While a product owner is assigned to a product, only the members of the product owner group can edit the **Product owner** setting.

The product owner is also visible on the **Released products** page.

Product owners and product releases

Only users from a product's product owner group can release that product. However, there is an exception when the product is a child item, and its parent is released by the parent's owner. In other words, if the product is part of the BOM of another product, the system doesn't check the product owner of each item in the BOM. It checks only the product owner of the parent item.

For example, product X is assigned to the *Design cabinets* product owner group. Product X is also part of the BOM of product Y, which is assigned to the *Design Speakers* product owner group. If a user from the *Design Speakers* product owner group releases product Y and its BOM, product X will be released together with product Y.

Product owners and approvals

Because product owners know whether specific engineering changes will benefit their products, it often makes sense to include them as part of the approval process in engineering change management. You can implement this approach by setting up the product owners as participant providers in the workflows that are used for engineering change management. The system will then assign approval tasks in the workflows, based on the products that are in engineering change requests and engineering change orders. Learn more in Manage changes to engineering products.

Engineering attributes and engineering attribute search

Article • 08/15/2024

To ensure that all product master data can be registered in the system, you should use engineering attributes to specify all non-standard characteristics. You can then use engineering attribute search to easily find products, based on those registered characteristics.

Create engineering attributes and attribute types

Typically, engineering products have many characteristics and properties that you must capture. Although you can register some of the properties by using the standard product fields, you can also create new engineering properties as required. You can define your own *engineering attributes* and make them part of the product definition.

Each engineering attribute must belong to an *attribute type*. This requirement exists because each engineering attribute must have a *data type* that defines the types of values that it can hold. An engineering attribute type can be a standard type (such as free text, integer, or decimal) or a custom type (such as text that has a specific set of values to select from). You can reuse each attribute type with any number of engineering attributes.

Set up engineering attribute types

To view, create, or edit an engineering attribute type, follow these steps.

1. Go to **Engineering change management** > **Setup** > **Attributes** > **Attribute types**.
2. Select an existing attribute type in the list pane, or select **New** on the Action Pane to create a new attribute type.
3. Set the following fields:
    - **Attribute type name** – Enter a name for the attribute type.
    - **Type** – Select a standard data type (*Currency*, *DateTime*, *Decimal*, *Integer*, *Text*, *Boolean*, or *Reference*).
    - **Fixed list** – This option is available only if you set the **Type** field to *Text*. Set it to *Yes* to define specific values for attributes of this type. In this case, a drop-

down list will be created. You use the **Value** FastTab to establish the values that are available for this attribute type. Set this option to *No* to allow users to enter any value. In this case, an input field will be created.

- **Value range** – This option is available only if you set the **Type** field to *Integer*, *Decimal*, or *Currency*. Set it to *Yes* to establish minimum and maximum values that will be accepted for attributes of this type. You use the **Range** FastTab to establish the minimum and maximum values, and (for currency) the currency that applies for the limits that you entered. Set this option to *No* to accept any value.
- **Unit of measure** – This field is available only if you set the **Type** field to *Integer* or *Decimal*. Select the unit of measure that applies for this attribute type. If no unit is required, leave this field blank.

Set up engineering attributes

To view, create, or edit an engineering attribute, follow these steps.

1. Go to **Engineering change management** > **Setup** > **Attributes** > **Engineering attributes**.

2. Select an existing attribute in the list pane, or select **New** on the Action Pane to create a new attribute.

3. Set the following fields:

    - **Name** – Enter a unique name for the attribute. Both the **Name** and **Friendly name** are shown throughout the system, though you can decide to hide any of the columns. The **Name** must be unique while **Friendly name** doesn't need to be.
    - **Attribute type** – Select an attribute type that you defined in the previous section.
    - **Friendly name** – Enter a common name for the attribute (except on the **Engineering attributes** page). Unlike the **Name**, this value doesn't need to be unique, which means that there could be two or more different attribute with the same friendly name.
    - **Description** – Enter a description of the attribute.
    - **Help text** – Enter Help text that tells other users what the attribute is for.
    - **Default value** – Enter a default value for the attribute. The options that are presented depend on the attribute type that you selected.
    - **Currency** – If the attribute type that you selected is a currency, select the currency that the attribute will accept and show values in.

4. If the attribute type that you selected is an integer or a decimal, the **Range** FastTab is shown. On this FastTab, set the following fields as required:

    - **Tolerance action** – Select how the system should respond if a user enters a value outside the specified range. If you select *Warning*, a warning is shown, but the user can save the value. If you select *Not allowed*, a warning is shown, and the value can't be saved until the user corrects it.
    - **Minimum** – Enter the minimum recommended or accepted value.
    - **Maximum** – Enter the maximum recommended or accepted value.

Engineering attribute inheritance

For product structures, such as bills of materials (BOMs) or formulas, selected attributes can be passed from the children items up to the parent items. You can think of this process as "reverse inheritance."

Turn engineering attribute inheritance on or off

This feature requires that both the *Engineering Change Management* and *Improved attribute inheritance for Engineering Change Management* features be turned on for your system. For details about how to turn these features on or off, see Engineering change management overview.

Attribute inheritance example

For a food product such as a carrot cake, the system must record each allergen that the product contains. The carrot cake can be modeled in the system as an engineering product that has a formula. This formula contains the carrot cake's ingredients, such as flour, milk, carrots, and nuts. In this example, the company provides two models for carrot cake: one that contains lactose and one that doesn't.

The cake that contains lactose has the following attributes at the ingredient level:

- Ingredient "flour": attribute "gluten" = yes
- Ingredient "milk": attribute " lactose" = yes
- Ingredient "nuts": attribute "nuts" = yes

The cake that doesn't contain lactose uses lactose-free milk and has the following attributes at the ingredient level:

- Ingredient "flour": attribute "gluten" = yes
- Ingredient "milk": attribute "lactose" = no

- Ingredient "nuts": attribute "nuts" = yes

Because these products are mostly similar, it might be convenient to pass these attributes from the children (the two variations) to the parent product (the basic carrot cake). To implement this "reverse inheritance," you can use the *Attribute inheritance* functionality. This functionality is defined for each engineering version.

Connect engineering attributes to an engineering product category

Some engineering attributes apply to all products, whereas others are specific to individual products or product categories. For example, electrical attributes aren't required for mechanical products. Therefore, you can set up *engineering product categories*. An engineering product category establishes the collection of engineering attributes that must be part of the definition for products that belong to that category. You can also specify which engineering attributes are mandatory and whether there is a default value.

For more information about how to work with engineering product categories, including information about how to connect attributes to categories, see Engineering versions and engineering product categories.

Set attribute values for engineering attributes

The engineering attributes that are connected to an engineering product category are presented when you create a new engineering product that is based on that category. At that time, you can set values for the attributes. Later, those values can be changed on the **Engineering version** page or as part of engineering change management in an engineering change order. Learn more in Manage changes to engineering products.

Create an engineering product

To create an engineering product, open the **Released products** page. Then, on the Action Pane, on **Product** tab, in the **New** group, select **Engineering product**.

You must specify the engineering category that the product belongs to. The category will set all the default values and characteristics for the product. It will also set the attributes that are applicable to the product. After the category is selected, values will be set for the attributes. You can then modify those values.

Search for products by using engineering attribute values

You can use engineering attribute search to find products by searching for their engineering attributes values. Therefore, you can easily find engineering products, based on their characteristics. You can search in the products that belong to an engineering product category, or you can search across all engineering products.

The search is available on product master data pages and from transactional items in the system, such as sales orders. For a transactional item, you can use the **Engineering attribute search** page to search for a product. You can then use the **Add as new line** button to add the product to the sales order lines. Products in the search results can also be added directly to the order.

Engineering products evolve during their product lifecycle for many reasons. For example, changes might be introduced to improve product serviceability, change a component because the supplier no longer offers it, respond to new insights, or fix mistakes in the initial design. Many reasons exist for storing these changes as part of an ongoing product without overwriting previous data. Here are some of these reasons:

- You want to keep track of the product as it was manufactured and delivered to your customers in previous lifecycle states.
- You need a lead time before you approve and apply the changes.
- You want to have a timestamp on each change, and you want to be able to deliver previously manufactured products separately from each other.

Engineering versions ensure that the various states of a product and its data are current and clear, and that they can be visualized in the system. This concept helps you maintain consistency, lock down the bill of materials (BOM) for production, eliminate variability, and easily identify changes.

Generally, the *form-fit-function* rule is applied to determine whether a change requires a new product, a new version, or an update to an existing version. Each of the three terms in the name of this rule refers to a specific aspect of a part, which helps engineers match parts to needs. The form-fit-function rule increases the flexibility of design changes, because minimal documentation and design cost are required to change a part, provided that the fit, form, and function of the product are maintained.

- **Fit** refers to the ability of the part or feature to connect to, mate with, or join to another feature or part in an assembly. The fit enables the part to meet the required assembly tolerances so that it can be useful.

- **Form** refers to characteristics of a part or assembly, such as the external dimensions, weight, size, and visual appearance. The form is the aspect that's most affected by an engineer's aesthetic choices. It includes the enclosure, chassis, and control panel, which become the outward "face" of the product.
- **Function** is a criterion that's met when the part effectively and reliably performs its stated purpose. For example, in an electronics product, function can depend on the solid-state components that are used, and the software or firmware. Often, it can also depend on the features of the selected enclosure. Two of the most common reasons that an enclosure can fail the function criterion are poorly placed or poorly sized ports, and misleading or missing labeling.

Engineering versions

When you use engineering products, each product has at least one engineering version. The initial engineering version is automatically created when you create an engineering product. Each engineering version stores the engineering-relevant data that is specific to that version. Here are some examples of this data:

- The version number and previous version number (if applicable)
- The effective-from and effective-to dates
- The product version active status, which indicates whether the version can be released and used in transactions (Learn more in Product readiness.)
- The engineering company that created and owns the product (Learn more in Engineering companies and data ownership rules.)
- Related engineering documents, such as an assembly manual, user instructions, pictures, and links
- The engineering attributes (Learn more in Engineering attributes and engineering attribute search.)
- Bill of materials (BOM) for engineering products
- Formulas for process manufacturing products
- The engineering routes

You can update this data on an existing version, or create a new version, by using an *engineering change order*. (Learn more in Manage changes to engineering products.) If you create a new version of a product, the system copies all engineering-relevant data to that new version. You can then modify the data for that new version. In this way, you can track specific data for each consecutive version. To compare the differences between consecutive engineering versions, inspect the engineering change order, which includes change types that indicate all changes.

As stated earlier, the initial engineering version is automatically created when you create an engineering product. The version number for this version follows the version number rule defined in the engineering category for the product. To transition to a subsequent version, add the product to an engineering change order as a line, and set the **Impact** field to *New version*. The engineering change order includes the details of the change from the current version to the next version.

An engineering product can be in only one engineering change order at a time. This restriction ensures data accuracy and helps avoid overlapping or contradictory changes in the product. Also, the **Engineer** field in the **Header** view of the engineering change order shows the engineer who is responsible for the change order. If the engineer belongs to a team that is defined in the system, the **Responsible** field shows the leader of that team.

Track versions in transactions

When you use engineering change management, your product master data always includes one or more engineering versions. In your setup of engineering products, you can choose whether the engineering version is also part of *logistical transactions*. (Learn more in the Set up engineering product categories section later in this article.) If the logistical impact is relevant, it differs per product and per company. Sometimes, only the latest version of a product is used. Therefore, when you introduce a new version, the previous version can no longer be used. In other cases, the previous version is required in logistical transactions to overcome the following challenges:

- The Logistics department must ship two pieces of a product to a customer. In this case, you must decide whether you want or will allow two different versions to be shipped.
- It's later discovered that a problem occurs, and that it's related to a specific change. In this case, it might be beneficial to determine exactly which version was shipped in each order.
- Companies typically want to ship old versions first, to phase them out of inventory. Especially for low-volume products, this approach can often be managed by determining the effectivity dates of the new version in relation to predictions about when stock of the old version will be depleted. However, sometimes you might not be able to make this comparison, or you may consider the uncertainty of stock level predictions to be too high.

The decision about whether to make versions visible in inventory depends on factors such as those that were previously mentioned, plus company practice and other considerations that are specific to each company. You can specify the behavior for the *engineering product category*. It applies to all products that created from that category, for all companies that the product is released to.

For products that are set up so that they have logistical impact, the engineering version must be specified on each transaction. Although the system proposes the *latest active version*, you can select from all the active versions that are available for the company. For products that are set up so that they don't have logistical impact, the engineering version isn't specified on transactions. However, the system uses the latest active version. For example, when you add a product to a production BOM, the latest version is used, and when you run master planning, the latest version is assumed.

Set up engineering product categories

An engineering product category provides a basis for creating a specific engineering product. Each category establishes a set of default values and policies. Therefore, when you create an engineering product, you first select the category to create it from.

A new category hierarchy type (*engineering product hierarchy*) is automatically set up for you. You can manually create the categories by going to **Engineering change management** > **Setup** > **Engineering product category details**.

Each engineering product category establishes the default behavior of the engineering products that you create based on that category. After you create an engineering product, you can't change its engineering product category. However, if you select the incorrect category, you can delete the product and then re-create it.

When an engineering product category is created, you're prevented from changing the following settings:

- Engineering company
- Product type
- Product subtype
- Product dimension group
- Configuration technology
- Version number rule

Other settings might inherit default values set up for the engineering product category. However, according to the system rules, you can change those values.

To work with engineering product categories, go to **Engineering change management** > **Setup** > **Engineering product category details**. Then follow one of these steps:

- To create a new category, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing category, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing category, select it in the list pane, and then select **Delete** on the Action Pane.

Header

Set the following fields on the header of an engineering product category.

Expand table

Field	Description
Name	Enter a name for the engineering product category.
Engineering company	Select the engineering company where products in this engineering product category can be created and where they're maintained.

Details FastTab

Set the following fields on the **Details** FastTab of an engineering product category.

Expand table

Field	Description
Product type	Select whether the category applies to products or services.
Production type	This field appears only when you enable formula change management in your system. Select the type of production that this engineering product category applies to: • **Planning item** – Use this engineering category to perform formula change management for planning items. Planning items use formulas. They resemble formula items, but they're used to produce only co-products and by-products, not finished products. Formulas are used during process manufacturing. • **BOM** – Use this engineering category to manage engineering products, which don't use formulas and typically (but not necessarily) include BOMs. • **Formula** – Use this engineering category to perform formula change management for finished products. These items have a formula but not a BOM. Formulas are used during process manufacturing.
Catch weight	This option appears only when you enable formula change management in your system. It's available only when the **Production type** field is set to *Planning item* or *Formula*. Set

Field	Description
	this option to *Yes* if you use this engineering category to manage items that require catch-weight support.
Track versions in transactions	Select whether the version of the product should be stamped on all transactions (logistical impact). For example, if you track the version in transactions, each sales order shows which specific version of the product was sold in that sales order. If you don't track the version in transactions, sales orders don't show which specific version was sold. Instead, they always show the latest version. • If this option is set to *Yes*, a product master is created for the product, and each version of the product is a variant that uses the *version* product dimension. The **Product subtype** field is automatically set to *Product master*, and in the **Product dimension group** field, you must select a product dimension group where the *version* dimension is active. Only product dimension groups where *version* is an active dimension are shown. You can create new product dimension groups by selecting the **Edit** button (pencil symbol). • If this option is set to *No*, the *version* product dimension isn't used. You can then select whether to create a product or a product master that uses the other dimensions. This option is often used for products that have a cost difference between versions, or products where different conditions apply in relation to the customer. Therefore, it's important to indicate which version was used in each transaction.
Product subtype	Select whether the category holds products or product masters. For product masters, product dimensions are used.
Product dimension group	The **Track versions in transactions** setting helps you select the product dimension group. If you specify that you want to track the version in transactions, the product dimension groups where the *version* dimension is used are shown. Otherwise, only product dimension groups where the *version* dimension isn't used are shown.
Product lifecycle state at creation	Set up the default product lifecycle state that an engineering product should have when it's first created. Learn more in Product lifecycle states and transactions.
Version number rule	Select the version number rule that applies to the category: • **Manual** – You choose the version number for each new version. • **Automatic** – The system sets the version number, based on a format that you define. When you set up the format, use a number sign (#) to represent a digit and any other character to represent a constant value. For example, if you define the format as *V-##*, the first version is "V-01," the second version is "V-02," and so on. • **List** – The system takes the next number from a predefined list of custom values that you define.
Enforce effectivity	Select whether the effectivity dates of engineering versions must be contiguous, or whether there can be gaps and overlaps. This setting affects the way that you can use the **Effective from** and **Effective to** fields for each engineering version where the category applies.

Field	Description
	• If this option is set to *Yes*, an **Effective from** value must be specified for each version, and neither overlaps nor gaps are allowed between versions. The date range for each engineering version is connected directly to the previous and next engineering versions, if they exist. In this scenario, the newest version is always used, and older versions are no longer used. • If this option is set to **No**, there are no restrictions on the effectivity date fields for engineering versions, and both overlaps and gaps are allowed. In this scenario, multiple versions can be active at the same time, and you can work with any active version. This option also affects BOMs and routes that are connected to a product version. Learn more in the Connect BOMs and routes to engineering versions section later in this article.
Use number rule nomenclature	Set this option to *Yes* to enable rules for defining a product number by using number sequences, engineering attribute names and values, and text constants as segments. To create or modify rules, select the **Edit** button.
Use name rule nomenclature	Set this option to *Yes* to enable rules for defining a name by using the engineering attribute names, engineering attribute values, and text constants as segments. To create or modify rules, select the **Edit** button.
Use description rule nomenclature	Set this option to *Yes* to enable rules for defining the description by using the engineering attribute names, engineering attribute values, and text constants as segments. To create or modify rules, select the **Edit** button.

Attributes FastTab

Use the grid on the **Attributes** FastTab to set up the engineering attributes that apply to products in this category. For information about how to create engineering attributes, see Engineering attributes and engineering attribute search.

Use the buttons on the **Attributes** FastTab to add, remove, and arrange attributes in the grid.

If you change the selection of attributes for an engineering category, and products already exist that are based on that category, you must decide whether to apply your changes to those products. If you want existing products to reflect the changes, select **Update existing products** on the **Attributes** FastTab.

For each row that you add to the grid, set the following fields.

Expand table

Field	Description
Name	Select the attribute to add.

Field	Description
Value	Select the default value for the attribute.
Mandatory	Choose whether the attribute is mandatory, which means users must specify a valid value for the attribute before they can save a product. The effect of this setting varies slightly based on the data type of the selected attribute, as defined in the following list. • **Boolean** – Set this value to *Yes* to require the attribute to have a value of *Yes* (the system refuses to save a product where the attribute is set to *No*). Set this value to *No* to accept a value of *Yes* or *No*. (Attributes of type *Boolean* can't have an empty value.) • **Integer or Decimal** – Set this value to *Yes* to require users to enter a non-zero value for this attribute. Set this value to *No* to allow users to save with a value of zero. (Attributes of these types can't have an empty value.) • **List** – Lists have a data type of *Text*, but also include a predefined list of possible values. Therefore, it's not possible to enter a blank value for attributes of this type, so this setting has no effect and is just informational. • **All other data types** – Set this value to *Yes* to make the attribute mandatory. Set this value to *No* to allow users to save a product without providing a value for this attribute.
Batch attribute	Select whether the attribute should be propagated through the batch functionality.

Readiness policy FastTab

Use the **Product readiness policy** field to select the readiness policy that should be applied to products that are created based on this engineering category. For more information, see Product readiness.

> ⓘ **Note**
>
> The **Product readiness policy** field works slightly differently if you turn on the *Product readiness checks* feature in your system. (That feature lets you apply readiness policies to standard [non-engineering] products). For more information, see Assign readiness policies to standard and engineering products.

Release policy FastTab

Use the **Product release policy** field to select the release policy that applies to products in this category. For more information, see Release product structures.

Connect BOMs and routes to engineering versions

The setting of the **Enforce effectivity** option is important for the connection of BOMs and routes to each engineering version. You can activate multiple BOMs or routes per product only if there's a difference in any of the following settings:

- Product dimension
- Quantity
- Site
- Effectivity dates

Engineering BOMs and routes are created from the engineering version where they apply. They can be recognized by the check mark in the **Engineering controlled** check box. When you work with engineering BOMs and routes, you typically don't design them by using different quantities. You also typically don't design different BOMs per site. Additionally, for engineering BOMs and routes, the effectivity dates always come from the engineering version. Therefore, an engineering version, its BOM, and its route all have the same effectivity dates.

For products where you use the *version* product dimension (together with logistical impact on the transactions), the version is also added to the BOMs and routes. This behavior helps differentiate the BOMs and routes of consecutive versions, regardless of the **Enforce effectivity** setting.

For products where you aren't using the *version* product dimension (without logistical impact on the transactions), the version isn't added to the BOMs or routes. Therefore, there's no difference between the BOMs and routes of consecutive versions. In this case, set the **Enforce effectivity** option to *Yes*. This setting helps prevent engineering versions from overlapping, and you can also activate the BOM and route of a newer version without first deactivating the BOM and route of the previous version. If you set the **Enforce effectivity** option to *Yes* in this case, you must manually deactivate the BOMs and routes of older versions before you can activate the latest version.

Manage changes in formulas and their ingredients

Article • 08/15/2024

If you're using the process manufacturing capabilities of Microsoft Dynamics 365 Supply Chain Management, you can also use the related formula management capabilities to manage the following changes:

- **Formula and planning items:** Manage changes to ingredients in formulas and their co-products and by-products.
- **Co-products and by-products:** Edit quantities and other information of the co-products and by-products in a formula.
- **Catchweight items:** Manage changes to catch-weight items.

Turn this feature on or off

The functionality described in this article requires that both the *Engineering Change Management* and *Manage changes to formulas and their ingredients* features be turned on for your system. For details about how to turn these features on or off, see Engineering change management overview.

Feature naming conventions

In the Supply Chain Management user interface (UI) and documentation, change management functionality is typically referred to as *engineering change management*, and the manageable products are typically referred to as *engineering products*. Although this terminology isn't usually associated with the management of formulas for process manufacturing, you should think of engineering change management as simply change management, and you should think of engineering products as versioned products.

Work with formula change management features

The following list summarizes how engineering change management features apply to formula management. It also provides links to more information. Because formula change management takes advantage of engineering change management features, you should learn how engineering change management works in general, so that you can use it to manage your formulas and their ingredients.

- **Centralized product data management** – Set up an organization that, through a managed release process, ensures that accurate and relevant product data is available to users across the enterprise. Learn more in Engineering companies and data ownership rules.
- **Product versioning** – Track changes to products through product versions, and control the product throughout all stages of the supply chain. In this way, you can track the changes in your formulations. Learn more in Engineering versions and engineering product categories.
- **Product lifecycle management** – Manage the visibility of product data across the organization, and control the availability of product versions at each stage of the supply chain. You have detailed control over when a product version can be used in specific business processes, and you can create your own lifecycle states to fit your business needs. Learn more in Product lifecycle states and transactions.
- **Formula change management** – Users throughout your organization can request changes to formulas. Use change orders to assess and document the impact of proposed changes. Add workflows to manage the change process and the release of new versions of the product and its formula. Learn more in Manage changes to engineering products.
- **Readiness control** – Use system checks and user guidance (questionnaires and checklists) to ensure that all required product data is fully entered before the product is released. Learn more in Product readiness.
- **Enhanced product release functionality** – Release fully defined versions of a product and its formula from an organization (legal entity) to other legal entities. You can even decide whether the product information must be reviewed or edited before release. Learn more in Release product structures.

Note that most of the articles that are linked to in the previous list provide examples that are based on bills of materials (BOMs). However, formulas work in a similar way. Here are some additional concepts that are useful to know when you use change management (or only formula change management) to manage formulas and BOMs:

- For each product engineering category, you can specify the production type (BOM, formula, or planning item). You can also specify whether catch-weight support is required for products that use that category.
- Co-products and by-products aren't engineering products. Therefore, they aren't versioned. If you must change them, just create a new product. This approach makes maintenance easier.
- You can manage end items that are BOMs and that have child formula items. The functionality will work for any combination of BOMs that contain formulas and/or formulas that contain BOMs.

Enable change management on existing products

Article • 08/15/2024

This article explains how you can enable change management for existing products. It also describes cases where your ability to enable change management is limited.

When you enable change management for an existing product, you can create versions of that product and trace changes that are made to it throughout its life. Therefore, you can track those changes by using change orders. To enable change management, you must convert the relevant products to *engineering items* (also referred to as engineering products). Engineering products are products that are versioned and managed through change management. A wizard is provided to guide you through the conversion process.

Turn this feature on or off

The functionality described in this article requires that both the *Engineering Change Management* and *Enable change management on existing products* features be turned on for your system. For details about how to turn these features on or off, see Engineering change management overview.

Restrictions and limitations

Not all product types can be converted to all other types. The following restrictions and limitations apply:

- When you convert a product to an engineering product, it remains a *product*. It doesn't become a *product master*.
- When you convert a product master that has a specific set of dimensions, those dimensions are maintained after the change. For example, if you convert a product master that has the size dimension, it will keep the size dimension.

Therefore, if you have a distinct product, you can change it only to an engineering product that doesn't track the product dimension in transactions (that is, the version dimension isn't used). See the remaining sections of this article for more information about these issues.

Prepare for conversion by creating all required engineering product categories

An *engineering product category* must be assigned to every engineering product. You will do this assignment when you run the **Convert to engineering product** wizard. Engineering product categories must exist for all relevant standard products *before* you can convert those products.

The engineering product category provides a basis for creating an engineering product, and it establishes a set of default values and policies. Engineering attributes and their default values (as defined for the engineering category) are also applied to the resulting engineering product. You can edit the attribute values and/or add more engineering attributes to the resulting product as needed.

The engineering product category must match the product that you assign it to. For example, the product type and dimension group must match both the product and its engineering product category. Learn more in Engineering versions and engineering product categories.

> **ⓘ Important**
>
> The **Convert to engineering product** wizard can convert product only to engineering products where the version isn't tracked in transactions. Therefore, the **Track version in transactions** option must be set to *No* for engineering product categories that you create to convert existing products.

For information about how to create engineering product categories, see Engineering versions and engineering product categories.

Run the Convert to engineering product wizard

The **Convert to engineering product** wizard helps you convert one or more existing products to engineering products. It converts the products into engineering products (versioned products) where the version isn't tracked in transactions (that is, the version dimension isn't used). After the conversion is completed, you can manage the products by using Engineering change management.

The conversion is permanent. Therefore, you won't be able to reverse it later.

Each converted engineering product will continue to be released in the same companies that the original product was released in. However, the engineering bill of materials

(BOM) and routes won't automatically be released to those companies.

Follow these steps to run the **Convert to engineering product** wizard and convert a product to an engineering product.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the grid, select the check box for each product that you want to convert.
3. On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Convert to engineering product** to open the wizard.
4. The first page of the wizard is the **Welcome** page. If you aren't already familiar with the conversion process, carefully read the information on this page. When you're ready to continue, select **Next**.
5. The **Select details for the products to be converted** page shows each product that you selected before you opened the wizard. Inspect the list. Use the **New** and **Delete** buttons on the toolbar to add or remove products as you require.
6. Use the following fields at the top of the grid to assign default values to every product that is listed. (You will be able to change these values for individual products after the conversion is completed.) Default values won't be assigned to products where a relevant value has already been assigned.

    - **Default engineering category** – Select an initial engineering product category to assign to every listed product. The category that you select will be applied only to products that are compatible with it.
    - **Default version** – Enter the initial product version to assign to every listed product. Every engineering product has at least one engineering version.
    - **Default lifecycle state** – Select the initial product lifecycle state to assign to every listed product.
    - **Current BOM will be part of the engineering product** – Select this check box if the current BOM for each listed product should be used as a BOM for the engineering product.

    For more information about product settings, see the next step.
7. Review each product that is listed in the grid, and evaluate how well the default values that you assigned apply to it. For each row, review the following information and set any relevant fields:

    - **Product number** – The product number.
    - **Product name** – The name of the product.

- **Engineering category** – Select the engineering product category that the product should belong to after it's converted. An appropriate category must already exist for each product, as was explained in the previous section of this article. You must assign a category to every product.
- **Version** – Enter the product version to assign to the product after it's converted. For example, you might select a number that fits in the number sequence that your category already uses. Each engineering version stores the engineering-relevant data that is specific to that version. Learn more in Engineering versions and engineering product categories.
- **Product lifecycle state** – Select the product lifecycle state that the product should be in after it's converted. The product lifecycle state lets you to control which transactions are allowed for a given engineering version. Learn more in Product lifecycle states and transactions.
- **Has BOM** – A selected check box indicates that the product has a BOM. The setting of this check box can help you decide how to set the **Current BOM will be part of the engineering product** check box.
- **Current BOM will be part of the engineering product** – Select this check box if the current BOM of the product should be used as a BOM for the engineering product. That BOM will then be managed by Engineering change management. If the product doesn't have a BOM, or if you prefer to manually create a BOM for the converted product later, clear this check box.
- **Has errors** – A selected check box indicates that the product setup has one or more errors. For example, the product type or the dimension group might not match in the category. Products that have errors will be skipped and won't be converted.

8. When you've finished, select **Validate** on the toolbar to validate the product setup. For each row, the **Has errors** check box will be updated to indicate the product's status. Adjust the values until the setup of every product is free of errors.

9. When all the products are set up correctly, select **Next** to continue.

10. The **Confirm selection** page shows the number of products that have no errors in their setup and are therefore ready for conversion. It also shows the number of products that will be skipped because of errors. To run the conversion as a batch job, set the **Run in batch** option to *Yes*.

11. Select **Finish** to apply your settings and start to convert the products to engineering products.

> ⓘ Note

If your system is set up to manually accept products before they are released, you must accept each converted product by using the **Open product releases** page in the appropriate companies. Learn more in Review and accept the product before you release it in the local company.

Product lifecycle states and transactions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

As an engineering product goes through its lifecycle, you need to control which transactions are allowed for each lifecycle state. For example, don't add products that aren't in a mature state to a sales order. Alternatively, if a product is reaching its end-of-life state, you might want to control the inflow of that product.

For an engineering product, changes to the lifecycle state connect to the product's engineering versions. Therefore, the product's lifecycle state can also connect to its engineering versions. When you connect the product lifecycle state to an engineering version, you can use the lifecycle state to control which transactions are allowed for the engineering version.

Create and manage product lifecycle states

To work with product lifecycle states, go to **Engineering change management** > **Setup** > **Product lifecycle state** or **Product information management** > **Setup** > **Product lifecycle state**. Both paths open the same **Product lifecycle state** page. For complete details about how to work with the settings here to create and configure your lifecycle states, go to Product lifecycle states.

Lifecycle states for released products and product variants

For a product that has variants (master and variants), the product (master) has a lifecycle state and each of the variants can have a different lifecycle state.

For specific processes, if either the variant or the product is blocked, the process is blocked. To determine whether a process is blocked, the system makes the following checks:

- For engineering-controlled products:
  - If the current engineering version is blocked, block the process.
  - If the current variant is blocked, block the process.
  - If the released product is blocked, block the process.

- For standard products:
  - If the current variant is blocked, block the process.
  - If the released product is blocked, block the process.

For example, suppose you only want to sell one variant (red) of a given product (t-shirt) and block sales of all other variants for now. You could implement this using the following setup:

- Assign the product a lifecycle state that allows the process. For example, assign the t-shirt product a lifecycle state of *Sellable*, which allows the *Sales order* business process.
- Assign the sellable variant a lifecycle state that allows the process. For example, assign the red variant a lifecycle state of *Sellable*.
- Assign all other variants a lifecycle state that blocks the process. For example, assign the white variant (and all other variants) a lifecycle state of *Not sellable*, which blocks the *Sales order* business process.

Default product lifecycle states

The **Default when released to a legal entity** setting for lifecycle states doesn't apply to engineering products. Instead, the engineering change category specifies the lifecycle state of an engineering product version after it's created in the engineering company. When you release the product to an operational company, the lifecycle state of the product is copied. In other words, when you release an engineering product to an operational company, it has the same lifecycle state that it had in the engineering company. You can overwrite the lifecycle state in the operational company.

The default lifecycle state for an engineering version is specified by its engineering category. The state defaults when you create a new engineering version, including the first version of a new product.

When you create a new product or engineering product, you can also set the default lifecycle state by specifying it on the template released product of the release policy assigned to the product.

In this case, it's possible for the product to have a different lifecycle state than the version when you create a new engineering product.

Manage changes to engineering products

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Engineering change management provides structured processes for managing changes to engineering products. Use the *engineering change request* process to propose and request changes, and then use the *engineering change order* process to make those changes. Users can create engineering change requests or engineering change orders. A process exists for reviewing and approving them, assessing their impact on existing transactions, and following up on them.

Engineering change requests

The engineering change request process lets you capture requests for changes from all the relevant departments in your company. It doesn't matter whether you work as an engineer, or in the Manufacturing, Sourcing, Warehouse, or Sales department: anybody can use an engineering change request to request a change. This change might be an idea for a new product, an issue that you discovered while working with an existing product, a suggestion for improving an existing product, or something else.

After someone submits a request for change, a workflow manages the *review and approval* process and identifies who must approve the change (for example, the product owner).

To set up a workflow for engineering change orders or engineering change requests, go to **Engineering change management** > **Engineering workflows**. Select **New**, select whether the workflow reviews engineering change orders or engineering change requests, and then configure the workflow.

For more information about workflows, see Workflow system overview. For more information about product owners, see Product owners.

Create a new engineering change request

To create an engineering change request, follow one of these steps.

- Go to **Engineering change management** > **Common** > **Engineering change management** > **Engineering change requests**, and then select **New** on the Action Pane.
- Open the **Product details** page for an existing engineering product. Then, on the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering change request** > **New engineering change request**.

A new change request is created. You can now set the fields on each FastTab, as described in the following subsections.

General FastTab

The **General** FastTab lets you provide a basic description of the change request. The following table describes the fields on this FastTab.

Expand table

Field	Description
Change request	Enter a name for the engineering change request.
Title	Enter text that briefly describes or identifies the changes in the request.
Priority	Select a value to indicate how high the priority of the change is. You can customize the available values for your company, as required. (Learn more in Establish common values for engineering change management.)
Category	Select a value to describe the type of change that you're requesting. You can customize the available values for your company, as required. (Learn more in Establish common values for engineering change management.)
Severity	Select a value to indicate the severity of the issue that should be fixed by implementing the request. You can customize the available values for your company, as required. (Learn more in Establish common values for engineering change management.)
Requested by	The name of the user who created the request.
On	The date when the request was created.
Status	The status of the request. When a request is first created, the status is *Created*. When the request is approved, the status changes to *Approved*. If a related change order has been created for the request, the status changes to *Followed up*.
Change	The change order number, if the change request was followed up on via a change order.

Field	Description
order	

Information FastTab

The **Information** FastTab lets you add more information about the request.

To add a row to the grid, select **New** on the toolbar above the grid, and then select one of the following options:

- **File** – Upload a file.
- **Image** – Upload an image file.
- **Note** – Enter a note directly in the grid.
- **URL** – Enter a URL directly in the grid.

The following table describes the fields on each row.

Expand table

Field	Description
Created date and time	The date and time when the row was created.
Type	The type of information that the row was created for (file, image, note, or URL).
Description	Enter a description for the row.
Restriction	A value that indicates whether the information that you added came from an internal or external source.
Attached	A selected check box indicates that the row includes an attachment (file or image). To download the attachment, select the row, and then select **Open** on the toolbar above the grid.

Products FastTab

The **Products** FastTab lets you list each product that the change request affects. Use the buttons on the toolbar to add products to the grid or to remove products.

This list is for informational purposes only. Therefore, you can add as many related products as you consider relevant. If you create a change request from the **Product details** page for an existing product, that product should be listed on the **Products** FastTab after you save the request record.

Source FastTab

The **Source** FastTab lets you track the starting point of the change request. It's useful if, for example, you want to see whether the change request was created from a sales order, who created it, and which company it was created in.

Evaluate the business impact of a change request and send notifications

When you review a request for change, search for dependencies. This approach helps you assess the impact of the requested change on open transactions, such as sales orders, production orders, and on-hand inventory. As you review change requests, send notifications to the people responsible for fulfilling the various types of related orders.

Review affected transactions, block selected transactions, and send notifications

To review affected transactions, block selected transactions, and send related notifications, follow these steps:

1. Go to **Engineering change management** > **Common** > **Engineering change management** > **Engineering change requests**.

2. Open an existing change request, or select **New** on the Action Pane to create a new change request.

3. On the Action Pane, on the **Change request** tab, in the **Business impact** group, select one of the following buttons:

    - **Search** – Scans all open transactions, and then opens the **Business impact to open transactions** dialog box, which lists all transactions that the change affects.
    - **View previous search** – Opens the **Business impact to open transactions** dialog box, which lists the results of the previous search. (A new search isn't done.)

4. The **Business impact to open transactions** dialog box provides a set of tabs, each of which shows a list of affected transactions of a specific type (**Sales orders**, **Purchase orders**, **Production orders**, **Inventory**, and so on). Each tab also shows a number that indicates the number of affected transactions of that type. Select a tab to view the relevant list.

5. To work with a transaction in the list, select it, and then select one of the following buttons on the toolbar:

- **View transaction** – Opens the selected transaction record.
- **Block order** – This button is available only on the **Sales orders** tab. Select it to block the selected sales order.
- **Block line** – This button is available only on the **Purchase orders** tab. Select it to block the selected purchase order line.
- **Notify responsible** – This button is available only on the **Sales orders** tab. Select it to send a change notification to the user who is set as responsible for the selected sales order. For more information about who can see the notifications and how, see Review and process change notifications for transactions.
- **Notify orderer** – This button is available only on the **Purchase orders** tab. Select it to send a change notification to the user who is set as the orderer for the selected purchase order. For more information about who can see the notifications and how, see Review and process change notifications for transactions.
- **Notify production** – This button is available only on the **Production orders** tab. Unlike sales orders and purchase orders, production orders don't have a single user who is set as responsible for them from end to end. Instead, various supervisors or planners usually take ownership for a specific site or for a specific part of the production (for example, for specific resources or resource groups). Therefore, when you select this button, all users who are responsible for any resource that is related to the selected production order receive a change notification. For more information about who can see the notifications and how, see Review and process change notifications for transactions.
- **Notify preparer** – This button is available only on the **Purchase requisition** tab. Select it to send a change notification to the user who is set as the preparer of the selected purchase requisition. For more information about who can see the notifications and how, see Review and process change notifications for transactions.
- **Notify sales responsible** – This button is available only on the **Quotations** tab. Select it to send a change notification to the user who is set as responsible for the selected quotation. For more information about who can see the notifications and how, see Review and process change notifications for transactions.
- **Scrap** – This button is available only on the **Inventory** tab. Select it to scrap the selected inventory.
- **View history** – Opens a history of actions that are taken on the selected transaction by using the **Business impact to open transactions** dialog box. (For example, the history shows whether notifications are sent or transactions are blocked.)
- **View all transactions** – Opens the full list of all transactions, not just the open transactions.

> **Important**
>
> The **Notify production** button is available only if the *Engineering notifications for production* feature is turned on for your system. For instructions on how to turn this feature and its prerequisites on or off, see Engineering change management overview.

Review and process change notifications for transactions

You can read and process the change notifications that you receive in the following ways:

- Except in the case of production orders, change notifications for the transactions that you're responsible for appear in the Action center. The **Show messages** button (bell symbol) on the right side of the navigation bar indicates when a message is available for you in the Action center. Select the **Show messages** button to open the Action center and review the messages.
- To view all production orders that an engineering notification is sent for, go to **Production orders** > **Production orders** > **All production orders**. Then, on the Action Pane, on the **Production order** tab, in the **Engineering change request** group, select **Engineering notifications** to open the **Engineering notifications** page.
- For production orders, you can choose to review only the change notifications that apply to the production resources that you manage. In the **Production floor management** workspace, on the Action Pane, select **Configure my workspace** to filter the page so it shows only information about the production units, groups, and/or resources that you manage. In the **Summary** section, a tile that is named **Production orders with changed products** shows a count of notifications that match your filter settings. Select this tile to open the **Engineering notifications** page, which shows the full list of transactions that meet the criteria of your filter.

As you're reviewing production order notifications on the **Engineering notifications** page, you can follow links to related change orders or production orders by selecting column values or using the related commands on the Action Pane. After you finish evaluating a change, and after you cancel or modify production orders as required, you can mark a notification as resolved. Select the notification, and then, on the Action Pane, select **Resolve**. The notification is removed from all users' views.

> **Important**

The ability to send notifications for production orders requires that the *Engineering notifications for production* feature be turned on for your system. For instructions on how to turn this feature and its prerequisites on or off, see **Engineering change management overview**.

Create a change order from a change request

An engineer who reviews an engineering change request can create an engineering change order directly from the **Engineering change requests** page. On the Action Pane, on the **Change request** tab, in the **Engineering change order** group, select **Copy link and products**.

Select the correct company for the new engineering change order. If the change order results in the engineering product itself being changed (new version, new product, or new variant), assign the change order to the engineering company. If only a local change is needed (**Impact** is set to *None*), assign the change order to a local company and the changes apply to the current product.

Engineering change orders

Engineering change orders provide a structured process for making changes to engineering products. Propose changes by using a copy of the engineering-relevant data. The real master data isn't affected. For more information about engineering-relevant data, see Engineering versions and engineering product categories.

You can create an engineering change order that is based on an approved engineering change request. Engineers can also create engineering change orders from scratch. You can include multiple products on a single engineering change order by following any of these steps:

- Manually select products.
- Use the bill of materials (BOM) to include products that are lower in the product structure (that is, children).
- Use a where-used search to include products that are higher in the product structure (that is, parents).

After the proposal for changes is completed, a workflow handles the review and approval process. You can set up different workflows, based on priority and severity.

To set up a workflow for engineering change orders or engineering change requests, go to **Engineering change management** > **Engineering workflows**. Select **New**, select whether the

workflow reviews engineering change orders or engineering change requests, and then configure the workflow.

For more information about workflows, see Workflow system overview.

Here are some typical stakeholders who might have to approve an engineering change order:

- **Product owners** – For more information about product owners, see Product owners.
- **Responsible team lead** – The **Engineer** field in the **Header** view of the engineering change order shows the engineer who created the engineering change order. If the engineer belongs to a team that is defined in the system, the **Responsible** field shows the leader of that team.
- **Finance department** – The Finance department might have to review cases where the change involves high costs.

You can choose whether to process the engineering change order directly after it's approved, as part of the workflow, or whether to process it later as a manual step. During processing of an engineering change order, engineering data on the actual product is updated.

While you're reviewing a request for change, on the Action Pane, on the **Change request** tab, in the **Business impact** group, select **Search** to assess the impact of the proposed change on open transactions, such as sales orders, production orders, and inventory on-hand. The results are shown in the **Business impact to open transactions** dialog box, where you can select impacted transactions and then use commands in the toolbar to view more information, notify the responsible user, or block the transaction.

Engineering change orders in engineering or operational companies

As described in Engineering companies and data ownership rules, the product data that you can edit varies depending on the type of legal entity that you're working in (an engineering company versus an operational company). Data ownership rules also apply to engineering change orders. Therefore, depending on the legal entity where you create an engineering change order, you can make different types of changes. Here are some examples:

- For engineering change orders in an *engineering company*, you can make basic changes to the engineering data. For example, you can create new versions of a product, change a product's structure via the BOM, and change engineering attribute values. For each affected product, select one of the following values in the **Impact** field:
  - **None** – Update the existing product version (in-version update).

- **New version** – Create a new version that is based on the selected product version.
- **New product** – Create a completely new product that is based on the selected product version.
- **New variant** – Create a new variant based on the selected product version. Its BOM and route information are copied.

- For engineering change orders in an *operational company*, you can change the logistical data of the product. For example, you can enrich the existing BOM with settings for sourcing, add local routes or local BOMs, and even enrich a BOM by adding new BOM lines for local packaging materials, lubrication fluids, or instructions in the local language. Enrichments that users make in the operational company are preserved when new updates are sent from the engineering company. Learn more in Engineering companies and data ownership rules.

  When engineering change orders are processed in the engineering company, the products are created and/or updated only in the engineering company. Therefore, if you need to update the product master data, you must also release the products to operational companies.

- You can release products directly from engineering change orders. Open the change order, and then, on the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Release product structure**. The process works just as it works when you release products from the **Released products** page. Learn more in Release product structures.

- You can have products automatically released from engineering change orders, based on the following factors:
  - Re-releases to companies where products were previously released. Select **Search** to scan all previous releases, and then select **View** to view the results. The **View** page shows the previous product releases, and you can select which products you want to re-release. Then close the **View** page, and select **Process** to re-release the selected products.
  - Automatic release settings in the release control of the engineering product category. You can do this release as part of the workflow. When the **collect release proposal** block is used, the release proposal is filled with re-releasing proposals (see the previous list item), and products are released to companies if the **Auto release** check box is selected in the release control of the engineering product category. You can select **View** to view the results, as described in the previous list item. The products are also released when the **process release proposal** block is used. If you choose only to collect the release proposal as part of the workflow, you can manually start the release by selecting **Process**, as described in the previous list item.

Follow up on an engineering change request via an engineering change order

As soon as an engineering change request is approved, you can follow up on it via an engineering change order. You can combine multiple engineering change requests into a single engineering change order. A single engineering change order can even include multiple products. (Typically, you use this approach when the same change must be applied to multiple products.) However, you can't create multiple engineering change orders from a single engineering change request.

To follow up on a change request via a change order, open the change request, and then, on the Action Pane, on the **Change order** tab, in the **Engineering change order** group, select **Copy link and products**. You can then select an existing engineering change order to connect the change request to, or you can create a new engineering change order for that specific request.

Engineering change order report

Engineering change order reports describe the changes made in an engineering change order. They're useful both during and after the review and approval process.

To view an engineering change order report, open the relevant change order. Then, on the Action Pane, on the **Change order** tab, in the **View** group, select **Engineering change order report**.

Fields on an engineering change order

Most of the fields on engineering change orders are the same as the fields for released products, engineering versions, documents, BOMs (lines), and routes (operations). However, the fields in the following table are unique to change orders.

Expand table

Field	Description
Engineering change reasons	Select the reason for changing the affected product.
Change description	Enter a description of the change.
Required special tooling	Specify whether special tooling is required to apply the change.
Engineering material disposition	Select a material disposition code for any waste that is produced when the change is applied.

Field	Description
Customer approval required	Specify whether customer approval is required before the change can be applied.
Received customer approval	Specify the status of the customer approval.
Environmental health and safety	Specify whether environmental health and safety rules are applicable to the change. If they are, select the applicable rules.

Use the **Maintain/copy change information** button to copy change information between affected products.

Use electronic signatures to approve and activate BOMs and routes

To use electronic signatures to approve and/or activate bills of material (BOM) and/or route changes, go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature requirements**. Then make sure each of the following items has **Signature required** set to *Yes*:

- Activate engineering change order product bill of materials
- Activate engineering change order product routes
- Approve engineering change order product bill of materials
- Approve engineering change order product routes
- Approve engineering version BOM and BOM versions
- Approve engineering version and route version

Last updated on 05/19/2026

Product readiness

Article • 06/03/2022

You can use readiness checks to help ensure that all the required master data has been specified for a product before it's used in transactions. When readiness checks are used, a user or team is made responsible for validating specific predefined product-related data.

You can mark the **Active** check box for an engineering product, variant, or version after all the required data has been entered and verified, and after all the readiness checks have been processed. If one or more checks haven't been processed for the product, version, or variant, then when you try to mark the **Active** check box, you will receive a prompt warning you that not all checks have been completed.

You can create readiness checks for new engineering products, variants, and versions. You can also apply readiness checks to standard (non-engineering) products. (Learn more in the Readiness checks on standard products section later in this article.)

You can use standard products in transactions even though not all readiness checks have been completed. If you need to block a product from being used in transactions, use its lifecycle state. You can assign a lifecycle state that blocks a product from being used in transactions and then, after all readiness checks have been completed, assign a new lifecycle state that allows the required transactions.

Types of readiness checks

There are three types of readiness checks:

- **System check** – The system verifies whether there is a valid record. For example, the record might be an active bill of materials (BOM).
- **Manual check** – A user verifies whether the record is valid. For example, a readiness check might require validation of the default order settings. In some cases, such as when the product is still being designed and therefore won't be placed in stock, no default order settings are required. However, default order settings might be required for another product of the same type, because the product can be held in stock. The user is responsible for knowing how to correctly decision whether a readiness check is required.
- **Checklist** – The user answers a series of questions from a checklist, and the system determines whether the answers meet expectations. The checklist can have any subject. For example, it can be used to determine whether marketing materials or product documentation is completed.

How readiness checks are created for a new engineering product, variant, or version

Readiness check policies can be applied at the released product level, the released variant level, and the engineering version level.

When you create a new *engineering product*, the system determines whether a readiness check policy applies to it. If a readiness check policy applies, the following events occur:

- Readiness checks are created for the product, according to the applicable policy.
- The engineering version is set to inactive to block the product from being used. All engineering versions for the product are set to inactive.

If a new *variant* is created for a product, the system checks whether a readiness check policy applies to it. (Readiness checks can be applied at the released variant level and the engineering version level.) If a policy applies, the following events occur:

- Readiness checks are created for the product, according to the applicable policy.
- The engineering version and variant are set to inactive to block the product from being used.

If a new engineering *version* is created for a product, the system checks whether a readiness check policy applies to it. (Readiness checks can be applied at the engineering version level.) If a policy applies, the following events occur:

- Readiness checks are created for the product, according to the applicable policy.
- The engineering version is set to inactive to block the product from being used.

> **Note**
>
> You can also set up readiness check policies for standard (non-engineering) products. Learn more in the Readiness checks on standard products section later in this article.

View readiness checks

View open readiness checks for a product or product version

To find the open readiness checks for a product, open the **Released products details** page. Then, on the Action Pane, on the **Product** tab, in the **Readiness checks** group,

select **Readiness checks**.

To find the open readiness checks for a product version, open the **Engineering versions** page for a released product and choose a version. Then, on the Action Pane, on the **Product** tab, in the **Checklist** group, select **Readiness checks**.

View open readiness checks that are assigned to you

To view the open readiness checks that are assigned to you, follow one of these steps.

- Go to **Engineering change management** > **Common** > **Product readiness** > **My open readiness checks**.
- Go to **Product information management** > **Workspaces** > **Product readiness for discrete manufacturing**.

The setup that specifies who a readiness check is assigned to is done for the readiness policy. Readiness checks can be assigned to a person or a team. If a readiness check is assigned to a team, there is one person on the team who must process the readiness check.

Process open readiness checks

Process system and manual readiness checks

After you open the **Readiness checks** page, you can view the subject of system and manual readiness checks by selecting **View related information** on the Action Pane. You can then complete and/or validate the data for the readiness check. Open readiness checks have a **Status** value of *Pending*. This status indicates that the readiness check must still be processed. To process a readiness check, follow one of these steps.

- On the Action Pane, select **Check/complete** to review and complete the readiness check. When you've finished, the **Status** field is updated to *Passed*.
- On the Action Pane, select **Skip** if you want to skip a readiness check that isn't mandatory. For example, you set up a readiness check for price calculations. However, you decide to skip this check while the product is still in the design phase. In this case, the **Status** field is updated to *Skipped*.

Depending on the configuration of the readiness policy, when the **Status** field for a readiness check is updated to *Passed*, an extra step might be required to approve the readiness check. In this case, select **Approval** to complete the readiness check. This approval step is always mandatory when the readiness check is skipped.

When all the open readiness checks for a new product, variant, or version have been processed and approved as required, the item automatically becomes active and therefore ready to use.

Process checklist readiness checks

To open a checklist, open the **Readiness checks** page, and then, on the Action Pane, select **Start checklist**. When you've completed the checklist, the system validates whether the readiness check is passed, based on the settings in the questionnaire. If the check is passed, the **Status** field is updated to *Passed*. If the readiness check isn't mandatory, you can skip it. In this case, the **Status** field is updated to *Skipped*.

Depending on the configuration of the readiness policy, when the **Status** field for a readiness check is updated to *Passed*, an extra step might be required to approve the readiness check. In this case, select **Approval** to complete the readiness check. This approval step is always mandatory when the readiness check is skipped.

When all the open readiness checks for a new product, variant, or version have been processed and approved as needed, the item automatically becomes active and therefore ready to use.

Create and manage product readiness policies

Use product readiness policies to manage the readiness checks that apply to a product. Each readiness policy contains a set of readiness checks. When a readiness policy is assigned to an engineering product category or a shared product, all the products that are related to that category or shared product will have the readiness checks that are included in the readiness policy.

To work with product readiness policies, go to **Engineering change management** > **Setup** > **Product readiness policies**. Then follow one of these steps.

- To create a new policy, select **New** on the Action Pane, and then set the fields as described in the following subsections.
- To edit an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then, on the **General** FastTab, make sure that the **Active** option is set to *No*. Then select **Delete** on the Action Pane.

Header

Set the following fields on the header of a product readiness policy.

Expand table

Field	Description
Name	Enter a name for the policy.
Description	Enter a description of the policy.

General FastTab

Set the following fields on the **General** FastTab of a product readiness policy.

Expand table

Field	Description
Product type	Select whether the policy applies to products of the *Item* or *Service* type. You can't change this setting after you save the record.
Active	Use this option to help maintain your readiness policies. Set it to *Yes* for all readiness policies that you use. Set it to *No* to mark a readiness policy as inactive when it isn't used. Note that you can't inactivate a readiness policy that is assigned to an engineering product category or a shared product, and you can delete only inactive release policies.

Readiness control FastTab

For each type of readiness check that you want to include in the policy, add a row on the **Readiness control** FastTab. Use the following buttons on the FastTab toolbar to add and remove rows as you require:

- **Add check** – Add a standard readiness check to the policy. When you select this button, the **Add check** dialog box appears. There, you can select from a list of available checks.
- **Add existing questionnaire** – Add a blank row to the grid. You can then assign an existing questionnaire by setting the fields in the following table.
- **Copy** – Add a copy of the selected row to the grid.
- **Delete** – Delete the selected row from the grid.

For each row that you add, set the following fields.

Expand table

Field	Description
Process area	Select the area that the check is related to.
Type	Select whether the check is a system check, a manual check, or a checklist (questionnaire).
Name	If the check is a checklist, enter a name. For system and manual checks, this field is automatically set.
Description	If the check is a checklist, enter a description. For system and manual checks, this field is automatically set, and the description explains the focus of the check.
Apply checks on	Select whether the row should generate readiness checks in response to a new released product, released variant, or released version.
Execute in	Select whether readiness checks that the row generates apply to all companies or a single company.
Company	If you set the **Execute in** field to *Single company*, select the company.
Owner type	Select whether readiness checks that the row generates should be assigned to a person or a team.
Owner	Select the person or team that readiness checks that the row generates should be assigned to.
Questionnaire	Select the questionnaire that should be used for the checklist. The checklist is a local checklist in the company where the readiness check is done. The system must be able to evaluate whether the checklist is correctly answered. Therefore, the checklist must be set up so that an evaluation is done based on correct answers. For more information about how to create questionnaires, see Using questionnaires and its related articles.
Automatic approval	Readiness check records include an **Approved** check box that indicates the approval status. Select the **Automatic approval** check box for checks that should be set to approved immediately after the assigned user completes them. Clear this check box to require explicit approval as an extra step.
Mandatory	Select this check box for checks that must be completed by the assigned user. Mandatory checks can't be skipped.

Assign readiness policies to standard and engineering products

When you create a new product based on an engineering category, you create both a *released product* and a related *shared product*. The way that readiness policies are resolved for a released product depends on whether the *Product readiness checks*

feature is turned on for your system (see the Readiness checks on standard products section later in this article for details about this feature and how to turn it on or off).

- When the *Product readiness checks* feature is turned *off* on your system, the readiness policy is set and shown only on engineering category records. To learn which policy applies to a released product, the system checks the **Product readiness policy** field for the related engineering category. You can change the readiness policy for an existing product by editing the related engineering category (not the shared product).
- When the *Product readiness checks* feature is turned *on*, it adds a **Product readiness policy** field to the **Product** page (where shared products are set up) and to the **Released product** page (where the value is read-only and is taken from the related shared product). The system finds the readiness policy for a released product by checking the related shared product. When you use an engineering category to create a new engineering product, the system creates both a shared product and a released product, and copies any **Product readiness policy** setting for the engineering category to the new shared product. You can then change the readiness policy for an existing product by editing the related shared product (not the released engineering category).

To assign a readiness policy to a shared product, follow these steps.

1. Go to **Product information** > **Products** > **Products**.
2. Open or create the product that you want to assign a readiness policy to.
3. On the **General** FastTab, set the **Product readiness policy** field to the name of the policy that should apply to the product.

To assign a readiness policy to an engineering category, follow these steps.

1. Go to **Engineering change management** > **Setup** > **Engineering product category details**.
2. Open or create the engineering category that you want to assign a readiness policy to.
3. On the **Product readiness policy** FastTab, set the **Product readiness policy** field to the name of the policy that should apply to the engineering category.

Readiness checks on standard products

You can enable product readiness checks for standard (non-engineering) products by turning on the *Product readiness checks* feature in Feature management. This feature makes a few small changes to the readiness check system so that it supports standard products.

Enable or disable readiness checks on standard products

This feature requires that both the *Engineering Change Management* and *Product readiness checks* features be turned on for your system. For details about how to turn these features on or off, see Engineering change management overview.

Create readiness policies for standard products

You create readiness policies for standard products just as you do for engineering products. See the information earlier in this article.

Assign readiness policies to standard products

To assign a readiness policy to a standard product, open the related shared product, and set the **Product readiness policy** field to the name of the policy that should apply. Learn more in the Assign readiness policies to standard and engineering products section earlier in this article.

View and process readiness checks on standard products

When this feature is turned on, you view and process readiness checks for standard products just as you do for engineering product. See the information earlier in this article.

Release product structures

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To ensure that engineering-relevant product data can be easily reused in different legal entities, release complete product structures in addition to releasing products together with their engineering versions. You can release multilevel bill of materials (BOM) structures together with the parent in a single release action. In this case, the BOM and the lower-level products are also released.

Engineering companies create and maintain engineering products to meet quality requirements as they're designed. Each operational company that manufactures a product needs the same product and underlying BOM. Depending on the production facility, you might create the route locally. In this case, you don't release a route together with the product. For legal entities that sell the products but don't manufacture them, the BOM might not be required.

To make the process more efficient, all engineering-relevant data can be released to other operational companies at the same time. This data includes the product structure. During the release process, you can choose which part of the product data to release.

For more information about engineering companies and operational companies, see Engineering companies and data ownership rules.

You can release both standard products and engineering products together with the release product structure. During this process, the whole product structure is released, even the BOM and route from the company that the products are being released in.

For an example of how to release a product, see Release an engineering product to a local company.

Released data for a product when the release product structure is used

The release of engineering products includes the following data:

- **Product data** – A new released product is created.
- **Engineering version data** – The engineering version and its data are created or updated. If you release the same engineering version again to an operational company, the engineering data is overwritten.
- **Engineering attributes** – The engineering attributes and their values are created or updated.
- **Engineering bill of materials** – The engineering BOM and its lines can be created or updated. For more information about data ownership, see Product owners.
- **Engineering routes** – The engineering routes and their operations can be created or updated. For more information about data ownership, see Product owners.
- **Engineering documents** – The engineering documents that are connected to the engineering version are created or updated.

When you turn on engineering change management on your system, the release product structure is available. In addition, standard products include their BOMs and routes when they're released.

Product acceptance

Product acceptance is a key parameter that influences the release process. Set this parameter for each company by going to **Engineering change management** > **Setup** > **Engineering change management parameters**. For more information, see Engineering change management parameters.

Automatic product acceptance

Each release of engineering products starts when someone from the engineering company selects a product to release. When the **Product acceptance** parameter is set to *Automatic*, the user at the engineering company decides which product data to automatically release to the operational companies. The product is then automatically released to the companies that the user selects in the release wizard.

Manual product acceptance

Each release of engineering products starts when someone from the engineering company selects a product to release. When the **Product acceptance** parameter is set to *Manual*, the user at the engineering company decides which product data to release to the operational companies.

A user from each operational company then reviews the product data and decides whether to accept the release. The user at the operational company can set the following options when the data is received:

- If the products (updates) aren't relevant for the operational company, the user can choose not to accept the release.
- The user can change the item template for new products.
- The user can choose whether the product should be released together with their BOMs and/or routes, and whether they should be released as approved and active.
- The user can change the effective-from dates of the products.

For an example of how to accept a product, see Review and accept the product before you release it in the local company.

> **Note**
>
> For standard products, you can release from any legal entity to any other legal entity. For engineering products, the only legal entity that you can release from is the engineering company.

Release policies

Not all operational companies need the same product data. In general, operational companies that manufacture engineering products require a BOM, whereas operational companies that only sell engineering products don't require a BOM. Use release policies to establish the parameters that are used for the release of products.

For more information about engineering product categories, see Engineering versions and engineering product categories.

During the release process, you can influence the settings.

Create and manage product release policies

To work with product release policies, go to **Engineering change management** > **Setup** > **product release policies**. Then follow one of these steps.

- To create a new policy, select **New** on the Action Pane, and then set the fields as described in the following subsections.

- To edit an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described in the following subsections.
- To delete an existing policy, select it in the list pane, select **Edit** on the Action Pane, and then, on the **General** FastTab, make sure that the **Active** option is set to *No*. Then select **Delete** on the Action Pane.

Header

Set the following fields on the header of a product release policy.

Expand table

Field	Description
Name	Enter a name for the policy.
Description	Enter a description of the policy.

General FastTab

Set the following fields on the **General** FastTab of a product release policy.

Expand table

Field	Description
Product type	Select whether the policy applies to products of the *Item* or *Service* type. You can't change this setting after you save the record.
Production type	This field appears only when you enable formula change management in your system. Select the type of production that this release policy applies to: • **Co-product** – Use this release policy to manage co-products. Co-products are produced during process manufacturing, and aren't versioned or engineering products. Release policies for co-products can help ensure that important settings, such as **Storage dimension group** and **Tracking dimension group**, are set up by using a Released product template before they're released to a company. • **By-product** – Use this release policy to manage by-products. By-products are produced during process manufacturing, and aren't versioned or engineering products. Release policies for by-products can help ensure that important settings, such as **Storage dimension group** and **Tracking dimension group**, are set up by using a Released product template before they're released to a company. • **None** – Use this policy to manage standard products that aren't versioned or engineering products, or co-products or by-products. • **Planning item** – Use this release policy to manage planning items that are produced by using process manufacturing. Planning items use formulas. They resemble formula

Field	Description
	items, but they're used to produce only co-products and by-products, not finished products. • **BOM** – Use this release policy to manage engineering products, which don't use formulas and typically (but not necessarily) include BOMs. • **Formula** – Use this release policy to manage finished items that are produced by using process manufacturing. These items have a formula but not a BOM.
Apply templates	Select one of the following options to specify whether and how product release templates should be applied when the policy is used: • **Always** – Always use a template released product for releases. If you select this option, use the **All products** FastTab to specify the template that is used for each company that you release to. If you don't specify a template for each company that is listed on the **All products** FastTab, you receive an error when you try to save the policy. • **Optional** – If a template released product is specified for a company that is listed on the **All products** FastTab, that template is used when you release to that company. Otherwise, no template is used. If you select this option, you can save the policy without assigning templates to all companies. (No warning is shown.) • **Never** – No template released product is used for any companies that you release to, even if a template is specified for companies that are listed on **All products** FastTab. The template columns are unavailable.
Active	Use this option to help maintain your release policies. Set it to *Yes* for all release policies that you use. Set it to *No* to mark a release policy as inactive when it isn't used. You can't deactivate a release policy that is assigned to an engineering product category, and you can delete only inactive release policies.

All products FastTab

On the **All products** FastTab, add a row for each operational company that you want to use this policy to release to. Use the buttons on the **All products** FastTab to add and remove rows as needed. For each row that you add, set the following fields.

> **Note**
>
> The settings on the **All products** FastTab apply to both engineering products and standard products.

Expand table

Field	Description
Company accounts ID	Select the company that the row applies to. The parameters on the row apply when products are released to this company.
Template released product	Add a template for the product.
Copy BOM approval	Select this check box to copy the BOM approval status to the receiving company.
Copy BOM activation	Select this check box to copy the BOM activation status to the receiving company.
Copy route approval	Select this check box to copy the route approval status to the receiving company.
Copy route activation	Select this check box to copy the route activation status to the receiving company.

Option parameters for engineering products FastTab

Every time you add a row on the **All products** FastTab, a row that has a matching **Company accounts ID** value is also created on the **Option parameters for engineering products** FastTab. If you remove a row from the **All products** FastTab, the row that has a matching **Company accounts ID** value is also removed from the **Option parameters for engineering products** FastTab.

For each row shown on the **Option parameters for engineering products** FastTab, set the following fields.

> **Note**
>
> The settings on the **Option parameters for engineering products** FastTab apply only to engineering products.

Expand table

Field	Description
Template BOM	When a product that has a BOM is released, the lines of the specified template BOM are added. This field is useful for adding local components, such as packaging or instructions in the local language.
Template route	When a product that has a route is released, the lines of the specified template are added.

Field	Description
Copy effectivity	Select whether to copy effectivity dates from the engineering company to the operational company when you release products.
Automatically add to release proposal	Select this check box for products that should automatically be released on the engineering change order. In this way, products that belong to engineering product categories that use this release policy can automatically be released to operational companies where this option is set up. (Learn more in Manage changes to engineering products.)

Review each product when you release it

When engineering products that have BOMs or routes are released, the parameters default to values indicated in the release policy. As a user, you can influence this behavior on the releasing side when you use the release product structure.

To release engineering products, on the **Released products** page, select the products to release, and then select **Release product structure** to open the release wizard. The **Select engineering products to release** page shows the products. Select a single product, and then select **Release details** to review the release details for the product.

On the **Release details** page, you can change the value of the **Receive BOM**, **Copy BOM approval**, **Copy BOM activation**, **Receive BOM**, **Copy route approval**, and **Copy route activation** fields. In the push-pull scenario, you can change the value of the same fields on the receiving side, provided that the BOM and route are released.

Product owners and product releases

Because product owners know which legal entities need their products, only members of a product's product owner group can release that product. Other users can't release products that they don't own.

This behavior applies only when a product is directly selected for release. Non-owner users *can* release products that are part of another product's structure via a BOM when they release the parent product, provided that they own the parent product.

For example, product X is assigned to the *Design cabinets* product owner group. Product X is also part of the BOM of product Y, which is assigned to the *Design speakers* product owner group. If a user from the *Design speakers* product owner group releases product Y and its BOM, product X is released together with product Y.

Learn more in Product owners.

Release multiple BOMs/formulas

In older versions of Supply Chain Management, when you release a product, only the first active BOM or formula (as of the date of release) is released. If there are no active BOMs or formulas, the engineering version isn't released.

Starting in Supply Chain Management version 10.0.34, you can release multiple BOMs or formulas. To enable this new functionality, use the Feature management workspace to enable the *Release multiple BOMs/formulas for Engineering Change Management* feature. As of Supply Chain Management version 10.0.43, this feature is mandatory and can't be turned off.

When the *Release multiple BOMs/formulas for Engineering Change Management* feature is enabled, all BOMs or formulas that are active for a product are released when you release the product. This functionality can be relevant, for example, if you have multiple active formulas that apply for various from quantities. You can view the different BOMs or formulas and their respective routes on the BOM designer when releasing on the **Release product structure** page and when reviewing the release on **Open product releases** page.

A product template is required for release

The release policy for the company where a product is to be released must have a product template assigned. This requirement exists because some fields in the local company (such as item model group) are required to create a BOM, and many of these fields are company specific. These field values are copied to the released product from the release template and can be updated as needed.

Generate variants for engineering products

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to generate variants for engineering products.

Turn variant generation for engineering products on or off

The functionality described in this article requires that both the *Engineering Change Management* and *Variant generation for engineering products* features be turned on for your system. For details about how to turn these features on or off, see Engineering change management overview.

Generate one or more new variants of an engineering product

You can create one or more new variants of a product without copying information from an existing product. This is useful when you need to create several product variants at the same time.

The following procedure provides an example of how to create several variants that include the color dimension.

1. Open the **Released products** page (for example, go to **Engineering change management** > **Common** > **Released products**).
2. On the Action Pane, open the **Product** tab and, from the **New** group, select **Engineering product**.
3. The **New product** dialog opens. Select the appropriate **Engineering category**.
4. If your selected engineering category includes variant dimensions, then you can set values for them now. For this example, if the category has a **Color** dimension, you can set it to *Blue*.

5. Make other settings as needed. Select **OK** to create the product.
6. The product and the blue V-1 variant are created, and the new product now opens.
7. Add a bill of materials (BOM) and route to the variant as needed.
8. On the Action Pane, open the **Product** tab and, from the **Product master** group, select **Product dimensions**.
9. The **Product dimensions** page opens. This page includes a tab for each available dimension. On each tab, add a row for each value you will support for each relevant dimension. (For this example, you might add rows on the **Color** tab for *White*, *Yellow*, and *Green*).
10. Close the page, and then select **Released product variants**. Notice that the first variant that you created (blue V-1) appears.
11. On the Action Pane, on the **Product variant** tab, select **Variants suggestions**.
12. In the **Variant suggestions** dialog box, follow one of these steps:
    - At the top of the dialog box, there is a section for each available dimension. For each dimension, select the checkbox for each value that you want to generate a variant suggestion for, and then select **Suggest** on the toolbar. Relevant suggestions are added to the **Suggested variants** section.
    - Select **Suggest all** on the toolbar to generate variant suggestions for all available combinations of dimension values. The suggestions are added to the **Suggested variants** section.
13. In the **Suggested variants** section, select the checkbox for each variant that you want to create. Then select **Create** to generate and release the selected variants to the engineering company. The following conditions apply:
    - None of the created variants will have a BOM or route.
    - The attributes for these variants will default from the engineering category and will not be copied from the previous variant.

Generate a variant as a copy of another product variant

You can create a variant of a product based on another product variant. The bill of materials (BOM) and route from the source product variant are copied to the new variant. This may be useful for discrete manufacturing products where it can be helpful to create the BOM based on

a starting BOM and keep track of the changes from the previous variant. To maintain traceability, the system records which variant was copied to create new copy.

The following procedure provides an example of how to create a new variant that includes the color dimension by creating a copy of an existing variant

1. Open the **Released products** page (for example, go to **Engineering change management** > **Common** > **Released products**).
2. On the Action Pane, open the **Product** tab and, from the **New** group, select **Engineering product**.
3. The **New product** dialog opens. Select the appropriate **Engineering category**.
4. If your selected engineering category includes variant dimensions, then you can set values for them now. For this example, if the category has a **Color** dimension, you can set it to *Blue*.)
5. Make other settings as needed. Select **OK** to create the product.
6. The product and the blue V-1 variant are created, and the new product now opens.
7. Add a BOM and route to the variant as needed.
8. Add attributes to the product variant as needed.
9. Add the blue V-1 product variant to an engineering change order.
10. Set **Impact** to *New variant*.
11. Select the new color value (for example, *White*). Note that the following conditions will apply:

    - The new variant has a BOM and route that have been copied from the previous variant.
    - The new variant has the attributes copied from the previous variant.

12. Approve the change order.
13. Process the change order. After the order is processed, the new V-1 variant will be created and released to the engineering company.

Engineering change management FAQ

Article • 06/03/2022

This article provides answers to frequently asked questions about the engineering change management feature.

Should I track the version in transactions?

When you create an engineering change category, the **Engineering change category details** page provides an option that is named **Track version in transactions**. What is this setting, and what does it do?

- If you set the **Track version in transactions** option to *Yes*, the **Dimension group** field will be filtered so that it shows only dimension groups where version is an active dimension.
- If you set the **Track version in transactions** option to *No*, the **Dimension group** field will be filtered so that it shows only dimension groups where the version dimension is **not** an active dimension.

If you track the version in transactions

For engineering categories where you've selected a dimension group where version is an active dimension, you will track versions in transactions for products in that category. In this case, the engineering product will be a product master, and each version of the product will be a product variant that uses the version dimension. Other dimensions can be used together with the version dimension.

In this case, each engineering version will be treated as a variant in all processes. Therefore, if you have a specific variant in a transaction (so that you can determine which variant was sold or purchased), you must manage stock for each version, master planning will plan supply for each version, and so on. If you retire a version from the market, you must manually adjust its effective-from and effective-to dates so that they reflect the change. You must also manage your inventory to make sure that you don't have unused versions of items in your warehouses.

Although this option requires more management effort, we recommend it if you require high traceability of the specific versions that are used in each transaction.

If you don't track the version in transactions

For engineering categories where you've selected a dimension group where version is **not** an active dimension, you will **not** track versions in transactions for products in that category. In this case, if you don't use any other dimension, the engineering product will be a distinct product. The product will still be versioned, and you can manage information about specific versions (for example, their bill of materials [BOM] and route), but you won't be able to trace which specific version was used in each transaction. The effective-from and effective-to dates indicate the validity of each version.

This option is much easier to manage, because if you want to change from one version to another, you just have to make the required changes in a change order, and then update the effective-from and effective-to dates in the engineering version. The production processes will then pick up the required BOM and route for the product (and its specific version).

Most organizations choose this option because it provides version and change management, but it doesn't add the extra overhead of tracking the version in each transaction, in inventory, and during master planning.

Which fields are copied from the released item template?

When an engineering company creates an engineering product, that product is created as a released product in the engineering company. The released product that is created is based on the selected *released item template*. (The released item template is itself an existing released product.) The released item template is also used when the product is released to an operational company. In each case, the released item template defines most of the field values for the released product, and those values come from the associated **Released product details** page.

The following tables shows the fields that are copied during these processes.

Expand table

FastTab	Fields that are copied on product creation in the engineering company	Fields that are copied on release to an operational company
General	All fields in the **Administration** section	The same fields that are copied for the engineering company
Purchase	All fields	All fields except **Unit**

FastTab	Fields that are copied on product creation in the engineering company	Fields that are copied on release to an operational company
Sell	All fields in the following sections: **Sales order**, **Administration**, **Taxation**, **Price update**, **Base sales price**, **Charges**, **Discounts**, and **Alternative product**	All the same fields that are copied for the engineering company, except **Unit**
Foreign trade	All fields	All fields
Manage inventory	All fields and sections *except* **Physical dimensions** and **Catch weight**	All the same fields that are copied for the engineering company, except **Unit**
Engineer, **Plan**, **Manage costs**, **Manage projects**, **Financial dimensions**, and **Warehouse**	All fields	All fields except **BOM Unit**
Product variants	All fields in the **Default product variant** section	The same fields that are copied for the engineering company

In addition to the fields that are shown in the previous table, all default order settings are copied from the released item template, both when the product is created in the engineering company and when it's released to an operational company. (To view the default order settings for a released item template, open the relevant **Released product details** page, and then, on the Action Pane, on the **Manage inventory** tab, select **Default order settings**.)

> ⓘ Note
>
> - The unit is defaulted from the template.
> - For retailers using Dynamics 365 Commerce functionality, when assigning a retail category to a product, the retail category applies default values for many of the fields for the released product level. These defaults overwrite default values that may have already been set by the template or copied from engineering.

Should I create a separate legal entity for engineering products or use an existing legal

entity?

Your business requirements determine whether you should create a new legal entity for engineering products.

By creating a separate engineering company, you can keep engineering data separate and then add modifications as they are required for your local operational companies. In this way, you can achieve the following goals:

- Keep a separate entity where the engineering products are created and managed.
- Prevent engineering products from appearing together with the rest of your released products until they are ready and released.
- Clearly distinguish data that is dictated by engineering and local data.

On the other hand, you should probably use an existing legal entity as an engineering company if the following conditions apply to you:

- You have only one legal entity in your system, and/or you don't require a clear separation between products that are being engineered.
- You don't want to duplicate some data, such as resource groups, resources, operations, and (perhaps) sites.

What is the nomenclature for engineering versions and variants?

The nomenclature for engineering products and product variants works in the following way:

- For the engineering product (that is, the distinct product if no dimensions are used, or the product master if any dimension is used), the number rule nomenclature is defined in the engineering product category. There, you have the option to use a number sequence, text constants, and attribute names and values.
- For each variant of an engineering product (if your engineering product is a product master, variants are set up in the engineering product category where you specify the dimension group), the number rule nomenclature for each variant is defined in the dimension group. In this case, you can use the product ID of the master, and the dimension values and names.

Production process overview

07/10/2025

This article gives an overview of the production processes. It describes the various stages of production orders, batch orders, and kanbans, from order creation to closing of the financial period.

The production of products, a process that is also known as the production life cycle, follows specific steps that are required to complete the manufacture of an item. The life cycle begins with the creation of the production order, batch order, or kanban. It ends with a finished, manufactured item that is ready for either a customer or another phase of production. Each step in the life cycle requires different kinds of information to complete the process. As each step is completed, the production order, batch order, or kanban shows a change in the production status. Different types of products require different manufacturing processes.

The **Production control** module is linked to other modules, such as **Product information management**, **Inventory management**, **General ledger**, **Warehouse management**, **Project accounting**, and **Organization administration**. This integration supports the information flow that is required to complete the manufacturing of a finished item.

The production process is typically influenced by the cost accounting and inventory valuation methods that are chosen for a specific production process. Supply Chain Management supports both actual cost (first in, first out [FIFO]; last in, first out [LIFO]; moving average; and periodic weighted average) and standard cost methods. Lean manufacturing is implemented based on the backflush costing principle.

The choice of the cost measurement methods also defines the requirements for reporting about material and resource consumption during the production process. Typically, actual cost methods require accurate reporting on the job level, whereas periodic costing methods allow for less granular reporting of material and resource consumption.

Mixed mode manufacturing

Different products and production topologies require the application of different order types. Supply Chain Management can apply the various order types in a mixed mode. In other words, all order types can occur during the end-to-end process of producing one finished product.

- **Production order** – This is the classic order type to produce a specific product or product variant in a given quantity on a specific date. Production orders are based on bills of materials (BOMs) and routes.

- **Batch order** – This order type is used for process industries and discrete processes where the manufacturing conversion is based on a formula, or where co-products and by-products can be end products, either in addition to or instead of the main product. Batch orders use **Formula** type BOMs and routes.
- **Kanban** – Kanbans are used to signal repetitive lean manufacturing processes that are based on production flows, kanban rules, and BOMs.
- **Project** – A manufacturing project combines products and services with a given schedule and budget. The manufacturing part of a project can be delivered through any of the other order types.

Manufacturing principles

To select the manufacturing principle that best applies to a particular product and related market, you must consider the requirements of production and logistics, and also customer expectations about delivery lead times.

- **Make to stock** – This is the classic manufacturing principle, where products are produced for stock, based on forecast or minimum stock refill (the latter is typically calculated based on forecast or historic consumption).
- **Make to order** – Standard products are made to order or finished to order. Although pre-production might be done by using the Make to stock principle, expensive steps of the value chain, or steps that create variants, are triggered by a sales order or transfer order.
- **Configure to order** – As for the Make to order principle, the final operations of the value chain are made to order. The actual product variant that is produced isn't predefined but is created at the time of order entry, based on the configuration model of the sales product. The Configure to order principle requires a certain level of process unification for a given product line.
- **Engineer to order** – Engineer to order processes are typically addressed by a project and usually start with the engineering phase. During the engineering phase, the actual products that are required fulfill the order are designed and described. Production orders, batch orders, or kanbans can then be created to produce the products.

Overview of the production life cycle

The following steps in the production life cycle can occur for all order types of mixed mode manufacturing. However, not all of them are represented as an explicit order status.

1. **Created** – You can create a production order, batch order, or kanban manually, or you can configure the system to generate them based on various demand signals. Master planning creates production orders, batch orders, or kanbans by firming planned orders. Other demand signals are sales orders or pegged supply signals from other production

orders or kanbans. For fixed-quantity kanbans, demand signals are generated when kanbans are registered as empty.

2. **Estimated** – You can calculate estimates for material and resource consumption. The estimation generates inventory transactions for raw materials that have a status of **On order**. The receipts for main products, co-products, and by-products are generated when production orders or batch orders are estimated. If the BOM contains lines of the **Pegged supply** type, purchase orders for materials or subcontracted operation services are generated and pegged to the production order or batch order. Items or orders are reserved according to the reservation strategy of the production order, and the price of the finished goods is calculated based on parameter settings.

3. **Scheduled** – You can schedule production based on operations, individual jobs, or both.

    - **Operations scheduling** – This scheduling method provides a rough, long-term plan. By using this method, you can assign start and end dates to production orders. If the production orders are attached to route operations, you can assign them to cost center groups.
    - **Job scheduling** – This scheduling method provides a detailed plan. Each operation is broken down into individual jobs that have specific dates, times, and assigned operations resources. If finite capacity is used, jobs are assigned to operations resources based on availability. You can view and change the schedule in a Gantt chart.
    - **Kanban schedule** – Kanban jobs are scheduled on the kanban schedule board or automatically scheduled based on the automatic planning configuration of the kanban rules.

4. **Released** – You can release the production order or batch order when the schedule is finished and the material is available to be picked or prepared. The material availability check helps the shop floor supervisor assess the availability of material for the production orders or batch orders. You can also print the production order documents, such as the pick lists, job card, route card, and route job. When the production order is released, the status of the order changes to indicate that the production can begin. When warehouse management is used, release of the production order or batch order releases the production BOM lines to warehouse management. Warehouse waves and warehouse work are then generated according to the setup of the warehouse.

5. **Prepared/Picked** – When all materials and resources have been staged at the production location, the production BOM lines or kanban lines are updated to a status of **Picked**. Pegged supply orders and related warehouse work are typically completed at this stage. The kanban cards or job cards that are required to report production progress should be assigned and printed.

6. **Started** – When a production order, batch order, or kanban is started, you can report material and resource consumption against the order. The system can be configured to automatically post the material and resource consumption that are allocated to the order when the order is started. This allocation is known as preflushing, forward flushing, or autoconsumption. You can manually allocate materials to production orders or batch orders by creating additional picking list journals. You can also manually allocate labor and other route costs to the order. If you're using operations scheduling, you can allocate these costs by creating a route card journal. If you're using job scheduling, you can allocate the costs by creating a job card journal. Production orders or batch orders can be started in batches of the requested final quantity. Within a production order, batch order, or kanban, the jobs that are created can be started and reported separately through journals, the manufacturing execution terminal (MES Terminal), or the kanban boards.

7. Report progress/**Complete** jobs – Use the MES Terminal, production journals, kanban boards, or mobile scanning capabilities to report the production progress by job or resource. Material and resource consumption will be posted, and the status of the related kanbans, production orders, and batch orders might be updated to **Received** or **Reported as finished**. Put-away work for the warehouse might be created, depending on the warehouse configuration.

8. **Reported as finished** (the product receipt) – When a production order or batch order is reported as finished, the quantity of the finished goods that were completed is updated in inventory. This quantity includes the quantity of relevant co-products and by-products. If you're using work-in-process (WIP) accounting, a ledger journal is generated to reduce the WIP accounts and increase the inventory of the finished goods. When the cost of a production order is calculated, the actual cost of the production is posted. If the material and labor costs that are associated with a production aren't already allocated in a journal or by preflushing, they can be automatically allocated through back-flushing. Allocation through back-flushing involves the post-deducting of inventory transaction processes. If the production order is completed, select the **End job** check box to change the remaining status to **Ended**. Otherwise, leave the field empty to enable reporting of additional quantities that are produced.

9. **Quality assessment** – A product receipt can trigger the creation of quality orders, depending on the configuration of test processes and the quality rules that are established for specific products. Because a quality order can update the inventory status or the batch attributes of the tested products, quality assessment is a mandatory process in many industries.

10. **Put away** and **Ship to order** – After product receipt and quality assessment, optional put-away work directs the received products to the next point of consumption, to a finished goods warehouse, or to a shipment zone if there are ship-to-order requirements.

11. **Ended** – Before production is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. If you select the **End job** check box when you run the cost calculation, the production order status changes to **Ended**. This status prevents any additional costs from being posted to a completed production order.

12. **Period closure** – Some cost accounting principles, such as periodic average, back-flush costing, FIFO, or LIFO, require periodic activities to close the inventory or financial period. Typically, the system tries to report all material and resource consumption, and also corrections of inventory and scrap, before the periods are closed. This reporting is typically done by using inventory movement journals or adjustment journals. The goal is to assess the economic performance of operating units per period. In some cases, when long-running production orders are used that span the financial reporting periods, production journals are used to report the production progress and resource consumption by the end of the period.

Mixed mode planning - Combine discrete, process, and lean sourcing

06/17/2025

This article provides information about mixed mode planning. In mixed mode planning, you can model your supply chain based on the material flow. Dynamics 365 Supply Chain Management makes sure that the material flow follows your models, regardless of the supply policy that is selected (kanbans, production orders, purchase orders, batch orders, or transfer orders).

You can select your overall strategy for supplying a product, regardless of the product structure.

For example, you can have kanban control in the assembly, where materials are sourced for the assembly area by production orders, kanbans, transfers, batch orders, or any combination that is appropriate for the characteristics of your supply chain, but you can still have full visibility across supplies. This capability leads to optimized supply chain processes and enhanced visibility into your supply chain.

The granularity of the supply policies that are used in master scheduling depends on the storage dimensions that are enabled as coverage dimensions. To enable master scheduling to control the replenishment and supply of different types of locations (for example, by separating the production floor for different production units, or by separating different types of material and finished goods warehouses), we recommend that you enable Site and Warehouse as coverage dimensions. Alternatively, Warehouse can be omitted as a coverage dimension. In that case, when you use warehouse management processes (WMS), all movements inside a warehouse are controlled by warehouse work, whereas all movements across warehouses can be controlled by withdrawal kanbans.

Supply policies

Mixed mode planning controls how a product is supplied and, based on the supply, how derived requirements (consumption of items from a bill of materials [BOM]) are issued. Based on the order type, the system automatically sources materials to match the requirements.

Supply policies can be defined at the product level or at any granularity that supports your requirements. You define the granularity of supply policies on the **Default order settings** page.

Supply policies can be controlled by product, item dimensions (configuration, color, and size), site, and warehouse. This setup is done on the **Item coverage** page.

The default order type controls what order master planning generates.

Regardless of how the supply chain is modeled, Supply Chain Management supports your mix of supply policies. You can have production orders that are sourced from kanbans. Alternatively, you can have a batch order that requires a product that is supplied by transfers or by kanbans.

Supply Chain Management makes sure that the material flow follows the model.

The warehouse for picking material is assigned dynamically at run time, after the supply policy has been defined.

Typically, kanbans aren't created for future dates, because a kanban has a short life cycle. To maintain full visibility into the supply chain, we have introduced the new planning concept of a *planned kanban*, which is used to calculate derived requirements and helps guarantee that the requirements are sourced based on the same logic that is used when the actual kanban is created.

The same logic is present for all other supply policy types. Therefore, long-term materials planning is based on the same logic that you expect to run with the actual orders after production and supply are approved.

Materials allocation cross-supply policy – Resource consumption on BOMs

Resource consumption is an important functionality. Resource consumption enables a warehouse for picking materials to be selected dynamically, based on the supply policy (order type), and also makes maintenance of base data easier.

Resource consumption requires that the warehouse that materials are picked from be assigned based on the way that the product is supplied. In other words, at run time, the system finds the resources that should be used for manufacturing. Based on those resources, the system then finds the picking warehouse.

For work that is independent of a supply policy, you don't have to change information on the BOM if the supply is changed. For ad-hoc changes, Supply Chain Management makes sure that materials are sourced from the right warehouse.

Process manufacturing – The production type

For full flexibility in mixed mode, we recommend that you use production type BOMs for all products. You can then use production orders, kanbans, transfer orders, or purchase orders to

supply a product. For process manufacturing, you must use a production type of *Formula*, *Co-product*, *By-product*, or *Planning item*. Kanbans and production orders can't be used for these production types.

Manage subcontracting work in production

08/13/2025

This article explains how subcontracted operations are managed in Dynamics 365 Supply Chain Management. In other words, it explains how production operations that are allocated to a resource are managed by a vendor.

In production processes, work can be done by resources that are owned or administered by vendors. Typically, vendor resources are used to level periodic excess demand that surpasses the available capacity of a company's own resources. The vendor might also be able to offer specific resource capabilities or resources at a lower price.

Depending on the vendor resources that are used in a production process, a route often has additional logistic requirements, because the material and semi-finished products must first be transported to the vendor's site. Then the result of the subcontracted operation must be transported either to the location that is allocated to the next operation or to a finished goods warehouse.

When subcontracting operations or activities are used, they affect all stages of operations, from the definition of the operations that are required in production, costing, forecasting, planning, and scheduling, to the management of logistics for materials, semi-finished products, and finished goods. Finally, these resources require their own processes for accounting and cost control.

For internal resources, a fixed cost rate is typically allocated for a period. By contrast, the cost of subcontracted resources is based on the purchase price of the related service. The service is defined as another product, and is used to drive the procurement and purchase processes for a given subcontracted operation.

Currently, there's no explicit concept of semi-finished products in Supply Chain Management. For a production order that requires more than one operation in order to transform raw materials into a finished good, the finished good is posted back into inventory only in the last operation. The semi-finished products that the earlier operations produce are accounted in work in progress (WIP), but they aren't posted or tracked in inventory. Although you can split the routes and bills of materials (BOMs) into multiple smaller units, this approach increases the number of products, BOMs, and routes that must be managed.

There are two methods for modeling subcontracting work for production operations. These methods differ in the way that the subcontracting process can be modeled, the way that semi-finished products are represented in the process, and the way that cost control is managed.

- Subcontracting of route operations in production orders or batch orders

    - The service product must be a stocked product, and it must be part of the BOM.
    - This method supports first in, first out (FIFO) or standard cost.
    - Semi-finished products are represented by the service product in the process.
    - Cost control allocates the costs that are associated with subcontracted work to the material costs.
- Subcontracting of production flow activities in a lean production flow
    - The service is a non-stocked service product, and it isn't part of the BOM.
    - This method uses purchase agreements as service agreements.
    - This method uses backflush costing.
    - This method allows for aggregated and asynchronous procurement. (Material flow is independent of the procurement process.)
    - Cost control allocates subcontracted work in its own cost breakdown block.

Subcontracting of route operations

To use subcontracting of route operations for production or batch orders, the service product that is used for the procurement of the service must be defined as a product of the *Service* type. Additionally, it must have an item model group that has the **Stocked product** option under **Inventory policy** set to *Yes*. This option defines whether a product is accounted as inventory on product receipt (**Stocked product** = *Yes*), or whether the product is expensed on a profit and loss account (**Stocked product** = *No*). Although this behavior might seem contradictory, it's based on the fact that only products that have this policy will create inventory transactions that can be used in cost control to calculate planned cost and determine the actual cost when a production order is ended.

To be considered in planning and cost calculation, the service must be added to the BOM. The BOM line must be of the *Vendor* type, and it must be allocated to the route operation that the service is allocated to. This route operation must have a costing resource and resource requirement that point to a resource of the *Vendor* type that connects the operation and the related service to the corresponding vendor account.

When this configuration is used, a purchase order is created for the related service product, based on estimation of a production order. The purchase order of the service is used as an anchor for the subcontracted operations. The subcontracted work can be managed through the **Subcontracted work** list page in Production control. The subcontracted work is used to ship raw material and, eventually, a semi-finished product to the vendor in preparation for the operation. It's also used to receive the resulting product of the subcontracted operation in item arrival, where the service product is used to identify the arrival of the semi-finished product. When the purchase order line is received, the production operation is updated as completed.

A production order can have many operations, and each operation can be allocated to a different vendor. Therefore, an end-to-end production order might trigger multiple purchase orders.

Subcontracting of production flow activities

The lean manufacturing solution models the subcontracting work as a service that is related to an activity of a production flow (Task guide article). Therefore, this type of subcontracting is also referred to as activity-based subcontracting. A special cost group type, *Direct outsourcing*, has been introduced, and the subcontracting services aren't part of the BOM of the finished goods. When you use lean manufacturing, all activities are defined by kanbans that can be related to one or multiple production flow activities. So far, that explanation sounds just like an explanation of production orders. However, whereas production orders must always end with a finished product, you can create kanbans to supply a semi-finished product. You don't have to introduce a new product and BOM level.

Because kanban rules can be dynamic, you can model different variants of supply for the same product on a production flow. When you use lean subcontracting, the material flow and the financial flow are strictly separated. All material flow is represented by kanban activities. The purchase orders for the service products and the receipt postings of those services can be automated, based on the status of kanban jobs in the production flow. Kanban jobs can be started and completed even before the purchase orders are created. The subcontracting documents (purchase order and purchase receipt of the service) can be aggregated by period and service. Therefore, the number of purchase documents and lines can be kept small, even in highly repetitive operations where vendors provide subcontracted services in a single-piece flow.

Modeling subcontracting in a production flow

In a lean production flow, a process activity can be defined as subcontracted when it's allocated to a work cell (resource group) that has a single vendor resource. When a work cell is subcontracted, the related process activities must be linked to an active purchase agreement line that contains the service item and the price of the service. The service agreement of the activity also defines the calculation ratio between the product quantity of the kanban job and the resulting service quantity. You can select whether the service quantity is calculated based on the number of jobs, the good product quantity that is reported on the jobs, or the total product quantity (this total quantity includes scrapped products).

Transfer activities can also be defined as subcontracted. This definition occurs implicitly when you select the responsible party for the shipping in the transfer activity. When you select **Shipper** or **Recipient**, if the corresponding source or target warehouse is a vendor-managed

warehouse, the activity is considered subcontracted. When you select **Carrier**, the activity is always subcontracted. Like subcontracted process activities, a subcontracted transfer activity must be connected to a service agreement before the production flow can be activated.

Backflush costing

The cost accounting of subcontracted work is integrated into the costing for the lean manufacturing solution (backflush costing). When the purchase order receipt of the service is posted, or when invoicing occurs, the cost of the service is allocated to the production flow. For backflush costing, the variance of subcontracted services is calculated by offsetting the subcontracting block of the standard cost of the received products against the actual received and invoiced service quantities.

Material supply for subcontracted operations

Semi-finished products and other related materials must be transferred to the location where the work is physically performed. When you use subcontracted operations and activities, this transfer is often related to additional transport to a vendor-operated site. By allocating material in the BOM to the subcontracted operation, you declare that the material must be staged at the input location of the resource group for the allocated resource. Master planning or lean replenishment then provisions the material to that location.

To model the inventory that is located at a vendor site, it's a best practice in the industry to define a vendor-managed warehouse. You can easily define a vendor-managed warehouse by creating a new warehouse and assigning the vendor account. To document that material must be transferred to the vendor before an operation can be performed, you should allocate the vendor-managed warehouse to the input warehouse of the resource group that holds the resource.

To replenish material at this warehouse, you can use multiple strategies:

- Transfer orders
- Transfer journals
- Withdrawal kanbans
- Direct purchase to the vendor location

Semi-finished products are the exception to this rule. To transfer semi-finished products, you're limited to these options:

- For production and batch orders, semi-finished products can only be transferred logically by using the Picking list journal from the **Subcontracted work** list page. This journal will

create a delivery note document that can be used to transfer semi-finished and raw material to the vendor.

- For subcontracted operations in production flows, the transfer of semi-finished products is documented by the receipt of withdrawal or production kanbans at the vendor location. To model an explicit transfer activity, you can end a production kanban with an additional transfer activity.

> **Note**
>
> A production route for a single production order can't cross multiple sites. This rule also applies to the subcontracted work. Therefore, the warehouses that represent the vendor-managed material locations must be defined in the same site as the internal resources that are used in the route. Although production flows can cross sites, they can't transport semi-finished products from one site to another, because that operation implies a change of cost context.

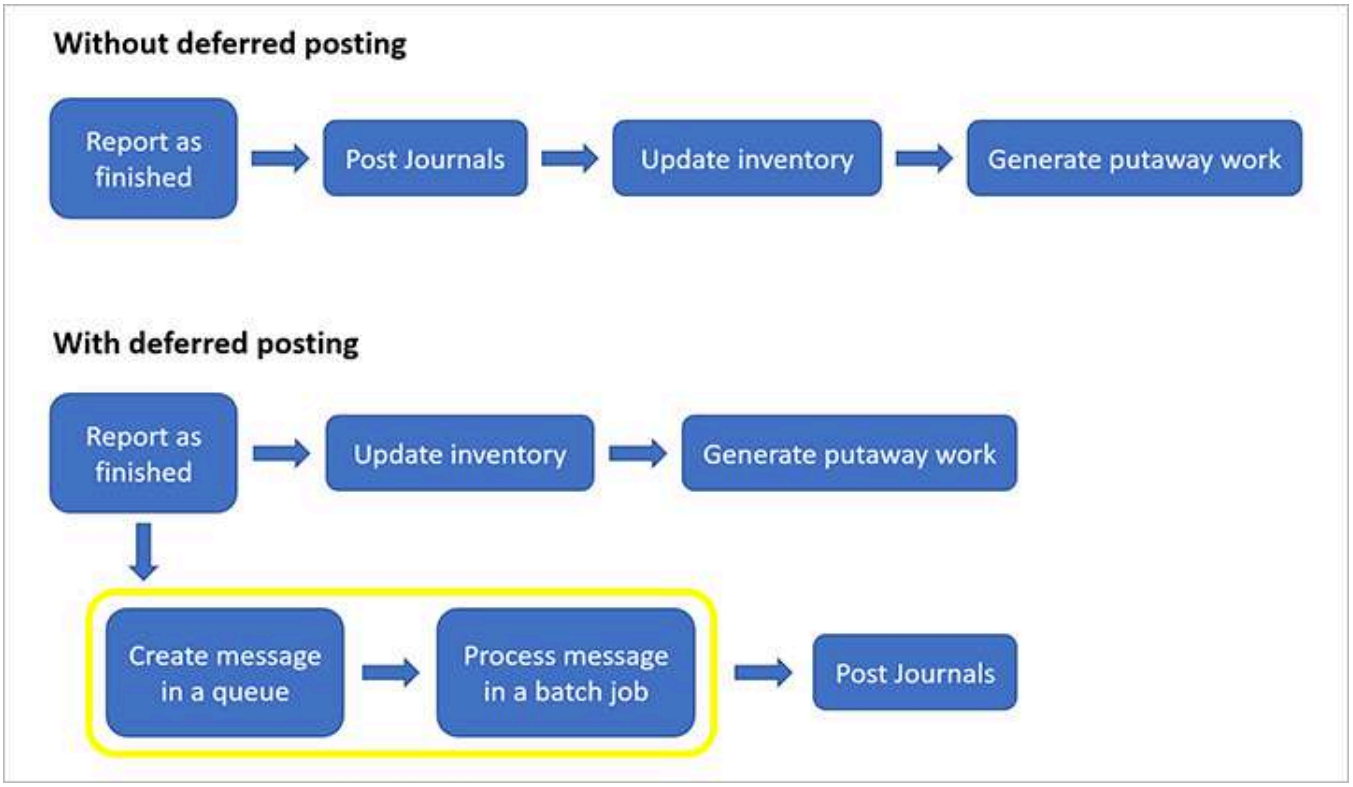
Typically, the output warehouse and location of a subcontracted resource group are directly allocated to the warehouse and location of the next step of the operation in the route or production flow. This setup helps reduce the amount of job reporting that occurs or the number additional transfer operations that must be modeled.

Make finished goods physically available before posting to journals

09/19/2025

When a worker reports a manufactured item as finished, the system registers it as available for further physical processing (such as shipment or putaway). During this process, the system also posts one or more journals (such as the report as the finished journal, picking list journal, and route card journal). If you want to make your items physically available before all postings are processed, you can set up the system to defer the journal postings. A batch job manages deferred postings and processes them as system resources allow.

The following illustration shows how processes for posting journals are invoked both with and without deferred posting.



Set up journal posting options for reporting as finished

Workers can report items as finished by using any of the following clients:

- Web client
- Warehouse Management mobile app
- Production floor execution interface

The web client uses the same posting method configuration as the Warehouse Management mobile app. However, you must configure the posting method that the production floor execution interface uses separately.

Set journal posting options for the web client and the Warehouse Management mobile app

In the mobile app, workers report items as finished by opening a mobile device menu item where the **Work creation process** value is *Report as finished* or *Report as finished and put away*. In the web client, workers report items as finished from the **All production orders** list page or the **Production order (details)** page. You can configure a company-wide default method and set up warehouse-specific overrides as needed.

Use the following procedure to configure the company-wide default posting method for reporting items as finished from the web client or the Warehouse Management mobile app.

1. Go to **Production control** > **Setup** > **Production control parameters**.
2. On the **Journals** tab, in the **Report as finished journal** section, set the **Posting method** field to one of the following values:
    - *Immediate* – When a worker reports an item as finished, the system fully processes all related journal postings before it marks the finished item as physically available.
    - *Deferred* – When a worker reports an item as finished, the system marks the finished item as physically available and adds the journal postings to a message queue. The system doesn't wait until the postings are fully processed before it marks the finished item as physically available.

Use the following procedure to configure warehouse-specific overrides for the default posting method that you set on the **Production control parameters** page.

1. Go to **Warehouse management** > **Setup** > **Inventory breakdown** > **Warehouses**.
2. Select the warehouse that you want to set up.
3. On the Action Pane, select **Edit**.
4. On the **Warehouse** FastTab, in the **Production orders** section, set the **Posting method** field to one of the following values:
    - *Inherit* – The selected warehouse inherits the setting from the **Production control parameters** page.
    - *Immediate* – When a worker reports an item as finished, the system fully processes all related journal postings before it marks the finished item as physically available.

- *Deferred* – When a worker reports an item as finished, the system marks the finished item as physically available and adds the journal postings to a message queue. The system doesn't wait until the postings are fully processed before it marks the finished item as physically available.

Set journal posting options for the production floor execution interface

Use the following procedure to configure the posting method that the system uses when a worker reports items as finished from the production floor execution interface.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Production order defaults**.

2. On the **Report as finished** tab, in the **Report as finished journal** section, set the **Posting method** field to one of the following values:

    - *Immediate* – When a worker reports an item as finished, the system fully processes all related journal postings before it marks the finished item as physically available.
    - *Deferred* – When a worker reports an item as finished, the system marks the finished item as physically available and adds the journal postings to a message queue. The system doesn't wait until the postings are fully processed before it marks the finished item as physically available.

Schedule the message processor batch job to process deferred postings

The message processor batch job processes the journal postings after the system queues them. To ensure that your journal postings are processed, you must configure this job to run at a regular interval. Use the following procedure to set up the required batch job.

1. Go to **System administration** > **Message processor** > **Message processor**.
2. On the **Parameters** FastTab, set the **Message queue** field to *Production*.
3. On the **Run in the background** FastTab, set the **Batch processing** option to *Yes*. Then set up a recurrent schedule, and configure other settings as required. The settings work just as they work for other types of background jobs in Microsoft Dynamics 365 Supply Chain Management.

Track the progress of your deferred postings

Deferred journal postings queue as *message processor messages* that wait until the *message processor* processes them. Set up the message processor to run as a scheduled batch job. To view the deferred posting messages that the message processor has processed or will process, go to **Production control** > **Production orders** > **Deferred production order posting**.

Message grid columns and filters

Use the fields at the top of the **Deferred production order posting** page to find specific messages.

The following filters are available:

- **Message type** – Specify the type of messages that appear in the grid.
- **Message state** – Specify the state of the messages that appear in the grid. The following states exist:
  - *Queued* – The message is ready to be processed by the message processor.
  - *Processed* – The message was successfully processed by the message processor.
  - *Canceled* – The message failed to be processed during the final attempt and was then canceled by the user.
  - *Failed* – The message failed to be processed during the last attempt. The system retries failed messages three times. It then gives up and leaves the message in the *Failed* state. You can't manually cancel or edit a message until after the last of these three attempts.
- **Message content** – This filter does a full-text search of message content. (Message content isn't shown in the grid.) The filter treats most special symbols (such as hyphens) as space characters, and it treats all space characters as Boolean OR operators. For example, if you search for a specific `journalid` value that equals *USMF-123456*, the system finds all messages that contain either "USMF" or "123456." In this case, the list of results is likely to be long. Therefore, it's better to enter just *123456*, because you get more specific results.

You can also sort and filter the list by selecting any of the column headings and entering criteria in the drop-down dialog box.

View the message log, message content, and details

Find detailed information about a message by selecting it in the grid and then selecting the **Log** or **Raw content** tab under the message grid, where each processing event is shown.

The toolbar on the **Log** tab includes the following buttons:

- **Log** – Select this button to show the processing results. This button is especially useful when messages have a **Processing result** value of *Failed*, and you want to learn the reasons for the processing failure.
- **Bundle** – Multiple message processing operations can run as part of the same batch process. Select this button to view this detailed data. For example, you can see whether dependencies exist that require a specific processing order for some messages.

Manually process or cancel a message

You can manually process or cancel a message, depending on its current state. Select the message in the grid, then select **Process** or **Cancel** on the Action Pane.

Set up business events to deliver alerts for failed processing results

You can set up business events that alert you about failed processing results. Go to **System administration** > **Setup** > **Business events** > **Business events catalog**, and activate the business event named *Message processor message processed*.

As part of the activation process, you're prompted to specify whether the event is specific to one legal entity or applies to all legal entities. You're also prompted to provide an **Endpoint name** value. You must define this value first.

> **Note**
>
> If the **When a Business Event occurs** field is set to *Microsoft Power Automate* (instead of *HTTPS*, for example), the **Endpoint name** value is automatically created in Supply Chain Management, based on the *Microsoft Power Automate* setup.

Unified number sequence for job IDs

Article • 06/03/2022

This feature provides a single, unified number sequence that generates job IDs for the Production control, Manufacturing execution, and Time and attendance modules. Previously, you were able to choose a different number sequence for each of these modules, which could result in conflicting job IDs if two or more of these sequences used an identical format. Such a conflict can cause data corruption.

Turn on this feature for your system

If your system doesn't already include the feature described in this article, go to Feature management and turn on the *Unified number sequence for job IDs* feature.

Set up the unified number sequence for job IDs

After enabling this feature, the existing **Job identification** number-sequence settings located on the parameters pages for the Production control, Manufacturing execution, and Time and attendance modules will be deprecated and a new **Unified job ID** field will be added. The **Unified job ID** value is shared by all three modules, thus ensuring that all modules reference the same number sequence. Job IDs will therefore be unique across all three modules and a conflict will never occur.

To set up the unified number sequence for job IDs:

1. Turn on the feature as described in the previous section.
2. Either identify the number sequence you want to use for your unified job IDs, or create a new one. Learn more in Number sequences overview.
3. Go to the **Production control parameters**, **Manufacturing execution parameters**, or **Time and attendance parameters** page. It doesn't matter which one you choose because when you make this setting on any of those pages, all of the other pages will update automatically.
4. Open the **Number sequences** tab on your selected parameters page.
5. Assign the **Number sequence code** that you identified previously to the **Unified job IDs** row of the grid.

Invoke process automation flows to create quality orders

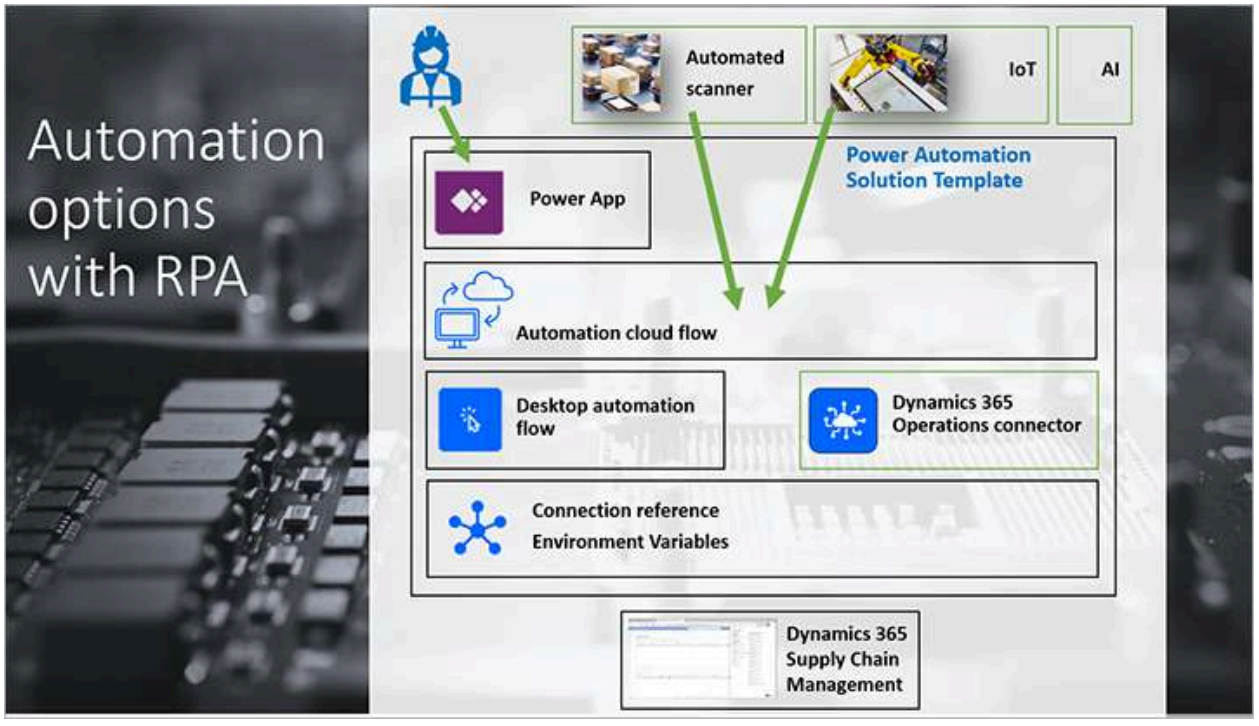
Article • 06/03/2022

Organizations have an increasing demand to automate standard business processes, provide more convenient interactions to the staff, and utilize various data signals and systems to drive business processes automatically. With robotic process automation (RPA) and Microsoft Power Automate, businesses can use a no-code experience to automate repetitive processes, thus gaining efficiency and accuracy.

The downloadable automation solution template for Supply Chain Management showcases how Power Automate can be used to automate business processes using quality orders as an example.

You can download the automation solution template here.

For an overview of this feature and its capabilities, see the following video: Utilize RPA to create quality orders in Dynamics 365 Supply Chain Management

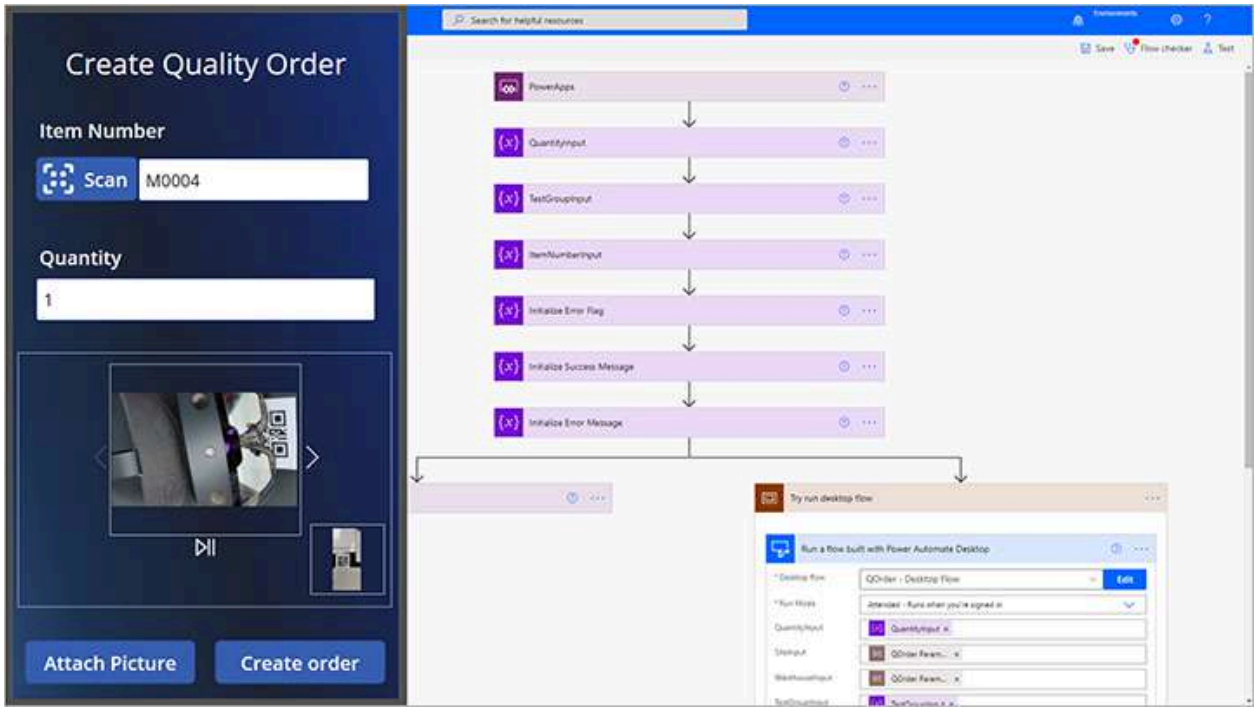


The Power Automate solution template includes a cloud automation flow and a desktop automation flow that automate the creation of quality orders in Supply Chain Management.

The automation can be started in response to many events and signals, including user input or machine signals (including the Internet of Things (IoT)). The *Q-Order* Power

Application example is included in the solution template. It allows the user to scan an item QR code, enter quantity, and attach pictures using a camera.

Solution parameters are included to configure the automation for a specific use case in a production facility.



For a complete step-by-step guide about how to download, install, and use the sample solution for automating quality order creation, see Automate quality order creation on Dynamics 365 Supply Chain Management with Robotic Process Automation using Power Automate Desktop.

Integrate with third-party manufacturing execution systems

08/13/2025

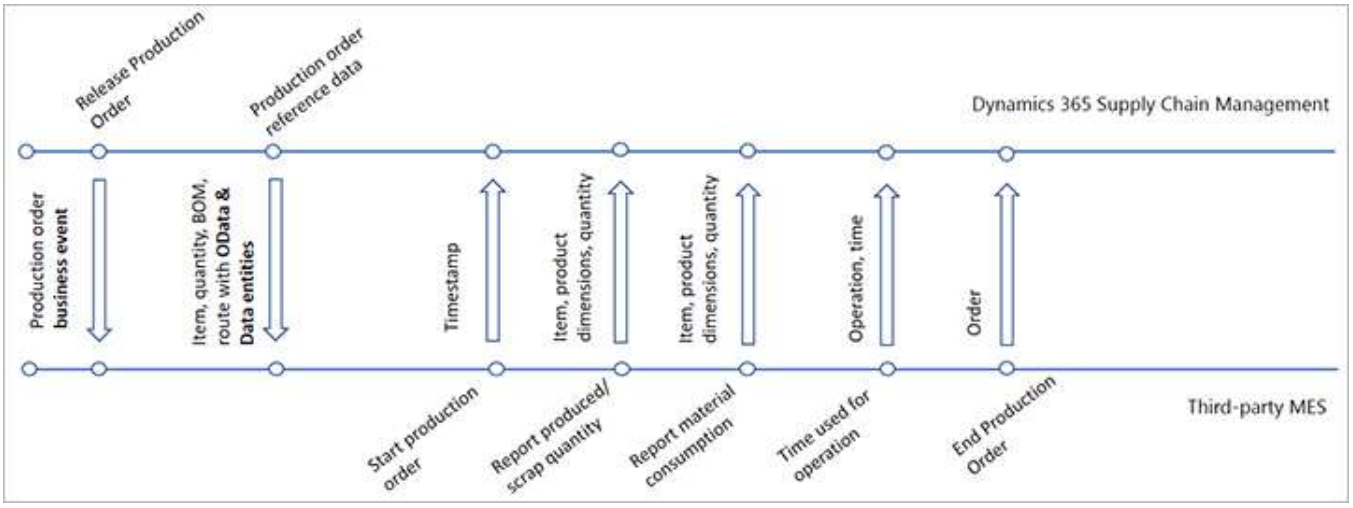
Some manufacturing organizations that use Microsoft Dynamics 365 Supply Chain Management use the native functionality in Dynamics 365 to control their manufacturing activities for machines, equipment, and personnel. However, other manufacturing organizations, especially those that have advanced manufacturing requirements, use a third-party manufacturing execution system (MES) instead. Organizations might choose a third-party MES solution because, for example, it's specifically tailored to their vertical industry.

In the integrated solution, data exchange is fully automated and occurs in near-real time. Therefore, data is kept current in both systems, and no manual data entry is required. For example, when material consumption is registered in the MES, the integration ensures that the same consumption is also registered in Dynamics 365. Therefore, up-to-date inventory records are available to other important processes, such as planning and sales.

The solution makes it faster, easier, and cheaper for Supply Chain Management users to integrate with third-party MESs. It offers the following features:

- Business events and interfaces that support key manufacturing execution processes
- A centralized dashboard where you can track the event processing history, and troubleshoot and fix processes that fail

The following illustration shows a typical collection of business events, processes, and messages that are exchanged in an integrated solution.



Prerequisites

To integrate with a third-party manufacturing execution system, the **Time and attendance** license key must be enabled in Supply Chain Management. Follow these steps to check whether it's enabled and to enable it if necessary:

1. Go to **System administration** > **Setup** > **License configuration**.
2. Make sure that the **Time and attendance** license key is enabled (shows a check mark). This license key is required because it controls the manufacturing execution system's functionality and data. If it isn't enabled, do the following steps:
   a. Put your system into maintenance mode, as described in Maintenance mode.
   b. On the **License configuration** page, select the **Time and attendance** check box.
   c. Turn off maintenance mode, as described in Maintenance mode

Processes available for MES integration

You can enable any or all of the following processes for integration.

Expand table

Process name	Description
Release production orders and production order status change business events	This process provides a business event that the MES can listen to, to get information about the production orders that should be produced. Reference data that is related to the production order is expected to be shared from Supply Chain Management to the MES through Open Data Protocol (OData) or data entities.
Start production order	This process provides Supply Chain Management with information about production orders that are being started by using the MES. It ensures that both systems have an up-to-date view of all manufacturing activities.
Report produced or scrapped quantity	This process provides Supply Chain Management with information about the good and error quantities that are reported on a production job by using the MES. It ensures that shop floor supervisors have an up-to-date view of production plan progress.
Report material consumption	This process provides Supply Chain Management with information from the MES about the quantities of materials that are consumed. It makes up-to-date inventory records available to other important processes, such as planning and sales.
Report time consumed for the operation	This process provides Supply Chain Management with information about the time that is used for a specific operation.
End production order	This process informs Supply Chain Management that the MES has updated a production order to its final status of *Ended*. This status indicates that no more quantities will be produced on the production order.

Monitor incoming messages

To monitor the incoming MES messages to the system, go to **Production control** > **Setup** > **Manufacturing execution** > **Manufacturing execution systems integration**.

All messages for a specific production order are processed in the sequence they're received. However, messages for different production orders might not be processed in the received sequence because batch jobs are processed in parallel. In case of failure, the batch job will attempt to process each message three times before setting it to *Failed* status.

The **Manufacturing execution systems integration** page works in the same way as the **Message processor messages** page and represents very similar functionality. (It even shows MES messages in addition to other types of messages.) For information about how to use either page to review messages, find and fix failed messages, and more, see Monitor and control message processor messages.

Call the API

To call the MES integration API, send a `POST` request to the following endpoint URL:

`/api/services/SysMessageServices/SysMessageService/SendMessage`

The body of the request that you send should resemble the following example. Replace the values for `_companyId`, `_messageType`, and `_messageContent` as required. For information about the various message types that the API supports and how to design their content, see the next section.

JSON

```
{
    "_companyId": "USMF",
    "_messageQueue": "JmgMES3P",
    "_messageType": "ProdProductionOrderReportFinished",
    "_messageContent":
    "{\"ProductionOrderNumber\": \"P000123\", \"ReportFinishedLines\":
[{\"ItemNumber\": \"A0001\", \"ReportedGoodQuantity\": 10,
\"ReportAsFinishedDate\": \"2021-01-01\"}]}"
}
```

API message types and content

This section describes each type of message that can be exchanged through the MES integration API.

Start production order message

For the *start production order* message, the `_messageType` value is `ProdProductionOrderStart`. The following table shows the fields that this message supports.

Expand table

Field name	Status	Type
`ProductionOrderNumber`	Mandatory	String
`StartedQuantity`	Optional	Real
`StartedDate`	Optional	Date
`AutomaticBOMConsumptionRule`	Optional	Enum (FlushingPrincip | Always | Never)
`AutomaticRouteConsumptionRule`	Optional	Enum (RouteDependent | Always | Never)

Report as finished message

For the *report as finished* message, the `_messageType` value is `ProdProductionOrderReportFinished`. The following table shows the fields that this message supports.

Expand table

Field name	Status	Type
`ProductionOrderNumber`	Mandatory	String
`ReportFinishedLines`	Mandatory	A list of lines (at least one), each of which contains the payload that is described in the next table
`PrintLabel`	Optional (Requires Supply Chain Management version 10.0.45 or later)	Enum (Yes | No)

The following table shows the fields that each line in the `ReportFinishedLines` section of the `ProdProductionOrderReportFinished` message supports.

Expand table

Field name	Status	Type
`LineNumber`	Optional	Real
`ItemNumber`	Optional	String
`ProductionType`	Optional	Enum (MainItem | Formula | BOM | Co_Product | By_Product | None), extensible
`ReportedErrorQuantity`	Optional	Real
`ReportedGoodQuantity`	Optional	Real
`ReportedErrorCatchWeightQuantity`	Optional	Real
`ReportedGoodCatchWeightQuantity`	Optional	Real
`AcceptError`	Optional	Enum (Yes | No)
`ErrorCause`	Optional	Enum (None | Material | Machine | OperatingStaff), extensible
`ExecutedDateTime`	Optional	DateTime
`ReportAsFinishedDate`	Optional	Date
`AutomaticBOMConsumptionRule`	Optional	Enum (FlushingPrincip | Always | Never)
`AutomaticRouteConsumptionRule`	Optional	Enum (RouteDependent | Always | Never)
`RespectFlushingPrincipleDuringOverproduction`	Optional	Enum (Yes | No)
`JournalNameId`	Optional	String
`PickingListJournalNameId`	Optional	String
`RouteCardJournalNameId`	Optional	String
`FromOperationNumber`	Optional	Integer
`ToOperationNumber`	Optional	Integer
`InventoryLotId`	Optional	String
`BaseValue`	Optional	String
`EndJob`	Optional	Enum (Yes | No)

Field name	Status	Type
`EndPickingList`	Optional	Enum (Yes | No)
`EndRouteCard`	Optional	Enum (Yes | No)
`PostNow`	Optional	Enum (Yes | No)
`AutoUpdate`	Optional	Enum (Yes | No)
`ProductColorId`	Optional	String
`ProductConfigurationId`	Optional	String
`ProductSizeId`	Optional	String
`ProductStyleId`	Optional	String
`ProductVersionId`	Optional	String
`ItemBatchNumber`	Optional	String
`ProductSerialNumber`	Optional	String
`GenerateLicensePlate`	Optional (Requires Supply Chain Management version 10.0.45 or later)	Enum (Yes | No)
`LicensePlateNumber`	Optional	String
`InventoryStatusId`	Optional	String
`ProductionWarehouseId`	Optional	String
`ProductionSiteId`	Optional	String
`ProductionWarehouseLocationId`	Optional	String
`InventoryDimension1` to `InventoryDimension12`	Optional	String

The 12 extensible dimensions (`InventoryDimension1` through `InventoryDimension12`) require customization and aren't always used. For more information about them, see Add new inventory dimensions through extension.

Material consumption (picking list) message

For the *material consumption (picking list)* message, the `_messageType` value is `ProdProductionOrderPickingList`. The following table shows the fields that this message

supports.

Expand table

Field name	Status	Type
`ProductionOrderNumber`	Mandatory	String
`JournalNameId`	Optional	String
`PickingListLines`	Mandatory	A list of lines (at least one), each of which contains the payload that is described in the next table

The following table shows the fields that each line in the `PickingListLines` section of the `ProdProductionOrderPickingList` message supports.

Expand table

Field name	Status	Type
`ItemNumber`	Mandatory	String
`ConsumptionBOMQuantity`	Optional	Real
`ProposalBOMQuantity`	Optional	Real
`ScrapBOMQuantity`	Optional	Real
`BOMUnitSymbol`	Optional	String
`ConsumptionInventoryQuantity`	Optional	Real
`ProposalInventoryQuantity`	Optional	Real
`ConsumptionCatchWeightQuantity`	Optional	Real
`ProposalCatchWeightQuantity`	Optional	Real
`ConsumptionDate`	Optional	Date
`OperationNumber`	Optional	Integer
`LineNumber`	Optional	Real
`PositionNumber`	Optional	String
`IsConsumptionEnded`	Optional	Enum (Yes | No)
`ErrorCause`	Optional	Enum (None | Material | Machine | OperatingStaff), extensible

Field name	Status	Type
`InventoryLotId`	Optional	String
`ProductColorId`	Optional	String
`ProductConfigurationId`	Optional	String
`ProductSizeId`	Optional	String
`ProductStyleId`	Optional	String
`ProductVersionId`	Optional	String
`ItemBatchNumber`	Optional	String
`ProductSerialNumber`	Optional	String
`LicensePlateNumber`	Optional	String
`InventoryStatusId`	Optional	String
`ProductionWarehouseId`	Optional	String
`ProductionSiteId`	Optional	String
`ProductionWarehouseLocationId`	Optional	String
`InventoryDimension1` to `InventoryDimension12`	Optional	String

Time used for operation (route card) message

For the *time used for operation (route card)* message, the `_messageType` value is `ProdProductionOrderRouteCard`. The following table shows the fields that this message supports.

Expand table

Field name	Status	Type
`ProductionOrderNumber`	Mandatory	String
`JournalNameId`	Optional	String
`RouteCardLines`	Mandatory	A list of lines (at least one), each of which contains the payload that is described in the next table

The following table shows the fields that each line in the `RouteCardLines` section of the `ProdProductionOrderRouteCard` message supports.

Expand table

Field name	Status	Type
`OperationNumber`	Mandatory	Integer
`OperationPriority`	Optional	Enum (Primary | Secondary1 | Secondary2 | ... | Secondary20)
`OperationId`	Optional	String
`OperationsResourceId`	Optional	String
`Worker`	Optional	String
`HoursRouteCostCategoryId`	Optional	String
`QuantityRouteCostCategoryId`	Optional	String
`HourlyRate`	Optional	Real
`Hours`	Optional	Real
`GoodQuantity`	Optional	Real
`ErrorQuantity`	Optional	Real
`CatchWeightGoodQuantity`	Optional	Real
`CatchWeightErrorQuantity`	Optional	Real
`QuantityPrice`	Optional	Real
`ProcessingPercentage`	Optional	Real
`ConsumptionDate`	Optional	Date
`TaskType`	Optional	Enum (QueueBefore | Setup | Process | Overlap | Transport | QueueAfter | Burden)
`ErrorCause`	Optional	Enum (None | Material | Machine | OperatingStaff), extensible
`OperationCompleted`	Optional	Enum (Yes | No)
`BOMConsumption`	Optional	Enum (Yes | No)
`ReportAsFinished`	Optional	Enum (Yes | No)

End production order message

For the *end production order* message, the `_messageType` value is `ProdProductionOrderEnd`. The following table shows the fields that this message supports.

Expand table

Field name	Status	Type
`ProductionOrderNumber`	Mandatory	String
`ExecutedDateTime`	Optional	DateTime
`EndedDate`	Optional	Date
`UseTimeAndAttendanceCost`	Optional	Enum (Yes | No)
`AutoReportAsFinished`	Optional	Enum (Yes | No)
`AutoUpdate`	Optional	Enum (Yes | No)

Other production information

The messages support actions or events that happen on the shop floor. They're processed using the MES integration framework described in this article. The design assumes that other reference information to be shared with the MES (such as product-related information, or the bill of materials or route (with its specific setup and configuration times) used in a specific production order) will be retrieved from the system using data entities via file transfer or OData.

Receive feedback about the state of a message

After the MES has sent a message to Supply Chain Management, it might be relevant for Supply Chain Management to return feedback about the state of the message. Here are some examples of cases where this behavior might be relevant:

- No person is responsible for constantly supervising the MES integration.
- The person who is responsible for supervising the MES integration wants to be notified by email when a message fails, so that they know that they have to take action.
- The MES must show an error message to inform the shop floor operator or somebody from the IT department that they have to take action.
- The MES must recalculate the order schedule after it receives a failure message (for example, because a production order failed to start).

