tab, in the grid, select the **Submit customer invoice derived** feature setup. Then select **Edit** or **View**, depending on the status of the feature version.

6. Repeat steps 4 and 5 for the **Project invoice** and **Advance invoice** table names.
7. On the **Integration channels** tab, in the **Channels** section, in the **Channel** field, enter the name of the data channel that you previously defined.
8. In the **Company** field, select a required legal entity. In the **Document context** field, select the context configuration that you previously created.
9. In the **Import sources** section, in the **Name** field, enter the **OutputFile** name that is actually used.
10. In the **Data entity name** field, select **Vendor invoice header**. In the **Model mapping** field, reference the **Vendor invoice import (PL)** configuration.
11. Add the **second** import source line, in the **Name** field, enter the **ReferenceNumber** value.
12. In the **Data entity name** field, select **Vendor invoice header**. In the **Model mapping** field, reference the **KSeF number message import (PL)** configuration.



13. Select **Save**, and close the page.

Configure Finance business data

Prerequisites

The legal entity's primary address must be in Poland.

Configure legal entity data

To configure the legal entity data, complete the steps in each of the following sections.

Enter a legal entity's address

To enter a legal entity's address, follow these steps:

1. In Finance, go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity. On the **Addresses** FastTab, add a valid primary address for the legal entity.

   > ⓘ **Note**
   >
   > Make sure that you define the following mandatory address elements: country/region code, ZIP/postal code, city, and building number.

Enter a legal entity's tax registration number

To enter a legal entity's tax registration number, follow these steps:

1. In Finance, go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select a legal entity. On the **Tax registration** FastTab, in the **Tax registration number** field, enter a valid tax registration number for the legal entity. This number is the seller's tax identification number (NIP).

Configure customer data

To configure the customer data, complete the steps in each of the following sections.

Enter a customer's address

To enter a customer's address, follow these steps:

1. In Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer. On the **Addresses** FastTab, add a valid address for the customer.

> ⓘ Note
>
> - For addresses in Poland, make sure that you define the following mandatory elements: country/region code, ZIP/postal code, city, and building number.
> - For foreign addresses, make sure that you define at least the following mandatory elements: country/region code and city.

Enter a customer's tax registration number

To enter a customer's tax registration number, follow these steps:

1. In Finance, go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer. On the **Invoice and delivery** FastTab, in the **Tax exempt number** field, enter a valid tax registration number for the customer. This number is the buyer's tax identification number (NIP).

Configure sales taxes

Configure the following sales tax codes related data that affect the system behavior in the event of non-taxable, zero-rated, or exempted operations:

1. Tax > Indirect taxes > Sales tax > Sales tax codes > Report setup > **Country/region type**.
2. Tax > Indirect taxes > Sales tax > Sales tax groups > Setup > **Exempt**.
3. Tax > Indirect taxes > Sales tax > Sales tax groups > Setup > **Exempt code**.
4. Tax > Indirect taxes > Sales tax > Sales tax groups > Setup > **Reverse charge**.
5. Tax > Setup > Sales tax > **Sales tax exempt codes**.

> ⓘ Note
>
> Different combinations of the preceding parameters dynamically enable and disable related XML elements in the output files of electronic invoices.

Configure extra data

You can add extra data to invoices. The system uses this data during electronic invoices XML file generation.

Configure electronic document properties

To configure electronic document properties, follow these steps:

1. In Finance, go to **Accounts receivable** > **Setup** > **Electronic document property types**.
2. Select **New** to add a property type.
3. In the **Type** field, enter the value to use as an extra data key (`Klucz`) in the resulting XML file of an electronic invoice.
4. In the **Group description** field, enter the **KSEF** value.

> **Note**
>
> Only the properties with the **KSEF** value in the **Group description** field are considered during the electronic invoice generation process. This data goes in a special section of electronic invoices headers named *DodatkowyOpis*.

1. Select **Applicability** to add an applicable table.
2. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Customer invoice journal** and **Project invoice**.
3. Add as many extra document properties as you need.
4. Save your changes and return to the **Electronic document property types** page.

1. Select **New** to add a property type.
2. In the **Type** field, enter **CorrectionType**. Enter the value exactly as shown.

> **Note**
>
> The electronic invoice generation process considers this property regardless of the value in the **Group description** field. This data is applicable only for corrected invoices and is used as

the type of correction populated in the *Faktura/Fa/TypKorekty* XML element.

1. Select **Applicability** to add an applicable table.
2. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Customer invoice journal** and **Project invoice**.
3. Save your changes and return to the **Electronic document property types** page.
4. Save your changes and close page.

Enter extra invoice data

To enter extra invoice data, follow these steps:

1. In Finance, go to **Accounts payable** > **Inquiries and reports** > **Invoice** > **Invoice journal**.
2. Select an invoice in the list. On the Action Pane, on the **Invoice** tab, in the **Properties** group, select **Electronic document properties**.
3. For all the properties related to *DodatkowyOpis* block, enter the required values. The system uses these values in the respective `Wartosc` elements in the resulting XML file of an electronic invoice.
4. For the **CorrectionType** property specifically, enter **1**, **2**, or **3**. If you don't define this property, or leave it empty, or enter any value other than 1, 2, or 3, the default value of the correction type is **1**.

> **Note**
>
> You can enter extra data for project invoices in a similar way at **Project management and accounting** > **Project invoices** > **Project invoice**.
>
> Extra data apply to the invoice header level only.

Configure the data for incoming electronic invoices matching

You must configure the following types of master data to provide a match for incoming electronic invoices:

- Vendors
- Products
- Units

Configure vendors

To configure vendors, follow these steps:

1. In Finance, go to **Accounts payable** > **Vendors** > **All vendors**, and select a vendor.
2. On the **Invoice and delivery** FastTab, in the **Tax exempt number** field, enter a valid value. The vendor's tax exempt number identifies the vendor during the import process for incoming electronic invoices. If the system doesn't find a vendor with matching data, the import process fails and shows a related error message.

Configure products

To configure products, follow these steps:

1. In Finance, go to **Product information management** > **Products** > **Released products**, and select a product.

2. On the Action Pane, on the **Purchase** tab, in the **Related information** group, select **External item description**.

3. In the **Vendor relation** field, select the vendor or vendor group that the product's external identification is being set up for.

4. In the **External item number** field, enter the identification number of the product for a specific vendor or the group of vendors. External item numbers identify the product during the import process for incoming electronic invoices. If the system doesn't find a product with matching criteria, the import process fails and shows a related error message.

   > ⓘ **Note**
   >
   > You should populate the external item number in the invoice line level **Indeks** element of incoming XML files of vendor electronic invoices.
   >
   > Symmetrically, while generating outgoing electronic invoices XML files for customers, the **Indeks** element is populated from the **External item number** defined for a specific customer in the related released product's **Sell** tab, in the **Related information** group, in the **External item description**.

Configure units

To configure units, follow these steps:

1. In Finance, go to **Organization administration** > **Setup** > **Units** > **Units**.

2. Select a unit, and then select **External codes**.
3. On the **External codes** page, in the **Overview** section, in the **Code** field, enter a code that corresponds to the selected unit.
4. In the **Value** section, in the **Value** field, enter the external code to match with the unit codes from incoming electronic invoices during the import process.

> **Note**
>
> External unit codes make sense only if incoming electronic invoices contain explicitly defined units. If incoming electronic invoices don't contain explicitly defined units, you can skip step 4.

Issue outgoing electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate and submit electronic invoices, see Submit electronic documents.

You can check the results of a submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** and selecting the required document type. For more information about the submission log, see Work with Electronic document submission log.

Configure printable invoice layouts

To enable QR code printing in invoices, follow these steps:

1. In Finance, go to **Accounts receivable** > **Setup** > **Forms** > **Form setup**.
2. Select **Print management**.
3. Select the **Customer invoice** report, and then, in the **Report format** field, reference the **SalesInvoice.ReportPL** layout.
4. Select the **Free text invoice** report, and then, in the **Report format** field, reference the **FreeTextInvoice.ReportPL** layout.
5. Select the **Sales advance invoice** report, and then, in the **Report format** field, reference the **CustAdvanceInvoice.ReportPL** layout.

If you use project invoices, follow these steps:

1. In Finance, go to **Project management and accounting** > **Setup** > **Forms** > **Form setup**.
2. Select **Print management**.
3. Select the **Project invoices without billing rules** report, and then, in the **Report format** field, reference the **PSAProjInvoice.ReportPL** layout.
4. Select the **Project invoices with billing rules** report, and then, in the **Report format** field, reference the **PSAContractLineInvoice.ReportPL** layout.
5. Select the **User defined project invoice** report, and then, in the **Report format** field, reference the **PSAManageInvoice.ReportPL** layout.

> **Note**
>
> The QR code that appears on the printouts of invoices represents the URL that takes you to the official portal of the **KSeF** system, where you can find the details of the related electronic invoice.
>
> QR codes are printed only for invoices that the **KSeF** system successfully submitted, validated, and accepted. Printing of QR codes for **Offline24** mode isn't supported in this implementation.

Receive incoming electronic invoices

To receive electronic invoices, follow these steps:

1. In Finance, go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

During the import process, the system tries to automatically match incoming electronic vendor invoices with existing confirmed purchase orders.

If the system doesn't find a purchase order, it raises a warning but continues to import the products on invoice lines as **Non-stock** items. Therefore, it expects that the products belong to an item model group where the **Stocked product** checkbox is cleared in the inventory policy.

If no related **Non-stock** products exist, the system tries to import invoice lines by referring to a default item. You must configure the default item in the system as a released product where the code is defined exactly as **DEFAULT_ITEM**. In addition, the product must belong to an item model group where the **Stocked product** checkbox is cleared in the inventory policy. If you don't

configure a default item in the system, the import process fails, and a related error message is shown.

To view the receipt logs for electronic invoices, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**. For more information about how to receive electronic invoices, see Receive electronic documents.

To view successfully received invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

Electronic invoicing in Saudi Arabia

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to get started with phase two of electronic invoicing for Saudi Arabia in Microsoft Dynamics 365 Finance.

This article provides information that will help you get started with phase two of electronic invoicing for Saudi Arabia. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup.

Prerequisites

Before you begin the procedures in this article, complete the following prerequisites:

- Become familiar with electronic invoicing as it's described in Electronic Invoicing service overview.
- Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.
- Import the **Saudi Arabian Zatca submission (SA)** version **14** or later and **Saudi Arabian ZATCA compliance check (SA)** version **20** or later electronic invoicing features from the repository. For more information, see Import features from the repository.

Configure the application-specific parameters

Before you begin, make sure that the following Electronic reporting (ER) format configurations are imported:

- Sales e-invoice (SA)
- Project e-invoice (SA)

To configure the application-specific parameters, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic reporting** tile, and then select the **Reporting configurations** tile.
2. On the **Configurations** page, select the **Sales e-invoice (SA)** format configuration.
3. On the **Configurations** menu, in the **Application specific parameters** section, selected **Setup**.
4. In the **Lookups** section, make sure that the **PaymentMethodSubstitutionLookup** lookup is selected.
5. In the **Conditions** section, select **Add** to add a condition.
6. In the **Name** column for the new condition, select the method of payment that's defined in the application. Then, in the **Lookup result** column, select a standardized method of payment code according to UN/EDIFACT Code list 4461.
7. Add specific conditions for each method of payment that's defined in the system, and save your changes.

   > **Note**
   >
   > In the **Name** column, you can select the ***Blank*** or ***Not blank*** placeholder value instead of a specific method of payment.

8. In the **State** field, change the state of the application-specific parameters to **Completed**. Then select **Save**.
9. Repeat steps 2 through 8 for the **Project e-invoice (SA)** ER format configuration as required.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Ensure that the country/region-specific ER configurations required for Saudi Arabia are imported. For more information, see Configure electronic invoicing parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

3. On the **Electronic document** tab, add records for the **Customer Invoice journal** and, if required, for the **Project invoice**, **Journal lines**, and **Fiscal transaction document** table names.

4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

5. For the **Customer Invoice journal** table name, select **Response types**.

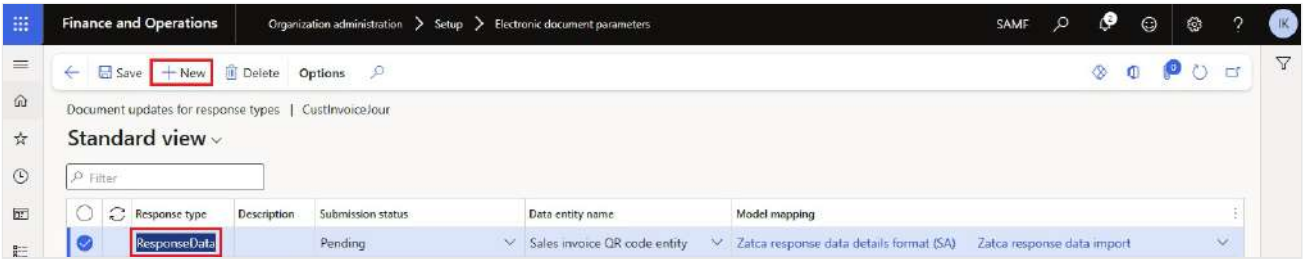
> **Note**
>
> When tax invoices are cleared, the Saudi Arabian tax authority (Zakat, Tax and Customs Authority [ZATCA]) generates a QR code that contains the digital signature for that clearance. This QR code must be imported back into Finance, together with other clearance information that the tax authority returns as a result of the submission of the tax invoices. To achieve this result, you must configure the response types in Finance.

6. Create a response type that has the same name as the related variable in the value of the **Configuration Integration point** parameter in the **Transform document (export), export QRCode** processing pipeline's action for the **Sales invoice** feature setup. The default value is **ResponseData**.

7. In the **Submission status** field, select **Pending**.

8. In the **Data entity name** field, select **Sales invoice QR code entity**.

9. In the **Model mapping** field, select **Zatca response data import**.



10. On the **Electronic invoicing** tab, on the **Number sequences** FastTab, add a record for the number sequence that should be used to count submitted electronic invoices.

Configure electronic invoicing features

> **Note**

This section describes the configuration steps for the **Saudi Arabian Zatca submission (SA)** electronic invoicing feature. These steps assume that the onboarding process is completed, and that you've obtained the Production Cryptographic Stamp Identifier (PCSID). If the onboarding process is still in progress, and you've obtained only the Compliance Cryptographic Stamp Identifier (CCSID), complete the same configuration steps for the **Saudi Arabian ZATCA compliance check (SA)** electronic invoicing feature.

Some of the parameters from the **Saudi Arabian Zatca submission (SA)** electronic invoicing feature are published with default values. Before you deploy the electronic invoicing feature to the service, review the default values, and update them as required so that they better reflect your business operations.

To configure electronic invoicing features, follow these steps:

1. In the **Globalization Studio** workspace, select the **Electronic invoicing** tile.
2. On the **Electronic invoicing features** page, verify that the **Saudi Arabian Zatca submission (SA)** electronic invoicing feature is selected.
3. On the **Versions** tab, verify that the **Draft** version is selected.
4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with ZATCA's API:

    - **ZatcaAPIEndPoint** – Enter the URL of the development portal or the production environment that ZATCA provided.
    - **ZatcaCertificateName** – Select **CCSID** or **PCSID**, depending on your place in the onboarding process.
    - **ZatcaSecretName** – Select **CCSIDSecret** or **PCSIDSecret**, depending on your place in the onboarding process.
    - **ZatcaNumberSequence** – Select the number sequence that you previously created on the **Electronic document parameters** page.

    The following illustration shows an example of a feature parameter setup that includes the URL for ZATCA's production endpoint. Update the values based on the configuration on the **Electronic document parameters** page.

5. On the **Setups** menu, select the **Sales invoice** feature setup, and then select **Edit**.

> **Note**
>
> For the **Saudi Arabian ZATCA compliance check (SA)** electronic invoicing feature, select the **Tax invoice compliance check** feature setup instead.

6. In the **Processing pipeline** section, select **Integrate with Saudi Arabia Zatca service**, and then follow these steps:

   a. Select the **API method name** name.

   b. In the **Value** field, select **Invoice clearance** for tax invoices or **Invoice reporting** for simplified invoices.

   > **Note**
   >
   > Depending on your place in the onboarding process, create either a CCSID or a PCSID, and configure it in advance in the Key Vault parameters.

7. Complete and deploy the **Saudi Arabian Zatca submission (SA)** feature to the service. For more information, see Complete and deploy a Globalization feature.

For more information about business data configuration and processing in Finance, see Customer electronic invoices in Saudi Arabia.

Electronic invoicing onboarding in Saudi Arabia

Onboarding is mandatory for all taxpayers who are subject to electronic invoicing in Saudi Arabia. Taxpayers and their software for e-invoicing must be onboarded with ZATCA. As a result of the onboarding process, taxpayers obtain Cryptographic Stamp Identifiers (CSIDs). CSIDs are required for integration with the electronic invoicing portal that ZATCA manages, and for further submission of electronic invoices.

Onboarding is an essential part of the electronic invoicing configuration. For more information about the onboarding process, see Onboarding for electronic invoicing in Saudi Arabia.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices. For more information about how to generate electronic invoices, see Submit electronic documents.

You can inquire about the results of a submission by going to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log** and selecting the required document type.

Onboarding for electronic invoicing in Saudi Arabia

This article explains how to onboard taxpayers and their electronic invoicing software with the Saudi Arabian tax authority in Microsoft Dynamics 365 Finance.

Onboarding is mandatory for all taxpayers who are subject to electronic invoicing in Saudi Arabia. As a result of the onboarding process, taxpayers get Cryptographic Stamp Identifiers (CSIDs). You need CSIDs for integration with the electronic invoicing portal that the Saudi Arabian tax authority (Zakat, Tax and Customs Authority [ZATCA]) manages, and for further submission of electronic invoices.

Prerequisites

- The legal entity must be registered as a taxpayer in Saudi Arabia and must have a valid value-added tax (VAT) registration number.
- The legal entity must have access to the Saudi Arabian Taxation Portal (ERAD).

Onboarding process

The onboarding process consists of two steps:

1. Get a Compliance CSID (CCSID), which ZATCA assigns to perform compliance checks on electronic invoice generation solutions (EGSs).
2. Get a Production CSID (PCSID), which ZATCA assigns to compliant EGSs.

Obtain a CCSID

To obtain a CCSID, follow these steps:

1. In the Saudi Arabian Taxation Portal (ERAD), go to the Onboarding and Management Portal by selecting the relevant tile.

2. On the main landing page of the Onboarding and Management Portal, select the **Onboard new solution unit/device** tile, and then select **Generate OTP code**.

3. Select the number of one-time password (OTP) codes to generate. The number depends on the number of e-invoicing generation units (devices) that you'll use.

4. Save the generated OTP codes so you can use them in later steps.

> **ⓘ Important**
>
> OTP codes are valid for only one hour after they're generated. Ensure you use them within that time.

5. Prepare a configuration file for the certificate signing request (CSR). Create this configuration file as a plain text file that contains the following data.

```txt
oid_section = OIDs
[OIDs]
certificateTemplateName = 1.3.6.1.4.1.311.20.2
[req]
default_bits = 2048
emailAddress = MyEmail@email.com
req_extensions = v3_req
x509_extensions = v3_ca
prompt = no
default_md = sha256
req_extensions = req_ext
distinguished_name = dn
[dn]
C=SA
OU=Riyad Branch
O=Contoso
CN=PREZATCA-Code-Signing
[v3_req]
basicConstraints = CA:FALSE
keyUsage = digitalSignature, nonRepudiation, keyEncipherment
[req_ext]
certificateTemplateName = ASN1:PRINTABLESTRING:PREZATCA-Code-Signing
subjectAltName = dirName:alt_names
[alt_names]
SN=1-TST|2-TST|3-ed22f1d8-e6a2-1118-9b58-d9a8f11e445f
UID=310122393500003
title=1100
registeredAddress= MyAddress
businessCategory=Industry
```

6. Save the CSR configuration file to the same location as the onboarding script, and name it **csr_config.txt**.

7. In the CSR configuration file, update the **emailAddress** value and the following data.

Expand table

Code	Description	Specification
C	The country/region code.	A two-letter code (ISO 3166 Alpha-2).
OU	The name of the organization unit.	For normal taxpayers, the value is free text. For VAT groups, identify the value through the fact that the eleventh digit of the organization identifier is "1". Validate that the input is a 10-digit Tax Identification Number (TIN).
O	The name of the organization or taxpayer.	Free text.
CN	Unique Name or Asset Tracking Number of the Solution Unit provided by the Taxpayer for each Solution unit	Use • **PREZATCA-Code-Signing** value for simulation • your actual number for production
certificateTemplateName	The unique name of the solution or unit.	Use • **ASN1:PRINTABLESTRING:PREZATCA-Code-Signing** value for simulation • **ASN1:PRINTABLESTRING:ZATCA-Code-Signing** for production
SN	Manufacturer or Solution Provider Name, Model or Version and Serial Number. Automatically filled and not by the Taxpayer: Unique identification code for the EGS.	Free text.
UID	The VAT registration number of the taxpayer.	A 15-digit number that begins with "3" and ends with "3".
title	The document type that the taxpayer's solution unit will issue.	Four-digit numerical input that uses "0" and "1" mapped to "TSCZ": "0" = False/Not supported, and "1" = True/Supported. "T" = Tax invoice (standard),

Code	Description	Specification
		"S" = Simplified tax invoice, "C" = For future use, and "Z" = For future use.
registeredAddress	The address of the branch or location where the device or solution unit is primarily situated.	Free text.
businessCategory	The industry or sector that the device or solution will generate invoices for.	Free text.

8. Run the onboarding script that's provided later in this article. Specify the OTP code and the CSR configuration file as input parameters. Here's an example.

    - for CCSID in simulation environment: `.\OnboardingScript.ps1 -action getComplianceCSID -otp 123345 -csrconfig .\csr_config.txt -environment simulation`
    - for CCSID in production environment: `.\OnboardingScript.ps1 -action getComplianceCSID -password 123 -environment production`

    > **Note**
    >
    > The **password** parameter is optional and can be omitted. If you include it, the certificate you generate has the specified password.

9. You receive the CCSID as a certificate file, **CCSID.pfx**. Save the secret for the CCSID as a text file, **CCSIDSecret.txt**. Save the CCSID certificate file in the Microsoft Azure Key Vault certificate, and save the secret in the Key Vault secret. For more information, see Customer certificates and secrets.

10. Configure the related feature setup in the **Saudi Arabian ZATCA compliance check (SA)** Electronic invoicing feature, and reference the CCSID certificate that you saved in the key vault. Use the certificate for communication with the ZATCA electronic invoicing portal.

Compliance check

After you get a CCSID by using the PowerShell script, ZATCA requires that you complete specific compliance checks by submitting sample invoices. This step is a prerequisite for requesting a PCSID.

Ensure that you successfully submit to ZATCA all types of sample invoices that you configured in the CSR configuration file. Use the standard process for issuing electronic invoices. For more information, see Issue electronic invoices in Finance and Supply Chain Management.

Follow the steps in Electronic invoicing in Saudi Arabia - Phase two. Use the **Saudi Arabian ZATCA compliance check (SA)** Electronic invoicing feature and the CCSID that you get.

After you complete the compliance checks, use the PowerShell script to get a PCSID. (See the onboarding script that's provided later in this article.)

> **Note**
>
> If you set the document type in the **title** field of the CSR configuration file to **1000**, you must submit the following three sample invoices for the compliance check:
>
> - Standard Tax Invoice
> - Standard Debit Note
> - Standard Credit Note
>
> If you set the document type to **0100**, you must submit the following three sample invoices for the compliance check:
>
> - Simplified Tax Invoice
> - Simplified Debit Note
> - Simplified Credit Note
>
> If you set the document type to **1100**, you must submit all six sample invoices for the compliance check.

Obtain a PCSID

To obtain a PCSID, you must correctly configure the solution for electronic invoice generation and submission, and the solution must be fully functioning. To achieve this result, you must complete all the required preliminary configuration steps. For more information, see Electronic invoicing in Saudi Arabia - Phase two.

To obtain a PCSID, follow these steps:

1. Ensure that you successfully submit all electronic invoices to ZATCA.
2. Run the onboarding script that's provided later in this article. Specify the CCSID as an input parameter. Here's an example.

   ```
   .\OnboardingScript.ps1 -action getProductionCSID -password 123 -environment production
   ```

   > **Note**
   >
   > The **password** parameter is optional and can be omitted. If you include it, the generated certificate has the specified password.

3. Receive the PCSID as a certificate file in PFX format. Save this PCSID certificate and secret file in the key vault.
4. Configure the related feature setup in the **Saudi Arabian Zatca submission (SA)** Electronic invoicing feature. Include the PCSID certificate and secret in the Key Vault parameters.

After you complete all the configuration steps, the system is ready to use in production mode.

To review the obtained CSIDs on the ZATCA side, use the **Review Existing Cryptographic Stamp Identifier (CSID)** tile on the landing page of the Onboarding and Management Portal. You can access this portal from the main Saudi Arabian Taxation Portal (ERAD).

Onboarding script

> **Note**
>
> Microsoft doesn't support the sample scripts under any standard support program or service. The sample scripts are provided as-is without warranty of any kind. Microsoft disclaims all implied warranties, including without limitation, any implied warranties of merchantability or of fitness for a particular purpose. You assume all risk arising from the use or performance of the sample scripts and documentation. In no event is Microsoft, its authors, or anyone else involved in the creation, production, or delivery of the scripts liable for any damages whatsoever, including without limitation, damages for loss of business profits, business interruption, loss of business information, or other pecuniary loss, arising

from the use of or inability to use the sample scripts or documentation, even if Microsoft has been advised of the possibility of such damages.

1. Use the following Windows PowerShell script to get a CCSID and a PCSID.

PowerShell

```
#Saudi Arabian electronic invoice onboarding script
#Version 1.3 (adds -environment switch for Simulation vs Production, better error
output)
param(
    $action,
    $otp,
    $csrconfig,
    $password,
    [ValidateSet("simulation","production")]
    $environment = "production"
)
$env:path = $env:path + ";C:\Program Files\Git\usr\bin"

# Select the correct ZATCA base URL for the target environment.
# Simulation onboarding (Fatoora Simulation portal) and Production onboarding
# (Fatoora portal) use DIFFERENT endpoints on the same gateway host.

Generate and submit simplified electronic invoices for Saudi Arabia

> **Note**
>
> The functionality described in this article supports the Phase 2 requirements of the E-invoicing implementation in the Kingdom of Saudi Arabia.

This article provides an overview of the functionality for simplified electronic invoices (e-invoices) that are available for Saudi Arabia in Microsoft Dynamics 365 Commerce. It also provides guidelines for setting up the functionality.

The electronic invoicing functionality that's available for Saudi Arabia in Commerce provides the following capabilities:

- Generate an XML file of a simplified e-invoice when a sales transaction concludes in Commerce point of sale (POS).
- Generate a cryptographic stamp, or a digital signature, for the simplified e-invoice.
- Generate and print a QR code for the simplified e-invoice that includes the cryptographic stamp.
- Submit the simplified e-invoice from Commerce headquarters to Saudi Arabian tax authorities (Zakat, Tax and Customs Authority [ZATCA]) for reporting purposes.

For more information about the electronic invoicing requirements for Saudi Arabia, see the E-Invoicing portal by ZATCA.

The high-level, end-to-end process flow in Commerce for Saudi Arabia is as follows:

1. When the checkout process completes for a sales transaction in POS, POS uses Commerce Scale Unit (CSU) to send Commerce runtime (CRT) a request to generate and digitally sign a simplified e-invoice. The Fiscal registration framework and an internal connector are used to implement the generation and digital signing of simplified e-invoices.

   > **Note**

> If POS is in offline mode, the local copy of CRT on the POS machine generates and digitally signs the e-invoice.

2. CRT generates a simplified e-invoice in an XML format. Electronic reporting (ER) is used to implement the XML format of e-invoices for Saudi Arabia. A common format is used for simplified e-invoices in Commerce and regular tax e-invoices in Dynamics 365 Finance.
3. CRT sends Commerce headquarters a request to provide a digital certificate.
4. Commerce headquarters extracts the digital certificate from Azure Key Vault and sends it back to CRT. For more information about how Commerce handles digital certificates, see the Configure the digital signature parameters section of this article.

   > **Note**
   >
   > If POS is in offline mode, the local copy of CRT uses a digital certificate that's locally installed on the POS machine.

5. CRT calculates the invoice hash, digitally signs the e-invoice data, and generates a QR code that includes the invoice hash and digital signature data. CRT also updates the XML invoice with the invoice hash and digital signature data. The e-invoice, the invoice hash, the QR code, and other information are saved in the channel database in a fiscal transaction that's linked to the sales transaction.
6. POS requests a sales receipt from CRT. CRT builds the receipt, including the QR code, and sends it back to POS. POS sends the receipt to the receipt printer.
7. Commerce headquarters uses Commerce Data Exchange (CDX) to download the sales transaction data together with fiscal transactions from CSU. The data is stored in the headquarters database throughout the life of your production environment.
8. Commerce headquarters extracts the simplified e-invoice in the XML format from the fiscal transaction that's linked to the sales transaction. It then submits the e-invoice to ZATCA. The submission is done by integrating with the Electronic Invoicing service. For more information about the common electronic invoicing capabilities that are available to Saudi Arabia, see Customer electronic invoices in Saudi Arabia.

Set up Commerce for Saudi Arabia

This section describes the Commerce settings that are specific to and recommended for Saudi Arabia. For more information about common Commerce features and settings, see Commerce home page.

As a prerequisite, complete the setup of the electronic invoicing functionality for Saudi Arabia, including the configuration of the Electronic invoicing service. For more information, see Customer electronic invoices in Saudi Arabia.

To use the Commerce functionality that's specific to Saudi Arabia, complete the following tasks:

- Set the **Country/region** field to **SAU** (Saudi Arabia) in the primary address of the legal entity.
- Set the **ISO code** field to **SA** (Saudi Arabia) in the POS functionality profile of every store that's located in Saudi Arabia.

Specify the following settings for Saudi Arabia. Run appropriate distribution jobs after you complete the setup.

1. Enable Commerce features for Saudi Arabia in the **Feature management** workspace.
2. Set up value-added tax (VAT) per the Saudi Arabian VAT regulations.
3. Configure custom fields and receipt formats to print QR codes on receipts and comply with the local regulatory requirements.
4. Configure the fiscal registration functionality for Saudi Arabia to enable the generation and digital signing of simplified e-invoices.
5. Configure digital certificates and other parameters of digital signing for the Commerce channel side.
6. Specify the ER configurations that Commerce headquarters should use to generate simplified e-invoices in POS and submit them.
7. Configure e-invoice submission for simplified e-invoices that are generated in POS.
8. Enable the digital signature in offline mode.

Mix and match transactions aren't supported in Saudi Arabia

A transaction can't include both sales and return lines together. All lines in a transaction must be of the same type. To enforce this requirement, enable the **Prohibit mixing sales and returns in one receipt** setting in the POS functionality profile. To enable it, go to **Retail and Commerce** > **Channel setup** > **POS setup** > **POS profiles** > **Functionality profiles**, select the functionality profile that is linked to the store, and on the **Functions** FastTab, select the **Prohibit mixing sales and returns in one receipt** check box.

Enable features for Saudi Arabia

In the **Feature management** workspace, enable the following features:

- KSA Electronic-Invoicing capability for the fiscal integration framework
- (Saudi Arabia) Electronic invoicing integration

Set up VAT per Saudi Arabian requirements

Create sales tax codes, sales tax groups, and item sales tax groups. Set up sales tax information for products and services. For more information about how to set up and use sales tax, see Sales tax overview and Configure sales tax codes.

Specify sales tax groups and enable the **Prices include sales tax** option for stores that are located in Saudi Arabia.

Configure custom fields to use in receipt formats for sales receipts

You can configure the language text and custom fields that are used in the POS receipt formats. The default company of the user who creates the receipt setup should be the same legal entity where you create the language text setup. Alternatively, create the same language texts in both the user's default company and the legal entity of the store that the setup is created for.

On the **Language text** page, on the **POS** tab, add the following records for the labels of the custom fields for receipt layouts. The **Language ID**, **Text ID**, and **Text** values that are shown in the table are examples. You can change them to meet your requirements. However, the **Text ID** values that you use must be unique, and they must be equal to or higher than 900001.

Expand table

Language ID	Text ID	Text
en-US	900001	QR Code

On the **Custom fields** page, add the following records for the custom fields for receipt layouts. The **Caption text ID** values must correspond to the **Text ID** values that you specified on the **Language text** page.

Expand table

Name	Type	Caption text ID
INVOICEQRCODE_SA	Receipt	900001

On the **Commerce parameters** page, on the **Configuration parameters** tab, add the following records.

Expand table

Name	Value
RetailEInvoiceFeature_SA.QrCodeHeight	200
RetailEInvoiceFeature_SA.QrCodeWidth	200

Configure receipt formats

For each required receipt format, change the value of the **Print behavior** field to **Always print**. You must also configure hardware profiles to support receipt printers and to enable Hardware station. For more information about how to work with POS peripherals, see Peripherals.

In the Receipt format designer, add the following custom fields to the appropriate receipt sections. Field names correspond to the language texts that you defined in the previous section.

- **Footer:** Add the following field:
  - **QR Code** – This field prints the QR code for the receipt.

For more information about how to work with receipt formats, see Set up and design receipt formats.

Set up fiscal registration

Complete the fiscal registration setup steps that are described in Set up the fiscal integration for Commerce channels:

1. Set up a fiscal registration process. Note the settings of the fiscal registration process that are specific to Saudi Arabia.
2. Set error handling settings.
3. Enable manual execution of deferred fiscal registration.

Configure the fiscal registration process

To enable the fiscal registration process for Saudi Arabia in Commerce headquarters, follow these steps:

1. Download configuration files for the fiscal document provider and the fiscal connector from the Commerce software development kit (SDK):
   a. Open the Dynamics 365 Commerce Solutions repository.
   b. Open the latest available release branch.
   c. Open **src** > **FiscalIntegration** > **ElectronicInvoiceSaudiArabia**.
   d. Download the configuration file for the fiscal connector, **ConnectorSample.xml**.
   e. Download the configuration file for the fiscal document provider, **DocumentProviderSample.xml**.

2. Go to **Retail and Commerce** > **Headquarters setup** > **Parameters** > **Shared parameters**. On the **General** tab, set the **Enable fiscal integration** option to **Yes**.

3. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Fiscal connectors**, and load the fiscal connector configuration file that you downloaded earlier.

4. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Fiscal document providers**, and load the fiscal document provider configuration file that you downloaded earlier.

5. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Connector functional profiles**. Create a new connector functional profile, and select the document provider and the connector that you loaded earlier. Then update the data mapping settings as required.

6. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Connector technical profiles**. Create a new connector technical profile, and select the connector that you loaded earlier. Set the connector type to **Internal**, and update the other connection settings as required.

7. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Fiscal connector groups**, and create a new fiscal connector group for the connector functional profile that you created earlier.

8. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Fiscal registration processes**. Create a new fiscal registration process, create a fiscal registration process step, and then select the fiscal connector group that you created earlier.

9. Go to **Retail and Commerce** > **Channel setup** > **POS setup** > **POS profiles** > **Functionality profiles**, and select a functionality profile that's linked to the store where the registration

process should be activated. On the **Fiscal registration process** FastTab, select the fiscal registration process that you created earlier. On the **Fiscal services** FastTab, select the connector technical profile that you created earlier.

10. Go to **Retail and Commerce** > **Retail and Commerce IT** > **Distribution schedule**. Open the distribution schedule, and select jobs **1070** and **1090** to transfer data to the channel database.

Configure the digital signature parameters

To digitally sign and submit simplified e-invoices, you must obtain Cryptographic Stamp Identifiers (CSIDs) from ZATCA. CSIDs come as digital certificates. For more information about how to obtain CSIDs, see Electronic invoicing onboarding in Saudi Arabia. You must get a CSID for each POS register that you use, because sequential numbering and digital signing of simplified e-invoices happen per POS register.

Store the digital certificates that you use to digitally sign simplified e-invoices in Key Vault. For the offline mode of the Store Commerce app, you can also sign by using a digital certificate that's stored in the local storage of the machine where the Store Commerce app is installed. The User-defined certificate profiles for retail stores feature enables configuration of certificates that are stored in Key Vault. It also supports failover to offline mode when Key Vault or Commerce headquarters isn't available. This feature extends the Manage secrets for retail channels feature.

To configure certificates and certificate profiles that you can use for digital signing, follow the steps in Set up certificate profiles. You must configure a separate certificate profile for each CSID that you get from ZATCA.

After you configure certificate profiles, follow these steps:

1. Go to **Retail and Commerce** > **Channel setup** > **Fiscal integration** > **Connector technical profiles**, and select the connector technical profile that you created earlier.
2. To configure certificate profiles per POS register, select **Override**, and create records for all registers that you must specify CSIDs for.
3. In each record, on the **Device** FastTab, in the **Certificate profile** field, specify a corresponding certificate profile. For more information about how to override connector technical profile settings, see Create connector technical profiles.

Specify ER configurations

Download the latest versions of the following configurations from the Dataverse repository. For more information, see Import Electronic reporting (ER) configurations from Dataverse.

- E-invoice generation configurations:
  - **Invoice model** data model
  - **Invoice model mapping for commerce (SA)** data model mapping
  - **Sales e-invoice (SA)** format
- E-invoice submission configurations:
  - **Customer invoice context model** data model
  - **Retail channel data** data model
  - **Retail fiscal document mapping** data model mapping
  - **Retail fiscal document format** format

You must also configure legal entity–specific parameters of the e-invoice format.

1. In the **Electronic reporting** workspace, select **Reporting configurations**.
2. On the **Configurations** page, select the **Sales e-invoice (SA)** format that you imported earlier, and then select **Configurations** > **Application specific parameters** > **Setup**.
3. On the **Application specific parameters** page, select the version of the format configuration that you want to configure the parameters for.
4. On the **Lookups** FastTab, select the record for the **PaymentMethodSubstitutionLookup** lookup.
5. On the **Conditions** FastTab, create records to link methods of payment that you configured for customers in the **Accounts receivable** module to payment means that ZATCA defines for e-invoices.
6. In the **Lookup result** field, select a payment means code.
7. In the **Name** field, select a customer payment method that must correspond to the payment means code. If you want the payment means code to be selected when the customer payment method isn't specified, select ***Blank***. If you want the payment means code to be selected for any customer payment method, select ***Not blank***.

   The **Line** field is automatically set. It defines the order in which payment means codes are searched for a customer payment method. You can change the order by using the **Move up** and **Move down** buttons.

8. Complete the configuration by setting the **State** field to **Completed**.

Configure e-invoice submission

Before you set up e-invoice submission parameters for Commerce, configure the Electronic invoicing service so that it can be used for Saudi Arabia. For more information, see Get started with Electronic invoicing for Saudi Arabia. To support the configuration of CSIDs per POS register, follow these steps for each POS register in your Electronic Invoicing environment.

1. Add a corresponding CSID certificate to the Key Vault parameters of the environment.

2. Create a feature setup of the **Processing pipeline** type for the electronic invoicing feature. To complete this step, configure the first feature setup, and then create new feature setups by copying them from the first one and modifying the parameters.

3. In the feature setup, follow these steps:
   a. In the integration action of the processing pipeline, specify the name of the CSID certificate that you added earlier.
   b. In the applicability rule, specify the corresponding **Store** and **RegisterNumber** values.

In Commerce headquarters, follow these steps to set up e-invoice submission parameters that are specific to Commerce for Saudi Arabia.

1. On the **Electronic document parameters** page, on the **Electronic document** tab, create a new record, and specify the following parameters:
   a. In the **Table name** field, select **Fiscal transaction document**.
   b. In the **Document context** field, select **Retail fiscal document context**.
   c. In the **Electronic document model mapping** field, select **Retail fiscal document mapping**.
   d. Select number sequences for submitted file names and batch submission IDs.

2. On the **Features** tab, mark the **Saudi Arabia electronic invoice** feature as **Enabled**.

Enable the digital signature in offline mode

To enable the digital signature in offline mode, follow these steps after you activate POS on a new device.

1. Sign in to POS.
2. On the **Database connection status** page, ensure that the offline database is fully synchronized. When the value of the **Pending downloads** field is **0**, the database is fully

synchronized.
3. Sign out of POS.
4. Wait for the offline database to be fully synchronized.
5. Sign in to POS.
6. On the **Database connection status** page, ensure that the offline database is fully synchronized. When the value of the **Pending transactions in offline database** field is **0**, the database is fully synchronized.
7. Restart POS.

E-invoice submission

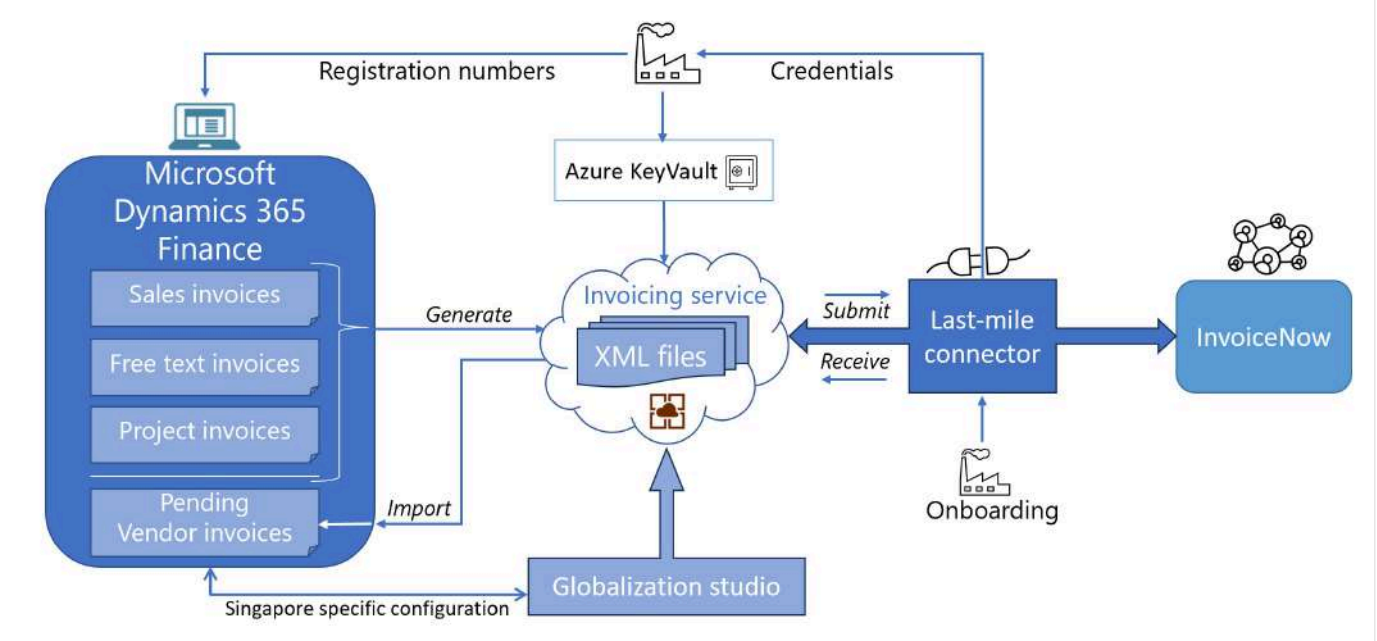
To initiate submission of simplified e-invoices to ZATCA, run the **Submit electronic documents** periodic operation in Commerce headquarters.

You can review the submission log on the **Electronic document submission log** page.

Last updated on 05/12/2026

Electronic invoicing for Singapore

This article helps you get started with electronic invoicing for Singapore. Set up the system to generate, submit, and receive electronic invoices in the Singaporean extension of the PEPPOL International (PINT) format in Microsoft Dynamics 365 Finance by using the last mile connector.



> **Note**
>
> This electronic invoicing approach uses an invoicing service that's applicable only to cloud deployments of Microsoft Dynamics 365 Finance.

Prerequisites

Before you start, make sure these prerequisites are in place:

- The company is a registered taxpayer in Singapore.
- The company has a signed agreement with the electronic document delivery service provider that supports document interchange in the PEPPOL (PINT) format.
- Register the following profile ID for Microsoft Dynamics 365 Finance electronic document interchange:
  - **urn:peppol:bis:billing** – Use this profile to interchange documents in PEPPOL (PINT) format.

- Get the credentials from the service provider to integrate the Electronic Invoicing service with the Electronic Invoicing service independent software vendor (ISV) last-mile connector.

  > **Note**
  >
  > This implementation assumes Edicom is the Electronic Invoicing ISV last-mile connection service provider. For more information, see Edicom integration with Microsoft Dynamics 365.

- Learn about Electronic Invoicing in the Electronic Invoicing service overview and Electronic invoicing components.
- Complete the common Electronic Invoicing service configuration in Electronic invoicing configuration.

Create the Azure Key Vault configuration

Create an Azure Key Vault to store required company secrets. For more information, see Configure Azure resources for Electronic invoicing.

Add the following element to the key vault:

- Add the secret for the **token** that authorizes access to Edicom services. Obtain it from Edicom as described in the prerequisites.

Set up electronic invoicing Key Vault parameters

Set up electronic invoicing Key Vault parameters.

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
2. On the **Electronic invoicing** tab, in **Key Vault settings**, in **Key Vault**, select the key vault reference you created earlier.
3. In **SAS token secret**, select the storage account secret URL used to authenticate access to the storage account.
4. Select **Key Vault parameters**.
5. On the **Key Vault parameters** page, in **Certificates**, select **Add** and create an element of the appropriate type for each secret described earlier.

- Add the **token** element of type **Secret**.

> ⓘ Note
>
> Match the value in the **Name** column to the secret name described earlier.

Import the electronic invoicing feature

1. Go to **Globalization Studio** and select the **Electronic invoicing** tile. Import the latest version of the **Singaporean electronic invoice (SG)** globalization feature as described in Import features from the repository.

2. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, confirm that the following Electronic reporting configurations are imported as a result of the **Singaporean electronic invoice (SG)** globalization feature import.

    - **Invoice model**
    - **Invoice model mapping**
    - **PINT Sales e-invoice**
    - **PINT Sales e-credit note**
    - **PINT Project e-invoice**
    - **PINT Project e-credit note**
    - **Customer invoice context model**
    - **Response message model**
    - **Edicom Response Processing**
    - **Error log import Json**

    > ⓘ Note
    >
    > If the configurations aren't imported, import them manually as described in Import Electronic reporting (ER) configurations from Dataverse.

3. In the **Electronic reporting** workspace, on the **Reporting configurations** tile, import the latest versions of the following Electronic reporting configurations to receive incoming vendor invoices.

    - **Vendor invoice import**
    - **Vendor invoice Mapping to destination**
    - **Import invoice context model**

Configure the electronic invoicing feature

The **Singaporean electronic invoice (SG)** feature publishes some parameters with default values. Before you deploy the feature, review the default values and update them so they reflect your business operations.

Review and update the **Singaporean electronic invoice (SG)** feature configuration:

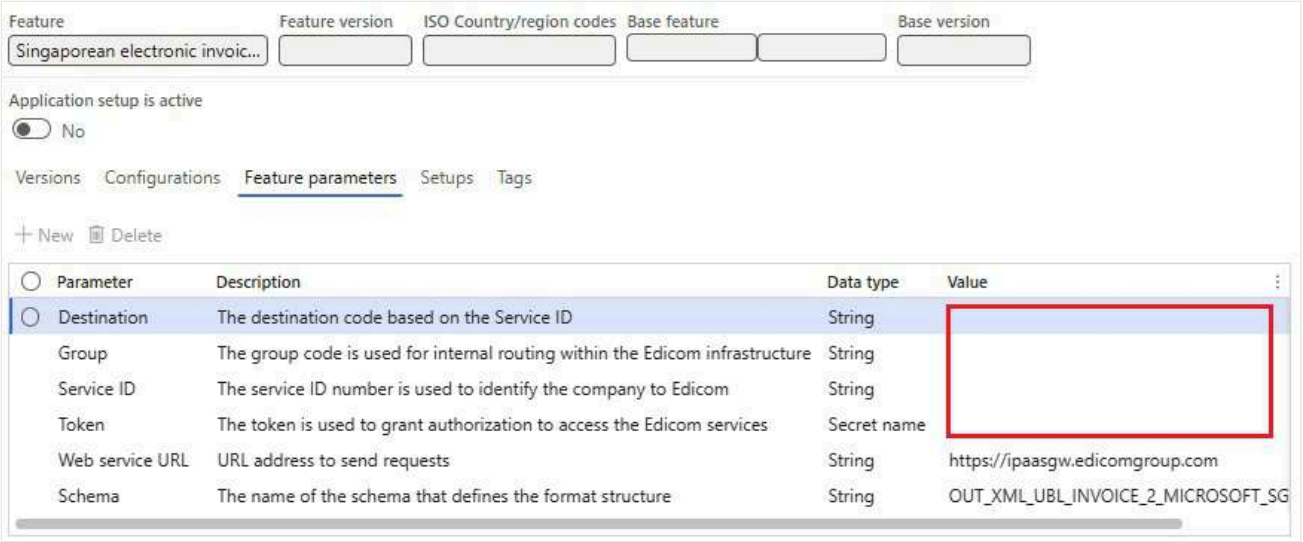
1. Go to **Globalization Studio** and select the **Electronic invoicing** tile. Import the globalization feature as described in Import features from the repository.

2. Copy the imported **Singaporean electronic invoice (SG)** globalization feature and select your configuration provider, as described in Create a Globalization feature.

3. On the **Versions** tab, check that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify these required **Edicom** connection and integration parameters:

    - **Service ID** – Use the service ID (Domain) number from Edicom to identify the company.
    - **Group** – Use the group code for internal routing within the Edicom infrastructure.
    - **Destination** – Construct the destination by appending **_EDIWIN** to the service ID number. For example, if the service ID number is **123456**, enter **123456_EDIWIN**.
    - **Token** – Select the name of the token you created earlier.



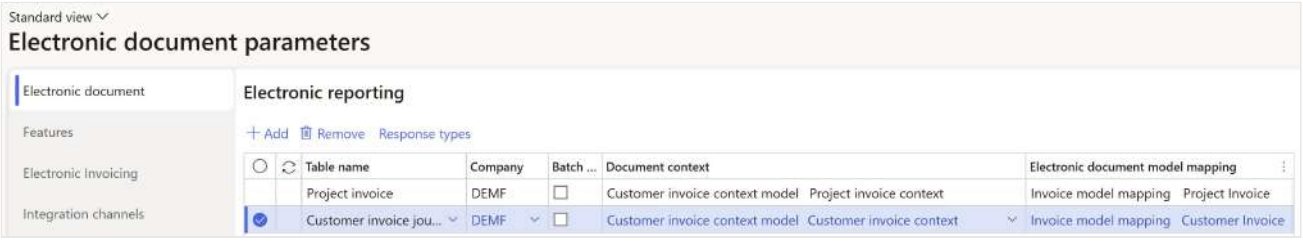
5. Each copy starts as a **Draft** version. Complete and deploy the feature as described in Complete and deploy a Globalization feature.

Configure electronic document parameters

1. Go to **Organization administration** > **Setup** > **Electronic document parameters**.

2. On the **Electronic document** tab, add records for the **Customer Invoice journal** and **Project invoice** tables.

3. For each table name, set the **Document context** and **Electronic document model mapping** fields as described in Set up electronic invoicing parameters.

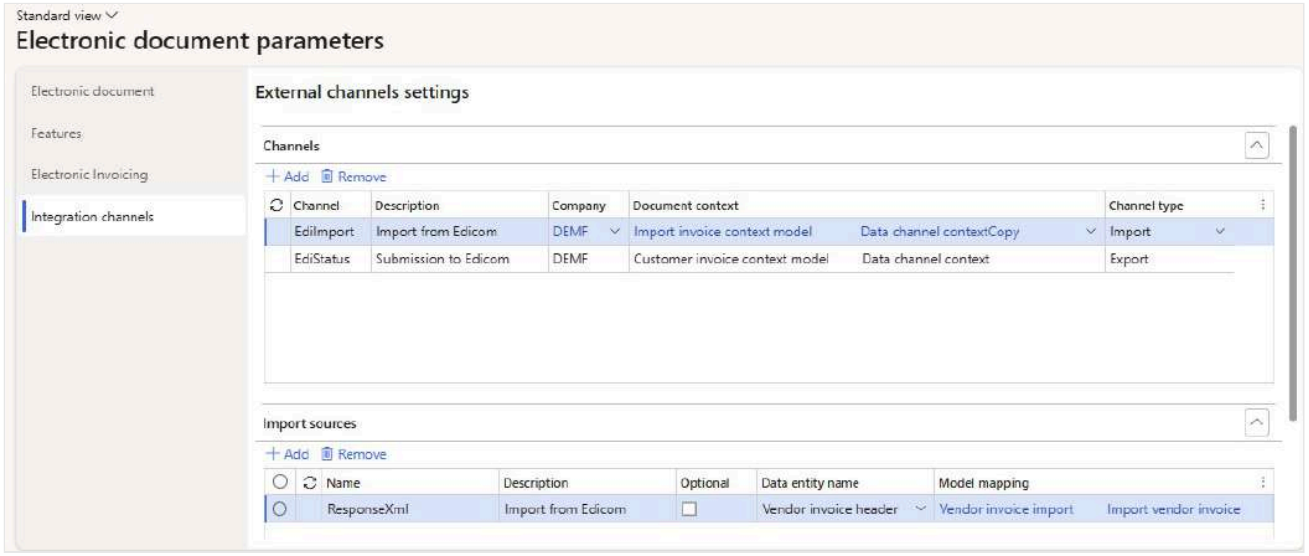


> **Note**
>
> If you created derived equivalents of the earlier Electronic Reporting configurations, use them instead of the standard configurations.

4. On the **Integration channels** tab, in the **Channels** section, select **Add** to create a new channel.

5. In the **Channel** field, enter **EdiStatus**. Enter the value exactly as shown. The system uses it to submit outgoing electronic invoices.

6. In the **Company** field, select the legal entity.
7. In the **Document context** field, select the **Data channel context** mapping from the **Customer invoice context model** configuration.
8. In the **Channel type** field, select **Export**.
9. In the **Channels** section, select **Add** to create another channel.
10. In the **Channel** field, enter **EdiImport**. Enter the value exactly as shown. The system uses it to import incoming electronic invoices.
11. In the **Company** field, select a required legal entity.
12. In the **Document context** field, select the **Data channel context** mapping from the **Import invoice context model** configuration.
13. In the **Channel type** field, select **Import**.
14. In the **Import sources** section, select **Add** to create an import source.
15. In the **Name** field, enter **ResponseXml**. Enter the value exactly as shown.
16. In the **Data entity name** field, select the **Vendor invoice header** entity.
17. In the **Model mapping** field, select the **Import vendor invoice** mapping from the **Vendor invoice import** configuration.
18. Select **Save**, and then close the page.



> ⓘ **Note**

If you use integration channels other than **EdiStatus** and **EdiImport**, do another configuration for the feature and related context configurations.

Set up registration numbers

If these registration types and categories already exist, skip this procedure.

Set up UEN number

To set up the Unique Entity Number (UEN) registration number, see UEN of the business user.

Set up GST number

To set up the Goods and Services Tax (GST) registration number, see GST Registration Number of the business user.

Set up address structure

Set up the postal address structure.

1. Go to **Organization administration** > **Global address book** > **Addresses** > **Address setup**.
2. Ensure the following required elements are configured:
    - Country code
    - Postal code
    - Street

Configure legal entity data

Enter the address

Add the primary address.

1. Go to **Organization administration** > **Organizations** > **Legal entities**, and select a legal entity.
2. On the **Addresses** FastTab, add the primary address for the legal entity.

Seller identification

Add the registration numbers.

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. On the Action Pane, select **Registration IDs**.
3. On the **Registration ID** FastTab, select **Add**, set **Registration type** to the Unique Entity Number (UEN) type you created earlier, and enter the UEN value in **Registration number**.
4. Select **Add**, set **Registration type** to the Goods and Services Tax (GST) type you created earlier, and enter the GST value in **Registration number**.

   The system puts the **UEN** number in the **Invoice\cac:AccountingSupplierParty\cac:Party\cbc:EndpointID** element and the **GST** number in the **Invoice\cac:AccountingSupplierParty\cac:Party\cac:PartyTaxScheme\cbc:CompanyID** element in the generated electronic invoice XML file. These values act as the seller's identification during submission.

Configure customer data

Enter the address

To enter the address, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer.
3. On the **Addresses** FastTab, add a valid address for the selected customer.

Buyer identification

To enter the registration numbers, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. On the Action Pane, on the **Customer** tab, in the **Registration** group, select **Registration IDs**.
3. On the **Registration ID** FastTab, select **Add** to create a registration ID.
4. In the **Registration type** field, select the Unique Entity Number (UEN) registration type that you created earlier.

5. In the **Registration number** field, enter a valid BRN registration number for the selected customer.
6. Select **Add** to create another registration ID, if necessary.
7. In the **Registration type** field, select the Goods and Services Tax (GST) registration type that you created earlier.
8. In the **Registration number** field, enter a valid SST registration number for the selected customer.

   The **UEN** number is entered in the **Invoice\cac:AccountingCustomerParty\cac:Party\cbc:EndpointID** element and the **GST** number is entered in the **Invoice\cac:AccountingCustomerParty\cac:Party\cac:PartyTaxScheme\cbc:CompanyID** element in the electronic invoice XML file that is generated. It's used as the buyer's identification during the submission process.

> **Note**
>
> For both, seller and buyer identification, the schema **0195** (Singapore UEN identifier) is used by default according to the Electronic Address Scheme (EAS). If you need to redefine the default schema, see the next section. Otherwise, you can ignore the next section.

Configure identification schemas

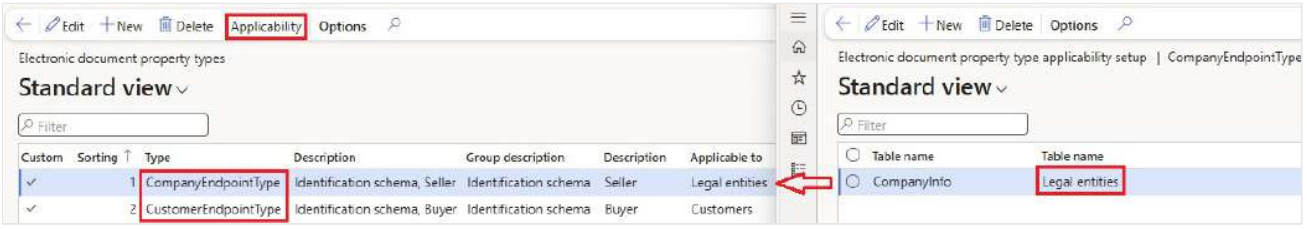
Follow these steps only if you need to redefine the default identification schemas for sellers or buyers.

Configure electronic document properties

Set up electronic document properties.

1. Go to **Accounts receivable** > **Setup** > **Electronic document property types**, and select **New**.
2. In the **Type** field, enter **CompanyEndpointType**. Enter the value exactly as shown. Use this type for the **Seller** identification schema definition.
3. Select **Applicability** to add an applicable table.

4. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Legal entities**.
5. Save your changes and return to the **Electronic document property types** page.
6. Select **New** to create another electronic document property type.
7. In the **Type** field, enter **CustomerEndpointType**. Enter the value exactly as shown. Use this type for the **Buyer** identification schema definition.
8. Select **Applicability** to add an applicable table.
9. On the **Electronic document property type applicability setup** page, in the **Table name** field, select **Customers**.
10. Save your changes, and return to the **Electronic document property types** page.
11. Save your changes, and close the page.



Enter the seller schema code

To enter the Seller schema code, follow these steps:

1. Go to **Organization administration** > **Organizations** > **Legal entities** and select a legal entity.
2. Select **Electronic document properties** from the Action Pane.
3. In the **Value** column, enter the required seller schema code.

Enter the buyer schema codes

To enter the buyer schema codes, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a specific customer in the list. On the Action Pane, select the **Customer** tab. In the **Properties** group, select **Electronic document properties**.
3. In the **Value** column, enter the required buyer schema code.

> **Note**
>
> Schema codes defined by electronic document property types take priority over the default **0195** schema code.

Set up units of measure

Set up units of measure.

1. Go to **Organization administration** > **Setup** > **Units** > **Units**.
2. Select a unit ID, and then select **External codes**.
3. On the **External codes** page, in **Overview**, in the **Code** column, enter the unit ID.
4. In the **Standard code** column, select the checkbox.
5. In the **Value** section, in the **Value** field, enter the external code from the UNECE Recommendation 20 code list.

   > **Note**
   >
   > If no specific unit of measure applies, the system uses the default value **EA**.

Configure sales tax codes

1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.
2. Select a sales tax code. On the Action Pane, on the **Sales tax code** tab, in the **Sales tax code** group, select **External codes**.
3. In the **Overview** section, create a line for the selected unit. In the **External code** field, enter the sales tax code from step 2.
4. In the **Value** section, in the **Value** field, enter an external code that matches one of the Singapore-specific Duty or tax or fee category codes.

Issue electronic invoices

After you complete the required configuration steps, generate and submit electronic invoices for posted invoices: go to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. Learn more in Submit electronic documents.

> **Important**
>
> In current implementations, the standard submission procedure only generates electronic invoices and stores them in the service. It doesn't submit them. To submit invoices, complete these extra steps.

Follow these steps to submit the generated electronic invoices.

1. In the **Feature management** workspace, confirm that the **Export channels for electronic invoicing integration** feature is enabled. To learn more, see Feature management overview.
2. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Run submission process in export channels**.
3. In the **Channel** field, select the export channel you created, and then select **OK**.

Check the submission results at **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**. Learn more in Work with Electronic document submission log.

> **Note**
>
> You can also find submitted electronic invoices in the **Ediwin** portal in the **Outbound** folder and its subfolders. You can monitor further processing there.

According to the Singaporean electronic invoicing requirements, each generated e-invoice is assigned a unique identifier. This identifier is added to the XML files of related e-invoices in the **cbc:UUID** element. You can also see the identifier in the related Invoice Journals as the rightmost column of the invoices list.

Receive incoming electronic invoices

Set more parameters in Microsoft Dynamics 365 Finance to import incoming invoices.

Configure these master data types to match incoming electronic invoices:

- vendors
- products
- units

Follow the steps in Import vendor electronic invoices, starting at Configure vendor data.

Receive electronic invoices

After you complete the configuration, receive incoming electronic invoices in the **PEPPOL** format.

> **Note**
>
> Review incoming electronic invoices in the **Inbound** folder and its subfolders in your Ediwin portal.

Receive electronic invoices:

1. Go to **Organization administration** > **Periodic** > **Electronic documents** > **Receive electronic documents**.
2. Select **OK**, and then close the page.

To view receipt logs for processed electronic invoices, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document receipt log**.

To view successfully received invoices, go to **Accounts payable** > **Invoices** > **Pending vendor invoices**.

More information

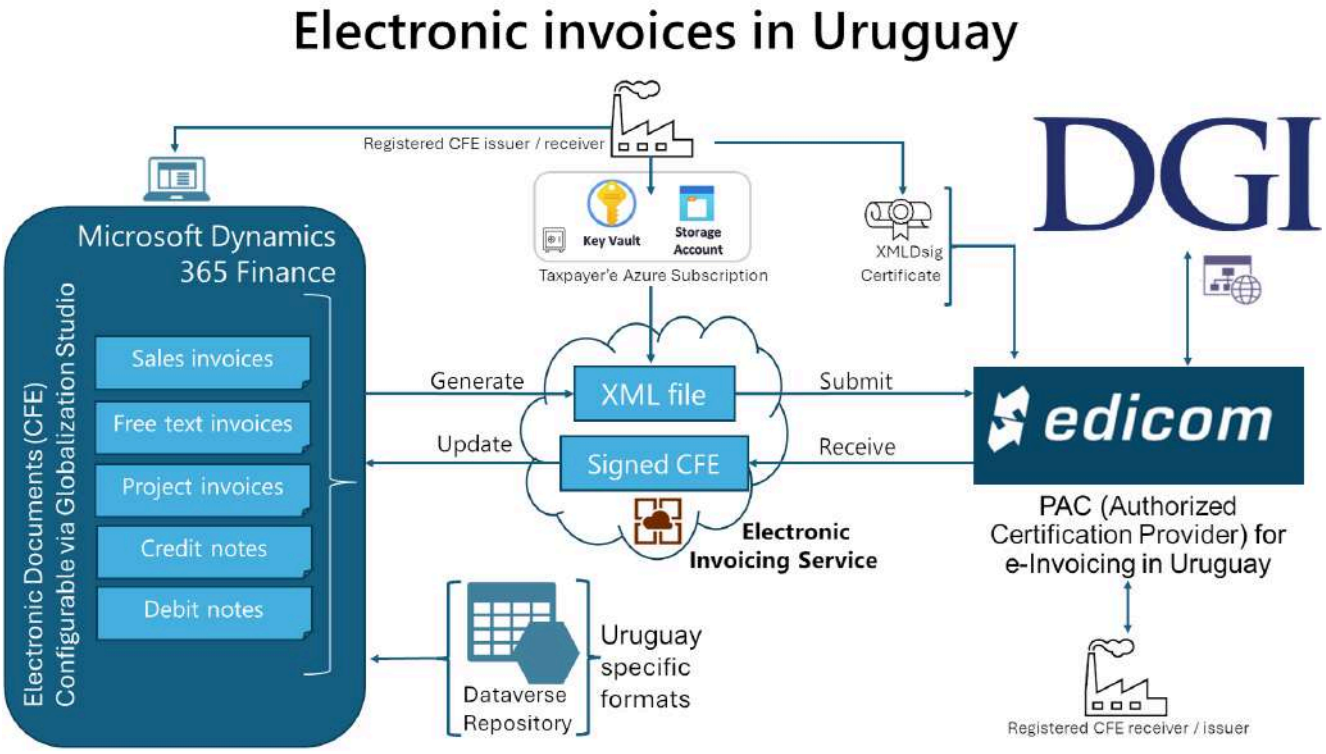
- Electronic invoicing coverage by country and region

Last updated on 03/11/2026

Get started with Electronic invoicing for Uruguay

This article provides information to help you get started with Electronic invoicing for Uruguay. It guides you through the configuration steps that are country/region-dependent in Microsoft Dynamics 365 Finance or Microsoft Dynamics 365 Supply Chain Management. These steps complement the steps that are described in Electronic invoicing setup. For the last-mile integration with the Uruguayan Tax Authorities, Microsoft is partnering with Edicom.

After you configure Electronic invoicing, you can generate, digitally sign, and submit the XML files of electronic invoices to the Edicom authorized certification provider (PAC) according to the regulatory requirements in Uruguay.



> **Note**
>
> The electronic invoicing approach that this article describes is implemented by using an invoicing service that is applicable only to cloud deployments of Finance or Supply Chain Management.

Prerequisites

Before you begin the procedures in this article, the following prerequisites must be met.

1. Ensure that the settings for the Uruguayan legal entity are in place. Learn more in Set up a legal entity and tax information for Uruguay.

2. Gain familiarity with and understanding of Electronic invoicing as it's described in Electronic invoicing overview.

3. Do the common part of Electronic Invoicing service configuration as described in Electronic invoicing configuration.

4. You must enable the following features in Feature management:

    - Electronic invoicing integration
    - Electronic invoicing integration resubmit document from failed action
    - Execute update actions for submitted documents

5. Ensure that the following Electronic reporting (ER) format configurations are imported. Learn more in Import Electronic reporting (ER) configurations from Dataverse, and Import Electronic reporting (ER) configurations.

    - Customer invoice context model
    - Edicom response error log import
    - Edicom Response Processing LATAM
    - Edicom source file response import format
    - Inventory e-Invoice (UY)
    - Inventory Export e-Invoice (UY)
    - e-Packing Slip (UY)
    - Export e-Packing Slip (UY)
    - Project e-Invoice (UY)
    - Project Export e-Invoice (UY)

    > **Note**
    >
    > These formats are based on the corresponding LATAM format configurations, which use the **Invoice model LATAM** and **Invoice model mapping LATAM** configurations. All other required configurations are imported automatically.

Configure the electronic invoicing feature

The "**Uruguay Electronic Invoice (UY) Edicom integration for Uruguay**" feature represents an outbound flow to issue the following sales documents.

Expand table

Name	Code	Original name
Electronic sales invoice	111	Factura electrónica de venta
Credit Note	112	Nota de Crédito
Debit Note	113	Nota de Débito
Packing Slip	181	Remito
Export invoice	121	Factura de exportación
Export Credit Note	122	Nota de Crédito de exportación
Export Debit Note	123	Nota de Débito de exportación
Export packing slip	124	Remito de exportación

Some parameters of the feature are published with default values. Before you deploy the Electronic invoicing feature to the service environment, add a feature that is based on the Microsoft-provided feature, and complete the common parameters on the **Feature parameters** tab. Review the default values, and update them as required, so that they better reflect your business operations.

Edicom Interactions for Uruguay

For Uruguay, there are at least four core interactions with Edicom in the base flow:

1. **Invoice submission**
2. **Signed XML retrieval**
3. **Status retrieval of the submitted invoice**
4. **Customer acceptance or rejection**

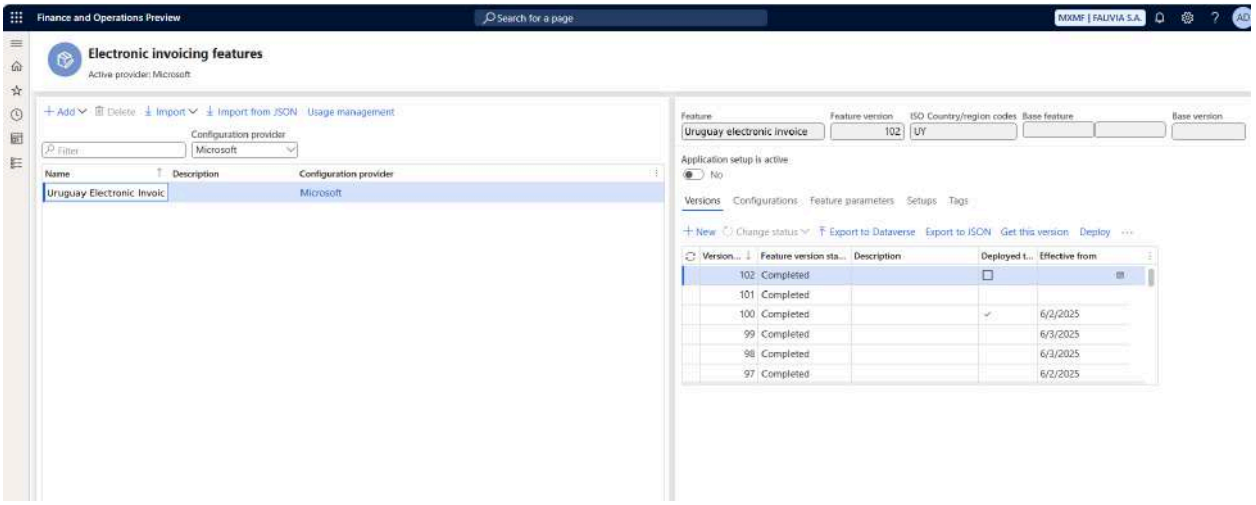
Each of these interactions requires common parameters, such as Edicom connection details and the authentication token provided by Edicom. These parameters are reused across the feature setup for all document types. Edicom supplies these values during the company's onboarding process.

Uruguay Electronic Invoice (UY) Edicom integration for Uruguay

> ⓘ **Important**

The **Uruguay Electronic Invoice (UY)** feature is provided by Microsoft. Before it can be used, it requires additional configuration, as described in this article. Learn how to configure invoicing features and apply changes in Work with feature setups. For example, in addition to the connection parameters, you can filter specific legal entities so that they are processed in applicability rules. By default, the feature is applicable to all legal entities that have a primary address in Uruguay.