In these cases, you can take advantage of the standard alert feature in Supply Chain Management. For information about how standard alerts work, see the following resources:

- Help article: Alerts overview
- Video: Alert rule options in finance and operations

For example, you might set up the following alerts to provide feedback about the state of a message:

- Create a business event ("Send externally") that is used when a message is *Failed*.
- Send a notification and email to the IT admin or production floor manager.

Clean up processed and canceled message processor messages

Over time, processed and canceled messages related to third-party MES systems can accumulate in the system, potentially affecting performance and data management. Therefore, you should periodically clean up these messages to maintain system efficiency. Learn more in Clean up processed and canceled message processor messages.

React to last-minute changes in production

Components or routes can often change at the last minute of the manufacturing process, just before production orders are released to the shop floor. This article describes a few types of last-minute changes that often occur and explains how to manage them in Microsoft Dynamics 365 Supply Chain Management.

Change BOM items on production orders

Sometimes, a bill of materials (BOM) item must be changed on multiple production orders. These changes are common when a change or revision is applied to a raw item. To allow for such changes, you can change one BOM item to another on estimated or scheduled production orders. Alternatively, you can use all the existing on-hand inventory of an item and then substitute a new item for that item.

Change a BOM item on a production order

To change a BOM item that's used on any production order, follow these steps:

1. Go to **Production control** > **Production orders** > **All production orders**.

2. Select one or more production orders that you want to change. You can change BOM items only for production orders that have a status of *Estimated* or *Scheduled*. (You can't change them for production orders that have a status of *Created*, for example.)

3. On the Action Pane, on the **Production order** tab, in the **Change** group, select **Change BOM item**.

4. In the **Change production order BOM item** dialog box, on the **Parameters** FastTab, in the **From item** section, specify the item that you want to change from. Include the item's inventory dimensions.

   When you enter the **Item number** value for the "from" item, the system looks up all transactions that have a reference of *Production line*. It shows on-hand inventory from the net requirement for the "from" item. The goal is to easily replace one item with another on the BOM of an item that's being produced.

5. In the **To item** section, specify the item that you want to change to. Include the item's inventory dimensions.

- The "to" item must use the same inventory unit of measure as the "from" item.
- If the new item requires a different quantity, specify the new quantity in the **New quantity** field.
- If the **New quantity** field is set to *0* (zero), the system uses the same quantity as the existing item.

6. The **Production order lines** FastTab shows a list of all the selected production orders that include the specified "from" item on their BOMs. Mark the orders where you want to substitute the specified "to" item for the specified "from" item.

7. A special case occurs when an item must be replaced by a new version or a new product. In this case, you might have to find the time when the on-hand inventory of an item (the "from" item) will be consumed, so that the new item can be swapped in for the production. You'll use the on-hand inventory until it becomes 0 (zero) and then mark all orders so that they use the new item. If this case applies to your current operation, you can select **Proposal to use-up on-hand** on the toolbar of the **Production order lines** FastTab to automatically change the product after its on-hand inventory reaches 0 (in other words, when the accumulated inventory goes negative). In this way, you can see the date when the item will no longer be used, and you can then change the effective dates for the version or item on the BOM.

8. On the **Run in the background** FastTab, either choose to implement the changes right away, or configure settings to control whether and how it runs as a batch job.

9. Select **OK** to apply your settings.

When the change is applied, the system changes the quantity of the BOM line for the "from" item to 0 (zero). It then creates a new BOM line that has the "to" item and the new quantity, and updates the line so that it shows the information for that item. The following fields from the line for the "from" item are copied to the line for the "to" item. Therefore, no manual changes are required.

- Line type
- Vendor
- Site
- Warehouse
- Scrap
- Flushing principle
- Resource consumption
- Per series

Change production order routes

It's often useful to change the setup times for routes when improvements are made or machines are changed for the same process.

To change a production order route, follow these steps:

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select one or more production orders that you want to change.
3. On the Action Pane, on the **Production order** tab, in the **Change** group, select **Change route**.
4. In the **Production order change route item** dialog box, on the **Parameters** FastTab, specify the "from" route and the "to" route.
5. The **Production order lines** FastTab shows a list of the selected production orders that use the "from" route. Mark the orders where you want to substitute the specified "to" route for the specified "from" route.
6. On the **Run in the background** FastTab, either choose to implement the changes right away, or configure settings to control whether and how it runs as a batch job.
7. Select **OK** to apply your settings.

Last updated on 12/30/2025

Production setup requirements

This article provides information about setup requirements before you can work with Production control.

Production control is integrated with features in other modules. This interconnectivity lets you change production orders and make sure that they're automatically updated in all other related processes and calculations in the system. The following setup processes are listed in the order that you should complete them in.

Required baseline setup in other modules

Information in other modules must be set up before you can work with Production control. This setup includes the following tasks:

- Set up general company information.
- Set up the general ledger.
- Define item groups.
- Set up ledger accounts for item groups.
- Set up the inventory item table in Inventory management.
- Create bills of materials (BOMs) and BOM versions in Product information management.

Required calendar and resource setup

Before you use Production control, open Organization administration, and create and define the calendar and operations resources in the following order:

1. **Working time templates** – Set up working time templates to define the times that are available for production scheduling.
2. **Calendars** – Set up working time calendars to define the days of the year that are available for production scheduling.
3. **Resource groups** – Set up resource groups to group the operations resources, so that you can get an overview of any free capacity when you run scheduling. You don't have to set up resource groups before you set up operations resources. However, we recommend that you understand how to group resources when you set up Production control.
4. **Resources** – Set up operations resources to define the resources that are used to complete the production process and plan for capacity.

Required production parameters setup

- **Production control parameters** – Set up basic production parameters to define how the system handles and processes production orders. Define how production orders are created, estimated, scheduled, and consumed. You can also select what kind of feedback you want and how cost accounting is done.

Required journal name identification

- **Production journal names** – Specify the production journal names that are used to record and post transactions.

Setup if you use operations

Operations represent the specific activities that are completed to produce the finished product.

- **Operations** – Set up operations to represent the tasks that must be completed to produce the finished item.
- **Relations** – Set up operation relations to establish detailed properties. To define operation relations, select **Relations** on the **Operations** page.

> ⓘ **Note**
>
> You must know the types of activities that are required in order to produce your item, and the order and priorities of those activities. You must also know which resources are involved, and how many.

Setup if you use routes

If you're working with routes, operations must be defined for every production route that you set up. The route represents the path that the item takes from operation to operation, from the start of the production process to the end.

- **Cost categories** – Set up cost categories to define the cost per hour of specified processes and setup times.
- **Cost groups** – Set up cost groups to create and maintain different types of costing.
- **Route groups** – Set up route groups to define parameters that are related to groups of routes. You must set up route groups before you can create production routes.

- **Routes** – Set up production routes, and define default settings to control scheduling, costing, and pricing of route operations, and to control progress reporting.
- **Route version** – Set up route versions to enable item variations in production.

Optional advanced settings

- **Production groups** – Set up production groups to establish relationships between the production order and ledger accounts. The ledger accounts are used to post or group orders for reporting.
- **Production pools** – Create production pools to group production orders so that you can process urgent production orders, or delete and post groups of orders.
- **Properties** – Define properties to create special attributes that you can assign to your resources to control the order of productions. These attributes are connected to the working time template.

Bills of materials and formulas

07/10/2025

This article provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – Gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – Typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMS are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – Used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.
- **Production BOM** – The actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – Used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that are expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

If a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have other important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. A BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create of production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version shouldn't be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

> **Note**
>
> A subproduction order is always created for pegged supply, even if on-hand inventory or other supply is available to cover the demand.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

> **Note**
>
> For BOMs that include subcontracted operations, the service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

BOM designer functionality

Article • 01/31/2025

This article describes how you can use the BOM designer page to design and work with tree structures for bills of materials (BOMs). To choose different configurations and specify what information appears on the lines of the tree, select **Setup**.

When you open the **BOM designer** page from the **Released products** page, it displays the hierarchy of bills of materials (BOMs) that are active and approved for the selected item, the default order site of the item, and the actual date.

To change the initial selection in the view, select **Filter**. By setting the display principle to **Selected/Active or Selected**, you can select individual BOM or route versions to use in the view. You can select non-approved and non-active BOM versions to show or maintain in the BOM designer.

> **Note**
>
> If you open the BOM designer from the **Bills of materials** list page, it doesn't display route information. Currently, the selection of a BOM or route version is a property of the BOM and route version, and applies to all instances of the BOM designer.

The following sections describe the functionality that is available on the various tabs of the BOM designer.

Analyzing a BOM structure by using the BOM designer

The BOM designer has two sections:

- The tree view of the BOM structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
  - **BOM line details** – Shows the details of the BOM line that is selected in the tree view.
  - **Item data** – Shows the details of the main item or the item that is used in the selected node. To maintain the selected item, select **Edit released product**.
  - **BOM** – Shows the header of the BOM that is related to the selected node.

- **Route** – Shows the header of the route that is related to the selected node.
- **Route operations** – Shows a preview of the operations for the route. When a BOM line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Selecting a BOM and route

The filter that is applied for the BOM and route is displayed in the header of the BOM designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

Expand table

Field	Description
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. **Note:** If you open the BOM designer for a product that isn't a product master, no product dimensions can be selected in the **Filter** dialog box.
Site	Change the site that the BOM tree is displayed for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current BOM structure and the current route: • When the principle is set to **Active or Selected/Active**, the valid BOM or route version for this date is found. • When the principle is set to **Selected/Active or Selected**, you can select a BOM version or route version by selecting **BOM** > **BOM versions** or **Route** > **Route versions**.
Version date	Enter the version date for the BOM and route. The version identifies which BOM version is used on a specific date, as determined by the version dates in the BOM version setup.
From quantity	Filter the versions by selecting a specific from quantity. If you set a value, different BOM and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only BOM lines that have valid dates. Right-click or double-click a BOM line to open the **Edit BOM line** page, where you can see the validity dates for that BOM line.

When you use the BOM designer to review or edit BOMs that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete BOM hierarchy. To simplify the overview, you can lock the top-level route in

the display by selecting **View** > **Lock route**. To unlock the route, select **View** > **Unlock route**.

Adding and editing BOMs and BOM lines

Use the **BOM lines** or **BOM** functions to modify the BOM lines or BOM. When you select a node in the tree, the type of the node determines that functions that are available.

Expand table

Function	Description	Node type and conditions
BOM lines > Edit	Open a dialog box where you can edit the BOM line attributes.	This function is available when a BOM line node is selected.
BOM lines > Delete	Delete a BOM line from the selected BOM.	This function is available when a BOM line node is selected, and the BOM isn't locked for editing.
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected BOM line.	This function is available when a BOM line node is selected.
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected BOM.	This function is available when the node that is selected has a selected BOM. If this function isn't available, a BOM version might be missing for the selected item variant. In this case, select **BOM** > **Create version** to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected BOM line.	This function is available when a BOM line node is selected.
BOM > Create version	Create a new BOM version or BOM for the product variant of the selected node.	This function is available when the BOM line node that is selected is linked to an item that has a production type of **BOM** or **Formula**.
BOM > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a BOM version.
BOM > Check	Validate and check the	This function is available when the node that is

Function	Description	Node type and conditions
	selected BOM.	selected is related to a BOM version.

Configuring the tree view

To customize the information that is shown in the tree view of the BOM designer, select **Setup**.

Expand table

Field group	Description
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The BOM designer displays the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

Override the default reservation principle for materials in production

06/17/2025

The *Override default production reservation* feature lets you set a default reservation principle for each item model group. Therefore, different reservation principles can automatically be applied for each item that is part of a production bill of materials (BOM) or batch order formula. You can select whether each item model group should override the default reservation principle that is set for an order, and what reservation principle should be used instead (*manual*, *estimation*, *scheduling*, *release*, or *start*).

When you create a new production order or batch order, the system prompts you to select the reservation principle for that order and all its BOM or formula lines. If you use the *Override default production reservation* feature, some or all BOM or formula lines can override your selected reservation principle and instead use the reservation principle set for their item model group.

For example, if you have raw materials or ingredients that require pick work, BOM or formula lines that are created for those products require a physical reservation, because physical reservation is a prerequisite for the generation of warehouse work. Typically, if you want the reservation to occur automatically, you select one of the following reservation principles: *estimation*, *scheduling*, *release*, or *start*. On the other hand, if you have materials or ingredients that don't require pick work, because they're consumed directly from a location, you typically select the *manual* reservation principle, which doesn't make any physical reservations or generate any pick work.

Assign a production reservation policy to an item model group

1. Go to **Cost management** > **Inventory accounting policies setup** > **Item model groups**.
2. Create or select an item model group.
3. On the **Inventory policies** FastTab, select the **Override item production reservation** check box.
4. In the **Reservation** field, select the reservation principle for items that belong to the selected model group. (Those items include items that are on a BOM or formula line.)
    - *Manual* – Items in the model group aren't automatically physically reserved for production. However, they can still be manually reserved as required.

- *Estimation* – Items in the model group are physically reserved during estimation of the production order.
- *Scheduling* – Items in the model group are physically reserved during scheduling of the production order.
- *Release* – Items in the model group are physically reserved when the production order is released.
- *Start* – Items in the model group are physically reserved at the start of the production order.

Example: Using reservation principles in a bulk/pack scenario

A bulk lubricant material is produced in a 1,000-liter mixer. After the bulk material is ready, it's pumped out to several filling stations, where bottles of different sizes are filled. After filling is completed, the bottles are packed into boxes. Those boxes are then packed onto pallets.

In this scenario, a batch order to make 1,000 liters of bulk material is created. (This order is the bulk order.) When this batch order is completed, it's reported as finished to the material input location of the filling stations. A batch order to fill and pack each bottle size is then created. (These orders are the pack orders.) The pack orders have a formula that consists of the bulk material, an empty bottle, a label, and other packing materials. Because the bulk material flows directly from the mixer tank to the filling stations, no warehouse work is required to pick this ingredient, and the bulk material is consumed directly from the input location. Therefore, the reservation principle is set to *manual*. The other materials are staged to the filling station by pick work. Therefore, the reservation principle for these lines is set to *release*, for example, so that the reservation automatically occurs when the pack order is released.

Reserve the same batch for a production order (preview)

[This article is prerelease documentation and is subject to change.]

Same-batch selection lets you reserve the consumption of a raw material on a production order or batch order against a single batch of inventory. This capability keeps batch traceability consistent through the manufacturing process. For example, when an ingredient must come from one batch to guarantee a uniform mix, same batch selection reserves the whole bill of materials (BOM) or formula line from one batch instead of spreading it across several batches. It brings the *Same batch selection* capability that's already available for sales orders to production and batch orders.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.49 or later.
- The feature named *(Preview) Use same batch selection for raw materials in production* must be turned on in feature management.
- The feature supports both warehouse management processes (WMS) and non–WMS scenarios. WMS scenarios are supported only when you use a reservation hierarchy where the batch number dimension is above the location dimension (a *Batch-above [location]* reservation hierarchy).
- This feature applies only to batch-enabled products that aren't tracked by serial numbers. That means that it only supports products assigned a tracking dimension group in which the *Batch number* dimension is active and the *Serial number* dimension is inactive.

Set the Same batch selection field on a BOM or formula line

The **Same batch selection** setting flows through the manufacturing setup, so you can control it at the level that makes sense for your process. The value comes from the **Same batch selection** field on the item model group and flows through the BOM and formula lines to the production order lines, where it becomes read-only.

You can override the default value on individual BOM or formula lines. Follow these steps:

1. Go to **Product information management** > **Bills of materials and formulas** > **Bills of materials** (or **Formulas**).

2. Select or create a BOM or formula version, and open its lines.

3. Select the line for the raw material that you want to configure.

4. On the **Line details** FastTab, select the **Setup** tab.

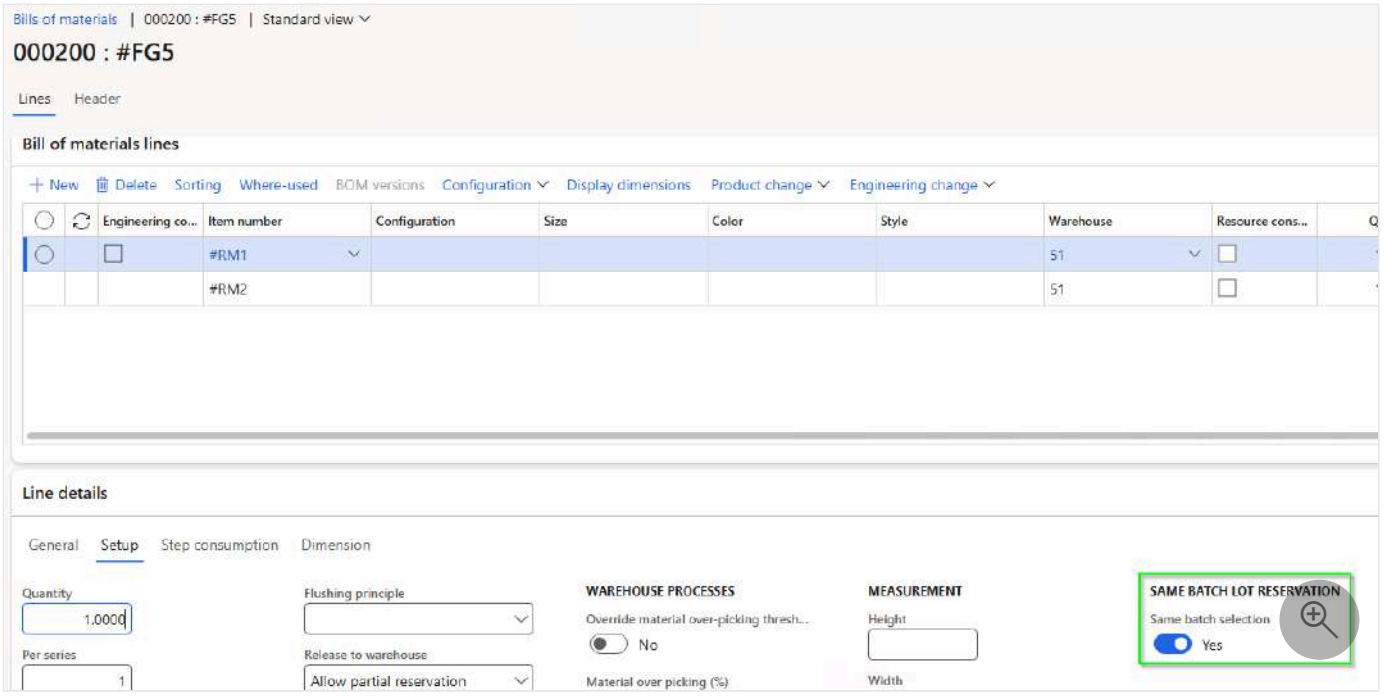
5. In the **Same batch lot reservation** field group, find the **Same batch selection** field. This field has the following values:

   - *Yes* – The raw material must be reserved from a single batch during production. Only inventory from one batch can be used for this line.
   - *No* – No single-batch constraint is applied. The system can reserve inventory from multiple batches.

   The field inherits its default value from the item model group that's assigned to the product. You can override it here for specific BOM or formula lines.

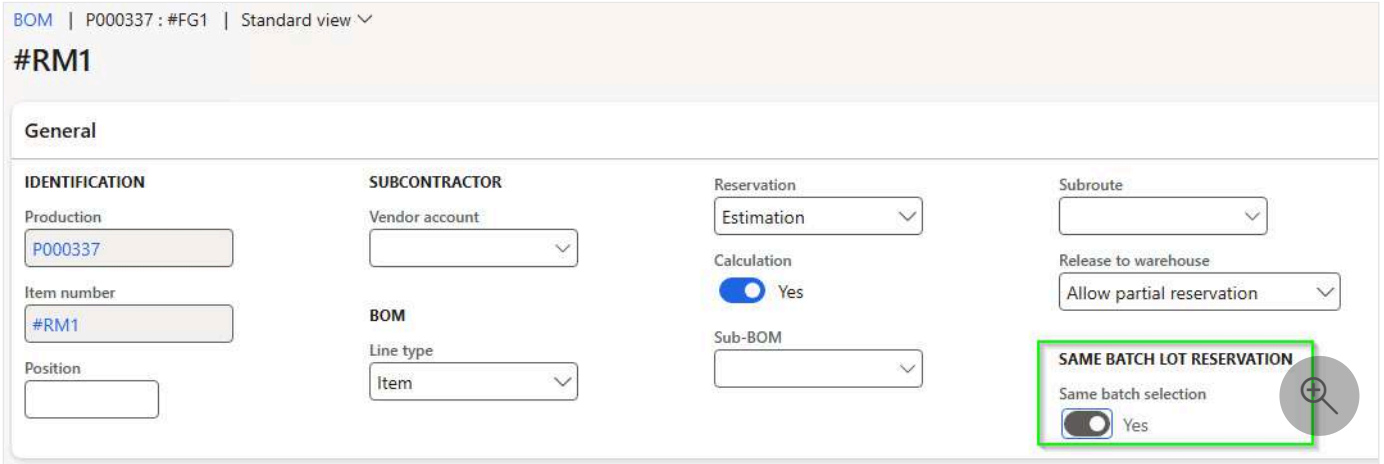
6. Select **Save**.

The following screenshot shows the **Bills of materials** page with the **Same batch selection** field highlighted on the **Setup** tab of the **Line details** FastTab.



When you create a production order or batch order, the BOM or formula line usually copies its **Same batch selection** value to the production order BOM line. On the production order BOM line, the **Same batch selection** field appears in the **Same batch lot reservation** field group on the **General** tab and is read-only.

The following screenshot shows the production order BOM line with the read-only **Same batch selection** field.



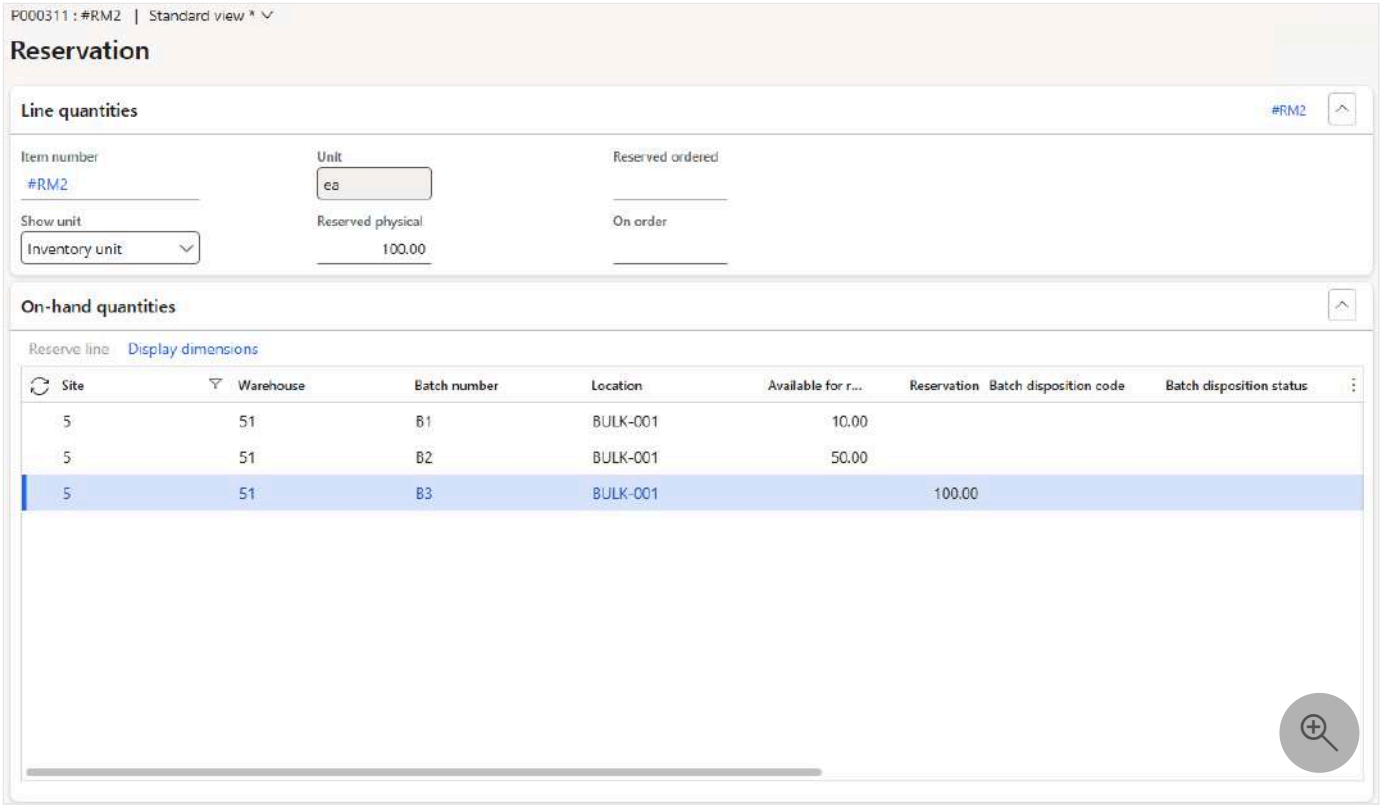
Reservation behavior

When you turn on same-batch selection for a production order or batch order line, the system tries to reserve the required quantity from a single batch during estimation. The outcome depends on available on-hand inventory. Reservation can happen automatically, according to the reservation rules of the BOM or formula line, or manually, when a user reserves against a specific batch directly from the order lines. In either case, same-batch selection constrains the reservation

so that the whole required quantity is drawn from one batch wherever on-hand allows. The outcome depends on available on-hand inventory:

- If a single batch has enough on-hand inventory to fulfill the line, the system reserves that batch. When the item model group enables FEFO, the system selects the batch that has the earliest expiry or best-before date.
- If no single batch can fulfill the line, the system doesn't reserve any batch against the BOM or formula line. The system doesn't show any warning or error message.

The following screenshot shows the **Reservation** page for a production order BOM line where a single batch (B3) was successfully reserved because it had sufficient quantity.



Batch selection sorting priority

When multiple batches can fulfill the requirement, the system selects a batch based on the following sorting priorities:

- **FEFO** – Expiry date or best-before date (ascending), then batch number (ascending).
- **Standard** – Batch number (ascending).

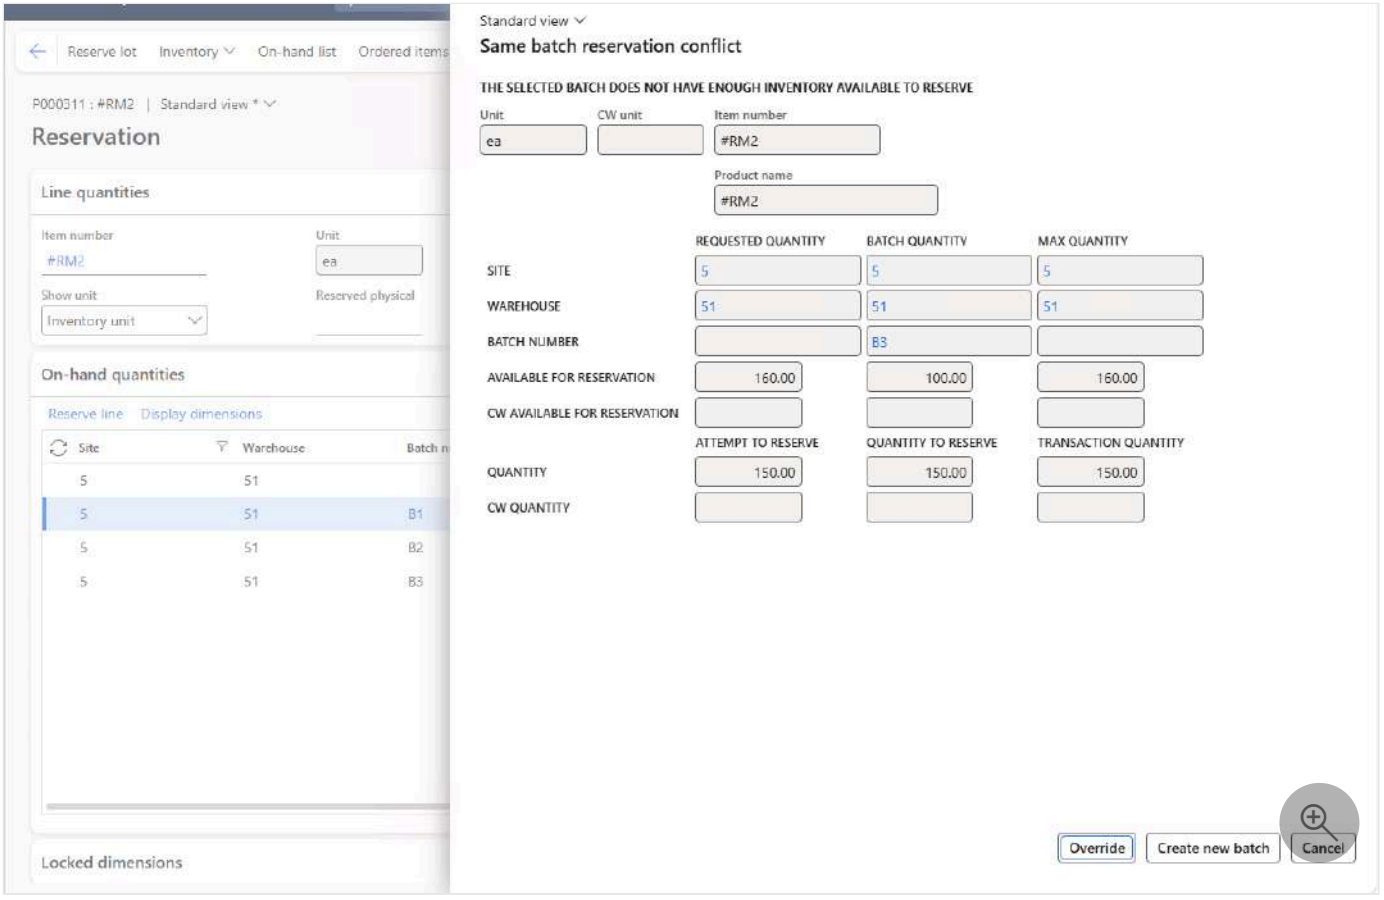
Resolve a same-batch reservation conflict

When you manually reserve a production order BOM line that you can't fulfill from a single batch, the **Same batch reservation conflict** page opens. This page shows the requested quantity, the

available batch quantity, and the maximum quantity available. It offers the following actions:

- **Override** – Turns off single-batch selection for that line and reserves the quantity across multiple batches. The line's **Same batch selection** setting is cleared and marked as overridden.
- **Create new batch** – Generates a new batch number through the standard number sequence and leaves the line on order, so that you can produce or receive inventory into the new batch.
- **Cancel** – Leaves the line on order with no batch reservation.

The following screenshot shows the **Same batch reservation conflict** page with the available actions.



> **Important**
>
> The **Lower quantity** action that's available for sales orders is intentionally turned off for production scenarios, because reducing the consumed quantity would invalidate the production estimation.

Batch reservation policy for non-WMS warehouses

For warehouses that don't use WMS, the **Batch reservation policy for non-advanced warehouses** parameter controls whether the system enforces single-batch reservation when the reservation hierarchy has the batch number dimension below the location dimension (a *Batch-below [location]* reservation hierarchy). To set this option, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **General** tab.
3. On the **Batches** FastTab, set **Batch reservation policy for non-advanced warehouses** to one of the following values:

    - *Simple* – The system doesn't consider same-batch selection constraints when using batch-below reservation hierarchy.
    - *Advanced* – The system applies FEFO rules and batch disposition codes during reservation. Same-batch selection for batch-below items on non-WMS warehouses is blocked, and an error message is shown.

Phantom items

08/13/2025

This article describes, in detail, how the *Phantom* line type can be used for the lines of a bill of materials (BOM) and a formula.

In figure 1, (a) is the BOM for product H and parts F and G, and (b) is the route sheet for products H and part F.

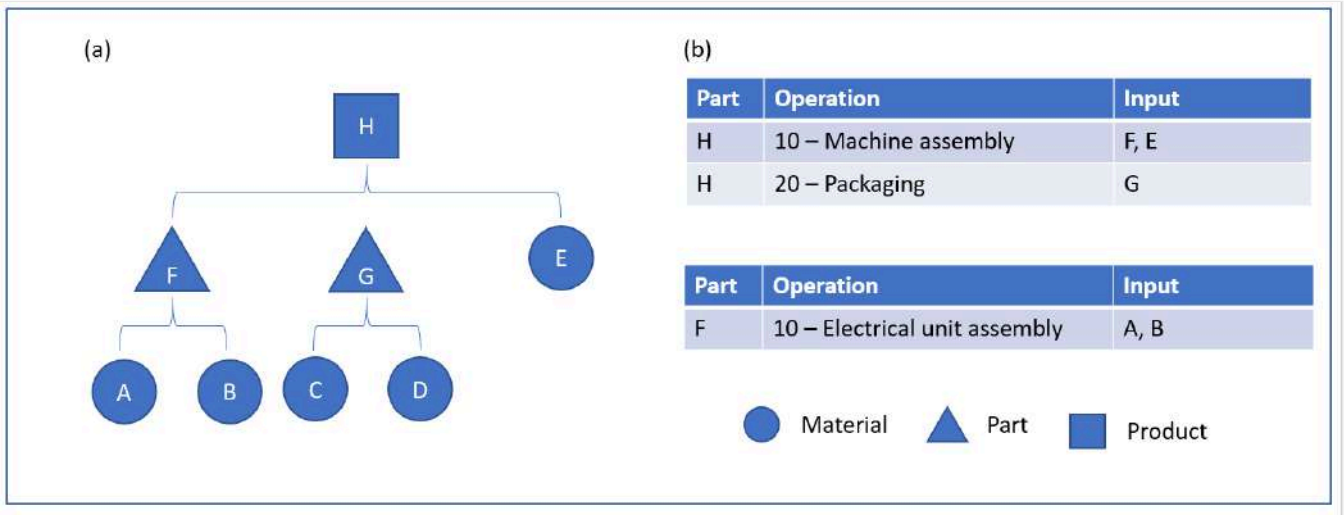

Figure 1: Engineering BOM

Figure 1 shows an example of a BOM structure in two levels. Finished product H represents a product for a machine assembly. The machine assembly consists of two parts, an electrical unit (F) that has two materials (A and B) and a group of packaging materials (G) that also has two materials (C and D). Another material (E) is used during the general assembly of the machine.

Figure 1 represents the Engineering BOM for product H. This structure provides a good overview of the parts and components of the overall machine assembly. However, although product designers might prefer to see the BOM represented in this way, this structure might not correctly represent the way that the machine is built on the shop floor.

For example, the Engineering BOM in the figure 1 indicates that electrical unit F is assembled as a separate part on a separate work order. However, on the shop floor, it might be judged more optimal to assemble the electrical unit as part of the overall machine assembly, not as a separate work order.

This Engineering BOM also indicates that part G is a separate part. However, in this structure, part G doesn't represent a physical part but a collection of packaging materials.

Therefore, although an Engineering BOM provides great value for the design of a product and maintenance of that design, it might not be the most logical way to support the manufacturing

execution process of the product. By contrast, a Manufacturing BOM represents the best way to build a product.

Figure 2 shows how the preceding Engineering BOM is transitioned into a Manufacturing BOM. In figure 2, (a) is the BOM for product H, and b is the route sheet for product H.

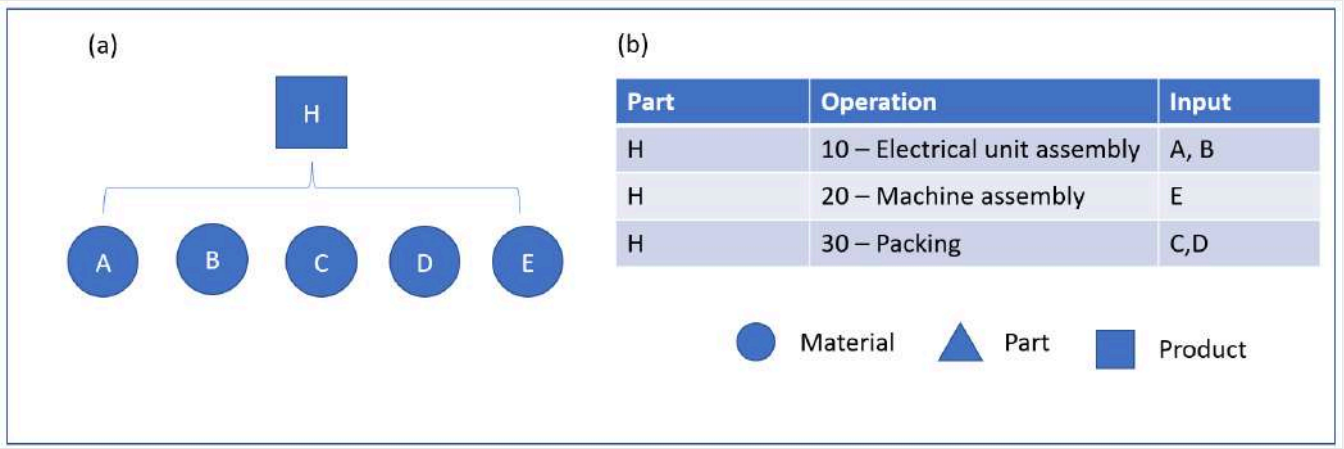

Figure 2: Manufacturing BOM

In this structure, you can see that there's no notion of parts F and G, and the materials that these parts consist of have been elevated to the next BOM level.

Unlike the Engineering BOM, which had two operations sheets, the Manufacturing BOM has only one operations sheet. The packaging operation that was linked to part G has also been elevated and is now part of the operations sheet for product H. The assembly of the electrical unit is the first operation. This order makes good sense, because this unit is used in the next operation, which is the machine assembly. The last operation is the packaging operation, which consumes two packing materials (C and D).

The transition between the Engineering BOM and the Manufacturing BOM is enabled through the *Phantom* BOM line type. As the term *phantom* indicates, parts F and G have disappeared during the transition between the two BOM types. In this example, the *Phantom* line type is applied to the BOM lines for parts F and G in the Engineering BOM. When a production or batch order is created, the Engineering BOM is copied to the production or batch order. Then, when the order is estimated, the transition from the Engineering BOM to the Manufacturing BOM occurs, as shown in figure 2. From the operations sheet in figure 2, packaging materials C and D are input for the operation.

Multilevel phantom BOM structures

The *Phantom* line type can be used in multilevel BOM structures, as shown in figure 3. In figure 3, (a) is the BOM for product G, and (b) is the route sheet for parts E and F and product G.

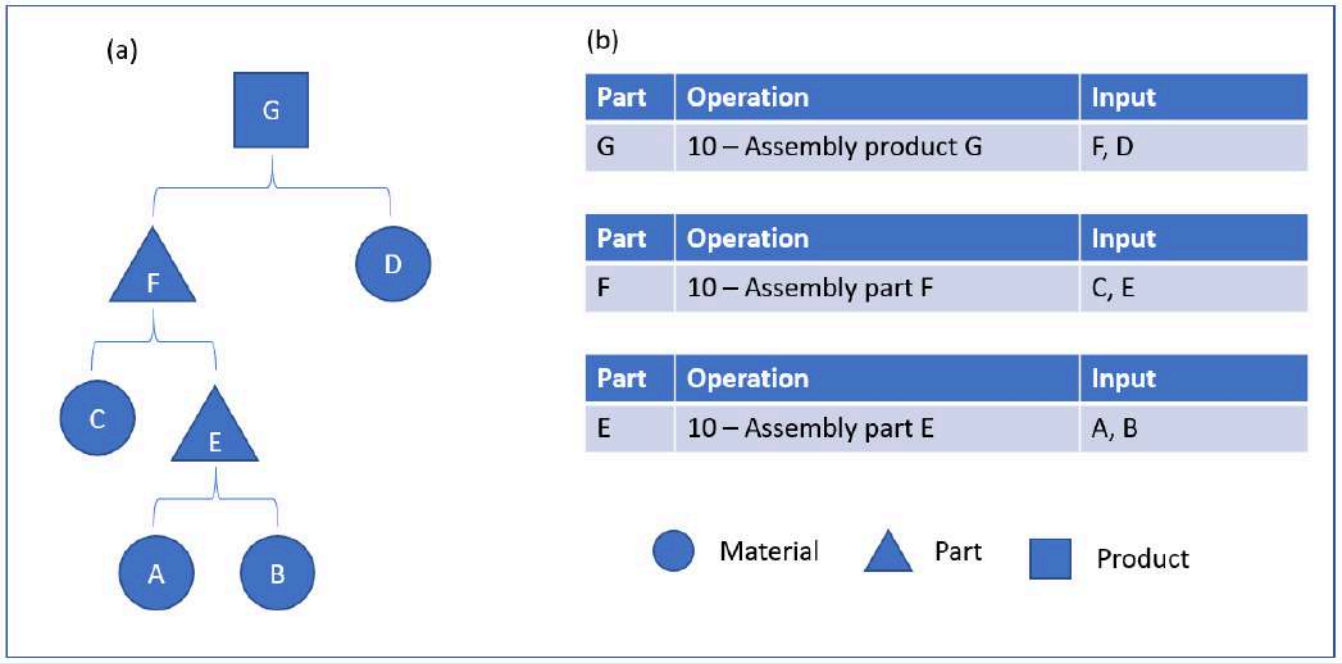

Figure 3: Engineering BOM part G

Figure 4 shows the resulting Manufacturing BOM and route sheet if the BOM lines for parts E and F are configured so that the line type is *Phantom*. In figure 4, (a) is the BOM for product G, and (b) is the route sheet for product G.

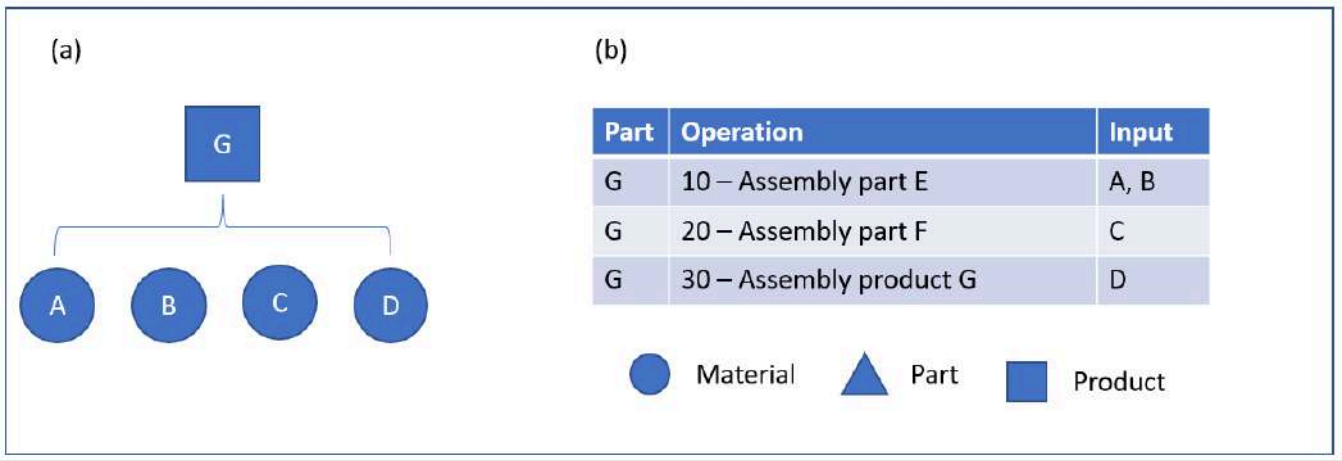

Figure 4: Manufacturing BOM part G

Phantom and route network

Phantom BOMs can also be used for a BOM that has a route network. In a route network, one or more operations run in parallel. Figure 5 shows an example of a route network that is used in a multilevel BOM. In figure 5, (a) is the BOM for product G and part F, and (b) is the route sheet for product G and part F, which has a route network.

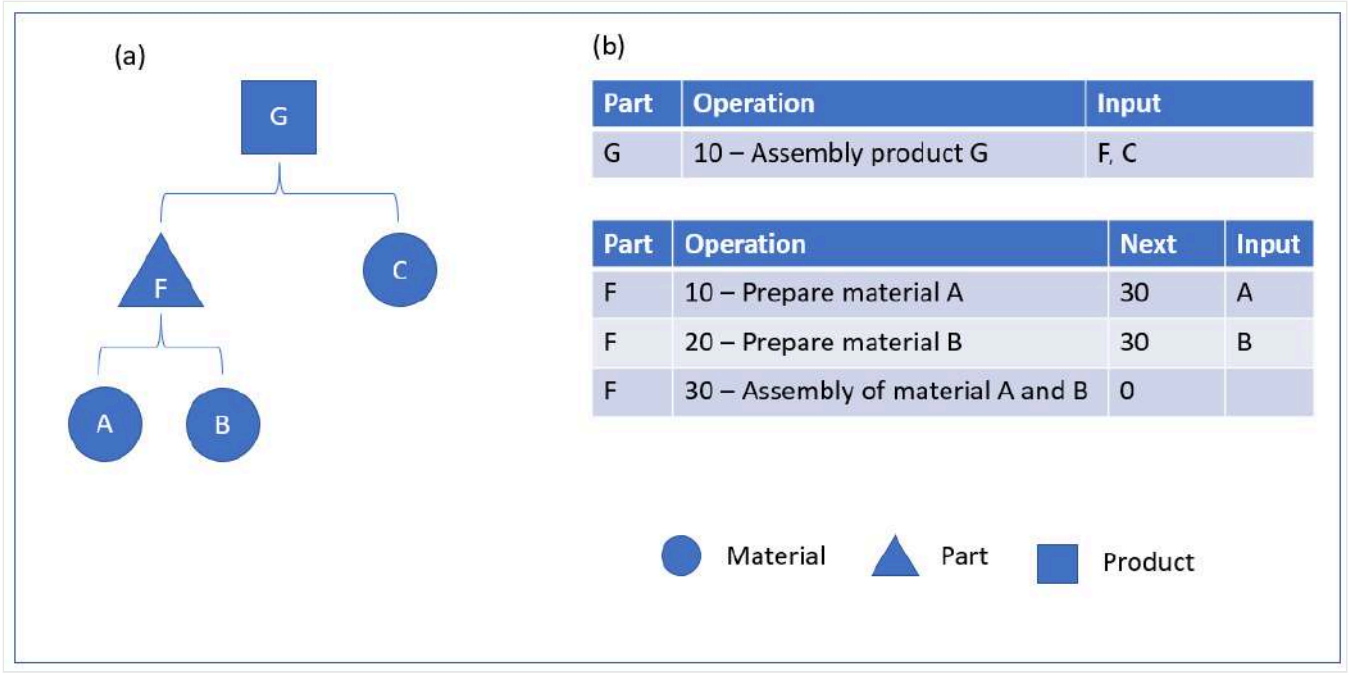

Figure 5: Engineering BOM part G, route network

In figure 6, (a) is the BOM for product G and part F, and (b) is the route sheet for product G and part F.

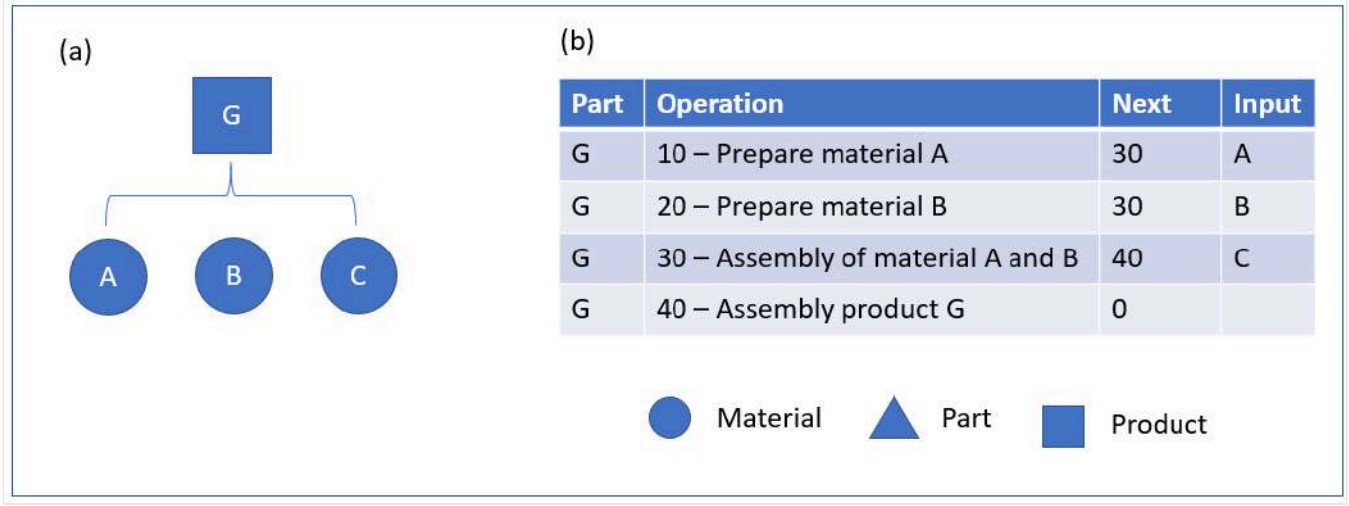

Figure 6: Manufacturing BOM part G, route network

BOM calculations

07/21/2025

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the Calculations page. This article provides information about BOM calculations.

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. You use the **Calculations** page to perform the following tasks:

- Calculate the cost of a manufactured item, and generate an associated item cost record within a costing version.
- Calculate the sales price of a manufactured item, and generate an associated item sales price record within a costing version.

The way that you use the **Calculations** page varies slightly, depending on how you initiate the BOM calculations. The way that you use the **Calculations** page also depends on whether the BOM calculations involve a costing version for standard costs or planned costs, and on several policies that are defined in the costing version that is used in the BOM calculations. A variation of the **Calculations** page is used in the context of a sales order, sales quotation, or service order line item. These calculations are known as order-specific BOM calculations. An order-specific BOM calculation doesn't generate an item cost record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation details** page. The calculation record includes a calculated cost and a calculated sales price. The **Calculations** page can be opened for a single manufactured item or for a costing version.

- To calculate costs for a single manufactured item, you initiate BOM calculations from the **Item price** page. The **Calculations** page inherits the item identifier. The costing version, BOM version, route version, calculation quantity, calculation date, and site must be specified.
    - By default, the BOM version and route version are set to the active versions for the item, site, date, and calculation quantity. However, you can override the default values with approved versions.
    - By default, the calculation quantity is set to the item's standard order quantity. However, you can override the default value.
    - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version. A future calculation date determines how pending cost records are used. BOM calculations use a pending cost record that has the nearest from-date that is on or before the calculation date.

- To calculate costs for all manufactured items or selected items, or to update items on a where-used basis, you initiate BOM calculations from the **Costing version setup** page or the **Costing version maintenance** page. The **Calculations** page inherits the costing version.
    - For the calculations, it's assumed that the active BOM version and route version are used for a manufactured item (and for the related site, date, and quantity), unless a manufactured component has a specified sub-BOM or subroute.
    - For the calculations, it's assumed that the standard order quantity is used for manufactured items. The standard order quantity provides the basis for calculating component quantities, determining the relevant BOM versions and route versions (when you use quantity-sensitive BOMs and routes), and amortizing constant costs. However, when a manufactured component has a BOM line type of *Production* or *Vendor*, or when you use a make-to-order explosion mode for the BOM calculations, this assumption doesn't apply, because quantities reflect the specified calculation quantity.
    - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version.

Other variations in BOM calculations reflect the costing type and restrictions of the costing version:

- BOM calculations that use standard costs must be restricted by costing version policies, because the restrictions help guarantee that standard costing principles are used. Standard costing principles require the enforcement of restrictions about the use of standard costs for purchased items, a single-level explosion mode, and the inclusion of miscellaneous charges in unit costs.
- BOM calculations that use planned costs don't have to follow standard costing principles. These BOM calculations can use different explosion modes, alternative sources of cost data for purchased items, and optional enforcement of restrictions within the costing version.

BOM calculations that use standard costs

Policies within the costing version (for standard costs) can mandate enforcement of five BOM calculation policies. The *Recording restriction* option in the costing version mandates one of these policies, where miscellaneous charges must be included in the unit price. Miscellaneous charges for purchased items can be entered manually, whereas miscellaneous charges for manufactured items reflect the calculated amortization of constant costs. The *Calculation restriction* option in the costing version mandates the other four BOM calculation policies:

- The source of cost contributions for purchased items must be based on standard costs. In other words, BOM calculations must use the item cost records within the specified costing version, or within the fallback that contains standard costs.
- To help guarantee accurate and consistent calculation of standard costs, the explosion mode must be single-level.
- To help guarantee consistent results when the sales price of the items is calculated, the profit setting must be mandated. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle must be mandated, and can be set to *None*, *Active* (for active cost records), or *Costing version* (for a specified costing version).

BOM calculations that use planned costs

Policies within the costing version (for planned costs) can optionally mandate enforcement of five BOM calculation policies. Alternatively, the policies can just provide default values. The *Recording restriction* option in the costing version determines whether the BOM calculation policy about miscellaneous charges will be mandated or act as a default value. Miscellaneous charges can optionally be included in the unit price. The *Calculation restriction* option in the costing version determines whether the other four BOM calculation policies will be mandated or act as default values:

- The source of cost contributions for a purchased item can be the item cost records within a costing version. Alternatively, the source can be defined by the BOM calculation group that is assigned to the item. For example, the BOM calculation group can define purchase price trade agreements as the source of cost contribution data.
- The explosion mode can be single-level, multilevel, or make-to-order, or it can be based on the BOM line item. The explosion mode for the BOM line type replicates the cost calculation logic for production order estimates.
- The profit setting can be mandated, or it can be a default value. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle can be mandated, or it can be a default value. The fallback principle can be set to *None*, *Active* (for active cost records), or *Costing version* (for a specified costing version).

BOM calculations generate warning messages and other types of messages. Several BOM calculation policies determine the types of messages. The warning conditions are defined in the BOM calculation group that is assigned to items. However, you can override these warning conditions when you initiate a BOM calculation. When the fallback principle is used, it's often helpful if the fallback is shown as an information message. When you're trying to update

calculated costs for items that have missing cost records, it's also helpful if the information message identifies items that weren't updated.

BOM calculations that use the fallback principle

The following situations illustrate two uses of the fallback principle:

- **Two-version approach to standard cost updates** - A costing version can contain the incremental changes to standard costs, such as pending cost records that represent new items or cost changes. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.
- **Simulation of the effect of cost changes by using planned costs** - A costing version for planned costs can contain incremental changes for simulation purposes. This costing version will include pending cost records that represent the simulated cost changes to items, cost categories, and calculation formulas for indirect cost. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.

BOM calculation of a suggested sales price

When you use a cost-plus-markup approach, the calculated sales price for an item reflects the set of profit-setting percentages that is specified for the BOM calculation, and the costs that are associated with the item's component items, routing operations, and applicable manufacturing overheads. The markup reflects profit-setting percentages that are assigned to cost groups, and the cost groups that are assigned to items, cost categories for routing operations, and the indirect cost calculation formulas for manufacturing overheads. The sets of profit-setting percentages are labeled *Standard*, *Profit 1*, *Profit 2*, and *Profit 3*. Within the Profit 1 set, for example, a profit-setting percentage of 50 percent can be defined for a cost group that is assigned to purchased material, and a profit-setting percentage of 80 percent can be defined for a cost group that is assigned to cost categories for routing operations. The context of the BOM calculation determines how the results of a calculated sales price are handled:

- **BOM calculation for an item and specified costing version** - The BOM calculation generates a pending sales price record within the costing version. This sales price record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). The sales price record acts mainly as reference information and isn't used as the basis for a sales price on sales orders.
- **Order-specific BOM calculation** - A variation of the **BOM calculation** page is used in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation doesn't generate a record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation results** page. This calculation

record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). Information about a selected calculation record can be transferred to the originating line item. For example, the calculated sales price can be transferred to a sales order line item.

Order-specific BOM calculations

An order-specific BOM calculation represents a variation of a BOM calculation for a manufactured item. The order-specific BOM calculation is performed in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation generates a calculation record that appears on the **BOM calculation results** page. The calculation record includes a calculated weight, a calculated cost that is based on active cost records, and a calculated sales price. The calculation record that each order-specific BOM calculation for an item generates on the **BOM calculation results** page is uniquely identified by a calculation number. The results of a calculation record can be optionally transferred to the originating line item. An order-specific BOM calculation differs from a BOM calculation for a manufactured item in two ways:

- An order-specific BOM calculation doesn't generate an item cost record within a costing version. Therefore, the BOM calculation policies aren't applied when an item cost record is created, or when a cost record is overwritten.
- An order-specific BOM calculation always uses the active cost records for components, cost categories, and indirect cost calculation formulas.

Production parameters for manufacturing execution

08/13/2025

This article provides information about the setup of production parameters for manufacturing execution.

Manufacturing execution can be used to register time and item consumption on production jobs or projects. Before you start to use manufacturing execution for job registrations, you must set up various production parameters that define how and when registrations are posted during the production process. The settings of production parameters affect inventory management, production management, and cost calculation.

Before workers start to make registrations on production jobs, you should carefully consider all settings on the **Production order defaults** page. Go to **Production control** > **Setup** > **Manufacturing execution** > **Production order defaults**. If your company uses the multisite functionality, you might want to set up different production parameters for each site. The following tabs are provided on the **Production order defaults** page:

- **General** – General parameter settings for production jobs.
- **Start** – Parameters that are used when production operations are started.
- **Operations** – Parameters that are applied to production operations and feedback about operations during the production process.
- **Report as finished** – Parameters that are used when items are reported as finished on the last operation of a production order.
- **Quantity validation** – Parameters that are used to validate start and feedback quantities on production orders.

Types of production jobs

On the **Operations** tab, you select which types of production jobs require registration.

Typically, workers make registrations on setup jobs and process jobs. However, if job scheduling is applied, you can select other job types that workers must make registrations on when production orders are processed. For example, you can require registrations on transport jobs.

> **Important**

Make sure that you select all relevant job types. Otherwise, jobs might not be available for registration. Your selections should match the selections in the **Job management** column on the **Setup** FastTab of the **Route groups** page (**Production control** > **Setup** > **Routes** > **Route groups**).

If **Job management** is selected on the route group, this job type is reported as finished on the production order when a job is reported as finished. When all job types that **Job management** is selected for have been reported as finished on an operation, the operation is reported as finished.

> ⓘ Note
>
> Some job types can be manually reported through production journals. In this case, select **Job management** for the job type, but don't select the job type for registration on the **Operations** tab on the **Production order defaults** page.

BOM consumption and picking list journals

A consistent setup for bill of materials (BOM) consumption is important because it helps guarantee that inventory management is efficient. For example, if BOM consumption parameters aren't set up correctly, materials might be deducted from inventory two times or not at all.

On the **Production order defaults** page, automatic BOM consumption is set up in three stages:

- At the start of a production. Set up this stage on the **Start** tab.
- During the production process when an operation is completed. Set up this stage on the **Operations** tab.
- When a production order is reported as finished. Set up this stage on the **Report as finished** tab.

For each stage, the **Automatic BOM consumption** field lets you select one of three methods for picking items for a production order:

- *Flushing principle* – This option is used in combination with an option that is defined for the BOM. Select **Production control** > **Production orders** > **All production orders**. On the **All production orders** page, select a production order in the list, and then, on the Action Pane, open the **Production order** tab and select **BOM**. On the **BOM** page, open the BOM line you want to set. Then open the **Setup** FastTab and select one of the following options in **Flushing principle** field:
  - *Start*

- *Finish*
- *Manual*
- *Available at location*
- Blank (No option is selected.)

If *Flushing principle* is selected in the **Automatic BOM consumption** field on the **Start** tab of the **Production order defaults** page, all materials that are set to *Start* in the BOM are deducted from inventory when the operation is started. The *Available at location* option is used for products that are enabled for warehouse management processes (WMS). If you select this flushing principle, material is flushed when warehouse work for raw material picking is completed. Material is also flushed when a BOM line that uses this flushing principle is released to warehouse and the material is available at the production input location.

> ⓘ **Note**
>
> If *Flushing principle* is selected in the **Automatic BOM consumption** field on the **Start** tab of the **Production order defaults** page, you must select the same value on either the **Operations** tab or the **Report as finished** tab. This requirement helps guarantee that materials are deducted from inventory on BOMs that use *Finish* as a flushing principle on the production order. If *Flushing principle* isn't selected on either the **Operations** tab or the **Report as finished** tab, materials might be deducted from inventory two times.

- *Always* – If you select this option for a stage, materials are always deducted from inventory at that stage. For example, materials for the production are deducted when the production order is started. This setting requires that *Never* be selected on the **Operations** and **Report as finished** tabs. This requirement helps prevent items from being deducted from inventory two times.

- *Never* – If you select this option for a stage, no BOM consumption occurs at that stage. For example, if you select *Never* on all three tabs (**Start**, **Operations**, and **Report as finished**), materials must be manually deducted from inventory.

> ⓘ **Important**
>
> Carefully consider your setup of the production order defaults, and make sure that the defaults that are selected on the various tabs of the **Production order defaults** page don't contradict each other.

The following examples illustrate parameter settings that support various BOM consumption principles. The parameters are set up on the **Production order defaults** page.

Example 1: Backflushing on operations

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on an operation.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status* or *Status + quantity*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Always*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status + quantity*

Example 2: Backflushing on production

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on the production order.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status* or *Status + quantity*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Always*
Report as finished	Update finished report on-line	*Status + quantity*

Example 3: Flushing principle

Use the following settings if picking list journals and BOM item consumption should be generated according to the flushing principle that is set for the BOM items.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status + quantity*
Start	Automatic BOM consumption	*Flushing principle*
Operations	Automatic BOM consumption	*Flushing principle*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status + quantity*

Example 4: Deduction of materials during startup of a production order

Use the following settings if picking list journals and BOM item consumption should be generated when a production is started.

Expand table

Tab	Field	***Setting***
Start	Update start on-line	*Status + quantity*
Start	Automatic BOM consumption	*Always*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status* or *Status + quantity*

Based on the selections that are described earlier in this section, picking list journals are posted at various stages of the production order process:

- When an operation is started
- When quantity feedback is reported on an operation
- When items are reported as finished on the production order

Example 5: Manual BOM consumption

You can use the following settings if materials should always be manually deducted from inventory. In this case, picking list journals aren't posted.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status*

Operations resources

07/10/2025

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas, or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

> ⓘ **Note**

If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (*Tool*, *Vendor*, *Machine*, *Human resources*, *Location*, or *Facility*). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. Learn more in Resource capabilities.

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected.

Note

When you assign operations resources of the *Vendor* type to a resource group, all operations resources that are assigned to that resource group must be of the *Vendor* type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they're processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here's the formula that is used for the calculation: Scheduling time = Time × 100 ÷ Efficiency percentage. *Time* includes both the run time and setup time.
- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to *Yes* if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to *No*, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to *Yes* if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to *Yes* if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that is scheduled for the primary operation determines the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the *Vendor* type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is actually scheduled.

Create an operations resource

Article • 09/29/2021

An operations resource performs the activities of a project or a production process. This procedures shows you how to define an operations resource. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to Resources.
2. Click New.
3. In the Resource field, type a value.
4. In the Description field, type a value.

Define capacity and consumption parameters

1. Expand the Operation section.
2. In the Scrap percentage field, enter a number.
3. In the Setup category field, enter or select a value.
    - Specify the cost category that defines how to account for the cost of setup.
4. In the Run time category field, enter or select a value.
    - Specify the cost category that defines how to account for the cost of run time.
5. In the Quantity category field, enter or select a value.
    - Specify the cost category that defines how to account for the resource cost based on the output quantity.
6. In the Capacity unit field, select an option.
    - Specify the unit in which to express the capacity of the operations resource.
7. In the Capacity field, enter a number.
8. In the Efficiency percentage field, enter a number.
    - Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the resource.
9. In the Operations scheduling percentage field, enter a number.

- Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling.

10. Select Yes in the Finite capacity field.

    - Set this option to Yes if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to No, the operations resource is assumed to have infinite capacity, and the resource might be overbooked.

11. Select Yes in the Bottleneck resource field.

Define working times

1. Expand the Calendars section.
2. Click Add.
3. In the Calendar field, enter or select a value.

    - Specify the working time calendar that defines the capacity (in hours) of the resource.

4. In the list, find and select the desired record.
5. In the list, click the link in the selected row.

Define resource capabilities

1. Expand the Capabilities section.
2. Click Add.

    - A capability is the ability of an operations resource to perform a particular activity. The scheduling engine allocates resources by matching the resource requirements of each activity to the capabilities of the available operations resources.

3. In the Capability field, enter or select a value.
4. In the Level field, enter a number.

    - Specify the level of proficiency by which the resource processes the capability.

5. In the Priority field, enter a number.

    - Specify the priority of the operations resource with respect to the capability. When scheduling by priority, the operations resource with the highest priority

(lowest numeric value) is selected first.

Assign resource to resource group

1. Expand the Resource groups section.
2. Click Add.
    - The resource group defines the site, production unit, and warehouse context for operations resources. The operations resource can only be scheduled when assigned to a resource group, and only on the site where the resource group is located.
3. In the Resource group field, enter or select a value.
4. In the Input location field, enter or select a value.
    - Specify the warehouse location from where the operations resource is consuming materials.

Resource capabilities

06/17/2025

This article provides information about resource capabilities. A capability is the ability of an operations resource to perform a particular activity. The article explains how capabilities and related concepts, such as proficiency level and priority, are used to select appropriate resources for an activity.

A capability is the ability of an operations resource to perform a particular activity. An operations resource can have more than one capability assigned to it, and a capability can be assigned to more than one resource. You can temporarily assign capabilities to resources by defining a start date and expiration date on the capability assignment. When the capability for a resource expires, the resource can't be scheduled for a project or a production that requires that capability. Expired capabilities can be renewed. You can delete capabilities provided that they aren't on a route relation or on part of a production route of an active production order. In general, be careful when you delete capabilities. Instead, consider adjusting the expiration date on the resources that have the capability. Capabilities can be assigned to all types of resources: tool, vendor, machine, location, facility, or human resource.

Level

Multiple resources often have the same functional capability but at different levels of proficiency (for example, strength, processing speed, or accuracy). Therefore, when you assign a capability to a resource, you can specify a **Level** value. The level is a simple numeric value. If you specify that a capability is a resource requirement for a production route, you can also specify a **Minimum level needed** value for that capability. The scheduling engine then selects only resources that have the required capability at a level that is equal to or exceeds the minimum level that is specified in the resource requirement.

Priority

Operations resources that have the same capabilities can be assigned a priority. Then, if multiple resources have capabilities that satisfy the scheduling requirements at the required level, and have free capacity, the scheduling engine can select among those resources. If **Priority** is selected in the **Primary resource selection** field on the **Scheduling parameters** page, the resource that has the highest priority (the lowest numeric value in the **Priority** field) is selected first during scheduling.

Resource requirements

When you define resource requirements for a production route, you can specify one or more capabilities as requirements. During production scheduling, the capabilities that are defined in the resource requirements on the route operation are matched with the capabilities that are defined for the resources. Resources that have capabilities that satisfy the requirements are selected. If multiple resources have the same functional capability but different proficiencies (such as strength, processing speed, or accuracy), you can either define multiple capabilities or use the capability level to qualify the capability of the resource. Here's an example:

- On a route, the drilling process time is set to 10 units per hour, but the requirement itself is defined as Drilling.
- You have two drilling machines, M1 and M2.
- The Drilling capability is assigned to both resources, the M1 machine and the M2 machine.
- The M1 machine can drill two units per hour, and the M2 machine can drill 11 units per hour.

In this example, both machines can be selected by the scheduling engine, because both satisfy the basic capability requirement (Drilling). However, the M1 machine can drill only two units per hour. Because this rate is much less than the 10 units per hour that are specified on the route, the M1 machine will cause production problems if it's selected. There are two ways to resolve this issue and make sure that the M2 machine is selected instead:

- Create two separate capabilities: Low-speed drilling and High speed drilling. Define Low-speed drilling as drilling that has a process time of one to nine units per hour. Define High-speed drilling as drilling that has a drilling process time of 10 to 19 units per hour. Then assign the M1 machine the Low-speed drilling capability, and assign the M2 machine the High-speed drilling capability. Finally, change the resource capability requirement on the route to High-speed drilling. The scheduling engine will then select the correct machine (M2).
- Use the capability level to qualify the Drilling capability that is assigned to the drilling machines. Specify that the M1 machine has the Drilling capability at a level of 2.0, and that the M2 machine has the Drilling capability at a level of 11.0. Then specify that 10.0 is the minimum level that is required for the Drilling capability requirement on the route. The scheduling engine will then determine that only the M2 machine satisfies the resource requirements.

Competencies for human resources

When you have operations resources of the **Human resources** type that are linked to workers in Human resources, you can also take advantage of the competencies of workers when you define the resource requirements for a production route. In other words, you can also specify

requirements for specific skills, courses, certificates, or titles. The scheduling engine can then select resources that are linked to workers, and the selection will be based on the competencies of those workers. The competencies are set up in Human resources, not on the **Resource capabilities** page. When you define skills, courses, certificates, or titles as resource requirements, you must use the Human resources functionality and link each resource of the **Human resources** type to a corresponding worker. If you aren't using the Human resources functionality, you can define capabilities on the **Resource capabilities** page that resemble or duplicate the competencies from Human resources. However, the **Resource capabilities** page doesn't contain the functionality that is required in order to maintain skills, courses, certifications, or titles.

Define resource capabilities

Article • 09/29/2021

Resource capabilities describe what operations resources can do. During scheduling, the requirements of each job and operation are matched against the capabilities of the available resources. This task guide will help you create a resource capability and assign it to a resource. The demo data company used to create this task is USMF.

Create a resource capability

1. Go to Resource capabilities.
2. Click New.
3. In the Capability field, type the ID of the resource capability.
    - For a given operation, you use the capability ID to specify that resources must have this capability to perform the operation.
4. In the Description field, enter a description of the capability.

Assign capability to a resource

1. Click Add.
2. In the Resource field, type the ID of the resource.
    - A resource capability can be assigned to one or more resources.
3. In the Expiration field, enter a date.
    - You can use this field to specify that a resource has the capability for only a limited time.
4. In the Priority field, enter a number.
    - When you schedule jobs and operations, you can specify whether to select resources by priority. If you choose to do this, and more than one resource can perform the job or operation by the requested date, the resource that has the lowest priority with respect to the required capability is selected.
5. In the Level field, enter a number.
    - When you specify that a job or operation requires a particular capability, you can also specify the minimum level that is required. Use the capability level to

differentiate resources that can perform the same job, but at different speeds, strengths, sizes, and so on.

Routes and operations

07/10/2025

This article provides information about routes and operations. A route defines the process for producing a product or product variant. It describes each step (operation) in the production process and the order that these steps must be performed in. For each step, the route also defines the required operations resources, the required setup time and run time, and how the cost should be calculated.

Overview

A route describes the order of operations that is required in order to produce a product or product variant. For each operation, the route also defines the operations resources that are required, the time that is required in order to set up and perform the operation, and how the cost should be calculated. You can use the same route to produce multiple products, or you can define a unique route for each product or product variant. You can even have multiple routes for the same product. In this case, the route that is used varies, depending on factors such as the quantity that must be produced. The definition of a route in Supply Chain Management consists of four separate elements that, together, describe the production process:

- **Route** – A route defines the structure of the production process. In other words, it defines the order of operations.
- **Operation** – An operation identifies a named step in a route, such as **Assembly**. The same operation can occur in multiple routes and can have different operation numbers.
- **Operation relation** – An operation relation defines the operational properties of an operation, such as the setup time and run time, cost categories, consumption parameters, and resource requirements. The operation relation enables the operational properties of an operation to vary, depending on the route that the operation is used in or the products that are being produced.
- **Route version** – A route version defines the route that is used to produce a product or product variant. Route versions enable routes to be reused across products or changed over time. They also enable different routes to be used to produce the same product. In this case, the route that is used depends on factors such as the location or the quantity that must be produced.

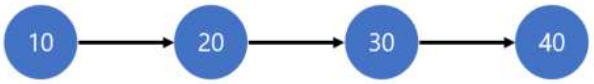
Routes

A route describes the order of operations that is used to produce a product or product variant. Each operation is assigned an operation number and a successor operation. The order of

operations forms a route network that can be represented by a directed chart that has one or more starting points and a single end point. In Supply Chain Management, routes are distinguished based on the type of structure. The two types of routes are simple routes and route networks. In the Production control parameters, you can specify whether only simple routes can be used, or whether the more complex route networks can be used.

Simple routes

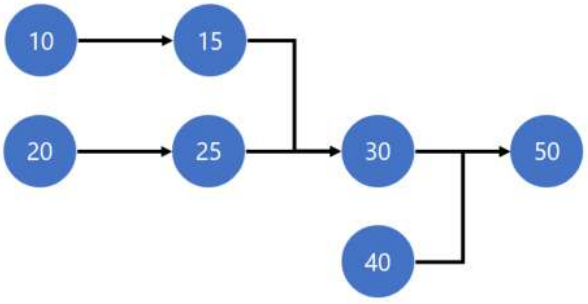
A simple route is sequential, and there's only one starting point for the route.



If you enable only simple routes in the Production control parameters, Supply Chain Management automatically generates the operation numbers (10, 20, 30, and so on) when you define the route.

Route networks

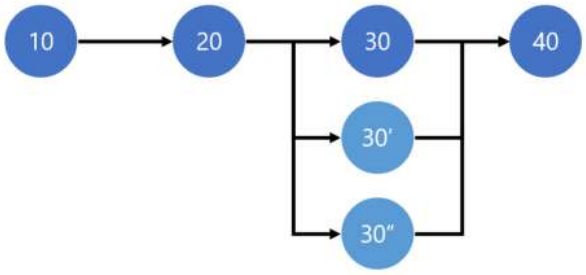
If you enable the more complex route networks in the Production control parameters, you can define routes that have multiple starting points and operations that can be run in parallel.



> **Note**
>
> - Each operation can have only one successor operation, and the entire route must end in a single operation.
> - This does not ensure that multiple operations that have the same successor operation (for example, operations 30 and 40 in the preceding illustration) will actually be run in parallel. The availability and capacity of resources might put constraints on the way that operations are scheduled.
> - You can't use 0 (zero) as the operation number. That number is reserved and is used to specify that the last operation in the route has no successor operation.

Parallel operations

Sometimes, a combination of multiple operations resources that have different characteristics is required in order to perform an operation. For example, an assembly operation might require a machine, a tool, and one worker for every two machines to oversee the operation. This example can be modeled by using parallel operations, where one operation is designated as the primary operation and the others are secondary.



Typically, the primary operation represents the bottleneck resource and dictates the run time for the secondary operations. However, during scheduling that involves finite capacity, the resources that are scheduled for both the primary operation and the secondary operations must be available and have free capacity at the same time.

Both the primary operation and the secondary operations must have the same operation number (30 in the preceding illustration).

In the preceding example, the resource requirement for the primary operation (30) is the machine, whereas the resource requirements for the secondary operations (30' and 30'') are the tool and the worker. A fifty-percent load helps guarantee that the scheduled worker can oversee two machines at the same time.

Approval of routes

A route must be approved before it can be used in the planning or manufacturing process. Approval indicates that the route design has been completed. The same released product or released product variant can have multiple approved routes. Typically, approval of a route occurs when the first relevant route version is approved. However, in some business scenarios, the approval of the route and the route version are separate activities that might involve different process owners.

Each route can be approved or unapproved separately. However, when a route is unapproved, all related route versions are also unapproved. In the Production control parameters, you can specify whether routes can be unapproved, and whether approved routes can be changed.

If you must keep a log of who approves each route, you can require electronic signatures for route approval. Users will then have to confirm their identity by using an electronic signature.

Operations

An operation is a step in the production process. Each operation has an ID and a simple description. The following table shows typical examples of operations from a machine shop.

Expand table

Operation	Description
PipeCut	Pipe cutting
TIGweld	TIG welding
JigAssy	Jig assembly
Inspection	Quality inspection

The operational properties of the operation, such as the setup time and run time, resource requirements, costing information, and consumption calculation, are specified on the operation relation. (For more information about operation relations, see the next section.)

Operation relations

The following operational properties of an operation are maintained on the operation relation:

- Cost categories
- Consumption parameters
- Processing times
- Processing quantities
- Resource requirements
- Notes and instructions

You can define multiple operation relations for the same operation. However, each operation relation is specific to one operation, and stores properties that are specific to a route, a released product, or a set of released products that are related to an item group. Therefore, the same operation can be used in multiple routes that have different operational properties. In addition, you can more easily maintain your master data if you use standard operations that have the same operational properties, regardless of the route that is used and product that is produced. The scope of the operation relation is defined through the **Item code**, **Item relation**, **Route code** and **Route relation** properties, as shown in the following table.

Expand table

Item code	Item relation	Route code	Route relation	Scope of the operation relation
Table	<Item ID>	Route	<Route ID>	The operational properties of an operation when it's used in the route where **Route number**=<*route ID*> to produce the released product where **Item number**=<*Item ID*>.
Table	<Item ID>	All		The default operational properties of an operation when it's used to produce the released product where **Item number**=<*Item ID*>. In other words, these operational properties apply when there's no route-specific operation relation for the released product.
Group	<Item group ID>	Route	<Route ID>	The operational properties of an operation when it's used in the route where **Route number**=<*route ID*> to produce released products that are associated with item group <*Item group ID*>, unless there's a route-specific operation relation for the released product.
Group	<Item group ID>	All		The default operational properties of an operation when it's used to produce released products that are associated with item group <*Item group ID*>, unless a more specific operation relation exists.
All		Route	<route ID>	The default operational properties of the operation when it's used in the route where **Route number**=<*route ID*>. In other words, these operational properties apply when there's no operation relation for this route that is specific to either the released product or its associated item group.
All		All		The default operational properties of an operation. These operational properties apply when a more specific operation relation doesn't exist.

You can also specify that an operation relation is specific to a site. In this way, the operational properties of an operation can vary, depending on the location (that is, the site) where the operation is performed. For configured products, you can also specify different operational properties for each product configuration.

Operation relations give you lots of flexibility when you define your routes. Additionally, the ability to define default properties helps reduce the amount of master data that you must maintain. However, this flexibility also means that you must be aware of the context that you modify an operation relation in.

> **Note**
>
> Because the operational properties are stored in operation relations per operation for each route, all occurrences of the same operation (for example, Assembly) have the same setup time, run time, and resource requirements. Therefore, if two occurrences of an operation must occur in the same route but have different run times, you must create two separate operations, such as Assembly1 and Assembly2.

Modifying product-specific routes

When you open the **Route** page from the **Released product details** page, the route versions that are associated with the selected released product are shown. In this context, for each operation, Supply Chain Management shows the operational properties from the operation relation that best matches the route version. You'll notice that the list of operations includes the **Item code** and **Route code** properties from the operation relation. Therefore, you can determine which operation relation is shown.

On the **Route** page, you can modify the operational properties of the operation, such as the run time or the cost categories. Your changes are stored on the operation relation that is specific to the route and released product that are referenced in the current route version. If the operation relation that is shown isn't specific to the route and the released product, before your changes are stored, the system creates a copy of the operation relation. This copy *is* specific to the route and released product. Therefore, your changes won't affect other routes or released products. To verify which operation relation is being modified on the **Route** page, look at the **Item code** and **Route code** fields.

You can also manually create an operation that is specific to a route and released product by using the **Copy and edit relation** function.

> **Note**
>
> If you add a new operation to a route on the **Route** page, an operation relation is created only for the current released product. Therefore, if the route is also used to produce other released products, no applicable operation relation will exist for those released products, and the route can no longer be used for those released products.

Maintaining operation relations per route

When you open the **Route details** page from the **Routes** list page, a list of all the operation relations that apply to the selected route is shown. Therefore, you can easily verify which

operational properties are used for which products. You can modify both default property values and product-specific property values.

If you add a new operation relation on the **Route details** page, the **Route code** field is automatically set to **Route**, and the **Route relation** field is set to the route number of the current route.

Maintaining operation relations per operation

From the **Operations** page, you can open the **Operation relations** page. On this page, you can modify all operation relations for a specific operation. You can even modify operation relations that contain default values.

If your business uses standard operations, and if the operational parameters are the same across all products and processes, the **Operation relations** page provides a convenient way to maintain the default operational properties of those operations.

Applying operation relations

In some cases, Supply Chain Management must find the operational properties for an operation. For example, when a purchase order is created, the operational properties of each operation must be copied from the operation relations to the production route. In these situations, Supply Chain Management searches the relevant operation relations from the most specific combination to the least specific combination.

When Supply Chain Management searches for the most relevant operation relation for a released product, an operation relation that matches the item ID of the released product is preferred over an operation relation that matches the item group ID. In turn, an operation relation that matches the item group ID is preferred over the default operation relation. The search is done in the following order:

1. **Item code**=*Table* and **Item relation**=<*Item ID*>
2. **Item code**=*Group* and **Item relation**=<*Item group ID*>
3. **Item code**=*All*
4. **Route code**=*Route* and **Route relation**=<*route ID*>
5. **Route code**=*All*
6. **Configuration**=<*configuration ID*>
7. **Configuration**=
8. **Site**=<*site ID*>
9. **Site**=

Therefore, an operation should be used only one time for each route. If the operation occurs multiple times in the same route, all occurrences of that operation will have the same operation relation, and you won't be able to have different properties (for example, run times) for each occurrence.

Route versions

Route versions are used to accommodate variations in the production of products or provide greater control over the production process. They define which route should be used when a specific released product or released product variant is produced. You can use the following constraints to define which route is used for a released product:

- Product dimensions (size, color, style, or configuration)
- Production quantity
- Production site
- Production date

When you're producing the product at a specific site, in a specific quantity, or in a specific period, you can designate a specific route version as the default route version. However, only one active route is allowed for a given released product and a given set of constraints.

On the **Production control parameters** page, you can require that the validity period of a route version must always be specified.

Approval of route versions

Before a route version can be used in the planning or manufacturing process, it must be approved. When you approve a route version, you can also approve the related route. However, a route version can be approved only if the related route is also approved.

Activating the default route version

When you activate a route version, you designate it as the default route version that master planning will use, or that will be used to create production orders. You can have only one active route version for a given set of constraints (for example, period, site, or quantity). If the version that you’re trying to activate conflicts with a version that is already active, you receive an error message. To prevent an ambiguous activation, you must then either inactivate the conflicting version or modify the constraints (usually the period) on the route version.

Electronic signatures

If you must keep a log that records who approves and activates each route version, you can require electronic signatures for these tasks. Users who approve and activate route versions will then have to confirm their identity by using an electronic signature.

Product change that uses case management

The product change case for the approval and activation of new or changed routes and route versions gives you an easy way to see an overview of the route version constraints. You can also approve and activate all routes that are related to a specific change in one operation and document the results in the product change case.

Maintaining routes

Depending on your business requirements, you might be able to reduce the effort that is required in order to maintain your process definitions.

Making routes independent of resources

In many systems, the operations resource or resource group that should perform an operation must be specified in the route. However, in Supply Chain Management, you can define a set of requirements that an operations resource must meet to be applicable for the operation. Therefore, the specific operations resource or resource group that should be used doesn't have to be determined until the operation is actually scheduled. This functionality is especially useful when you have many workers or machines that can perform the same operation.

For example, you specify that an operation requires an operations resource of the **Machine** type that has a **Stamping** capability of 20 tons. The scheduling engine will then resolve these requirements to a specific operations resource or resource group when the operation is scheduled. Because you can just specify these requirements instead of binding the operation to a specific machine, you have much more flexibility. Additionally, maintenance is easier when resources are moved or new resources are added.

For more information about the various types of resource requirements and how to use them, see Operations resource requirements and Resource capabilities.

Sharing routes across sites

If you produce the same product at more than one production site, and if the steps for producing the product are the same at all sites, you can often design a shared route that is used across all production sites. To create a shared route, don't specify a site on the route itself.

However, you must still create a route version that associates the shared route with the product at each site.

You must also make sure that the resource requirements for each operation in the route don't call for specific operations resources or resource groups, but are instead expressed in terms of the characteristics of the required resources. The scheduling engine will then be able to assign the appropriate operations resources from the site that the production is scheduled on. For example, if there are small differences in the run time, or if the setup time for a certain operation is site-specific, you can specify this information by adding an additional operation relation for that site.

To take full advantage of the benefits of shared routes, you should also use resource consumption on the corresponding bill of materials (BOM). When you set the flag for resource consumption on the BOM line, the warehouse and location that raw materials should be consumed from is inferred from the operations resource that the operation is scheduled on. Therefore, the warehouse and location don't have to be determined until the production is actually scheduled. In this way, you can make both the BOM and the route independent of the physical location where the product is produced.

Standard operation relations

If your business uses standardized operations throughout production, and if there's little or no variation in the setup time, run time, consumption calculation, cost calculation, and so on, you might benefit from creating default operation relations for all operations. In this case, avoid creating operation relations that are specific to any route or released product.

If you also express resource requirements in terms of skills and capabilities, and make your routes site-independent, you can help keep the ongoing maintenance of your business processes to a minimum.

When you use this approach, the **Operation relations** page becomes your primary destination for maintaining run times and other properties.

Resource-specific process times

If you don't specify an operations resource or resource group as part of the resource requirements for an operation, the applicable resources might operate at different speeds. Therefore, the time that is required in order to process an operation might vary. To resolve this issue, you can use the **Formula** field on the operation relation to specify how the process time is calculated. The following options are available:

- **Standard** – (Default option) The calculation uses only the fields from the operation relation and multiplies the specified run time by the order quantity.
- **Capacity** – The calculation includes the **Capacity** field from the operations resource. Therefore, the time is resource-dependent. The value that is specified on the operations resource is capacity per hour. The **Process time** is calculated as **Order quantity** divided by **Capacity**. The capacity value isn't specific to a particular unit of measure and therefore isn't converted based on the **Capacity unit** field, which is just a descriptive field that isn't used in calculations.
- **Batch** – A batch capacity is calculated by using information from the operation relation. The number of batches and, therefore, the process time can then be calculated based on the order quantity.
- **Resource batch** – This option is basically the same as the **Batch** option. However, the calculation includes the **Batch capacity** field from the operations resource. Therefore, the time is resource dependent.

Set up route groups

You can define the route groups and the setup for its route or job types under **Production control** > **Setup** > **Routes** > **Route groups**. For each route/job type in the route group, you can select or clear the following options:

- **Activation** – Select this option to enable calculations and scheduling for the selected job type, and to receive job feedback when you run job scheduling. You need to select this option to enable the job type and then, select the rest of the options for that job type. If the activation isn't selected, that job type won't be enabled, regardless of the selection of the other options.
- **Job management** – Select this option to include the job type in job management when you run job scheduling.
- **Working time** – Select this option to schedule the job type according to the working time calendar that is defined for the operations resource, otherwise the Gregorian calendar is used. Working time can be scheduled either according to the Gregorian calendar or the defined working calendar. If you select this option, scheduling is based on the defined working time calendar. Additionally, the job of the job type is scheduled from midnight on the date that is defined as the job's starting date.
- **Capacity** – Select this option to reserve capacity for the job type when you run job scheduling. If you select this option, capacity is reserved when scheduling is run for the selected job type. This gives you an overview of which job types in each route group use the operations resources. For example, in a situation where drying resources are bottleneck resources, these resources must be specified as bottlenecks. Drying operations that are assigned to queue time job types will reserve drying resources.

For each of the job types, you first need to activate or de-activate it. When de-activated, none of the other setup (Job management, working time, and capacity) will be considered, as the job type won't be active.

One of the job types is *Overlap*. Overlap allows different jobs to be performed at the same time. When jobs are overlapping, the resources can be used but can't be reserved for the specific jobs. Therefore, when **Activation** is selected for the row with a **Route/job type** of *Overlap*, the rest of the settings (**Job management**, **Working time**, and **Capacity**) don't have any impact on the route group.

> **Note**
>
> When you upgrade versions, you might encounter the following error: *CRL Error occurred while invoking the scheduling engine*. If you receive this error, go to the **Route groups** page and for all the routes where you have activated the **Route/job type** *Overlap*, clear the **Job management**, **Working time**, and **Capacity** check boxes.

This article explains how to set up the system and the Warehouse Management mobile app to support work policies. Use this functionality to quickly register inventory without creating putaway work when you receive purchase or transfer orders, or when you complete manufacturing processes. This article provides general information. For detailed information related to license plate receiving, see License plate receiving via the Warehouse Management mobile app.

A work policy controls whether warehouse work is created when a manufactured item is reported as finished, or when goods are received by using the Warehouse Management mobile app. Set up each work policy by defining the conditions where it applies: the work order types and processes, the inventory location, and (optionally) the products. For example, a purchase order for product *A0001* must be received in location *RECV* in warehouse *24*. Later, the product is consumed in another process at location *RECV*. In this case, set up a work policy to prevent putaway work from being created when a worker reports product *A0001* as received in location *RECV*.

> **Note**
>
> - For a work policy to be active, you must define at least one location for it on the **Inventory locations** FastTab of the **Work policies** page.
> - You can't specify the same location for multiple work policies.
> - The **Print label** option for mobile device menu items doesn't print a license plate label unless work was created.

The Work policies page

To set up work policies, go to **Warehouse management** > **Setup** > **Work** > **Work policies**. Then, on each FastTab, set the fields as described in the following subsections.

The Work order types FastTab

On the **Work order types** FastTab, add all the work order types and the related work processes that the work policy applies to. The following work order types and related work processes are supported for work policies.

Expand table

Work order type	Work process
Raw material picking	All related processes
Co-product and by-product put away	All related processes
Finished goods putaway	All related processes
Transfer receipt	License plate receiving (and putaway)
Purchase orders	• License plate receiving (and putaway) • Load item receiving (and putaway) • Purchase order line receiving (and putaway) • Purchase order item receiving (and putaway)
Inbound shipment order	• License plate receiving (and putaway) • Load item receiving (and putaway) • Inbound shipment order line receiving (and putaway) • Inbound shipment order item receiving (and putaway)

To set up a work policy so that it applies to several work processes of the same work order type, add a separate line for each work process to the grid.

For each line in the grid, set the **Work creation method** field to one of the following values:

- **Never** – The work policy prevents warehouse work from being created for the selected work order type and related work process.
- **Cross docking** – The work policy creates cross-docking work by using the policy that you select in the **Cross docking policy name** field.

The Inventory locations FastTab

On the **Inventory locations** FastTab, add all the locations where this work policy should be applied. If you don't associate any location with a work policy, the work policy isn't applied to any process.

You can't specify the same location for multiple work policies.

You can use a warehouse location assigned to a location profile where the **Use license plate tracking** option is turned off. In this case, workers directly register the on-hand inventory.

The Products FastTab

On the **Products** tab, set the **Product selection** field to control which products the policy applies to:

- **All** – The policy applies to all products.
- **Selected** – The policy applies only to products listed in the grid. Use the toolbar on the **Products** FastTab to add products to the grid or remove them from the grid.

Default and custom "to" locations

Mobile device menu items that use the following work creation processes provide the **Use default data** option. This option lets you assign a custom "to" location to one or more menu items. (This option was already available for some other types of menu items.)

- License plate receiving (and putaway)
- Load item receiving (and putaway)
- Purchase order line receiving (and putaway)
- Purchase order item receiving (and putaway)
- Inbound shipment order line receiving (and putaway)
- Inbound shipment order item receiving (and putaway)

The **To location** setting for a menu item overrides the default receiving location for the warehouse, for all orders that are processed by using that menu item.

To set up a mobile device menu item to support receiving at a custom location, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select or create a menu item that uses one of the work creation processes that are listed earlier in this section.

3. On the **General** FastTab, set the **Use default data** option to **Yes**.

4. On the Action Pane, select **Default data**.

5. On the **Default data** page, set the following values:

    - **Default data field:** Set this field to *To location*.
    - **Warehouse:** Select the destination warehouse to use with this menu item.
    - **Location:** This field lists all the location IDs that are available for the selected warehouse. However, the setting of this field doesn't actually have any effect. Therefore, you can leave it blank. Nevertheless, you can use the list to confirm the ID that you must enter in the **Hardcoded value** field.
    - **Hardcoded value:** Enter the location ID for the receiving location that applies to this menu item.

> **Tip**
>
> You can apply a work policy only if the relevant work policy setup lists all the receiving locations. This requirement applies regardless of whether you're using the default warehouse receiving location or a custom "to" location.

Example scenario: Warehouse receiving

All products that are received by the *Purchase order item receiving (and putaway)* process must be registered in location *FL-001*, and they must be available in warehouse *24*. However, work should not be created. Products that are received by any other process (that is, by using other mobile device menu items) should be registered at the default warehouse receiving location (*RECV*), and work should be created as usual. (This scenario doesn't show the default receiving setup.)

This scenario requires the following elements:

- A work policy for the *Purchase order item receiving (and putaway)* process in location *FL-001*, for all products
- A mobile device menu item that has default data, and that sets the **To location** field to *FL-001*

Prerequisites

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a work policy

1. Go to **Warehouse management** > **Setup** > **Work** > **Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No purchase item putaway work*.
4. Select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
    - **Work order type:** *Purchase orders*
    - **Work process:** *Purchase order item receiving (and putaway)*
    - **Work creation method:** *Never*
    - **Cross docking policy name:** Leave this field blank.
6. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
    - **Warehouse:** *24*
    - **Location:** *FL-001*
7. On the **Products** FastTab, set the **Product selection** field to *All*.
8. Select **Save**.

Set up a mobile device menu item to change the receiving location

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the left pane, select the existing **Purchase receive** menu item.
3. On the **General** FastTab, set the **Use default data** option to *Yes*.
4. Select **Save**.

5. On the Action Pane, select **Default data**.

6. On the **Default data** page, on the Action Pane, select **New** to add a row to the grid, and then set the following values for the new row:

    - **Default data field:** *To location*
    - **Warehouse:** *24*
    - **Location:** Leave this field blank.
    - **Hardcoded value:** *FL-001*

7. Select **Save**.

Receive a purchase order without creating work

The example in this section shows how to receive a purchase order item, but without creating work, at a location that differs from the default receiving location set up for the warehouse. This example uses the work policy and mobile device item that you created earlier in this scenario.

Create a purchase order

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.

2. Select **New**.

3. In **Create purchase order**, set the following values:

    - **Vendor account:** *US-101*
    - **Site:** *2*
    - **Warehouse:** *24*

4. Select **OK** to close the dialog box and open the new purchase order.

5. On the **Purchase order lines** FastTab, set the following values for the empty row:

    - **Item number:** *A0001*
    - **Quantity:** *1*

6. Select **Save**.

7. Make a note of the purchase order number.

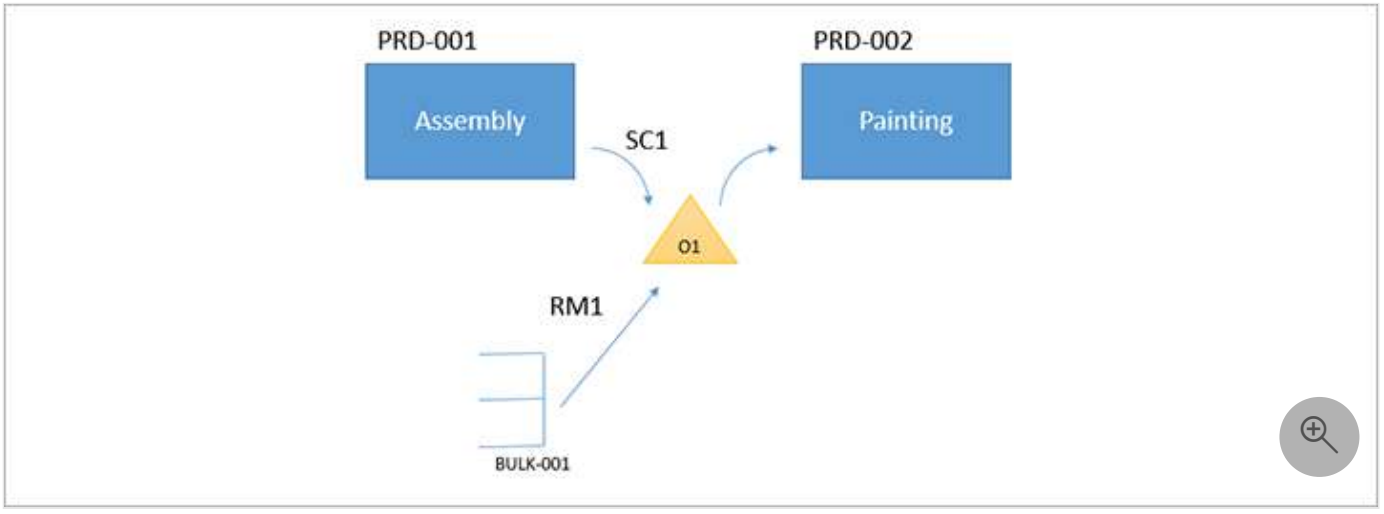
Receive a purchase order

1. On the mobile device, sign in to warehouse *24* by using *24* as the user ID and *1* as the password.
2. Select **Inbound**.
3. Select **Purchase receive**. The **Location** field should be set to *FL-001*.
4. Enter the purchase order number for the purchase order that you created in the previous procedure.
5. In the **Item number** field, enter *A0001*.
6. Select **OK**.
7. In the **Quantity** field, enter *1*.
8. Select **OK**.

The purchase order is now received, but no work is associated with it. The on-hand inventory is updated, and a quantity of *1* of item *A0001* is now available at location *FL-001*.

Example scenario: Manufacturing

In the following example, there are two production orders, *PRD-001* and *PRD-002*. Production order *PRD-001* has an operation named *Assembly*, where product *SC1* is reported as finished to location *001*. Production order *PRD-002* has an operation named *Painting* and consumes product *SC1* from location *001*. Production order *PRD-002* also consumes raw material *RM1* from location *001*. Raw material *RM1* is stored in warehouse location *BULK-001* and is picked to location *001* by warehouse work for raw material picking. The picking work is generated when production *PRD-002* is released.



When you plan to configure a warehouse work policy for this scenario, consider the following points:

- You don't need warehouse work for putaway of finished goods when you report product *SC1* as finished from production order *PRD-001* to location *001*. The reason is that the

Painting operation for production order *PRD-002* consumes product *SC1* at the same location.
- You need warehouse work for raw material picking to move raw material *RM1* from warehouse location *BULK-001* to location *001*.

Here is an example of a work policy that you can set up, based on these considerations:

- **Work policy name:** *No putaway work*
- **Work order types:** *Finished goods put away* and *Co-product and by-product put away*
- **Inventory locations:** Warehouse *51* and location *001*
- **Products:** *SC1*

The following example scenario provides step-by-step instructions for setting up the warehouse work policy for this scenario.

Example scenario: Report as finished to a location that isn't license plate–controlled

This scenario shows an example where a production order is reported as finished to a location that isn't license plate–controlled.

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a warehouse work policy

Warehouse processes don't always include warehouse work. By defining a work policy, you can prevent the creation of work for raw material picking and putaway of finished goods for a set of products at specific locations.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No putaway work*.
4. On the Action Pane, select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

- **Work order type:** *Finished goods put away*
- **Work process:** *All related work processes*
- **Work creation method:** *Never*
- **Cross docking policy name:** Leave this field blank.

6. Select **Add** again to add a second row to the grid, and then set the following values for the new row:

   - **Work order type:** *Co-product and by-product put away*
   - **Work process:** *All related work processes*
   - **Work creation method:** *Never*
   - **Cross docking policy name:** Leave this field blank.

7. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

   - **Warehouse:** *51*
   - **Location:** *001*

8. On the **Products** FastTab, set the **Product selection** field to *Selected*.

9. On the **Products** FastTab, select **Add** to add a row to the grid.

10. In the new row, set the **Item number** field to *L0101*.

11. On the Action Pane, select **Save**.

Set up an output location

1. Go to **Organization administration** > **Resources** > **Resource groups**.

2. In the left pane, select resource group **5102**.

3. On the **General** FastTab, set the following values:

   - **Output warehouse:** *51*
   - **Output location:** *001*

4. On the Action Pane, select **Save**.

> ⓘ **Note**

Location *001* isn't a license plate–controlled location. You can set up an output location that isn't license plate–controlled only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Go to **Production control** > **Production orders** > **All production orders**.
2. On the Action Pane, select **New production order**.
3. In the **Create production order** dialog box, set the **Item number** field to *L0101*.
4. Select **Create** to create the order and close the dialog box.

   A new production order is added to the grid on the **All production orders** page.

   Keep the new production order selected.
5. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**.
6. In the **Estimate** dialog box, read the estimate, and then select **OK** to close the dialog box.
7. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**.
8. In the **Start** dialog box, on the **General** tab, set the **Automatic BOM consumption** field to *Never*.
9. Select **OK** to save your setting and close the dialog box.
10. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Report as finished**.
11. In the **Report as finished** dialog box, on the **General** tab, set the **Accept error** option to *Yes*.
12. Select **OK** to save your setting and close the dialog box.
13. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**.

When the production order is reported as finished, no work is generated for putaway. This behavior occurs because a work policy is defined that prevents work from being generated when product *L0101* is reported as finished to location *001*.

More information

For more information about mobile device menu items, see Set up mobile devices for warehouse work.

For more information about license plate receiving and work policies, see License plate receiving via the Warehouse Management mobile app.

Create working time scheduling properties

Article • 09/29/2021

Working time scheduling properties are used to categorize working time intervals and define the settings that operators must take into account. This procedure shows how to define a working time scheduling property and associated property values. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to **Workspaces** > **Resource lifecycle management**.
2. Select **Properties**.

Create property

1. Select **New**.
2. In the **Property** field, type a value.
3. In the **Name** field, type a value.

Create property values

1. In the list, mark the selected row.
2. In the **Name** field, type a value.
3. In the **Value** field, type a value.
4. Select **Save**.

Create working time templates

Article • 09/29/2021

Working time templates define the working hours throughout a week and are used to generate working times for a period of time. This procedure shows you how to define a working time template using working time scheduling properties for categorizing working time intervals. You can walk through this procedure in demo data company USMF, or using your own data.

1. Go to **Workspaces** > **Resource lifecycle management**.
2. Select **Working time templates**.

Create working time template

1. Select **New**.
2. In the **Working time template** field, type a value.
3. In the **Name** field, type a value.
4. Expand the **Monday** section.
5. Select **Add**.
6. In the **From** field, enter a time.

    - Specify the time when work begins in the morning.

7. In the **To** field, enter a time.

    - Specify the time when workers break for lunch.

8. Select **Add**.
9. In the **From** field, enter a time.

    - Specify the time when work resumes after lunch.

10. In the **To** field, enter a time.

    - Specify the end of the work day.

Replicate working times to all week days

1. Select **Copy day**.

    - Copy the working times definitions from Monday to Tuesday.

2. Select **OK**.

3. Select **Copy day**.
    - Copy the working times definitions from Monday to Wednesday.
4. In the **To weekday** field, select an option.
5. Select **OK**.
6. Select **Copy day**.
    - Copy the working times definitions from Monday to Thursday.
7. In the **To weekday** field, select an option.
8. Select **OK**.
9. Select **Copy day**.
    - Copy the working times definitions from Monday to Friday.
10. In the **To weekday** field, select an option.
11. Select **OK**.

Define time slots for special operations

1. Expand the **Friday** section.
2. In the list, find and select the desired record.
3. In the **Property** field, enter or select a value.
4. In the list, find and select the desired record.
5. In the **Property** field, enter or select a value.

Mark weekend days as closed for pickup

1. Expand the **Saturday** section.
2. Select *Yes* in the **Closed for pickup** field.
3. Expand the **Sunday** section.
4. Select *Yes* in the **Closed for pickup** field.

Define discrete manufacturing resource group

Article • 09/29/2021

A resource group is a set of operations resources that typically correspond to the physical organization of work cells, defined by yellow lines on the production shop floor. This procedure shows you how to define a ressource group for use in discrete production. You can walk through this procedure in demo data company USMF, or use your own data.

1. Go to Resource groups.
2. Click New.
3. In the Resource group field, type a value.
4. In the Description field, type a value.
5. In the Site field, enter or select a value.
6. In the Production unit field, enter or select a value.

Define default operational parameters

1. Expand the Operation section.
2. In the Scrap percentage field, enter a number.
3. In the Setup category field, enter or select a value.
4. In the Run time category field, enter or select a value.
5. In the Operations scheduling percentage field, enter a number.

Define operating hours

1. Expand the Calendars section.
2. Click Add.
3. In the Calendar field, enter or select a value.

Add operations resources

1. Expand the Resources section.
2. Click Add.
3. In the Resource field, enter or select a value.
4. Click Add.
5. In the Resource field, enter or select a value.

6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.

Add an existing activity to a production flow version

Article • 09/29/2021

When creating new versions of production flows, you can choose to add activities created for the older versions, to the new version. This procedure shows how a new version is created for an existing production flow, without copying the activities. In the next step, an existing activity is added to the new version.

This task requires production flow with version and activities already created.

Create a new production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. Click Edit.
5. In the list, mark the selected row.
6. In the Expiration date field, enter a date and time.

    - Note that before you create a new production flow version, make sure to check the expiration date and time of the active version. The new version will be created with an effective start date, which connects to the expiry date of the selected version.

7. Click Add.
8. Select No in the Copy from version field.

    - Select No to start with an empty version if most of the activities of the copied version will be replaced by new activities. Add the unchanged activities to the Add existing function in the activity form manually.

9. Select No in the Duplicate kanban rules field.

    - When the activities are not copied to the new version, it is not possible to copy the kanban rules at the time of creation of the new version. Instead you will use the create replacement kanban function later in the kanban rule form, to replace kanban rules of the old production flow version with kanban rules using the activities of the new version.

10. Click OK.

11. In the list, find and select the desired record.

Add an existing activity

1. Click Activities.
2. Click Add existing to open the drop dialog.

    - Find and select an existing activity to be added to the new production flow version. Note that the list shows all activities that have been created for this production flow for all previous versions of the flow.

3. In the Activity field, enter or select a value.
4. Click OK.

Deactivate a production flow version

Article • 09/29/2021

When an active production flow version is no longer needed, it can be deactivated. You should only use this option if all kanban rules and activities have ended and will not be activated again. Note that the expiry date of all kanban rules related to this production flow version will be updated with the current date and time.

To modify an active production flow version, consider setting an expiry date for the active version and create a new version. This will allow you to continue your production operations while preparing the new version and related kanban rules.

To expire an active production flow version, you need to set an expiry date. In that sense, deactivation is more like an exception than a rule.

For this procedure you need a production flow with a version that can be deactivated. Do not try this in a production environment unless you are 100% positive that the version is fully obsolete.

Deactivate a production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.
5. Click Deactivate.
    - Do not proceed if you are not 100% positive that this production flow version is obsolete. Clicking Ok will expire all active kanban rules and put an immediate stop to all production and replenishment activities of this production flow version.
6. Click OK.

Define an expiry date for a production flow version

Article • 09/29/2021

To end the validity and the processing of a production flow version on a given date, or to plan replacement of an active version with a new version, you have to set an expiry date on the version. It is not necessary to deactivate the version.

Set an expiration date to end a production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.

    - Select any production flow that has a version that is already defined.

3. In the list, click the link in the selected row.
4. Click Edit.
5. In the list, mark the selected row.
6. In the Expiration date field, enter a date and time.

    - For the expiration date, a new version will not start or become activated. It will also no longer be possible to create or start jobs for this production flow. You can still complete started jobs after the expiration date.

Define production flow models

Article • 09/29/2021

Production flow models describe how the capacity of lean manufacturing work cells is calculated and maintained. Therefore the definition of a production flow model is a prerequisite of the definition of work cells. The demo data company used to create this procedure is USMF.

Define a production flow model.

1. Go to Production control > Setup > Lean production flow > Production flow models.
2. Click New.
3. In the Production flow model field, enter an ID for the production flow model.
4. In the Model type field, select an option.

    - There are two model types: Throughput type and Hours type. For Throughput type, the capacity of work cells that use this production flow model will be expressed and calculated in product quantities. For Hours type, the capacity of work cells that uses this production flow model will be expressed and calculated in hours. Note that this property can't be changed for an existing production flow model. After a work cell has capacity reservations, the production flow model type can't be changed.

5. Enter the number of days in the EPE Cycle.

    - The interval describes the period when every part produced by a production flow or work cell will be produced at least once. The shorter the EPE cycle, the more flexible the production process is. If EPE Cycle = 0, all demand can be produced in the same day. The EPE Cycle is used to schedule lean process jobs. When scheduling a job on a work cell with EPE Cycle = 5, the scheduling process will look for capacity on the work cell at Due date - EPE Cycle (5 days ahead of the due date) to ensure that the product can be produced in that cycle. The inventory lead time of a product is usually equal to or greater than the EPE Cycle of the related production process.

6. In the Planning period type field, select an option.

    - After a work cell has capacity reservations, the planning period type cannot by changed. You can only select production flow models with the same period type for this given work cell.

7. In the Planning time fence field, enter a number.

    - The planning time fence describes the number of days where capacity reservations can be made for the related work cells. In the Planning time fence, enter the number of days. Kanban process jobs that fall outside of this period are not planned with automatic planning. The planning time fence is typically two times the average inventory lead time of the products produced in a production flow or work cell. The EPE Cycle should not be more than half the planning time fence.

8. In the Capacity shortage reaction field, select an option.

    - The options include: Postpone - Postponing the full demand of the scheduling event on the next available production day, with available throughput. Cancel - End the automatic planning for the scheduling event and leave the related jobs unplanned. Add to requested day - Plan the requested jobs for the requested period. This overloads the cell for this day and requires the planner to review and to a manual interaction . Distribute to available periods - Distribute the different jobs of the scheduling event to all available production days, beginning from the first available day. The minimum distribution quantity is the kanban job quantity. The distribution assigns the minimum planning quantity (kanban quantity) to every day with enough available throughput.

Operations scheduling

07/10/2025

This article provides information about operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

You can schedule production at the operation level and the job level. Unlike job scheduling, operations scheduling doesn't explode the operations for the production route into jobs. If you want to include more detail in the scheduling, such as information about current capacity, you can run job scheduling after you run operations scheduling. You can also run job scheduling only. Job scheduling is typically used to schedule individual jobs on the shop floor for an immediate or short-term time frame.

Components of operations scheduling

The main components of operations scheduling are the scheduling direction, the capacity of resources, and materials optimization. By using operations scheduling, you can achieve the following goals:

- Control the planning method by scheduling forward or backward from a given date.
- Optimize the use of resources by scheduling productions based on the capacity of the resources. This approach also helps identify when alternative resources should be used.
- Optimize the use of materials by scheduling productions based on the availability of the required materials.
- Schedule and synchronize reference productions. The dates of the reference productions are adjusted when the production order’s schedule is changed.

You must estimate the cost of a production order before you can run operations scheduling. If you haven't run an estimate, it's automatically run before operations scheduling is started. An operations schedule specifies the following information:

- The product that is planned for production
- The configuration of the product
- The quantities that are involved in the production
- The dates when the production will start and end
- The capacity reservations for the resources that perform the production activities

The setup time, process time, and run time are set for operations in the production. After you run operations scheduling, the status of the production order is *Scheduled*, and all operations are scheduled in the order that is specified by the production route. However, only the duration of the operation is considered. Start times and end times aren't scheduled.

Scheduling direction and date

The scheduling direction is fundamental to the scheduling process. Production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward from the scheduling date** – You can schedule production to start as early as possible. Production can be started today, tomorrow, or on any date in the future. The production is scheduled forward in time to the earliest possible end date.
- **Backward from the scheduling date** – You can schedule production to start as late as possible. Backward scheduling is based on the date when the production must be completed. The schedule counts backward from that date to the latest possible date that the production can be started and still be completed on time.

Resource scheduling

When you run an operations schedule, each operation in the production route is scheduled for the resource that is specified for the operation. Additionally, the duration of each operation is specified on the production route. If a resource group is specified for an operation, the scheduling reserves capacity on the group. However, unlike job scheduling, operations scheduling doesn't select the specific resources in the group. If you're working with finite capacity, the schedule depends on the availability of the resources that are required in order to complete production. Operations scheduling follows the sequence of operations that is specified on the production route. The scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The sum of available capacity on the resources that are involved determines the capacity for the resource group. Capacity reservations that already exist for the resources are considered unavailable capacity. If there isn't enough available capacity for the production, the production orders can be delayed or even stopped. You can also specify the efficiency that you expect from the resources that are involved in the production. You specify the efficiency as a percentage on the resource. The efficiency percentage adjusts the throughput of the resource. This adjustment affects the time that is reserved for the resource. The lead times for the operations that use the resource are also adjusted accordingly.

Operations scheduling and master planning

The operations schedule also drives master planning and determines calculations for material requirements. Operations scheduling considers the following information:

- **Backlogged productions** – Products that are planned, released, or started
- **Material availability** – Inventory, subproductions, suppliers, and vendors

- **Capacity availability** – Resources that are required for production

> **Note**
>
> If you're using multi-threaded master planning and operations scheduling, finite capacity will not be considered.

Cancellations

When you run operations scheduling, you can cancel specific parts of the routing. These parts include the queue time, setup time, process time, overlap time, and transport times.

Finite materials

If you're working with finite materials, scheduling also depends on the availability of the materials that are required for production. If there aren't enough available components for the production, production can be delayed. You can base scheduling on the use of materials by specifying the materials that must be available for production. When you optimize on both resource capacity and the availability of materials, production is calculated according to these restrictions. A production order can't be scheduled to start until capacity and materials are available at the same time and in the required quantities.

Related information

- Operations scheduling options

Job scheduling

09/19/2025

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. Use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. Assign these jobs to the operations resources that perform them. Job scheduling also lets you synchronize all jobs that the selected job references. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can run only on one machine at a time, or when you want to optimize the job that runs for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. Use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that the production route specifies. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This method is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This method is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that's available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that uses finite materials ensures that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they're required.

Finite properties

Job scheduling that uses special properties requires that you specify properties for the operations on the production route. The system must fulfill these properties to reserve capacity.

References

Job scheduling schedules all productions that the current production references. If a production has one or more subproductions, schedule the subproductions at the same time as the main production, because you can't start the main production until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- *Duration* – The scheduling engine selects the resource that has the shortest lead time.
- *Priority* – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

> ⓘ **Note**
>
> Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Action center message is displayed, and job scheduling doesn't find the best alternative resource.

When you run job scheduling, the system plans the resources based on the limitations that you define in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process.

> ⓘ **Note**
>
> For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Job scheduling assigns resources to jobs. You can set maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of

resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling uses the efficiency percentages that you specify for the resources. Efficiency percentages reduce or increase the time that the system reserves for the resource. Therefore, lead time also increases or decreases. The system uses the following formula for the calculation: `Scheduling time = Time × 100 ÷ Efficiency percentage`. In this formula, *Time* includes both the run time and the setup time.

Gantt chart for job scheduling

07/10/2025

The Gantt chart is designed to empower production planners to control and optimize the production plan. The Gantt chart makes the flow of operations transparent and makes it easy to adjust the production schedule while taking into account material or resource shortages. This helps planners make the best use of available resources, minimize work in progress, and optimize throughput times for production orders.

A Gantt chart is a visual representation of scheduled activities within a defined time interval. The activities are scheduled on resources that have capacity defined by a capacity calendar. The following types of activities can be shown in the Gantt chart.

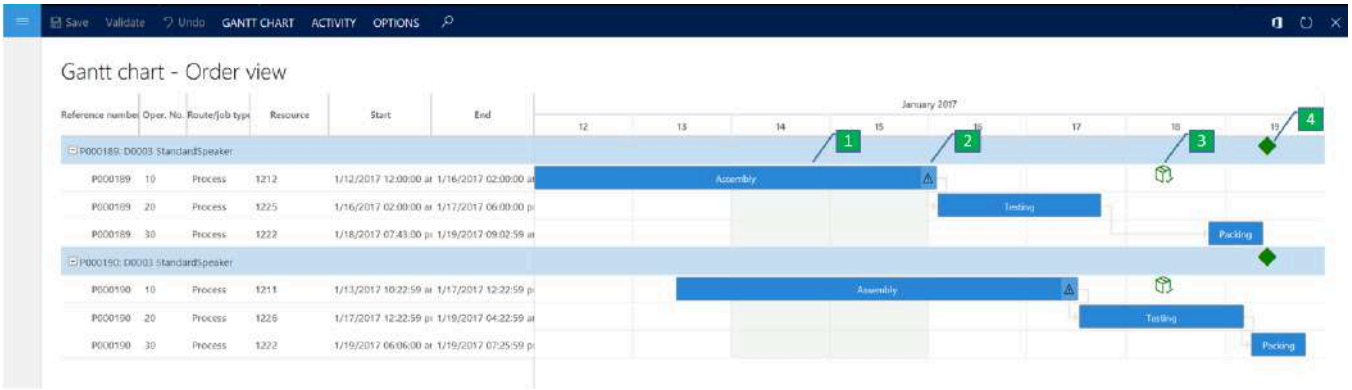
- Jobs from production orders that are job scheduled.
- Jobs from planned production orders.
- Job scheduled project activities of type Hour forecasts.

Gantt chart views

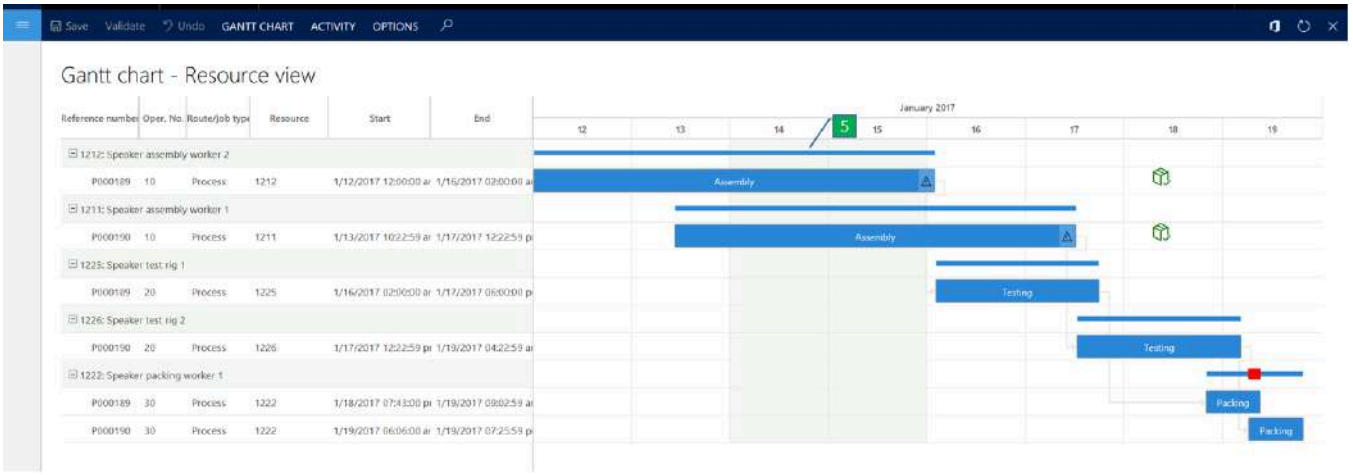
The Gantt chart can be opened in two different views, **Order view** and **Resource view**. In **Order view**, activities are grouped under production orders. This can be useful, for example, if you want to maintain an overview of all the jobs belonging to the same orders. In **Resource view** all jobs are grouped under individual resources. This view can be useful when optimizing the plan at a resource level, for example, a machine or a group of machines. The Gantt charts shown in the illustrations below show **Order view** and **Resource view** with these key elements:

1. Gantt chart activity
2. Material shortage icon
3. Material availability icon
4. Order delivery date icon
5. Capacity bar

The following screenshot shows the order view.



The following screenshot shows the resource view.



Activities

The activities appear as bars and are organized in a time scale grid with a scheduled start and end time, making the length of the bars proportional to the time that is necessary to complete the activity. The activities are shown according to a time scale. You can adjust the time scale on the menu where you select a start and end date and a time unit, for example, hours or days. By adjusting the time scale, you can set focus on a time interval in which you want to manage activities.

To get a better overview, there are different options for controlling the color of the activities. You can configure an individual color for activities, use the theme color that is the general color theme used for the application, or set up the color to be controlled by the color code for production orders.

The time interval for activities has a background shade. Periods with a white shade indicate a time interval with defined capacity on the resource for the activity, whereas periods with a grey shade indicate time intervals with no capacity defined.

On the left side of the chart, there's additional information about the activity, for example, the resource on which the activity is scheduled and production order number. The connection between jobs belonging to the same order is shown with an arrow.

You can get more information about an activity in the activity dialog box. To open the dialog box, double-click the activity or select the **information** menu. In the activity dialog you can see the scheduled start and end date, and time information about which materials the activity is planned to consume.

The activities can be grouped in Grouping levels. The Grouping levels are hierarchical and can be used to make a logical grouping of activities. For example, if you have a layout where manufacturing activities are grouped by site, production units, resource groups, and resources,

you can use the Grouping levels to group the activities according to that layout. The grouping levels can be expanded and collapsed either on the individual grouping level or for all levels in the chart by using the **Expand all** and **Collapse all** buttons on the menu. You can also configure the grouping levels to be expanded or collapsed when the chart is opened.

Material availability

The Gantt chart can be set up to provide the planner with detailed information about material status for the individual activities. For example, this can be helpful if material is delayed and is affecting the production plan. In this case, the material issues will be highlighted in the Gantt chart to help the planner to understand consequences and make necessary adjustments.

A job will appear with a material shortage icon if the schedule start date of the job is later than the material availability date for materials consumed by the job. The material availability date is calculated based on the pegging information in the dynamic master plan. The material shortage icon will, for example, appear on a job that is consuming a material that is pegged against a purchase order that has a receipt that is later than the planned start date of the job.

Indicator of material availability date

When you set up the chart to show jobs with material shortages an icon for showing the material availability date for the job can also be shown. The icon will only be shown if the material availability date is within the defined time interval of the chart. If the material availability date lies outside the defined time interval, then more detailed material availability information can be retrieved from the material list in the job dialog box. In the list, there's also an icon showing late materials for the job. You can reschedule a job using the material availability date as a start date.

Indicator of order delivery date

This icon indicates the delivery date for a production order. The icon is only visible in the order view.

Capacity bar

You can configure the chart to show a resource capacity bar. This bar provides an overview of the resource capacity for an activity in the defined time interval of the chart. The capacity bar isn't shown for periods of the time where the resource isn't booked. In periods where the resource is booked to capacity, the capacity bar is shown as a solid bar. In periods where the resource is overbooked, the bar will appear thicker and in a red color. For example, if two jobs overlap, the capacity bar will indicate an overbooking in the time interval where there's an

overlap. The capacity bar is updated dynamically when you schedule a job. You enable the capacity bar on the **Show capacity bar** menu. It can only be shown in **Resource view**. If you want to get a more detailed view of the capacity load on a resource, use the **Capacity load** chart, which can be opened from the menu or the context menu for a selected activity.

Job scheduling in the Gantt chart

The Gantt chart offers different options for making adjustments to the production plan. In the Gantt chart, you can reschedule activities as a drag-and-drop interaction or from a schedule menu. In the planning process, you can take resource capacity, resource capabilities, and material constraints into account.

Schedule a job as a drag-and-drop interaction

You can reschedule job within the defined time interval as a drag-and-drop interaction. You can only reschedule the job on the same resource, and you can only schedule one job at a time.

Schedule a job from the menu

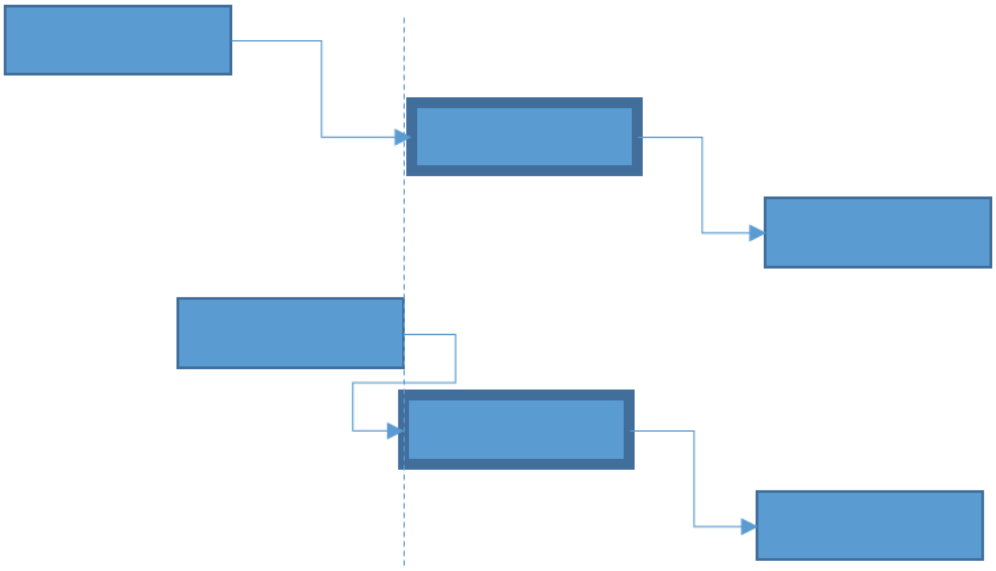
On the **Schedule jobs** menu, you can schedule one or more selected jobs in the chart based on a scheduling direction and a scheduling date time. There are three available schedule directions.

- Forward from scheduling date
- Backward from scheduling date
- Forward from material availability date

It isn't possible to schedule a job outside the defined time interval of the Gantt chart. If you do that, the job will be left unscheduled and you'll receive the error message, "Could not schedule the job within the loaded time period."

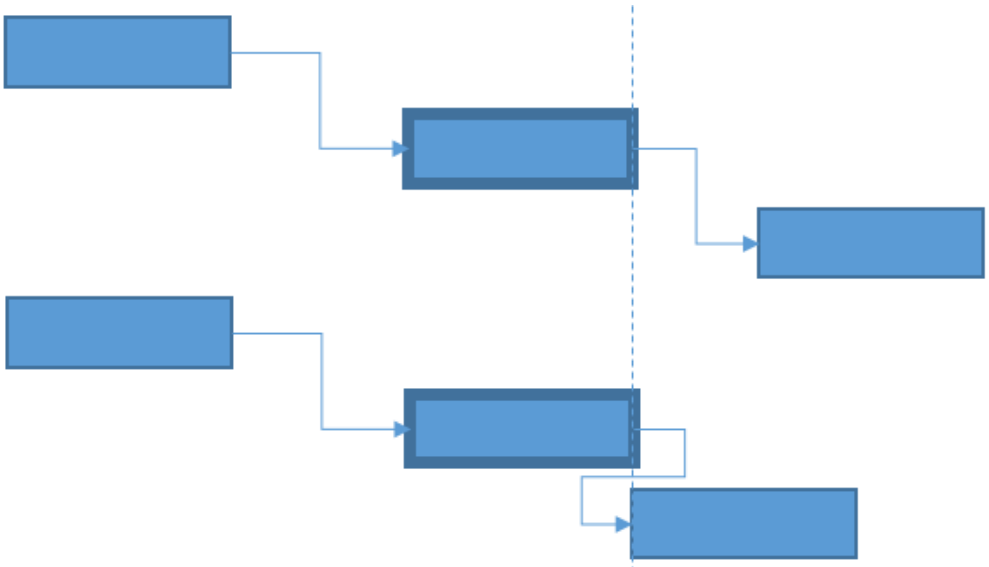
Schedule previous jobs

In a network of activities, such as jobs belonging to the same production order, you can use the **Schedule previous jobs** function to schedule the previous jobs relative to a selected job in the network. In the following example, the highlighted activity is the selected job. The diagram shows before a previous job is scheduled and after the previous job is scheduled.