1. Import the latest version of the **Uruguay Electronic Invoice (UY)** Globalization feature as described in Import features from the repository. The following illustrations show what the feature looks like after you import it from Dataverse.



If you go to the Configuration tab, as shown in the previous screenshot, there's a page displaying information similar to the following table:

Expand table

Name	Version	Status	Country/region code
Edicom Response Processing LATAM	13.2.5	Completed	
e-Packing Slip (UY)	296.140.89.125	Completed	UY
Export e-Packing Slip (UY)	296.140.89.41	Completed	UY
Inventory Export e-Invoice (UY)	296.140.89.52	Completed	UY
Inventory e-Invoice (UY)	296.140.89.64	Completed	UY
Project e-Invoice (UY)	296.139.40.39	Completed	UY

Note

The version numbers may change if the formats have been updated. The table is for illustrative purposes only.

2. Create a copy of the imported Globalization feature, and select your configuration provider. Learn more in Create a Globalization feature.

3. On the **Versions** tab, confirm that the **Draft** version is selected.

4. On the **Feature parameters** tab, specify values for the following connection and integration parameters that are required for interoperation with Edicom's API.
These parameters are general-purpose and are used across the different actions in the setups, so you only need to configure them once in this section.

> **Tip**
>
> The following table provides **example values** for each feature parameter, so you can understand the type of data that should be entered for each one. These values are **illustrative only** and were provided by Edicom to Microsoft for testing purposes. When you are onboarded, Edicom provides you with your own unique values to use in your configuration.

Expand table

Parameter	Description	Data type	Value
EdicomApplication	Application	String	<ID_PROVIDED_EDICOM>
EdicomDomain	Domain	String	<ID_PROVIDED_EDICOM>
EdicomGetStatusSchema	Get status schema name	String	IN_DOCUMENT_STATUS_MICROSOFT_UY
EdicomGroup	Group	String	<GROUP_ID>
EdicomSignedXMLSchema	Signed XML schema name	String	EDIWIN-SOURCE-FILE_XML_CFE_ADENDA_<ID_PROVIDED_EDICOM>
EdicomSubmitInvoiceDestination	Destination name	String	<ID_PROVIDED_EDICOM>_EDIWIN
EdicomSubmitInvoiceSchema	Submit invoice	String	OUTBOUND_DOCUMENT_MICROSOFT_UY

Parameter	Description	Data type	Value
	schema name		
EdicomToken	Auth token	Secret name	EdiwinUruguayToken
EdicomWebServiceURL	Web service URL	String	https://ipaasgw.edicomgroup.com

> **Tip**
>
> When configuring the feature parameters for Edicom integration, follow these steps:
>
> - Select **Application**, and enter the service ID number you obtained from Edicom.
> - Select **Domain**, and enter the same service ID number.
> - Select **Get status schema name**, and enter the provided schema name.
> - Select **Group**, and enter the group code you received.
> - Select **Signed XML schema name**, and enter the appropriate schema name.
> - Select **Destination name**, and enter the service ID number concatenated with "_EDIWIN". For example, if your service ID is 123456, enter **123456_EDIWIN**.
> - Select **Submit invoice schema name**, and enter the schema name.
> - Select **Auth token**, and choose the name of the secret you created for the token.
> - Select **Web service URL**, and verify the web address is correct.

5. The copy of the feature is always created as a **Draft** version. Regardless of whether you made changes, you must complete, publish, and deploy the feature as described in Complete and deploy a Globalization feature.

Outbound flow pipeline

There are six electronic invoice formats for Uruguay included in the **Uruguay Electronic Invoice (UY) feature**. Each format requires its own setup and configuration. The formats are:

- **Inventory e-Invoice (UY)**
- **Inventory Export e-Invoice (UY)**
- **e-Packing Slip (UY)**
- **Export e-Packing Slip (UY)**
- **Project e-Invoice (UY)**
- **Project Export e-Invoice (UY)**

The following sections have guidance on the general configuration steps that apply to all six formats. Specific considerations and requirements for each individual format are explained, so you can ensure that each one is configured correctly according to its unique needs.

Electronic invoice feature

Setups-View

After importing the feature, in the second screenshot, five tabs are available: **Versions**, **Configuration**, **Feature parameters**, **Setups**, and **Tags**. Select the **Setups** tab, and then select **View**. This opens the page **Feature version setup**:

Feature version setup

This page allows you to review and configure the details of the feature setup for Uruguay. On the left side of this page, there are four sections: **Processing pipeline**, **Applicability rules**, **Variables**, and **Parameters**.

Processing pipeline

The Setup Actions and Parameters section is divided into two distinct grids:

Top Right – Processing Pipeline

The **Processing pipeline** grid should is similar to the following table:

Expand table

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Transform document	Generate invoice XML file					
Integrate with Edicom	Submit invoice					
Get status from Edicom for an invoice	Get signed XML from Edicom					**Checked**
Get status from Edicom for an invoice	Get invoice status from Edicom					

Action	Action name	Description	Enable retry	Retry action	Export result	Update action
Process response	Process invoice status response					
Terminate pipeline	Terminate pipeline	Terminates the processing pipeline				

> **Note**
>
> The **Get status from Edicom for an invoice** action is crucial in the flow, as it is marked with the **Update action** checkbox. This designation means that this specific step—and all steps following it repeatedly execute in a loop. The system continues this process until the invoice reaches a final, terminal status, ensuring that the latest status from Edicom is always retrieved and processed.

Bottom Right – Parameters

The lower grid shows the Parameters associated with the selected processing action. These parameters allow for fine-tuning of the selected step's behavior. Each entry includes a parameter name, description, data type, and value, enabling users to configure processing logic according to their business requirements.

Transform document parameters

Expand table

Name	Description	Value
Input file	Source file provides to the action the data to be executed.	Variable: BusinessDocumentDataModel
Direction	Direction describes which format will be used: import or export	export
Configuration	Configuration describes format which will be executed	Inventory e-Invoice: Inventory e-Invoice
Configuration Integration point	Source file provides data to the reporting runtime	InvoiceCustomer
Custom file name	Custom file name from the client	

Linking the correct format in Transform document parameters

When configuring the **Transform document** action in the processing pipeline, ensure the following:

- **Configuration**: Set this to the exact name of the feature format you are configuring.
  - For example:
    - `Project e-Invoice (UY)` → Configuration: `Project e-Invoice (UY)`
    - `Inventory e-Invoice (UY)` → Configuration: `Inventory e-Invoice (UY)`
    - `Project Export e-Invoice (UY)` → Configuration: `Project Export e-Invoice (UY)`
    - `Inventory Export e-Invoice (UY)` → Configuration: `Inventory Export e-Invoice (UY)`
    - `e-Packing Slip (UY)` → Configuration: `e-Packing Slip (UY)`
    - `Export e-Packing Slip (UY)` → Configuration: `Export e-Packing Slip (UY)`
- **Configuration Integration Point**:
  - Use `InvoiceCustomer` for inventory-related formats (`Inventory e-Invoice (UY)`, `Inventory Export e-Invoice (UY)`, `e-Packing Slip (UY)`, `Export e-Packing Slip (UY)`).
  - Use `InvoiceProject` for project-related formats (`Project e-Invoice (UY)`, `Project Export e-Invoice (UY)`).

> **Tip**
>
> If the feature name contains "Project", use `InvoiceProject`. If it contains "Inventory", use `InvoiceCustomer`. Incorrect settings will result in empty XML or missing required data.

Integrate with Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
Http request body	Http request body (can be empty)	Generate invoice XML file: Output file
User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	

Name	Description	Value
Auth token	Auth token secret name in the KeyVault	EdiwinUruguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Destination	Destination	FeatureParameter: EdicomSubmitInvoiceDestination
Schema	Schema	FeatureParameter: EdicomSubmitInvoiceSchema
Duplicates	Duplicates	0
Group	Group	FeatureParameter: EdicomGroup
Custom file name	Custom file name from the client	Generate invoice XML file: File name

Get signed XML from Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinUruguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Schema	Schema	FeatureParameter: EdicomSignedXMLSchema
Group	Group	FeatureParameter: EdicomGroup
ERP UUID	Reference Id of the document submitted to Edicom	Submit invoice: ExternalID

Get invoice status from Edicom parameters

Expand table

Name	Description	Value
Web service URL	URL address to send request	FeatureParameter: EdicomWebServiceURL
User name	KeyVault secret name to store user name	
Password	KeyVault secret name to store user password	
Client ID	Client ID secret name in the KeyVault	
Client Secret	Client Secret secret name in the KeyVault	
Auth token	Auth token secret name in the KeyVault	EdiwinUruguayToken
Domain	Domain	FeatureParameter: EdicomDomain
Application	Application	FeatureParameter: EdicomApplication
Schema	Schema	FeatureParameter: EdicomGetStatusSchema
Group	Group	FeatureParameter: EdicomGroup
ERP UUID	Reference Id of the document submitted to Edicom	Submit invoice: ExternalID

Process response parameters

Expand table

Name	Description	Value
Input file	Response to analyze	Get invoice status from Edicom: Output file
Reporting configuration list	List of configurations used for response parsing	Edicom Response Processing LATAM: Edicom Response Processing LATAM
Custom file name	Custom file name from the client	
Reporting configuration list	List of configurations used for response parsing	Edicom response error log import: Edicom response error log import

Terminate pipeline parameters

Expand table

Name	Description	Value
Terminal state	Desired state of the pipeline when terminating	complete
Number of days	Number of days to wait before terminating	8

> **Note**
>
> - If the status response indicates a failure, the pipeline is terminated, and the submission is marked as failed.
> - If the response indicates successful submission to the Uruguayan Tax Authorities (DGI), the process will be completed after 8 days, provided no additional responses are received in the meantime.

Applicability Rules and Feature Setup Scope

Applicability rules must be correctly configured to provide context, so that the exact Electronic Invoicing Globalization feature that must run in the Electronic Invoicing service can be found. These applicability rules are provided out of the box by checking the legal entity's International Organization for Standardization (ISO) country/region code.

Applicability rules for Uruguayan electronic invoice formats

Below are the applicability rules for each electronic invoice format for Uruguay. Replace `<Legal Entity ID>` with the actual ID of your legal entity.

Inventory UY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
Or		DocumentType	Equals	Customer invoice	string
		DocumentType	Equals	Customer credit note	string
		DocumentType	Equals	Customer debit note	string

Inventory Expo UY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
		DocumentType	Equals	Export Customer invoice	string
		DocumentType	Equals	Export Customer debit note	string
		DocumentType	Equals	Export Customer credit note	string

e-Packing Slip UY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
		DocumentType	Equals	Customer packing slip	string

Export e-Packing Slip UY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
		DocumentType	Equals	Export Packing Slip	string

Project UY

Expand table

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
Or		DocumentType	Equals	Project invoice	string

And/or	And/or	Field	Operator type	Value	Data type
		DocumentType	Equals	Project credit note	string
		DocumentType	Equals	Project debit note	string

Project Expo UY

And/or	And/or	Field	Operator type	Value	Data type
And		CountryISOCode	Equals	UY	string
		LegalEntityId	Equals	<Legal Entity ID>	string
		DocumentType	Equals	Export Project invoice	string
		DocumentType	Equals	Export Project credit note	string
		DocumentType	Equals	Export Project debit note	string

Variables

The following variables are used in the outbound data flow actions of the Uruguayan feature. (These variables are provided out of the box.)

- **BusinessDocumentDataModel** – The Business Document Data model variable that is received from Finance or Supply Chain Management and transformed into the format that is required for submission.
- **SignedXML** – The signed XML variable that is sent back to Finance or Supply Chain Management. This variable contains the base64-encoded response body from the **Get Signed XML from Edicom** step. It's used in the response types to save the signed XML that is obtained from Edicom as an attachment to the invoice journal. It's also used to generate printable reports through QR codes.

Name	Description	Type	Data type	Value
BusinessDocumentDataModel	Contains the electronic document from the client	From client	file	
SignedXML	Signed XML document in base64-encoded format	To client	file	Get signed XML from Edicom.Base64ResponseBody

After you import the **Electronic invoicing for Uruguay** feature that includes the out of the box default feature setup, follow the steps in the next section to configure electronic documents.

Setups-Application Setup

To configure the mapping between Dynamics 365 Finance source tables and electronic document formats, go to the **Setups** tab within the **Electronic invoice feature** section, and then select **Application Setup**. This step lets you define how data from Finance is linked to the correct electronic invoice formats for Uruguay.

> **Note**
>
> Although this configuration is not set at the general feature level, it acts globally for the selected feature setup. You don't need to repeat these steps for each individual format or feature—one configuration is sufficient for all supported document types within the feature.

The following grid defines the link between the source table in Dynamics 365 Finance, the document context model, and the mapping configuration used for electronic invoicing:

Table name	Context model / Context	Electronic document mapping	Mapping name	Description
Customer invoice journal	Customer invoice context model / Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice	Maps customer invoices from the CustInvoiceJour table to the LATAM invoice model for electronic submission.
Project invoice	Customer invoice context model / Project invoice context	Invoice Model mapping LATAM	Project E-Invoice	Maps project invoices to the LATAM invoice model for electronic submission.

> **Tip**
>
> Ensure that the Context and Mapping name match the document type. Incorrect mappings cause errors in XML generation or submission to DGI.

Configure electronic document parameters

To configure electronic document parameters, follow these steps:

1. Make sure that the country/region-specific ER configurations for the document context and electronic document model mapping that are required for Uruguay are imported. Learn more in Set up Electronic document parameters.
2. Go to **Organization administration** > **Setup** > **Electronic document parameters**.
3. In the **Electronic document** section, add records for the **Customer Invoice journal** and **Project invoice** table names.
4. For each table name, set the **Document context** and **Electronic document model mapping** fields in accordance with step 1.

The Electronic Document Parameters page in Dynamics 365 Finance. Shows on the left-hand navigation pane, we can see the following options:

- Electronic Document
- Features
- Electronic Invoicing
- Integration Channels

For the Electronic Document option on the right-hand side, the section labeled Electronic Reporting is displayed.

Within Electronic Reporting, a grid is presented which lists the electronic document configurations. This grid includes important associations between:

- The source table name
- The document context model and context
- The electronic document model mapping
- The final mapping name used for generating the electronic invoice.

This configuration is essential for determining how Dynamics 365 Finance maps internal data models to external electronic formats for submission to tax authorities or service providers.

Configure the grid as follows:

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Customer invoice journal	No	Customer invoice context model	Customer invoice context	Invoice Model mapping LATAM	Customer E-Invoice

Table name	Microsoft-owned	Document context model	Document context	Electronic document model mapping	Mapping name
Project invoice	No	Customer invoice context model	Project invoice context	Invoice Model mapping LATAM	Project E-Invoice

1. Save your changes, and close the page.

2. For each table name, follow these steps:

   a. Select **Response types**, select **New** to create a response type that you will get from the back end, and enter the following values:

   - In the **Response type** field, enter **SignedXML** (the default value). (See the Variables section of this article.)
   - In the **Description** field, enter any meaningful name. Alternatively, leave the field blank.
   - In the **Submission status** field, select **Pending**.
   - In the **Model mapping** field, select **Edicom source file response format**.

   b. Repeat the preceding step, but set the **Submission status** field to **Pending update actions execution**. In this way, you can run a subset of the actions in the processing pipeline in a loop to continuously pull updated statuses and other information for the submitted documents from the tax authority. In the standard view, you should see a table similar to the following:

Response type	Description	Submission status	Data entity name	Model mapping
SignedXML	Signed XML obtained from EDICOM	Pending		Edicom source file response import format
SignedXML	Signed XML obtained from EDICOM	Pending update actions execution		Edicom source file response import format

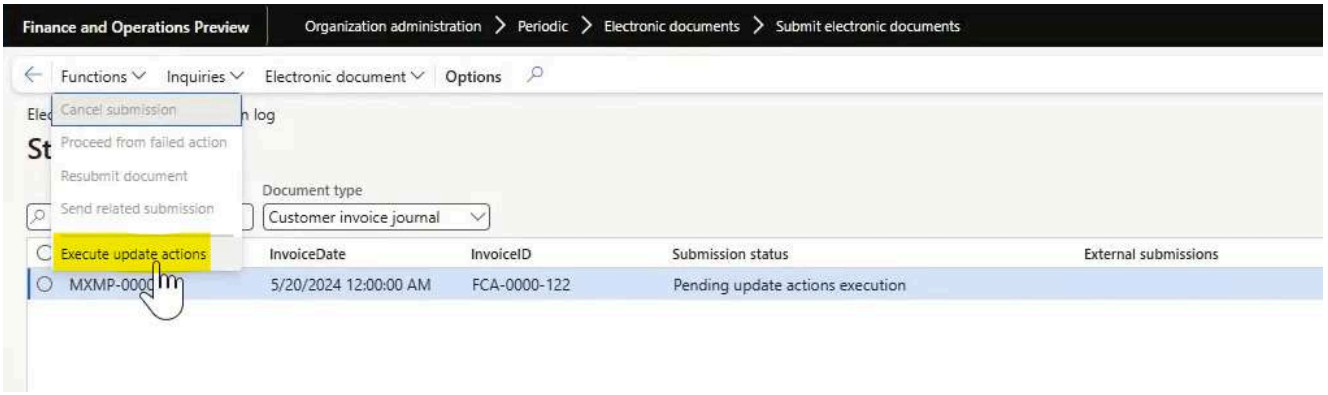
> **Note**
>
> The response includes the signed XML that is obtained from Edicom. This signed XML is stored in the system as an attachment to the corresponding invoice journal. It will eventually be used to generate printable invoices through QR codes.

Issue electronic invoices

After you complete all the required configuration steps, you can generate and submit electronic invoices for posted invoices by going to **Organization administration** > **Periodic** > **Electronic documents** > **Submit electronic documents**. For more information about how to generate electronic invoices, see Submit electronic documents.

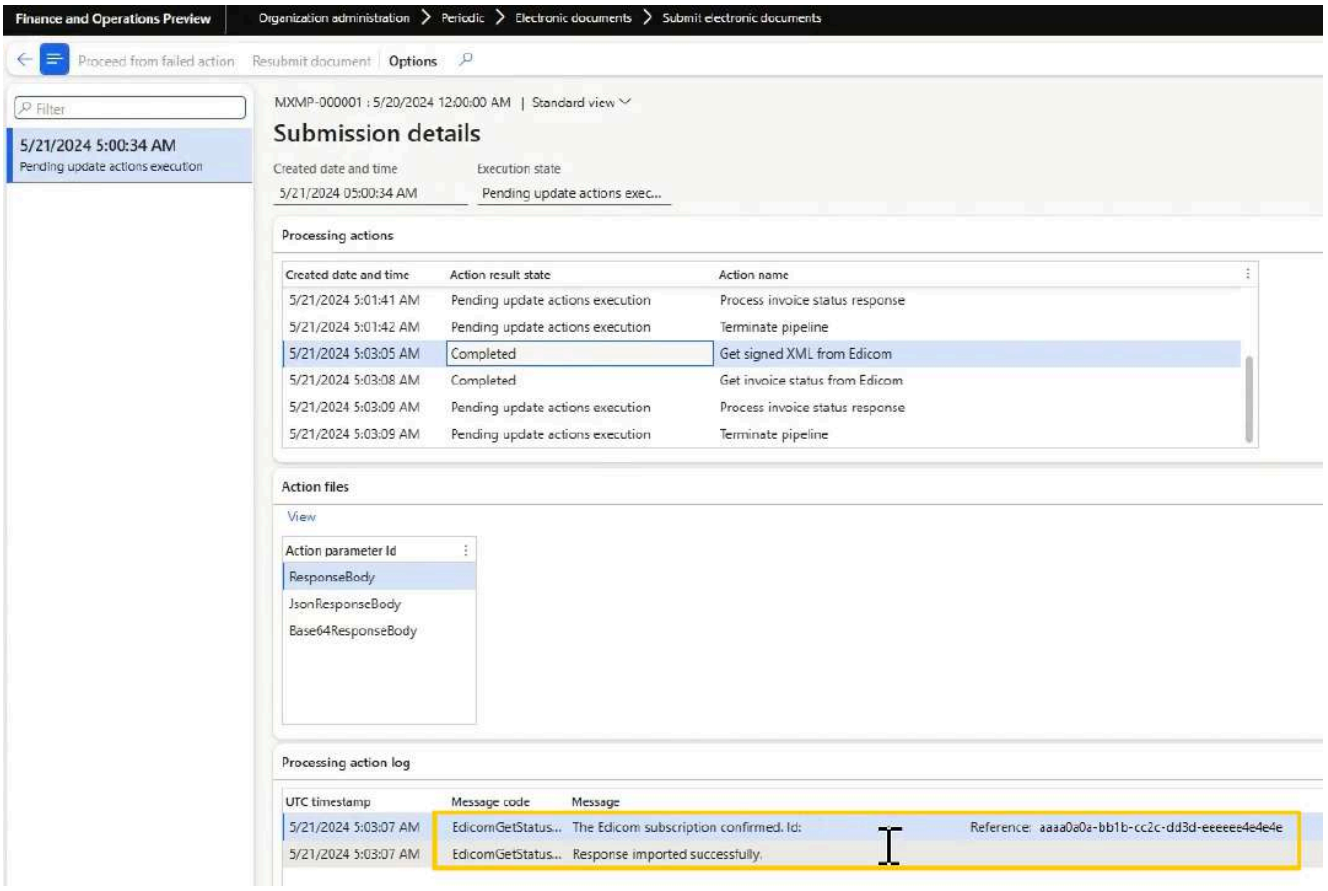
To inquire about the results of a submission, go to **Organization administration** > **Periodic** > **Electronic documents** > **Electronic document submission log**, and select the required document type. For more information, see Work with Electronic document submission log.

For Uruguay, after you submit the invoice, the submission status is set to **Pending update actions execution**. The response body is probably empty for the signed XML and the call to get the invoice status. An empty response body indicates that the XML wasn't available immediately after submission. To address the pending status, a function that is named **Execute update actions** is used. This function resumes the pipeline from the action that is marked as an update action. It then runs all subsequent actions in the pipeline in a loop. The status should change to **Executing** again. Then, after a few seconds, it reverts to **Pending update actions execution**.

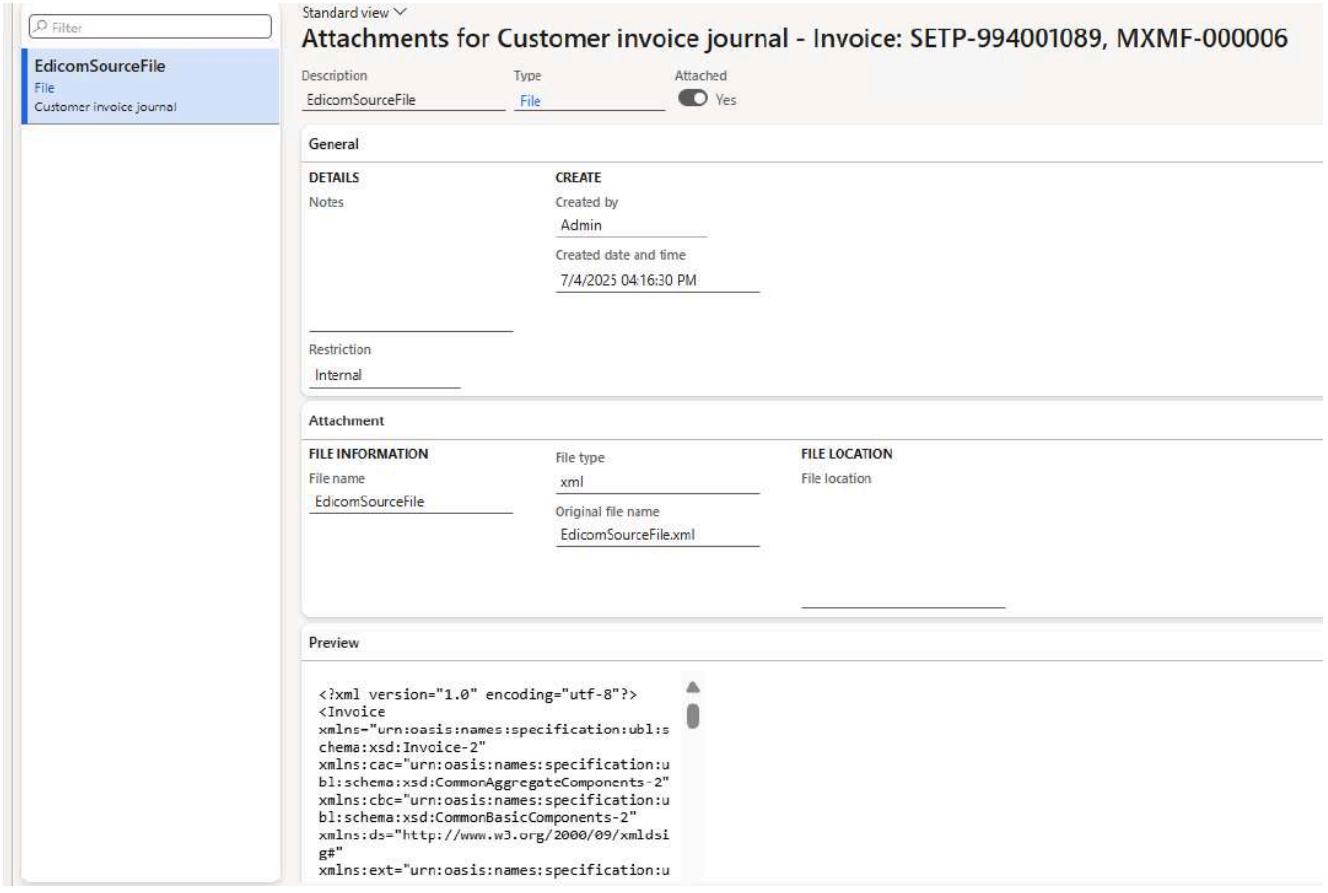


> **Note**
>
> By setting a recurrence schedule, you can configure the **Execute update actions** function to run in batch mode on a periodic basis.

When you review the submission details, you should notice that the steps run again. This time, the signed XML is received.



As a result of the completed outbound flow, the signed XML is attached to the invoice journal as **EdicomSourceFile**.



For Uruguay, the **Process response** action completes the pipeline after a few minutes.

Electronic Invoicing service FAQ

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides answers to frequently asked questions about the Electronic Invoicing service. Electronic invoicing extends the electronic invoicing capabilities that exist in Microsoft Dynamics 365 Finance, Dynamics 365 Supply Chain Management, and Dynamics 365 Project Operations.

What's important about electronic invoicing, and why should it matter to my organization?

Operational complexity and risk intensify as organizations grow globally and expand their footprints across regions. Maintaining compliance and adapting to frequently changing regulations are growing challenges. These challenges are especially important for invoicing. Invoicing is traditionally expensive and prone to errors because companies rely on paper documents and manually intensive processes.

Organizations have begun to move away from paper invoices to help reduce cost and speed up the end-to-end process. Governments are increasingly turning to electronic invoicing as a key component of tax digitalization. By requiring that organizations digitally submit real-time tax information to tax authorities, governments can minimize tax evasion and manipulation, and reduce fraud.

The world is shifting to paperless document processing. Customers that don't implement electronic invoicing might risk compliance issues and unnecessary costs. They might also risk lagging behind their competitors.

Don't Finance, Supply Chain Management, and Project Operations already include electronic invoicing functionality? What value does this functionality provide to me as a customer?

Electronic invoicing extends the electronic invoicing capabilities that exist in Finance, Supply Chain Management, and Project Operations. Additionally, the functionality simplifies adherence to the newest electronic invoicing standards. It also provides coherent experiences for different geographies in electronic invoice processing and exchange. Electronic invoicing's capabilities unlock a range of benefits. Here are some examples:

- Faster and easier adoption of country/region-specific requirements
- Standardization of e-invoicing solution implementations
- Enhanced traceability of e-invoice processing
- Easier maintenance to comply with changing legal requirements and local business practices
- Simplified solution packaging
- Scaling capabilities for a large volume of submitted documents, to achieve faster turnaround
- The ability to share your solutions with other companies

Does the Electronic Invoicing service support on-premises installations of Finance, Supply Chain Management, and Project Operations?

No, the current platform doesn't support the on-premises versions, and there are no plans to support them in the future.

Does the Electronic Invoicing service interface with the vendor import automation feature?

No. There are plans for this interface, but there's no timeline. When Microsoft plans a timeline, it announces the dates in the Release plans.

How does the Electronic Invoicing service handle file attachments for an electronic invoice? Is a SharePoint server needed to embed PDF files into the XML file?

The Electronic Invoicing service handles files attached to an electronic invoice as embedded binary data in an XML element. You don't need a SharePoint server to embed PDF files.

However, you must store the attachment in the Finance, Supply Chain Management, and Project Operations document management system.

Is the Electronic Invoicing service available according to the regulations of my country/region?

The Electronic Invoicing service is a microservice platform that's globally available.

Microsoft plans to publish the electronic invoice formats and integrations for the countries/regions that are functionally localized by Microsoft. For more information, see Availability of electronic invoicing features.

If the electronic invoicing format for your country/region isn't listed, the platform aims to support this scenario in the future. You can still benefit from the configuration capabilities of Electronic invoicing and configure the electronic invoicing format by yourself. Alternatively, you can work with a partner or independent software vendor (ISV) to configure the electronic invoicing format for your organization. For more information, see Electronic Invoicing service ISV last-mile connector.

Do I have to sign up to get the Electronic Invoicing service, or do I just have to turn it on in Feature management?

If you have a license for Finance, Supply Chain Management, and Project Operations, see Get started with Electronic invoicing add-on service administration to sign up for Electronic invoicing.

Does the Electronic Invoicing service work with Tier 1 virtual machines? What's the minimal required environment?

Integration with the Electronic Invoicing service requires at least a Tier 2 virtual machine to host Finance or Supply Chain Management. For more information about environment planning, see Environment planning.

Does the Electronic Invoicing service have a test mode for testing invoice submission?

You can achieve testing through configuration. To test invoice submission, you can connect to Finance or Supply Chain Management from a user acceptance testing (UAT) environment and submit the test invoices. Electronic invoicing supports the configuration of test digital certificates. For e-invoices that require digital approval, it also supports the setup of a URL from test web services that the tax authorities publish.

Does the Electronic Invoicing service enable a legal entity in Finance or Supply Chain Management that's configured for a specific country/region to consume electronic invoicing features from different countries/regions?

Yes. You can use the electronic invoicing features to process business document submissions independently of the country/region of the legal entity. However, the following conditions must be met:

- The business document that's generated uses the appropriate document model mapping.
- There's a match between the business document and applicability rules that are configured in the electronic invoicing feature.

Does the Electronic Invoicing service use the same configuration and design experience that the Electronic reporting module in Finance and Supply Chain Management provides?

Yes. The same designer tools that the **Electronic reporting** (ER) module in Finance and Supply Chain Management uses are used to create and configure data model mapping and file format configurations.

Can I extend and configure the applicability rules so that they aren't tied to any specific parameter, such as a legal entity?

Yes. You can fully configure the applicability rules. You can add or remove clauses, build logic operations, and group and ungroup clauses.

Does the Electronic Invoicing service support adding other ER format configurations to generate other types of documents? Does it support electronically sending these documents to customers as delivery notes, for example?

You can use other ER format configurations to produce the desired output files. However, to generate business documents, the ER format configuration must be derived from the same ER invoice model mapping that's configured in Finance or Supply Chain Management. Out of the box, electronic invoicing doesn't support sending the output file directly to the customer as an electronic data interchange (EDI) transaction.

Does the Electronic Invoicing service support exchanging electronic invoices with customers? Does it support configuring different invoice formats for the same invoice?

The capability to receive and import vendor electronic invoices is on the roadmap. However, the capability to automatically send electronic invoices to customers isn't currently supported.

Does the Electronic Invoicing service support exchanging EDI messages with other companies?

The Electronic Invoicing service focuses on exchanging electronic invoice message types, driven by regulatory compliance requirements. The capability to receive and import vendor electronic invoices is on the roadmap. However, the capability to send electronic invoice files to customers isn't currently supported, except in scenarios where the electronic invoice must be sent to the customer as a regulatory requirement.

Does the Electronic Invoicing service support importing or merging customizations that are made in the ER format configurations from the legacy Electronic invoicing feature?

You can reuse ER format configurations in the Electronic Invoicing service. However, the ER format configuration must come from the same ER invoice model mapping that the Electronic invoicing feature was designed to use. Finance or Supply Chain Management uses this mapping to generate the business documents.

Does the Electronic Invoicing service support issuing electronic invoices from custom-made tables? If so, how do I create the ER data model configurations for these new tables and entities?

Yes, you can issue electronic invoices from custom-made tables. However, you must customize the invoice model mapping and add the required references to the custom-made tables. Alternatively, depending on the complexity, you must create a new invoice model mapping.

Does the Electronic Invoicing service support different web service endpoints?

Yes, Electronic Invoicing supports different web service endpoints. You can use configurable integration with REST web services or several parametrized country/region-specific web service integrations. You can configure different endpoints for the same web services and APIs by using different versions of configurations. For more information, see List of parameters by action.

Is Electronic invoicing integrated with the APIs of the various invoice operators from the Nordic countries/regions, or should this integration be handled on a case-by-case basis?

Microsoft continuously extends functional coverage to provide out-of-box integrations by using the Electronic invoicing features. For more information about the formats and integrations that are supported, see Availability of electronic invoicing features and Electronic Invoicing service ISV last-mile connector.

Tax Calculation overview

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Tax Calculation helps automate and simplify the tax determination and calculation process. The tax engine is fully configurable. You can configure elements such as the taxable data model, tax code, tax applicability matrix, and tax calculation formula.

Tax Calculation is a highly scalable tax engine that's designed to support you in performing the following tasks:

- Automatically determine the correct sales tax group, item sales tax group, and tax codes through an enhanced determination mechanism.
- Support multiple tax registration numbers in one legal entity, and automatically determine the correct tax registration number on taxable transactions.
- Support tax determination, calculation, posting, and settlement for transfer orders.
- Define configurable tax calculation formulas and conditions for your specific business requirements.
- Share the tax determination and calculation solution across legal entities to save maintenance effort and avoid errors.
- Support customer and vendor tax registration number determination.
- Support list code determination.
- Support tax calculation parameters at the tax jurisdiction level.

For more information, see Get started with tax service.

Versions

Import and set up your Tax Calculation configuration by using the version that matches your Microsoft Dynamics 365 Finance or Microsoft Dynamics 365 Supply Chain Management version.

Expand table

Finance or Supply Chain Management version	Tax configuration version
10.0.47	Tax Calculation Configuration 50.78.269 This configuration is also compatible with all lower supported versions.
10.0.46	Tax Calculation Configuration 47.73.265
10.0.45	Tax Calculation Configuration 47.73.265

> **Important**
>
> To use **Tax Calculation Configuration 50.78.269**, you need to synchronize **Tax measure types**. To complete this step:
>
> 1. Open **Globalization studio** workspace, select **Electronic reporting** tile, and then select **Tax configurations** tile.
> 2. On **Configurations** page, select **Configurations**.
> 3. Under **Advanced settings** group, select **Tax measure types**.
> 4. On **Tax Measure types** page, select **Synchronize**.

Data flow

Here's an outline of the data flow process for Tax Calculation.

1. In the **Globalization Studio** workspace in Finance, view and import taxable document model configurations and model mapping configurations. If you need to extend configurations for an advanced scenario, see Add data fields in tax configurations.
2. In the **Globalization Studio** workspace in Finance, create or maintain tax features. Use tax features to maintain tax rates and tax applicability rules.
3. After you finalize the tax feature setup, change the **Feature version status** to *Completed*.
4. In **Tax calculation parameters**, select which tax feature setup version to use for a specific legal entity.
5. In Finance and Supply Chain Management, operate transactions as usual. When Tax Calculation is needed, the client collects information from the transaction, such as the sales order or purchase order, and packages the information as payload. The client then sends a request to calculate the tax.
6. The tax calculation service receives the tax calculation request from the client and completes the calculation. It returns the tax result to the client.

7. The Dynamics 365 client receives the tax result and presents the tax calculation result on a sales tax page.

Supported transactions

You can enable tax calculation by transaction.

The following table lists the transactions supported in each version.

Expand table

Version	Transactions
10.0.43	Customer advance invoice Vendor advance invoice Interest note Collection letter
10.0.42	Slip journal (Cash) [ITA] Customs declaration journal
10.0.41	Write-off journal Prepayment customer invoice (Sales order)
10.0.40	[POL] Single Administrative Document (SAD)
10.0.39	Prepayment handling
10.0.38	Project invoice proposal Journals (Hour/Expense/Item/Fee) Project quotations Intercompany customer invoice Microsoft Dynamics 365 Project Operations integration journal
10.0.36	Invoice register Invoice approval Invoice pool
10.0.29	Periodic journals
10.0.28	Vendor payment journal Customer payment journal
10.0.26	General journals Vendor invoice journal
10.0.23	Free text invoice
10.0.21	Sales

Version	Transactions
	• Sales quotation • Sales order • Confirmation • Picking list • Packing slip • Sales invoice • Credit note • Return order • Header miscellaneous charge • Line miscellaneous charge Purchase • Purchase order • Confirmation • Receipts list • Product receipt • Purchase invoice • Header miscellaneous charge • Line miscellaneous charge • Credit note • Return order • Purchase requisition • Purchase requisition line miscellaneous charge • Request for quotation • Request for quotation header miscellaneous charge • Request for quotation line miscellaneous charge Inventory • Transfer order – ship • Transfer order – receive

Supported countries/regions

You can run Tax Calculation with supported localization features. The following table lists the countries and regions for a legal entity's primary address.

Expand table

Version	Country or region
10.0.26	• China • Czech Republic

Version	Country or region
	• Spain
10.0.24	• Mexico
10.0.23	• Thailand • Japan • Malaysia • Singapore • Indonesia
10.0.22	• Australia • Bahrain • Canada • Egypt • Hong Kong SAR • Kuwait • New Zealand • Oman • Qatar • Saudi Arabic • South Africa • United Arab Emirates
10.0.21	• Austria • Belgium • Denmark • Estonia • Finland • France • Germany • Hungary • Iceland • Ireland • Italy • Latvia • Lithuania • Netherlands • Norway • Poland • Sweden • Switzerland • United Kingdom • United States

> **Note**
>
> For any country or region that Microsoft doesn't localize, you can enable and run Tax Calculation by using other global features.

Get started with Tax Calculation

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about how to get started with Tax Calculation. The sections in this article guide you through the high-level design and configuration steps in Dynamics 365 Finance and Dynamics 365 Supply Chain Management.

High-level design

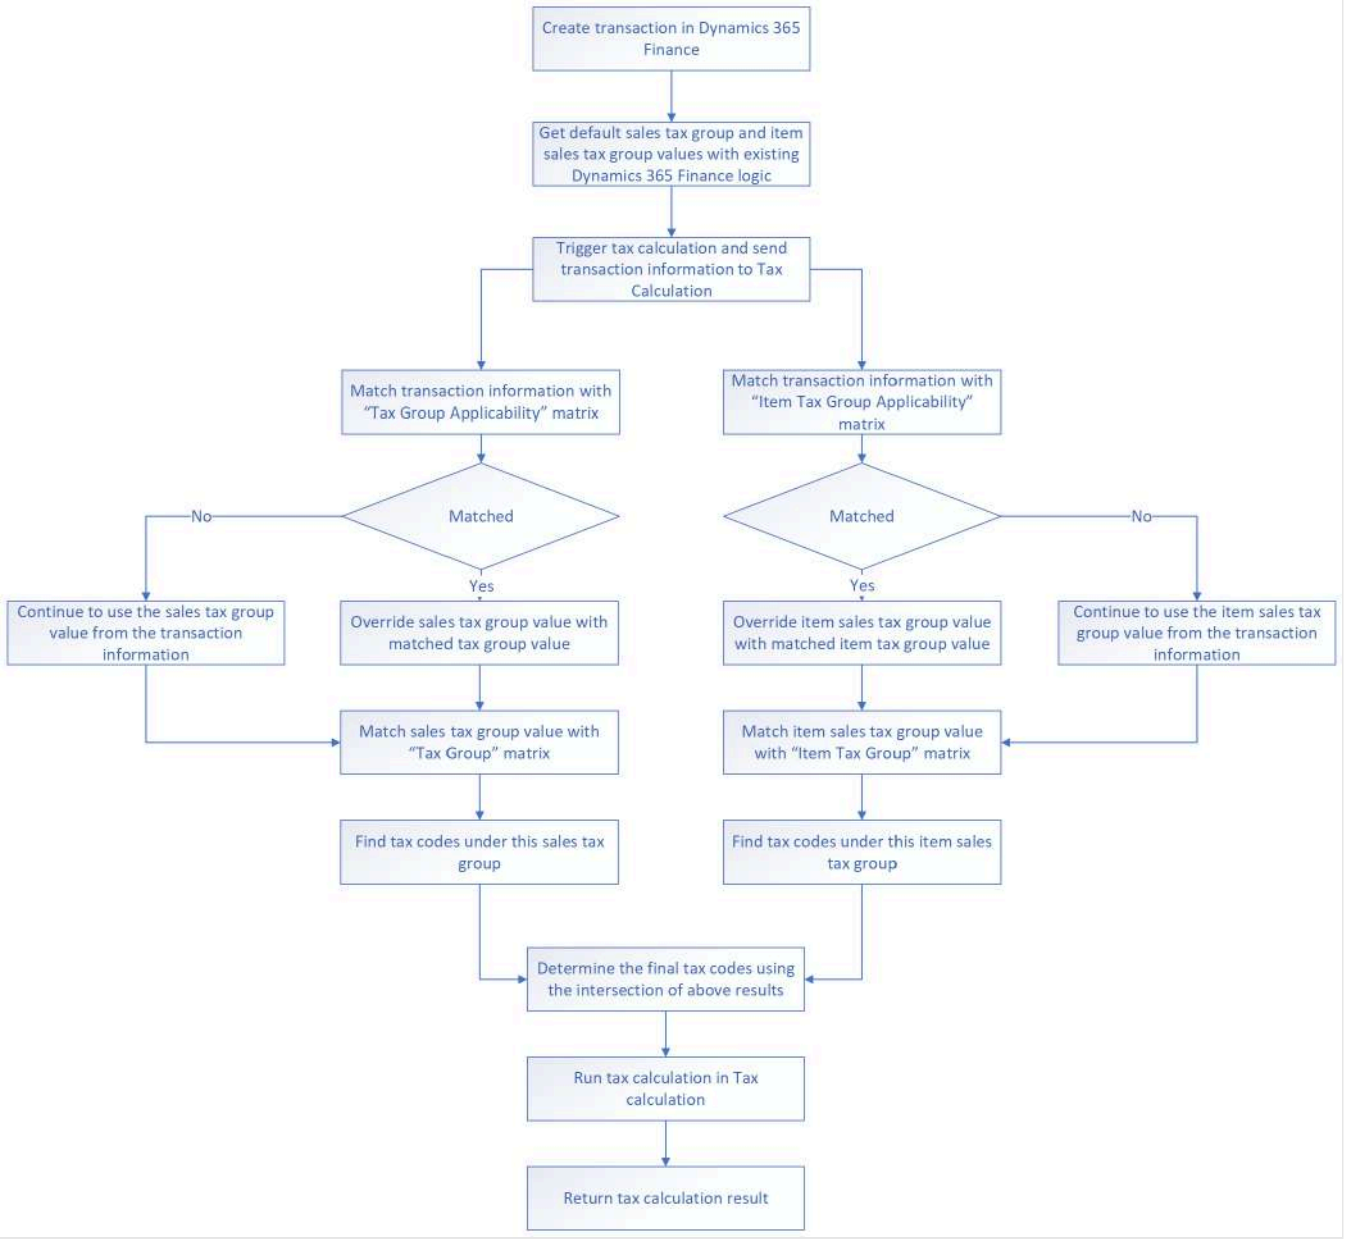
Runtime design

The following illustration shows the high-level runtime design of Tax Calculation.

1. A transaction, such as a sales order or purchase order, is created in Finance.
2. Finance automatically uses the default values of the sales tax group and the item sales tax group.
3. When the **Sales tax** button is selected on the transaction, the tax calculation is triggered. Finance then sends the transaction information to Tax Calculation.
4. Tax Calculation matches the transaction information with predefined rules in the tax feature to find a more accurate sales tax group and item sales tax group simultaneously.
    - If Tax Calculation matches the transaction information with the **Tax Group Applicability** matrix, it overrides the sales tax group value with the matched tax group value in the applicability rule. Otherwise, it continues to use the sales tax group value from the transaction information.
    - If Tax Calculation matches the transaction information with the **Item Tax Group Applicability** matrix, it overrides the item sales tax group value with the matched item tax group value in the applicability rule. Otherwise, it continues to use the item sales tax group value from the transaction information.
5. Tax Calculation determines the final tax codes by using the intersection of the sales tax group and the item sales tax group.

6. Tax Calculation calculates tax, based on the final tax codes that it determined.

7. Tax Calculation returns the tax calculation result. The **Sales tax** page shows the tax calculation result.



High-level configuration

The following steps provide a high-level overview of the configuration process for Tax Calculation.

1. In the **Globalization Studio** workspace, select the **Tax calculation** tile, and create the **Tax Calculation** feature.

2. Set up the **Tax Calculation** feature:
   a. Select the tax configuration version.
   b. Create tax codes.

c. Create a tax group.
d. Create an item tax group.
e. (Optional) Create tax group applicability if you want to override the default sales tax group that is entered from customer or vendor master data.
f. (Optional) Create item group applicability if you want to override the default item sales tax group that is entered from the item master data.

3. Complete the **Tax Calculation** feature.

4. In the **Tax calculation parameters**, select the **Tax Calculation** feature.

After you complete these steps, the following setups automatically sync from the Tax feature setup to Finance:

- Sales tax codes
- Sales tax groups
- Item sales tax groups

The remaining sections in this article provide more detailed configuration steps.

Configure the Tax Calculation feature

The steps in this section aren't related to a specific legal entity. Complete this procedure only once. You can complete it in any legal entity in Globalization Studio workspace in Finance (if you're using version 10.0.39 or later).

1. Import the correct tax configuration version, based on your Finance version. Follow the steps in Import Electronic reporting (ER) configurations from Dataverse.

2. Open the **Globalization Studio** workspace, select the **Tax Calculation** tile. On the **Tax calculation features** page, select the **Add** button, and select one of the following feature types:

   - **New feature** – Create a feature setup that has blank content.
   - **Based on existing feature** – Create a feature from an existing feature, and copy the content from the existing feature setup.

   > ⓘ **Note**
   >
   > You can import a demo feature for the **DEMF** demo legal entity. For more information, see **Import feature demo data**.

3. Enter a name and description for the feature, and then select **Create feature**.

After you create the feature, a draft version of it is automatically created. You can select **Get this version** to rebase the draft version on any completed version.

4. Select the draft version of the feature, and then select **Edit**. The **Tax Calculation setup** page is filled in.

5. Select **Configuration version**. You should see the configuration version that you imported.

   Microsoft provides a default tax configuration for tax calculation. This configuration covers most of the requirements for tax calculation behaviors. Microsoft updates it based on market feedback. If you must extend the configuration to meet specific requirements, see How to build extension in tax service for information about how to generate and select your own tax configuration.

6. After you select **Configuration version**, several additional tabs appear. Follow the order that is shown here to complete the mandatory tab setup.

   Mandatory setup

   - **Tax codes** – Maintain master data for tax codes. Finance automatically synchronizes all tax codes that you create on this tab when you enable the current version.
   - **Tax group** – Define the tax group master data and the tax codes under the group.
   - **Item tax group** – Define the item tax group master data and the tax codes under the group.

   Optional setup

   - **Tax group applicability** – Define a matrix that determines the tax group. If no applicability rules in this matrix match the taxable document from Dynamics 365, Tax Calculation uses the default value on the taxable document line.
   - **Item tax group applicability** – Define a matrix that determines the item tax group. If no applicability rules in this matrix match the taxable document from Dynamics 365, Tax Calculation uses the default value on the taxable document line.
   - **Customer tax registration number applicability** – If you have multiple tax registration numbers for one customer, Tax Calculation can automatically determine the correct tax registration number. In the matrix on this tab, define the rules that should be used to make the determination. Otherwise, Finance and Supply Chain Management continue to use the default tax registration number on taxable documents for sales transactions.
   - **Vendor tax registration number applicability** – If you have multiple tax registration numbers for one vendor, Tax Calculation can automatically determine the correct tax registration number. In the matrix on this tab, define the rules that should be used to make the determination. Otherwise, Finance and Supply Chain Management

continue to use the default tax registration number on taxable documents for purchase transactions.

- **List code applicability** – Automatically determine the value of the **List code** field through more flexible and configurable rules. In the matrix on this tab, define the rules that should be used to make the determination. Otherwise, Finance and Supply Chain Management continue to use the default code on taxable documents.

7. On the **Tax codes** tab, select **Add**, and enter the tax code and a description.

8. Select **Calculation origin**. The calculation origin defines how the tax base amount and the tax amount are calculated. The following values are available:

    - By net amount
    - By gross amount
    - By quantity
    - By margin
    - Tax on tax

9. Select **Save**. More fields become available, based on the **Calculation origin** that you selected.

10. Use the following options to identify the nature of the tax code:

    - Is exempt
    - Is use tax
    - Is reverse charge
    - Exclude from base amount calculation

    For a use tax scenario, set up a single tax code that has a positive tax rate, and mark it as **Is use tax**.

    For a reverse charge scenario, set up two tax codes, one of which has a positive tax rate, and the other of which has a negative tax rate but the same rate value. Mark the negative tax code as **Is reverse charge**. For more information about the reverse charge solution in Finance, see Reverse charge mechanism for VAT/GST scheme.

    For some tax types that should be excluded from the calculation of the tax base amount for price-inclusive transactions (for example, custom duty in some countries or regions), select the **Exclude from Base Amount Calculation** checkbox. For more information about this parameter, see Calculating tax on top of price when Prices include taxes is enabled.

    Maintain tax rates and the tax amount limits for this tax code.

11. Repeat steps 8 through 11 to add all other required tax codes.

12. On the **Tax group** tab, select the **Tax group** column, add it to the matrix as the input condition, and then add lines to maintain the tax group master data.

    Here's an example.

    Expand table

Tax group	Tax codes
DEU_Dom	DEU_VAT19; DEU_VAT7
DEU_EU	DEU_Exempt
BEL_Dom	BEL_VAT21; BEL_VAT6
BEL_EU	BEL_Exempt

13. On the **Item tax group** tab, select **Item tax group** column, add it to the matrix as the input condition, and then add lines to maintain the item tax group master data.

    Here's an example.

    Expand table

Item tax group	Tax codes
Full	DEU_VAT19; BEL_VAT21; DEU_Exempt; BEL_Exempt
Reduced	DEU_VAT7; BEL_VAT6; DEU_Exempt; BEL_Exempt

14. On the **Tax group applicability** tab, select the columns that are required to determine the correct tax group, and then select **Add**. Enter or select values for each column. The **Tax group** field is the output of this matrix. If you don't configure this tab, the sales tax group on the transaction line is used.

    Here's an example.

    Expand table

Business process	Ship from	Ship to	Tax group
Sales	DEU	DEU	DEU_Dom
Sales	DEU	FRA	DEU_EU
Sales	BEL	BEL	BEL_Dom
Sales	BEL	FRA	BEL_EU

> **Note**
>
> If the default sales tax group on your taxable document lines is correct, leave this matrix blank. For more information, see the Runtime design section in this article.

15. On the **Item tax group applicability** tab, select the columns that are required to determine the correct tax code, and then select **Add**. Enter or select values for each column. The **Item tax group** field is the output of this matrix. If you don't configure this tab, the item sales tax group on the transaction line is used.

    Here's an example.

    Expand table

Item code	Item tax group
D0001	Full
D0003	Reduced

    > **Note**
    >
    > If the default item sales tax group on your taxable document lines is correct, leave this matrix blank. For more information, see the Runtime design section in this article.

    For more information about how tax codes are determined in Tax Calculation, see Sales tax group and item sales tax group determination logic.

16. Set up the applicability of customer tax registration numbers, vendor tax registration numbers, and list codes, based on your business needs.

17. Select **Save**, and then close the page.

18. Select **Change status** > **Complete**. After the status is changed to **Complete**, you can't edit the version. Each legal entity can see this version of the tax feature setup on **Tax calculation parameters** page.

Set up Tax Calculation in Globalization studio Workspace

After you complete the setup in the Configure the Tax Calculation feature section, follow these steps to enable Tax Calculation and use the settings provided by the Tax Calculation feature.

Set up the configuration in this section by legal entity. You must configure it for each legal entity that you want to enable Tax Calculation for in Finance.

1. In Finance, go to **Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**.
2. On the **General** tab, set the following fields:
    - **Enable advanced tax calculation** – Select this checkbox to enable Tax Calculation for the legal entity. If you don't enable it for the current legal entity, the legal entity continues to use the existing tax engine to determine and calculate tax.
    - **Feature name** – Select a completed tax feature setup and version for the legal entity. For more information about how to set up and complete a published tax feature, see the previous section of this article.
    - **Business Process** – Select the business processes to enable.
3. Use the **Sales tax rounding rule** group of fields to define the expected rounding rule for the legal entity. For more information about the rounding logic, see Tax calculation rounding rules.
4. On the **Error handling** tab, define the expected error handling method for the legal entity. Three options are available:
    - No
    - Warning
    - Error

    Set up an error handling method for each result code in the **Details** section.
5. On the **Multiple VAT registration** tab, you can turn on VAT declaration, EU Sales List, and Intrastat separately to work under a multiple VAT registrations scenario. For more information about tax reporting for multiple VAT registrations, see Reporting for multiple VAT registrations.
6. Save the setup, and repeat the previous steps for each additional legal entity. When you complete a new version of Tax Calculation feature and want to apply it, set the **Feature name** field on the **General** tab of the **Tax calculation parameters** page (see step 2).

Last updated on 03/21/2026

Set up tax codes

This article explains how to set up tax codes in the Tax Calculation feature of Globalization studio workspace. It includes the setup for a simple scenario to make the tax code work and information about some advanced tax code functionality for complex scenarios.

> **Important**
>
> The setup of tax codes in the Tax Calculation of Globalization studio workspace is legal entity–agnostic. Tax codes are automatically synced to Sales tax codes when you enable the Enable advanced tax calculation in the Tax calculation parameters for a selected legal entity in Finance.

Simple setup

Follow these steps to use a tax code in a simple scenario, such as a scenario where there's only one tax rate.

1. Open the **Globalization Studio** workspace, select **Globalization services**, and then select the **Tax Calculation** tile.
2. On the **Tax calculation features** page, select the feature and version that you want to set up, and then select **Edit**.
3. On the **General** tab, select **Configuration version**.
4. On the **Tax codes** tab, select **Add**, and enter the tax code and a description.
5. Select **Calculation origin**. A calculation origin is a group of methods that are defined in the tax configuration version that you selected. For this simple scenario, select **By net amount**.
6. Select **Save**. More fields become available, based on the calculation origin that you selected.
7. On the **Rates** FastTab, select **Add** to add one tax rate for this tax code.
8. Select **Save**.

Calculation origin

The calculation origin defines how the system calculates the tax base amount and the tax amount. The **Calculation origin** field offers the following values:

- By net amount
- By gross amount

- By quantity
- By margin
- Tax on tax

By net amount

If you select **By net amount** in the **Calculation origin** field, the system calculates the tax amount as a percentage of the purchase or sales amount, excluding any other tax codes.

For example, the tax rate is 25 percent, the invoice line shows a quantity of 10 items at 1.00 each, and the customer is allowed a 10-percent line discount. In this case, the system calculates amounts as follows:

- **Net amount:** (10 × 1.00) – 10 percent = 9.00
- **Sales tax:** 9.00 × 25 percent = 2.25
- **Total invoice amount:** 9.00 + 2.25 = 11.25

By gross amount

If you select **By gross amount** in the **Calculation origin** field, the system calculates the tax amount as a percentage of the gross sales amount. The gross amount is the line's net amount plus all taxes and fees for the line except the one tax where the **Calculation origin** field is set to **By gross amount**.

For example, the tax authority imposes special duties on an item. The duty amounts are added to the net amount before tax is calculated. The following tax codes are used:

- **Duty 1** – The rate is 10 percent, and the **By net amount** calculation method is used.
- **Duty 2** – The rate is 20 percent, and the **By net amount** calculation method is used.
- **Tax rate** – The rate is 25 percent, and the **By gross amount** calculation method is used.

If the net amount is 10.00, the Duty 1 amount is 1.00 (10.00 × 10 percent), and the Duty 2 amount is 2.00 (10.00 × 20 percent). In this case, amounts are calculated in the following way:

- **Gross amount:** Net amount + Duty 1 amount + Duty 2 amount = 10.00 + 1.00 + 2.00 = 13.00
- **Tax amount:** 13.00 × 25 percent = 3.25
- **Total duties and tax:** 1.00 + 2.00 + 3.25 = 6.25
- **Total invoice amount:** 10.00 + 6.25 = 16.25

By quantity

If you select **By quantity** in the **Calculation origin** field, the tax amount is calculated as a fixed amount per unit and multiplied by the quantity that you enter on the document line. You specify the amount per unit on the **Rates** FastTab.

For example, you set up the tax code as 1.20 per unit. On a sales invoice line, you sell 25 units of an item. In this case, the tax amount is calculated as 25 × 1.20 = 30.00.

> ⓘ **Note**
>
> If you enter the transaction in a unit other than the unit that's specified on the tax code, the unit is automatically converted based on the unit conversions that are set up on the **Unit conversions** page. This function is available starting from the 10.0.40 update.

By quantity, additional option

You can choose whether to calculate a tax amount By quantity before other tax codes and add it to the net amount before other tax codes are calculated where **Calculation origin** = **By Net Amount**.

Examples

Assume two tax codes are calculated on a transaction:

- **Duty**: Calculation origin = By quantity, the value is set to 5.00 per unit = pcs
- **Tax**: Calculation origin = as shown in the examples below, the value is set to 25%

One piece of an item is sold at a unit price of 10.00.

Example 1

Tax: Calculation origin = By Gross Amount method. The **Calculate before sales tax** option has no effect, because **Tax** is calculated as a percentage of the gross amount. Duty: 1 × 5.00 = 5.00. Gross amount: 10.00 + 5.00 = 15.00. Tax: 15.00 × 25% = 3.75. Total tax: 5.00 + 3.75 = 8.75. Total amount: 10.00 + 8.75 = 18.75.

Example 2

Tax: Calculation origin = By Net Amount. The **Calculate before sales tax** option isn't selected for the **Duty** calculation. Net amount: 10.00. Duty: 1 × 5.00 = 5.00. Tax: 10.00 × 25% = 2.50. Total tax: 5.00 + 2.50 = 7.50. Total amount: 10.00 + 7.50 = 17.50.

Example 3

Tax: Calculation origin = By Net Amount. The **Calculate before sales tax option** is selected for the **Duty** calculation. Net amount: 10.00. Duty: 1 × 5.00 = 5.00. Tax: (10.00 + 5.00) × 25% = 3.75. Total tax: 5.00 + 3.75 = 8.75. Total amount: 10.00 + 8.75 = 18.75.

Example 4

The results of example 3 and example 1 are the same, because there's only one duty. Assume that you have two duties, and only one of them is included in the net amount for the sales tax calculation: Duty 1: 5.00, using the By Quantity method, and the **Calculate before sales tax** option is selected. Duty 2: 2.50, using the By Quantity method, and the **Calculate before sales tax** option isn't selected. Tax: 25%, using the By Net Amount method. Net amount: 10.00. Duty 1: 1 × 5.00 = 5.00. Duty 2: 1 × 2.50 = 2.50. Net amount subject to tax: 10.00 + 5.00 = 15.00. Tax: 15.00 × 25% = 3.75. Total taxes, including duties: 5.00 + 2.50 + 3.75 = 11.25. Total amount: 10.00 + 11.25 = 21.25. The 25% **Tax** is calculated for the sum of the net amount (10.00) + Duty 1 (5.00) = 15.00. Duty 2 is added to the tax amount after the sales tax is calculated.

By margin

If you select **By margin** in the **Calculation origin** field, the system calculates the tax amount as a percentage of the sales margin. The sales margin is the sales amount minus the cost amount. This calculation method applies only to sales transactions.

For example, the tax rate is 25 percent, the invoice line shows a quantity of 10 items at 10.00 each, and the cost per item is 6. In this case, amounts are calculated in the following way:

- **Sales margin:** 10 × (10.00 – 6.00) = 40.00
- **Tax amount:** 40.00 × 25 percent = 10.00
- **Total invoice amount:** 100.00 + 10.00 = 110.00

Tax on tax

If you select **Tax on tax** in the **Calculation origin** field, the system calculates the sales tax as a percentage of all the other tax amounts on the same document line.

For example, use the following tax codes:

- **Duty 1** – The rate is 10 percent, and the **By net amount** calculation method is used.
- **Duty 2** – The rate is 20 percent, and the **By net amount** calculation method is used.
- **Tax on duty** – The rate is 25 percent, and the **Tax on tax** calculation method is used.

In this case, amounts are calculated in the following way:

- **Net amount:** 10.00
- **Duty 1:** 10.00 × 10 percent = 1.00
- **Duty 2:** 10.00 × 20 percent = 2.00
- **Tax on duty:** 3.00 × 25 percent = 0.75
- **Total tax:** 1.00 + 2.00 + 0.75 = 3.75
- **Total invoice amount:** 10.00 + 3.75 = 13.75

Advanced functionality

This section explains some advanced functionality of the tax code setup for complex scenarios.

Tax exemption

If you set the **Is Exempt** option to **Yes** on the **General** FastTab, the tax amount is always 0, regardless of the actual tax rate.

Set the **Exempt Code** field to specify the reason for the exemption.

You can enable master data lookup for the **Exempt Code** field. By using this feature, you can select among the exempt code values that are defined in Finance. For information about how to enable master data lookup, see Enable master data lookup for tax calculation configuration.

For example, the tax rate is 25 percent, and the **Is Exempt** option is set to **Yes** on the tax code. The invoice line shows a quantity of 10 items at 1.00 each, and the customer is allowed a 10-percent line discount. In this case, amounts are calculated in the following way:

- **Net amount:** (10 × 1.00) – 10 percent = 9.00
- **Sales tax:** 0.00
- **Total invoice amount:** 9.00 + 0.00 = 9.00

Use tax

If you set the **Is Use Tax** option to **Yes** on the **General** FastTab, the tax amount posts to the **Use tax payable** account instead of the **Vendor summary** account.

For example, the tax rate is 25 percent, and you set the **Is Use Tax** option to **Yes** on the tax code. The invoice line shows a quantity of 10 items at 1.00 each, and the customer is allowed a 10-percent line discount. In this case, amounts are calculated in the following way:

- **Net amount:** (10 × 1.00) – 10 percent = 9.00
- **Use tax:** 9.00 × 25 percent = 2.25
- **Total invoice amount:** 9.00 + 0.00 = 9.00

> **Important**
>
> If you set both the **Is Exempt** option and the **Is Use Tax** option to **Yes** on a tax code, the code is recognized as tax-exempt for sales transactions and use tax for purchase transactions.

Reverse charges

If you set the **Is Reverse Charge** option to **Yes** on the **General** FastTab, you can configure the tax rate as negative. For a reverse charge scenario, set up two tax codes: one that has a positive tax rate and one that has a negative tax rate. Both tax codes should have the same rate value, and set the **Is Reverse Charge** option to **Yes** on the tax code that has a negative tax rate. For more information about the reverse charge solution in Finance, see Reverse charge mechanism for VAT/GST scheme.

For example, you determine two tax codes on one invoice line. One tax rate is 25 percent. The other tax rate is -25 percent, and you set the **Is Reverse Charge** option to **Yes** on the second tax code. The invoice line shows a quantity of 10 items at 1.00 each. In this case, the amounts are calculated in the following way:

- **Net amount:** (10 × 1.00) = 10.00
- **Tax code 1:** 10.00 × 25 percent = 2.50
- **Tax code 2:** 10 × -25 percent = -2.50
- **Total invoice amount:** 10.00 + 2.50 -2.50 = 10.00

Exclusion from base amount calculations

If you set the **Exclude from base amount calculation** option to **Yes** on the **General** FastTab, the calculated tax amount of the tax code is excluded from the tax base amount for other tax code calculations in the price-inclusive scenario.

For more information, see Calculate tax on prices when Prices include taxes is enabled.

Rates

On the **Rate** FastTab, you can define different tax rates for different ranges of tax base amounts. To calculate the tax amount, the Tax Calculation service always uses the rate that matches the tax base amount.

For example, you might configure tax rates as shown in the following table.

Expand table

Minimum amount	Maximum amount	Tax rate
0	1,000	10 percent
1,000	5,000	15 percent
5,000	10,000	20 percent
10,000	0	30 percent

In this case, calculate the tax amount as follows:

- If the tax base amount is 300.00, the tax rate is 10 percent, and the tax amount is 300.00 × 10 percent = 30.00.
- If the tax base amount is 3,000.00, the tax rate is 15 percent, and the tax amount is 3,000.00 × 15 percent = 450.00.
- If the tax base amount is 6,000.00, the tax rate is 20 percent, and the tax amount is 6,000.00 × 20 percent = 1,200.00.
- If the tax base amount is 20,000.00, the tax rate is 30 percent, and the tax amount is 20,000.00 × 30 percent = 6,000.00.

> **Note**
>
> If the tax base amount can match both the maximum amount on one line and the minimum amount on the other line, the base uses the tax rate that matches the minimum base amount. For example, if the tax base amount is 1,000.00, the tax rate is 15 percent, and the tax amount is 1,000.00 × 15 percent = 150.00.

Limits

On the **Limits** FastTab, you can define tax limits to override the calculated tax amount if the tax amount falls outside the minimum or maximum range.

- If the calculated tax amount is more than or equal to the maximum tax amount that you configure on the **Limits** FastTab, the final tax amount equals the maximum tax amount.
- If the calculated tax amount is less than the minimum tax amount that you configure on the **Limits** FastTab, the final tax amount is 0.

For example, the tax limits are configured in the following way:

- **Minimum tax amount:** 100
- **Maximum tax amount:** 1,000

If the calculated tax amount is 2,000, the final tax amount is 1,000.

If the calculated tax amount is 500, the final tax amount is 500.

If the calculated tax amount is 80, the final tax amount is 0.

Set up tax groups

This article explains how to set up tax groups in the Tax Calculation feature. It also explains how to set up the tax group applicability rule matrix and configure lines in the matrix.

The concept of tax groups in the Tax Calculation feature resembles the concept of sales tax groups in Microsoft Dynamics 365 Finance. They're groups of tax codes. The Tax Calculation feature uses the intersection of a tax group and an item tax group to determine the tax codes.

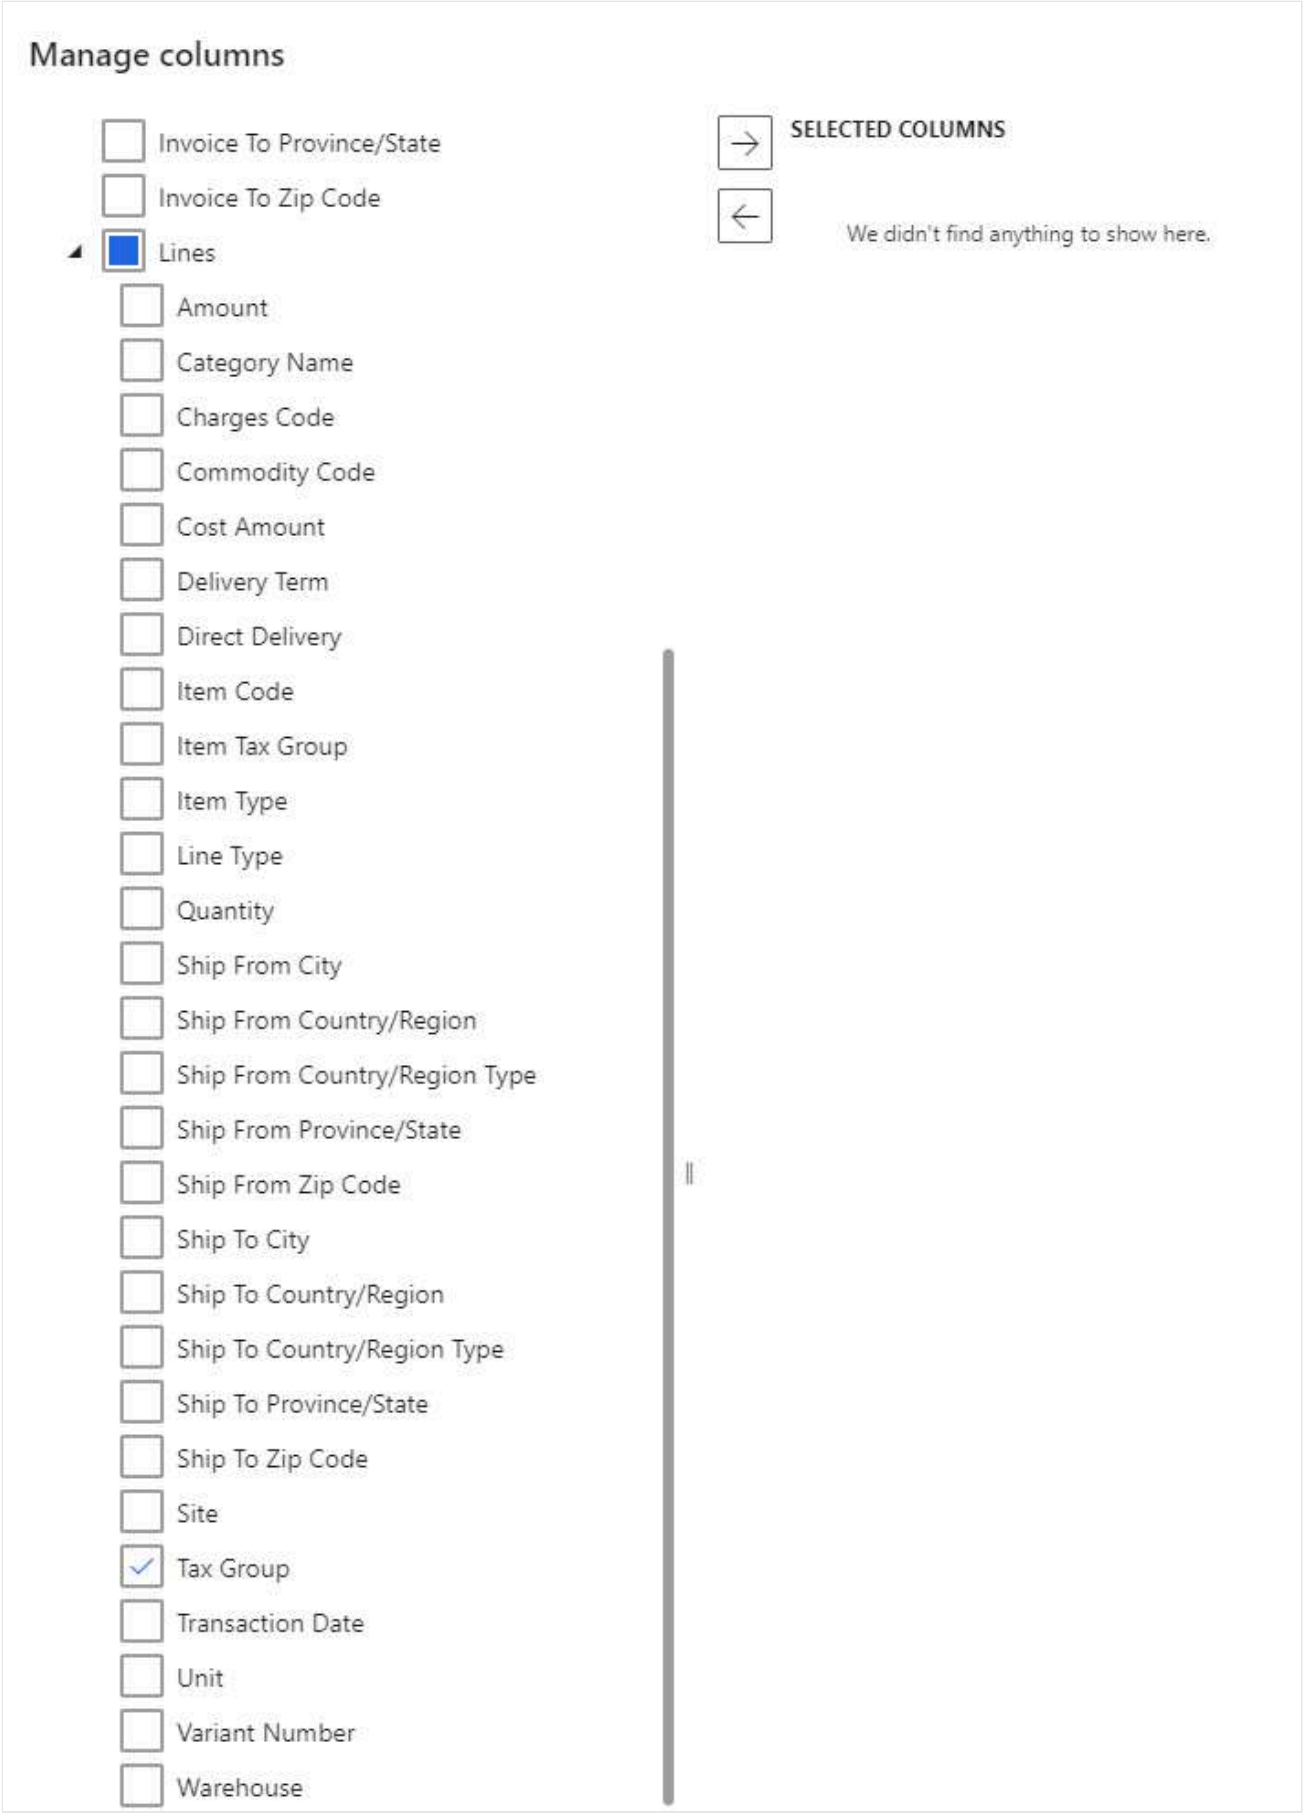
However, tax groups in the Tax Calculation feature differ from sales tax groups in Finance in that they don't have additional parameters, such as **Use tax** and **Exempt tax**. Instead, those parameters are available at the tax code level.

> **Important**
>
> The setup of tax groups in the Tax Calculation of Globalization studio workspace is legal entity–agnostic. When you enable the **Enable advanced tax calculation** in the Tax calculation parameters, the system automatically syncs tax groups to the Sales tax groups for the selected legal entity.

Set up a tax group

Follow these steps to set up a tax group.

1. In Finance, open the **Globalization Studio** workspace, select **Globalization services**, and then select the **Tax Calculation** tile.
2. On the **Tax calculation features** page, select the feature and version that you want to set up, and then select **Edit**.
3. On the **General** tab, select **Configuration version**.
4. On the **Tax group** tab, select **Manage Column**. If you're setting up a tax group for the first time, the fields in the **Manage column** dialog box are automatically set.
5. In the list on the left, expand the **Lines** node, and select the checkbox for **Tax Group**.



6. Select the right arrow button to add **Tax Group** to the **Selected columns** list on the right.

7. Select **OK**.

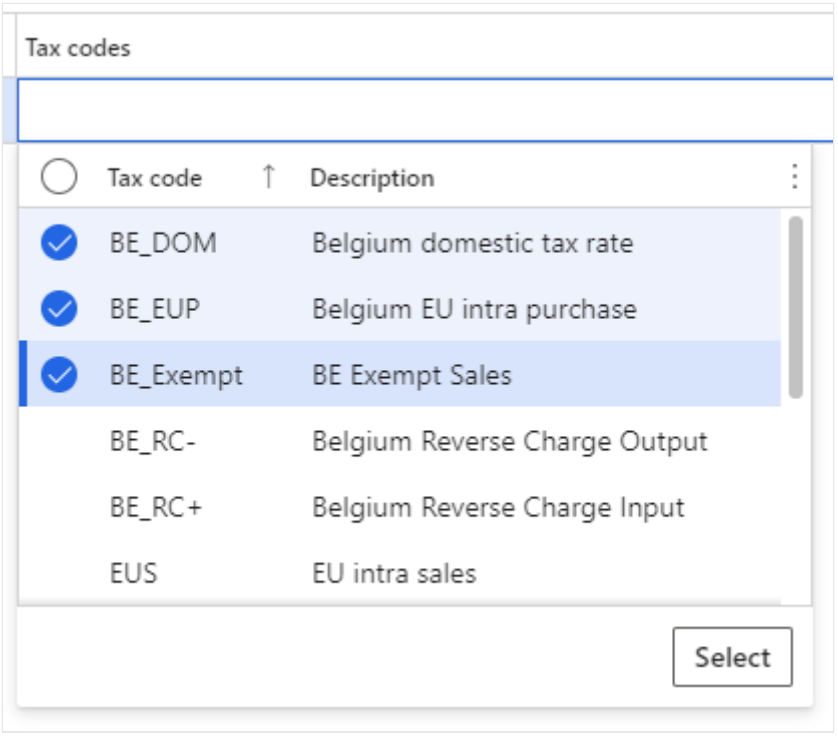
Configure a tax group

When you set up a tax group, you create the tax group applicability rule matrix. Add lines to the matrix to configure the tax group.

1. On the **Tax group** tab, select **Add**.
2. In the **Tax group** field, enter the name of the tax group.

   > **Important**
   >
   > Limit the name of the tax group to 10 characters. This name syncs with Finance, which has a limit of 10 characters for the names of sales tax groups.

3. In the **Tax codes** field, select the checkbox for each tax code that you want to include in the tax group. You can include multiple tax codes in one tax group.



4. Repeat steps 1 through 3 to add more tax groups.

Last updated on 03/21/2026

Set up item tax groups

This article explains how to set up item tax groups in the Tax Calculation feature. It also explains how to set up the item tax group applicability rule matrix and configure lines in the matrix.

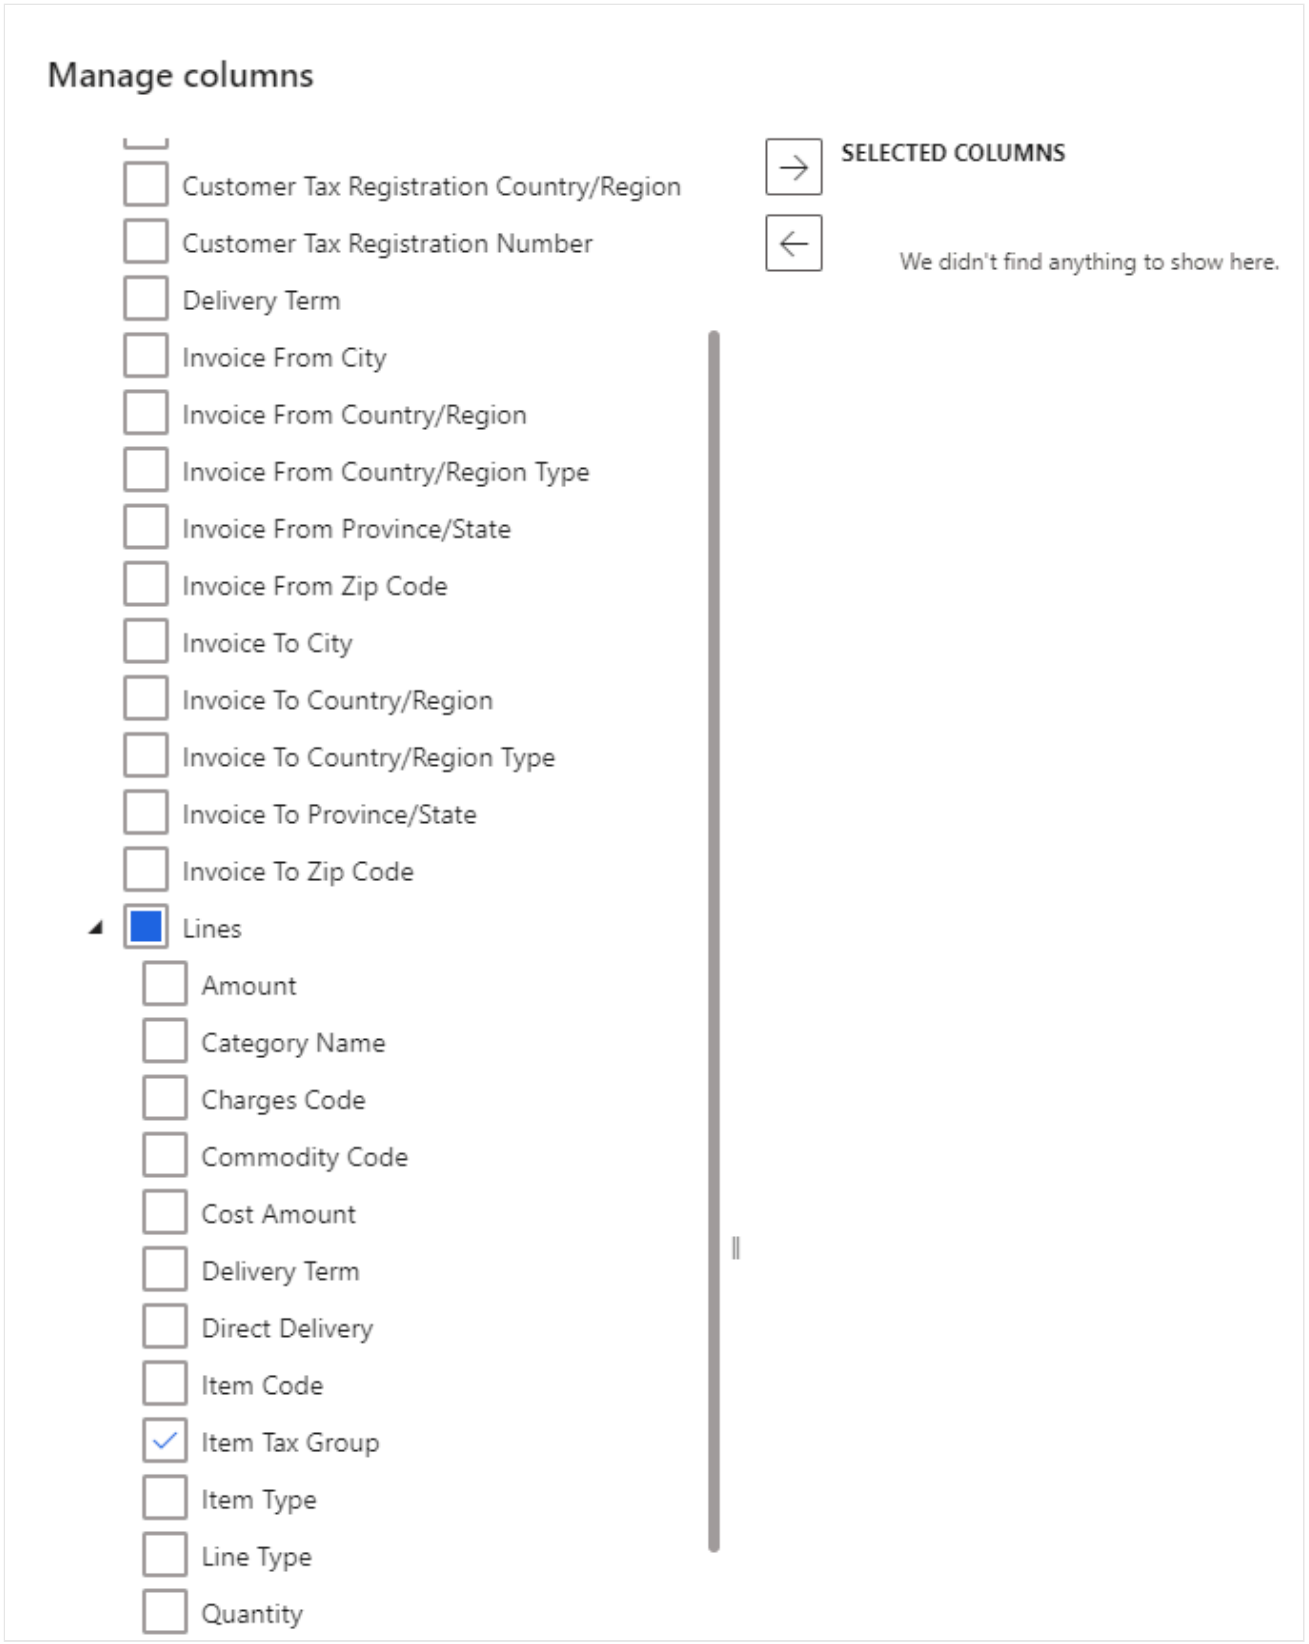
The concept of item tax groups in the Tax Calculation feature resembles the concept of item sales tax groups in Microsoft Dynamics 365 Finance. They're groups of tax codes. The Tax Calculation feature uses the intersection of a tax group and an item tax group to determine the tax codes.

> ⓘ **Important**
>
> The setup of item tax groups in the Tax Calculation feature of the Globalization studio workspace is legal entity–agnostic. When you enable the **Enable advanced tax calculation** in the Tax Calculation feature, the system automatically syncs item tax groups to the item sales tax groups for the selected legal entity.

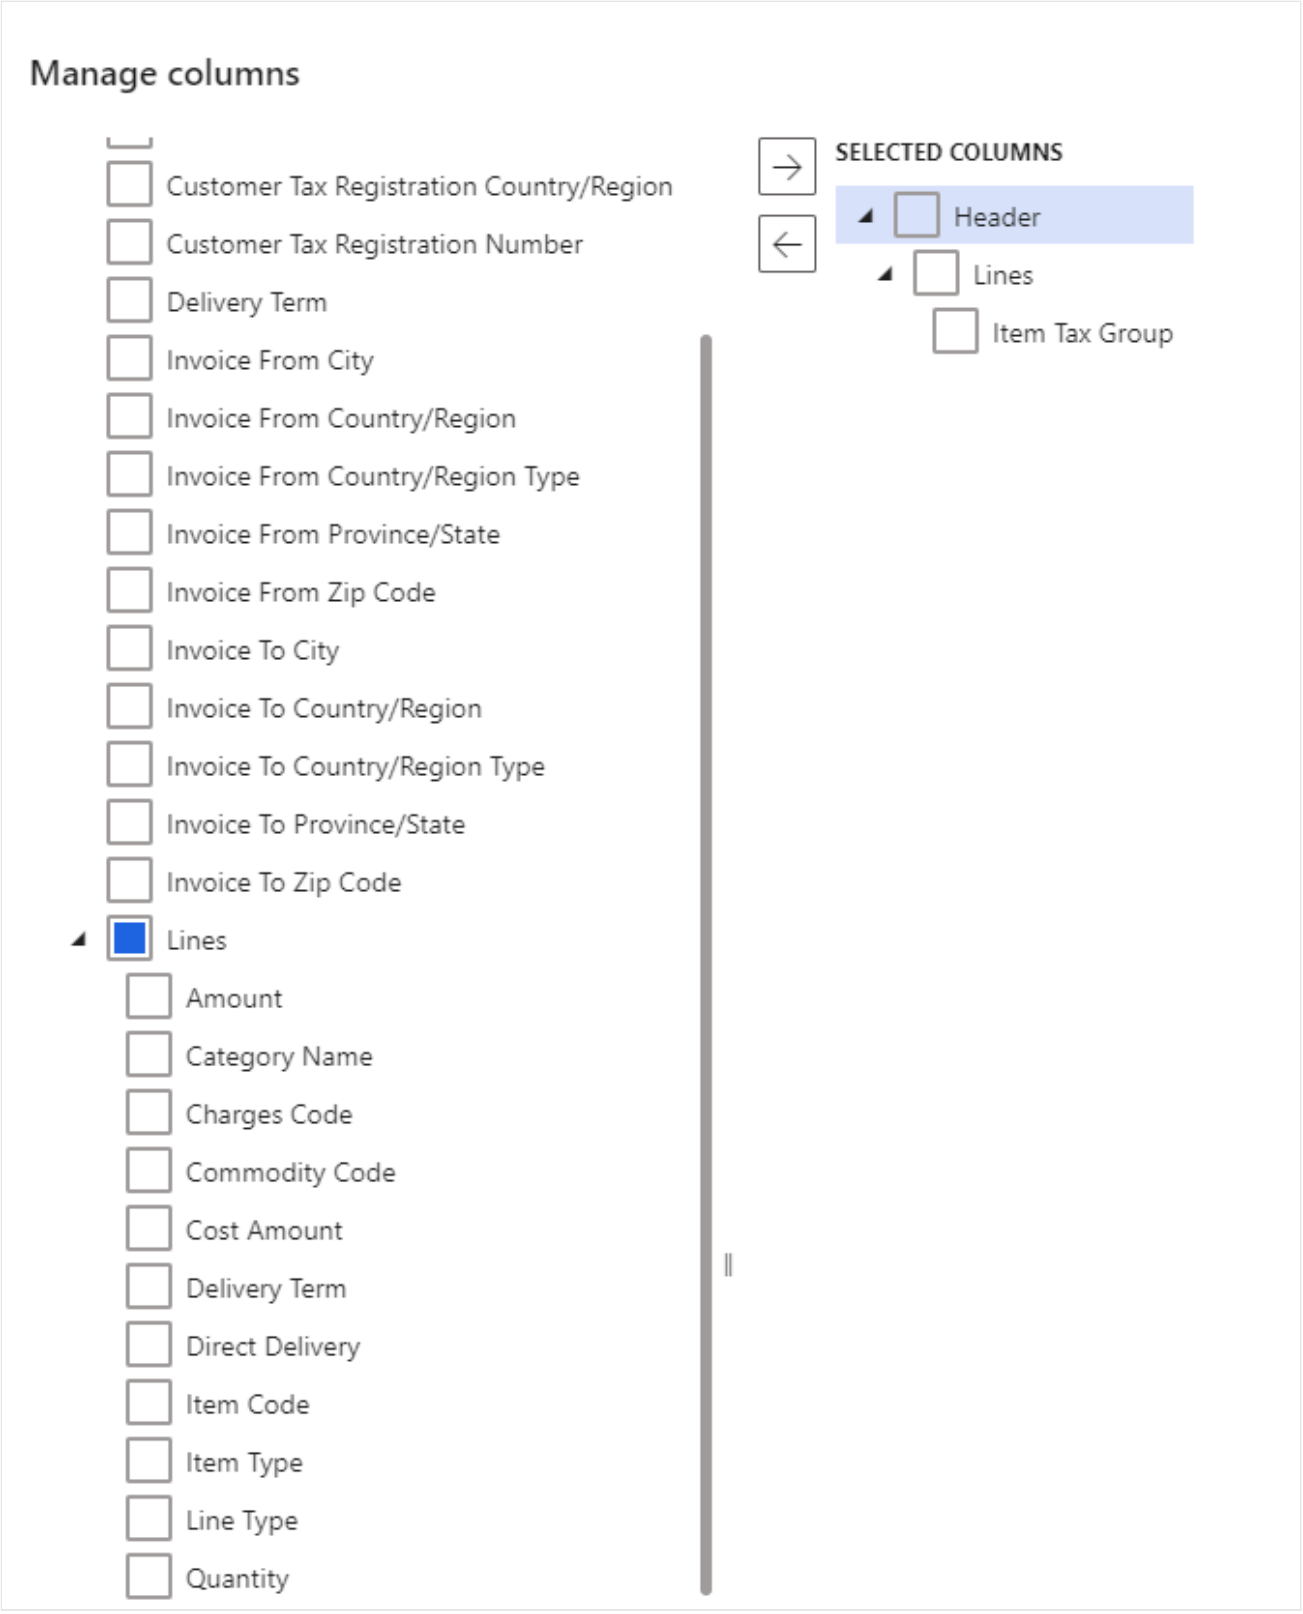
Set up an item tax group

Follow these steps to set up an item tax group.

1. In Finance, open the **Globalization Studio** workspace, select **Globalization services**, and then select the **Tax Calculation** tile.
2. On the **Tax calculation features** page, select the feature and version that you want to set up, and then select **Edit**.
3. On the **General** tab, select **Configuration version**.
4. On the **Item tax group** tab, select **Manage column**. If you're setting up an item tax group for the first time, the fields in the **Manage column** dialog box are automatically set.
5. In the list on the left, expand the **Lines** node, and select the checkbox for **Item Tax Group**.



6. Select the right arrow button to add **Item Tax Group** to the **Selected columns** list on the right.



7. Select **OK**.

Configure an item tax group

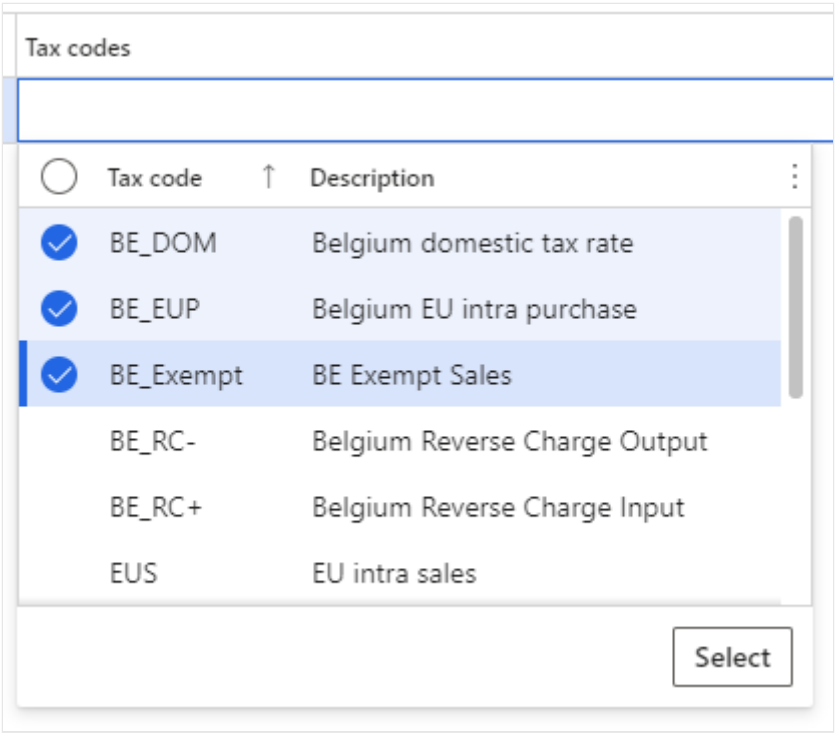
When you set up an item tax group, you create the applicability rule matrix. Add lines to the matrix to configure the item tax group.

1. On the **Item tax group** tab, select **Add**.

2. In the **Item tax group** field, enter the name of the item tax group.

> **Important**
>
> Limit the name of the item tax group to 10 characters. This name syncs with Finance, which has a limit of 10 characters for the names of item sales tax groups.

3. In the **Tax codes** field, select the checkbox for each tax code that you want to include in the item tax group. You can include multiple tax codes in one item tax group.



4. Repeat steps 1 through 3 to add more item tax groups.

Import and export tax calculations

This article provides information about the import and export functionality of the tax calculation feature. This functionality helps ensure a flexible and efficient configuration experience.

Import and export tax codes

Export templates

1. Open the **Globalization Studio** workspace, select **Globalization services**, and then select the **Tax Calculation** tile.
2. On the **Tax calculation features** page, select an existing feature, or create a new feature.
3. In the **Versions** grid, select **Edit**.
4. On the **Tax calculation** feature page, set the configuration version.
5. On the **Tax codes** tab, select **Import**.
6. Select **Export a tax code template** to download the **TaxCodesTemplate.zip** file.
7. Unzip the **TaxCodesTemplate.zip** file. The tax code templates are compressed separately according to **Calculation origin** value.
8. Unzip the **By Net Amount.zip** file to get the following comma-separated values (CSV) files:
    - **TaxCode.csv** – Enter the tax codes.
    - **TaxLimit.csv** – Enter the tax limits for each tax code.
    - **TaxRate.csv** – Enter the tax rates for each tax code.

> ⓘ **Note**
>
> By default, the templates include entries for the **Sample** tax code. If you don't remove the **Sample** tax code from the CSV files, the import process adds it to the feature.

Import tax codes

Follow these steps to import the **Sample** tax code in the template into your tax calculation feature.

1. On the **Tax calculation features** page, select the feature. In the **Versions** grid, select **Edit**.
2. On the **Tax codes** tab, select **Import**.
3. Select **Browse**, find and select the **TaxCode.csv** file. In the **Target table** field, select **Tax code**.
4. Select **OK** to import the tax code.
5. Find and select the **TaxRate.csv** file. In the **Target table** field, select **Tax rate**.
6. Select **OK** to import the tax rate.
7. Find and select the **TaxLimit.csv** file. In the **Target table** field, select **Tax limit**.
8. Select **OK** to import the tax limit.

You can also directly import the ZIP file that includes all three CSV files. By using this method, you can quickly and easily complete the import.

1. On the **Tax calculation** feature page, on the **Tax codes** tab, select **Import**.
2. Select **Browse**, find and select the **By Net Amount.zip** file, and then select **OK**.

Export tax codes

1. On the **Tax calculation features** page, select the feature. In the **Versions** grid, select **Edit**.
2. On the **Tax codes** tab, select **Export**.

   The **Export** button is available when there's at least one tax code in the **Tax codes** grid.
3. Select **OK** to export all tax codes of the feature in a ZIP file.

> **Note**
>
> Use the exported file as a template to import tax codes into the corresponding feature.

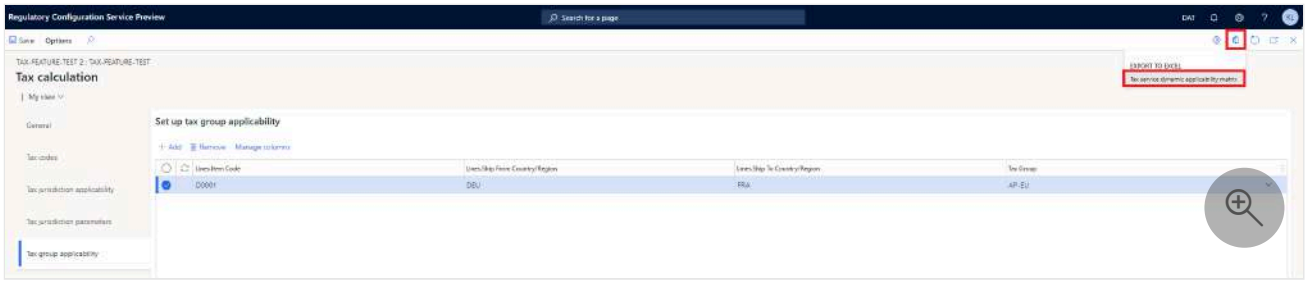
Import and export applicability rules

Export applicability rules

1. On the **Tax calculation features** page, select an existing feature, or create a new feature.
2. In the **Versions** grid, select **Edit**.
3. On the **Tax calculation** feature page, set the configuration version.

4. On the **Tax group applicability** tab, select the rows in the **Set up tax group applicability** grid.

5. Select the **Open in Microsoft Office** button, and then select **Tax service dynamic applicability matrix**.



6. Select **Download** to export the selected rows to a Microsoft Excel worksheet.

Import applicability rules

The Excel worksheet that you downloaded contains the structure of the **Set up tax group applicability** grid. You can add new rules directly in the worksheet. When you finish, follow these steps to import the new rules back into the **Set up tax group applicability** grid.

1. In the Excel worksheet, select and copy the rows to import.
2. On the **Tax group applicability** tab, select **Add** to insert an empty record at the bottom of the **Set up tax group applicability** grid.
3. Select **Ctrl+V** to paste the copied rows into the grid.
4. Select **Save**.

Import feature demo data

Follow these steps to import feature demo data.

1. On the **Tax calculation features** page, select **Import**. Then, on the **Import feature from Dataverse repository** page, select **Synchronize**.
2. In the table, select the **tax-calculation-feature-demo-data** feature, and then select **Import**.
3. Select **View** to review the tax codes, groups, and applicability rules that are defined in the imported feature.
4. Switch to the **DEMF** legal entity, and then go to **Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**.
5. On the **General** tab, select **Enable advanced tax calculation**.
6. In the **Feature setup name** field, select **tax-calculation-feature-demo-data**.

7. Select a settlement period and a ledger posting group for the new demo tax codes, and then select **Confirm**.
8. Select **Save**.

> **Note**
>
> The **tax-calculation-feature-demo-data** demo feature is based on feature version **40.54.234** and is designed for the **DEMF** demo legal entity.

Enable master data lookup for tax calculation configuration

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up and enable the tax calculation master data lookup functionality. A dropdown list is available to select values in the tax calculation configuration for fields such as **Legal entity**, **Vendor account**, **Item code**, and **Delivery term**.

1. In the **Feature management** workspace, enable the **Enable applicability rules value lookup for Tax Calculation** feature.

   > **Note**
   >
   > Starting from version 10.0.43, you can't enable this feature through feature management. Instead, use the **Enable lookups in applicability rules** parameter in the **Tax feature setup**.

2. Make sure that you imported the latest configuration and model mapping versions. If you didn't, follow the steps in Import Electronic reporting (ER) configurations from Dataverse to import them.

   - Tax Data Model.version.40.xml
   - Tax Calculation Data Model 40.65.xml
   - FNO Model Mapping 40.65.35.xml (For this model mapping, set the **Default for model mapping** parameter to **Yes**.)
   - Tax Calculation Configuration 40.65.249.xml

3. On the tax **Feature version** setup page, select configuration version 40.65.249.

   > **Note**
   >
   > If you have a customized configuration, you must rebase the configuration and then use the customized configuration.

4. In the **Source legal entity** field, select legal entities. You can choose master data from these legal entities.

Sync the tax setup from the Tax Calculation feature to Dynamics 365 Finance

This article explains how to sync tax setup master data from the Tax Calculation feature to Microsoft Dynamics 365 Finance.

After you complete the required setup steps in Get started with Tax Calculation, the Tax Calculation feature automatically syncs the following tax setup data to Finance.

Sales tax code

Expand table

Tax Calculation feature	Finance
Tax code	Sales tax code
Description	Name
User input	Settlement period
User input	Ledger posting group
User input	Sales tax currency
A negative tax rate is configured	Allow negative sales tax percentage

Tax value

Expand table

Tax Calculation feature	Finance
From transaction date	From date
To transaction date	To date
Minimum amount	Minimum limit
Maximum amount	Maximum limit
Tax rate	Value
Non-deductible rate	Non-deductible percentage

Tax limits

Expand table

Tax calculation feature	Finance
From transaction date	From date
To transaction date	To date
Minimum tax amount	Minimum sales tax
Maximum tax amount	Maximum sales tax

Sales tax group

Expand table

Tax calculation feature	Finance
Tax group	Sales tax group
Tax codes under this tax group	Sales tax codes under this sales tax group
The tax code is marked as **Is Exempt**	Exempt
The tax code is marked as **Is Exempt**	Exempt code
The tax code is marked as **Is Reverse Charge**	Reverse charge
The tax code is marked as **Is Use Tax**	Use tax

Item sales tax group

Expand table

Tax Calculation feature	Finance
Item tax group	Item sales tax group
Tax codes under this item tax group	Sales tax codes under this item sales tax group

After the synchronization finishes, continue to maintain the remaining parameters in Finance for posting and reporting purposes.

> ⓘ Note

Synchronization of the tax setup from Finance to the Tax Calculation feature isn't supported. For an existing Finance environment, first create the tax setup in the Tax Calculation feature. Then sync the setup data back to the Finance environment.

Automate tax feature creation based on tax master data (Preview)

[This article is prerelease documentation and is subject to change.]

This article explains how to use the functionality to automatically create a Tax Calculation feature based on existing sales tax master data in Microsoft Dynamics 365 Finance.

This feature reduces time and effort for businesses by simplifying the transition from standard sales tax functionality to the advanced Tax Calculation functionality. An automated tax feature creation process enables you to adopt and realize the benefits of Tax Calculation faster and with less manual work. It reads existing sales tax master data in the legal entity and automatically creates the required records in the Tax feature setup, reusing existing tax codes, sales tax groups, and item sales tax groups. This approach minimizes setup complexity, preserves current configurations, and ensures a smoother transition to the advanced Tax Calculation experience.

> **Note**
>
> This functionality is supported globally, except for Brazil and India.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

Before you begin, ensure the following prerequisites are met:

- Import the latest Tax Configuration in **Electronic reporting** > **Tax configurations**. Learn more in Import Electronic reporting (ER) configurations from Dataverse or Import Electronic reporting (ER) configurations.

- Enable the **(Preview) Automate tax feature creation based on tax master data** feature in the **Feature management** workspace.

Enable the Automate tax feature

To enable the Automate tax feature, follow these steps:

1. In the **Feature management** workspace, find and enable the **(Preview) Automate tax feature creation based on tax master data** feature.
2. After you enable the Automate tax feature, the **Tax Data Migration (preview)** button becomes available in the header of the Tax Calculation workspace in Globalization Studio.

Run the autocreate tax feature process

To run the autocreate tax feature process, follow these steps:

1. Go to **Globalization Studio** > **Tax Calculation**.
2. In the header, select the **Tax Data Migration (preview)** button.

> ⓘ **Note**
>
> Although Globalization Studio settings are legal entity agnostic, this functionality works only for the currently selected legal entity. You must switch to the correct legal entity before starting the process.

When the process finishes, the system creates the tax feature version in a **Completed** state. The following message is displayed: **The tax feature 'xxxx' is created successfully. You can review the setup in the feature version by using the View button. If updates are needed, create a new version to edit the tax feature.**

To review the generated setup, use the **View** button. If you need to make changes, create a new version of the feature to make edits. Learn more in Configure the Tax Calculation feature.

Tax feature creation behavior overview

During the tax feature creation process, existing sales tax settings are mapped from the legal entity into the Tax Calculation feature setup. The following sections describe key behaviors.

Tax group level settings

In standard sales tax, define settings such as cash discount, use tax, reverse charge, and exempt at the tax group level. In Tax Calculation, define these settings at the line level in the tax feature. The functionality considers this setup mapping and creates the appropriate records during the tax feature creation.

Tax code variant handling

When you assign a tax code to multiple tax groups with different parameters, the system creates extra tax code variants during the tax feature creation process. For example:

- In Tax Group **Test1**, the same tax code **Test10** is marked as **Exempt**.
- In Tax Group **Test2**, tax code **Test10** has **Use tax** enabled.

The system creates multiple versions of the tax code (for example, Test10, Test10_1, Test10_2, and so on). Each version is assigned to the appropriate tax group with the corresponding parameters.

If a tax code name is already at the maximum length (10 characters) and a variant needs to be created, the name is truncated and a suffix is appended. For example, **Test123456** becomes **Test1234_1**. Despite truncation, the tax codes are correctly assigned to their respective tax groups.

Reverse sales tax on cash discount

The system sets the default tax jurisdiction parameters based on the General ledger parameter values. If the **Reverse sales tax on cash discount** value in a sales tax group differs from the General ledger parameter, the system displays the following warning: **The default Reverse tax on cash discount parameter differs from the one set in the group(s): 'xxxx', 'xxxx'. Once the process completes, please manually create rules to ensure proper configuration.**