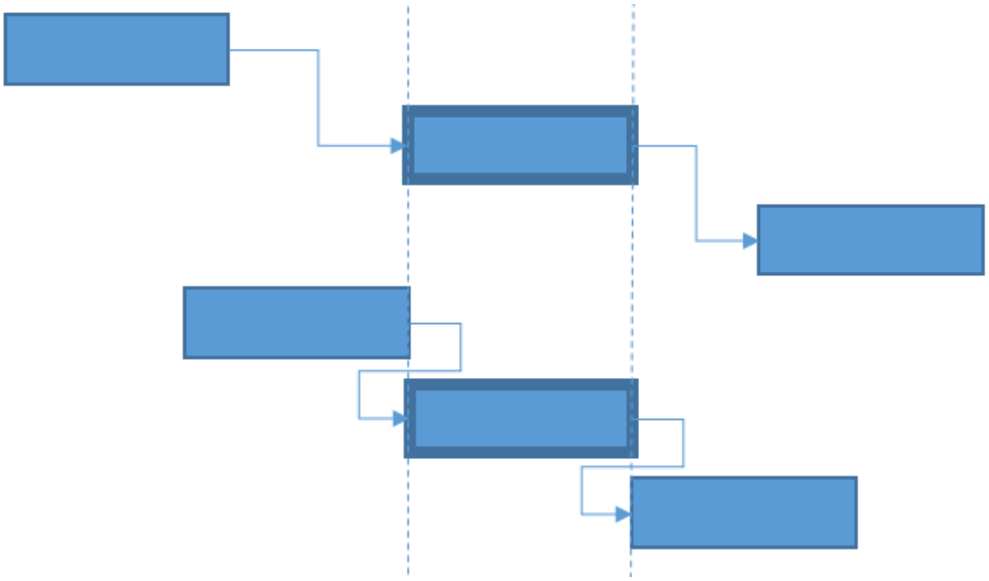
Schedule next jobs

You can use the **Schedule next jobs** function to schedule the next jobs relative to a selected job in a network of activities. In the following example, the highlighted activity is the selected job. The diagram shows before the next job is scheduled and after the next job is scheduled.



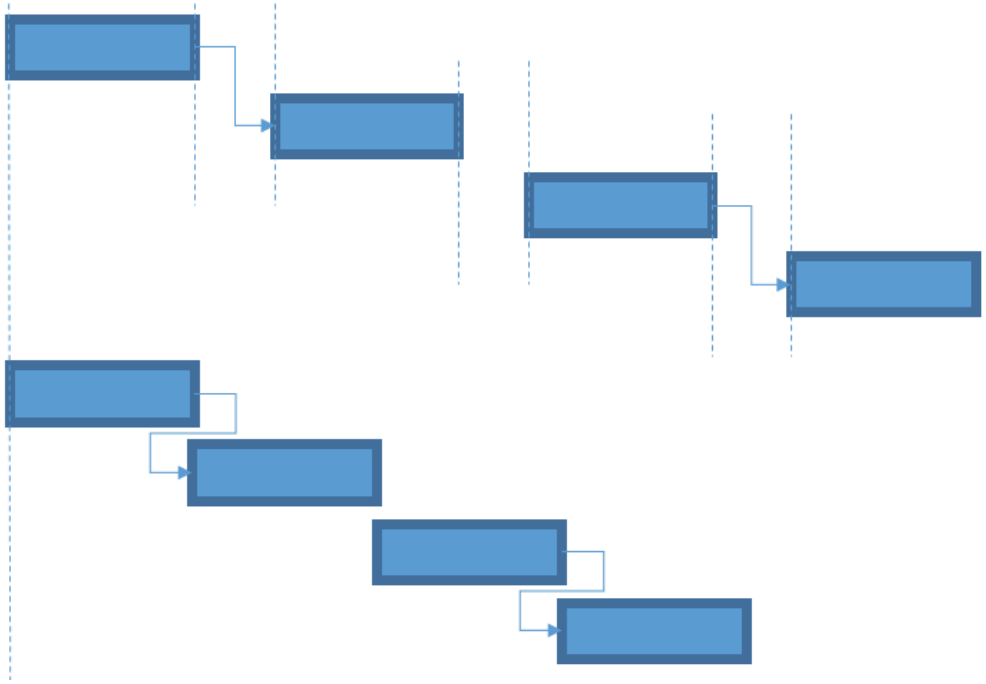
Schedule around job

You can use the **Schedule around job** function to schedule the next job and the previous job relative to a selected job in a network of activities. In the following example, the highlighted activity is the selected job. The diagram shows before a job is scheduled and after the job is scheduled.



Arrange jobs

You can use the **Arrange** function to arrange selected activities on the same resource. These activities can be in the same network of activities, but can also belong to different networks. When you use the arrange function, the time gaps between the selected activities will be eliminated. You can use this function to optimize the capacity utilization of the resources. The diagram shows before a job is scheduled and after the job is scheduled.



Reassign activities from one resource to another

You can reassign a job from one resource to another. This can be useful in situations where a machine is out of order or overbooked, and you need to find another available resource that can do the job.

Reassigning an activity as a drag-and-drop interaction

In the **Resource** view, you can reassign an activity to a different resource in the Gantt chart as a drag-and-drop interaction. You do that by selecting the row in which the activity is scheduled. After the row is selected, you can drag the row to the resource in the chart grouped under a different resource grouping level.

Reassigning an activity from the Schedule jobs menu

You can reassign a job from the **Schedule job** dialog box opened from the **Schedule job** menu. From this menu, you can only reassign a job to a resource that is already loaded to the Gantt chart. If you only select one job, then the drop-down list for the resource will be sorted by applicable resources. If you select more jobs, then there will be no information about applicable resources from the resource list.

Load additional resources to the Gantt chart

In the **Resource view**, you can load additional resources to the Gantt chart. This can be useful if you want to find an alternative resource for a job that is scheduled on a machine that is overbooked or broken down. On the **Load additional resources** page, you'll get a list of resources that are date efficient as of the date the list is opened. Applicable resources, relative to a selected job in the Gantt chart, will be listed first. If you have multiple jobs selected prior to opening the list no indication of applicable resources will be shown. On the **Load additional resources** page, you can select one or more resources that will be loaded to the Gantt chart when you confirm your selection. If there are no jobs scheduled on the selected resource in the time interval of the Gantt chart, then the resource will be placed under a resource grouping level in the bottom of the list of activities in the Gantt chart.

Access the Gantt chart

The Gantt chart can be opened from the following pages.

Expand table

Page	Description
Production order list and detail	On the **Production order list and detail** page, you can open the Gantt chart from one or more selected orders. Opening the chart from the **Gantt chart** menu item will load all jobs related to the selected production orders, but also jobs from other production orders that are scheduled on the same resources. Opening the chart from the **Gantt chart – Fast view** menu item will only load

Page	Description
	jobs related to the selected production orders. In this view, it isn't possible to schedule jobs.
Resource	On the **Resource** page, you can open the Gantt chart from the menu item **Gantt chart**. When selected, all the jobs scheduled on the resource in a selected time interval will be loaded to the chart.
Resource group	On the **Resource group** page, you can open the Gantt chart from the menu item **Gantt** chart. When selected, all the jobs scheduled on the resources in the resource group will be shown in a selected time interval.
Gantt charts	On the **Gantt charts** page, you can configure Gantt charts by resources and resource groups. For example, if you want to control production activities for specific sets of resources or resource groups, then you can make individual configurations of those on the **Gantt charts** page. You can then open the Gantt chart from each configuration.
Hour forecasts (project)	Project activities of type **Hour forecast** can be job scheduled on resources. On the **Hour forecast** page, on the **Scheduling** menu, you can open the Gantt chart on an order to see job scheduled project activities of type hour forecast.
Job to complete (List in **Production floor management** workspace)	The **Jobs to complete list in the Production floor management** workspace shows jobs from production and batch orders that are in progress on the selected resources for the workspace. On the **Gantt chart** menu item you can open the Gantt chart, where all the jobs selected in the list will be loaded to the chart.
Production orders to release (Opened from the **Production floor management** workspace)	The **Production orders to release** page is opened from the **Production floor management** workspace. This page shows scheduled production and batch orders pending release. On this page, you can open the Gantt chart for selected production orders.

Operations scheduling options

09/19/2025

This article describes the options for operations scheduling. Use operations scheduling to provide a general estimate of the production process over time.

Operations scheduling calculates the following information for a production order:

- Start and end dates for the production order and each operation.
- Resources assigned to operations.

Several settings determine how production schedules are calculated. You define these settings on the **Operations scheduling** page. The following information describes the scheduling options.

Operations scheduling

Scheduling direction

The scheduling direction is fundamental to the scheduling process. You can schedule a production forward or backward from any date, depending on timing and scheduling requirements.

- **Forward scheduling** – Schedule a production to start as early as possible. The production can start today, tomorrow, or on any specific date in the future. The production is scheduled to start on the earliest possible date and is planned forward in time to the earliest possible end date.
- **Backward scheduling** – Schedule a production to start as late as possible. The schedule is based on the date when the production must be completed and counts backward to the latest possible date that the production can start without missing its target deadline.

The following options are available:

- **Forward from today** – Schedule forward from the current date. (The current date is the system date.)
- **Forward from planned start** – Schedule forward from an earlier start date. If there's no previous scheduling, the scheduling direction is forward from the current date.
- **Forward from scheduling date** – Schedule forward from the date that you specify in the **Scheduling date** field. If you don't specify a scheduling date, the scheduling direction is forward from the current date.

- **Backward from delivery date** – Schedule backward from the delivery date that you specify for the production order. If you select this option, but don't specify a delivery date, the delivery date is the current date.
- **Backward from planned end** – Schedule backward from a previously calculated end date. If there's no previous scheduling, the end date is the current date.
- **Backward from scheduling date** – Schedule backward from the date that you specify in the **Scheduling date** field. If you don't specify a scheduling date, the current date is used. Backward from scheduling date is calculated for the production order the last time that a requirement was calculated. If you don't specify a date for the production order, the current system date is used.
- **Backward from futures date** – Schedule backward from the futures date that was calculated for the production order the last time that a requirement was calculated. If you don't specify a futures date for the production order, the current system date is used.
- **As last scheduling** – For operations scheduling and job scheduling, the selected scheduling direction and date are saved. Therefore, you can select this option for subsequent scheduling. If there's no previous scheduling of the production order, scheduling is backward from the current system date.
- **Forward from tomorrow** – Schedule forward from the current date plus one day.
- **Forward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, the production order is scheduled forward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.
- **Backward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, planned orders are scheduled backward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.

Scheduling date

Use this date for the **Forward from scheduling date** and **Backward from scheduling date** scheduling directions. Scheduling is backward or forward from this date. For more information, see the previous section, "Scheduling direction."

Recalculate BOM levels

When you select **Recalculate BOM levels**, the selected bill of materials (BOM) levels are recalculated to help guarantee the correct scheduling order.

Limitations

Finite capacity

Scheduling depends on the availability of the resources that are required to complete production. If there's not enough capacity, production orders can be delayed or even stopped. If you apply finite capacity to operations scheduling, existing capacity reservations that you made on the resources are considered, and the system sees that capacity as unavailable. The production order is scheduled based on the availability of capacity on the resources that are required. Operations scheduling uses the specified sequence of operations to determine the order of operations in the production route. Operations scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The capacity of the resource groups is the sum of available capacity on all the resources in the resource groups.

Finite material

Scheduling also depends on the availability of the materials that are required for production. Insufficient component availability can also cause production delays. Scheduling can also be based on the use of materials. Just specify the materials that must be available for production instead of the materials that aren't critical. This type of scheduling is known as scheduling with finite material. When you specify finite materials, production is scheduled based on whether materials are available. When you optimize on both capacity and materials, production is calculated to meet both restrictions. The availability of capacity and materials is considered, and the production order’s operations can't be scheduled to start until capacity and materials are available at the same time and in the required quantities. Select this check box if materials should be considered limited during scheduling. If the materials are limited, the material's coverage for that time is considered. In other words, scheduling considers the future dates that are calculated for the items. Scheduling reserves raw materials and explodes the current production. If scheduling occurs several times, only the first scheduling runs an explosion and makes reservations. If you make changes in the production BOM or route, the next scheduling runs an explosion. For the explosion, it's assumed that the materials are required on the same day. Because the production isn't scheduled at the time of the master schedule explosion, the current date is the best estimate of when the items will be available. The explosion then checks whether the items are available. If the items are available, the production requirement can be fulfilled. If the items aren't available by the current date, a planned order is generated, and an offset selection is made for the planned order. If automatic firming is set for the planned order, the planned order is firmed automatically for purchase or production. The production status is automatically changed to the status that is specified in the **Requested production status** field in the **Coverage groups** dialog box. If the check box is cleared, the materials are always considered available. Therefore, scheduling doesn't consider whether the materials are available at the time of requirement.

Finite property

Select this check box if the job scheduling should include property requirements.

Keep production unit

Select whether the scheduling engine should schedule only resources that are already specified on the production unit.

Keep warehouse from resource

Select whether the scheduling engine should schedule only resources that are associated with the input warehouse that is specified on the resource.

References

Schedule references

When references depend on production orders, they're also known as subproductions. You can schedule subproductions as part of the scheduling of a production order. Select this check box if the scheduling of subproductions should be based on the scheduling of the main production. In relation to the main production, overlying productions are scheduled forward, and underlying productions are scheduled backward. You can view production order references in the **Reference level** field on the **Production orders** page.

Synchronize references

You can synchronize references with the production order. If you select this option, the system moves and aligns the dates of the subproductions when you make changes to the production order's schedule. If a production order has one or more subproductions, you might want to schedule the subproductions together with the main production. In this case, you can't start the main production until you complete the related subproductions. Therefore, select this check box if you want the scheduling of subproductions to be based on the start and end times of the selected production. You can select this check box only if you also select the **Schedule references** check box.

Cancellation

Cancel queue time

Select this check box to exclude queue time from the scheduling.

Cancel setup

Select this check box to exclude setup time from the scheduling.

Cancel process

Select this check box to exclude run time from the scheduling.

Cancel overlap

Select this check box to exclude overlap time from the scheduling.

Cancel transport

Select this check box to exclude transit time from the scheduling.

Set default

You can save the current values as default values. Two options are available:

- Set as my default
- Set as default for everyone

Operations scheduling

Schedule a production order with operations and job scheduling

06/17/2025

This article focuses on scheduling a production order with operations scheduling and job scheduling. No jobs are created with operations scheduling whereas jobs are created with job scheduling. This procedure is intended for the production manager, production planner, or shop floor supervisor working in a discrete manufacturing environment.

Create a production order

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select **New production order**.
3. In the **Item number** field, enter or select the item number for the production order.
4. Select **Create**.

Schedule operations for the production order

1. Mark the newly created row.
2. On the Action Pane, select **Schedule**.
3. Select **Schedule operations**.
4. In the **Scheduling direction** field, select *Forward from scheduling date*.
5. In the **Scheduling date** field, enter a date. Select a future date, for example, today plus one week. With the selected **Scheduling direction**, the production order will be scheduled forward from this date.
6. Select **OK**.
7. In the list, mark the selected row. The status is changed to *Scheduled*.
8. Select **All jobs**.
9. Close the page.

Schedule jobs for the production order

1. On the Action Pane, select **Schedule**.
2. Select **Schedule jobs**.
3. In the **Scheduling direction** field, select *Forward from scheduling date*.
4. In the **Scheduling date** field, enter a date. Select a date in the future, for example, today plus one week. With the selected **Scheduling direction**, the production order will be scheduled forward from this date.

5. Select **OK**.
6. On the Action Pane, select **Production order**.
7. Select **All jobs**.

Production order lifecycle overview

Article • 01/31/2025

When a production order is created, a request is initiated to start producing an item. The production order contains information about what to produce, the quantity to produce, and the planned finish date. It also contains information about which materials to consume and which process to follow to produce the item.

A production order passes through stages of the production life cycle. When an order is created, it's assigned the status *Created*. When an order is finished, it's assigned the status *Ended*. A parameter setting in each stage allows a user to configure each step. The setting can be set up for a single user or for all users.

The production bill of material and the production route are the main entities of the production order. They're copied to the production order based on the selected item and quantity that are going to be produced. Before the production order is started, the production bill of material and route can be edited.

A production order can be created in the following scenarios:

- Created by master planning execution based on material demand.
- Created directly from a sales order line or when a higher-level production order is created and estimated (pegged supply).
- Created manually.

Create a production order

07/10/2025

This procedure shows how to create a production order. The demo data company used to create this procedure is USMF. This is the first of seven procedures that together explain the production-order lifecycle.

Create a production order

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select **New production order**.
3. In the **Item number** field, type *D0001*.
4. In the **Delivery** field, enter a date. The delivery date indicates when the production order should end in order to deliver on time. This date can be used in the scheduling process. For example, you can schedule the order backward from the delivery date.
5. Set **Quantity** to *20*.
6. Select Create.

> **Note**
>
> The **BOM number** field automatically displays the number of any active BOM for the current item, but you can change the BOM for the production order by selecting an active BOM from the list of approved BOM versions. The **Route number** field automatically displays the number of any active route for the current item, but you can change the route for the production order by selecting an active route from the list of approved route versions.

Validate the production order

1. In the list, select the link in the selected row. Select the link for the production order number that you have just created. This opens the details page for the order.
2. Select **Edit**.
3. In the **Delivery** field, enter a date. For example, you can change the delivery date for the production order.
4. Select **Save**.
5. Close the page.

Update the BOM

1. On the Action Pane, select **Production order**.
2. Select **BOM**. Open the BOM page to validate the BOM data that was copied from the default data when the production order was created. In this procedure, you need to update the quantity for a BOM.
3. Select **Edit**.
4. In the **Quantity** field, enter a number. Changing the quantity on the BOM line affects the cost estimate of material consumption for the production order.
5. Select **Save**.
6. Close the page.

Update the production route

1. On the Action Pane, select **Production order**.
2. Select **Route**. Open the **Route** page to validate the data of the production route that was copied from the default data when the order was created. In this procedure, you need to update the quantity for one of the operations in the production route.
3. In the list, find and select the desired record.
4. Select **Edit**.
5. In the **Process qty.** field, enter a number. Changing the process time affects the estimated route consumption and the cost of the production order.
6. Select **Save**.
7. Close the page.

Estimate a production order

Article • 04/01/2021

You can run this procedure by using the USMF demo data company or your own data set. In both cases, you need to have an open production order that has the Created status. This is the second procedure out of seven which explains the production order lifecycle.

Estimate a production order

1. Go to Production control > Production orders > All production orders.
2. Select an order that has the Created status in the grid.
3. On the Action Pane, click Production order.
4. Click Estimate.
    - In this step, the estimated costs of a single production order is calculated.
5. Click OK.

View the calculation details

1. On the Action Pane, click Manage costs.
2. Click View calculation details.
    - This page displays the cost breakdown. For example, you can view the total cost price per unit for the finished product in the first row. The subsequent rows contain costs according to the bill of materials, production route, and indirect costs.

Schedule a production order

Article • 09/29/2021

This procedure shows how to schedule a production order. The demo data company used to create this procedure is USMF. This is the third procedure out of seven which explains the production order lifecycle.

Schedule a production order

1. Go to Production control > Production orders > All production orders.
    - Select a production order that has the Estimated status.
2. On the Action Pane, click Schedule.
3. Click Schedule jobs.
    - The parameters for scheduling are set up on this page. You can set up the parameters for specific users or all users.
4. In the Scheduling direction field, select 'Forward from today'.
5. In the Scheduling date field, enter a date.
6. Select or clear the Finite capacity check box.
7. Select or clear the Finite material check box.
8. Click OK.

View the scheduling results

1. On the Action Pane, click Production order.
2. Click All jobs.
    - This page displays the scheduled jobs that you have just generated.
3. Expand or collapse the Scheduling section.
    - On the Scheduling FastTab, you can view the scheduled date and time.
4. Click Inquiries.
5. Click Capacity load.
    - The Capacity load page displays the capacity that is reserved through job scheduling, the total number of hours that are currently reserved on the

resource, and the number of hours that remain available for job scheduling on the resource.

6. Close the page.
7. Close the page.

Release a production order

Article • 09/29/2021

This procedure shows how to release a production order. The demo data company used to create this procedure is USMF. This is the fourth procedure out of seven which explains the production order lifecycle.

1. Go to Production control > Production orders > All production orders.

    - In the grid, select a production order that has the Scheduled status.

2. On the Action Pane, click Production order.
3. Click Release.

    - On this page, you can confirm the release of the selected range of production orders. Click Select if you want to add orders.
    - The Release step indicates when the production order is released to the production shop floor so that the shop floor operators can report progress on the production jobs. Production papers that contain relevant information about processing the jobs can be issued. The warehouse work for raw material picking is generated for the items that are set up for the warehouse process.

4. Click the General tab.

    - Select which production reports should be printed. The Job card report prints a page for each scheduled job and requires the production order to be scheduled at the job level. The report contains information about the scheduled start and end time, the quantity to produce, and which resource processes the job. The Route job report collects the same information on the same page, but does not print a page for each job. The Route card report only shows the operations but not the jobs. Therefore, this report does not require job scheduling, but can be used when production orders are scheduled at the operation level.

5. Click the Print route card checkbox.
6. Click OK.
7. Close the page.

Feedback

Start a production order

06/17/2025

This procedure shows how to start a production order on the shop floor. Time and material consumption are reported in this process. The demo data company used to create this procedure is USMF. This is the fifth procedure out of seven which explains the production order lifecycle.

Start a production order

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select a production order that has the *Released* status.
3. On the Action Pane, select **Production order**.
4. Select **Start**. On this page, you can confirm the start of the production order.
5. Select the **General** tab.
6. In the **From Oper. No.** field, enter *10*.
7. In the **Automatic route consumption** field, select *Always*.
8. Select the **Post route card now** checkbox.
9. In the **Automatic BOM consumption** field, select *Always*.
10. Select the **Post picking list now** checkbox.
11. Select the **Print picking list** checkbox.
12. Select **OK**. This is the printed picking list that shows the materials used for the production order.
13. Close the page.

Validate the picking list

1. On the Action Pane, select **View**.
2. Select **Picking list**.
3. In the list, find and select the desired record.
4. In the list, select the link in the selected row.
5. Select **Edit**.
6. In the **Consumption** field, enter a number.
7. Select **Post**.
8. Select **OK**. In the picking list journal, the materials consumed by the production order are posted. Before posting the journal, you can make adjustments if there's a difference between the estimated quantity and the actual consumed quantity.
9. Select the **GridPanel** tab.
10. Close the page.

Verify the route card journal

1. On the Action Pane, select **View**.
2. Select **Route card**.
3. In the list, find and select the desired record.
4. In the list, select the link in the selected row.
5. Select **Edit**.
6. In the **Hours** field, enter a number.
7. Select **Post**.
8. Select **OK**.

In the route card journal, the time spent on the individual operations is recorded. Good and error quantity can also be reported.

Report a production order as finished

06/17/2025

This procedure shows how to report a production order as finished. This is the sixth procedure out of seven which explains the production order lifecycle.

Report a production order as finished

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select a production order that has the *Started* status.
3. On the Action Pane, select **Production order**.
4. Select **Report as finished**. On this page, you can confirm the quantity of the finished product to be reported as finished.
5. Open the **General** tab and make the following settings:
    - **Good quantity** – Enter the quantity of usable items produced.
    - **Error quantity** – Enter the quantity of unusable items produced.
    - **Error cause** – Select the cause of the error for unusable items (for example, *Material*).
    - **End job** – Set as needed.
    - **Accept error** – Set as needed.
6. Select **OK**.

Verify the Report as finished journal

1. On the Action Pane, select **View**.
2. Select **Reported as finished**.
3. In the list, mark the selected row.
4. In the list, select the link in the selected row.
5. The report as finished journal is posted. If you want to make adjustments to the journal, manually create a new journal where you can make changes.

End a production order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure shows how to end a production order. It is the final procedure out of seven procedures that explain the production order lifecycle.

End a production order

To end a production order, follow these steps:

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select a production order that has the status *Reported as finished*.
3. On the Action Pane, select **Production order**.
4. Select **End**. On this page, you can confirm that you want to end the production order.
5. Open the **General** tab.
6. In the **Date** field, enter a date.
7. In the **Scrap method** field, select *Allocation*. When you select the allocation method, costs from the scrapped materials are added to the finished goods.
8. Select **OK**.

Validate calculation results

To validate the calculation results after you end the production order, follow these steps:

1. On the Action Pane, select **Manage costs**.
2. Select **View cost comparison**. After you end the production order, you can compare the estimated cost price against the realized cost price to get an overview of the production variances.

Last updated on 05/27/2026

Release production orders

06/17/2025

A released production order is an order that has been authorized for production. The term Released is used to describe a state in the production order life cycle, where the production order is available for execution on the production shop floor and for warehouse processes.

Characteristics of the Released state

The *Released* state is one state in the production order life cycle. Production orders that are in the *Released* state are available for execution on the production shop floor and for warehouse processes. The *Released* state has the following characteristics:

- A production order can be changed to the *Released* state either from the production order or by using a batch process. The production order can also be updated automatically from planned production orders that are firmed by using the **Firming time fence** field on the **Master plan** page.
- The *Released* state is the signal for the shop floor operators (operators) to start executing the production jobs on the shop floor.
- Production papers, such as route cards, route jobs, and jobs cards provide information about production jobs and can be issued.
- For materials that are physically reserved, warehouse work is generated to pick materials for the production order.

Releasing jobs to the shop floor

After a production order is released, production jobs that are related to the order are visible and ready for registration. The operators can make job registrations, such as Start, Stop, and Completion, on the production floor execution interface. The registered time and quantity are automatically transferred from the registration pages to production journals to keep track of the consumed time and quantity.

Route cards

A route card provides an overview of information that comes from route and operation setups, and from operation and job scheduling methods.

Route jobs

A route job lists each job of an operation in detail, and includes setup, process, queue, and transportation times. For example, an operation such as painting might require individual jobs, such as setup time, run time for the painting process, and queue time for drying.

Job cards

A job card lists the individual job numbers of a particular operation. One job appears on each page. The jobs that are included on a job card, and their estimated times, come from the route and operation setup information. From a job card, you can open the **Production journal lines**, **job card** page. People who run operations resources can provide feedback about the production process. There are fields where you can enter consumption statistics and information such as the error quantity.

Warehouse work for raw material picking

Work for raw material picking is generated during release. Work is generated only for the quantity of materials that was physically reserved for the production order before the order was released. The following setup is required to generate warehouse work for raw material picking:

- A location directive for raw materials picking that determines which warehouse location to pick the materials in
- A wave template for raw materials, where policies for the execution of warehouse work are configured
- A production input location that determines where materials are put

When using license plate controlled locations, you can choose whether the ordered quantity or the full quantity available for the item should be picked while processing the raw material picking work. To set this option:

1. Go to **Product information management** > **Products** > **Released products** and open the relevant item.
2. Expand the **Warehouse** FastTab.
3. Select one of the following options for the **Material picking in license plate locations** field:

    - *Order picking* – Only the ordered quantity should be picked.
    - *Staging* – Whenever possible, the full quantity available at the license plate should be picked. For a worker to be able to pick the full license plate quantity, the license plate must not contain mixed items and must not have mixed dimensions. If the

license plate contains mixed dimensions or items, the pick will proceed as if it were set to *Order picking*.

Report production orders as finished

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Reporting as finished is a production stage. At this stage, you report a finished product and move it from the production order to the inventory.

When you report a quantity of finished goods as finished on a production order, you update the inventory as on-hand. You can report partial quantities of the originally planned order quantity as finished. You can also report error quantities with an associated error reason when reporting quantities as finished. When a production order reaches the *Reported as finished* stage, it means that you can't report any more quantity for the production order.

The report as finished process has the following characteristics:

- You can set up consumption of raw material and time that are proportional to the reported quantity (back-flushing).
- You can generate putaway work for items that are enabled for warehouse processes.
- You can set up the planned or standard cost value of the finished goods to be reported to ledger accounts.
- You can create a quality order for the reported quantity based on the setup of a quality association. You report the quantity to the output location. Warehouse work is then generated to move the quantity from the output location to its final destination defined by the location directive for the putaway work.
- You can create a quality order when a production order is reported as finished if a quality association is set up.

Set a production order to Reporting as finished

You can set a production order to report as finished through the standard production order update function, or through the route and job card journals, or through the **Report as finished** journal. Workers can also use the production floor execution interface to update the stage to

Reported as finished when they report on the last job of the production order. Finally, you can add the **Report as finished** option as a process for the Warehouse Management mobile app.

Last updated on 05/27/2026

Register and track batch/serial numbers for finished products and their components

08/13/2025

Workers and managers can register batch/serial numbers for materials and components that are used in manufacturing processes. They can also then associate those numbers with the batch/serial numbers of the products that are produced. In this way, manufacturers can optimize their processes, enhance product quality, and respond quickly to any issues that arise. Managers can use the item tracing report to effectively track batch/serial numbers that are registered through the *Tracked components* feature.

> **Tip**
>
> You can also track batch/serial numbers for materials and components using the Traceability Add-in for Dynamics 365 Supply Chain Management (preview), which offers a graphical browser interface and an API for integration with external systems.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.
- The feature that's named *Tracked components* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

Enable registration of tracked component information

To enable registration of tracked component information in production processes, follow these steps.

1. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters**.
2. On the **Bills of materials** tab, set the **Enable tracked components** option to *Yes*.

Enable registration of tracked components on products

Before you can use tracked components functionality for a product or its components, the following conditions must be met:

- The product must be defined as serial controlled or batch controlled.
- The product must be associated with a tracked components policy.

To create a tracked components policy, follow these steps.

1. Go to **Production** > **Setup** > **Production** > **Tracked components policy**.

2. Use the buttons on the Action Pane to add a new policy or edit an existing one.

3. For the new or selected policy, set the following fields:

    - **Name** – Enter a name for the policy.
    - **Description** – Enter a description of the policy.
    - **Use tracked components** – Set this option to *Yes* to register tracked information for products that are associated with the policy.
    - **Check pre-allocation for product** – Set this option to *Yes* to validate serial or batch numbers for finished goods when tracked component information is registered.
    - **Check for pre-allocation for components** – Set this option to *Yes* to validate serial or batch numbers for components when tracked component information is registered.
    - **Serial number matching limit** – Set this option to *Yes* to ensure that the number of component serial numbers that are matched to a product serial number doesn't exceed the planned quantity on the production order bill of materials (BOM) line. If the number of matched components exceeds the planned quantity, the system blocks the match to prevent over-allocation.

Register tracked components for finished items

To register tracked components for the finished items for any production order, follow these steps.

1. Start from any of the following places:

    - **All production orders** list or details
    - **Picking list** journal line
    - **Route card** journal line
    - **Job card** journal line

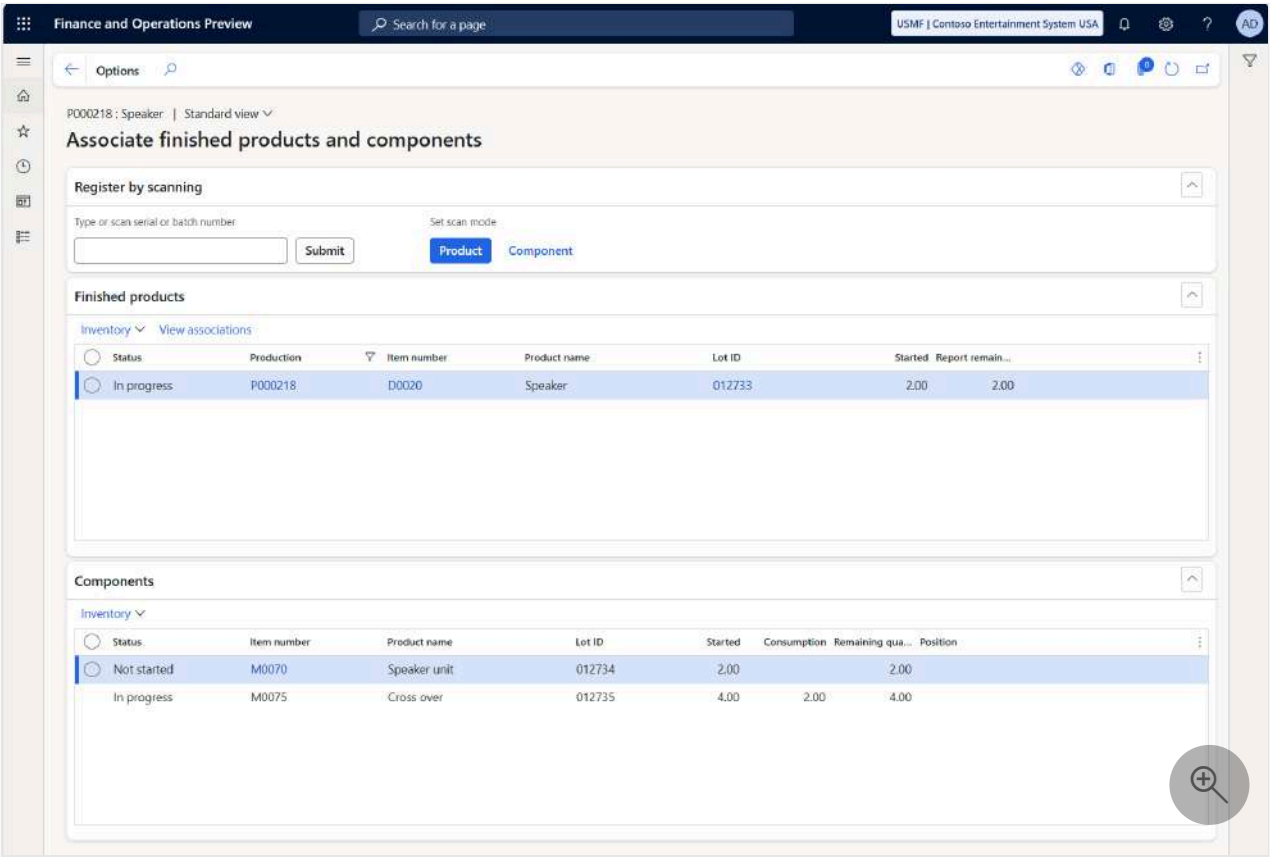
- **Report as finished** journal line
- **Current operations**
- Production order **Start** dialog
- Production order **Report as finished** dialog

2. Select the production order that you want to register batch or serial numbers for.

3. On the Action Pane, find the tab that includes the **Track components** button, and select that button.

4. On the **Tracked components** page, the **Type or scan serial or batch number** field is automatically in focus. In addition, the **Scan mode** field is automatically set to *Product* to indicate that you're about to enter the batch or serial number of a finished product. Follow one of the steps:

   - If you're using a scanner, scan the bar code of the first finished product that you want to register.
   - If you're using a keyboard, enter the batch or serial number of the first finished product that you want to register, and then select **Submit**.



5. The value of the **Scan mode** field is changed to *Component*. You can now register the batch or serial number of a component by following one of these steps:

   - If you're using GS1 bar codes, your system might be able to detect which component you're scanning. In this case, you can just scan the component bar code,

which includes both the component item number and its serial or batch number.
    - If you're using simple bar codes, or if you're using a keyboard, first select a component in the grid on the **Component** FastTab. Then enter or scan the batch or serial number of that component.

6. Repeat the previous step until you finish registering all the components for the current finished product.

7. Change the value of the **Scan mode** field back to *Product*, and repeat this procedure until you finish registering all finished products and their components for the current production order.

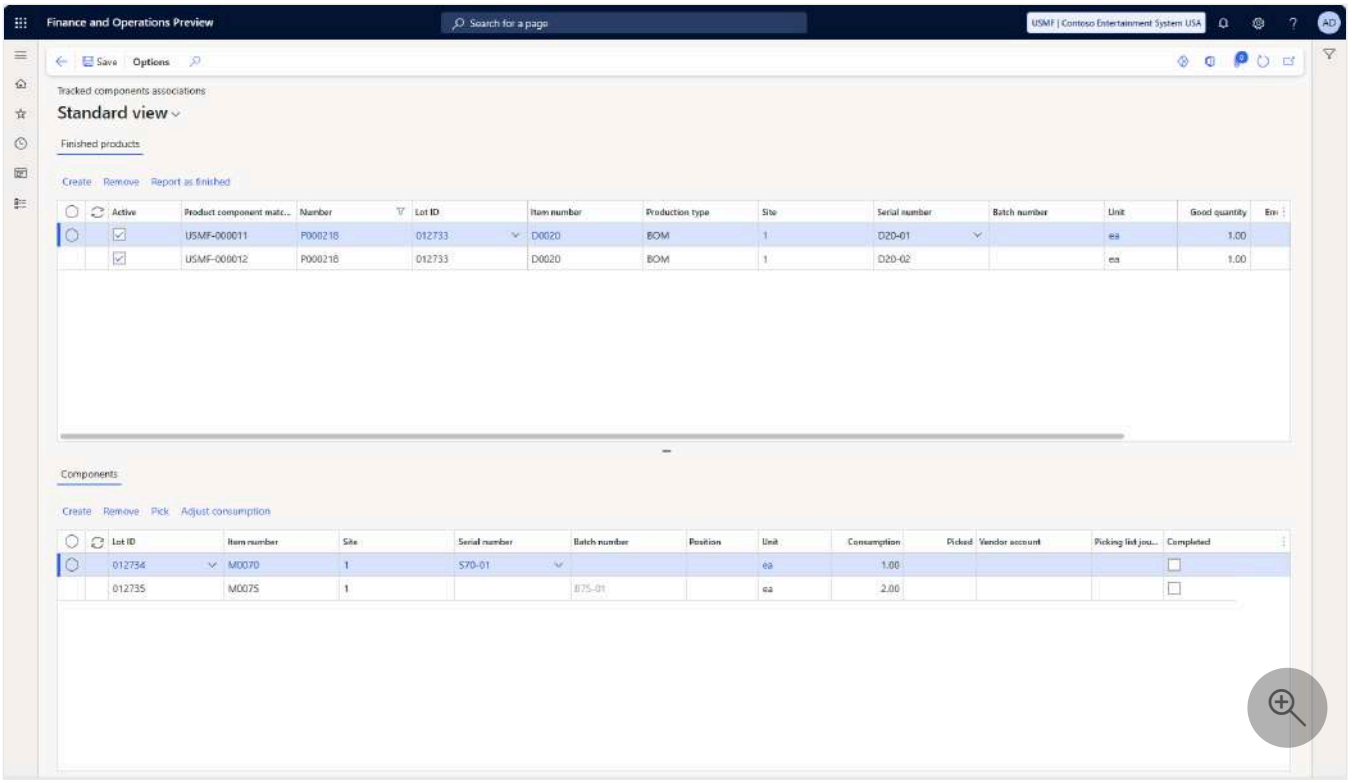
   At any time, you can review and correct the registrations that you've made so far. On the **Finished products** FastTab, on the toolbar, select **View associations** to open the **Tracked components associations** page. For information about how to work with this page, see the next section.

As you work, the **Status** field on the **Finished product** FastTab of the **Tracked components** page indicates the registration status of each finished product. The **Status** field on the **Components** FastTab indicates the registration status of each component in the selected finished product. The **Status** field on each FastTab can have the following values:

- *Not started* – No batch or serial number has been associated with the product or component.
- *In progress* – An association has been established, but only for part of the started quantity for the finished product or the component. On the **Components** FastTab, the **Started**, **Consumption**, and **Remaining quantity** columns let you track the quantity that has been allocated.
- *Completed* – No remaining quantity remains to be allocated for the finished product or the component.

Review and edit batch/serial numbers for finished products and their components

Use the **Tracked components associations** page to review and edit batch/serial numbers for finished products and their components. For information about how to open this page for a selected production order, see the previous section.



Finished products

The **Finished products** section lists batch/serial number registrations for the products that are being produced for the selected production order. The toolbar in this section provides the following buttons:

- **Create** – Add a new row to the grid so that you can register the serial or batch number for a missing finished product.
- **Remove** – Remove one or more selected finished products.
- **Report as finished** – Report a selected row as finished. You can first edit the **Good quantity** and/or **Error quantity** value for batch products as required.

Components

The **Components** section lists the components of the finished product that's selected in the **Finished products** grid. For each component, this section shows the registered batch or serial number, and you can enter or correct these values as required. The toolbar in this section provides the following buttons:

- **Create** – Add a new row to the grid so that you can register the serial or batch number for a missing component.
- **Remove** – Remove one or more selected components.
- **Pick** – Manually pick the quantity that's planned for consumption, as specified in the **Consumption** field.

- **Adjust consumption** – Generate a production picking list journal to manually adjust the consumption. In this case, the quantity that's specified in the **Consumption** field is automatically entered in the picking list journal.

Report as finished from the job card device

07/10/2025

> **Important**
>
> The job card device is no longer supported and has been replaced by the production floor execution interface. We strongly recommend that you use the production floor execution interface instead of the job card device.

Workers use the **Report progress** page on the job card device to report quantities that have been completed for a production job. This article describes how to set up various options that establish how workers can report as finished using this page and what happens next. Options include:

- Control whether and how quantities that are reported as finished are added to inventory.
- Control whether and how batch numbers are generated and applied when reporting as finished.
- Control whether and how serial numbers are generated and applied when reporting as finished.
- Control whether and how to report as finished to a license plate.

Control whether quantities that are reported as finished are added to inventory

To control whether and how the quantities that are reported as finished on the last operation should be added to inventory, follow these steps.

1. Go to **Product control** > **Setup** > **Manufacturing execution** > **Production order defaults**.
2. On the **Report as finished** tab, set the **Update finished report on-line** field to one of the following values:
    - **No** – No quantity will be added to inventory when quantities are reported on the last operation. The status of the production order will never change.
    - **Status + Quantity** – The status of the production order will change to *Reported as finished*, and the quantity will be reported as finished to inventory.
    - **Quantity** – The quantity will be reported as finished to inventory, but the status of the production order will never change.
    - **Status** – Only the status of the production order will change. No quantities will be added to inventory when quantities are reported on the last operation.

> **Note**
>
> Quantities aren't tracked in inventory if the operations that they are reported as finished on aren't defined as the last operation. However, those quantities can be used to view progress. They can also be included in rules that control whether workers can start the next operation before a defined threshold of reported quantities on the previous operation is reached. You can define these rules on the **Quantity validation** tab on the **Production order defaults** page.

For more information about how to work with the **Production order defaults** page, see Production parameters for manufacturing execution.

Report batch-controlled items as finished

The job card device supports three scenarios for reporting on batch items. These scenarios apply both to items that are enabled for warehouse management processes (WMS) and to items that aren't enabled for WMS.

- **Manually assigned batch numbers** - Workers enter a custom batch number. This batch number might come from an external source that isn't known to the system.
- **Predefined batch numbers** - Workers select a batch number in a list of batch numbers that the system automatically generates before the production order is released to the job card device.
- **Fixed batch numbers** - Workers don't enter or select a batch number. Instead, the system automatically assigns a batch number to the production order before it's released.

Configure products that require batch number reporting

To enable a product to support any of the available batch-controlled scenarios, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product to configure.
3. On the **Manage inventory** FastTab, in the **Batch number group** field, select the tracking number group that is set up to support your scenario.

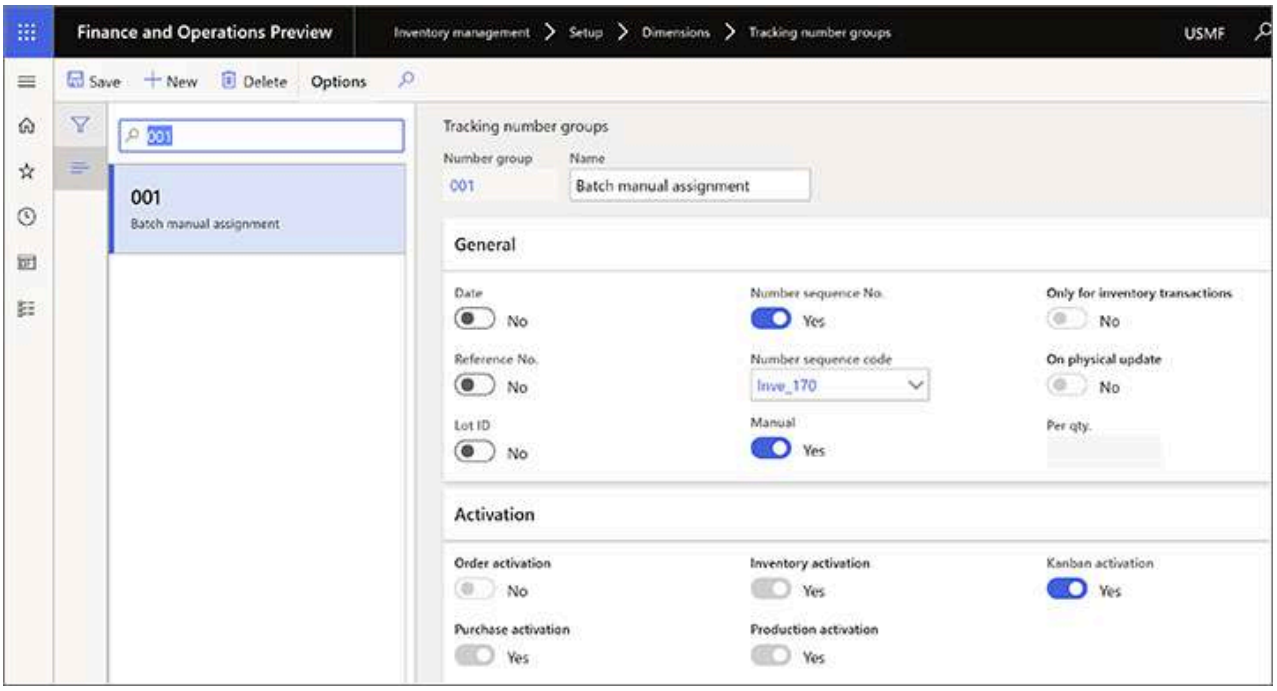
> **Note**
>
> By default, if no batch number group is assigned to a batch-controlled product, the job card device provides manual entry for the batch number during reporting as finished.

The following sections describe how to set up tracking number groups to support each of the three scenarios for reporting on batch items.

Set up a tracking number group that lets workers manually assign a batch number

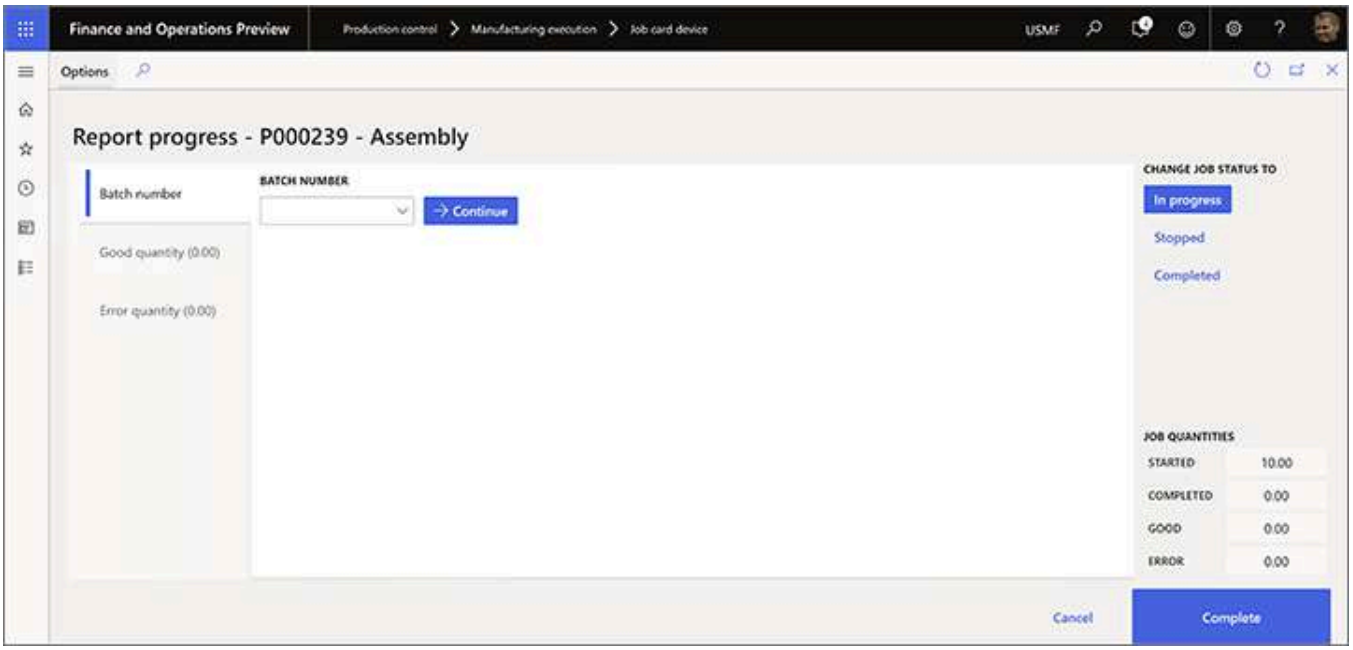
To allow for manually assigned batch numbers, follow these steps to set up a tracking number group.

1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Manual** option to **Yes**.



4. Set other values as you require, and then select this tracking number group as the batch number group for released products that you want to use this scenario for.

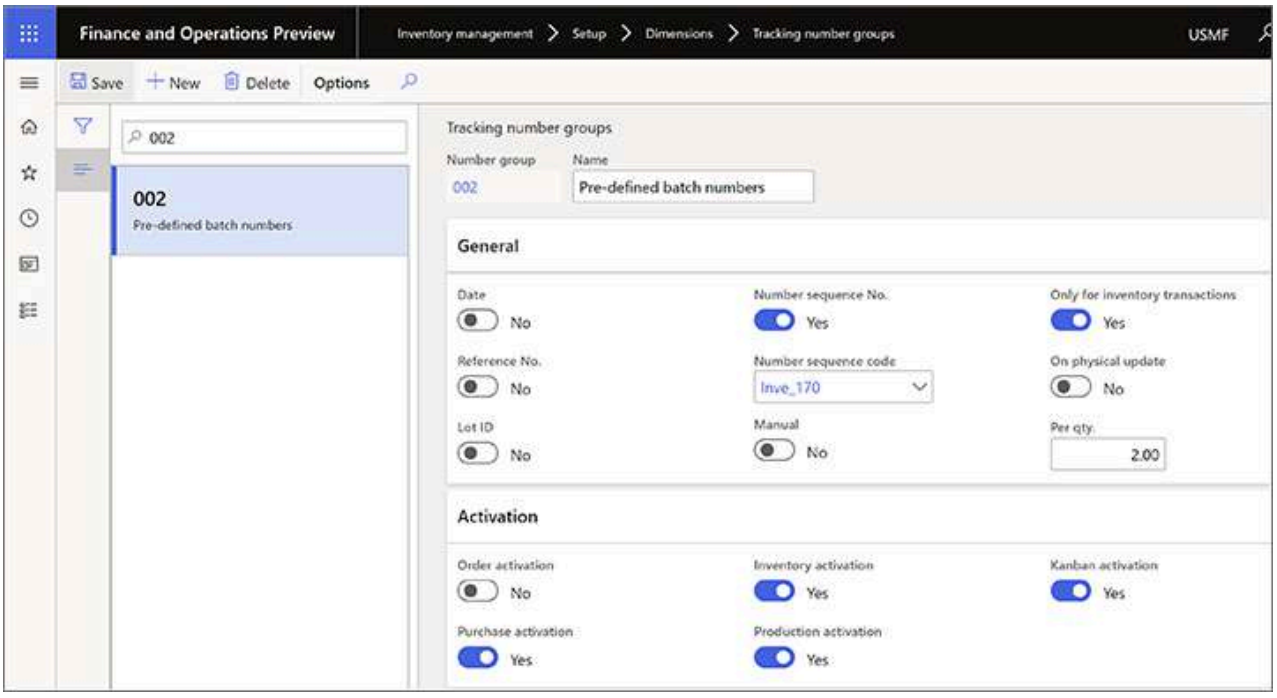
When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides is a text box where workers can enter any value.



Set up a tracking number group that provides a list of predefined batch numbers

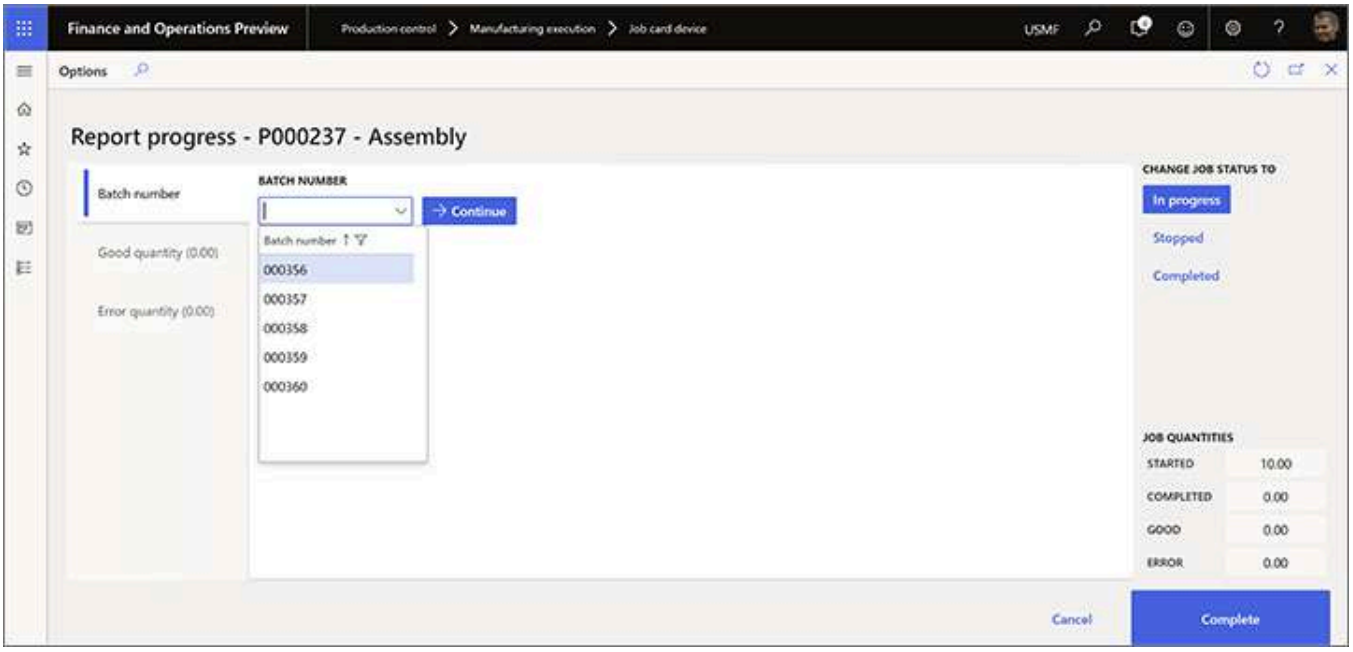
To provide a list of predefined batch numbers, follow these steps to set up a tracking number group.

1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **Yes**.
4. Use the **Per qty** field to split batch numbers per quantity, based on the value that you enter. For example, you have a production order for ten pieces, and the **Per qty** field is set to *2*. In this case, five batch numbers will be assigned to the production order when it's created.



5. Set other values as you require, and then select this tracking number group as the batch number group for released products that you want to use this scenario for.

When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides is a drop-down list where workers must select a predefined value.



Set up a tracking number group that automatically assigns batch numbers

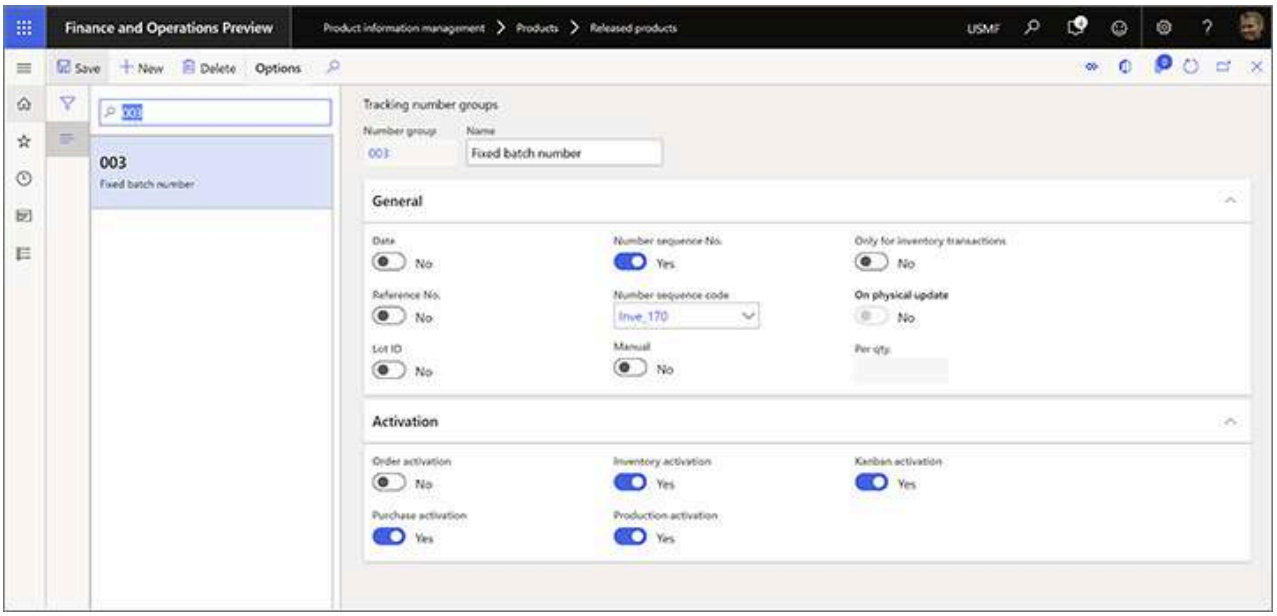
If batch numbers should be assigned automatically, without worker input, follow these steps to set up a tracking number group.

1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.

2. Create or select the tracking number group to set up.

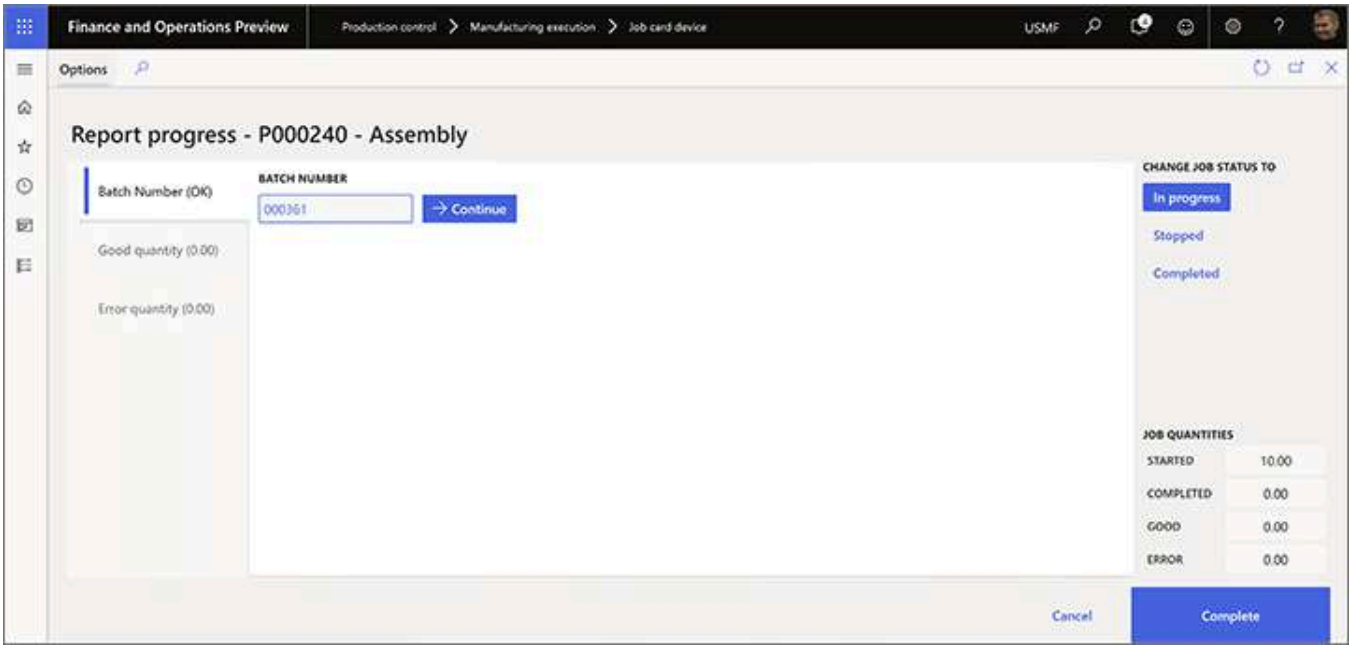
3. On the **General** FastTab, set the **Only for inventory transactions** option to **No**.

4. Set the **Manual** option to **No**.



5. Set other values as you require, and then select this tracking number group as the batch number group for released products that you want to use this scenario for.

When you use this scenario, the **Batch number** field that the **Report progress** page on the job card device provides shows a value, but workers can't edit it.



Report serial-controlled items as finished

The job card device supports three scenarios for reporting on serial-controlled items. These scenarios apply both to items that are enabled for warehouse management processes (WMS)

and to items that aren't enabled for WMS.

- **Manually assigned serial numbers** - Workers enter a custom serial number. This serial number might come from an external source that isn't known to the system.
- **Predefined serial numbers** - Workers select a serial number in a list of serial numbers that the system automatically generates before the production order is released to the job card device.
- **Fixed serial number** - Workers don't enter or select a serial number. Instead, the system automatically assigns a serial number to the production order before it's released.

Configure products that require serial-number reporting

To enable a product to support any of the available serial-controlled scenarios, follow these steps:

To enable each scenario, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product to configure.
3. On the **Manage inventory** FastTab, in the **Serial number group** field, select the tracking number group that is set up to support your scenario.

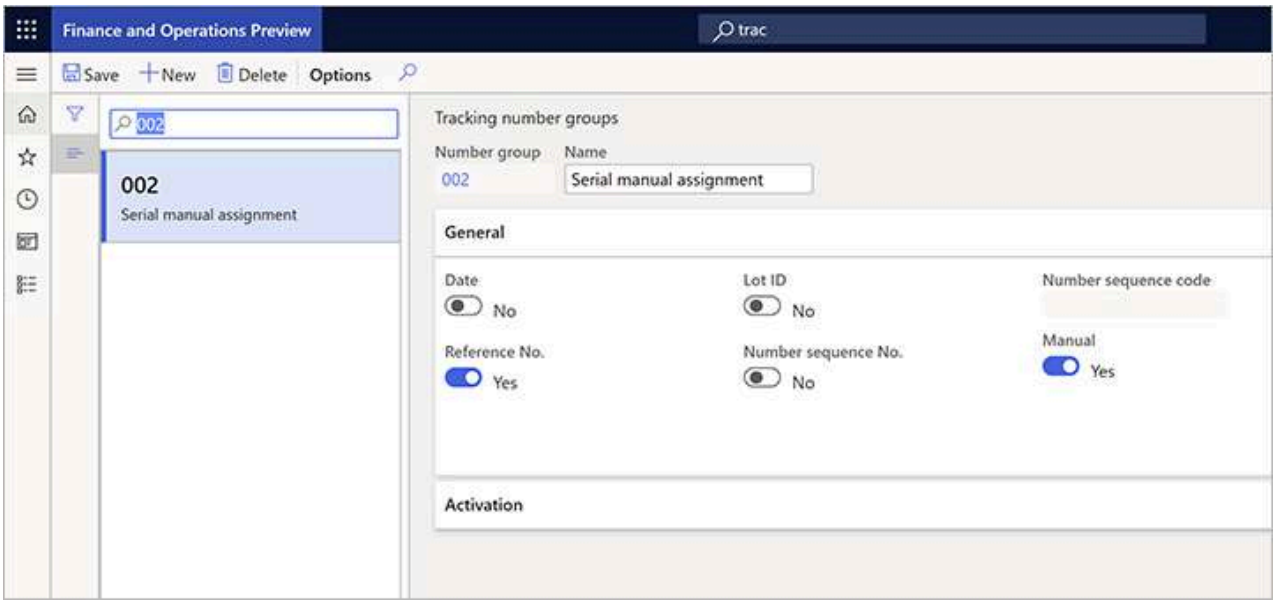
> ⓘ **Note**
>
> By default, if no serial number group is assigned to a serial-controlled product, the job card device provides manual entry for the serial number during reporting as finished.

The following sections describe how to set up tracking number groups to support each of the three scenarios for reporting on serial-controlled items.

Set up a tracking number group that lets workers manually assign a serial number

To allow for manually assigned serial numbers, follow these steps to set up a tracking number group.

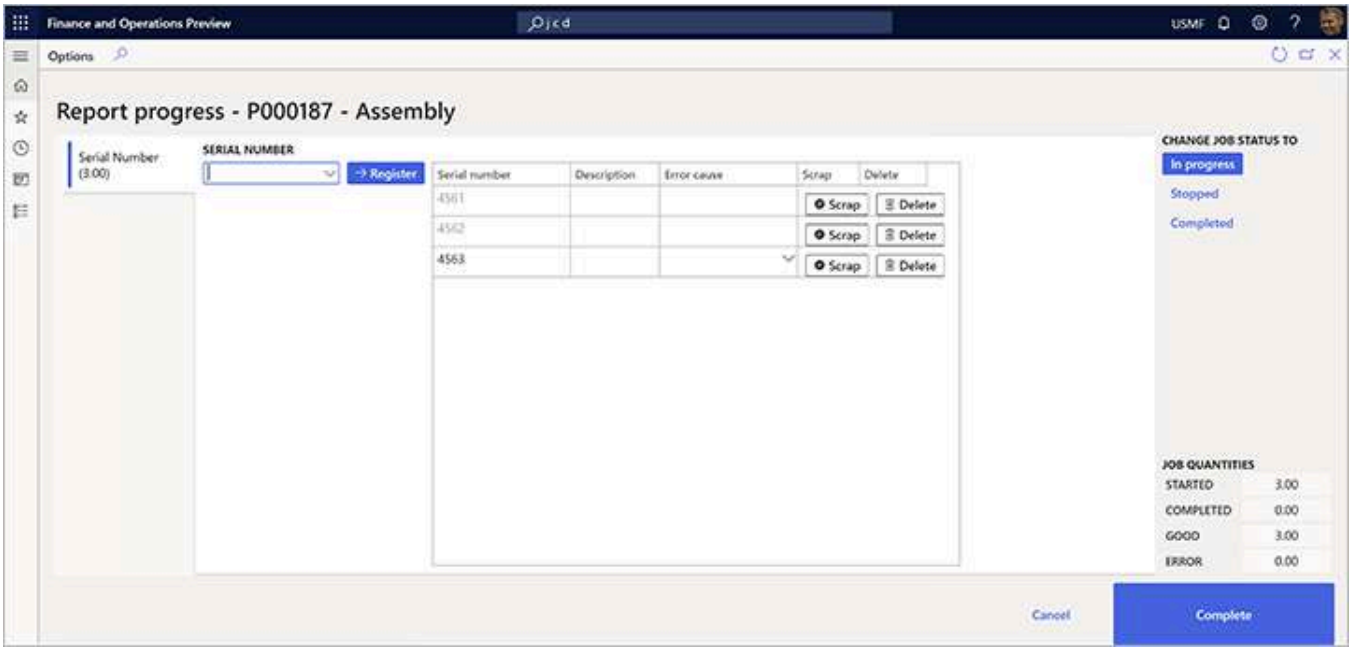
1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Manual** option to **Yes**.



4. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides is a text box where workers can enter any value for the serial number. On entering a value, it is added to the serial number list. In this list, workers can do the following:

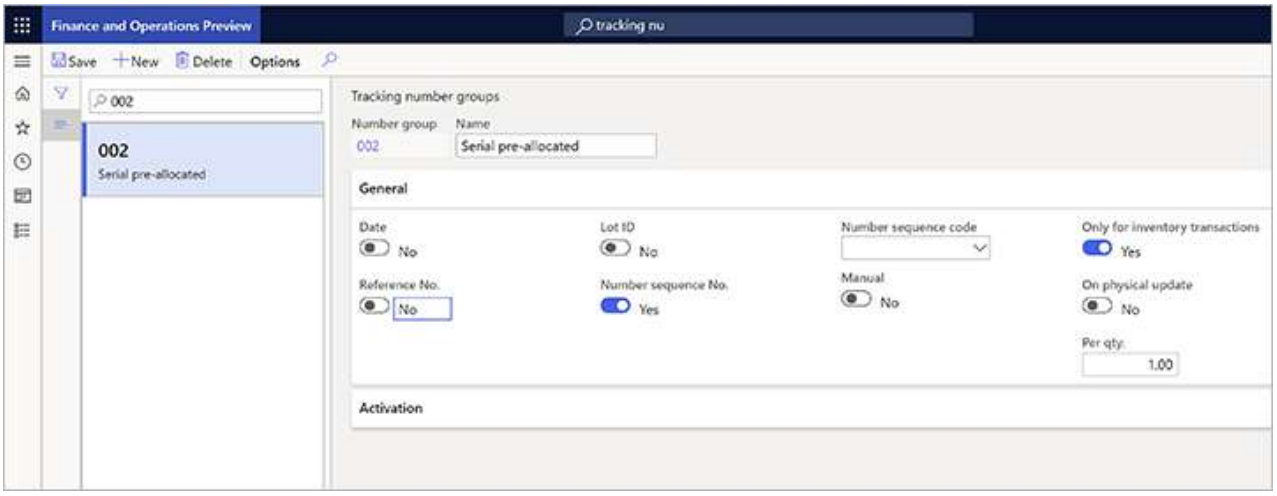
- To mark a serial number as scrapped, select the **Scrap** button for the appropriate row. The worker will be prompted to provide an **Error cause**.
- To delete a serial number, select the **Delete** button for the appropriate row.



Set up a tracking number group that provides a list of predefined serial numbers

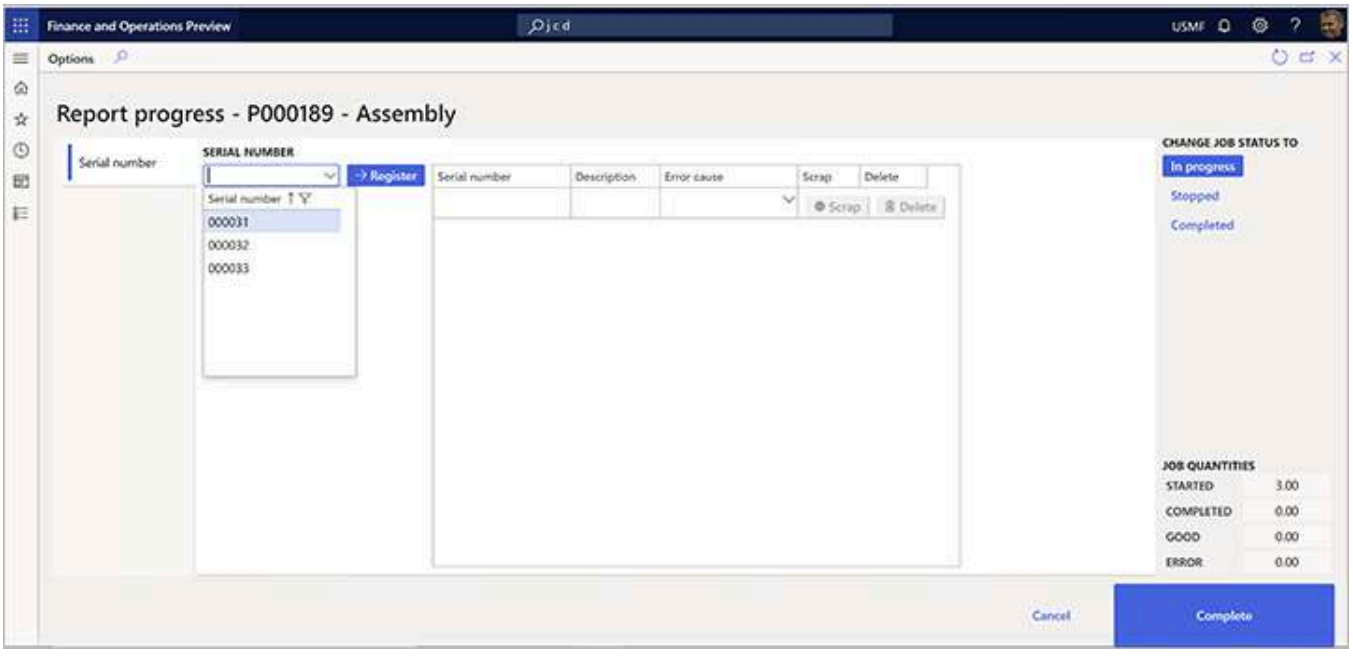
To provide a list of predefined serial numbers, follow these steps to set up a tracking number group.

1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **Yes**.
4. Use the **Per qty** field to split serial numbers per quantity of one.



5. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

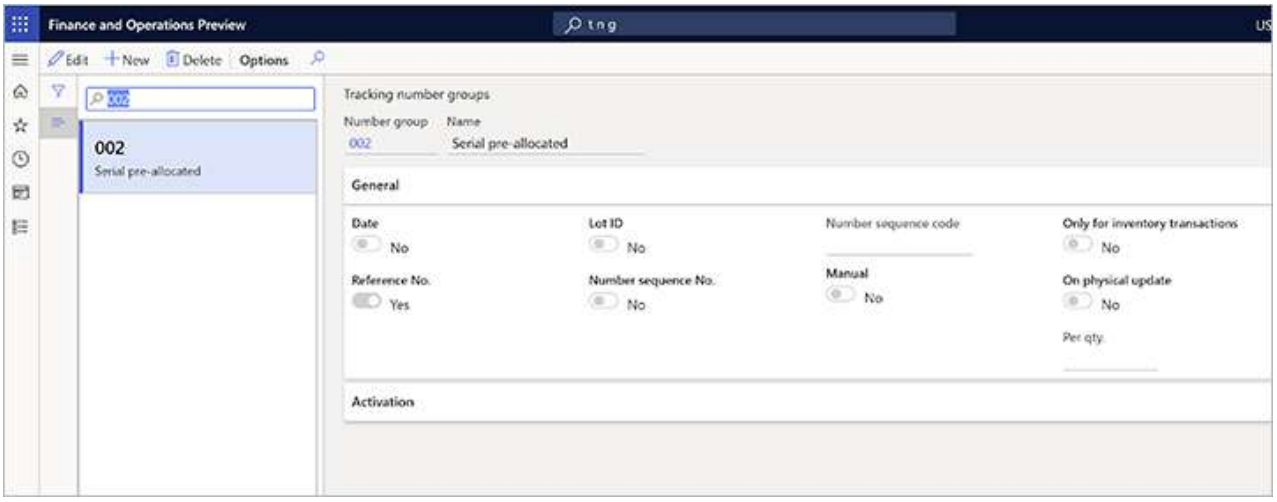
When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides is a drop-down list where workers must select a predefined value.



Set up a tracking number group that automatically assigns serial numbers

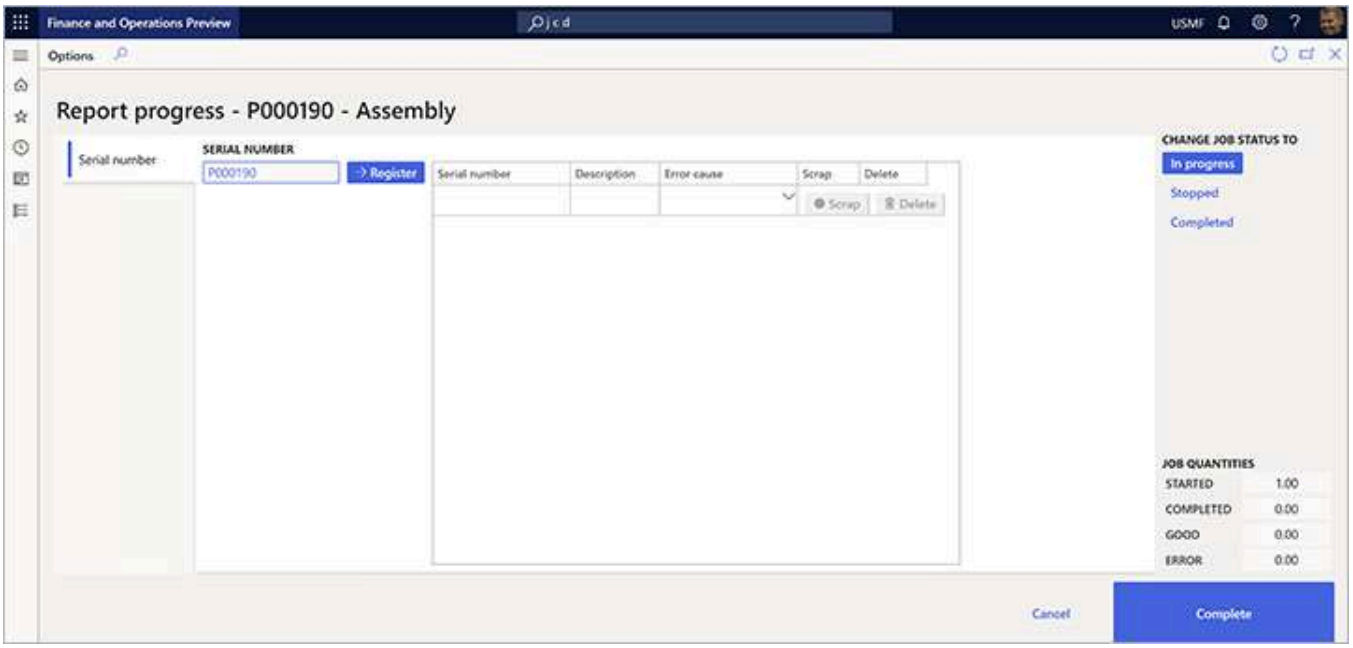
If a serial number should be assigned automatically, without worker input, follow these steps to set up a tracking number group.

1. Go to **Inventory management** > **Setup** > **Dimensions** > **Tracking number groups**.
2. Create or select the tracking number group to set up.
3. On the **General** FastTab, set the **Only for inventory transactions** option to **No**.
4. Set the **Manual** option to **No**.



5. Set other values as you require, and then select this tracking number group as the serial number group for released products that you want to use this scenario for.

When you use this scenario, the **Serial number** field that the **Report progress** page on the job card device provides shows a value, but workers can't edit it. This scenario is only relevant when a production order is created for a quantity of one piece of a serial number-controlled item.



Report as finished to a license plate

Warehouse management processes (WMS) can use the license plate dimension to track inventory on warehouse locations that have been set up for this purpose. In this case, the license plate number is required when a worker reports quantities as finished.

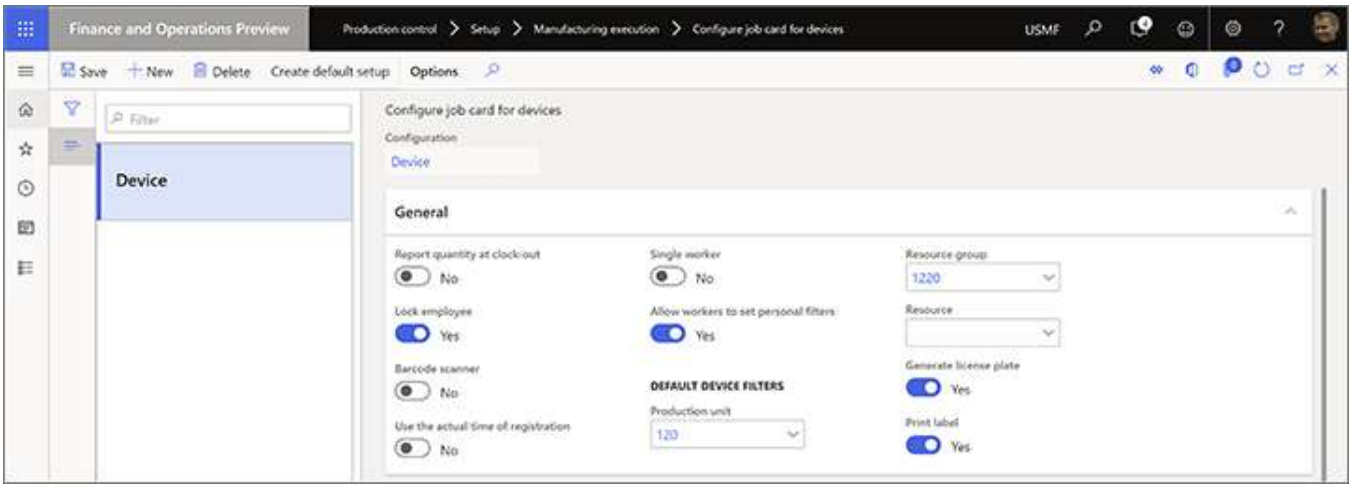
Set up reporting as finished to a license plate

To control whether workers should reuse an existing license plate or generate a new license plate when they report quantities as finished, follow these steps.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure job card for devices**.

2. Set the following options for each device:

    - **Generate license plate** – Set this option to **Yes** to generate a new license plate for each report as finished. Set it to **No** if an existing license plate should be used for each report as finished.
    - **Print label** – Set this option to **Yes** if the worker must print a license plate label for each report as finished. Set it to **No** if no label is required.



> **Note**
>
> To configure the label, go to **Warehouse management** > **Setup** > **Document routing** > **Document routing**. Learn more in Document routing label layouts.

Provide mixed-reality Guides for workers in production

Article • 06/03/2022

Workers in production processes will benefit from relevant instructions that are provided at the right time in the context of their work. *Instructions* apply in several domains of work, including: assembly, service, operations, certification, and safety. Across all of these core business functions, ongoing training instructions can help empower workers to achieve more and work better.

Introduction

You can provide instructions in different ways. One efficient system that ships out of the box uses Dynamics 365 Guides.

Dynamics 365 Guides can help empower your employees with hands-on learning. You can define standardized processes with step-by-step instructions that guide your employees to the tools and parts they need and show employees how to use these tools in real work situations.

You can attach guides to various aspects of production control including:

- Resources
- Resource groups
- Released products
- Formulas
- Formula versions
- Bills of material (BOMs)
- BOM versions
- Routes
- Route versions
- Route operation relations

> **Note**
>
> You can also attach Guides with Asset Management. For more information about that option, see Integrate Dynamics 365 Supply Chain Management (Asset Management) with Dynamics 365 Guides.

When a first-line worker chooses a job on the shop floor through Supply Chain Management, the worker can see the relevant guides on the production floor execution interface. When the worker chooses a specific guide, a QR code for that guide is shown on the screen. The worker then uses their HoloLens to scan the QR code, which launches Guides and shows the required instructions.

The following subsections describe a few selected scenarios where companies across industries can see the biggest value when using Guides to present instructions for manufacturing.

Assembly

Instructions in assembly operations show workers the tools and parts they need and how to use them in real work situations.

Production managers can create and assign Guides, for example, for production routes, operation relations, or bills of material. Workers will find the relevant instructions on the respective operation experience on the shop floor.

Service

Equip technicians with guided instructions at the job site, eliminating the need to schedule additional visits.

Service managers can assign Guides, for example, to specific products that walk through routines of quality assessment.

Quality

Rollout new processes and ensure increased consistency by turning employee knowledge into a repeatable tool.

Quality assurance managers can assign guides, for example, to products that walk through routines of quality assessment.

Certifications

Ensure every employee meets high standards by quickly identifying who needs help and where.

Safety

Provide instructions that walk through dangerous procedures virtually before attempting in the physical environment. With a mixed reality approach, workers can experience dangerous procedures virtually.

Production managers can provide dedicated handling instructions for hazardous material handling or delicate handling procedures by assigning instructions to product items, routes, and operations.

Get started with instructions and Guides

To enable instructions in production processes, Supply Chain Management provides an out-of-the-box integration with Dynamics 365 Guides. A licensed and installed application instance of Guides is required to build, maintain, and assign mixed reality instructions to production assets and work.

Prerequisites

To use this feature, your system must include the following:

- Dynamics 365 Supply Chain Management version 10.0.15 or later
- Dual-write for Supply Chain Management apps.
- Dynamics 365 Guides version 400.0.1.48 or later

Turn on the feature

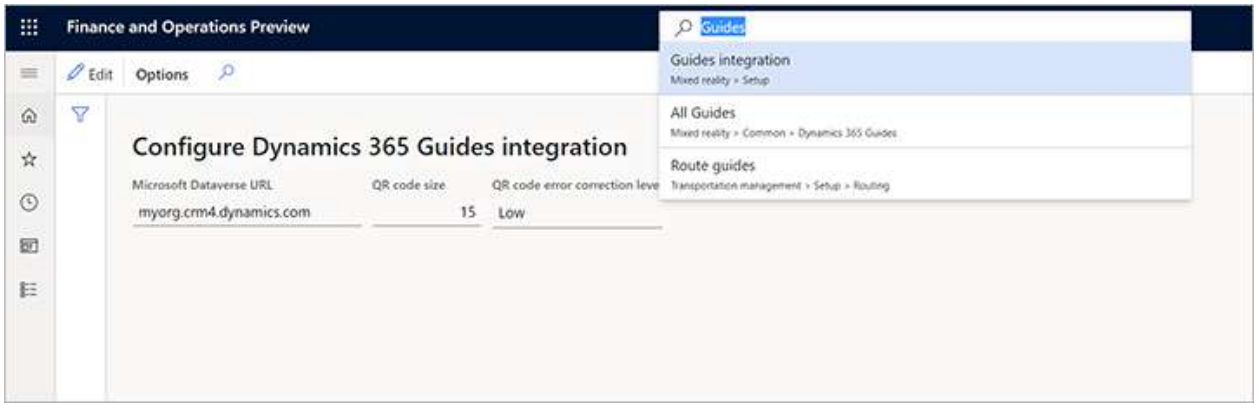
To make the feature available on your system, you must enable its configuration keys. You only need to do this once. To do this, an administrator must do the following:

1. Place your system into maintenance mode as described in Maintenance mode.
2. Go to **System administration** > **Setup** > **License configuration**.
3. Expand the **Mixed reality** section and then select the **Mixed reality guide** check box.

4. Expand the **Production management** section and then select the **Production instructions** check box.
5. Turn off maintenance mode as described in Maintenance mode.

Configure how Guides appear on the shop floor

To configure how Guides appear on the shop floor, go to **Mixed Reality** > **Dynamics 365 Guides** > **Configure Guides integration**.



Set the following fields:

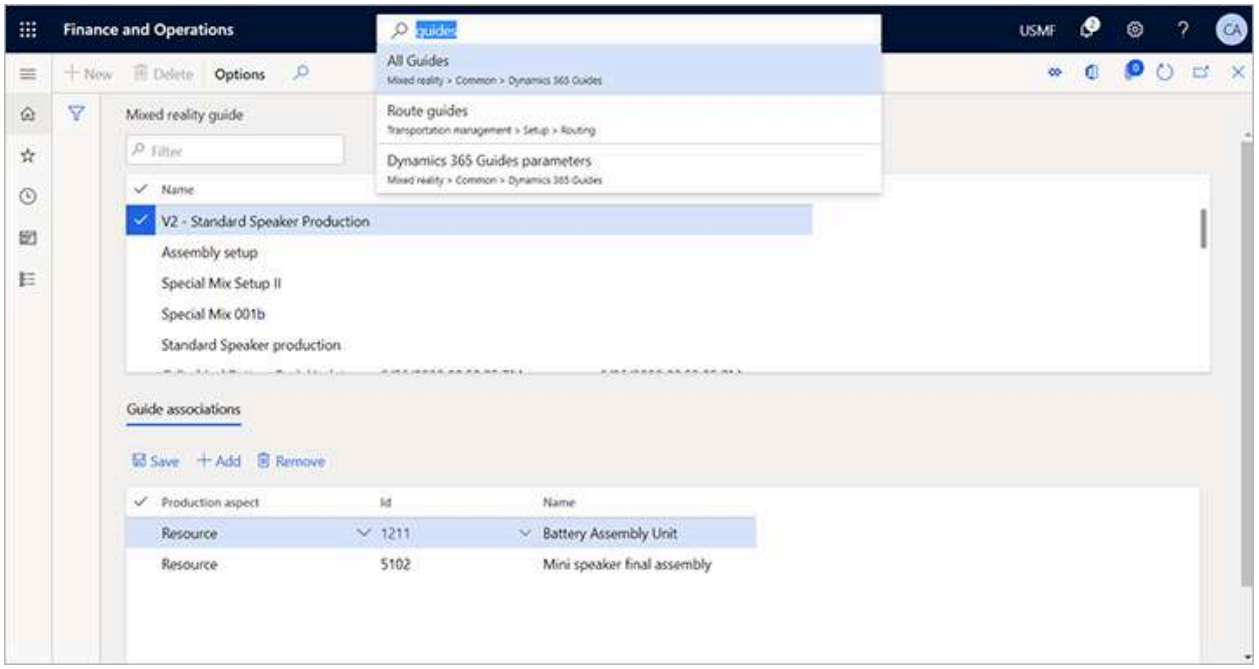
- **Microsoft Dataverse URL** - Specify the URL for the Microsoft Dataverse environment where you create your Guides. The format is "contoso.crm4.dynamics.com", where the first part of the URL is typically named after your organization (such as "contoso."), the second part is specific to the data region of your environment (such as "crm4."), and the last part is the domain (such as "dynamics.com"). One way to find the right URL is to go to the Microsoft 365 apps page and then open your Guides app. When Guides opens, you will see the URL in the address bar of your browser (only take the base URL, which should resemble the previous example). This value is used to compose addresses for your guides and will be encoded into the QR codes."
- **QR code size** - Set the size of the rendered QR code. We recommend choosing a size that will fill most of your display screen, but not more. Typically, *15* is a good value.
- **QR code error correction level** - Set the granularity of the QR code. Higher granularity can help increase the code's reliability, but your **QR code size** must be large enough to support the level of detail required by your selected correction level.

> **Tip**

- QR codes sizes that are too large for your display will take a bit longer to render and then be scaled down to fit your display. These do not provide a benefit.
- QR code sizes that are too small may decrease the ability of HoloLens to read the code properly in some environments.
- We recommend that you test the settings for each device that will display QR codes for HoloLens users. Choose settings that provide sufficient readability in your shop floor environment.

Get an overview of all Guide assignments

Use the **All Guides** page to see the list of all available Guides in your organization and all assignments to your production processes and resources. To open it, go to **Mixed reality** > **Guides** > **All Guides**. The list at the top shows all the available Guides and you can use the field here to filter the list. The list at the bottom shows all Guide assignments and provides a toolbar for managing them.



The following sections describe the types of objects that you can assign Guides to. Each assigned guide provides instructions that are automatically attached to the respective production jobs and will be available on the shop floor.

Associate a Guide to a resource

Add a Guide to a resource to offer the Guide in the context of relevant production jobs.

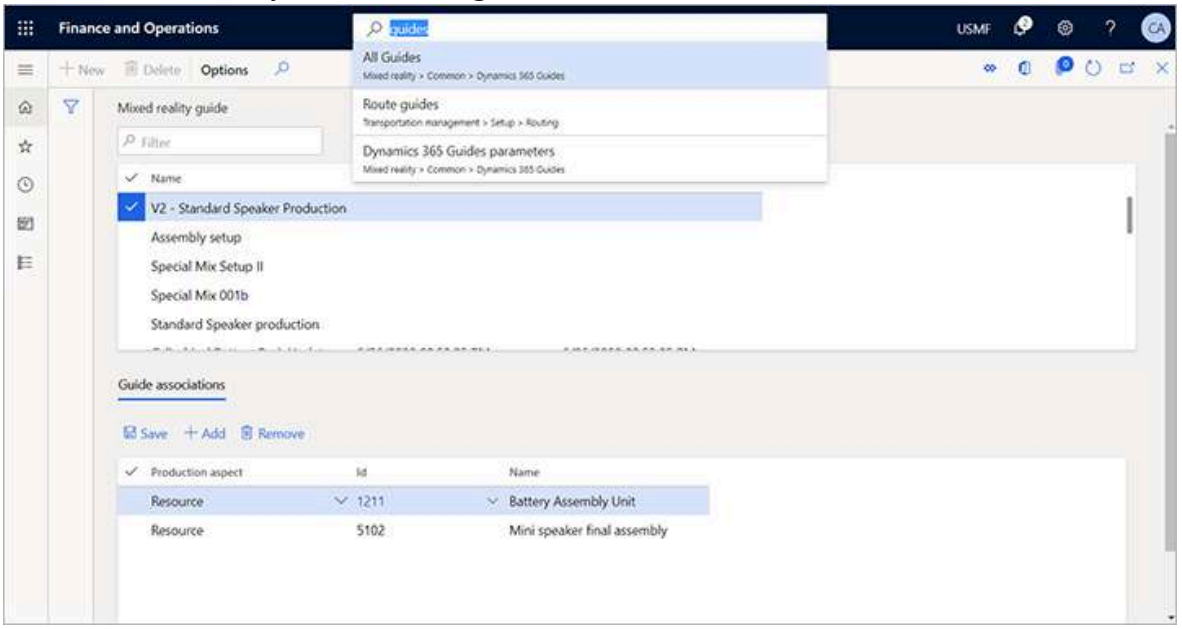
Typical scenario using resources

For example, you could attach a Guide with general machine security or handling instructions to a resource of type machine. Then, the Guide will be available on every job that is performed on the machine.

Add a Guide to a resource

To add a Guide to a resource:

1. Go to **Production control** > **Setup** > **Resources** > **Resources**.
2. From the list pane, select the resource you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign. If you have a large number of Guides, then you can filter the list to find the one you are looking for.



Associate a Guide to a resource group

You can add a guide to resource groups if you use them to manage groups of machines, production lines, or work cells.

Typical scenarios using resource groups

Example 1: You have defined a resource group for several machines of the same model. Instead of assigning the relevant handling instruction guide for the machine model to

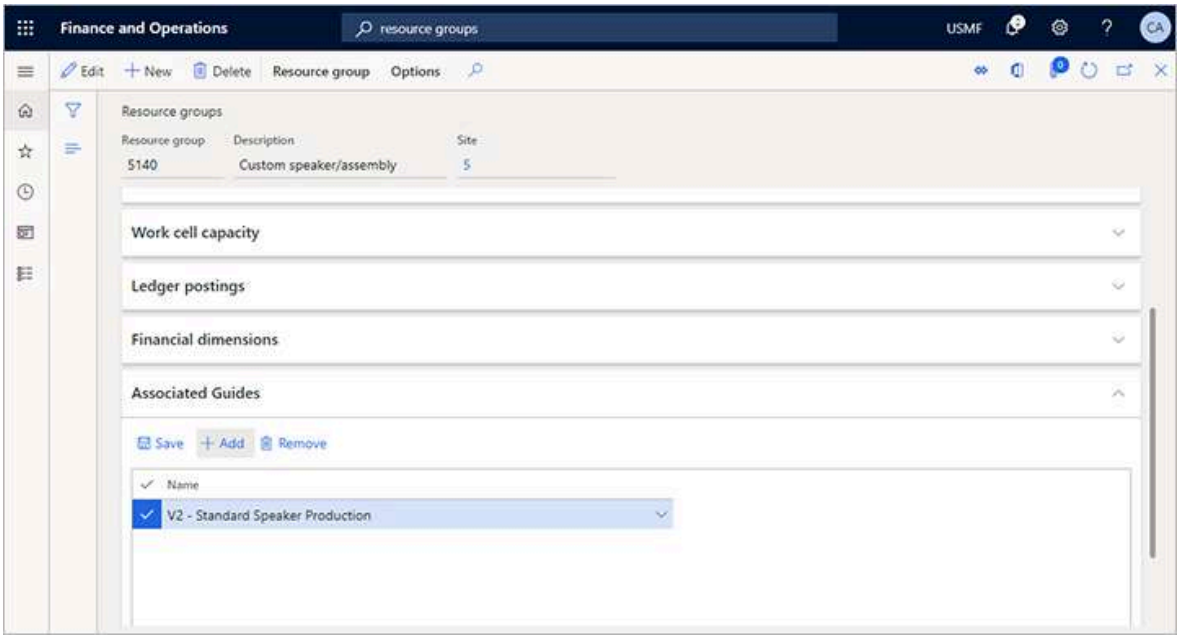
every relevant resource, you could instead assign the Guide to the resource group that reflects that machine model.

Example 2: You have defined a resource group for a work cell that contains different machines and you have a Guide that provides general instructions for how to maintain the work cell. The Guide applies to any production activity in this work cell.

Add a Guide to a resource group

To add a Guide to a resource group:

1. Go to **Production control** > **Setup** > **Resources** > **Resource groups**.
2. From the list pane, select the resource group you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign. If you have a large number of Guides, then you can filter the list to find the one you are looking for.



Associate a Guide to a released product

You can add a guide to any released product.

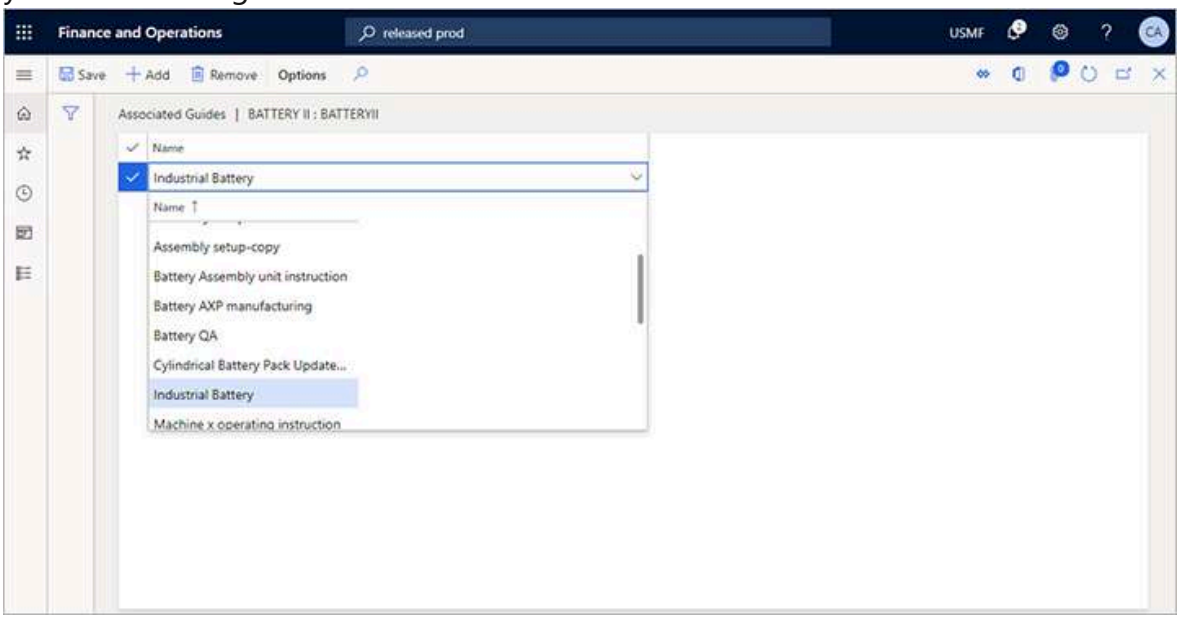
Typical scenario using released products

Product-level Guides help shop floor workers with instructions relevant to operating or handling a specific released product or item.

Add a Guide to a released product

To add a Guide to a released product:

1. Go to **Production information management** > **Products** > **Released products**.
2. Open the product you want to assign a Guide to.
3. On the Action Pane, open the **Engineer** tab and from the **View** group, select **Associated Guides**.
4. The **Associated Guides** page opens for your selected product.
5. Select **Add** on the Action Pane to add a new line to the grid.
6. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a formula

You can add a guide to any formula.

Typical scenario using formulas

Formula-level Guides provide shop floor workers with guided handling instructions in the context of a formula or recipe. Guides can also be assigned to versions of a formula.

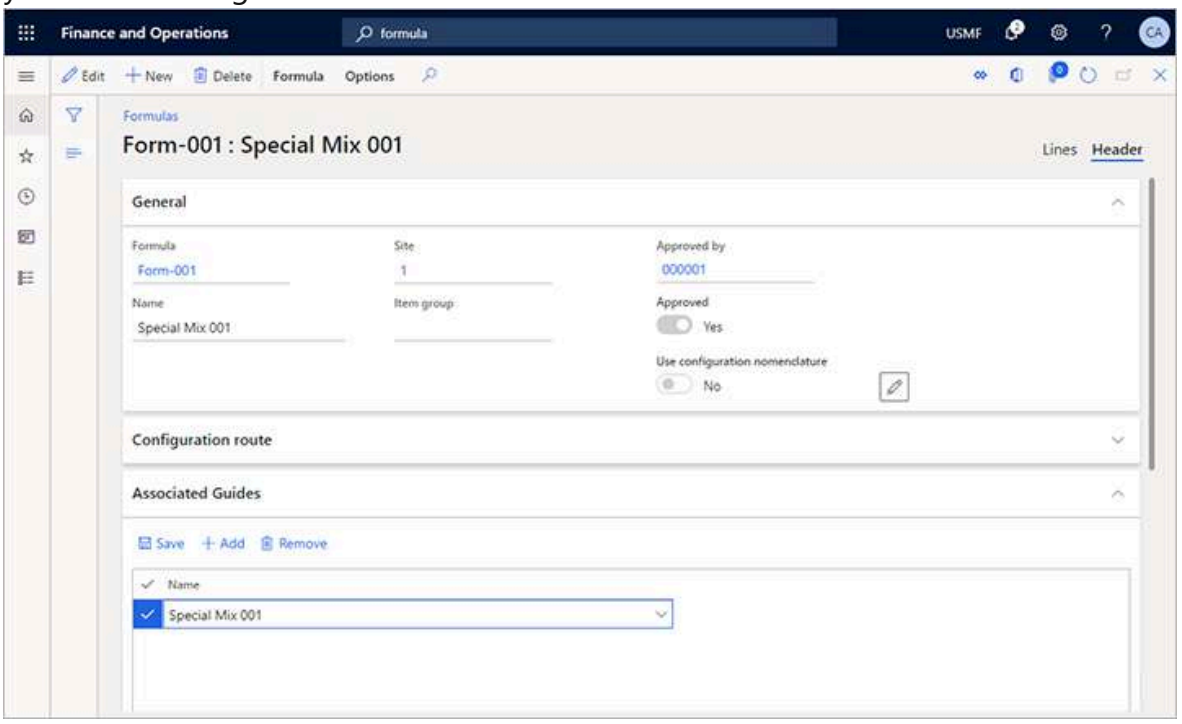
> **Note**
>
> You can assign guidance relevant for production processes based on a formula to a route, route version, or route operation relations.

> Guides can't currently be attached to individual formula lines.

Add a Guide to a formula

To add a Guide to a formula:

1. Go to **Production information management** > **Bills of materials and formulas** > **Formulas**.
2. Open the formula you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. Expand the **Associated Guides** FastTab.
5. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
6. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a formula version

You can add a guide to any formula version.

Typical scenario using formula versions

Guides attached to an individual version of a formula provide shop floor workers with instructions that walk through the production of that version of the formula recipe.

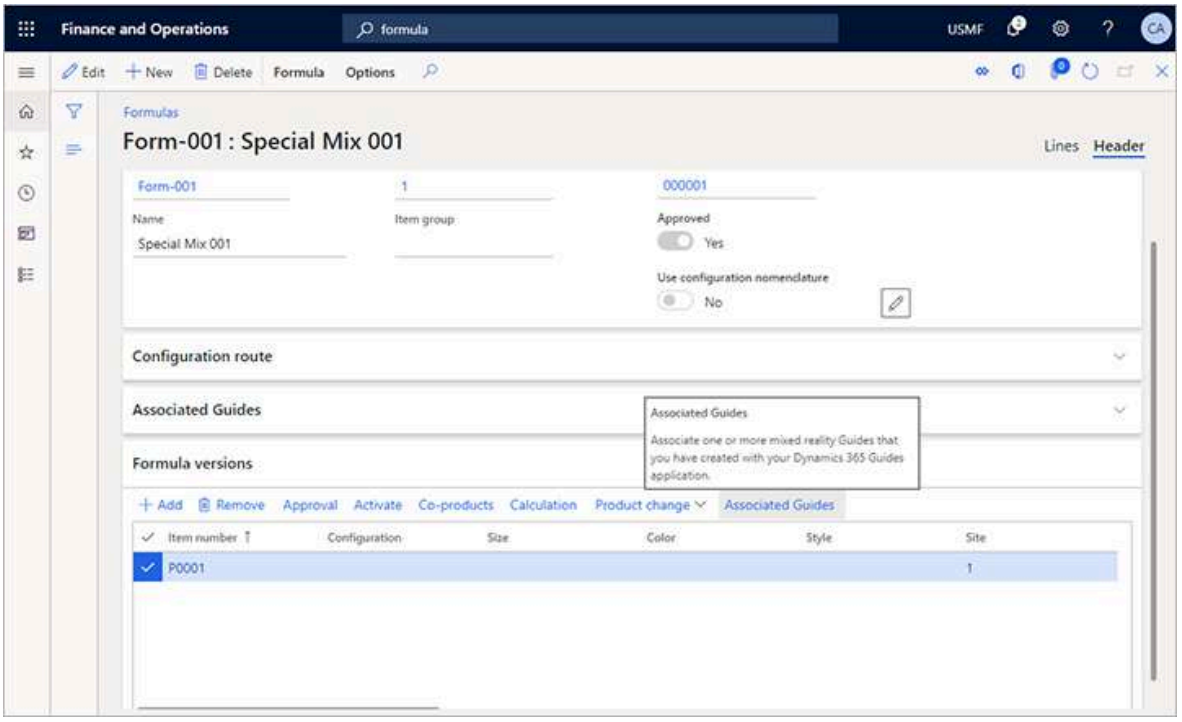
> **Tip**
>
> You can assign guidance relevant for production processes based on this formula version to a route, route version, or route operation relations.

> **Note**
>
> Guides can't currently be attached to individual formula lines.

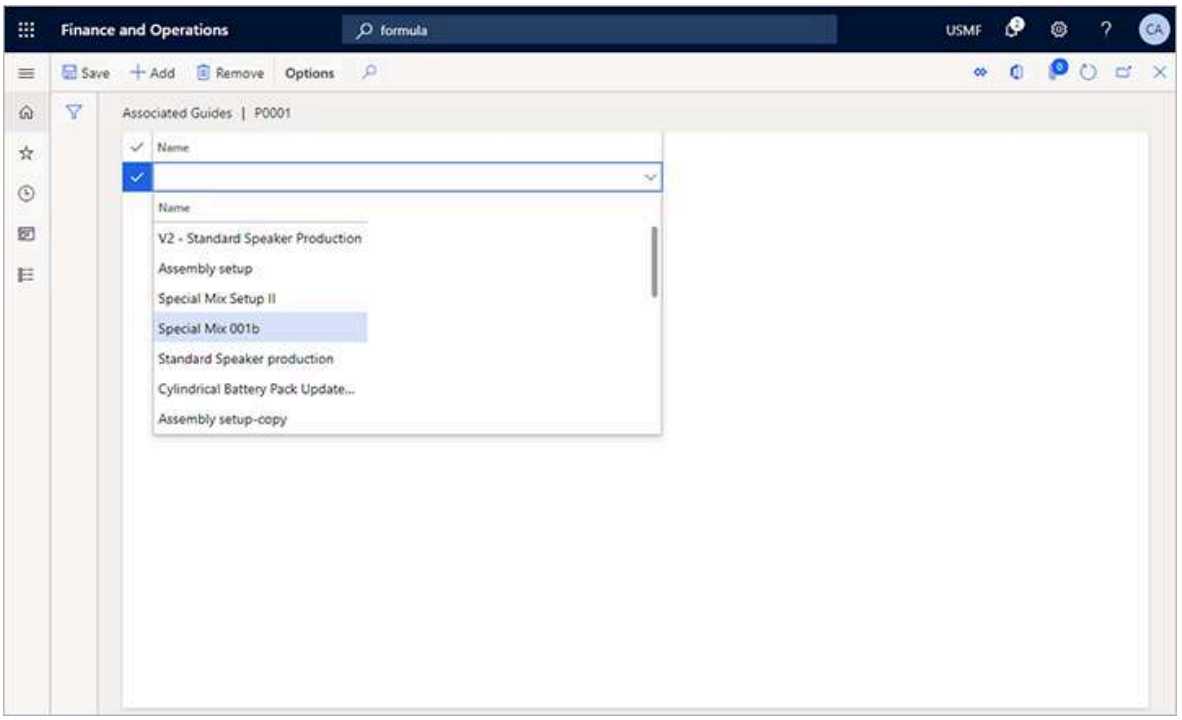
Add a Guide to a formula version

To add a Guide to a formula version:

1. Go to **Production information management** > **Bills of materials and formulas** > **Formulas**.
2. Open the formula that includes a version that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. On the **Formula versions** FastTab, select the version you want to assign a Guide to.
5. On the **Formula versions** toolbar, select **Associated Guides**.



6. The **Associated Guides** page opens for your formula version.
7. Select **Add** on the Action Pane to add a new line to the grid.
8. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a bill of materials

You can add a guide to any bill of materials (BOM).

Typical scenario using bills of materials

Guides attached to a BOM provide shop floor workers with instructions that explain how to prepare and handle material from a BOM. Guides can also be assigned to versions of a BOM.

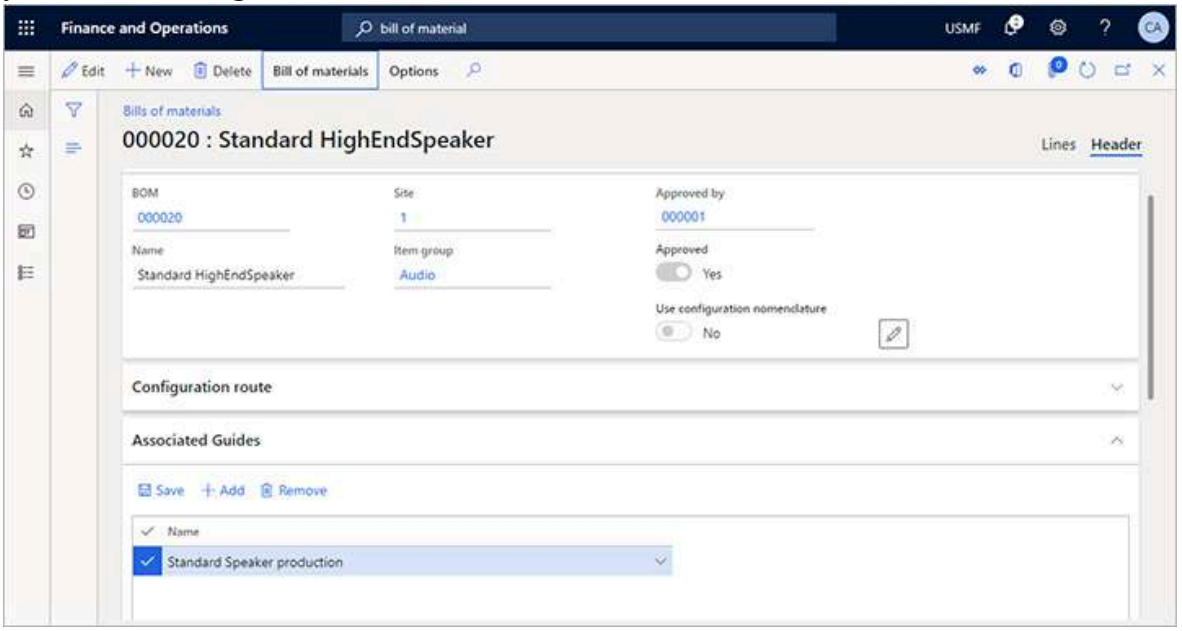
> **Note**
>
> Guides can't currently be attached to individual BOM lines.

Add a Guide to a bill of materials

To add a Guide to a bill of material:

1. Go to **Production information management** > **Bills of materials and formulas** > **Bills of materials**.
2. Open the bill of materials that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. Expand the **Associated Guides** FastTab.
5. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.

6. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a bill of materials version

You can add a guide to any bill of materials version.

Typical scenario using bill of materials versions

Guides attached to an individual BOM version provide shop floor workers with instructions that explain how to prepare and handle material for a version of a BOM that is different from the generic BOM or other versions of it.

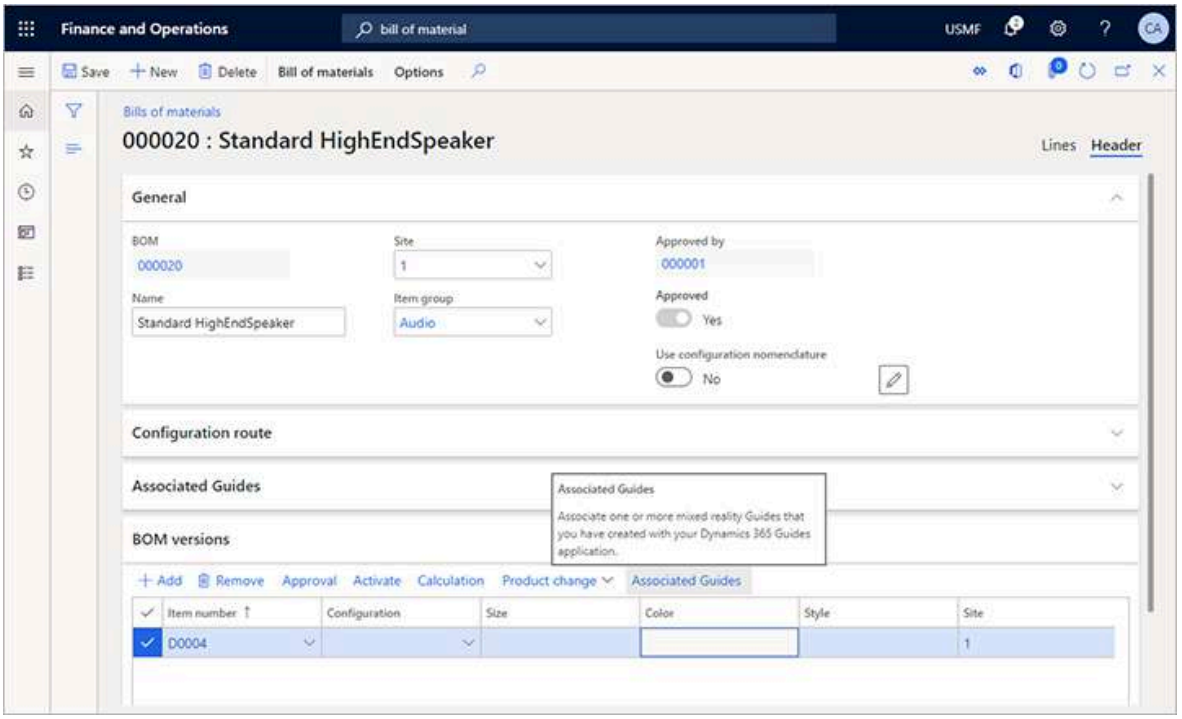
> **Note**
>
> Guides can't currently be attached to individual BOM lines.

Add a Guide to a bill of materials version

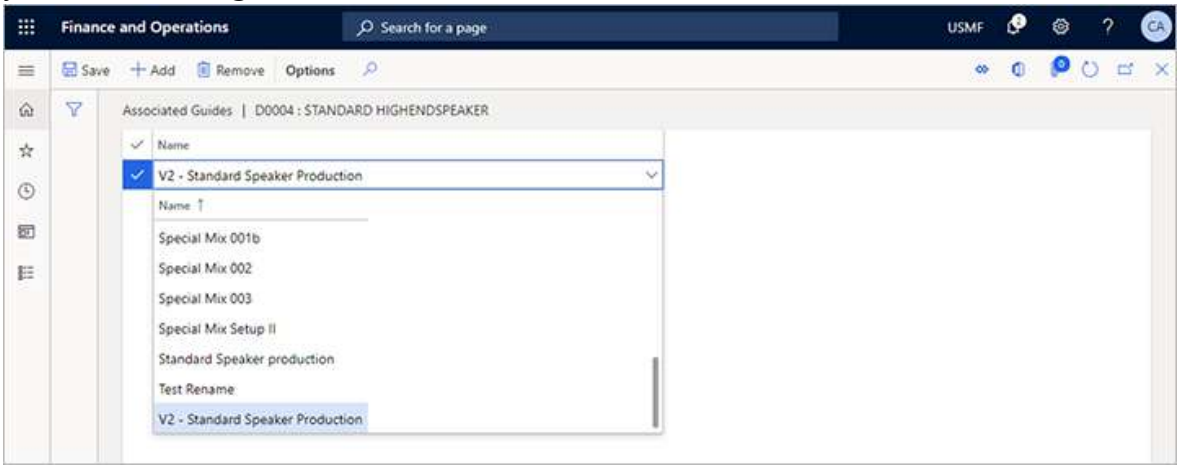
To add a Guide to a bill of materials version:

1. Go to **Production information management** > **Bills of materials and formulas** > **Bills of materials**.
2. Open the BOM that includes a version that you want to assign a Guide to.
3. Open the **Header** tab above the top FastTab.
4. On the **BOM versions** FastTab, select the version you want to assign a Guide to.

5. On the **BOM versions** toolbar, select **Associated Guides**.



6. The **Associated Guides** page opens for your BOM version.
7. Select **Add** on the Action Pane to add a new line to the grid.
8. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a route

You can add a guide to any route.

Typical scenario using routes

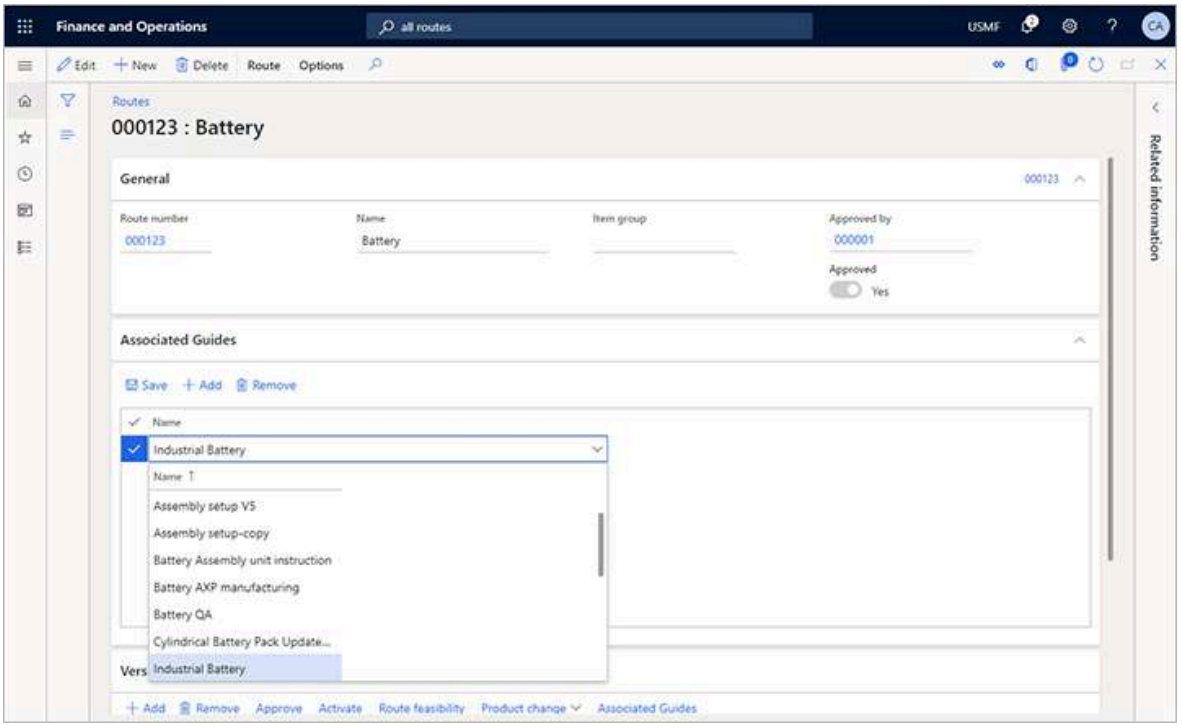
Routes are typically used to specify how a certain released product shall be produced based on a BOM or BOM version and with a set of resources or resource groups.

Assign a Guide to a route to provide step-by-step instructions for the respective production process.

Add a Guide to a route

To add a Guide to a route:

1. Go to **Production control** > **All routes**.
2. Open the route that you want to assign a Guide to.
3. Expand the **Associated Guides** FastTab.
4. Select **Add** from the **Associated Guides** toolbar. A new line is added to the grid.
5. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a route version

You can add a guide to any route version.

Typical scenario using route versions

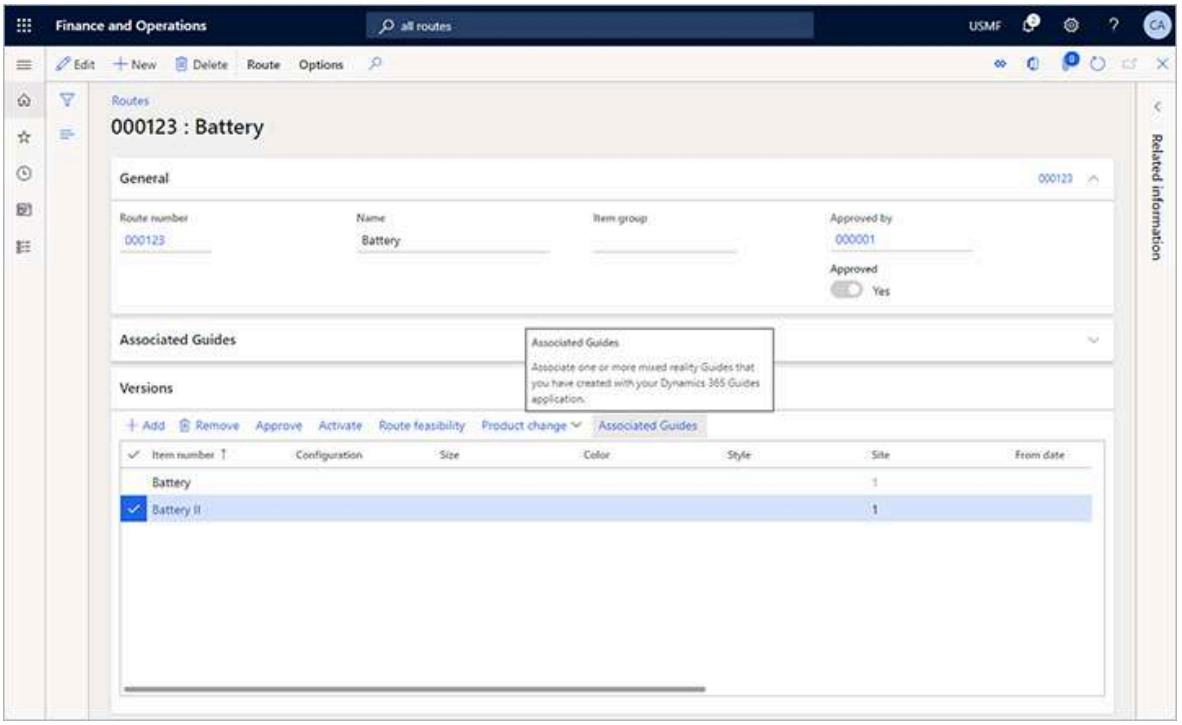
Routes versions are typically used to specify variants of production processes based on an existing route. You can assign different Guides to each route version.

Add a Guide to a route version

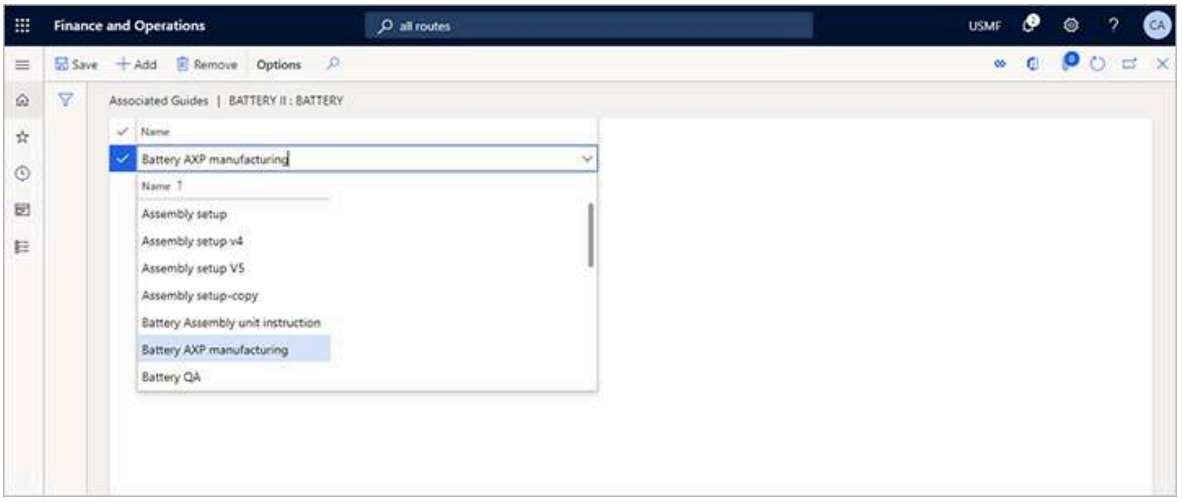
To add a Guide to a route version:

1. Go to **Production control** > **All routes**.
2. Open the route that you want to assign a Guide to.
3. On the **Versions** FastTab, select the version you want to assign a Guide to.

4. On the **Versions** toolbar, select **Associated Guides**.



5. The **Associated Guides** page opens for your BOM version.
6. Select **Add** on the Action Pane to add a new line to the grid.
7. For the new line, use the drop-down list in the **Name** column to choose the Guide you want to assign.



Associate a Guide to a route operation relation

You can add a guide to any route operation relation.

Typical scenario using route operation relations

Operation relations are the most specific way to add guidance to a product process and its related operations. You can specify guidance for each operation in a route and specify different guidance for any type of relation context specified for a route, such as

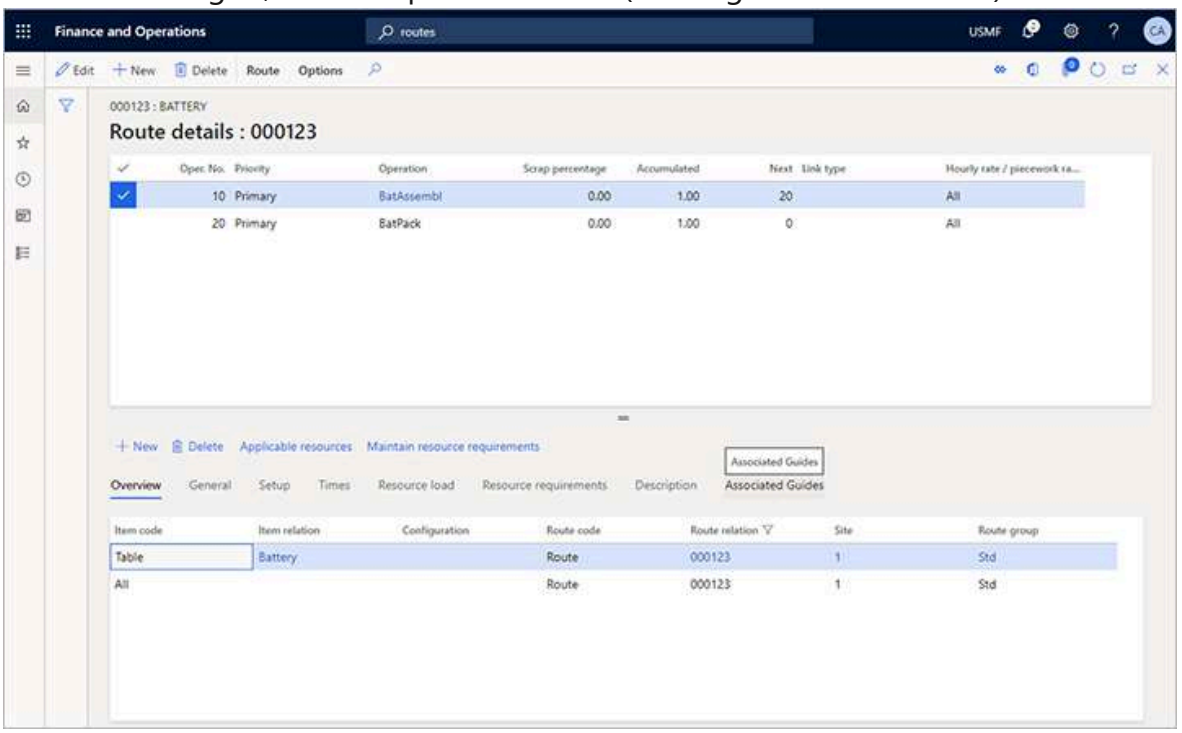
for specific items, configurations, and more. You can also specify to which stages in the operation the guidance applies (such as setup, queueing, process, or transport).