After the tax feature is created, you must manually maintain the tax jurisdiction parameters to ensure the sales tax group-level parameter scenario works correctly. Learn more in Tax jurisdiction parameters setup.

Tax group character limit

If a tax group or item tax group contains tax codes whose total length exceeds 1,000 characters, the process stops and one of the following messages is displayed:

- **The tax group 'xxxx' contains too many or excessively long tax codes. The total length must not exceed 1,000 characters. The process has been canceled.**
- **The item tax group 'xxxx' contains too many or excessively long tax codes. The total length must not exceed 1,000 characters. The process has been canceled.**

Data mapping during tax feature creation

The following tables describe the mapping that applies during the tax feature creation process.

General ledger parameters to Tax jurisdiction parameters

Expand table

General ledger – Sales tax setting	Tax jurisdiction parameter after tax feature creation
Reverse sales tax on cash discount	Default Reverse Tax On Cash Discount
Deduct cash discount before sales tax calculation	Default Deduct Cash Discount Before Tax Calculation
Cash discount is calculated on amount including sales tax (Customer)	Default Calculate Cash Discount On Amount Including Tax – Customer
Cash discount is calculated on amount including sales tax (Vendor)	Default Calculate Cash Discount On Amount Including Tax – Vendor

Sales tax code origin to Tax code calculation origin

Expand table

Sales tax code origin	Tax Calculation feature origin
Percentage of gross amount	By Gross Amount
Percentage of net amount	By Net Amount
Percentage of margin	By Margin
Calculate percentage of net amount	By Percentage of Net
Amount per unit	By Quantity
Percentage of sales tax	Tax on Tax

Rounding precision behavior

In the Tax Calculation feature, the rounding precision behaves similarly to the configuration on the **Tax Configuration** page. However, the **Rounding Method** is initially set to **Ordinary**, which functions equivalently to **Normal** rounding.

After you create the tax feature

When the process finishes, review the following items:

1. **Tax jurisdiction parameters** – Verify that the mapped parameters from the general ledger match your business requirements. If the **Reverse sales tax on cash discount** value differs at the tax group level, manually create rules in the tax feature setup.
2. **Tax code variants** – Review any tax code variants that the process created with suffixes (_1, _2, and so on). Check the tax group assignments in the feature parameters to confirm they're correct.
3. **Tax code settings** – Verify that tax code origins, rates, and other settings are correct.
4. **Rounding method** – The default rounding method is set to **Ordinary**. Adjust if your business requires a different rounding method.
5. **No incremental updates** – The process always creates a tax feature based on the full current tax master data. If you modify tax master data after the tax feature is created (for example, add new tax codes, update tax groups, or change tax code settings), those changes aren't automatically reflected in the previously created tax feature. To incorporate the changes, you can either create a new version of the tax feature and update the setup manually, or run the **Tax Data Migration** process again to recreate the tax feature from scratch based on the current master data.

After you review and, if needed, update the created tax feature, assign it to the legal entity and start using it for tax calculation. To do so, follow the steps in Set up Tax Calculation in Globalization Studio workspace.

If you create new tax codes, sales tax groups, or item sales tax groups during the tax feature creation process (for example, tax code variants with suffixes), the process synchronizes those records back to the standard sales tax tables in Dynamics 365 Finance. Learn more in Sync the tax setup from the Tax Calculation feature to Finance.

Key considerations and known limitations

Expand table

Topic	Description
One legal entity at a time	The process can only create a tax feature for the legal entity that you're currently signed into. Switch to the correct legal entity before starting the process.
Manual adjustments for parameters	If tax code attributes differ from ledger parameters or tax groups, you might need to adjust parameters manually after the tax feature is created.

Topic	Description
Tax code name limited to 10 characters	Tax codes are limited to a maximum of 10 characters. Longer codes are truncated before a suffix is appended (for example, `Test123456` becomes `Test1234_1`).
Tax group character limit of 1,000	A tax group or item tax group that contains over 1,000 characters causes an error. The process stops and the following message is displayed: "The tax group 'xxxx' contains too many or excessively long tax codes. The total length must not exceed 1,000 characters. The process has been canceled."
Reverse Sales Tax on Cash Discount	If the value of **Reverse sales tax on cash discount** in a sales tax group differs from the default General ledger parameter, you must manually create rules after the tax feature is created to ensure proper configuration. Tax jurisdiction parameters setup
Tax code variant handling	If a tax code (for example, VAT0) exists in different tax groups with different settings (such as exempt or use tax), the process creates separate tax code variants with a suffix (for example, VAT0 and VAT0_1). The suffixes (_1, _2, and so on) are assigned in a nondeterministic order, but the parameter mappings remain correct. To identify which tax group a variant belongs to, check the tax group specified in the feature parameters.
Brazil and India not supported	The functionality isn't available for legal entities in Brazil and India.

Tax calculation data model

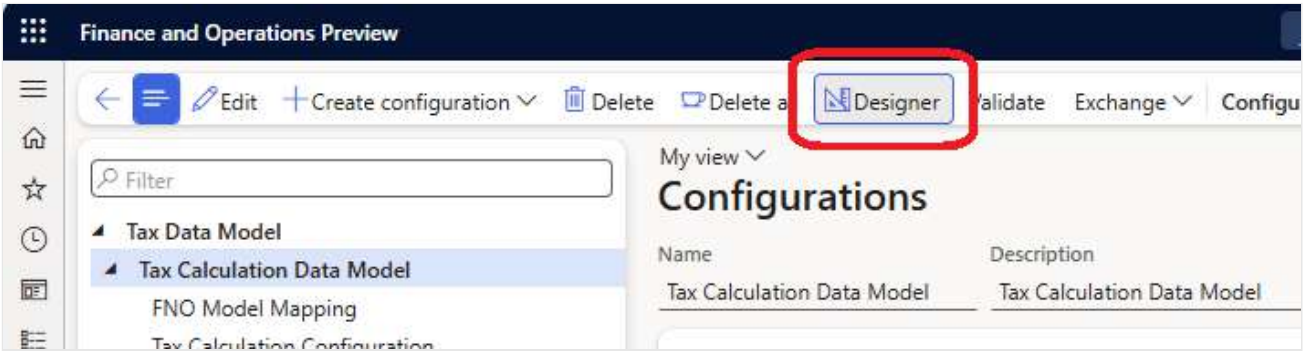
This article provides information about how the field values in the tax data model are determined in tax calculation transactions.

The *tax data model* consists of fields that are required for tax calculations. Microsoft provides the *tax calculation data model*, which includes the header fields and line fields of transaction documents in finance and operations apps. The fields that are defined in the tax calculation data model are the available columns of the applicability rules tables in the configuration of the tax calculation feature configuration.

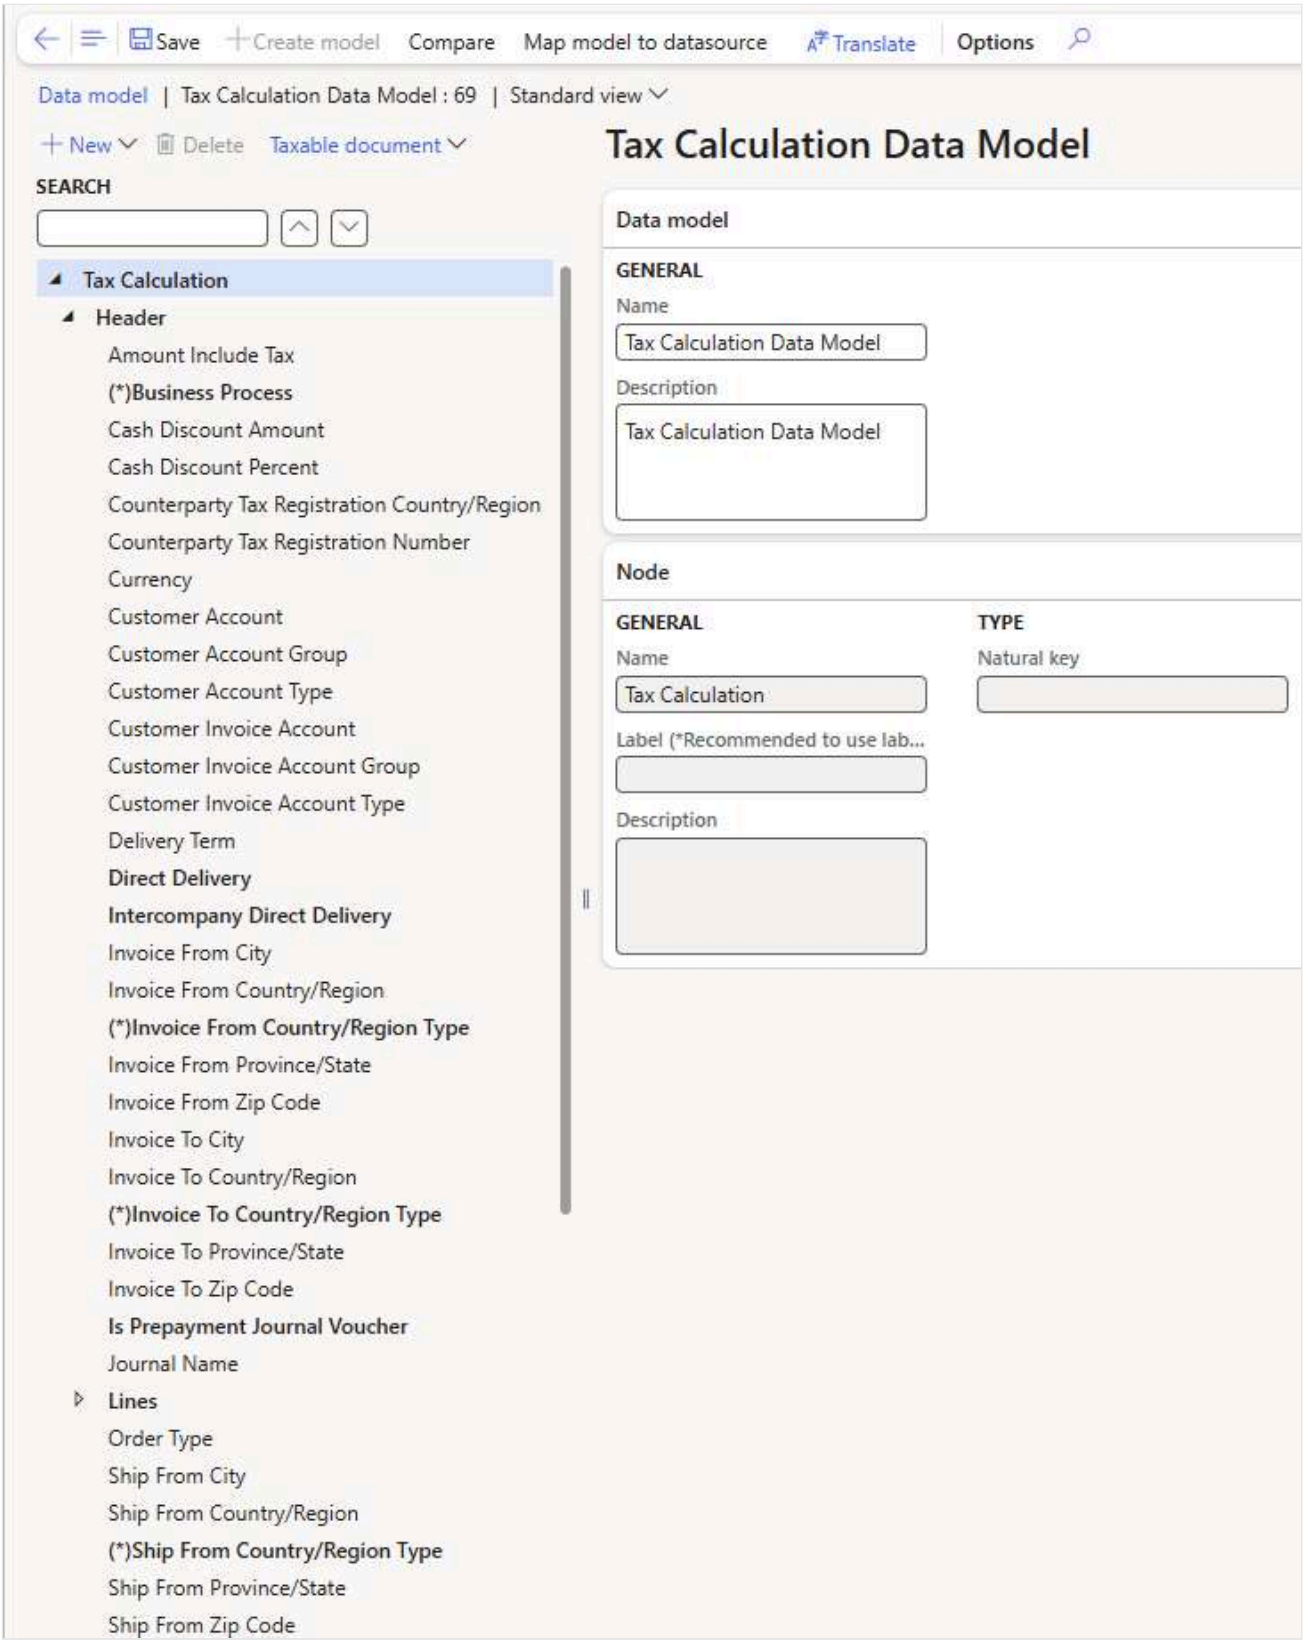
> **Note**
>
> Some nodes that are defined in the data model, such as **Record ID** and **Table ID**, are for technical purposes. They aren't available columns in the tax calculation feature configuration.

Follow these steps to view the tax calculation data model.

1. Open the **Globalization Studio** workspace, and select **Electronic reporting** > **Tax configurations**.
2. Select **Tax Data Model** > **Tax Calculation Data Model**.
3. On the **Versions** tab, select a version.
4. Select **Designer**.



5. Expand the **Tax Calculation** node.
6. Expand the **Header** node to view the header data models.
7. Expand the **Lines** node to view the line data models.



You can also view the tax calculation data model and the available columns in the applicability rules table.

1. Open the **Globalization Studio** workspace, select **Globalization services**, and then select the **Tax Calculation** tile.

2. On the **Tax calculation features** page, find a tax feature that has a status of **Draft**, and then select **Edit**.

3. On the **General** tab, select the configuration version, based on the version of the tax calculation data model. For example, select **40.46.212**.

4. On the **Tax group applicability** tab, select **Manage columns**.

The tax calculation data model is integrated with finance and operations apps. During each transaction that is related to tax calculation, the system collects the values of the fields that are defined in the applicability rules tables and sends them to the tax calculation service. In version 40.46, 57 predefined data models are available for the following transaction types: purchase orders, sales orders, transfer orders, purchase requisitions, requests for quotation, and sales quotations.

Version updates and restrictions

- **Free text invoice:** Supported as of version 40.50.221 and Finance version 10.0.23.
- **General journals:** Supported as of version 40.54.234 and Finance version 10.0.26.

  Restriction: One voucher and payment fee aren't supported.
- **Vendor invoice journal:** Supported as of version 40.54.234 and Finance version 10.0.26.
- **Periodic journals:** Supported as of version 40.55.236 and Finance version 10.0.29.

Field mapping

Thirty-two data models can be included as fields on the header of a transaction. However, not all fields are applicable to all transaction types. The following table shows which header fields are available for specific transaction types. In some cases, the field mapping must be determined by predefined logic. Where applicable, the logic is provided.

Expand table

Header field	Business transaction type and field mapping
Amount include tax	• **Sales order:** Prices include sales tax • **Purchase order:** Prices include sales tax • **Purchase requisition:** No • **Request for quotation:** Prices include sales tax • **Sales quotation:** Prices include sales tax • **Free text invoice:** Prices include sales tax • **Journal:** Amounts include sales tax
Business process	• **Sales order:** Sales • **Purchase order:** Purchase • **Transfer order - Ship:** Inventory • **Transfer order - Receive:** Inventory • **Purchase requisition:** Purchase • **Request for quotation:** Purchase • **Sales quotation:** Sales • **Free text invoice:** FTI • **Journal:** Journal

Twenty-six data models are included as fields on the lines of a transaction. As for the header fields, not all fields are applicable to all transaction types. The following table shows which line fields are available for specific transaction types. In some cases, the field mapping must be determined by predefined logic. Where applicable, the logic is provided.

Ship to ZIP code	• **Sales order:** 1. Line > Delivery address > ZIP/postal code • **Purchase order:** 1. Line > Delivery address > ZIP/postal code 2. Header > Delivery address > ZIP/postal code • **Transfer order - Ship:** 1. Header > To warehouse > Primary address > ZIP/postal code 2. Header > To site > Primary address > ZIP/postal code • **Transfer order - Receive:** 1. Header > To warehouse > Primary address > ZIP/postal code 2. Header > To site > Primary address > ZIP/postal code

Line field	Business transaction type and mapping
	• **Purchase requisition:** 1. Line > Delivery address > ZIP/postal code • **Request for quotation:** 1. Line > Delivery address > ZIP/postal code • **Sales quotation:** 1. Line > Delivery address > ZIP/postal code
Site	• **Sales order:** 1. Line > Site 2. Product > Site • **Purchase order:** 1. Line > Site 2. Product > Site • **Transfer order - Ship:** The Site that is selected for the From warehouse on the line • **Transfer order - receive:** The Site that is selected for the From warehouse on the line • **Purchase requisition:** Line > Site • **Request for quotation:** Line > Site • **Sales quotation:** 1. Line > Site 2. Product > Site
Transaction date	• **Sales order:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page (**General ledger** > **Setup** > **General ledger parameters**). For example, if **Delivery date** is selected, the date is retrieved by using the following order: 1. Line confirmed ship date 2. Header confirmed ship date 3. Line requested ship date 4. Header requested ship date If the configured calculation date type isn't available in the transaction, the current session date is retrieved instead. • **Purchase order:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. For example, if **Delivery date** is selected, the date is retrieved by using the following order:

Line field	Business transaction type and mapping
	1. Line confirmed delivery date 2. Line delivery date 3. Header delivery date If the configured calculation data type isn't available in the transaction, the current session date is retrieved instead. • **Transfer order - Ship:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. For example, if **Delivery date** is selected, the date is retrieved by using the following order: 1. Ship date 2. Receipt date 3. Posting date If **Invoice date** or **Document date** is selected, the posting date is retrieved. • **Transfer order - Received:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. For example, if **Delivery date** is selected, the date is retrieved by using the following order: 1. Ship date 2. Receipt date 3. Posting date If **Invoice date** or **Document date** is selected, the posting date is retrieved. • **Purchase requisition:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. If the configured calculation date type isn't available in the transaction, the current session date is retrieved instead. • **Request for quotation:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. If the configured calculation date type isn't available in the transaction, the current session date is retrieved instead. • **Sales quotation:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. For example, if **Delivery date** is selected, the date is retrieved by using the following order: 1. Line > Attributes > Ship date 2. Line > Delivery > Requested ship date 3. Header requested ship date If the configured calculation date type isn't available in the transaction, the current session date is retrieved instead. • **Free text invoice:** The date that is used for tax calculation. The logic follows the configuration of the **Calculation date type** field on the **Sales tax** tab of the **General ledger parameters** page. For example, if **Delivery date** is selected, the date is retrieved by using the following order:

Line field	Business transaction type and mapping
	1. Line confirmed ship date 2. Header confirmed ship date 3. Line requested ship date 4. Header requested ship date If the configured calculation date type isn't available in the transaction, the current session date is retrieved instead. • **Journal:** Date
Unit	• **Sales order:** Unit • **Purchase order:** Unit • **Transfer order - Ship:** Unit • **Transfer order - Receive:** Unit • **Purchase requisition:** Unit • **Request for quotation:** Unit • **Sales quotation:** Unit
Variant number	• **Sales order:** Variant number • **Purchase order:** Variant number • **Sales quotation:** Variant number

Sales tax applicability and sales tax group determination logic

This article explains the logic for determining sales tax applicability and sales tax groups in the tax feature setup.

Matching logic

The applicability logic tries to match the condition that includes the most input fields. Each field that has a value has a *weight* of 10. A condition that has a higher total weight has a higher priority.

Example

The following example shows how the matching logic works.

The **Tax group applicability** tab is configured as shown in the following table.

Expand table

Business process	Currency	Item code	Tax group	Weight
Purchase	EUR		TG_A	20
Purchase	EUR	D0001	TG_B	30

For the first line in the table, two input fields are set. Therefore, the line has a weight of 20. For the second line, three fields are set. Therefore, the line has a weight of 30.

When sales tax is calculated for a purchase order that has the EUR currency and item D0001, Tax Calculation uses the condition that has a higher weight. Therefore, it uses the second line in the table.

Adjust execution sequence

You can adjust the execution sequence of the applicability rules that have equal weight.

Example

The following example shows how the **Adjust execution sequence** button works.

The **Tax group applicability** tab is configured as shown in the following table.

Expand table

Business process	Currency	Item code	Tax group	Weight
Purchase	EUR		TG_A	20
Purchase		D0001	TG_B	20

According to the matching logic, the rules in the table have equal weight. If you purchase item **D0001** with the transaction currency **EUR**, the first rule (Tax group **TG_A**) applies.

Complete the following steps to adjust the rule that applies.

1. Select **Adjust execution sequence**.
2. Select the second rule, and then select **Move up**.
3. Select **Complete**.

Now, the second rule (Tax group **TG_B**) is moved above the first one and applies first.

> **Note**
>
> You can't move a rule above or under another rule that has a different **Weight**.

Sales tax group and item sale tax group determination logic

When you create a document line on a business document, such as a sales order, purchase order, or vendor invoice, the system sets the **Sales tax group** and **Item sales tax group** fields to the values from the master data. Then, when tax is calculated, the system updates these fields according to the conditions that you configure in the Tax feature setup on the **Tax group applicability** and **Item tax group applicability** tabs.

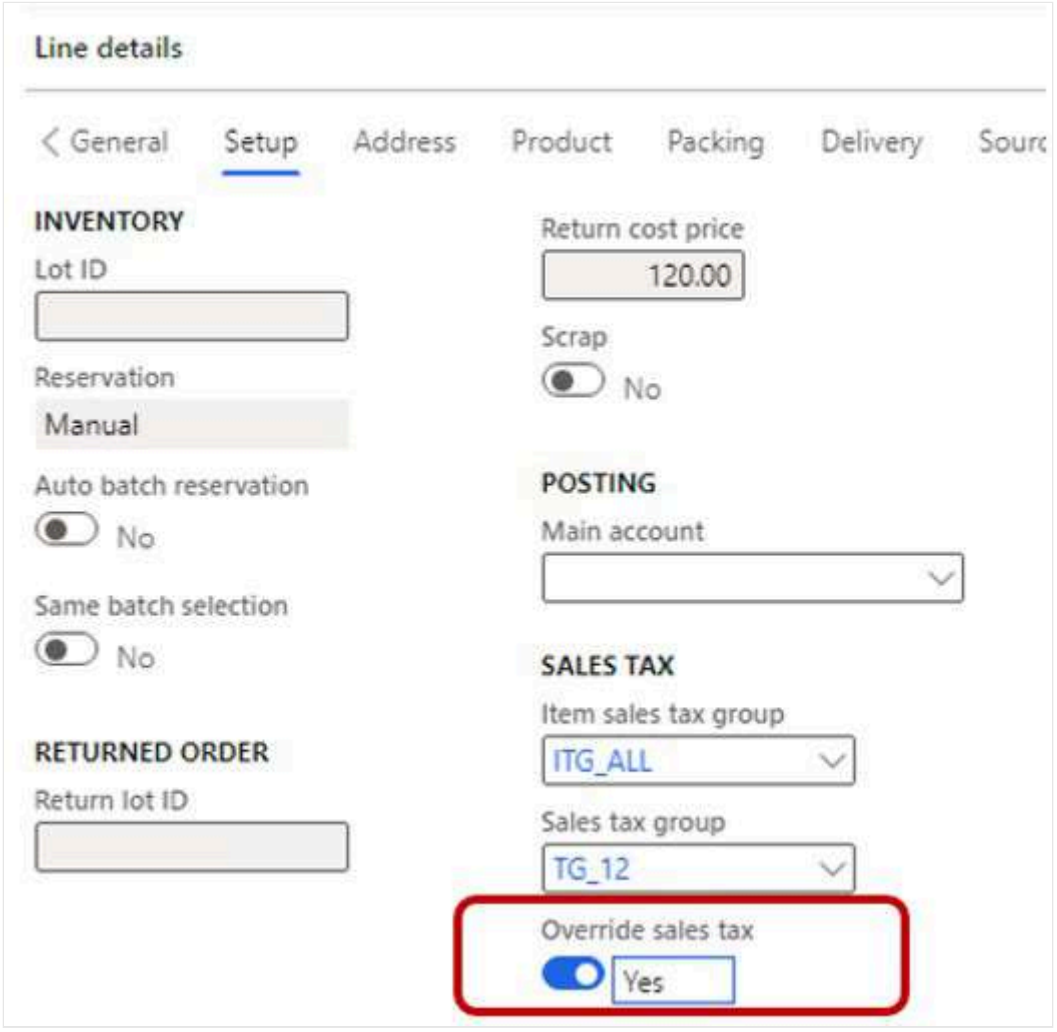
If you don't configure an applicability rule for the tax group or item tax group in the Tax feature setup, Tax Calculation uses the default rules from the master data in Microsoft Dynamics 365 Finance.

> **Note**

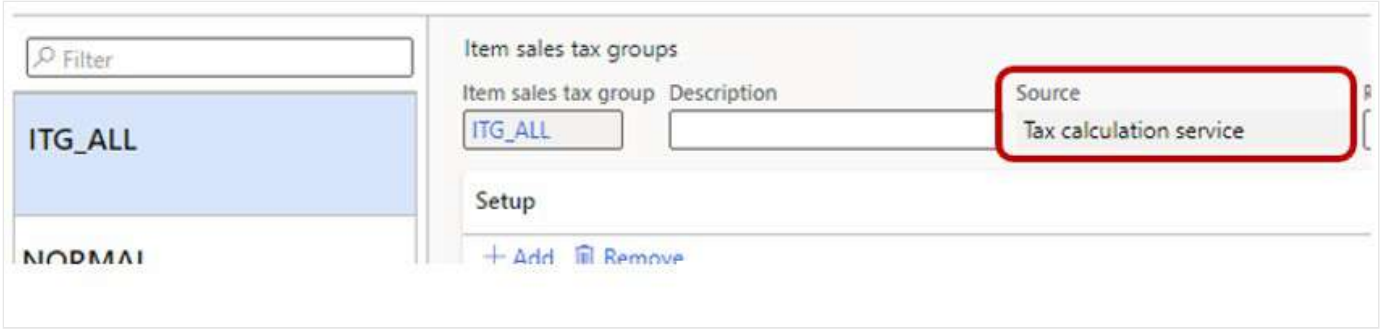
You must create and maintain the sales tax group and item sales tax group in the Tax calculation feature.

Override sales tax

You can update the tax groups that Tax Calculation determines without having to reconfigure the Tax feature. For example, you might need to update the tax groups because the rule is incorrectly set up, or because you need an exception to the rule. By setting the **Override sales tax** option to **Yes** on the line details page for a document line, you can select the required sales tax group and item sales tax group.



The system calculates the tax codes based on the intersection of the tax codes that you define on the **Tax group** and **Item tax group** tabs in the Tax feature setup. In Finance, the value of the **Source** field indicates that the system synchronizes the tax groups from the Tax feature setup.



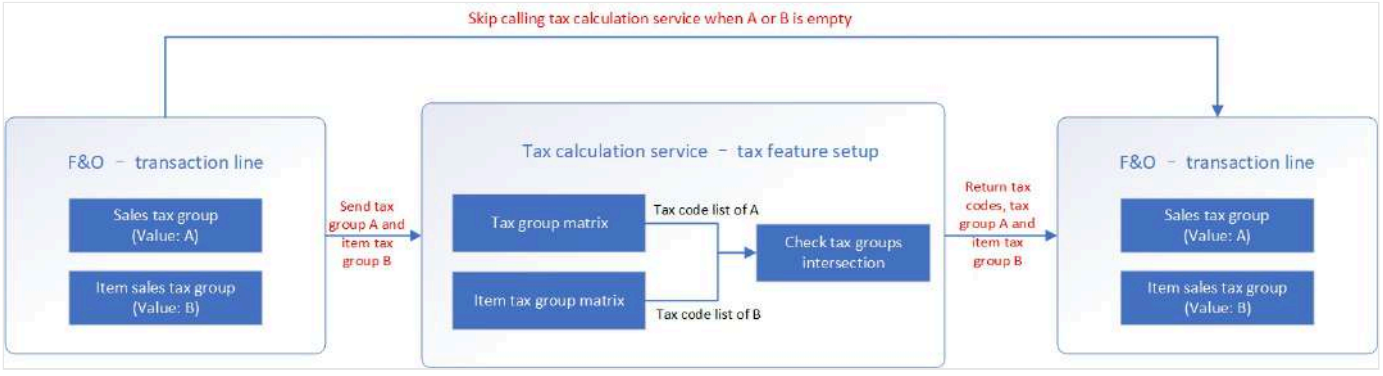
> **Note**
>
> If you leave the **Sales tax group** or **Item sales tax group** field blank, and set the **Override sales tax** option to **Yes**, the system doesn't send the line to the Tax calculation service for processing.

The system adds the **Override sales tax** checkbox to the **Customer** and **Vendor** master data on the **Invoice and delivery** FastTab. The system also adds the checkbox to the Sales order, Purchase order, Free text invoice header, and to the line level of those documents.

The following process combines tax code determination logic with override sales tax:

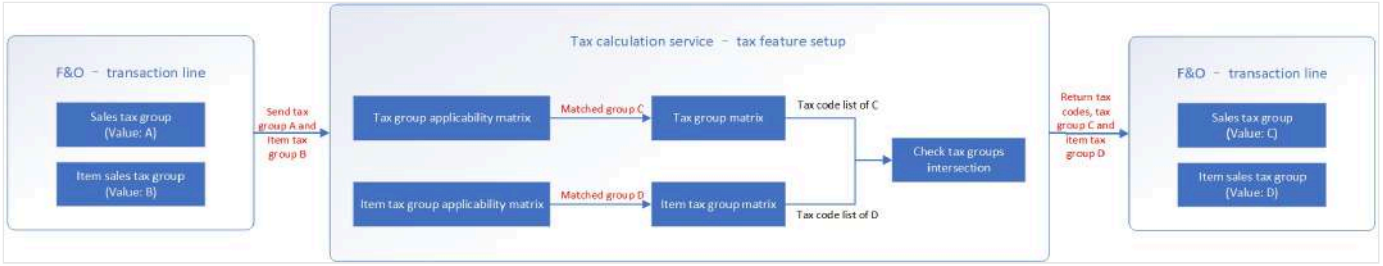
Scenario 1: Override sales tax = Yes

The flow that combines tax code determination logic with override sales tax yes.



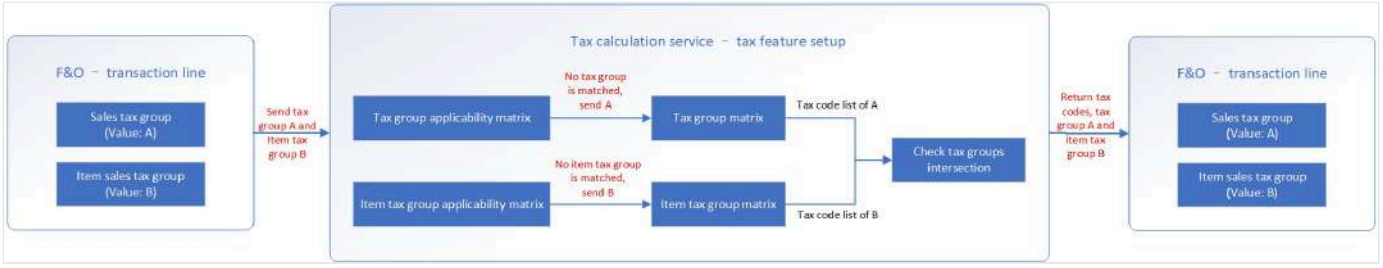
Scenario 2: Override sales tax = No and applicability rule can be matched

The flow that combines tax code determination logic with override sales tax no and matched applicability rules.



Scenario 3: Override sales tax = No and applicability rule can't be matched

The flow that combines tax code determination logic with override sales tax no and applicability rules mismatch.



Update order lines

You can bulk update lines if you change the **Override sales tax** checkbox on the header level. You can also add this checkbox to the **Update order lines** parameters pages for Sales order, Sales quotation, and Purchase order. For example, if you set the option to **Prompt**, when you change the **Override sales tax** checkbox on the header of the document, the dialog box opens. You can select whether the document lines should be updated.

> **Note**
>
> Header-level and line-level charges inherit the **Override sales tax** option from the header or line of the document, respectively.
>
> Current limitation: When you update the **Override sales tax** checkbox on a header or line level, the respective charges don't inherit this checkbox if you already created the charges.

Reverse charge applicability rules

For information about the configuration for reverse charge rules, see Set up reverse charge rules.

When the document lines meet the reverse charge rules that you configure in Finance, the **Override sales tax** checkbox is set to **Yes** for the affected lines. The default value for **Sales tax group** comes from the **Purchase order sales tax group** or **Sales order sales tax group** field. You

specify these fields on the **General ledger parameters** page, on the **Reverse charge** tab. For more information about these fields, see Set up default parameters.

> **Note**
>
> For reverse charges, you also need to create and maintain the sales tax groups and item sales tax groups in the Tax feature setup.

Tax jurisdiction parameters for cash discount calculation setup

This article provides information about the setup of cash discount calculation options.

When a single legal entity has several value-added tax (VAT) registrations in different countries or regions, the requirements for calculating cash discounts and sales tax might vary by country or region. If you need different cash discount calculation options for different VAT registrations, set up the options on the **Tax jurisdiction parameters** and **Tax jurisdiction applicability** tabs of the **Tax calculation** page.

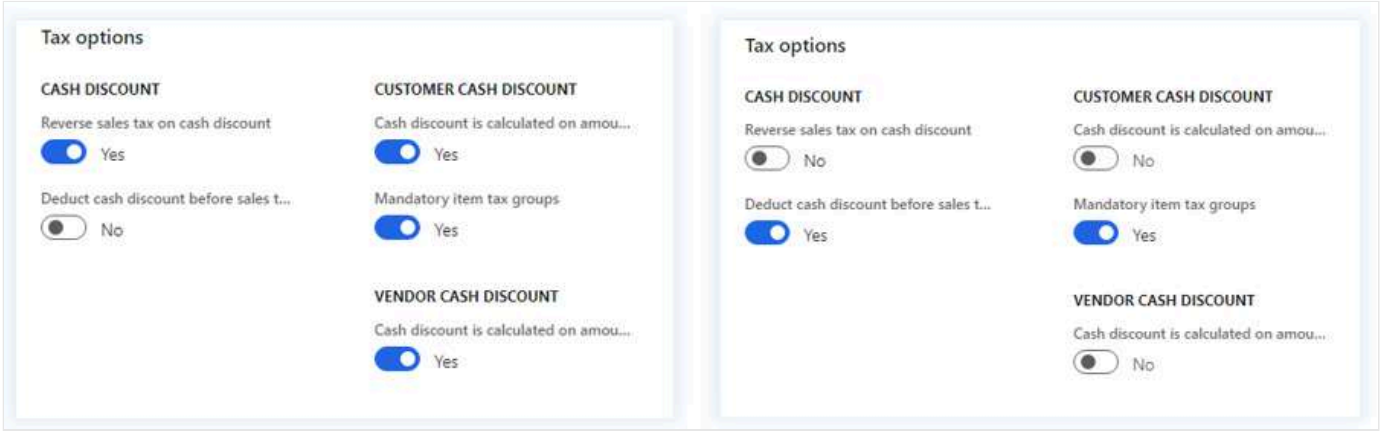
Tax jurisdiction parameters setup

Microsoft Dynamics 365 Finance supports the following generic combinations of cash discount calculation options.

Expand table

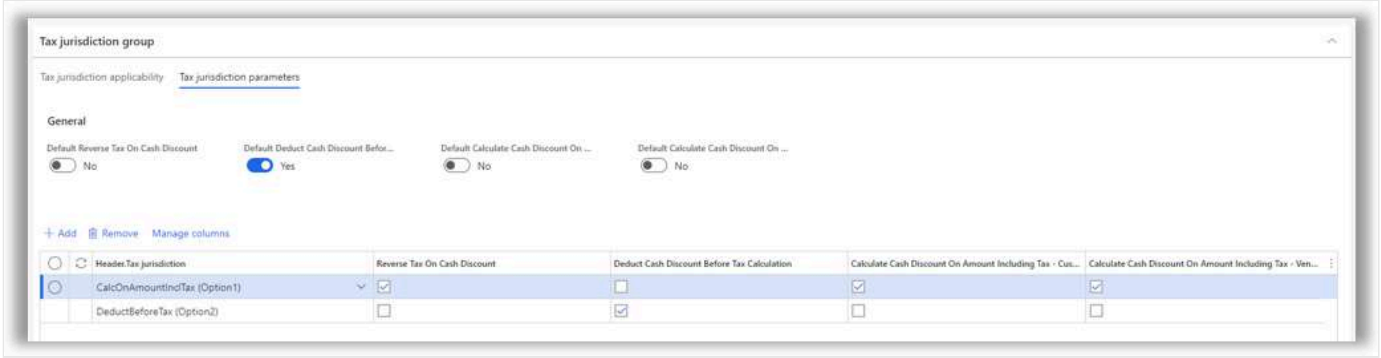
Parameter	Option 1	Option 2
Reverse sales tax on cash discount	Yes	No
Deduct cash discount before sales tax calculation	No	Yes
Cash discount is calculated on amount including sales tax (This parameter is available for both the customer side and the vendor side.)	Yes	No

The following illustration shows the parameter setup for both options.

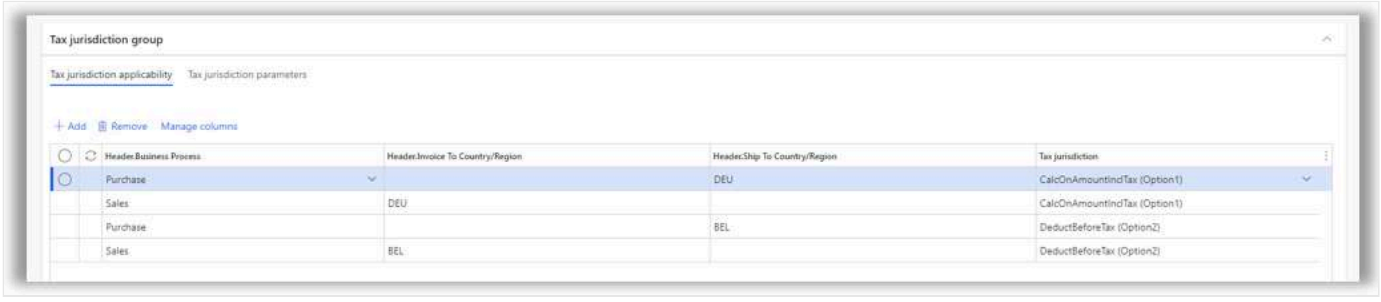


> **Note**
>
> - The **Deduct Cash Discount Before Tax Calculation** and **Calculate Cash Discount On Amount Including Tax** parameters are mutually exclusive.
> - Currently, the tax calculation feature setup doesn't support cross-measure validation. Finance performs the validation when it retrieves the parameters from the Tax calculation service.
> - For a tax jurisdiction code, don't set both the **Deduct Cash Discount Before Tax Calculation** parameter and the **Calculate Cash Discount On Amount Including Tax** parameter to **Yes** on the **Tax calculation** page.

To set up the cash discount calculation option in the tax calculation feature setup, create a tax jurisdiction code on the **Tax jurisdiction parameters** tab in the **Tax jurisdiction** group.



Use the fields on the **Tax jurisdiction applicability** tab in the **Tax jurisdiction** group to define rules that determine when a cash discount calculation option should be applied. You can select header-level fields for the determination.



If no matching rule is found on the **Tax jurisdiction applicability** tab, the default parameters on the **General** tab are used.

Example: Cash discount parameters setup

To determine a tax jurisdiction code, use **Ship To/Ship From Country/Region** or **Invoice To Country/Region**. When you create a sales order for a customer in Germany (DEU), **Option1** is selected. When you create a sales order for a customer in Belgium (BEL), **Option2** is selected.

The following table shows the results of the cash discount and sales tax calculation for a sales order that has a net amount of 1,000 and a 4-percent cash discount. For tax calculation purposes, the tax rate that is used for **Option1** is 19 percent. For **Option2**, it's 21 percent.

Expand table

Sales order or tax jurisdiction code	Option1	Option2
Net amount	1,000	1,000
Invoice amount	1,190	1,201.60
Sales tax amount	190 (= 1,000 × 19%)	201.60 (= [1000 – 40] × 21%)
Cash discount amount	47.60 (= 1,190 × 4%)	40 (= 1,000 × 4%)

> **Important**
>
> This functionality supports sales order, purchase order, vendor invoice, and free text invoice operations.

Calculate tax on prices when prices include taxes is enabled

This article explains how to use the **Exclude from base amount calculation** parameter of a tax code.

Use the **Exclude from base amount calculation** parameter to calculate tax amounts in a flexible way. When you enable this parameter for a tax code and prices include sales tax, the Tax calculation service calculates tax amounts for the marked sales tax code as if it wasn't included in the base amount.

The following example shows how the tax calculation works.

A sales tax group and an item sales tax group contain two sales tax codes. The **Exclude from base amount calculation** parameter is enabled for one tax code.

Expand table

Tax code	Tax rate	Exclude from base amount calculation
TaxCodeA	20%	No
TaxCodeB	10%	Yes

If you create a sales order or a purchase order where you enable the **Prices include sales tax** option, and the net amount of a line equals 120, the tax is calculated in the following way.

Expand table

Tax code	Tax base amount	Amount
TaxCodeA	100	20
TaxCodeB	120	12

> **Note**

In this example, tax code TaxCodeA is configured as **By Net amount**, and tax code TaxCodeB is configured as **By Gross amount**. If tax code TaxCodeB is configured as **By Net Amount** instead, its tax base amount equals 100, and its tax amount equals 10.

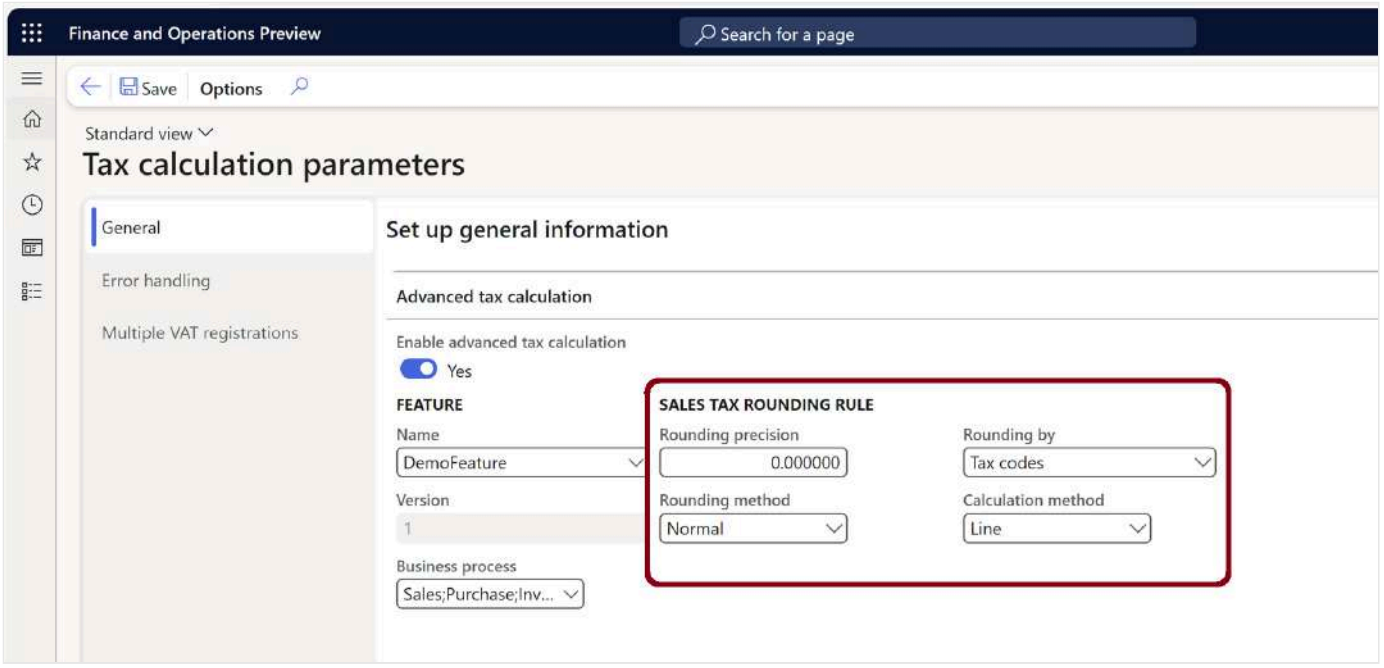
Tax calculation rounding rules

This article provides information about how the rounding rules work on the **Tax calculation parameters** page.

> **Note**
>
> When the **Enable advanced tax calculation** parameter is enabled, the rounding rules on the **Sales tax code** and **Sales tax group** pages aren't effective.

You can view the configuration of rounding rules for the tax calculation service in the **Sales tax rounding rule** section on the **Calculation** FastTab on the **General** tab of the **Tax calculation parameters** page (**Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**).



The **Rounding precision** and **Rounding method** fields determine how calculated amounts in the payload from the tax calculation service are rounded.

Rounding precision

The **Rounding precision** field supports a value that has up to six decimal places. For example, if you set the **Rounding precision** field to **0.000000**, calculated amounts are rounded to six decimal places and then sent to Microsoft Dynamics 365 Finance. For example, if the **Normal** rounding method is used, the amount **987.1234567** is rounded to **987.123457**.

> **Note**
>
> Finance rounds amounts according to the currency rounding rules. Therefore, the tax amounts that are shown and recorded in transactions are affected by both tax calculation rounding rules and currency rounding rules.

Rounding method

You can configure the rounding method for tax calculation for each legal entity. In the **Rounding method** field, select from three options: **Normal**, **Downward**, and **Rounding-up**.

Rounding example

The following table provides an example that shows how the amount **987.345** is rounded for different combinations of rounding precisions and rounding methods.

Expand table

Rounding method	0.00	0.01	0.10	1.00	10.00	0.02	0.05	0.25
Normal	987.35	987.35	987.30	987.00	990.00	987.34	987.35	987.25
Downward	987.00	987.34	987.30	987.00	980.00	987.34	987.30	987.25
Rounding-up	988.00	987.35	987.40	988.00	990.00	987.36	987.35	987.50

You can configure the calculation and rounding logic of tax amounts according to taxation rules.

Rounding by

In the **Rounding by** field, select the rounding principle that applies to the taxes. The following options are available:

- **Tax codes** – Round the tax amount inside each tax code.
- **Tax code combinations** – Round the tax amount inside the tax code combination on the line.

Calculation method

In the **Calculation method** field, select whether to calculate taxes on invoices for each line or all lines. The following options are available:

- **Line** – Calculate the tax amount on a line-by-line basis. The tax amount on each line is unaffected by the tax amount on other lines.
- **Total** – Calculate the tax amount across all the lines on one document.

Rounding calculation example

This example shows the different calculations you can do for one invoice, for different combinations of **Rounding by** and **Calculation method** values. For this example, the following setup is in place:

- The invoice has four lines.
- There are two tax codes: **VAT1** (10 percent) and **VAT2** (10 percent).
- The rounding precision is set to **0.01**.
- The rounding method is set to **Rounding-up**.

Rounding by = Tax codes and Calculation method = Line

Expand table

Line number	Line net amount	Determined tax codes	Tax amount before rounding	Rounded tax amount
1	11.11	VAT1	1.111	1.12
2	22.22	VAT1; VAT2	2.222; 2.222	2.23; 2.23
3	33.33	VAT1	3.333	3.34
4	44.44	VAT1; VAT2	4.444; 4.444	4.45; 4.45

Rounding by = Tax code combinations and Calculation method = Line

Expand table

Line number	Line net amount	Determined tax codes	Tax amount before rounding	Rounded tax amount
1	11.11	VAT1	1.111	1.12
2*	22.22	VAT1; VAT2	2.222; 2.222	2.23; 2.22
3	33.33	VAT1	3.333	3.34
4**	44.44	VAT1; VAT2	4.444; 4.444	4.45; 4.44

* Line 2 = Round[22.22 × (10 percent + 10 percent)] = 2.23 + 2.22

** Line 4 = Round[44.44 × (10 percent + 10 percent)] = 4.45 + 4.44

Rounding by = Tax codes and Calculation method = Total

Expand table

Line number	Line net amount	Determined tax codes	Tax amount before rounding	Rounded tax amount
1	11.11	VAT1*	1.111	1.12
2	22.22	VAT1*; VAT2**	2.222; 2.222	2.22; 2.23
3	33.33	VAT1*	3.333	3.33
4	44.44	VAT1*; VAT2**	4.444; 4.444	4.44; 4.44

* VAT1(Line 1, Line 2, Line 3, Line 4) = Round[(11.11 + 22.22 + 33.33 + 44.44) × 10 percent] = 1.12 + 2.22 + 3.33 + 4.44

** VAT2(Line 2, Line 4) = Round[(22.22 + 44.44) × 10 percent] = 2.23 + 4.44

Rounding by = Tax code combinations and Calculation method = Total

Expand table

Line number	Line net amount	Determined tax codes	Tax amount before rounding	Rounded tax amount
1*	11.11	VAT1	1.111	1.12
2**	22.22	VAT1; VAT2	2.222; 2.222	2.23; 2.22
3*	33.33	VAT1	3.333	3.33

Multiple VAT registration numbers

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about the functionality for multiple value-added tax (VAT) registration numbers. By using this functionality, you can set up the tax registration numbers of a legal entity and its customers and vendors in different countries or regions. You can then post and settle taxes according to registration in the appropriate country or region.

Here are the main steps to configure and use this functionality:

- Assign the registration type for VAT registration to the VAT ID registration category.
- Set up the legal entity's, customers', and vendors' VAT registration numbers on the **Registration ID** FastTab on the **Manage addresses** page.
- Specify the legal entity's VAT registration number for the sales tax authority, and specify the settlement period. The sales tax codes that are assigned to the settlement period identify the legal entity's VAT registration.

The tax calculation feature can identify the customer and vendor VAT registration numbers for transactions. The identified tax registration numbers are available in the sales tax transactions.

The sales tax settlement procedure uses the country or region code of the registration ID.

Prerequisites

Before you begin, Tax Calculation must be configured. For more information, see Tax Calculation.

Enable the feature

1. In the **Feature management** workspace, turn on the **Support multiple VAT registration numbers** feature.
2. Go to **Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**, and turn on the **Enable advanced tax calculation** option.

> **Note**

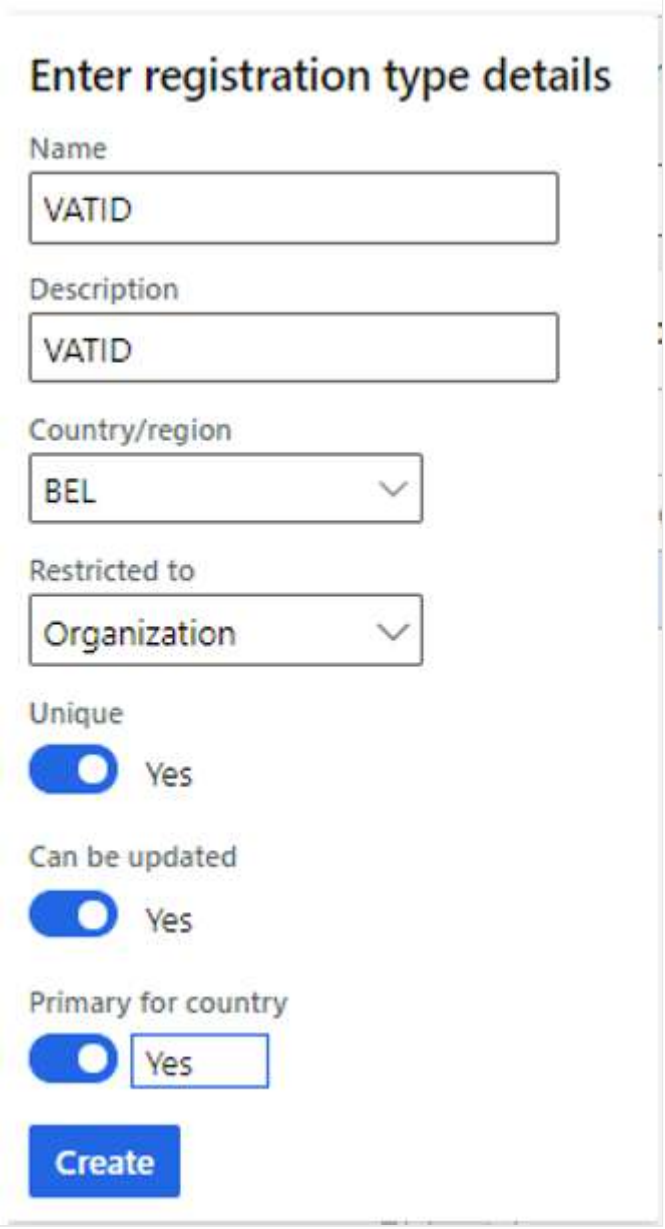
In the 10.0.39 update, you can no longer enable this feature through Feature management. It's now controlled by the **Support multiple VAT registration numbers** parameter on the **Tax calculation parameters** page.

Set up a VAT ID for a legal entity, customers, and vendors

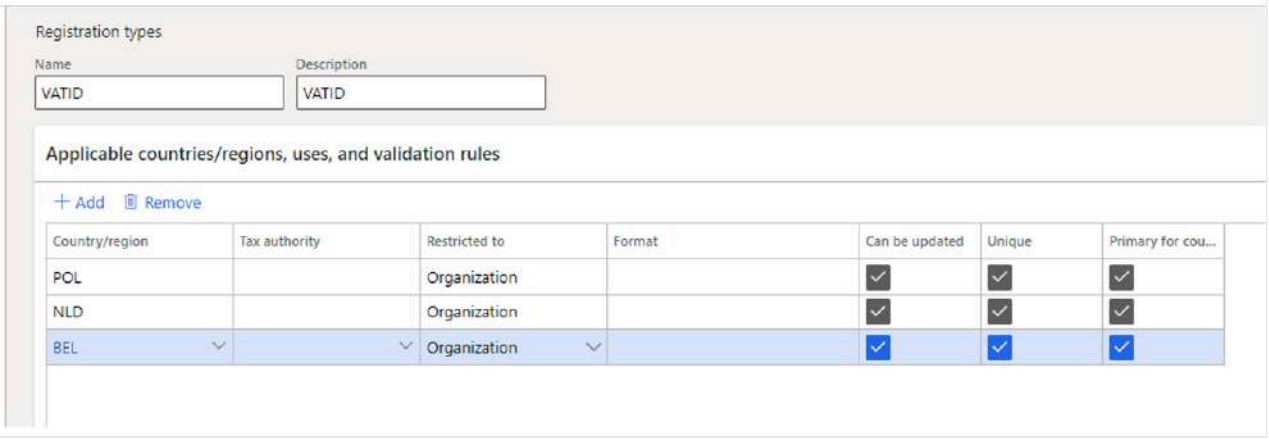
To set up the VAT registration numbers for a legal entity and its customers and vendors, use the registration ID framework to create these registration numbers. For more information, see Registration IDs.

Set up registration types and categories

1. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration types**, and create a new registration type, such as **VATID**.



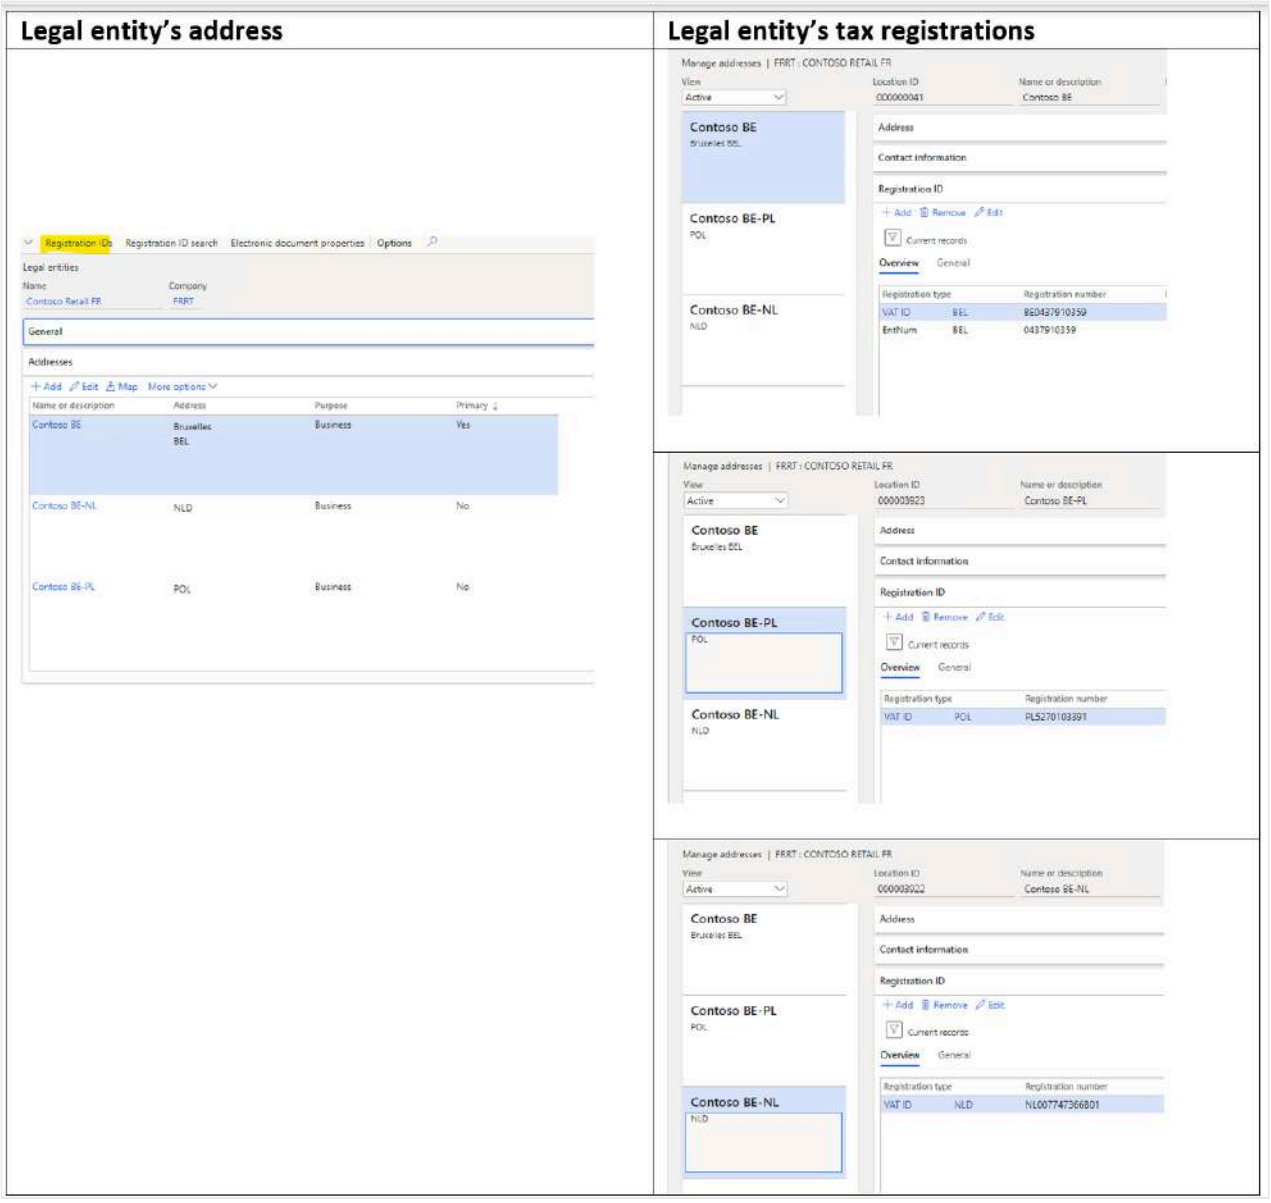
2. On the **Applicable countries/regions, uses, and validation rules** FastTab, create a registration type line for each country or region where the legal entity, customers, and vendors have registrations.



3. Go to **Organization administration** > **Global address book** > **Registration types** > **Registration categories**, and assign the registration types that you just created to the **VAT ID** registration category.

Create VAT registration numbers for a legal entity, customers, and vendors

1. Go to **Organization administration** > **Organizations** > **Legal entities**.
2. Select **Registration IDs**, and assign VAT ID registration to each address where the legal entity has VAT registrations.

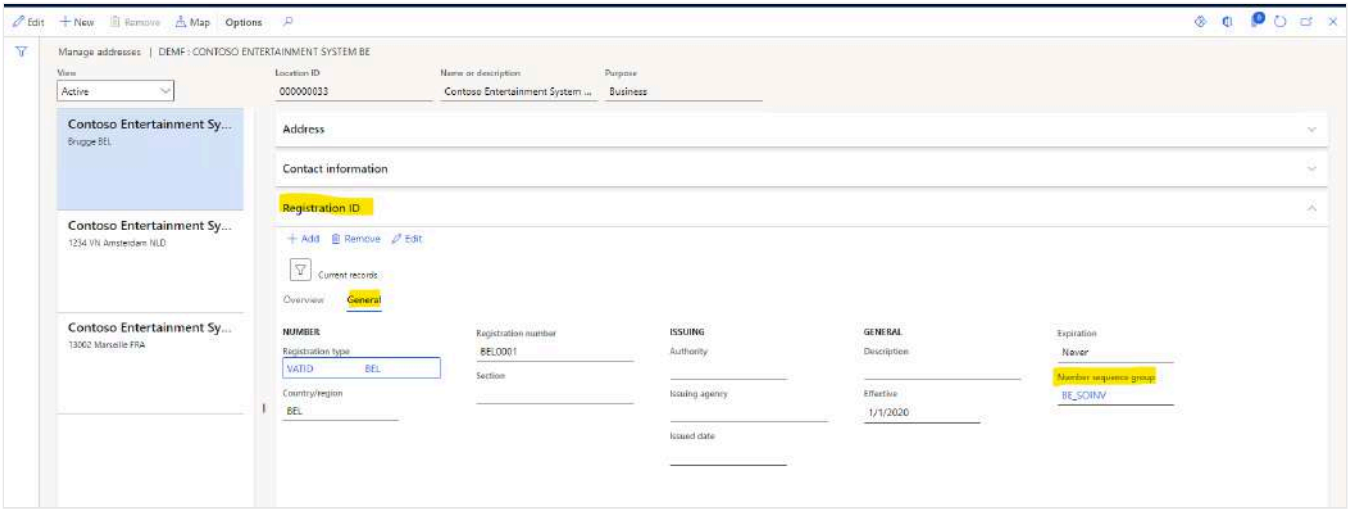


> **Note**
>
> To automatically identify customer and vendor VAT registration numbers for sales tax transactions, sales documents, and purchase documents, either create the numbers in the tax calculation feature on the **Customer tax registration number applicability** and **Vendor tax registration number applicability** tabs or enable the **Update tax exempt number from customer address** parameter on the **Multiple VAT registrations** tab of the **Tax calculation parameters** page.

Set up number sequences for a legal entity's registration numbers

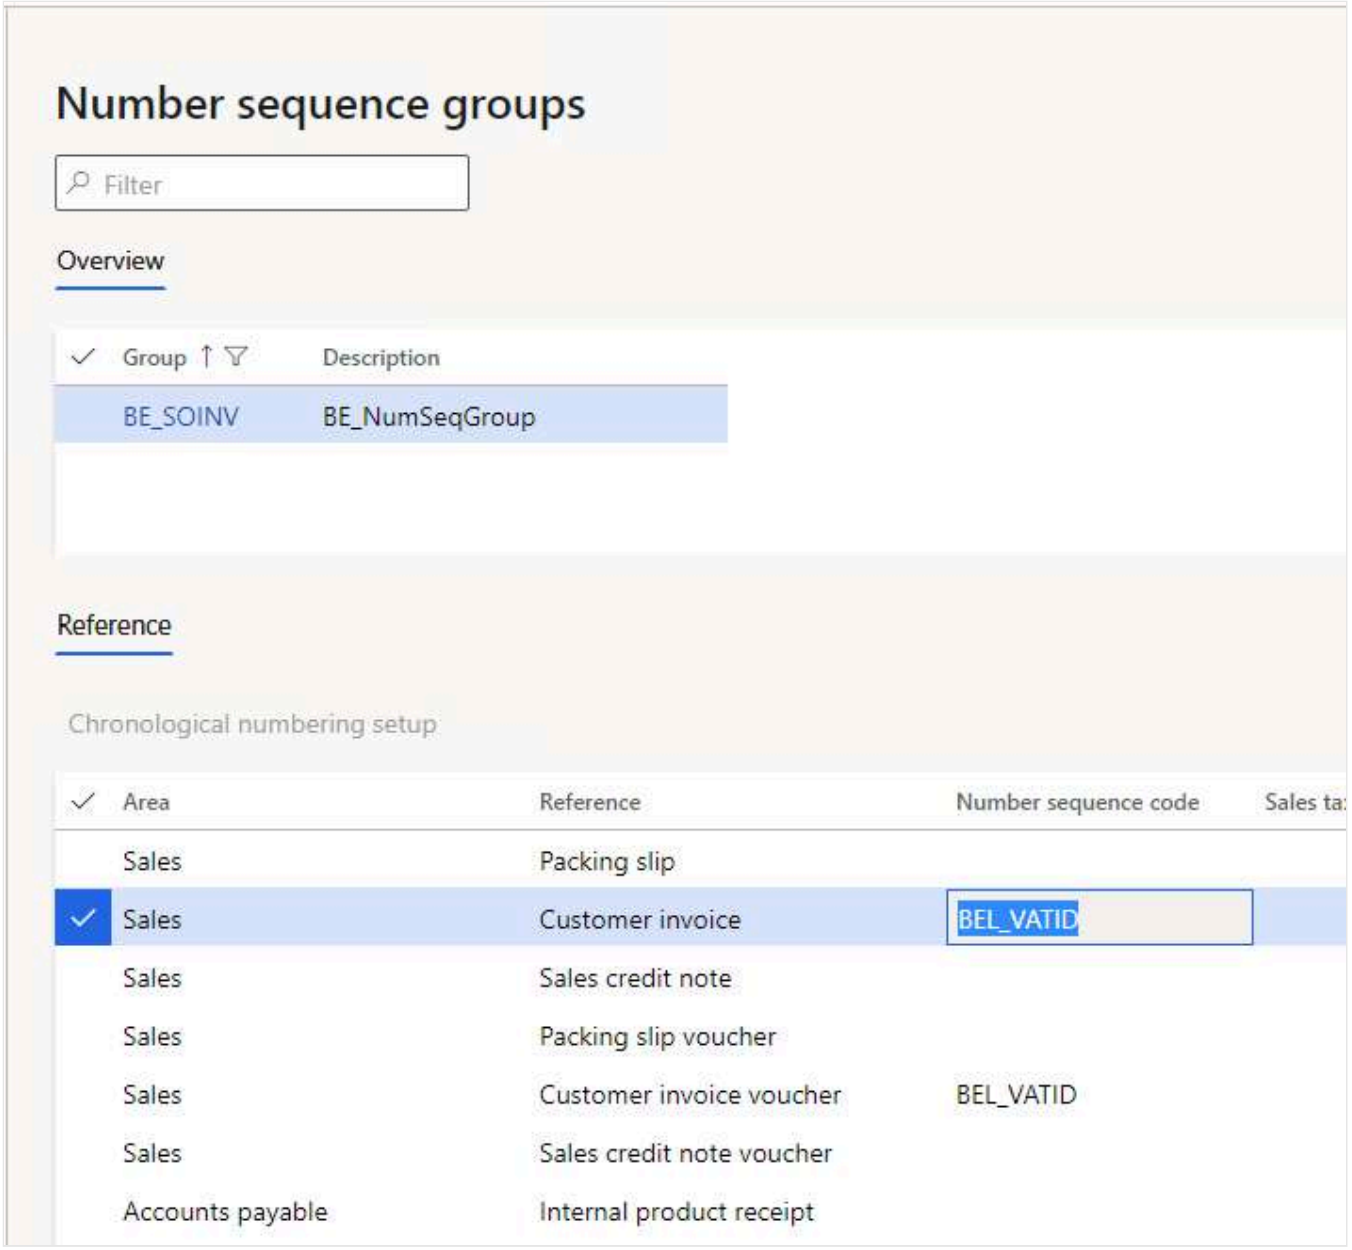
To generate separate number sequences for documents such as packing slips and invoices, create a number sequence group. Then, on the **Manage addresses** page, on the **Registration**

ID FastTab, on the **General** tab, assign the number sequence group to the VAT ID of the legal entity.



Next, on the **Number sequence groups** page, in the **Reference** section, set up the required number sequence codes for the supported references.

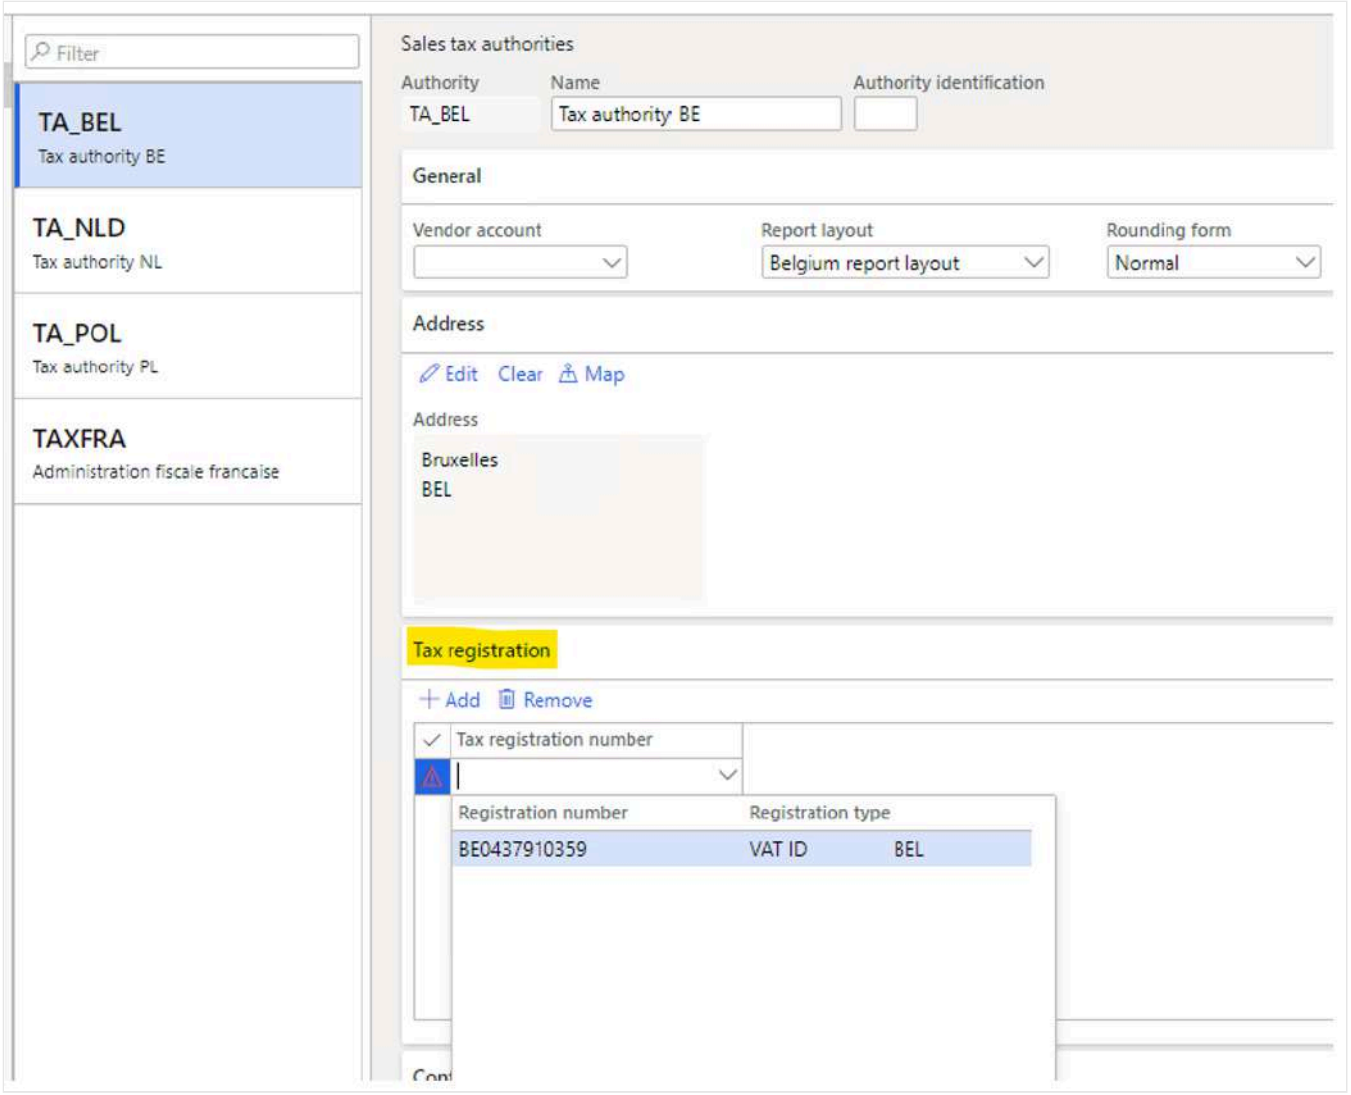
The code for the number sequence group is then entered by default on the sales order or purchase order header after the legal entity's tax registration is determined. The documents are numbered according to the number sequences that are assigned to the references.



> **Note**
>
> The default logic supports only sales orders, purchase orders, and free text invoices.

Set up tax authorities

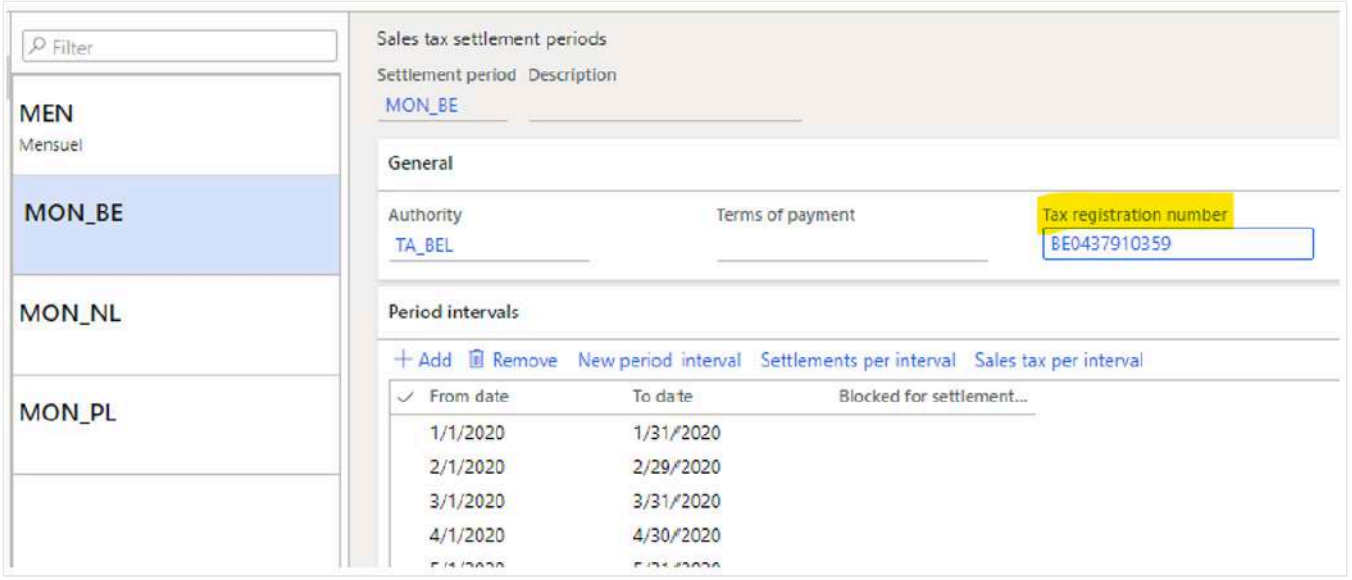
1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax authorities**, and create all the tax authorities that the legal entity must report to.
2. On the **Tax registration** FastTab, add the appropriate VAT registration number.



> **Note**
>
> The lookup for the **Tax registration number** field on the **Tax registration** FastTab contains only the registration numbers of the legal entity that have a VAT ID registration category. The list of registration IDs is available for the corresponding country or region of the tax authority.
>
> Date effectivity isn't supported for assigned registration numbers. If you change or expire the registration number of the legal entity, you must manually update the tax registration in the setup of the tax authority and sales tax settlement period.

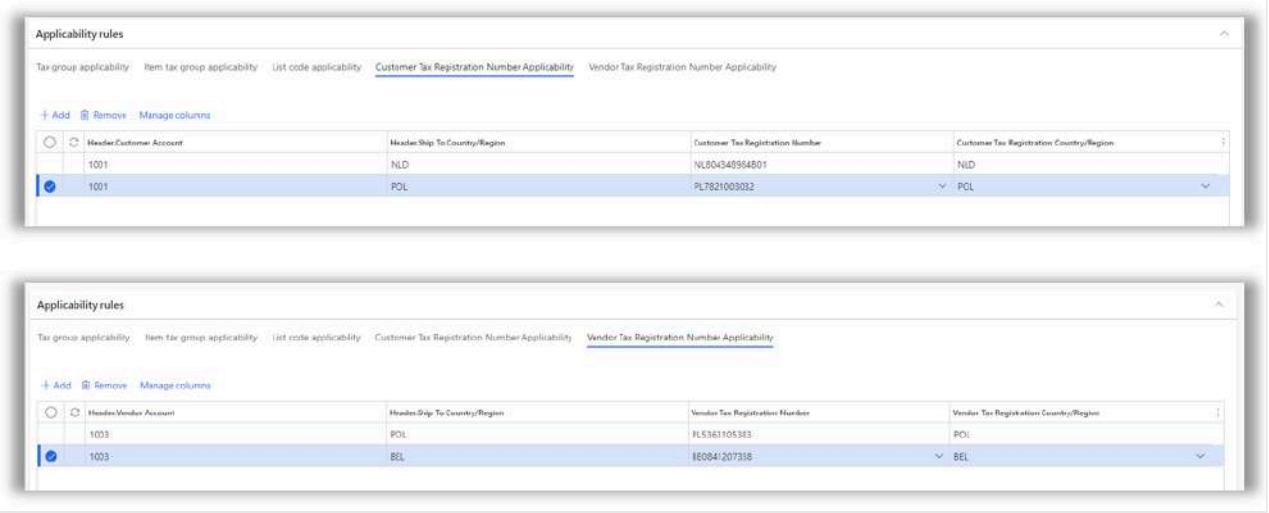
Set up the sales tax settlement period

On **Sales tax settlement periods**, create sales tax settlement periods. In the **Tax registration number** field, verify that the corresponding legal entity's VAT registration number is assigned.



Set up customer and vendor tax registration numbers in the Tax feature setup

1. Open the tax calculation feature setup.
2. On the **Customer Tax Registration Number Applicability** tab, under **Applicability rules**, verify that the registration IDs for customers are defined.
3. On the **Vendor Tax Registration Number Applicability** tab, under **Applicability rules**, verify that the registration IDs for vendors are defined.



> **Note**
>
> This step is optional unless the customer or vendor has multiple tax registration numbers, and you want the Tax Calculation feature to determine the ID. As the default value for the customer or vendor tax registration number, the Tax Calculation feature uses the value entered in the **Tax exempt number** field on the header of

sales and purchase documents. It replaces that default value with the value that you defined in customer or vendor tax registration number applicability rules.

During sales tax calculation and document posting, the tax feature returns the customer's or vendor's tax registration number to Dynamics 365 Finance and updates the **Tax exempt number** field on the sales order or purchase order. If the corresponding value isn't set up on the **Registration ID** FastTab on the **Manage addresses** page for the customer or vendor, the registration ID is left blank, and you receive the following message: "Customer tax registration 'xxx' is not found in the customer's Registration IDs setup. To add customer tax registration to sales tax transactions and posted documents, make sure the registration is defined in the Registration IDs setup."

Sales order and purchase order processing

On the **Tax calculation parameters** page, make sure that the **Enable advanced tax calculation** option is turned on, and that **Sales** and **Purchase** are selected in the **Business process** field.

If you assign sales tax codes on lines that you create for a sales order or purchase order to different sales tax settlement periods and tax registrations, the order has multiple registration numbers. To control the system behavior in this scenario, the **Check Tax registration number in document lines** option is available on the **Accounts receivable parameters** and **Accounts payable parameters** pages.

Before version 10.0.41, the system didn't support assigning sales tax codes to different registration numbers on a sales order or purchase order. During sales tax calculation and document posting, you receive an error message and can't continue the process. For information about the item ID, sales tax codes, settlement periods, and tax registration numbers that are identified for the order lines, view the message details.

Starting with version 10.0.41, you can create sales orders and sales quotations with lines that have different tax registration numbers. The **Check Tax registration number in document lines** option on the **Accounts receivable parameters** page still controls the level of validation: *None*, *Warning*, or *Error*.

> **Important**
>
> You can't assign multiple tax registrations to individual sales order document lines. If tax calculation determines that different tax registration numbers (VAT IDs) of the legal entity are assigned to an individual line, an error is displayed.

When you post, the system automatically splits sales orders into different sales confirmations, picking lists, packing slips, and invoices according to the VAT IDs it determines for document lines. Go to **Account receivable parameters** > **Summary update** > **Split based on** to select whether sales confirmation and/or picking list should be split based on the tax registration number. For packing slips and invoice postings, this option is mandatory and is set to **Yes**.

Temporary sales tax and posted sales tax

On the **Temporary sales tax** page, you can preview the identified VAT registration numbers of the legal entity, customers, and vendors. The following new fields are available on the page:

- **Tax registration number** – The VAT registration number of the legal entity.
- **Customer tax registration number** – The VAT registration number of the customer. This field is available only for sales orders.
- **Vendor tax registration number** – The VAT registration number of the vendor. This field is available only for purchase orders.

On the **Posted sales tax** page, the following new fields are available. You can sort and filter sales tax transactions by these fields.

- **Tax registration number** – The VAT registration number of the legal entity.
- **Counterparty tax registration number** – The VAT registration number of the counterparty.

Sales tax settlement procedure updates

The **Settle and post sales tax** periodic task now uses the country/region code of the legal entity's tax registration.

> **Note**
>
> If you don't set the tax registration number for a tax period, you receive the following error message: "Tax registration number is not set up for the tax settlement period xxx" and the settlement process stops.

After the settlement process finishes, the system doesn't print a sales tax payment report. Instead, you receive the following message: "The sales tax settlement and posting is completed. The voucher 'xxxx, m/d/yyyy' has been posted."

You can still manually run the sales tax payment report by going to **Tax** > **Inquiries and reports** > **Sales tax inquiries** > **Sales tax payments**.

> **Note**
>
> Even if you don't enable the feature on the **Tax calculation parameters** page, the system copies the tax registration ID from the original sales tax transactions to the offset sales tax transactions.

Reporting for multiple VAT registrations

This article explains how to report for multiple value-added tax (VAT) registrations from a single legal entity. You can use this functionality in the following countries or regions:

- Austria
- Belgium
- Czechia
- Denmark
- Estonia
- Finland
- France
- Germany
- Italy
- Latvia
- Lithuania
- Netherlands
- Norway
- Poland
- Spain
- Sweden
- Switzerland
- United Kingdom

The scope of reporting is limited to generation of the following reports:

- Intrastat
- EU sales list
- VAT declaration

For an overview of the functionality, see the following TechTalk session from September 29, 2021: VAT Reporting for Multiple Tax Registrations in Single Legal Entity.

Prerequisites

Before you begin, configure the following prerequisites:

- **Tax Calculation service**. For more information, see Tax Calculation.

- **Support multiple VAT registration numbers**. For more information, see Multiple VAT registration numbers.

Enable features in feature management

1. Go to **Workspaces** > **Feature management**.
2. In the feature list, select and enable the following features:
    - Intrastat reporting for multiple VAT registrations
    - EU Sales list reporting for multiple VAT registrations
    - EU sales list transfer based on tax transactions only
    - Sales tax declaration for multiple VAT registrations

> ⓘ **Note**
>
> If you transfer between warehouses in different countries or regions that have a tax registration, you must also enable the **Tax in transfer order** feature and configure the Tax Calculation service for tax in transfer orders. For more information, see Tax feature support for transfer orders.

Activate feature for specific legal entity

1. Go to **Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**.
2. On the **General** tab, set **Enable tax service** to **Yes**.
3. On the **Multiple VAT registrations** tab, set **VAT declaration**, **EU Sales List**, and **Intrastat** to **Yes** to activate VAT reporting, EU sales list reporting, or Intrastat reporting respectively, for the selected legal entity.

> ⓘ **Note**
>
> You can only access country or region-specific functionality that's applicable to the country or region of the primary address of the selected legal entity. Formats for the VAT declaration, EU sales list, and Intrastat are available for countries or regions of other VAT registrations. Other country or region-specific functionality that's applicable to the countries or regions of other VAT registrations isn't available in this legal entity.

Set up country/region properties for multiple VAT registrations

1. Go to **Tax** > **Set up** > **Foreign trade** > **Foreign trade parameters**.
2. On the **Country/region properties** tab, set up the following country/region types: **EU**, **EFTA**, or **Third country/region**.

   The following information applies to documents about movements of goods between European Union (EU) countries/regions, except movements within the same country/region (for example from Belgium to Belgium):

   - By default, the list code is **EU trade**, and it's transferred to the EU sales list.
   - Documents are transferred to Intrastat.

> ⓘ **Note**
>
> If you set the country/region of the legal entity's primary address as an EU member state, select **EU** (not **Domestic**) for the country/region type on the **Country/region properties** tab.

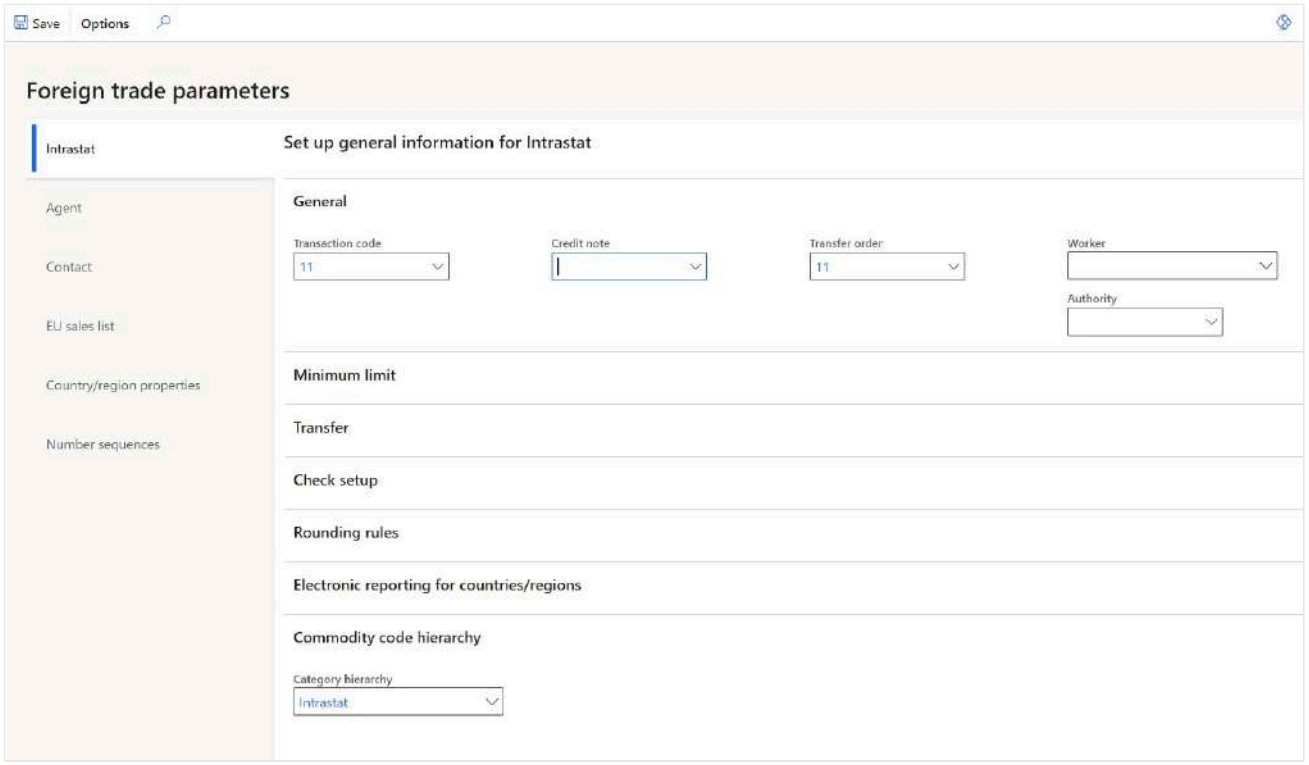
Intrastat reporting for multiple VAT registrations

Set up Intrastat for multiple VAT registrations

Intrastat parameters that you specify for a legal entity apply to all tax registrations that you set up in that legal entity.

1. Go to **Tax** > **Set up** > **Foreign trade** > **Foreign trade parameters**.
2. On the **Intrastat** tab, set up the parameters on the following FastTabs:

   - General: Transaction codes, worker, tax authority.
   - Minimum limit
   - Transfer
   - Check setup
   - Rounding rules
   - Electronic reporting for countries/regions
   - Commodity code hierarchy

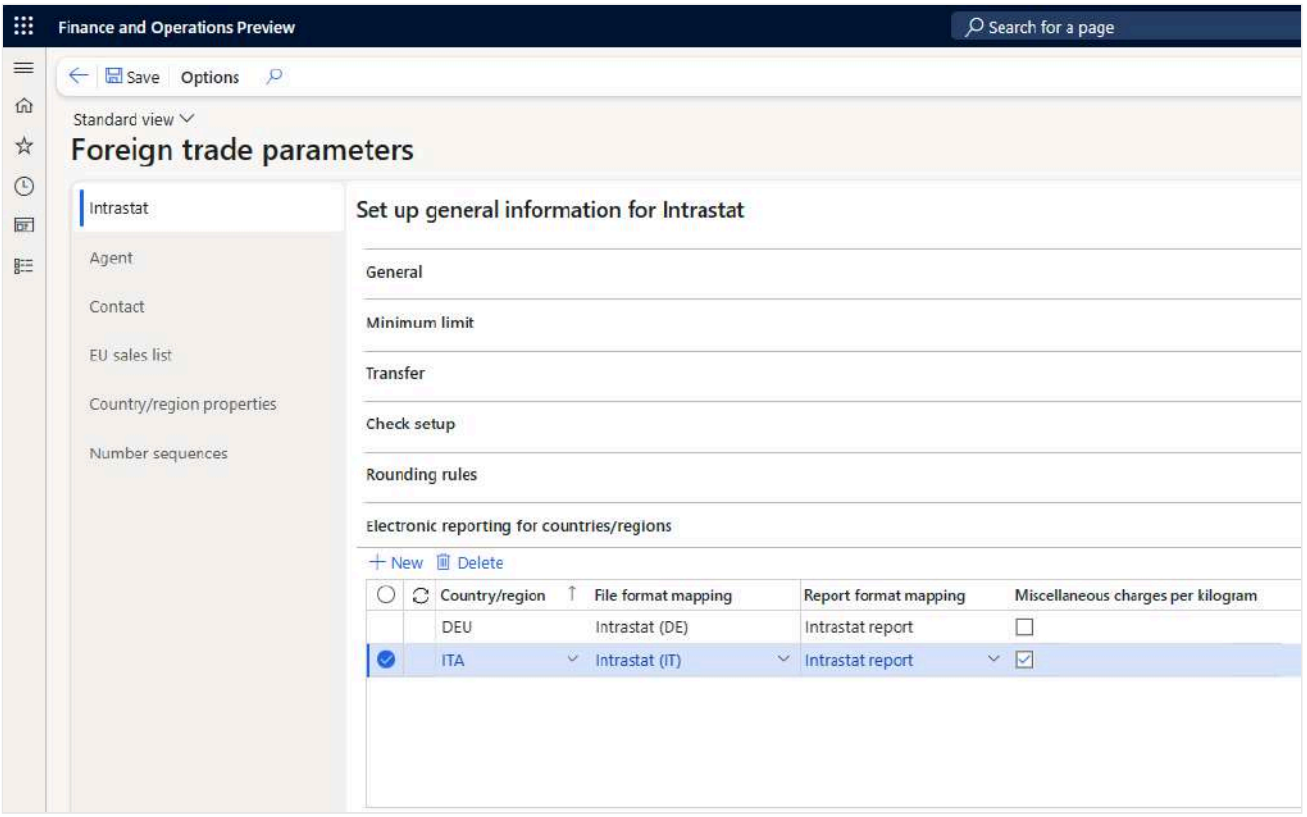


3. Go to **Tax** > **Setup** > **Foreign trade** > **Compression of Intrastat** to set up Intrastat compression rules. All tax registrations have the same setup for compression rules.

For more information about how to configure Intrastat, see Intrastat overview.

Set up Intrastat reporting formats

1. Go to **Tax** > **Set up** > **Foreign trade** > **Foreign trade parameters**.
2. On the **Intrastat** tab, on the **Electronic reporting for countries/regions** FastTab, select the Intrastat reporting format for each country/region of your tax registration.
3. In the **File format mapping** field, select the Electronic reporting (ER) format for Intrastat file export. For example, select **Intrastat (DE)** for Germany (DEU).
4. In the **Report format mapping** field, select the ER format for printable report layout, such as **Intrastat report**.
5. The **Miscellaneous charges per kilogram** checkbox is available when **Country/region** field is set to **ITA** (Italy). Select this checkbox to calculate miscellaneous charges by multiplying the cost of each kilogram and the weight of goods in kilograms. If you clear this checkbox, miscellaneous charges are calculated as a percentage of the invoice amount. For more information, see Miscellaneous charges per kilogram in an Intrastat declaration.



> **Note**
>
> You can select an ER format if the **ISO Country/region codes** field on the **ISO Country/region codes** FastTab is blank in this format.

The following table shows the earliest ER format versions that you can select the format for.

Expand table

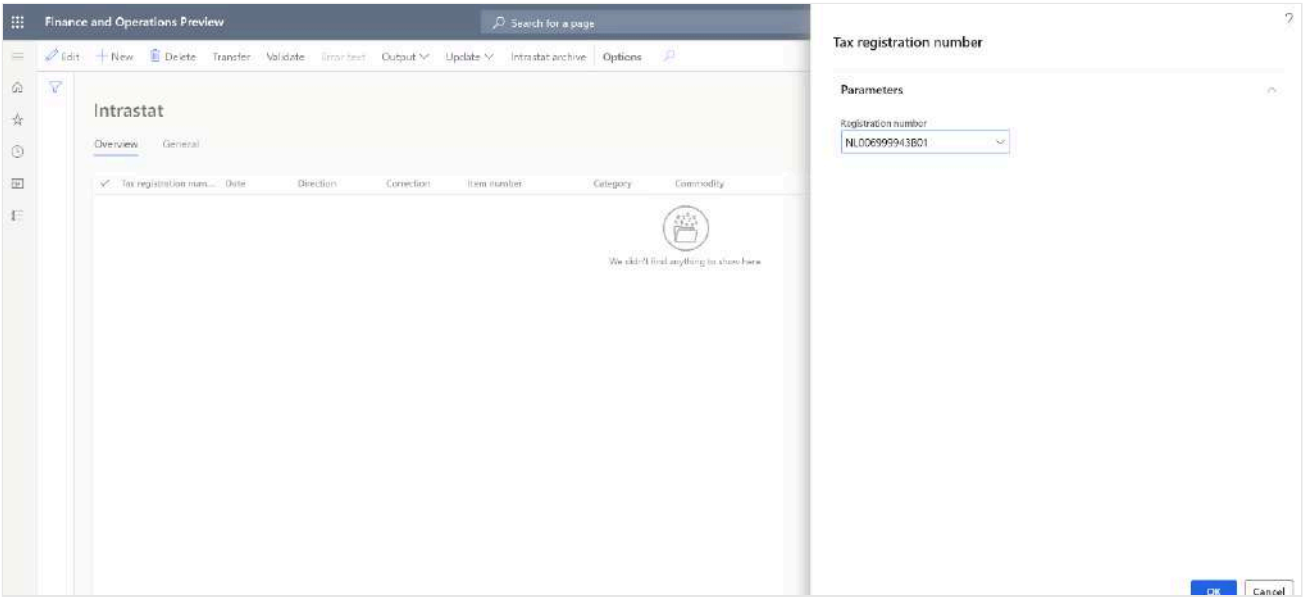
Release	Country/region	ER format
10.0.19	All	Intrastat model.version.16
10.0.19	Netherlands	Intrastat (NL).version.1.3
10.0.20	France	Intrastat INTRACOM (FR).version.13.5 Intrastat SAISUNIC (FR).version.1.3
10.0.20	United Kingdom (Northern Ireland)	Intrastat (UK).version.1.2
10.0.21	Austria	Intrastat (AT).version.16.3
10.0.21	Germany	INSTAT XML (DE).version.22.9.9
10.0.21	Spain	Intrastat (ES).version.16.7

Release	Country/region	ER format
10.0.21	Sweden	Intrastat (SE).version.16.4
10.0.23	Finland	Intrastat (FI).version.2.3
10.0.23	Denmark	Intrastat (DK).version.25.4
10.0.23	Poland	Intrastat (PL).version.25.5
10.0.25	Belgium	Intrastat (BE).version.2.9
10.0.34	The Czech Republic	Intrastat (CZ).version.24.6
10.0.38 10.0.37 - build 10.0.1725.25 10.0.36 - build 10.0.1695.56	Italy	Intrastat (IT).version.24.36

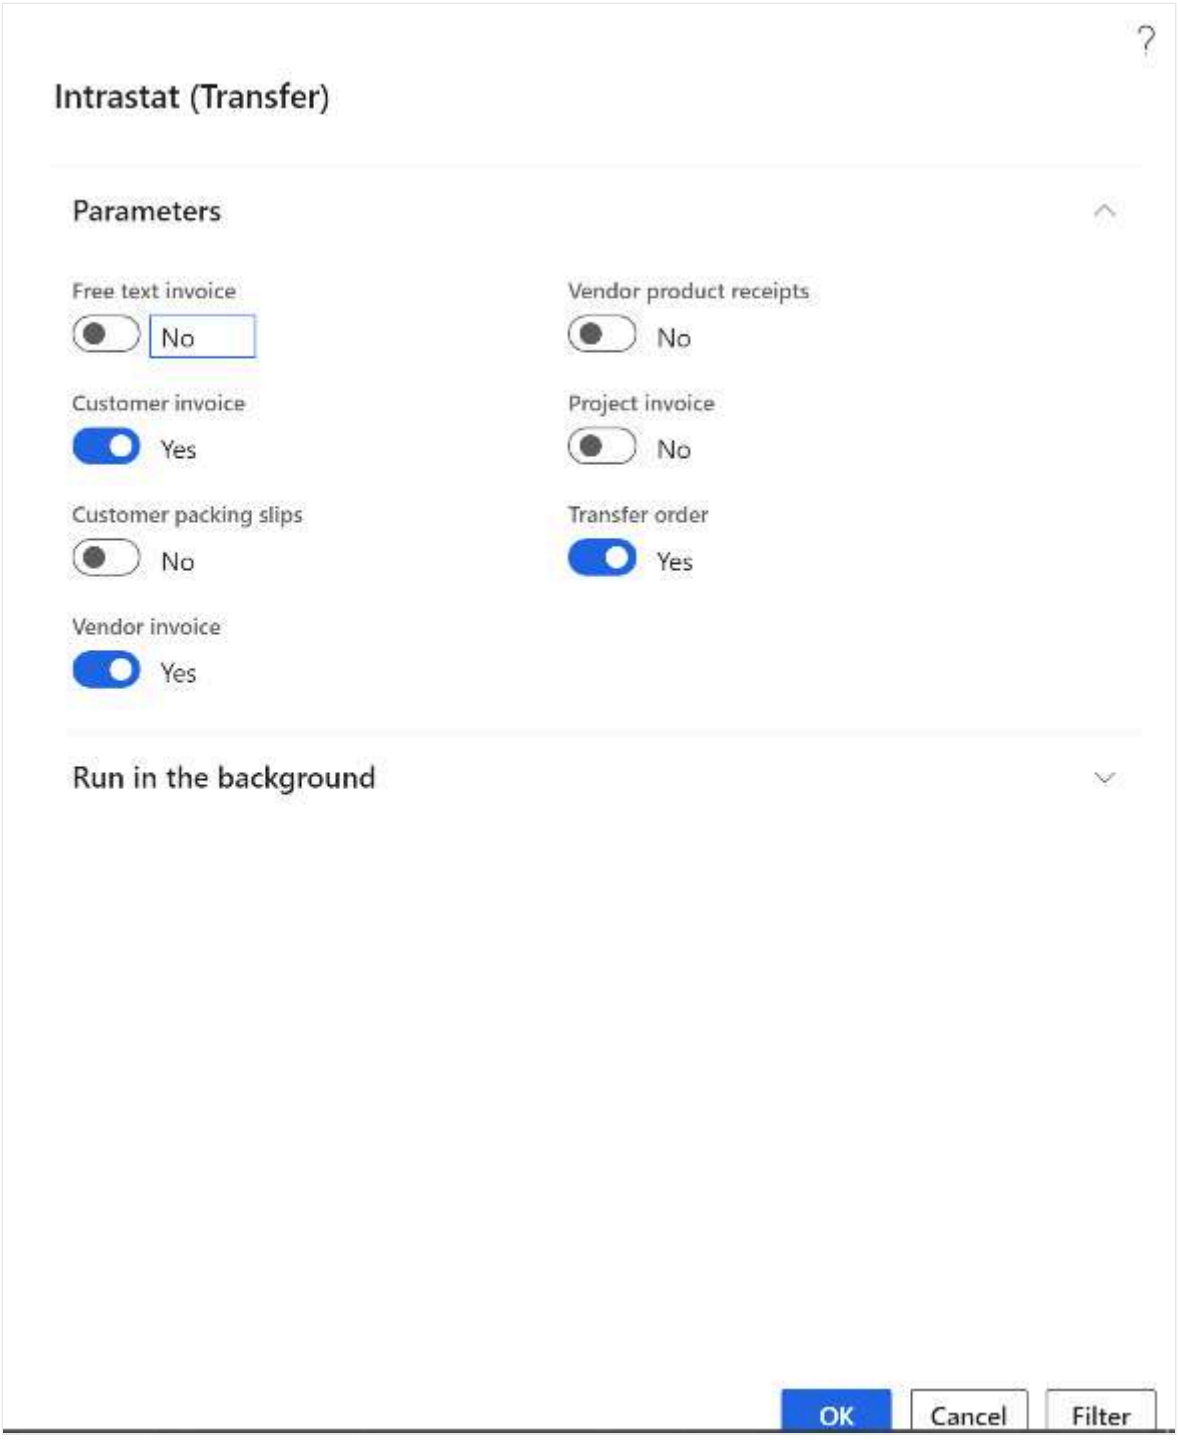
For more information, see Download ER configurations from the Global repository of Configuration service.

Transfer and report Intrastat

1. Go to **Tax** > **Declarations** > **Foreign trade** > **Intrastat**.
2. Select **Transfer**.
3. In the **Tax registration number** dialog box, select the tax registration number to transfer transactions for, and then select **OK**.



4. In the **Intrastat (Transfer)** dialog box, select the documents to transfer: **Free text invoice**, **Customer invoice**, **Customer packing slips**, **Vendor invoice**, **Vendor product receipts**, **Project invoice**, or **Transfer order**. Then select **OK**.

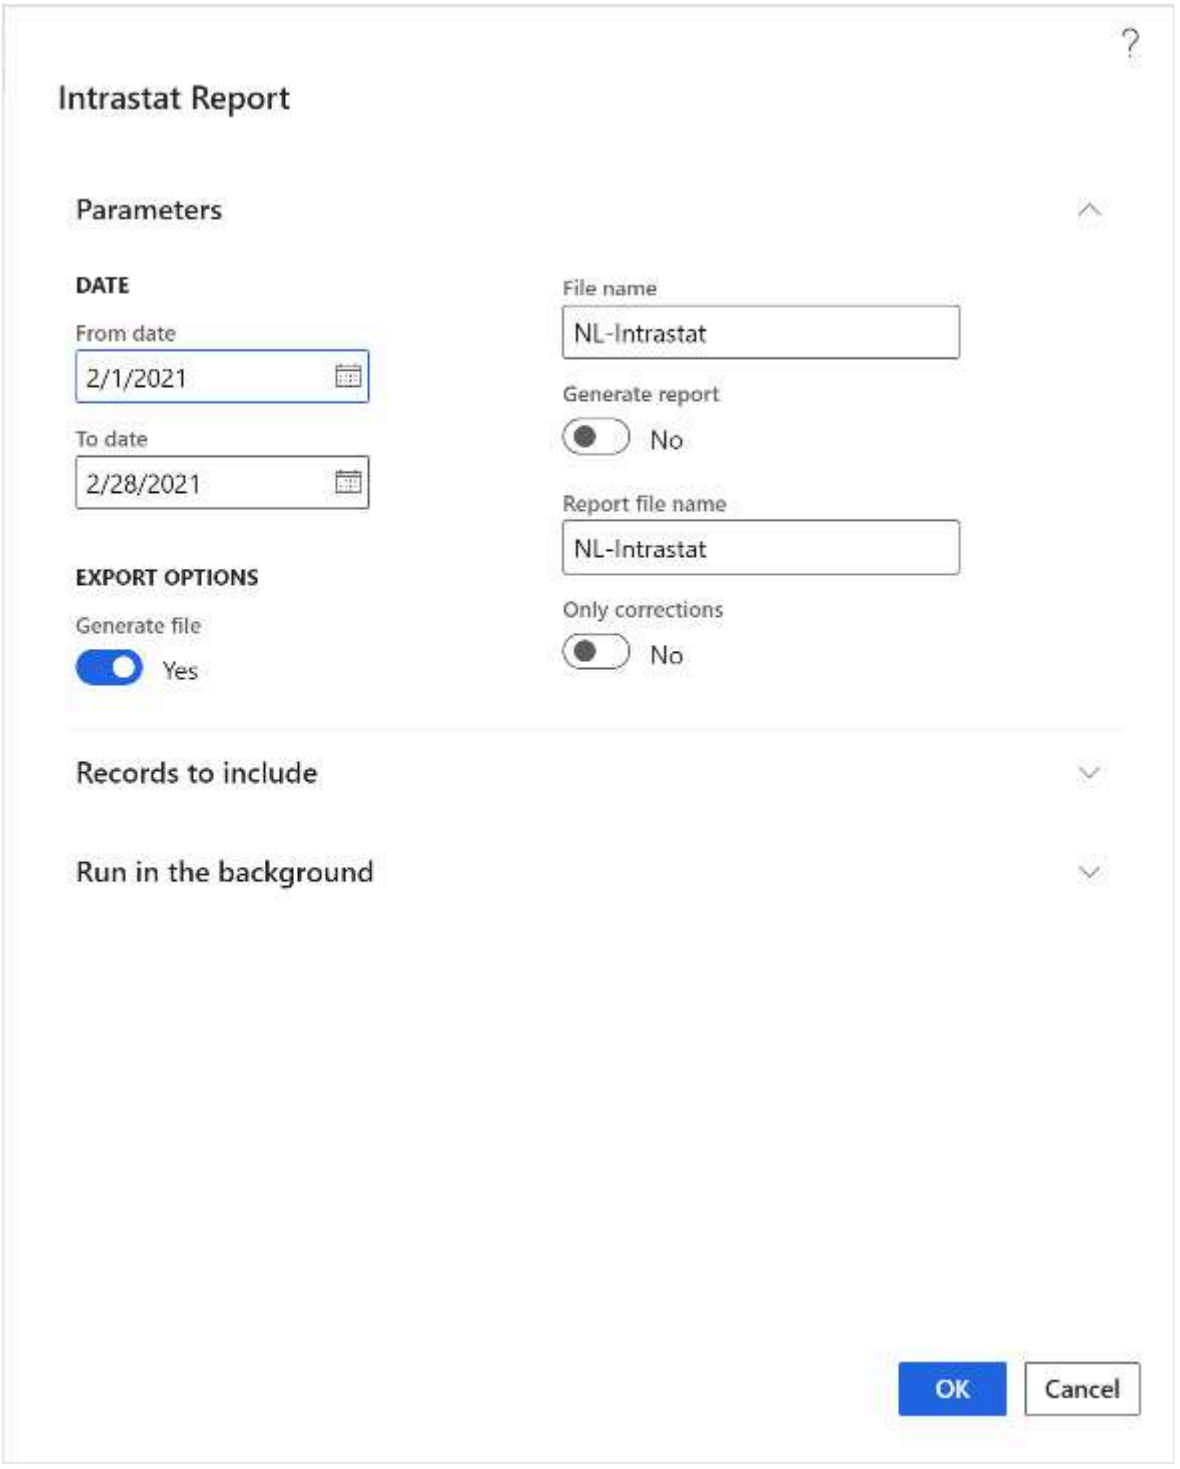


5. Transactions for the selected tax registration and documents are transferred. Review the transactions, and make any adjustments that are required.

> **Note**
>
> In the 10.0.19 and 10.0.20 releases, the Intrastat **Transfer** function has country/region-specific logic that isn't yet covered in the **Intrastat transfer for Multiple Tax ID** feature

for the following countries/regions: the Czech Republic, Finland, Germany, Hungary, Italy, Latvia, Lithuania, Poland, and Spain.

6. Select **Output** > **Report**.
7. In the **Tax registration number** dialog box, select the tax registration number to generate the Intrastat report for, and then select **OK**.
8. In the **Intrastat Report** dialog box, in the **From date** and **To date** fields, define the period to generate the Intrastat report for.
9. Set the **Generate file** option to **Yes** to generate an electronic reporting file. Then, in the **File name** field, enter the name of the output electronic file, if applicable.
10. Set the **Generate report** option to **Yes** to generate a Microsoft Excel report. Then, in the **Report file name** field, enter the name of the output Excel file, if applicable.



11. The dialog box also contains country/region-specific fields that are required in the country/region-specific Intrastat report. Set these fields as required.

12. Select **OK** to generate the report.

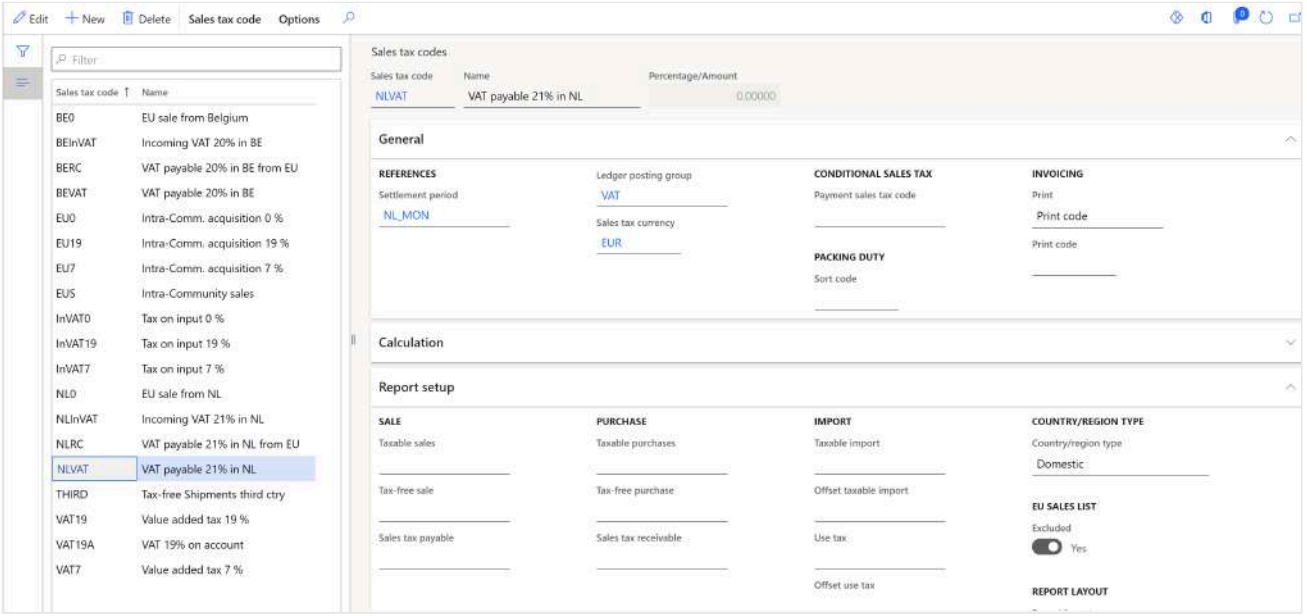
EU sales list reporting for multiple VAT registrations

Set up the EU sales list

Set up sales tax codes

1. Go to **Tax** > **Sales tax** > **Sales tax codes**.
2. Create unique sales tax codes for each of your tax registrations.
3. On the **Report setup** FastTab, in the **EU sales list** section, set the **Excluded** option to **Yes** if tax transactions that have a selected sales tax code shouldn't be transferred to the EU sales list.
4. In the **Country/region type** section, in the **Country/region type** field, define the tax transaction type for VAT reporting: **EU**, **Domestic**, or **Third country/region**.

   This setting is mandatory in some countries/regions, such as the United Kingdom.



Set up item sales tax groups

1. Go to **Tax** > **Sales tax** > **Item sales tax groups**.
2. In the **Reporting type** field, select the reporting type for EU sales list reporting: **Item**, **Service**, or **Investment** (for Belgium).

Set up EU sales list parameters

All tax registrations use the same settings for EU sales list parameters.

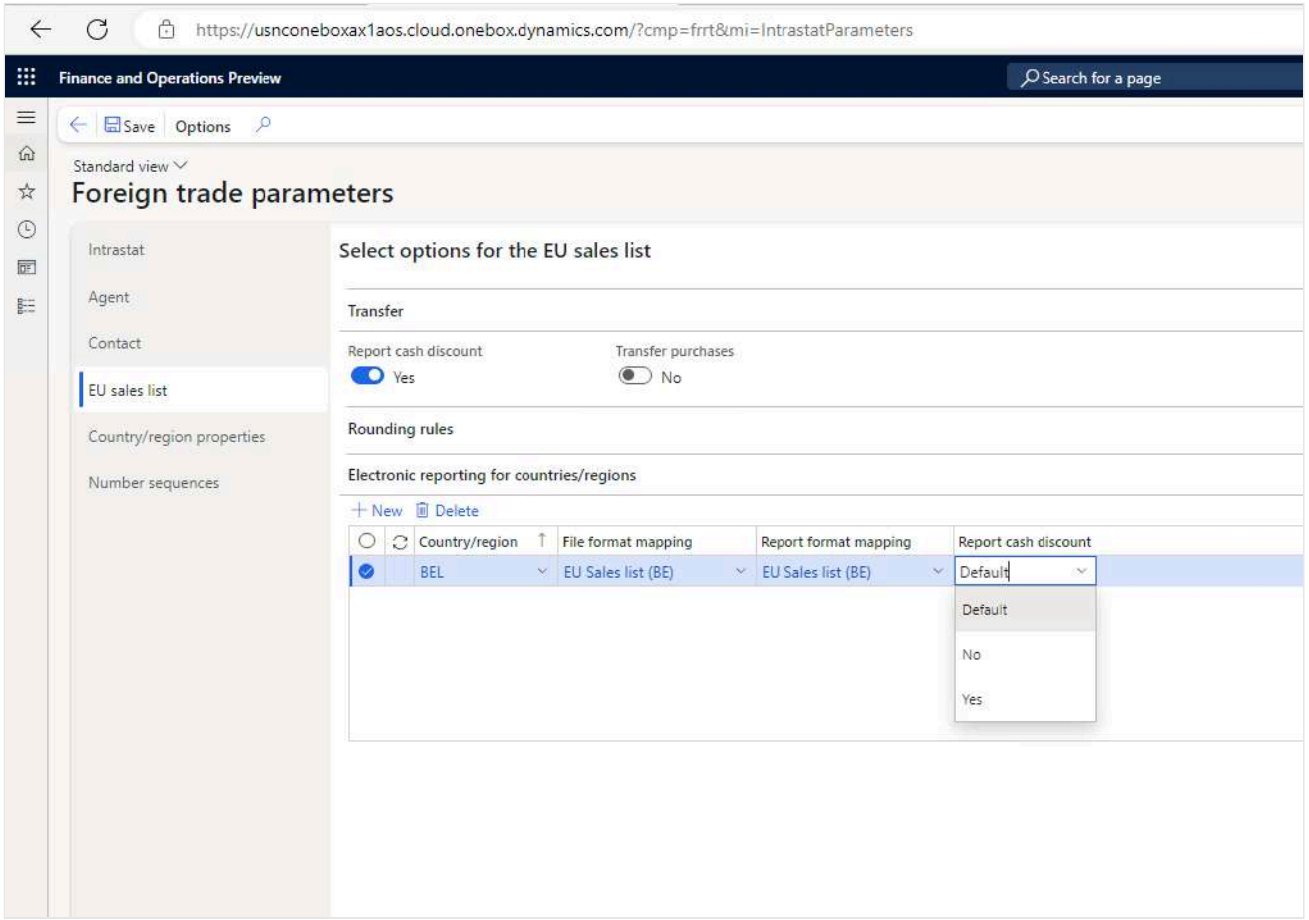
1. Go to **Tax** > **Setup** > **Foreign trade** > **Foreign trade parameters**.
2. On the **EU sales list** tab, set up the parameters on the **Transfer** and **Rounding rules** FastTabs.

> **Note**

If one of your tax registrations is in Poland or Hungary (countries/regions that report purchases in addition to sales), set the **Transfer purchases** option to **Yes**.

Set up EU sales list reporting formats

1. Go to **Tax** > **Set up** > **Foreign trade** > **Foreign trade parameters**.
2. On the **EU sales list** tab, on the **Electronic reporting for countries/regions** FastTab, select EU sales list reporting formats for each country/region of your tax registration.
3. In the **File format mapping** field, select the ER format for EU sales list report electronic format. For example, for Netherlands, select **EU Sales list (NL)**.
4. In the **Report format mapping** field, select the ER format for printable report layout. For example, select either **EU sales list by rows report** or **EU sales list by columns report**.
5. In the **Report cash discount** field, select **Yes** if the selected country/region cash discount must be transferred to the EU sales list. Select **No** if the selected country/region cash discount must not be transferred to EU sales list. Leave the value set to **Default** if the value specified in the **Report cash discount** field on the **Transfer** FastTab must be applied to the selected country/region.



> **Note**
>
> You can select an ER format if the **ISO Country/region codes** field on the **ISO Country/region codes** FastTab is blank in this format.

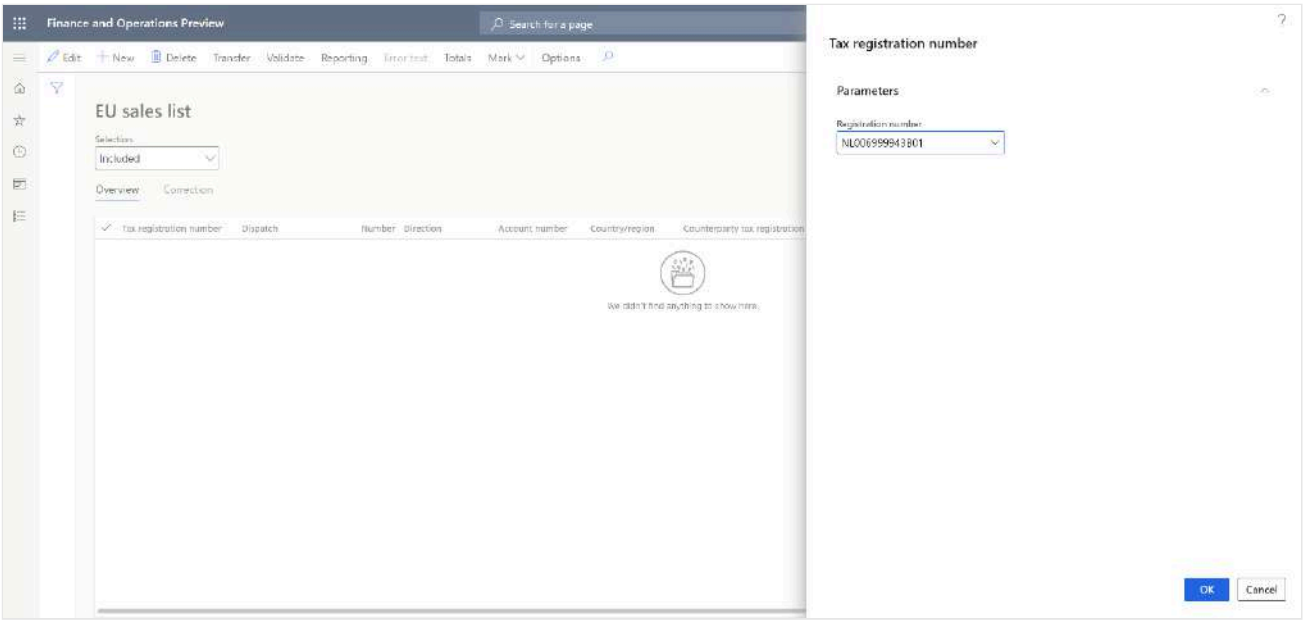
The following table shows the earliest ER format versions that you can select the format for.

Expand table

Release	Country/region	ER format
10.0.19	All	EU Sales list model.version.9
10.0.19	Netherlands	EU Sales list (NL).version.1.10
10.0.20	France	EU Sales list (FR).version.1.2
10.0.20	United Kingdom (Northern Ireland)	EU Sales list XML (UK).version.9.6 EU Sales list TXT (UK).version.9.7
10.0.21	Austria	EU Sales list (AT).version.9.5
10.0.21	Germany	EU Sales list (DE).version.9.5
10.0.21	Spain	EU Sales list (ES).version.9.2
10.0.21	Sweden	EU Sales list (SE).version.13.7
10.0.23	Finland	EU Sales list (FI).version.2.5
10.0.23	Denmark	EU Sales list (DK).version.13.4
10.0.24	Poland	EU Sales list (PL).version.14.7
10.0.25	Belgium	EU Sales list (BE).version.2.3
10.0.33	The Czech Republic	EU Sales list (CZ).version.15.9

Transfer and report the EU sales list

1. Go to **Tax** > **Declarations** > **Foreign trade** > **EU sales list**.
2. Select **Transfer**.
3. In the **Tax registration number** dialog, select the tax registration number to transfer transactions for, and then select **OK**.



4. In the **Transfer transactions for EU sales list** dialog box, select the documents and reporting types to transfer.

Transfer transactions for EU sales list

Select reporting types and invoice information to restrict the transactions that will be transferred to the EU sales list form and printed on the EU sales list report. You can make changes to the list before you print the report.

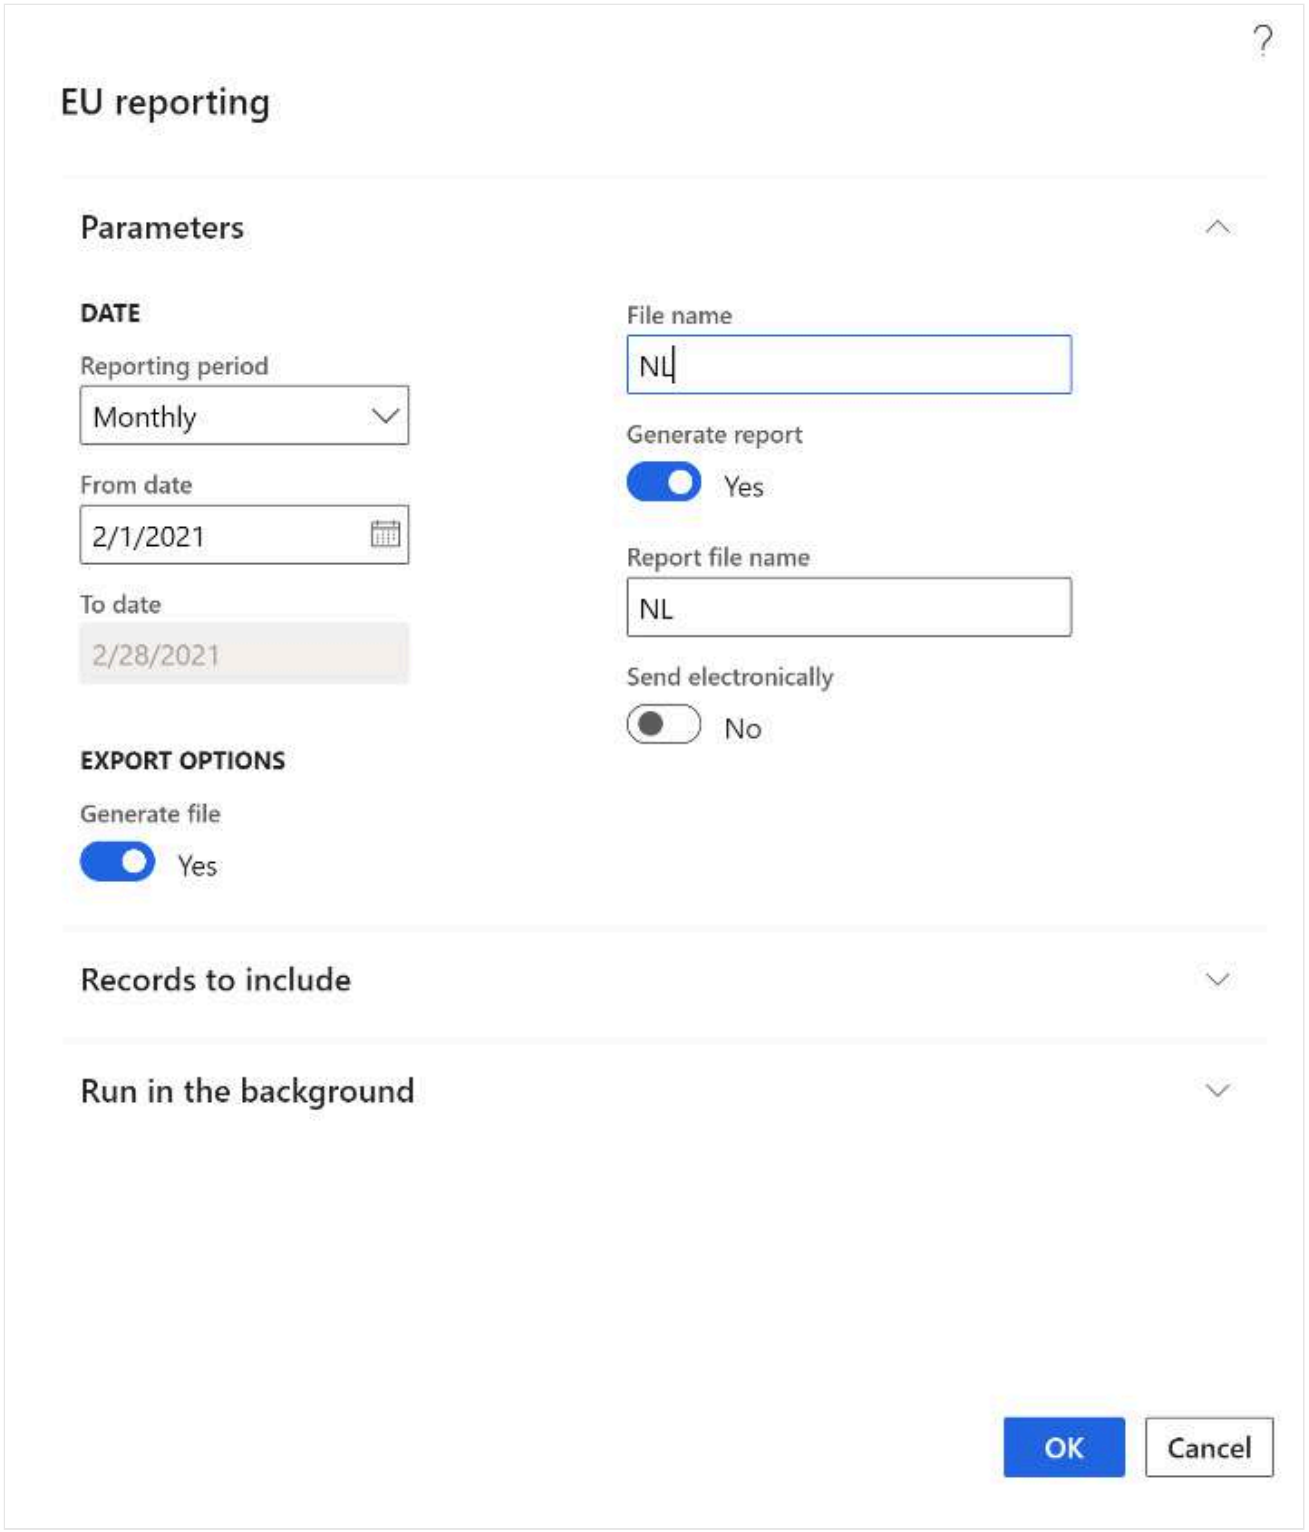
Run in the background

5. Select **Select** to adjust the default filter for transactions that should be transferred, and then select **Transfer**.
6. The system transfers transactions for the selected tax registration, documents, and reporting types. Review the transactions, and make any adjustments that are required.
7. Select **Reporting**.
8. In the **Tax registration number** dialog box, select the tax registration number to generate the EU sales list report for, and then select **OK**.
9. In the **EU reporting** dialog box, in the **From date** field, specify the first date to generate the EU sales list report for.
10. Set the **Generate file** option to **Yes** to generate an electronic reporting file. Then, in the **File name** field, enter the name of the output electronic file.
11. Set the **Generate report** option to **Yes** to generate an Excel report. Then, in the **Report file name** field, enter the name of the output Excel file.



12. The dialog box also contains country/region-specific fields that are required in the country/region-specific EU sales list report. Set these fields as required.

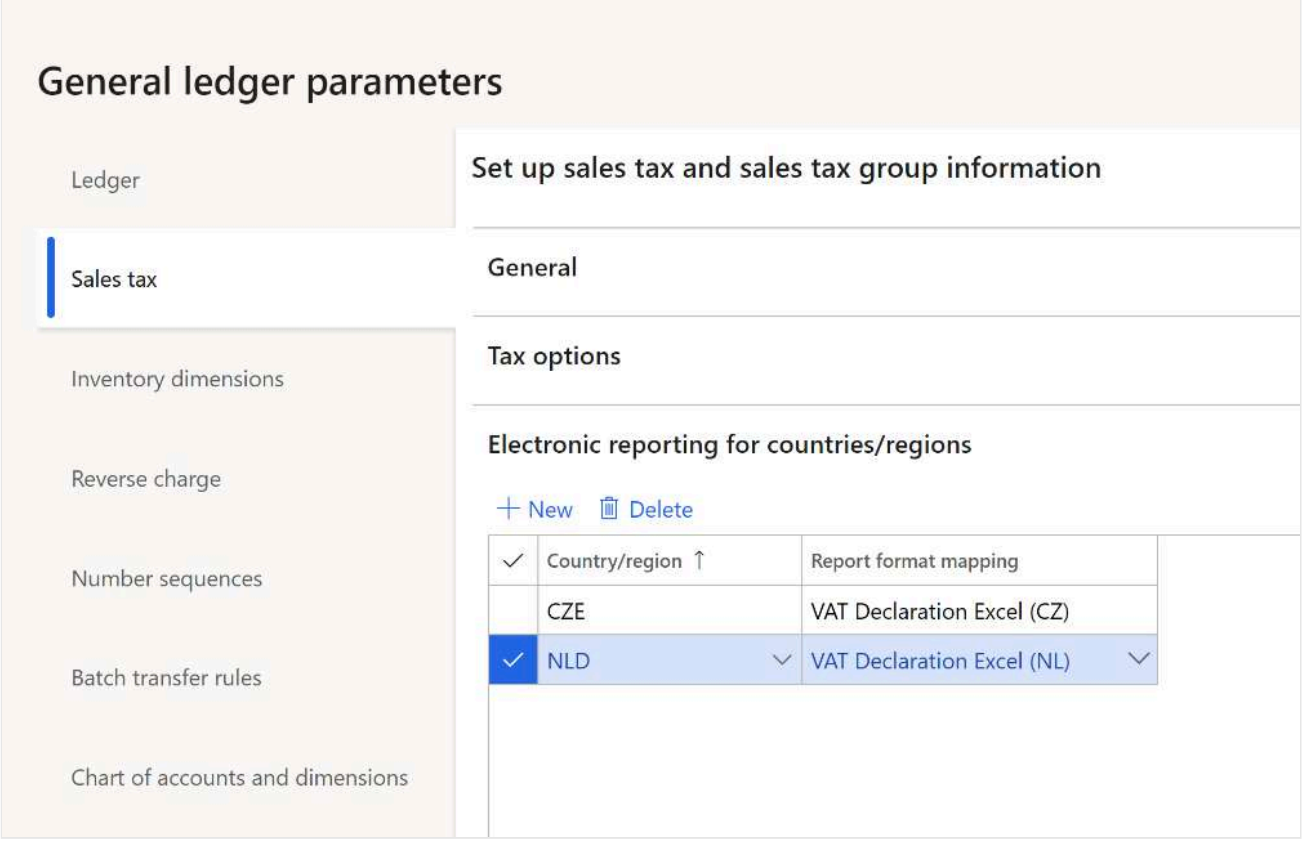
13. Select **OK** to generate the report.

VAT declaration reporting for multiple VAT registrations

Set up for VAT declaration reporting

1. Go to **Tax** > **Set up** > **Parameters** > **General ledger parameters**.

2. On the **Sales tax** tab, on the **Electronic reporting for countries/regions** FastTab, select the VAT reporting formats for each country or region of your tax registration.



> **Note**
>
> You can select an ER format if the **ISO Country/region codes** field on the **ISO Country/region codes** FastTab is blank in this format.

The following table shows the earliest ER format versions that you can select the format for. For more information about how to run VAT declaration for specific countries or regions, review the related article.

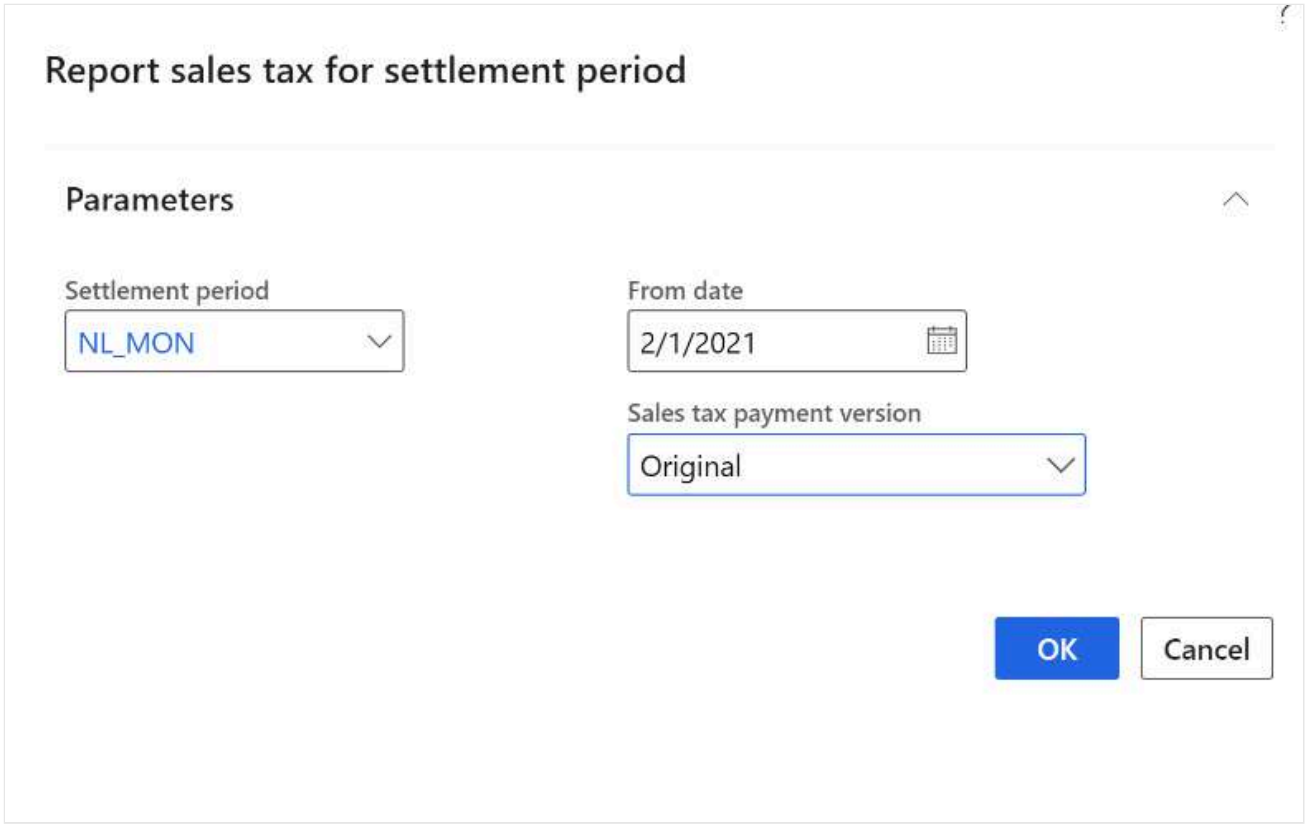
>
> The VAT declaration of Poland (JPK-V7) is supported by using the Electronic messaging functionality only. For more information, see **VAT declaration with registers (JPK-V7, VDEK)**.

Generate a VAT declaration for multiple VAT registrations

1. Go to **Tax** > **Declarations** > **Sales tax** > **Report sales tax for settlement period**.
2. In the **Report sales tax for settlement period** dialog box, in the **Settlement period** field, select a settlement period.
3. In the **From date** field, specify the first date to generate the VAT declaration for.
4. In the **Sales tax payment version** field, select one of the following values:
    - **Original:** Generate a report for sales tax transactions of the original sales tax payment or before the sales tax payment is generated.
    - **Corrections:** Generate a report for sales tax transactions of all subsequent sales tax payments for the period.
    - **Total list:** Generate a report for all sales tax transactions for the period, including the original and all corrections.



5. Select **OK** to generate the report.

Tax feature support for transfer orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about tax calculation and posting integration in transfer orders. By using this functionality, you can set up tax calculation and posting in transfer orders for stock transfers. Under European Union (EU) value-added tax (VAT) regulations, stock transfers are considered intra-community supply and intra-community acquisitions.

Set up tax calculation for tax and transfer order transactions

Follow these steps to set up the tax that is involved in a transfer order. In the example that is shown here, the transfer order is from the Netherlands to Belgium.

1. On the **Tax calculation features** page, on the **Versions** tab, select the draft feature version, and then select **Edit**.

2. On the **Tax features setup** page, on the **Tax codes** tab, select **Add** to create new tax codes. For this example, create three tax codes: **NL-Exempt**, **BE-RC-21**, and **BE-RC+21**.

    - When a transfer order ships from a warehouse in the Netherlands, apply the Netherlands VAT exempted tax code (**NL-Exempt**).

      Create the tax code **NL-Exempt**.
      a. Select **Add**, enter **NL-Exempt** in the **Tax code** field.
      b. Select **By Net Amount** in the **Tax component** field.
      c. Select **Save**.
      d. Select **Add** in the **Rate** table.
      e. Set **Is Exempt** to **Yes** in the **General** section.
      f. In the **Exempt Code** field, enter **EC**.

    - When a transfer order arrives at a Belgium warehouse, apply the reverse charge mechanism by using the **BE-RC-21** and **BE-RC+21** tax codes.

      Create the tax code **BE-RC-21**.

a. Select **Add**, enter **BE-RC-21** in the **Tax code** field.
b. Select **By Net Amount** in the **Tax component** field.
c. Select **Save**.
d. Select **Add** in the **Rate** table.
e. Enter **-21** in the **Tax Rate** field.
f. Set **Is Reverse Charge** to **Yes** in the **General** section.
g. Select **Save**.

Create the tax code **BE-RC+21**.

a. Select **Add**, enter **BE-RC+21** in the **Tax code** field.
b. Select **By Net Amount** in the **Tax component** field.
c. Select **Save**.
d. Select **Add** in the **Rate** table.
e. Enter **21** in the **Tax Rate** field.
f. Select **Save**.

3. Define the tax group.
   a. Select **Manage columns**, and then select the line field **Tax Group**.
   b. Select ->, and then select **OK**.
   c. Select **Add** to add a tax group.
   d. In the **Tax Group** column, enter **AR-EU** and then select the **NL-Exempt** tax code.
   e. Select **Add** to add a tax group.
   f. In the **Tax Group** column, enter **RC-VAT** and then select the **BE-RC-21** and **BE-RC+21** tax codes.

4. Define the item tax group.
   a. Select **Manage columns**, and then select the line field **Item Tax Group**.
   b. Select -> and then select **OK**.
   c. Select **Add** to add an item tax group.
   d. Enter **FULL** in the column **Item Tax Group**. Select tax codes **BE-RC-21**, **BE-RC+21**, and **NL-Exempt**.

5. Define the applicability of the tax group.

   a. Select **Manage columns**, and then select columns that you want to use to build the applicability table.

   > ⓘ **Note**
   >
   > Be sure to add the **Business process** and **Tax directions** columns to the table. Both columns are essential to the functionality for tax in transfer orders.

b. Add applicability rules. Don't leave the **Tax group** field blank.

Add a new rule for transfer order shipment.

i. Select **Add** in the **Applicability rules** table.
ii. In the **Business process** field, select **Inventory** to make the rule applicable for a transfer order.
iii. In the **Ship From Country/Region** field, enter **NLD**.
iv. In the **Ship To Country/Region** field, enter **BEL**.
v. In the **Tax direction** field, select **Output** to make the rule applicable to transfer order shipment.
vi. In the **Tax Group** field, select **AR-EU**.

Add another rule for transfer order receipt.

i. Select **Add** in the **Applicability rules** table.
ii. In the **Business process** field, select **Inventory** to make the rule applicable for a transfer order.
iii. In the **Ship From Country/Region** field, enter **NLD**.
iv. In the **Ship To Country/Region** field, enter **BEL**.
v. In the **Tax direction** field, select **Input** to make the rule applicable to transfer order receipt.
vi. In the **Tax Group** field, select **RC-VAT**.

6. Define the applicability of the item tax group.

a. Select **Manage columns**, and then select columns that you want to use to build the applicability table.

b. Add applicability rules.

> ⓘ **Note**
>
> If the item sales tax group defaulted on your taxable document lines is already correct, leave this matrix blank.

Add a new rule for transfer order shipment and receipt.

i. On the **Applicability rules** page, select **Add**.
ii. In the **Business process** field, select **Inventory** to make the rule applicable for the transfer order.
iii. In the **Item Tax Group** field, select **FULL**.

7. Complete and publish the new tax feature version.

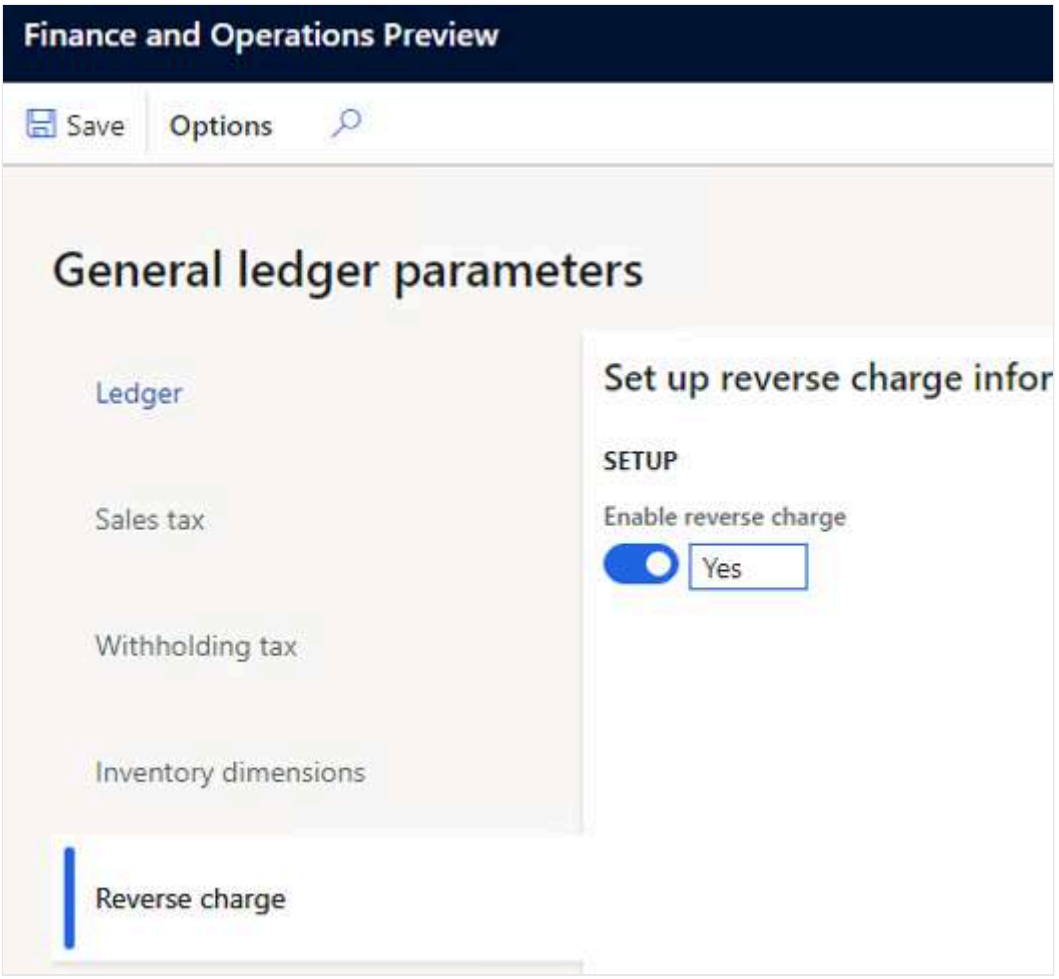
Set up Finance for transfer order transactions

1. Enable the tax calculation **Enable advanced tax calculation** parameter, and select the **Inventory** business process.

   > **Important**
   >
   > You must complete this step for each legal entity in Finance where you want the tax calculation feature and the functionality for tax in transfer orders to be available.

   a. Go to **Tax** > **Setup** > **Tax configuration** > **Tax calculation parameters**.
   b. In the **Business process** field, select **Inventory**.

2. Verify that the reverse charge mechanism is set up. Go to **General ledger** > **Setup** > **Parameters**, and then, on the **Reverse charge** tab, verify that the **Enable reverse charge** option is set to **Yes**.

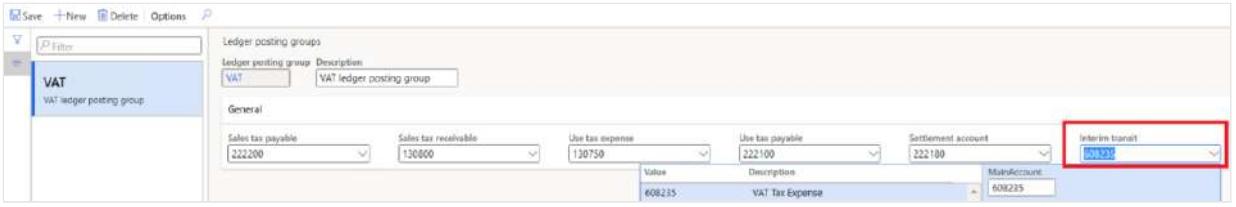


3. Verify that the related tax codes, tax groups, item tax groups, and VAT registration numbers are set up in Finance according to the tax calculation guidance.

4. Set up an interim transit account. This step is required only when the tax that you apply to a transfer order isn't applicable to a tax-exempted or reverse charge mechanism.

a. Go to **Tax** > **Setup** > **Sales tax** > **Ledger posting groups**.

b. In the **Interim transit** field, select a ledger account.

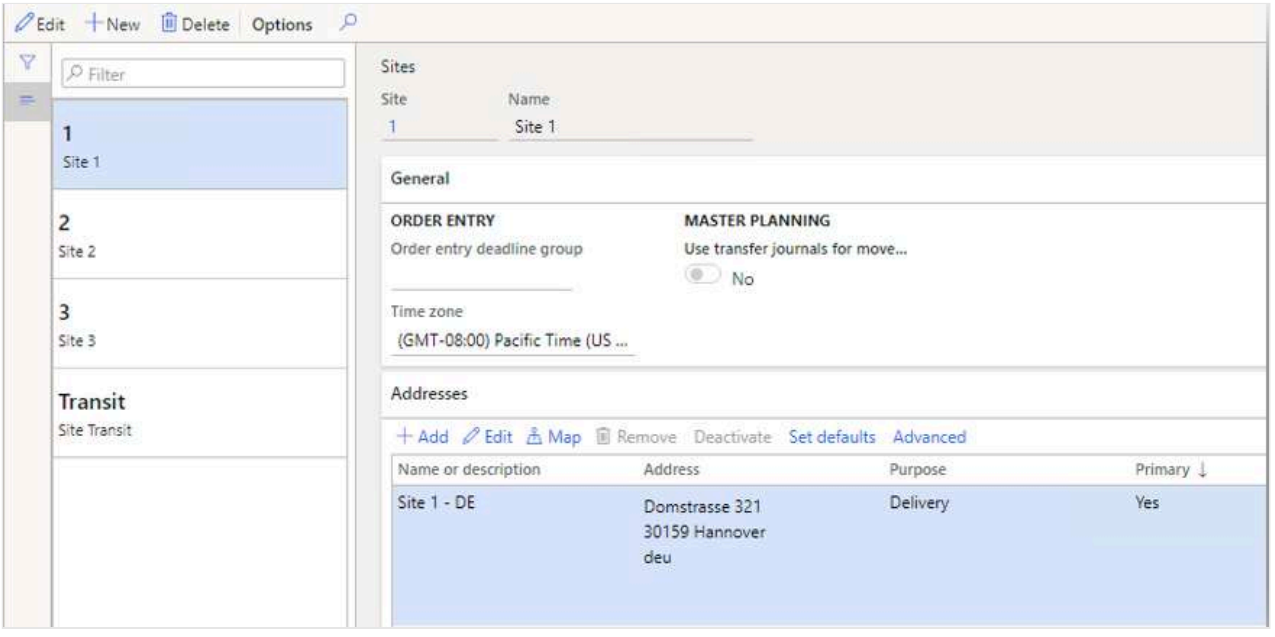


Set up basic inventory for transfer order transactions

Follow these steps to set up basic inventory to enable transfer order transactions.

1. Create ship-from and ship-to sites for your warehouses in different countries or regions, and add the primary address for each site.
   a. Go to **Warehouse management** > **Setup** > **Warehouse** > **Sites**.
   b. Select **New** to create the site that you assign to a warehouse later.
   c. Repeat step 2 for all the other sites that you must create.

> **Note**
>
> One of the sites that you create should be named **Transit**. In later steps of this procedure, you assign this site to the transit warehouse, so that tax-related inventory vouchers can be posted in "ship" and "receive" transactions for transfer orders. The address of the transit site is irrelevant to tax calculation. Therefore, you can leave it blank.

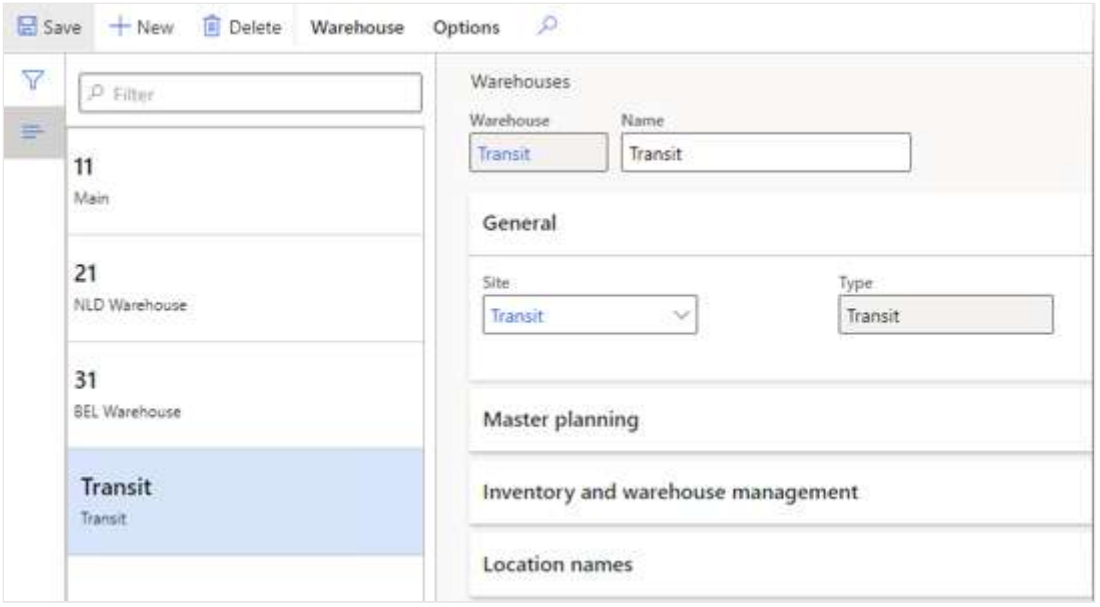


2. Create ship-from, transit, and ship-to warehouses. Any address information that you maintain in a warehouse overrides the site address during tax calculation.

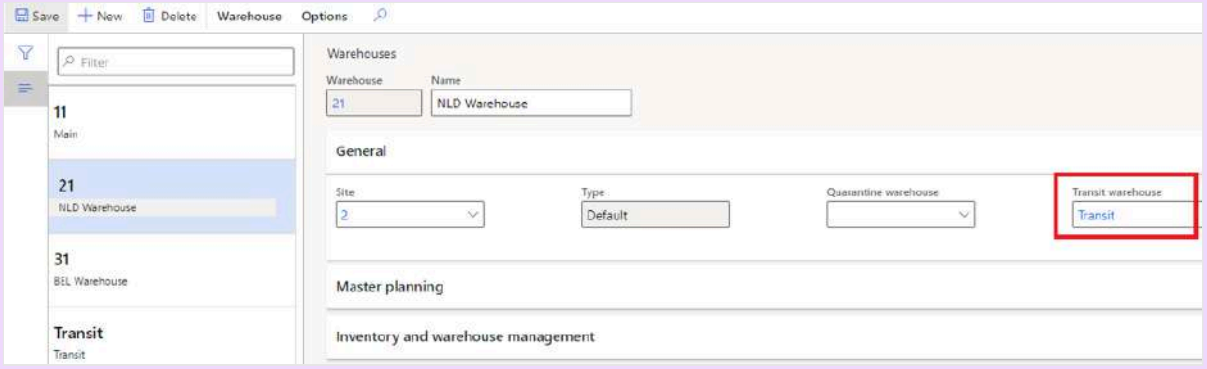
   a. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.

   b. Select **New** to create a warehouse, and assign it to the corresponding site.

   c. Repeat step 2 to create a warehouse for each site as required.



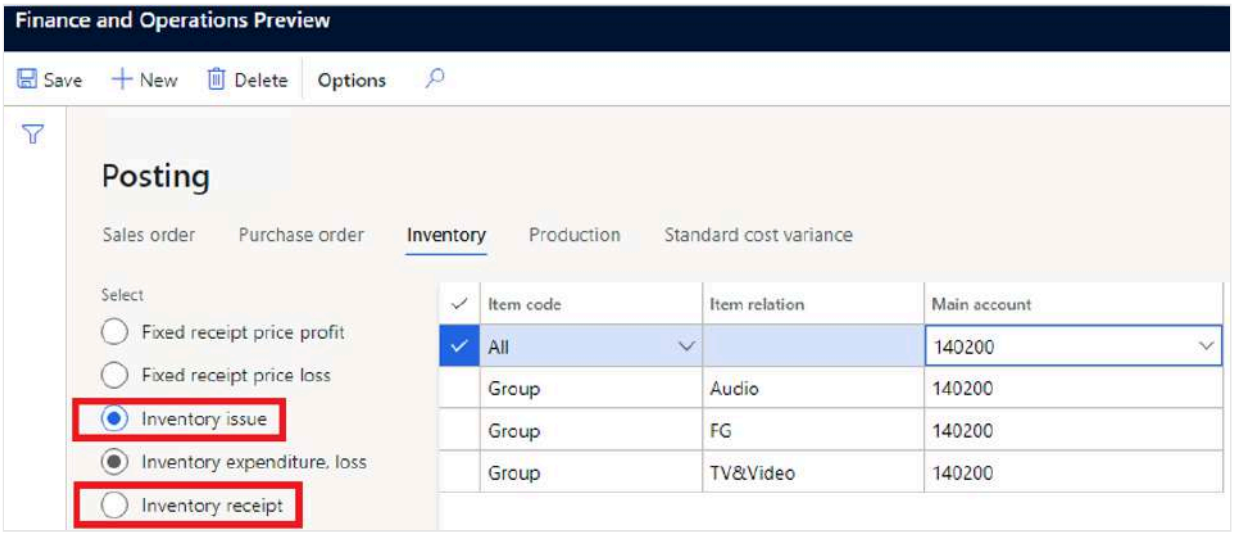
> ⓘ **Note**
>
> For a ship-from warehouse, you must select a transit warehouse in the **Transit warehouse** field for transfer order transactions.



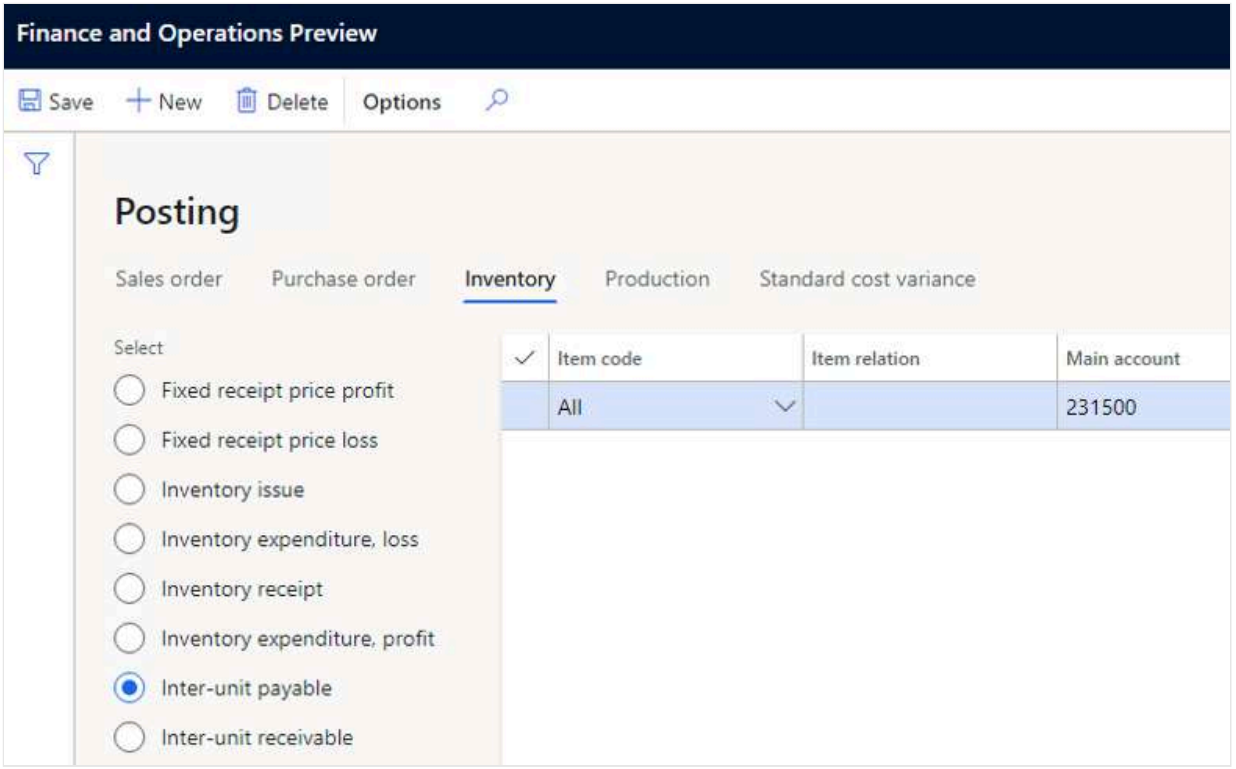
3. Verify that the inventory posting configuration is set up for transfer order transactions.

   a. Go to **Inventory management** > **Setup** > **Posting** > **Posting**.

   b. On the **Inventory** tab, verify that a ledger account is set up for both **Inventory issue** and **Inventory receipt** posting.



c. Verify that a ledger account is set up for **Inter-unit payable** posting.



d. Verify that a ledger account is set up for **Inter-unit receivable** posting.

Print tax information on transfer order documents

This article explains how to print tax information on transfer order documents. You can print the pro-forma invoice document of a transfer order for stock transfers that are considered intra-community supply and intra-community acquisitions under European Union (EU) value-added tax (VAT) regulations.

The following tax-relevant data is added to the transfer order documents:

- The names and the ship-from and ship-to addresses for the stock transfer
- The tax identification numbers of the supplier and the recipient
- The unit price and the taxable amount of the supplied goods
- The tax code, tax rate, tax amount, and tax directives

To configure this data, complete the following main steps.

1. Enable and set up the tax feature for transfer orders.

2. Create and set up multiple tax registration numbers for a legal entity.

3. Set up the exempt code, description, tax directives, and print code in tax codes. For this example, create and synchronize three tax codes in Microsoft Dynamics 365 Finance: **NL-Exempt**, **BE-RC-21**, and **BE-RC+21**.
   a. In Finance, go to **Tax** > **Setup** > **Sales tax** > **Sales tax exempt codes**.
   b. Select **Edit**, and enter a description for the **EC** exempt code. For example, enter **Tax-free EC shipments with tax registration number**.
   c. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.
   d. Select the **BE-RC-21** tax code, and then select **Tax directives**.
   e. Select **New**.
   f. In the **Language** field, select **EN-US**. Then, in the **Text** field, enter **Document laying down the transfer of goods in the sense of article 138. 2. c) of EU VAT Directive 2006/112/EC**.
   g. Close the page.
   h. On the **General** tab, in the **Print** field, select **Sales tax rate**.
   i. Select the **NL-Exempt** tax code, and then, on the **General** tab, in the **Print** field, select **Sales tax rate**.

> **Note**
>
> The tax code, tax rate, and tax-exempt description don't print on transfer order documents if you don't maintain an exempt code description or tax directives for the tax code.

Print the transfer order - shipment document

After you ship a transfer, follow these steps to print the transfer order - shipment document.

1. Go to **Inventory management** > **Inquiries and reports** > **Transfer orders** > **Shipment**.
2. On the **Parameters** tab, in the **Print** group, select **Tax information**.
3. On **Records to include** tab, select **Filter**, select the transfer order number, and then select **OK**.
4. Select **OK** to print the transfer order - shipment document.

Print the transfer order - receipt document

After you receive a transfer, follow these steps to print the transfer order - receipt document.

1. Go to **Inventory management** > **Inquiries and reports** > **Transfer orders** > **Receive**.
2. On the **Parameters** tab, in the **Print** group, select **Tax information**.
3. On the **Records to include** tab, select **Filter**, select the transfer order number, and then select **OK**.
4. Select **OK** to print the transfer order - receipt document.

Print the transfer overview document

Follow these steps to print the transfer overview document.

> **Note**
>
> Tax information is available only when the transfer order is shipped or received.

1. Go to **Inventory management** > **Inquiries and reports** > **Transfer orders** > **Transfer overview**.
2. On the **Parameters** tab, in the **Print** group, select **Tax information**.

3. On the **Records to include** tab, select **Filter**, select the transfer order number, and then select **OK**.
4. Select **OK** to print the transfer overview document.

Exchange rate type for sales tax

This article explains the logic for exchange rate type setup and calculation for sales tax.

As of Microsoft Dynamics 365 Finance version 10.0.35, the functionality for value-added tax (VAT) exchange rates is extended for more countries and regions. In addition, the following capabilities are enhanced:

- Support for direct recalculation from the transaction currency to the tax currency
- Support for amount adjustments in the tax currency

Prerequisites and setup

This functionality is available only for legal entities that enable the Tax Calculation feature for the selected business processes. For more information about Tax Calculation, its capabilities, and how to set it up, see Tax Calculation overview.

In addition, you must enable the following features in the **Feature management** workspace:

- **Date of VAT register** (For more information about this feature, see Tax point date (Date of VAT register).)
- **Enable exchange rate types for sales tax**

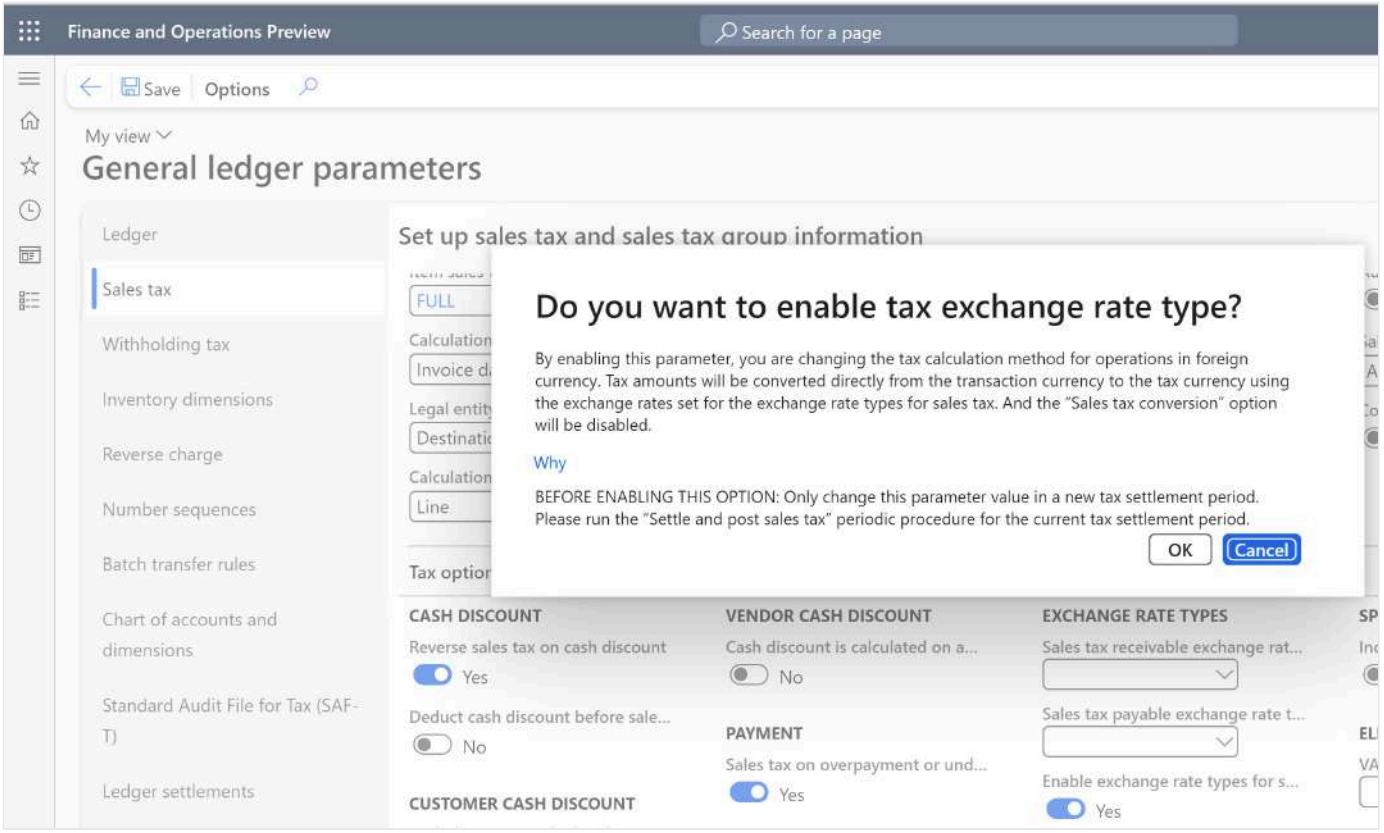
After you enable these features, you might have to refresh the page to update the user interface (UI).

> ⓘ **Note**
>
> If you didn't use the **Date of VAT register** functionality, follow the instructions in Sales tax transactions extension consistency check.

Next, on the **General ledger parameters** page, on the **Sales tax** tab, on the **Tax options** FastTab, set the **Enable exchange rate types for sales tax** option to **Yes**. Enable this parameter in a new tax settlement period. Be sure to run the **Settle and post sales tax** periodic procedure for the current tax settlement period.

When you enable the parameter, you receive the following message:

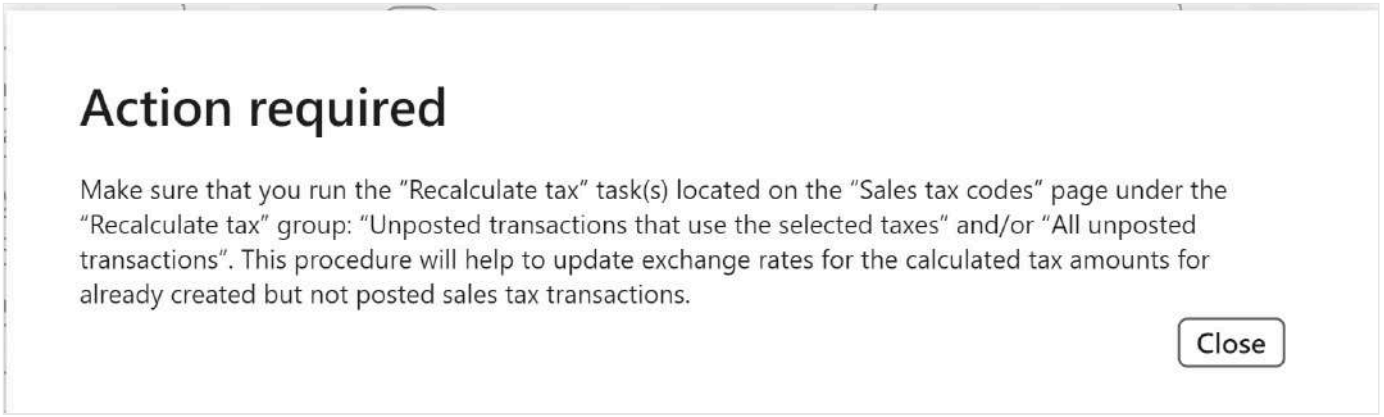
> By enabling this parameter, you change the tax calculation method for operations in foreign currency. Tax amounts are converted directly from the transaction currency to the tax currency by using the exchange rates set for the exchange rate types for sales tax. The **Sales tax conversion** option is disabled. This option controls how to convert tax amount from transaction currency to tax currency - via either Accounting currency or Reporting currency.



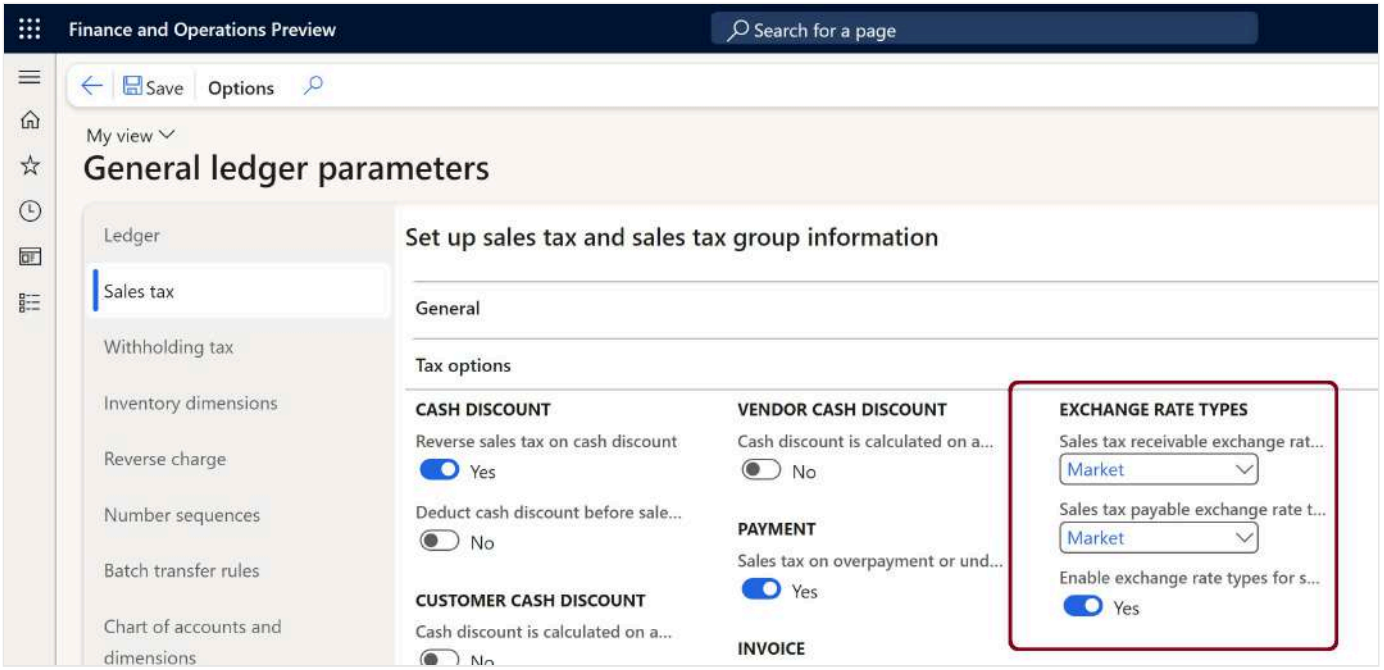
Another message prompts you to run the **Recalculate tax** tasks in the **Recalculate tax** group on the **Sales tax codes** page. Those tasks can include the following two tasks:

- Unposted transactions that use the selected taxes
- All unposted transactions

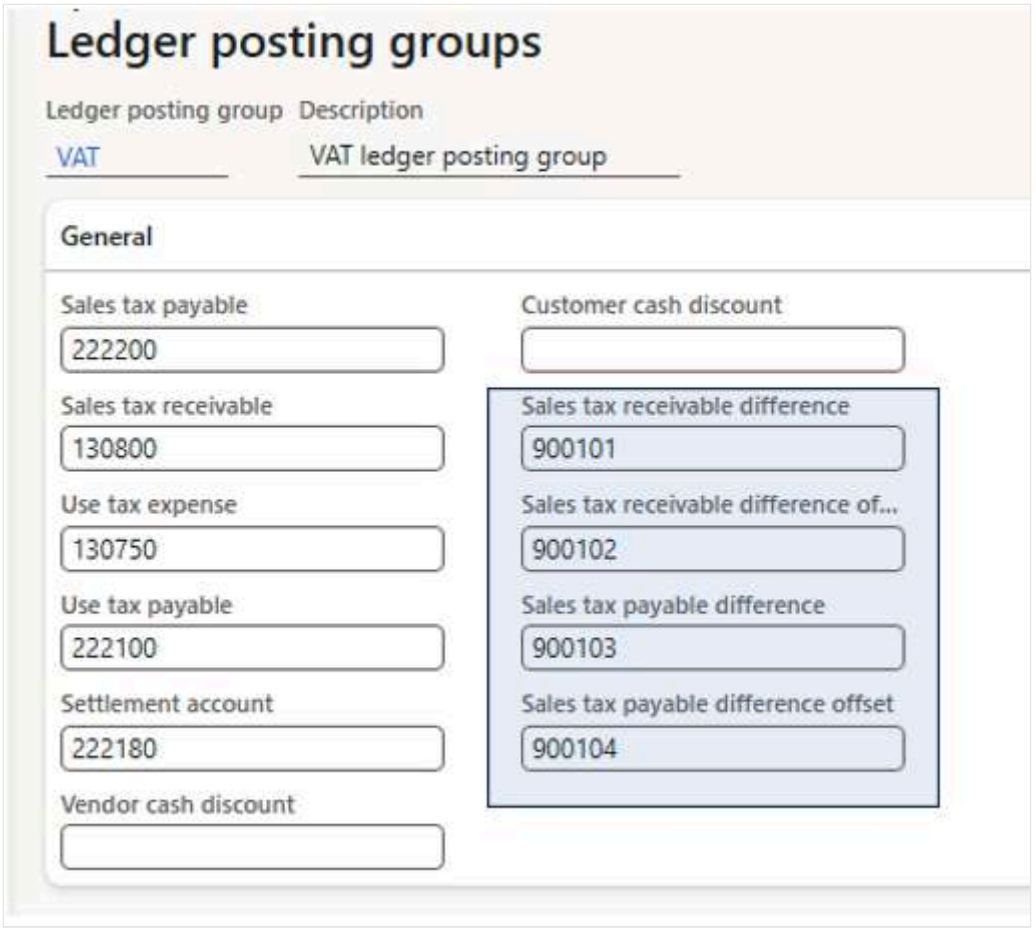
These tasks help you update exchange rates for the calculated tax amounts for sales tax transactions that you created but didn't post.



Next, on the **General ledger parameters** page, on the **Sales tax** tab, on the **Tax options** FastTab, in the **Sales tax receivable exchange rate type** and **Sales tax payable exchange rate type** fields, select the exchange rate types to use for purchase and sales operations. If you leave these fields blank, the exchange rates come from the exchange rate types that are set on the **Ledger** page.



Finally, on the **Ledger posting groups** page (**Tax** > **Setup** > **Sales tax** > **Ledger posting groups**), set up sales tax receivable and sales tax payable difference and difference offset accounts in the ledger posting groups.



Overview of the functionality

After you set up the functionality, you can post invoices that use foreign currency, and adjust the exchange rate and tax amounts on the **Sales tax transactions** page.

On the **Sales Tax transactions** page of the document you're processing, in the **Date of VAT register** field, select the date when the exchange rate for tax amount calculations should be applied. You can edit the **Sales tax exchange rate** and **Date of VAT register** fields.

You can also use the **Adjusted amount origin (VAT exchange rate)** or **Adjusted sales tax amount (VAT exchange rate)** field to enter actual VAT amounts in the local currency that's stated in an external document. When you review the accounting, you can view sales tax difference amounts on the **Subledger journal** page. This information is relevant to documents that follow the source document framework.

When you post a document, you can view any differences in sales tax amount for transactions that post to the general ledger accounts you configured. These differences happen because of the difference between the tax currency exchange rate and the accounting currency exchange rate for your organization. For the *Sales tax payable* sales tax direction, the tax difference posts with a *Sales tax payable difference* tax direction. For the *Sales tax receivable* sales tax direction, the

tax adjustment records with a *Sales tax receivable difference* tax direction. For use tax, the tax difference posts with a *Use tax* sales tax direction.

> **Note**
>
> After you post tax transactions, updating the **Date of VAT register** field on the **VAT register transactions** has no effect on the tax adjustment transaction posting.

Example

In this example, a legal entity issues a free text invoice in a foreign currency. The invoice amount is 1,100 US dollars (USD) and includes VAT at a rate of 10 percent. The VAT is calculated based on the special exchange rate.

Expand table

Currency	Currency code
Legal entity accounting currency	EUR
Legal entity reporting currency	USD
Tax code currency	PLN
Transaction currency	USD

Set up the following exchange rates for business accounting purposes on the **Ledger** page.

Expand table

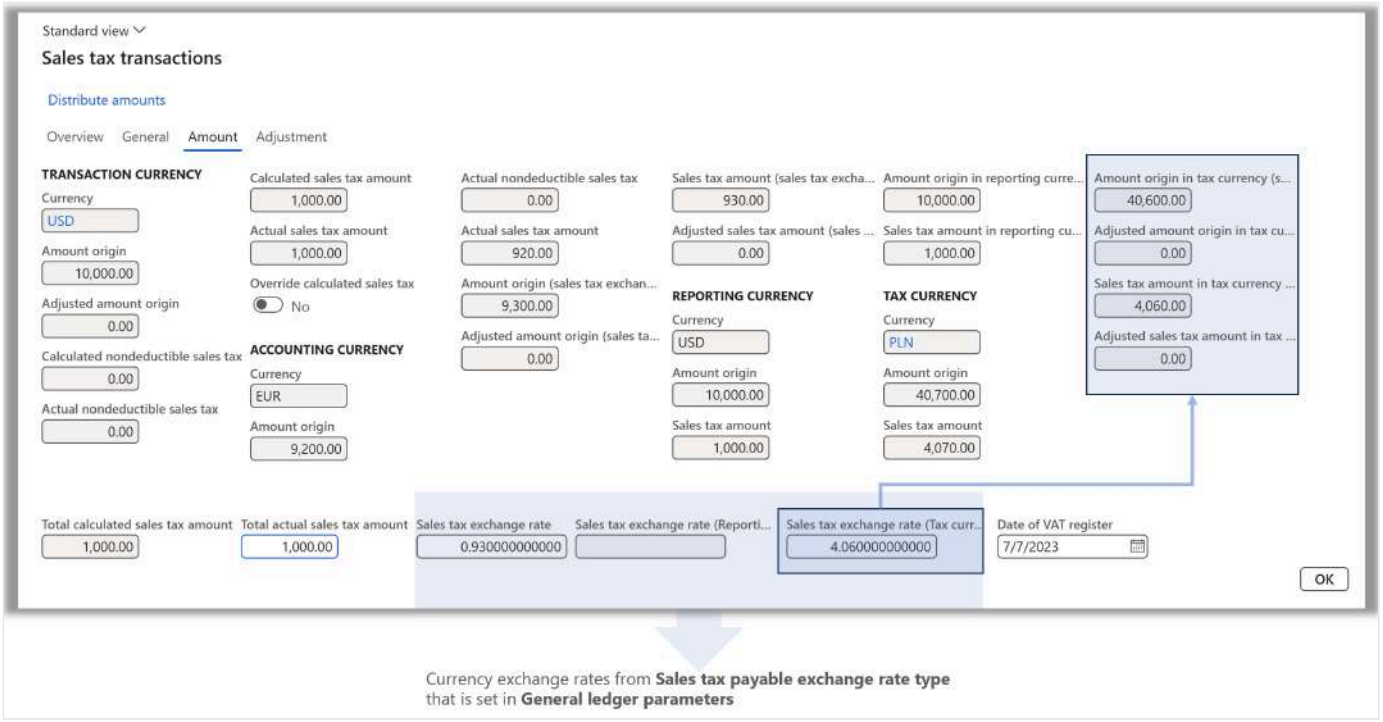
Currency code	Exchange rate
USD : EUR	1 : 0.92
EUR : PLN	1 : 4.44
USD : PLN	1 : 4.07

Set up the following exchange rates for tax calculation purposes on the **Sales tax** tab of the **General ledger parameters** page.

Expand table

Currency code	Exchange rate
USD : EUR	1 : 0.93
EUR : PLN	1 : 4.46
USD : PLN	1 : 4.06

On the **Sales tax transactions** page, on the **Amount** tab, review the calculated sales tax. Then, in the free text invoice, select **Sales tax**.



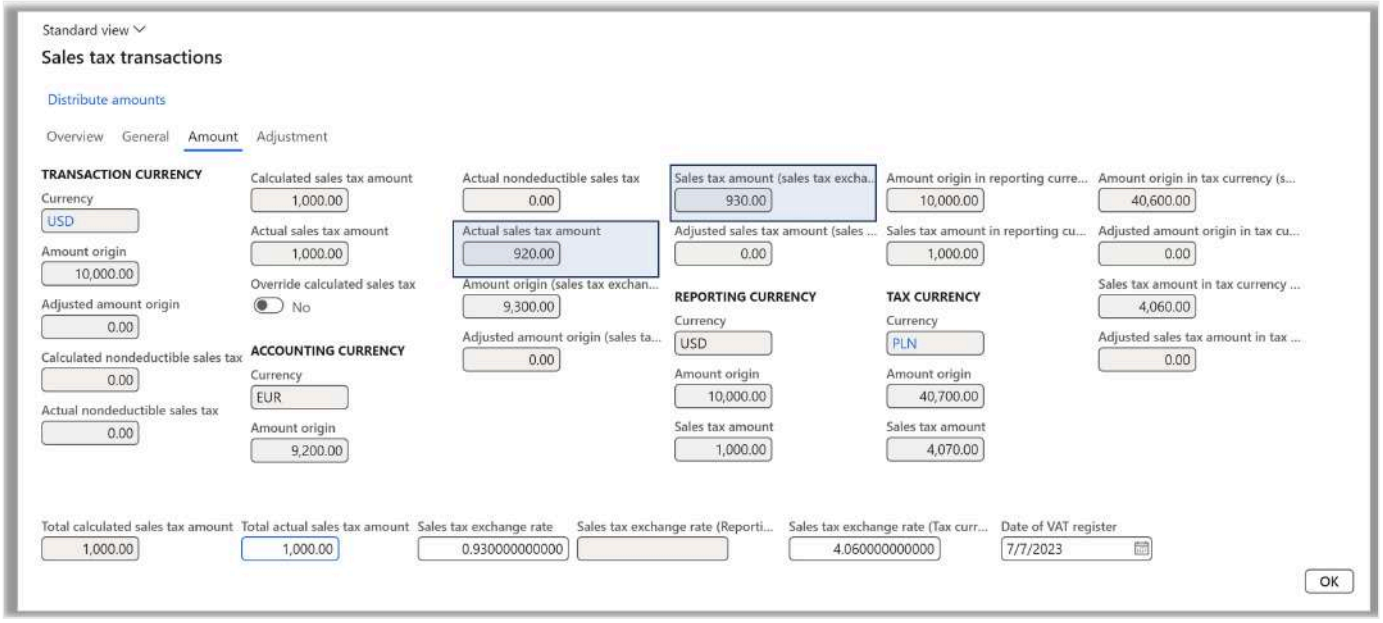
On the **Temporary sales tax transactions** page, you can review the exchange rates, amount origin, and tax amounts in the accounting currency, reporting currency, and tax currency. These amounts are shown for both exchange rate types: the one that's set on the **Ledger** page and the one that's set on the **General ledger parameters** page.

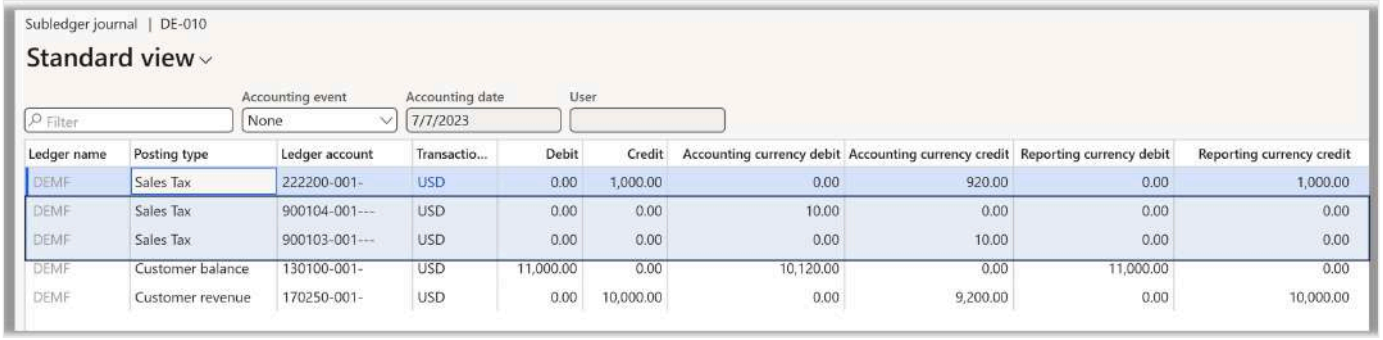
On the **Adjustment** tab, you can adjust tax amounts in the accounting currency and the tax currency.

> **Note**
>
> In this example, the reporting currency and transaction currency are the same (USD). Therefore, the exchange rate for the reporting currency isn't editable.

On the **Subledger journal** page, you can review amounts and accounts for the calculated sales tax difference. In this example, the exchange rate of the EUR-USD currency pair differs for the

accounting currency exchange rate type on the **Ledger** page and the sales tax payable exchange rate type on the **General ledger parameters** page.





After you post the document, review the posted sales tax transactions and voucher. The tax difference is posted with a *Sales tax payable difference* tax direction.

> **Note**
>
> For better user experience, add the following fields to the **Posted sales tax** page by using the *Insert columns* function and saving the *View*:
>
> - Base amount in accounting currency
> - Base amount in reporting currency
> - Base amount in tax currency
> - Sales tax amount in accounting currency
> - Sales tax amount in reporting currency
> - Sales tax amount in tax currency

Ledger account	Account name	Currency	Amount in transaction currency	Amount	Amount in reporting currency	Posting type
130100-001-	Accounts Receivable - Domestic	USD	11,000.00	10,120.00	11,000.00	Customer balance
170250-001-	Development	USD	-10,000.00	9,200.00	-10,000.00	Customer revenue
222200-001-	VAT Tax Payable	USD	-1,000.00	920.00	-1,000.00	Sales Tax
900103-001---	Sales tax payable difference	USD	0.00	10.00	0.00	Sales Tax
900104-001---	Sales tax payable difference offset	USD	0.00	10.00	0.00	Sales Tax

For this example, all the ledger accounts are different to demonstrate the postings.

To reflect the tax difference on the sales tax payable and sales tax receivable tax accounts, select the appropriate accounts in the **Sales tax payable difference** and **Sales tax receivable difference** fields.

> **Note**
>
> - If the tax currency differs from the accounting and reporting currencies, the sales tax transaction records the tax difference amounts in the tax currency.
> - In the voucher, the system records the tax difference in the accounting and reporting currencies on ledger accounts set in the sales tax code posting.

Tax integration overview

Tax integration is a framework that replaces the legacy tax calculation engine and, as required, calls the Tax Calculation service. This article introduces the basic flow of tax integration.

Entrance to tax integration

The `TaxIntegrationFacade` class contains most of the code and functions for tax integration. However, some additional code is required to enter the tax integration flow before `TaxIntegrationFacade`. This code is the entrance to tax integration. The entrance code constructs a document object, `TaxIntegrationDocumentObject`, which it passes to `TaxIntegrationFacade`. The entrance code also prepares some basic information that's used in the following integration actions.

TaxIntegrationFacade

The `TaxIntegrationFacade` class implements and controls the real flow of tax integration by calling several classes, such as `TaxIntegration***ActivityOnDocument`. The class passes a `TaxIntegrationDocumentObject` from activity to activity. These activities perform their actions on the object in turn.

The following list shows all document-level activities that have the suffix "OnDocument." There are also line-level activities that work on `TaxIntegrationLineObject`. Those activities have the suffix "OnLine."

- **TaxIntegrationSettingRetrievalActivityOnDocument** – This activity retrieves settings that affect tax calculation and saves them to the `TaxIntegrationDocumentObject` object.
- **TaxIntegrationDataRetrievalActivityOnDocument** – This activity prepares the metadata that's required by tax calculation and then copies it to the `TaxIntegrationDocumentObject` object.
- **TaxIntegrationCalculationActivityOnDocument** – This activity transforms the `TaxIntegrationDocumentObject` object to a request, sends the request to the Tax Calculation service, and then parses the response.
- **TaxIntegrationErrorHandlingActivityOnDocument** – This activity handles the error message that's returned from the Tax Calculation service.
- **TaxIntegrationTaxIdActivityOnDocument** – This activity processes logic that's related to the **Multiple VAT ID** feature.

- **TaxIntegrationListCodeActivityOnDocument** – This activity processes logic that's related to the **List Code** feature.
- **TaxIntegrationCurrencyExchangeActivityOnDocument** – This activity processes logic that's related to the **Currency Exchange rate/Rounding/Penny difference adjustment** feature.
- **TaxIntegrationDataPersistenceActivityOnDocument** – This activity persists the tax calculation result and other information that must be saved to the database, including the value-added tax (VAT) ID and list code.

Facade, sequence, and activities in tax integration

The **facade** controls the tax integration flow through a **sequence** that maintains a list of **activities**. This article introduces these three classes in tax integration.

Facade

X++