> ⓘ **Note**
>
> If you specify guides for several operation relations of a route, among those guides, only the guide from the most specific relation will be show on the shop floor for the generated job.

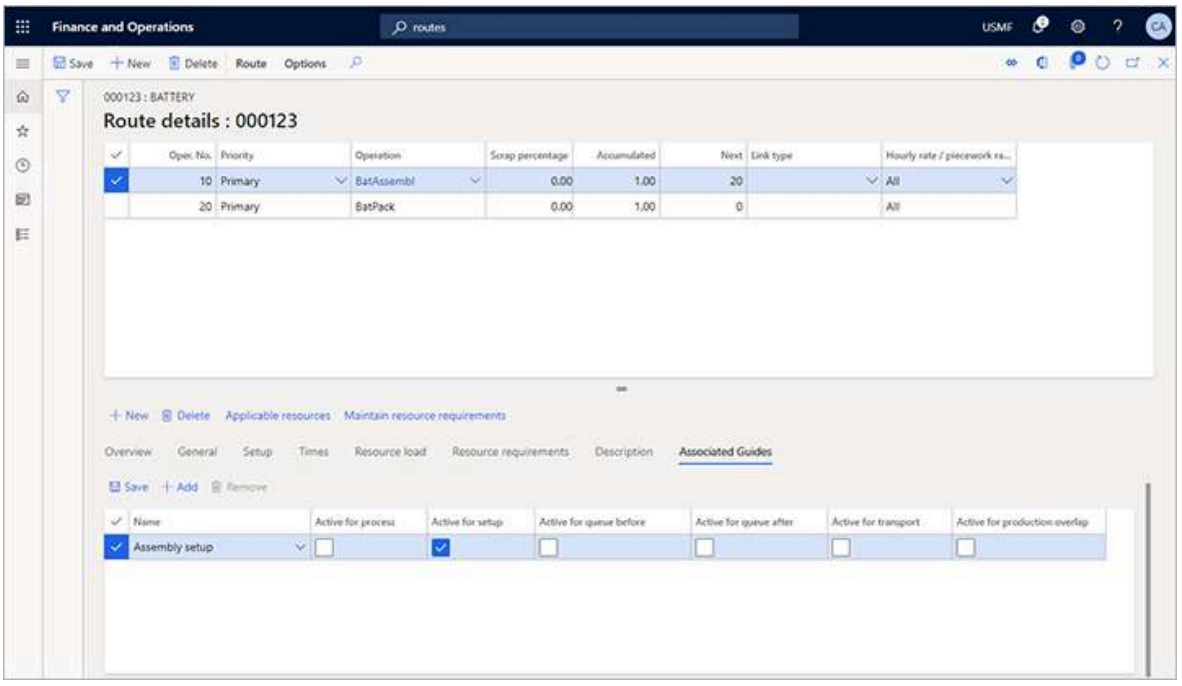
Add a Guide to a route operation relation

To add a Guide to a route operation relation:

1. Go to **Production control** > **All routes**.
2. Open the route that you want to assign a Guide to.
3. On the Action Pane, open the **Route** tab and from the **Maintain** group, select **Route details**.
4. The **Route details** page opens for your selected rout.
5. In the top grid, select the operation you want to provide guidance for.
6. In the bottom grid, select a specific relation (or the generic **All** relation).



7. Above the bottom gird, open the **Associated Guides** tab.

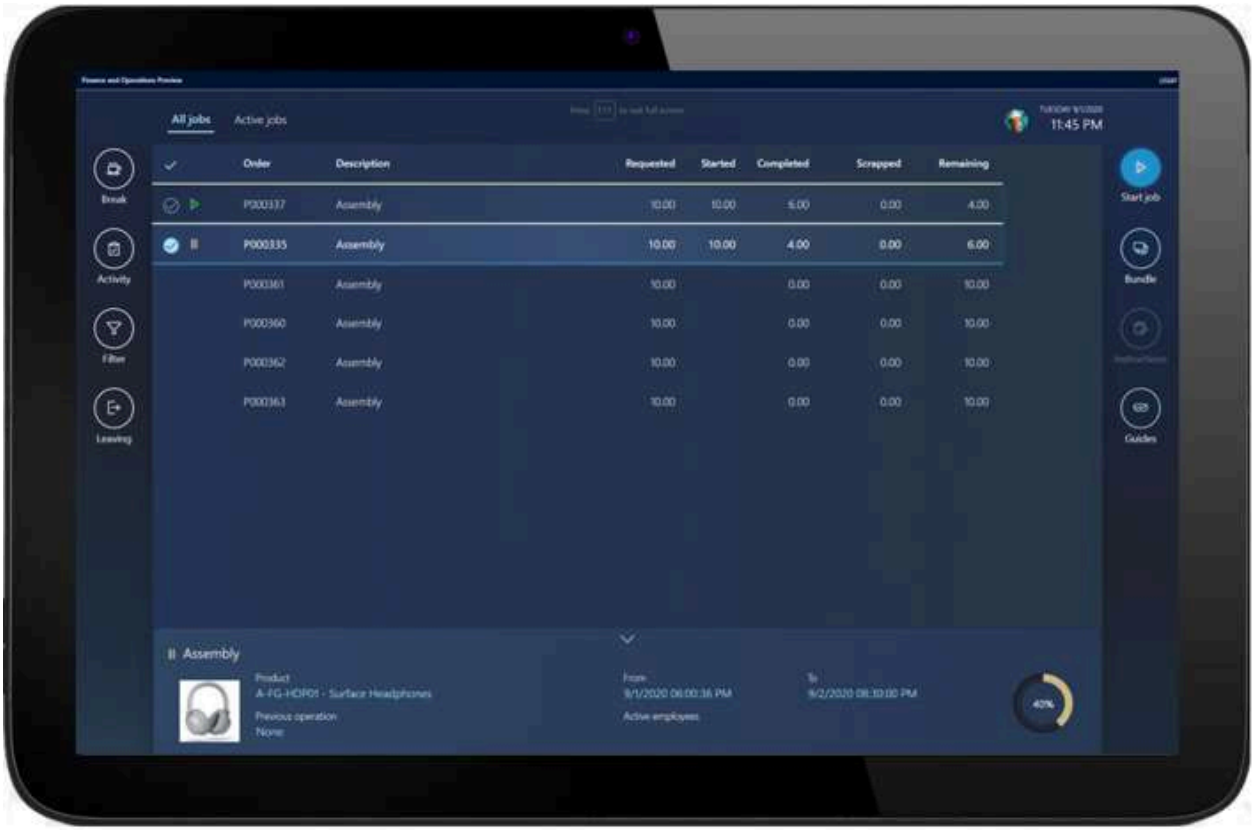


8. Select **Add** from the toolbar at the top of the bottom grid to add a new line to the grid.
9. For the new row, use the drop-down list in the **Name** column to choose the Guide you want to assign. In the rest of the row, select the check box for each context where the selected Guide should be available.

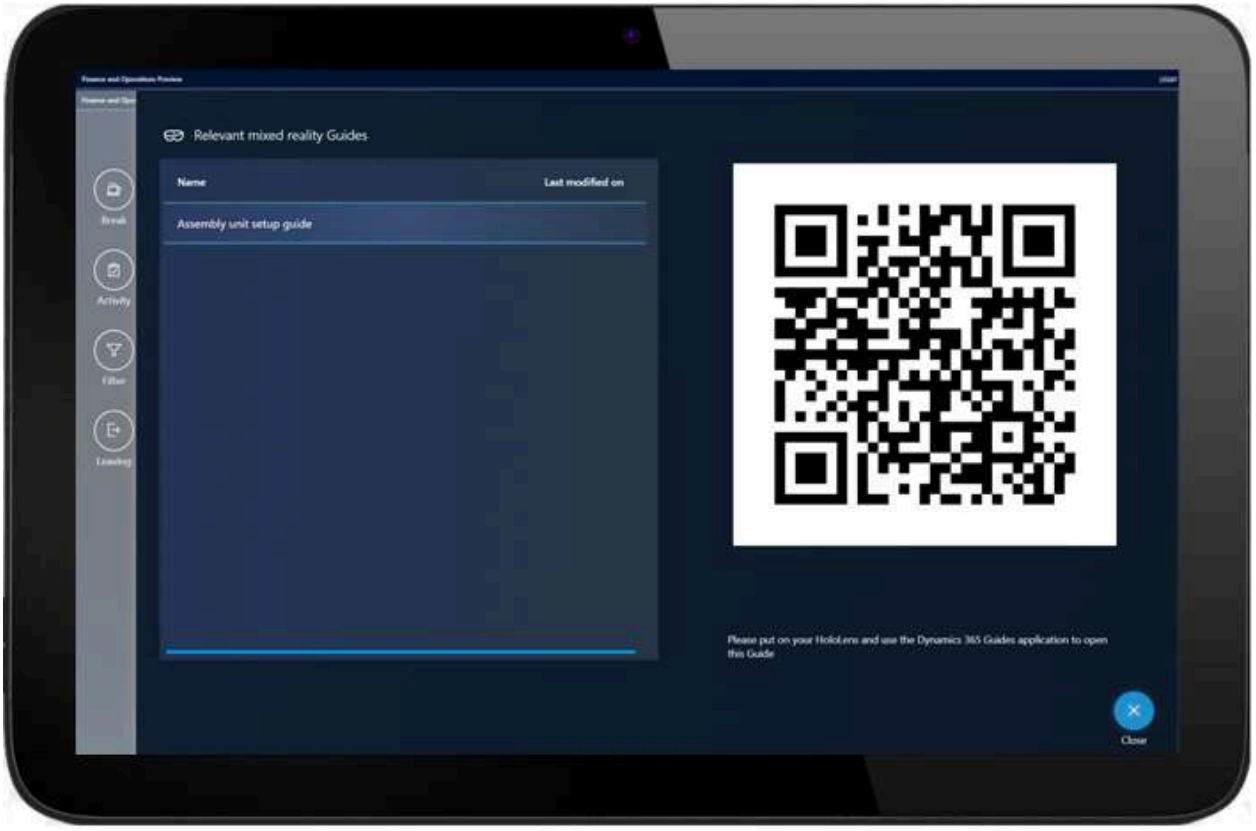
> ⓘ **Note**
>
> You can add one or more guides for each stage of each operation.

Select guides from the shop floor execution interface

When a worker opens a job list on the shop floor execution interface, Supply Chain Management finds the relevant guides for the jobs shown. Use the **Guides** button to view the relevant guides.



Then put on a HoloLens and access the respective guide by glancing at the QR code and activating the respective Guide.



Resolving the logic for selecting Guides

You can add Guides to the following production data:

- Resources
- Resource groups
- Released products
- Formulas
- Formula versions
- Bills of material (BOMs)
- BOM versions
- Routes
- Route versions
- Route operation relations

When Supply Chain Management generates the jobs for the production floor, it will collect the relevant Guides from those sources. Take note of the following important rules.

- If you attach a BOM version or formula version to a route or production order, then any Guides attached to this version, and also the Guides attached to the parent BOM or formula of that version, will be shown on the job.
- If you attach a route version to a production order, then any Guides attached to this version, and also the Guides attached to the parent route of that version, will be shown on the job.
- If you define several route operation relations that include the *All* relation and assign Guides to those, only the Guides from the most specific relation will be shown for the job.

Reverse the production order status

09/19/2025

This article describes how to reverse production order status.

If you reverse the status of a production order, the order and all operations that are associated with the routes revert to a previous step in the production life cycle. For example, a production order has a status of *Scheduled*, and you change the status back to *Created*. In this case, the system first changes the status to *Estimated*, which is the status that immediately precedes *Scheduled*. It can then change the status to the status that you want, *Created*.

If your order reaches the *Report as finished* status, you can still reverse it to an earlier status. However, you must rerun estimation and operations scheduling, job scheduling, or both types of scheduling, to update the information on the order. This step is required, because any reservations of remaining item consumption and operations resource consumption must also be reset.

This article explains what occurs when you reverse the status of a production order in the following ways:

- From *Estimated* to *Created*
- From *Scheduled* to *Estimated*
- From *Released* to *Scheduled*
- From *Started* to *Released*

From Estimated to Created

When you reverse the status of a production order from *Estimated* to *Created*, the following events occur:

- The system removes the item consumption that it calculated for the items in the bill of materials (BOM).
- The system deletes inventory transactions on the production line, and resets the **Remain status** field on the production order's BOM lines to *Ended*.
- If the **Derived purchases** and **Derived production** options are selected, the system deletes any underlying purchase orders or production orders.
- If you estimated the costs of the production order, or if you manually reserved items so that they could be used in production, the system removes those transactions.

From Scheduled to Estimated

When you reverse the status of a production order from *Scheduled* to *Estimated*, the following events occur:

- The system removes the scheduled start and end dates and times.
- The system removes capacity reservations that were made during scheduling, and deletes jobs that were created during job scheduling.
- The system resets all information that is recorded about operation scheduling and job scheduling on the **Production order details** page.

From Released to Scheduled

When you reverse the status of a production order from *Released* to *Scheduled*, the only change is the value in the status field.

From Started to Released

When you reverse the status of a production order from *Started* to *Released*, the following events occur:

- The system reverts all items that were reported as finished.
- If you picked material, or if you made inbound and outbound deliveries to production, the systems reverses those settings.
- The system changes the **Remain status** field on the production order's BOM lines from *Ended* to *Material consumption*.
- If you registered time, or if you reported quantities as finished for the operations in the production route, the system reverses those settings.
- The system changes the **Remain status** field from *Ended* to *Route consumption* in the production route.
- The system reverses the settings for all items that you posted as in process or work in process.
- On the **Production order details** page, the system resets fields that show a quantity that was started or reported as finished. The system also resets the dates for those transactions.

Visibility into material exceptions

Article • 06/03/2022

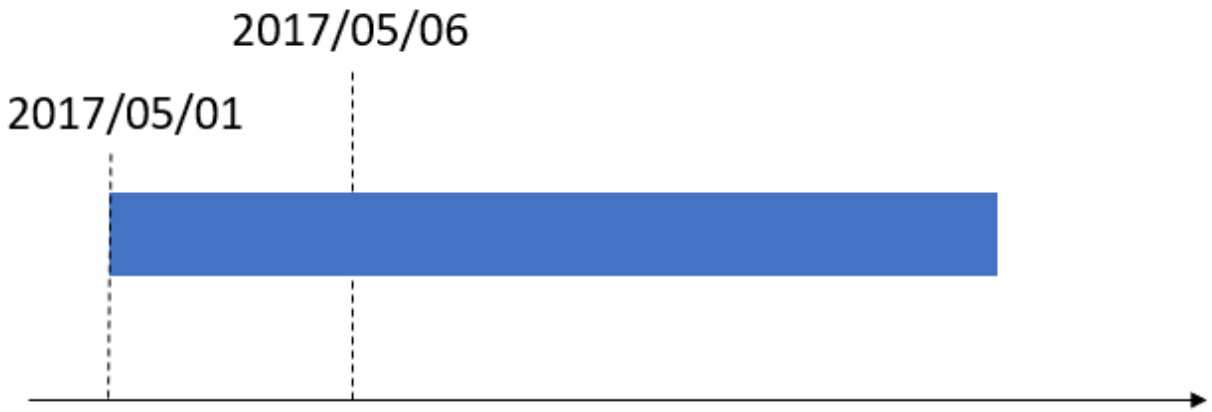
In the **Production floor management** workspace, three tiles give you better visibility into exceptions for raw materials for production orders and batch orders:

- Unreleased material lines needing attention
- Unprocessed waves needing attention
- Open warehouse work needing attention

For all three tiles, the raw material date of the bill of materials (BOM) lines and formula lines is compared against the workspace date, and also against the filters for **Production unit**, **Resource group**, and **Resource** that are set on the **Configure my work space** menu. By default, the workspace date is set to the current date, but you can adjust it.

An unreleased BOM line or formula line requires attention if the raw material date of the line is the same as or earlier than the workspace date, and if it meets the criteria that are defined by the filters in the workspace.

In the following figure, the blue bar represents a production job that is scheduled on a resource. The job is scheduled to start on May 1, 2017 (2017/05/01). This date is the raw material date. In other words, the materials that are assigned to the job on the BOM and formula lines must be ready on this date. The other date in the figure, May 6, 2017 (2017/05/06), represents the workspace date. In this example, the raw material date is earlier than the workspace date. Therefore, the date when consumption of the raw material was supposed to start has passed, and the BOM and formula lines meet the criteria for requiring attention.



Unreleased material lines needing attention

A BOM or formula line can be released to the warehouse in three ways:

- As part of a production order or batch order release
- As a manual release
- Automatically through a batch job

Learn more in Release BOM and formula lines to the warehouse.

If a BOM or formula line hasn't been released or has been only partly released, and if the date and filter criteria of the workspace are met, the line is included in the calculation of the number that appears on the **Unreleased material lines needing attention** tile.

When you select the tile, the **Release to warehouse** page is opened. This page shows the number of unreleased BOM and formula lines that is indicated by the number on the tile. The unreleased lines appear in the upper grid. This grid shows the quantity that was originally estimated for the line, the quantity that has already been released, and the remaining quantity that must still be released. You can add lines from the upper grid to the lower grid. From the lower grid, you can then release the selected lines to the warehouse. From the lower grid, you can also adjust the quantity to release so that only a partial quantity is released.

Unprocessed waves needing attention

When a BOM or formula line is released, it's added to either a new production wave or an existing open wave, depending on the configuration of the production wave template. Through the configuration of the wave template, you can also set up a wave so that it's automatically processed when a BOM or formula line is released. When the wave is processed, warehouse work for raw material picking is generated. If the wave template is configured so that waves aren't processed at the time of release, the wave remains in an unprocessed state. The **Unprocessed waves needing attention** tile shows the number of BOM and formula lines that have been released to the warehouse on unprocessed waves, and that have a raw material date that is earlier than or the same as the workspace date. The lines must also be consumed by an operation resource that applies to the filter of the workspace.

When the tile is selected, the **All production waves** page opens. This page is filtered by the number of open waves that contain wave lines from released BOM and formula lines that meet the criteria for the tile.

Manually maintain production waves

On the **All production waves** page, you can use buttons on **Wave** tab of the Action Pane to manually **Process** and **Release** a wave. You can also use the **Maintain productions**

option to view and maintain **Prod BOM Pool** data, which is used to handle the waving process.

Open warehouse work needing attention

The **Open warehouse work needing attention** tile shows the number of BOM and formula lines that have been released to the warehouse, that have unprocessed work, and that have a raw material date that is earlier than or the same as the workspace date. The lines must also be consumed by an operation resource that applies to the filter of the workspace.

When the tile is selected, the **All work** page is opened. This page is filtered by the number of open work headers that contain work lines from released BOM and formula lines that meet the criteria for the tile. From the **All work** page, you can manually process the work.

Release BOM and formula lines to the warehouse

This article describes the process for releasing raw material for bill of materials (BOM) lines and formula lines to the warehouse. When you release a BOM or formula line to the warehouse, the system first determines whether material is already available at the production input location on the shop floor where the material will be consumed for the production process.

- If the material is available at the production input location, it's picked from that location immediately after the signal is given for the release of material to the warehouse.
- If the material isn't available at the production input location, the material release indicates that material must be moved from locations in the warehouse to the production input location. The material is moved via warehouse work for raw material picking. Therefore, warehouse processes for raw material picking must be configured. Learn more in Replenishment overview and Control warehouse work by using work templates and location directives.

Methods for releasing BOM and formula lines

You can configure the release of BOM and formula lines so that it occurs as part of the release of a production order or batch order. Alternatively, the release can be controlled by a batch job or done as a manual interaction.

The method that is used to release BOM and formula lines is controlled by the **Production line release** parameter. You can find this parameter at **Production control** > **Setup** > **Production parameters**.

- **Release BOM and formula lines as part of production or batch order release** – In this method, BOM and formula lines for a production or batch order are released as part of the process of releasing the order. Usually, during the release of a production or batch order, production jobs are released to the shop floor workers, and production papers are printed. During this process, the status of the order is also changed to **Released**.
- **Release BOM and formula lines via a batch job or as a manual interaction** – In this method, BOM and formula lines can be released only through the **Automatic release of BOM and formula lines** batch job or as a manual interaction. To manually release BOM and

formula lines, on the production order list page or the production order details page, on the Action Pane, select **Release to warehouse**.

For a quick demonstration of how to release BOM and formula lines to production by using a batch job, watch this short YouTube video: Release production picking to the warehouse in batch .

Releasing the BOM and formula lines by using a batch job

The **Automatic release of BOM and formula lines** batch job goes through selected BOM and formula lines that have a remaining quantity to release. The job considers only orders that have a status of **Released**, **Started**, or **Reported as finished**. If a BOM or formula line has a remaining quantity to release, the job releases up to the quantity that can be covered by the quantity that has already been physically reserved and the quantity that is physically available.

Example of a batch job release

Expand table

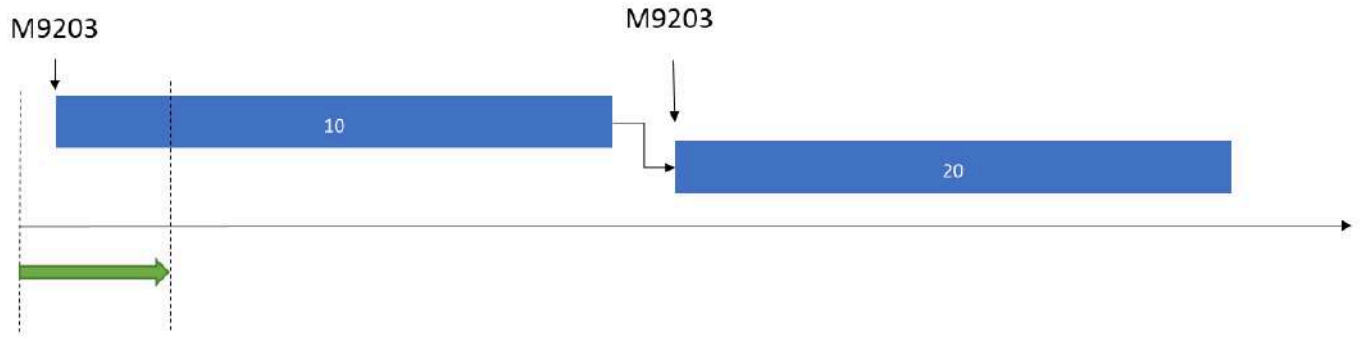
Scenario	Remaining quantity to release	Physically reserved quantity	Physically available quantity	Quantity released by the batch job
1	100	20	90	100
2	100	20	70	90
3	100	0	90	90
4	100	0	110	100
5	100	20	0	20

Batch job setup

In the query for the **Automatic release of BOM and formula lines** batch job, you can set up a filter criterion to specify how many days ahead the job should look for lines that have unreleased quantities. In the query for the job, in the **Raw material date** field, use the **(LessThanDate())** function as a filter criterion.

The following illustration shows a production order that has two jobs, 10 and 20, that cover the assembly and packing for the production order. Each job is set up to consume a quantity of

material. In this illustration, the release time fence that is indicated by the green arrow below the time line equals the number of days that has been specified in the **(LessThanDate())** criterion. For example, **(LessThanDate(2))** indicates that the job should look for unreleased quantities only within a time fence of two days.



Releasing material per operation number or in proportion to the amount of finished goods

If you release materials by using the **On production order release** parameter setting, when you do a manual release, you have two options for controlling the material release:

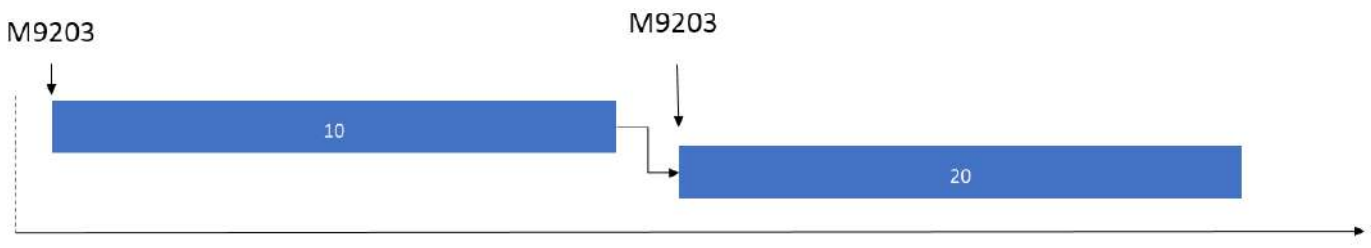
- Release material per operation number.
- Release material in proportion to the amount of finished goods.

Release material per operation number

To control the operations that material should be released to, use the **Release to warehouse** page.

- Select **Production control** > **Production orders** > **All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then use the **From Oper. No.** and **To Oper. No** fields to specify the range of operation numbers.

The following illustration shows a production order that has two operations, 10 and 20. In this example, if you limit the release to operation 10, only material M9203 will be released.



For a quick demonstration of how to release material in proportion to the amount of finished goods, watch this short YouTube video about enhancements to the production order release process.

Release material in proportion to the amount of finished goods

You can release raw material for a partial quantity of finished goods or in a specific unit.

- To release raw material for a partial quantity of finished goods, select **Production control** > **Production orders** > **All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then enter a quantity in the **Quantity** field.

  For example, a production order is created and scheduled for 1,000 pieces (pcs.). The shop floor supervisor is planning the production of 100 pcs. for the next shift and wants to release materials only for that shift. In this case, the supervisor can use the **Quantity** field to release materials for the 100 pcs. that are planned for the next shift.

- To release raw material in a specific unit, select **Production control** > **Production orders** > **All production orders**, select a production order, and then, on the **Warehouse** tab, select **Release to warehouse**. Then use the **Unit** field to select the unit of the finished good to release material in.

  The units that are available are defined in the unit sequence group ID of the finished good.

  For example, a finished good has the following unit conversion between pounds (lbs.) and pallet (PL): 1 PL = 100 lbs. To create a production order for 10,000 lbs. of the finished good, you can release raw materials for the number of pallets that you plan to produce. Select **PL** as the unit, and then select a corresponding number in the **Quantity** field.

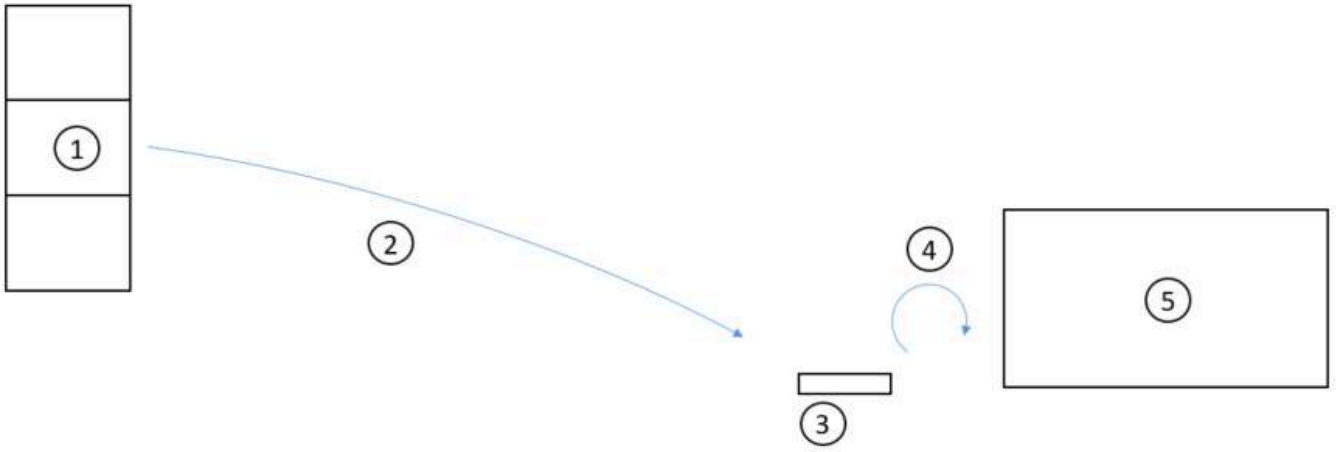
Register material consumption using a mobile device

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes a workflow that enables registration of raw material consumption in production by using a handheld device.

Introduction

This workflow is relevant if there is a strict requirement for material traceability. In those cases, to maintain traceability of the materials, the exact time and quantity must be reported for the consumption. This process can be seen as opposed to pre- or back-flushing operations, where there is an offset between the time of registration and the time when the actual consumption takes place. This explains why a strategy of automatic consumption cannot be used for some materials with traceability requirements. Let's look at a simple scenario that explains how to set up a workflow to enable registration of raw material consumption in production by using a handheld device.



Scenario details

A continuous production process (5) consumes the batch-controlled raw material RM-100. The material is on-hand on location Bulk-001 (1) on license plate PL-1 with two batches, B1 and B2, both with a quantity of 100 lbs. Warehouse work (2) is released and processed for RM-100, and

the material is picked from Bulk-001 to the production input location PIL-01 (3), which is defined as non-license plate controlled. The machine operator weighs out material from the production input location (3) and registers the weight and batch number as consumed (4). From the production input location, a portion of the material is manually added to the production process in defined time intervals. When the machine operator adds material, it is weighed on a scale and the batch number is registered.

Set up the workflow to register consumption using a handheld device

Create a finished-good product, FG-100, with a bill of material that has the batch-controlled raw material RM-100. Add two batches, B1 and B2, of RM-100 in a quantity of 100 to location: Bulk-001 on license plate: PL-1. The flushing principle on the bill of material line for RM-100 is set to **Manual**. Set the production input location to PIL-01. You can do that by selecting this location as the default production input location on warehouse 51.

1. Create a new mobile device menu item:

- **Menu item name** - Register material consumption.
- **Title** - Register material consumption.
- **Mode** - Indirect.
- **Activity code** - Register material consumption.

2. Add the menu item to the **Production Mobile** device menu.
3. Create a production order for the finished product:

- **Item number** - FG-100
- **Site** - 5
- **Warehouse** - 51
- **Quantity** - 150

The production order is **Estimated** and **Released** and warehouse work is created.

4. Complete the work using the workflow for raw material picking for the handheld device.

This will bring the material from the bulk location to the production input location PIL-01. After the work is completed, the material has the status **Picked on the production input location**. The status after work has been processed can be either **Picked** or **Reserved physical**. This is configured with the parameter **Issue status after put on the warehouse form**.

5. Start the production order either from the client or from the handheld device by using the **Production start** menu item.

After the production order has been started, you can register material consumption with the workflow for the handheld device. Let's start by registering consumption of 25 lbs of batch B1.

6. Select the **Register material consumption** menu item in the menu for the hand held device, enter the following details:

- The production order number.
- The location on which the material is going to be consumed, in this case PIL-01.
- Item number RM-100.
- Batch number B1.
- A quantity of 25.

7. Select **OK**.

Note that the message "Journal line is created" appears on the display. On the production order there is an open journal of the type **Production picking list** for item number RM-100 and batch number B1.

You can now choose to continue your registration, for example on batch number B2, and each time you select **OK,** a new journal line is added to the open journal.

After you have finished your registration, select **Done** to post the journal and end the workflow.

Additional comments

- If a user cancels the workflow after a journal line is created, the journal is in an unposted state but if the user at a later point uses the workflow for the same production order, then the lines will be added to the open journal rather than to a new journal.
- The new workflow also supports the registration of serial numbers.
- It is only possible to register an item number that is defined in the bill of material or in the formula for the selected production order or batch order.
- Material can be overconsumed. For example, if the material is estimated to be consumed with the quantity of 100 lbs, then it can be overconsumed with a quantity of, for example, 105 lbs.

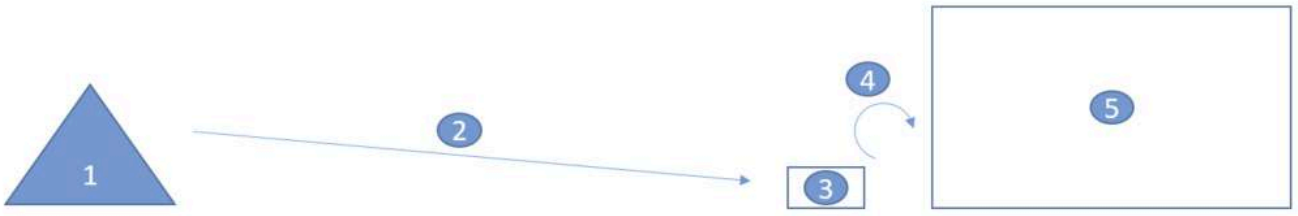
Control raw material consumption by using flushing principles

07/10/2025

Flushing principles reflect different consumption strategies for raw materials that are used in production processes. Consumption is the process that deducts material from the on-hand inventory and sets the value of the consumed materials to *Work in progress* (WIP) for production orders and batch orders. Raw materials are usually consumed from a location that is configured for the process that consumes the material. This location is known as the production input location.

Before material consumption, the materials are moved to the input location. The following illustration shows the process.



The following elements are shown in the illustration:

1. Material warehouse
2. Raw material picking
3. Production input location
4. Raw material consumption
5. Production process

Material consumption is controlled by the following four flushing principles:

- Manual
- Start
- Finish
- Available at location

The flushing principles are configured in a hierarchy of default values. The hierarchy starts at the released product, where the flushing principle has the value *Start*. On the bill of materials (BOM) or formula line, the flushing principle from the product can be overridden. The default flushing principle on the production BOM lines or batch order formula lines is taken from the product or the overridden value on the BOM or formulas.

Description of the flushing principles

Manual

The *Manual* flushing principle indicates that the registration of material consumption is a manual operation. This principle is relevant if, for example, you want to be able to track time, and the quantity of consumed batch numbers or serial numbers must be accounted for, for tracking purposes. Manual consumption is registered in a production picking list journal. For items that are enabled for warehouse management processes (WMS), a hand-held flow can be applied.

Start

The *Start* flushing principle indicates that material will be automatically consumed when the production order is started. The amount of material that is consumed is proportional to the quantity that is started. When the Start flushing principle is used together with the manufacturing execution system, it can also be used to flush materials when an operation or a process job is started. This principle is relevant if, for example, the variance in the consumption is low, the materials are low-value materials, there are no tracking requirements, or there's a short run time on operations.

Finish

The *Finish* flushing principle indicates that material will be automatically consumed when the production order is reported as finished, or when an operation that is set up to consume the materials is registered as completed. The amount of material that is consumed is proportional to the quantity that is reported as finished. When the *Finish* flushing principle is used together with the manufacturing execution system, it can also be used to flush materials when an operation or a process job is completed. This principle is relevant in the same situations as the Start principle. However, the *Finish* principle is for operations that have a longer run time, where materials shouldn't be set to *Work in progress* before the operation is completed.

> **Note**
>
> You can't use the *Finish* flushing principle together with planning items. Instead, we recommend that you use the *Start* flushing principle. Planning items have a production type of *Planning item*, and only co-products and by-products can be reported as finished on batch orders that are created for planning items.

Available at location

The *Available at location* flushing principle indicates that the material will be automatically consumed when it's registered as picked for production. The material is registered as picked from location when work for the raw material picking is completed, or when material is available on the production input location and the material line is released to the warehouse. The picking list that is generated during the process is posted in a batch job. This principle is relevant if, for example, you have many picking activities against one production order. In this case, you don't have to update the picking list manually, and you can get a current view of the WIP balance.

> **Note**
>
> The *Available at location* flushing principle only applies for products that are enabled for warehouse management processes (WMS).

Production output location

This article describes the hierarchy that is used to identify the production output location.

The production output location is the location where a finished good is first stored after it's produced. Usually, this location is close to the production process that produces the finished good. The production output location is used as intermediate storage for the material before it's moved on to the shipment area, a storage location, a production input location for a downstream production process, and so on.

A default production output location is set when finished goods are reported on a production order or batch order. The following hierarchy is used to identify this output location:

1. Use the output location that is defined on the production order or batch order header.
2. If no location is found there, use the output location that is defined on the resource that is used by the last operation that is defined in the production route.
3. If no location is found there, use the output location that is defined on the resource group that is used by the resource for the last operation that is defined in the production route.
4. If no location is found there, use the output location that is defined on the warehouse that is defined for the production order.

A default production output location is set only for products that are set up by using warehouse management processes (WMS). When this type of item is reported as finished, warehouse work of the **Finished goods put away** or **Co-product and by-product put away** type is created. This type of work uses the production output location as the pick location. The put-away location is determined by the location directives.

Last updated on 07/01/2026

Report BOMs as finished

This article provides information about reporting BOMs as finished.

The **Report as finished** and **Max. report as Finished** pages are used to report bills of materials (BOMs) as finished. Conceptually, the process for reporting a BOM as finished is the same as the process for reporting a production order as finished. This process can be used in, for example, simple assembly and kitting processes, where the more advanced capabilities of production orders aren't required. The **Report as finished** page lets you report multiple BOMs as finished in a batch. The **Max. report as Finished** page lets you report only one BOM as finished at a time. The **Report as finished** page is available from a menu item in Inventory management, and both pages are available as a menu items on the **Released products** page.

Report as finished page

If you open the **Report as finished** page from a released product, the page suggests that you report the standard inventory default quantity as finished. By default, the active BOM version is shown, but you can change the BOM version if there are other approved versions. The page also lets you delete records and create new records for released products that should be reported as finished. To use a query to select products, click the **Select** menu item. You can manually confirm reporting as finished for the selected products by clicking **OK**. Alternatively, you can set up the process to run in a batch. When the report as finished process is confirmed, the system generates a BOM journal where the posting to inventory is processed. This journal consists of one line item for the finished product and a line item for each BOM line. You can control whether the journal is automatically posted or whether it is left open for additional adjustments.

Max. report as finished page

On the **Max. report as finished** page, each BOM line indicates the number of pieces of the product that can be reported as finished. This calculation is based on the physical available on-hand inventory of each material line. In the following example, one piece of item number FG consumes two pieces of raw material RM10 and one piece of raw material RM20. Because there are only 10 pieces of RM10 on hand, the maximum quantity of FG that can be reported as finished is five pieces. This value is shown in the **Max. Report as finished** field.

Expand table

Level	Item number	Quantity	On-hand	Max. Report as finished
0	FG	1	0	5
1	RM10	-2	10	5
1	RM20	-1	8	8

BOMs that have multiple levels

When a BOM has multiple levels, you can control how materials are accounted for at all levels by using the **Explosion** field. This field is available on both the **Report as finished** page and the **Max. report as Finished** page. The following options are available:

- **Never** – Underlying BOMs aren't exploded if there is a material shortage.
- **Always** – All underlying BOMs are fully exploded. Therefore, any free on-hand inventory for semi-finished component items isn't used.
- **Shortage** – Underlying BOMs are exploded only if the full quantity of the material that is wanted isn't available.

Example

In this example, three pieces of the finished product (item number FG) are ready to be reported as finished. There is a two-level BOM, as shown here.

Expand table

Level	Item number	BOM-line quantity	On-hand
0	FG		
1	COMP	1	2
1	RM	1	

The following tables show how the setting of the **Explosion** field affects the way that BOM journal lines are generated. **Explosion: Never**

Expand table

Level	Item number	Quantity
0	FG	3

Level	Item number	Quantity
1	COMP	-3

As the preceding table shows, only item number COMP is considered deducted in the journal. Item number RM, which is part of COMP, isn't exploded to the journal line, and the two on-hand pieces of COMP aren't considered. **Explosion: Always**

Expand table

Level	Item number	Quantity
0	FG	3
1	RM	-3

In this case, item number COMP is exploded into its raw material, item number RM. The two on-hand pieces of COMP aren't considered in the quantity of RM to consume. **Explosion: Shortage**

Expand table

Level	Item number	Quantity
0	FG	3
1	COMP	-2
1	RM	-1

In this case, the two on-hand pieces of item number COMP are considered. However, because three pieces of item number FG are required, one piece of item number RM is also required in order to make the additional one piece of COMP.

Report as finished to a non-license plate controlled location (Application, May 2016)

Article • 09/29/2021

This task guide shows an example of reporting as finished to a location that isn't license plate–controlled. An applicable work policy is the prerequisite for this task. A previous task guide showed the setup of the work policy. This task guide requires Dynamics AX application 7.0.1 or later.

Set up an output location

1. Go to Organization administration > Resources > Resource groups.
2. In the list, select resource group '5102'.
3. Click Edit.
4. In the Output warehouse field, enter '51'.
5. In the Output location field, enter '001'.

    - Location 001 isn't a license plate–controlled location. You can set up a non–license plate output location only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Close the page.
2. Go to Production control > Production orders > All production orders.
3. Click New production order.
4. In the Item number field, enter 'L0101'.
5. Click Create.
6. On the Action Pane, click Production order.
7. Click Estimate.
8. Click OK.
9. Click Start.
10. Click the General tab.
11. In the Automatic BOM consumption field, select 'Never'.
12. Click OK.

13. Click Report as finished.
14. Click the General tab.
15. Select Yes in the Accept error field.
16. Click OK.
17. On the Action Pane, click Warehouse.
18. Click Work details.

    - When the production order was reported as finished, no work was generated for put-away. This occurs because a work policy is defined that prevents work from being generated when product L0101 is reported as finished to location 001.

Use the safety stock journal to update minimum coverage

Article • 01/06/2025

This procedure shows how to calculate minimum coverage proposals based on historical transactions and then update the item coverage with the proposals. This is done using the safety stock journal. The demo data company used to create this task is USMF. This task is intended for the production planner, to help maintain minimum coverage.

Create a new safety stock journal name

1. Go to **Master planning** > **Setup** > **Safety stock journal names**.
2. Select **New**.
3. In the **Name** field, type *Material*.
4. In the **Description** field, type *Material*.
5. Close the page.

Create a safety stock journal

1. Go to **Master planning** > **Master planning** > **Run** > **Safety stock calculation**.
2. Select **New**.
3. In the **Name** field, enter or select a value. Select the safety stock journal name that you created, for example, Material.
4. Select **Create lines**.
5. In the **From date** field, enter a date.
6. In the **To date** field, enter a date.
7. Select **OK**. This will create lines for the dimensions that have inventory transactions.

Calculate proposal

1. Select **Calculate proposal**.
2. Select the **Use average issue during lead time** option.
3. Set **Multiplication factor** to *10*. The Multiply factor is used to adjust the proposal. Because demo data only has a few transactions, you will need to set the factor to get a realistic proposal.
4. Select **OK**. Scroll down to find M0002 and M0003. View the **Calculated minimum** quantity column.

Update minimum quantity

1. In the **New minimum quantity** field, enter a number. Update the New minimum quantity to match the value in the Calculated minimum quantity. If the Calculated minimum is zero, you can enter the desired future value. For example, you can enter the Calculated minimum quantity in this field for M0002 that has warehouse 12.
2. In the list, find and select the desired record. For example, you can select M0002 that has warehouse 12.
3. In the **New minimum quantity** field, enter a number. Update the New minimum quantity to match the value in the Calculated minimum quantity. If the Calculated minimum is zero you can enter the desired future value.

Post the new minimum quantity and validate the result

1. Select **Post**.
2. Select **OK**.
3. Select to follow the link in the **Item number** field.
4. Select to follow the link in the **Item number** field.
5. On the Action Pane, select **Plan**.
6. Select **Item coverage**. Notice that the **Minimum quantity** has been updated with the new minimum quantity from the safety stock journal.

Material substitution in manufacturing

09/19/2025

This article describes how to substitute materials during the production process. There are three methods for doing so:

- By date, when one material is substituted for another after a specific date
- During master planning, when a material in a formula is substituted with a different material because it's out of stock
- During production, when a material is unexpectedly out of stock and is substituted with a different material

Substituting material by date

Consider the following scenario: A machine that a company is manufacturing contains a component that expires from the vendor's catalog in two months. From the expiration date onward, the vendor offers a new component that you can substitute for the old component. Set up **From** and **To** validity dates on bill of materials (BOM) lines. For this example, set up the old component to expire by entering the expiration date in the **To-date** field. Then, on the BOM, set up the new replacement component so that it's valid from the day after the old component expires. To do this, enter the start date in the **From-date** field.

Substituting material by planning

You can substitute materials during planning only when you're using formulas, not when you're using a BOM. Consider the following scenario: A food manufacturing company is making a sauce from a formula that has 20 ingredients. One ingredient in the formula can be substituted by one of two other ingredients. However, because these two ingredients are more expensive than the preferred ingredient, substitution is used only if the preferred ingredient is out of stock. The material that you can substitute is called A, whereas the two materials that can replace it are called B and C. Material substitution by planning is controlled by the **Plan group** and **Priority** fields on the formula lines. For this example, you create formula lines for the three materials, and associate the formula lines with the same plan group. In the setup, the formula line for material A has the highest priority (lowest number), the formula line for material C has the lowest priority, and the formula line for material B has a priority that is between the priority of the other two lines. If you have demand for the finished item, master planning first determines whether the demand for material A can be covered. If the demand can't be covered, master planning looks at materials B and C, in order of priority. If material B is on hand, it will be used after a planned batch order is firmed for the formula. If none of the materials are on hand, master planning creates a planned order for material A.

> **Tip**
>
> When you set up formula lines in a plan group, specify a quantity only on the material that has the highest priority. This quantity calculates the demand of all materials in the plan, even the materials that have lower priority. You can't specify different quantities on lower-priority items in the plan group.

Substituting material during production

Consider the following scenario: A piece of metal plate is required for a welding operation. During the operation, a warehouse worker informs the machine operator that the plate is out of stock. However, it's decided that the plate can be substituted with a plate that is slightly thicker. That way, the operation can be finalized. You can add the material to the production picking list. Then, when the picking list is posted, the system adds the material to the production BOM.

Production feedback

Article • 06/21/2024

This article provides information about production feedback, which lets workers provide feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers the opportunity to provide feedback about production jobs. It lets workers record time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished.

Workers can also provide production feedback using the production floor execution interface, which is part of the manufacturing execution functionality in the **Production control** module. The production floor execution interface has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The production floor execution interface has a touch-optimized user interface. Feedback submitted through the production floor execution interface updates the production journals.

Allocate time to jobs in a job bundle

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In Manufacturing execution, you can bundle jobs. You can then start multiple jobs at the same time on the Job list page.

If you bundle jobs, you must define how the total registered time for all the jobs should be allocated to each job. You define the allocation by selecting one of the following options in the **Bundle type** field on the **Allocation keys** page:

- **Estimation** – Time is divided among the jobs, based on the estimated time for the jobs.
- **Jobs** – Time is divided according to total jobs that are bundled and how much time was spent finishing all the jobs.
- **Net time** – Time is divided equally among the jobs that are in the bundle at any time.
- **Real time** – Actual job time is allocated. The cost can be calculated based on the actual payroll cost. **Note:** The **Real time** allocation key is available only if your company uses the payroll functionality in Time and attendance.

The following examples show the results of the various allocation keys.

Example scenario

You need to complete three jobs in your job queue. You start the first job, and while that job is in progress, you start the second and third jobs. Therefore, there's a bundle of three jobs. The following table shows the estimated production time for each job.

Expand table

Job	Production time
Job 1	1 hour

Job	Production time
Job 2	3 hours
Job 3	4 hours
Total	8 hours

The following table shows the actual work hours that you spend on each job.

Expand table

Job	Start time	End time	Bundle time
Job 1	09:00	11:00	2 hours
Job 2	10:00	13:00	3 hours
Job 3	10:00	15:00	5 hours
Bundle	09:00	15:00	6 hours

The following sections describe the results of the calculated time for each allocation key.

Estimation allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time × (Estimated job time ÷ Total estimated time)

Expand table

Job	Formula	Allocated time
Job 1	6 × (1 ÷ 8) hours	0.75 hour
Job 2	6 × (3 ÷ 8) hours	2.25 hours
Job 3	6 × (4 ÷ 8) hours	3.00 hours

Jobs allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time ÷ Number of jobs

Expand table

Job	Formula	Allocated time
Job 1	6 ÷ 3	2 hours
Job 2	6 ÷ 3	2 hours
Job 3	6 ÷ 3	2 hours

Net time allocation key

The following table shows the formula for calculating allocated time. The formula is: Calculated time per reporting = Bundle time ÷ Number of jobs

Expand table

Example	09:00–10:00 (1 hour)	10:00–11:00 (1 hour)	11:00–13:00 (2 hours)	13:00–15:00 (2 hours)	Allocated time
Number of jobs in the bundle	1	3	2	1	Not applicable
Job 1	1 ÷ 1 = 1 hour	1 ÷ 3 = 0.33 hour	Not applicable	Not applicable	1.33 hours
Job 2	Not applicable	1 ÷ 3 = 0.33 hour	2 ÷ 2 = 1 hour	Not applicable	1.33 hours
Job 3	Not applicable	1 ÷ 3 = 0.33 hour	2 ÷ 2 = 1 hour	2 ÷ 1 = 2 hours	3.33 hours

Real-time allocation key

To calculate production costs based on real costs, clear the **Cost category** option on the **Production order defaults** page. The following table shows the formula for calculating allocated time. The formula is: Actual time per job = Actual time in bundle

Expand table

Job	Actual time
Job 1	2 hours
Job 2	3 hours
Job 3	5 hours

Consider the three jobs that a worker performs with an hourly wage of USD 12.00. The worker doesn't earn any overtime bonus or premium for the time spent on the jobs. The worker spends six hours working on the three bundled jobs. Therefore, the salary cost is 6 × USD 12.00 = USD 72.00. When you use real-time allocation, the system recalculates the cost per hour by using the factor from the Net time formula. The system then transfers the actual time that was spent on each job together with the corrected cost price per hour. In the example, six hours are spent, although 10 hours were allocated. The following table shows the formula for calculating cost. The formula is: Cost per hour = (Total bundle time per job (Net time) ÷ Actual time per job) × Standard cost price per hour

Expand table

Job	Calculation of corrected cost per hour	Corrected cost per hour	Allocated time	Total cost of job
Job 1	(1.33 ÷ 2) × USD 12.00	USD 8.00	2 hours	USD 16.00
Job 2	(1.33 ÷ 3) × USD 12.00	USD 5.33	3 hours	USD 16.00
Job 3	(3.33 ÷ 5) × USD 12.00	USD 8.00	5 hours	USD 40.00

The corrected cost per hour and the job time are posted in a production journal.

> **Note**
>
> If you select the **Cost category** option on the **General** tab on the **Production order defaults** page, the system transfers the actual time for each job to a production journal, where the cost is applied to the cost category of the specific job.

Calculate material consumption

08/13/2025

This article provides information about various options that are related to the calculation of material consumption.

The following options that are related to the calculation of material consumption are available on the **Setup** and **Step consumption** tabs on the **Line details** FastTab of the **Bill of materials** page.

Variable and constant consumption

In the **Consumption is** field, you can select whether consumption should be calculated as a constant quantity or a variable quantity. Select *Constant* if a fixed quantity or volume is required for the production, regardless of the quantity that is produced. Select *Variable*, which is the default setting, if the required amount of material in the finished goods is proportional to the number of finished goods that are produced.

Calculating consumption from a formula

In the **Formula** field, you can set up various formulas for calculating material consumption. If you use the default value, *Standard*, the consumption isn't calculated from a formula. The following formulas work together with the **Height**, **Width**, **Depth**, **Density**, and **Constant** fields:

- Height * Constant
- Height * Width * Constant
- Height * Width * Depth * Constant
- (Height * Width * Depth / Density) * Constant

Rounding up and multiples

Together, the **Rounding up** and **Multiples** fields let you round up the material consumption value. For example, you can round up the value according to the handling unit in which the raw material is picked for production. The following options are available in the **Rounding up** field: *Quantity*, *Measurement*, and *Consumption*.

Quantity

If you select *Quantity* as the rounding-up mechanism, the quantity must be a multiple of the specified quantity. For example, if whole numbers are required, select *1* in the **Multiples** field.

Numbers are then rounded up to a quantity that is divisible by 1.

Measurement

Typically, you select *Measurement* as the rounding-up mechanism when the raw material comes in specific dimensions. For example, a piece of 2-meter metal tube is required for a finished good, and the metal tube is stored in 4.5-meter lengths. In this case, the *Measurement* rounding-up mechanism can be used to calculate how many metal tubes are required to produce a specific number of pieces of the finished good. For this example, the **Formula** field is set to *Height * Constant*. The **Height** field is set to *2* to indicate the length of the tube that is required for the finished good. The **Multiple** field is set to *4.5* to indicate that the tube is picked in lengths of 4.5 meters. Here's the calculation:

1. Number of multiples that are required for 10 pieces of the finished good: 10 ÷ 2 = 5 pieces
2. Total consumption: 4.5 × 5 = 22.5 meters of metal tube

It's assumed that 0.5 meters of tube is scrapped for every five pieces of tube that are consumed.

Consumption

Typically, you select *Consumption* as the rounding-up mechanism when raw material must be picked in whole quantities of a specific handling unit of the product. For example, 2 quarts of paint are used to produce one piece of a finished good, and the paint is picked in 25-quart cans. In this case, the *Consumption* rounding-up mechanism can be used to round up consumption to whole numbers of 25-quart cans. Here's the calculation for the amount of paint that is required if 180 pieces of the finished good must be produced:

1. Paint that is required, excluding scrap: 180 × 2 = 360 quarts
2. Number of cans: 360 ÷ 25 = 14.4, which is rounded up to 15
3. Paint that is required, including scrap: 15 × 25 = 375 quarts

Step consumption

Step consumption is used to calculate constant consumption in quantity intervals. If you select *Step consumption* in the **Formula** field on the **Setup** tab, you can add information about the steps on the **Step consumption** tab. The fixed consumed quantity can be set up in intervals of the produced quantity. For example, step consumption is set up as shown in the following table.

Expand table

From series	Quantity
0.00	10.0000
100.00	20.0000
200.00	40.0000

The bill of materials (BOM) quantity is 1, and the production quantity is 110. The formula for the consumption is From series (Quantity) = Consumption. Because the production quantity is 110, it falls into the "From 100 series." Therefore, the quantity is 20.

Production posting

This article provides information about different types of postings in the production process.

Production posting activities follow production processes that are described in the sections below.

Material consumption

Materials are registered as consumed during production when the production picking list journal is posted. This process generates issue transactions that deduct the on-hand inventory. In the production parameters, you can specify whether the value of raw materials that are in progress (work in process [WIP]) should be posted in the ledger. The value of raw materials that are in progress (WIP) is then posted to a dedicated Picking list account and a dedicated Picking list offset account.

Time consumption

The time that workers spend on production jobs is recorded in the Route card journal or the Job card journal. When these journals are posted, ledger posting to a dedicated account for resources that are in progress (WIP) is processed. This posting represents the value of the time that is spent on the production order. After the production order is registered as ended, the WIP accounts are settled.

Reporting finished goods and error quantities

When a production order is reported as finished, the quantity of the finished goods that have been completed is updated in Inventory management through the Report as finished journal. If you're using WIP accounting, which can be set up in the production parameters, a ledger journal is made to reduce the WIP accounts and increase the inventory of the finished goods. The journal uses the standard cost that is defined for the product.

Ending the production order

Before a production order is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. The overall cost of the finished item is debited from the inventory Receipt account

and credited to the inventory Issues account. If you select the **End job** check box when you run the cost calculation, the status of the production order is changed to *Ended*. This status prevents any additional costs from being unintentionally posted to a completed production order. You can specify that the value of error quantities that are reported during reporting as finished should be allocated to the good quantities that are reported as finished. Alternatively, you can specify that the value of error quantities should be posted to a dedicated scrap account.

Controlling the level of ledger posting

In the **Production control parameters**, you can use the **Ledger posting** field to set the level of ledger posting for production processes. The following values are available:

- *Item and resource* – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from resource or resource group from the route operations.
- *Item and category* – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from the cost categories that are associated with the route operations.
- *Production groups* – Use the ledger accounts that are set up on the production groups for both material and time consumption. The production groups are associated with the released products and copied to the production orders when those orders are created. The posting on the production orders will then follow the production groups that are associated with the production order.

> **Note**
>
> If the standard method for calculating the cost of the finished item was used, the final transactions reflect this fact. If actual costs and the costs that are calculated by using the standard method differ, the difference is posted to the account that shows profit or loss.

Last updated on 11/26/2025

Lean manufacturing overview

Article • 01/31/2025

This article provides an overview and description of the lean manufacturing features in Dynamics 365 Supply Chain Management.

Lean manufacturing offers tools that you can use to model lean operations. These tools support and promote the following concepts and business activities:

- Create a lean manufacturing foundation by modeling manufacturing and logistics processes as production flows.
- Implement a lean pull system by using kanbans to signal demand requirements.
- Monitor and maintain kanban jobs.

The lean manufacturing architecture consists of production flows, activities, and kanban rules. These structures are fully integrated with Supply Chain Management processes. You can use lean manufacturing in a mixed-mode manufacturing environment that combines various supply, production, and sourcing strategies. These strategies include production orders, batch orders for process industries, purchase orders, and transfer orders.

> **ⓘ Important**
>
> You can use Supply Chain Management to support the implementation of lean manufacturing with kanbans. However, a successful implementation of lean principles depends on the internal business processes that you use, and the actual production conditions and environment. |

Modeling manufacturing and logistics processes as production flows

To create a lean manufacturing foundation, model the manufacturing and logistics processes as production flows. This activity consists of the following tasks:

1. Identify the processes for which you want to implement a lean replenishment strategy, and then model these processes as production flows. You can then analyze and streamline the processes. One of the goals of a lean implementation is to reduce waste by improving the flow of material and information.
2. Define a production flow as a sequence of activities that describes the flow of material. A transfer activity defines the movement of a product or products from

one location to another. A process activity defines a value-added operation that is applied to a product.

3. Create a version of the production flow that defines the requirements for takt time. These requirements are used to calculate the cycle times of each activity in the production flow. You can create multiple versions of production flows, and then use these versions to improve processes.

Using kanbans to signal demand requirements

A pull system produces goods only when goods are needed. This practice reduces delivery lead times and excess inventory. You can use kanbans to plan, track, and process requirements that are based on production flows. To create a kanban framework, create kanban rules that define when kanbans are created, and how the requirements are fulfilled. You can create two types of kanban rules. Manufacturing rules create process kanban jobs, and withdrawal kanban rules create transfer kanban jobs. You can set up the following replenishment strategies:

- **Fixed quantity** kanban rules are related to a fixed number of handling units, which means that the numbers of active kanbans are constant. Whenever all the products from a Kanban are consumed and the handling units are manually emptied, a new kanban of the same type is created. When you create fixed quantity kanban rules, you can calculate the optimal kanban quantities and the product quantities that are used. The calculation takes into account forecast, actual demand from open orders, lead time to replenish items, and historical demands.
- **Scheduled** kanban rules replenish requirements that are calculated by master planning. Master planning generates planned kanbans that can be firmed to kanbans.
- **Event** kanban rules replenish requirements that originate from sales order lines, production bill of materials (BOM) lines, kanban lines, or minimum inventory settings. When event kanbans are generated, they're pegged to the source requirements.

When kanbans are created, one or more kanban jobs are generated based on the kanban flow activities that are defined in the kanban rules.

Monitoring and maintaining kanban jobs

Lean manufacturing provides visibility into the current status of manufacturing and logistics activities that are governed by the kanban rules. As a result, you can plan and prioritize the following tasks:

- Gain an overview of the current kanban job schedule.
- Plan and reschedule kanban jobs.
- Track and register the status of kanban jobs.

The following list describes the specialized kanban boards:

- Kanban job scheduling – Provides an overview of the kanban jobs. The board displays kanban jobs and their status for one or multiple work cells. The jobs are listed according to the planning periods (days or weeks) that are defined in the production flow model. The board also displays the capacity consumption for each planning period, so that you can monitor the scheduled load. You can change the status of kanban jobs, reschedule kanban jobs to different planning periods, and perform other tasks.
- Kanban board for transfer jobs – This board provides an overview of the current transfer jobs. You can update and register picking lists, start and complete transfer jobs, and perform other tasks.
- Kanban board for process jobs – This board is designed to support the normal production flow and give an overview of the current situation in one or multiple work cells. From this board Kanbans can be prioritized, picked, or manufactured. The board is also designed to support bar code scanning for the reporting of Kanbans.

Kanban jobs and integration with Supply Chain Management processes

Kanban jobs are fully integrated with current processes for inventory transactions in Supply Chain Management.

- You can perform picking activities to replenish material that is used to fulfill the requirements of kanban jobs.
- You can print kanban cards, circulating kanban cards, and picking lists to support the use of kanbans. These documents are used to represent, track, and register kanban jobs in the warehouse and on the production floor.
- You can register the picking and transfer activities in inventory by scanning bar codes.

In addition, lean manufacturing supports the purchasing and invoicing processes for services that are referenced by subcontracted activities.

- You can assign purchase agreement lines and services to subcontracted activities.
- You can create periodic purchase orders and receipt advices to support the purchase and invoicing of the services.

White papers

The following white papers explore various aspects of lean manufacturing in Dynamics 365 Supply Chain Management:

- Lean manufacturing: Capable to promise and kanban job scheduling
- Lean manufacturing: Production flows and activities

Activity-based subcontracting

Article • 06/03/2022

This article describes, in detail, how to use subcontracted activities in a production flow for lean manufacturing.

In Microsoft Dynamics 365 Supply Chain Management, there are two approaches for subcontracting: production orders and lean manufacturing. In the lean manufacturing approach, the subcontracting work is modeled as a service that is related to an activity of a production flow. A special type of cost group type that is named **Direct outsourcing** has been introduced, and the subcontracting services are no longer part of a bill of materials (BOM). The cost accounting of subcontracted work is fully integrated into the costing solution for lean manufacturing.

Production flows that involve subcontractors

The basic principle of a production flow doesn't change when activities are subcontracted. Material still flows between locations, process activities convert material to products, and transfer activities move material or products from one location to another. You can model locations and work cells as vendor-managed by assigning the vendor account to a warehouse or to a resource of a resource group.

Based on these capabilities, lean manufacturing doesn't require any specific features in order to support the flow of material and products. All possible scenarios that involve vendors as providers of production or transport services can be modeled based on the architecture of production flow and activities.

For example, a subcontractor works out of a supermarket that is located at the subcontractor. When handling units are emptied at the subcontractor, the kanban cards are returned to the assembly cell together with the next shipment. The supermarket at the subcontractor is then replenished. The transfers to and from the subcontractor can be modeled as explicit transfer activities to support a picking and shipment process. If an explicit registration isn't required in order to support the physical transport, the transfer activities can be omitted.

A subcontractor can be used to load balance the overall capacity of the production flow. For example, a production flow is modeled by using scheduled kanban rules. The planner uses the kanban scheduling board to schedule and load level both work cells on demand. The planner also monitors the consolidated supply schedule for the supermarket on the **Supply schedule** page. Multiple subcontractors can be modeled in one or multiple production flows, and there might be multiple kanban rules that can be

used to supply the same product to the same location through different activities. The planner can convert kanbans to an alternative kanban rule to reschedule a kanban that was originally created for internal production to an alternative process. In fact, the subcontracted nature of the work cell has no impact on the production flow. The same working principle applies for two parallel internal work cells or for two subcontracted cells.

Like any other activity in a production flow, subcontracted activities can consume and supply inventoried, non-inventoried (work in process [WIP]), and semi-finished material and products. In all cases, the processes for scheduling and executing subcontracted activities are the same. Additionally, these process the same as the processes for internal work.

Purchase process for subcontracted activities (services)

The purchase process for subcontracted activities is based on the physical material flow that is registered by kanban job progress, for example, Start or Complete. The financial flow, for example, cost of subcontracted work, is a secondary flow that follows the physical flow. At the same time, the purchase process is an independent process that allows for manual adjustment of the purchase documents at every step. Here is the purchase process for subcontracted activities:

1. Create a purchase agreement. The purchase agreement is created for the service and connected to the activity of the production flow.
2. Create a purchase order. A release purchase order can be created for the service, based on the scheduled kanban jobs. Jobs for the same service can be grouped to purchase order lines by day, week, or month. The purchase order lines can be created at any time after the kanban jobs are created. Purchase order lines can even be created after the fact. This option is usually selected if a subcontractor provides services without additional notice, based on the kanbans or kanban cards that the subcontractor receives. In this case, deviations between the purchase order and the invoice can be minimized.
3. Generate kanban cards, material, and a picking list to send to the subcontractor to prepare for processing. Based on the detailed modeling of the production flow, the preparation is done on the kanban board for process activities by using the picking list and the preparation function. Alternatively, the preparation is done on the kanban board for transfer jobs by using the picking list and start or completion. For inventoried material, both processes can be supported by a WMS-Picking and Shipment process. A bill of lading can be created on demand.

4. Generate kanban handling units and kanban cards. After processing, cards are returned from the subcontractor. Usually, the cards include a delivery note that specifies the physical material that has been shipped. A reference to the provided services isn't required. The arrival of the material or product at the customer is registered on the kanban board, depending on the kanban cards. (Either the kanban board for process activities or the kanban board for transfer jobs is used, depending on the modeled activities.).
5. Create a receipt advisory. The receipt advisory can be used to replace a packing slip document for the received services. Receipt advisories can be generated based on the completed kanban jobs for the subcontracting activity for a selected period. For each job receipt, advisories are created for the related purchase order line. The receipt advisory can be printed and sent to the subcontractor as confirmation of receipt.
6. Generate an invoice.

The process ends when the subcontractor is invoiced for a period. The invoice match is done against the receipt advisories that are created. Because the receipt advisories represent the exact physical receipt of material, the three-way matching is simplified.

Configuring activities for subcontracting

The following sections describe how to configure activities for subcontracting.

Subcontracted services

The payment item that is used in activity-based subcontracting must be a product that has the following properties:

- **Product type:** Service
- **Inventory model group:** Non stocked

This requirement enforces the use of the first in, first out (FIFO) inventory model. **Note:** Cost calculation of the products requires that the standard cost of the service be defined. A purchase agreement with the vendor is required. Otherwise, the service can't be used for activity-based subcontracting.

Subcontracted process activities

To configure a process activity as a subcontracted activity, follow these steps.

1. Configure a subcontracted work cell. To configure a work cell as subcontracted, you must create a resource of the **Vendor** type and associate it with the work cell

(resource group). A runtime cost category of the **Direct outsourcing** cost group type should be assigned to the work cell. The cost categories for setup and quantity aren't required.

2. After a process activity is created and related to a subcontracted work cell, you must configure a service for the activity before the production flow version can be activated. You complete this step on the **Activity details** page. For activities that are associated with a subcontracted work cell, the **Service terms** FastTab is shown. On this FastTab, add a default service that is valid for all output items. If specific output items require different services or different service calculation parameters (for example, a different service ratio), you can add other services to the activity.

Subcontracted transfer activities

A transfer activity is configured as a subcontracted activity, depending on the **Freighted by** setting of the transfer activity. The following options are available:

- **Shipper** – The activity is subcontracted if the transfer from the warehouse is managed by a vendor (as defined by a property of the warehouse). All selected purchase agreements for services must have the same vendor ID as the warehouse.
- **Recipient** – The activity is subcontracted if the transfer to the warehouse is managed by a vendor (as defined by a property of the warehouse). All selected purchase agreements for services must have the same vendor ID as the warehouse.
- **Carrier** – The activity is subcontracted to any vendor that provides the service. To be valid, a carrier must be created for warehouse management and must have an assigned vendor account.

As for process activities, you must configure a default service for subcontracted transfer activities on the **Service terms** FastTab of the **Activity details** page.

Service quantity calculation

The whole purchase process is based on an item reference for a service. This item reference is measured in a unit of measure of a service. Services are usually measured either in the number of services (units) or in time. To calculate the service quantity, based on the registered completion of kanban jobs, you can use the following methods:

- **Calculation that is based on the number of jobs** – One kanban job equals *n* units of service, regardless of the product quantity that is supplied. In lean manufacturing, one job corresponds to one handling unit. This calculation method applies to all services that have a fixed price per handling unit. Therefore, this

method usually applies to transfer activities. However, it can also apply to process activities that process whole handling units.

- **Calculation that is based on the product quantity** – The service quantity is relative to the product quantity that is scheduled/supplied. When the supplied product quantity is calculated, error quantities can be either included or excluded. This calculation method applies to all cases where the service price per unit of processed product is agreed upon.
- **Calculation that is based on the activity time** – The theoretical activity times are calculated, based on the processing time of the activity, the total processed quantity, and the throughput ratio of the processed product. This calculation method applies to services that are paid by the hour and have a variance in time per processed product.

Cost accounting of subcontracted services

When the receipt advisory or a vendor packing slip on a purchase order that was created for a production flow (in other words, a purchase order that was generated based on kanban jobs for subcontracted activities) is posted, the value of the receipt is accounted in the WIP accounts of the production flow. Deviations of invoices are also accounted to the production flow. A cost category for subcontracted work has been introduced. This cost category enable transparent tracking of the value of subcontracted work that is allocated to WIP and consumed per period.

The backflush costing for lean manufacturing at the end of a costing period calculates the actual variances of the products that are produced from the production flow during the costing period.

Modeling transfers as subcontracted activities

People often consider transport nonproductive and think that it adds no value. However, when the cost of subcontracting is compared to the cost of internal production, the cost of additional transport activities must be considered. A production flow that spans multiple locations and requires transport services should model the transport cost as part of the cost of supplying the products to the customer.

Activity-based subcontracting in lean manufacturing lets you integrate carriers and transport vendors that move material and products between the locations of a production flow. By modeling a transfer activity, you can assign a carrier or vendor. The transfer activities/job is based on a service and purchase agreement, and you can create purchase orders and receipt advisories, based on the actual transfer jobs. This functionality is the same as the functionality for subcontracted process activities.

Supply Chain Management now supports BOM calculation that includes transport services, the creation of related purchase orders, integrated receipt registration, and the integration of transport service costs into the production flow costing.

Modeling a lean organization

Article • 09/29/2021

The article provides information about the key concepts in modeling a lean organization.

Typically, a lean manufacturing scenario is more than just a collection of unrelated kanban rules or material supply policies. The flow of material and products throughout work cells and locations for a specific production or supply scenario can be described as a sequence or small network of process or transfer activities. This sequence or network is known as a production flow.

Production flows in lean manufacturing

In production scenarios that are based on production orders, material is issued to a specific production order. During a sequence of operations that is based on a bill of materials (BOM) and routes, products are created and are finally received at the supplied location. The throughput time of production orders varies from minutes to weeks. All related cost, material, and labor are accumulated on the production order.

To reduce the delivery lead times and excess inventory between work centers that batch production causes, lean manufacturing introduces kanban replenishment and supermarkets in manufacturing and warehouse replenishment. Typically, these features disrupt the production of partially independent kanban cycles. The replenishment of a kanban for a semi-finished product is no longer triggered by an order for a finished product.

To re-establish a production and cost context for the various kanban scenarios that are proposed, activity-based production flows have been introduced as the backbone of lean manufacturing. All kanban rules refer to this predefined structure. The activity-based model supports the setup of a wide range of scenarios. However, this model doesn't add complexity for the shop floor workers, because all scenarios use the same activity-based user interface.

Semi-finished products (non-BOM levels)

Lean manufacturing integrates kanbans for inventoried products and semi-finished products in a single framework, and therefore offers a unified user experience for all cases. Because of this architecture, additional BOM levels no longer have to be

introduced to enable kanbans to be used for semi-finished products. This architecture also helps reduce inventory transactions to a minimum.

Products and material in work in progress

The reduction of batch sizes to the ideal state of a single piece flow in lean manufacturing can cause a dramatic increase in inventory transactions if each picking process or kanban registration causes transactions for the consumed items. The production flow architecture allows for the transfer of material to the production flow, together with the withdrawal kanbans in storage or transport handling unit sizes. The value of the issued material is added to the work in progress (WIP) account that is related to the production flow. This behavior resembles the behavior for material that is issued to a production order. The same principle can be applied to products and semi-finished products. Unless these products are created, transferred, or consumed within a production flow, inventory transactions are optional. After the products are posted to inventory, the WIP account for the production flow is reduced by deducting by the related standard cost.

Value streams and value stream mapping

The architecture of Lean manufacturing is inspired by the five Lean principles that were formulated by Womack and Jones: Customer value, Value stream, flow, pull, and perfection. One approved method for implementing lean manufacturing solutions in the physical world of manufacturing is value stream mapping (VSM). This method was introduced by Rother and Shook in their publication “Learning to See” at the Lean Manufacturing Institute.

The future-state value stream can be modeled as a production flow version. All processes of the value stream are modeled as process activities. Movements or transfers can be modeled as transfer activities if the transfer status must be registered, or if integration with inventory picking or consolidated shipments is required.

The value stream itself is modeled as an operating unit. Therefore, the value stream can be used as a financial dimension.

For more information about operating units, see Create an operating unit.

Costing for lean manufacturing based on the production flow

The periodic consolidation of the cost for a production flow corrects the related WIP account and enables variances to be determined for the products that are supplied by the production flow.

Continuous improvement

To better support continuous improvement, the production flows are implemented in time-effective versions. Therefore, an existing production flow version, together with all related kanban rules, can be copied to a future version of the production flow. In addition, the future-state production flow can be modeled before it's validated and activated for production. To help guarantee a seamless material flow on the transition date and beyond, existing kanbans from old production flow versions are automatically related to the new version.

Simplicity

For the implementation of Lean manufacturing, we choose a production flow and activity approach that enables simple and complex production scenarios to be modeled in a single scalable architecture. A closer look at the activity concept reveals a new simplicity for those users who require it: the shop floor and logistics workers. By reporting against activity-based jobs instead of inventory transactions, a unified user interface for all lean manufacturing variants transfers the business complexity from the user interface to where it belongs: the production flow as the backbone of lean manufacturing.

Operations resources

07/10/2025

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas, or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

> ⓘ **Note**

If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (*Tool*, *Vendor*, *Machine*, *Human resources*, *Location*, or *Facility*). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. Learn more in Resource capabilities.

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected.

Note

When you assign operations resources of the *Vendor* type to a resource group, all operations resources that are assigned to that resource group must be of the *Vendor* type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they're processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here's the formula that is used for the calculation: Scheduling time = Time × 100 ÷ Efficiency percentage. *Time* includes both the run time and setup time.
- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to *Yes* if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to *No*, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to *Yes* if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to *Yes* if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that is scheduled for the primary operation determines the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the *Vendor* type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is actually scheduled.

Define lean manufacturing work cells

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A work cell is a specific form of resource groups that can be used in lean manufacturing process activities. Work cells have input and output locations and a capacity definition based on a production flow model. The demo data company used to create this procedure is USMF

Create a work cell.

1. Go to Organization administration > Resources > Resource groups.
2. Click New.
3. In the Resource group field, type a value.
    - The work cell ID is typically a systematic code and has to be unique for the legal entity.
4. In the Description field, type a value.
    - The description contains the name or title of the work cell.
5. In the Site field, click the drop-down button to open the lookup.
    - A work cell is located at one specific site. Both input and output warehouse and location have to be located on this site.
6. In the list, click the link in the selected row.
7. In the Production unit field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
    - Select a production unit that this work cell belongs to.
9. Select the Work cell check box.
    - To use a resource group as a lean work cell, the Work cell check box has to be selected. Note that this property cannot be changed after resource group is created.
10. In the Input warehouse field, click the drop-down button to open the lookup.

11. In the list, click the link in the selected row.

    - For accounting and material control, the material staged on the shop floor is typically allocated to a specific virtual warehouse. However, if you want to replenish the locations using warehouse work, they must be part of the receptive raw material warehouse.

12. In the Input location field, click the drop-down button to open the lookup.
13. In the list, click the link in the selected row.

    - Note that for a process activity, the input location can by overwritten in general or for a specific product or product variant by defining picking activities that feed to the process activity. The input locations of a work cell cannot be license plate controlled.

14. In the Output warehouse field, click the drop-down button to open the lookup.
15. In the list, find and select the desired record.

    - In multiple activity production flows or production lines, this is often the input warehouse of the next work cell or the sales or transit warehouse where a product is typically transferred to after the production process. Remember when modeling lean manufacturing processes, transport is usually waste, as is reporting transport.

16. In the list, click the link in the selected row.
17. In the Output location field, click the drop-down button to open the lookup.

    - In a production flow with multiple process activities this if often the input location of the next work cell.

18. In the list, find and select the desired record.
19. In the list, click the link in the selected row.
20. Expand or collapse the Operation section.

    - A Run time category must be provided to enable cost calculation and processing of lean kanban jobs.

21. In the Run time category field, click the drop-down button to open the lookup.
22. In the list, find and select the desired record.

    - The run time cost category is used in standard cost calculation and on backflush costing.

23. In the list, click the link in the selected row.
24. Expand or collapse the Calendars section.
25. Click Add.

26. In the Calendar field, click the drop-down button to open the lookup.
27. In the list, find and select the desired record.

    - Typically work cells of a given site use the same working time calendar. If work cells can have individual working times, you might need to create a specific working time calendar for the work cell. Note that the calendar should have a standard working time defined when used for a lean work cell, because the capacity definition is usually related to the standard working time of a work day.

28. In the list, click the link in the selected row.
29. Expand or collapse the Work cell capacity section.
30. Click Add.
31. In the Production flow model field, click the drop-down button to open the lookup.
32. In the list, find and select the desired record.

    - This procedures requires production flow model type Throughput, to show the definition of throughput capacity.

33. In the list, click the link in the selected row.
34. In the Capacity period field, select an option.

    - The options include: Standard workday - The capacity is expressed by the length of the standard workday of the working time calendar for the work cell. For each day, the actual working time is determined from the calendar and the effective available capacity is calculated based on that. Week - Allows a weekly capacity. There is no adjustment done by the actual working time. Month - Allows a monthly capacity. There is no adjustment done by the actual capacity. Typically, the standard workday is used for daily periods and the weekly capacity is used for weekly capacity periods.

35. In the Average throughput quantity field, enter a number.

    - Note that a lean operation is never set up for the maximum possible capacity in an ideal environment. Instead the capacity should always be defined for operations running under typical circumstances.

36. In the Unit field, click the drop-down button to open the lookup.
37. In the list, click the link in the selected row.
38. ResolveChanges the Unit.

Add a financial dimension

1. Expand or collapse the Financial dimensions section.

- Note that financial dimensions defined on the production flow override the financial dimension of a given work cell. The financial dimensions that can be selected depend on the configuration of the financial dimensions of your system. The following steps correspond to the Demo data set in company USMF. When using different data, the steps might not be applicable.

2. In the CostCenter field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.

    - The dimensions that need to be selected on lean work cells depend on the implementation of financial dimensions in the accounting model for a specific legal entity.

4. In the list, click the link in the selected row.
5. In the ItemGroup field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, click the link in the selected row.

Save

1. Click Save.

Define lean schedule groups

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Lean schedule groups are defined to group and distinguish products in kanban scheduling. The grouping can be done as generic association per company or specific to a work cell. Each group has a color code assigned for visual indication in the kanban scheduling listpage. The demo data company used to create this procedure is USMF.

Define lean scheduling group

1. Go to Product information management > Lean manufacturing > Lean schedule groups.
2. Click New.
3. In the Schedule group field, type a value.
    - A schedule group can be defined as global group or specific to a work cell. In this simple example, we define a global group, and the work cell is kept empty. The settings of this group apply to all work cells that do not have specific schedule groups.
4. Select a color from the color selection.
    - The colors are used to highlight the jobs on the kanban schedule list page or the kanban process board.
5. In the list, mark the selected row.
6. In the list, click the link in the selected row.

Associate product

1. Associate a specific product
    - There are two ways to associate products to lean schedule groups, either as a specific product (Item relation type = Item) or as part of an item allocation key (item relation type = group).
2. In the Item relation type field, select Item

3. In the Item number field, type a value.
4. In the Throughput ratio field, enter a number.

    - The default Throughput ratio is 1, which means that the related products consume exactly the capacity specified in the process activities of the production flows. Throughput ratio > 1 defines a higher resource consumption, Throughput ratio < 1 defines a lower resource consumption. The ratio is used in the cost calculation and in the calculation of the kanban job consumption.

Associate item allocation key

1. Associate an item allocation key

    - Add an association to an item allocation key by using the Item relation type Group. Note that for this process, you need a forecast item alllocation key defined in your data.

2. In the Item relation type field, select Group
3. In the Item allocation key field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.

Visual scheduling for lean manufacturing

Article • 06/03/2022

This article provides information about the Kanban schedule board, which the production planner can use to control and optimize the production plan for kanban jobs.

This article provides information about the Kanban schedule board, which the production planner can use to control and optimize the production plan for kanban jobs.

The Kanban schedule board lets the production planner control and optimize the production plan for kanban jobs. It makes the flow of kanban jobs transparent, and gives the production planner a tool that optimizes and adjusts the production plan for the lean manufacturing work cell.

Visual scheduling of kanban jobs

A kanban job can consist of one or many kanban jobs. There are two types of kanban jobs:

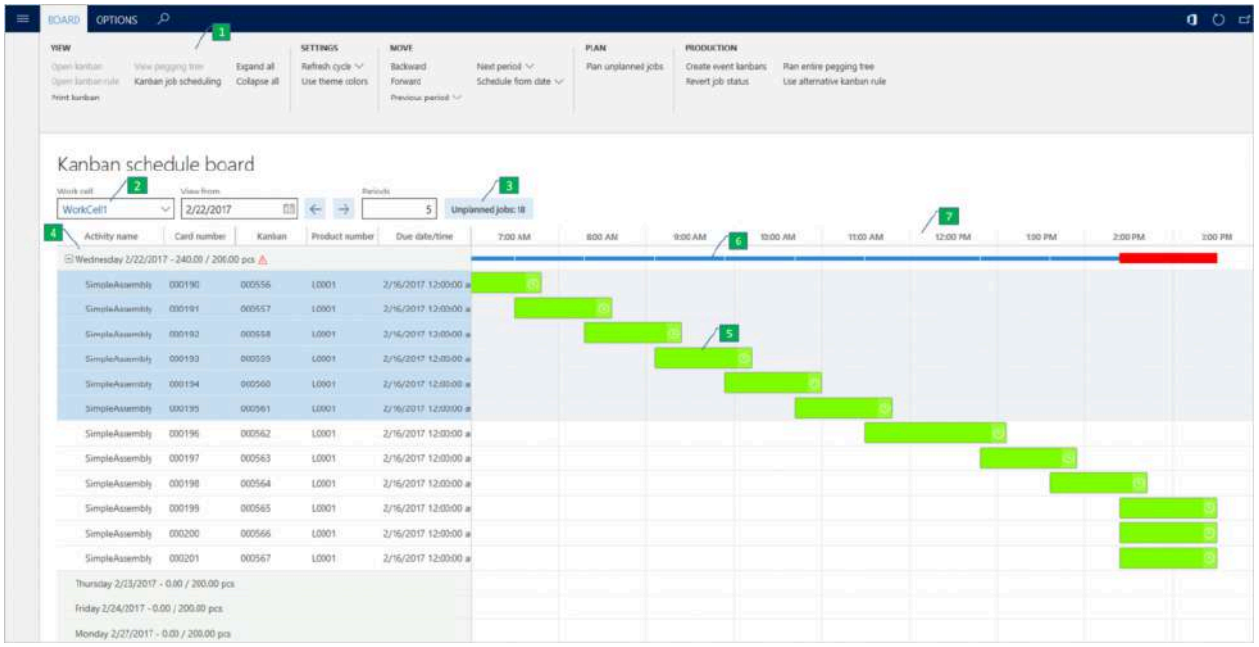
- Process
- Transfer

You can schedule only jobs of the **Process** type. The kanban job and its properties, such as the activity time, are defined in the production kanban flow. In the production kanban flow, the kanban job is also assigned to a work cell. The work cell's daily capacity is calculated based on the work cell capacity that is set on the resource group. It's adjusted by the daily working time in the related calendar. When a kanban job is scheduled, the job loads the capacity of the work cell. The Kanban schedule board provides the following main features:

- A graphical overview of the production plan in a lean work cell. This overview shows the planned kanban process jobs in the defined periods.
- A tool that lets you schedule unplanned kanban jobs and reschedule previously scheduled jobs.

Kanban schedule board

The **Kanban schedule board** page contains seven main elements, as shown in the following illustration.



1. Action Pane
2. Filter fields
3. Button for unplanned jobs
4. Period node
5. Kanban job
6. Capacity bar
7. Time scale

View the time scale

The board is divided into periods, each of which is represented as a node (4). The period nodes are listed on the vertical axis, and the horizontal axis represents a time scale (7) that shows the length of the period. A period has a length of either one day or one week. The period length is determined by the configuration of the work cell that is selected for the Kanban schedule board (2). For each period node, the Kanban schedule board indicates how much the scheduled kanban jobs are loading the period. There is also an indication of the maximum throughput for the period. If the scheduled throughput exceeds the maximum throughput, the period is considered as overloaded, and a red warning symbol appears. A scheduled kanban job appears in a period that has scheduled start and end times (5). The length of the job is equal to the activity time. Kanban jobs appear as overlapping in a period if their activity times exceed the task time of the work cell.

View job status

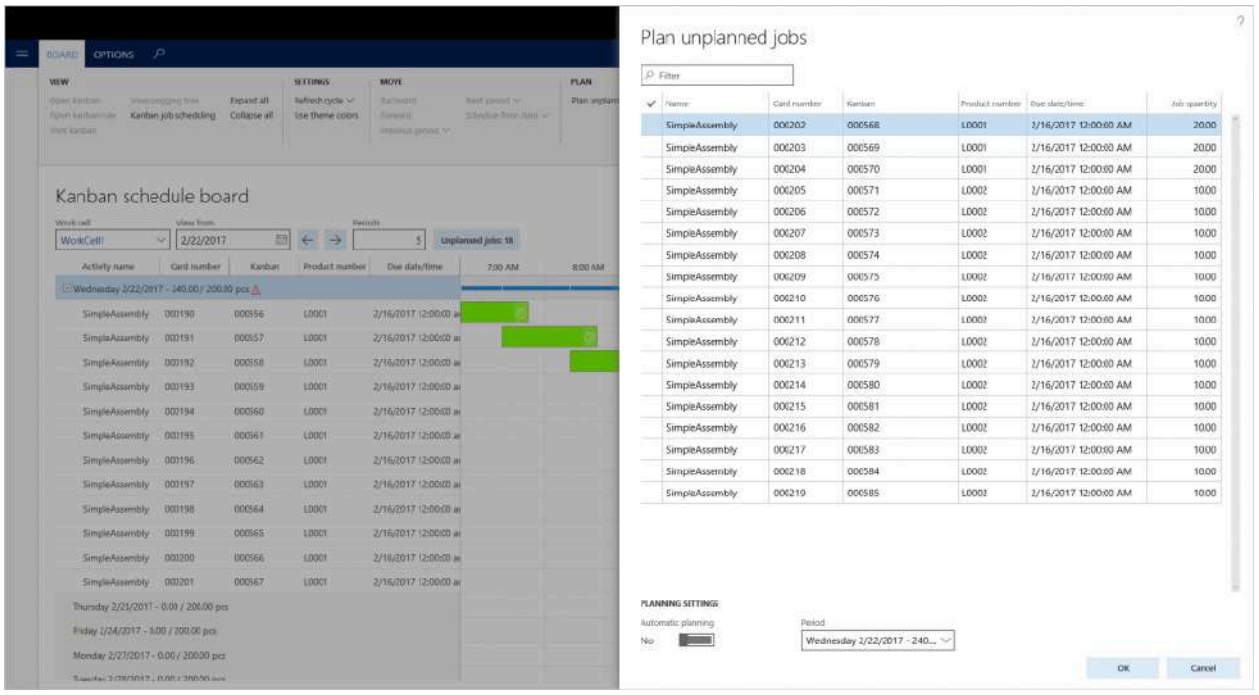
More information about a kanban job is available in the tooltip that appears when you hover the pointer over the job. A symbol provides information about the status of the job. For example, a clock symbol indicates that the kanban job is overdue.

Use colors to view the Kanban schedule board

To enhance the overview that the Kanban schedule board provides, you can use colors to distinguish kanban jobs. The color of a kanban job is configured in the lean schedule group, where you can aggregate the products that should be produced in the same sequence. The **Use theme colors** button on the **Board** tab of the Action Pane lets you switch between the application theme colors and the colors that are configured in the lean schedule group. For each period, a capacity bar (6) indicates how many of the available hours for the period have been loaded with kanban jobs. If the period is overloaded, the capacity bar appears thicker and in red. All these functions are available on the **Board** tab of the Action Pane (1) at the top of the **Kanban schedule board** page.

Plan unplanned jobs

You can schedule unplanned kanban jobs from the **Plan unplanned jobs** dialog box. To open this dialog box, click the **Unplanned jobs** button that shows the current number of unplanned jobs. Alternatively, click **Plan unplanned jobs** on the **Board** tab of the Action Pane. The dialog box shows a list of the unplanned kanban jobs for the work cell. You can use the **Filter** field to filter on all fields in the grid. For example, you can filter on kanban jobs for a specific product. After you have a filtered list of the jobs that you want to schedule, select them in the list, and then click **OK**. To use automatic planning to schedule the jobs, set the **Automatic planning** option to **Yes**. In this case, the jobs are scheduled into a period according to their due date. You can also schedule the jobs by period. Just select a period in the **Period** field. The following illustration shows an example of the **Plan unplanned jobs** dialog box.



Sequence kanban jobs within the same period

You can change the sequence of one or more selected jobs within a period. This capability can be useful if you want to prioritize some jobs within the period. Alternatively, you might want to sequence jobs that have the same product attributes, to optimize job execution. You can change the sequence through a drag-and-drop operation, or by using the **Backward** and **Forward** menu items on the **Board** tab of the Action Pane.

Reassign kanban jobs across periods

Jobs can be reassigned from one period to another. This capability can be useful if a period is overloaded and you want to level the load to periods that have spare capacity. You can reassign jobs through a drag-and-drop operation, or by using the **Next period** and **Previous period** menu items on the **Board** tab of the Action Pane.

Open the Kanban schedule board

You can open the Kanban schedule board by using the menu item on the following pages:

- **Production area** page
- **Kanban jobs scheduling** page
- **Production flow visualization** page

Kanban job scheduling for lean manufacturing

Article • 09/29/2021

This article provides information about visual control over kanban job scheduling and various ways to schedule kanban jobs.

The **Kanban job scheduling** page provides visual control over the schedules of lean manufacturing work cells. It gives an overview of all kanban jobs and provides multiple filtering capabilities. From this page, you can move to all other pages that are related to kanban configuration and execution.

Automatic scheduling of kanban jobs

Scheduling can be triggered automatically if you set the **Automatic planning quantity** parameter on the kanban rule. If you set **Automatic planning quantity** to **1**, each kanban job is planned immediately when it's created. The result is a series of first pull, first serve operations. If you set **Automatic planning quantity** to a value that is more than 1, kanban jobs are grouped before they are planned.

This concept enables kanban sizes to be reduced below the actual economic batch sizes. For example, the economic batch size for a specific item (or item family) is 30. Instead of creating kanbans that use the product quantity, 30, you can configure the kanban rule so that it has a product quantity of 10 and an **Automatic planning quantity** value of **3**. Although automatic planning schedules the kanban jobs for the work cell only when three unplanned jobs exist, it's fully transparent to the planner and the shop floor supervisor that two unplanned jobs might be awaiting execution. The planner or shop floor manager can then take those two jobs into production by manually planning them or creating additional kanbans.

Manual scheduling

For manual scheduling, finance and operations introduced the kanban scheduling board. Manual scheduling can be combined with automatic scheduling. The kanban scheduling board lets you plan and unplan jobs, moved them in sequence, or move them from period to period. Jobs that are based on a kanban rule where the **Automatic planning** value is more than **0** can be manually unplanned. However, these jobs will be replanned when the next automatic planning event occurs (that is, when a new kanban is created). The following options are available for manual scheduling:

- **Schedule** schedules the selected jobs according to their due date. (This option resembles automatic planning.)
- **Schedule forward from date** tries to schedule the selected jobs according to their due date but constrains the result by using the specified earliest start date.
- **Backward** moves the selected scheduled jobs back in the sequence within the period.
- **Forward** moves the selected scheduled jobs forward in the sequence with the period.
- **Previous period** moves the selected scheduled jobs to the start or end of the previous period.
- **Next period** moves the selected scheduled jobs to the start or end of the next period.
- **Plan** > **Revert job status** lets you unschedule a scheduled job.

Lean scheduling groups

Each color represents a lean scheduling group. Lean scheduling groups can be freely defined as generic groups or as groups that belong to a single work cell. Items and dimensions can be freely assigned to the scheduling groups. For example, in a Painting cell, a schedule group can represent a color of the product. In work that is driven by specific tooling requirements, items might be grouped by tool requirement, and a packaging work cell might group items by packaging template. The use of colors for lean scheduling groups is optional but recommended. It improves visibility into the status of the plan. For example, it's very easy to see which colors are produced on which day, and you can tell at a glance how this work can be optimized.

Work cell capacity and period capacity

The capacity of a lean work cell is always concurrent capacity. In other words, multiple jobs can be active in a work cell at the same time. The capacity can be tracked in two modes: throughput and hours.

Throughput

The capacity of a work cell is defined by the average throughput quantity of a reference period (standard workday, week, or month). The actual capacity per day or week is then calculated based on the working times of the calendar that is assigned to the work cell. The capacity that is loaded by job is the quantity of the job, adjusted by the throughput ratio of the item in the work cell.

Hours

The available capacity by day or week is defined by the calendar that is assigned to the work cell. The capacity that is loaded by job is the cycle time of the activity, adjusted by the quantity (default activity quantity versus actual job quantity) and the throughput ratio of the item in the work cell.

Period capacity FactBox

The **Kanban job scheduling** list page contains a FactBox that shows the available and booked period capacity for the selected work cell. Depending on the selected schedule periods in the production flow model, the periods show days or weeks.

Job scheduling

09/19/2025

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. Use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. Assign these jobs to the operations resources that perform them. Job scheduling also lets you synchronize all jobs that the selected job references. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can run only on one machine at a time, or when you want to optimize the job that runs for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. Use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that the production route specifies. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This method is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This method is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that's available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that uses finite materials ensures that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they're required.

Finite properties

Job scheduling that uses special properties requires that you specify properties for the operations on the production route. The system must fulfill these properties to reserve capacity.

References

Job scheduling schedules all productions that the current production references. If a production has one or more subproductions, schedule the subproductions at the same time as the main production, because you can't start the main production until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- *Duration* – The scheduling engine selects the resource that has the shortest lead time.
- *Priority* – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

> ⓘ **Note**
>
> Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Action center message is displayed, and job scheduling doesn't find the best alternative resource.

When you run job scheduling, the system plans the resources based on the limitations that you define in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process.

> ⓘ **Note**
>
> For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Job scheduling assigns resources to jobs. You can set maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of

resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling uses the efficiency percentages that you specify for the resources. Efficiency percentages reduce or increase the time that the system reserves for the resource. Therefore, lead time also increases or decreases. The system uses the following formula for the calculation: `Scheduling time = Time × 100 ÷ Efficiency percentage`. In this formula, *Time* includes both the run time and the setup time.

Kanban transfer board support for bar code scanners

The Kanban transfer board supports scanner input from a widget bar code scanner to Select, Start, Complete, and Empty a kanban job.

Registration modes

On the **Scanner registration** FastTab you can select the registration mode, which controls the action when you scan a kanban card number or manually type the number in the Kanban card number field.

Expand table

Set registration mode	Description
Start	Registers a Kanban transfer job as in progress.
Complete	Registers a Kanban transfer job as completed.
Empty	Registers the material handling unit that is referenced by a Kanban card as empty.
Select	Registers a Kanban card number and automatically selects the referenced job in the Kanban list.

Registration mode Select

When you use a bar code reader to select a job, the display mode of the kanban board changes. In this mode, the following conditions apply:

- Only the scanned kanban job is displayed.
- The details of the selected job are displayed in the **Details** FastTab.
- The **Messages** FastTab displays messages only for the selected job.
- You can change the status of the job by using the functions that are available on the Action Pane. The Kanban transfer board continues to display only a single job during this time.
- You can update the information in the list of jobs manually by clicking **Refresh** (Shift+F5) on the Action Pane. After you refresh the information, the full results for the job filter are

displayed again.

Job status and possible actions

The status of the selected job and the status of any pegged jobs for event kanbans, determine whether you can process the job further. The following table displays information about these statuses and tasks:

- The statuses that are available for jobs, or for the handling units that are referenced by the jobs.
- Each task that you can perform for the job.

Expand table

Job type	Job status or handling unit status	Update picking list	Start	Update registration	Complete	Empty	Create event kanbans
Transfer	• Not planned • No pegged jobs, or pegged jobs are Completed	Yes	Yes	Yes	Yes	No	Yes
Transfer	• Not planned • The pegged job is not Completed	Yes	No	Yes	No	No	No
Transfer	In progress	Yes	No	Yes	Yes	No	No
Transfer	Completed	No	No	No	No	Yes	No
Transfer or process	Empty	No	No	No	No	No	No
Transfer or process	A kanban card is not found	No	No	No	No	No	No

Job type	Job status or handling unit status	Update picking list	Start	Update registration	Complete	Empty	Create event kanbans
Transfer or process	A kanban card is found, but it is not assigned to a kanban	No	No	No	No	No	No
Process	• Not planned • Prepared • In progress	No	No	No	No	No	No
Process	Completed	No	No	No	No	No	No

Production feedback

Article • 06/21/2024

This article provides information about production feedback, which lets workers provide feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers the opportunity to provide feedback about production jobs. It lets workers record time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished.

Workers can also provide production feedback using the production floor execution interface, which is part of the manufacturing execution functionality in the **Production control** module. The production floor execution interface has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The production floor execution interface has a touch-optimized user interface. Feedback submitted through the production floor execution interface updates the production journals.

Create a production flow version

Article • 04/19/2024

This procedure focuses on creating a new production flow version. For this procedure, the production parameters for lean manufacturing and the units of measurement for class time must be defined. You also need to define a value stream and a production group. The demo data company used to create this procedure is USMF.

Create a production flow

1. Go to Production control > Setup > Lean production flow > Production flows.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. In the Name field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.

    - Select an operating unit of type value stream. A value stream is an operating unit that spans all activities and flows of the value stream. At this stage, operating units are limited to a legal entity and have no further functionality.

7. In the Production group field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.

    - Select a production group for the production flow. Production groups allow the definition of material, labor, and WIP accounts for a production process. To associate the accounting context to a production flow, a production group must be selected.

9. Click Save.

Create a production flow version

1. Click Add.
2. In the Expiration date field, enter a date and time.

    - If required, define an Expiration date for the version. You can update it at any given time, even for active versions. You can use it to plan to phase out a version.

3. Click OK.

4. In the list, mark the selected row.
5. In the Unit field, type a value.
6. ResolveChanges the Takt unit.
7. In the Average takt time field, enter a number.

    - Define the Average takt time of the version. For the takt control of the production flow version, define a targeted average takt time. The takt is defined as quantity per time period. In the example, the takt time is 0.2 hours per 10 pieces. For a working time of 8 hours, this corresponds to a daily throughput capacity of 400 pieces.

8. In the Quantity per cycle field, enter a number.

    - Define the quantity per cycle related to the Average takt time.

9. Toggle the expansion of the Version details section.
10. In the Minimum takt time field, enter a number.

    - Define the minimum takt time. The minimum takt time must be less than or equal to the average takt time.

11. In the Maximum takt time field, enter a number.

    - The maximum takt time must be higher than or equal to the Average takt time.

12. In the Period for actual cycle time (days) field, enter a number.

    - Enter the number of days in the Period for actual cycle time. The period for actual cycle time is the number of days that jobs are aggregated from the actual minute backwards to calculate the actual cycle time. The value can be changed at any time and is only used for the calculation of the actual cycle times.

13. Click Save.

Create process activities for lean manufacturing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Create a process activity for lean manufacturing.

Prerequisites:

1. A production flow and version that is not active must be created.
2. A work cell must be created.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.

Create a new activity

1. Click Activities.
    - Ensure that the selected production flow has a version in draft and select that version.
2. Click Create new plan activity.
3. Click Next.
4. In the Name field, type a value.
5. In the Name field, type a value.
    - Note that the name must be unique for a given production flow for all versions.
6. In the Process quantity field, enter a number.
    - Note that no matter what job quantity will be processed, this is the minimum quantity per job to calculate the labor cost. If job quantities deviate from this

quantity, labor cost variance will be created.

7. Click Next.

Select the work cell

1. In the Work cell field, click the drop-down button to open the lookup.
2. In the list, click the link in the selected row.

Define the inventory updates

1. Select or clear the Update on hand receipt check box.

    - If Update On hand = No, you can define the activity to receive a semi-finished product (the activity does not reach the next BOM level). You can also select to consume semi-finished products.

Define the picking activities

1. Click Next.
2. In the list, mark the selected row.

    - A default picking activity is created for the input location of the selected work cell.

3. Click Add.

    - You can create additional picking activities for specific products, that are not staged at the work cell input activity.

4. In the list, find and select the desired record.
5. In the Item number field, type a value.
6. In the Warehouse field, click the drop-down button to open the lookup.

    - With this definition, all materials consumed in the activity are picked from the default input warehouse and location except the item that is defined in the second picking activity. This item will be picked from a different warehouse and location.

7. In the list, find and select the desired record.
8. In the list, click the link in the selected row.
9. Select or clear the Register scrap check box.
10. Click Next.

Define the activity times

1. In the list, find and select the desired record.

    - The definition of a Runtime is required. The Runtime is used to calculate costs and the throughput times of the kanban jobs. Runtimes are not used to calculate capacity load and consumption, this is calculated by cycle time, derived from the production flow version task.

2. In the Time field, enter a number.
3. In the Unit field, type a value.
4. Select the Time unit.
5. In the Per quantity field, enter a number.
6. In the list, find and select the desired record.

    - Queue times are optional.

7. In the Time field, enter a number.
8. In the Unit field, type a value.
9. Select the Time unit.
10. In the Per quantity field, enter a number.
11. Click Next.
12. Click Finish.
13. Close the page.

Last updated on 06/19/2025

Create transfer activities for lean manufacturing

Article • 09/29/2021

Create a transfer activity for lean manufacturing.

Prerequisites:

1. A production flow and version that is not active must be created.
2. The from and to warehouse and locations must be created. Optionally, the replenishing or the replenished work cell should be created.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
    - Note that the production flow must have a version in draft status.
3. In the list, click the link in the selected row.

Create a new activity

1. Click Activities.
    - Ensure that the selected production flow has a version in draft and select that version.
2. Click Create new plan activity.
3. Click Next.
4. In the Name field, type a value.
5. In the Activity type field, select 'Transfer'.
6. In the Process quantity field, enter a number.
7. Click Next.

Select the Work cells

1. In the Replenishing field, click the drop-down button to open the lookup.

- To use the work cell output location as the from location in the transfer activity, select a work cell. The same can be done with the replenished work cell, which sets the target location of the transfer activity.

2. In the list, click the link in the selected row.

Define the inventory updates

1. In the Product type field, select an option.

    - Note that a transfer does not change the type of product. You can transfer finished products or semi-finished products (transfer between two activities of a production flow and possibly a kanban flow). When transferring finished products, you can select if picking or receiving results in an inventory transaction.

Define the transfer locations

1. Click Next.
2. In the Warehouse field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. In the Location field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. In the Freighted by field, select 'Shipper'.

    - Options include: Shipper - the organization operating the shipping warehouse, Recipient - the organization operating the receiving warehouse, Carrier - a third party vendor. If the operating organization is a vendor, the transfer activity requires a subcontracting agreement.

8. Click Next.

Define the activity times

1. In the list, find and select the desired record.

    - The definition of a Runtime is required. The Runtime is used to calculate cost and the throughput times of the kanban jobs. Runtimes are not used to calculate capacity load and consumption, which is calculated by cycle time, derived from the production flow version task.

2. In the Time field, enter a number.
3. In the Unit field, type a value.
4. Select the Time unit.
5. In the Per quantity field, enter a number.
6. In the list, find and select the desired record.

    - Queue times are optional.

7. In the Time field, enter a number.
8. In the Unit field, type a value.
9. Select the Time unit.
10. In the Per quantity field, enter a number.
11. Click Next.
12. Click Finish.
13. Close the page.

Validate a production flow and version

Article • 09/29/2021

This procedure shows how to create a new production flow and a first version for lean manufacturing. Prerequisites: The production parameters for Lean manufacturing and the units of measure for class time must be defined. You need to define a Value stream and a Production group. This procedure refers to the legal entity USMF in demo data. However, assuming that the legal entity is configured for Lean manufacturing, other legal entities can be used.

Create a production flow

1. Go to Production control > Setup > Lean production flow > Production flows.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. In the Name field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.

    - A value stream is an operating unit that spans over all activities and flows of the value stream. At this stage, operating units are limited to a legal entity and have no further functionality.

7. In the Production group field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.

    - Production groups allow the definition of material, labor, and WIP accounts for a production process. To associate the accounting context to a production flow, a production group must be selected.

9. Click Save.

Create a production flow version

1. Click Add.
2. In the Expiration date field, enter a date and time.

    - You can update the Expiration date of the version at any given time, even for active versions. Use the expiration of the version to plan for a phase out of a version.

3. Click OK.
4. In the list, mark the selected row.
5. In the Unit field, type a value.
6. Select the Takt unit.
7. In the Average takt time field, enter a number.

    - For the takt control of the production flow version, define a targeted average takt time. The takt is defined as quantity per time period. In the given example, the takt time is 0.2 hours per 10 pieces. For a working time of 8 hours, this corresponds to a daily throughput capacity of 400 pieces.

8. In the Quantity per cycle field, enter a number.
9. Expand or collapse the Version details section.
10. In the Minimum takt time field, enter a number.

    - The minimum takt time must be less than or equal to the average takt time.

11. In the Maximum takt time field, enter a number.

    - The maximum takt time must be higher than or equal to the Average takt time.

12. Enter a number of days in the Period for actual cycle time

    - The period for actual cycle time is the number of days that jobs are aggregated from the actual minute backwards to calculate the actual cycle time. The value can be changed at any time and is only used for the calculation of the actual cycle times.

13. Click Save.

Activate a production flow version

Article • 09/29/2021

Before kanban jobs can be created and activities can be processed for a production flow version, you should activate the version. As a best practice, activate the version before its effective start date and time expire. To complete this task, you must have a production flow version that has the Draft status in order to activate the version.

Find and activate a production flow version

1. Go to Production flows.
2. In the list, find and select the desired record.

    - Select a production flow version that has Draft in the Plan status field.

3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.

    - Select a production flow version that has Draft in the Plan status field.

5. Click Activate.
6. Click OK.

Create activity relation - Successor

Article • 09/29/2021

The flow of activities in a lean production flow is documented through activity relations. This recording shows how to create an activity relation.

Prerequisites:

- A production flow and version in draft mode.
- Two activities that follow each other in the production flow are created but not related.

Find the production flow version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, mark the selected row.
5. In the list, select a draft version.

    - Activity relations can be added to both draft or active versions of a production flow.

Open the activity overview

1. Click Activities.

    - Note that the form shows all activities of the production flow that are allocated to the Version of the production flows that you are working in.

Add a Successor

1. Click Add successor.
2. In the Activity field, click the drop-down button to open the lookup.
3. In the list, find and select the desired record.
4. In the list, click the link in the selected row.
5. Select the Constraint check box.
6. In the Constraint value field, enter a number.

- The constraint time is the time to be scheduled between the scheduled end of the predecessor (due date and time) and the scheduled start of the successor.

7. In the Units field, type a value.
8. In the Cycle time ratio field, enter a number.

    - If both activities run at the same takt, the cycle time ratio should be 1. If the predecessor runs at the double speed of the successor, the ratio should be 2. The cycle time ratios are used to calculate the individual cycle times of the production flow activities.

9. Click OK.
10. Close the page.
11. Click the GridPanel tab.
12. Close the page.
13. Refresh the page.

Add a predecessor to a production flow activity

Article • 04/19/2024

In a production flow version, all activities must be sequenced. An activity can have one or multiple predecessors or successors.

This procedure shows how to associate a predecessor to an activity.

To perform this task, you need a production flow that has the Draft version with at least two activities that can be connected.

To learn more, read the white paper Lean manufacturing: Production flows and activities.

Find the production flow and version

1. Go to Production control > Setup > Lean production flow > Production flows.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. In the list, find and select the desired record.
5. Click Activities.

Select an activity and add a predecessor

1. In the list, find and select the desired record.
2. Click Add predecessor.
3. In the Activity field, enter or select a value.
4. In the Cycle time ratio field, enter a number.

    - The default cycle time ratio of an activity relation is 1. This assumes that both activities run at the same pace or takt time. If the predecessor runs at a higher pace (lower takt time), the ratio should be lower than 1, if the predecessor runs at a slower pace (higher takt time) the cycle time ratio is greater than 1.

5. Click OK.

Create a value stream

Article • 09/29/2021

Value streams are operating units, that group one or multiple production flows. To define a production flow, you first must define a value stream.

Open the form

1. Go to Production control > Setup > Lean production flow > Value streams.

Create a new value stream

1. Click New to open the drop dialog.
2. In the Name field, type a value.

Select a value stream manager

1. In the Manager field, click the drop-down button to open the lookup.
    - The value stream manager is defined to document the organization.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.

Save and close

1. Click Save.
2. Close the page.
3. Refresh the page.

Lean pegging from sales orders

Article • 09/29/2021

This procedure focuses on validating the pegging tree from a sales line where the item is produced with kanbans. After validating the pegging tree, all the kanban jobs are planned. This is useful for order scenarios where the order taker needs to ensure that production can start right away. The demo data company used to create this procedure is USMF. This procedure is intended for the advanced order taker working in a lean company.

Create a sales order for a kanban controlled item

1. Go to All sales orders.
2. Click New.
3. In the Customer account field, enter or select a value.
    - Use US-001.
4. Click OK.
5. In the Item number field, type 'L0001'.
6. Set Quantity to '30'.
    - It is important that the quantity is higher than 24 in order to trigger the event kanban rule.

Open a pegging tree

1. Click Product and supply.
2. Click View pegging tree.
    - Notice that the pegging tree shows all levels of the pegging needed for the sales order line. In this case, there are two levels of kanbans and all the required components.

Plan the pegging tree

1. In the tree, select 'Sales line 000832\Kanban 000558'.
2. Expand the Kanban jobs section.

- Notice that the job status for the kanban job is Not planned.

3. Click Plan entire pegging tree.

    - This will plan all kanban jobs in the pegging tree, changing the Job status from Not planned to Planned.

4. Refresh the page.

    - Notice that the kanban Job status changed from Not planned to Planned.

5. In the tree, select 'Sales line 000832\Kanban 000558\Issue for L0001\Kanban 000559'.

    - The job for the second kanban is also planned, because the entire pegging tree is planned. Notice that the kanban job status is changed from Not planned to Planned.

Create a subcontracted work cell for lean manufacturing

Article • 09/29/2021

To model subcontracted work for lean manufacturing, you must create a work cell that is associated with the vendor that provides the work. A subcontracted work cell is linked to the vendor through the association of a resource of the Vendor type. If you play this recording in the USMF demo company, you can select vendor account ID 1002 and site 1.

Create a vendor resource

1. Go to Resources.
2. Click New.
3. In the Resource field, type a value.
4. In the Description field, type a value.
5. In the Type field, select 'Vendor'.
6. In the Vendor field, click the drop-down button to open the lookup.

Create the resource group

1. Go to Resource groups.
2. Click New.
3. In the Resource group field, type a value.
4. In the Description field, type a value.
5. In the Site field, click the drop-down button to open the lookup.

    - Select the site that the work cell should be allocated to. In theory, a site can represent a single site that is operated by a vendor. However, in most cases, subcontracted resources are just allocated to the site that orders the subcontracted work. Note that the input and output warehouses of subcontracted work cells must be on the same site.

6. In the Site field, type a value.
7. @SysTaskRecorder:_RequestClose
8. Select or clear the Work cell check box.
9. In the Input warehouse field, click the drop-down button to open the lookup.

- Select the warehouse and location that are used to stage the material for the vendor-managed work cell. In many cases, the warehouse and location are modeled by using a separate warehouse per vendor and one location per work cell.

10. In the Input location field, click the drop-down button to open the lookup.
11. In the Output warehouse field, click the drop-down button to open the lookup.

    - Define the warehouse and location where the material is posted when the subcontracted activities of the work cell are posted. The warehouse and location can be at the vendor site if the vendor reports the kanban jobs. Alternatively, the warehouse and location can be the receiving location that is associated with the next step of the production flow.

12. In the Output location field, click the drop-down button to open the lookup.
13. Expand or collapse the Calendars section.
14. Click Add.
15. In the Calendar field, click the drop-down button to open the lookup.

    - Associate the working time calendar of the work cell with the resource group. For critical resources, we recommend that you define specific calendars that represent the exact working times and related capacities of the work cell or vendor site.

16. Expand or collapse the Resources section.
17. Click Add.

    - A subcontracted resource group must have an associated resource of the Vendor type that links the resource group to the vendor account.

18. In the Resource field, click the drop-down button to open the lookup.

    - Select or enter the vendor resource that you created in the previous sub-task.

19. Expand or collapse the Work cell capacity section.
20. Click Add.

    - A work cell must have a defined capacity. In this example, we create a throughput capacity of 100 pieces per standard workday.

21. In the Production flow model field, click the drop-down button to open the lookup.
22. In the Capacity period field, select an option.
23. In the Average throughput quantity field, enter a number.
24. In the Unit field, click the drop-down button to open the lookup.

25. ResolveChanges the Unit.

Add a kanban quantity calculation policy to a kanban rule

Article • 09/29/2021

This procedure focuses on creating a kanban quantity calculation policy and adding it to a kanban rule to optimize the kanban size and quantities. The demo data company used to create this procedure is USMF. This procedure is intended for the value stream manager. This procedure is a prerequisite for creating the procedure Calculate kanban quantity suggestions.

Create a kanban quantity calculation policy

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Kanban quantity calculation policies.
2. Click New.
3. In the Name field, type a value.
    - For example, type Speaker2016.
4. In the Master plan field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.
    - Select StaticPlan to calculate demand.
6. In the list, click the link in the selected row.
7. Click Save.
8. In the Minimum kanban quantity field, enter '1'.
    - This is the additional number of kanbans that is included in the kanban quantity calculation.
9. Set Safety factor to '1'.
    - This is the factor that is used to calculate additional quantity of safety stock.
10. In the Days ahead field, enter '30'.
    - This is the number of days prior to the kanban quantity calculation date that is included in the demand calculation.
11. In the Days behind field, enter '30'.

- This is the number of days forward from the kanban quantity calculation date that is included in the demand calculation. The formula used for the calculation is shown with the actual values. For example, Kanban quantity = ((Average daily demand x lead time x 2.00) / Product quantity per handling unit) + 1

12. Close the page.

Add the kanban quantity calculation policy to a kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. In the list, find and select the desired record.

    - Select kanban rule 000020 for this procedure.

3. In the list, click the link in the selected row.
4. Toggle the expansion of the Kanban quantity calculation policies section.
5. Click Add.

    - Add the kanban quantity calculation policy that you have just created in the previous sub-task.

6. In the list, mark the selected row.
7. In the Name field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.

    - Select the policy Speaker2016 that you have just created in the previous sub-task.

Calculate kanban quantity suggestions

Article • 09/29/2021

This procedure focuses on optimizing the kanban size and quantities for a specific kanban rule by using the kanban quantity calculation. The demo data company used to create this procedure is USMF. This procedure is intended for the value stream manager. It is a prerequisite that you have completed the procedure Add a new kanban quantity calculation policy to a kanban rule.

Create a kanban quantity calculation

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Calculate kanban quantity.
2. Click New.
3. In the Name field, type 'Speaker2016'.
4. In the Name field, click the drop-down button to open the lookup.

    - Select the policy that you have created in the procedure Add a new kanban quantity calculation policy to a kanban rule. For example, Speaker2016.

5. In the list, click the link in the selected row.
6. In the Rule active as of date field, set the date and time to '2012-12-17T08:00:00'.

    - This date serves as the basis for determining which fixed kanban rules are included in the kanban quantity calculation.

7. In the Fulfilled demand period start date field, set the date and time to '2012-11-17T09:00:00'.

    - The date from when past demand transactions are included to calculate the kanban quantity.

8. In the Fulfilled demand period end date field, set the date and time to '2012-12-17T07:59:59'.

    - The date until when past demand transactions are included to calculate the kanban quantity.

9. In the Demand period start date field, set the date and time to '2012-12-17T08:00:00'.

    - The date from when current demand transactions are included to calculate the kanban quantity.

10. In the Demand period end date field, set the date and time to '2013-01-16T07:59:59'.

    - The date until when current demand transactions are included to calculate the kanban quantity.

Generate kanban quantity proposal

1. Click Save.
2. Click Generate.

    - This generates a kanban quantity proposal line for the kanban rule 000020.

Run kanban quantity calculation

1. Click Calculate.

    - This calculates the kanban quantity proposal.

2. Click OK.
3. In the list, mark the selected row.

    - Notice the suggested kanban quantity is 2.

Change product quantity and calculate again

1. Set Product quantity to '5'.
2. Click Calculate.
3. Click OK.

    - Notice that with a kanban quantity of 5, the suggestion is changed to a kanban quantity of 4.
    - This is caused by the fact that with a lower product quantity, we need more kanbans to fulfill the demand.

Update kanban rule

1. In the Rule effective date field, enter a date and time.

    - Set the 'Rule active as of date' to a date in the future. For example, today + one year.

2. Click Update.
3. Click OK.
4. Close the page.

Validate change on kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. In the list, click the link in the selected row.
    - Select the kanban rule that was created in the previous sub-task. This should be the first kanban rule in the list sorted by number.
3. Toggle the expansion of the Details section.
    - Notice the effective date, which means that this rule is not activated until this date.
4. Toggle the expansion of the Quantities section.
    - Notice this is the default quantity that you entered on the kanban quantity calculation.
    - Notice this is the fixed kanban quantity of 4 from the kanban quantity calculation.
5. Click the ListPanel tab.

Change kanban rules for a process job

Article • 09/29/2021

This procedure focuses on changing the used kanban rule for a given kanban. This is useful to level load resources or in case of breakdown. The demo data company used to create this procedure is USMF. This procedure is intended for the planner, working at a lean manufacturing company, responsible for the value stream.

Copy kanban rule

1. Go to Kanban rules.
2. In the list, find and select the desired record.

    - Select Event Kanban rule 000022 for L0001.

3. Click Duplicate kanban rule.
4. Click OK.

Change kanban rule

1. Close the page.
2. Go to Kanban job scheduling.
3. In the list, mark the selected row.

    - Select line with Kanban 000177.

4. Click Use alternative kanban rule.
5. Click Next.
6. In the Kanban rule field, enter or select a value.

    - Select the kanban rule that was created earlier. This is the kanban rule with the highest number.

7. Click Finish.

    - Now the kanban job is using an another kanban rule. This can be useful to level load work cells.

Create a BOM line event kanban rule

Article • 09/29/2021

This task focuses on the setup needed to create an event kanban rule to ensure supply for production BOM lines in a mixed lean and classic production environment. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product.

Create a new kanban rule

1. Go to Production control > Periodic tasks > Kanban quantity calculation > Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
    - The Withdrawal type is used to create transfer kanbans.
4. In the Replenishment strategy field, select 'Event'.
    - The Event strategy is selected to create the transfer of kanbans based on an event. Later in the task guide, we will trigger it by estimating a production order.
5. In the First plan activity field, enter or select a value.
    - Enter or select ReplenishSpeakerComponents. This transfer activity has receipt (output) warehouse and location 12, which means that material will be moved to location 12 in warehouse 12.
6. Expand the Details section.
7. In the Product field, enter or select M0001.
8. Expand the Events section.
9. In the BOM line event field, select 'Automatic'.
    - With the BOM line event field set to Automatic, kanban will be created to fulfill material needs for production order BOM lines.
10. Close the page.

Create and modify a new production order

1. Go to Production control > Production orders > All production orders.
2. Click New production order.
3. In the Item number field, enter or select a value.
    - Enter or select 'L0001'. We use item L0001 because item M0001 is included in the BOM for item L0001.
4. Click Create.
5. In the list, click the link in the row for L0001
6. Click BOM.
7. In the list, click the link in the selected row.
8. Click Edit.
9. In the Line type field, select 'Pegged supply'.
    - Pegged supply is selected to trigger the supply creation of a kanban.
10. Select No in the Resource consumption field.
    - Clearing the check box of Resource consumption lets us change the warehouse.
11. Expand the Inventory dimensions section.
12. In the Warehouse field, type '12'.
    - Warehouse is set to 12 because this is the output warehouse for the withdrawal activity.
13. In the Location field, type '12'.
    - Location is set to 12 because this is the output location of the withdrawal activity.
14. Close the page.
15. Close the page.

Estimate the production order and view the kanban created

1. Click Estimate.
    - Estimating the production order will trigger the creation of the associated kanban to supply item M0001.
2. Click OK.

3. Close the page.
4. Close the page.
5. Go to Product information management > Lean manufacturing > Kanban rules.
6. In the list, click the link in the selected row.

    - Select the event kanban rule created for item M0001.

7. Expand the Kanbans section.
8. In the list, mark the selected row.

    - Notice the kanban created to supply M0001 for the estimated production order.
    - This is the last step!

Create a fixed quantity kanban rule for manufacturing

Article • 09/29/2021

This procedure focuses on the setup needed to create a fixed manufacturing kanban rule for triggering transforming activities, at a work cell, in a lean environment. The demo data company used to create this procedure is USMF. This procedure is intended for the Process Engineer or the Value Stream Manager, as they prepare production of a new or modified product.

Create new kanban rule

1. Go to Kanban rules.
2. Click New.
    - Notice that the default Type is Manufacturing and Replenishment strategy is Fixed. You do not have to change these parameters.
3. In the First plan activity field, enter or select a value.
    - This is the activity that will be performed for kanbans created based on this kanban rule. Select 'SpeakerTestAndPackaging'.
4. Expand the Details section.
5. In the Product field, enter or select a value.
    - Select L0050.
6. In the Unit of measure field, enter or select a value.
    - Select minutes.
7. In the Lead time field, enter a number.
    - Enter 5.

Set quantities

1. Expand the Quantities section.
2. Set Default quantity to '10'.
    - This is the quantity that will be transferred for each kanban.

3. Select the Product quantity variance check box.

    - With this, selected kanbans can be completed with a variance from the default quantity. To allow kanbans to be completed with a quantity from 8 to 12, set both variances to 2.

4. Set Variance below to '2'.

    - This will allow completing down to 10 - 2 = 8

5. Set Variance above to '2'.

    - This will allow completing up to 10 + 2 = 12

6. In the Fixed kanban quantity field, enter a number.

    - This is the amount of kanbans that should be active. In this case, 5 kanbans processing 10 each.

7. In the Alert boundary minimum field, enter '2'.

    - Used to keep track of the minimum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.

8. In the Alert boundary maximum field, enter '4'.

    - Used to keep track of the maximum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.

9. In the Automatic planning quantity field, enter '1'.

    - Setting this to 1 means that every kanban will be automatically planned. If we entered 3, the kanbans would not be planned until 3 empty kanbans are ready for planning. This is useful for grouping work and avoiding too much setup.

Create Kanbans

1. Expand the Kanbans section.
2. Click Save.

    - The kanban rule needs to be saved before kanbans can be created.

3. Click Add.

- Note that there are no active kanbans, due to this the suggested 'Number of new kanbans' are 5. This is equal to the 'Fixed kanban quantity'.

4. Click Create.

- This will create 5 kanbans.
- Note that 5 kanbans, for 10 each, was created for this manufacturing kanban rule. This is the last step in this procedure.

Create a kanban rule using a kanban line event

Article • 09/29/2021

This procedure creates a kanban rule by using the kanban line event setting to trigger pull from a process activity. The kanban rule is triggered by a kanban process activity, with a quantity equal to or greater than 25 each. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Event'.

    - This generates kanbans directly from demand. It is used to set up rules that define a make-to-order scenario.

4. In the First plan activity field, enter or select a value.

    - Enter or select SpeakerAssemblyAndPolish. The first activity of a manufacturing kanban rule is a process activity in the production flow. When you select the activity, the validity dates of the activity are copied to the validity dates of the kanban rule.

5. Expand the Details section.
6. In the Product field, type 'L0001'.
7. Expand the Events section.
8. In the Kanban line event field, select 'Automatic'.

    - This generates event kanbans on demand. The field is used to configure kanban rules that replenish material that is required for a downstream process activity. When you select Automatic, the event kanbans are created with the demand. This setting is recommended if you expect to execute production on the same day.

9. Set Minimum event quantity to '25'.

- Event kanbans are generated when the demand quantity is equal to or more than this field. This is useful if you want to produce an order quantity less than this field on one machine and more than this field on another machine.

10. Click Save.

Create sales order and trigger kanban chain

1. Go to Sales and marketing > Sales orders > All sales orders.
2. Click New.
3. In the Customer account field, enter or select a value.

    - Select Customer account US-003, Forest Wholesales.

4. Click OK.
5. In the Item number field, type 'L0001'.

    - L0001 is the item for which you created the kanban rule.

6. Set Quantity to '27'.

    - Because 27 is higher than the minimum quantity of 25 on the kanban rule, this will trigger an event kanban.

7. In the Site field, type '1'.
8. In the Warehouse field, enter or select a value.

    - Select warehouse 13.

9. Click Save.

View the kanban generated by the kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. In the list, find and select the desired record.
3. Expand the Kanbans section.

    - Notice that a kanban for 27 was created to process the activity based on the created kanban rule.
    - This is the last step.

Create a kanban rule using a minimum stock event

Article • 09/29/2021

This procedure focuses on the setup needed to create a kanban rule using a minimum stock event to ensure that a specific product is always available at a specific location. A kanban rule is created to transfer material to the location when the inventory level drops below 200 pieces. By running the Pegging event processing, the needed kanbans are created. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a new kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
    - This type is used to create transfer kanbans.
4. In the Replenishment strategy field, select 'Event'.
    - The Event strategy is used to create the transfer kanbans based on an event. Later in the procedure, you will trigger transfer kanbans by using stock replenishment.
5. In the First plan activity field, enter or select a value.
    - Enter or select ReplenishSpeakerComponents. This transfer activity has receipt (output) warehouse and location 12, which means that materials will be moved to location 12 in warehouse 12.
6. Expand the Details section.
7. In the Product field, enter or select a value.
    - Select M0007.
8. Expand the Events section.
9. In the Stock replenishment event field, select 'Batch'.
    - This creates kanbans to fulfill material needs at the related location during Pegging event processing.

Set the minimum quantity for the item

1. Click to follow the link in the Product field.
2. Click to follow the link in the Item number field.
3. Expand the Product image FactBox.
4. On the Action Pane, click Plan.
5. Click Item coverage.
6. Click New.
7. In the list, mark the selected row.
8. In the Warehouse field, enter or select a value.

    - Set Warehouse to 12.

9. Set Minimum to '200'.

Run the batch event creation job

1. Go to Production control > Periodic tasks > Kanban job batch processing > Pegging event processing.
2. Click OK.
3. Go to Product information management > Lean manufacturing > Kanban rules.
4. In the list, click the link in the selected row.

    - Select the kanban rule that you created earlier.

5. Expand the Kanbans section.

    - Notice that a kanban was created to transfer the needed material to warehouse 12.

Create a kanban rule for multiple activities

Article • 09/29/2021

This procedure shows how to create a kanban rule that includes multiple activities from a production flow. The demo data company used to create this task is USMF. This task is intended for the process engineer or the value stream manager, as they prepare production of a new or modified product in a lean environment.

Create a new kanban rule

1. Go to Product information management > Lean manufacturing > Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Scheduled'.
4. In the First plan activity field, enter or select a value.
    - Select SpeakerAssemblyAndPolish.
5. Select the Multiple activities check box.
    - The purpose is to include more than one activity in the kanban rule. You choose a path in the production flow when you select the last plan activity.
6. In the Last plan activity field, enter or select a value.
    - Select SpeakerTestAndPackaging. After you select the value, a page automatically opens. Select the kanban flow SpeakerAssemblyAndPolish > SpeakerTestAndPackaging. Click OK.
7. Expand the Details section.
8. In the Product field, enter or select a value.
    - Select Item L0006.

Create kanban and view jobs

1. Expand the Kanbans section.
2. Click Add.
3. In the Number of new kanbans field, enter '1'.
    - This will create one kanban.

4. Set Product quantity to '3'.
    - Kanban will process 3 products.
5. In the Due date/time field, enter a date and time.
    - You can enter Today.
6. Click Create.
7. Click Details.
    - Notice that the kanban has two process jobs from the production flow. The first one is SpeakerAssemblyAndPolish, and the second one is SpeakerTestAndPackaging.
    - This is the last step!

Create a new kanban rule by duplicating an existing kanban rule

Article • 09/29/2021

This procedure focuses on creating a duplicate of an existing kanban rule. This is useful if you want to create new kanban rules based on existing kanban rules. The demo data company used to create this procedure is USMF. This procedure is intended for the process engineer or the value stream manager as they prepare production for a changed production flow or a new replenishment rule.

Select a kanban rule

1. Go to Kanban rules.
2. In the list, find and select the desired record.

    - Select kanban rule 000017 for Product M0006.

Duplicate a kanban rule

1. Click Duplicate kanban rule.

    - When duplicating a kanban rule, it is possible to change type, dates, activities, and the product selection. Change the product for this procedure in the next step.

2. In the Product field, enter or select a value.

    - Select M0007.

3. Click OK.

    - Note that a duplicate of kanban rule 000017 is created.

Create a replacement kanban rule

Article • 09/29/2021

This procedure focuses on replacing an existing kanban rule with a new kanban rule on a specific date. This is useful when changes in the production flow or replenishment rules need to be coordinated and scheduled. The demo data company used to create procedure is USMF. This procedure is intended for the process engineer or the value stream manager when they prepare production for a changed production flow or a new replenishment rule. This task replaces kanban rule 000022 with a new rule and increases the maximum quantity from 48 to 100 for the new rule.

Select a kanban rule to replace

1. Go to Kanban rules.
2. In the list, find and select the desired record.

    - Select kanban rule 000022.

Create a replacement kanban rule

1. Click Replace kanban rule.
2. In the Effective date field, enter a date and time.

    - Select a date in the future, such as one week from now. This is the date and time when the new kanban rule becomes active and replaces the old kanban rule.
    - If the kanban rule changes the path in the production flow, another activity can be selected. In this procedure, we will keep the activity untouched.

3. Click OK.

    - Notice that a new kanban rule is created to replace kanban rule 000022.
    - The effective date is set according to the date chosen when you replace the kanban rule.

4. In the list, find and select the desired record.

    - Select the replaced kanban rule 000022.
    - Notice that the replaced kanban rule has the same date as the Expiration date because this is the date when it will expire.

5. In the list, select row 1.

    - Select the new kanban rule on top of the list. This is the kanban rule with the highest kanban rule number.

6. In the list, click the link in the selected row.

    - Click the kanban rule number to open the kanban rule.

Modify maximum quantity for the replacement kanban rule

1. Set Maximum quantity to '100'.

    - Expand the Quantities FastTab to see the Maximum quantity field. Changing the maximum quantity to 100 will allow up to 100 kanbans to be processed. This is the last step in this task.

Create a sales event kanban rule

Article • 09/29/2021

This procedure focuses on the setup needed to create a kanban rule that is triggered during sales order creation. The event kanban rule replenishes requirements that originate from sales order lines. The demo data company used to create this procedure is USMF. It is intended for the process engineer or the value stream manager as they prepare production of a new or modified product.

Create a new kanban rule

1. Go to Kanban rules.
2. Click New.
3. In the Replenishment strategy field, select 'Event'.

    - Selecting Event means that the kanban rule is triggered by an event, for example, creation of a sales order line. This is applied to areas where each kanban should cover a specific demand.

4. In the First plan activity field, enter or select a value.

    - Select Final assembly.

5. Expand the Details section.
6. In the Product field, enter or select a value.

    - Select L0050.

Define an event

1. Expand the Events section.
2. In the Sales event field, select 'Automatic'.

    - By selecting the sales event Automatic, this kanban rule will be triggered automatically when a sales line matches the product and receipt location. In this procedure, it is product L0050 on warehouse 13.

3. Set Minimum event quantity to '50'.

    - With a minimum event quantity of 50, the kanban rule will only be triggered by events with a quantity of 50 or more.

4. Expand the Production flow section.

    - Notice that the Receipt location is warehouse 13. This means that this kanban rule will be triggered for this location.
    - In this example, a sales line for product L0050, with a quantity of 50 or more, on warehouse 13, will trigger this kanban rule.

Create sales line to trigger event kanban rule

1. Go to All sales orders.

    - A warning is shown when the kanban rule is saved, which means that kanbans will be created in real-time during sales order creation.

2. Click New.
3. In the Customer account field, enter or select a value.

    - For example, select US-003.

4. Click OK.
5. In the Item number field, type 'L0050'.
6. In the Site field, type '1'.

    - Select Site 1 because Warehouse 13 is on Site 1.

7. In the Warehouse field, enter or select a value.

    - Set Warehouse to 13.

8. Set Quantity to '75'.

    - Enter a quantity of 50 or greater, to trigger the created kanban rule.

Verify that kanban is created

1. Click Product and supply.
2. Click View pegging tree.

    - Notice that a kanban with the same quantity as the sales line is created. You can also see the material issues needed to produce L0050. This is the last step in this procedure.

Create a withdrawal kanban rule

Article • 09/29/2021

This procedure shows the setup that is needed to create a withdrawal kanban rule for transferring material in a lean environment. The demo data company used to create this procedure is USMF. This procedure is intended for the Process Engineer or the Value Stream Manager, as they prepare replenishment of new or modified material.

Create new kanban rule

1. Go to Kanban rules.
2. Click New.
3. In the Type field, select 'Withdrawal'.
    - The Withdrawal type is used for kanban rules to transfer material or goods.
4. In the First plan activity field, enter or select a value.
    - Select ReplenishSpeakerComponents. This activity is set up to move components from warehouse 11, location 11 to warehouse 12, and location 12.
5. In the Product field, enter or select a value.
    - Select M0007.
6. In the Lead time field, enter a number.
    - For example, 60.
7. In the Unit of measure field, enter or select a value.
    - For example, Minutes.

Set quantities for kanban

1. Set Default quantity to '5'.
    - This is the quantity that will be transferred for each kanban.
2. In the Fixed kanban quantity field, enter '2'.

- This is the amount of kanbans that should be active. In this case, 2 kanbans transferring 5 each.

3. In the Alert boundary minimum field, enter '1'.

    - Used to keep track of the minimum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.

4. In the Alert boundary maximum field, enter '2'.

    - Used to keep track of the maximum amount of full kanbans that should be at the destination. For example, this is used on the kanban quantity overview.

Create kanbans

1. Click Save.

    - The kanban rule needs to be saved before kanbans can be created.

2. Click Add.

    - Note that there are no active kanbans because the suggested 'Number of new kanbans' is 2, which is equal to the 'Fixed kanban quantity'.

3. Click Create.

    - This will create two kanbans.
    - Note that 2 kanbans, for 5 each, was created for this withdrawal kanban rule. This is the last step in this procedure.

Execute kanban process jobs

Article • 09/29/2021

This procedure focuses on executing kanban process jobs. The first job is completed with the expected quantity and has no errors. The second job is completed with errors. The demo data company used to create this procedure is USMF. This procedure is intended for the machine operator.

Select a kanban job

1. Go to Production control > Kanban > Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. Click the row with resource group 1250. This filters the Jobs list to display only the jobs for work cell 1250.

    - Mark the row that has the Planned job status.

Complete a job with expected quantity

1. Expand or collapse the Details section.

    - This section displays important information about card number, item number, quantity ordered, and activity name.

2. Expand or collapse the Production instructions section.

    - This section displays production instructions for the activity. The instructions can be text, pictures, drawings, and other documents.

3. Click Start.

    - Select a job that is not completed. Use status icons in the Job status field to view job status.

4. Click Complete.

    - The job is completed with the expected quality.

Complete a job with errors

1. Click Start.

- When a job is completed, the next job on the list is selected automatically. This is why you don't need to select a job before you click Start.

2. On the Action Pane, click Manufacture.
3. Click Complete (details).
4. In the list, mark the selected row.
5. In the Error quantity field, enter a number.
6. In the Good quantity field, enter a number.
7. Click OK.

Move scheduled kanban jobs

Article • 09/29/2021

This procedure focuses on moving planned process kanban jobs to a different period. The demo data company used to create this procedure is USMF. This procedure is intended for the shop floor supervisor or production planner working with kanbans.

Select scheduled kanban jobs.

1. Go to **Production control** > **Kanban** > **Kanban job scheduling**.
2. In the **Work cell** field, click the drop-down button to open the lookup.
3. In the list, mark the selected row.
    - Select work cell 1250.
4. Click **Select**.
5. In the **Display job status** field, select **Scheduled**. This filters the job list to display only the scheduled kanban jobs.

Move kanban jobs to a different period.

1. In the list, find and select the desired record. Select a job that has the **Planned job** status, for example, a job scheduled on December 20, 2012 in the **Planned period** field. Then move the job to the previous period.
2. Click **Previous period**.
3. Click **End** to move the job to the end of the job list as the last job in the previous period.
4. In the list, find and select the desired record. Select a job that has the **Planned job** status, for example, a job scheduled on December 18, 2012 in the **Planned period** field. Then move the job to the next period.
5. Click **Next period**.
6. Click **Start** to move the job to the start of the job list as the first job in the previous period.

Move a job within a period.

1. In the list, find and select the desired record. Select a job that has the Planned job status, for example, the second job scheduled on December 19, 2012 in the **Planned period** field. Then move the job within the planned period.
2. Click **Forward**. Notice that the job is moved one line down on the list.
3. Click **Backward**. Notice that the job is moved one line up on the list.

Prepare a process kanban job when materials are available for the work cell

Article • 09/29/2021

This task focuses on preparing a process kanban job when all materials are available for the work cell. The demo data company used to create this task is USMF. This task is intended for the machine operator.

1. Go to Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.

    - Select work cell 1250 and click OK.

4. In the list, select row 4.

    - In the clean demo company, Kanban 000329 in row 4 is the first job that is not completed yet.

5. Toggle the expansion of the Picking list section.

    - Verify that the supply status is available for all items in the picking list.
    - If multiple jobs are selected, the picking list will show the sum of all items needed for the selected jobs.

6. Click Prepare.

    - The preparation process is now completed. The selected check box for all rows in the picking list indicates that the supply status is picked.

Prepare a process kanban job when materials are not available for the work cell

Article • 09/29/2021

This procedure focuses on preparing a process kanban job when some materials are not available for the work cell, therefore it's necessary to pick materials from the warehouse. The procedure "Prepare a process kanban job when materials are available" is a prerequisite for creating this procedure. This procedure is intended for the machine operator. The demo data company used to create this procedure is USMF.

1. Go to Production control > Kanban > Kanban board for process jobs.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.

    - Select work cell 1250.

4. In the list, find and select the desired record.

    - Select Kanban 000356.

5. In the list, find and select the desired record.

    - In the list, deselect row 4. or Select row 4 if you haven't completed the task "Prepare a process kanban job when materials are available."

6. Toggle the expansion of the Picking list section.

    - The No entry icon in the supply status indicates that 48 ea of item P0002 are missing for the work cell.

Transfer materials to work cell

1. Toggle the expansion of the Transfer jobs section.
2. Use the Quick Filter to filter on the Item number field with a value of 'P0002'.
3. In the list, find and select the desired record.
4. Click Start.

    - Transfer is in progress.

5. Click Complete.

- Item P0002 is now available in the picking list for the kanban job. This means that we can prepare the kanban with all the needed materials.

6. Click Prepare.

- Notice that an icon in the Job status indicates that the job is now ready.

Remove a kanban job from the schedule

Article • 09/29/2021

This procedure focuses on removing a planned process kanban job from the schedule by reverting the job status to Not planned. The demo data company used to create this procedure is USMF. This procedure is intended for the shop floor supervisor or production planner.

Find a planned kanban job

1. Go to Production control > Kanban > Kanban job scheduling.
2. In the Work cell field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.

    - Select work cell 1250.

4. Click Select.
5. In the Display job status field, select 'Scheduled'.

Remove the planned kanban job from the schedule

1. In the list, find and select the desired record.

    - Select a job that has the Planned status, for example, a job from December 19, 2012.

2. On the Action Pane, click Plan.
3. Click Revert job status.
4. Click OK.

    - This will revert the current job status from 'Planned' to 'Not planned' and remove it from the process board.

Revert kanban job status

Article • 09/29/2021

This procedure focuses on reverting an incorrect kanban job status. This is useful in case the machine operator updates the wrong job, or sets the wrong status by mistake. In this procedure, a kanban job is registered as prepared by mistake, and the status is reverted. The demo data company used to create this procedure is USMF. This procedure is intended for the shop supervisor or machine operator working in a lean manufacturing company.

Open process board for the work cell

1. Go to Kanban board for process jobs.
2. In the Work cell field, enter or select a value.

    - Select work cell 1260.

Prepare kanban job

1. Click Prepare.

    - If you can't click Prepare because it is grayed out, make sure that the selected kanban job has status Planned, which is indicated by the empty kanban icon. If Prepare fails, make sure that all materials in the Picking list are available.

2. In the list, select the prepared job.

    - Select the first job that you have just prepared.
    - Notice that the jobs status is prepared, which is indicated with a triangle inside the kanban icon.

Revert the status of the prepared kanban job

1. In the list, mark the selected row.

    - Select the first job that was prepared.

2. On the Action Pane, click Manufacture.
3. Click Revert status.

- You can use an alternative kanban rule when the following conditions are true: - The replenishment strategy is the same for both rules. - The version of the production flow is the same for both rules. - The product that is supplied is the same for both rules. - Any downstream activities that are configured for the last activity of the kanban rules must be the same for both rules. - The same supplied inventory dimensions must be configured for both rules. - The status of the handling unit must be Not assigned. - The configuration for event kanbans must be the same.
- Ensure that the new status is Planned.

4. Click OK.
5. In the list, unmark the selected row.

- Select the same job.
- Notice that the job status for the kanban job is reverted to Planned, which is indicated by an empty kanban icon.

Schedule kanban jobs

Article • 09/29/2021

This procedure focuses on scheduling process kanban jobs for a specific work cell. The procedure "Prepare a process kanban job when materials are not available" is a prerequisite for creating this procedure. The demo data company used to create this procedure is USMF. This task is intended for the shop floor supervisor and production planner working with kanbans.

Select kanban jobs for a work cell

1. Go to Production control > Kanban > Kanban job scheduling.
2. Expand the Period capacity fact box

    - Expand the Kanban FactBox.

3. In the Work cell field, click the drop-down button to open the lookup.
4. In the list, mark the selected row.

    - Select work cell 1250. This will filter the view to display only the jobs for work cell 1250.

5. In the list, click the link in the selected row.
6. Click Select.

Schedule a kanban job in the first available period

1. In the list, mark the selected row.

    - Select the first row in the list that has the Not planned status. The dotted icon in the Job status field indicates not planned.

2. Click Schedule.

    - This will schedule the kanban job in the first available period.
    - Notice that the kanban job is moved to the end of the list because it has been added to the period starting from today.
    - If the period starting from today is fully booked, the job will be moved to the first available period.

Schedule two kanban jobs for a specific day

1. In the list, select row 1.
    - You should see that the first row has the Not planned status in the Job status field.
2. In the list, select row 2.
    - You should see that the second row has the Not planned status in the Job status field. Now you have the first two jobs selected.
3. Click Schedule from date to open the drop dialog.
4. Check or uncheck the Override capacity shortage reaction box.
    - This option allows you to override the default capacity shortage reaction.
5. In the Capacity shortage reaction field, select 'Add to the requested period'.
    - This option will ensure that the job is added to the requested period, regardless if the work cell might be overloaded.
6. Click Schedule.
    - Notice that both jobs are added to the desired period.
    - In the Period capacity section, you can see the load for each period. The Consumption field shows the scheduled consumption in this period. If the scheduled consumption is higher than the available capacity in this period, the overloaded consumption will be selected.

Transfer materials with kanban jobs

Article • 09/29/2021

This procedure focuses on executing a withdrawal kanban job to transfer materials. The demo data company used to create this procedure is USMF. This procedure is intended for the warehouse worker.

Display transfer jobs

1. Go to Production control > Kanban > Kanban board for transfer jobs.
2. Expand or collapse the Filters section.

    - In the Filters section, you can specify what jobs you want to see by filtering on Production flow, Activity name, From warehouse and location, and To warehouse and location.

3. In the From warehouse field, type '11'.
4. In the To location field, type '12'.

Start a transfer job

1. In the list, deselect the selected row - if any.
2. In the list, select row 4.

    - Select the first job with status Not planned. Make sure this is the only job selected.

3. Click Start.

    - Notice that an icon indicates that the job is started.

Select a second transfer job and change quantity

1. In the list, find and select the desired record.

    - You can have multiple jobs selected, but for now select row 5.

2. In the list, find and select the desired record.

- Make sure the job in the previous step is the only one selected. Deselect all other jobs.

3. Note the value in the Job quantity field to reference later
4. Set Job quantity to '30'.

    - Notice the warning! You are not allowed to transfer 30. According to the setup of the kanban rule, you can only transfer the original quantity.

5. Use the value noted previously in the Job quantity field

    - Set the Job quantity to the previous value.

Start the second transfer job

1. Click Start.

    - This will start the transfer of the job in row 5.

Complete both transfer jobs

1. In the list, select row 4.

    - Now two transfer jobs are selected on row 4 and row 5.

2. Click Complete.

    - This will complete the transfer of both jobs.

Update kanban status

Article • 09/29/2021

When a kanban is emptied by mistake or a received kanban needs to be emptied, you need to update kanban status. The demo data company used to create this procedure is USMF. This procedure is intended for the shop supervisor.

Find the kanban.

1. Go to Production control > Kanban > Kanbans.
2. Open Handling unit status column filter.
3. Click Clear.
    - This resets the filters.
4. Use the Quick Filter to find records. For example, filter on the Card number field with a value of '000149'.

Change emptied status to received status

1. Click Reverse empty handling unit.
2. Click OK.
    - Notice that the Handling unit status is Received.

Change received status to emptied status

1. Click Empty kanban.
2. In the list, mark the selected row.
    - Notice that the Handling unit status is Emptied.

Bills of materials and formulas

07/10/2025

This article provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – Gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – Typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMS are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – Used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.
- **Production BOM** – The actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – Used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that are expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

If a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have other important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. A BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create of production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version shouldn't be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

> **Note**
>
> A subproduction order is always created for pegged supply, even if on-hand inventory or other supply is available to cover the demand.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

> **Note**
>
> For BOMs that include subcontracted operations, the service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

Formulas and formula versions

07/10/2025

A formula defines the materials, ingredients, and outcomes of a specific process in process manufacturing. Together with the corresponding route, the formula defines the whole process in process manufacturing. Formulas are used to plan and produce products in process manufacturing.

A formula consists of the ingredients and quantities that are required in order to produce a specific quantity of a formula item. Depending on the task that you perform, you can access formula functionality from Inventory and warehouse management or Product information management.

Formulas and formula lines

A formula consists of one or more formula lines that identify the ingredients or items that make up the formula. A formula line can contain Bill of materials (BOM) items, formula items, catch-weight items, purchased items, co-products, or by-products. Because many items are used in multiple products, an item can be used in more than one formula.

An example of a formula is the formula for a chocolate chip cookie. The ingredients for this formula use multiple lines, such as flour, sugar, eggs, butter, and chocolate chips. The formula for the chocolate chip cookie contains ingredients that are likely used in other formulas. While you make the chocolate chip cookies, there might be leftovers, such as crumbs, or some of the cookies might be overbaked or undercooked. These items can be set up as co-products or by-products, depending on the production operations.

When you create a formula line, you use the line type to indicate how the system should handle the line when you run master planning and produce batch orders. Each line type gives a different result. The following table describes the line types that you can select.

Expand table

Line type	Description
Item	Select *Item* when the item is a raw material or a semi-finished item that is picked from inventory or when the item is a service.
Phantom	Select *Phantom* when you want to explode any lower-level formula items that are contained on formula lines. When you estimate the batch order, and the formula items are exploded, the component items are listed as formula lines on the batch order. Additionally, the corresponding routes are added to the production route. Formula items are exploded by

Line type	Description
	using the current configuration. When you use the *Phantom* line type, you can handle production and measurement configurations that occur at different formula levels. If you select *Phantom* for a product on the **Engineer** FastTab of the **Released product details** page and then use this product in a formula, the line type of the formula line is changed to *Phantom*. You can't select *Phantom* for a catch-weight item, or for items where the production type is *Co-product*, *By-product*, or *Planning item*.
Pegged supply	Select *Pegged supply* to create a batch order, production order, kanban, transfer order, or purchase order for the ingredient that is contained on the formula line. The related order is determined based on the default order settings and the production type of the ingredient, and is created when you estimate the batch order. The required ingredient quantities are reserved for the batch order.
Vendor	Select *Vendor* if the production process uses a subcontractor, and you want to create a subproduction or purchase order for the subcontractor. The service or work that the subcontractor performs must be created by using a formula item or service item. You can attach the item to the parent item as a formula line. The route must contain an operation that is assigned to the subcontractor's operations resource. This operation is attached to the formula line by using the **Oper. No.** field.

Formula versions

When you create a new formula, you must first create a formula version before you add the formula line items and their specific characteristics. Every formula must have at least one version. The **Approved** button on a formula version becomes available only after a version record has been successfully saved. Each formula version record is associated with one or many co-products and by-products that can be produced as you produce the finished product. Many products can be made from the same ingredients in different batch sizes, in multiples, or by using different yields. You can create as many versions of a formula as you require.

To manage multiple active formula versions, use effective date ranges or "from" quantity fields. Multiple active formula versions can exist only if the date range and "from" quantity don't overlap.

Unlike BOMs, where one BOM is often associated with many BOM versions, only one formula version typically exists per formula. Remember that only one formula version can be activated for the coverage dimensions and quantity for a given product. However, many formula versions might exist for other reasons, and you can manually select them when you create a batch order.

Approve and activate formulas and formula versions

Formulas and formula versions must be approved before they can be used for planning and production. Formulas are usually activated before they're used. However, during production, you can select a formula version that is approved, but that isn't activated.

To help secure a formula or formula version, you can set the **Block editing** and **Block removal of approval** parameters on the **Production control parameters** page.

If you select **Block editing**, and the formula is approved, no fields on the formula lines can be deleted or edited. However, if you remove the approval of the formula, you can delete and modify the formula lines. You can also create new formulas and new formula versions.

If you select **Block removal of approval**, you can't remove the approval of an approved formula or formula version. However, you can create new formulas and new formula versions, and you can remove the activation of the formula version.

You can add more levels of control by using the electronic signature functionality. When a user is set up so that an electronic signature is required at the time of formula approval, a **Signature** page appears when the formula is activated. The user must be authorized to sign electronically, and the certificate must be successfully validated before the change can be committed. If the signature can't be authenticated, the approval or removal of approval is denied, and the change that initiated the approval or removal of approval is returned to its original state.

Use the Scalable feature

The Scalable feature is available only if all the item components in the formula are set to **Variable consumption**. The feature isn't available if item components are set to **Fixed consumption** or **Step consumption**. When the Scalable feature is used, if you change an ingredient in a formula, the quantity of the other ingredients that you select is adjusted. The size of the formula is also adjusted. Likewise, if you change the formula size, the quantity of all scalable ingredients is changed. This feature is intended specifically for formula creation and maintenance. It doesn't indicate whether the quantity of an ingredient will be scaled up or down on a batch order.

Use Step consumption

Step consumption eliminates the requirement that you must enter a quantity on the **Formula line** tab for an ingredient. Instead, Step consumption is configured so that it has a **From series** value and a **Quantity** value. The information from the Step consumption per series record that

satisfies the quantity on the batch order is selected. Step consumption is useful when the consumption rate isn't linear with respect to the batch order size and only increases the requirement when a specific quantity threshold is met. To enable this feature for a new formula, under the **Consumption calculation** group, change the formula setting for the applicable ingredient from **Standard** to **Step**. You specify this consumption method on the **Setup** tab of the **Formula line** page.

Operations resources

07/10/2025

Operations resources perform the activities of a project or a production process. They can be of different types, and can have different capabilities.

Operations resources

Operations resources are the machines, tools, workers, facilities, physical areas, or vendors that perform the activities of a project or a production process. They can be of different types and can have different capabilities.

- **Vendor** – An external resource that performs project activities or production operations. An example is a subcontractor. By linking vendor resources to a vendor account, you can generate purchases for subcontractors, based on the bill of materials (BOM) lines or production lines.
- **Human resources** – A project or production worker that perform an activity, either alone or as an operator of a tool or a machine. If you're using the Human resources functionality, you can link human resources to a worker. The scheduling engine can then allocate the resources, based on the competencies that are defined for the corresponding worker.
- **Machine** – A machine or other production equipment that is required in production.
- **Tool** – An instrument or device that is typically used together with another resource to perform an activity in a project or in production.
- **Location** – A physical location of a specific size that is required in order to perform an activity. An example is an assembly area.
- **Facility** – A building or fixed structure that is required in order to perform an activity.

Calendars

A calendar can be assigned to an operations resource and describes the capacity (in hours) of that resource. The working times of the operations resource are determined by the calendar that is assigned to the resource group that the operations resource is part of. You can set an effective date and an expiration date for the assigned calendar. You can then assign more than one calendar to an operations resource. However, the dates of the assigned calendars can't overlap, and the operations resource can be assigned only one calendar at a time.

> ⓘ **Note**

If there are no effective working calendars for a resource group (for example, if the last assigned calendar or the only assigned calendar has expired), you can no longer access the operations resources that are assigned to the resource group for production planning and operations scheduling. You can also assign a calendar to a resource group to specify the working times for both the resource group and all the operations resources that are assigned to the resource group. The capacity of the resource group is calculated as the sum of the capacities of each operations resource that is assigned to that resource group. The calendar that is assigned to a resource group can change over time.

Resource capabilities

A capability is the ability of an operations resource to perform a particular activity. You can assign one or more capabilities to an operations resource. The scheduling engine will then allocate resources by matching the resource requirements of each activity to the capabilities of the available operations resources. Capabilities can be assigned to all types of operations resources (*Tool*, *Vendor*, *Machine*, *Human resources*, *Location*, or *Facility*). To assign capabilities to operations resources for a limited time, define a start date and an expiration date on the capability assignment. Learn more in Resource capabilities.

Resource groups

A resource group is a set of operations resources that represents the granularity at which you want to schedule resources when you use the operations scheduling method. Therefore, resource groups typically correspond to the physical organization of work cells that is demarcated by yellow lines on the production shop floor. The resource group defines the site, production unit, and warehouse context for operations resources that are assigned to the group. When you assign an operations resource to a resource group, the resource can be scheduled at the site where the resource group is located. You don't have to assign the operations resources that you create to a resource group. However, an operations resource must be assigned to a resource group before it can be scheduled to perform work. An operations resource can be assigned to a resource group for a limited time. You can also assign an operations resource to multiple resource groups, so that you can then share the resource across sites. However, the effective dates and expiration dates can't overlap. In other words, you can't assign an operations resource to two resource groups at the same time. Changes in resource group assignments are effective only for new resource allocations. Capacity reservations for jobs, operations, and project hour forecasts that are already scheduled won't be affected.

Note

When you assign operations resources of the *Vendor* type to a resource group, all operations resources that are assigned to that resource group must be of the *Vendor* type and must be linked to the same vendor account.

Production units

A production unit is an administrative unit that is a collection of resource groups. A production unit can contain multiple resource groups, but a resource group can be assigned to only one production unit. A production unit reflects the physical layout of production resources, and has no effect on transactions or how they're processed. You must associate a production unit with a site. You can also assign a picking warehouse and a storage warehouse to a production unit. You can use a production unit to consolidate and filter production-related data. For example, a shop floor manager can see an overview of the outstanding workload and the available capacity for a particular production unit. You can change the production unit that is assigned to a resource group. You can also delete a production unit. However, these changes to the production unit are effective only for new orders that are created after master scheduling is run. If you want to apply the production unit change to existing orders, you must make this change manually.

Resource scheduling

Operations resources are assigned to activities when a project or a production is scheduled. Two scheduling methods are available: operations scheduling and job scheduling. When you use operations scheduling, each operation or project activity is scheduled on the resource group that contains operations resources that match the resource requirements that are specified for the operation. If a specific operations resource is required for the operation, scheduling reserves capacity only on a specific operations resource in the group. Job scheduling is a more detailed form of scheduling than operations scheduling. It breaks down each operation into its individual tasks or jobs. These jobs are then assigned to the operations resources that will perform them. Scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route or project activities. If you're working with finite capacity, the schedule depends on the availability of the operations resources that are required in order to complete the activity. For operations scheduling, the capacity of the resource group is the sum of the available capacity of the operations resources that are part of that group. Capacity reservations that already exist for the operations resources are considered unavailable capacity. If there isn't enough available capacity for production, the production orders can be delayed or even stopped. On the **Resources** page, you can define several properties that control how capacity reservations are made:

- **Capacity** – Specify the operations resource's capacity per hour in terms of the capacity unit of measure.
- **Batch capacity** – Specify the maximum number of pieces that the operations resource can process per run.
- **Efficiency percentage** – Specify the efficiency that you expect from the operations resource. The efficiency percentage adjusts the throughput of the operations resource and affects the time that is reserved for the resource. The lead times for the operations that use the operations resource are also adjusted accordingly. Here's the formula that is used for the calculation: Scheduling time = Time × 100 ÷ Efficiency percentage. *Time* includes both the run time and setup time.
- **Operations scheduling percentage** – Specify the maximum percentage of capacity of the operations resource that you want to use in operations scheduling. To allow for flexibility in capacity during job scheduling, you should set this percentage to less than 100 percent.
- **Finite capacity** – Set this option to *Yes* if the operations resource should be scheduled based on the actual capacity that is available, and if existing capacity reservations should be considered. If this option is set to *No*, the operations resource is assumed to have infinite capacity, and the resource might therefore be overbooked.
- **Finite property** – Set this option to *Yes* if you want the operations resource to be scheduled based on the actual capacity that is available with respect to the required working time scheduling properties.
- **Exclusive** – Set this option to *Yes* if you don't want the operations resource to be available for another job or operation until the current production is completed. In this case, the operations resource can't be used even if there are gaps in the resource's run time.
- **Bottleneck resource** – Define the operations resource as a bottleneck resource. A bottleneck resource is scheduled by using finite capacity when the **Finite capacity** and **Bottleneck scheduling** options on the **Master plans** page are selected.

To schedule multiple operations resources at the same time to perform, for example, an operation in production, you must specify the requirements for the various resources by using primary and secondary operations. You can then also reserve multiple operations resources that have different capacity. The operations resource that is scheduled for the primary operation determines the duration of the activity.

Lean work cells

You can specify that a resource group is a lean work cell. The resource group can then be part of a production flow. By specifying a resource group as a lean work cell, you also prevent the resource group and the assigned operations resources from being allocated to the operations of a production order or a project hour forecast. For each resource group that acts as a lean work cell, you must specify the following information:

- **Calendar** – The working calendar of the work cell, which must have the property of a standard workday.
- **Input warehouse and location** – The default location that is used to pick material for an activity.
- **Output warehouse and location** – The default location where all output of the work cell is put.
- **Runtime cost category** – This category must be defined for the work cell if direct labor is tracked in costing.

When a resource group is used as a lean work cell, the capacity of the work cell is specified directly on the resource group. Therefore, you don't have to assign operations resources to the resource group. Only when the work cell is managed by a subcontractor, an operations resource of the *Vendor* type must be assigned to the work cell. If you assign an operations resource to a resource group that is marked as a work cell, the capacity of the work cell isn't affected.

Costing resources

When you define an activity such as a route operation or a project hour forecast, you can specify the requirement for a specific operations resource or resource group. However, you can also specify the requirement for an operations resource of a specific type, or an operations resource that has a specific capability or competency. For this reason, the actual resource assignment isn't made until the activity is scheduled and capacity is reserved. Therefore, on a route operation, you can specify that estimation and BOM calculation must be based on a specific operations resource. This operations resource is referred to as the costing resource. You can also transfer cost categories and operation times from the costing resource to the activity. When the operation is scheduled, estimation and BOM calculation are done by using the operations resource that is actually scheduled.

Resource capabilities

06/17/2025

This article provides information about resource capabilities. A capability is the ability of an operations resource to perform a particular activity. The article explains how capabilities and related concepts, such as proficiency level and priority, are used to select appropriate resources for an activity.

A capability is the ability of an operations resource to perform a particular activity. An operations resource can have more than one capability assigned to it, and a capability can be assigned to more than one resource. You can temporarily assign capabilities to resources by defining a start date and expiration date on the capability assignment. When the capability for a resource expires, the resource can't be scheduled for a project or a production that requires that capability. Expired capabilities can be renewed. You can delete capabilities provided that they aren't on a route relation or on part of a production route of an active production order. In general, be careful when you delete capabilities. Instead, consider adjusting the expiration date on the resources that have the capability. Capabilities can be assigned to all types of resources: tool, vendor, machine, location, facility, or human resource.

Level

Multiple resources often have the same functional capability but at different levels of proficiency (for example, strength, processing speed, or accuracy). Therefore, when you assign a capability to a resource, you can specify a **Level** value. The level is a simple numeric value. If you specify that a capability is a resource requirement for a production route, you can also specify a **Minimum level needed** value for that capability. The scheduling engine then selects only resources that have the required capability at a level that is equal to or exceeds the minimum level that is specified in the resource requirement.

Priority

Operations resources that have the same capabilities can be assigned a priority. Then, if multiple resources have capabilities that satisfy the scheduling requirements at the required level, and have free capacity, the scheduling engine can select among those resources. If **Priority** is selected in the **Primary resource selection** field on the **Scheduling parameters** page, the resource that has the highest priority (the lowest numeric value in the **Priority** field) is selected first during scheduling.

Resource requirements

When you define resource requirements for a production route, you can specify one or more capabilities as requirements. During production scheduling, the capabilities that are defined in the resource requirements on the route operation are matched with the capabilities that are defined for the resources. Resources that have capabilities that satisfy the requirements are selected. If multiple resources have the same functional capability but different proficiencies (such as strength, processing speed, or accuracy), you can either define multiple capabilities or use the capability level to qualify the capability of the resource. Here's an example:

- On a route, the drilling process time is set to 10 units per hour, but the requirement itself is defined as Drilling.
- You have two drilling machines, M1 and M2.
- The Drilling capability is assigned to both resources, the M1 machine and the M2 machine.
- The M1 machine can drill two units per hour, and the M2 machine can drill 11 units per hour.

In this example, both machines can be selected by the scheduling engine, because both satisfy the basic capability requirement (Drilling). However, the M1 machine can drill only two units per hour. Because this rate is much less than the 10 units per hour that are specified on the route, the M1 machine will cause production problems if it's selected. There are two ways to resolve this issue and make sure that the M2 machine is selected instead:

- Create two separate capabilities: Low-speed drilling and High speed drilling. Define Low-speed drilling as drilling that has a process time of one to nine units per hour. Define High-speed drilling as drilling that has a drilling process time of 10 to 19 units per hour. Then assign the M1 machine the Low-speed drilling capability, and assign the M2 machine the High-speed drilling capability. Finally, change the resource capability requirement on the route to High-speed drilling. The scheduling engine will then select the correct machine (M2).
- Use the capability level to qualify the Drilling capability that is assigned to the drilling machines. Specify that the M1 machine has the Drilling capability at a level of 2.0, and that the M2 machine has the Drilling capability at a level of 11.0. Then specify that 10.0 is the minimum level that is required for the Drilling capability requirement on the route. The scheduling engine will then determine that only the M2 machine satisfies the resource requirements.

Competencies for human resources

When you have operations resources of the **Human resources** type that are linked to workers in Human resources, you can also take advantage of the competencies of workers when you define the resource requirements for a production route. In other words, you can also specify

requirements for specific skills, courses, certificates, or titles. The scheduling engine can then select resources that are linked to workers, and the selection will be based on the competencies of those workers. The competencies are set up in Human resources, not on the **Resource capabilities** page. When you define skills, courses, certificates, or titles as resource requirements, you must use the Human resources functionality and link each resource of the **Human resources** type to a corresponding worker. If you aren't using the Human resources functionality, you can define capabilities on the **Resource capabilities** page that resemble or duplicate the competencies from Human resources. However, the **Resource capabilities** page doesn't contain the functionality that is required in order to maintain skills, courses, certifications, or titles.

Batch attributes

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about batch attributes. Batch attributes are characteristics of raw materials and finished products that make up inventory batches. The article also explains how to assign batch attributes, and how you can search on them when you reserve batches.

Batch attributes are characteristics of raw materials and finished products that make up inventory batches. Batch attributes can vary, depending on factors such as environmental conditions, the quality of the raw materials that are used to produce the batch, or the outcome of the finished product. The number and types of batch attributes that are used can vary widely from one industry to another. Here are two examples that show how to use batch attributes:

- In the cheese industry, milk, which is one of the raw materials that are used to produce the cheese, can have attributes such as fat content and percentage weight. The cheese that is produced from the milk can have other attributes, such as moisture and age.
- In the steel industry, the iron that is produced might have attributes such as the percentages of magnesium content, silver content, and zinc content.

To better manage the number and types of attributes, you can use batch attribute groups. In this way, you don't have to add each attribute individually.

Assign batch attributes

You can assign batch attributes to individual products that are held in inventory batches, or you can assign them to products that are associated with specific customers. Before you can assign a batch attribute at the customer level, you must assign it at the product level. The product must have the batch dimension set to *Active* in the tracking dimension group. To assign a batch attribute to an individual product, use the product-specific page. If the attribute is specific to a product for a customer, use the customer-specific page. When you add an attribute to a product, you also define other parameters. Here are some examples:

- The minimum and maximum ranges for an attribute of the *Integer* or *Fraction* type.
- The tolerance actions for an attribute of the *Integer* or *Fraction* type. If the value of the attribute falls outside the minimum and maximum range, the action can be either a

warning message or an error message.
- The target value for the attribute. This value is the optimal value of the attribute, and it applies to all attribute types.

You can access the pages for products that you select on the **Released products** page in Product information management. After you assign batch attributes to a product, you can add specific values to the attributes on the **Inventory batch attributes** page.

Reserve batches

You can search on batch attributes when you do batch reservations for a sales order to fulfill a customer's order, or when you pick and reserve batches for a production order. The search helps locate an inventory batch that contains the product that has the batch attribute that you want. After you locate the batch or batches, you can reserve the product to the originating inventory transaction line.

Batch balancing

09/19/2025

This article describes how the batch balancing process works.

For more information, watch a video on batch balancing.

In the batch balancing process, you calculate the amount of ingredients to use in a production batch from the concentration of active ingredients in selected product batches.

Products that have an active ingredient

You can define a product by its concentration of an active ingredient. Model the active ingredient of a product by using a product-specific batch attribute that has a minimum value, a maximum value, and a target level.

The target level of a batch attribute represents the estimated percentage of an active ingredient in a product. The minimum and maximum values represent the accepted deviation from the target level. Use these values, for example, as an accepted tolerance for batches at product receipt.

A product can have only one active ingredient. To specify the active ingredient of a product, first define a product-specific batch attribute. Then associate the attribute as a base attribute of the product.

On the product level, specify how the level of the active ingredient for a batch of the product should be recorded: as part of the purchase receipt process or as part of a quality order process.

To associate a base attribute with a product, complete the following setup steps:

1. Make the product batch-controlled by assigning a tracking dimension group to the product that has an active Batch dimension.
2. Define the attribute that indicates the ingredient levels as a product-specific batch attribute for the product.

To look up and edit the actual value of the active ingredient for a batch:

1. Go to **Inventory management** > **Inquiries and reports** > **Tracking dimensions** > **Batches**.
2. Select a batch number from the grid.
3. On the Action Pane, open the **View** tab and then select **Inventory batch attributes**.

Ingredient types and how they interact in the batch balancing process

Formula lines that you create can have one of these ingredient types:

- None
- Active
- Compensating
- Filler

The rest of this section provides examples that show how each ingredient type works. The examples are based on the following formula that has a total batch size of 100 liters.

Expand table

Ingredient type	Item number	Formula line quantity	Unit
None	A	20	Liter
Active	B	30	Liter
Compensating	C	10	Liter
Filler	D	40	Liter

The following table provides an overview of the results of each example.

Expand table

Item number	Ingredient type	Estimated quantity	Balanced quantity	Active quantity	Unit	Base value
A	None	20	20		Liter	
B	Active	30	25.71	9.00	Liter	30.00
C	Compensating	10	14.72		Liter	
D	Filler	40	39.57		Liter	

Active ingredients

When you add a product with a base attribute to a formula line, you add an *active ingredient* to the formula. You can use batch orders with formulas that include active ingredients for the batch balancing process. For each ingredient in the formula, the batch balancing process

estimates the amount needed to produce the product. The estimate is based on the concentration of active ingredients in the selected batches.

Active ingredient example

Ingredient B has base attribute X and a target level of 30. It's included in a formula that requires 30 liters of ingredient B for every 100 liters of the product. You create a batch order with a batch size of 100 liters. You start the batch order, and during the batch balancing process, you select a batch of ingredient B that has a potency level of 35. Because the potency level of 35 is higher than the target level of 30, the batch balancing process reduces the balanced quantity of ingredient B by using the ratio of the potency value to the target level of the batch, which is multiplied by the estimated quantity. The calculation of the balanced quantity looks like this:

(30 ÷ 35) × 30 liters = 25.71 liters

None ingredients

When you apply the batch balancing process and set the **Ingredient type** to *None*, the estimated quantity and the balanced quantity of the formula line in the batch order are the same.

None ingredient example

You assign ingredient A to an ingredient of the *None* type and add it to a formula for a finished product. The formula requires 10 liters of ingredient A for every 100 liters of the finished product. When a batch order requires 200 liters, both the estimated quantity and the balanced quantity of ingredient A are 20 liters.

Compensating ingredients

A compensating ingredient can either offset or complement the effect of the active ingredient in a product. Therefore, the quantity of a compensating ingredient that you consume depends on the potency of the product:

- **Opposing effect** – If the amount of the active ingredient is more than anticipated, you must add less of the compensating ingredient.
- **Complementary effect** – If the amount of the active ingredient is less than anticipated, you must add more of the compensating ingredient.

The relation between an active ingredient and a complementary ingredient is set up on the **Compensating principle** page.

Follow these steps to set up relations between ingredients.

1. Select **Product information management** > **Bills and materials and formulas** > **Formulas**.
2. Open a formula line, and then select **Ingredients** to open the **Compensating principle** page.
3. Select the line that represents a compensating principle, and then select the active ingredient to compensate.

In the compensating principle, enter a positive or negative compensating factor to specify how much to compensate for, and whether the principle should be opposing or complementary. A positive factor indicates a complementary effect, and a negative factor indicates an opposing effect.

Compensating ingredient example

Ingredient B is an active ingredient that has base attribute X and a target level of 30. It's included in a formula that requires 30 liters of ingredient B for every 100 liters of the product. Ingredient C is a compensating ingredient, and a quantity of 10 is included in the same formula. A compensating factor of 1.10 is set up for the compensating principle. Therefore, the balanced quantity of the compensating ingredient is reduced by the difference between the active ingredient's balanced quantity and the estimated required quantity multiplied by 1.10.

In the example for the *Active* ingredient type, the balanced quantity of the required active ingredient is calculated as 25.71, and the estimated required quantity is calculated as 30. In this case, the balanced quantity of the compensating ingredient is calculated like this:

1. Determine the difference between the estimated and the balanced quantity:
   25.71 – 30 = –4.29

2. Multiply the result by the compensating factor:
   4.29 × 1.10 = –4.72

3. Reduce the estimated compensating quantity by –4.72 to determine the balanced compensating quantity:
   10 – (–4.72) = 14.72

Because 1.10 is a positive compensating factor, this compensating principle has a complementary effect. In this case, the active ingredient is more potent than anticipated. Therefore, you need more of the compensating ingredient.

Filler ingredients

A *filler ingredient* is a neutral ingredient that you use to reach the desired output quantity of the finished product. Adjustments to filler quantities are based on variations in the active ingredient and the compensating ingredient compared to the standard quantity.

Filler ingredient example

You formulate a product that includes ingredients A, B, C, and D for a formula size of 100 liters. You calculate the balanced quantity of all the ingredient types except the *Filler* ingredient type that you use on one line. You calculate the balanced quantity of the filler ingredient as the difference between the batch size of 100 liters and the sum of ingredients A, B, and C:

100 – (20 + 25.71 + 14.72) = 39.57

The batch balancing process

You perform the batch balancing process from the **Batch balancing** page. Select **Cost management** > **Batch orders**, then, on the **Process** tab, select **Batch balancing**. Batch balancing is available for batch orders that have a status of *Started*.

In general, you can apply batch balancing to batch orders if the formula has at least one formula line where the **Ingredient type** is *Active*. (For the exception to this rule, see the "Batch orders that aren't applicable for batch balancing" section later in this article.)

You can divide the batch balancing process into two subprocesses:

1. Balance batch ingredients
2. Confirm and release the formula

Balance batch ingredients

In the Balance batch ingredients subprocess, the system calculates the amount of ingredients to use for the production batch based on the selected batches that have active ingredients. As a rule, you can complete the calculation only if there's full coverage of all ingredients. You can't balance only part of the batch that the batch order is set up to produce.

> **Note**
>
> You can't save a calculation and then complete the batch balancing process later. If you close the **Batch balancing** page, you must repeat the calculation to complete the process.

Confirm and release the formula

After you calculate the ingredient quantities, confirm and release the formula. The release process differs, depending on whether the products are enabled for warehouse management processes (WMS):

- For WMS-enabled products, the formula line is released to the warehouse according to the principles for WMS. The formula line is released in quantities that match the balanced quantities, and it's released for the specific batches that are selected for the active ingredients. Formula lines can be released to warehouse only as part of the batch balancing process. Although there are other options for releasing materials for production to warehouse, those options can't be used for formula lines.
- For non-WMS products, a production picking list is created for the product when you confirm and release the formula.

A single formula can include both WMS-enabled products and non-WMS products. In this case, the WMS-enabled products are released to warehouse. For the non-WMS products, a picking list is created when the formula is confirmed and released.

Batch orders that aren't applicable for batch balancing

Batch orders usually apply batch balancing when the formula has at least one formula line where the **Ingredient type** is *Active*. However, the following exceptions apply:

- If a formula contains an active ingredient for a product that is enabled for the WMS, but batch number is below location in the reservation hierarchy, the batch order isn't applicable for batch balancing.
- If the formula unit of measure is different from the inventory unit of measure of the active ingredient, the batch order isn't applicable for batch balancing.

A batch order that isn't applicable for batch balancing goes through the regular process cycle for batch orders.

Catch weight product processing with warehouse management

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Prerequisites

To use warehouse management to process catch weight products, turn on the functionality by using a license configuration key. Go to **System administration** > **Setup** > **License configuration**. Then, on the **Configuration keys** tab, expand **Trade** > **Warehouse and Transportation management**, and select the check box for **Catch weight for warehouse**. Turn on both the **Warehouse and Transportation management** license configuration key and the **Process distribution** > **Catch weight** license configuration keys.

After the license configuration key is turned on, when you create a released product, you can select **Catch weight**. You can also associate the released product with a storage dimension group that the **Use warehouse management processes** parameter is selected for.

Before you can use the product in Warehouse management, complete some basic product-specific setup for catch weight:

- Define the nominal weight conversion between the catch weight unit (box) and the inventory unit (kilogram [kg]) as part of a unit conversion definition.
- Define the minimum and maximum weight tolerances as part of the catch weight unit setup.
- Set up a unit sequence group where the catch weight unit is defined as the lowest stock keeping unit (SKU).
- Set up a catch weight item handling policy.

Learn more in Setting up and maintaining catch weight items.

Transaction adjustments

Because the weight of inventory when it comes into a warehouse can differ from the weight when the inventory is issued out of the warehouse, the catch weight product processing must adjust the inventory.

> **Note**
>
> Mobile device activity triggers the transaction adjustments only if the Outbound weight variance method of the item's catch weight item handling policy is **Allow weight variance**.

Example 1

During a **Report as finished** production process, the inbound weight of a license plate that contains eight boxes of a catch weight product is captured as 80.1 kg. The license plate is then stored away in the finished goods area, and during the storage period, some weight is lost into the air.

Later, as part of a sales order picking process, the weight of the same license plate is captured as 79.8 kg. Therefore, in the system, you now have a weight difference as part of the physical dimension set.

In this case, the system automatically adjusts the difference by posting a transaction for the missing 0.3 kg.

Example 2

In its definition, a product is set up to tolerate a minimum weight of 8 kg and a maximum weight of 12 kg for the **Box** catch weight unit.

You have two boxes of the product, and they have a registered weight of 16 kg. If a warehouse worker picks and weighs one of the boxes, and the weight is captured as 9 kg, the remaining box weighs 7 kg. However, because 7 kg is below the minimum weight, the system does an automatic adjustment to increase the weight of the on-hand inventory by 1 kg.

To set up the accounts that these adjustments are posted to, go to **Cost management** > **Ledger integration policies setup** > **Posting**. Then, on the **Inventory** tab, define the following accounts:

- Catch weight loss account
- Catch weight profit account

Catch weight item handling policy

The catch weight item handling policy defines two primary warehouse management flows for the items: when the weight of the items is captured, and how it's captured.

You can define when the weight is captured for sales and transfer order processing. The weight can be captured during either of the following processes:

- **Picking** – The weight is captured during the initial pick work lines of order work.
- **Packing** – The weight is captured during manual packing. (You must send the items to a packing station.)

If the actual weight is captured at the packing station during the container packing processes, warehouse workers aren't prompted to capture the weight during picking work. Instead, the average weight of the physical inventory is used as the weight of the picked inventory that goes to the packing area. This concept also applies to catch weight items that are tracked by tags. For tag-tracked items, these parameters determine when the tag is captured. The tag can be captured either at picking time by using the mobile device or during manual packing.

> ⓘ **Note**
>
> Because the **Packing** option causes inventory to be updated with the average picked weight, this could trigger a discrepancy that could cause a catch weight profit/loss adjustment and/or a difference between on-hand inventory weight and catch weight tag weight.

For internal processes, such as counting and adjustment corrections, you can define whether the weight should be captured. If it isn't captured, the nominal weight is used. Other options let you capture weight per catch weight unit and per counting quantity.

You can also define how the weight is captured. In one of the two main flows, catch weight tags are tracked and used to capture the weight. In the other flow, catch weight tags aren't tracked.

- **Yes** – The item uses catch weight tags. Each tag number represents one catch weight unit (box), and a weight and other information are associated with the tag. For outbound processes, the weight that is associated with the tag is used.
- **No** – The item doesn't use catch weight tags. The inbound and outbound weighing processes are based on the actual weight that is captured during each process.

The process of tracking catch weight tags can be used for items that don't change weight during the storage period. The weight is captured only during the inbound warehouse process. During the outbound process, the catch weight tags are just scanned, and the weights that are associated with the tags are used for the outbound transactional processing.

Another important parameter that is related to the processing of catch weight tags is **Catch weight tag dimension tracking method**. Tags can be either partially tracked or fully tracked. If a tag is partially tracked, it tracks product dimensions, tracking dimensions, and inventory status. If a tag is fully tracked, it tracks product dimensions, tracking dimensions, and **all** storage dimensions.

Additionally, when an item is tag-tracked, there's an **Outbound tag capturing method** parameter. You can set this parameter so that you're always prompted for the tag on outbound transactions from the mobile device. Alternatively, you can set the parameter so that you're prompted for tags only when they're required. For example, there are five catch weight tags in inventory on a given license plate, and you indicate that you want to pick all five tags from the license plate. In this case, if the **Outbound tag capturing method** parameter is set to **Only prompt for tag when needed**, the five tags are automatically picked. You don't have to scan each tag. If the parameter is set to **Always prompt for tag**, you must scan each tag, even if all five tags are being picked.

> ⓘ **Note**
>
> As a rule, tags are captured and updated only from the mobile device menu items. Nevertheless, there are a few scenarios where tags are captured somewhere else (for example, from the manual packing station). However, in general, the mobile device menu items should be used for all warehouse activity if tags are used.

How to capture catch weight

When catch weight tag tracking is used, a tag must always be created for every catch weight unit that is received, and every tag must always be associated with a weight.

For example, **Box** is the catch weight unit, and you receive one pallet of eight boxes. In this case, you must create eight unique catch weight tags, and associate a weight with each tag. Depending on the inbound catch weight tag, you can either capture the weight of all eight boxes and distribute the average weight to each box, or capture a unique weight for each box.

When using the *Use existing catch weight tags when reporting production orders as finished* feature with the process enabled via a mobile device menu item, the inventory is updated based on existing catch weight tag information. As a result, the Warehouse Management mobile app doesn't prompt for capturing the catch weight tag data as part of a production report as a finished operation.

When catch weight tag tracking isn't used, the weight can be captured for each dimension set (for example, for each license plate and tracking dimension). Alternatively, the weight can be captured based on an aggregated level, such as five license plates (pallets).

For the methods for capturing outbound weight, the **Per catch weight unit** option lets you specify that the weighing should be done for each catch weight unit (for example, per box). The **Per picking unit** option lets you specify that the weight should be captured based on the quantity that you pick (for example, three boxes). If you use the **Not captured** option, the average weight is used for the production line picking and internal movement processes.

Define multiple weight capturing methods on the catch weight item handling policy. Various transactions use each weight capturing method parameter. The following table summarizes which parameters are used by which transactions.

Expand table

Method	Transaction
Outbound weight capturing method	Sales picking, Transfer picking
Production picking weight capturing method	Production picking, Production consumption
Movement weight capturing method	Movement
When to capture correction of weight	Adjustments, Counting
Counting weight capturing method	Counting
Warehouse transfer weight capturing method	Warehouse transfer

To prevent the warehouse management picking processes from capturing weights that cause catch weight profit/loss adjustments, you can use the Outbound weight variance method. The Outbound weight variance method applies during the following mobile device processes: sales picking, transfer picking, production picking, movements, counting, and warehouse transfers. You can use the **Restrict weight variance** option if the weight of the catch weight item doesn't fluctuate during warehouse storage, and if catch weight profit/loss adjustments aren't required. You can use the **Allow weight variance** option if the weight can fluctuate, and if catch weight profit/loss adjustments are required when a weight fluctuation is recorded.

Unsupported scenarios

Not all workflows support catch weight product processing with warehouse management. The following restrictions currently apply. They apply to all catch weight items, regardless of whether

they're tagged.

Configuring catch weight products for warehouse management processes

- Only formula processing is supported for catch weight products (not bill of materials).
- Catch weight products can't be associated with a tracking dimension group by using the Owner dimension.
- Catch weight products can't be used as services.
- You can use catch weight products as "stocked products" only as part of the item model group.
- You can't use catch weight products together with the functionality for tracking "Active in sales process."
- Catch weight products can't be used together with the functionality for capturing serial numbers. Therefore, products can't be transferred from a "blank" to a serial number as part of the picking/packing process.
- Catch weight products can't be used together with the functionality for registering serials before consumption.
- You can't use catch weight products that are variant-enabled together with the functionality for converting variant units of measure.
- Catch weight products can't be marked as a commerce "product kit."
- Catch weight products can be used only with a unit sequence group that has catch weight handling units, and that has the catch weight unit as the lowest sequence.
- The setup of bar codes for catch weight products doesn't support a variable weight setup.

Order processing

- The creation of advance ship notice (ASN/packing structures) doesn't support weight information.
- You must maintain the order quantity based on the catch weight unit.

Inbound warehouse processing

- Receiving license plates requires that weights be assigned during registration, because weight information isn't supported as part of the advance ship notice. When catch weight tag processes are used, the tag number must be manually assigned per catch weight unit.
- Inbound quality check work isn't supported for catch weight products. If configured, the quality check work is skipped.

Inventory and warehouse operations

- Manual creation of quarantine orders isn't supported for catch weight products.
- Manual movement of inventory that is related to open work isn't supported for catch weight products.
- License plate loading to initialize warehouse stock isn't supported for catch weight products.
- Batch balancing processes aren't supported for catch weight products.
- Handling of negative physical inventory isn't supported for catch weight products.
- Inventory marking can't be used for catch weight products.

Outbound warehouse processing

- The functionality for cluster picking isn't supported for catch weight products.
- Pick and pack warehouse processing isn't supported for catch weight products.
- For catch weight products, work that is defined in a work template cannot be run automatically.
- For catch weight products, the system doesn't support manual packing station processing where packed container picking work is created after containers are closed.
- The functionality for pcs-by-pcs scanning isn't supported for catch weight products.

Production processing

- For catch weight products, only batch orders for formula products are supported.
- Kanban functionality isn't supported for catch weight products.
- For catch weight products, serial numbers can't be registered before consumption.
- The functionality for reversing license plates from production isn't supported for catch weight products.
- For catch weight products, reporting as finished can't be registered by serial number.

Transportation management processing

- Load building workbench processing isn't supported for catch weight products.
- Transport request lines aren't supported for catch weight products.

Other restrictions and behaviors for catch weight product processing with warehouse management

- During picking processes where the user isn't prompted to identify tracking dimensions, the weight assignment is done based on the average weight. This behavior occurs when, for example, a combination of tracking dimensions is used in the same location and, after a user processes picking, only one tracking dimension value remains in the location.
- When inventory is reserved for a catch weight product that is configured for warehouse management processes (WMS), the reservation is done based on the minimum weight that is defined, even if this quantity is the on-hand last handling quantity. This behavior differs from the behavior for items that aren't configured for WMS. There is one exception to this restriction. For production picking, when the last handling quantity of a catch weight product that is serial number–controlled is picked, the actual weight is used.
- Processes that use the weight as part of capacity calculations (wave thresholds, work maximum breaks, container maximums, location load capacities, and so on) don't use the actual weight of the inventory. Instead, the processes are based on the physical handling weight that is defined for the product.
- In general, Commerce functionality isn't supported for catch weight products.
- For catch weight products, inventory status can't be updated from **Warehouse status change**.

Catch weight tags

A catch weight tag can be created by using a Warehouse Management mobile app process, it can be manually created in the form **Warehouse management** > **Enquiries and reports** > **Catch weight tag** or it can be created by using a data entity process. If a catch weight tag is associated with an inbound source document line, such as purchase order line, the tag will be registered. If the line is used for outbound processing, the tag will be updated as shipped. You can view all the historical catch weight tag registration events via the **Catch weight tag registration** option from the **Catch weight tag** page.

You can use the **Change tag captured weight** option to manually update the weight value for a catch weight tag. Note that the weight for the inventory on-hand won't get adjusted as part of this manual process, but you can easily use the **On-hand discrepancies for catch weight tagged items** page to look up any discrepancies between the currently active catch weight tags and the current inventory.

Other manual options are to **Register tag** to a source document line and **Register work** against an existing warehouse work.

In addition to the restrictions that currently apply for catch weight products, tagged catch weight products have other restrictions that currently apply.

- All manual updates to inventory (that is, updates that aren't done using a mobile device) must include corresponding manual updates to the associated catch weight tags because these updates aren't done automatically. For example, manual adjustment journals will update inventory but not the associated catch weight tags.
- You must manually update catch weight tags to reflect replenishment work movements. This is because the system can't capture weights while processing replenishment work and therefore records the average weight instead.
- Mixed licensing place receiving isn't currently supported for tagged catch weight items.
- The processing of sales return order receiving can record catch weight tags. However, the process doesn't validate that the returned tag is the same tag that was originally shipped for a sales order.
- The mobile device menu item that has the **Register material consumption** activity code doesn't currently support recording catch weight tags.
- Although counting processes are supported for tagged catch weight items, they're limited. For example, you can use the mobile device options for counting tagged catch weight items, and the average weight is used. However, catch weight tags aren't automatically updated by the counting transaction. After the counting transaction is completed, the catch weight tags must be manually updated so that they reflect the inventory. If items that weren't originally in a location are counted into that location, the nominal weight is used.
- License plate consolidation doesn't currently support tagged catch weight items.
- Reverse work functionality isn't supported for catch weight items that are tag number–tracked.

> **Note**
>
> The preceding information about catch weight tags is valid only if the catch weight product has a catch weight tag dimension tracking method that is fully tracked (that is, if the **Catch weight tag dimension tracking method** parameter on the catch weight item handling policy is set to **Product dimensions, tracking dimensions and all storage dimensions**). If the catch weight item is only partially tag-tracked (that is, if the **Catch weight tag dimension tracking method** parameter on the catch weight item handling policy is set to **Product dimensions, tracking dimensions and Inventory Status**), additional restrictions apply. Because visibility is lost between the tag and inventory in this case, some additional scenarios aren't supported.

Copy a formula

Article • 09/29/2021

This procedure focuses on creating a formula that includes the same ingredients as an existing formula, but with minor differences. To create the formula lines, you can use the Copy function to copy an existing formula that has most of the ingredients that you need. You can then make any necessary changes to the individual lines in the new version. By using the Copy function, you do not have to create multiple formulas that are almost identical. The demo data company used to create this task is USP2.

Create a formula

1. Go to Product information management > Bills of materials and formulas > Formulas.
2. Click New.
3. In the Formula field, type a value.
4. In the Name field, type a value.
    - Type a meaningful name for the formula.
5. In the Site field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. In the Item group field, click the drop-down button to open the lookup.
8. In the list, find and select the desired record.
9. In the list, click the link in the selected row.
10. Click Save.

Copy formula lines

1. On the Action Pane, click Formula.
2. Click Copy.
3. In the Item number field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. In the Formula version field, click the drop-down button to open the lookup.
6. In the list, click the link in the selected row.
7. Click OK.

Adjust copied formula lines

1. In the list, mark the selected row.
2. Click Delete.
3. Click Yes.

Approve formula

1. On the Action Pane, click Formula.
2. Click Approve formula.
3. In the Approved by field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. Click Select.
6. Click OK.

Copy co-products from an existing formula version

Article • 09/29/2021

This procedure shows how to copy co-products from an existing formula version to a different formula version for a released product. It is a prerequisite that there is at least one formula version associated with co-products. The demo data company USP2 is used to create this procedure.

Find a released product

1. Go to Released products.
2. Click Show filters.
    - You are about to add the field Production type in the filter dialog box.
3. Click Add a filter field to add the field Production type.
    - In the next step, you need to manually enter Formula in the Production type field before you select Apply. This sets the filter on the list of released products.
4. Manually enter Formula in the Production type field.
5. Click Apply.

Select a released product

1. In the list, find and select the desired record.
2. Click Formula versions.
    - On the Engineering Action Pane, click Formula versions.

Copy co-products

1. On the Action Pane, click Formula version.
2. Click Co-products.
3. Click Copy.
4. In the Item number field, enter or select a value.
5. In the Formula version field, enter or select a value.
6. Click OK.

7. Close the page.

Create a formula by copying from an existing formula

Article • 09/29/2021

This procedure shows how to quickly create a new formula by copying from an existing formula. You can use the demo data companies USMF, USP2, or USPI to create this procedure.

Create a new formula

1. Go to Formulas.
2. Click New.
3. In the Formula field, type a value.
4. In the Name field, type a value.
5. In the Site field, enter or select a value.
6. In the Item group field, enter or select a value.
7. Click Save.

Copy from an existing formula

1. Click Copy.
2. In the Item number field, enter or select a value.
3. In the Formula version field, enter or select a value.
4. Click OK.

Revise the copied formula

1. In the list, find and select the desired record.
2. Click Delete.
3. Click Yes.

Approve formula

1. Click Approve formula.
2. In the Approved by field, enter or select a value.
3. Click OK.
4. Close the page.

Production parameters for manufacturing execution

08/13/2025

This article provides information about the setup of production parameters for manufacturing execution.

Manufacturing execution can be used to register time and item consumption on production jobs or projects. Before you start to use manufacturing execution for job registrations, you must set up various production parameters that define how and when registrations are posted during the production process. The settings of production parameters affect inventory management, production management, and cost calculation.

Before workers start to make registrations on production jobs, you should carefully consider all settings on the **Production order defaults** page. Go to **Production control** > **Setup** > **Manufacturing execution** > **Production order defaults**. If your company uses the multisite functionality, you might want to set up different production parameters for each site. The following tabs are provided on the **Production order defaults** page:

- **General** – General parameter settings for production jobs.
- **Start** – Parameters that are used when production operations are started.
- **Operations** – Parameters that are applied to production operations and feedback about operations during the production process.
- **Report as finished** – Parameters that are used when items are reported as finished on the last operation of a production order.
- **Quantity validation** – Parameters that are used to validate start and feedback quantities on production orders.

Types of production jobs

On the **Operations** tab, you select which types of production jobs require registration.

Typically, workers make registrations on setup jobs and process jobs. However, if job scheduling is applied, you can select other job types that workers must make registrations on when production orders are processed. For example, you can require registrations on transport jobs.

> **Important**

Make sure that you select all relevant job types. Otherwise, jobs might not be available for registration. Your selections should match the selections in the **Job management** column on the **Setup** FastTab of the **Route groups** page (**Production control** > **Setup** > **Routes** > **Route groups**).

If **Job management** is selected on the route group, this job type is reported as finished on the production order when a job is reported as finished. When all job types that **Job management** is selected for have been reported as finished on an operation, the operation is reported as finished.

> ⓘ Note
>
> Some job types can be manually reported through production journals. In this case, select **Job management** for the job type, but don't select the job type for registration on the **Operations** tab on the **Production order defaults** page.

BOM consumption and picking list journals

A consistent setup for bill of materials (BOM) consumption is important because it helps guarantee that inventory management is efficient. For example, if BOM consumption parameters aren't set up correctly, materials might be deducted from inventory two times or not at all.

On the **Production order defaults** page, automatic BOM consumption is set up in three stages:

- At the start of a production. Set up this stage on the **Start** tab.
- During the production process when an operation is completed. Set up this stage on the **Operations** tab.
- When a production order is reported as finished. Set up this stage on the **Report as finished** tab.

For each stage, the **Automatic BOM consumption** field lets you select one of three methods for picking items for a production order:

- *Flushing principle* – This option is used in combination with an option that is defined for the BOM. Select **Production control** > **Production orders** > **All production orders**. On the **All production orders** page, select a production order in the list, and then, on the Action Pane, open the **Production order** tab and select **BOM**. On the **BOM** page, open the BOM line you want to set. Then open the **Setup** FastTab and select one of the following options in **Flushing principle** field:
  - *Start*

- *Finish*
- *Manual*
- *Available at location*
- Blank (No option is selected.)

If *Flushing principle* is selected in the **Automatic BOM consumption** field on the **Start** tab of the **Production order defaults** page, all materials that are set to *Start* in the BOM are deducted from inventory when the operation is started. The *Available at location* option is used for products that are enabled for warehouse management processes (WMS). If you select this flushing principle, material is flushed when warehouse work for raw material picking is completed. Material is also flushed when a BOM line that uses this flushing principle is released to warehouse and the material is available at the production input location.

> ⓘ **Note**
>
> If *Flushing principle* is selected in the **Automatic BOM consumption** field on the **Start** tab of the **Production order defaults** page, you must select the same value on either the **Operations** tab or the **Report as finished** tab. This requirement helps guarantee that materials are deducted from inventory on BOMs that use *Finish* as a flushing principle on the production order. If *Flushing principle* isn't selected on either the **Operations** tab or the **Report as finished** tab, materials might be deducted from inventory two times.

- *Always* – If you select this option for a stage, materials are always deducted from inventory at that stage. For example, materials for the production are deducted when the production order is started. This setting requires that *Never* be selected on the **Operations** and **Report as finished** tabs. This requirement helps prevent items from being deducted from inventory two times.

- *Never* – If you select this option for a stage, no BOM consumption occurs at that stage. For example, if you select *Never* on all three tabs (**Start**, **Operations**, and **Report as finished**), materials must be manually deducted from inventory.

> ⓘ **Important**
>
> Carefully consider your setup of the production order defaults, and make sure that the defaults that are selected on the various tabs of the **Production order defaults** page don't contradict each other.

The following examples illustrate parameter settings that support various BOM consumption principles. The parameters are set up on the **Production order defaults** page.

Example 1: Backflushing on operations

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on an operation.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status* or *Status + quantity*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Always*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status + quantity*

Example 2: Backflushing on production

Use the following settings if picking list journals and BOM item consumption should be generated when items are reported as finished on the production order.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status* or *Status + quantity*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Always*
Report as finished	Update finished report on-line	*Status + quantity*

Example 3: Flushing principle

Use the following settings if picking list journals and BOM item consumption should be generated according to the flushing principle that is set for the BOM items.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status + quantity*
Start	Automatic BOM consumption	*Flushing principle*
Operations	Automatic BOM consumption	*Flushing principle*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status + quantity*

Example 4: Deduction of materials during startup of a production order

Use the following settings if picking list journals and BOM item consumption should be generated when a production is started.

Expand table

Tab	Field	***Setting***
Start	Update start on-line	*Status + quantity*
Start	Automatic BOM consumption	*Always*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status* or *Status + quantity*

Based on the selections that are described earlier in this section, picking list journals are posted at various stages of the production order process:

- When an operation is started
- When quantity feedback is reported on an operation
- When items are reported as finished on the production order

Example 5: Manual BOM consumption

You can use the following settings if materials should always be manually deducted from inventory. In this case, picking list journals aren't posted.

Expand table

Tab	Field	Setting
Start	Update start on-line	*Status*
Start	Automatic BOM consumption	*Never*
Operations	Automatic BOM consumption	*Never*
Report as finished	Automatic BOM consumption	*Never*
Report as finished	Update finished report on-line	*Status*

Production setup requirements

This article provides information about setup requirements before you can work with Production control.

Production control is integrated with features in other modules. This interconnectivity lets you change production orders and make sure that they're automatically updated in all other related processes and calculations in the system. The following setup processes are listed in the order that you should complete them in.

Required baseline setup in other modules

Information in other modules must be set up before you can work with Production control. This setup includes the following tasks:

- Set up general company information.
- Set up the general ledger.
- Define item groups.
- Set up ledger accounts for item groups.
- Set up the inventory item table in Inventory management.
- Create bills of materials (BOMs) and BOM versions in Product information management.

Required calendar and resource setup

Before you use Production control, open Organization administration, and create and define the calendar and operations resources in the following order:

1. **Working time templates** – Set up working time templates to define the times that are available for production scheduling.
2. **Calendars** – Set up working time calendars to define the days of the year that are available for production scheduling.
3. **Resource groups** – Set up resource groups to group the operations resources, so that you can get an overview of any free capacity when you run scheduling. You don't have to set up resource groups before you set up operations resources. However, we recommend that you understand how to group resources when you set up Production control.
4. **Resources** – Set up operations resources to define the resources that are used to complete the production process and plan for capacity.

Required production parameters setup

- **Production control parameters** – Set up basic production parameters to define how the system handles and processes production orders. Define how production orders are created, estimated, scheduled, and consumed. You can also select what kind of feedback you want and how cost accounting is done.

Required journal name identification

- **Production journal names** – Specify the production journal names that are used to record and post transactions.

Setup if you use operations

Operations represent the specific activities that are completed to produce the finished product.

- **Operations** – Set up operations to represent the tasks that must be completed to produce the finished item.
- **Relations** – Set up operation relations to establish detailed properties. To define operation relations, select **Relations** on the **Operations** page.

> ⓘ **Note**
>
> You must know the types of activities that are required in order to produce your item, and the order and priorities of those activities. You must also know which resources are involved, and how many.

Setup if you use routes

If you're working with routes, operations must be defined for every production route that you set up. The route represents the path that the item takes from operation to operation, from the start of the production process to the end.

- **Cost categories** – Set up cost categories to define the cost per hour of specified processes and setup times.
- **Cost groups** – Set up cost groups to create and maintain different types of costing.
- **Route groups** – Set up route groups to define parameters that are related to groups of routes. You must set up route groups before you can create production routes.

- **Routes** – Set up production routes, and define default settings to control scheduling, costing, and pricing of route operations, and to control progress reporting.
- **Route version** – Set up route versions to enable item variations in production.

Optional advanced settings

- **Production groups** – Set up production groups to establish relationships between the production order and ledger accounts. The ledger accounts are used to post or group orders for reporting.
- **Production pools** – Create production pools to group production orders so that you can process urgent production orders, or delete and post groups of orders.
- **Properties** – Define properties to create special attributes that you can assign to your resources to control the order of productions. These attributes are connected to the working time template.

Last updated on 12/19/2025

Operations scheduling

07/10/2025

This article provides information about operations scheduling. You can use operations scheduling to provide a general estimate of the production process over time.

You can schedule production at the operation level and the job level. Unlike job scheduling, operations scheduling doesn't explode the operations for the production route into jobs. If you want to include more detail in the scheduling, such as information about current capacity, you can run job scheduling after you run operations scheduling. You can also run job scheduling only. Job scheduling is typically used to schedule individual jobs on the shop floor for an immediate or short-term time frame.

Components of operations scheduling

The main components of operations scheduling are the scheduling direction, the capacity of resources, and materials optimization. By using operations scheduling, you can achieve the following goals:

- Control the planning method by scheduling forward or backward from a given date.
- Optimize the use of resources by scheduling productions based on the capacity of the resources. This approach also helps identify when alternative resources should be used.
- Optimize the use of materials by scheduling productions based on the availability of the required materials.
- Schedule and synchronize reference productions. The dates of the reference productions are adjusted when the production order’s schedule is changed.

You must estimate the cost of a production order before you can run operations scheduling. If you haven't run an estimate, it's automatically run before operations scheduling is started. An operations schedule specifies the following information:

- The product that is planned for production
- The configuration of the product
- The quantities that are involved in the production
- The dates when the production will start and end
- The capacity reservations for the resources that perform the production activities

The setup time, process time, and run time are set for operations in the production. After you run operations scheduling, the status of the production order is *Scheduled*, and all operations are scheduled in the order that is specified by the production route. However, only the duration of the operation is considered. Start times and end times aren't scheduled.

Scheduling direction and date

The scheduling direction is fundamental to the scheduling process. Production can be scheduled forward or backward from any date, depending on timing and scheduling requirements.

- **Forward from the scheduling date** – You can schedule production to start as early as possible. Production can be started today, tomorrow, or on any date in the future. The production is scheduled forward in time to the earliest possible end date.
- **Backward from the scheduling date** – You can schedule production to start as late as possible. Backward scheduling is based on the date when the production must be completed. The schedule counts backward from that date to the latest possible date that the production can be started and still be completed on time.

Resource scheduling

When you run an operations schedule, each operation in the production route is scheduled for the resource that is specified for the operation. Additionally, the duration of each operation is specified on the production route. If a resource group is specified for an operation, the scheduling reserves capacity on the group. However, unlike job scheduling, operations scheduling doesn't select the specific resources in the group. If you're working with finite capacity, the schedule depends on the availability of the resources that are required in order to complete production. Operations scheduling follows the sequence of operations that is specified on the production route. The scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The sum of available capacity on the resources that are involved determines the capacity for the resource group. Capacity reservations that already exist for the resources are considered unavailable capacity. If there isn't enough available capacity for the production, the production orders can be delayed or even stopped. You can also specify the efficiency that you expect from the resources that are involved in the production. You specify the efficiency as a percentage on the resource. The efficiency percentage adjusts the throughput of the resource. This adjustment affects the time that is reserved for the resource. The lead times for the operations that use the resource are also adjusted accordingly.

Operations scheduling and master planning

The operations schedule also drives master planning and determines calculations for material requirements. Operations scheduling considers the following information:

- **Backlogged productions** – Products that are planned, released, or started
- **Material availability** – Inventory, subproductions, suppliers, and vendors

- **Capacity availability** – Resources that are required for production

> **Note**
>
> If you're using multi-threaded master planning and operations scheduling, finite capacity will not be considered.

Cancellations

When you run operations scheduling, you can cancel specific parts of the routing. These parts include the queue time, setup time, process time, overlap time, and transport times.

Finite materials

If you're working with finite materials, scheduling also depends on the availability of the materials that are required for production. If there aren't enough available components for the production, production can be delayed. You can base scheduling on the use of materials by specifying the materials that must be available for production. When you optimize on both resource capacity and the availability of materials, production is calculated according to these restrictions. A production order can't be scheduled to start until capacity and materials are available at the same time and in the required quantities.

- Operations scheduling options

Operations scheduling options

09/19/2025

This article describes the options for operations scheduling. Use operations scheduling to provide a general estimate of the production process over time.

Operations scheduling calculates the following information for a production order:

- Start and end dates for the production order and each operation.
- Resources assigned to operations.

Several settings determine how production schedules are calculated. You define these settings on the **Operations scheduling** page. The following information describes the scheduling options.

Operations scheduling

Scheduling direction

The scheduling direction is fundamental to the scheduling process. You can schedule a production forward or backward from any date, depending on timing and scheduling requirements.

- **Forward scheduling** – Schedule a production to start as early as possible. The production can start today, tomorrow, or on any specific date in the future. The production is scheduled to start on the earliest possible date and is planned forward in time to the earliest possible end date.
- **Backward scheduling** – Schedule a production to start as late as possible. The schedule is based on the date when the production must be completed and counts backward to the latest possible date that the production can start without missing its target deadline.

The following options are available:

- **Forward from today** – Schedule forward from the current date. (The current date is the system date.)
- **Forward from planned start** – Schedule forward from an earlier start date. If there's no previous scheduling, the scheduling direction is forward from the current date.
- **Forward from scheduling date** – Schedule forward from the date that you specify in the **Scheduling date** field. If you don't specify a scheduling date, the scheduling direction is forward from the current date.

- **Backward from delivery date** – Schedule backward from the delivery date that you specify for the production order. If you select this option, but don't specify a delivery date, the delivery date is the current date.
- **Backward from planned end** – Schedule backward from a previously calculated end date. If there's no previous scheduling, the end date is the current date.
- **Backward from scheduling date** – Schedule backward from the date that you specify in the **Scheduling date** field. If you don't specify a scheduling date, the current date is used. Backward from scheduling date is calculated for the production order the last time that a requirement was calculated. If you don't specify a date for the production order, the current system date is used.
- **Backward from futures date** – Schedule backward from the futures date that was calculated for the production order the last time that a requirement was calculated. If you don't specify a futures date for the production order, the current system date is used.
- **As last scheduling** – For operations scheduling and job scheduling, the selected scheduling direction and date are saved. Therefore, you can select this option for subsequent scheduling. If there's no previous scheduling of the production order, scheduling is backward from the current system date.
- **Forward from tomorrow** – Schedule forward from the current date plus one day.
- **Forward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, the production order is scheduled forward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.
- **Backward from previous job** – This option is relevant only in job scheduling. If you select this scheduling direction for operations scheduling, planned orders are scheduled backward from the current date. In job scheduling, scheduling is established for one job, and all other jobs for the production are scheduled based on that job.

Scheduling date

Use this date for the **Forward from scheduling date** and **Backward from scheduling date** scheduling directions. Scheduling is backward or forward from this date. For more information, see the previous section, "Scheduling direction."

Recalculate BOM levels

When you select **Recalculate BOM levels**, the selected bill of materials (BOM) levels are recalculated to help guarantee the correct scheduling order.

Limitations

Finite capacity

Scheduling depends on the availability of the resources that are required to complete production. If there's not enough capacity, production orders can be delayed or even stopped. If you apply finite capacity to operations scheduling, existing capacity reservations that you made on the resources are considered, and the system sees that capacity as unavailable. The production order is scheduled based on the availability of capacity on the resources that are required. Operations scheduling uses the specified sequence of operations to determine the order of operations in the production route. Operations scheduling reserves capacity on the resource groups, based on the operation times that are defined on the production route. The capacity of the resource groups is the sum of available capacity on all the resources in the resource groups.

Finite material

Scheduling also depends on the availability of the materials that are required for production. Insufficient component availability can also cause production delays. Scheduling can also be based on the use of materials. Just specify the materials that must be available for production instead of the materials that aren't critical. This type of scheduling is known as scheduling with finite material. When you specify finite materials, production is scheduled based on whether materials are available. When you optimize on both capacity and materials, production is calculated to meet both restrictions. The availability of capacity and materials is considered, and the production order’s operations can't be scheduled to start until capacity and materials are available at the same time and in the required quantities. Select this check box if materials should be considered limited during scheduling. If the materials are limited, the material's coverage for that time is considered. In other words, scheduling considers the future dates that are calculated for the items. Scheduling reserves raw materials and explodes the current production. If scheduling occurs several times, only the first scheduling runs an explosion and makes reservations. If you make changes in the production BOM or route, the next scheduling runs an explosion. For the explosion, it's assumed that the materials are required on the same day. Because the production isn't scheduled at the time of the master schedule explosion, the current date is the best estimate of when the items will be available. The explosion then checks whether the items are available. If the items are available, the production requirement can be fulfilled. If the items aren't available by the current date, a planned order is generated, and an offset selection is made for the planned order. If automatic firming is set for the planned order, the planned order is firmed automatically for purchase or production. The production status is automatically changed to the status that is specified in the **Requested production status** field in the **Coverage groups** dialog box. If the check box is cleared, the materials are always considered available. Therefore, scheduling doesn't consider whether the materials are available at the time of requirement.

Finite property

Select this check box if the job scheduling should include property requirements.

Keep production unit

Select whether the scheduling engine should schedule only resources that are already specified on the production unit.

Keep warehouse from resource

Select whether the scheduling engine should schedule only resources that are associated with the input warehouse that is specified on the resource.

References

Schedule references

When references depend on production orders, they're also known as subproductions. You can schedule subproductions as part of the scheduling of a production order. Select this check box if the scheduling of subproductions should be based on the scheduling of the main production. In relation to the main production, overlying productions are scheduled forward, and underlying productions are scheduled backward. You can view production order references in the **Reference level** field on the **Production orders** page.

Synchronize references

You can synchronize references with the production order. If you select this option, the system moves and aligns the dates of the subproductions when you make changes to the production order's schedule. If a production order has one or more subproductions, you might want to schedule the subproductions together with the main production. In this case, you can't start the main production until you complete the related subproductions. Therefore, select this check box if you want the scheduling of subproductions to be based on the start and end times of the selected production. You can select this check box only if you also select the **Schedule references** check box.

Cancellation

Cancel queue time

Select this check box to exclude queue time from the scheduling.

Cancel setup

Select this check box to exclude setup time from the scheduling.

Cancel process

Select this check box to exclude run time from the scheduling.

Cancel overlap

Select this check box to exclude overlap time from the scheduling.

Cancel transport

Select this check box to exclude transit time from the scheduling.

Set default

You can save the current values as default values. Two options are available:

- Set as my default
- Set as default for everyone

Operations scheduling

Job scheduling

09/19/2025

This article provides information about job scheduling, which is a more detailed form of scheduling than operations scheduling. Use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment.

You can use job scheduling to schedule individual jobs or shop orders, and to control the manufacturing environment. Job scheduling breaks down each operation into its individual tasks or jobs. Assign these jobs to the operations resources that perform them. Job scheduling also lets you synchronize all jobs that the selected job references. You can specify a start date and time or end date and time for the job, and then run scheduling. The time that you specify can be the start time or the end time, depending on the scheduling direction. This functionality is useful when, for example, a job can run only on one machine at a time, or when you want to optimize the job that runs for each resource.

Tasks in the job scheduling process

The job scheduling process includes the following tasks:

- Split operations into jobs.
- Schedule jobs, based on the dates and times for the resources that are specified for the related operation.
- Calculate start times and end times for each job. Use finite capacity to make sure that there are no overlapping times.
- Determine which resources in the resource group run the job on. This task requires that a resource group be specified for an operation. Job scheduling selects the resources or resource groups based on the shortest lead time, and also considers any previous reservations on the resources.
- Explode operations into jobs when you run job scheduling. The jobs are scheduled by date and time, according to the order that the production route specifies. The setup of the operation determines the jobs that are exploded during the scheduling process. The route group assigned to the operation controls whether jobs are generated. A job is generated only if it has a specific duration. For example, a transport time job is generated if a transport time was specified for the selected operation.

Scheduling direction

You can schedule jobs either forward or backward.

- **Forward** – Use the forward scheduling direction to start the production as early as possible. This method is also known as the push method, because the production is being pushed forward through the production process. The production is scheduled to start and end on the earliest possible dates.
- **Backward** – Use the backward scheduling direction to start the production as late as possible. This method is also known as the pull method, because it's based on the date when the production must be completed. Backward scheduling counts backward to the latest possible date that the production can be started without missing its target deadline.

Finite capacity

You can schedule jobs by using finite capacity. When you use finite capacity, the capacity that is scheduled can't be larger than the capacity that's available for the resource. Available time is defined as the interval when the resource is available and there are no other reservations on capacity. Scheduling that is based on finite capacity makes sure that start times and end times for an operation on a specific date don't overlap. The resource capacity that is already reserved is considered, and overlaps between the start times and end times are also considered. Finite capacity determines the amount of capacity that must be available for a resource in order to achieve optimal use of that resource. This determination is balanced against a calculation of the shortest possible lead time between operations.

Finite materials

Job scheduling that uses finite materials ensures that the required materials are available when the operation starts. The coverage rules for items define these limits. Scheduling uses requirement explosion to determine when the component items are available. If you schedule without setting finite materials, the system assumes that all items are available when they're required.

Finite properties

Job scheduling that uses special properties requires that you specify properties for the operations on the production route. The system must fulfill these properties to reserve capacity.

References

Job scheduling schedules all productions that the current production references. If a production has one or more subproductions, schedule the subproductions at the same time as the main production, because you can't start the main production until the related subproductions are completed.

Schedule resources

The scheduling engine examines combinations of resources to identify those combinations that can satisfy requirements. You can specify selection criteria by selecting one of the following values in the **Primary resource selection** field on the **Scheduling parameters** page:

- *Duration* – The scheduling engine selects the resource that has the shortest lead time.
- *Priority* – The scheduling engine selects the resource that has the highest priority if two or more resources have identical capabilities and levels. The resource that has the lowest numeric value in this field has the highest priority.

> ⓘ **Note**
>
> Scheduling by duration can cause decreased performance when the same resource group contains many resources and secondary operations are used. You can schedule a maximum of 32 resources per operation. If you exceed this quantity, an Action center message is displayed, and job scheduling doesn't find the best alternative resource.

When you run job scheduling, the system plans the resources based on the limitations that you define in the resource parameters. You can control the capacity of the resources by using calendar settings. The system calculates loads for resources during the scheduling process.

> ⓘ **Note**
>
> For productions that use the operations scheduling function, you can run job scheduling after operations scheduling. If you aren't using operations scheduling, you can run job scheduling alone.

Maximum capacities for resources per job order

Job scheduling assigns resources to jobs. You can set maximum capacities for resources per job order. For example, you can set up the system to schedule no more than 50 percent of total capacity for a production order. This setup gives you more control over the scheduling of

resources on the job scheduling level. Therefore, it can help prevent issues if not enough capacity is available to perform simultaneous productions.

Resource efficiency

Job scheduling uses the efficiency percentages that you specify for the resources. Efficiency percentages reduce or increase the time that the system reserves for the resource. Therefore, lead time also increases or decreases. The system uses the following formula for the calculation: `Scheduling time = Time × 100 ÷ Efficiency percentage`. In this formula, *Time* includes both the run time and the setup time.

Consolidated batch orders

This article describes the concept of consolidated batch orders.

A bulk item that is produced is considered a parent item, whereas a packed item is considered a child item. The relation between the bulk item and the packed item is expressed in a bulk item conversion. This bulk item conversion is defined on the bulk item itself.

Packed items can be packaged into containers of either a single size or multiple sizes that are considered one unit. By consolidating the orders for a bulk item, you can see all the related batch orders in a single view that can help you determine any remaining work that must be completed.

A consolidated batch order can contain any combination of the following orders:

- A single bulk order and multiple packed orders
- Multiple bulk orders and multiple packed orders
- Multiple bulk orders and a single packed order
- Only packed orders

Batch order lifecycle from create to start

Article • 09/29/2021

This procedure takes you through the first part of the life cycle of a batch order.

From creation, cost estimation, and over production job scheduling to the actual start of a batch order.

The demo data company used to create this procedure is USMF.

The prerequisites for running the procedure with another dataset are a released product with an active formula and route version.

Create a batch order

1. Go to All production orders.
2. Click New batch order.
3. In the Item number field, enter or select a value.
4. Click Create.
5. Use the Quick Filter to filter on the Production field with a value of 'b'.

View production formula and expected co-products

1. On the Action Pane, click Production order.
2. Click Formula.
3. Close the page.
4. Click Co-products.
5. Close the page.

Estimate the batch order

1. Click Estimate.
2. Click OK.
3. On the Action Pane, click Manage costs.
4. Click View calculation details.
5. Close the page.

Release the batch order

1. On the Action Pane, click Production order.
2. Click Release.
3. Click OK.

Schedule production jobs

1. On the Action Pane, click Schedule.
2. Click Schedule jobs.
3. Select No in the Finite capacity field.
4. Select No in the Finite material field.
5. Click OK.
6. On the Action Pane, click Production order.
7. Click All jobs.
8. Close the page.

Start the batch order

1. Click Start.
2. Click the General tab.
3. Select No in the Post picking list now field.
4. Click OK.
5. On the Action Pane, click View.
6. Click Picking list.
7. In the list, click the link in the selected row.
8. Close the page.
9. Close the page.
10. Click Route card.
11. In the list, click the link in the selected row.
12. Close the page.
13. Close the page.

Sequence production jobs for process manufacturing

Article • 09/29/2021

This procedure uses paint products as an example to show how to sequence planned orders according to the priority of color and package size. The demo data company used to create this procedure is USPI. This procedure is intended for the production planner.

Run master planning for USPI

1. Go to Master planning > Master planning > Run > Master planning.
2. In the Master plan field, click the drop-down button to open the lookup.
3. In the list, click the link in the selected row.

    - Select MasterPlan.

4. Click OK.

    - This starts Master Planning, including the sequence process. This process can take a few minutes.

View planned orders for the paint products

1. Go to Master planning > Master planning > Planned orders.
2. Expand the Item details FactBox.
3. Expand the Schedule details FactBox.
4. In the Plan field, click the drop-down button to open the lookup.
5. In the list, find and select the desired record.

    - Select MasterPlan.

6. In the list, click the link in the selected row.
7. Use the Quick Filter to filter on the Item number field with a value of 'P300'.

    - Unlock to scroll to the right to see the order date and delivery date. Notice that these items have an order date of Today and the delivery dates for the planned orders are not sequenced after the priority of color and package size, as shown in the product name. You can hover over an item number to see the product name and priority.

Sequence planned orders for paint

1. Close the page.
2. Go to Master planning > Master planning > Sequenced planned orders.
3. Expand the Item details FactBox.
4. Expand the Schedule details FactBox.

    - Note: Here you see that the Start date/time for the planned orders are sequenced according to color and package size within a bucket period of 28 days. These periods are defined by a number in the field Campaign. The sequenced planned order form acts like the typical planned order form, and the production planner can firm the planned orders here.

5. Mark all rows.
6. Click Accept.

    - This will update the planned orders with the selected sequence action of either Postpone or Advance.

Verify the sequence of the planned orders

1. Close the page.
2. Go to Master planning > Master planning > Planned orders.
3. Expand the Item details FactBox.
4. Expand the Schedule details FactBox.
5. In the Plan field, click the drop-down button to open the lookup.
6. In the list, find and select the desired record.

    - Select MasterPlan.

7. In the list, click the link in the selected row.
8. Use the Quick Filter to filter on the Item number field with a value of 'P300'.

    - Notice that the orders now are sequenced according to the priority of color and size and the planned orders start at the earliest order date and delivery date. Validate the Order date column or the Start date in the Schedule details FactBbox.

Material substitution in manufacturing

09/19/2025

This article describes how to substitute materials during the production process. There are three methods for doing so:

- By date, when one material is substituted for another after a specific date
- During master planning, when a material in a formula is substituted with a different material because it's out of stock
- During production, when a material is unexpectedly out of stock and is substituted with a different material

Substituting material by date

Consider the following scenario: A machine that a company is manufacturing contains a component that expires from the vendor's catalog in two months. From the expiration date onward, the vendor offers a new component that you can substitute for the old component. Set up **From** and **To** validity dates on bill of materials (BOM) lines. For this example, set up the old component to expire by entering the expiration date in the **To-date** field. Then, on the BOM, set up the new replacement component so that it's valid from the day after the old component expires. To do this, enter the start date in the **From-date** field.

Substituting material by planning

You can substitute materials during planning only when you're using formulas, not when you're using a BOM. Consider the following scenario: A food manufacturing company is making a sauce from a formula that has 20 ingredients. One ingredient in the formula can be substituted by one of two other ingredients. However, because these two ingredients are more expensive than the preferred ingredient, substitution is used only if the preferred ingredient is out of stock. The material that you can substitute is called A, whereas the two materials that can replace it are called B and C. Material substitution by planning is controlled by the **Plan group** and **Priority** fields on the formula lines. For this example, you create formula lines for the three materials, and associate the formula lines with the same plan group. In the setup, the formula line for material A has the highest priority (lowest number), the formula line for material C has the lowest priority, and the formula line for material B has a priority that is between the priority of the other two lines. If you have demand for the finished item, master planning first determines whether the demand for material A can be covered. If the demand can't be covered, master planning looks at materials B and C, in order of priority. If material B is on hand, it will be used after a planned batch order is firmed for the formula. If none of the materials are on hand, master planning creates a planned order for material A.

> **Tip**
>
> When you set up formula lines in a plan group, specify a quantity only on the material that has the highest priority. This quantity calculates the demand of all materials in the plan, even the materials that have lower priority. You can't specify different quantities on lower-priority items in the plan group.

Substituting material during production

Consider the following scenario: A piece of metal plate is required for a welding operation. During the operation, a warehouse worker informs the machine operator that the plate is out of stock. However, it's decided that the plate can be substituted with a plate that is slightly thicker. That way, the operation can be finalized. You can add the material to the production picking list. Then, when the picking list is posted, the system adds the material to the production BOM.

Register and track batch/serial numbers for finished products and their components

08/13/2025

Workers and managers can register batch/serial numbers for materials and components that are used in manufacturing processes. They can also then associate those numbers with the batch/serial numbers of the products that are produced. In this way, manufacturers can optimize their processes, enhance product quality, and respond quickly to any issues that arise. Managers can use the item tracing report to effectively track batch/serial numbers that are registered through the *Tracked components* feature.

> **Tip**
>
> You can also track batch/serial numbers for materials and components using the Traceability Add-in for Dynamics 365 Supply Chain Management (preview), which offers a graphical browser interface and an API for integration with external systems.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.
- The feature that's named *Tracked components* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

Enable registration of tracked component information

To enable registration of tracked component information in production processes, follow these steps.

1. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters**.
2. On the **Bills of materials** tab, set the **Enable tracked components** option to *Yes*.

Enable registration of tracked components on products

Before you can use tracked components functionality for a product or its components, the following conditions must be met:

- The product must be defined as serial controlled or batch controlled.
- The product must be associated with a tracked components policy.

To create a tracked components policy, follow these steps.

1. Go to **Production** > **Setup** > **Production** > **Tracked components policy**.

2. Use the buttons on the Action Pane to add a new policy or edit an existing one.

3. For the new or selected policy, set the following fields:

    - **Name** – Enter a name for the policy.
    - **Description** – Enter a description of the policy.
    - **Use tracked components** – Set this option to *Yes* to register tracked information for products that are associated with the policy.
    - **Check pre-allocation for product** – Set this option to *Yes* to validate serial or batch numbers for finished goods when tracked component information is registered.
    - **Check for pre-allocation for components** – Set this option to *Yes* to validate serial or batch numbers for components when tracked component information is registered.
    - **Serial number matching limit** – Set this option to *Yes* to ensure that the number of component serial numbers that are matched to a product serial number doesn't exceed the planned quantity on the production order bill of materials (BOM) line. If the number of matched components exceeds the planned quantity, the system blocks the match to prevent over-allocation.

Register tracked components for finished items

To register tracked components for the finished items for any production order, follow these steps.

1. Start from any of the following places:

    - **All production orders** list or details
    - **Picking list** journal line
    - **Route card** journal line
    - **Job card** journal line

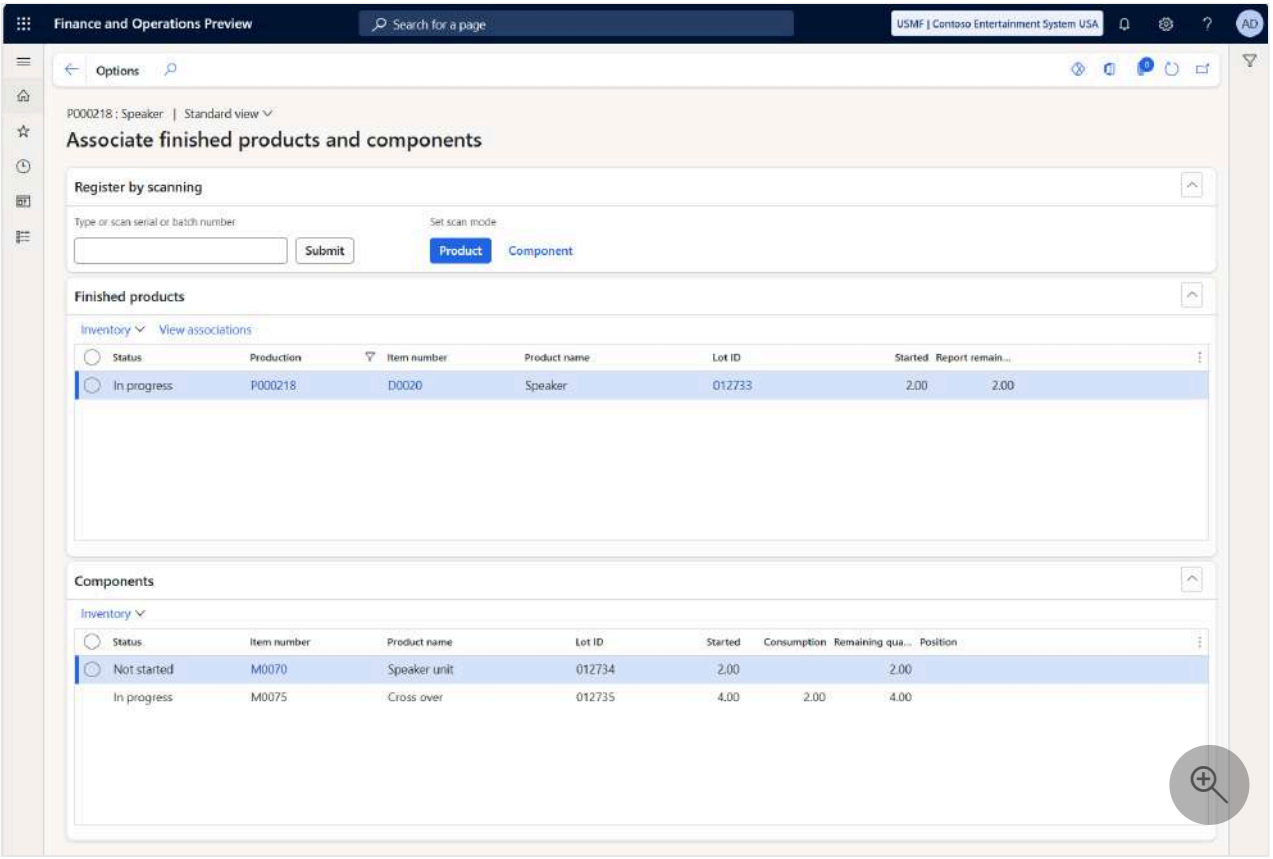
- **Report as finished** journal line
- **Current operations**
- Production order **Start** dialog
- Production order **Report as finished** dialog

2. Select the production order that you want to register batch or serial numbers for.

3. On the Action Pane, find the tab that includes the **Track components** button, and select that button.

4. On the **Tracked components** page, the **Type or scan serial or batch number** field is automatically in focus. In addition, the **Scan mode** field is automatically set to *Product* to indicate that you're about to enter the batch or serial number of a finished product. Follow one of the steps:

   - If you're using a scanner, scan the bar code of the first finished product that you want to register.
   - If you're using a keyboard, enter the batch or serial number of the first finished product that you want to register, and then select **Submit**.



5. The value of the **Scan mode** field is changed to *Component*. You can now register the batch or serial number of a component by following one of these steps:

   - If you're using GS1 bar codes, your system might be able to detect which component you're scanning. In this case, you can just scan the component bar code,

which includes both the component item number and its serial or batch number.
    - If you're using simple bar codes, or if you're using a keyboard, first select a component in the grid on the **Component** FastTab. Then enter or scan the batch or serial number of that component.

6. Repeat the previous step until you finish registering all the components for the current finished product.

7. Change the value of the **Scan mode** field back to *Product*, and repeat this procedure until you finish registering all finished products and their components for the current production order.

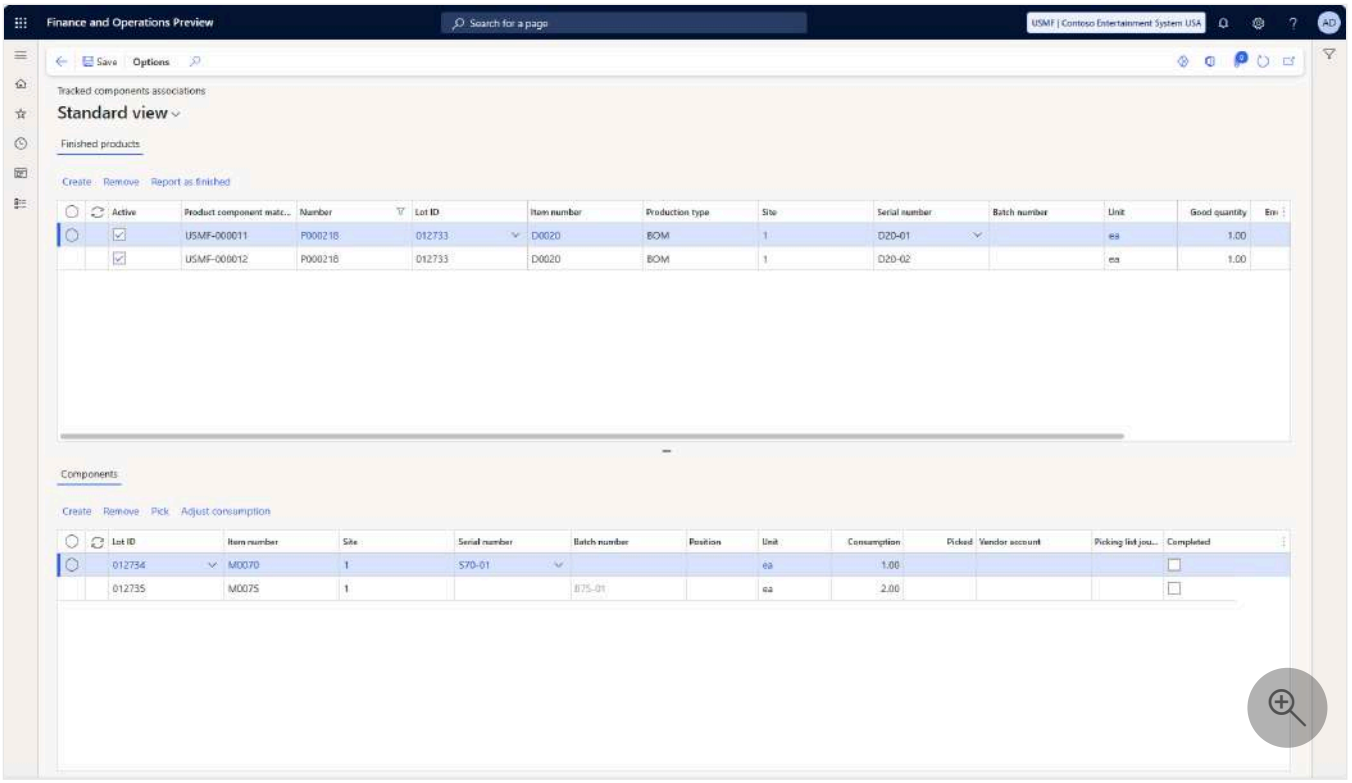
   At any time, you can review and correct the registrations that you've made so far. On the **Finished products** FastTab, on the toolbar, select **View associations** to open the **Tracked components associations** page. For information about how to work with this page, see the next section.

As you work, the **Status** field on the **Finished product** FastTab of the **Tracked components** page indicates the registration status of each finished product. The **Status** field on the **Components** FastTab indicates the registration status of each component in the selected finished product. The **Status** field on each FastTab can have the following values:

- *Not started* – No batch or serial number has been associated with the product or component.
- *In progress* – An association has been established, but only for part of the started quantity for the finished product or the component. On the **Components** FastTab, the **Started**, **Consumption**, and **Remaining quantity** columns let you track the quantity that has been allocated.
- *Completed* – No remaining quantity remains to be allocated for the finished product or the component.

Review and edit batch/serial numbers for finished products and their components

Use the **Tracked components associations** page to review and edit batch/serial numbers for finished products and their components. For information about how to open this page for a selected production order, see the previous section.



Finished products

The **Finished products** section lists batch/serial number registrations for the products that are being produced for the selected production order. The toolbar in this section provides the following buttons:

- **Create** – Add a new row to the grid so that you can register the serial or batch number for a missing finished product.
- **Remove** – Remove one or more selected finished products.
- **Report as finished** – Report a selected row as finished. You can first edit the **Good quantity** and/or **Error quantity** value for batch products as required.

Components

The **Components** section lists the components of the finished product that's selected in the **Finished products** grid. For each component, this section shows the registered batch or serial number, and you can enter or correct these values as required. The toolbar in this section provides the following buttons:

- **Create** – Add a new row to the grid so that you can register the serial or batch number for a missing component.
- **Remove** – Remove one or more selected components.
- **Pick** – Manually pick the quantity that's planned for consumption, as specified in the **Consumption** field.

- **Adjust consumption** – Generate a production picking list journal to manually adjust the consumption. In this case, the quantity that's specified in the **Consumption** field is automatically entered in the picking list journal.

Production feedback

Article • 06/21/2024

This article provides information about production feedback, which lets workers provide feedback about production jobs. The article includes information about the various ways that production feedback can be updated.

Production feedback gives workers the opportunity to provide feedback about production jobs. It lets workers record time and material consumption on production orders, operation quantities and status, and errors that cause a job or operation to fail. Production feedback can be updated in journals that are related to production orders. The **Production job card** and **Production route card** journals are used to report time and quantities per job or operation. For reporting about the last job or operation, quantities on the finished product can be reported as finished.

Workers can also provide production feedback using the production floor execution interface, which is part of the manufacturing execution functionality in the **Production control** module. The production floor execution interface has a configurable user interface that shows a list of the released jobs in a prioritized order for a selected work area. It also offers advanced options such as job bundling and team work. The production floor execution interface has a touch-optimized user interface. Feedback submitted through the production floor execution interface updates the production journals.

Time and attendance registration overview

07/10/2025

Time registration workers can enter different types of time registrations, for example, clock in, clock out, register indirect activities, and absence registration. This article describes registrations, their calculation, approval, and the use of workflow to add structure and automated approval to the process of approving timesheets.

Registrations

In companies that use time and attendance, workers must register the time that they spend at work in addition to their attendance. Some companies might only require workers to register clocking-in and clocking-out times. In other companies, workers might also be required to register time consumption on the actual activities they perform and the breaks they take. The intended users of time and attendance are:

- Workers, who are required to register time and attendance at regular intervals, for example daily, weekly or bi-weekly.
- Supervisors, managers, and payroll officers who calculate, approve, and transfer worker registrations for further processing.

> **Note**
>
> If you run Time and attendance together with Manufacturing execution, all registrations on projects, project activities, indirect activities, absence codes, and overtime and flex time will be recorded and are used to calculate payroll in both modules.

Time registrations workers

To be able to register time and absence, workers must be set up as time registration workers in the company they're employed in.

After setup, the workers can enter different types of registrations.

- Clocking in- and out when arriving or leaving work.
- Time and item consumption on production jobs.
- Time used on a machine on the shop floor, if the machine has been defined as a resource.

> **Note**
>
> A worker can be automatically assigned the time registrations that are made on a particular machine on the shop floor, if the worker chooses to work as an assistant to the machine when they start the production job.

- Time registrations on projects and project activities.
- Registering project fees and item consumption via the respective project fee journals and project item journals.
- Planned absence.
- Absence when arriving late to work or leaving earlier than planned.
- Work breaks, either manually registered or automatically calculated by the system.
- Indirect activities, which are nonproductive activities a worker might engage in during a workday. Examples of these activities include meetings or cleaning their workspace.
- Overtime, which can be registered either as extra hours, flextime, or overtime.

Adding clock-out registrations

If a worker forgets to clock-out at the end of their workday, the missing registration can be added by running a batch job. The system will compare the clock-in time and the clock-out time according to the associated profile of the worker, and automatically insert the missing clock-out registration to match the profile's end time. Both the clock-in and clock-out registrations are vital for the subsequent calculation and approval of time registrations before they can be transferred to payroll.

Calculating registrations

When a registration worker is assigned a calculation group that typically relates to a specific team, shift, or work group. The team manager or supervisor typically validates the registrations made by the workers, and is therefore also the responsible person to run the calculation for the respective calculation groups on a daily basis. As part of the calculation process the team manager or supervisor is able to:

- Correct erroneous registrations. For example, change switch codes and adjust feedback on production jobs.

- Add missing registrations. For example, create clock-out registrations and create absence transactions.
- Delete incorrect registrations.

Because the registered time must match the worker's time profile prior to calculating the registrations, you must override the work time profile for any worker who has an exception to their standard work time profile. If the worker profile is day shift, and the worker has agreed to work a night shift with no overtime pay, the team manager or supervisor must override the default worker profile in order to calculate the working time at the standard night rate and not as overtime. The calculation will also display an error if an absence registration is missing. It must be added before the calculation can be completed.

Approving registrations

Just as you assign a calculation group to a time registration worker, you must assign an approval group as well. Typically the group will be specific to a team, shift, or work group. You must approve the time registrations that were calculated correctly – this means doing a calculation without errors – before pay items can be generated that afterward can be transferred to a payroll system. The payroll administrator will typically do the approval of registrations, and prior to the approval they're able to:

- Override pay agreements for individual workers.
- Add manual premiums.
- Enter additional information about absence registrations.

> **Note**
>
> If overtime has been calculated for specific workers, the overtime can be allocated to specific jobs during the day. This is relevant if job cost is calculated based on worker pay.

Approving registrations using workflow

You can set up a workflow approval process that automatically approves registrations that comply with workflow rules, leaving only deviations to be handled manually. If workflow approval is activated, the team manager or supervisor submits the calculated registrations for approval. The workflow process will generate the appropriate approvals and tasks, and then assign them to the right users and roles as identified in the workflow. There are two workflow approvals for time and attendance.

Expand table

Workflow	Purpose	Registration type
Time and attendance days total	The workflow validates registrations against, for example, the expected number of work hours for the day.	
Time and attendance journal registration.	The workflow validates each registration type for the date of the registration.	Time and attendance • Clock-in • Clock-out • Absence • Break • Switch code • Project • Project activity • Indirect activity Production jobs • Queue before • Setup • Process • Overlap • Transport • Queue after • Start assistance • Stop assistance

Transferring approved registrations

After approval of the registrations, you can transfer them to a periodic payroll job. A transferred registration is posted to an activity or job that it relates to, for example, a production order or a project. Payroll transactions are generated for each worker based on the registrations.

Reversing transferred registrations

The task of reversing transactions – rolling them back – can be done until the time when the payroll period's pay transfer is run. This means that payroll data has been transferred to an external file. When reversed, all registrations are withdrawn, and any transactions posted on production orders or projects are offset and neutralized.

> ⓘ **Note**
>
> The external file can be imported into a payroll system.

Registrations in electronic timecards

Workers with job tasks that don't require immediate feedback, as is the case with production jobs, but who work on project activities, can benefit from using the electronic timecard. Electronic timecards offer the flexibility to enter registrations at any time and in the best way for your business schedule (daily, weekly, or when a worker is in the office again after being away). To use electronic timecards or these workers, you must specify, Use timecard, in the worker details. Electronic timecards enable the worker to register:

- Date
- Registration type
- Job reference, such as project, indirect activity, or production order
- Job identification
- Time consumption
- Project fees
- Project items

Electronic batch records (EBRs)

Electronic batch records (EBRs) are required by part 11 of Title 21 of the Code of Federal Regulations (21 CFR Part 11), which applies to life science and pharmaceutical industries. EBRs consist of two major components:

- **Master manufacturing record (MMR)** – This component documents all the methods that might be used to produce an item and the various ways that the item's characteristics might be measured.
- **Batch production record (BPR)** – This component documents the actual method that was used to produce the item and the actual value of the measurement for each of the item's characteristics. It also details the characteristics and quantities of the ingredients that were used to produce the item.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later.
- The following features must be turned on in Feature management. As of Supply Chain Management version 10.0.47, both of these features are turned on by default.
  - *Advanced quality management* (As of Supply Chain Management version 10.0.49, this feature is mandatory and can't be turned off.)
  - *Electronic signature improvements*

Turn electronic signature requirements for EBRs on or off

To set up the electronic signature requirements for the types of records that are used for EBRs, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature requirements**.

2. In the left pane, select the row for a feature that you want to turn electronic signature requirements on or off for. For EBRs, the usual expectation is that signatures are required for the following features (as listed in the **Name** column):

    - *Activate BOM version*
    - *Approve bill of materials*
    - *Activate route version*
    - *Approve BOM version*
    - *Approve route*
    - *Approve route version*
    - *Post dispensing ticket production journal*
    - *Post picking list production journal (non-dispensing)*
    - *Post report as finished production journal*
    - *Post route card production journal*
    - *Validate quality order*

3. In the right pane, set the **Signature required** option to *Yes* to require signatures from users who perform actions that are related to the feature. Set the option to *No* to turn off the requirement.

4. Repeat steps 2 and 3 for every other feature that you want to turn electronic signature requirements on or off for.

Set up EBRs

To enable EBRs, follow these steps:

1. Go to **Production control** > **Setup** > **Production control parameters**.

2. On the **Electronic batch record** tab, set the following fields:

    - **Use electronic batch records** – Set this option to *Yes* to enable EBRs in your system. When you change the setting to *Yes*, a message notifies you that you must remove approvals on bills of materials (BOMs), formulas, or routes before you edit those records. In this way, the system can capture electronic signatures of the users who perform the edits. While EBRs are enabled, the *block editing* functions for routes and BOMs/formulas are automatically enabled and can't be disabled. The block editing feature for routes and BOMs/formulas prevents those records from being edited after they are approved. Approval must be removed before the records are edited. Then,

after editing is completed, approval is required before the records can be used in production.

- **Include batch expiration on BPR** – Select whether the batch expiration date should be included on the BPR report.
- **Suppress work instructions on EBR** – Select whether the work instruction section of the BPR report should be omitted if there aren't any work instructions.
- **Allow BPR to print multiple reports at once** – Select whether multiple BPRs can be printed on a single report. If this option is set to *No*, only one BPR can be printed per report.

Set up a number sequence for EBRs

Because EBRs are maintained independently of the batch order or production order, a number sequence must be established.

1. Go to **Production control** > **Setup** > **Production control parameters**.
2. On the **Number sequences** tab, set up a new number sequence for the row where the **Reference** field is set to *Batch production record*.

Set up electronics signature requirements

You can configure electronic signature requirements to support EBRs for the following types of production journals:

- Picking list journal
- Route and job card journals
- Report as finished journal

Each of these journal types provides the following electronic signature options:

- **Post route card production journal** – When this option is set to *Yes*, the system notifies users that route card journals are no longer automatically posted when a batch or production order is started.
- **Post picking list production journal (non-dispensing)** – When this option is set to *Yes*, the system notifies users that picking list journals are no longer automatically posted when a batch or production order is started. In addition, the option for reporting the batch or production order as finished is disabled. Because the system must capture the electronic signature of the users who post those activities, the report as finished production journal must be used to report a batch or production order as finished.

- **Validate quality order** – When this option is set to *Yes*, the system requires a signature when an overall quality order is validated. However, no signature is required when individual tests of a quality order are validated.

Add work instructions to formula items

To add work instructions to a formula line, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Open or select the item that uses the formula that you want to add instructions to.
3. On the Action Pane, on the **Engineer** tab, select **Formula versions**.
4. In the list pane, select the formula version that you want to edit.
5. On the Action Pane, on the **Formulas** tab, select **Formula**.
6. If the **Approved** option for the formula is set to *Yes* on the **Formula header** FastTab, you must follow these steps to remove the approval before you can edit the formula:
   a. On the Action Pane, on the **Formula** tab, select **Approve formula**.
   b. In the dialog, set the **Remove approval** option to *Yes*.
   c. Select **OK**.
7. On the **Formula lines** FastTab, select the line that you want to add instructions to.
8. On the **Line details** FastTab, on the **Work instructions** tab, select **Add** on the toolbar to add work instructions for the selected line.
9. In the **Type** field, select *Note*. Then, in the **Description** field, enter a short description.
10. In the lower text box, enter the required work instructions or other comments.
11. On the Action Pane, select **Save**.

Add work instructions to BOM items

To add work instructions to a BOM line, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Open or select the item that uses the BOM that you want to add instructions to.
3. On the Action Pane, on the **Engineer** tab, select **BOM versions**.

4. In the list pane, select the BOM version that you want to edit.
5. On the Action Pane, on the **Bill of materials** tab, select **Bills of materials**.
6. If the **Approved** option for the BOM is set to *Yes* on the **Bill of materials header** FastTab, you must follow these steps to remove the approval before you can edit the BOM:
   a. On the Action Pane, on the **Bill of materials** tab, select **Approval**.
   b. In the dialog, set the **Remove approval** option to *Yes*.
   c. Select **OK**.
7. On the **Bill of materials lines** FastTab, select the line that you want to add instructions to.
8. On the **Line details** FastTab, on the **Work instructions** tab, select **Add** on the toolbar to add work instructions for the selected line.
9. In the **Type** field, select *Note*. Then, in the **Description** field, enter a short description.
10. In the lower text box, enter the required work instructions or other comments.
11. On the Action Pane, select **Save**.

Add work instructions for routes

To add work instructions for an operation line, you must edit the route. When EBRs are used, formula lines for approved routes can't be edited. To add work instructions to a route, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Open or select the item that uses the route that you want to edit.
3. On the Action Pane, on the **Engineer** tab, in the **View** group, select **Route**.
4. In the top section, select the route version that you want to edit.
5. If a check mark appears in the **Approved** column for the selected route version, you must follow these steps to remove the approval before you can edit the route:
   a. On the Action Pane, on the **Route version** tab, select **Approve**.
   b. In the dialog, set the **Remove approval** option to *Yes*.
   c. Select **OK**.
6. In the bottom section, on the **Overview** tab, select the operation that you want to edit.

7. On the **Work instructions** tab, select **New** on the toolbar to add work instructions for the selected operation.
8. In the **Type** field, select *Note*. Then, in the **Description** field, enter a short description.
9. In the lower text box, enter the required work instructions or other comments.

Configure test plan instructions for test groups

When test plan instructions are associated with a line in a test group, quality orders that reference the test group show the instructions as read-only text. To add test plan instruction to a test group, follow these steps:

1. Go to **Inventory Management** > **Setup** > **Quality control** > **Test groups**.
2. In the top section, on the **Overview** tab, select the test group that you want to add instructions to.
3. In the bottom section, on the **Overview** tab, select the test that you want to add instructions to.
4. On the **Test plan notes** tab, select **Add** on the toolbar to add work instructions for the selected test line.
5. In the **Type** field, select *Note*. Then, in the **Description** field, enter a short description.
6. In the lower text box, enter the required work instructions or other comments.

Work with EBRs

After all the required production data is set up for a BOM or formula item, you can search for that information. This capability is the primary purpose of EBRs.

As was mentioned earlier, EBRs consist of two major components:

- **Master manufacturing record (MMR)** – This component documents all the methods that might be used to produce an item and the various ways that the item's characteristics might be measured. The MMR query contains all the BOM/formula versions that are approved for use in the manufacture of the item. It also includes the various approved route versions. In addition, the information includes quality associations that are referenced by the production process for the item. As a result of these quality associations, quality orders are automatically generated for the item. If the item is an ingredient, quality associations for that ingredient might be referenced and cause quality orders to be generated during an inspection. Other characteristics might be referenced for the ingredients or produced items to indicate the type of characteristic that is being measured. The measured characteristic

might be related to a specific inventory batch dimension or to the vendor that supplied the ingredient.

- **Batch production record (BPR)** – This component documents the actual method that was used to produce the item and the actual value of the measurement for each of the item's characteristics. It also details the characteristics and quantities of the ingredients that were used to produce the item. The BPR query contains the BOM/formula version that was used in the production process, together with the proposed ingredient quantities that were estimated for completion of the production. In addition, the information includes the exact quantities that were used, in comparison to what was estimated or proposed, and any new ingredients that were substituted during the production process.

Whereas the MMR maintains the types of characteristics that might be measured for the item, the BPR maintains the actual values of those measured characteristics. The BPR contains the actual details of the quality orders that were referenced by the quality associations in the MMR.

Run an MMR query

When you run an MMR query, you first select the target item number. You can also select a site to limit the BOM/formula and route versions to that site. In addition, you can select a date and/or quantity.

The query results show all applicable route versions. The BOM/formula versions and the route version number are hyperlinks. You can use them to open the details page for the selected version. The results also show and summarize quality associations that are referenced as production or coproduct production. Select **Details** for a quality association to open the details page for it. Finally, the results show inventory batch attributes that are defined for the produced item, together with the applicable range and target value for each characteristic.

To run an MMR query, follow these steps:

1. Go to **Production control** > **Inquiries** > **Electronic batch records** > **Master manufacturing record**.

2. At the top of the page, set up the query by specifying one or more of the following criteria:

    - **Item number** – Select the item to list the manufacturing information for. The dropdown list includes only items where the **Production type** field is set to *BOM*, *Formula*, or *Planning item*.
    - **Site** – Select a specific site for the selected item.
    - **Date** – Enter a "from" date to filter the formula/BOM version for the selected item.

- **Quantity** – Enter a "from" quantity to filter the formula/BOM version for the selected item.

Results and information are shown on the following FastTabs:

- **General** – This FastTab shows general information about the selected item.
- **BOM/formula versions** – This FastTab lists the formula/BOM versions of the selected item, based on the specified criteria.
- **Route versions** – This FastTab lists the route versions of the selected item, based on the specified criteria.
- **Quality associations** – This FastTab lists all quality association relations for the selected item. Use the **Details** button to open the quality association page for the selected record.
- **Inventory batch attributes** – This FastTab lists all inventory batch attributes that are specified for the selected item.

Run a BPR query

When you run a BPR query, you first select either the target item number or the BPR that is associated with a specific batch or production order.

The query contains the BOM/formula version that was used in the production process, together with the proposed ingredient quantities that were estimated for completion of the production. The information also includes the exact quantities that were used, in comparison to what was estimated or proposed, and any new ingredients that were substituted during the production process. In the BPR, you can view the inventory batch attributes and any quality orders for the produced items. You can also view the inventory batch attributes, vendor batch details, and quality orders for the raw material items that were used in the production process.

To run a BPR query, follow these steps:

1. Go to **Production control** > **Inquiries** > **Electronic batch records** > **Batch production record**.

2. At the top of the page, set up the query by specifying one or more of the following criteria:

    - **Item number** – Select the item to list the manufacturing information for. The dropdown list includes only items where the **Production type** field is set to *BOM*, *Formula*, or *Planning item*.
    - **Batch production record** – Select the BPR ID for a corresponding batch or production order. If you select this criterion before the item number, the **Item number** field is

automatically set to the item number of the batch or production order that is related to the selected BPR ID.

Results and information are shown on the following FastTabs:

- **Production order** – This FastTab shows the batch or production order that is related to the specified BPR ID.
- **Report as finished** – This FastTab shows the items that were produced for the batch or production order that is related to the specified BPR ID. (For formula items, the produced items include coproducts and by-products.) This FastTab is populated when the report as finished production journal is created. Use the **Inventory batch attributes** button on the toolbar to view attribute information for the selected record. (The **Inventory batch attributes** button is available only if there is batch number for the selected record.) Use the **Quality orders** button to view the quality orders for the selected record.
- **BOM/formula** – This FastTab lists the raw material items that were used to produce the selected item.
- **Picking list** – This FastTab shows information from the picking list production journal of the batch or production order. It's populated when the picking list production journal is created. Use the **Inventory batch attributes** button to view attribute information for the selected record. (The **Inventory batch attributes** button is available only if there is a batch number for the selected record.) Use the **Vendor batch details** button to view the vendor batch information for the selected record. (The **Vendor batch details** button is available only if there is a batch number for the selected record.) Use the **Quality orders** button to view the quality orders for the selected record.
- **Route** – This FastTab lists the route version that is used on the batch or production order.
- **Route card** – This FastTab shows the information from the route card production journal of the batch or production order. It's populated when the route card production journal is created.
- **Job card** – This FastTab shows information from the job card production journal of the batch or production order. It's populated when the job card production journal is created.

Generate a BPR report

You can view and/or print a report for a specific BPR ID. A simplified version of the report contains the same information that is reflected in a BPR query.

To generate a BPR report, follow these steps:

1. Run a BPR query to find the relevant BPR, as described in the previous section.

2. On the Action Pane, select **Batch production report (BPR)**.
3. In the dialog, on the **Parameters** FastTab, select the details that you want to include on the report.
4. On the **Destination** FastTab, select whether you want to view the report on screen, print it, save it as a file, or email it.
5. Select **OK** to generate the report.

Last updated on 07/27/2026

Production dispensing

When you deal with hazardous materials or sensitive components in production processes, accurate dispensing of materials is crucial. It helps minimize the risk of contamination, preserve the integrity of the materials, and ensure the safety of both the product and personnel.

The processing of dispensing materials to a production order involves allocating and providing the raw materials or components that are required for the production process. It's essential in some environments, for several reasons:

- In highly regulated industries, such as pharmaceuticals or chemicals, precise dispensing ensures compliance with strict guidelines and standards, and helps maintain product quality and safety.
- When hazardous or sensitive materials are handled, the dispensing process is often performed in a type of controlled environment that is known as a clean room. A sealed box is transferred from the warehouse to the clean room. There, the box is unsealed, and the materials are dispensed. After dispensing is completed, the box is sealed again and returned to the warehouse. This process ensures that the materials remain uncontaminated and safe throughout the handling and dispensing stages.
- For expensive materials, precise dispensing helps prevent waste and fraud. Therefore, it reduces costs and ensures efficient resource use. Additionally, accurate dispensing contributes to consistent product quality. Therefore, it not only helps meet customer expectations but also protects workers and the environment by ensuring that dangerous substances are handled correctly.

To support the regulated dispensing process, you can take these actions:

- Set up thresholds for over-dispensing and under-dispensing. In this way, you help maintain compliance and quality by ensuring that the correct quantities are dispensed.
- Configure the system to automatically return any remaining, undispensed materials to inventory.
- Restrict the dispensing process to workers who are authorized to perform it. In this way, you ensure that only trained and qualified personnel handle the materials.
- Require that workers use an electronic signature to sign off on the dispensed quantities. An electronic signature helps ensure the authenticity and integrity of a process. It provides a secure and verifiable way to confirm that the correct actions were performed by authorized

personnel. Therefore, it helps maintain compliance with regulatory standards. Learn more about electronic signatures in Electronic signatures overview

Workers use the **Dispensing ticket** page to manage the dispensing of materials to the production or batch order. On this page, they register and confirm the amount of material that must be dispensed. After confirmation, the dispensed quantities are registered as consumed in the *dispensing pick journal*. Materials that aren't configured for dispensing on the production or batch order are issued through the production picking list journal.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later.
- The following features must be turned on in Feature management. As of Supply Chain Management version 10.0.47, both of these features are turned on by default.
  - *Advanced quality management* (As of Supply Chain Management version 10.0.49, this feature is mandatory and can't be turned off.)
  - *Dispense management* (As of Supply Chain Management version 10.0.49, this feature is mandatory and can't be turned off.)

Set up a dispensing pick journal

To set up a journal for dispensing materials to production and batch orders, follow these steps:

1. Go to **Production control** > **Setup** > **Production journal names**.
2. Select **New** to create a journal name for the dispensing pick journal.
3. Enter a name and a description.
4. Set the **Dispensing tickets** option to *Yes*.
5. Leave the all other fields set at their default value.
6. On the Action Pane, select **Save**.