```
public final static class TaxIntegrationFacade
```

The facade (`TaxIntegrationFacade`) is the outermost interface of tax integration. It's a bridge to the Tax Calculation service.

The following example shows the most important method.

X++

```
[Replaceable]
public static void calculate(TaxIntegrationDocumentObject _document)
```

This method accepts a document (`TaxIntegrationDocumentObject`) as input, and it returns `void`.

The method modifies the document directly. The document also serves as the output.

> ⓘ **Note**
>
> The method is replaceable. In other words, it can be completely replaced (customized).

X++

```
TaxIntegrationSequence sequence = TaxIntegrationSequence::construct(LoggerName)

.appendActivityOnDocument(TaxIntegrationSettingRetrievalActivityOnDocument::construct(
))

.appendActivityOnDocument(TaxIntegrationDataRetrievalActivityOnDocument::construct())

.appendActivityOnDocument(TaxIntegrationCalculationActivityOnDocument::construct())
    // ...
```

```
.appendActivityOnDocument(TaxIntegrationDataPersistenceActivityOnDocument::construct()
);
sequence.act(_document);
if (!_document.isOK())
{
    throw _document.getException();
}
```

Inside the method, a sequence (`TaxIntegrationSequence`) is constructed and invoked. The method appends all activities to the sequence in order.

As required, the method explicitly throws an exception at the end.

Sequence

The sequence (`TaxIntegrationSquence`) is a special activity that maintains a sequence of activities. When you invoke its `act` method, it runs all activities in the order that you append them.

X++

```
public final class TaxIntegrationSequence
    extends TaxIntegrationAbstractActivity
{
    public final void act(TaxIntegrationDocumentObject _document);
    private void actInternal(TaxIntegrationDocumentObject _document);
}
```

To use a sequence (`TaxIntegrationSequence`), follow these steps:

1. Use the `construct` method to create the sequence.
2. Use the `appendActivitySequence`, `appendActivityOnDocument`, and `appendActivityOnLine` methods to build up the sequence.
3. Use the `act` method to play the sequence.

Internally, the sequence maintains an activity list (`List`). It then enumerates that list when you invoke `act`.

- The sequence calls the `shouldSkip` method of an activity to determine whether to skip the activity for the current document.
- For `TaxIntegrationSequence` and `TaxIntegrationAbstractActivityOnDocument`, if the activity isn't skipped, the sequence invokes the `act` method directly.

- For `TaxIntegrationAbstractActivityOnLine`, the sequence enumerates all `TaxIntegrationLineObject` objects in the document and invokes its `act` method. Charges are also implemented by the `TaxIntegrationLine` object. The sequence first invokes the `act` method on the charges of the document. Then, it invokes the `act` method on the lines of the document, together with the charges on each line. For example, there are two charges and two lines on a document. At the same time, there are two charges on each line. In this case, the complete sequence is as follows:

    1. The first charge of the document
    2. The second charge of the document
    3. The first line of the document
    4. The first charge of the first line
    5. The second charge of the first line
    6. The second line of the document
    7. The first charge of the second line
    8. The second charge of the second line

You can use `TaxIntegrationSequence` directly. It's a concrete class that has a public `act` method.

The following example shows the `actInternal` method for quick reference.

X++

```
private void actInternal(TaxIntegrationDocumentObject _document)
{
    var enumerator = list.getEnumerator();
    while (enumerator.moveNext())
    {
        anytype current = enumerator.current();
        if (current is TaxIntegrationSequence)
        {
            TaxIntegrationSequence sequence = current;
            sequence.act(_document);
            continue;
        }
        if (current is TaxIntegrationAbstractActivityOnDocument)
        {
            TaxIntegrationAbstractActivityOnDocument activity = current;
            if (!activity.shouldSkip(_document))
            {
                activity.act(_document);
            }
            continue;
        }
        if (current is TaxIntegrationAbstractActivityOnLine)
        {
            TaxIntegrationAbstractActivityOnLine activity = current;
```

```
            if (!activity.shouldSkip(_document))
            {
                SetEnumerator chargeEnumerator =
_document.getChargeSet().getEnumerator();
                while (chargeEnumerator.moveNext())
                {
                    TaxIntegrationLineObject charge = chargeEnumerator.current();
                    activity.act(charge);
                }
                SetEnumerator lineEnumerator = _document.getLineSet().getEnumerator();
                while (lineEnumerator.moveNext())
                {
                    TaxIntegrationLineObject line = lineEnumerator.current();
                    activity.act(line);
                    chargeEnumerator = line.getChargeSet().getEnumerator();
                    while (chargeEnumerator.moveNext())
                    {
                        TaxIntegrationLineObject charge = chargeEnumerator.current();
                        activity.act(charge);
                    }
                }
            }
            continue;
        }
    }
}
```

Activity

An activity does the real work in an integration flow. It acts as a segment in the integration flow. The name of an activity describes its purpose.

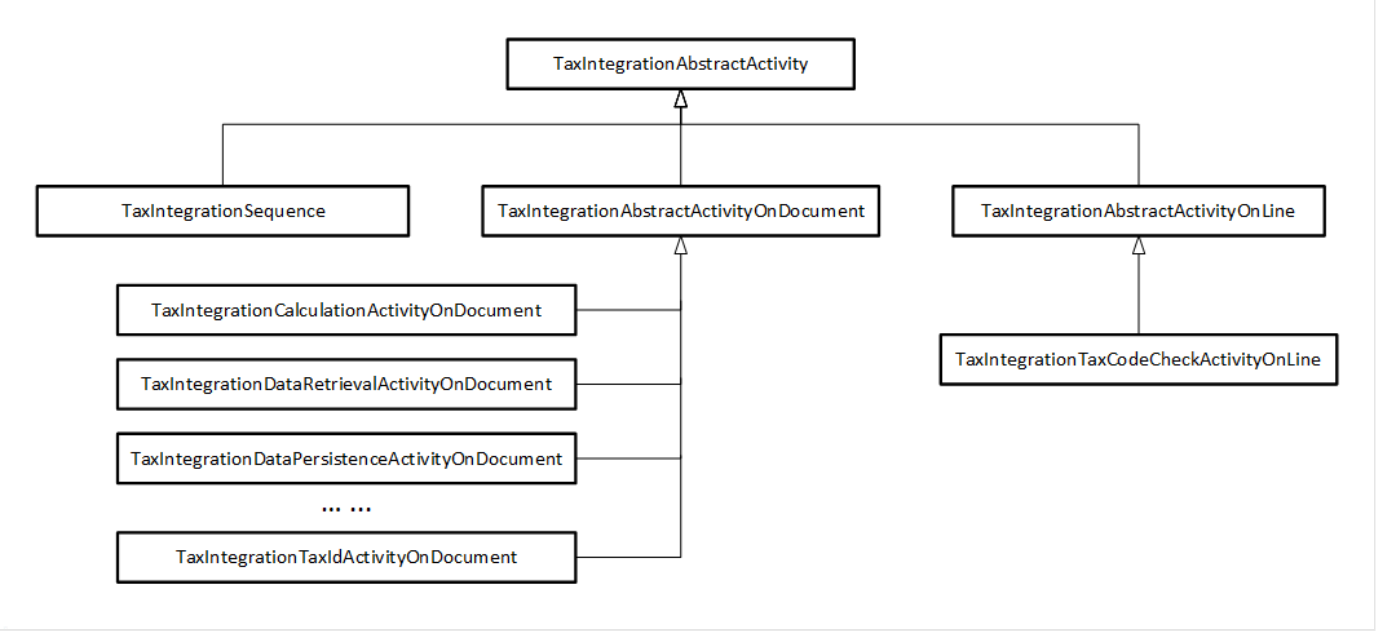
All activities inherit from the same class, `TaxIntegrationAbstractActivity`. There are three types of activities:

- `TaxIntegrationSequence`
- `TaxIntegrationAbstractActivityOnDocument`
- `TaxIntegrationAbstractActivityOnLine`

Each type of activity contains an `act` method and an `actInternal` method, but they accept different arguments. `TaxIntegrationAbstractActivityOnDocument` and `TaxIntegrationAbstractActivityOnLine` are abstract classes that are intended to be extended. They have an internal `act` method and an abstract `actInternal` method. Therefore, a new activity should extend one of these two abstract classes. The activity should implement its own `actInternal` method to hold the real logic of the activity. If the activity isn't applicable to all transactions and documents, it should implement its own `shouldSkip` method.

`TaxIntegrationSequence` is a concrete class that's intended to be used directly. It has a public `act` method.

All three types of activities log events during the `act` method as required after `TaxIntegrationLogLevelUtility` is checked. The logging context is inherited from `TaxIntegrationAbstractActivity`. The following illustration shows the hierarchy of activities.



For more information about how to add a new activity, see Add a new activity in tax integration.

Sequence

`TaxIntegrationSequence` is a special activity.

Document activity

The document activity acts on `TaxIntegrationDocumentObject` and extends `TaxIntegrationAbstractActivityOnDocument`.

X++

```
public abstract class TaxIntegrationAbstractActivityOnDocument
    extends TaxIntegrationAbstractActivity
{
    internal final void act(TaxIntegrationDocumentObject _document);
    protected abstract void actInternal(TaxIntegrationDocumentObject _document);
}
```

A new document activity should implement the `actInternal` method to hold the logic of this activity. The `actInternal` method accepts a `TaxIntegrationDocumentObject` object as input.

Therefore, unlike a line activity, it can manipulate data at the document level. However, a document activity can also act on `TaxIntegrationLineObject` by enumerating the `TaxIntegrationDocumentObject` object. Most document activities handle data at both the document level and the line level. If an activity isn't applicable to all transactions and documents, it should implement its own `shouldSkip` method.

Line activity

The line activity acts on `TaxIntegrationLineObject` and extends `TaxIntegrationAbstractActivityOnLine`.

X++

```
public abstract class TaxIntegrationAbstractActivityOnLine
    extends TaxIntegrationAbstractActivity
{
    internal final void act(TaxIntegrationLineObject _line);
    protected abstract void actInternal(TaxIntegrationLineObject _line);
}
```

A new line activity should implement the `actInternal` method to hold the logic for this activity. The `actInternal` method accepts a `TaxIntegrationLineObject` object as input and can manipulate data only on the given line object. However, because charges are also described as a `TaxIntegrationLineObject` object, the line activity also processes charges. If an activity isn't applicable to **all lines** in the document, it should implement its own `shouldSkip` method. The `shouldSkip` method accepts a `TaxIntegrationDocumentObject` object as input and indicates whether to skip the current activity for **all lines** (including charges) in the document.

Current activities

Here's the list of current activities, in the order of `TaxIntegrationFacade::calculate`:

1. TaxIntegrationSettingRetrievalActivityOnDocument
2. TaxIntegrationDataRetrievalActivityOnDocument
3. TaxIntegrationCalculationActivityOnDocument
4. TaxIntegrationErrorHandlingActivityOnDocument
5. TaxIntegrationTaxCodeCheckActivityOnLine
6. TaxIntegrationTaxIdActivityOnDocument
7. TaxIntegrationListCodeActivityOnDocument
8. TaxIntegrationCurrencyExchangeActivityOnDocument
9. TaxIntegrationDataPersistenceActivityOnDocument

Entrance code to tax integration

This article explains how to integrate a new transaction into tax integration. Before you start to use tax integration, you need some "entrance code" so that you can bypass the legacy tax engine and use the new logic instead. This article describes how to introduce this entrance code.

Find a code point

The first step is to find a code point for the entrance code. This code point should meet the following conditions:

- The code point should be before tax is calculated by the legacy tax engine, so that tax calculation can be bypassed. Additionally, the code point should bypass only tax calculation. No other processes should be bypassed.
- The code should be in a context that contains the basic transaction information that you can use to initialize a `TaxIntegrationDocumentObject` object. You can initialize the object in two ways:
  - From the transaction header table record itself
  - By using the table ID and record ID to distinguish the header table record of the transaction

Usually, if the transaction that you must integrate is already supported by the legacy tax engine, it has a specific derived class of the `TaxCalculation` class, such as `TaxSales` for sales orders or `TaxPurch` for purchase orders. This class is an ideal code point. Currently, all transactions such as purchase orders and sales orders use this approach. You can refer to `TaxPurch.calculateTax()` and `TaxSales.calc()`.

If the transaction isn't supported by the legacy tax engine, you should create the subclass of `Tax`. This article doesn't cover this scenario.

Implement the entrance of tax integration

This example uses the entry point code of the sales order, `TaxSales.xpp`.

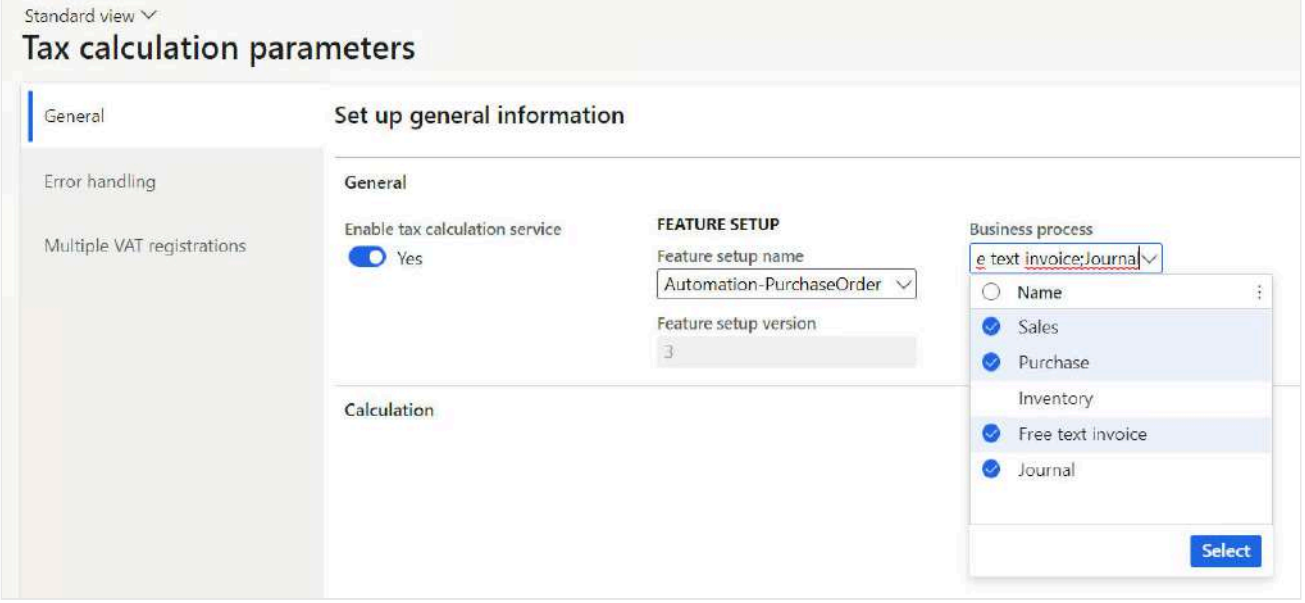
X++

```
TaxAmount calc()
{
```

```
    TaxAmount taxAmount;
    if
(Tax::isTaxIntegrationEnabledForBusinessProcess(TaxIntegrationBusinessProcess::Sales))
    {
        taxAmount = this.calcUsingTaxIntegration();
        return taxAmount;
    }
    boolean                 moreLines;
    TaxBaseCur              baseAmount;
    ...
}
```

- Use `Tax::isTaxIntegrationEnabledForBusinessProcess()` to check whether to use tax integration for a transaction. This line acts as a switch that you can use to enable tax integration for a transaction from the front end.

  You can control this switch by setting the **Business process** field in the **Feature setup** section of the **General** tab on the **Tax calculation parameters** page (**Tax** > **Setup** > **Tax configuration** > **Tax calculation**).



- `TaxIntegrationBusinessProcess` is an enumeration (enum) type that currently has five values: *Sales*, *Purchase*, *Inventory* (used for transfer orders), *Free text invoice*, and *Journal*. If your new transaction isn't covered by these five values, you can add a new business process enum value for it.

- All logic is wrapped in `this.calcUsingTaxIntegration()`.

The calcUsingTaxIntegration method

The `calcUsingTaxIntegration` method prepares a `TaxIntegrationDocumentObject` object and calls `TaxIntegrationFacade::calculate(document)`. The following example uses the purchase order.

X++

```
private TaxAmount calcUsingTaxIntegration()
{
    // code on lock
    ...
    TaxAmountCur taxAmount;
    try
    {
        TaxIntegrationDocumentObject document;
        document =
TaxIntegrationDocumentObject::constructWithRecord(purchCalcTax.getSource());
        this.setFieldsForLegacyTax();
        this.setFieldsForTaxIntegrationDocumentObject(document);
        TaxIntegrationFacade::calculate(document);
        amountInclTaxMap = document.getAmountIncludingTax();
        amountExclTaxMap = document.getAmountExcludingTax();
        ...
        taxAmount = this.finalizeCalculationForTaxIntegration(
            TaxParameters::isBankExchRateEnabled_W() &&
purchCalcTax.vendInvoiceInfoTable(),
            doIsolateTransactionScopeTrue);
    }
    // code on error handling
    ...
    return taxAmount;
}
```

This code completes the following steps.

1. Construct a `TaxIntegrationDocumentObject` object in one of two ways:
    - `TaxIntegrationDocumentObject::constructWithRecord(Common _record)` receives a transaction header table record as its parameter. This method is preferred because it avoids conflict when fields are updated in the transaction table in the data persistence activity.
    - `TaxIntegrationDocumentObject::construct(RefTableId _tableId, RefRecId _recId)` receives a table ID and a record ID as its parameters to distinguish the header table record of the transaction. However, because the header table record is reselected from the database, a conflict might occur.
2. Use the setter methods to set basic information for the `TaxIntegrationDocumentObject` object. In the preceding example, the code completes this step by calling the `this.setFieldsForTaxIntegrationDocumentObject(document)` method.
3. Call `TaxIntegrationFacade::calculate(document)` to trigger the real tax integration flow.
4. Get the `amountIncludingTax` map for compatibility with the existing tax adjustment function.

5. Call the `this.finalizeCalculationForTaxIntegration()` method to handle `TaxUncommitted`. This step is required only if the transaction is using `TaxUncommitted`.

6. Return the tax amount.

Set fields for the document object

The `this.setFieldsForTaxIntegrationDocumentObject()` method initializes basic data fields for a taxable document to use in later activities.

Retrieve most of the data fields in the data retrieval activity. However, set some of them here for the following reasons:

- The field is fundamental and is used before the data retrieval activity. Examples include `headingTableId` and `headingRecId`.
- The field can be accessed only in this context. For example, the tax object is set by `_document.setLegacyTax(this);`
- It's convenient to set some fields here because you can use local methods and methods in the subclass of `TradeCalcTax` to avoid duplicate code with the data retrieval class. Examples include the document date, invoice date, and delivery date.

Set the data fields according to the new transaction before you call the facade. Usually, you can retrieve data by using an object of `TradeCalcTax` in the context of the entrance point. For example, `SalesFormLetter` is an object of `SalesCalcTax_Sales` for sales orders, `purchCalcTax` for purchase orders, and `custInvoiceCalcTax` for free text invoices.

The following example is from `TaxPurch.xpp`.

X++

```
protected void setFieldsForTaxIntegrationDocumentObject(TaxIntegrationDocumentObject
_document)
{
    _document.setTransactionDate(this.taxDate);
    // This deliveryDateMarkup() is for header.
    _document.setDeliveryDate(salesFormLetter.deliveryDateMarkup());
    _document.setDocumentDate(salesFormLetter.documentDate());
    _document.setInvoiceDate(salesFormLetter.invoiceDate());
    _document.setTransactionCurrencyCode(salesFormLetter.currencyCode());
    _document.setCompany(this.getCompany());
    _document.setHeadingTableId(this.headingTableId());
    _document.setHeadingRecId(this.headingRecId());
    // this sign is used as sign in TmpTaxWorkTrans, 1 for purchase and -1 for sales.
    _document.setSign(-1);
    _document.setSource(TaxModuleType::Sales);
```

```
    _document.setBusinessProcess(TaxIntegrationBusinessProcess::Sales);
    _document.setPrepaid(this.isPrePayment());
    _document.setEUROTriangulation(this.getTriangulation());
    _document.setLegacyTax(this);
    _document.setShouldSkipDocumentCharge(skipTableMarkup);
    _document.setShouldSkipLineCharge(skipLineMarkup);
}
```

Implement tax integration activities

This article provides information about how to implement the required activities for a new transaction.

Activities are the classes that complete the job in tax integration. The process passes a document object, `TaxIntegrationDocumentObject`, from activity to activity. Each activity performs an action on the metadata in `TaxIntegrationDocumentObject`. All tax integration activities extend the `TaxIntegrationAbstractActivity` class. You can append them to a sequence and run them by using `TaxIntegrationFacade::calculate()` in the order you appended them.

To integrate a new transaction, you don't need to implement or modify all the activities. In most cases, two specific activities are enough: `TaxIntegrationDataRetrievalActivityOnDocument` and `TaxIntegrationDataPersistenceActivityOnDocument`. If you enable more features for the new transaction, see Uptake features of tax integration.

Data retrieval activity

The data retrieval activity (`TaxIntegrationDataPersistenceActivityOnDocument`) copies all the metadata that's required for tax calculation from a database to a `TaxIntegrationDocumentObject` object.

This activity constructs and then calls a transaction-specific subclass of the `TaxIntegrationAbstractDataRetrievalTemplate` class, according to the `HeadingTableId` value of the current processed transaction in the factory pattern. Next, the subclass queries all the transaction lines, charges, and other useful information from the database and saves it to the document object.

To begin the data retrieval activity, create and implement a new subclass of `TaxIntegrationAbstractDataRetrievalTemplate`. Give the subclass a name, such as `TaxIntegration***DataRetrieval`. The following list shows some of the data retrieval classes for the integrated transactions:

- AxClass/TaxIntegrationPurchTableDataRetrieval
- AxClass/TaxIntegrationPurchParmTableDataRetrieval
- AxClass/TaxIntegrationPurchREQTableDataRetrieval
- AxClass/TaxIntegrationPurchRFQTableDataRetrieval
- AxClass/TaxIntegrationVendInvoiceInfoTableDataRetrieval

- AxClass/TaxIntegrationSalesTableDataRetrieval
- AxClass/TaxIntegrationSalesParmDataRetrieval

The names consist of the prefix *TaxIntegration*, the header table name of the transaction, and then *DataRetrieval*. If you need to integrate the free text invoice transaction, implement a `TaxIntegrationCustInvoiceTableRetrieval` class.

Implementing the data retrieval class

This section introduces the implementation of the data retrieval class. It uses `TaxIntegrationPurchTableDataRetrieval` as an example to provide an outline of this class.

X++

```
[TaxIntegrationDataRetrieval(tableStr(PurchTable))]     // Attribute for
TaxIntegrationDataRetrievalActivityOnDocument to call this class
public class TaxIntegrationPurchTableDataRetrieval extends
TaxIntegrationAbstractDataRetrievalTemplate
{
    protected PurchTable purchTable;        // Header table buffer
    protected PurchLine purchLine;          // Line table buffer
    // Query builder methods, for the SQL query for framework to execute
    [Replaceable]
    protected SysDaQueryObject getDocumentQueryObject()
    [Replaceable]
    protected SysDaQueryObject getLineQueryObject()
    [Replaceable]
    protected SysDaQueryObject getDocumentChargeQueryObject()
    [Replaceable]
    protected SysDaQueryObject getLineChargeQueryObject()
    // Construct a TaxIntegrationLineObject
    protected TaxIntegrationLineObject constructLine()
    // Data retrieval methods, copy the metadata from table buffer to Document object.
    protected void copyToDocument()
    protected void copyToDocumentFromHeaderTable()
    protected void copyToLine(TaxIntegrationLineObject _line)
    protected void copyToLineFromLineTable(TaxIntegrationLineObject _line)
    ...
}
```

Declaration

The following example is from `TaxIntegrationPurchTableDataRetrieval.xpp`.

X++

```
/// <summary>
/// The <c>TaxIntegrationPurchTableDataRetrieval</c> class retrieves data from
```

```
<c>PurchTable</c>, etc.
/// </summary>
[TaxIntegrationDataRetrieval(tableStr(PurchTable))]
public class TaxIntegrationPurchTableDataRetrieval
    extends TaxIntegrationAbstractDataRetrievalTemplate
{
    // ...
```

Declare the class with the `[TaxIntegrationDataRetrieval(tableStr(PurchTable))]` attribute. `TaxIntegrationDataRetrievalActivityOnDocument` uses this attribute to construct and call the class by using the factory pattern. Use the transaction header table as the table name. The table ID must match the `HeadingTableId` value that you initialize in the `TaxIntegrationDocumentObject` object.

Refer to the `actStatic` method of `TaxIntegrationDataRetrievalActivityOnDocument.xpp`, which is shown here.

X++

```
protected static void actStatic(TaxIntegrationDocumentObject _document)
{
    // ...
    TaxIntegrationAbstractDataRetrievalTemplate dataRetrievalInstance =
SysExtensionAppClassFactory::getClassFromSysAttributeWithInstantiationStrategy(
        classStr(TaxIntegrationAbstractDataRetrievalTemplate),
        new
TaxIntegrationDataRetrievalAttribute(tableId2Name(_document.getLocalTableId())),
        new SysExtensionGenericInstantiation(_document));
    /// ...
    dataRetrievalInstance.execute();
}
```

Declare at least two tables for each transaction. For this transaction, declare the header table and line table. (For example, for purchase orders, use the `PurchTable` and `PurchLine` tables.) If you use fields from other tables as input for the calculation, declare them here.

X++

```
[TaxIntegrationDataRetrieval(tableStr(PurchTable))]
public class TaxIntegrationPurchTableDataRetrieval
    extends TaxIntegrationAbstractDataRetrievalTemplate
{
    protected PurchTable purchTable;
    protected PurchLine purchLine;
    protected TransportationDocument transportationDocument;    // Other tables
through join relationship
```

```
    protected VendTable vendTable;
    private LedgerDimensionDefaultAccount ledgerAccount;
```

Create a query object

Tax integration queries use the `SysDaQuery` method. After you implement several `get***QueryObject()` methods, the tax integration framework calls those methods, retrieves the data from the database, and assigns it to the table buffer that you declared earlier.

Format four query objects so that you can perform the following queries:

- Query the header level tables by using the `HeadingTableId` and `HeadingRecId` values in `TaxIntegrationDocumentObject`. The header-level tables refer to tables that are related to the transaction header table (for example, `PurchTable` for purchase orders). If you construct the document object with a record by using `TaxIntegrationDocumentObject::constructWithRecord(Common _record)`, assign the header table to the buffer by using `this.document.getLocalRecord()` directly. You don't need to query the header table again.
- Query the line table by using the relationship between the header table and the line table, after you provide the header table buffer.
- Query the header charge (`MarkupTrans`).
- Query the line charge (`MarkupTrans`).

The following example is from `TaxIntegrationPurchTableDataRetrieval.xpp`.

X++

```
/// <summary>
/// Gets the query for the document.
/// </summary>
/// <returns>The query for the document.</returns>
[Replaceable]
protected SysDaQueryObject getDocumentQueryObject()
{
    this.purchTable = this.document.getLocalRecord();
    SysDaQueryObjectBuilder queryObjectBuilder =
SysDaQueryObjectBuilder::from(this.vendTable)
        .where(this.vendTable, fieldStr(VendTable, AccountNum))
            .isEqualTo(this.purchTable, fieldStr(PurchTable, OrderAccount))
        .outerJoin(this.transportationDocument) // primary key
            .where(this.transportationDocument, fieldStr(TransportationDocument,
RecId))
                .isEqualTo(this.purchTable, fieldStr(PurchTable,
TransportationDocument));
        .outerJoin(this.vendTableInvoice) // alternate key
            .where(this.vendTableInvoice, fieldStr(VendTable, AccountNum))
```

```
                .isEqualTo(this.purchTable, fieldStr(PurchTable, InvoiceAccount));
    return queryObjectBuilder.toSysDaQueryObject();
}
/// <summary>
/// Gets the query for the lines of the document.
/// </summary>
/// <returns>The query for the lines of the document</returns>
[Replaceable]
protected SysDaQueryObject getLineQueryObject()
{
    return SysDaQueryObjectBuilder::from(this.purchLine)
        .where(this.purchLine, fieldStr(PurchLine, PurchId))
            .isEqualToLiteral(this.purchTable.PurchId)
        .toSysDaQueryObject();
}
/// <summary>
/// Gets the query for the charges of the document.
/// </summary>
/// <returns>The query for the charges of the document</returns>
[Replaceable]
protected SysDaQueryObject getDocumentChargeQueryObject()
{
    return SysDaQueryObjectBuilder::from(this.markupTransOfDocument)
        .where(this.markupTransOfDocument, fieldStr(MarkupTrans, TransTableId))
            .isEqualToLiteral(this.purchTable.TableId)
        .where(this.markupTransOfDocument, fieldStr(MarkupTrans, TransRecId))
            .isEqualToLiteral(this.purchTable.RecId)
        .toSysDaQueryObject();
}
/// <summary>
/// Gets the query for the charges of each line.
/// </summary>
/// <returns>The query for the charges of each line.</returns>
[Replaceable]
protected SysDaQueryObject getLineChargeQueryObject()
{
    return SysDaQueryObjectBuilder::from(this.markupTransOfLine)
        .where(this.markupTransOfLine, fieldStr(MarkupTrans, TransTableId))
            .isEqualToLiteral(this.purchLine.TableId)
        .where(this.markupTransOfLine, fieldStr(MarkupTrans, TransRecId))
            .isEqualToLiteral(this.purchLine.RecId)
        .toSysDaQueryObject();
}
```

ⓘ Note

If you require fields from other tables, join them in the query object. In the preceding example, this approach is used for `transportationDocument` in the `getDocumentQueryObject()` method.

Construct the line object

```
X++
```

```
/// <summary>
/// Constructs a line of the document.
/// </summary>
/// <returns>The constructed line of the document.</returns>
protected TaxIntegrationLineObject constructLine()
{
    return TaxIntegrationLineObject::constructOnDocument(
        this.purchLine.TableId,
        this.purchLine.RecId,
        this.document);
}
```

Construct a `TaxIntegrationLineObject` object by using the line's table ID and record ID. The framework calls this method. Replace the table buffer for the new transaction.

Copy methods

Implement several methods that begin with *copy* to copy metadata from the table buffer to the document object. For more information, see Retrieve data from the database. Because you create new classes, you can disregard the information about extensions.

When you implement the methods, determine which fields are required for the Tax Calculation service, and copy only the required fields. For information about how to add new fields, see Add the data variable in the object class. For information about how to add them to the request, see Add data to the request.

Data persistence activity

When you run the data persistence activity (`TaxIntegrationDataPersistenceActivityOnDocument`), it calls the Tax Calculation service. It processes the response and saves it to `TaxIntegrationDocumentObject`. The data persistence activity updates the necessary metadata in the database, including tax calculation results, tax group, tax item group, VAT ID, and list code.

Like the data retrieval class, `TaxIntegrationDataPersistenceActivityOnDocument` builds and calls the data persistence class based on the `HeadingTableId` value of the current transaction. Your job is to implement a `TaxIntegration***DataPersistence` class. For example, you implement the `TaxIntegrationCustInvoiceTableDataPersistence` class for free text invoices.

However, unlike the data retrieval activity, `TaxIntegrationDataPersistenceActivityOnDocument` handles most of the persistence work, including the tax calculation result. This part is managed

by standard code, so no extra work is needed when you integrate a new transaction.

The new persistence class saves transaction-specific fields, such as the tax group, tax item group, VAT ID, number sequence group, and list code, to the database.

The following example shows the basic structure of `TaxIntegrationPurchTableDataPersistence`.

X++

```
/// <summary>
/// The <c>TaxIntegrationPurchTableDataPersistence</c> class persists data to
<c>PurchTable</c>, etc.
/// </summary>
[TaxIntegrationDataPersistence(tableStr(PurchTable))] // Attribute for
TaxIntegrationDataPersistenceActivityOnDocument to call
public class TaxIntegrationPurchTableDataPersistence
    extends TaxIntegrationAbstractDataPersistenceTemplate
{
    // Table buffer to be updated
    protected PurchTable purchTable;
    protected PurchLine purchLine;
    // Query builder methods
    [Replaceable]
    protected SysDaQueryObject getDocumentQueryObject()
    [Replaceable]
    protected SysDaQueryObject getLineQueryObject()
    [Replaceable]
    protected SysDaQueryObject getDocumentChargeQueryObject()
    [Replaceable]
    protected SysDaQueryObject getLineChargeQueryObject()
    // Get line object
    protected TaxIntegrationLineObject getLine()
    // Save to database
    protected boolean saveDocument()
    protected boolean saveLine(TaxIntegrationLineObject _line)
    ...
}
```

As the preceding example shows, the structure of the data persistence class resembles the structure of the data retrieval class. The only difference is that the data retrieval class copies data from the *database* to the *document object*, whereas the data persistence class copies data from the *document object* to the *database*. Here's a brief introduction to the implementation. Not all code examples are included.

- `[TaxIntegrationDataPersistence(tableStr(PurchTable))]` is an attribute for `TaxIntegrationDataPersistenceActivityOnDocument` to construct in the factory pattern.
- `QueryObject` is almost the same as for data retrieval, except for two points:

    - `.forUpdate()` is called for the persistence class to update data to the database.
    - The `Less` table is used because it must be updated.

- The `getLine()` method resembles the `constructLine()` method in the data retrieval class. However, it's enough to replace the table name with the new transaction table.

- Methods that begin with *save* are the main job in this class. For more information, see the next section.

Save methods

The following example is from `TaxIntegrationPurchTableDataPersistence`.

X++

```
/// <summary>
/// Saves the document.
/// </summary>
/// <returns>Always true.</returns>
protected boolean saveDocument()
{
    TaxIntegrationTaxIdUtility::saveTaxIDFromDocumentToTable(document, purchTable);
    TaxIntegrationListCodeUtility::saveListCodeFromDocumentToTable(document,
purchTable);
    this.saveNumberSequenceGroupToTable();
    return true;
}
/// <summary>
/// Saves the current line of the document.
/// </summary>
/// <param name = "_line">The current line of the document.</param>
/// <returns>true if the operation is successful; otherwise, false.</returns>
protected boolean saveLine(TaxIntegrationLineObject _line)
{
    if (!_line.isTaxable())
    {
        return true;
    }
    TaxGroup taxGroup = _line.getTaxGroup();
    TaxItemGroup taxItemGroup = _line.getTaxItemGroup();
    this.checkGroup(taxGroup, taxItemGroup);
    purchLine.TaxGroup = taxGroup;
    purchLine.TaxItemGroup = taxItemGroup;
    purchLine.doUpdate();
    return true;
}
```

The `saveDocument()` method updates fields in the header table, whereas the `saveLine()` method updates fields in the transaction line table.

Currently, the VAT ID, number sequence group, and list code are updated in the header table. In the `saveLine()` method, you must update the tax group and item tax group that the Tax Calculation service returns. This requirement applies to most transactions.

> **Note**
>
> To help avoid extra logic, use `doUpdate()` instead of `update()`.

Last updated on 03/21/2026

Uptake features and functions

This article introduces the features and functions you need to implement to integrate a new transaction.

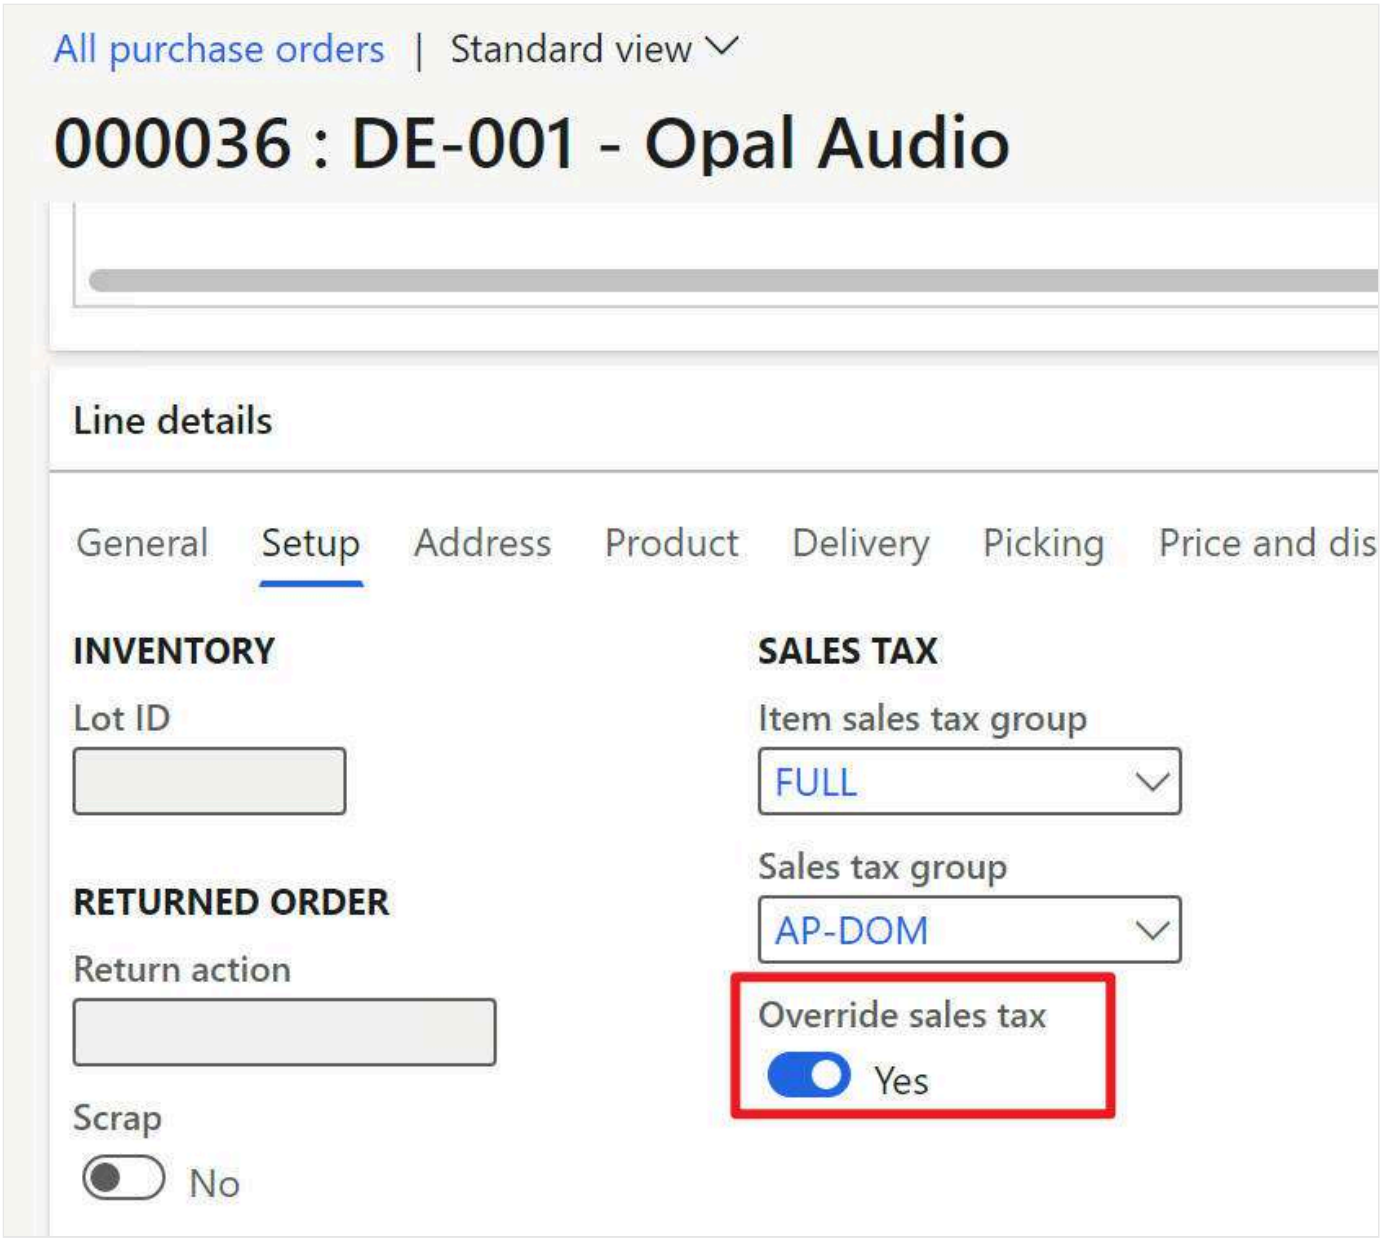
Tax integration supports the following features and functionalities:

- Override sales tax
- Multiple VAT ID
- List code
- Cash discount

Override sales tax

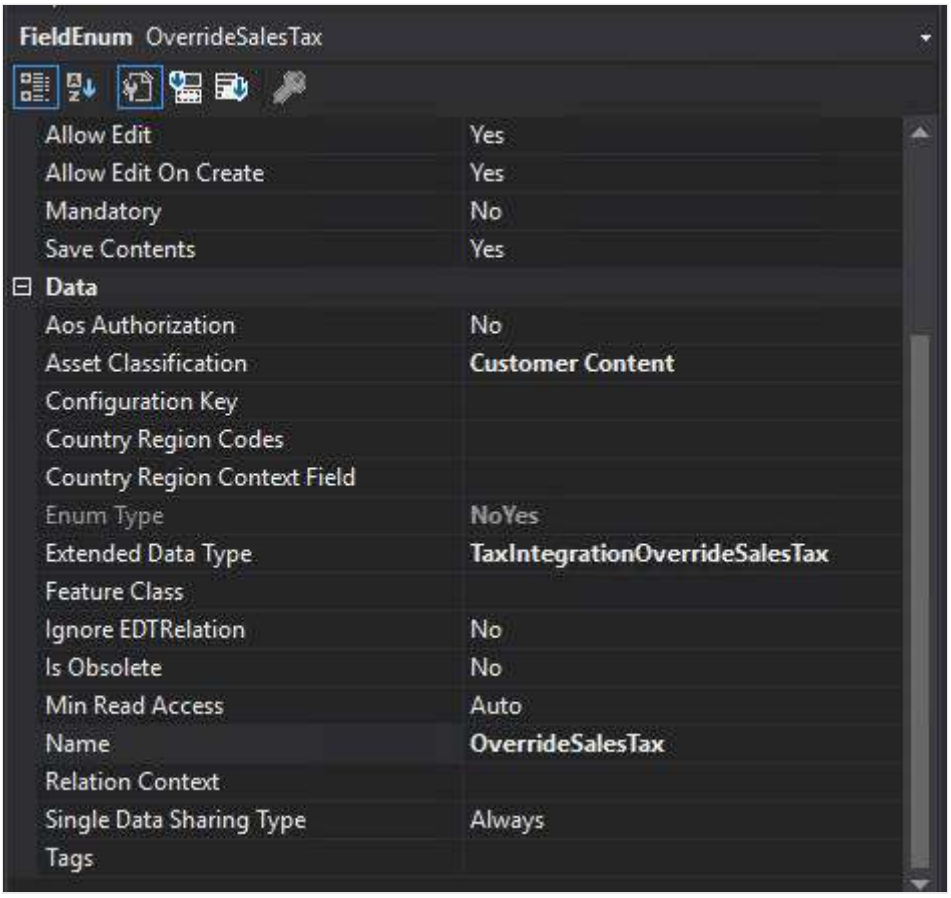
In tax integration, you can't edit the tax group and item tax group on a line, because the Tax Calculation engine determines taxes. By using the **Override sales tax group** functionality, you can change the tax group or item tax group on a line for calculating sales tax. This calculation overrides the tax groups that the Tax Calculation engine determines.

When you set the **Override sales tax** option to **Yes**, you can select a specific tax group and item tax group for tax calculation.



Follow these steps to enable the functionality.

1. Add the **Override sales tax** field to the transaction line table schema and to the **Sales tax** section, if it exists.



2. Set the default visibility to **false** on related transaction forms.

3. Map the **Override sales tax** field to the `SalesPurchJournalLine` map. This map is widely used in tax integration. If you don't map it, you might need extra code to realize the expected function.

4. Set the visibility and editability on the transaction form:

    - Set the default visibility to **false** on the transaction form data source.
    - Set the default visibility to **true** only if you enable tax integration for this transaction.

      X++

      ```
      if (isTaxIntegrationEnabledForPurchase) // Condition should be modified
      according to the business process
      {
          PurchTable_ds.object(fieldNum(PurchTable,
      OverrideSalesTax)).visible(true);
          PurchLine_ds.object(fieldNum(PurchLine,
      OverrideSalesTax)).visible(true);
      }
      ```

    - Add an `allowEdit` control to the transaction form to control the editability of the tax group and item tax group. Usually, add this control in three places:

- The `init()` method of the form
- The `active` method of line
- The `modified()` method of the **Override sales tax** field

```
X++
```

```
if (isTaxIntegrationEnabledForPurchase) // Condition should be modified
according to the business process
{
    PurchLine_ds.object(fieldNum(PurchLine,
TaxGroup)).allowEdit(purchLine.OverrideSalesTax == NoYes::Yes);
    PurchLine_ds.object(fieldNum(PurchLine,
TaxItemGroup)).allowEdit(purchLine.OverrideSalesTax == NoYes::Yes);
}
```

5. Set the value of the override sales tax in the data retrieval activity.

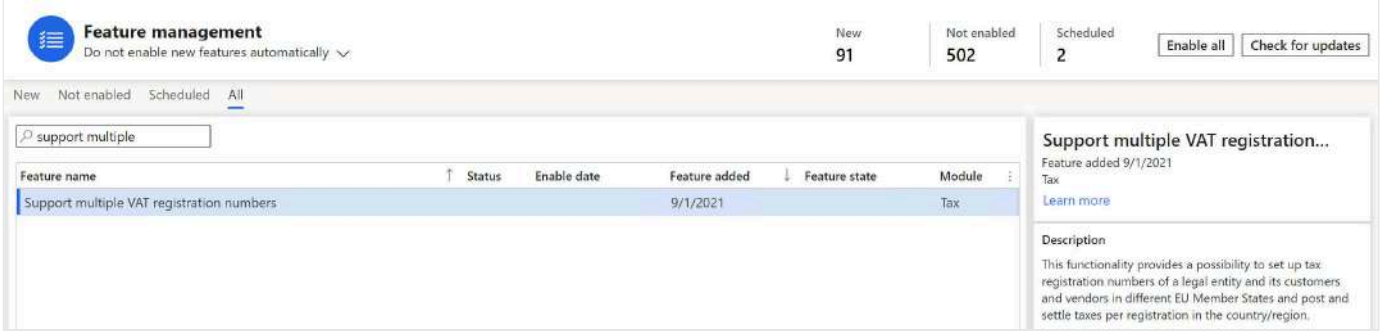
   `line.setOverrideSalesTax(this.vendInvoiceInfoLine.OverrideSalesTax);`

6. To keep the design consistent, the new charge enters the default override sales tax from its origin. Modify `MarkupTrans::getOverrideSalesTaxFromParentRecord(MarkupTransRefTableId _tableId, MarkupTransRefRecId _refRecId)` for new transaction support.

7. (Optional) Modify related entities to support the import and export of override sales tax.

Multiple VAT ID

The **Multiple VAT ID** feature enables the value-added tax (VAT) ID to be determined from the Tax Calculation engine. The **Support multiple VAT registration numbers** feature controls this feature. For more information, see Multiple VAT registration numbers.



You must enter and save two registration numbers in this feature: the registration number for the tax authority of the current legal entity and the registration number for the counterparty. If a transaction doesn't have a customer or vendor as a counterparty, the counterparty registration number doesn't work for it.

> **Note**
>
> There's only one legal entity registration number and one counterparty registration number for all lines in a transaction. Most of the code for this feature is in `TaxIntegrationTaxIdActivityOnDocument.xpp`.

Database schema

The **TaxId** and **PartyTaxId** data fields are used for the record IDs of registration numbers. Developers add these two fields to the following related tables to store the registration numbers of a transaction:

- TmpTaxWorkTrans
- TaxUncommitted
- TaxTrans
- CustPackingslipJour
- CustInvoiceJour
- VendPackingSlipJour
- VendInvoiceJour

The first three tables in the preceding list (tax-related tables) are line-level tables. The last four tables are header-level tables, because one transaction should have the same registration number.

Registration number for the legal entity

When you enable the **Support multiple VAT registration numbers** feature, you also enable the legal entity registration number. You don't need to enter anything here for a new transaction. If the system determines the tax code, it fills in the legal entity registration number with the registration number that's assigned to the settlement period of that tax code. The system determines this number at `TaxIntegrationTaxIdActivityOnDocument::populateTaxLineTaxId()` and saves it to the database together with the tax result.

The system also includes validation logic for the legal entity registration number in case it determines different registration numbers for different lines in a transaction. The system performs this validation at `TaxIntegrationTaxIdActivityOnDocument::checkTaxIdConsistency()`.

Counterparty registration number

The Tax Calculation engine determines the counterparty registration number. After the system receives the response, it validates the number and saves it to the database together with the legal entity registration number. However, if the Tax Calculation engine determines a number that isn't in the user's master data, the system writes the default value on the transaction header to the database instead of the returned value. The counterparty registration number doesn't apply to all transactions. However, the system includes extra logic to handle this approach.

Default logic

The system applies default logic from customer and vendor master data to the transaction header. You can set the **Tax-exempt number** value at the customer and vendor master data levels. When you create a new transaction, the system enters the default tax-exempt number on it. However, you can select a new number to override the default number. If the number that the tax engine returns isn't valid, the system uses the number on the header before tax calculation as the default number.

The tax-exempt number is a string field (**VATNum**) instead of a record ID, and it has two data sources. One data source is from the tax registration number, and the other is from the tax-exempt number. Tax integration supports only the tax registration number as its source. You should add two new fields, **VATNumRecId** and **VATNumTableType**, to the appropriate tables to distinguish the record.

When you add a new transaction, decide whether to add the **VATNum**, **VATNumRecId**, and **VATNumTableType** fields to the transaction header table. If you add these fields, also add the table to `TaxExemptVATNumMap`. The record ID and table type are then automatically saved to the header table when users select a number in the user interface (UI).

A developer must identify the default logic and call `copyPrimaryRegistrationNumberToVATMap` to copy the two fields to the newly created transaction header table. Use the following default code from `CustTable` to `SalesTable` as an example in `SalesTable.xpp`.

X++

```
private void initRegistrationNumbers(CustTable _custTable)
{
    this.vatNum =
_custTable.getPrimaryRegistrationNumber(TaxRegistrationTypesList::TAXID);
    _custTable.copyPrimaryRegistrationNumberToVATMap(this);     // This line is to
copy the new fields.
    this.EnterpriseNumber =
_custTable.getPrimaryRegistrationNumber(TaxRegistrationTypesList::UID);
}
```

Switch function

1. Modify the switch function to support the new transaction during journalization:

   `TaxIntegrationUtils::isMultipleTaxIdEnabledForJournalV3(RefTableId _journalHeaderTableId, RefRecId _journalHeaderRecId, Tax _tax = null)`

2. If there's no counterparty, or if the counterparty registration number doesn't apply to the new transaction, skip the counterparty logic at `TaxIntegrationTaxIdActivityOnDocument::shouldSetPartyTaxId()`.

   X++

```
protected static boolean shouldSetPartyTaxId(TaxIntegrationDocumentObject
_document)
{
    // Sales quotation for a prospect customer doesn't apply to the counterparty
VAT ID
    if (_document.getHeadingTableId() == tableNum(SalesQuotationTable) &&
_document.getCustVendAccount() == '')
        return false;
    // Currently for purchase order and sales order, the party tax ID is set only
if returned by the tax engine.
    // For Transfer Order, its party tax ID isn't determined by the tax engine
and must be set for the first calculation round.
    return _document.isPartyTaxIdReturned()
        || ((_document.getBusinessProcess() ==
TaxIntegrationBusinessProcess::Inventory)
            && !(TaxInventTransferCalcTaxContext::current() &&
TaxInventTransferCalcTaxContext::current().parmShouldSkipSetPartyTaxId()))
        // If a default exists, always go through the tax ID process.
        || _document.getPartyTaxIdRecIdDefault();
}
```

Number sequence group

The number sequence group is part of the **Multiple VAT ID** feature. When you update the VAT ID on the transaction header, update the corresponding number sequence group. However, this update doesn't apply to all transactions. If you need to integrate the number sequence group into the new transaction, use the following example in the data persistence activity.

X++

```
private void saveNumberSequenceGroupToTable()
{
    NumberSequenceGroupId numberSequenceGroupId = document.getNumberSequenceGroupId();
    if (numberSequenceGroupId && custInvoiceTable.numberSequenceGroup !=
```

```
numberSequenceGroupId)
    {
        ttsbegin;
        custInvoiceTable.numberSequenceGroup = document.getNumberSequenceGroupId();
        custInvoiceTable.doUpdate();
        ttscommit;
    }
}
```

The tax ID activity determines this value for all transactions. Add and call the logic in the data persistence activity to persist the number sequence group.

List code

The tax engine determines the list code, which resembles the counterparty VAT ID, and persists it in the database. Always enable the list code feature if you configure the list code applicability matrix in Tax calculation feature.

Data retrieval

Retrieve the default list code to `TaxIntegrationDocument`. Add a line in the `copyToDocumentFromHeaderTable` method of the newly created data retrieval class.

X++

```
protected void copyToDocumentFromHeaderTable()
{
    super();
    ...
    document.setListCode(this.purchTable.ListCode);
    ...
}
```

Map list code to map

The data persistence class uses a `SalesPurchJournalTable` map to reduce duplicate code. Map the list code from the header table to the map.

X++

```
<AxTableMapping>
<MappingTable>SalesPurchJournalTable</MappingTable>
    <Connections>
        ...
        <AxTableMappingConnection>
            <MapField>ListCode</MapField>
```

```
            <MapFieldTo>ListCode</MapFieldTo>
        </AxTableMappingConnection>
    </Connections>
</AxTableMapping>
```

If you don't map your transaction table to this `SalesPurchJournalTable` map, write your own logic in the data persistence activity to update the list code.

Data persistence

Call the `TaxIntegrationListCodeUtility::saveListCodeFromDocumentToTable()` method in the `saveDocument` method of the newly created data persistence class.

X++

```
/// <summary>
/// Saves the document.
/// </summary>
/// <returns>Always true.</returns>
protected boolean saveDocument()
{
    TaxIntegrationTaxIdUtility::saveTaxIDFromDocumentToTable(document, salesTable);
    TaxIntegrationListCodeUtility::saveListCodeFromDocumentToTable(document,
salesTable);
    return true;
}
```

Currency exchange, rounding, and penny difference adjustment

This functionality is enabled by default. Set the transaction currency, the fixed exchange rate for the reporting currency, and the fixed exchange rate for the accounting currency in the document object. The `TaxIntegrationCurrencyExchangeActivityOnDocument` activity performs this action. `TaxIntegrationFacade` calls this activity without any condition. You don't need to take any action to use this functionality.

Cash discount

If your finance and operations apps already support the cash discount function for the new transaction, tax integration also enables the Tax Calculation engine to determine the cash discount parameters. Here's a brief overview of the process for enabling this functionality.

1. In the code base, find all references to cash discount parameters.

2. Replace the references to cash discount parameters with parameters from the Tax Calculation engine. You can retrieve the parameters by using one of two methods:

    - `TaxIntegrationFacade::getTaxJurisdictionParameters(RefTableId _sourceHeadingTableId, RefRecId _sourceHeadingRecId)`
    - `TaxIntegrationFacade::getTaxJurisdictionParametersByTable(Common _sourceHeadingTable)`

3. Extend the switch functions to enable the new transaction:

    - `TaxIntegrationUtils::shouldRetrieveCashDiscParametersFromTaxService(RefTableId _refTableId, RefRecId _refRecId)`
    - `TaxIntegrationUtils::getBusinessProcessBySourceHeadingTable(RefTableId _sourceHeadingTableId, RefRecId _sourceHeadingRecId)`

Modifications on the switch function and the front end

This article explains the modifications that are required on switch functions and the front end to integrate a new transaction.

Modification on switch functions to enable a new transaction

The switch function controls whether tax integration should be applied to a specific transaction, header table, and line table. As a developer, extend the switch function to enable the new transaction.

In `Tax.xpp`, add the header and line tables of new transactions according to the business process. Extend the method so that it returns *true* for the header and line tables of the new transaction.

X++