Grant users access to production dispensing features

All users who should be able to dispense products in the production process must have the *Production dispenser* security role assigned to them. To assign this role to a user, follow these steps:

1. Go to **System administration** > **Users** > **Users**.
2. Open the user that you want to enable for production dispensing.
3. In the **User's roles** section, select **Assign roles**.
4. In the list, select the *Production dispenser* role.
5. Select **OK**.

Require electronic signatures for production dispensing

To require an electronic signature when users post the dispensing pick journal, follow these steps:

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature requirements**.
2. In the list pane, select the row where the **Name** field is set to *Post dispensing ticket production journal*.
3. Set the **Signature required** option to *Yes*.
4. In the list pane, select the row where the **Name** field is set to *Post picking list production journal (non-dispensing)*.
5. Set the **Signature required** option to *Yes*.
6. On the Action Pane, select **Save**.

Set up measuring devices

You can create a catalog of measuring devices that are used in the dispensing process. These devices are typically scales. Every dispensing ticket can have a measuring device assigned to it. In the production control parameters, you can set up a default device. To set up a measuring device, follow these steps:

1. Go to **Inventory management** > **Setup** > **Quality control** > **Measuring devices**.

2. Use the buttons on the Action Pane to add a new measuring device or edit an existing one. (You can also delete an existing device.)

3. For the new or selected measuring device, set the following fields:

    - **Name**
    - **Description**
    - **Test instrument tag** – Specify a unique identifier for the measuring device. You can use this ID to track the device's calibration history. Learn more about instrument calibration in Test instrument calibration.

Set up production control parameters

To enable production dispensing and configure how it works in your system, you must configure several settings on the **Production control parameters** page. To configure the required production control parameters, follow these steps:

1. Go to **Production control** > **Setup** > **Production control parameters**.
2. On the **Standard update** tab, set the following fields:
    - **Enable dispensing for production** – Set this option to *Yes* to enable production dispensing to be used in a production flow.
    - **Allow over-dispensing with reverse pick** – Set this option to *Yes* to enable material to be over-dispensed or over-picked, and any remainder to be returned to inventory through an automatically generated pick list.
3. On the **Journals** tab, in the **Dispensing tickets** field, select the journal name that you created for the dispensing pick journal. This journal is the default journal for dispensed products.
4. On the **General** tab, in the **Default measuring device** field, select the measuring device that should appear by default on the **Dispensing ticket** page.

Set up a product for the dispensing process

To use a dispensing process, you must configure dispensing options for each relevant product.

> ⓘ **Note**
>
> Products that are enabled for warehouse management processes (WMS) can't be enabled for the dispensing process.

To set up a product for the dispensing process, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Create a new product, or open an existing product that you want to set up for dispensing.
3. On the **Manage inventory** FastTab, in the **Dispensing** section, set the following fields:

- **Dispensing control** – Set this option to *Yes* to enable dispensing control for the product.
- **Underdispense** – Define the under-dispending threshold. In other words, specify the percentage by which the dispensed quantity can be less than the proposed quantity. In this way, when workers enter the dispensed quantity in the dispensing ticket on a production order, the system validates that the quantity doesn't fall below the defined threshold.
- **Overdispense** – Define the over-dispensing threshold. In other words, specify the percentage by which the dispensed quantity can exceed the proposed quantity. In this way, when workers enter the dispensed quantity in the dispensing ticket on a production order, the system validates that the quantity doesn't go above the defined threshold.
- **Authorized personnel** – Set this option to *Yes* to allow only workers who have the *Production dispenser* security role to perform dispensing.

> ⓘ **Note**
>
> When you add a bill of materials (BOM) or formula line that includes a product that is enabled for dispensing, that line inherits the item's over-dispensing and under-dispensing thresholds. However, you can override the inherited values on the BOM or formula line. The new values are then used when the dispensed quantity is validated during the dispensing process.

Generate the dispensing ticket and dispensing pick journal

To create the dispensing ticket and dispensing pick journal for a production or batch order where BOM or formula lines are enabled for dispensing, follow these steps:

1. Go to **Production control** > **Production orders** > **All production orders**.
2. Select **New production order** or **New batch order**.
3. In the dialog, in the **Item number** field, select a product that has an approved BOM or formula version where items are enabled for dispensing.
4. Leave all other fields in the dialog set at their default value.
5. Select **OK** to create the order.

6. On the Action Pane, select **Estimate** to move the order to the *Estimated* state.
7. On the Action Pane, select **Release**.
8. In the dialog, on the **General** tab, set the following fields:
    - **Picking list** – Select a name for the picking list.
    - **Dispensing tickets** – Select a name for the dispensing ticket.
9. Select **OK** to close the dialog and move the order to the *Released* state.
10. On the batch order page, on the Action Pane, on the **View** tab, in the **Journals** group, select the following buttons:
    - **Dispensing ticket** – Open the dispensing ticket that was created when the batch order was released.
    - **Dispensing pick journal** – Open the dispensing pick journal that was created when the batch order was released.

Work with the dispensing ticket and dispensing pick journal

After the batch or production order is released as described in previous sections, workers can open the dispensing ticket to register the amount of material that is dispensed for the order.

1. On the production or batch order page, on the Action Pane, on the **View** tab, in the **Journals** group, select **Dispensing ticket**.
2. In the **Journal** column, select the journal that you want to open.
3. In the **Dispensing details** section, select **New** to create a line for registering a dispensed quantity. If you're making multiple measurements of the same portion of the material that you're dispensing, you can create a separate line for each measurement.
4. Select **Post dispensed** to calculate the average value of the registered measurements. In the **Journal lines** section, the **Dispensed** field of the line item for the dispensed material is updated with the calculated average value.
5. On the Action Pane, select **Confirm** to transfer the value for the calculated dispensed quantity to the dispensing pick journal.

6. On the Action Pane, select **Post** to post the dispensing pick journal. The dispensed quantity is registered as consumed in inventory.

> ⓘ Note
>
> Instead of posting the dispensing pick journal from the dispensing ticket, you can post it directly from the dispensing pick journal page.

Automatically create a dispensing pick journal to revert remaining material from the dispensing process

If you set the **Allow over-dispensing with reverse pick** option to *Yes* as described in the Set up production control parameters section, the system can automatically generate a dispensing pick list to reverse material that was over-picked for the dispensing process. This capability can be relevant when you stage materials in full handling units, such as a container or bag, to the location where the dispensing process is performed.

To have any remainder from over-dispensed or over-picked material returned to inventory through an automatically generated pick list, follow these steps:

> ⓘ Note
>
> Before you begin, ensure that the **Allow over-dispensing with reverse pick** option is set to *Yes* on the **Production control parameters** page.

1. Generate the dispensing ticket and dispensing pick journal by releasing the production or batch order as described in previous sections.
2. On the production or batch order page, on the Action Pane, on the **View** tab, in the **Journals** group, select **Dispensing pick journal**.
3. In the **Journal** column, select the journal that you want to open.
4. In the **Journal lines** section, in the **Consumption** field, increase the value so that it matches the quantity of the material that you want to stage to the dispensing area.
5. Close the dispensing pick journal.
6. On the order page, on the **View** tab, select **Dispensing ticket**.
7. In the **Dispensing details** section, select **New** to create lines for the measurements of the dispensed material.

8. Select **Post dispensed**. In the **Journal lines** section, the **Dispensed** field on the material line is updated.
9. On the Action Pane, select **Confirm** to transfer the value for the calculated dispensed quantity to the dispensing pick journal.
10. On the Action Pane, select **Post** to post the dispensing pick journal.
11. Return to the order page.
12. On the Action Pane, on the **View** tab, in the **Journals** group, select **All**.
13. Select the journal where the description starts with "Dispensing adjustment for."
14. Open the journal, and notice that the journal line has a negative quantity. This quantity was calculated as the difference between the quantity that was registered as staged and the quantity that was confirmed and posted as dispensed.
15. Post the journal to update the inventory with the quantity that was over-picked for the dispensing process.

Allocate time to jobs in a job bundle

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In Manufacturing execution, you can bundle jobs. You can then start multiple jobs at the same time on the Job list page.

If you bundle jobs, you must define how the total registered time for all the jobs should be allocated to each job. You define the allocation by selecting one of the following options in the **Bundle type** field on the **Allocation keys** page:

- **Estimation** – Time is divided among the jobs, based on the estimated time for the jobs.
- **Jobs** – Time is divided according to total jobs that are bundled and how much time was spent finishing all the jobs.
- **Net time** – Time is divided equally among the jobs that are in the bundle at any time.
- **Real time** – Actual job time is allocated. The cost can be calculated based on the actual payroll cost. **Note:** The **Real time** allocation key is available only if your company uses the payroll functionality in Time and attendance.

The following examples show the results of the various allocation keys.

Example scenario

You need to complete three jobs in your job queue. You start the first job, and while that job is in progress, you start the second and third jobs. Therefore, there's a bundle of three jobs. The following table shows the estimated production time for each job.

Expand table

Job	Production time
Job 1	1 hour

Job	Production time
Job 2	3 hours
Job 3	4 hours
Total	8 hours

The following table shows the actual work hours that you spend on each job.

Expand table

Job	Start time	End time	Bundle time
Job 1	09:00	11:00	2 hours
Job 2	10:00	13:00	3 hours
Job 3	10:00	15:00	5 hours
Bundle	09:00	15:00	6 hours

The following sections describe the results of the calculated time for each allocation key.

Estimation allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time × (Estimated job time ÷ Total estimated time)

Expand table

Job	Formula	Allocated time
Job 1	6 × (1 ÷ 8) hours	0.75 hour
Job 2	6 × (3 ÷ 8) hours	2.25 hours
Job 3	6 × (4 ÷ 8) hours	3.00 hours

Jobs allocation key

The following table illustrates the formula for calculating allocated time. Here is the formula: Time per job = Total bundle time ÷ Number of jobs

Expand table

Job	Formula	Allocated time
Job 1	6 ÷ 3	2 hours
Job 2	6 ÷ 3	2 hours
Job 3	6 ÷ 3	2 hours

Net time allocation key

The following table shows the formula for calculating allocated time. The formula is: Calculated time per reporting = Bundle time ÷ Number of jobs

Expand table

Example	09:00–10:00 (1 hour)	10:00–11:00 (1 hour)	11:00–13:00 (2 hours)	13:00–15:00 (2 hours)	Allocated time
Number of jobs in the bundle	1	3	2	1	Not applicable
Job 1	1 ÷ 1 = 1 hour	1 ÷ 3 = 0.33 hour	Not applicable	Not applicable	1.33 hours
Job 2	Not applicable	1 ÷ 3 = 0.33 hour	2 ÷ 2 = 1 hour	Not applicable	1.33 hours
Job 3	Not applicable	1 ÷ 3 = 0.33 hour	2 ÷ 2 = 1 hour	2 ÷ 1 = 2 hours	3.33 hours

Real-time allocation key

To calculate production costs based on real costs, clear the **Cost category** option on the **Production order defaults** page. The following table shows the formula for calculating allocated time. The formula is: Actual time per job = Actual time in bundle

Expand table

Job	Actual time
Job 1	2 hours
Job 2	3 hours
Job 3	5 hours

Consider the three jobs that a worker performs with an hourly wage of USD 12.00. The worker doesn't earn any overtime bonus or premium for the time spent on the jobs. The worker spends six hours working on the three bundled jobs. Therefore, the salary cost is 6 × USD 12.00 = USD 72.00. When you use real-time allocation, the system recalculates the cost per hour by using the factor from the Net time formula. The system then transfers the actual time that was spent on each job together with the corrected cost price per hour. In the example, six hours are spent, although 10 hours were allocated. The following table shows the formula for calculating cost. The formula is: Cost per hour = (Total bundle time per job (Net time) ÷ Actual time per job) × Standard cost price per hour

Expand table

Job	Calculation of corrected cost per hour	Corrected cost per hour	Allocated time	Total cost of job
Job 1	(1.33 ÷ 2) × USD 12.00	USD 8.00	2 hours	USD 16.00
Job 2	(1.33 ÷ 3) × USD 12.00	USD 5.33	3 hours	USD 16.00
Job 3	(3.33 ÷ 5) × USD 12.00	USD 8.00	5 hours	USD 40.00

The corrected cost per hour and the job time are posted in a production journal.

> **Note**
>
> If you select the **Cost category** option on the **General** tab on the **Production order defaults** page, the system transfers the actual time for each job to a production journal, where the cost is applied to the cost category of the specific job.

Last updated on 05/27/2026

Calculate material consumption

08/13/2025

This article provides information about various options that are related to the calculation of material consumption.

The following options that are related to the calculation of material consumption are available on the **Setup** and **Step consumption** tabs on the **Line details** FastTab of the **Bill of materials** page.

Variable and constant consumption

In the **Consumption is** field, you can select whether consumption should be calculated as a constant quantity or a variable quantity. Select *Constant* if a fixed quantity or volume is required for the production, regardless of the quantity that is produced. Select *Variable*, which is the default setting, if the required amount of material in the finished goods is proportional to the number of finished goods that are produced.

Calculating consumption from a formula

In the **Formula** field, you can set up various formulas for calculating material consumption. If you use the default value, *Standard*, the consumption isn't calculated from a formula. The following formulas work together with the **Height**, **Width**, **Depth**, **Density**, and **Constant** fields:

- Height * Constant
- Height * Width * Constant
- Height * Width * Depth * Constant
- (Height * Width * Depth / Density) * Constant

Rounding up and multiples

Together, the **Rounding up** and **Multiples** fields let you round up the material consumption value. For example, you can round up the value according to the handling unit in which the raw material is picked for production. The following options are available in the **Rounding up** field: *Quantity*, *Measurement*, and *Consumption*.

Quantity

If you select *Quantity* as the rounding-up mechanism, the quantity must be a multiple of the specified quantity. For example, if whole numbers are required, select *1* in the **Multiples** field.

Numbers are then rounded up to a quantity that is divisible by 1.

Measurement

Typically, you select *Measurement* as the rounding-up mechanism when the raw material comes in specific dimensions. For example, a piece of 2-meter metal tube is required for a finished good, and the metal tube is stored in 4.5-meter lengths. In this case, the *Measurement* rounding-up mechanism can be used to calculate how many metal tubes are required to produce a specific number of pieces of the finished good. For this example, the **Formula** field is set to *Height * Constant*. The **Height** field is set to *2* to indicate the length of the tube that is required for the finished good. The **Multiple** field is set to *4.5* to indicate that the tube is picked in lengths of 4.5 meters. Here's the calculation:

1. Number of multiples that are required for 10 pieces of the finished good: 10 ÷ 2 = 5 pieces
2. Total consumption: 4.5 × 5 = 22.5 meters of metal tube

It's assumed that 0.5 meters of tube is scrapped for every five pieces of tube that are consumed.

Consumption

Typically, you select *Consumption* as the rounding-up mechanism when raw material must be picked in whole quantities of a specific handling unit of the product. For example, 2 quarts of paint are used to produce one piece of a finished good, and the paint is picked in 25-quart cans. In this case, the *Consumption* rounding-up mechanism can be used to round up consumption to whole numbers of 25-quart cans. Here's the calculation for the amount of paint that is required if 180 pieces of the finished good must be produced:

1. Paint that is required, excluding scrap: 180 × 2 = 360 quarts
2. Number of cans: 360 ÷ 25 = 14.4, which is rounded up to 15
3. Paint that is required, including scrap: 15 × 25 = 375 quarts

Step consumption

Step consumption is used to calculate constant consumption in quantity intervals. If you select *Step consumption* in the **Formula** field on the **Setup** tab, you can add information about the steps on the **Step consumption** tab. The fixed consumed quantity can be set up in intervals of the produced quantity. For example, step consumption is set up as shown in the following table.

Expand table

From series	Quantity
0.00	10.0000
100.00	20.0000
200.00	40.0000

The bill of materials (BOM) quantity is 1, and the production quantity is 110. The formula for the consumption is From series (Quantity) = Consumption. Because the production quantity is 110, it falls into the "From 100 series." Therefore, the quantity is 20.

Production posting

This article provides information about different types of postings in the production process.

Production posting activities follow production processes that are described in the sections below.

Material consumption

Materials are registered as consumed during production when the production picking list journal is posted. This process generates issue transactions that deduct the on-hand inventory. In the production parameters, you can specify whether the value of raw materials that are in progress (work in process [WIP]) should be posted in the ledger. The value of raw materials that are in progress (WIP) is then posted to a dedicated Picking list account and a dedicated Picking list offset account.

Time consumption

The time that workers spend on production jobs is recorded in the Route card journal or the Job card journal. When these journals are posted, ledger posting to a dedicated account for resources that are in progress (WIP) is processed. This posting represents the value of the time that is spent on the production order. After the production order is registered as ended, the WIP accounts are settled.

Reporting finished goods and error quantities

When a production order is reported as finished, the quantity of the finished goods that have been completed is updated in Inventory management through the Report as finished journal. If you're using WIP accounting, which can be set up in the production parameters, a ledger journal is made to reduce the WIP accounts and increase the inventory of the finished goods. The journal uses the standard cost that is defined for the product.

Ending the production order

Before a production order is ended, actual costs are calculated for the quantity that was produced. All estimated costs of material, labor, and overhead are reversed and replaced with actual costs. The overall cost of the finished item is debited from the inventory Receipt account

and credited to the inventory Issues account. If you select the **End job** check box when you run the cost calculation, the status of the production order is changed to *Ended*. This status prevents any additional costs from being unintentionally posted to a completed production order. You can specify that the value of error quantities that are reported during reporting as finished should be allocated to the good quantities that are reported as finished. Alternatively, you can specify that the value of error quantities should be posted to a dedicated scrap account.

Controlling the level of ledger posting

In the **Production control parameters**, you can use the **Ledger posting** field to set the level of ledger posting for production processes. The following values are available:

- *Item and resource* – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from resource or resource group from the route operations.
- *Item and category* – Use the ledger accounts that are set up on the item groups for raw materials and finished goods. WIP for time consumption is taken from the cost categories that are associated with the route operations.
- *Production groups* – Use the ledger accounts that are set up on the production groups for both material and time consumption. The production groups are associated with the released products and copied to the production orders when those orders are created. The posting on the production orders will then follow the production groups that are associated with the production order.

> **Note**
>
> If the standard method for calculating the cost of the finished item was used, the final transactions reflect this fact. If actual costs and the costs that are calculated by using the standard method differ, the difference is posted to the account that shows profit or loss.

Last updated on 11/26/2025

Time and attendance registration overview

07/10/2025

Time registration workers can enter different types of time registrations, for example, clock in, clock out, register indirect activities, and absence registration. This article describes registrations, their calculation, approval, and the use of workflow to add structure and automated approval to the process of approving timesheets.

Registrations

In companies that use time and attendance, workers must register the time that they spend at work in addition to their attendance. Some companies might only require workers to register clocking-in and clocking-out times. In other companies, workers might also be required to register time consumption on the actual activities they perform and the breaks they take. The intended users of time and attendance are:

- Workers, who are required to register time and attendance at regular intervals, for example daily, weekly or bi-weekly.
- Supervisors, managers, and payroll officers who calculate, approve, and transfer worker registrations for further processing.

> **Note**
>
> If you run Time and attendance together with Manufacturing execution, all registrations on projects, project activities, indirect activities, absence codes, and overtime and flex time will be recorded and are used to calculate payroll in both modules.

Time registrations workers

To be able to register time and absence, workers must be set up as time registration workers in the company they're employed in.

After setup, the workers can enter different types of registrations.

- Clocking in- and out when arriving or leaving work.
- Time and item consumption on production jobs.
- Time used on a machine on the shop floor, if the machine has been defined as a resource.

> **Note**
>
> A worker can be automatically assigned the time registrations that are made on a particular machine on the shop floor, if the worker chooses to work as an assistant to the machine when they start the production job.

- Time registrations on projects and project activities.
- Registering project fees and item consumption via the respective project fee journals and project item journals.
- Planned absence.
- Absence when arriving late to work or leaving earlier than planned.
- Work breaks, either manually registered or automatically calculated by the system.
- Indirect activities, which are nonproductive activities a worker might engage in during a workday. Examples of these activities include meetings or cleaning their workspace.
- Overtime, which can be registered either as extra hours, flextime, or overtime.

Adding clock-out registrations

If a worker forgets to clock-out at the end of their workday, the missing registration can be added by running a batch job. The system will compare the clock-in time and the clock-out time according to the associated profile of the worker, and automatically insert the missing clock-out registration to match the profile's end time. Both the clock-in and clock-out registrations are vital for the subsequent calculation and approval of time registrations before they can be transferred to payroll.

Calculating registrations

When a registration worker is assigned a calculation group that typically relates to a specific team, shift, or work group. The team manager or supervisor typically validates the registrations made by the workers, and is therefore also the responsible person to run the calculation for the respective calculation groups on a daily basis. As part of the calculation process the team manager or supervisor is able to:

- Correct erroneous registrations. For example, change switch codes and adjust feedback on production jobs.

- Add missing registrations. For example, create clock-out registrations and create absence transactions.
- Delete incorrect registrations.

Because the registered time must match the worker's time profile prior to calculating the registrations, you must override the work time profile for any worker who has an exception to their standard work time profile. If the worker profile is day shift, and the worker has agreed to work a night shift with no overtime pay, the team manager or supervisor must override the default worker profile in order to calculate the working time at the standard night rate and not as overtime. The calculation will also display an error if an absence registration is missing. It must be added before the calculation can be completed.

Approving registrations

Just as you assign a calculation group to a time registration worker, you must assign an approval group as well. Typically the group will be specific to a team, shift, or work group. You must approve the time registrations that were calculated correctly – this means doing a calculation without errors – before pay items can be generated that afterward can be transferred to a payroll system. The payroll administrator will typically do the approval of registrations, and prior to the approval they're able to:

- Override pay agreements for individual workers.
- Add manual premiums.
- Enter additional information about absence registrations.

> **Note**
>
> If overtime has been calculated for specific workers, the overtime can be allocated to specific jobs during the day. This is relevant if job cost is calculated based on worker pay.

Approving registrations using workflow

You can set up a workflow approval process that automatically approves registrations that comply with workflow rules, leaving only deviations to be handled manually. If workflow approval is activated, the team manager or supervisor submits the calculated registrations for approval. The workflow process will generate the appropriate approvals and tasks, and then assign them to the right users and roles as identified in the workflow. There are two workflow approvals for time and attendance.

Expand table

Workflow	Purpose	Registration type
Time and attendance days total	The workflow validates registrations against, for example, the expected number of work hours for the day.	
Time and attendance journal registration.	The workflow validates each registration type for the date of the registration.	Time and attendance • Clock-in • Clock-out • Absence • Break • Switch code • Project • Project activity • Indirect activity Production jobs • Queue before • Setup • Process • Overlap • Transport • Queue after • Start assistance • Stop assistance

Transferring approved registrations

After approval of the registrations, you can transfer them to a periodic payroll job. A transferred registration is posted to an activity or job that it relates to, for example, a production order or a project. Payroll transactions are generated for each worker based on the registrations.

Reversing transferred registrations

The task of reversing transactions – rolling them back – can be done until the time when the payroll period's pay transfer is run. This means that payroll data has been transferred to an external file. When reversed, all registrations are withdrawn, and any transactions posted on production orders or projects are offset and neutralized.

> ⓘ **Note**
>
> The external file can be imported into a payroll system.

Registrations in electronic timecards

Workers with job tasks that don't require immediate feedback, as is the case with production jobs, but who work on project activities, can benefit from using the electronic timecard. Electronic timecards offer the flexibility to enter registrations at any time and in the best way for your business schedule (daily, weekly, or when a worker is in the office again after being away). To use electronic timecards or these workers, you must specify, Use timecard, in the worker details. Electronic timecards enable the worker to register:

- Date
- Registration type
- Job reference, such as project, indirect activity, or production order
- Job identification
- Time consumption
- Project fees
- Project items

Registration for manufacturing execution

09/19/2025

This article describes key concepts and terms that you need to understand to configure and use manufacturing execution.

Manufacturing execution is primarily for manufacturing companies. Workers register time and item consumption on production jobs by using the production floor execution interface. All registrations go through approval and later transfer to the relevant modules. Continuous approval and transfer of registrations lets managers easily track actual costs on production orders.

Set up operations to use cost for estimated or actual time

On the **Route groups** page, you can configure whether a production job uses estimated or actual time when it's reported in the production floor execution interface.

Follow these steps to configure a route group.

1. Go to **Production control** > **Setup** > **Routes** > **Route groups**.
2. Select or create a route group.
3. On the **General** FastTab, set the **Run time** option to one of the following values:
    - *No* – When a job is stopped or completed, generate a job card journal on the production order. This journal has the actual time that the worker spent on the job.
    - *Yes* – When a job is started, generate a route card journal on the production order. This journal has the estimated time for the operation.

Set up operations to use either estimated or actual time for cost calculations

You can use the **Skip time adjustments** option on the **Production order defaults** page to specify whether calculations of actual cost per production order include time adjustments that are made to actual recorded work times. Adjustments apply when a supervisor uses the **Time and attendance** module to review and edit the recorded work times that each worker registers to record time and attendance. Adjustments can reflect events such as registration errors or

unpaid time off. If you skip time adjustments, you can end production orders without waiting for supervisor approvals.

Prerequisites

Before you can use the **Skip time adjustments** option, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.41 or later.
- You must turn on the feature named *Skip time adjustments when calculating actual cost per production order* in Feature management.

> **Important**
>
> The *Skip time adjustments when calculating actual cost per production order* feature changes the way that automatic route consumption works. When you enable it, route groups that use *estimated production times* to calculate actual production order costs don't include *recorded times* in the calculation.

Set the Skip time adjustments option

Follow these steps to configure whether time adjustments are made to production orders as part of the processing of workers' daily registrations.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Production order defaults**.

2. On the **General** tab, set the **Skip time adjustments** option to one of the following values:

    - *No* – Apply adjustments when a supervisor reviews and edits the recorded work times that each worker registers to record time and attendance.
    - *Yes* – Consider only recorded start and end times. If you skip time adjustments, you can end production orders without waiting for supervisor approvals.

Manufacturing execution and registration terminology

The following table defines terms that pertain to manufacturing execution and related registration tasks.

Expand table

Term	Definition
Manufacturing execution	A function that registers time, material consumption, and costs on production jobs, projects, and indirect activities. Registration happens in a manufacturing execution registration client, such as the production floor execution interface.
Job list	The production floor execution interface shows workers the list of jobs that they must perform on a specific resource, such as a machine. A worker can register time and item consumption on each job or task on the job list.
Job bundling	An approach where a worker starts more than one job at the same time in the production floor execution interface. The time that a worker spends on bundled jobs can be allocated to the individual jobs in various ways by using allocation keys.
Pilot/assistant registrations	A worker can register as an assistant to a resource and create a small team where several workers work on the same production jobs. Resources that workers connect to as assistants are known as *pilots*. Only the pilot resource must make registrations. All assistants then automatically get the same registrations. For example, if a machine acts as the pilot, workers who register as assistants to that machine can make registrations in the production floor execution interface. In this case, both the machine and the workers who are connected as assistants receive the same registrations.
Indirect activity	An activity or task that isn't directly related to a production job or a project. Examples include a department meeting, a cleaning job, and a maintenance job on the shop floor. Workers can make registrations on indirect activities in the same way that they make registrations on production jobs and projects.

Registrations in manufacturing execution

Workers can make various types of registrations in manufacturing execution for work that is performed on production jobs. Depending on the system setup, workers might also be able to make registrations on project activities and nonproductive tasks, such as breaks, absences, and indirect activities. The following list describes the registration types:

- **Clock-in/clock-out** (available with time and attendance) – Workers clock in when they arrive at work, and they clock out when they leave to go home.
- **Register on production jobs** – Workers can make registrations on the production jobs that appear on their job list. Examples of these registrations include starting a job and reporting feedback for a job. Workers can start several jobs at the same time. This approach is known as job bundling.
- **Register on inventory** – Workers can make registrations on materials that they use on the shop floor, but that aren't directly related to production jobs. Examples of these materials include grease, lubricants, and other materials that are used to keep machinery running. Registration is done in an inventory journal.

- **Register on projects** (available with time and attendance) – Workers can make registrations on the projects or project activities that appear on their job list. Examples of these registrations include starting work and finishing work.
- **Register project fees and project items** (available with time and attendance) – Workers can register fees (expenses) that are associated with a project in a project fee journal. Examples of these fees include mileage and a bridge toll. Workers can also register item consumption on projects. This registration is done in a project item journal.
- **Register as assistant to another worker** – If two or more workers work together on a production job or a project, a worker can register as an assistant to a machine or another worker. That machine or other worker acts as the pilot. The pilot can select another worker as the pilot, as required.
- **Register absence** (available with time and attendance) – Workers can register time on various absence codes that are set up. Absence can be indicated if a worker arrives late, requires absence during the workday, or leaves earlier than expected according to the standard work time profile.
- **Register breaks** (available with time and attendance) – During the workday, workers can register that they're leaving their workstation to take a break. Several break types can be set up. When a worker returns and signs in again, the system registers that the worker is back, and the break registration stops.
- **Register indirect activities** (available with time and attendance) – Indirect activities are nonproductive activities that workers might engage in during a workday. Examples include a department meeting, a team meeting, and a maintenance job that is performed on the shop floor. Workers can make registrations on the indirect activities that are set up.
- **Register overtime** (available with time and attendance) – Workers who are asked to work longer hours can select whether the extra hours should be registered as flextime or overtime.

Pay based on registrations

Article • 03/09/2023

This article explains, in detail, how pay is calculated based on worker registrations. It includes examples that show how the various combinations of setup options that are available for the calculation affect the result. Here are some of the areas that will be covered:

- Flex time
- Overtime
- Breaks
- Switch codes
- Pay items
- Pay agreements
- Time and attendance calculation parameters
- Absence

The use of flex time

Periods of flex time are set up in the time profiles that are used in Time and attendance. There are two flex profile types: **Flex+** and **Flex-**. When a worker registers time in a Flex+ period, the worker's flex balance is increased by the hours that were worked. The worker doesn't receive any compensation for the hours that were worked during the Flex+ period. However, the worker can take time off during the Flex- periods and be compensated with the hours from their flex balance. Therefore, time off during the flex periods is considered an absence by the system.

Scenarios based on flex periods

The two scenarios that follow are based on a flex profile that represents a workday. For both scenarios, pay is calculated according to the flex period where the worker clocks in and out.

Flex profile for one workday

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Scenario 1: A worker registers clock-in during a Flex+ period and clock-out during a Flex- period

The worker's registrations for the day looks like this.

Expand table

Journal registration type	Start	End
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	02:45 PM	02:45 PM

The worker's registrations for the day are calculated and transferred to pay on the **Approve** page (**Time and attendance** > **Review and approve** > **Approve**). After the registrations have been calculated, the result of the calculation can be viewed on the **Times** tab.

To understand this scenario, see the following fields.

Expand table

Flex +	Flex -	Time	Pay time
0.50	0.75	8.25	8.50

Calculation of Flex+

According to the flex profile, the time between 06:00 AM and 07:00 AM is a Flex+ period. Therefore, if the worker clocks in at 06:30 AM, they earn 0.5 hours. This amount of time is added to the worker's flex account.

Calculation of Flex-

According to the flex profile, the Flex- period starts at 02:30 PM and ends at 03:30 PM. Therefore, if the worker clocks out at 02:45 PM, the 45 minutes (0.75 hours) that remain in the Flex- period are registered as pay time, and the same amount of time is deducted from the worker's flex account. The 45 minutes are included in pay time because the worker will be granted pay for the remaining 45 minutes in the Flex- period. If the worker is absent during the Flex- period, the 45 minutes will be deducted from their flex account.

Calculation of Time

Time is calculated as the time between clock-in and clock-out, that is, 06:30 AM to 14:45 PM with equals 8.25 hours.

Calculation of Pay time

Pay time is the time that a worker is granted pay during. In this scenario, the worker is at work for 8.25 hours (**Time**). However, **Pay time** is calculated as 8.50 hours because the worker is granted pay during the Flex- period after they clocked out. The pay time equals the planned work hours because Flex+ time is added to the worker's flex account, not to the pay time. The absence time during the Flex- period is compensated for by the pay time and deducted from the worker's flex account.

Expand table

Time	Registration type	Pay time (hours)
6:30 AM - 7:00 AM	Flex+	0
7:00 AM – 2:45 PM	Standard time	7.75
2:45 PM – 3:30 PM	Flex-	0.75 (Absence period)
	Total	8.50

Scenario 2: A worker works during the whole Flex- period and also works overtime

The worker's registrations for the day look like this.

Expand table

Journal registration type	Start	End
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	05:00 PM
Clock out	05:00 PM	05:00 PM

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

Expand table

Flex +	Flex -	Time	Pay time	Pay overtime
0.50	0.00	10.50	10.00	1.50

Calculation of Flex+

According to the flex profile, the time between 06:00 AM and 07:00 AM is a Flex+ period. Therefore, if the worker clocks in at 06:30 AM, they earn 0.5 hours of Flex+ time on their flex balance.

Calculation of Flex-

Because the worker is working during the Flex- period, Flex- isn't calculated. Flex- is calculated only if the worker is absent during the Flex- period. From a payment perspective, if the worker works during the Flex- period, they are granted the pay rate that is defined for standard time. If the worker if is absent during the Flex- period, the 45 minutes are deducted from their flex account.

Calculation of Time

Time is calculated as the time between clock-in at 06:30 AM and clock-out at 05:00 PM, or 10.50 hours.

Calculation of Pay time

In this scenario, the worker works 10.50 hours (**Time**). However, **Pay time** is calculated as 10.00 hours because the worker isn't granted pay during the Flex+ period.

Calculation of Pay overtime

Expand table

Time	Registration type	Pay time (hours)
6:30 AM - 7:00 AM	Flex+	0
7:00 AM – 2:30 PM	Standard time	7.50
2:30 PM – 3:30 PM	Flex-	1.00
3:30 PM – 05:00 PM	Overtime	1.50
	Total	10.00

Generation of pay items

Worker registrations for the day can be transferred from the **Approve** page. During the transfer process, pay items and transferred registrations are generated. Pay items represent a breakdown of pay time into standard time, overtime, paid break time, and so on.

To open the list of pay items, select **Time and attendance** > **Review and approve** > **Approve**. Then select **Inquiry** > **Transferred registrations**.

The pay items are the basis for a worker's pay. You can generate a file that includes the information from the pay items and transfer that file to a payroll system.

As part of the transfer process, time and cost from production and project activities are transferred to production and project journals to account for the time and cost spend. The transferred registrations are the basis for time and cost price per hour for production orders and projects. You can open the transferred registrations by using the **Inquiry** menu on the **Approve** page.

For example, for scenario 2, the following pay items are generated.

Expand table

Wage type	Pay type	Pay units	Rate	Total cost
Standard time	1201	10.0	10	100

Wage type	Pay type	Pay units	Rate	Total cost
Overtime	1301	1.50	5	7.50
			Total	107.50

The pay item for standard time has a pay unit of 10 hours that covers standard time, Flex- time, and overtime. Standard time, Flex- time, and overtime are consolidated into one pay item because all the types are calculated as standard time, based on the default setting of a parameter on the **Calculation parameters** page (**Time and attendance** > **Setup** > **Calculation parameters**). The overtime is calculated on top of the standard time by using an additional rate of 5.

If you want to clearly distinguish standard time and overtime, so that the pay units for the pay types cover only the actual time spend on standard time and overtime, the pay units for standard time must be calculated as 8.50, and the pay units for overtime must be calculated as 1.50.

To configure the system to clearly distinguish standard time and overtime, you must exclude overtime from the standard time. You must also change the setup of the pay type for overtime so that the pay rate for overtime covers all payments for the hours that were spent on overtime.

Exclude overtime from the standard time

On the **Calculation parameters** page, select **Overtime** as the profile specification type, and set the **Pay time** option to **No**, as shown here.

Expand table

Reg. specification	Profile specification type	Calculation	Setting	Paid	Setting
Working time	Overtime	Standard time	Yes	Pay time	No
		Pay time	Yes	Pay overtime	Yes

After you adjust the calculation parameters, the following pay items are generated.

Expand table

Wage type	Pay type	Pay units	Rate	Total cost
Standard time	1201	8.50	10	85.0
Overtime	1301	1.50	15	22.50
			Total	107.50

> **Note**
>
> The calculation parameters have a recommended standard setting. In general, you should be careful when you change these parameters. To restore the recommended standard settings, on the **Calculation parameters** page, select **Restore values**.

Allow a deviation from the standard pay profiles

On the **Profiles** page (**Time and attendance** > **Setup** > **Time profiles** > **Profiles**), you can set up profile types that include switch codes and breaks.

Switch codes

You can use switch codes to allow workers to deviate from their profile type by changing a different profile type. For example, you can allow a worker to change from Flex+ time to overtime. A worker can add a switch code during registration, or you can assign the task of adding a switch code to the approver of the registrations.

Before a switch code can be used, you must define it as a type of indirect activity. You must then add the switch code to the time profile for the period where you want to allow a change of profile type. For example, follow these steps to create a switch code that allows the Flex+ period to be changed from 06:00 AM to 07:00 AM to overtime.

1. Create a switch code that is named **OTBCI (Convert flex to overtime before clock-in)**. Select **Time and attendance** > **Manage indirect activities** > **Indirect activities**.
2. In the **Switch code** column, add OTBCI to the Flex+ line in the time profile.
3. In the **Secondary** column, add the **Overtime** profile type.

Consider the following flex profile that represents a workday.

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

Expand table

Journal registration type	Start	End
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	05:00 PM	05:00 PM

The following pay items are generated after the transfer.

Expand table

Wage type	Pay type	Pay units	Rate	Total cost
Standard time	1201	8.50	10	85.0
Overtime	1305	1.50	15	22.50
			Total	107.50

On the **Approve** page, undo the transfer, and then use the **Switch code** menu to apply the **OTBCI** switch code. When you transfer the registrations a second time, the following pay items are generated.

Expand table

Wage type	Pay type	Pay units	Rate	Total cost
Standard time	1201	8.50	10	80.0
Overtime	1305	2.00	15	30.0
			Total	107.50

> **Note**
>
> When you apply the switch code, overtime is increased by 0.5 hour, from 1.50 to 2.00. The 0.5 hour is the conversion of the Flex+ time that is registered, from 6:30 AM to 07:00 to overtime.

Breaks

Breaks from work affect the calculation of worker pay. Breaks are defined as a type of indirect activity. They can be defined as either **Paid**, to allow the break to add to the worker's pay, or **Unpaid**, to prevent the break from adding to the worker's pay. A break can also be defined as either **Planned** or **Registered**.

Planned breaks

If a company has a fixed break time, such as a fixed break for lunch, the break can be predefined in the time profile. In this case, the worker doesn't have to register the break on the production floor execution interface. Instead, the break is automatically accounted for when the worker's registrations are calculated on the **Approve** page.

Registered breaks

If a company doesn't use planned breaks, workers can register breaks during the workday. Registered breaks can be used, for example, if a worker is working against a flex time profile that has no defined clock-in and clock-out times. Registered breaks are a type of indirect activity. The worker registers the break on the production floor execution interface. Here, the worker can select the type of break in a list of predefined break activities.

Paid and unpaid breaks

Break activities can be set up as **Paid** or **Unpaid**. A paid break is included in the calculation of pay time, and the system uses the pay type that is defined in the pay

agreement for the **Break** registration type.

Example of a planned break

Consider the following time profile that includes an unpaid break for lunch.

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	12:00 PM	Monday
Break	12:00 PM	12:30 PM	Monday
Standard time	12:30 PM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

Expand table

Journal registration type	Start	End
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	02:45 PM
Clock out	05:00 PM	05:00 PM

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

Expand table

Flex +	Flex -	Time	Pay time	Non-paid break time	Pay overtime
0.50	0.00	10.50	9.50	0.5	1.50

> **Note**
>
> The system calculated 0.5 hours of unpaid break time, and that time isn't part of the pay time.

Example of a registered break

Consider the following time profile that doesn't include planned breaks.

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

Expand table

Journal registration type	Start	End
Clock in	06:30 AM	06:30 AM
Production job	06:30 AM	05:00 PM
Break	12:03 PM	12:32 PM
Clock out	05:00 PM	05:00 PM

When the registrations are calculated, the time for the activities is calculated.

Expand table

Journal registration type	Start	End	Time
Clock in	06:30 AM	06:30 AM	
Production job	06:30 AM	05:00 PM	10.00
Break	12:03 PM	12:32 PM	0.50
Clock out	05:00 PM	05:00 PM	

> **Note**
>
> The time for the break runs in parallel with the time for the activity (a production job, in this example). This behavior is always used for break activities. When the registrations are calculated, the break time is subtracted from the activity time. In this case, the production job has a duration of 10.50 hours, but the time is calculated as 10 because 0.5 hours of break time are subtracted from the activity time.

After you've calculated the journal registrations on the **Approve** page, you can view the calculation result on the **Times** tab. To understand this scenario, see the following fields.

Expand table

Flex +	Flex -	Time	Pay time	Non-paid break time	Pay overtime
0.50	0.00	10.50	9.50	0.5	1.50

If the planned break had been paid instead of unpaid, the calculation result would look like this.

Expand table

Flex +	Flex -	Time	Pay time	Paid break time	Pay overtime
0.50	0.00	10.50	10.00	0.5	1.50

Pay items and paid breaks

When you transfer registrations on the **Approve** page, pay items are generated. A separate pay item is generated for paid breaks.

The pay rate for a paid break is determined by the pay type that is set up in the pay agreements for the break. Instead of using a pay type, you can set up the cost price per

hour on the break for a defined date interval.

Consider the following time profile.

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Here are the worker's registrations for the day.

Expand table

Journal registration type	Start	End	Time
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	03:00 PM	7.5
Break (Paid)	12:00 PM	12:30 PM	0.5
Clock out	03:00 PM	03:00 PM	

For this example, the pay type for standard time is set to **1201**, and a pay rate of **10** is set up in the pay agreement. The paid break has a pay type of **1301** and a pay rate of **8**. When the registrations are transferred, the following pay items are generated.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	7.50	10
Flex-	1201	0.50	10
Break (Paid)	1301	0.50	8

How the cost of paid breaks is allocated to projects and production orders

The hourly cost on project activities and production jobs can be set up so that it's determined either by the pay rates that are calculated in Time and attendance or by the cost categories that are defined for the activities.

To set up the cost category, select **Production control** > **Setup** > **Manufacturing execution** > **Production order defaults**, and set the **Cost category** field to either **Yes** or **No**.

- **No** – Cost is calculated based on pay rates that are defined for Time and attendance registration types.
- **Yes** – Cost is calculated based on cost categories for production and project activities.

Cost calculation based on pay rates that are calculated in Time and attendance

The following example shows how the hourly cost is calculated when the cost is set up so that it's calculated based on pay rates.

The hourly cost rate that is used for production orders and projects is calculated during the transfer process. To view the hourly rate per activity, open the **Approve** page in Time and attendance, and then select **Inquiry** > **Transferred registrations**. You can find the hourly cost rate per registration on the **Cost prices** tab.

Consider the following registrations that use the same time profile as the previous example.

Expand table

Journal registration type	Start	End	Time
Clock in	07:00 AM	07:00 AM	
Process (Order: 4711)	07:00 AM	11:00 AM	4
Process (Order: 4712)	11:00 AM	03:00 PM	3.50
Break (Paid)	12:00 PM	12:30 PM	0.50
Clock out	03:00 PM	03:00 PM	

After the registrations are transferred, the following transferred registrations are generated.

Expand table

Registration type	Time	Cost price per hour
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.00
Process (Order: 4712)	3.50	11.14
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

The calculation of the cost price per hour for the paid break depends on a setting for the direct payroll costs. Select **Time and attendance** > **Setup** > **Time and attendance parameters**. On the **Cost price** tab, under **Direct payroll costs**, in the **Standard time** field, you can select **Yes**, **No**, or **Allocation**.

- **Yes** – This value is used for the preceding example. The cost is allocated to the production or project activity that runs in parallel with the paid break activity. In the example, this activity is the production job for order 4712. As you can see, the cost price per hour for the paid break is 0 (zero), and it's allocated to the job that runs in parallel with the break.

  The paid break has a duration of 0.5 hour, and the pay rate is 8. Therefore, the total cost for the paid break is 4. The total cost is then allocated to the 3.5-hour process job. Therefore, the paid break contributes 1.14 per hour to the cost (4 ÷ 3.5 = 1.14).

- **Allocation** – The paid break is equally distributed to the jobs that are registered for the day. If this value is used for the preceding example, the following transferred registrations are generated.

  Expand table

Registration type	Time	Cost price per hour
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.53
Process (Order: 4712)	3.50	10.53

Registration type	Time	Cost price per hour
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

The total process time for the two production jobs is 7.5 hours, and the total cost of the paid break is 4. Therefore, the cost of the break is calculated as 0.53 (= 4 ÷ 7.5).

- **No** – The cost of the paid break doesn't increase the hourly cost of the process activities.

Expand table

Registration type	Time	Cost price per hour
Clock-in	0.00	0.00
Process (Order: 4711)	4.00	10.00
Process (Order: 4712)	3.50	10.00
Break (Paid)	0.50	0.00
Clock out	0.00	0.00

Absence

An absence code is used to register the period of a worker's absence. Like breaks and switch codes, an absence code is a type of an indirect activity. Absence time can be either planned or registered, and absence can be either legal or illegal. Examples of legal absence include a doctor's appointment, a seminar, or jury duty. Illegal absence is absence that has no good reason, such as when a worker is late for work. Usually, legal absence doesn't cause a deduction in a worker's pay, whereas illegal absence does cause a deduction.

Planned absence

You can create planned absence for workers on the **Create planned absence** page (**Time and attendance** > **Create planned absence**). There, the planned absence is registered as an absence job for a specified date and time interval.

The job is based on a query. Therefore, you can create planned absence for multiple workers, such as workers who belong to the same calculation group. If the planned absence is for a single worker, the registration can be entered from either the **Attendance** page or the **Time registration workers** page.

- To enter an absence registration from the **Attendance** page, select **Time and attendance** > **Inquiries and reports** > **Attendance** > **Attendance**, and then select **Absence registration**.
- To enter an absence registration from the ***Time registration workers*** page, select **Time and attendance** > **Setup** > **Time registration workers**, and then, on the **Time** tab, under **Time assignment**, select **Absence registrations**.

You can use the **Planned absences** report to see an overview of planned absences for workers. To open this report, select **Time and attendance** > **Inquiries and reports** > **Absence reports** > **Planned absences**.

Registered absence

In general, workers are considered absent if they aren't at work for any period between their planned clock-in time and their planned clock-out time. If workers clock in later than planned, or if they clock out earlier than planned, they are prompted to select an absence code to indicate the reason for the absence. An absence code can be set up so that it's applicable to registration. Only applicable codes will be available for selection in the list.

Scenarios based on various combinations of work hour registrations

The following scenarios show the pay items and entries for approval that are generated for workers based on their registrations. All the scenarios are based on the following time profile.

Expand table

Profile type	Start	End	Day
Over time	00:00 AM	06:00 AM	Monday
Flex+	06:00 AM	07:00 AM	Monday
Clock in	07:00 AM	07:00 AM	Monday

Profile type	Start	End	Day
Standard time	07:00 AM	02:30 PM	Monday
Flex-	02:30 PM	03:30 PM	Monday
Clock out	03:30 PM	03:30 PM	Monday
Over time	03:30 PM	06:00 AM	Tuesday

Scenario 1: The worker clocks in later than planned

The worker clocks in at 08:30 AM. Because their planned clock-in time is 07:00 AM, they are 1.50 hours late for work. Because the 1.50 hour is considered absence time, the worker is prompted to select an absence code. The worker leaves work at 03:30 PM, which is the planned clock-out time. When the worker's registrations are calculated and approved, the absence registration, together with the absence code that the worker selected at clock-in, appears for the time between 07:00 AM and 08:30 AM.

In the time profile, you can configure the **Clock-in** registration type so that there is a tolerance when workers are late for work. For example, if you set up a tolerance of 5, the worker is prompted for an absence code only if they clock in later than 07:05 AM.

In this case, because the worker doesn't have a good reason for being late for work, they select an absence code that is defined for illegal absence. An absence code is considered applicable to illegal absence if the setting for overtime deduction is enabled for the absence group that the absence code belongs to. To set the setting, select **Time and attendance** > **Setup** > **Groups** > **Absence groups**, and then select the **Deduct overtime** check box.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

Expand table

Journal registration type	Start	End	Time
Absence (illegal - late for work)	07:00 AM	08:30 AM	1.5
Clock in	08:30 AM	08:30 AM	
Production job	07:30 AM	03:30 PM	7.0
Clock out	03:30 PM	03:30 PM	

Here is the resulting pay item after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	7.00	10

Scenario 2: The worker clocks out before the planned clock-out time during a standard-time period

The worker clocks in at 07:00 AM and clocks out early at 01:00 PM. Because 01:00 PM is before planned clock-out at 03:30 PM, and 01:00 AM is in a standard-time period, the worker is prompted to select an absence code. The worker selects an absence code for a doctor's appointment, which is defined as legal absence. The pay rate for legal absence is defined in the pay agreements for the **Absence** registration type (**Time and attendance** > **Setup** > **Payroll** > **Pay agreements**).

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

Expand table

Journal registration type	Start	End	Time
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	01:00 PM	4.0
Clock out	01:00 PM	01:00 PM	
Absence (legal – doctor's appointment)	01:00 PM	03:30 PM	3.5

Here is the resulting pay item after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	7.50	10

Scenario 3: The worker clocks out before the planned clock-out time during a Flex- period

The worker clocks in at 07:00 AM and clocks out at 02:15 PM, which is in the planned Flex- period. The time between the actual clock-out time and the planned clock-out

time isn't considered absence, and the worker isn't prompted to select an absence code. The amount is deducted from the worker's flex account, and the worker is granted pay during the remaining part of the Flex- period, from 02:15 to 03:30 PM.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

Expand table

Journal registration type	Start	End	Time
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	02:15 PM	7.25
Clock out	02:15 PM	02:15 PM	

Here is the resulting pay item after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	8.50	10

Scenario 4: The worker clocks in late and clocks out after the planned clock-out time during an overtime period

The worker clocks in late at 09:30 AM and then, to compensate for their late attendance, they work overtime and clocks out at 05:00 PM. Because the worker came in late and compensated by working longer, the company doesn't want to grant the worker overtime pay for the hours that they worked between the planned clock-out at 03:30 PM and their actual clock-out at 05:00 PM, even though this period is defined as overtime in the time profile.

To handle this scenario, the absence code can be set up to reduce overtime hours by any hours of illegal absence that the worker has on the same day. Select **Time and attendance** > **Setup** > **Groups** > **Absence groups**, and select the **Deduct overtime** check box to deduct overtime from hours of illegal absence.

Here is how the worker's registrations for the day appear on the **Approve** page after calculation.

Expand table

Journal registration type	Start	End	Time
Absence (illegal - late for work)	07:00 AM	09:30 AM	1.5
Clock in	09:30 AM	09:30 AM	
Production job	09:30 AM	05:00 PM	7.5
Clock out	05:30 PM	05:30 PM	

If the **Deduct overtime** check box is selected for the selected absence code, the overtime payment is deducted by the hours that the worker was illegally absent. In this case, the following pay items are generated after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	9.00	10
Overtime	1301	0.5	15

Here, the 1.5 hours of illegal absence, from 07:00 AM to 09:30 AM, deduct the 2.0 hours of overtime, from 03:30 PM to 05:30 PM. The result of the registration is 1.5 hours of standard time and 0.5 hours of overtime.

By contrast, if the **Deduct overtime** check box is cleared for the selected absence code, the overtime payment is granted to the worker, even though they were late and had an illegal absence. In this case, the following pay items are generated after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	7.50	10
Overtime	1301	2.0	15

Scenario 5: The worker clocks out before the planned clock-out time and can convert the absence period to a Flex- period

The following example shows how a worker's flex account can be reduced by converting the absence period to a Flex- period.

The worker clocks in at 07:00 AM and clocks out at 01:00 PM. The worker has an agreement that they can go home for the weekend if they deduct these hours from their flex account. When the worker clocks out at 01:00 PM, they are prompted to select an absence code, because the period of absence for the remaining part of the workday that is affected isn't in a planned Flex- period. To convert the remaining part of the workday to a Flex- period, the worker can select an absence code that is set up to reduce their flex account.

To reduce the balance of flexible hours for workers who register absence on a workday, select **Time and attendance** > **Setup** > **Groups** > **Absence groups**, and select the **Reduce flex** check box.

Here is how the worker's registrations for the day appear on the **Approve** page before calculation.

Expand table

Journal registration type	Start	End	Time
Clock in	07:00 AM	07:00 AM	
Production job	07:00 AM	01:00 PM	6.0
Clock out	01:00 PM	01:00 PM	

If the worker selects an absence code for illegal absence, here is how the resulting pay item will look after the registration is transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	6.00	10

If the worker selects an absence code for legal absence, and the absence code is set up to reduce their flex account, here is how the resulting pay items will look after the registrations are transferred.

Expand table

Wage type	Pay type	Pay units	Rate
Standard time	1201	8.50	10

In this case, the worker's flex balance is reduced by the hours between the actual clock-out time and the planned clock-out time (that is, the 2.5 hours from 01:00 PM to 03:30 PM).

> **Note**
>
> We don't recommend that you select both the **Deduct flex** check box and the **Deduct overtime** check box for an absence code, because this setup will deduct the illegal hours from the worker's overtime hours and at the same time reduce the worker's flex account.

Scenario 6: There is no planned absence for the day and no worker attendance for the day

If the worker doesn't show up for work on a workday, and there is no planned absence for the worker on that day, a default absence code is used for the calculation of the worker's registrations. To define default absence codes, select **Time and attendance** > **Time and attendance parameters**. You can then select an absence code in the following fields:

- Auto insert Flex-
- Auto insert absence

When the daily registrations are calculated for a worker who is enabled for flexible hours, the absence code that is specified in the **Auto insert flex-** field is used as a default absence code. If the worker isn't enabled for flexible hours, the absence code that is specified in the **Auto insert absence** field is used. If a company has a combination of workers who are enabled for flexible hours and workers who aren't enabled for flexible hours, both parameters must be set up.

Absence registration in Time and attendance

This article describes the concepts for absence and explains how to handle absence in Time and attendance.

Absence that is based on regular work hours

Workers are considered absent for any hours that they don't work during their regular work hours. Regular work hours are defined in a worker's standard time profile.

For example, a worker is working on a day profile that has clock-in at 7:00 AM and clock-out at 3:00 PM. If the worker clocks in at 9:00 AM, they are considered absent from 7:00 AM to 9:00 AM on that day.

In this case, workers are prompted to enter a reason for their absence. They can specify a reason by selecting an absence code.

Absence codes

Absence codes define the various types of absence. Absence codes are defined by the company.

Various rules can be applied to absence codes. For example, an absence code can be configured to deduct or grant pay.

For example, a company defines a **Late** absence code that workers use if they come in late and don't have a good reason. The company also defines an **Internal course** absence code that workers use for time that they spend attending internal courses. These absence codes can be set up so that **Late** deducts from a worker's pay but **Internal course** doesn't deduct from a worker's pay.

You can set up automatic absence codes. These absence codes can be used to calculate a worker's time when no absence is registered. The worker's time profile determines whether the absence code for standard time or flex time is used.

Set up standard time and flex time

- Configure the parameters for standard time and flex time by using the **Auto insert absence** and **Auto insert Flex-** options on the **Time and attendance parameters** page.

Absence groups

Absence codes are grouped into absence groups. You use absence groups to group absence codes that have common characteristics. Examples include absence codes for a legal absence, or absence because of a doctor's appointment, jury duty, or a sick child.

Planned absence

If you know that a worker will be absent for a period, such as an upcoming vacation, you can use planned absence. You set up planned absence by configuring the absence code so that it considers the planned absence. When you set up a planned absence, you aren't prompted for an absence code during the absence period when user time registrations are calculated. Planned absence can be defined for a single worker, or you can define a batch job to bulk update the planned absence for workers.

Set up planned absence

1. Select **Human resources** > **Workers** > **Employees**, and select an employee.
2. Select **Time** > **Time assignments** > **Time Absence registration**, and set up the planned absence.

Interrupted planned absence

If you apply the **Interrupt** option when you set up a planned absence, the planned absence will be interrupted if the worker signs in during the planned absence period. The planned absence will be marked as **Interrupted** and won't have any effect on future calculations.

Set up a planned absence for interruption

1. Open the **Time Absence registration** page as described in the procedure for setting up planned absence.
2. Select **Interrupt**.

The **Interrupt** option applies when time is registered through the shop floor terminal or the shop floor device. The option doesn't apply if the registrations are entered on the calculation and approval pages, or on the **Electronic timecard** page.

Examples of the use of absence in a flex profile

The following three examples show how absence is calculated in a profile that has flex periods.

The examples use the following profile.

Expand table

Clock-in	Standard time	Break	Standard time	Flex-	Clock-out	Flex+
8 AM	9 AM to 11:30 AM	11:30 AM to 12 PM	12 PM to 3 PM	3 PM to 4 PM	4 PM	4 PM to 6 PM

Example 1: Signing out during a Flex- period

The worker clocks in at 8:00 AM and clocks out at 3:30 PM. In this case, because the worker clocks out during a Flex- period, no absence is calculated, and half an hour is deducted from the worker's flex balance.

Example 2: Signing out in during Standard time period

The worker clocks in at 8:00 AM and clocks out at 2:30 PM. In this case, because the worker clocks out during the Standard time period, absence is calculated from 2:30 PM to 4 PM, and an absence period of 1.5 hours is registered. An absence code for that period is required.

Example 3: Signing out during a Flex+ period

The worker clocks in at 8:00 AM and clocks out at 4:30 PM. In this case, because the worker clocks out during a Flex+ period, no absence is calculated, and half an hour is added to the worker's flex balance.

Absence in the calculation and approval process

Worker time registrations must be calculated and approved before they can be transferred to a payroll system as pay items.

An approver can change a worker's time registrations. The approver can even change any absence that the worker has registered. If the approver manually enters a time period that has an absence code, the absence code for that period isn't overridden by the default absence code from the Time and attendance parameters.

For example, a worker clocks in at 10 AM and selects an absence code that indicates that they are late. Later, the worker informs their supervisor that they had a doctor's appointment from 8 AM to 10 AM. A doctor's appointment should not cause a deduction in the worker's pay. Therefore, in this case, the supervisor can adjust the two hours of absence from 8 AM to 10 AM by manually entering an absence code that indicates illness for those two hours.

Calculate and approve absence

- Select **Time attendance** > **Review and approve** > **Approve or Calculate**.

Last updated on 07/01/2026

Flex groups

Article • 03/09/2023

Flexible working hours let companies minimize payments for overtime by offering workers extra time off during periods when the workload is low. This feature is relevant, for example, in segments that experience seasonal changes in workload.

You can use flex groups to set the following rules and principles for a worker's flexible hours:

- Rules for flex regulations
- Principle for calculating the worker's flex balance

Set up flexible working hours in flex groups

- Select **Time and attendance** > **Setup** > **Groups** > **Flex groups** to set up flex groups for flexible hours.

Associate workers with flex groups

- Select **Time and attendance** > **Setup** > **Time registration workers**.

Rules for flex regulations

You can use rules for flex regulations to define flex limits, or the minimum and maximum number of hours that are allowed in the worker's flex account. The flex limits are set up on the flex group. When the flex limits are exceeded, a worker's flex balance and pay can be adjusted.

If a worker's allowed flex minimum is exceeded (that is, if the number of hours in the flex account is below the specified minimum), you can use these methods to adjust the worker's flex balance by making a flex regulation:

- The worker's flex account can be adjusted to the specified allowed minimum, but without deducting the worker's pay for the number of hours that the flex account is below the allowed minimum.
- The worker's pay can be deducted for the number of hours that the flex account is below the allowed minimum. This deduction is done by generating pay items for a specific pay type that have a negative or positive pay unit.

If the worker's allowed flex maximum is exceeded, you can use these methods to adjust the worker's flex balance by making a flex regulation:

- The worker's flex account can be adjusted back to the specified allowed maximum, but without compensating the worker's pay for the number of hours that the worker worked above the allowed maximum.
- The number of hours that the worker worked above the allowed maximum can be converted to pay. This conversion is done by generating pay items for a specific pay type.

You can adjust a flex balance at the following times:

- When a payment file that is based on payroll data is exported by using the **Transfer pay** job. The payroll data is generated when you transfer the worker's registration from the **Approve** page.
- When the **Adjust flex balance** job is processed.

> ⓘ **Note**
>
> Flex regulations don't occur during the daily approval and transfer of worker registrations on the **Approve** page.

Principle for calculating a worker's flex balance

The principle for calculating the hours that the worker's flex balance are adjusted by is set up on the flex group. Select **Time and attendance** > **Setup** > **Groups** > **Flex groups**.

The following two principles can be used:

- **Time** – The worker's flexible hours are calculated only from the worker's registered time for the day. When the worker's daily registrations are calculated, the number of Flex+ and Flex- hours for the day is calculated from the Flex+ and Flex- zones that are defined in the worker's time profile.
- **Pay types** – The worker's flexible hours are calculated based on earnings of the pay types for Flex+ and Flex- that are defined in the worker's pay agreement. The pay agreement is associated with the time registration worker. You might want to use pay types to manage flex accounts if, for example, you want to increase a worker's flex account by a specific factor in one or more flex zones.

Scenario 1: Adjusting a worker's pay and flex account because the allowed flex minimum is exceeded

A worker who can work flexible hours has a negative flex account.

- **Flex account:** -4

The worker is associated with a flex group that has the following configuration:

- **Flex minimum:** -0.5
- **Minimum pay type:** 1302
- **Pay type factor:** -1.00

As the difference between the worker's flex account and the allowed flex minimum indicates, the worker has exceeded the allowed flex minimum by 3.5 hours.

When the payroll administrator transfers the worker's pay data by running the **Transfer to pay** or **Flex adjustment** job, the following adjustments are made:

- The worker's flex account is adjusted by 3.5 hours. Therefore, the flex balance of -4.0 hours becomes adjusted to the worker's allowed flex minimum of -0.5 hours.
- A pay item for pay type 1302 is created. This pay item has a pay unit of -3.5 hours that will be deducted from the worker's pay. In this case, the pay unit is a negative number, because the positive adjustment of 3.5 hours is multiplied by the negative pay type factor of -1.0 that is defined on the flex group. This pay item will be part of the pay file that is generated by the **Transfer to pay** job.

Scenario 2: Adjusting a worker's pay and flex account because the allowed flex maximum is exceeded

A worker who can work flexible hours has a positive flex account.

- **Flex account:** 6

The worker is associated with a flex group that has the following configuration:

- **Flex maximum:** 2.0
- **Minimum pay type:** 1302
- **Pay type factor:** -1.0

As the difference between the worker's flex account and their allowed flex maximum indicates, the worker has exceeded their allowed flex maximum by 4.0 hours.

When the payroll administrator transfers the worker's pay data by running the **Transfer to pay** or **Flex adjustment** job, the following adjustments are made:

- The worker's flex account is adjusted by -4.0 hours. Therefore, the flex balance of 6.0 hours becomes adjusted to the worker's allowed flex maximum of 2.0 hours.

- A pay item for pay type 1302 is created. This pay item has a pay unit of 4.0 hours that will be added to the worker's pay. In this case, the pay unit is a positive number, because the negative adjustment of 4.0 hours is multiplied by the negative pay type factor of -1.0 that is defined on the flex group. This pay item will be part of the pay file that is generated by the **Transfer to pay** job.

Scenario 3: Managing a worker's flex balance based on pay types

As we explained earlier, flex accounts can be managed based either on the time that is registered in the Flex+ and Flex- zones that are defined the worker's time profile, or on the pay types that are defined in the worker's pay agreements. If pay types are used, a worker's flex account is adjusted by the pay items that are generated when you transfer the worker's registration from the **Approve** page. You might want to use pay types to manage flex accounts if, for example, you want to increase a worker's flex account by a specific factor in one or more flex zones.

This scenario uses the following flex profile that represents a workday.

Expand table

Profile type	Start	End
Flex+	12:00 AM	08:00 AM
Clock in	08:00 AM	08:00 AM
Flex-	08:00 AM	09:00 AM
Standard time	09:00 AM	11:30 AM
Paid break	11:30 AM	12:00 PM
Flex-	12:00 PM	04:00 PM
Clock out	04:00 PM	04:00 PM
Flex+	04:00 PM	12:00 AM

In this case, you want to be able to manage the worker's flex balance based on pay types. Therefore, you must set the **Based on pay types** option to **Yes** on the worker's flex group.

To account for the flexible hours, you must also define a new pay type. For this scenario, the pay type is named **FlexCnt**.

Expand table

Pay type	Description
FlexCnt	Flex counter

Next, follow these steps to set up a pay type and add lines of the new type to a pay profile.

1. Select **Time and attendance** > **Setup** > **Groups** > **Flex groups**, and then select **New**.
2. In both the **Flex+** field and the **Flex-** field, specify the new pay type, **FlexCnt**.
3. Select **Time and attendance** > **Setup** > **Pay agreements**, and then select **Agreement lines**.
4. For **Monday**, for the **Flex+** profile type, add the following three lines.

Expand table

Pay type	Description	From time	To time	Minimum	Maximum	Factor
FlexCnt	Flex counter	12:00 AM	06:00 PM	00.00	00.00	1.00
FlexCnt	Flex counter	06:00 PM	12:00 AM	00.00	02.00	1.50
FlexCnt	Flex counter	06:00 PM	12:00 AM	02.00	06.00	2.00

> **Note**
>
> Each line is used for a different time interval and has a different factor. The flexible hours that the worker works in a time interval are multiplied by the factor for that line. For example, hours that are worked from 06:00 PM to 08:00 PM are multiplied by 1.50. The factor is specified in the **Factor** field on the **General** tab of the **Pay agreement lines** page.

The worker enters the following registrations for the day.

Expand table

Journal registration type	Start	End
Clock in	07:00 AM	07:00 AM

Journal registration type	Start	End
Production job	07:00 AM	09:00 PM
Clock out	09:00 PM	09:00 PM

The amount that must be paid is calculated on the **Approve** page, based on the worker's registration. After the registration is calculated, you can view the result on the **Times** tab. For this scenario, you're interested in the following fields.

Expand table

Flex +	Flex -	Time	Pay time
6.00	0.00	13.50	08.00

The amount of Flex+ time is six hours, and the calculation is based on the flex zones in the time profile. This amount consists of one hour of Flex+ time from 07:00 AM to 08:00 AM and five hours of Flex+ time from 04:00 PM to 09:00 PM.

When you transfer the registrations, you will notice that the amount of Flex+ time is changed from 6.0 hours to 8.0 hours.

Expand table

Flex +	Flex -	Time	Pay time
8.00	0.00	13.50	08.00

This change occurs after the transfer because the flexible hours have been calculated based on pay types instead of time. The following table shows how the eight hours are calculated.

Expand table

From	To	Time	Factor	Flex account
07:00 AM	08:00 AM	1	1	1
04:00 PM	06:00 PM	2	1	2
06:00 PM	08:00 PM	2	1.5	3
08:00 PM	09:00 PM	1	2	2
			Total	**8**

Enable the payroll process for time and attendance

Article • 09/29/2021

This procedure shows how to enable the payroll process for time and attendance. The demo data company used to create this procedure is USMF.

Create a pay type with a related pay rate

1. Time and attendance > Setup > Payroll > Pay types
2. Click New.
3. In the Pay type field, type a value.
4. In the Description field, type a value.
5. Click Save.
6. Click Rates.

    - Rates for pay types are set up for specific time intervals, and individual rates can be created for workers. It is not always necessary to create rates for pay types in time and attendance. This information may already exist in the payroll system that is used to generate wages.

7. Click New.
8. In the list, mark the selected row.
9. In the Rate field, enter a number.
10. Click Save.

Create a pay agreement

1. Close the page.
2. Close the page.
3. Go to Pay agreements.

    - Time and attendance > Setup > Pay agreements

4. Click New.
5. In the Pay agreement field, type a value.
6. In the Description field, type a value.
7. Click Save.
8. Click Agreement lines.
9. Click New.

10. In the list, mark the selected row.
11. In the Profile type field, enter or select a value.
12. In the Pay type field, enter or select a value.

Set up pay agreement for time and registration worker

1. Close the page.
2. Close the page.
3. Go to Time registration workers.

    - Time and attendance > Setup > Time registration workers

4. In the list, click the link in the selected row.
5. Click the Employment tab.
6. Expand the Time registration section.
7. Click Edit.
8. In the Pay agreement field, enter or select a value.

How workers use the production floor execution interface

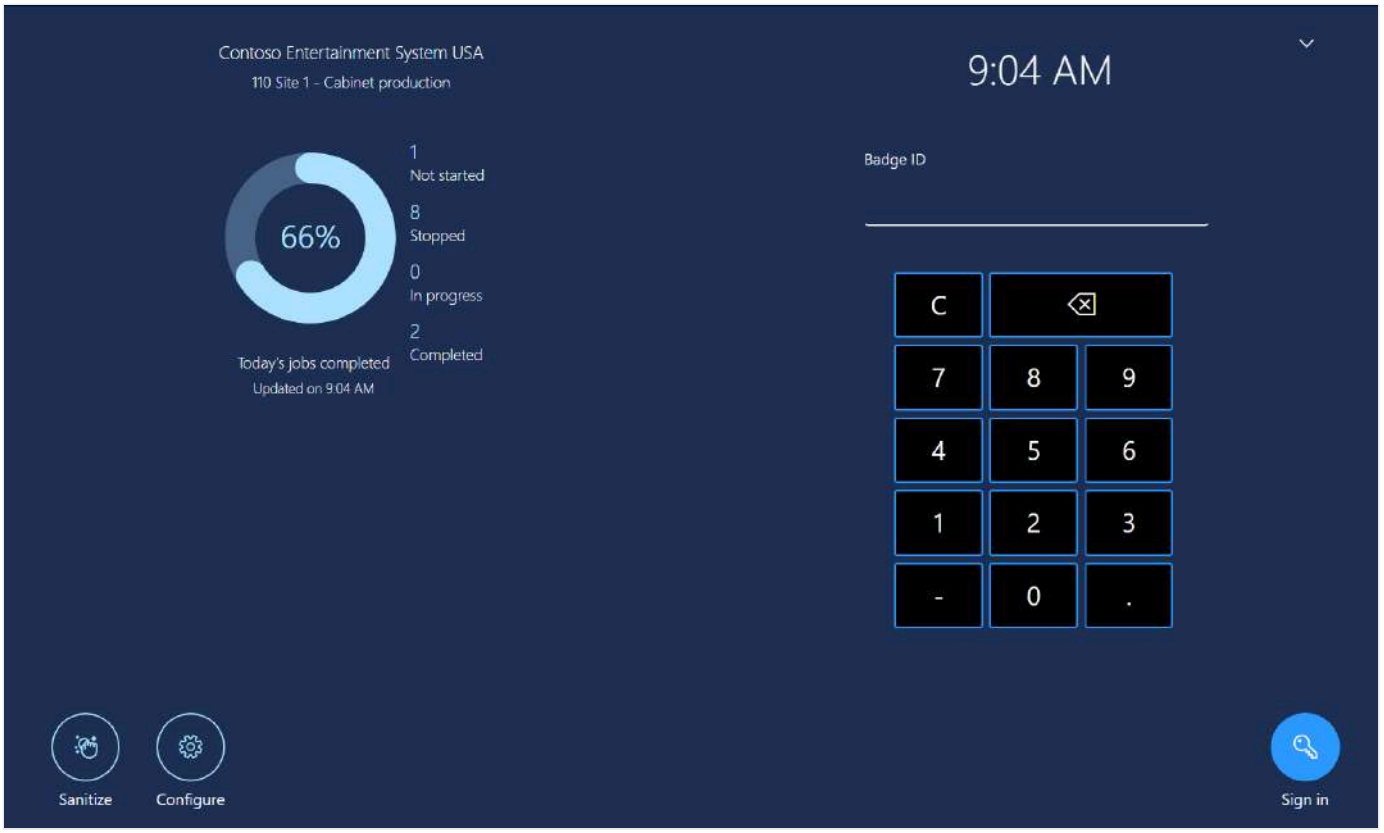
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The production floor execution interface is optimized for touch interaction. Its design provides visual contrast that meets accessibility requirements for shop floor environments. However, it also enables multiple jobs to be started in parallel from a job list. This capability is also known as *job bundling*. Additionally, from a job list, workers can open a guide that was created in Microsoft Dynamics 365 Guide. In this way, they can get visual instructions on a HoloLens.

Sign in to the production floor execution interface as a worker

Before workers can start to use the device, a supervisor or technical staff must prepare it and open the correct page in Dynamics 365 Supply Chain Management. For more information about how to set up the device, see Set up a device to run the production floor execution interface.

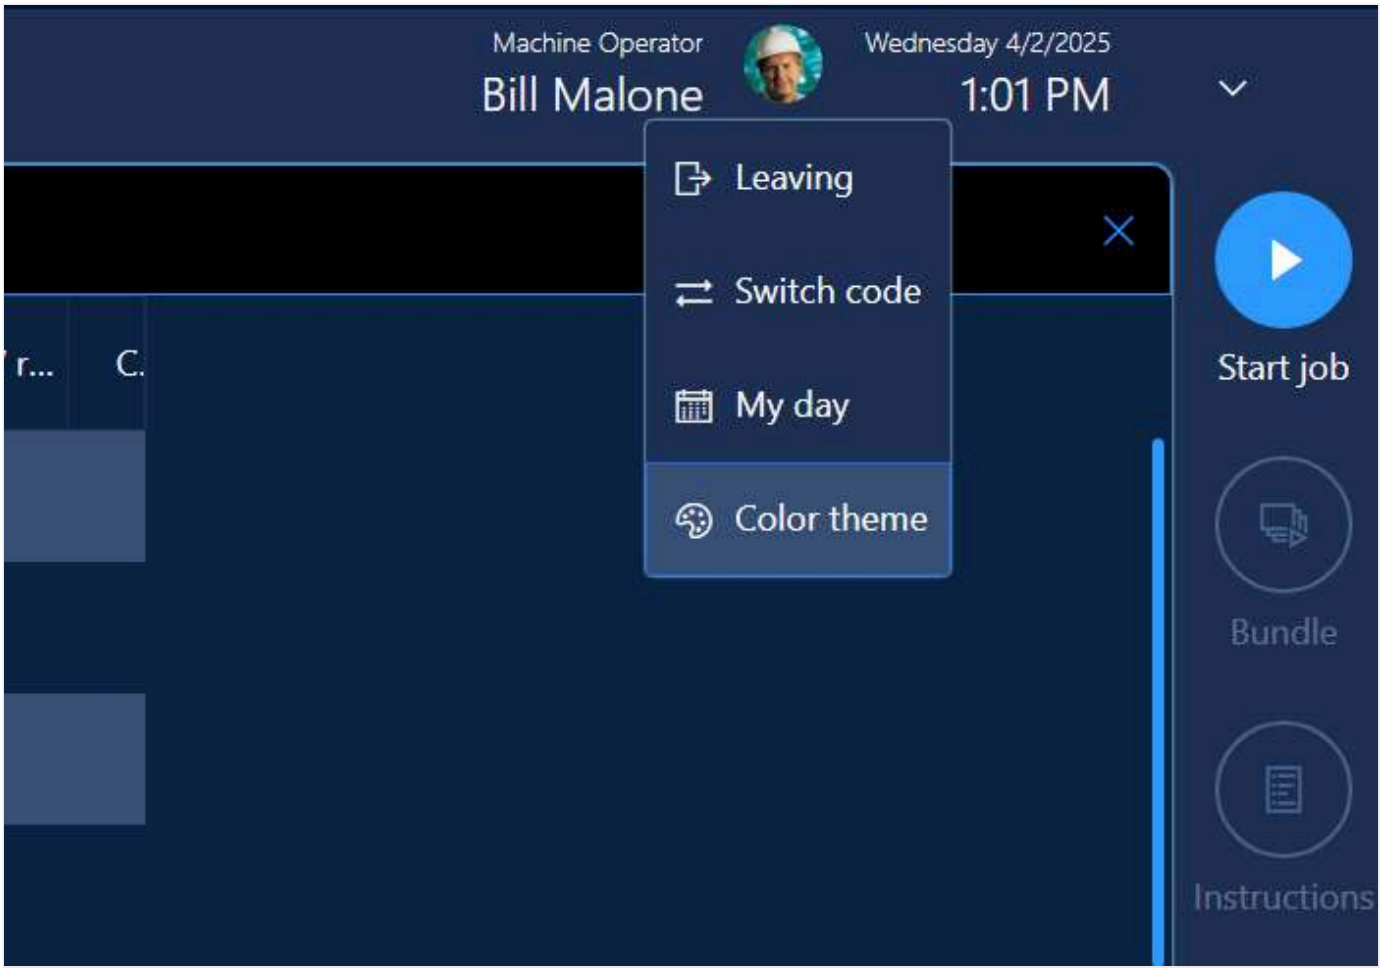
After the device is prepared, the sign-in page appears on it. This page shows information about the status of jobs for the local work cell. This information is updated periodically. On the page, workers use their badge IDs, personnel number, and/or password to sign in. Although workers don't need a user account for Supply Chain Management, they must have a *time registered worker* account that they can use when they sign in. For more information about how to set up sign-in options and worker accounts to use the production floor execution interface, see Set up worker accounts to use the production floor execution interface.



The remaining sections of this article describe how workers interact with the interface.

Choose a display color theme

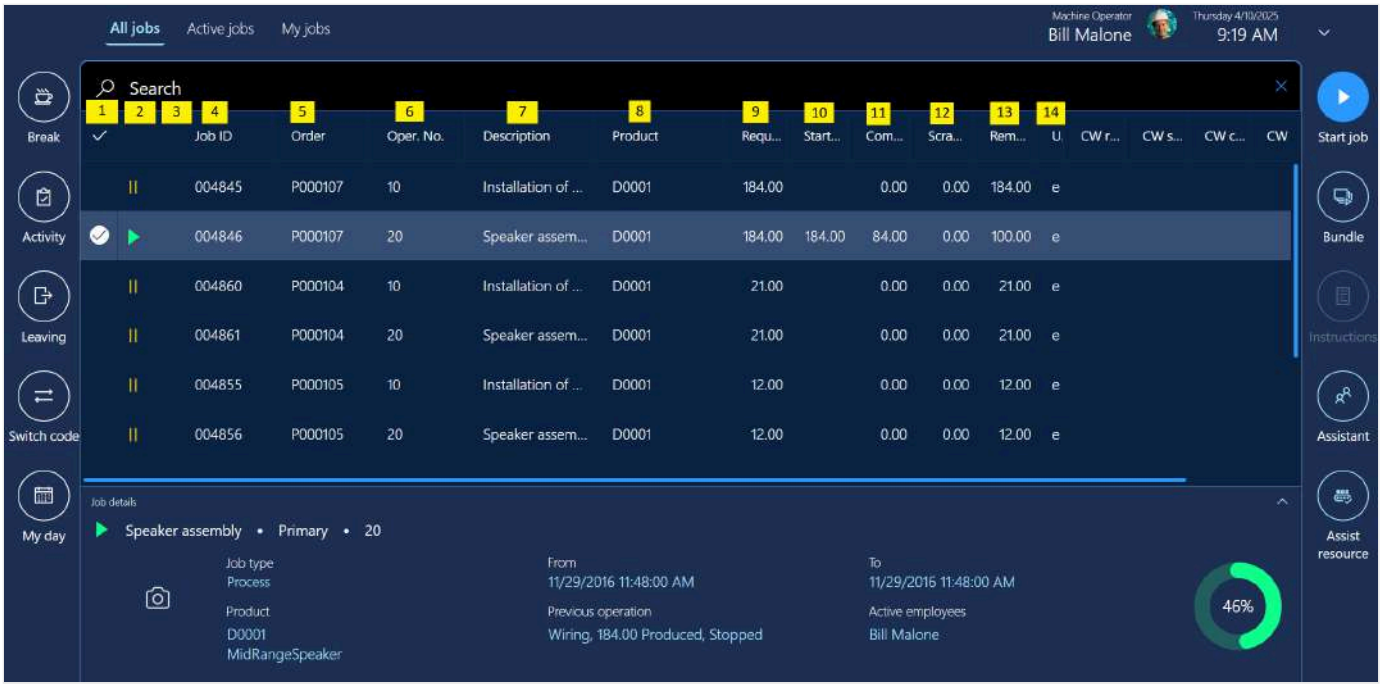
Individual workers can choose their preferred theme by selecting their worker photo (or icon) and then selecting **Color theme** from the dropdown list.



A dialog opens where the worker can select a new theme and preview the colors. The theme is applied immediately. When the worker selects the theme, the system saves it in user preferences. The theme is applied the next time the worker signs in, regardless of the current device's settings.

All jobs tab

The **All jobs** tab provides a job list that shows all the production jobs that have a status of *Not started*, *Stopped*, or *Started*. (You can customize this tab name, so it might be different for your system.)



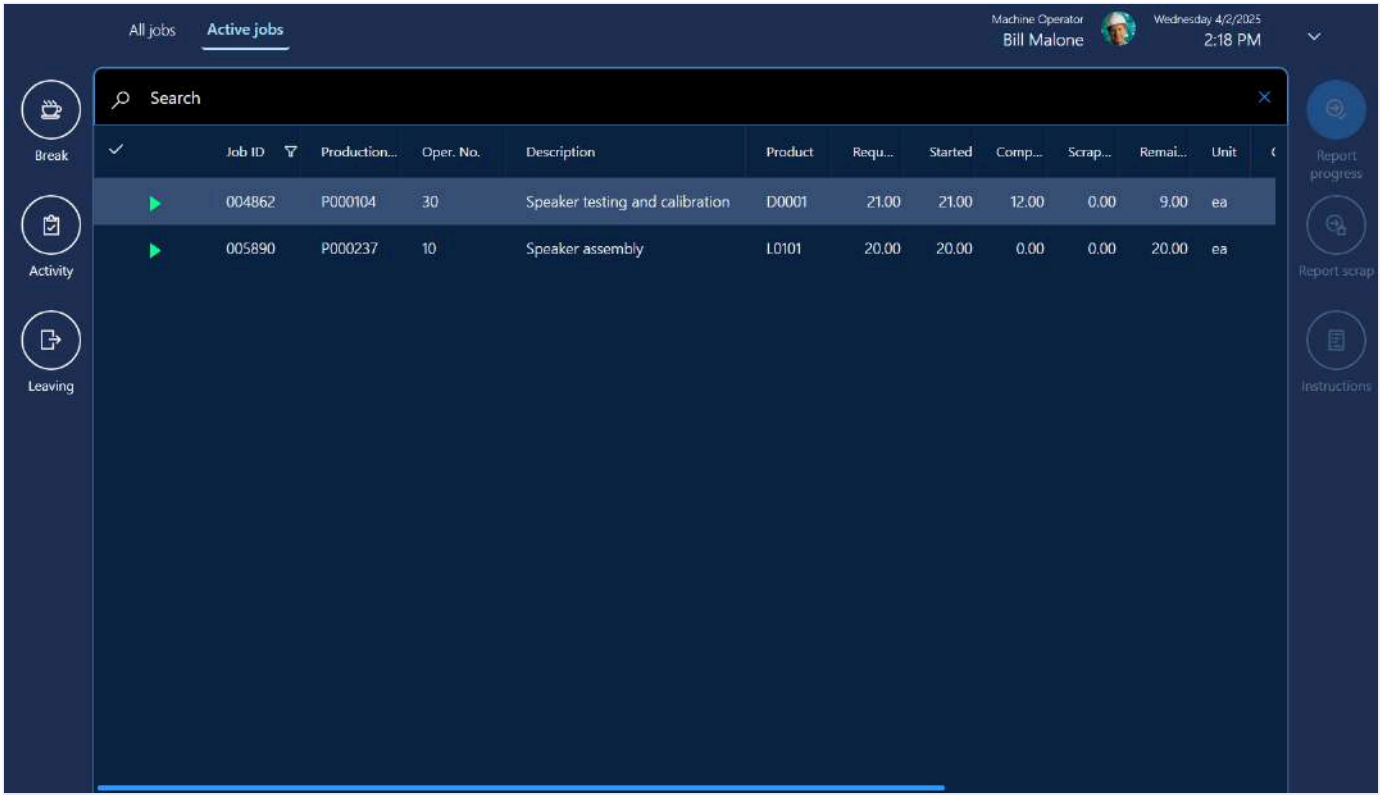
The job list has the following columns. The numbers correspond to the numbers in the previous illustration.

1. **Selection column** – The leftmost column uses check marks to indicate jobs selected by the worker. Workers can select multiple jobs in the list at the same time. To select all the jobs in the list, select the check mark in the column header. When a single job is selected, details about that job appear in the lower part of the page.
2. **Job status column** – This column uses symbols to indicate the status of each job. Jobs that have no symbol in this column have a status of *Not started*. A green triangle indicates jobs that have a status of *Started*. Two yellow vertical lines indicate jobs that have a status of *Stopped*.
3. **High priority column** – This column uses exclamation marks to indicate jobs that have high priority.
4. **Job ID** – This column shows the unique job ID for a job.
5. **Order** – This column shows the production order number for a job.
6. **Oper. No.** – This column shows the operation number of the operation that a job is part of.
7. **Description** – This column shows a description of the operation that a job is part of.
8. **Product** – This column shows the product number of the item that a job produces.
9. **Requested** – This column shows the quantity that a job is planned to produce.
10. **Started** – This column shows the quantity that's already started for a job.
11. **Completed** – This column shows the quantity that's already completed for a job.
12. **Scrapped** – This column shows the quantity that's already scrapped for a job.
13. **Remaining** – This column shows the quantity that remains to be completed for a job.
14. **Unit** – This column shows the unit of measure of quantity for a job.

If the catch weight configuration key is enabled for your system, you might see additional columns to support the catch weight items.

Active jobs tab

The **Active jobs** tab shows a list of all jobs that the signed-in worker already started. (You can customize this tab name, so it might be different for your system.)



The **Active jobs** list shows the same columns as the **All jobs** list.

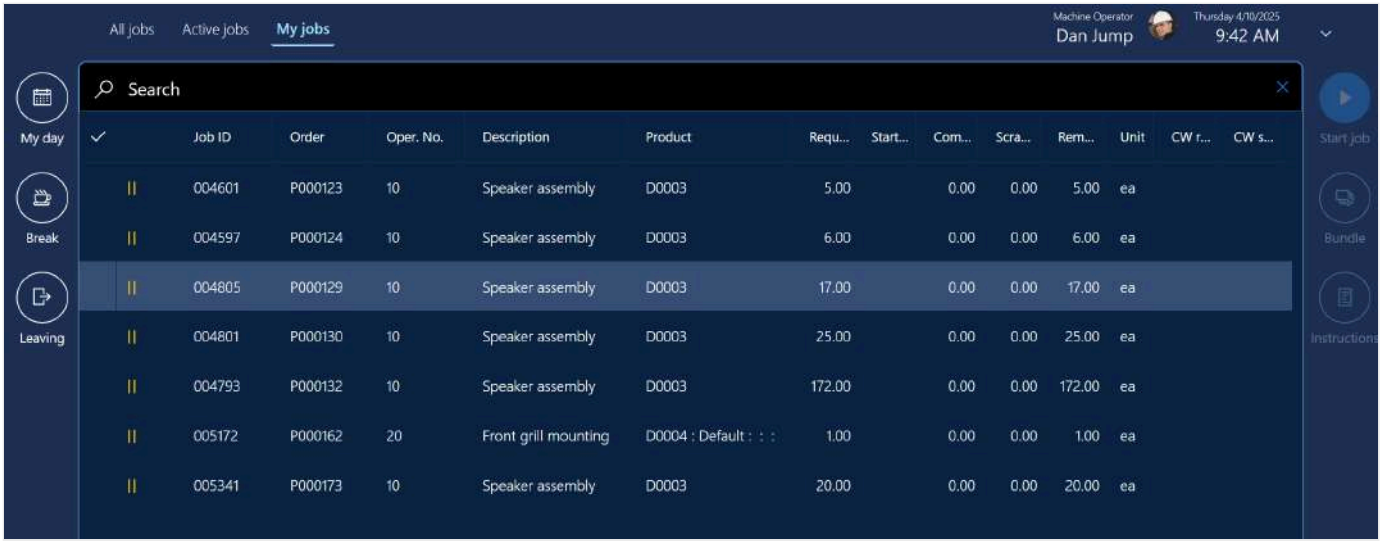
My jobs tab

The **My jobs** tab lets workers easily view all unstarted and unfinished jobs that are assigned specifically to them. It's useful in companies where jobs are sometimes or always assigned to specific workers (human resources) instead of other types of resources (such as machines).

The scheduling system automatically assigns each production job to a specific resource record, and each resource record has a type (such as machine or human). When you set up an employee as a production worker, you can associate the worker account with a unique human resource record.

The **My jobs** tab lists all unstarted and unfinished jobs assigned to signed-in worker's human resource record, if any worker is signed in. It never lists jobs that are assigned to a machine or other type of resource, even if the signed-in worker started to work on those jobs.

To view all jobs that the signed-in worker started, regardless of the type of resource that each job is assigned to, use the **Active jobs** tab. To view all unfinished jobs that match the configuration of the local job filter, regardless of the worker or start status, use the **All jobs** tab.

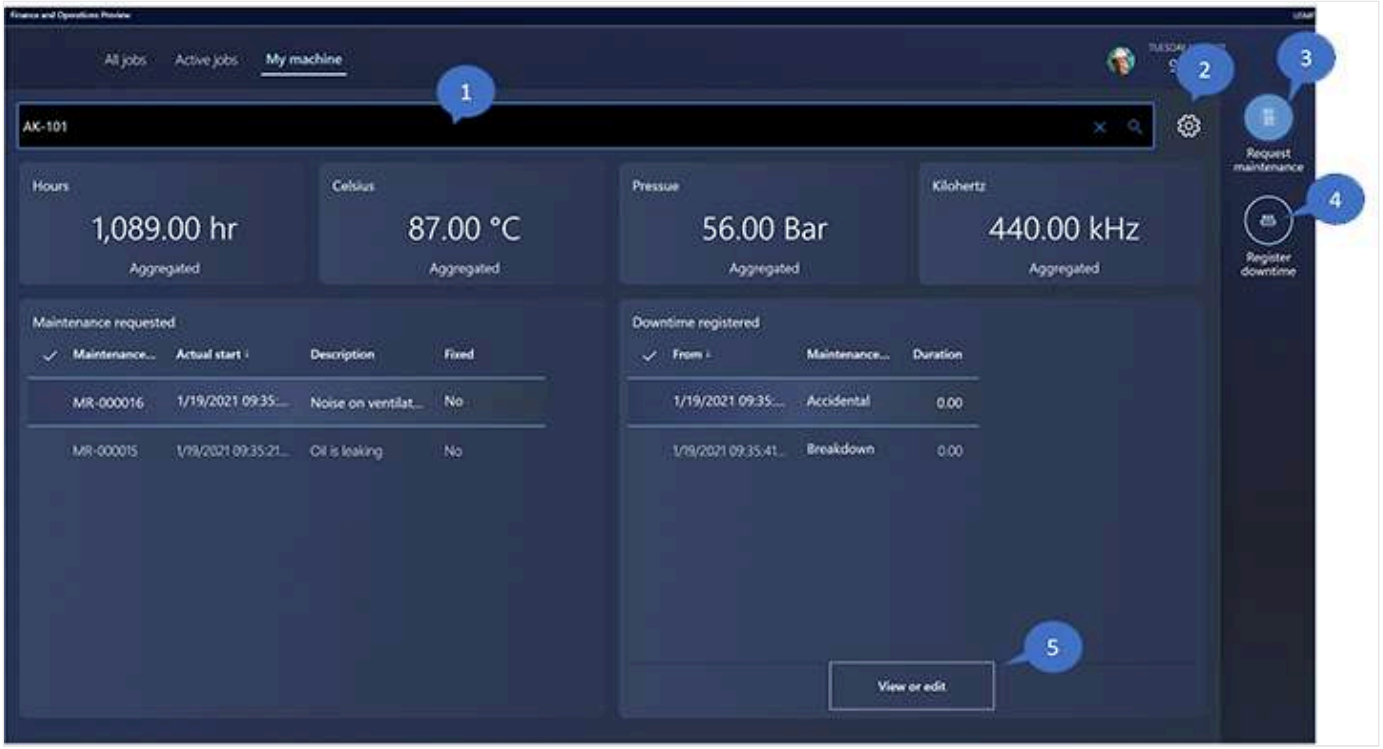


Project tabs

The project tabs **All project jobs**, **Projects**, **Project budget**, and **Project activities** allow workers to register the time spent on production-related activities. Workers can select a project-related activity from the list and log its start. The activity is marked as completed when the worker registers another activity, such as an indirect task or another project activity. The time registered by the worker is recorded under the projects associated with these activities.

My machine tab

The **My machine** tab lets workers select an asset connected to a machine resource within the filter set on the **All jobs** tab. The worker can then view the state and health of the selected asset by reading values for up to four selected counters and lists of recent maintenance requests and registered downtimes. The worker can also request maintenance for the selected asset and register and edit machine downtime. (You can customize this tab name and it might be different for your system.)

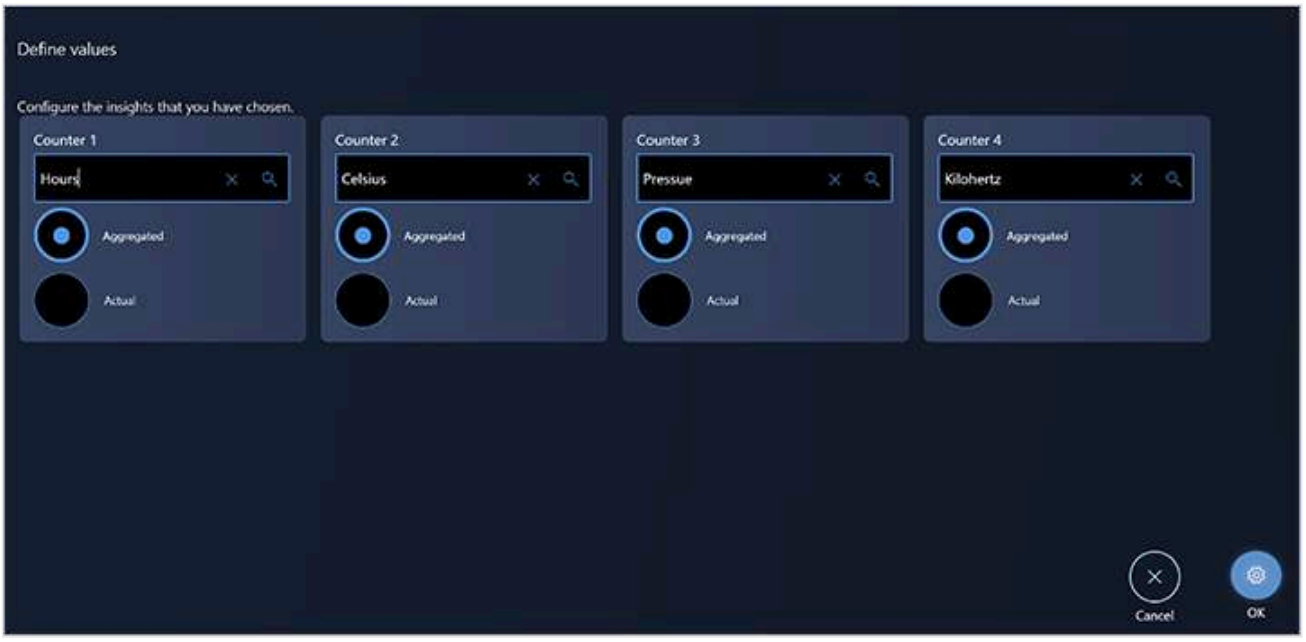


The **My machine** tab has the following columns. The numbers correspond to the numbers in the previous illustration.

1. **Machine asset** – Select the machine asset that you want to track. Start typing a name to select from a list of matching assets, or select the magnifying-glass icon to select from a list of all assets associated with the resources that are within the filter of the job list.

   > ⓘ **Note**
   >
   > Supply Chain Management users can assign a resource to each asset as needed by using the **All assets** page (on the **Fixed asset** tab, by using the **Resource** drop-down list). For more information, see Create an asset.

2. **Settings** – Select the gear icon to open a dialog box where you can choose which counters to view for the selected machine asset. Values for these counters show at the top of the **Asset management** tab. The **Settings** menu (shown in the following screenshot) lets you enable up to four counters. For each counter that you want to enable, use the lookup field at the top of the tile to select a counter. The lookup field lists all of the counters associated to the asset selected at the top of the **Asset management** page. Set each counter to monitor either the **Aggregated** value or the latest **Actual** value for the counter. For example, if you set a counter that tracks how many hours the machine has been running, set it to **Aggregated**. If you set a counter to measure the latest updated temperature or pressure, set it to **Actual**. Select **OK** to save your settings and close the dialog box.



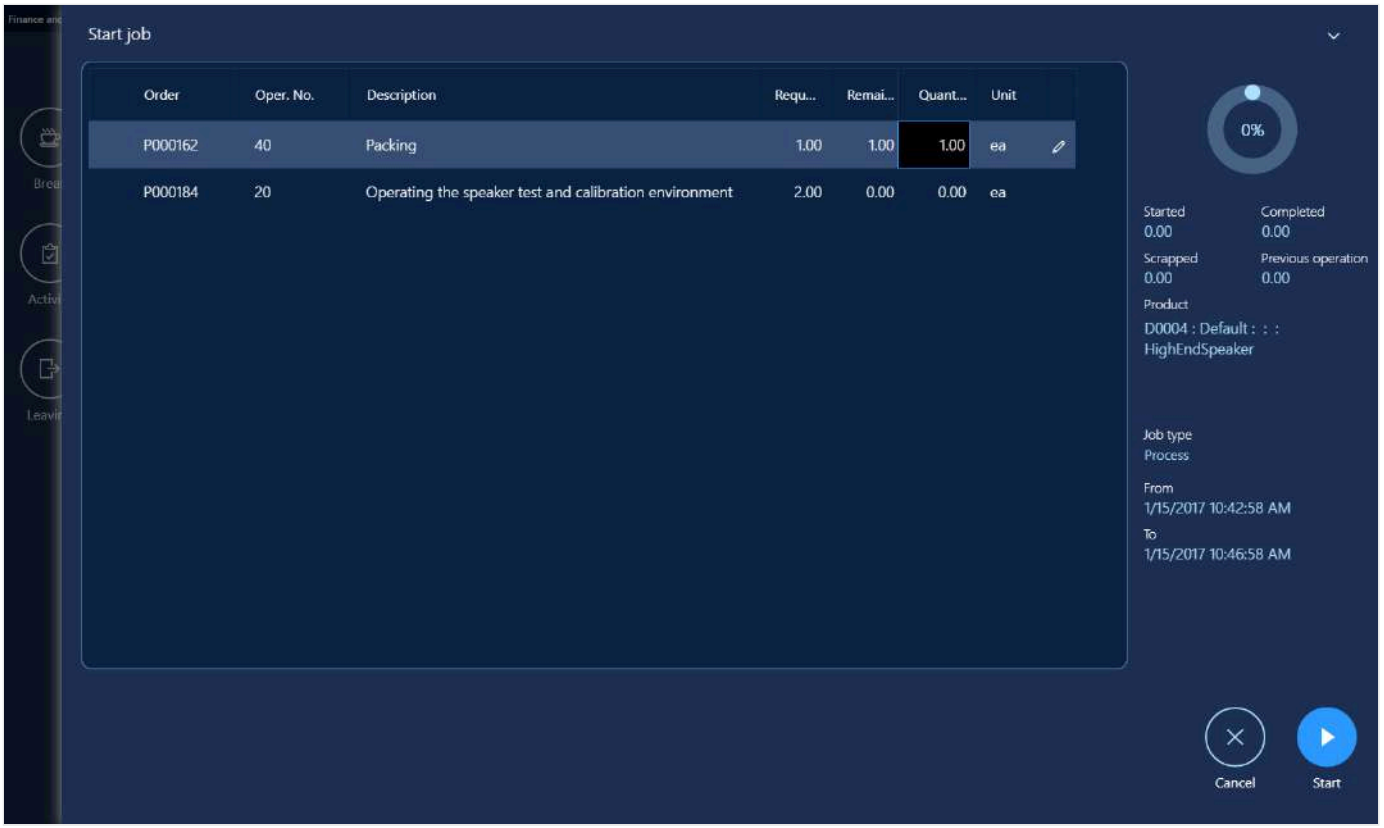
3. **Request maintenance** – Select this button to open a dialog box where you can create a maintenance request. You can provide a description and a note. A Supply Chain Management user sees the request and can convert the maintenance request to a maintenance work order.

4. **Register downtime** – Select this button to open a dialog box where you can register machine downtime. You can select a reason code and enter a date and time span for the downtime. The machine downtime registration is used for calculating the efficiency of the machine asset.

5. **View or edit** – Select this button to open a dialog box where you can edit or view existing downtime records.

Starting and completing production jobs

Workers start a production job by selecting a job on the **All jobs** tab and then selecting **Start job** to open the **Start job** dialog box.

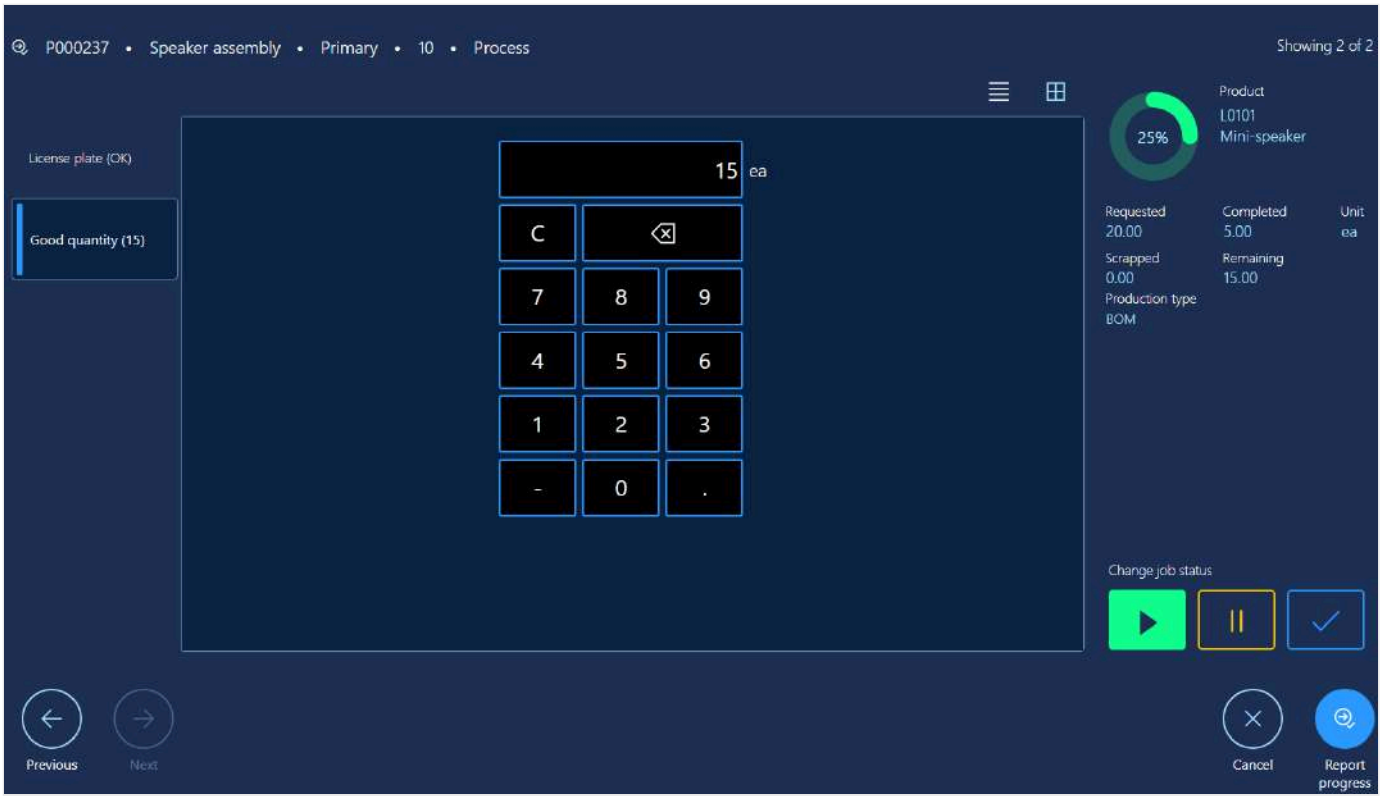


Workers use the **Start job** dialog box to confirm the production quantity and then start the job. Workers can adjust the quantity by selecting the **Quantity** field and then using the numeric keyboard that appears. Workers then select **Start** to start to work on the job. The **Start job** dialog box is closed, and the job is added to the **Active jobs** tab.

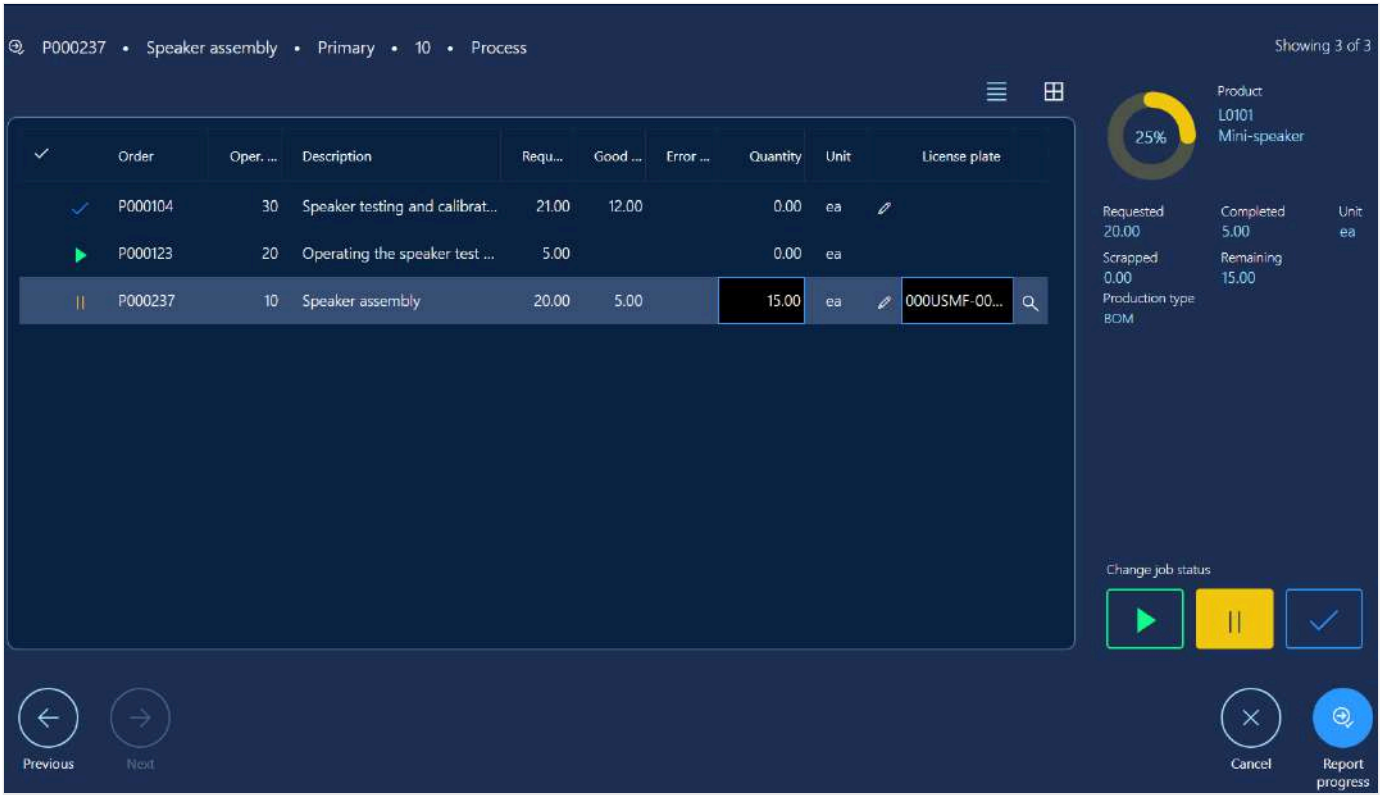
Workers can start a job that is in any status. When a worker starts a job that has a status of *Not started*, the **Quantity** field in the **Start job** dialog box initially shows the full quantity. When a worker starts a job that has a status of *Started* or *Stopped*, the **Quantity** field initially shows the remaining quantity.

Reporting good quantities

When a worker completes or partially completes a job, they can report good quantities that were produced by selecting a job on the **Active jobs** tab and then selecting **Report progress**. Then, in the **Report progress** dialog box, the worker enters the good quantity by using the numeric keyboard. The quantity is blank by default. After a quantity is entered, the worker can update the status of the job to *In progress*, *Stopped*, or *Completed*.



Workers reporting job progress can choose to work from a list view that shows several jobs at once, or from a detail view that shows more information about one job at a time.



Reporting good quantities on batch orders that have co-products and by-products

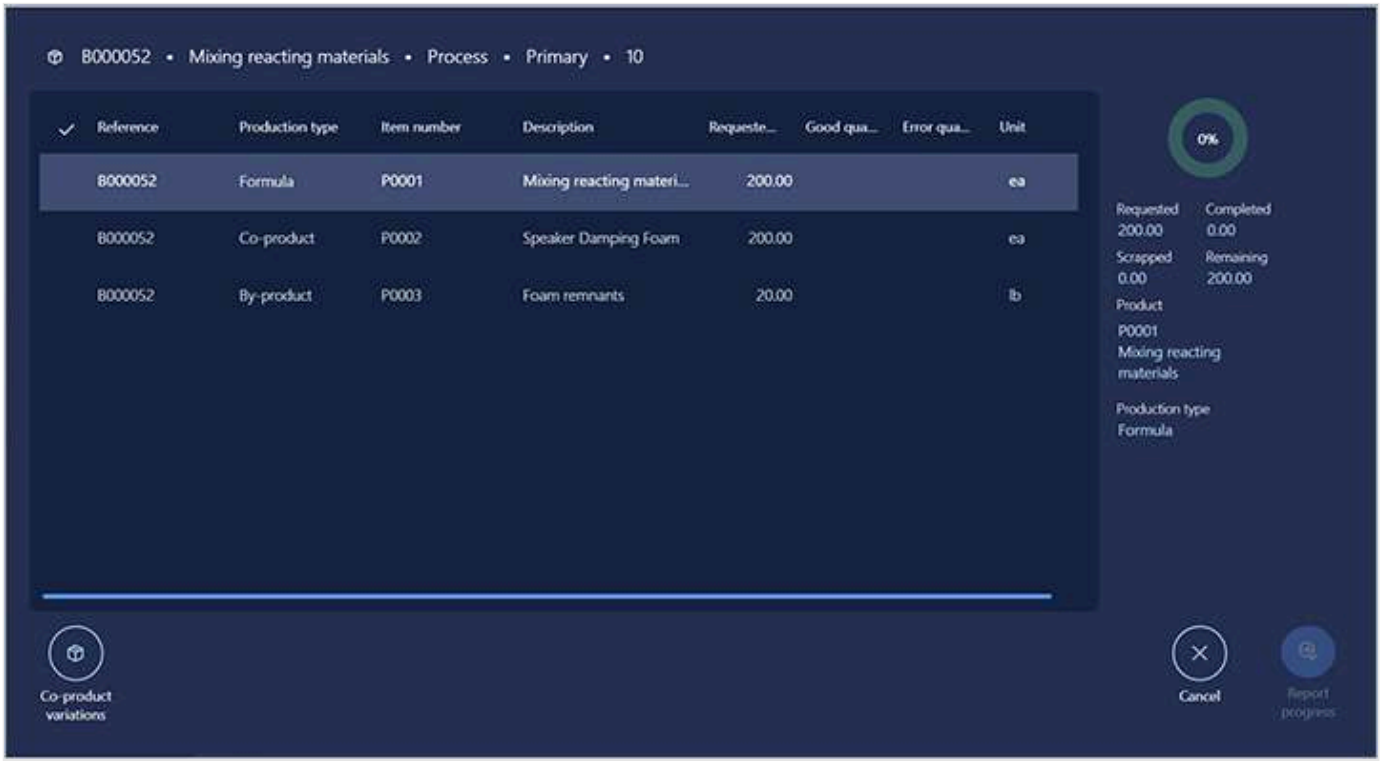
Workers use the production floor execution interface to report progress on batch orders. This reporting includes co-products and by-products.

Some manufacturers, especially in process industries, use batch orders to manage their production processes. Batch orders are created from formulas, and those formulas can be defined so that they have co-products and by-products as output. When feedback about those batch orders is reported, the amount of output must be registered on the formula item, and also on the co-products and by-products.

When a worker completes or partially completes a job on a batch order, they can report good or scrap quantities for each product that is defined as output for the order. Products that are defined as output for a batch order can be of the *Formula*, *Co-product*, or *By-product* type.

To report good quantities on the products, a worker selects a job on the **Active jobs** tab and then selects **Report progress**.

Then, in the **Report progress** dialog box, the worker can select among the products that are defined as output for the batch order to report on. The worker can select one or many products in the list, and then select **Report progress**. For each product, the quantity is blank by default, and the worker can use the numeric keyboard to enter the quantity. The worker can use the **Previous** and **Next** buttons to move between the selected products. After the quantity is entered for each product, the worker can update the status of the job to *In progress*, *Stopped*, or *Completed*.



Reporting on batch orders for planning items

When a worker completes a job on a batch order for a planning item, they report quantities only on co-products and by-products, because planning items don't contain an item of the *Formula* type.

Reporting co-product variation

If a batch order is created from a formula version where the **Co-products variations** option is set to *Yes*, the worker can report on co-products that aren't part of the definition for the batch orders. This functionality is used in scenarios where unexpected product output can occur in the production process.

In this case, the worker can specify the co-product and quantity to report by selecting **Co-products variations** in the report progress dialog box. The worker can then select among all the released products that are defined as co-products.

Reporting catch weight items

Workers can use the production floor execution interface to report progress on batch orders that are created for catch weight items. Batch orders are created from formulas, which can be defined to have catch weight items as formula items, co-products, and by-products. A formula can also be defined to have formula lines for ingredients that are defined for catch weight. Catch weight items use two units of measure to track inventory: catch weight quantity and inventory quantity. For example, in the food industry, boxed meat can be defined as a catch weight item, where the catch weight quantity is used to track the number of boxes and the inventory quantity is used to track the weight of the boxes.

Reporting scrap

When a worker completes or partially completes a job, they can report scrap by selecting a job on the **Active jobs** tab and then selecting **Report scrap**. In the **Report scrap** dialog box, the worker enters the scrap quantity by using the numeric keyboard. The worker also selects a reason (*None*, *Machine*, *Operator*, or *Material*).

Workers reporting job scrap can choose to work from a list view that shows several jobs at once, or from a detail view that shows more information about one job at a time.

Automatically report a job as finished by using sensor signals (preview)

[This section is prerelease documentation and is subject to change.]

You can fit production machines with sensors that report completed operations. By integrating these sensors with Supply Chain Management, you can set up scenarios where the system automatically reports finished quantities when a machine generates enough sensor signals to reach a defined output threshold. The scenario requires fitting the machine with a sensor that emits a signal for each production cycle, and mapping that sensor to the corresponding resource and operation in Supply Chain Management. By defining how many signals correspond to one finished unit, the system can automatically determine when progress should be reported and update the production order and inventory accordingly. If your plant is set up to support this scenario, you can also set up the production floor execution interface to provide real-time visibility into the sensor signals and counters, so workers can monitor the production process more effectively and adjust the counters as needed. For more information about how to set up this scenario and view the counters in the production floor execution interface, see Production auto report scenario (preview).

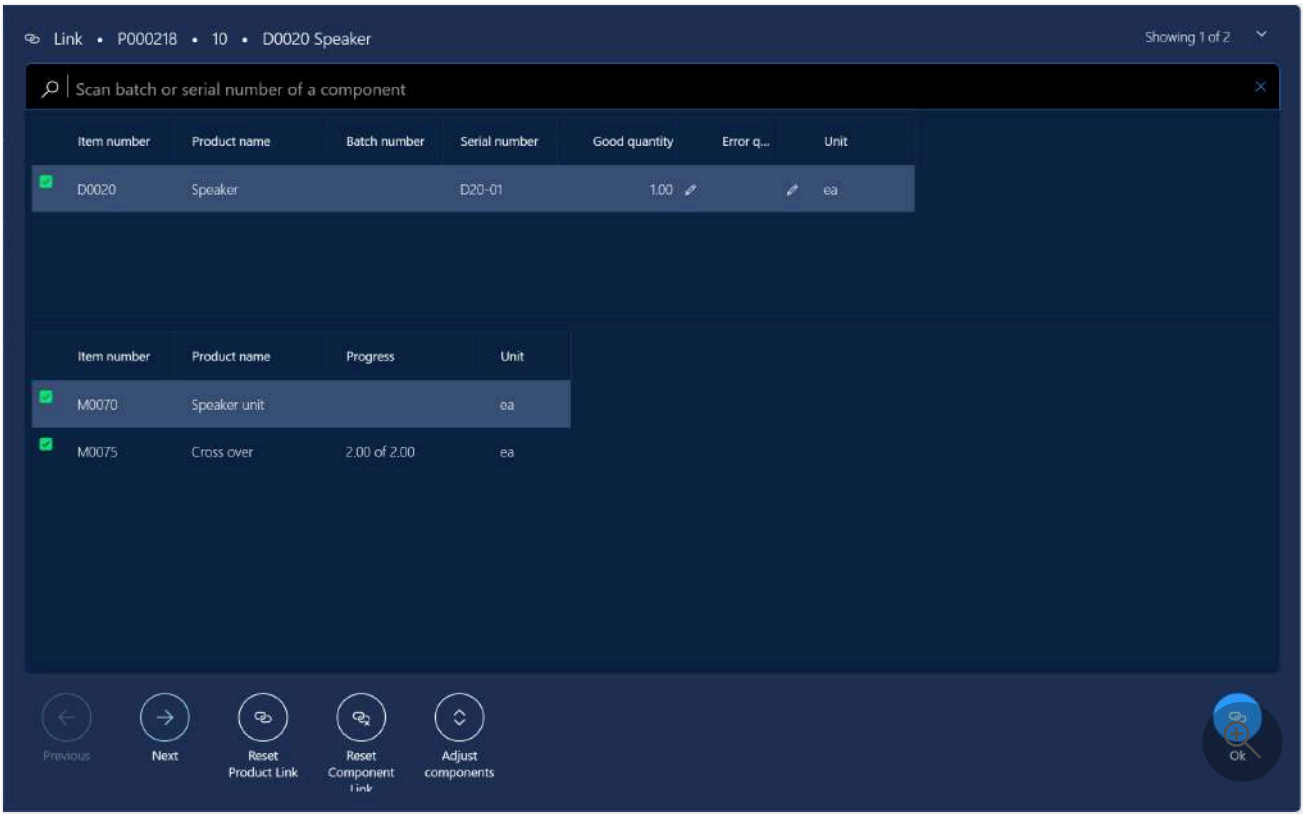
> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Register batch/serial numbers for finished products and their components

Workers can use the production floor execution interface to register batch or serial numbers for tracked components and the finished products that they're producing. For information about how to add this functionality to the interface, see Configure the production floor execution interface.

Workers follow these steps to register tracked components.

1. When you start a production job, select **Tracked component** to start registering batch or serial numbers for the product and its components.



2. When the interface prompts you, scan the batch or serial number of the product that's manufactured.

3. Select a component to add to the product, and then scan the batch/serial number of that component.

4. Continue to add and scan components until all of them are registered.

5. Review the on-screen information, and make any required adjustments to the registrations by using the buttons at the bottom of the page.

6. Select **Next**.

7. Continue to process items on the production order until all products are registered.

Adjust material consumption and make material reservations (preview)

[This section is prerelease documentation and is subject to change.]

> ⓘ **Note**

This feature is generally available (GA) for non-WMS items, but is still in preview for WMS-enabled items.

Workers can adjust material consumption for each production job. Use this functionality when the actual quantity of materials that a production job consumes is different from the planned quantity. Adjust the quantity to keep the inventory levels current.

Workers can also make reservations on the batch or serial numbers of materials. Use this functionality when a worker must manually specify which material batch or serial numbers were consumed, to meet material traceability requirements.

Workers can specify the quantity to adjust by selecting **Adjust material**. This button is available in the following locations:

- In the **Report scrap** dialog box
- In the **Report progress** dialog box
- On the toolbar on the right

For information about how to add this functionality to the interface, see Configure the production floor execution interface.

Important

- This is a preview feature.
- Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Adjust material consumption from the Report scrap and Report progress dialog boxes

After a worker enters the quantity to report in the **Report progress** or **Report scrap** dialog box, the **Adjust material** button becomes available. When the user selects this button, the **Adjust material** dialog box appears. This dialog box lists the items that are planned to be consumed when the good or scrapped quantity is reported for the job.

The list in the dialog box shows the following information:

- **Product number** – The product master and product variant.
- **Product name** – The name of the product.
- **Proposal** – The estimated quantity of material that will be consumed when progress or scrap is reported for the specified quantity for the job.
- **Consumption** – The actual quantity of material that will be consumed when progress or scrap is reported for the specified quantity for the job.
- **Reserved** – The quantity of material that is physically reserved in inventory.
- **Unit** – The bill of materials (BOM) unit.

The right side of the dialog box shows the following information:

- **Product number** – The product master and product variant.
- **Estimated** – The estimated quantity to consume.
- **Started** – The quantity that is started on the production job.
- **Remaining quantity** – Of the estimated quantity, the quantity that remains to be consumed.
- **Released quantity** – The quantity that is consumed.

The following actions can be performed:

- The worker can specify the quantity to adjust for a material by selecting **Adjust consumption**. After the quantity is confirmed, the quantity in the **Consumption** column is updated with the adjusted quantity.
- When the worker selects **Adjust material**, a production picking list journal is created. This journal contains the same items and quantities as the **Adjust material** list.
- When the worker adjusts a quantity in the **Adjust material** dialog box, the **Proposal** field on the corresponding journal line is updated with the same quantity. If the worker selects **Cancel** in the **Adjust material** dialog box, the picking list is deleted.
- If the worker selects **OK**, the picking list isn't deleted. It's posted when the job is reported in the **Report scrap** or **Report progress** dialog box.
- If the worker selects **Cancel** in the **Report progress** or **Report scrap** dialog box, the picking list is deleted.

Adjust material from the primary or secondary toolbar

You can configure the **Adjust material** button to appear on the primary or secondary toolbar. For more information, see Design the production floor execution interface. A worker selects **Adjust material** for a production job that is in progress. The **Adjust material** dialog box appears, where the worker can make the desired adjustments. When the dialog box opens, the system creates a production picking list that contains lines for the adjusted quantities for the production order. If

the worker selects **Post now**, the adjustment is confirmed, and the picking list is posted. If the worker selects **Cancel**, the picking list is deleted, and no adjustment is made.

Adjust material consumption for catch weight items

Workers can adjust material consumption for catch weight items. This functionality is used in scenarios where the actual quantity of a catch weight material consumed by a production job is more or less than the planned quantity. Adjust the quantity to keep the inventory levels current. When a worker adjusts consumption of a catch weight item, they can adjust both the catch weight quantity and the inventory quantity. For example, if a production job is planned to consume five boxes that have an estimated weight of 2 kilograms per box, the worker can adjust both the number of boxes to consume and the weight of the boxes. The system validates that the specified weight of the boxes is within the defined minimum and maximum threshold that is defined on the released product.

Reserve materials

In the **Adjust material** dialog box, a worker can make and adjust material reservations by selecting **Reserve material**. The **Reserve material** dialog box that appears shows the physically available inventory for the item for each storage and tracking dimension.

If the material is enabled for warehouse management processes (WMS), the list shows only the physically available inventory for the production input location for the material. The production input location is defined on the resource where the production job is planned. If the item number is batch or serial number controlled, the full list of physically available batch or serial numbers is shown. To specify a quantity to reserve, the worker selects **Reserve material**. To remove an existing reservation, the worker selects **Remove reservation**.

For more information about how to set up the production input location, see the following blog post: Setting up the production input location.

> **Note**
>
> Reservations that a worker makes in the **Reserve material** dialog box remain when the worker selects **Cancel** in the **Report progress** or **Report scrap** dialog box.
>
> It isn't possible to adjust reservations for catch weight items.

Completing a job and starting a new job

Usually, workers complete a job by selecting one or more current jobs on the **Active jobs** tab and then selecting **Report progress**. They then enter the quantity that was produced (the good quantity) and set the status to *Complete*. If more than one job was selected, a worker then uses the **Previous** and **Next** buttons to move among them. To start a new job, the worker selects it on the **All jobs** tab and then selects **Start job**.

A worker can also start a new job while their previous job is still open. Once again, the worker selects the new job on the **All jobs** tab and then selects **Start job**. However, in this case, the **Start job** dialog box informs the worker that they are currently working on a job, and that they must therefore either stop or complete that job before they start the new job.

Working on multiple jobs in parallel

One worker can work on multiple jobs at the same time (that is, in parallel). In this case, the collection of jobs that the worker is working on is called a *job bundle*. The worker can add new jobs to the bundle, or complete one or more jobs in the bundle. The following two scenarios show how a worker can work on jobs in parallel.

Scenario 1: A worker who has no active jobs wants to start two jobs and work on them in parallel

The worker selects the two jobs on the **All jobs** tab and then selects **Start job**. The **Start job** dialog box shows both selected jobs, and the worker can adjust the quantity to start on each job. The worker then confirms the dialog box and can start both jobs.

Scenario 2: A worker who has two active jobs that are in progress wants to start a third job and work on it in parallel with the other two

The worker selects the third job on the **All jobs** tab and then selects **Bundle**. In the **Bundle** dialog box, the worker can adjust the quantity to start. The worker then confirms the dialog box by selecting **Bundle**.

Working on indirect activities

Indirect activities are activities that aren't directly related to a production order. Indirect activities can be flexibly defined, as described in Set up indirect activities for time and attendance.

For example, Shannon, a floor worker at Contoso, wants to attend a company meeting, and meetings are considered an indirect activity. One of the following two scenarios applies:

- **Shannon is working on one or more active jobs.** Shannon selects **Activity**, identifies the activity (meeting), and confirms the selection. A message that appears informs Shannon about jobs that are in progress. From the message, Shannon can choose to complete or stop the jobs before going to the meeting.
- **Shannon doesn't have any active jobs.** Shannon selects **Activity**, identifies the activity (meeting), and confirms the selection. Shannon is now registered as being at the meeting.

In both scenarios, after confirming the selection, Shannon goes to either the sign-in page or a page that waits for the confirmation that Shannon has returned from the indirect activity. The page that appears depends on the configuration of the production floor execution interface. (Learn more in Configure the production floor execution interface.)

Registering breaks

Workers can register breaks. Breaks can be flexibly defined, as described in Pay based on registrations.

A worker registers a break by selecting **Break** and then selecting the card that represents the break type (such as lunch). After the worker confirms the selection, the device shows either the sign-in page or a page that waits for the worker to confirm that they have returned from the break. The page that appears depends on the configuration of the production floor execution interface. (Learn more in Configure the production floor execution interface.)

View the "My day" dialog

The **My day** dialog provides workers with an overview of their registrations and balances. The dialog is divided into the following three sections:

- The main section lists the registrations that the current worker made on a selected date. It opens showing registrations for the current day, and provides a date picker that lets the worker view other days.
- The **Last calculated daily balance** section shows the worker's current balances for paid time, paid overtime, absence, and paid absence. These values are based on the registrations that are calculated during the approval process.
- The **Balances** section provides an overview of the balances within a defined period for selected categories of registrations, such as vacation, standard time, and overtime. These

balances are based on the way statistical balances are set up in the **Time and attendance** module. For more information about how to set this up, see Show vacation balances in the production floor execution interface.

Admins can add this feature to the interface by placing the **My day** button on a toolbar for each relevant tab as described in Design the production floor execution interface.

Working in teams

When multiple workers are assigned to the same production job, they can form a team. The team can nominate one worker as a pilot. The remaining workers then automatically become assistants of that pilot. For the resulting team, only the pilot registers job status. Time records apply to all team members.

Prerequisites

To use teams, an admin must enable the **Assistant** action for the primary toolbar on the **All jobs** tab of the production floor execution interface. For instructions, see Design the production floor execution interface.

Form a new team that has a pilot and an assistant

A worker registers as an assistant by selecting **Assistant** on the **All jobs** tab. Then, in the **Select an employee to assist** dialog box that appears, the worker selects a pilot in a list of workers who are actively working on a job. After the worker confirms their selection, they become an assistant to the selected worker, who becomes the pilot for the new team.

Assign a new pilot to an existing team

When a team wants to select a new pilot, the current pilot nominates another worker in the team as the new pilot. To nominate a new pilot, the current pilot selects **Assistant** on the **All jobs** tab. Then, in the **Change pilot** dialog box that appears, the pilot selects a new pilot in a list of workers who are already on the team. After the current pilot confirms their selection, they are removed from the team. However, they can rejoin the team as they require.

Assistant clocks out

When a worker who works as an assistant clocks out, they leave the team. If the **Permanent teams** and **Restart at clock in** options are set to *Yes*, a worker who clocks out automatically

rejoins the team the next time that they clock in. You can find these options on the **General** tab of the **Time and attendance parameters** page.

Opening instructions

Workers can open a document attached to a job by selecting **Instructions**. The **Instructions** button appears only if a document is associated with the job in the master data. For example, if a document attached to a product on the **Released products** page in Supply Chain Management is available for workers to open it in the shop floor execution interface.

Opening mixed-reality guides for HoloLens

Dynamics 365 Guides empower workers by providing hands-on learning that uses mixed reality. You can define standardized processes where step-by-step instructions guide workers to the tools and parts that they need and show how to use those tools in real work situations. Here's an overview of the process.

1. Every time a worker opens a job list in the shop floor execution interface, the interface finds all relevant guides for the jobs that are shown.
2. The worker selects **Guides** to view the list of guides.
3. The worker selects a relevant guide in the list.
4. The shop floor execution interface shows a QR code for the selected guide.
5. The worker puts on a HoloLens and glances at the QR code to start the guide.
6. The worker works through the guide to learn the task.

For more information about how to create, assign, and use guides for HoloLens, see Provide mixed-reality Guides for workers in production.

Last updated on 07/01/2026

Configure the production floor execution interface

10/29/2025

Shop floor workers use the production floor execution interface to register their daily work, such as when they start a job, report feedback about jobs, register indirect activities, and report absence. These registrations are the basis for tracking progress and cost on production orders, and for calculating the basis for the workers' pay.

When you open the production floor execution interface, it automatically loads a selected configuration and job filter that are specific to the browser and device. In the configuration, you set the policies that must be applicable for a specific usage. Here are some usage examples:

- On a device in the company hall, employees clock in when they come into the office, and they clock out when they leave for the day.
- On a device on the shop floor, machine operators register when they start and complete jobs. They also register breaks and indirect activities.

This article describes the various options for configuring a production floor execution interface for each device in use at your site.

Turn on the production floor execution interface optional features

The production floor execution interface is always available in Supply Chain Management. But several optional features can be turned on or off for your system. Use the Feature management page to turn on any or all of the features described in the following subsections as required.

Register material consumption

Some manufacturers, especially those in the process industries, must explicitly register the amount of material that is consumed for each batch or production order. For example, workers might use a scale to weigh the amount of material that is consumed as they work. To ensure full material traceability, these organizations must also register the batch numbers that were consumed to produce each product.

There are two versions of this feature. One supports items that *are not* enabled to use warehouse management processes (WMS). The other supports items that *are* enabled to use WMS.

- The *Register material consumption on the production floor execution interface (non-WMS)* feature enables workers to use the production floor execution interface to register material consumption, batch numbers, and serial numbers, but only for non-WMS items.

- The *Register material consumption as complete and edit dimensions on the production floor execution interface* feature enables workers to use the production floor execution interface to adjust material consumption, batch and serial numbers, and license plates for both non-WMS and WMS-enabled items. It also enables workers to mark the consumption of a specific material as completed by marking an **End** flag on the line item for a material.

Register material consumption on the production floor execution interface (non-WMS) functionality is always available as part of Supply Chain Management. To use additional related functionality, turn on one or both of the following features in Feature management:

- *Register material consumption as complete and edit dimensions on the production floor execution interface* (This feature adds support for WMS-enabled items. It requires Supply Chain Management version 10.0.42 or later. As of Supply Chain Management version 10.0.45, this feature is turned on by default.)
- *Add lines to the adjust materials dialog* (Allows workers to add and delete material lines in the **Adjust Materials** dialog on the production floor execution interface. It requires Supply Chain Management version 10.0.44 or later.)

Tracked components

This feature lets workers and managers register batch/serial numbers for materials and components that are used in manufacturing processes. They can then associate those numbers with the batch/serial numbers of the products that are produced. In this way, manufacturers can optimize their processes, enhance product quality, and respond quickly to any issues that arise. Managers can use the item tracing report to effectively track batch/serial numbers that are registered through the *Tracked components* feature.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.
- The feature that's named *Tracked components* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.
- You must make the feature available to workers by adding a **Tracked components** button to the appropriate tab and toolbar, as described in Design the production floor execution interface.

For more information about this feature, see Register batch/serial numbers for finished products and their components (preview).

Select color themes on production floor execution interface

When configuring the production floor execution interface, supervisors can select one of several default color themes, ranging from dark to light. Each worker can also select their own preferred theme, which overrides the default each time that worker signs in.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later.
- The feature that's named *Select color themes on production floor execution interface* must be turned on in Feature management.

List view for reporting job scrap from the production floor execution interface

Workers reporting job scrap from the production floor execution interface can choose to work from a list view that shows several jobs at once, or from a detail view that shows more information about one job at a time. Previously, only the detail view was available.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later.
- The feature that's named *List view for reporting job scrap from the production floor execution interface* must be turned on in Feature management.

Streamline the process for registering indirect activities

This feature streamlines the process for workers to register for indirect activities. Without this feature, when a worker registered for an indirect activity, a dialog box would open, asking them whether they wanted to stop the activity or log it at the end of their shift. This feature removes the dialog. Instead, the system automatically adds the indirect activity to the worker's active job list. The system stops the indirect activity when the worker begins a new task (such as a production job), another indirect activity, or a project job

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.42 or later.
- The feature that's named *Streamlined registration process for indirect activities on the Production floor execution* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

Report progress on multiple jobs in the report-progress list view

This feature lets workers reporting job progress to select the desired status on multiple jobs in the report-progress list view.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.42 or later.
- The feature that's named *Set the desired status on selected jobs in report progress list view in the production floor execution interface* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

Enhanced numpad control

The enhanced numpad input control replaces the previous one. It is now an element of type *Real* instead of type *String*, which makes the decimal separator consistent with the regional settings.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.45 or later.
- The feature that's named *Enhanced numpad control for production floor execution interface* must be turned on in Feature management.

View material list

This feature allows production floor workers to view the list of materials required for a job directly within the production floor execution interface. This feature enhances visibility into material requirements, helping workers ensure that all necessary components are available before starting or continuing a production task.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.
- The feature that's named *Material list on the production floor execution interface* must be turned on in Feature management.

To show the material list, set **View materials** to *Yes* on the **Report progress** FastTab of the **Configure production floor execution** page for the relevant production floor execution configurations.

Report serial numbers beyond single unit

This feature lets workers use the production floor execution interface to report a quantity greater than one for items that are tracked by serial number but not strictly controlled by it. To enable this functionality, the item must be linked to a tracking dimension group where the **Serial number control setting** is set to *No* for the serial number dimension.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.
- The feature that's named *Serial number reporting beyond single unit* must be turned on in Feature management.

Record test results from the production floor execution interface (preview)

[This section is prerelease documentation and is subject to change.]

This feature allows workers to record test results on quality orders directly from the production floor execution interface.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.
- The feature that's named *(Preview) Record test results from the production floor execution interface* must be turned on in Feature management.

Auto-complete secondary operation with primary

This feature completes secondary operations automatically when a worker uses the production floor execution interface to complete their related primary operation. The time recorded for the secondary operation matches the time registered for the primary operation. Supervisors can activate this functionality by enabling the **Complete secondary operation with primary** parameter on the route group associated the secondary operation.

To use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.
- The feature that's named *Auto-complete secondary operation with primary* must be turned on in Feature management.

Work with production floor execution configurations

To create and maintain production floor execution configurations, go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**. The **Configure production floor execution** page shows a list of existing configurations. On this page, you can perform the following actions:

- Select any production floor configuration that is listed in the left column to view and edit it.
- On the Action Pane, select **New** to add a new configuration to the list. Then, in the **Configuration** field, enter a name to identify the new configuration. The name that you enter must be unique among all configurations, and you won't be able to edit it later. In the **Description** field, you can optionally enter a description of the configuration.

Next, configure the various settings for the selected configuration, as described in the following subsections.

The General FastTab

The following settings are available on the **General** FastTab:

- **Clock in and out only** – Set this option to *Yes* to create a simplified interface that provides only clock-in and clock-out functionality. This setting disables most of the other options on this page. You must remove all lines from the **Tab selection** FastTab before you can enable this option.
- **Report quantity at clock-out** – Set this option to *Yes* to prompt workers to report feedback about jobs that are in progress when they clock out. When this option is set to *No*, workers won't be prompted.
- **Lock employee** – When this option is set to *No*, workers will be signed out immediately after they make a registration (such as a new job). The interface will then return to the sign-in page. When this option is set to *Yes*, workers will stay signed in to the production floor execution interface. However, a worker can manually sign out so that another worker can sign in while the production floor execution interface continues to run under the same system user account.
- **Use the actual time of registration** – Set this option to *Yes* to set the time for each new registration to the exact time when the worker submitted the registration. When this option is set to *No*, the sign-in time is used instead. You will usually want to set this option to *Yes* if you've set the **Lock employee** and/or **Single worker** option to *Yes* in cases where workers often remain signed in for longer periods.
- **Single worker** – Set this option to *Yes* if only one worker uses each production floor execution interface where this configuration is active. When this option is set to *Yes*, the **Lock employee** option is automatically set to *Yes*. In addition, this setting removes the requirement (and ability) for the worker to sign in by using a badge ID or personnel number. Instead, the worker signs in to Microsoft Dynamics 365 Supply Chain Management by using a system user account that is linked to a *time registered worker*, and gets signed in to the production floor execution interface as that worker at the same time. Learn more in Set up worker accounts to use the production floor execution interface.
- **Suppress numpad keyboard** – Select this option to prevent the numpad keyboard from opening when you need to change or enter a quantity.

The Tab selection FastTab

Use the settings on the **Tab selection** FastTab to select which tabs the production floor execution interface should show when the current configuration is active. You can design as many tabs as you need, and then add and arrange them as you require by using the buttons on the FastTab toolbar. For information about how to design tabs and work with the settings here, see Design the production floor execution interface.

The Login FastTab

The following settings are available on the **Login** FastTab:

- **Enable numpad** – Set this option to *Yes* to add a numpad to the sign-in screen, which allows workers to enter their badge ID or personal number using a touch-screen numpad. Set this option to *No* to hide the numpad.
- **Allow locking the touchscreen** – Set this option to *Yes* to allow workers to lock the touchscreen of the production floor execution interface so that they can sanitize it. When this option is set to *Yes*, a **Lock screen for sanitizing** button is added to the sign-in page. When a worker selects this button, the touchscreen is temporarily locked to prevent unintended input. A countdown timer is also shown. The worker can then safely clean the device and the screen. When the countdown is completed, the touchscreen is automatically unlocked.
- **Screen lock duration** – When the **Allow locking touchscreen** option is set to *Yes*, use this option to specify the number of seconds that the touchscreen should be locked for sanitizing. The duration must be between 5 and 120 seconds.

The Main view FastTab

The following settings are available on the **Main view** FastTab:

- **Enable search** – Set this option to *Yes* to include a search field on the jobs list. Workers can find a specific job by entering the job ID, or they can find all jobs for a specific order by entering the order ID. Workers can enter the ID by using a keypad or scanning a bar code.
- **Enable search by project ID** – Set this option to *Yes* to enable workers to search by project ID (in addition to job ID and order ID) in the search field of the production floor execution interface. You can set this option to *Yes* only when the **Enable search** option is also set to *Yes*.
- **Auto-open start dialog** – When this option is set to *Yes*, the **Start job** dialog box is automatically opened when workers use the search bar to find a job.
- **Auto-open report progress dialog** – When this option is set to *Yes*, the **Report progress** dialog box is automatically opened when workers use the search bar to find a job.

The Report progress FastTab

The following settings are available on the **Report progress** FastTab:

- **Skip product selection** – Set this option to *Yes* to skip the page where workers identify which items they want to report progress on (formula item, co-products, and by-products). If you choose to skip this page, workers will go straight to the page where they

specify the finished quantity and dimensions of each produced formula item, co-product, and by-product.

- **View materials** – Set to *Yes* to allow production floor workers to view the list of materials for a production order from the **Report progress** dialogue. This feature enhances visibility into material requirements, helping workers ensure that all necessary components are available before starting or continuing a production task.
- **Enable adjust material** – Set this option to *Yes* to include the **Adjust material** button in the **Report progress** dialog box. Workers can select this button to adjust material consumption for the job.
- **Default remaining quantity** – Set this option to *Yes* to pre-fill the expected remaining quantity for a production job in the **Report progress** dialog box.
- **Default nominal quantity** – Set to *Yes* to pre-populate the nominal quantity for catch weight items in the report progress dialog. Set to *No* to leave the field blank, which allows workers to enter the quantity manually.
- **Require existing license plate** – Choose whether workers should be required to specify an existing license plate when reporting as finished. Set to *Yes* to require workers to specify a license plate that already exists in the system. Set to *No* to allow the worker to specify any license plate. If the reported license plate doesn't already exist, the system will create it.
- **Generate license plate** – Set this option to *Yes* to generate a new license plate every time that a worker uses the production floor execution interface to report as finished. The license plate number is generated from a number sequence that is set up on the **Warehouse management parameters** page. When this option is set to *No*, workers must specify an existing license plate when they report as finished.
- **Print label** – Set this option to *Yes* to print a license plate label when a worker uses the production floor execution interface to report as finished. The configuration of the label is set up in document routing, as described in Document routing label layouts.
- **Add material line** – Set this option to *Yes* to enable the addition and deletion of material lines within the adjust material dialog.

Clean up job configurations

When the shop floor supervisor sets up the production floor execution interface, they select a configuration and a job filter. These selections are stored in a reference table in Supply Chain Management, and the browser uses an ID that is stored in a local cookie to find the correct row in that table. The table also logs the date and time that a worker last signed in to each device.

A batch job periodically cleans entries in the references table for devices that haven't logged any activity in the last 60 days. You can also manually clean the entries at any time by following these steps.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**.
2. On the Action Pane, select **Clean up client configurations**.
3. In the **Clean up client configuration** dialog box, set the **Number of days** field to the number of days of inactivity (before today) to consider. You will remove all configurations and sign-in records for devices that haven't been active during that time.
4. Select **OK** to clean up the relevant configurations, based on the **Number of days** setting.

Show vacation balances in the production floor execution interface

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an example scenario that shows how to set up Microsoft Dynamics 365 Supply Chain Management so that it uses payroll statistics to provide each worker with an overview of their vacation balance for the current year. Workers will be able to see their vacation balance in the **My day** dialog box in the production floor execution interface.

This scenario uses the Danish holiday law, where the vacation year goes from September 1 through August 31. In this scenario, your company has hired a new worker and will grant that worker a balance of 10 vacation days for the rest of the current vacation year.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Create a new pay type

Start by creating a new *pay type* that will track workers' earned vacation days (also referred to as their *vacation balance*). Typically, pay types are used to calculate workers' pay. However, the pay type that you create here will be used to calculate a balance.

1. Go to **Time and attendance** > **Setup** > **Payroll** > **Pay types**.
2. On the Action Pane, select **New** to add a row to the grid.
3. On the new row, set the following values:
    - **Pay type:** *5151-1*
    - **Description:** *Counter for worker vacation days*
    - **Include in export:** *No*

Update the pay agreement

In this section, you will edit an existing *pay agreement* by adding the new pay type and setting the rules that define how each worker's vacation balance is adjusted when vacation days are registered.

1. Go to **Time and attendance** > **Setup** > **Payroll** > **Pay agreements**.
2. Select the pay agreement where you want to set up the vacation policy. (If you're working with standard USMF sample data, there is only one pay agreement, *Man*.)
3. Make sure that the selected pay agreement is valid for the current date. If you're working with standard USMF sample data, the **To date** field of the *Man* pay agreement might be set to a date that is in the past. Change the value so that it's a year or two in the future, as required.
4. On the Action Pane, select **Agreement lines**.
5. On the **Pay agreement lines** page, on the **Overview** FastTab, set the following values on the toolbar:
    - In the first drop-down list, select **Monday**.
    - In the second drop-down list, select **Absence**.
6. On the Action Pane, select **New** to add a row to the grid.
7. On the new row, set the **Pay type** field to the pay type that you created for this scenario (*5151-1*). Leave all other fields set to their default values.
8. While the new row is still selected, on the **General** FastTab, set the following values:
    - **Absence code:** *Vacation*
    - **Use fixed quantity:** *Yes*
    - **Constant:** *-1*
9. On the Action Pane, select **Copy day**.
10. In the **Copy day** dialog box, set the following values:
    - **Tuesday**, **Wednesday**, **Thursday**, and **Friday:** *Yes*
    - **Overwrite:** *Yes*
    - **Absence:** *Yes*
11. Select **OK**.

Create a payroll statistic group

Payroll statistic groups are used to set up statistics for worker registrations during a period. In this scenario, you will use a payroll statistic group to calculate the number of vacation days that workers earn during a vacation period. In Denmark, the vacation period runs from September 1 through August 31.

1. Go to **Time and attendance** > **Setup** > **Payroll** > **Payroll statistics groups**.
2. On the Action Pane, select **New** to add a row to the grid.
3. On the new row, set the following values:
    - **Payroll statistics group:** *VAC*
    - **Description:** *Vacation balance*
    - **Transfer:** *No*
4. While the new row is still selected, select **Setup** on the Action Pane.
5. On the **Setup** page, on the Action Pane, select **New** to add a row to the grid.
6. On the new row, set the **Pay type** field to *5151-1*.
7. Select and hold (or right-click) the **Period code** field, and then select **View details**. You can now set up the period code that you will assign to this field later.
8. On the **Period types** page, on the Action Pane, select **New** to add a row to the grid.
9. On the new row, set the following values:
    - **Period types:** *VacYear*
    - **Description:** *Vacation year*
    - **Frequency:** *Years*
10. While the new row is still selected, select **Generate periods** on the Action Pane.
11. In the **Generate periods** dialog box, set the following values:
    - **Specify start date of the period:** *September 1, 2021*
    - **Length of period:** *5*
12. Select **OK**.
13. Close the **Period types** page to return to the **Payroll statistics groups** page.
14. Set the **Period code** field to the period type that you just created (*VacYear*).

Create a statistical balance setup

In this section, you will create a *statistical balance setup* that is linked to the payroll statistic group that you created in the previous section. Later, you will link this statistical balance setup to the **My day** view in the production floor execution interface. The **My day** view will then be able to show the vacation balances for the pay type that is assigned to the associated payroll statistic group.

1. Go to **Time and attendance** > **Setup** > **Payroll** > **Statistical balance setup**.
2. On the Action Pane, select **New** to add a row to the grid.
3. On the new row, set the following values:
    - **Payroll statistics group:** *VAC*
    - **External name:** *Vacation balance*
    - **Flex:** *No*

Create a manual premium

Manual premiums are typically used to grant workers extra pay for extra work. In this scenario, you will create a manual premium that you can use to set the initial vacation balance for each worker.

1. Go to **Time and attendance** > **Setup** > **Payroll** > **Manual premiums**.
2. On the Action Pane, select **New** to add a record.
3. In the new record, set the following values:
    - **Premiums:** *VAC*
    - **Description:** *Adjustments to workers' vacation balance*
    - **Pay type:** *5151-1*

Set a worker's initial vacation balance and adjust it by one day

Payroll administrators use the **Approve** page to review and approve workers' daily registrations. In this scenario, you will take on the role of an admin so that you can set the initial vacation balance for a worker and register vacation days that the worker takes.

1. Go to **Time and attendance** > **Review and approve** > **Approve**.

2. In the **Approve** dialog box, set the following fields:

    - **Approval group** – Select the approval group that you belong to. (If you're working with standard USMF sample data, there is only one approval group, *AdmMan*.)
    - **View entire group, 1 day** – Select the option, and then set the field to the current date.

3. Select **OK**.

4. The **Approve** page shows a list of records that match your criteria. Select the worker that you want to approve. If you're working with standard USMF sample data, select worker *000496* (*Christina Portra*).

5. Grant the selected worker 10 days of vacation:

    a. While the worker is still selected, select **Premium lines** on the Action Pane.

    b. On the **Premium lines** page, on the Action Pane, select **New** to add a row to the grid.

    c. On the new row, set the following values:

    - **Premiums:** *VAC*
    - **Quantity:** *10*

    d. Close the **Premium lines** page.

6. On the **Approve** page, register the fact that the worker used one of their vacation days on the current date:

    a. While the worker is still selected, in the lower part of the page, on the **Overview** tab, select **New** on the toolbar to add a row to the grid.

    b. On the new row, set the following values:

    - **Journal registration type:** *Absence*
    - **Reference:** *Vacation*

    c. In the upper part of the page, select **Transfer** on the toolbar to apply the vacation balance and calculate the deduction.

Configure the production floor execution interface so that it includes the My day dialog box

In this section, you will add a **My day** button to the production floor execution interface. Workers can then use this button to open the **My day** dialog box.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**.
2. Select a configuration, such as *Default*.
3. On the Action Pane, select **Design tabs**.
4. On the **Design tabs** page, in the list pane, select *All jobs* to view the settings for that tab. The **Main view** field should now show a value of *All jobs*.
5. On the Action Pane, select **Edit**.
6. On the **Secondary tool bar** FastTab, in the **Available actions** column, select **My day**. Then select the right arrow button to move it to the **Selected actions** column.

Check your balance in the production floor execution interface

In this section, you will sign in to the production floor execution interface as the worker whose vacation time you set up earlier. You will then open the **My day** dialog box to view your vacation balance.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Production floor execution**.
2. If you're prompted to select a configuration, select the configuration that you set up earlier in this scenario (*Default*).
3. Sign in as the user that you set up earlier in this scenario. If you're working with standard USMF sample data, you should be able to sign in by entering *123* in the **Badge ID** field. This badge ID corresponds to Christina Portra.
4. Select **My day** on the left toolbar.
5. Inspect the **Balances** section of the dialog box. This section should now show that you have a balance of nine vacation days.

Last updated on 10/03/2025

Design the production floor execution interface

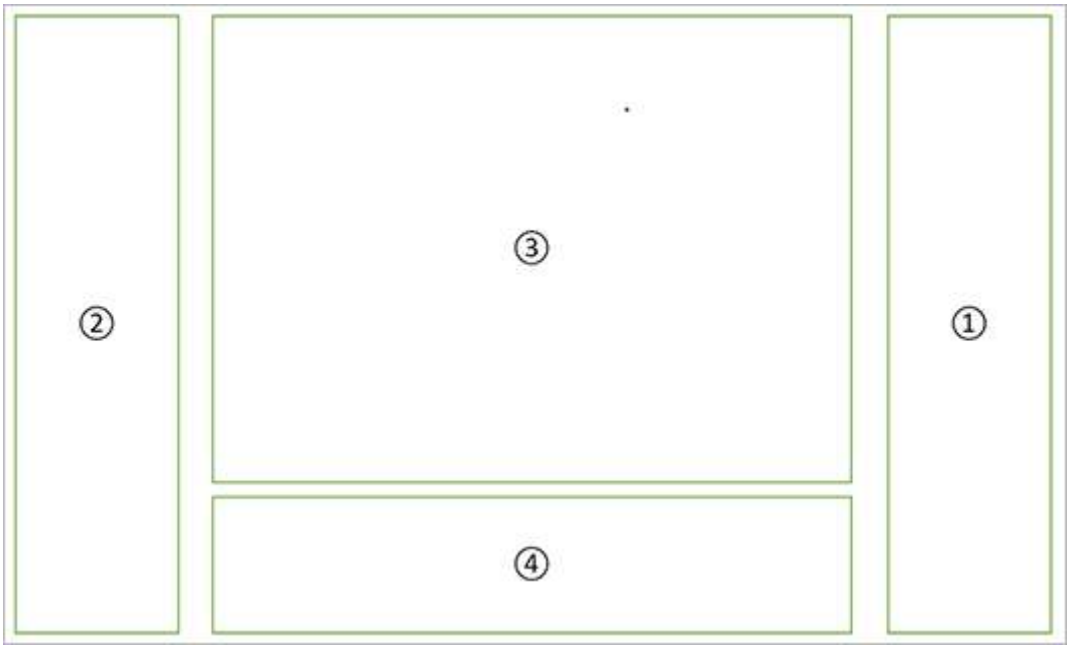
06/17/2025

You can design the content of the user interface for each configuration used by the production floor execution interface. For example, workers in one work cell might need to be able to open job instructions on the production floor, while in another work cell, instructions aren't needed. In that case, two configurations should be created, one with a button for opening document attachments and one without this button.

Design a tab

On the **Configure production floor execution** page, you can create and configure tabs by selecting **Design tabs** on the Action Pane.

Each tab is divided into four sections, as shown in the following illustration.



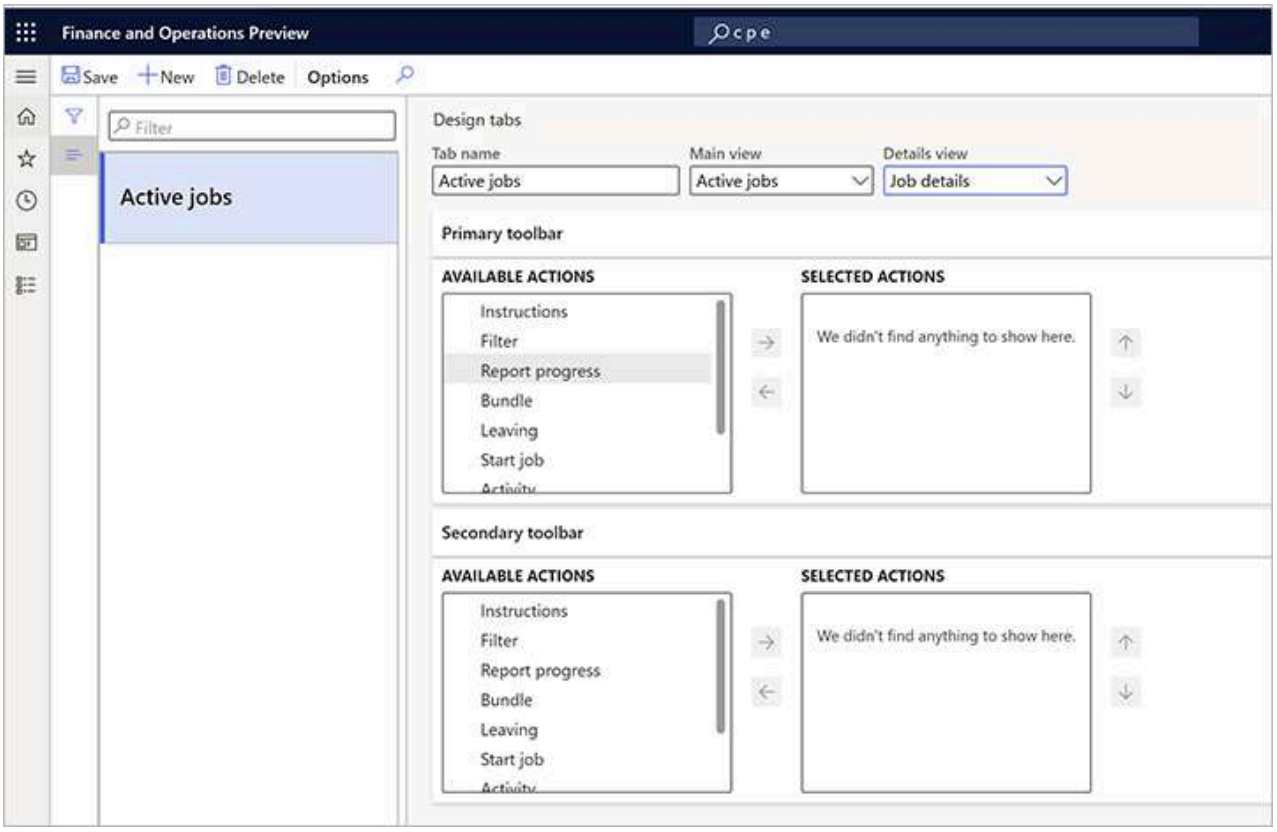
The following elements are shown in the illustration:

1. Primary toolbar
2. Secondary toolbar
3. Main view
4. Detailed view

To create and configure a new tab, follow these steps:

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**.

2. Select **Design tabs** on the Action Pane to open the **Design tabs** page.



3. Select **New** on the Action Pane.

4. Make the following settings in the header of the page:

    - **Tab name** – Specify a name for the tab.
    - **Main view** – Select among the predefined job lists (*Active jobs*, *All jobs*, *My jobs*, and *My machine*).
    - **Details view** – Select between a blank value or **Job details**. If you select the blank value, there will be no detailed view in the tab. If you select **Job details**, the detailed view will contain a detailed description of the job selected in the job list in the main view.

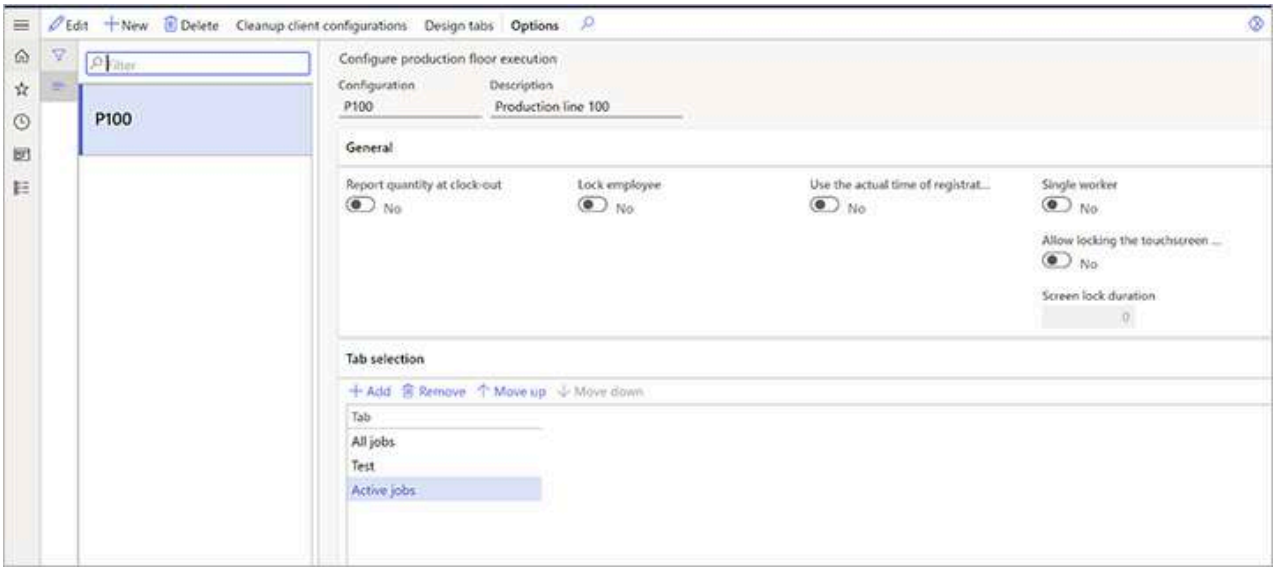
5. In the **Primary toolbar** section, choose which buttons should be available in the primary toolbar. The **Available actions** column shows a list of all the buttons that can be added. The **Selected actions** column shows a list of all the buttons that are included in the current configuration. Use the buttons between the columns to move selected items between the columns as needed. Use the up and down buttons next to the **Selected actions** column to control the order in which the buttons are presented in the user interface.

6. In the **Secondary toolbar** section, choose which buttons should be available in the secondary toolbar. The **Available actions** column shows a list of all the buttons that can be added. The **Selected actions** column shows a list of all the buttons that are included in the current configuration. Use the buttons between the columns to move selected items between the columns as needed. Use the up and down buttons next to the **Selected actions** column to control the order in which the buttons are presented in the user interface.

Associate a tab with a configuration

After you designed all the tabs you need, you can associate them with a configuration.

1. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**.



2. On the **Tab selection** FastTab, select **Add**.

3. A new row is added to the grid. For this new row, select the name of a tab that you want to add to the configuration.

4. Continue to add additional tabs as needed.

5. Use the **Move up** and **Move down** buttons on the toolbar to arrange the tabs as needed. The tabs will be displayed from left to right in the order shown (the tab at the top is shown on the left).

Set up a device to run the production floor execution interface

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You must set up the production floor execution interface for each device on the production floor. Companies typically set up each device differently, depending on the purpose that the device serves. For example, one device might be in the reception area where workers clock in and clock out, and another device might be on the shop floor where workers manage their jobs.

Set the configuration and filters for a specific device

To set the configuration and job filters for a device, sign in to the **Production floor execution** page by using an account that has a security role that includes the *Maintain time supervision* duty. (Among the out-of-box security roles, only *Shop floor supervisor* has this duty.) Then follow these steps:

1. Go to the device that you want to set up, and sign in to Microsoft Dynamics 365 Supply Chain Management as a shop floor supervisor. (Use an account that includes the *Maintain time supervision* duty.)

2. Make sure that a configuration is available for the device that you're setting up. If no configuration exists, a default configuration is provided. For more information about how to set up a configuration, see Configure the production floor execution interface.

3. Go to **Production control** > **Manufacturing execution** > **Production floor execution**.

   If the production floor execution interface has already been configured at least one time on the current device, a sign-in page appears. Otherwise, a welcome page appears.

4. On either the sign-in page or the welcome page, select **Configure**.

5. Select a configuration in the list.

6. Select **Next**.

7. Select one or more filters to apply to the current device. These filters help ensure that only relevant jobs show on the device. To set a filter, select the filter type to open a list of values, and then select the value to filter on. The following filters are available:

    - **Production unit** – This filter is the highest-level filter. It typically refers to a large work area that has several resource groups and individual resources in it.
    - **Resource group** – This filter is a mid-level filter. It typically refers to a collection of related resources in a limited area of the workspace. If you select a **Production unit** filter first, the list of resource groups shows only groups from that unit. Otherwise, it shows all available resource groups.
    - **Resource** – This filter is the most specific filter. It typically refers to a specific machine or other single resource. If you select a **Resource group** and/or **Production unit** filter first, the list of resources shows only resources from that group and/or unit. Otherwise, it shows all available resources.

8. Select **Next**.

9. Select the display color theme to apply to the current device.

10. Select **OK**.

11. The sign-in page appears, and your device is ready for use.

Allow a worker to override the default filters

You can give specific workers permission to change the filter settings on any device that they use. For workers who have this permission, the production floor execution interface provides a **Filter** button on the **All jobs** and **Active job** pages.

> ⓘ **Note**
>
> If a worker changes a filter, the new filter applies from that point forward, for all users who sign in to the device.

To allow a worker to override the default job filters that you set up for a device, follow these steps:

1. Go to **Time and attendance** > **Setup** > **Time registration workers**.
2. Select a worker in the list to open that worker's **Time registration workers** page.
3. On the **Time registration** tab, set the **Set filters** option to *Yes*.

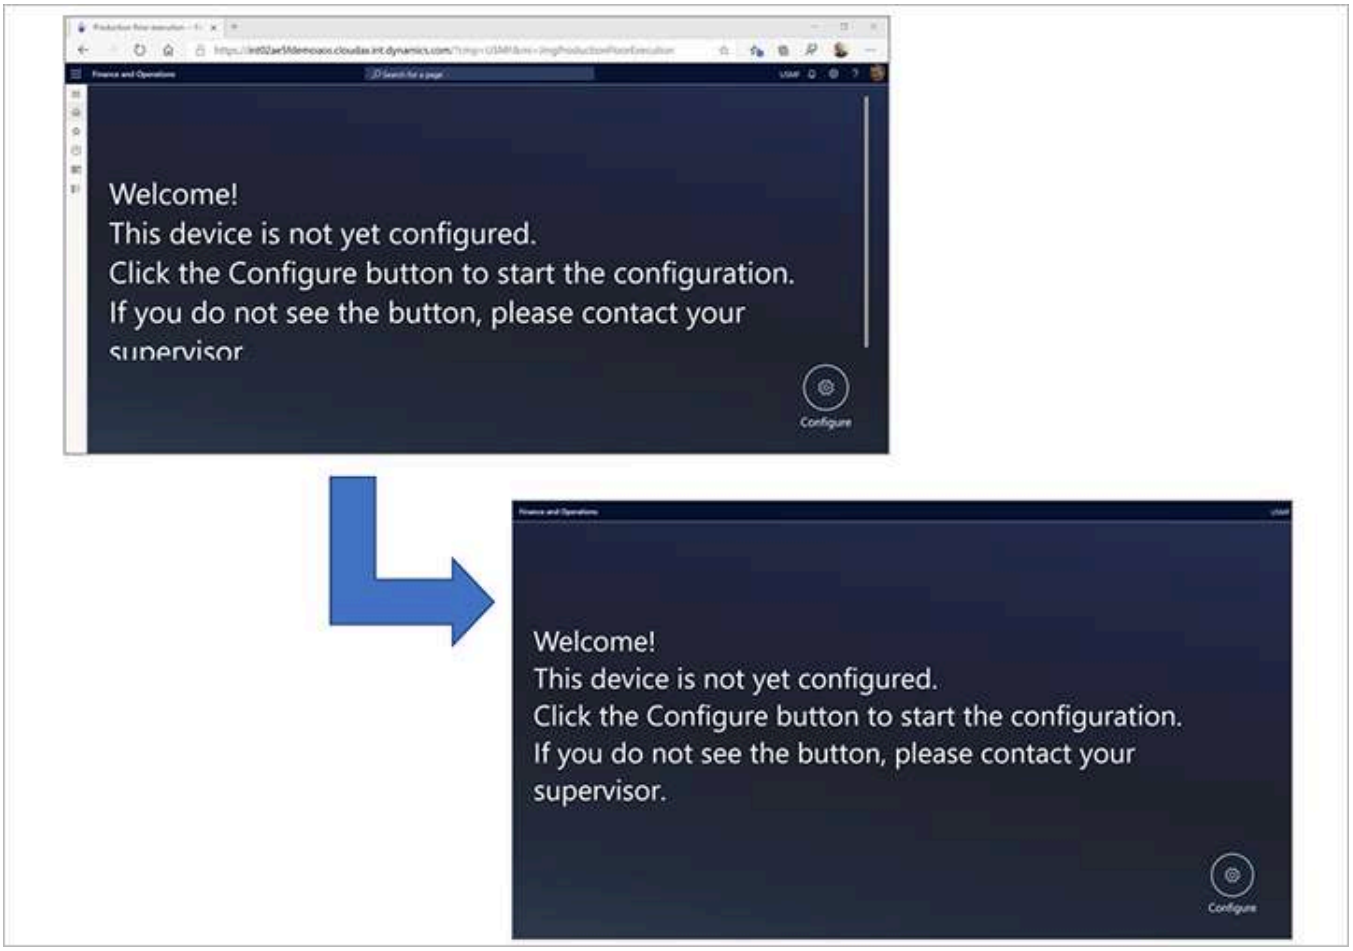
For more information about how to set up worker accounts to access the production floor execution interface, see Set up worker accounts to use the production floor execution interface.

Run the interface in full-screen mode

Often, you'll run the production floor execution interface on a device that is used exclusively for that purpose. Therefore, it might make sense to run the interface in full-screen mode, without showing any navigation or browser chrome.

- To hide the navigation pane that appears in Supply Chain Management, add the following text to the end of the URL in the browser's address bar: `\&limitednav=true`.
- To also hide the browser's address bar, use the browser's native full-screen mode. For instructions, see your browser's documentation.

The upper part of the following illustration shows how the interface looks by default. The lower part shows how it looks in full-screen mode when the navigation pane is hidden.



Extend the session past 12 hours (preview)

[This section is prerelease documentation and is subject to change.]

By default, the production floor execution interface automatically signs out if no one uses it for 12 hours. A Supply Chain Management user must then sign in again. However, you can extend the timeout limit to up to 90 days.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

To allow sessions to extend past 12 hours, the feature named *(Preview) Enables session management for users* must be turned on in feature management.

Set the session timeout for a device

To set the session timeout for a device, follow these steps:

1. Go to **System administration** > **Users** > **User session management**.
2. Do one of the following steps:
    - Find and select the row where **User ID** shows the account that you use to sign in to the device.
    - If the relevant user account isn't listed, select **New** on the Action Pane and then select the relevant **User ID** for the new row.
3. For your new or selected row, set **Maximum session length (hours)** to the desired number of hours, up to 2,160 hours (90 days).
4. On the Action Pane, select **Save**.

Set up worker accounts to use the production floor execution interface

09/19/2025

This article explains how to set up worker accounts so workers can sign in and use the production floor execution interface.

Choose sign-in requirements

Workers start work by signing in to the production floor execution interface. You can require workers to identify themselves with either their personnel number or badge number, and you can also require a password.

To choose your sign-in requirements, follow these steps:

1. Go to **Time and attendance** > **Setup** > **Time and attendance parameters**.
2. On the **General** tab, make the following settings:

    - **Use password** – If you want to require a password, set this option to *Yes*. Set it to *No* if you want to allow workers to sign in using only their badge ID or personnel number. If you choose to require a password, you must assign one to each worker account as described later in this article.
    - **Use badge ID** – Set this option to *Yes* to require users to sign in with their badge ID. Set it to *No* to require users to sign in with their personnel number. All worker accounts automatically have a unique personnel number. If you choose to require a badge ID, you must assign one to each worker account as described later in this article.

3. On the Action Pane, select **Save**.

Set up a worker account

Workers sign in with credentials linked to their worker account. You can also set each worker account to prevent or allow the worker to change the filter settings on any device they use.

To set up a worker account, follow these steps:

1. Go to **Human resources** > **Workers** > **Workers**.

2. Find and open the account you want to set up or select **New** on the Action Pane to create a new worker account.

3. Open the **Time registration** tab.

4. Find the **Activate on registration terminals** button on the **Time registration** FastTab toolbar.

    - If the button is grayed out, the worker is already set up as a *time registered worker*, so you can skip this step.
    - If the button is available, select it to open the **Create time registration worker** dialog. Make all of the required settings and select **OK**. The worker is now set up as a *time registered worker*.

5. Make the following settings to enable the worker to sign in to the production floor execution interface and choose whether the worker can override default job filters:

    - **Identification** – If you set up your system to require a password when signing in to the production floor execution interface, enter a password for the current worker here.
    - **Badge ID** – If you set up your system to require a badge ID when signing in to the production floor execution interface, enter a badge ID for the current worker here.
    - **Set filters** – To allow a worker to override the default job filters that you set up for a device, set this option to *Yes*. For more information about this option, see Set up a device to run the production floor execution interface.

    > ⓘ **Note**
    >
    > Each worker's personnel number is automatically assigned by the system and can't be changed. You can read each worker's personnel number next to their name on the details page, or in the **Personnel number** column on the list page. This is the ID that workers must use to sign in if you set up your system to require a personnel number instead of a badge ID.

6. Continue to set up the worker account as required. When you're done, select **Save** on the Action Pane.

Single worker configuration

You can configure a production floor execution interface device to be used by a single worker. This option removes the requirement (and ability) for the worker to sign in by using a badge ID or personnel number. Instead, the worker signs in to Microsoft Dynamics 365 Supply Chain Management by using a system user account that's linked to a *time registered worker*, and gets

signed in to the production floor execution interface as that worker at the same time. For details about how to set up this option, see Configure the production floor execution interface.

Style the production floor execution interface

08/13/2025

The article explains how to configure form controls so that the default production floor execution styles are applied to them.

Forms and dialogs

Styles can be applied to a form or dialog only if the following requirements are met:

- If the form should resemble the existing report progress form, the name of your form or dialog must start with `JmgProductionFloorExecutionCustomInputDialog`.
- The form or dialog can contain a detail form part. To apply styles to it, the name of the detail form part must start with `JmgProductionFloorExecutionCustomDetailsDialog`.
- If the form or dialog should have a simple view, then the name of the simple view must start with `JmgProductionFloorExecutionCustomDialog`. Examples of forms that have a simple view include the start form and the indirect activity form.
- All the controls in the dialog must be configured as described in this article.

> **Important**
>
> The features mentioned in the first two bullet points of this list require Supply Chain Management version 10.0.19 or later.

Styles can be applied to the **OK** button in a dialog only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `OkButtonGroup`.

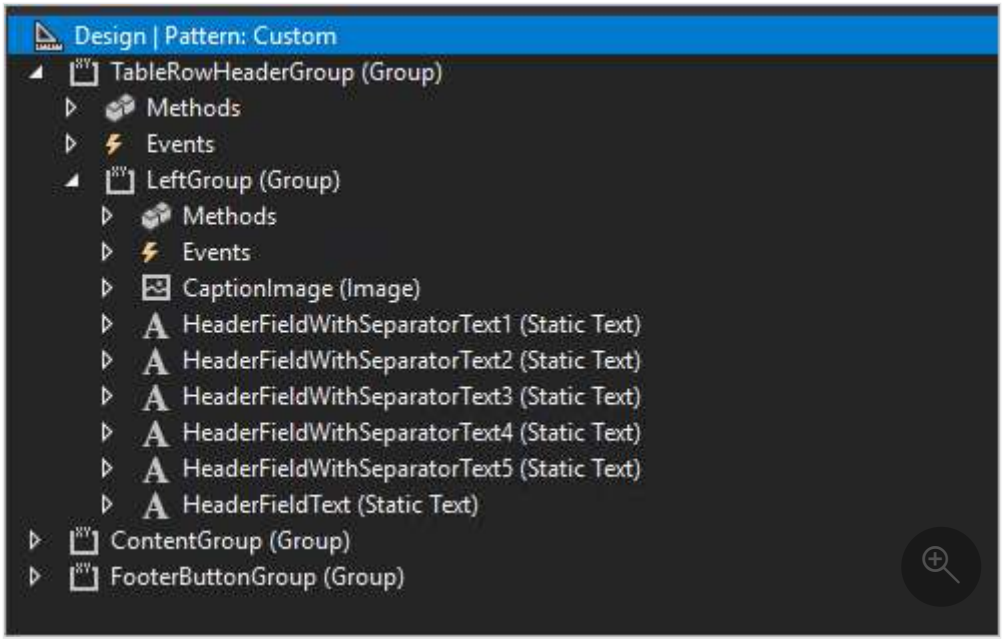
Styles can be applied to the **Cancel** button in a dialog box only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `CancelButtonGroup`.

Header

The following illustration shows a typical form or dialog header.

In Visual Studio, headers are created by using a structure such as the one that is shown in the following illustration.



To add text to your header, use code such as the following example.

X++

```
private void setCaption()
{
    HeaderFieldWithSeparatorText1.text("Report Progress");
    HeaderFieldWithSeparatorText2.text(ProdId);

    …

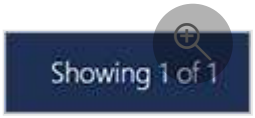
    HeaderFieldText.text(OprNum);
}
```

When you write your header code, apply the following rules:

- The name of main group must be `TableRowHeaderGroup`.
- Each block of text (separated by bullets) must start with `HeaderFieldWithSeparatorText`.
- The last text name must start with `HeaderFieldText`.
- `CaptionImage` can be skipped.

Progress indicator

You can include a progress indicator, which is shown to the right of the header. The following illustration shows a progress indicator.



To show the progress indicator, the text field must be named `ShowProgress`.

Grid

Styles are automatically applied. No specific configuration is required.

The grid should have a `TabularView` style, and the `run()` method on the custom form must be overwritten, because a new grid isn't yet supported. Add the following code.

```
X++
```

```
public void run()
{
    super();
    // To opt out a page from the new grid
    this.forceLegacyGrid();
}
```

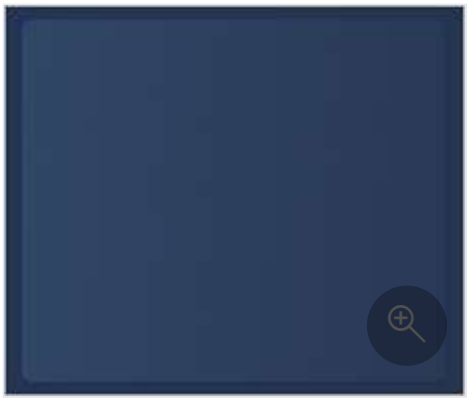
To refresh data in a main view, you might want to use something like `this.parmParentForm().updateLayout();` in a `click` method of your action. (For an example, look at the `JmgProductionFloorExecutionReportFeedbackAction` class.) Just make sure that `parmDataSource` is set in the `init` method of your new form (`formCaller.parmDataSource(this.dataSource(1));`). For an example, look at the `JmgProductionFloorExecutionMainGrid` form.

Card view

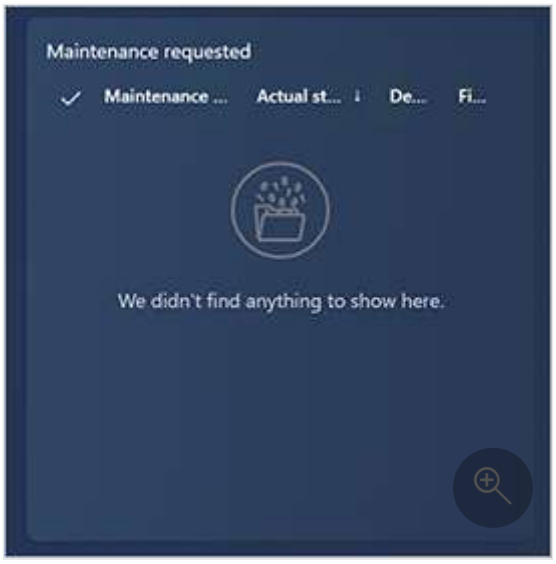
Styles can be applied to card view controls only if the following requirements are met:

- Each card view is contained in a form group.
- The group name starts with `CardGroup` (for example, `CardGroupJobsView`).

The following illustration shows a card view that has no controls inside it.



The following illustrations show card views that have controls inside them.



Business card

Styles can be applied to business card controls only if the following requirements are met:

- Each business card is contained in a form group.
- The group name starts with `BusinessCardGroup` (for example, `BusinessCardGroupJobsList`).

Set the following properties on the business card:

- **Style:** *list*
- **Extended style:** *cardList*
- **Multi Select:** *No*
- **Show Col Labels:** *No*

Radio button

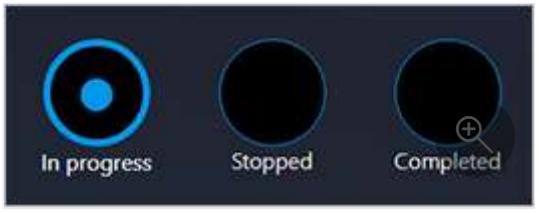
Styles can be applied to radio buttons only if the following requirements are met:

- Each radio button is contained in a form group.
- The group name starts with `RadioTextBelow` or `RadioTextRight`, depending on where you want the text to appear.

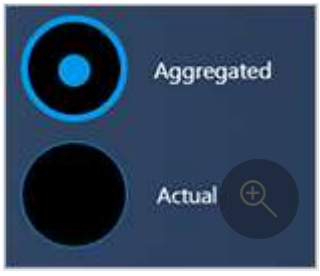
Set the following properties on the radio button:

- **Toggle button:** *Check*
- **Toggle value:** *On* if the radio button should be selected; otherwise, *Off*

The following illustration shows an example where the text appears below the radio buttons.



The following illustration shows an example where the text appears to the right of the radio buttons.



Radio buttons in Internet Explorer

Radio button styles aren't supported in Internet Explorer. The following illustration shows what radio buttons look like in Internet Explorer.

Buttons

Styles can be applied to buttons only if the following requirements are met:

- Each group of buttons is contained in a form group. All the buttons in the group will have the same style.
- There are no requirements about the name of the group.

Set the following properties on the buttons:

- **Button Display:** *TextWithImageLeft*
- **Normal Image:** This property can't be blank. For example, use *CoffeeScript*.
- **Text:** This property can't be blank. For example, use *Start Break*.
- **Width:** *Auto* or *SizeToContent*
- **Height:** *Auto* or *SizeToContent*

Primary button

Styles can be applied to a primary button only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `DefaultButtonGroup` or `PrimaryButtonGroup` (for example, `DefaultButtonGroup10`).

Secondary button

Styles can be applied to a secondary button only if the following requirements are met:

- The button is contained in a form group.
- The group is named **Right panel**, or the group name starts with `SecondaryButtonGroup`.

Third-group button

Styles can be applied to a third-group button only if the following requirements are met:

- The button is contained in a form group.
- The group is named **Left panel**, or the group name starts with `ThirdButtonGroup`.

Fourth-group button

Styles can be applied to a fourth-group button only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `FourthButtonGroup`.

Set the following properties on the button:

- **Button Display:** *TextOnly*
- **Normal Image:** This property must be blank.
- **Text:** This property can't be blank. For example, use *View* or *Edit*.
- **Width:** *Auto*
- **Height:** *Auto*

Flat button

Styles can be applied to a flat button only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `FlatButtonGroup`.

Set the following properties on the button:

- **Button Display:** *ImageOnly*
- **Normal Image:** This property can't be blank. For example, use *CoffeeScript*.
- **Text:** This property must be blank.
- **Width:** *Auto* or *SizeToContent*
- **Height:** *Auto* or *SizeToContent*

Continue button

Styles can be applied to a continue button only if the following requirements are met:

- The button is contained in a form group.
- The group name starts with `ContinueButtonGroup`.

Set the following properties on the button:

- **Button Display:** *ImageOnly*
- **Normal Image:** *Forward*
- **Text:** This property must be blank.
- **Width:** *Auto* or *SizeToContent*
- **Height:** *Auto* or *SizeToContent*

Combo box

A combo box is a combination of three controls: an input control, a button that clears the input control, and a button that runs a search.

Styles can be applied to a combo box only if the following requirements are met:

- The combo box is contained in a form group.
- The group name starts with `Combobox`.
- Inside the group, the first control is an `AxFormStringControl` control. This control shows the current value, and it's where the user enters the required value.
- The second control is a `CommonButton` control, and its name starts with `ClearButton`. This button must contain code that uses the `enable` property to show or hide the button. For example, to show or hide the **Clear** button while the user is typing information in the input control, you can use the following code.

```
X++
```

```
public void textChange()
{
    super();
    ClearButtonSerial.enabled(this.text()? true : false);
}
```

You should have one method where the data is set in the input control. Enable the **Clear** button in that method. Here is an example.

X++

```
public void setSerialId(str _serialId)
{
    JmgTmpJobBundleProdFeedback.InventSerial = _serialId;
    ClearButtonSerial.enabled(_serialId? true : false);

    if (_serialId)
    {
        this.addSerialNumber();
    }
}
```

Use the following code for the `clicked` method of the **Clear** button.

X++

```
public void clicked()
{
    element.setSerialId('');
    InventSerialId.setFocus(); // set focus back to the input box
}
```

Set the value of the input control, `AxFormStringControl`, when the form is initialized by using the `init` method. If the value isn't blank, enable the **Clear** button. If the value is blank, disable the **Clear** button.

- The third control is a `CommonButton` control, and its name starts with `SearchButton`.

The following illustration shows two combo box controls. The combo box on the left has an empty text box, and the **Clear** button is disabled. The combo box on the right has text in the text box, and the **Clear** button is enabled.

Quick filter

The quick filter control adds a search field to the page. You can apply styles to a quick filter provided the following requirements are met:

- The quick filter is contained in a form group.
- The group name starts with `SearchInputGroup`.
- Inside the group, the first control is a `QuickFilter` control. (This control is where the user enters the search string.)
- The second control is a `FormStaticTextControl` that is named `NumberOfResults`. (This control is optional. If it's included, it shows the number of found items.)
- The third control is a `CommonButton` control, and its name starts with `ClearButton`.

The following illustration shows two quick filter controls. The quick filter on the left has an empty quick filter, and the number of results isn't visible. The quick filter on the right contains a search string and shows the number of results.

Center-align elements on a tab

To align elements in the center of a tab, the group name must start with `TabContentGroup`, and the group must have the following properties:

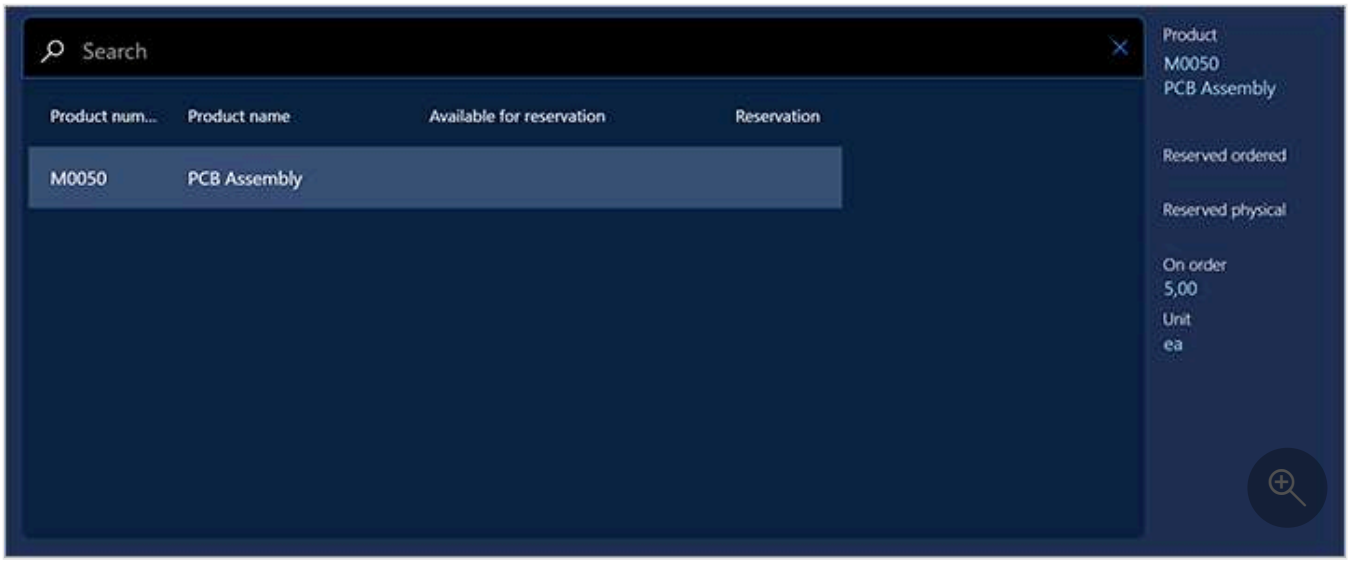
- **Width Mode:** `SizeToAvailable`
- **Height Mode:** `SizeToAvailable`

Align a grid, detail part, and quick filter

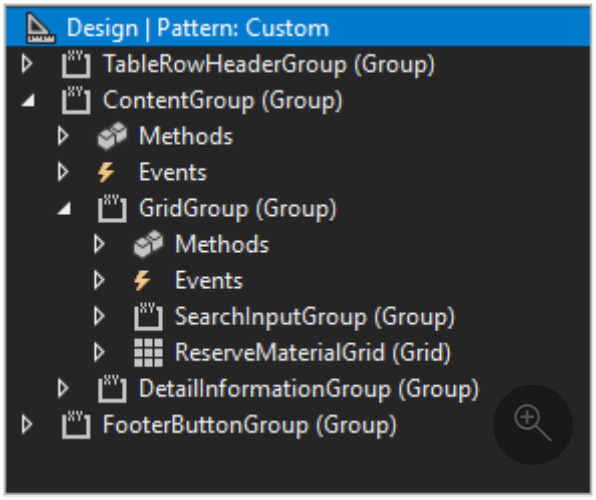
To arrange a customized grid, detail part, and quick filter so that they resemble the standard design, keep the following points in mind when you put them all together:

- If the grid has a quick filter, both the grid and the quick filter should be inside the group that has a name that starts with `GridGroup`.
- To apply styles to a detail part, the group name must start with `DetailInformationGroup`,

The following illustration shows a typical grid that includes a quick filter and a detail part on the right.



In Visual Studio, a grid, detail part, and quick filter can be created by using a structure such as the one that is shown in the following illustration.



Related information

Customize the production floor execution interface

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Developers can extend current forms or create their own forms and buttons for the production floor execution interface. After you've added the code for these new elements, admins or shop floor managers can easily add them to the interface by using the standard configuration controls.

For example, here are some of the possible solutions if new columns are needed in a main form:

- Extend the `JmgProductionFloorExecutionMainGrid` form, and add the desired fields.
- Create a new form, and add it as a new main view (tab).

Add a new button (action)

To add a new button (action), follow these steps to create a class that implements your custom action.

1. Create a new class that is named `<ExtensionPrefix>_JmgProductionFloorExecution<ActionName>Action`, where:
    - `<ExtensionPrefix>` uniquely identifies your solution, typically by using your company name.
    - `<ActionName>` is a unique name for the class. It typically identifies the kind of action.
2. The new class must extend the `JmgProductionFloorExecutionAction` class.
3. Override all necessary methods.

For examples, look at the code for the following classes:

- `JmgProductionFloorExecutionBreakAction` – A class for a simple action that doesn't need any records.

- `JmgProductionFloorExecutionReportFeedbackAction` – A class that provides more complex functionality.

When you've finished, the new button (action) will automatically be listed on the **Design tabs** page in Microsoft Dynamics 365 Supply Chain Management. There, you (or an admin or floor manager) can easily add it to the primary or secondary toolbar, just as you can add the standard buttons. For instructions, see Design the production floor execution interface.

Add a new main view

1. Create a new form that has the desired elements and functionality. This is a new form, not an extension. Name the form `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>`, where:

    - `<ExtensionPrefix>` uniquely identifies your solution, typically by using your company name.
    - `<FormName>` is a unique name for the form.

2. Create a menu item that is named `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>`.

3. Create an extension that is named `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>_Extension`, where the `getMainMenuItemsList` method is extended by adding the new menu item to the list. The following code shows an example.

    X++

    ```
    [ExtensionOf(classStr(JmgProductionFloorExecutionMenuItemProvider))]
    public final class
    <ExtensionPrefix>_JmgProductionFloorExecutionForm<FormName>_Extension{
        static public List getMainMenuItemsList()
        {
            List menuItemList = next getMainMenuItemsList();

    menuItemList.addEnd(menuItemDisplayStr(<ExtensionPrefix>_JmgProductionFloorExec
    utionForm<FormName>));
            return menuItemList;
        }
    ```

When you've finished, the new main view will automatically be listed in the **Main view** combo box on the **Design tabs** page in Supply Chain Management. There, you (or an admin or floor manager) can easily add it to new or existing tabs, just as you can add the standard main views. For instructions, see Design the production floor execution interface.

Add a details view

1. Create a new form that has the desired elements and functionality. This is a new form, not an extension. Name the form `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>Detail`, where:

    - `<ExtensionPrefix>` uniquely identifies your solution, typically by using your company name.
    - `<FormName>` is a unique name for the form.

2. Create a menu item that is named `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>Detail`.

3. Create an extension that is named `<ExtensionPrefix>_JmgProductionFloorExecution<FormName>_Extension`, where the `getDetailsMenuItemList` method is extended by adding the new menu item to the list.

When you've finished, the new details view will automatically be listed in the **Details view** combo box on the **Design tabs** page in Supply Chain Management. There, you (or an admin or floor manager) can easily add it to new or existing tabs, just as you can add the standard details views. For instructions, see Design the production floor execution interface.

Add a numeric keypad to a form or dialog

The following example shows how to add numeric keypads to a form.

1. The number of numeric keypad controllers that each form contains must equal the number of numeric keypads in that form.

    X++

    ```
    private JmgProductionFloorExecutionNumpadController   numpadController1;
    private JmgProductionFloorExecutionNumpadController   numpadController2;
    private JmgProductionFloorExecutionNumpadController   numpadController3;
    ```

2. Set up the behavior of each numeric keypad controller, and connect each numeric keypad controller to a numeric keypad form part.

    X++

    ```
    /// <summary>
    /// Initializes all numpad controllers, defines their behavior and connects
    them with numpad form parts.
    /// </summary>
    ```

```
public void initializeNumpadController()
{
    numpadController1 = new JmgProductionFloorExecutionNumpadController();
    numpadController1.getValueFromNumpadDelegate +=
eventhandler(this.setQuanityValueFromNumpad_1);
    QuantityNumpad1.getPartFormRun().setNumpadController(numpadController1);

    numpadController2 = new JmgProductionFloorExecutionNumpadController();
    numpadController2.parmNumpadEnabled(false);
    numpadController2.parmNumpadValue(333.56);
    numpadController2.getValueFromNumpadDelegate +=
eventhandler(this.setQuanityValueFromNumpad_2);
    QuantityNumpad2.getPartFormRun().setNumpadController(numpadController2);
}
```

Use a numeric keypad as a pop-up dialog

The following example shows one way to set up a numeric keypad controller for a pop-up dialog.

X++

```
private void setupNumpadController()
{
    numpadController = new JmgProductionFloorExecutionNumpadController();
    numpadController.parmShouldNumpadShowOkCancelButtons(true);
    numpadController.setNumpadValueToParentFormDelegate +=
eventhandler(this.setQtyValueFromNumpad);
}
```

The following example shows one way to call the numeric keypad pop-up dialog.

X++

```
Args args = new Args();
args.name(formstr(JmgProductionFloorExecutionNumpad));
args.menuItemName(menuItemDisplayStr(JmgProductionFloorExecutionNumpad));
args.caller(element);
Object formRun = classfactory.formRunClass(args);
formRun.init();
formRun.setNumpadController(numpadController);
numpadController.setValueToNumpad(333.56);
formRun.run();
```

Add a date and time controls to a form or dialog

This section shows how to add date and time controls to a form or dialog. The touch-friendly date and time controls enable workers to specify dates and times. The following screenshots

show how the controls typically appear on the page. The time control provides both 12-hour and 24-hour versions; the version shown will follow the preference set for the user account under which the interface is running.

The following procedure shows an example of how to add date and time controls to a form.

1. To add date and time controls, add a standard form part to the form. In the initialize method of the form part, set the target name to `JmgProductionFloorExecutionDateControl` for the date control or `JmgProductionFloorExecutionTimeControl` for the time control.

   X++

   ```
   public void initialize()
   {
       super();

   this.targetName(menuItemDisplayStr(JmgProductionFloorExecutionDateControl));
   }
   ```

   X++

   ```
   public void initialize()
   {
       super();

   this.targetName(menuItemDisplayStr(JmgProductionFloorExecutionTimeControl));
   }
   ```

2. Add a controller to the form for each date and time control that the form should contain. (The number of controllers must equal the number of date and time controls in the form.)

```
X++
private JmgProductionFloorExecutionDateTimeController  dateFromController;
private JmgProductionFloorExecutionDateTimeController  dateToController;
private JmgProductionFloorExecutionDateTimeController  timeFromController;
private JmgProductionFloorExecutionDateTimeController  timeToController;
```

3. Declare the required variables (of type `utcdatetime`).

```
X++
private utcdatetime fromDateTime;
private utcdatetime toDateTime;
```

4. Create methods where the datetime will be updated by the datetime controllers. The following example shows one such method.

```
X++
private void setFromDateTime(utcdatetime _value)
    {
        fromDateTime = _value;
    }
```

5. Set up the behavior of each datetime controller and connect each controller to a form part. The following example shows how to set up data for date-from and time-from controls. You could add similar code for date-to and time-to controls (not shown).

```
X++
/// <summary>
/// Initializes all date and time controllers, defines their behavior, and
connects them with the form parts.
/// </summary>
private void initializeDateControlControllers()
{
    dateFromController = new JmgProductionFloorExecutionDateTimeController();
    dateFromController.setDateControlValueToCallerFormDelegate +=
eventhandler(this.setFromDateTime);
    dateFromController.parmDateTimeValue(fromDateTime);

    timeFromController = new JmgProductionFloorExecutionDateTimeController();
    timeFromController.setDateControlValueToCallerFormDelegate +=
eventhandler(this.setFromDateTime);
    timeFromController.parmDateTimeValue(fromDateTime);
```

```
DateFromFormPart.getPartFormRun().setDateControlController(dateFromController,
timeFromController);

TimeFromFormPart.getPartFormRun().setTimeControlController(timeFromController,
dateFromController);

    ...

}
```

If all you need is a date control, you can skip the time control setup and instead just set up the date control as shown in the following example:

X++

```
{
    dateFromController = new JmgProductionFloorExecutionDateTimeController();
    dateFromController.setDateControlValueToCallerFormDelegate +=
eventhandler(this.setFromDateTime);
    dateFromController.parmDateTimeValue(fromDateTime);

DateFromFormPart.getPartFormRun().setDateControlController(dateFromController,
null);
}
```

6. Remember to unsubscribe from events when the form is closed.

X++

```
public void close()
{
   DateFromFormPart.getPartFormRun().close();
   TimeFromFormPart.getPartFormRun().close();

   dateFromController.setDateControlValueToCallerFormDelegate -=
eventhandler(this.setFromDateTime);
   timeFromController.setDateControlValueToCallerFormDelegate -=
eventhandler(this.setFromDateTime);

   super();
}
```

Execute a query on the main form

If you need to run a query to refresh or update the data on the main form after a specific action, use the following approach:

X++

```
parentForm.parmChangeEvent().raiseEvent();
```

Where `parentForm` is `JmgProductionFloorExecution` form.

Rebate management module overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can use the **Rebate management** module to create contracts, deals, or agreements between your business and its customers or vendors, so that you can calculate rebates, deductions, and royalties. Rebate management tracks and maintains rebate and deduction transactions in a central location where users can effectively create, review, and process them.

Rebate management supports the creation, maintenance, and processing of *rebates*. A rebate is the return of part of the purchase price by a seller or a buyer. Rebates are typically based on the purchase of a specific quantity or value of goods during a specific period. Unlike discounts, rebates are done after the purchase amount is fully invoiced.

Rebate management also supports *deductions*. A deduction is compensation, a consideration, or a fee that is paid either for a license or the privilege to use intellectual property such as a brand, copyright, or patent, or for the privilege to use a natural resource for a purpose such as for fishing, hunting, or mining. Deductions are usually calculated as a percentage of the revenue or profit from realized use. The more the intellectual property or natural resource is used, the greater the deduction that is realized.

Additionally, Rebate management supports customer *royalties*. Royalties are payments that one party makes to the licensee or franchisee for the right to use an asset.

Rebate management lets you define posting profiles for provisions, rebates, and write-offs. Furthermore, the postings can be defined for a specific customer or vendor. In this way, deals that don't apply to all customer or vendor scenarios can be tracked via postings.

Rebate transactions are automatically generated, based on the calculation method that is selected and scheduled in batch jobs. Additionally, you can set up workflows to manage, review, and approve agreements.

Basis calculation

Customer rebates, customer royalties, and vendor rebates can all use a different basis, depending on your business requirements:

- Customer rebates can be based on sales orders, delivery notes, or invoices.
- Customer royalties can be based on sales orders, delivery notes, or paid invoices.
- Vendor rebates can be based on either purchase orders or sales orders. They can be calculated based on products that are purchased from the rebate vendor and sold to customers via sales invoices.

Flexible calculations

Rebate calculation periods are available for both customer deals and vendor deals. A calculation period defines the length of the deal, the calculation frequency, and the calculation period. The rebates can be accrued based on the sales order quantities or amounts for qualified products during the rebate period.

For each agreement calculation, any of the following periods can be set:

- Invoice
- Day
- Week
- Month
- Quarter
- Year
- Customized period
- Any multiple of any of the previously listed periods

The calculation can be applied to individual customers and products, groups of customers and products, or all customers and products. Rebates that have multiple detail lines can have different qualifying date ranges. The provision and claim periods can differ. For example, provisions can be processed every day, whereas claims are processed once per month.

Rebates can be configured based on many different parameters. For example, they can be configured as a percentage, a rate, or a fixed amount. There are four main calculation methods:

- Stepped
- Cumulative
- Rolling
- Total value

Rebate calculation results can also be reduced by other rebates, depending on whether the rebate is set up to calculate based on the net amount.

On the vendor side, rebates that are based on sales orders can calculate the price based on a first in, first out (FIFO) rule, the latest purchase price, the average purchase price, or the sales price.

Rebate target transactions

The outputs that the rebate deal or agreement generates can be financials or items.

Financial outputs are determined by the payment type that is assigned to the agreement from the posting profile. These outputs can include customer deduction journals, free text invoices, and vendor invoices. For auditing purposes, financial rebate target transactions include a reference to the originating rebate agreement.

Item outputs create a free item sales order for customer rebates and a purchase order for vendor rebates. Item rebate target transactions contain options to determine which rebate reference should be entered on the free item sales order or purchase order.

Accurate rebate calculations

The combination of the associated deals, the frequency of the calculations, the calculation basis, and the calculation method that is selected determines the accuracy and precision of rebate calculations. Rebate provisions can be used to accrue posted and claimed values.

Provisions can be managed daily, weekly, monthly, or according to a custom period. However, the functionality can allocate or pay the rebate, or receive payment of it, at any defined frequency that is the same length as or longer than the provision frequency. Write-off uses the same frequency as the rebate. Users can easily adjust a plan or payment amounts at any time during the payout.

Users no longer have to handle deals or provisions in two steps. Provisions and write-offs are posted directly to the ledger. Additionally, credit notes can be created automatically. Therefore, there's full integration with accounts payable and accounts receivable. During processing, the calculations can consider settlement discounts, paid invoices, trade discounts, and existing credit notes to ensure that amounts and values are accurately calculated.

When rebates are calculated, the process creates transactions that can be reviewed before posting occurs. A separate process posts rebate management transactions. A journal, credit note, or debit transaction can then be created during posting to proposed transactions. Reporting statements and transaction listings can be obtained to ensure compliance, effectiveness, and transparency.

Guaranteed royalty payments

In Rebate management, automatic payment generation enables royalties to be handled quickly and easily, even when guaranteed minimums apply.

Maximizing spend versus rebates

Vendors and products can be grouped by territory, and different offers can be provided, depending on the country/region of the transaction. When users select products, they can define the items that are included and the number of items that will be used in the rebate settlement.

Next steps

- Rebate management deals
- Process, review, and post rebates
- Manage deductions using the deduction workbench

Rebate management parameters

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The **Rebate management parameters** page is used to define settings that apply across the **Rebate management** module. These settings affect posting, status updates, number sequences, and other behavior. The setup on this page is shared across legal entities and can be modified by users who have the appropriate security permissions.

To open the **Rebate management parameters** page, go to **Rebate management** > **Setup** > **Rebate management parameters**. Then set the fields as described in the following subsections.

Rebate management tab

The following table describes the fields that are available on the **Rebate management** tab of the **Rebate management parameters** page.

Expand table

Field	Description
Default status	Select the default status for all new deals. To define the set of status values that is available for selection, use the **Rebate statuses** page.
Process by dimension	Select whether provision, rebate, and write-off transactions should be processed by financial dimension. When this option is turned on, the system uses financial dimensions from the source transactions in the target transactions.
Check if previously posted	Select the system behavior if unposted rebate transactions are processed more than once for the same period: • **Warning** – The system allows users to override the original transactions lines, but a warning is shown. • **Error** – The system prevents users from overriding the original transactions lines, and an error message is shown.
Automatically post journals	Select whether the system should automatically post proposed journals. Those journals include daily journals that are used for provisions and customer deductions, and also vendor tax invoice journals.

Field	Description
Automatically post free text invoices	Select whether the system should automatically post free text invoices. This option applies only to free text invoices where the payment type is set to *Tax invoice customer deductions*.
Rebate item order reference	Select the rebate reference to use on sales orders and purchase orders that are generated from the rebate process (*None*, *Rebate management deal*, *Rebate management number*, *Rebate transaction number*, or *Document notes*).
Use claim process	Set this option to *Yes* to use a claims process. In this way, you can mark transactions that Rebate management creates as either claimed or unclaimed, and then post only the claimed transactions. For example, you calculate rebates for a month's worth of transactions, but the customer has left two days unclaimed. In this case, the unclaimed transactions will be re-created the next time that you run the *Process* function for the next period. If you set this option to *No*, all claim transactions are posted.
Include order type journal	For deals or deal lines where the transaction type is set to *Order*, this option controls whether a sales order of the *Journal* type should be included. It provides flexibility if those types of orders are used in scenarios where a rebate shouldn't yet apply.

Number sequences tab

Use the **Number sequences** tab on the **Rebate management parameters** page to assign number sequence codes to the different number sequences that Rebate management uses. The following table describes the purpose of each of those number sequences. For more information about number sequences, see Number sequences overview and its related articles.

Expand table

Reference	Description
Rebate management deal	The number sequence assigns a unique key value to each rebate deal. This key is used when deals are created.
Rebate management number	The number sequence assigns a unique key value to each rebate. This key is used to identify rebate relationships.
Rebate transaction number	The number sequence assigns a unique key value to each rebate transaction. This key is used to identify rebate transactions.
Tax Invoice	The number sequence assigns a unique key value to each rebate invoice. This key is used when rebate journals are automatically posted.

Feature visibility tab

Rebate management adds features (fields and functions) to several frequently used pages in Microsoft Dynamics 365 Supply Chain Management. Those pages include pages that are related to sales orders and sales deals. If you're using Rebate management, you must make those features visible everywhere before you can benefit from them. If you aren't using Rebate management, you can hide the features to keep them out of the way.

On the **Feature visibility** tab of the **Rebate management parameters** page, set the **Activate** option to *Yes* to make Rebate management features visible wherever they're available. Set it to *No* to hide the features on common pages outside the **Rebate management** module. However, even when the option is set to *No*, the module itself, including the **Rebate management parameters** page, will remain available to users who have the appropriate permissions to access it.

Last updated on 08/05/2025

Rebate management deal workflows

To approve rebate deals, Rebate management uses the same workflow platform as other finance and operations apps. Two job processes are associated with every workflow:

- One element of the workflow approves the deal.
- One element of the workflow activates the deal so that the user or workflow process can approve the transactions.

Before you can use a rebate deal, it must be active in the **Rebate management** module. To activate a deal, you must first create and configure a *Rebate management deal workflow*.

Users can't manually approve deals. The workflow must always be used.

Create and manage Rebate management deal workflows

To work with your Rebate management deal workflows, go to **Rebate management** > **Setup** > **Rebate management workflows**. There, you can view, create, and update workflows as required. Only one workflow of this type can be active at a time. For more information about workflows, how to work with the **Rebate management workflows** page, and how to create workflows, see Workflow system overview and its related articles.

Use a workflow to activate a deal

To activate a deal through a workflow, open the deal (for example, on the **All rebate management deals** page). Then, on the Action Pane, select **Workflow** > **Submit**. After the new deal has been processed and approved through the workflow, it will be active and ready to use.

After a deal has been activated, you can't change most of its setup. If you must change an active deal, first deactivate it, and then create a new deal. If the new deal should resemble the old deal, you can create it by copying the old deal.

You can change the following settings for a deal after it has been activated:

- Reconcile by
- Cumulative guarantee
- Posting profile

- Posting profile for guarantee
- Document notes
- Currency
- From date
- To date

In addition, rebate lines can be removed.

Resubmit a workflow

Sometimes, you might have to resubmit a workflow for a deal because of missing or incorrect data, an activated or updated rebate deal, modified rebate rules, or an extension of the original rebate period. To resubmit a workflow, you must first deactivate the active deal, then edit it as required, and finally reactivate it.

Prerequisites

Before you can deactivate and resubmit workflows for vendor rebate deals, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.43 or later.
- The feature named *Enable resubmission of workflows for vendor rebate deals* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

Deactivate and resubmit a workflow

To deactivate and resubmit a workflow for a vendor rebate deal, follow these steps:

1. Go to **Rebate management** > **Rebate management deals** > **All rebate management deals**.
2. Find and select the deal that you want to deactivate, edit, and resubmit. The deal must already be active.
3. On the Action Pane, on the **Rebate management deals** tab, select **Deactivate**.
4. Edit the deal as required. Here are some examples of changes that you might make:
    - Change the due date for one or more deal lines.
    - Add one or more new deal lines.

- Add a new rebate period for an existing deal line.

5. After you finish editing the deal, on the Action Pane, select **Workflow** > **Submit**.

The resubmission works for both customer rebates and vendor rebates.

Rebate reduction principles

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can group Rebate management deals into *reduction principles* to reduce other provisions that are associated with an item, and/or to reduce the resulting values of rebate calculations. After the rebate reduction principles are set up, you can optionally assign them, as required, to the lines of your Rebate management deals.

The rebate reduction principle rules apply only when rebate deals overlap. Therefore, they might grant multiple rebates in situations where multiple rebates aren't owed.

Manage rebate reduction principles

To work with rebate reduction principles, go to **Rebate management** > **Setup** > **Rebate reduction principles**. Then use the buttons on the Action Pane to add and remove reduction principles as required. For each principle, set the fields as described in the following table.

Expand table

Field	Description
Rebate reduction principle	Enter a unique name for the rebate reduction principle.
Description	Enter a description of the rebate reduction principle.
Apply reduction	Select this check box to apply a reduction basis to rebates that belong to this rebate reduction principle.
Reduction basis	If you selected the **Apply reduction** check box, select the reduction basis (*Provision*, *Rebates*, or *Both*). If you select *Both*, and if both a provision and a rebate have been posted for a previous deal, only the rebate is applied.
Exclude from reduction	If this check box is selected, provisions and rebates that belong to this rebate reduction principle are excluded from subsequent reductions. The setting of the **Reduction basis** field doesn't apply to this setting.

Examples of rebate reduction principle setups

The following table shows some typical examples of rebate reduction principle setups. For each of these rebate reduction principles, the value of the **Description** field describes the purpose of the rebate reduction principle.

Expand table

Rebate reduction principle	Description	Apply reduction	Reduction basis	Exclude from reduction
Deferred	Reduce rebate	Yes	Both	No
Exclreb	Exclude rebate	Yes	Rebate	Yes
Multiple	Multiple rebates	Yes	Both	Yes
None	Prov and Rebate only	No	Both	Yes
Provision	Provision only	Yes	Provision	No
Rebate	Rebate only	Yes	Rebate	Yes

Examples of rebate reduction principle calculations

You have a sales order that has a single sales order line. This line has a value of $1,000. The following deals apply to the order:

- **Deal 1:** 10 percent on $1,000
- **Deal 2:** 15 percent on $1,000
- **Deal 3:** 20 percent on $1,000
- **Deal 4:** 25 percent on $1,000

The order of processing is very important. The processing order is based on the way that you work, as described in Process, review, and post rebates.

For example, the following table summarizes the result if you use the order *1, 2, 3, 4*, and if you process only the provisions.

Expand table

Deal	Description and settings	Provision result
1	The classification doesn't check other deals for reductions. The check is done for both provisions and rebates.	$1,000 × 10% = $100

Deal	Description and settings	Provision result
	• **Apply reduction:** *No* • **Reduction basis:** *Both* • **Exclude from reduction:** *No*	
2	The classification checks other deals for reductions but is flagged so that it itself is ignored. The check is done only for rebates. • **Apply reduction:** *Yes* • **Reduction basis:** *Rebate* • **Exclude from reduction:** *Yes*	$1,000 × 15% = $150
3	The classification checks other deals for reductions. The check is done for both provisions and rebates. • **Apply reduction:** *Yes* • **Reduction basis:** *Both* • **Exclude from reduction:** *No*	($1,000 – Deal 1) × 20% = $180
4	The classification checks other deals for reductions. The check is done for both provisions and rebates. • **Apply reduction:** *Yes* • **Reduction basis:** *Both* • **Exclude from reduction:** *No*	($1,000 – Deal 1 – Deal 3) × 25% = $180

The following table shows some examples where the provision is processed in different orders, and where different totals are therefore achieved. The variance in the provisions depends on the order that the system processes the deals in. It's important that you understand how the order of processing affects the final rebate amount.

Expand table

Sequence	Calculation
1 (1, 2, 3, 4)	• **Deal 1:** $1,000 × 10% = $100 • **Deal 2:** $1,000 × 15% = $150 • **Deal 3:** ($1,000 – Deal 1) × 20% = $180 • **Deal 4:** ($1,000 – Deal 1 – Deal 2) × 25% = $180 • **Total provision:** $610
2 (4, 3, 2, 1)	• **Deal 4:** $1,000 x 25% = $250 • **Deal 3:** ($1,000 – Deal 4) × 20% = $150 • **Deal 2:** $1,000 x 15% = $150

Sequence	Calculation
	• **Deal 1:** $1,000 x 10% = $100 • **Total provision:** $650
3 (3, 2, 1, 4)	• **Deal 3:** $1,000 x 20% = $200 • **Deal 2:** $1,000 x 15% = $150 • **Deal 1:** $1,000 x 10% = $100 • **Deal 4:** ($1,000 – Deal 3 – Deal 1) × 25% = $175 • **Total provision:** $625
4 (2, 4, 1, 3)	• **Deal 2:** $1,000 × 15% = $150 • **Deal 4:** $1,000 × 25% = $250 • **Deal 1:** $1,000 × 10% = $100 • **Deal 3:** ($1,000 – Deal 4 – Deal 1) × 20% = $130 • **Total provision:** $630

Last updated on 08/05/2025

Rebate statuses

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Rebate statuses help you to track the status of each Rebate management deal. You can also use them for reporting and inquiry purposes. You can set up and name as many rebate status values as you require to support your business process.

To set up rebate statuses, go to **Rebate management** > **Setup** > **Status** > **Status**. Then use the buttons on the Action Pane to add and remove status values as required. For each status, set the following fields:

- **Rebate status** – Enter a name for the status (such as *Negotiating*, *Agreed*, or *Completed*).
- **Description** – Enter a description of the status to provide more information about how it should be used.

On the **Rebate management parameters** page, you can select a default status. That status is then assigned to all new Rebate management deals that are created.

Last updated on 08/05/2025

Rebate management groups

07/21/2025

Rebate management calculations can be driven by groups. Rebate management groups can be created for customers, vendors, and items. They can be attached to a master record.

Rebate management customer groups

The calculation for a group of customers is often created for a chain of companies, such as a supermarket chain or a franchise company. This type of calculation is usually related to a rebate.

A deduction is often calculated without considering who the qualifying order was sold to. However, there are exceptions. For example, a licensee might create a deduction scheme where customer group A receives 4 percent, but customer group B receives only 3 percent.

Set up customer groups

To work with Rebate management customer groups, go to **Rebate management** > **Rebate management groups setup** > **Customer groups**. You can use the buttons on the Action Pane to add and remove groups as required. For each group, set the following fields:

- **Rebate management group** – Enter a unique name for the group.
- **Description** – Enter a description of the group to provide more information about how it should be used.

Manage customer group assignments

Each customer can belong to any number of Rebate management groups. To view and assign group members, you can start from either the group list or the customer list.

To view, add, or remove customers for a selected group, follow these steps.

1. Go to **Rebate management** > **Rebate management groups setup** > **Customer groups**.
2. Select the group to manage.
3. On the Action Pane, select **Customers**. The **Rebate management groups** page appears and shows a list of customers that are already members of the selected group.
4. To add a new customer to the group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:

- **Customer account** – Select the customer account ID.

5. To remove a customer from the group, select the customer, and then select **Delete** on the Action Pane.

To view, add, or remove group assignments for a selected customer, follow these steps.

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select the customer to work with.
3. On the Action Pane, on the **Customer** tab, in the **Rebate management** group, select **Rebate management groups**. The **Rebate management groups** page appears and shows a list of groups that the selected customer already belongs to.
4. To add the customer to a new group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:

    - **Rebate management group** – Select the group to add the customer to.

5. To remove a customer from a group, select the group, and then select **Delete** on the Action Pane.

Rebate management vendor groups

The calculation for a group of vendors is often created for a group of delivery points. This type of calculation is usually related to a rebate.

Set up vendor groups

To work with Rebate management vendor groups, go to **Rebate management** > **Rebate management groups setup** > **Vendor groups**. You can use the buttons on the Action Pane to add and remove groups as required. For each group, set the following fields:

- **Rebate management group** – Enter a unique name for the group.
- **Description** – Enter a description of the group to provide more information about how it should be used.

Manage vendor group assignments

Each vendor can belong to any number of Rebate management groups. To view and assign group members, you can start from either the group list or the vendor list.

To view, add, or remove vendors for a selected group, follow these steps.

1. Go to **Rebate management** > **Rebate management groups setup** > **Vendor groups**.
2. Select the group to manage.
3. On the Action Pane, select **Vendors**. The **Rebate management groups** page appears and shows a list of vendors that are already members of the selected group.
4. To add a new vendor to the group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:
    - **Vendor account** – Select the vendor account ID.
5. To remove a vendor from the group, select the vendor, and then select **Delete** on the Action Pane.

To view, add, or remove group assignments for a selected vendor, follow these steps.

1. Go to **Accounts payable** > **Vendors** > **All vendors**.
2. Select the vendor to work with.
3. On the Action Pane, on the **Vendor** tab, in the **Rebate management** group, select **Rebate management groups**. The **Rebate management groups** page appears and shows a list of groups that the selected vendor already belongs to.
4. To add the vendor to a new group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:
    - **Rebate management group** – Select the group to add the vendor to.
5. To remove a vendor from a group, select the group, and then select **Delete** on the Action Pane.

Item rebate groups

By grouping items, you have more flexibility when rebates and deductions are calculated. This approach is often a more efficient way to set up rebates and deductions for customers and vendors.

Set up item groups

To work with Rebate management item groups, go to **Rebate management** > **Rebate management groups setup** > **Item groups**. You can use the buttons on the Action Pane to add and remove groups as required. For each group, set the following fields:

- **Rebate management group** – Enter a unique name for the group.
- **Description** – Enter a description of the group to provide more information about how it should be used.

Manage item group assignments

Each item can belong to any number of Rebate management groups. To view and assign group members, you can start from either the group list or the item list. You can also add items based on your category hierarchy.

To view, add, or remove items for a selected group, follow these steps.

1. Go to **Rebate management** > **Rebate management groups setup** > **Item groups**.
2. Select the group to manage.
3. On the Action Pane, select **Items**. The **Rebate management groups** page appears and shows a list of items that are already members of the selected group.
4. To add a new item to the group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:
    - **Item account** – Select the item account ID.
5. To remove an item from the group, select the item, and then select **Delete** on the Action Pane.

To view, add, or remove group assignments for a selected item, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the item to work with.
3. On the Action Pane, on the **Product** tab, in the **Rebate management** group, select **Rebate management groups**. The **Rebate management groups** page appears and shows a list of groups that the selected item already belongs to.
4. To add the item to a new group, select **New** on the Action Pane to add a row to the grid. Then set the following field for the new row:
    - **Rebate management group** – Select the group to add the item to.
5. To remove an item from a group, select the group, and then select **Delete** on the Action Pane.

To add items to a group based on your category hierarchy, follow these steps.

1. Go to **Rebate management** > **Rebate management groups setup** > **Item groups**.
2. Select the group to manage.
3. On the Action Pane, select **Add items**.
4. In the **Add items** dialog box, in the **Category hierarchy** field, select a top-level category.
5. The item hierarchy is opened in the left pane. Select the hierarchy level that you're looking for.
6. Items from the selected hierarchy and hierarchy level are now listed in the right pane. Follow these steps to work with the pane:
    - Select the check box for each item that you want to add.
    - Select the check box on the grid header to select all the items that are listed.
    - Select the **Show selected** button to filter the grid so that it shows only the items that you've selected so far. Select the button again to return to the full list.
7. Select **OK** to apply your item selection to the selected group.

Rebate management posting setup

Rebate management posting profiles are used to determine posting entries for Rebate management calculation lines. When a posting profile is selected on the deal header, it applies to all deal lines.

This feature works across companies (legal entities). You can specify the company that provisions will be accrued to and that claims will be paid by. You can also set different provision debit accounts and write-off credit accounts per source posting company.

To set up Rebate management posting profiles for customers and vendors, go to **Rebate management** > **Rebate management posting setup** > **Rebate management posting profiles**. The **Rebate management posting profiles** page includes a list pane that shows all your existing profiles. You can use the buttons on the Action Pane to add profiles to the list or remove them.

The remaining sections of this article describe how to use the available fields when you create or edit a profile.

Create a profile that sends rebates to the original transaction account

You can configure rebate management posting profiles to send rebates as output to the original transaction account from the related sales order or purchase order. Before you can use this capability, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.43 or later.
- The feature named *Enable posting of vendor rebate outputs to purchase order vendors* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default. As of version 10.0.49, it's mandatory and can't be turned off.

To set up this functionality, select the appropriate value in the **Use account source** field of your posting profile, as described later in this article.

Posting profile header

The following table describes the settings that are available in the header section of each Rebate management posting profile.

Expand table

Field	Description
Posting profile	Enter a unique name for the profile.
Description	Enter a description of the profile.
Module	Select the module that the rebates and royalties of the profile are associated with (*Customer* or *Vendor*).
Type	Select the profile type (*Rebate* or *Royalty*).
Payment type	This field determines the format of the posted rebate output. When the **Type** field is set to *Rebate*, the following values are available: • *Pay using accounts payable* – When you post a customer rebate, a vendor invoice for the remittance vendor that is set up on the rebate customer is created. When you post a vendor rebate, a vendor invoice for the rebate vendor account is created. • *Customer deductions* – When you post the rebate, a customer deduction journal for the rebate customer is created. • *Tax invoice customer deductions* – When you post the rebate, a free text invoice for the rebate customer is created. • *Trade spending* – When you post the rebate, a customer deduction journal for the rebate customer is created. • *Reporting* – When you post the rebate, a customer deduction journal for the rebate customer is created. When the **Type** field is set to *Royalty*, the following values are available: • *Pay using accounts payable* – When you post the rebate, a vendor invoice for the rebate vendor account is created. • *Reporting* – When you post the rebate, a vendor invoice for the rebate vendor account is created. Learn more in the Payment types section that follows.
Company	Select the company (legal entity) that provisions will be accrued to and that claims will be paid by.

Payment types

The following table summarizes how the various settings of the **Payment type** field affect where payments are posted. Payments can be posted to a customer account, vendor account, or remittance account, depending on the target transaction and the rebate type.

Expand table

Payment type	Target transaction type	Rebate type	Payment to (invoice account)
Pay using accounts payable	Vendor invoice journal	Customer rebate	Customer's remittance vendor account
Pay using accounts payable	Vendor invoice journal	Customer royalty	Vendor account
Pay using accounts payable	Vendor invoice journal	Vendor rebate	Vendor account
Customer deductions	Daily journal	Customer rebate	Customer account
Tax invoice customer deductions	Free text invoice	Customer rebate	Customer account
Trade spending	Daily journal	Customer rebate	Customer account
Reporting	Daily journal	Customer rebate	Customer account
Reporting	Vendor invoice journal	Customer royalty	Vendor account
Reporting	Vendor invoice journal	Vendor rebate	Vendor account

Note

Consider the following points when you set up Rebate management deals:

- For deals where the **Reconcile by** field is set to *Deal*, you can't use the dynamic deal account during posting. You must use a specified customer or vendor account.
- For deals where the **Reconcile by** field is set to *Line*, you can use a posting profile that offsets to a dynamic deal account on the deal line, because the customer or vendor is set per deal line.

Posting FastTab

The following table describes the fields that are available on the **Posting** FastTab of each Rebate management posting profile.

Expand table

Field	Description
Credit type	Select whether to credit a ledger account or a customer. If the **Payment type** field on the header is set to *Tax invoice customer deductions*, this field is set to *Ledger account*. For vendor rebates, this field is set to *Ledger account*.
Credit account	Select the account that credit amounts are posted to when rebate provisions are made. This account will also be used as an offset account when the rebate is posted to credit the customer or debit the vendor.
Name of journal (In the **Provision** section)	Select the name of the journal to use to record the posted provision.
Type	Select whether to post the rebate to a ledger account, or to a customer or vendor. If the **Payment type** field on the header is set to *Tax invoice customer deductions*, this field is set to *Customer/Vendor*.
Use account source	Select one of the following values: • *Fixed account* – If you select this value, you must specify an account in the **Rebate account** field. • *Deal line account* – Use the customer or vendor account that is specified on the rebate line. You can select this value only for deals where the **Reconcile by** field is set to *Line* and deal lines where the **Account code** field is set to *Table*. It doesn't apply to customer royalty posting profiles or vendor rebates that are based on sales orders. • *Sold-to customer* – Send rebate output to the sold-to customer from the original sales order. This setting is valid only for profiles where the **Module** field is set to *Customer*. • *Purchase order vendor* – Send rebate output to the purchased-from vendor on the original purchase order. This setting is valid only for profiles where the **Module** field is set to *Vendor*.
Rebate account	If you set the **Use account source** field to *Fixed account*, specify the account that actual rebate expenses are posted to.
Name of journal (In the **Rebate management** field group)	Select the name of the journal to use to post a credit note for the rebate amount to the customer or vendor. This field is unavailable when the **Payment type** field on the header is set to *Tax invoice customer deductions*. For customer rebates, journal names of the *Daily* journal type will be available. For customer royalties and vendor rebates, journal names of the *Vendor invoice recording* journal type will be available.
Item sales tax group	Specify whether the rebate is taxable.
Name of journal (In the **Write off** field group)	If the rebate that is posted doesn't equal the provision, the difference can be written off. Select the name of the journal to use to record the posted write-off.

Posting by company FastTab

The **Posting by company** FastTab of each Rebate management posting profile lets you specify the posting account that is used by each company (legal entity) in the grid.

Use the buttons on the toolbar to add companies to the grid and remove them. Each time that you add a row to the grid, use the **Company** field to specify the legal entity for that row. The **Name** field is then set automatically.

Select the row for each company, and then enter the following information by using the fields below the grid:

- **Debit type** – Select whether to debit a ledger account or a vendor. For customer rebates and royalties, this field is set to *Ledger account*.
- **Debit account** – Enter the account that the debit amount is posted to when rebate provisions are made.
- **Main account** – Select the main account for write-offs.

Rebate management deals

07/21/2025

Rebate management deals are used to control different methods and bases for calculating rebates and royalties. They include rules for inclusions and exclusions. There are three types of Rebate management deals: customer rebates, customer royalties, and vendor rebates. All three types use similar settings. This article points out differences where they exist.

Create a deal

1. Go to **Rebate management** > **Rebate management deals** > **All rebate management deals**. On the **All rebate management deals** list page, you can create and work with deals of all three types.

   Alternatively, follow one of these steps. In each case, the list page that appears provides all the same settings as the **All rebate management deals** list page, but it's filtered to show deals of only one type.

   - Go to **Rebate management** > **Rebate management deals** > **Customer rebate deals** to create only customer rebate deals.
   - Go to **Rebate management** > **Rebate management deals** > **Customer royalty deals** to create only customer royalty deals.
   - Go to **Rebate management** > **Rebate management deals** > **Vendor rebate deals** to create only vendor rebate deals.

2. On the Action Pane, select **New**.

3. In the **Create new deal** dialog box, set the following fields:

   - **Rebate management deal** – If you've set up a number sequence for rebate deals, this field is automatically set to a unique, system-generated ID. Otherwise, enter a unique ID.

   - **Description** – Enter a description of the deal.

   - **Module** – Select the type of partner that the deal applies to (*Customer* or *Vendor*). Depending on the page that you started from, this field might be automatically set based on the selected deal type. In this case, the field is read-only.

   - **Type** – Select the type of deal (*Rebate* or *Royalty*). Depending on the page that you started from, this field might be automatically set based on the selected deal type. In this case, the field is read-only.

- **Reconcile by** – Select how the deal should be calculated and reconciled:
  - *Deal* – A single rebate should be processed for all rebates and deductions in the deal.
  - *Line* – Rebates should be processed for each line in a deal.

- **Posting profile** – Select the posting profile to use for transactions where the deal applies. This field is available only when the **Reconcile by** field is set to *Deal*. If it's set to *Line*, you'll assign the profile later, for each line that you add to the deal.

- **Posting profile for guarantee** – Select the posting profile to use for guarantee transactions. Posting profiles are required for guarantee transactions only if the guarantee applies to a royalty. Otherwise, although a posting profile isn't mandatory, if no posting profile is specified, an error is shown when guarantees are posted. This field is available only when the **Type** field is set to *Royalty*.

- **Rebate output** – Select how the rebate or royalty should be paid:
  - *Financial* – Generate a free text credit note or accounts payable debit note, so that monies can be paid or received later. Provisions *can* be used with rebates where this option is selected. This option is the only available option when the **Type** field is set to *Royalty*.
  - *Item* – Generate a sales order for items according to the deal setup. On this sales order, a price of 0 (zero) is assigned to each item. Provisions *can't* be used with rebates where this option is selected.

- **Rebate currency** – Select the currency to use when the rebate, deduction, or royalty is paid.

- **Document notes** – Enter notes about the deal, as required.

- **Cumulative guarantee** – You can set this option to *Yes* only if the **Type** field is set to *Royalty*. This option affects the calculation of guaranteed deduction payments. Here's an example:
  - The guarantee of the deal is to sell a value that will lead to a payment of $10,000 per quarter.
  - The organization that is selling the goods sells a value that causes a deduction payment of $12,000 in quarter 1. The result is a $12,000 royalty that is paid, minus the $10,000 guarantee.
  - If the **Cumulative guarantee** option is set to *Yes*, the additional $2,000 of royalties that were paid in quarter 1 apply to quarter 2. Therefore, the customer is guaranteed $8,000 (the $10,000 guarantee minus the $2,000 additional payment).
  - In quarter 2, you register sales that trigger a $5,000 royalty.
  - The system identifies a $3,000 payment (the $8,000 guarantee minus the $5,000 of paid royalties).

    - If the **Cumulative guarantee** option is set to *No*, the full $10,000 are guaranteed each quarter. This guarantee corresponds to a suggested payment of $5,000 payment in quarter 2 (the $10,000 guarantee minus the $5,000 of paid royalties).

4. Select **OK** to create the deal and close the dialog box.

This procedure creates the header level of the new deal. Next, you'll add lines to the deal.

Add lines to a deal

After you've created a deal as described in the previous section, you can open it from the list page. You can then add lines to identify the customers or vendors, items, time frames, a basis, and calculation methods for the deal. A deal can have one or multiple lines. If a deal has multiple lines, they're generally of the same type, or the same parameters are associated with them. Until you add lines to a deal, the deal won't actually do anything.

1. Open the appropriate rebate deals list page, as described in the previous section.

2. Find and open the deal that you want to work with.

3. On the **Rebate management** FastTab, select one of the following buttons to add a deal line to the grid:

    - **Add line** – Add a new, blank deal line.
    - **Copy line** – If an existing deal line resembles the deal line that you want to add, you can select this button to copy add a copy of it. The new deal line will include all the settings from the related Rebate management details. You can then edit the settings. For example, you'll typically update the item relation and the rebate percentage.

4. On the new deal line, set the following fields:

    - **Rebate management number** – If you've set up a number sequence for Rebate management numbers, this field is automatically set to a unique, system-generated ID. Otherwise, enter a unique ID.

    - **Type** – The type of deal that the line applies to (*Rebate* or *Royalty*). The value is copied from the header and can't be changed.

    - **Description** – Enter a description of the deal line.

    - **Company** – Select the company (legal entity) that the deal line applies to. During processing, users can process only deal lines that are assigned to the company that they're currently using. The **Customer rebates deals** list page provides a multi-

company view, based on the security access of the user. However, you can edit and process rebates only for the company that you're currently using.

- **Account code** – Select the scope of customers or vendors that the deal line applies to:
  - *Table* – The deal line applies to a specific customer or vendor.
  - *Group* – The deal line applies to a group of customers or vendors. For more information about how to set up groups, see Rebate management groups.
  - *All* – The deal line applies to all customers or vendors.

- **Account relation** – If you selected *Table* in the **Account code** field, select the customer or vendor that the deal applies to. If you selected *Group*, select the customer or vendor group. If you selected *All*, this field is unavailable.

- **Item code** – Select the scope of items that the deal line applies to:
  - *Table* – The deal line applies to a specific item.
  - *Group* – The deal line applies to a group of items. For more information about how to set up groups, see Rebate management groups.
  - *All* – The deal line applies to all items.

- **Item relation** – If you selected *Table* in the **Item code** field, select the item that the deal line applies to. If you selected *Group*, select the item group. If you selected *All*, this field is unavailable.

- **Unit type** – Select the unit type that applies to the deal line (*Inventory unit* or *Catch weight unit*). This field might be blank for older records. In this case, the *Inventory unit* value is assumed.

- **(Inventory management parameters)** – In the remaining fields on the deal line, specify values for the inventory management parameters that will be used to define the items that are included in the deal (such as the item size, color, style, site, and warehouse). To add or remove the dimensions, select **Display dimensions** on the Action Pane.

5. On the Action Pane, select **Save**.

6. If you want to further limit the set of items that a deal line applies to, select the line, and then, on the **Rebate management** FastTab, select **Filter** to open a standard **Inquiry** dialog box.

7. For each deal line that you add, set up the calculation details and other details on the **Rebate management details** FastTab, as described in the next section.

Add Rebate management details to a deal line

For each line in your deal, you must set up details on the **Rebate management details** FastTab. First select the deal line on the **Rebate management** FastTab. Then set values for that deal line by using the various tabs on the **Rebate management details** FastTab. The following subsections describe how to use each tab.

Settings on the General tab

The **General** tab on the **Rebate management details** FastTab lets you set up the calculation method and basis for the selected deal line. This setup controls whether a minimum purchase is required, the posting profiles that are associated with the deal line, and the details of the calculation. The following table describes the fields that are available.

Expand table

Field	Description
Calculation method	Select the method to use when the selected deal line is combined with other deal lines (*Stepped*, *Cumulative*, *Rolling*, or *Total*). The value of this field can dramatically affect the outcome of your rebate calculations. For a full description of each method and examples that show how it affects the rebate calculation, see the Calculation methods for deal lines section later in this article.
Basis	Select whether the rebate is applied based on quantity (that is, the total number of units that are purchased or sold) or value (that is, the total price of goods that are purchased or sold).
Transaction type	Select the point in the process when the calculation should occur: • *Order* – Use the ordered quantity or value as the basis for the calculation. • *Delivered* – Use the delivered quantity or value as the basis for the calculation. • *Invoice* – Use the invoiced quantity or value as the basis for the calculation.
Unit	If you selected *Quantity* in the **Basis** field, select the unit that the quantity must be specified in.
Minimum amount	Enter the minimum amount that must be paid per period. You can enter a negative value to allow for negative rebate amounts if credit notes exceed sales for the period.
Rebate reduction principle	Select the rebate reduction principle that applies to the deal line.
Variant number	If the deal line applies to an item that has variants, select the variant that the deal line applies to.

Field	Description
Vendor rebate basis	This field is shown only for vendor rebates (that is, deals where the **Module** field is set to *Vendor*). Select the basis for the vendor rebate: • *Purchase order* – The rebate that the vendor receives is based on the quantity or value on the purchase order. • *Sales order* – The vendor receives a rebate only after the goods have been sold. The rebate is based on the quantity or value on the sales order.
Price basis	This field is shown only for vendor rebates (deals where the **Module** field is set to *Vendor*). If you selected *Sales order* in the **Vendor rebate basis** field, select the applicable price basis: • *FIFO* – The **Calculate FIFO purchase price** periodic task must be run to calculate the rebate. (To run the task, go to **Rebates management** > **Periodic tasks** > **Calculate FIFO purchase price**.) A first in, first out (FIFO) rule will be used to calculate the value of the stock that is sold. This value will then be used to calculate the vendor rebates. Here's an example: ◦ **Stock sold:** 1,000 units at $3.00 each = $3,000 ◦ **Current purchase price, based on FIFO:** $2.00 ◦ **Working calculation:** *Units sold* × *Current purchase price* = 1,000 × $2.00 = $2,000 • *Latest Purchase Price* – The value from the last purchase transaction will be used to calculate the vendor rebates. Here's an example: ◦ **Stock sold:** 1,000 units at $3.00 each = $3,000 ◦ **Latest purchase price:** $2.00 ◦ **Working calculation:** *Units sold* × *Latest purchase price* = 1,000 × $2.00 = $2,000 • *Average Purchase Price* – The weighted average value for the last *X* months will be used to calculate the vendor rebates. If you select this option, you must enter the number of months in the **Number of months** field (which is available only when the **Price basis** field is set to *Average Purchase Price*). Here's an example: ◦ **Stock sold:** 1,000 units at $3.00 each = $3,000 ◦ **Average purchase price:** $2.00 ◦ **Working calculation:** *Units sold* × *Average purchase price* = 1,000 × $2.00 = $2,000 • *Sales Price* – The sales price will be used to calculate the vendor rebates. Here's an example: ◦ **Stock sold:** 1,000 units at $3.00 each = $3,000 ◦ **Average purchase price:** $2.00 ◦ **Working calculation:** *Units sold* × *Sales price* = 1,000 × $3.00 = $3,000
Number of months	This field is shown only for vendor rebates (deals where the **Module** field is set to *Vendor*). If you selected *Average Purchase Price* in the **Price basis** field, enter the number of months that should be used.
Posting profile	Select the posting profile that applies to the selected deal line. This profile is used only when the **Reconcile by** field on the deal header is set to *Line*. If the **Reconcile by** field is

Field	Description
	set to *Deal*, the posting profile that is set on the deal header is always used. If no posting profile is set on the deal line, the posting profile that is set on the deal header is used.
Posting profile for guarantee	This field works like the **Posting profile** field, but it applies only to royalties.
Payment type	The payment type for the posting profile that is selected for the deal.
Sales tax inclusive	Select whether the transaction is tax-inclusive. Tax inclusiveness is relevant only when the **Basis** field is set to *Value*. The invoice amount will be used as the tax-inclusive amount. If the rebate calculation is based on a percentage, the system will multiply the rebate percentage by the tax-inclusive amount. The calculation uses the sales tax value from the deal line.
Include credit notes	Set this option to *Yes* to include credit notes in the rebate calculation. If you set this option to *Yes*, the effect varies, depending on the value of the **Transaction type** field: • If the **Transaction type** field is set to *Invoice*, the calculation will factor in credit notes. This configuration is the usual configuration. • If the **Transaction type** field is set to *Order*, the calculation will factor in both sales orders that have negative values and open returned orders.
Discounted amount	Set this option to *Yes* to base the calculation on the discounted amount of the item or items in cases where deal line discounts are given.
Paid invoices only	Set this option to *Yes* if the calculation should consider only fully paid invoices. (In other words, rebates won't be calculated for partially paid invoices.) This option is available only when the **Transaction type** field is set to *Invoice*.
Include free text	Set this option to *Yes* to include free text invoices in the calculation. Free text invoices can be included only for deal lines where the **Item code** field is set to *All*.
Include settlement discount	Set this option to *Yes* to reduce the rebate by the first settlement discount. It's assumed that the organization will take the first settlement discount. Set this option to *No* to enable the settlement discount to be used later.
Document notes	Enter notes that should be used as transaction text on rebate transaction journal lines.

Settings on the Dates tab

The settings on the **Dates** tab on the **Rebate management details** FastTab define the frequency and timing of the calculations that are specified on the **General** tab. They determine how calculations occur at processing time.

This tab lets you specify the range of dates that the selected deal line is valid for and the calculation frequency. You can also specify whether the guarantee should be posted, and when.

You can use the buttons on the toolbar to add date lines to the grid or remove them. If multiple date lines exist, the valid date ranges must not overlap. Otherwise, you'll receive an error message when you try to save the deal.

The following table describes the fields that are available for each date line.

Expand table

Field	Description
From date	Enter the first date that the date line applies to. If "from" and "to" dates are specified on the header of the deal, they're used as default values for every new date line.
To date	Enter the last date that the date line applies to. If "from" and "to" dates are specified on the header of the deal, they're used as default values for every new date line.
Per	Specify how often the deal line should be calculated. Enter an integer here, and then select a unit in the **Cumulate by** field. For example, to calculate every other week, set the **Per** field to *2* and the **Cumulate by** field to *Weeks*.
Cumulate by	Select the unit that applies to the **Per** setting. Select *Lifetime* to calculate over the whole lifetime of the deal line. Select *Customized period* to select a period that is defined in the general ledger. In this case, you must also set the **Period type** field.
Period type	This field is available only when the **Cumulate by** field is set to *Customized period*. The values that are available for selection come from the period types that are defined in the general ledger.
First day of the week	Specify how the weeks are identified for the period. This field is available only when the **Cumulate by** field is set to *Weeks*.
Claim per	Specify how often rebate monies can be claimed for the deal line. Enter an integer here, and then select a unit in the **Claim by** field.
Claim by	Select the unit that applies to the **Claim per** setting. Select *Lifetime* to allow claims just once during the whole lifetime of the deal line. Select *Customized period* to select a period that is defined in the general ledger. In this case, you must also set the **Claim period type** field.
Claim period type	This field is available only when the **Claim by** field is set to *Customized period*. The values that are available for selection come from the period types that are defined in the general ledger.
Process at posting	Select this check box if the claim line should be processed at posting time. This option is available only for deal lines where the **Transaction type** field on the **General** tab is set to *Delivered* or *Invoice*. For provisions, the provision will be posted when the delivery note or invoice is generated.

Field	Description
Guarantee per	This field applies only to royalty deals. Specify how often the guarantee of the royalty should be calculated during the period that is defined by the **Cumulate by** setting. Enter an integer here, and then select a payment time in the **Guarantee paid** field.
Guarantee paid	This field applies only to royalty deals. It works with the **Guarantee per** field to define the frequency of the guarantee calculation. Select one of the following values: • *Beginning of period* – The guarantee is paid at the beginning of the agreement period that is defined for the date line. The full guarantee is processed first. Only the value of royalties that exceed the guaranteed amount is posted as a royalty. Here's an example: ◦ **Guarantee minimum:** $10,000 over two months. ◦ **Month 1:** $10,000 were posted as a guarantee, and $0 in royalties were posted. ◦ **Month 2:** $2,000 were posted to royalties, and $0 in guarantees were posted. ◦ **Working calculation:** *Remaining guarantee* – *Royalties posted* = $0 – $2,000 = -$2,000. Because a royalty payment of $2,000 is required, a journal is created for $2,000. **Note:** The guarantee should be calculated and posted together with the deductions provision for the first period. • *End of period* – The guarantee isn't paid until the end of the deductions agreement, as defined on the date line. Here's an example: ◦ **Guarantee minimum:** $10,000 over two months. ◦ **Month 1:** $5,000 were posted as a royalty, and a journal was created. ◦ **Month 2:** $7,000 were posted as a royalty, and a journal was created. ◦ **Working calculation:** Because the royalties exceed the guarantee amount, $0 are posted to the guarantee. **Note:** The guarantee should be calculated and posted only together with the deductions and rebates transaction for the final period.
Guarantee minimum	This field applies only to royalty deals. Enter the minimum amount of the guarantee for a royalty, in the currency that is defined on the deal header.

Settings on the Lines tab

The **Lines** tab of the **Rebate management details** FastTab lets you define calculation lines for the selected deal line. Each calculation line establishes a quantity or value threshold, and a related compensation amount or items. The **Basis** field on the **General** tab specifies whether each calculation line is based on a quantity or a value.

You can use the buttons on the toolbar to add calculation lines to the grid or remove them. You can have any number of calculation lines. However, if multiple calculation lines exist, the "to" and "from" quantity or value ranges must not overlap.

The following table describes the fields that are available for each calculation line.

Expand table

Field	Description
From qty/value	Enter the minimum quantity or value that the calculation line applies to.
To qty/value	Enter the maximum quantity or value that the calculation line applies to.
Rebate management method	This field is available only for deals where the **Rebate output** field on the header is set to *Financial*. Select the method to use to calculate the rebate: • *Fixed amount off* – A fixed price amount is used for the line. • *Percentage off* – A percentage of the sale amount is used. • *Amount off* – A fixed price amount per order is used. **Important:** We strongly recommend that you use the same method for every calculation line on the **Lines** tab. If a new method is required, create a new deal line. Remember that you can use the **Copy line** button on the **Rebate management** FastTab to create a new deal line from an existing deal line. **Note:** If the **Rebate output** field is set to *Item*, this field is always set to *Fixed amount off*. For more information about how to specify the items, see the text that follows this table.
Rebate management amount	This field is available only for deals where the **Rebate output** on the header is set to *Financial*. Enter the amount that should be used to calculate the rebate, based on the method that you selected in the **Rebate management method** field.

As was mentioned in the previous table, for deals where the **Rebate output** field on the header is set to *Item*, you must specify the items that will be provided for every calculation line on the **Lines** tab. To specify the items, follow these steps.

1. On the **Lines** tab, create the required calculation line if it doesn't exist, and select it.
2. If the deal hasn't been saved since you created the calculation line, select **Save** on the Action Pane.
3. On the **Lines** tab, select **Items**.
4. On the **Items** page, use the buttons on the Action Pane to add items to the grid, or remove items, as required. For each row, set the following fields:
    - **Item number** – Select the item that will be provided.
    - **(Other dimensions)** – If you must use more dimensions to define the item (for example, item configuration, size, color, style, site, or warehouse), specify them. To add or remove available dimensions, select **Display dimensions** on the Action Pane.

- **Quantity** – Enter the quantity that will be provided after the threshold for the selected calculation line is met.
- **Unit** – Select the unit that the **Quantity** value is specified in.
- **Multiple** – This field works with the **Quantity** field. For example, on an item line, you set the **Quantity** field to *2* and the **Multiple** field of *100*. If you then have a total sales order quantity of 150, two of the items will be free (two per 100).

Settings on the Inventory dimensions tab

The **Inventory dimensions** tab on the **Rebate management details** FastTab shows all the available dimension values for the product that is specified for the selected deal line. It includes dimensions that aren't shown on the **Rebate management** FastTab. You can edit values only for those dimensions that apply to the selected product.

You can add more dimensions to the grid on the **Rebate management** FastTab by selecting **Display dimensions** on the Action Pane.

Calculation methods for deal lines

Every time that you set up details for one of your deal lines, as described in the previous section, you must select the calculation method for that line. This section explains each calculation method and provides examples that show how each method calculates the total rebate for orders and deal lines. In these examples, the orders and deal lines are identical. Only the calculation methods differ.

Stepped calculation method

The stepped calculation method calculates on a step-by-step basis, where each deal line incrementally contributes to the rebate until the sales quantity or value is reached. The steps can be based on either the quantity or the value of the goods that are sold, depending on the setting of the **Basis** field on the **General** tab of the **Rebate management details** FastTab.

For example, a deal line is set up so that the **Calculation method** field is set to *Stepped* and the **Basis** field is set to *Value*. It includes calculation lines that provide the following rebates:

- **Line A:** 10 percent up to $1,000
- **Line B:** 25 percent up to $2,500

If the value of the goods that were purchased or sold is $2,000, the resulting rebate of $350 is calculated in the following way:

- **Rebate (A):** *Threshold (A)* × *Percentage (A)* = $1,000 × 10 percent = $100

- **Rebate (B):** (*Value sold – Threshold (A)*) × *Percentage (B)* = ($2,000 – $1,000) × 25 percent = $250
- **Total rebate:** *Rebate (A)* + *Rebate (B)* = $100 + $250 = $350

If the **Basis** field is set to *Quantity* instead of *Value*, the stepped calculation method works in a similar way. The first step is used for the identified quantity until the second step is reached. The second step is then used for all quantity above the first step, until the third step is reached. This process then continues through all subsequent steps.

Cumulative calculation method

The cumulative calculation method uses just one calculation line to calculate the rebate. If multiple calculation lines are available for the deal line, the highest-value or highest-quantity calculation line that is reached is used for the whole quantity or value. Like the other calculation methods, the cumulative method uses the setting of the **Basis** field on the **General** tab of the **Rebate management details** FastTab to determine whether the sales quantity or the sales value is used to calculate the rebates.

For example, a deal line is set up so that the **Calculation method** field is set to *Cumulative* and the **Basis** field is set to *Value*. It includes calculation lines that provide the following rebates:

- **Line A:** 10 percent up to $1,000
- **Line B:** 25 percent up to $2,500

If the value of the goods that were purchased or sold is $2,000, the calculation uses only line B. The resulting rebate of $500 is calculated in the following way:

- **Total rebate:** *Value sold* × *Rebate (B)* = $2,000 × 25 percent = $500

Rolling calculation method

The rolling calculation method calculates all possible calculation lines for the deal. If there are multiple calculation lines, and more than one of them is reached, all the calculation lines that are reached will be used, but upper thresholds apply to each percentage. Like the other calculation methods, the rolling method uses the setting of the **Basis** field on the **General** tab of the **Rebate management details** FastTab to determine whether the sales quantity or the sales value is used to calculate the rebates.

For example, a deal line is set up so that the **Calculation method** field is set to *Rolling* and the **Basis** field is set to *Value*. It includes calculation lines that provide the following rebates:

- **Line A:** 10 percent up to $1,000
- **Line B:** 25 percent up to $2,500

If the value of the goods that were purchased or sold is $2,000, the resulting rebate of $600 is calculated in the following way:

- **Rebate (A):** *Threshold (A)* × *Percentage (A)* = $1,000 × 10 percent = $100
- **Rebate (B):** *Value sold* × *Percentage (B)* = $2,000 × 25 percent = $500
- **Total rebate:** *Rebate (A)* + *Rebate (B)* = $100 + $500 = $600

Total calculation method

The total calculation method uses all calculation lines to calculate the rebate. It applies the total quantity to calculate the rebate for each calculation line that is reached, and each calculation line applies its percentage to the full amount. Like the other calculation methods, the total method uses the setting of the **Basis** field on the **General** tab of the **Rebate management details** FastTab to determine whether the sales quantity or the sales value is used to calculate the rebates.

For example, a deal line is set up so that the **Calculation method** field is set to *Total* and the **Basis** field is set to *Value*. It includes calculation lines that provide the following rebates:

- **Line A:** 10 percent up to $1,000
- **Line B:** 25 percent up to $2,500

If the value of the goods that were purchased or sold is $2,000, the resulting rebate of $700 is calculated in the following way:

- **Rebate (A):** *Value sold* × *Percentage (A)* = $2,000 × 10 percent = $200
- **Rebate (B):** *Value sold* × *Percentage (B)* = $2,000 × 25 percent = $500
- **Total rebate:** *Rebate (A)* + *Rebate (B)* = $200 + $500 = $700

Process, review, and post rebates

This article describes how to process your Rebate management deals, calculate their discounts, review the transactions that are generated, post transactions, and review the postings.

Change the status of a deal

You can assign a status to each deal to help track it. The status is for informational purposes only.

1. Select a deal (for example, on the **All rebate management deals** page).
2. On the Action Pane, on the **Rebate management deals** tab, in the **Maintain** group, select **Change status**.
3. In the **Change status** dialog box, set the **Rebate status** field to a new status.
4. Select **OK**.

Calculate FIFO purchase prices

The **Calculate FIFO purchase price** periodic task must be run to calculate the rebates for deals where the **Price basis** field is set to *FIFO*. The system will use a first in, first out (FIFO) rule to calculate the value of the stock that was sold. This value will then be used to calculate the vendor rebates.

Go to **Rebates management** > **Periodic tasks** > **Calculate FIFO purchase price**. In the dialog box that appears, select **OK** to run the calculation.

Create source transactions

You can create the sales orders or purchase orders that have source transactions either before or after you create an applicable Rebate management deal.

You can set up each deal line so that it automatically creates a rebate provision by posting the delivery or invoice for a sales order or purchase order. Set the **Transaction type** field for the deal line to *Delivery* or *Invoice*, and set the **Process at posting** option to *Yes*. If the **Transaction type** field is set to *Order*, processing at posting is disabled. For source transactions that were created after a deal was activated, you can still process the provision as described in the Process Rebate management deals section later in this article.

Enable price details

Before you can create source transactions, you must enable the **Enable price details** option for account receivables.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Price details** FastTab, set the **Enable price details** option to *Yes*.

Create a source transaction

To create a source transaction, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New**.

   To mimic the way that rebate claims are generated, you must now create a sales order where the product and quantity qualify the customer for a rebate.
3. In the **Customer account** field, enter or select a customer that will qualify for a rebate deal.
4. Select **OK** to create the sales order.
5. On the **Sales order lines** FastTab, add a line, and set the following fields for it:

   - **Item number** – Specify an item that qualifies for a rebate.
   - **Quantity** – Specify a quantity that qualifies for a rebate deal that includes a line where the **Basis** field is set to *Quantity*.
   - **Unit price** – Specify a price that qualifies for a rebate deal that includes a line where the **Basis** field is set to *Value*.
   - **Site** – Select a site where the product is available, and that qualifies for a rebate deal.
   - **Warehouse** – Select a warehouse where the product is available, and that qualifies for a rebate deal.
6. On the **Sales order lines** FastTab, on the toolbar, select **Sales order line** > **Price details**. This command is available only if you enabled price details as described in the previous section.
7. On the **Price details** page, select the **Rebate management** FastTab. This FastTab lists all the rebate management deals that apply to the current order line and shows the estimated rebate amount in the order's currency. The amounts are only estimates of the future rebate claims. The actual rebate amounts might differ. Here are some of the factors that might affect the actual amounts:

   - The total sales volume that the customer achieved under a periodic rebate agreement.

- Whether the customer returned all quantities or partial quantities.
- Whether the applicable sales order achieved the transaction type (*Order, Delivery*, or *Invoice*) that is defined for the Rebate management deal.
- The deal's **Output** value. A blank rebate amount will be shown for deals where the **Output** field is set to *Item*.

8. On the **Detail** FastTab, notice that the **Margin estimation** section includes the following fields. These fields are added by Rebate management. All of them show values per unit (whereas the fields on the **Rebate management** FastTab show total values for the line).

    - **Rebate management rebate amount** (sales orders only)
    - **Rebate management royalty amount** (sales orders only)
    - **Rebate management vendor rebate amount** (sales orders and purchase orders)

9. Close the **Price details** page.

10. If the sales order shouldn't qualify for the rebates that you just viewed, follow these steps to exclude rebates. (However, you usually won't exclude rebates.)
    a. On the **Sales order lines** FastTab, select the relevant line.
    b. On the **Line details** FastTab, on the **Price and discount** tab, set the **Exclude from rebate management** option to *Yes*. This option doesn't apply to purchase orders. Furthermore, only customer rebates are excluded when this option is set to *Yes*. Customer royalty rebates and vendor rebates still apply.

11. On the Action Pane, on the **Pick and pack** tab, in the **Generate** group, select **Post packing slip**.

12. On the **Parameters** FastTab, in the **Quantity** field, select *All*.

13. Select **OK**.

14. If you're prompted to confirm the operation, select **OK**.

15. On the Action Pane, on the **Invoice** tab, in the **Generate** group, select **Invoice**.

16. On the **Parameters** FastTab, in the **Quantity** field, select *All* or *Packing slip*.

17. Select **OK**.

18. If you're prompted to confirm the operation, select **OK**.

Process Rebate management deals

When you process a deal, the system calculates all relevant rebates and royalties that are set up. Only selected deals that have calculation periods that are ready to be calculated and that have a status of *Active* will be processed. After processing is completed, the system generates a set of transactions that you can review and then post.

> ⓘ **Note**
>
> In all cases, rebates are processed at the level that is specified by each deal's **Reconcile by** setting (*Deal* or *Line*). You can do single-line calculations only for deals where the **Reconcile by** field is set to *Line*.

Process all lines for one or more deals

1. Open the appropriate rebate deals list page for the type of deal that you want to work with.
2. Select the row for each deal that you want to process (or open the deal that you want to process).
3. On the Action Pane, on the **Rebate management deals** tab, in the **Generate** group, select one of the following commands:
    - **Process** > **Provision** – Provision a set of accruals for each relevant rebate deal, but don't post them. This menu item is unavailable for deals where the **Rebate output** field is set to *Item*.
    - **Process** > **Rebate management** – Process a series of transactions that provide the value of the rebate for each deal.
    - **Process** > **Write off** – For each source transaction for the rebate deal and specified period, process the variance between the amounts that were posted for a provision and for rebate management. This menu item is unavailable for deals where the **Rebate output** field is set to *Item*.
4. In the dialog box that appears, set the **From date** and **To date** fields to define the date range for the calculation.
5. Select **OK** to run the calculation.