```
/// <summary>
/// Checks whether Tax Integration is enabled.
/// </summary>
/// <param name = "_refTableId">The table id.</param>
/// <returns>Whether Tax Integration is enabled.</returns>
public static boolean isTaxIntegrationEnabledForTable(RefTableId _refTableId)
{
    if (TaxIntegrationFlight::instance().isEnabled()
        && TaxIntegrationTaxServiceParameters::find().IsEnable)
    {
        switch (_refTableId)
        {
            case tableNum(SalesTable):
            case tableNum(SalesLine):
            case tableNum(SalesParmTable):
            case tableNum(SalesParmLine):
            case tableNum(SalesQuotationTable):
            case tableNum(SalesQuotationLine):
                return
TaxIntegrationBusinessProcessTable::exist(TaxIntegrationBusinessProcess::Sales);
            case tableNum(PurchTable):
            case tableNum(PurchLine):
            case tableNum(VendInvoiceInfoTable):
            case tableNum(VendInvoiceInfoSubTable):
            case tableNum(VendInvoiceInfoLine):
            case tableNum(PurchParmTable):
            case tableNum(PurchParmLine):
```

```
            case tableNum(PurchReqLine):
            case tableNum(PurchRFQCaseTable):
            case tableNum(PurchRFQCaseLine):
            case tableNum(PurchRFQTable):
            case tableNum(PurchRFQLine):
                return
TaxIntegrationBusinessProcessTable::exist(TaxIntegrationBusinessProcess::Purchase);
            default:
                return false;
        }
    }
    return false;
}
```

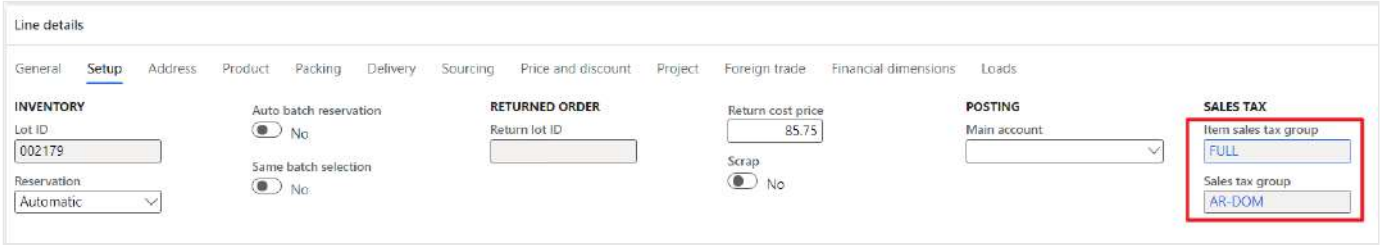
Modification on the front end

Uptake the front-end modification to adapt to the tax integration business logic.

In the transaction form, make the **Override sales tax** control visible. Don't allow users to edit the tax group or the item tax group. The following example uses a sales quotation in the `init()` method of the `SalesQuotationTable` form.

X++

```
if
(Tax::isTaxIntegrationEnabledForBusinessProcess(TaxIntegrationBusinessProcess::Sales))
{
    SalesQuotationTable_ds.object(fieldNum(SalesQuotationTable,
OverrideSalesTax)).visible(true);
    SalesQuotationLine_ds.object(fieldNum(SalesQuotationLine,
TaxGroup)).allowEdit(false);
    SalesQuotationLine_ds.object(fieldNum(SalesQuotationLine,
TaxItemGroup)).allowEdit(false);
    SalesQuotationLine_ds.object(fieldNum(SalesQuotationLine,
OverrideSalesTax)).visible(true);
}
```



Find all buttons that can trigger tax calculation, and reread the data source after tax calculation. Because several fields are updated during the calculation of tax integration, the data source of the form must also be refreshed to reflect the changes. The following example uses free text invoices. This code is from `CustFreeInvoice.xpp`.

X++

```
private void refreshDataSourceForTaxIntegration()
{
    if (isTaxIntegrationEnabledForFTI)
    {
        CustInvoiceTable_ds.reread();
        CustInvoiceLine_ds.research(true);
    }
}
```

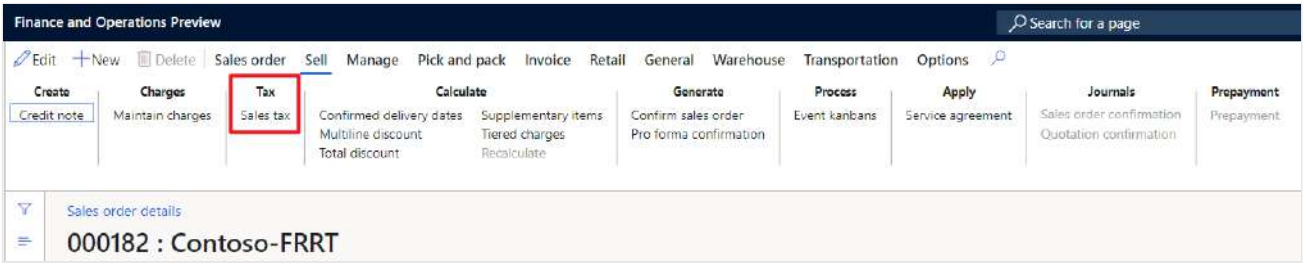
Make a method for the form, and then call that method after tax calculation is triggered by a user interface (UI) action. Here's an example.

X++

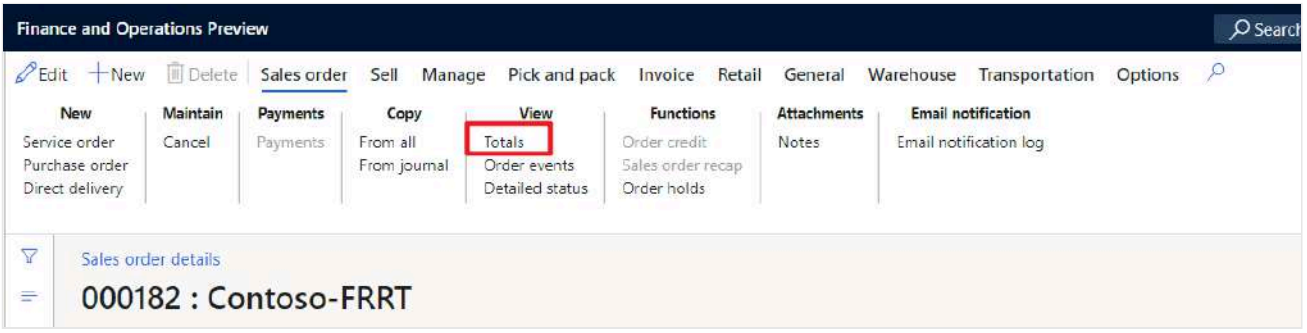
```
[Control("MenuFunctionButton")]
class CustInvoiceTableTotals
{
    public void clicked()
    {
        super();
        element.refreshDataSourceForTaxIntegration();
    }
}
```

Usually, there can be three buttons:

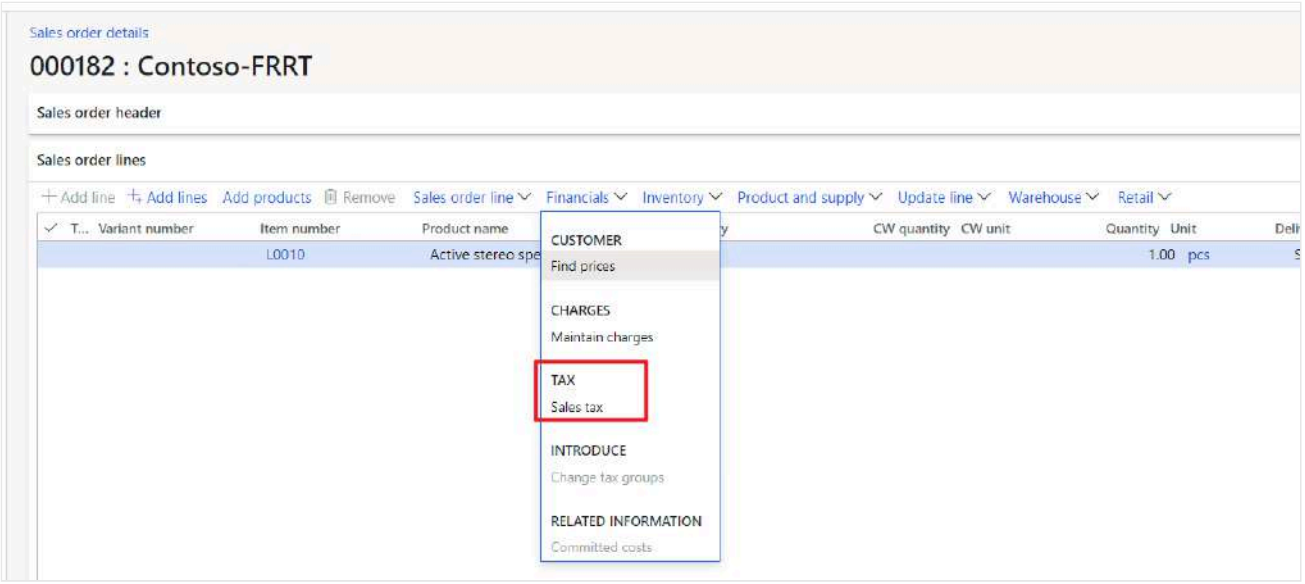
- **Sales tax** button on the Action Pane



- **Totals** button on the Action Pane



- **Sales tax** button on the line



If other buttons trigger tax calculation, call the refresh in the `clicked()` method of those buttons.

Add a new activity in tax integration

This article provides information about how to add a new or customized activity to the tax integration framework. Before you begin, be sure to read Facade, sequence, and activities in tax integration.

Create a new activity

Document activity or line activity

Before you create the activity class, think about the kinds of activities that you need.

If all actions are at the line level, you don't need anything from the document level. Therefore, consider a line activity. Create a line activity, and extend `TaxIntegrationAbstractActivityOnLine`.

X++

```
public class TaxIntegrationTaxCodeCheckActivityOnLine
    extends TaxIntegrationAbstractActivityOnLine
{
}
```

If actions are at both the document level and the line level, you need a document object. Create a document activity, and extend `TaxIntegrationAbstractActivityOnDocument`.

X++

```
public class TaxIntegrationDataPersistenceActivityOnDocument
    extends TaxIntegrationAbstractActivityOnDocument
{
}
```

Implement shouldSkip

Implement the `shouldSkip` method to skip the activity in specific scenarios. This method is defined in `TaxIntegrationAbstractActivity`. The `shouldSkip` method of the document activity and the `shouldSkip` method of the line activity have the same signature, and they accept `TaxIntegrationDocumentActivity` as input.

For example, if the activity isn't applicable to purchase orders, add a business process check in its `shouldSkip` method.

X++

```
internal boolean shouldSkip(TaxIntegrationDocumentObject _document)
{
    // call super() for some common check
    if (super(_document))
    {
        return true;
    }
    // Skip specifically for purchase order
    if (_document.getBusinessProcess() == TaxIntegrationBusinessProcess::Purchase)
    {
        return true;
    }
}
```

> ⓘ **Note**
>
> In most cases, call `super()`, because `shouldSkip()` in `TaxIntegrationAbstractActivity` has some basic checks (for example, if the document has exceptions). For a line activity, `shouldSkip()` also takes a document object as input. Therefore, it determines whether **all lines (including charges)** in the current document should be skipped. There's no way to determine whether a specific line should be skipped in the framework. If such a determination is required, you can do it in the `actInternal` method of the line activity.

Implement actInternal

Write the real business logic of the activity in the `actInternal` method. The `actInternal` method of the document activity and the `actInternal` method of the line activity have different signatures.

For the line activity

The `actInternal` method of the line activity accepts a `TaxIntegrationLineObject` object as input and can manipulate data at the line level.

For the document activity

The `actInternal` method of the document activity accepts a `TaxIntegrationDocumentObject` object as input and can manipulate data in the whole document.

Most of the document activities manipulate data at the line level. Enumerate the lines in the document object, and then continue as required. The following example shows `TaxIntegrationTaxIdActivityOnDocument.xpp`.

X++

```
SetEnumerator chargeEnumerator = _document.getChargeSet().getEnumerator();
while (chargeEnumerator.moveNext())
{
    TaxIntegrationLineObject charge = chargeEnumerator.current();
    // process the document charge
    if (!TaxIntegrationTaxIdActivityOnDocument::populateLine(charge))
    {
        return;
    }
}
SetEnumerator lineEnumerator = _document.getLineSet().getEnumerator();
while (lineEnumerator.moveNext())
{
    TaxIntegrationLineObject line = lineEnumerator.current();
    // process the line
    if (!TaxIntegrationTaxIdActivityOnDocument::populateLine(line))
    {
        return;
    }
    chargeEnumerator = line.getChargeSet().getEnumerator();
    while (chargeEnumerator.moveNext())
    {
        TaxIntegrationLineObject charge = chargeEnumerator.current();
        // process the line charge
        if (!TaxIntegrationTaxIdActivityOnDocument::populateLine(charge))
        {
            return;
        }
    }
}
```

Append an activity to the sequence

The new activity can't take effect until you add it to a `TaxIntegrationSequence` object. Therefore, as for other activities, append it to the `TaxIntegrationSequence` object in the `TaxIntegrationFacade::calculate` method.

X++

```
TaxIntegrationSequence sequence = TaxIntegrationSequence::construct(LoggerName)

.appendActivityOnDocument(TaxIntegrationSettingRetrievalActivityOnDocument::construct(
))
```

```
.appendActivityOnDocument(TaxIntegrationDataRetrievalActivityOnDocument::construct())

.appendActivityOnDocument(TaxIntegrationCalculationActivityOnDocument::construct())
    // ...

.appendActivityOnDocument(TaxIntegrationDataPersistenceActivityOnDocument::construct()
);
sequence.act(_document);
```

> **Note**
>
> To append the activity by extension, replace the whole method, because the method is replaceable. Carefully arrange the order of the activities, because the activities usually depend on the activities that you append in front of them.

Add data fields in tax configurations

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to customize tax configurations by using data fields that are added in the tax integration.

Customize the tax data model

1. In Microsoft Dynamics 365 Finance, go to **Electronic Reporting** > **Tax configurations**.
2. In the configuration tree, select **Tax Calculation Data Model**. Then, on the action pane, select **Create configuration**.

> **Note**
>
> If there's no configuration provider available, create one and make it active for your tax configuration. For more information, see Create configuration providers and mark them as active.

1. In the drop-down dialog box, select **Taxable document model derived from Name: Tax Calculation Data Model, Microsoft**, enter a name for the new tax data model, and then select **Create configuration**.
2. Select the tax data model that you just created, and then, on the action pane, select **Designer**.
3. Expand the data model tree, select **Lines**, and then select **New**.
4. In the **Create node** dialog box, enter a name, specify the item type, and then select **Add**.
5. Add any required columns.
6. On the action pane, select **Save**, and then select **Complete**.
7. Close the page, and view the completed version of your tax data model.

Customize the tax configuration

1. In Finance, go to **Electronic reporting** > **Tax configurations**.

2. In the configuration tree, selectMarkdown, content, and Acrolinx fixes **Tax Calculation Configuration**. Then, on the action pane, select **Create configuration**.
3. In the drop-down dialog box, select **Tax service configuration derived from Name: Tax Calculation Configuration, Microsoft**, enter a name for the new tax configuration, and then select **Create configuration**.
4. Select the tax configuration that you just created. On the action pane, select **Designer**.
5. In the **Properties** section, in the **Data model** field, select the customized tax data model that you created earlier.
6. In the **Data model version** field, select the completed version of the tax data model.
7. Select **Add**, and add the required tax measures.
8. On the action pane, select **Save**, and then select **Complete**.
9. Close the page, and view the completed version of your tax configuration.

Implement tax features in the customized tax configuration

1. In Finance, go to **Globalization Features** > **Tax**.
2. Select **Add**, enter information about the new feature, and then select **Create feature**.
3. On the **Versions** tab, select the feature, and then select **Edit**.
4. On the **General** tab, in the **Configuration version** field, select the customized tax configuration and version.
5. In the **Manage columns** dialog box, select the header and line columns that you want to include in your customized tax measure, and then select the right arrow button to add them to the **Selected columns** list.

Add data fields in the tax integration by using extension

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to use X++ extensions to add data fields in the tax integration. You can extend these fields to the tax data model of the tax service and use them to determine tax codes. For more information, see Add data fields in tax configurations.

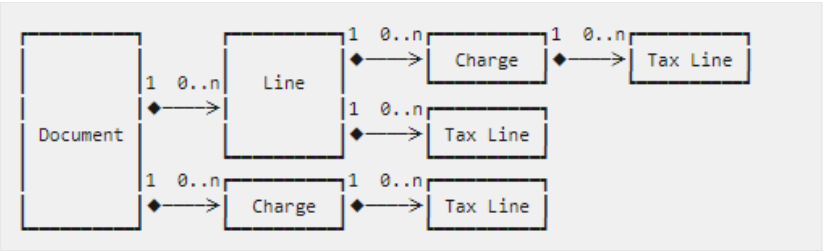
Data model

Objects carry the data in the data model, and classes implement these objects.

Here is a list of the major objects:

- AxClass/TaxIntegration**Document**Object
- AxClass/TaxIntegration**Line**Object
- AxClass/TaxIntegration**TaxLine**Object

The following illustration shows how these objects are related.



A **Document** object can contain many **Line** objects. Each object contains metadata for the tax service.

- `TaxIntegrationDocumentObject` has `originAddress` metadata, which contains information about the source address, and `includingTax` metadata, which indicates whether the line amount includes sales tax.
- `TaxIntegrationLineObject` has `itemId`, `quantity`, and `categoryId` metadata.

> **Note**
>
> `TaxIntegrationLineObject` also implements **Charge** objects.

Integration flow

Activities manipulate the data in the flow.

Key activities

- AxClass/TaxIntegration**Calculation**ActivityOnDocument

- AxClass/TaxIntegration**CurrencyExchange**ActivityOnDocument
- AxClass/TaxIntegration**DataPersistence**ActivityOnDocument
- AxClass/TaxIntegration**DataRetrieval**ActivityOnDocument
- AxClass/TaxIntegration**SettingRetrieval**ActivityOnDocument

Activities run in the following order:

1. Setting Retrieval
2. Data Retrieval
3. Calculation Service
4. Currency Exchange
5. Data Persistence

For example, extend **Data Retrieval** before **Calculation Service**.

Data Retrieval activities

Data Retrieval activities retrieve data from the database. Adapters for different transactions are available to retrieve data from different transaction tables:

- AxClass/TaxIntegration**PurchTable**DataRetrieval
- AxClass/TaxIntegration**PurchParmTable**DataRetrieval
- AxClass/TaxIntegration**PurchREQTable**DataRetrieval
- AxClass/TaxIntegration**PurchRFQTable**DataRetrieval
- AxClass/TaxIntegration**VendInvoiceInfoTable**DataRetrieval
- AxClass/TaxIntegration**SalesTable**DataRetrieval
- AxClass/TaxIntegration**SalesParm**DataRetrieval

In these **Data Retrieval** activities, you copy data from the database to `TaxIntegrationDocumentObject` and `TaxIntegrationLineObject`. Because all these activities extend the same abstract template class, they have common methods.

Calculation Service activities

The **Calculation Service** activity is the link between the tax service and the tax integration. This activity is responsible for the following functions:

1. Construct the request.
2. Post the request to the tax service.
3. Get the response from the tax service.
4. Parse the response.

A data field that you add to the request is posted together with other metadata.

Extension implementation

This section provides detailed steps that explain how to implement the extension. It uses the **Cost center** and **Project** financial dimensions as examples.

Step 1. Add the data variable in the object class

The object class contains the data variable and getter and setter methods for the data. Add the data field to either `TaxIntegrationDocumentObject` or `TaxIntegrationLineObject`, depending on the level of the field. The following example uses the line level, and the file name is `TaxIntegrationLineObject_Extension.xpp`.

> **Note**
>
> If the data field that you're adding is at the document level, change the file name to `TaxIntegrationDocumentObject_Extension.xpp`.

X++

```
[ExtensionOf(classStr(TaxIntegrationLineObject))]
final class TaxIntegrationLineObject_Extension
{
    private OMOperatingUnitNumber costCenter;
    private ProjId projectId;

    /// <summary>
    /// Gets a costCenter.
    /// </summary>
    /// <returns>The cost center.</returns>
    public final OMOperatingUnitNumber getCostCenter()
    {
        return this.costCenter;
    }

    /// <summary>
    /// Sets the cost center.
    /// </summary>
    /// <param name = "_value">The cost center.</param>
    public final void setCostCenter(OMOperatingUnitNumber _value)
    {
        this.costCenter = _value;
    }

    /// <summary>
    /// Gets a project ID.
    /// </summary>
    /// <returns>The project ID.</returns>
    public final ProjId getProjectId()
    {
        return this.projectId;
    }

    /// <summary>
    /// Sets the project ID.
    /// </summary>
    /// <param name = "_value">The project ID.</param>
    public final void setProjectId(ProjId _value)
    {
        this.projectId = _value;
    }
}
```

Add **Cost center** and **Project** as private variables. Create getter and setter methods for these data fields to manipulate the data.

Step 2. Retrieve data from the database

Specify the transaction, and extend the appropriate adapter classes to retrieve the data. For example, if you use a **Purchase order** transaction, extend `TaxIntegrationPurchTableDataRetrieval` and `TaxIntegrationVendInvoiceInfoTableDataRetrieval`.

> **Note**
>
> `TaxIntegrationPurchParmTableDataRetrieval` inherits from `TaxIntegrationPurchTableDataRetrieval`. Don't change `TaxIntegrationPurchParmTableDataRetrieval` unless the logic of the `purchTable` and `purchParmTable` tables differs.

If you need to add a data field for all transactions, extend all `DataRetrieval` classes.

Because all **Data Retrieval** activities extend the same template class, the class structures, variables, and methods are similar.

X++

```
protected TaxIntegrationDocumentObject document;

/// <summary>
/// Copies to the document.
/// </summary>
protected abstract void copyToDocument()
{
    // It is recommended to implement as:
    //
    // this.copyToDocumentByDefault();
    // this.copyToDocumentFromHeaderTable();
    // this.copyAddressToDocument();
}

/// <summary>
/// Copies to the current line of the document.
/// </summary>
/// <param name = "_line">The current line of the document.</param>
protected abstract void copyToLine(TaxIntegrationLineObject _line)
{
    // It is recommended to implement as:
    //
    // this.copyToLineByDefault(_line);
    // this.copyToLineFromLineTable(_line);
    // this.copyQuantityAndTransactionAmountToLine(_line);
    // this.copyAddressToLine(_line);
    // this.copyToLineFromHeaderTable(_line);
}
```

The following example shows the basic structure when the `PurchTable` table is used.

X++

```
public class TaxIntegrationPurchTableDataRetrieval extends TaxIntegrationAbstractDataRetrievalTemplate
{
    protected PurchTable purchTable;
    protected PurchLine purchLine;

    // Query builder methods
    [Replaceable]
    protected SysDaQueryObject getDocumentQueryObject()
    [Replaceable]
    protected SysDaQueryObject getLineQueryObject()
    [Replaceable]
    protected SysDaQueryObject getDocumentChargeQueryObject()
```

```
    [Replaceable]
    protected SysDaQueryObject getLineChargeQueryObject()

    // Data retrieval methods
    protected void copyToDocument()
    protected void copyToDocumentFromHeaderTable()
    protected void copyToLine(TaxIntegrationLineObject _line)
    protected void copyToLineFromLineTable(TaxIntegrationLineObject _line)
    ...
}
```

When the `CopyToDocument` method is called, the `this.purchTable` buffer already exists. The purpose of this method is to copy all the required data from `this.purchTable` to the `document` object by using the setter method that you created in the `DocumentObject` class.

Likewise, a `this.purchLine` buffer already exists in the `CopyToLine` method. The purpose of this method is to copy all the required data from `this.purchLine` to the `_line` object by using the setter method that you created in the `LineObject` class.

The most straightforward approach is to extend the `CopyToDocument` and `CopyToLine` methods. However, try the `copyToDocumentFromHeaderTable` and `copyToLineFromLineTable` methods first. If they don't work as you require, implement your own method, and call it in `CopyToDocument` and `CopyToLine`. There are three common situations where you might use this approach:

- The required field is in `PurchTable` or `PurchLine`. In this situation, extend `copyToDocumentFromHeaderTable` and `copyToLineFromLineTable`. Here's the sample code.

  X++

  ```
  /// <summary>
  /// Copies to the current line of the document from.
  /// </summary>
  /// <param name = "_line">The current line of the document.</param>
  protected void copyToLineFromLineTable(TaxIntegrationLineObject _line)
  {
      next copyToLineFromLineTable(_line);
      // if we already added XXX in TaxIntegrationLineObject
      _line.setXXX(this.purchLine.XXX);
  }
  ```

- The required data isn't in the default table of the transaction. However, there are some join relationships with the default table, and the field is required on most lines. In this situation, replace `getDocumentQueryObject` or `getLineObject` to query the table by join relationship. In the following example, the **Deliver Now** field is integrated with the sales order at the line level.

  X++

  ```
  public class TaxIntegrationSalesTableDataRetrieval
  {
      protected MCRSalesLineDropShipment mcrSalesLineDropShipment;

      /// <summary>
      /// Gets the query for the lines of the document.
      /// </summary>
      /// <returns>The query for the lines of the document</returns>
      [Replaceable]
      protected SysDaQueryObject getLineQueryObject()
      {
          return SysDaQueryObjectBuilder::from(this.salesLine)
  ```

```
            .where(this.salesLine, fieldStr(SalesLine,
SalesId)).isEqualToLiteral(this.salesTable.SalesId)
            .outerJoin(this.mcrSalesLineDropShipment)
            .where(this.mcrSalesLineDropShipment, fieldStr(MCRSalesLineDropShipment,
SalesLine)).isEqualTo(this.salesLine, fieldStr(SalesLine, RecId))
            .toSysDaQueryObject();
    }
}
```

In this example, a `mcrSalesLineDropShipment` buffer is declared, and the query is defined in `getLineQueryObject`. The query uses the relationship `MCRSalesLineDropShipment.SalesLine == SalesLine.RecId`. While you're extending in this situation, you can replace `getLineQueryObject` with your own constructed query object. However, note the following points:

- Because the return value of the `getLineQueryObject` method is `SysDaQueryObject`, you must construct this object by using the SysDa approach.
- You can't remove existing tables.

- The required data is related to the transaction table by a complicated join relationship, or the relation isn't one to one (1:1) but one to many (1:N). In this situation, things become a little complicated. This situation applies to the example of financial dimensions.

  In this situation, you can implement your own method to retrieve the data. Here's the sample code in the `TaxIntegrationPurchTableDataRetrieval_Extension.xpp` file.

X++

```
[ExtensionOf(classStr(TaxIntegrationPurchTableDataRetrieval))]
final class TaxIntegrationPurchTableDataRetrieval_Extension
{
    private const str CostCenterKey = 'CostCenter';
    private const str ProjectKey = 'Project';

    /// <summary>
    /// Copies to the current line of the document from.
    /// </summary>
    /// <param name = "_line">The current line of the document.</param>
    protected void copyToLineFromLineTable(TaxIntegrationLineObject _line)
    {
        Map dimensionAttributeMap =
this.getDimensionAttributeMapByDefaultDimension(this.purchline.DefaultDimension);
        if (dimensionAttributeMap.exists(CostCenterKey))
        {
            _line.setCostCenter(dimensionAttributeMap.lookup(CostCenterKey));
        }
        if (dimensionAttributeMap.exists(ProjectKey))
        {
            _line.setProjectId(dimensionAttributeMap.lookup(ProjectKey));
        }
        next copyToLineFromLineTable(_line);
    }
    private Map getDimensionAttributeMapByDefaultDimension(RefRecId _defaultDimension)
    {
        DimensionAttribute dimensionAttribute;
        DimensionAttributeValue dimensionAttributeValue;
        DimensionAttributeValueSetItem dimensionAttributeValueSetItem;
        Map ret = new Map(Types::String, Types::String);

        select Name, RecId from dimensionAttribute
            join dimensionAttributeValue
                where dimensionAttributeValue.dimensionAttribute == dimensionAttribute.RecId
            join DimensionAttributeValueSetItem
                where DimensionAttributeValueSetItem.DimensionAttributeValue ==
```

```
DimensionAttributeValue.RecId
                    && DimensionAttributeValueSetItem.DimensionAttributeValueSet ==
_defaultDimension;

        while(dimensionAttribute.RecId)
        {
            ret.insert(dimensionAttribute.Name, dimensionAttributeValue.DisplayValue);
            next dimensionAttribute;
        }
        return ret;
    }
}
```

Step 3. Add data to the request

Extend the `copyToTaxableDocumentHeaderWrapperFromTaxIntegrationDocumentObject` or `copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine` method to add data to the request. The following code shows an example in the `TaxIntegrationCalculationActivityOnDocument_CalculationService_Extension.xpp` file.

X++

```
[ExtensionOf(classStr(TaxIntegrationCalculationActivityOnDocument_CalculationService))]
final static class TaxIntegrationCalculationActivityOnDocument_CalculationService_Extension
{
    // Define the field name in the request
    private const str IOCostCenter = 'Cost Center';
    private const str IOProject = 'Project';
    // private const str IOEnumExample = 'Enum Example';

    /// <summary>
    /// Copies to <c>TaxableDocumentLineWrapper</c> from <c>TaxIntegrationLineObject</c> by line.
    /// </summary>
    /// <param name = "_destination"><c>TaxableDocumentLineWrapper</c>.</param>
    /// <param name = "_source"><c>TaxIntegrationLineObject</c>.</param>
    protected static void
copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine(Microsoft.Dynamics.TaxCalculation.ApiCo
ntracts.TaxableDocumentLineWrapper _destination, TaxIntegrationLineObject _source)
    {
        next copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine(_destination, _source);
        // Set the field we need to integrated for tax service
        _destination.SetField(IOCostCenter, _source.getCostCenter());
        _destination.SetField(IOProject, _source.getProjectId());

        // If the field to be extended is an enum type, use enum2Symbol to convert an enum variable
exampleEnum of ExampleEnumType to a string
        // _destination.SetField(IOEnumExample, enum2Symbol(enumNum(ExampleEnumType),
_source.getExampleEnum()));
    }
}
```

In this code, `_destination` is the wrapper object that generates the request, and `_source` is the `TaxIntegrationLineObject` object.

> **Note**
>
> Define the field name used in the request as **private const str**. The string should be exactly the same as the node name (not the label) added in the article Add data fields in tax configurations.

Set the field in the **copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine** method by using the **SetField** method. The data type of the second parameter should be **string**. If the data type isn't **string**, convert it to string. If the data type is X++ **enum type**, use the **enum2Symbol** method to convert the enum value to a string. The enum value added in the tax configuration should be exactly the same as the enum name. The following list describes the differences between enum value, label, and name.

- The name of enum is a symbolic name in code. **enum2Symbol()** converts the enum value to its name.
- The value of the enum is integer.
- The label of the enum can be different across preferred languages. **enum2Str()** converts the enum value to its label.

Model dependency

To successfully build the project, add the following reference models to the model dependencies:

- ApplicationPlatform
- ApplicationSuite
- Tax Engine
- Dimensions, if you use financial dimension
- Other necessary models referenced in the code

Validation

After you complete the previous steps, you can validate your changes.

1. In Finance, go to **Accounts payable** and add **&debug=vs%2CconfirmExit&** to the URL. For example, `https://usnconeboxax1aos.cloud.onebox.dynamics.com/?cmp=DEMF&mi=PurchTableListPage&debug=vs%2CconfirmExit&`. The final **&** is essential.
2. Open the **Purchase order** page and select **New** to create a purchase order.
3. Set the value for the customized field, and then select **Sales tax**. A troubleshooting file with prefix, **TaxServiceTroubleshootingLog** is downloaded automatically. This file contains the transaction information posted to the Tax Calculation Service.
4. Check if the customized field added is present in the **Tax service calculation input JSON** section and if its value is correct. If the value isn't correct, double check the steps in this document.

File example:

```
===Tax service calculation input JSON:===
{
  "TaxableDocument": {
    "Header": [
      {
        "Lines": [
          {
            "Line Type": "Normal",
            "Item Code": "",
            "Item Type": "Item",
            "Quantity": 0.0,
            "Amount": 1000.0,
            "Currency": "EUR",
            "Transaction Date": "2022-1-26T00:00:00",
            ...
```

```
            /// The new fields added at line level
            "Cost Center": "003",
            "Project": "Proj-123"
          }
        ],
        "Amount include tax": true,
        "Business Process": "Journal",
        "Currency": "",
        "Vendor Account": "DE-001",
        "Vendor Invoice Account": "DE-001",
        ...
        // The new fields added at header level, no new fields in this example
        ...
      }
    ]
  },
}
...
```

Appendix

This appendix shows the complete sample code for the integration of the financial dimensions, **Cost center** and **Project** at the line level.

TaxIntegrationLineObject_Extension.xpp

X++

```
[ExtensionOf(classStr(TaxIntegrationLineObject))]
final class TaxIntegrationLineObject_Extension
{
    private OMOperatingUnitNumber costCenter;
    private ProjId projectId;

    /// <summary>
    /// Gets a costCenter.
    /// </summary>
    /// <returns>The cost center.</returns>
    public final OMOperatingUnitNumber getCostCenter()
    {
        return this.costCenter;
    }

    /// <summary>
    /// Sets the cost center.
    /// </summary>
    /// <param name = "_value">The cost center.</param>
    public final void setCostCenter(OMOperatingUnitNumber _value)
    {
        this.costCenter = _value;
    }

    /// <summary>
    /// Gets a project ID.
    /// </summary>
    /// <returns>The project ID.</returns>
    public final ProjId getProjectId()
    {
        return this.projectId;
    }

    /// <summary>
    /// Sets the project ID.
```

```
    /// </summary>
    /// <param name = "_value">The project ID.</param>
    public final void setProjectId(ProjId _value)
    {
        this.projectId = _value;
    }
}
```

TaxIntegrationPurchTableDataRetrieval_Extension.xpp

X++

```
[ExtensionOf(classStr(TaxIntegrationPurchTableDataRetrieval))]
final class TaxIntegrationPurchTableDataRetrieval_Extension
{
    private const str CostCenterKey = 'CostCenter';
    private const str ProjectKey = 'Project';

    /// <summary>
    /// Copies to the current line of the document from.
    /// </summary>
    /// <param name = "_line">The current line of the document.</param>
    protected void copyToLineFromLineTable(TaxIntegrationLineObject _line)
    {
        Map dimensionAttributeMap =
this.getDimensionAttributeMapByDefaultDimension(this.purchline.DefaultDimension);
        if (dimensionAttributeMap.exists(CostCenterKey))
        {
            _line.setCostCenter(dimensionAttributeMap.lookup(CostCenterKey));
        }
        if (dimensionAttributeMap.exists(ProjectKey))
        {
            _line.setProjectId(dimensionAttributeMap.lookup(ProjectKey));
        }
        next copyToLineFromLineTable(_line);
    }
    private Map getDimensionAttributeMapByDefaultDimension(RefRecId _defaultDimension)
    {
        DimensionAttribute dimensionAttribute;
        DimensionAttributeValue dimensionAttributeValue;
        DimensionAttributeValueSetItem dimensionAttributeValueSetItem;
        Map ret = new Map(Types::String, Types::String);
        select Name, RecId from dimensionAttribute
            join dimensionAttributeValue
                where dimensionAttributeValue.dimensionAttribute == dimensionAttribute.RecId
            join DimensionAttributeValueSetItem
                where DimensionAttributeValueSetItem.DimensionAttributeValue ==
DimensionAttributeValue.RecId
                    && DimensionAttributeValueSetItem.DimensionAttributeValueSet == _defaultDimension;
        while(dimensionAttribute.RecId)
        {
            ret.insert(dimensionAttribute.Name, dimensionAttributeValue.DisplayValue);
            next dimensionAttribute;
        }
        return ret;
    }
}
```

TaxIntegrationCalculationActivityOnDocument_CalculationService_Extensic

X++

```
[ExtensionOf(classStr(TaxIntegrationCalculationActivityOnDocument_CalculationService))]
final static class TaxIntegrationCalculationActivityOnDocument_CalculationService_Extension
{
    // Define the field name in the request
    private const str IOCostCenter = 'Cost Center';
    private const str IOProject = 'Project';

    /// <summary>
    /// Copies to <c>TaxableDocumentLineWrapper</c> from <c>TaxIntegrationLineObject</c> by line.
    /// </summary>
    /// <param name = "_destination"><c>TaxableDocumentLineWrapper</c>.</param>
    /// <param name = "_source"><c>TaxIntegrationLineObject</c>.</param>
    protected static void
copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine(Microsoft.Dynamics.TaxCalculation.ApiCo
ntracts.TaxableDocumentLineWrapper _destination, TaxIntegrationLineObject _source)
    {
        next copyToTaxableDocumentLineWrapperFromTaxIntegrationLineObjectByLine(_destination, _source);
        // Set the field we need to integrated for tax service
        _destination.SetField(IOCostCenter, _source.getCostCenter());
        _destination.SetField(IOProject, _source.getProjectId());
    }
}
```

Customize tax configurations for master data lookup

Follow the steps in this article to customize tax configurations to extend master data lookup functionality.

Import a tax configuration provided by Microsoft

Follow the steps in Import Electronic reporting (ER) configurations from Dataverse and import the correct tax configuration version, based on your Finance version.

> **Note**
>
> By default, the Dataverse model mapping is imported. If you receive warning messages during the configuration import process, enable the virtual entities in Dataverse. For more information, see Enable Dataverse virtual entities.

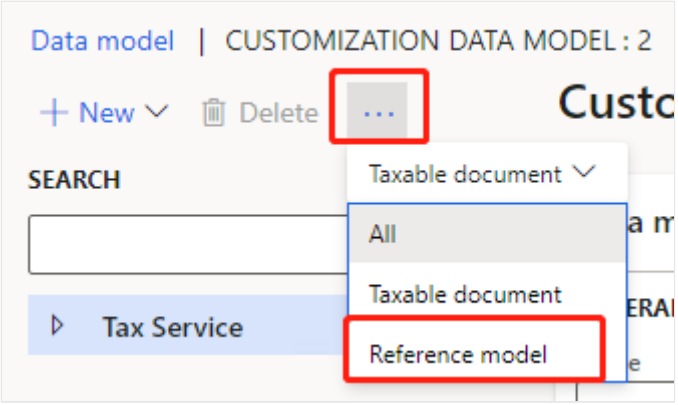
Create a customized data model configuration

1. In the **Electronic reporting** workspace, select **Tax configurations**, and then select the data model configuration to extend. For example, select **Tax Calculation Data Model**.
2. Select **Create configuration**.
3. Select **Taxable document model derived from Name: Tax Calculation Data Model, Microsoft**.
4. In the **Name** field, enter **Customization data model**.
5. Select **Create configuration**.

Create customized reference models

1. On the **Tax configurations** page, select **Customization data model**, and then select **Designer**.

2. Select the ellipsis button (**...**), and then select the **Reference model** view.



3. Create the customized reference model. The customized model is a root model. The customized entity is a record list. The customized field is a string field that you want to use in the lookup. You can add more fields as you require.

4. Select the ellipsis button (...), and then select the **Taxable document** view.

5. Select the attribute to bind to the customized reference model. For example, select **Customized attribute**, and then follow these steps:

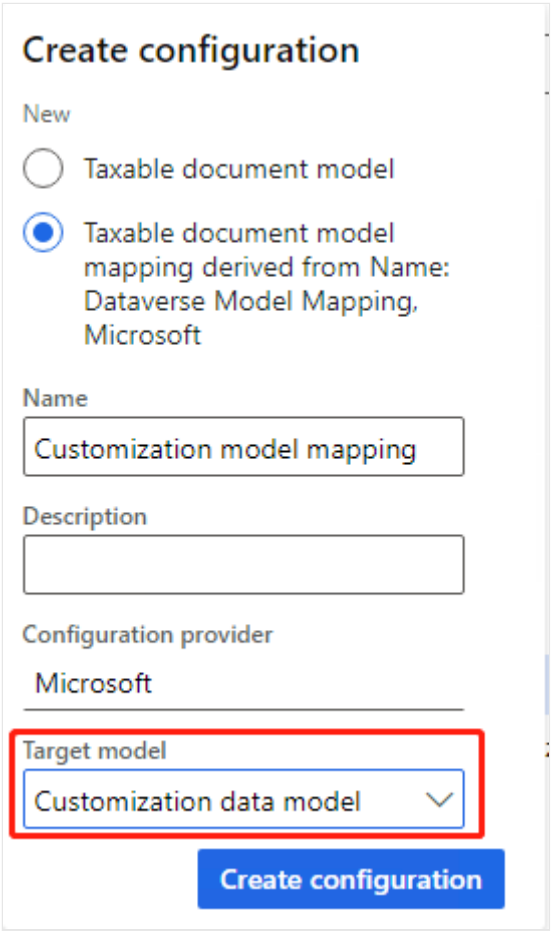
   a. Select **Select reference model**.

   b. Select **Customized model**, and then select **OK**. The reference model name is updated to the value of the **Natural key** field.

   c. Select **Save**, and then select **Complete**.

Create a customized model mapping configuration

1. In the **Electronic reporting** workspace, select **Tax configurations**, and then select the **Dataverse model mapping** configuration.
2. In the **Default for model mapping** field, select **No**.
3. Select **Create configuration**.
4. Select **Taxable document model mapping derived from Name: Dataverse Model Mapping, Microsoft**.
5. In the **Name** field, enter **Customization model mapping**.
6. In the **Target model** field, select the **Customization data model** data model.
7. Select **Create configuration**.

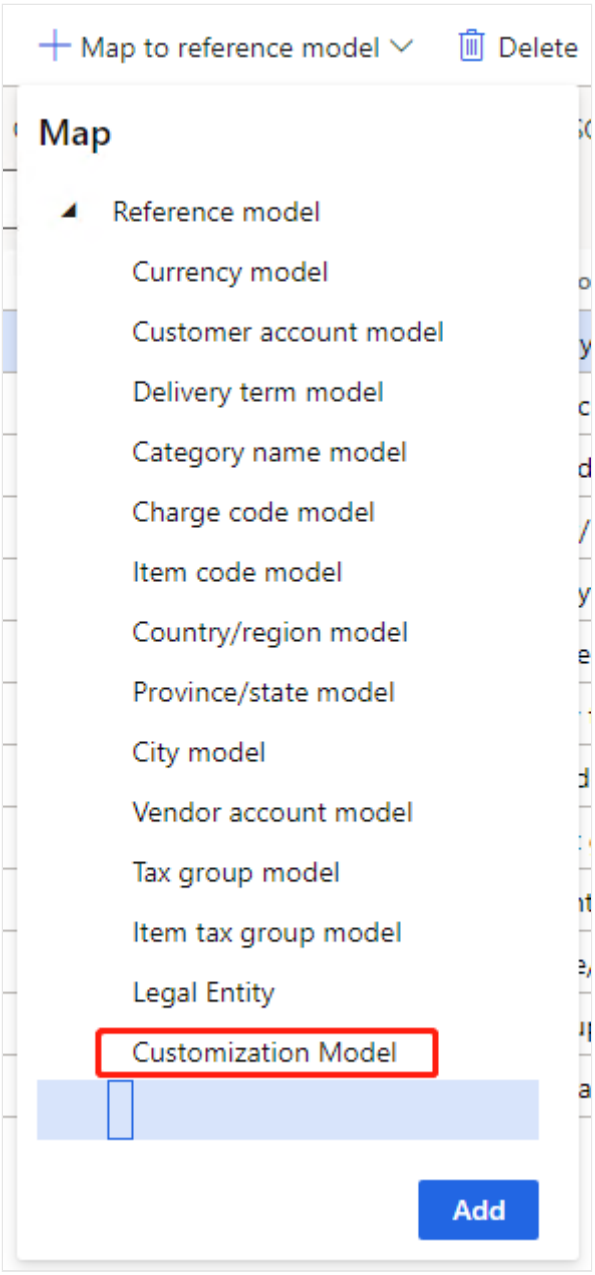


8. Select **Customization model mapping**, and set the **Connected application** field to the connection that you created in step 8 of Set up an environment for master data lookup.
9. Set the **Default for model mapping** field to **Yes**.

Create customized model mappings

1. On **Tax configurations**, select **Customization model mapping**.

2. Select **Designer**, and then select **Customization Model**.



Map a model mapping to a Dataverse entity

1. On the **Model mapping designer** page, select **Customization Model**, and then select **Designer**.

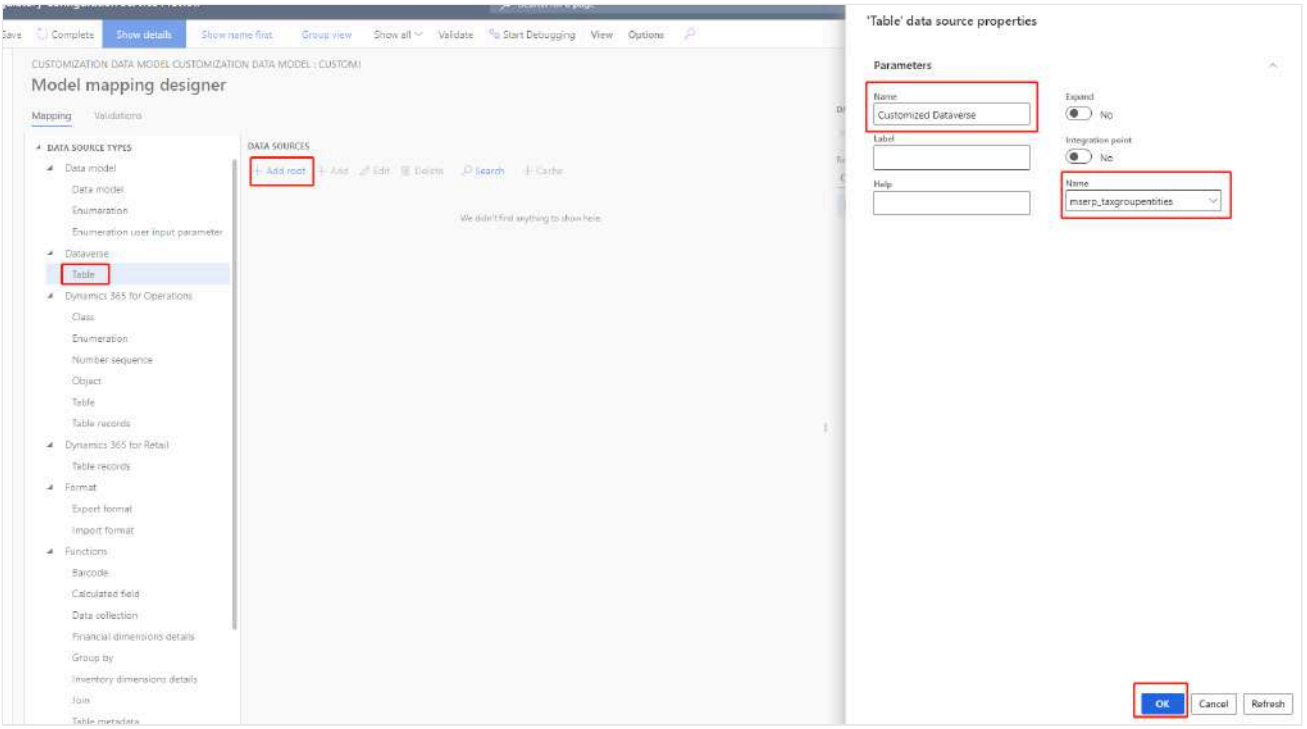
2. In the **Data source types** tree, select **Dataverse Table**.

3. On the **Data sources** tab, select **Add root**.

4. In the **Name** field, enter **Customized Dataverse**.

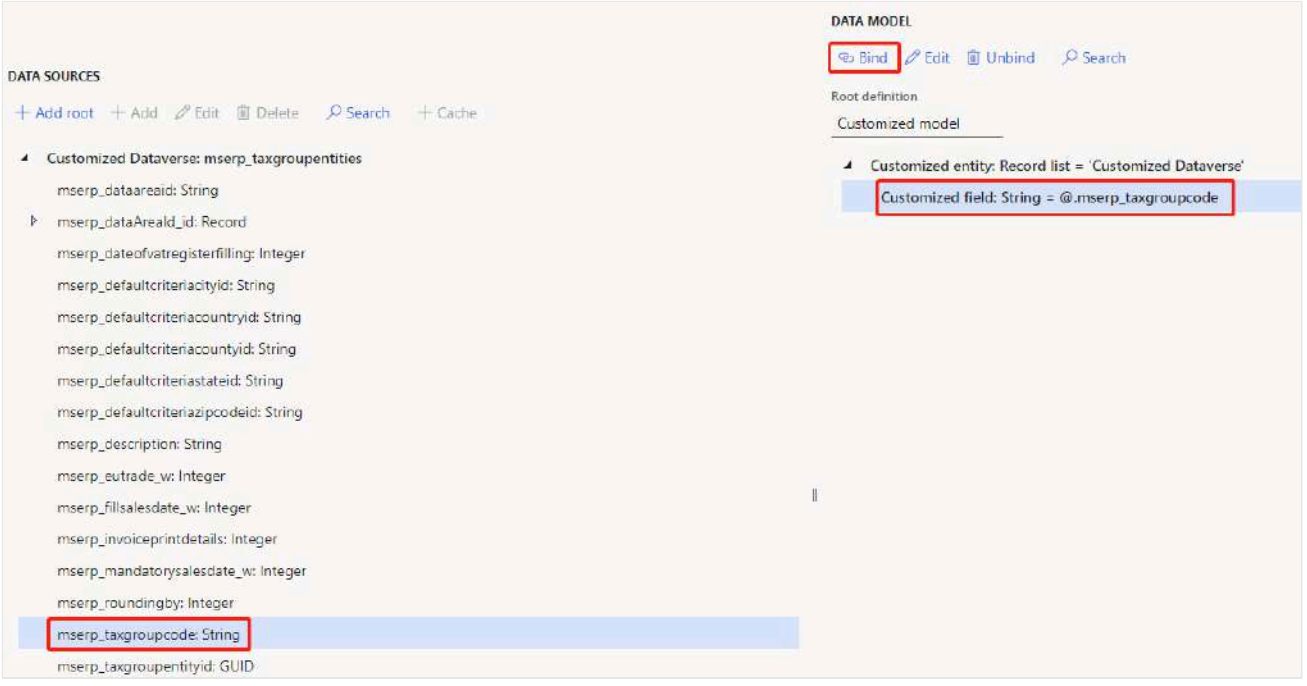
5. In the second **Name** field, select an entity.

6. Select **OK**.



7. Select **Customized Dataverse** and **Customized entity**, and then select **Bind**.

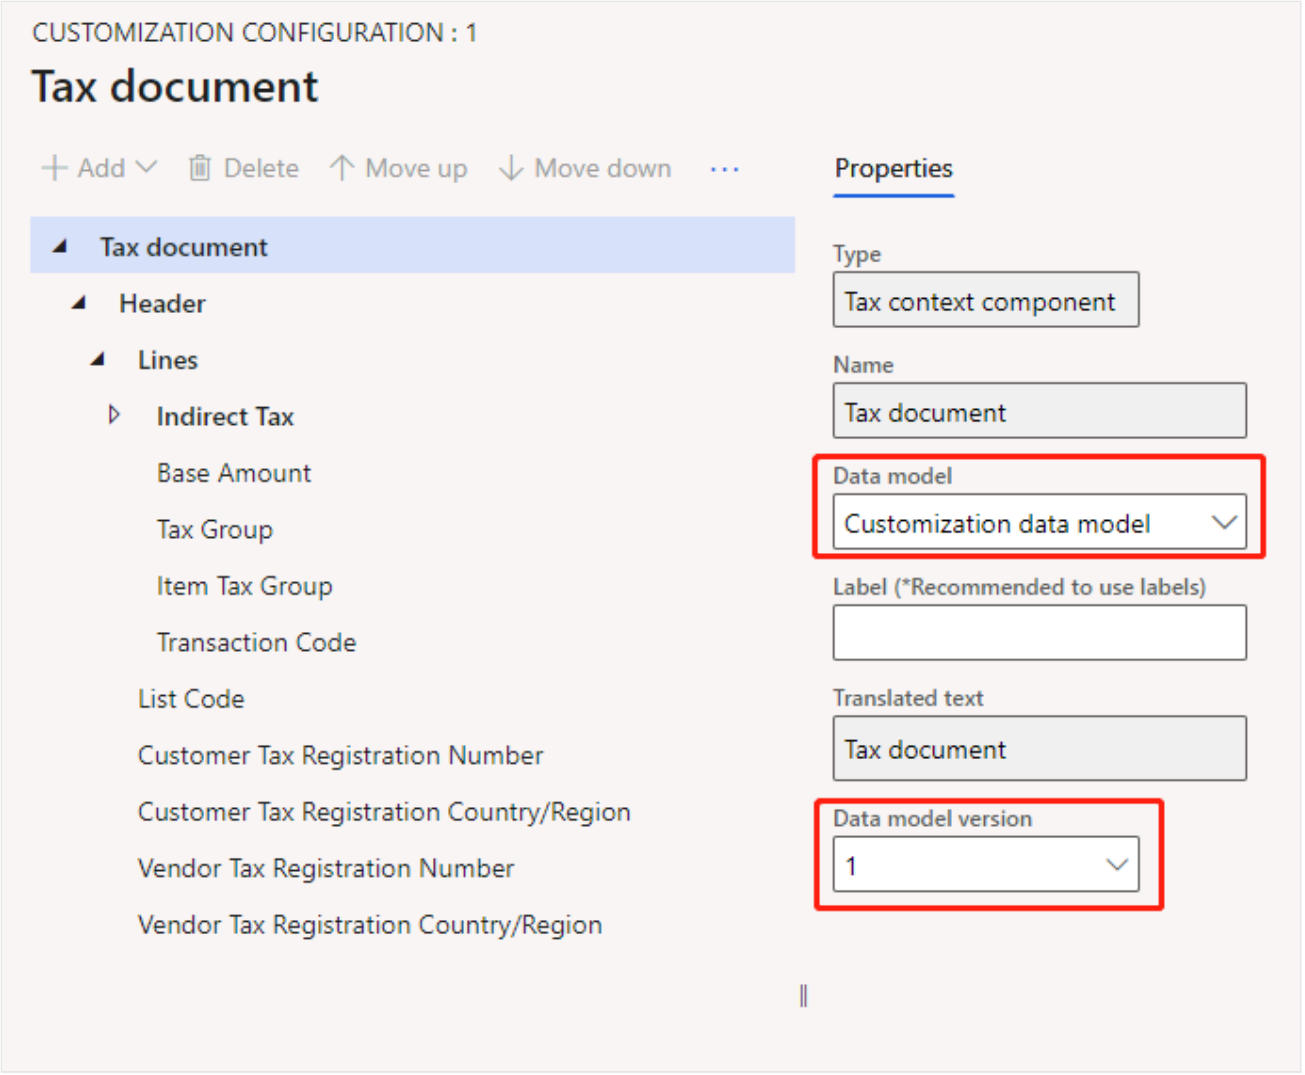
8. Under **Customized Dataverse** and **Customized field**, select a field, and then select **Bind**.



9. Select **Save**, and then select **Complete**.

Create a customized tax configuration

1. In the **Electronic reporting** workspace, select **Tax configurations**, and then select **Tax Calculation Configuration**.
2. Select **Create configuration**.
3. Select **Tax service configuration derived from Name: Tax Calculation Configuration, Microsoft**.
4. In the **Name** field, enter **Customization configuration**.
5. Select **Create configuration**.
6. Select **Customization configuration**, and then select **Designer**.
7. In the **Data model** field, select **Customization data model**.
8. In the **Data model version** field, select the corresponding data model version.



9. Select **Complete**.

The tax features list is empty on the Tax calculation parameters page

This article provides a resolution for an issue where the list of tax features on the **Tax calculation parameters** page is empty in Dynamics 365 Finance.

Symptoms

In Dynamics 365 Finance, when you try to select a value in the **Name** field under **FEATURE** on the **Tax calculation parameters** page, the list of values is empty.

Cause

The tax feature isn't created in Globalization Studio.

Resolution

To solve this issue, create the tax feature in Globalization Studio.

For more information, see Configure the Tax Calculation feature.

"Tax code cannot be determined" error in Tax Calculation

This article explains the troubleshooting steps that you can take if you receive a "Tax code cannot be determined" error in Tax Calculation in Dynamics 365 Finance.

Symptoms

You receive the following error message:

> Header/Lines - 1, tax code cannot be determined.

Alternatively, you find the error message in the troubleshooting file, as shown in the following example. For more information, see How to enable debug mode for troubleshooting.

jsonc

```
======================Tax calculation result JSON:==========================
{
    "taxDocument": {
        "Header": [
            {
                "Lines": [
                    {
                        ...
                        "Errors": [
                            {
                                "Code": "TaxSetup20001",
                                "Message": "Header/Lines - 1, tax code cannot be
determined."
                            }
                        ],
                        "Adjustment": null
                    }
                ],
                "Measures": {
                    ...
                },
                ...
            }
        ]
    },
    ...
}
```

Cause

The issue is probably occurring because the tax group and the item tax group don't intersect.

Resolution

To solve the issue:

1. In the troubleshooting file, verify that tax group and item tax group are determined. If the values for `Tax Group` and `Item Tax Group` are blank, the tax group and item tax group aren't determined. If they're determined, the results might be incorrect.

   Here's an example of a troubleshooting file:

   jsonc

   ```
   ======================Tax calculation result JSON:============================
   {
       "taxDocument": {
           "Header": [
               {
                   "Lines": [
                       {
                           "Tax Codes": {},
                           "Measures": {
                               "Tax Group": "Group A",
                               "Item Tax Group": "Group B"
                           },
                           "Adjustment": null
                       }
                   ],
                   "Measures": {
                       ...
                   },
                   ...
               }
           ]
       },
       ...
   }
   ```

2. Verify that the **Override sales tax** option on the **Setup** tab of the sales order line details is enabled.

   - If it's enabled, tax codes are determined by the `Tax group` and `Item tax group` values that you enter on the transaction line. Verify that these values are entered correctly.

- If it isn't enabled, verify that correct values are set for the **Tax group applicability** and **Item tax group applicability** fields. For more information, see "No matching result could be found" error in the Tax Calculation.

3. If the tax group and item tax group are determined correctly, determine whether there's any intersection for them.

   a. In Globalization Studio, go to **Tax features** > **Tax codes and groups** > **Tax group**.

   Expand table

Line.Tax Group	Tax Codes
Group A	A

   b. Go to **Tax features** > **Tax codes and groups** > **Item tax group**.

   Expand table

Line.Item Tax Group	Tax Codes
Group B	B

   If there's no intersection for the tax group and the item tax group, the tax code won't be determined.

Mitigation

1. Go through each step in the Resolution section of this article, and fix the setup as required. If the tax group and item tax group aren't determined correctly, see "No matching result could be found" error in Tax Calculation.

2. If there's no intersection for the tax group and the item tax group, create a new feature version in Globalization Studio, and then fix the setup.

   - Go to **Tax features** > **Tax codes and groups** > **Item tax group**.

   Expand table

Line.Item Tax Group	Tax codes
Group B	A;B

The tax code will be determined as **A**.

"No matching result could be found" error in the Tax Calculation

This article explains the troubleshooting steps that you can take if you receive the "No matching result could be found" error in Tax Calculation in Dynamics 365 Finance.

Symptoms

You receive the following error message:

> Header/Lines - 1, Tax group applicability, no matching result could be found.

jsonc

```
======================Tax calculation result JSON:==========================
{
    "taxDocument": {
        "Header": [
            {
                "Lines": [
                    {
                        ...
                        "Errors": [
                            {
                                "Code": "TaxSetup20000",
                                "Message": "Header/Lines - 1, Tax group applicability,
no matching result could be found."
                            }
                        ],
                        "Adjustment": null
                    }
                ],
                "Measures": {
                    ...
                },
                ...
            }
        ]
    },
    ...
}
```

Cause

The issue occurs when the feature setup in Globalization Studio is incorrect.

Resolution

1. Download the troubleshooting file. For more information, see How to enable debug mode for troubleshooting.

2. Compare the Tax calculation input with the feature setup to fix the setup issue.

   The following example shows the Tax calculation input.

   jsonc

```
==============================Tax calculation input
JSON:====================================
{
    "TaxableDocument": {
        "Header": [
            {
                "Lines": [
                    {
                        ...
                    }
                ],
                "Business Process": "Sales",
                "Ship From Zip Code": "30159",
            }
        ]
    },