Process one or more specific deal lines for a selected deal

1. Open the appropriate rebate deals list page for the type of deal that you want to work with.

2. Open the deal that you want to process a line from.

3. Select the **Lines** tab in the upper-right corner.

4. On **Rebate management** FastTab, select the row for each deal line that you want to process.

5. On the toolbar of the **Rebate management** FastTab, select one of the following commands. (These commands are available only for deals where the **Reconcile by** field is set to *Line*.)

    - **Process** > **Provision** – Provision a set of accruals for each relevant deal line, but don't post them. This menu item is unavailable for deals where the **Rebate output** field is set to *Item*.
    - **Process** > **Rebate management** – Process a series of transactions that provide the value of the rebate for each deal line.
    - **Process** > **Write off** – For each source transaction for the rebate deal and specified period, process the variance between the amounts that were posted for a provision and for rebate management. This menu item is unavailable for deals where the **Rebate output** field is set to *Item*.

6. In the dialog box that appears, set the **From date** and **To date** fields to define the date range for the calculation.

7. Select **OK** to run the calculation.

Process deals using a batch job

Instead of processing specific deals or deal lines, you can run a batch job to process several deals at the same time. You can optionally apply record filters and/or set up a recurring schedule. To process deals by using a batch job, follow these steps:

1. Follow one of these steps:

    - Go to **Rebate management** > **Periodic tasks** > **Process** > **Provision** to provision a set of accruals for each relevant deal, but without posting them.
    - Go to **Rebate management** > **Periodic tasks** > **Process** > **Rebate management** to process a series of transactions that provide the value of the rebate for each deal.
    - Go to **Rebate management** > **Periodic tasks** > **Process** > **Write off** to reverse previously posted transactions to write them off so that new rebate deal transactions can be calculated.

2. In the dialog box that appears, on the **Parameters** FastTab, in the **Period** section, set the **From date** and **To date** fields to define the date range for transactions for the calculation.

3. In the **Guarantee Period** section, set the **From date** and **To date** fields to define the date range for guarantees for the calculation.

4. On the **Records to include** FastTab, you can set up filters to limit the set of deals that the batch job will process. These settings work in the same way that they work for other types of batch jobs.

5. On the **Run in the background** FastTab, you can set up batch processing and scheduling options as required. These settings work in the same way that they work for other types of batch jobs.

6. Select **OK** to run and/or schedule the calculation.

Process deals by using the rebate workbench

Instead of processing specific deals or deal lines, you can use the *rebate workbench* to process multiple deals at the same time. You can optionally apply record filters and/or set up a recurring schedule. You don't have to select any rows. The system will process all lines that meet the date and filter requirements that you set up.

To process deals by using the rebate workbench, follow these steps:

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.

2. On the Action Pane, on the **Rebate workbench** tab, in the **Processing** group, select one of the following commands:

    - **Process** > **Provision** – Provision a set of accruals for each relevant deal line, but don't post the accruals.
    - **Process** > **Rebate management** – Process a series of transactions that provide the value of the rebate for each deal line.
    - **Process** > **Write off** – Process the variance between provision and rebate management that is posted for each source transaction per rebate deal and specified period.

3. In the **Rebate management** dialog box, in the **Period** section, set the **From date** and **To date** fields to define the date range for the calculation.

4. In the **Guarantee period** section, set the **From date** and **To date** fields to define the date range for guarantees for the calculation.

5. On the **Records to include** FastTab, you can set up filters to limit the set of deals that the batch job will process. These settings work in the same way that they work for other types of batch jobs.

6. On the **Run in the background** FastTab, you can set up batch processing and scheduling options as required. These settings work in the same way that they work for other types of batch jobs.

7. Select **OK** to run and/or schedule the calculation.

View and edit Rebate management transactions

When you process one or more deals, the system creates transactions that you can view and, perhaps, edit before you post them.

View and edit Rebate management transactions by using the rebate deals list page

To view and edit Rebate management transactions using the rebate deals list page, follow these steps:

1. Follow one of these steps:

    - Select the deal to view transactions for (for example, on the **All rebate management deals** page). On the Action Pane, on the **Rebate management deals** tab, in the **Transactions** group, select **Transactions** or **Guarantee transactions**, depending on the type of transaction that you want to view.
    - Open a deal (for example, on the **All rebate management deals** page) to view its details. On the **Rebate management** FastTab, select the deal line to view transactions for. Then, on the toolbar, select **Transactions** or **Guarantee transactions**, depending on the type of transaction that you want to view. (These buttons are available only for deals where the **Reconcile by** field is set to *Line*.)

2. The **Rebate management date transactions** or **Rebate management guarantee transactions** page appears. It contains a grid, where each line represents a collection of transactions from a single rebate or guarantee period. Select a row in the grid, and then, on the Action Pane, select **Source transactions** to view the transactions that belong to that row.

3. The page that appears shows a list of the transactions of the selected type that belong to the selected row. Each transaction provides relevant details, depending on the transaction

type. For guarantee transactions, you can only view the list. For other types of transactions, you can perform the following actions on this page:

- To verify the total value of all claimed transactions on the page, view the **Claimed amount** field.
- To view more information about any transaction, select it, and then select the **General**, **Financial dimension**, or **Dimension** tab.
- To view any reductions that apply, select **Reduction transactions** on the Action Pane. Learn more in Rebate reduction principles.
- To mark transactions as either claimed or unclaimed if you're using a claims process, select the relevant rows, and then, on the Action Pane, select one of the following commands. (You enable claims processes on the **Rebate management parameters** page.)
  - **Set claimed** > **All** – Mark all transactions as claimed.
  - **Set claimed** > **Selected** – Mark the selected transactions as claimed.
  - **Set unclaimed** > **All** – Mark all transactions as unclaimed.
  - **Set unclaimed** > **Selected** – Mark the selected transactions as unclaimed.
- Select **Post** on the Action Pane to post the claim for all the relevant lines. If you're using a claims process (when the **Use claim process** option is enabled on the **Rebate management parameters** page), only the lines that are marked as **Claimed** are posted. Otherwise, all the source transactions for the selected rebate transaction are posted. The **Post** button is available only for rebate transactions. It's unavailable for provision and write-off transactions. In the **Post** dialog box, the **From date** and **To date** fields are automatically set. Set the **Posting date** field, and then select **OK**.
- To adjust the amount that is shown for any open or unposted transaction, select the transaction, and then follow one of these steps:
  - Edit the value in the **Corrected amount** field.
  - On the Action Pane, select **Set correction**. Then, in the drop-down dialog box that appears, in the **Corrected amount** field, enter a value.

> **Note**

If you're using a claims process, when you process the next period, the transaction list will include any unclaimed transactions from the previous posting, plus any new transactions for the selected period.

View and edit Rebate management transactions by using the rebate workbench

To view and edit Rebate management transactions by using the rebate workbench, follow these steps:

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.
2. Set the **Show** field to *Not posted*.
3. The **Rebate workbench** page shows a list of the transactions. Each transaction provides relevant details. These details vary, depending on the transaction type. You can perform the following actions on this page:
    - To view more information about any transaction, select it, and then select the **General**, **Financial dimension**, or **Dimension** tab.
    - If you're using a claims process, you can mark transactions as either claimed or unclaimed. Select the relevant rows, and then, on the Action Pane, on the **Rebate workbench** tab, select one of the following commands. (You enable claims processes on the Rebate management parameters page.)
        - **Set claimed** – Mark the selected transactions as claimed.
        - **Set unclaimed** – Mark the selected transactions as unclaimed.
    - To post the claim for one or more lines, select the relevant lines. Then, on the Action Pane, on the **Rebate workbench** tab, select **Post**. The **Post** button is available for provision, rebate, and write-off transactions. In the **Post** dialog box, the **From date** and **To date** fields are automatically set. Set the **Posting date** field, and then select **OK**.
    - To adjust the amount that is shown for any open or unposted transaction, select the transaction, and then follow one of these steps:
        - Edit the value in the **Corrected amount** field.
        - On the Action Pane, on the **Rebate workbench** tab, select **Set correction**. Then, in the drop-down dialog box that appears, in the **Corrected amount** field, enter a value.

> **Note**
>
> If you're using a claims process, when you process the next period, the transaction list will include any unclaimed transactions from the previous posting, plus any new transactions for the selected period.

Consolidate vendor invoices for the same vendor in vendor rebate deals

Sometimes, vendor rebate deals are listed over multiple lines (for example, because the output is split by financial dimension). In these cases, it can be cumbersome to manage multiple entries and vendor accounts for the same vendor. To improve efficiency when payable invoices are generated for vendor accounts, you can consolidate multiple ledger lines for the same vendor into a single vendor line that has several ledger lines.

Turn on vendor invoice consolidation

Before you can set your system to consolidate vendor invoices, it must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.43 or later.
- The feature named *Consolidate vendor invoices for the same vendor in vendor rebate deals* must be turned on in Feature management. As of Supply Chain Management version 10.0.45, this feature is turned on by default. As of version 10.0.49, it's mandatory and can't be turned off.

How vendor invoice consolidation works

You can configure the system to divide rebates by financial dimension for reporting purposes. The system then splits the output into several lines when you post a rebate. The split is based on the financial dimensions of each source transaction (purchase order line or sales order line).

The following procedure explains how to view the effects of vendor invoice consolidation.

1. Go to **Rebate management** > **Setup** > **Rebate management parameters**.
2. On the **Rebate management** tab, set the **Process by dimension** option to *Yes*. Your system is now set to divide rebates by financial dimension for reporting purposes.

3. Go to **Rebate management** > **Rebate management deals** > **All rebate management deals**, and open an active vendor rebate deal.

4. On the Action Pane, on the **Rebate management deals** tab, select **Process** > **Rebate management**.

5. Because of the **Process by dimension** setting, the system divides the output. Each line shows a debit or credit account together with its ledger account code. This situation can cause reconciliation issues, especially when multiple lines point to the same vendor. To view the output, on the Action Pane, on the **Rebate management deals** tab, select **Transactions**.

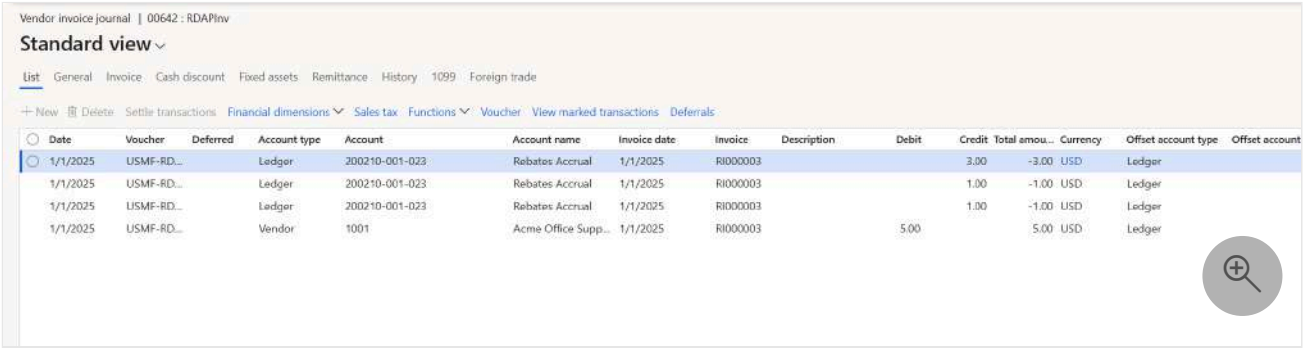
6. At the top of the grid, set the **Show** field to *Posted*.

7. Select a transaction, and then, on the Action Pane, select **Target transactions**.

8. Select the target transaction line, and then select **View details**. The output journal lines are shown.

   Without vendor consolidation, there are multiple vendor invoices for the same vendor in vendor rebate deals, as shown in the following screenshot.

   With vendor consolidation, there's just one vendor line that has multiple ledger lines, as shown in the following screenshot. This consolidation makes it easier for businesses to consolidate and send rebate output to their vendors and to report in the rebate related journals.



Post rebate transactions

To post the value of a processed provision, rebate management amount, and write-off, you must run the posting process. The posting process marks the provision, rebate management, or write-off transactions as posted, and creates the target transaction. If you don't have to review the target transaction, these transactions can be set up so that they're automatically posted.

Set up the system to post all target transactions automatically

To set up your system to post all target transactions as soon as they're generated by a posting provision, rebate management amount, and write-off, turn on the **Automatically post journals** and/or **Automatically post free text invoices** option on the **Rebate management parameters** page. Learn more in Rebate management parameters.

Post transactions for all lines for one or more deals

After you've processed the relevant deals, follow these steps to review and post the generated transactions for all lines for one or more deals.

1. Open the appropriate rebate deals list page for the type of deal that you want to work with.
2. Select the row for each deal that you want to post (or open the deal that you want to post).
3. On the Action Pane, on the **Rebate management deals** tab, in the **Generate** group, select one of the following commands:
    - **Post** > **Provision** – Post available accruals transactions that you've created.
    - **Post** > **Rebate management** – Post available rebate transactions that you've created.
    - **Post** > **Write off** – Post available write-off transactions that you've created.
4. In the dialog box that appears, set the **Posting date** field. Then set the **From date** and **To date** fields to define the date range for the transactions that must be posted.
5. Select **OK** to post the transactions.

Post transactions for one or more specific deal lines for a selected deal

After you've processed the relevant deals, follow these steps to review and post the generated transactions for one or more specific deal lines for a selected deal. This procedure is applicable only for deals where the **Reconcile by** field is set to *Line*.

1. Open the appropriate rebate deals list page for the type of deal that you want to work with.
2. Open the deal that has a line that you want to post transactions for.
3. Select the **Lines** tab in the upper-right corner.
4. On **Rebate management** FastTab, select the row for each deal line that you want to post.
5. On the toolbar of the **Rebate management** FastTab, select one of the following commands. (These commands are available only for deals where **Reconcile by** is set to *Line*.)
    - **Post** > **Provision** – Post available accruals transactions that you've created.
    - **Post** > **Rebate management** – Post available rebate transactions that you've created.
    - **Post** > **Write off** – Post available write-off transactions that you've created.
6. In the dialog box that appears, set the **Posting date** field. Then set the **From date** and **To date** fields to define the date range for the transactions that must be posted.
7. Select **OK** to post the transactions.

Post transactions using a batch job

Instead of posting transactions for specific deals or deal lines, you can run a batch job to post transactions for several deals at the same time. You can optionally apply record filters and/or set up a recurring schedule. To post transactions by using a batch job, follow these steps:

1. Follow one of these steps:
    - Go to **Rebate management** > **Periodic tasks** > **Post** > **Provision** to post available accrual transactions that you've created.
    - Go to **Rebate management** > **Periodic tasks** > **Post** > **Rebate management** to post available rebate transactions that you've created.
    - Go to **Rebate management** > **Periodic tasks** > **Post** > **Write off** to post available write-off transactions that you've created.
2. In the dialog box that appears, on the **Parameters** FastTab, in the **Period** section, set the **Posting date** field. Then set the **From date** and **To date** fields to define the date range for the transactions that must be posted.
3. In the **Guarantee Period** section, set the **From date** and **To date** fields to define the date range for the guarantees that must be posted.

4. On the **Records to include** FastTab, you can set up filters to limit the set of deals that the batch job will process. These settings work in the same way that they work for other types of batch jobs.

5. On the **Run in the background** FastTab, you can set up batch processing and scheduling options as required. These settings work in the same way that they work for other types of batch jobs.

6. Select **OK** to run and/or schedule the calculation.

Post transactions by using the rebate workbench

After you've processed provision, rebate, or write-off transactions, follow these steps to use the rebate workbench to review and post the generated transactions for one or more specific transaction lines for all deals.

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.

2. In the grid, select the row for each transaction line that you want to post. You can select unposted provision, rebate, and/or write-off transactions. The following rules apply:

    - The system will also post all lines that have the same **Rebate transaction number** value as the lines that you select.
    - The system won't post any lines of the *Rebate* transaction type that aren't marked as claimed.
    - If you select lines that have already been posted, the system will skip the posted lines.
    - The **Post** button is available only if you select at least one unposted line.

3. On the Action Pane, on the **Rebate workbench** tab, in the **Processing** group, select **Post**.

4. In the **Post** dialog box, set the **Posting date** field. The **From date** and **To date** fields are automatically set, based on the earliest **From date** value and the latest **To date** value for the selected rows.

5. Select **OK** to post the transactions.

Review Rebate management journals

After your transactions have been posted, you can review the resulting journals, documents, or items. Target transactions for rebates and royalties are based on the payment type that is set in the posting profile and the rebate's output type. For example, if the rebate output is set to *Item*, a

sales order will be created for a customer rebate, and a purchase order will be created for a vendor rebate. These orders can be viewed via the target transactions. Alternatively, if the payment is set up to use Accounts payable, a vendor invoice for the vendor that is set up on the customer will be created for customer rebates.

Review journals by using the rebate deals list page

To review the journal entries that are associated with a Rebate management deal, follow these steps:

1. Open the appropriate rebate deals list page for the type of deal that you want to work with.
2. Select the deal to inspect journal entries for.
3. On the Action Pane, on the **Rebate management deals** tab, in the **Transactions** group, select either **Transactions** or **Guarantee transactions**, depending on the type of transactions that you want to look at.
4. Set the **Show** field to *All* or *Posted*.
5. Find and select the transaction collection that you want to inspect, and then, on the Action Pane, select one of the following buttons. (These buttons are available only when relevant postings exist for the selected transaction collection.)
    - **Target transactions** – Review relevant journals and other types of documents that were generated by the selected deal.
    - **Items** – Review relevant sales orders or purchase orders that were generated by the selected deal.
6. A list of relevant journals, documents, or items appears. To view more information about any journal, document, or item, select its row, and then, on the Action Pane, select **View details**.

Review journals by using the rebate workbench

To review journals by using the rebate workbench, follow these steps:

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.
2. Set the **Show** field to *All* or *Posted*.
3. Find and select the line that you want to inspect. Then, on the Action Pane, on the **Rebate workbench** tab, in the **View** group, select **Target transactions**. This button is available only if relevant postings exist for the selected line.

4. A list of relevant journals, documents, or items appears. To view more information about any journal, document, or item, select its row, and then, on the Action Pane, select **View details**.

Rebate management transactions on the deduction workbench

When you post a Rebate management transaction that has one of the following **Payment type** values, the system creates a customer deduction journal or a free text invoice for the relevant customer account:

- Customer deductions
- Tax invoice customer deductions
- Trade spending
- Reporting

After a target transaction is created and posted, it will be available as an open transaction on the **Deduction workbench** page (**Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**). Open transactions have a **Claim type** value of *Rebate management*, and a **Rebate transaction number** value is available to enable traceability. The date is set to the posting date of the Rebate management target transaction. To use the deduction workbench to settle open transactions to existing deductions for the same customer account, select **Maintain** > **Match** on the Action Pane.

Learn more in Manage deductions using the deduction workbench.

Purge unposted transactions

After you've processed provision, rebate, or write-off transactions, follow these steps to purge selected unposted transactions.

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.
2. Set the **Show** field to *Not posted*.
3. Find and select the transactions to delete. Then, on the Action Pane, on the **Rebate workbench** tab, in the **Processing** group, select **Purge**.
4. Select **OK** to delete the unposted transactions.

Cancel a posted provision

After you've processed and posted a provision, follow these steps to cancel the posted provision transactions.

1. Go to **Rebate management** > **Rebate management deals** > **Rebate workbench**.
2. Set the **Show** field to *Posted*.
3. Find and select the provision transactions to cancel. Then, on the Action Pane, on the **Rebate workbench** tab, in the **Processing** group, select **Cancel provision**.
4. Select **OK** to reverse the transactions.

These provision reversals will also be visible in the relevant Rebate management journals.

Manage deductions using the deduction workbench

07/21/2025

This article describes how to use the deduction workbench to process customer payments that include deductions.

A customer who is owed a rebate can decide not to wait for a rebate payout. Instead, the customer can send a payment that includes a deduction for the amount of the rebate. To handle this type of transaction, you can use the deduction workbench to match deductions to open credit transactions, split deductions, deny deductions, and write off deductions.

> **Note**
>
> The deduction workbench has been part of the sales and marketing functionality in Microsoft Dynamics 365 Supply Chain Management for a long time. However, it has now been enhanced so that it also works with the newer **Rebate management** module. This article describes how to use both older features and Rebate management features of the deduction workbench.

Prerequisites

Set up the old deduction management system

You can use the deduction workbench together with the old deduction management capabilities of Supply Chain Management, even if you aren't using the **Rebate management** module. However, you must first prepare your system as described in this section.

Before you can use the deduction workbench, you must complete the setup tasks that are described in Set up deduction management. You should also have some type of rebate agreement set up for the customer: either a customer rebate, as described in Setting up and maintaining customer rebates, or a trade allowance rebate.

If you're applying a deduction to a customer rebate, you must complete these tasks:

- Set up your customer rebates.
- Approve and process the rebate, so that you can use the deduction workbench.

If you're applying a deduction to a trade allowance rebate, you must complete these tasks:

- Set up billback rebates.
- Apply billback rebates.

Configure accounts receivable and deductions

The system records all deduction events in a claim journal. Therefore, your system must include a journal that can be used for this purpose. If you don't already have a claim journal, set it up now. This journal is required to create deductions directly on the deduction workbench, customer settlement, or customer page.

To set up a new claim journal for deductions, follow these steps.

1. Go to **General ledger** > **Journal setup** > **Journal names**.

2. Select **New**, and set the following fields for the new journal name:

    - **Name** – Enter a unique name for the claim journal.
    - **Description** – Enter a description of the new journal.
    - **Journal type** – Select *Daily*.
    - **Voucher series** – Assign an existing number sequence. Alternatively, create a new number sequence that has company scope, and assign it to the new journal name.

3. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

4. On the **Deductions** tab, on the **General** FastTab, set the **Claim journal name** field to the journal name that you just created.

5. On the **Return order** FastTab, set the following fields:

    - **Create return order** – Set this option to specify what the system should do when a quantity-based claim is approved:
        - *Yes* – Create a return order.
        - *No* – Create a negative sales order.

    - **Creation without attached invoice** – Select a value to specify what the system should do when a quantity-based claim is approved but no invoice is attached:
        - *Accept* – Create a return order.
        - *Warning* – Create a return order, but show the following warning message: "Claim is not attached to an invoice."
        - *Error* – Don't create a return order, and show the following error message: "Claim is not attached to an invoice. Update has been canceled."

    - **Create return order prior to deduction approval** – Set this option to *Yes* if return orders can be created before the claim is approved. This setting applies only to

quantity-based claims where the **Create return order** option is set to *Yes*.

Configure General ledger parameters

When the system creates a claim journal for a new deduction, it also creates two new customer transactions: one to offset the amount of the claim against the original invoice and one to register a customer's debt to the amount of the claim (because the claim hasn't yet been approved). Therefore, you must set up your system so that a single voucher can have multiple customer lines.

To enable a single voucher to have multiple customer lines, follow these steps.

1. Go to **General ledger** > **Ledger setup** > **General ledger parameters**.
2. On the **Ledger** tab, on the **General** FastTab, set the **Allow multiple transactions within one voucher** option to *Yes*.
3. If you receive a warning message, select **Close** to accept the change.

Create deduction reasons

The system requires that users specify a reason for each deduction that they enter directly on the deduction workbench, customer settlement, or customer page. The reason determines how the deduction is handled when it's approved.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction reasons**.

2. Select **New** to add a row to the grid, and then set the following fields for it:

    - **Claim reason** – Enter a unique name for the reason.

    - **Description** – Enter a description of the reason to provide more information about how it should be used.

    - **Claim basis** – Select a claim basis for the claim reason:
        - *Price based* – Create a free text credit upon approval.
        - *Quantity based* – Create a negative sales order or return order upon approval.

    - **Return reason code** – Select a return reason code to apply as the **Return reason code** value for the return order.

    - **Type** – Select a deduction type. The **Deduction offset** value for the selected type will be used to set the **Deduction offset** field when a deduction or claim is created. Deduction types are defined on the **Deduction types** page (**Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction types**).

- **Claim posting account** – This field is available only when the **Claim basis** field is set to *Price based*. When a price-based claim is approved, the system assigns the ledger account that you select here as the **Main account** value for the draft free text credit note.

Set up the settle approved deductions periodic task

For deductions that are created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, you can set up the *Settle approved deductions* periodic task to automatically match deductions and credits that have matching **Deduction ID** values and amounts.

To schedule this task, go to **Sales marketing** > **Periodic tasks** > **Settle approved deductions**, and set up options, filters, and a schedule, just as for other types of periodic tasks.

> ⓘ **Note**
>
> If the **Automatic settlement** option is set to *Yes* on the **Settlement** tab of the **Accounts receivable parameters** page (**Account receivable** > **Setup** > **Accounts receivable parameters**), the *Settle approved deductions* periodic task won't do anything, because the credit will automatically be settled.

Create a deduction

Create a deduction journal entry by using the customer payment journal

To create a deduction journal entry, follow these steps.

1. Go to **Accounts receivable** > **Payments** > **Customer payment journal**.
2. Select **New** to add a row to the grid.
3. In the **Name** field for the new row, select the name of the journal.
4. On the Action Pane, select **Lines**.
5. Enter the date, company account, and customer account number.
6. In the **Invoice** field, select the invoice that the deduction is associated with.
7. In the **Credit** field, enter the amount that the customer paid.
8. Select **OK** to confirm that the amount is less than the total amount of the marked transaction.
9. Select the offset account type and the offset account.
10. On the toolbar above the grid, select **Deductions**.

11. On the **Deduction** page, on the Action Pane, select **New** to add a row to the grid. The **Deduction ID** field for the new row is automatically set.
12. In the **Type** field, select the deduction type.
13. In the **Amount** field, enter the amount that is shown in the **Balance** field below the deduction list. This amount represents the amount that the customer deducted from the payment.
14. Close the **Deduction** page. You're returned to the **Customer payments** page, which now shows a new line for the deduction.
15. On the Action Pane, select **Validate** > **Validate**. You should receive the following message: "Journal is OK."
16. On the Action Pane, select **Post**.

Create a deduction by using the deduction workbench

To create a new deduction on the deduction workbench, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.

2. On the Action Pane, select **Maintain** > **New deduction**.

   In the **New deduction** dialog box, the **Deduction ID** field is set based on the **Deduction ID** number sequence that is defined on the **Trade allowance management parameters** page (**Sales and marketing** > **Setup** > **Trade allowances** > **Trade allowance management parameters**).

3. Set the following fields:

   - **Customer account** – Select the customer account that the deduction applies to.
   - **External claim number** – Enter the customer's claim reference.
   - **Claim amount** – Enter the tax-inclusive claim amount. The value must be positive.
   - **Currency** – Select the currency for the deduction. The default value is the currency that is set for the selected customer account.
   - **Claim basis** – Select the claim basis. The claim basis determines the type of credit transaction that is created after the deduction or claim is approved.
     - *Price based* – A draft free text invoice will be created.
     - *Quantity based* – A negative sales order or return order will be created.
   - **Claim date** – Select the date of the claim. The default value is the current date.
   - **Claim reason** – Select the reason code that applies to the current deduction. The claim basis that you selected affects the options that apply. For more information

about how to create and configure the claim reasons that are available for selection here, see the Create deduction reasons section earlier in this article.

- **Notes** – Add any notes that apply. When the claim is approved, the approver will be able to edit or add to the claim's notes.

- **Create claim journal** – Set this option to specify whether the claim journal should be created when the claim or deduction is created:
  - *Yes* – The system will create and post a general journal by using the claim journal that is set up on the **Accounts receivable parameters** page. (Learn more in the Configure accounts receivable and deductions section earlier in this article.) When an invoice is attached to the claim, the claim journal is used to reduce the balance of the applicable invoice. If the claim is later rejected, the claim journal and settlements (if an invoice was attached) will be reversed.
  - *No* – No claim journal is created at this time. It will be created when the claim is approved. An invoice can still be attached to the new claim, even though a claim journal isn't created. However, settlement can't be done without the claim journal.

4. Select **OK**.

   A new deduction is created. If you set the **Create claim journal** option to *Yes*, the following transactions are posted:

   - **Two new customer transactions** – One transaction offsets the amount of the claim against the original invoice. The other transaction registers a customer's debt to the amount of the claim, because the claim hasn't yet been approved. The original invoice transaction and the offsetting claim transaction will automatically be marked for settlement when you attach the invoice by selecting **Maintain** > **Attach invoice** on the Action Pane.
   - **Two offsetting transactions** – These transactions are posted to the **Deduction offset** ledger account.
   - **Claim journal** – To view the claim journal for each deduction that is shown on the deduction workbench, select the **References** tab. The claim journal is shown in the **Journal batch number** field. You can also view the claim journal on the **Deduction events** tab. There, it will have an **Update type** value of *Match*.

Create a deduction from a customer settlement

The process of creating a deduction from a customer settlement resembles the process of creating a deduction via the deduction workbench. However, the customer and invoice currency are automatically set, and the invoice is attached. You don't have to select **Maintain** >

Attach invoice on the Action Pane when you create a claim or deduction via the customer settlement page.

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select the customer to create a deduction for.
3. On the Action Pane, on the **Collect** tab, in the **Settle** group, select **Settle transactions**.
4. In the **Setting transactions** dialog box, on the **Overview** tab, select the invoice to create the deduction against.
5. On the toolbar, select **Deductions** > **New deduction**.

   In the **New deduction** dialog box, the **Deduction ID** field is set based on the **Deduction ID** number sequence that is defined on the **Trade allowance management parameters** page (**Sales and marketing** > **Setup** > **Trade allowances** > **Trade allowance management parameters**). The **Customer account** field is set to the customer account that the deduction applies to.
6. Set the following fields:

   - **External claim number** – Enter the customer's claim reference.
   - **Claim amount** – Enter the tax-inclusive claim amount. The value must be positive.
   - **Currency** – Select the currency for the deduction. The default value is the currency that is set for the selected customer account.
   - **Claim basis** – Select the claim basis. The claim basis determines the type of credit transaction that is created after the deduction or claim is approved.
     - *Price based* – A draft free text invoice will be created.
     - *Quantity based* – A negative sales order or return order will be created.
   - **Claim date** – Select the date of the claim. The default value is the current date.
   - **Claim reason** – Select the reason code that applies to the current deduction. The claim basis that you selected affects the options that apply. For more information about how to create and configure the claim reasons that are available for selection here, see the Create deduction reasons section earlier in this article.
   - **Notes** – Add any notes that apply. When the claim is approved, the approver will be able to edit or add to the claim's notes.
   - **Create claim journal** – Set this option to specify whether the claim journal should be created when the claim or deduction is created:

- *Yes* – The system will create and post a general journal by using the claim journal that is set up on the **Accounts receivable parameters** page. (Learn more in the Configure accounts receivable and deductions section earlier in this article.) When an invoice is attached to the claim, the claim journal is used to reduce the balance of the applicable invoice. If the claim is later rejected, the claim journal and settlements (if an invoice was attached) will be reversed.
- *No* – No claim journal is created at this time. It will be created when the claim is approved. An invoice can still be attached to the new claim, even though a claim journal isn't created. However, settlement can't be done without the claim journal.

7. Select **OK**.

   A new deduction is created. If you set the **Create claim journal** option to *Yes*, the following transactions are posted:

   - **Two new customer transactions** – One transaction offsets the amount of the claim against the original invoice. The other transaction registers a customer's debt to the amount of the claim, because the claim hasn't yet been approved. The original invoice transaction and the offsetting claim transaction will automatically be marked for settlement when you attach the invoice by selecting **Maintain** > **Attach invoice** on the Action Pane.
   - **Two offsetting transactions** – These transactions are posted to the **Deduction offset** ledger account.
   - **Claim journal** – To view the claim journal for each deduction that is shown on the deduction workbench, select the **References** tab. The claim journal is shown in the **Journal batch number** field. You can also view the claim journal on the **Deduction events** tab. There, it will have an **Update type** value of *Match*.

   You're returned to the **Settle transactions** page, which now shows the selected invoice as marked. The **Post** button is available only if you set the **Create claim journal** option to *Yes*. If it's available, select **Post** to reduce the balance on the invoice by the **Claim amount** value.

Create a deduction from a customer page

The process of creating a deduction from a customer page resembles the process of creating a deduction via the deduction workbench. However, the customer is automatically set.

1. Go to **Accounts receivable** > **Customers** > **All customers**.

2. Select the customer to create a deduction for.

3. On the Action Pane, on the **Collect** tab, in the **Deductions** group, select **Create deductions**.

   In the **New deduction** dialog box, the **Deduction ID** field is set based on the **Deduction ID** number sequence that is defined on the **Trade allowance management parameters** page (**Sales and marketing** > **Setup** > **Trade allowances** > **Trade allowance management parameters**). The **Customer account** field is set to the customer account that the deduction applies to.

4. Set the following fields:

   - **External claim number** – Enter the customer's claim reference.
   - **Claim amount** – Enter the tax-inclusive claim amount. The value must be positive.
   - **Currency** – Select the currency for the deduction. The default value is the currency that is set for the selected customer account.
   - **Claim basis** – Select the claim basis. The claim basis determines the type of credit transaction that is created after the deduction or claim is approved.
     - *Price based* – A draft free text invoice will be created.
     - *Quantity based* – A negative sales order or return order will be created.
   - **Claim date** – Select the date of the claim. The default value is the current date.
   - **Claim reason** – Select the reason code that applies to the current deduction. The claim basis that you selected affects the options that apply. For more information about how to create and configure the claim reasons that are available for selection here, see the Create deduction reasons section earlier in this article.
   - **Notes** – Add any notes that apply. When the claim is approved, the approver will be able to edit or add to the claim's notes.
   - **Create claim journal** – Set this option to specify whether the claim journal should be created when the claim or deduction is created:
     - *Yes* – The system will create and post a general journal by using the claim journal that is set up on the **Accounts receivable parameters** page. (Learn more in the Configure accounts receivable and deductions section earlier in this article.) When an invoice is attached to the claim, the claim journal is used to reduce the balance of the applicable invoice. If the claim is later rejected, the claim journal and settlements (if an invoice was attached) will be reversed.
     - *No* – No claim journal is created at this time. It will be created when the claim is approved. An invoice can still be attached to the new claim, even though a claim

journal isn't created. However, settlement can't be done without the claim journal.

5. Select **OK**.

   A new deduction is created. If you set the **Create claim journal** option to *Yes*, the following transactions are posted:

   - **Two new customer transactions** – One transaction offsets the amount of the claim against the original invoice. The other transaction registers a customer's debt to the amount of the claim, because the claim hasn't yet been approved. The original invoice transaction and the offsetting claim transaction will automatically be marked for settlement when you attach the invoice by selecting **Maintain** > **Attach invoice** on the Action Pane.
   - **Two offsetting transactions** – These transactions are posted to the **Deduction offset** ledger account.
   - **Claim journal** – To view the claim journal for each deduction that is shown on the deduction workbench, select the **References** tab. The claim journal is shown in the **Journal batch number** field. You can also view the claim journal on the **Deduction events** tab. There, it will have an **Update type** value of *Match*.

Create a credit note for a customer

After an approved rebate exists for a customer, you can create a credit note on the customer's account to represent the rebate, as required. The credit then appears on the deduction workbench, where it can be matched to a deduction.

To create a credit note, follow these steps.

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. Select the customer.
3. On the Action Pane, on the **Collect** tab, in the **Settle** group, select **Settle transactions**.
4. In the **Settle transactions** dialog box, select the transaction that the rebate was applied to.
5. On the toolbar, on the **Functions** menu, select the type of rebate program that applies.
6. On the **Rebate** page, on the **Overview** tab, select the **Mark** checkbox next to the relevant rebate ID.
7. On the Action Pane, select **Functions** > **Create credit note**.

Process a deduction on the deduction workbench

On the deduction workbench, you can match deductions to open credit transactions, split deductions, deny deductions, and write off deductions.

Depending on how you want to process a deduction, complete one or more of the procedures in the following subsections. You can combine the procedures as required. For example, you can split a deduction into two parts, and then match one part to a credit but leave the remaining part on the workbench so that it be matched to another credit later. You can also match a deduction to a credit that is smaller than the deduction amount, and then deny or write off the remaining balance of the deduction.

Match a deduction to a credit

To match a deduction to a credit, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. In the **Open transactions** section, select the **Mark** checkbox for the credit to match to the deduction. If multiple credits are listed, you can select more than one credit to match to the deduction. If you want the system to automatically select credits that match the amount of the deduction, on the toolbar, select an appropriate option on **Select deduction amount** menu.
4. On the Action Pane, select **Maintain** > **Match**. The system matches the deduction to the credit. If a balance remains in the deduction, it's shown in the **Remaining amount** field on the **Deductions** tab.

   > ⓘ **Note**
   >
   > For deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, the **Maintain** > **Match** command is available only if the **Claim status** field is set to *Accepted*. This command can be used to manually match the price-based or quantity-based transaction to the associated credit in the **Open transactions** section. This credit is created either when the deduction is approved (by using the **Maintain** > **Approve deduction** command), or when it's attached to an existing credit as described in the Credits created outside the approve deduction process section later in this article. The *Settle approved deductions* periodic task (**Sales marketing** > **Periodic tasks** > **Settle approved deductions**) can also be used to automatically match deductions and credits that have matching **Deduction ID** values and amounts.

Split a deduction

To split a deduction, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Split**.
4. In the **Split** dialog box, in the **Split amount** field, enter the amount to split from the main deduction. Then select **OK**.
5. On the **Deductions** tab, notice that a new record appears for the split amount. The original deduction record contains the remainder of the deduction balance. You can now manage the two parts of the original rebate separately.
6. Select the original deduction record, and then select the **References** tab. The **Split amount** field shows the amount that was split off from the original amount.

Attach an invoice to a deduction

You can attach an invoice to a deduction if the deduction was created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, and if no invoice is currently attached to it (that is, the **Invoice** column is blank).

To attach an invoice to a deduction, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Attach invoice**.
4. In the **Attach invoice** dialog box, select an invoice, and then select **OK**.
5. In the **Settle transactions** dialog box, follow one of these steps, depending on whether a claim journal was posted when the deduction was created:
    - If a claim journal was posted, the invoice that you selected and the claim journal's customer credit transaction show a check mark in the **Mark** column. Select **Post**. The remaining balance on the attached invoice is reduced by the claim amount.
    - If a claim journal wasn't posted, no transaction shows a check mark in the **Mark** column. Because you can't offset against a claim journal until the deduction is approved, select **Cancel**.

Detach an invoice from a deduction

You can detach an invoice from a deduction if the deduction was created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, if an invoice is currently attached to it (that is, the **Invoice** column shows an invoice number), and if the **Claim status** field is set to *Open*. You might complete this task because an incorrect invoice was attached. The invoice is removed from the deduction, and its remaining balance is updated if it was reduced when the invoice was attached.

To detach an invoice, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Detach invoice**.

Approve a deduction

You can approve deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page. However, you can approve only deductions where the **Claim status** field is set to *Open*.

To approve a deduction, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Approve deduction**.
4. In the **Approve deduction** dialog box, edit or add information to the **Note** value as required.
5. If the deduction is price-based, and an invoice hasn't been attached to it, select an item sales tax group. Typically, the tax item group is set on the invoice. Therefore, the tax item code must be specified when it isn't attached to an invoice.
6. Select **OK**.

   At this point, no further changes can be made to the deduction. If the **Create claim journal** option was set to *No* when the deduction was created, the claim journal is created and posted when the deduction is approved. After the deduction is approved, the credit is automatically created and opened. The type depends on the deduction's **Claim basis** value:

   - *Price based* – If the deduction is price-based, a free text invoice is created for the customer account. You can add a description and post the credit. The following fields are filled in by the deduction when the draft is created:

- **Deduction ID** – This field is added to the header to enable traceability back to the deduction.
- **Main account** – The value is determined by the **Claim posting account** value that is set for the deduction reason that is assigned to the deduction.
- **Item sales tax group** – The value is determined by the attached invoice or by the value that you selected when you approved the deduction.
- **Unit price** – The value is the credit of the deduction's claim amount.
- **Invoice text** – By default, this field is set to the deduction's **Notes** value.

- *Quantity based* – If the deduction is quantity-based, an open sales order or return order is created. The **Create return order** setting on the Accounts receivable parameters page determines whether a sales order or a return order is created when the deduction is approved. The **Copy orders** page appears and is filtered to show rows where the **Invoice account** field is set to the deduction's customer account. Follow these steps:

  a. On the **Invoices** FastTab, the **Headers** section shows sales invoices where the **Invoice account** value matches the deduction's customer account. Select an applicable sales invoice.

  b. The **Lines** section shows lines from the selected sales invoice. Select the **Select** checkbox for each line that you want to copy. Alternatively, in the **Headers** section, select the **Select all** checkbox for the sales order to select all its lines.

  c. Adjust the **Quantity** value for one or more lines as required.

     All the lines that you've selected so far are listed on the **Selected lines or header to be copied** FastTab.

  d. Repeat the previous two steps as required until all the required lines are listed on the **Selected lines or header to be copied** FastTab.

  e. Select **OK**.

     The new return order is opened, and the following fields are automatically set:
     - **Deduction ID** – This field is added to the header to enable traceability back to the deduction.
     - **Return reason code** – By default, this field is set to the **Return reason code** value that is set for the deduction reason that is assigned to the deduction.

After the credit is invoiced, it appears in the **Open transactions** section of the deduction workbench against the applicable **Deduction ID** value, and its **Claim type** field is set to *Other credits*. The credit will be available until it's settled with the deduction in one of the following ways:

- You manually settle it by selecting **Maintain** > **Match** on the Action Pane.
- It's automatically settled by the *Settle approved claims* periodic job (**Sales and marketing** > **Periodic tasks** > **Settle approved claims**).
- It's automatically settled because the **Automatic settlement** option on the **Settlement** tab of the **Accounts receivable parameters** page is set to *Yes*.

To view the credit that is created when the deduction is approved, you can also use the **Open credit** button in the **Open transactions** section of the deduction workbench.

Create a return order

You can create a return order for deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page. However, all the following conditions must be met:

- The **Claim basis** field is set to *Quantity based*.
- The **Claim status** field is set to *Open*.
- The **Create return order** option on the **Deductions** tab of the Accounts receivable parameters page is set to *Yes*.
- The **Create return order prior to deduction approval** option on the **Deductions** tab of the Accounts receivable parameters page is set to *Yes*.

To create a return order, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Create return order**.
4. In the **Approve deduction** dialog box, edit or add information to the existing **Notes** value as required, and then select **OK**.
5. In the **Copy orders** dialog box, on the **Invoices** FastTab, the **Headers** section shows sales invoices where the **Invoice account** value matches the deduction's customer account. Select an applicable sales invoice.
6. The **Lines** section shows lines from the selected sales invoice. Select the **Select** checkbox for each line you want to copy. Alternatively, in the **Headers** section, select the **Select all** checkbox for the sales order to select all its lines.
7. Adjust the **Quantity** value for one or more lines as required.

   All the lines that you've selected so far are listed on the **Selected lines or header to be copied** FastTab.

8. Repeat the previous two steps as required until all the required lines are listed on the **Selected lines or header to be copied** FastTab.

9. Select **OK**.

   The new return order is opened, and the following fields are automatically set:

   - **Deduction ID** – This field is added to the header to enable traceability back to the deduction.
   - **Return reason code** – By default, this field is set to the **Return reason code** value that is set for the deduction reason that is assigned to the deduction.

Deny a deduction

To deny a deduction, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.

2. Select the **Mark** checkbox for the deduction to process.

3. On the Action Pane, select **Maintain** > **Deny**.

4. In the **Deny** dialog box, select the reason code for the denial, and then select **OK**.

5. In the **Show** field below the Action Pane, select *Closed*.

   The **Deductions** tab shows the denied deduction, and the **Remaining amount** field for the deduction is set to *0.00*.

   For deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, the following events occur:

   - On the **References** tab, fields in the **Denial** section are updated.
   - If you selected to create the claim journal when the deduction was created, and if an invoice has been attached to the deduction that reduced the invoice's balance, the invoice is detached, and the remaining balance of the previously attached invoice is increased by the rejected claim's amount.
   - The deduction's **Status** field is set to *Closed*.
   - The deduction's **Claim status** field is set to *Rejected*.

To reverse a denial, follow these steps.

1. On the **Deductions** tab, select a denied deduction.

2. On the Action Pane, select **Reverse denial**.

For deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, the following events occur:

- On the **References** tab, fields in the **Denial** section are updated.
- The deduction's **Status** field is set to *Open*.
- The deduction's **Claim status** field is set to *Open*.

Write off a deduction

To write off a deduction, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the **Mark** checkbox for the deduction to process.
3. On the Action Pane, select **Maintain** > **Write-off**.
4. In the **Write-off** dialog box, select the reason code for the write-off, and then select **OK**.
5. In the **Show** field, select *Closed*.

   The **Deductions** tab shows the written-off deduction, and the **Remaining amount** field for the deduction is set to *0.00*.

   For deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, the following events occur:

   - On the **References** tab, fields in the **Write-off** section are updated.
   - If you created the claim journal when the deduction was created, a claim journal is posted to the deduction's write-off reason code. You can view this entry on the **Deduction events** tab, where it has an **Update type** value of *Write-off*.
   - The deduction's **Status** field is set to *Closed*
   - The deduction's **Claim status** field is set to *Write-off*.

To reverse a write-off, follow these steps.

1. On the **Deductions** tab, select a denied deduction.
2. On the Action Pane, select **Reverse write-off**.

   For deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page, the following events occur:

- On the **References** tab, fields in the **Write-off** section are updated.
- If you created the claim journal when the deduction was created, a claim journal is posted to the deduction's write-off reason code. You can view this entry on the **Deduction events** tab, where it has an **Update type** value of *Reverse write-off*.
- The deduction's **Status** field is set to *Open*.
- The deduction's **Claim status** field is set to *Open*.

Credits created outside the Approve deduction process

This section applies only to deductions that were created by using the **New deduction** command on the deduction workbench, customer settlement, or customer page.

Different users might already have created a free text invoice, return order, or negative sales order for a customer's claim outside the **Approve deduction** process. When the existing deduction is approved on the deduction workbench, the system automatically creates another free text invoice, return order, or negative sales order. This section describes how to attach existing credits to a deduction before the deduction is approved, to help prevent duplicate credits.

Attach a credit to deduction

This section describes how you can attach a credit to a deduction from the credit.

After a credit is attached to the deduction, you can view it by using the **Open credit** button on the toolbar in the **Open transactions** section of the deduction workbench.

After a credit is invoiced, and the deduction is approved, the credit appears in the **Open transactions** section of the deduction workbench against the applicable **Deduction ID** value, and its **Claim type** field is set to *Other credits*.

Attach a free text invoice to a deduction

To attach a free text invoice to a deduction, follow these steps.

1. Go to **Accounts receivable** > **Invoices** > **All free text invoices**.
2. Select the applicable invoice.
3. On the Action Pane, on the **Invoice** tab, select **Attach credit to deduction**. This button is available only if the free text invoice's **Deduction ID** field is blank. A blank field indicates that the free text invoice isn't already attached to a deduction.

4. On the **Attach credit to deduction** page, you can select *one* deduction. Only open *price-based* deductions are available for selection.
5. Select **OK**. The **Deduction ID** field is set on the free text invoice's header.

Attach a return order to a deduction

To attach a return order to a deduction, follow these steps.

1. Go to **Accounts receivable** > **Orders** > **All return orders**.
2. Select the applicable received or open return merchandise authorization (RMA) number.
3. On the Action Pane, on the **Return order** tab, select **Attach credit to deduction**. This button is available only if the return order's **Deduction ID** field is blank. A blank field indicates that the return order isn't already attached to a deduction.
4. On the **Attach credit to deduction** page, you can select *one* deduction. Only open *quantity-based* deductions are available for selection.
5. Select **OK**. The **Deduction ID** field is set on the return order's header.

Attach a sales order to a deduction

To attach a sales order to a deduction, follow these steps.

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Select the applicable open, delivered, or invoiced sales order.
3. On the Action Pane, on the **Invoice** tab, select **Attach credit to deduction**. This button is available only if the sales order's **Deduction ID** field is blank. A blank field indicates that the sales order isn't already attached to a deduction.
4. On the **Attach deduction** page, you can select *one* deduction. Only open *quantity-based* deductions are available for selection.
5. Select **OK**. The **Deduction ID** field is set on the sales order's header.

Detach a deduction from a credit

If the incorrect deduction has been attached, you can detach it from the credit. However, all the following conditions must be met:

- A credit is attached to the deduction.
- The **Claim status** field is set to *Open*.

To detach a deduction from a credit, follow one of these steps, depending on the credit type:

- **Free text invoices:** On the **All free text invoices** page, select an invoice. Then, on the Action Pane, on the **Invoice** tab, select **Detach credit from deduction**.

- **Return orders:** On the **All return orders** page, select an order. Then, on the Action Pane, on the **Return order** tab, select **Detach credit from deduction**.
- **Sales orders:** On the **All sales orders** page, select an order. Then, on the Action Pane, on the **Invoice** tab, select **Detach credit from deduction**.

Attach a deduction to a credit

This section describes how you can attach a deduction to a credit from the deduction.

Attach a deduction to a free text, return order, or sales order credit

To attach a deduction to a free text, return order, or sales order credit, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. Select the applicable open deduction.
3. On the Action Pane, select **Maintain** > **Attach deduction to credit**. This button is available only if the **Claim status** field is set to *Open*.
4. On the **Attach credit** page, you can select *one* credit. The type of credits that is shown depends on the deduction's **Claim basis** value:
    - *Price based* – The page shows free text invoices for the customer account where the **Deduction ID** field is blank. Customer requisitions are also shown because the free text invoice might be unposted. Therefore, it might not have a number that can be referenced.
    - *Quantity based* – The type of credits that is shown depends on the setting of the **Create return order** option on the Accounts receivable parameters page:
        - *Yes* – The page shows return orders for the customer account where the **Deduction ID** field is blank.
        - *No* – The page shows sales orders for the customer account where the **Deduction ID** field is blank.
5. Select **OK**. The **Deduction ID** field is set on the credit's header.

After a credit is attached to the deduction, you can view it by using the **Open credit** button on the toolbar in the **Open transactions** section of the deduction workbench.

After a credit is invoiced, and the deduction is approved, the credit appears in the **Open transactions** section of the deduction workbench against the applicable **Deduction ID** value, and its **Claim type** field is set to *Other credits*.

Detach a credit from the deduction

If the incorrect credit has been attached, you can detach it from the deduction. On the Action Pane, in the **Maintain** group, select **Detach deduction from credit**. The **Deduction ID** value is removed from the credit.

The **Detach deduction from credit** button is available only if the following conditions are met:

- A credit is attached to the deduction.
- The **Claim status** field is set to *Open*.

Create a one-time promotion

Sometimes, you might not have an approved rebate that you can match to a deduction. In this case, you can use the *one-time promotion* feature to match the deduction to a trade allowance that is associated with the customer. The *one-time promotion* feature creates a new trade allowance agreement and a lump sum merchandising event. It then matches the lump sum to the deduction and makes the postings that are required to close the deduction.

This feature is useful if you use trade allowances. For more information about trade allowances, see Trade allowance management.

First, you must set up a template that can be used to create the new trade allowance agreement. To set up a template, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Templates**.
2. On the Action Pane, select **New**.
3. In the fields, enter the information that should appear in the agreements that are created from the template.
4. On the **Customers** FastTab, in the **Hierarchy** field, select a hierarchy level.
5. In the hierarchy list, select the customer that has an unmatched deduction, and then select the right arrow button (>). The customer is added to the **Trade allowance agreement customers** list.
6. Set the remaining fields as you require, and then close the page.
7. Go to **Sales and marketing** > **Setup** > **Trade allowance** > **Trade allowance management parameters**.
8. On the **Overview** tab, in the **One-time promotion template** field, select the name of the template to use to create one-time promotions.

Next, you can create a one-time promotion on the deduction workbench. To create a one-time promotion, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.

2. Select the **Mark** checkbox next to the deduction to process.

3. On the Action Pane, select **Maintain** > **Settle deduction as one-time promotion**.

4. In the **One-time promotion** dialog box, follow these steps to associate the deduction with one or more funds:
   a. Select **New**, and then, in the **Fund ID** field, select a fund ID. Repeat this step to add as many funds as you require.
   b. In the **Percent** field next to each fund ID, enter the percentage of the deduction to allocate to the fund. The amounts that you enter in the **Percent** fields must total 100 percent.

5. Select **OK**. The system creates a new trade allowance agreement that has a lump sum merchandising event and matches the lump sum to the deduction.

Do a mass update of deductions

If you must make the same change to multiple deductions, you can select those deductions and do a mass update of their fields.

To do a mass update, follow these steps.

1. Go to **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**.
2. In the **Show** field below the Action Pane, select the type of deductions to view.
3. Select the checkbox next to each deduction that you want to update. Then, on the Action Pane, select **Maintain** > **Mass update**.
4. The **Mass update** dialog box shows the selected deductions. Update the fields as you require, and then select **OK** to accept the changes.

Sales and marketing overview

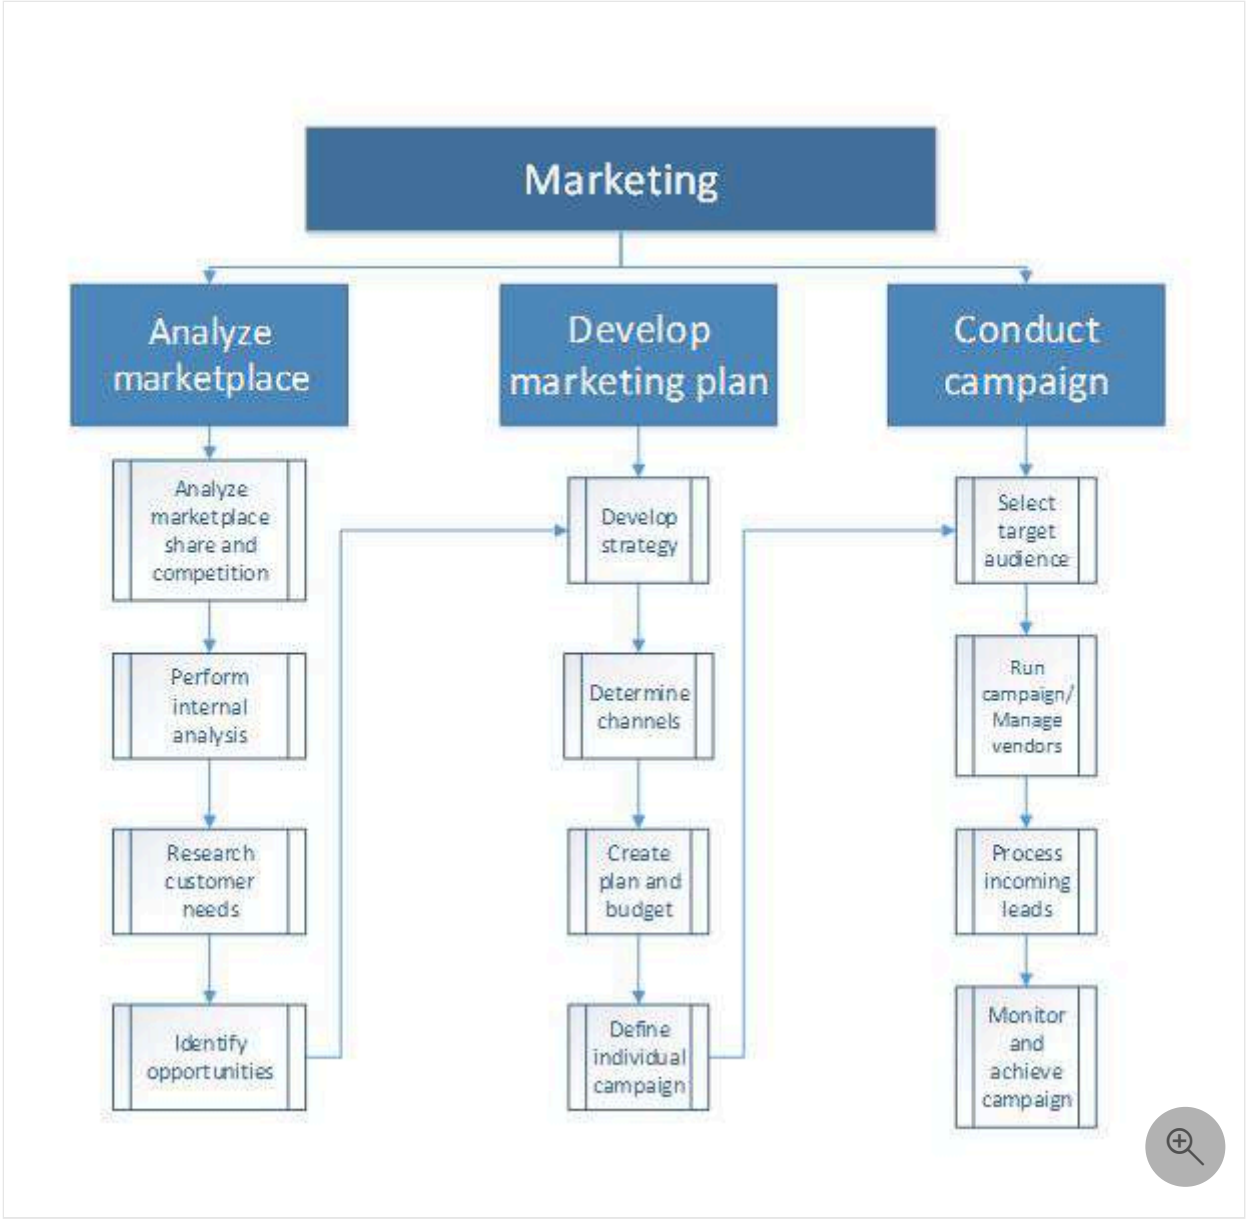
Use Sales and marketing to obtain, store, and use various types of data in the sales flow. This data includes the original sales initiative, future follow-up action, and additional sales.

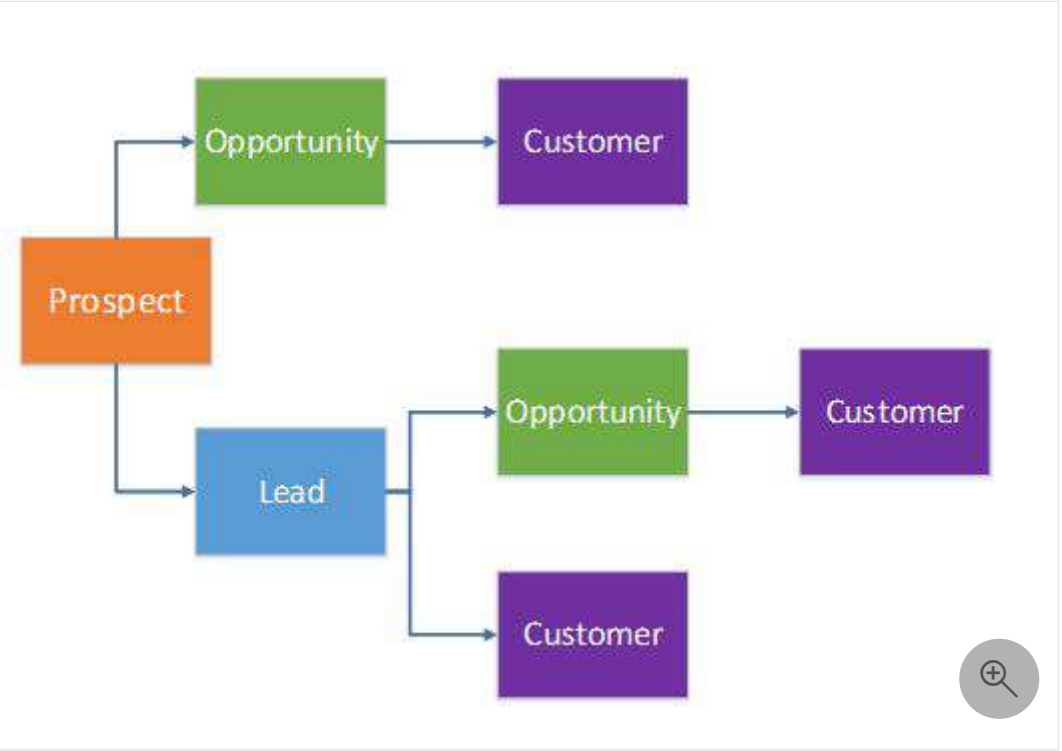
Marketing

Use marketing campaigns and activities to find and build relationships with potential customers, so that initial interactions can develop into sales relationships. The following process flow shows the business process for marketing.



Relationships

In sales and marketing, the initial interactions that you have with potential customers can occur in various situations. For example, you might find a prospective customer while you're attending a trade show, or you might have a possible lead with a customer after your organization runs a mass mailing campaign. It's very important that you understand the flow of a party's entity before that party becomes a customer. The following graphic shows the flow of entity relationships as a potential customer becomes an actual customer.

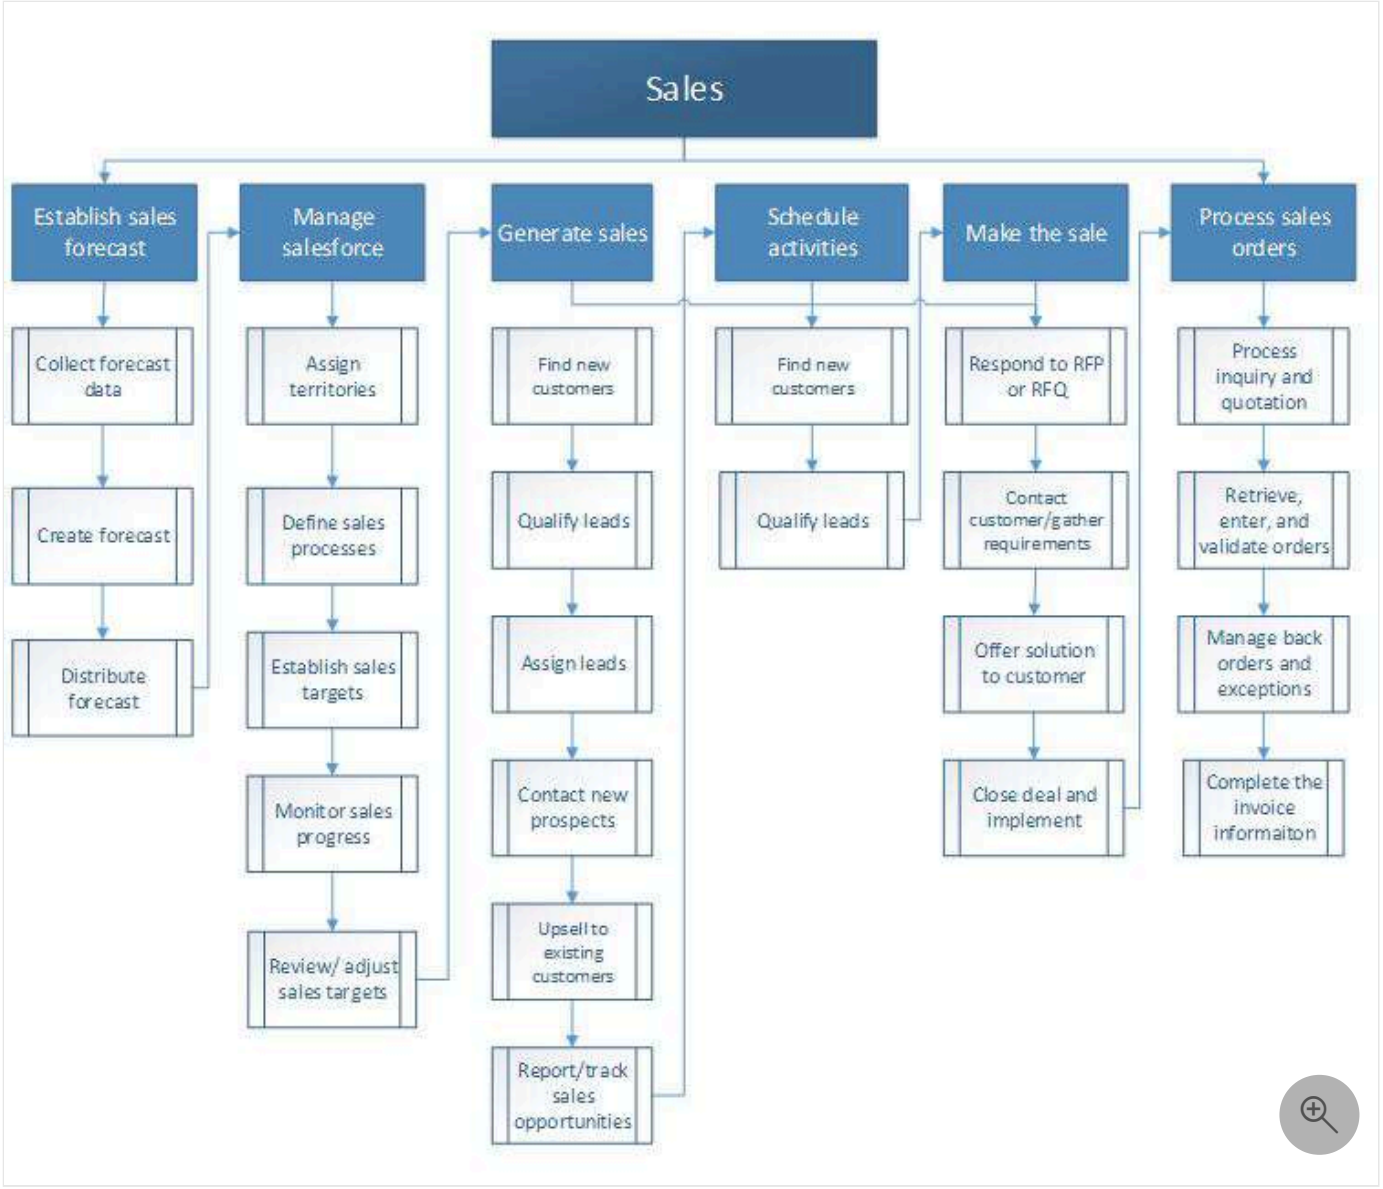


Campaigns

A campaign targets the contacts for prospects, leads, opportunities, and customers that are selected to participate in the campaign. In Supply Chain Management, you can create several types of campaigns, such as telemarketing, mailing, and email campaigns, to maximize your customer potential. As your campaign progresses and you receive positive responses, you can begin the sales process with those recipients who respond positively to the campaign.

Sales

Use the sales functionality to create quotations, up-sell and cross-sell to new and existing customers, create sales orders, and create sales invoices for customers. The following process flow shows the business process for sales.



Sales quotations

Create sales quotations to present customers an offer of the goods or services that you provide. A customer might request a quotation, or you might create a quotation in response to a request from a potential or existing customer. When the customer approves the sales quotation, you can convert it to a sales order.

Up-sell/cross-sell

Up-selling and cross-selling are techniques for selling products when an order is entered for a customer. In up-selling, you suggest another product instead of the current product. In cross-selling, you suggest a product in addition to the current product. When you set up product lists, you can create specific rules to indicate when a product should be suggested as a cross-sell or up-sell product.

Sales orders

When you create a new sales order, select the type of sales order to create. You have five options.
> [!NOTE]

> After you create a sales order, you can change any order type, except the **Items requirements** type if the sales order has a status of **Delivered**.

Expand table

Sales order type	Description
Journal	Use this type as a draft for a sales order. This type has no effect on the stock quantities and doesn't generate item transactions.
Subscription	Use this type for recurring orders. When the order is invoiced, the order status is automatically set to an open order. The delivered quantity that was invoiced and the remaining deliveries are updated. You can't use this sales order type if you're using the Warehouse management functionality.
Sales order	Use this type when a customer places or confirms an order.
Returned order	Use this type when a customer returns an item. A return-item number (RMA number) is assigned automatically.
Item requirements	This type is created automatically when you make an item sale through a project.

Sales agreements

A sales agreement is a contract that commits the customer to buy a product in a specific quantity or for a specific amount over time, in exchange for special prices and discounts. The prices and discounts of the sales agreement overrule any prices and discounts that are stated in any trade agreements that exist. A sales agreement is valid for a defined period. The requested ship date specified for a sale on the **Sales order** page should be in the valid period. By default, a sales agreement is on hold. You can order from a sales agreement only when it's set to **Effective**.

Backorders

When you enter and validate orders, you might need to manage backorders and exceptions before you can complete the sale. Backorders are either purchase orders that a vendor is yet to deliver or sales orders that you're yet to deliver to a customer. It's important that you follow up on backorders. For example, if a vendor delays products, you might need to change the date of

delivery to a customer and then inform the customer of the delay. You can view backorders by item, customer, or vendor.

Viewing backorders by item

When you view backorders by item, you can follow up on the expected future flow of transactions for a specific item. For example, you can check the following information:

- The number of sales orders that are placed for an item
- Whether deliveries of the item from vendors are still missing
- Whether you should order more items so that you can deliver all sales orders in a timely manner

By doing this check, you can respond to requests from customers about the timing of the item delivery. In addition, you can prioritize the sales backorders and split the items that are on hand between the orders.

Viewing backorders by customer

When you view backorders by customer, you can view the status of the customer's remaining orders. This check is useful when you must respond to customers who are waiting for items that are delayed.

Viewing backorders by vendor

When you view backorders by vendor, you can follow up on missing deliveries and expected dates of delivery. This check also helps you prioritize the backorders when products arrive from vendors and the sales orders must be picked for delivery.

Invoices

During the sales process, you can create three types of invoices:

- Customer invoice
- Free text invoice
- Pro forma invoice

Customer invoice

A customer invoice is a bill that an organization gives to a customer in connection with a sale. You create this kind of customer invoice based on a sales order that includes a header and one or

more lines for items or services. The customer invoice completes the sales order, packing slip, and sales invoice cycle.

You can post and print a single customer invoice, based on either a sales order or the packing slip and date. You can also post and print multiple customer invoices together, based on the packing slips and dates. When you post a single customer invoice by using the sales order, the **Invoiced remainder** quantity for each item is updated with the total of the invoiced quantities from the selected sales order.

If both the **Invoiced remainder** and **Deliver remainder** quantities for all items on the sales order are 0 (zero), the status of the sales order changes to **Invoiced**. If the quantity of either field isn't 0, the status of the sales order isn't changed, and you can enter additional invoices. To post and print one or more customer invoices based on the packing slips, you must already have posted at least one packing slip for each sales order. The customer invoice is based on the packing slips and reflects the quantities that are listed.

You can create a customer invoice that is based on the packing slip line items that you shipped to date, even if all the items for a particular sales order aren't yet shipped. You might do this if, for example, your legal entity issues one invoice per customer per month to cover all the deliveries that you ship during that month. Each packing slip represents a partial or complete delivery of the items on the sales order.

When you post the invoice, the **Invoice remainder** quantity for each item is updated with the total of the delivered quantities from the selected packing slips. If the **Invoice remainder** and **Deliver remainder** quantities for all items on the sales order are 0 (zero), the status of the sales order changes to **Invoiced**. If the quantity isn't 0, the status of the sales order isn't changed, and you can enter additional invoices. Inventory transactions are updated with the invoice number, and the status on the sales order line changes to **Invoiced**.

Free text invoice

A free text invoice is an invoice that isn't related to a sales order. It contains order lines that include ledger accounts, free-text descriptions, and a sales amount. You can't enter an item number on this kind of invoice, and you must enter the appropriate sales tax information. A main account for the sale is indicated on each invoice line. The customer balance is posted to the summary account from the posting profile that is used for the free text invoice.

Pro forma invoice

A pro forma invoice is an invoice that you prepare as an estimate of the actual invoice amount before the invoice is posted. You can print a pro forma invoice for either a customer invoice or a free text invoice.

Order promising

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about order promising. Order promising helps you reliably promise delivery dates to your customers and gives you flexibility so that you can meet those dates.

Order promising calculates the earliest ship and receipt dates, and is based on the delivery date control method and transport days. You can select among the following delivery date control methods:

- **Sales lead time** – Sales lead time is the time between creation of the sales order and shipment of the items. The delivery date calculation is based on a default number of days, and doesn't consider stock availability, known demand, or planned supply.
- **ATP (available-to-promise)** – ATP is the quantity of an item that is available and can be promised to a customer on a specific date. The ATP calculation includes uncommitted inventory, lead times, planned receipts, and issues.
- **ATP + Issue margin** – The shipping date equals the ATP date plus the issue margin for the item. The issue margin is the time that is required to prepare the items for shipment.
- **CTP (capable-to-promise)** – Availability is calculated through explosion. If you're using Planning Optimization, the *CTP* delivery date control method isn't allowed and, if it's selected, will cause an error when the calculation runs. For more information about how to set up and use CTP, see Calculate sales order delivery dates using CTP.
- **CTP for Planning Optimization** – Use the CTP calculation that is provided by Planning Optimization. This option has no effect if you're using the built-in master planning engine. For more information about how to set up and use CTP, see Calculate sales order delivery dates using CTP.

> **Note**

When a sales order is updated, the order promising information is only updated if the existing order promising date can't be fulfilled, as illustrated in the following examples:

- **Example 1**: The current order promising date is July 20, but due to increased quantity, you can't deliver until July 25. Because the current date can no longer be met, order promising is triggered.
- **Example 2**: The current order promising date is July 20, but due to decreased quantity, it's now possible to deliver on July 15. However, because the current date can still be fulfilled, order promising isn't triggered, and July 20 remains the order promising date.

ATP calculations

The ATP quantity is calculated by using the **cumulative ATP with look-ahead** method. The main advantage of this ATP calculation method is that it can handle cases where the sum of issues among receipts is more than the latest receipt. For example, when a quantity from an earlier receipt must be used to meet a requirement. The **cumulative ATP with look-ahead** calculation method includes all issues until the cumulative quantity to receive exceeds the cumulative quantity to issue. Therefore, this ATP calculation method evaluates whether some of the quantity from an earlier period can be used in a later period.

The ATP quantity is the uncommitted inventory balance in the first period. Typically, it's calculated for each period in which a receipt is scheduled. The program calculates the ATP period in days and calculates the current date as the first date for the ATP quantity. In the first period, ATP includes on-hand inventory minus customer orders that are due and overdue.

ATP is calculated by using the following formula:

ATP = ATP for the previous period + Receipts for the current period – Issues for the current period – Net issue quantity for each future period until the period when the sum of receipts for all future periods, up to and including the future period, exceeds the sum of issues up to and including the future period.

Notice that the ATP calculation doesn't include information around expiry date and beyond the ATP time fence that the system expects when any quantity can be promised.

When there are no more issues or receipts to consider, the ATP quantity for the following dates is the same as the latest calculated ATP quantity.

If all the dimensions used for an item aren't given when the ATP check is completed, you can still specify them on the issue and receipts. In this case, in the ATP calculation, the receipts and issues

must be aggregated to the existing dimensions to reduce the number of receipt and issue lines that are used in the ATP calculation.

The ATP quantity that is shown is always greater than or equal to 0 (zero). If the calculation returns a negative ATP quantity (for example, if the quantity that was previously promised exceeds the available quantity), the quantity is automatically set to 0.

Example

The **ATP backward demand time fence** field controls how far back in time to look for delayed demand orders or inventory issues. The **ATP backward supply time fence** field controls how far back in time to look for delayed supply orders or inventory receipts. For example, if orders that are delayed by only seven days should be considered in the ATP calculation, both fields should be set to **7**.

The **ATP delayed demand offset time** and **ATP delayed supply offset time** fields control when the delayed demand or supply is considered in the ATP calculation. For example, if the delayed supply and demand should be considered in the ATP calculation the day after tomorrow, set both fields to **2**. A value of **2** means that the quantity of an item on a delayed purchase order that should be considered in the ATP calculation is available two days after the current date.

For the following example, **7** is entered in the **ATP backward demand time fence** and **ATP backward supply time fence** fields, and **1** is entered in the **ATP delayed demand offset time** and **ATP delayed supply offset time** fields.

You haven't received a purchase order for 200 pieces of a product that should have been received three days ago. Therefore, a sales order line for 75 pieces of the same product that should have been shipped yesterday isn't shipped.

A customer calls and wants to order 150 pieces of the same product. When you verify the availability of the product, you find that another purchase order for 100 pieces of the product will be delivered 10 days later.

You create a sales order line for the product and enter **150** as the quantity.

Because the delivery date control method is ATP, the ATP data is calculated to find the earliest possible ship date. Based on the settings, the delayed purchase order and sales order are considered, and the resulting ATP quantity for the current date is 0. Tomorrow, when the delayed purchase order is expected to be received, the ATP quantity is calculated as more than 0 (in this

case, it's calculated as 125). However, 10 days from now, when the additional purchase order for 100 pieces is expected to be received, the ATP quantity becomes more than 150.

Therefore, the ship date is set to 10 days from now, based on the ATP calculation. Therefore, you tell the customer that the requested quantity can be delivered 10 days from now.

CTP calculations

CTP functionality lets you give customers realistic dates for when you can promise specific goods. For each sales line, you can provide a date that takes account of existing on-hand inventory, production capacity, and transportation times.

CTP extends ATP functionality by considering capacity information. Whereas ATP considers only material availability and assumes infinite capacity resources, CTP considers availability of both materials and capacity. Therefore, it provides a more realistic picture of whether demand can be satisfied within a given time frame.

CTP works slightly differently, depending on the master planning engine that you're using (Planning Optimization or the built-in engine). CTP for Planning Optimization currently supports only a subset of the CTP scenarios that are supported by the built-in engine.

For detailed information about how to set up and use CTP for each engine, see Calculate sales order delivery dates using CTP.

Calculate sales order delivery dates using CTP

Capable-to-promise (CTP) functionality lets you give customers realistic dates for when you can promise specific goods. For each sales line, you can provide a date that takes account of existing on-hand inventory, production capacity, and transportation times.

CTP extends available-to-promise (ATP) functionality by considering capacity information. Whereas ATP considers material availability and assumes infinite capacity resources, CTP considers availability of both materials and capacity.

CTP works slightly differently, depending on the master planning engine that you're using (Planning Optimization or the deprecated master planning engine). This article describes how to set it up for each engine.

How CTP compares to ATP

Use ATP when you sell from stock and capacity isn't a constraint. Use CTP when you assemble or make-to-order and capacity constraints must be taken into account. In such cases, CTP can often provide a more accurate result, as the following example shows.

Item A is an item that is composed of items B and C, and the on-hand quantity of item A is 0 (zero). If you do an ATP check, the ATP quantity is also 0 (zero). However, if you do a CTP check, the system checks the availability of items B and C, checks the resources that are required to make them into item A, and calculates how many of item A can be made. In addition, the CTP calculation can check the resources and materials that are required to make more of items B and C, and to use them to make more of item A.

A CTP calculation that considers both materials and resources might show a larger quantity than a calculation that checks only materials, particularly when the item that's being checked is an assemble or make-to-order item. In other words, CTP functionality is based on the explosion function and can be run for a selected sales order line to calculate the expected delivery date.

Near real-time CTP

Near real-time CTP enables the system to calculate CTP confirmed dates in the background, without blocking user interface (UI) interactions and without requiring that you run planning to

update the dates. *Near real-time CTP* also lets you use standard CTP delivery date control with Planning Optimization. This approach removes some of the limitations that apply when you use CTP with either planning engine. Without *Near real-time CTP*, you must use *Batch CTP* instead of *CTP* delivery date control if you're using Planning Optimization.

> **Note**
>
> - Because both Planning Optimization and the deprecated master planning engine can now use standard *CTP* delivery date control, CTP for Planning Optimization delivery date control is renamed in Supply Chain Management version 10.0.41. It's now named *Batch CTP* instead of *CTP for Planning Optimization* to better describe the difference.
> - Because CTP considers material and capacity availability and lead times for the bill of material and route for the item sold, the CTP calculation isn't as fast as the ATP calculation. When deciding which order promising policy to apply for an item, base the policy on whether the item is produced to and sold from stock (ATP, ATP + Issue Margin, or Sales Lead Time) or if it's an assemble or make-to-order item (CTP).

Enable Near real-time CTP

Before you can use *Near real-time CTP*, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.41 or later.
- The following features must be turned on in Feature management (in this order):
    1. *Improve Planning Optimization performance by merging and queueing plan regeneration jobs*
    2. *Near real-time CTP*

Queueing and merging plan regeneration jobs

The prerequisite feature, *Improve Planning Optimization performance by merging and queueing plan regeneration jobs*, enables the system to queue and merge plan regeneration requests. This capability eliminates the "Another job for the same plan is currently in progress" error and minimizes the average time that is required to complete a planning run when multiple users are working at the same time.

Here's how queueing and merging works:

- By default, the system can merge up to 10 planning requests into a single job. When the system reaches that limit, it adds new planning requests to the queue as standalone jobs. The system can also merge those jobs into another new job. If you need to change the maximum number of planning requests, contact Microsoft Support for assistance.

- You can merge planning requests into a single job only if they meet the following requirements:
  - All merged requests must belong to the same organization and master plan.
  - All merged requests must use the same filter attribute (such as `ItemId`).
  - All merged requests must have the same UI language.

- Before the system adds a planning request to the queue as a standalone job, it checks for other existing jobs that aren't yet started and can be merged with it.

- By default, the queue can hold up to 20 jobs. When the queue reaches that limit, all users who submit planning runs receive an error until more space becomes available in the queue. Each job in the queue can include several merged planning jobs. If you need to change the maximum number of jobs that are allowed in the queue, contact Microsoft Support for assistance.

Near real-time CTP functionality

Near real-time CTP provides the following functionality:

- Multiple sellers can create sales lines at the same time and immediately get confirmed delivery dates.
- When you mass-import sales lines, the system automatically calculates confirmed delivery dates.
- You can use the **Calculate confirmed delivery dates** dialog box to make the system recalculate all confirmed dates for a sales order. If you set the **Allow multiple deliveries** option to *No*, the system automatically sets all sales order lines so that they use the same delivery date.

How CTP differs, depending on the master planning engine and delivery date control that you use

The following table summarizes how CTP differs, depending on the master planning engine and delivery date control that you use.

Expand table

Element	Batch CTP	CTP
Planning engine support	Planning Optimization only	Planning Optimization and the deprecated master planning engine
Delivery date control setting for orders, order lines, and products	*Batch CTP*	*CTP*
Calculation time	The calculation is triggered when a dynamic plan is run as a scheduled task.	The calculation is immediately triggered each time that you enter or update a sales order line.
Batch CTP status field value	A value of *Not ready* is shown for orders and order lines where the dynamic plan hasn't been run since the orders and lines were created or last updated. A value of *Ready* is shown for orders and lines where CTP was used to calculate confirmed delivery dates by running the dynamic plan.	A value of *Ready* is always shown.
CTP status field value	The field isn't shown.	A value is shown only if you're using Planning Optimization. The value represents the status of the delivery date calculation.

Set default delivery date control methods

The system can use any of several methods to calculate delivery date estimates for each order and order line. Set the delivery date control method that you want to use most often as the global default method. You can also set individual overrides for each product. Later, you can override the default methods for each order and/or order line as you require.

Set the global default delivery date control

The default delivery date control method applies to all new order lines where an override doesn't apply. To select a method, follow these steps:

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

2. On the **Shipments** tab, on the **Delivery control** FastTab, in the **Delivery date control** field, select the method that you want to use as the default method for your company:

    - *None* – Don't calculate delivery dates.
    - *Sales lead time* – Sales lead time is the time between creation of the sales order and shipment of the items. The delivery date calculation is based on a default number of days, and doesn't consider stock availability, known demand, or planned supply.
    - *ATP* – ATP is the quantity of an item that's available and can be promised to a customer on a specific date. The ATP calculation includes uncommitted inventory, lead times, planned receipts, and issues.
    - *ATP + Issue margin* – The shipping date equals the ATP date plus the issue margin for the item. The issue margin is the time that is required to prepare the items for shipment.
    - *CTP* – Use the standard CTP calculation, which provides near-real-time calculations. To use this option with Planning Optimization, you must enable *Near real-time CTP* for your system.
    - *Batch CTP* – Use the non-real-time CTP calculation that's available for Planning Optimization. This setting has no effect if you're using the deprecated master planning engine.

Set delivery date control overrides for individual products

Assign overrides for specific products when you want to use a delivery date control method other than the one that you set as your global default method.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product that you want to set up.
3. On the Action Pane, on the **Manage inventory** tab, in the **Order settings** group, select **Default order settings**.
4. On the **Default order settings** page, on the **Sales order** FastTab, set the **Override delivery control** option to *Yes*.
5. In the **Delivery date control** field, select the method to use for the selected product. The same options that are described in the Set the global default delivery date control section are available.

Schedule Batch CTP calculations

When you use Batch CTP, you must run a dynamic plan to trigger the system to do the CTP calculations and then set the confirmed ship and receipt dates for all relevant orders. The plan

must include all items that confirmed ship and receipt dates are required for. (When you use standard CTP delivery date control, the CTP calculations are immediately done locally. Therefore, you don't have to run a dynamic plan to see the CTP results.)

To ensure that the dates are available in good time for all users, set up batch jobs to run the relevant plans on a recurring basis. For example, a batch job that is set up to run a dynamic plan every 30 minutes sets the confirmed ship and receive dates every 30 minutes. Therefore, users who enter and import orders wait a maximum of 30 minutes to get the confirmed ship and receive dates.

To set up a batch job to run a dynamic plan on a regular schedule, follow these steps:

1. Go to **Master planning** > **Master planning** > **Run** > **Master planning**.
2. In the **Master planning** dialog box, on the **Parameters** FastTab, set the **Master plan** field to the dynamic plan that you want to run.
3. On the **Run in the background** FastTab, set the **Batch processing** option to *Yes*.
4. Select **Recurrence**, and set up the schedule as required.
5. Select **OK** to save the schedule.
6. Select **OK** to create the batch job and close the dialog box.

Use standard CTP delivery date control

To use standard CTP delivery date control, you must either use the deprecated master planning engine or use Planning Optimization with *Near real-time CTP* enabled.

Create a new order that uses standard CTP delivery date control

Each time that you add a new sales order or order line, the system assigns a default delivery date control method to it. The order header always starts with the global default method. If you assign an override to an ordered item, the new order line uses that override. Otherwise, the new order line also uses the global default method. Therefore, set your default methods so that they match the delivery date control method that you most often use. After you create an order, you can override the default method at the order header and/or order line level as you require. Learn more in Set default delivery date control methods and Change existing sales orders to use CTP.

View confirmed delivery dates when you use standard CTP delivery date control

CTP calculations apply to orders and order lines where the **Delivery date control** field is set to *CTP*.

For sales lines that use standard CTP delivery date control, the system automatically sets the **Confirmed ship date** and **Confirmed receipt date** fields each time that you save a sales line. If you make a relevant change to a sales line later (for example, by changing its quantity or site), the system immediately recalculates the dates.

- To view the confirmed delivery dates for a sales order line, open the sales order, and select the sales line. Then, on the **Line details** FastTab, on the **Delivery** tab, review the **Confirmed ship date** and **Confirmed receipt date** values.
- To view the confirmed delivery dates for an entire order, open the sales order, and select the **Header** view. Then, on the **Delivery** FastTab, review the **Confirmed ship date** and **Confirmed receipt date** values.

Use Batch CTP

Create a new order that uses Batch CTP

Each time that you add a new sales order or order line, the system assigns a default delivery date control method to it. The order header always starts with the global default method. If you assign an override to an ordered item, the new order line uses that override. Otherwise, the new order line also uses the global default method. Therefore, set your default methods so that they match the delivery date control method that you most often use. After you create an order, you can override the default method at the order header and/or order line level as you require. Learn more in Set default delivery date control methods and Change existing sales orders to use CTP.

View confirmed delivery dates when you use Batch CTP

Batch CTP calculations apply to orders and order lines where the **Delivery date control** field is set to *Batch CTP*.

For sales lines that use Batch CTP, the **Confirmed ship date** and **Confirmed receipt date** fields stay blank until you run the appropriate dynamic plan (typically by using a periodic batch job). The system then sets these fields automatically. Learn more in Schedule Batch CTP calculations.

The **Batch CTP status** field shows whether confirmed dates are calculated for each line that uses Batch CTP. The field is set to *Not ready* for lines and orders where the confirmed delivery dates aren't calculated yet or are no longer valid because of other changes. The field is set to *Ready* for lines and orders that are calculated. You can view the status for each line and for the entire order.

- To view the status for a sales order line, open the sales order, and select the sales line. Then, on the **Line details** FastTab, on the **Delivery** tab, review the **Batch CTP status** value. The **Delivery** FastTab also shows the **Confirmed ship date** and **Confirmed receipt date** values for the line after they're calculated.
- To view the status for an entire order, open the sales order, and select the **Header** view. Then, on the **Delivery** FastTab, review the **Batch CTP status** value. The **Delivery** FastTab also shows the **Confirmed ship date** and **Confirmed receipt date** values for the order after they're calculated.

> ⓘ **Note**
>
> - If you update a sales order line after Batch CTP calculates confirmed dates for it, the system clears those dates until the next time that the appropriate dynamic plan runs.
> - If you edit a related setting that might affect existing confirmed dates (for example, by changing lead times, reservations, or markings), clear the confirmed dates for the relevant existing orders. This action changes the status of each relevant line to *Not ready*. This change causes the system to recalculate the confirmed dates the next time that it runs the dynamic plan.
> - Batch CTP only calculates confirmed dates for sales lines with status *Not Ready*, so subsequent Planning Optimization runs that affect planned supply for sales lines with status *Ready* might cause the confirmed dates to become out of sync with the latest plan result. To prevent this, consider firming planned orders early to make sure that generated supply remains unaffected by future Planning Optimization runs.

Change existing sales orders so that they use CTP

You can change the **Delivery date control** value for any open order at any time. You can change the value at the header level and/or for each line as you require.

Change to CTP at the order header level

To change an order so that it uses CTP at the order header level, follow these steps:

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Open the sales order that you want to set up, or create a new one.
3. Select **Header** to open the header information on the **Sales order details** page.

4. On the **Delivery** FastTab, set the **Delivery date control** field to one of the following values, depending on the planning engine that you're using:

    - *CTP* – Use the standard CTP calculation, which provides near-real-time calculations. To use this option with Planning Optimization, you must enable *Near real-time CTP* for your system.
    - *Batch CTP* – Use the non-real-time CTP calculation that's available for Planning Optimization. This setting has no effect if you're using the deprecated master planning engine.

5. Select **OK** to apply your changes.

Change to CTP at the order line level

If you create an order line by using a different delivery date control method, you can change to CTP at any time. Changes that you make at the line level don't affect any other lines. However, they might cause the overall order delivery dates to move forward or backward, depending on how each updated line calculation changes.

To change an order so that it uses CTP at the line level, follow these steps:

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.

2. Open the sales order that you want to set up, or create a new one.

3. On the **Sales order details** page, on the **Sales order line** FastTab, select the sales order line that you want to set up.

4. On the **Line details** FastTab, on the **Delivery** tab, set the **Delivery date control** field to one of the following values, depending on the planning engine that you're using:

    - *CTP* – Use the standard CTP calculation, which provides near-real-time calculations. To use this option with Planning Optimization, you must enable *Near real-time CTP* for your system.
    - *Batch CTP* – Use the non-real-time CTP calculation that's available for Planning Optimization. This setting has no effect if you're using the deprecated master planning engine.

    The **Available ship and receipt dates** dialog box appears, and shows the available ship and receipt dates. This dialog box works the same way for order lines as it does for the order header, as described in the previous section.

5. On the Action Pane, select **Save**.

Additional resources

- Keep supply for confirmed demand in Planning Optimization
- Optimize confirmed dates for CTP line changes

Order entry deadlines

This article provides information about order entry deadlines. An order entry deadline is a cut-off time that determines whether a customer order is treated (and fulfilled) as if it was received on the current day or the next day.

In many companies, only sales orders that are received before a certain time of day are treated as if they were received on that day. Any orders that are received after that time are treated as if they are received on the next business day. This cut-off time for orders is known as the order entry deadline.

Order entry deadlines are used as input for order promising. Therefore, they help you manage customer expectations about order deliveries. For example, customers can see that, if they place an order with you before a specific time, you will commit to shipping the goods on the same day. However, if they miss that deadline, they can expect the shipment only on the next business day. You set order entry deadlines based on your warehouse capabilities and shipping carrier schedules.

On the **Order entry deadlines** page, you set up order entry deadline times for all the days of the week. If orders are received after the specified times, they are treated as if they are received on the next day. By default, these times are set to 23:59 (that is, one minute before midnight at the end of the relevant day). You can change the default times so that they coincide with actual ship or receipt deadline times.

You can define order entry deadlines for a specific group of customers. For example, you might want a specific group of customers to have order entry deadlines that are later than those of other customers. In this case, you first define groups for order entry deadlines on the **Order entry deadline groups** page. You then assign the groups to customers on the **Customers** page.

If your company consists of several sites, you can set up order entry deadlines for each site. If the sites are located in different time zones, the order entry deadlines are set up in each site's time zone. However, when you work with sales orders and sales quotations, the order entry deadline is converted to your time zone on the **Available ship and receipt dates** page.

On the **Activate order entry deadline combinations** page, you define the combinations of sites and order entry deadline groups that are allowed.

Example: Order entry deadline

The order entry deadline on Tuesdays has been set to 16:00. On a particular Tuesday, at 17:00, you try to set the current date as the ship date. (Note that there is no lead time for this example.) If the **Delivery date control** check box is selected, you receive a warning that states that the date isn't valid. This warning appears on the **Available ship and receipt dates** page, where you can then select alternative dates.

Example: Different order entry deadlines per site

Your company consists of two sites. The sites are located in different time zones, as shown in the following table.

Expand table

Site A	Site B
California	Florida
PST (Pacific Standard Time)	EST (Eastern Standard Time)

Sites A and B have defined the following order entry deadlines.

Expand table

Day of the week	A: Order entry deadlines (PST)	B: Order entry deadlines (EST)
Monday	13:00	14:00
Tuesday	13:00	14:00
Wednesday	13:00	14:00
Thursday	13:00	14:00
Friday	13:00	14:00

You're an order processor in Utah, where the time zone is MST (Mountain Standard Time). Therefore, provided that you place orders with site A before 14:00 MST and place orders with site B before 12:00 MST, you meet the order entry deadlines for both sites.

The following table shows how the order entry deadlines for sites A and B are converted to MST time.

Expand table

Site A: PST	Site A: MST	Site B: EST	Site B: MST
13:00	14:00	14:00	12:00

Note: If adjustment for daylight saving time is in effect, the order entry deadlines are adjusted accordingly.

Example: Same order entry deadline per site

Your company consists of two sites. The sites are located in different time zones, as shown in the following table.

Expand table

Site A	Site B
California	Florida
PST (Pacific Standard Time)	EST (Eastern Standard Time)

Sites A and B have defined the following order entry deadlines.

Expand table

Day of the week	PST and EST
Monday	13:00
Tuesday	13:00
Wednesday	13:00
Thursday	13:00
Friday	13:00

You're an order processor in Utah, where the time zone is MST. Therefore, provided that you place orders with site A before 14:00 MST and place orders with site B before 11:00 MST, you meet the order entry deadlines for both sites.

The following table shows how the order entry deadlines for sites A and B are converted to MST time.

Expand table

Site A: PST	Site A: MST	Site B: EST	Site B: MST
13:00	14:00	13:00	11:00

Note: If adjustment for daylight saving time is in effect, the order entry deadlines are adjusted accordingly.

Delivery alternatives

Article • 09/29/2021

Sales order takers can use the **Delivery alternatives** page to discover alternative order fulfillment options.

The **Delivery alternatives** page layout gives an overview of all alternative options. It also lets order takers look beyond the current company for fulfillment opportunities. They can now view both intercompany opportunities and opportunities from external vendors. By sorting the options by delivery date, sales order takers can view an intelligent list of delivery alternatives. In addition, parameters help them better manage the suggested deliveries. Because transport time can affect delivery dates, sales order takers can explore the various transportation choices that carriers offer. Because detailed information is shown for each suggestion, order takers can make informed decisions directly from the **Delivery alternatives** page.

Open the Delivery alternatives page

You can open the **Delivery alternatives** page from the sales order line.

1. Select **Products and supply** > **Delivery alternatives**.
2. Select **Line details** > **Delivery** > **Delivery alternatives.**

You can also open the **Delivery alternatives** page by opening the **Sales order processing and inquiry** workspace, and then selecting **Orders and favorites** > **Delayed order lines** > **Delivery alternatives Note:** You can open the **Delivery alternatives** page only if both the following conditions are met:

- All mandatory sales line information is filled in.
- The **Delivery date control** field is set to a value other than **None**.

Delivery date control methods

The delivery date control method determines how the system establishes delivery dates, how delivery alternatives are calculated, and what information is shown. Note that delivery date control takes calendars into consideration. Therefore, the following calendars can affect the suggested receipt date: Warehouse calendar, Transport calendar, Vendor calendar, and Customer calendar. The following table describes each method for delivery date control.

Expand table

Method	Description
None	• Delivery alternatives for sales lines aren't supported. This option turns off delivery date control.
Sales lead time	• Delivery alternatives are calculated based on the predefined sales lead time. The transport days are calculated based on the mode of delivery. • Delivery alternatives include warehouses that have on-hand inventory, and supply/demand orders.
ATP	• Delivery alternatives are calculated based on available to promise (ATP) logic. The current availability and expected future availability are considered. The transport days are calculated based on the mode of delivery. • Delivery alternatives include warehouses that have on-hand inventory, and supply/demand orders.
ATP + Issue margin	• Delivery alternatives are calculated as for the ATP method, but the issue margin is included in the calculation.

CTP	• Delivery alternatives are calculated based on the capable to promise (CTP) logic. MRP explosion is used to determine availability. Note that, at a minimum, CTP offsets delivery dates to the sales lead time. The transport days are calculated based on the mode of delivery.
	• Delivery alternatives include suggestions for the following warehouses:
	  ◦ Current warehouse
	  ◦ Default warehouse
	  ◦ All warehouses that have available on-hand inventory
	  ◦ All warehouses that have supply orders
	  ◦ All warehouses that have active bill of materials (BOM) versions

View information about delivery alternatives

This section describes the information about delivery alternatives that is available on each FastTab of the **Delivery alternatives** page.

The Product FastTab

This FastTab shows a summary of the product and details of the current sales line.

The Delivery alternatives FastTab

This FastTab shows a list of delivery alternatives that is sorted by receipt date. Above the list, you can select which options to base the suggestions on. You can also select the mode of delivery, which determines the transport days. The following options are available:

- **Include other product variants** - This option is available for products that have product variants. It will include delivery alternatives for other variants of the product. This option isn't available for CTP.
- **Include partial quantity** - By default, only suggestions that fulfill the full quantity of the sales line are included. Select this option to include suggestions that only partially fulfill the order line. This option is useful when the customer requests an earlier delivery date and accepts partial delivery.

- **Include later dates** - By default, only suggestions that are better (earlier) than the current dates on the sales line are shown. Select this option to include later dates. This option can be useful in situations where parameters other than the date have priority. For example, a specific vendor or warehouse might be preferred.
- **Mode of delivery** - Select the preferred mode of delivery to optimize transport time and cost. You will immediately see the effect on the suggested delivery alternatives. Therefore, it's easy to compare the alternatives.
- **Include procurement** - When procurement is selected, the suggested delivery alternatives include options to procure from both external vendors and other companies in the enterprise (intercompany). The **Include procurement** option is supported for ATP and ATP + Issue margin delivery date control. Procurement options from the default purchase vendor for the product and all approved vendors for the product are included.
- For external vendors, the calculation is based on the purchase lead time.
- For intercompany, the calculation considers what is available from the sourcing company, based on delivery date control in the sourcing company.
- **Delivery type** (Relevant for procurement)
  - **Stock** - Products are shipped from the sourcing warehouse to the site/warehouse on the sales line. They are then shipped from that warehouse to the customer.
  - **Direct delivery** - Products are shipped directly from the sourcing warehouse to the customer.

The Availability information FastTab

Information on this FastTab is related to the delivery alternative line that is selected. The following information is shown, depending on the delivery date control for the sales line:

- **Sales lead time**
  - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
  - **Parameters** - Show the inventory unit and sales lead time.

- **ATP and ATP + Issue margin**
  - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
  - **Parameters** - Show the inventory unit and sales lead time.
  - **Future availability** - Show a graphical representation of current and future availability for the selected site and warehouse under **Delivery alternatives**. You can select the chart columns to see more detailed information about the future

availability of the product. The slider shows a list of relevant demand and supply orders within the ATP time fence.

- CTP
  - **Available today** - Show the current physical on-hand, physical reserved, and available physical inventory.
  - **Parameters** - Show the inventory unit and sales lead time.
  - **Explosion** - Show a supply explosion of the selected delivery alternative. You can use **Setup** to change the fields and inventory dimensions that are shown in the explosion.

The Impact of selected alternative FastTab

This FastTab highlights the impact of the selected delivery alternative. If you select **OK**, the sales line is updated with the highlighted values in the SELECTED columns. Note that, if the quantity on the selected delivery alternative is less than quantity on the sales line, a delivery schedule is created, and the order line is split into two lines: one line for the selected quantity and one line for the remaining quantity. You can also update the commercial line so that it matches the schedule lines and affects the pricing.

Direct deliveries

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about direct deliveries. Direct deliveries are deliveries that a vendor sends directly to your customer.

Direct deliveries save delivery time and reduce the costs that are associated with carrying inventory, because you don't hold the products in your warehouse before you ship them to the customer.

You can create direct deliveries from the **Sales order** page. First, create a sales order and order lines. Then, on the Action Pane, on the **Sales order** tab, select **Direct delivery**. Finally, specify the lines that must be handled as a direct delivery. A link is now created between the sales order lines for the direct delivery and the corresponding purchase order lines.

> **Note**
>
> If part of the ordered quantity is already delivered, you must split the remaining quantity. Create a new line for the quantity that you must directly deliver, and subtract that quantity from the quantity on the original line. For example, if the original quantity was 15, and five are delivered, you must create a new line for the remaining quantity, 10, and then reduce the original quantity by that amount.

After you create the direct delivery link between the sales order lines and the purchase order lines, the sales order line packing slip is updated automatically through the purchase order line product receipt and can only be updated from the purchase order line product receipt update. Run either a product receipt update or an invoice update from the purchase order. If the invoice update is done on from the purchase order without a previous product receipt, then no automatic packing slip update happens for the sales order. However, the sales order line is still updated to *delivered*. You can then invoice-update the sales order, but don't do a packing slip

update because this action is triggered automatically. You can update the invoice for the sales order from the **Sales order** page. An invoice update can't cause the quantity on the sales order to exceed the quantity that is delivered. For example, a sales order line has 10 pieces, but only five pieces from the sales order line are updated to *delivered*. If you select *All* in the **Quantity** list when you invoice-update the sales order, only the quantities that are delivered and not yet invoiced are invoice-updated.

Delivery date

When you update the **Requested receipt date** field on the sales order line, the **Delivery date** field on the corresponding purchase order line is also updated. Similarly, when you update the **Confirmed** field on the purchase order line, the **Confirmed receipt date** and **Confirmed ship date** fields on the corresponding sales order line are also updated.

Delivery address

Typically, the delivery address for a purchase order is the company's address. However, when you create a direct delivery, you enter the customer's address as the delivery address. If you change the delivery address on a purchase order line that has a delivery type of **Direct delivery**, the delivery address on the corresponding sales order line is also updated. Similarly, if you change the delivery address on the sales order line, the delivery address on the purchase order line is also updated.

Deleting order lines

If you try to delete a sales order line that has a delivery type of **Direct delivery**, a message box states that purchase order lines are attached to the line. If the sales order line is partially delivered, you can't delete the sales order line or the purchase order lines that are attached to it.

Warehouse

When you create a direct delivery, the items that you sell never physically arrive at your warehouse. However, you must still specify a warehouse on the sales order line. Similarly, picking requirements might be specified on the item model group for the item. However, because the items never physically arrive at your warehouse, these requirements are ignored when the sales order is a direct delivery.

Delivery schedules

Article • 01/27/2025

In Microsoft Dynamics 365 Supply Chain Management, delivery schedules are used to manage and track the delivery of order quantities in multiple shipments. They are particularly useful when a single sales order, sales quotation, or purchase order must be delivered in several parts over time.

Here's a breakdown of how delivery schedules work:

1. **Create delivery schedules.** When you create a delivery schedule, the total quantity of an order line is divided into multiple delivery lines, based on the delivery schedule, quantity, mode of delivery, and storage dimensions (such as site and warehouse). Each delivery line represents a separate shipment.
2. **Manage delivery lines.** Delivery lines can have different delivery dates, quantities, modes of delivery, and storage dimensions. The original order line is converted to a *commercial line*, which acts as a header for the delivery lines. If delivery line quantities are changed, the commercial line is automatically updated so that it reflects the total quantity.
3. **Process orders.** Orders that have a delivery schedule are processed against the delivery lines. This processing includes the posting of packing slips, product receipts, and invoicing. When documents such as confirmations or invoices are printed, only the delivery lines are shown, not the original commercial lines.

When you create a delivery schedule, the type of the original order line is automatically changed to *Order line with multiple deliveries*. A line of this type is referred to as a commercial line and is marked by a symbol. The delivery line is marked by a different symbol. If you change a quantity on a delivery line, the commercial line is updated to the total quantity of the delivery schedule. If a trade agreement defines a total discount for the order, the delivery schedule ensures that your order is eligible for the total order discount, even when the order is split into separate deliveries.

Orders that have a delivery schedule are processed against the delivery lines. This processing includes the posting of packing slips, product receipts, and invoicing.

Document printouts of orders and quotations that have a delivery schedule show only the delivery lines. They don't show the original lines (commercial lines).

> **Note**
>
> Only the delivery lines are shown when you perform the following actions:
>
> - Post
> - Copy pages

- Browse list pages and reports

When you confirm sales quotations, the resulting sales orders show the whole delivery schedule, even the order lines that have multiple deliveries. In addition, the whole delivery schedule is shown on all the major pages, such as sales orders, sales quotations, and purchase orders.

Example of a delivery schedule

In this example, a customer requests delivery of 600 chairs in batches of 100 chairs over a period of six months. To keep track of the delivery requirements, you create a delivery schedule. On the delivery schedule page, you create six separate delivery lines. Each delivery line contains 100 chairs and indicates the delivery date for those 100 chairs. In this case, each line is offset on the first of the month for six consecutive months.

Expand table

Item	Value
Total order (original order line)	600 chairs
Requested delivery schedule	100 chairs per month
Requested time frame for delivery	6 months, on the first day of each month

Create delivery schedule

This procedure demonstrates how to create a delivery schedule for a sales order. A delivery schedule is used when a quantity on an order or a quotation is requested to be delivered in multiple shipments.

To create delivery schedule, follow these steps:

1. Go to **All sales orders**.
2. Select **New**.
3. In the **Customer account** field, enter or select a value.
4. Select **OK**.
5. In the **Item number** field, enter or select a value.
6. In the **Quantity** field, enter a number that is bigger than *1*.
7. Select **Sales order line**.
8. Select **Delivery schedule**.

    - The **Delivery schedule** page is the place where you can specify the number of shipments in which the total quantity of the order line will be delivered to the customer.
    - By default, the system copies the total quantity and other delivery details of the original sales line into the first delivery schedule line. In this example, we'll create a schedule for two shipments, with the second shipment's date offset by a week from the first one.

9. In the **Quantity** field, enter a number that is part of the total quantity.
10. Select **New**.
11. In the **Quantity** field, enter the remaining quantity.
12. In the **Requested ship date** field, enter a date a date that is one week ahead from the date of the first delivery line.

    - The two options on the **Charges conversion** FastTab control how you want the charges to be distributed across the delivery schedule lines, once they've been assigned to the original order line. If you select **Copy gross amounts**, the same charge amount is copied to each line. The **Allocate to delivery lines** option divides the charge equally across the delivery lines.
    - Only fixed charges can be divided, whereas variable charges will still be copied to the lines.

13. Move the cursor away from the second delivery line to update the page. You can keep track of the total quantity that's allocated to the delivery schedule lines by looking at the **Total** and **Remaining** fields. When the remaining quantity is zero, the full quantity from the original line has been allocated to the schedule.
14. Select **OK**.

    - The delivery schedule has now been copied to the order lines.
    - The original order line, referred to as a **Commercial** line, has been converted to an order line with multiple deliveries. It is marked with a distinct icon and acts as a header for the delivery lines.
    - The two new lines, referred to as delivery lines, make up one delivery schedule. The order will be processed against these lines and not the original line. If documents such as confirmation slips, picking lists, packing slips, or invoices are printed, only the delivery lines are shown.
    - The delivery lines can have different delivery dates, quantities, modes of delivery, and storage dimensions, such as site and warehouse. However, the product dimensions must always match the ones on the commercial line and can't be changed.

15. In the **Quantity** field, enter a number that's bigger than the current one.
16. Select the commercial line to see the effect of the quantity recalculation.
17. On the Action Pane, select **Pick and pack**.
18. Select **Post packing slip**.
19. Expand the **Parameters** section.
20. In the **Quantity** field, select *All*. Note that the packing slip will be created for the two delivery schedule lines and not the original order line.
21. Select *Yes* in the **Print packing slip** field.
22. Select **OK**.
23. Select **Yes**.
24. Close the page.

Working with serialized items

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to register serial numbers on packing slips or invoices during the sales process. This functionality is useful if a company wants to capture serial numbers for service and warranty purposes, but doesn't need to maintain serial numbers in inventory from receipt to issue.

Many companies just want to capture serial numbers for service and warranty purposes, and don't need to maintain serial numbers in inventory from receipt to issue. In these scenarios, you can register the serial numbers on the packing slips or invoices when products are sold. If products are later returned, you can trace each product to an invoice to determine whether you sold the product, and whether the service or warranty obligations are valid.

You must enable serial numbers for the sales process by selecting the **Active in sales process** option on the **Tracking dimension groups** page. The following events then occur in Supply Chain Management:

- On the **Serial numbers** FastTab, the **Serial number control** option is set to *Yes*. When you select this option, you must register one serial number for each item on the packing slip or invoice.
- All selections on the tracking dimension group for serial numbers are cleared, except the **Blank issue allowed** option. You can select the **Blank issue allowed** option to override the serial number control, and allow products to be packed and invoiced without registering serial numbers.

> **Important**
>
> When the **Physical inventory** option for the **Serial number** dimension is cleared, including the automatic clearing that occurs when you select **Active in sales process**, on-hand

inventory isn't tracked per serial number. This change can cause discrepancies between received and issued serial numbers for the same item.

When do I register serial numbers during the sales process?

You can register serial numbers either on the packing slip for a sales order or on the invoice. When you prepare an invoice for a serialized item that was shipped together with a packing slip, you can select which serial numbers on the packing slip to invoice. The number of registered serial numbers must not exceed the quantity of items that were shipped. If you're creating a partial invoice, you can select fewer serialized items than were registered on the packing slip. When you print a packing slip or an invoice, the serial numbers that were registered are included.

Can I enter serial numbers by scanning them, or do I have to type them?

You can either scan or type serial numbers. When you use a scanner, the scan mode determines whether the serial numbers are added to or removed from the list of serial numbers on the invoice or packing slip. If you want to scan serial numbers by using, for example, a hand-held bar code scanner, configure the scanner to send an Enter or TAB command after the serial number. This command indicates the end of the data stream. Otherwise, you must press Enter or TAB on the keyboard after you scan each serial number.

If I enable serial numbers for the sales process, do I have to register all serial numbers for all items?

The setup of the tracking dimension group that is assigned to the product determines whether serial numbers must be registered for all items on a packing slip or invoice. When you enable serial numbers for the sales process, the **Serial number control** option is automatically selected. You must then register one serial number, or register a blank registration for an unreadable number, for each item on the packing slip or invoice. If you don't want to require a serial number for each item, select the **Blank issue allowed** option on the tracking dimension group that is assigned to the item. You can then register fewer serial numbers than the quantity of items that are being shipped. If you register more serial numbers than the quantity of items that are being shipped, you won't be able to post the packing slip or invoice.

Can I register serial numbers for partial invoices and partial shipments?

You can create partial invoices and packing slips for sales orders, and register serial numbers only for the items that those invoices and packing slips include. If you want to create a partial invoice and you have more than one packing slip for the sales order, you can include serial numbers from more than one packing slip. However, there can be only one packing slip that doesn't include all serial numbers. For example, if you have three packing slips, and each packing slip includes two serialized items, you can't create a partial invoice for one item from each packing slip.

What do I do when a serial number isn't readable?

If a serial number can't be read or scanned, you can create a blank line for the item by selecting **Not readable** on the **Serial numbers** page. If the serial number becomes available later, you can update the invoice or packing slip. For more information, see the next section, "Can I correct or change the serial numbers that I registered for a sales order?"

Can I correct or change the serial numbers that I registered for a sales order?

Yes, you can correct serial numbers if the following conditions are met:

- **Invoices** – You can change the serial numbers for items that you didn't yet invoice. The packing slip is then also updated. However, if you corrected a sales order line by registering a negative quantity, you can't change serial numbers for the sales order line.
- **Packing slips** – You can't partially correct a packing slip line that contains serialized items. You must reverse the full quantity for the line. If you canceled or corrected a packing slip, you don't have to register the reversed serial numbers again when you create a new packing slip for the same serialized items. The numbers that you registered are used.

Can I view the serial numbers that shipped together with a specific packing slip, or that were included on an invoice?

Yes, you can run an inquiry on the packing slip journal line or invoice journal line to view a list of all serial numbers that the document includes.

Can I view the serialized items that I have on hand?

No, you can't view the serialized items that you have on hand, because serial numbers aren't registered for items until the items are sold.

Can I register serial numbers for catchweight items?

No, you can't register serial numbers for catch-weight items during the sales process. Additionally, if a product is set up as a catch-weight item, you can't assign the product to a tracking dimension group that is set up to use serial numbers only during the sales process.

Can I register serial numbers at the retail POS?

Yes, the retail point of sale (POS) prompts the user to enter a serial number when the user sells an item that is assigned a tracking dimension group that is set up to use serial numbers only during the sales process.

What security roles are required to register serial numbers during the sales process?

All roles that can maintain sales packing slips and sales invoices can use this functionality. The following duties let workers correct serial numbers and register blank entries for serial numbers that can't be read or scanned:

- Maintain serial number corrections
- Maintain registration of non-readable serial numbers

Reserve the same batch for a sales order

Article • 09/29/2021

This article explains how to set up a product to allow reservation of inventory against a single batch of inventory.

Same batch reservation lets you reserve inventory for a sales order line against a single batch of inventory. For example, a customer who orders wallpaper can request that the whole order be filled from the same batch or lot, to avoid inconsistencies among the rolls. To set up a product to use same batch reservation, the following settings must be active in the item model group, tracking dimension group, and storage dimension group that you assign to the product:

- **Item model groups** – The item model group must have the **Same batch selection** and **Consolidate requirement** fields selected in the **Reservation** field group for inventory policies.
- **Tracking dimensions groups** – The tracking dimension group must have the **Coverage plan by dimension** field selected for the batch number.
- **Storage dimensions groups** – The storage dimension group must have the **Coverage plan by dimension** field selected for **Site** and **Warehouse**.

When you reserve inventory for a product on a sales order line that is set up for same batch selection, the system tries to reserve the ordered quantity from a single inventory batch. Any specific batch attribute requirements are also considered. If the quantity can't be filled from a single batch, the **Same batch reservation conflict** page appears. This page describes the issues and also the actions that you can take to continue with the reservation. The following conditions might prevent the batch from being reserved:

- The batch disposition code has **Block reservation** for sales flagged as **Blocked**.
- The batch has expired, based on the expiration date and any applicable customer sellable days. The item can still be considered for reservation if the item model group for the item is First Expiry First Out (FEFO) date–controlled, and if the best-before date is selected as the pick criterion.
- The batch doesn't have enough shelf-life days remaining, based on the expiration date and best-before date, plus any customer sellable days.

For items associated with a storage dimension group that has **Use warehouse management processes** enabled, you can reserve specific batch numbers by using a reservation hierarchy where the batch number inventory dimension is defined above the location dimension. This type of reservation hierarchy is also known as a *Batch-above [location]* reservation hierarchy. The **Batch reservation** page for sales and transfer order

lines also lets you select and reserve multiple lines based on the available batch numbers. For more information about what to do if you are using a reservation hierarchy that has the batch number dimension below the location (*Batch-below [location]*), see Flexible warehouse-level dimension reservation policy.

Ship orders as direct deliveries

07/10/2025

This article demonstrates how to create a direct delivery for a sales order. You use direct delivery when you want to ship goods to the customer directly from your vendor, instead of shipping them to your own warehouse first. To successfully complete the second subtask *Create direct deliveries from the workbench*, make sure that the item that you choose on the sales order has a default vendor specified on the **Purchase** FastTab of the released product master.

Set an individual order for direct delivery

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Select **New**.
3. Enter or select a value in the **Customer account** field, then select **OK**
4. Enter or select values in the **Item number** and **Site** fields, then select **Save**.
5. On the Action Pane, select **Sales order**, then select **Direct delivery**. The Create delivery page lists all the open sales order lines as copied from the sales order. You can review the order details, and if necessary, you can modify details such purchase quantity and pricing terms before you create the direct delivery.
6. Select **Yes** in the **Include all** field.

    - If you want to generate a direct delivery for only a subset of the sales order lines, select these individually.
    - The **Vendor account** field might already be populated with a vendor number. If the default vendor is set up for the product (on the associated Item coverage), then this vendor will be copied to the line. Otherwise, you must enter a vendor manually. In this example, we'll select a new vendor in the next step, even if one is already populated.

7. Enter or select a value in the **Vendor account** field, then select **OK**. The message informs you that the purchase order has now been created.
8. Expand the **Line details** section.
9. Select the **Delivery** tab and verify that the **Direct delivery** field is set to *Yes*.
10. On the Action Pane, select **General**.
11. Select **Related orders**.
12. Select the link in the **Purchase order** field.
13. Expand the **Line details** section and select the **Address** tab.

    - The delivery address for this purchase order line is the customer's delivery address and not your company's address.

- If you change the delivery address on either the purchase order line or the originating sales order line, the address on the corresponding order line will be automatically updated.

14. Select the **Delivery** tab.

    - Like the sales order line, the associated purchase order line type is also set to *Direct delivery*.
    - The purchase order line's **Delivery date** and the **Confirmed delivery date** are set to the **Requested receipt date** and **Confirmed receipt date** of the originating sales order line respectively.
    - If you update any of these dates on either the purchase line or the sales line, the dates on the corresponding order will be automatically updated.
    - The purchase order that is set to deliver goods directly to the customer is linked to the originating sales order using a special association. This association imposes the rule that the packing slip update of the sales order can't be done from the sales order itself and must be done by using the purchase order. However, customer invoicing must be carried out from the sales order.

15. On the Action Pane, select **Purchase**.
16. Select **Confirmation**.
17. Select **OK**.
18. On the Action Pane, select **Receive**.
19. Select **Product receipt**.
20. In the **Product receipt** field, type a value.
21. Select **OK**.
22. On the Action Pane, select **General**.
23. Select **Related orders** and highlight the desired record.

    - After the purchase order has been updated as received, or in other words, after the vendor has shipped the goods to your customer's address, the status of the originating sales order is automatically updated to Delivered.
    - The sales order can now be invoiced.

24. Select **OK**.
25. Close the page.
26. Select **OK**. Close the pages and return to the home page.

Create direct deliveries from the workbench

1. Go to **Navigation** > **Modules** > **Accounts receivable** > **Orders** > **All sales orders**.
2. Select **New**.
3. Enter or select a value in the **Customer account** field, then select **OK**.

4. Enter or select a value in the **Item number** and **Site** fields.
5. Expand the **Line details** section, then select the **Delivery** tab. Instead of creating a direct delivery as part of the sales order processing as in the previous procedure, you can choose to hand over this task to a purchasing professional. To include the sales order line in the direct delivery handling process, you must mark the line for direct delivery.
6. Select *Yes* in the **Direct delivery** field.

    - If the item has already been set up for direct delivery by default, the field will automatically be set to *Yes* at the order line entry. You can set up an item for direct delivery on the Released product's master by setting the Direct delivery option to Yes and selecting a default Direct delivery warehouse.
    - Because the purchase order hasn't yet been created, the **Direct delivery status** is set to *To be direct delivered*.

7. Select **Save**.
8. Close pages until you return to the home page.
9. Enter *Direct delivery* in the search bar.

    - The Direct delivery page acts as a workbench that provides the purchasing agent with an overview of all the sales order lines that are to be direct delivered and it allows them to create the respective purchase orders. In addition, they can view the open direct delivery orders and the confirmed orders on the **Confirmation** and **Delivery** tabs.
    - After you have created a direct delivery order, it automatically moved to the Confirmation tab. You can choose to confirm the order directly from this page. When the purchase is confirmed, it will automatically move to the **Delivery** tab, from which you can register its receipt.

Ship sales orders without warehousing

Article • 01/31/2023

This article explains how to update a sales order when products are shipped to the customer. The guide is applicable to the fulfillment flow that is not set up for warehouse management (neither basic or warehouse management processes (WMS)), and therefore does not require product picking to be registered before shipment. You can run this procedure on your own data or in demo data company USMF. In both cases, before you start this task, create a sales order for an inventoried product with a quantity of greater than 1. To avoid a posting error, you need to check that the product's on-hand quantity in the site and warehouse that you've selected on the order covers the order quantity.

Post packing slip for an order

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. In the list, find and select the order you have created for this task.
3. On the Action Pane, select **Pick and pack**.
4. Select **Post packing slip**.
5. Expand or collapse the **Parameters** section.
6. In the **Quantity** field, select **All**.

    - Other options include **Deliver now** and **Picked**. If the order line is to be shipped partially and the **Deliver now** field on the order line contains a quantity, you would select **Deliver now**. If your organization's fulfillment flow includes picking as a separate process that is managed by and registered with a picking list, you would select **Picked**.
    - Check that the **Posting** option is set to **Yes**.

7. Set the **Print packing slip** option to **Yes**. The **Overview** tab contains a list of packing slips to be generated in this posting. If you are shipping an individual order, there will typically be one packing slip. However, if that order's lines are to be shipped from different sites, posting will automatically be split into the appropriate number of documents. This is a mandatory condition that cannot be changed. Similarly, the posting will also be split into multiple documents if the order's lines are to be shipped to different delivery addresses, and the shipping policy is set up to require a split.
8. On the **Lines** tab, select the row for the order line to be shipped.
9. In the **Update** field, enter a number lower than the original quantity.
10. Select **OK**.

11. Select **Yes**.
12. Close the page.
13. On the Action Pane, select **Options**.
14. Select **Change view**.
15. Select **Header view**.

    - If all of the lines on the order have been fully shipped, the order status changes from Open to Delivered.
    - In this example, the order line has been shipped partially. This is why the order status remains Open.
    - The **Document status** field is set to Packing slip because at least one of the order lines have been shipped.

16. On the Action Pane, select **General**.
17. Select **Line quantity**.
18. Close the page.
19. On the Action Pane, select **Pick and pack**.
20. Select **Packing slip**. The **Packing slip journal** page contains all the packing slip documents that were generated for your order. You can review details of each document and print them, if you wish.

Automatic application of charges

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Based on the customer or vendor that you're working with or the item that you're selling, you might want to apply specific additional charges. The *charges* feature in Microsoft Dynamics 365 Supply Chain Management helps you automatically apply charges to purchase orders or sales orders.

Automatic charges (auto charges) are automatically applied when you create a sales order or a purchase order. You can define auto charges for specific vendors, customers, groups of vendors, groups of customers, items, or groups of items. You can also define auto charges that apply to all vendors, customers, or items.

Set up parameters

The **Procurement and sourcing parameters** page has a few settings that are especially relevant when you want to apply charges automatically in the purchase order. To complete this setup, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Prices** tab, on the **Prices** FastTab, set the following fields:
    - **Find auto charges for header** – Set this option to *Yes* if charges should automatically be applied to purchase order headers.
    - **Find auto charges for line** – Set this option to *Yes* if charges should automatically be applied to purchase order lines.

The **Accounts receivable parameters** page also has a few settings that are especially relevant when you want to apply charges automatically in the sales order. To complete this setup, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Prices** FastTab, set the following fields:

- **Find auto charges for header** – Set this option to *Yes* if charges should automatically be applied to sales quotation and sales order headers.
- **Find auto charges for line** – Set this option to *Yes* if charges should automatically be applied to sales quotation and sales order lines.

Set up charges codes

To apply charges, you must first define charges codes.

1. Follow one of these steps:

   - For purchase orders: Go to **Procurement and sourcing** > **Setup** > **Charges** > **Charges code**.
   - For sales orders: Go to **Accounts receivable** > **Setup** > **Charges** > **Charges code**.

2. On the Action Pane, select **New** to create a charges code.

3. In the header of the new record, set the following fields:

   - **Charges code** – Enter a code for the charges.
   - **Description** – Enter a description of the charges.
   - **Item sales tax group** – Select an item sales tax group, if applicable.
   - **Prorate** – Set this option to *Yes* if you want to prorate your charges. This option is available only for sales orders.
   - **Maximum amount** – Enter the maximum amount that's allowed for the charges code. This field is used to validate charges for vendor invoices. It's available only for purchase orders.

     > ⓘ **Note**
     >
     > To turn on the functionality for validating charges for purchase orders, go to **Accounts payable** > **Setup** > **Accounts payable parameters**. On the **Invoice validation** FastTab, in the **Invoice validation** section, set the **Enable invoice matching validation** option to *Yes*.

4. The **Posting** FastTab includes **Debit** and **Credit** sections. Set the following fields, depending on the ledger that you want to post the charges to:

   - **Type** – Select the type of account that you're posting to (*Ledger*, *Customer*, or *Item*). If you select *Ledger account* as the debit type or credit type, specify a posting type in

the **Posting** field, and specify the main account in the **Account** field.
- **Posting** – Select the type of postings to create (such as *Broker fee* or *Customer settlement*).
- **Account** – Select the account to post the charge for.

5. On the Action Pane, select **Save**.

Create charge groups

Charge groups automatically apply specific charges to a group of customers or vendors. The following subsections describe how to create and assign these charge groups.

Charge groups for purchase orders

To create charge groups for purchase orders, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Charges** > **Vendor charges group**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
    - **Charges group** – Enter the name of the charge group.
    - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Procurement and sourcing** > **Vendors** > **All vendors**, and either open an existing vendor or create a new vendor.
5. On the **Purchase order defaults** FastTab, in the **Purchase order** section, set the **Charges group** field to the charge group that you created.

Charge groups for sales orders

To create charge groups for sales orders, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Charges** > **Customer charge groups**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
    - **Charges group** – Enter the name of the charge group.
    - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.

4. Go to **Accounts receivable** > **Customers** > **All customers**, and either open an existing customer or create a new customer.

5. On the **Sales order defaults** FastTab, in the **Sales order** section, set the **Charges group** field to the charge group that you created.

Define auto charges

After you set up your charge codes, follow these steps to define the auto charges.

1. Follow one of these steps:

    - For purchase orders: Go to **Procurement and sourcing** > **Setup** > **Charges** > **Automatic charges**.
    - For sales orders: Go to **Accounts receivable** > **Setup** > **Charges setup** > **Auto charges**.

2. In the list pane, in the **Level** field, select the level where your auto charge applies:

    - *Header* – Apply charges to the order header.
    - *Line* – Apply charges to the order lines.

3. Select an existing auto charge to edit it, or select **New** to define a new auto charge.

4. In the **Account code** list, select one of the following values to specify the scope of accounts that the auto charge affects:

    - *Table* – Assign charges to a specific customer or vendor.
    - *Group* – Assign charges to a miscellaneous charges group.
    - *All* – Assign charges to all customers or vendors.

5. In the **Customer relation** or **Vendor relation** field, select a specific customer or vendor if you set the **Account code** field to *Table*. If you set the **Account code** field to *Group*, select a customer or vendor charges group.

6. In the **Item code** field, select one of the following values to specify the scope of items that the auto charge affects. You can select an item code only when you define auto charges at the line level.

    - *Table* – Assign charges to a specific item.
    - *Group* – Assign charges to an item charges group.
    - *All* – Assign charges to all items.

7. In the **Item relation** field, select a specific item if you set the **Item code** field to *Table*. If you set the **Item code** field to *Group*, select an item charges group.

8. *For sales orders only:* In the **Mode of delivery code** field, select one of the following values to specify the scope of delivery modes that the auto charge affects:

    - *Table* – Assign charges to a specific mode of delivery.
    - *Group* – Assign charges to a mode of delivery group.
    - *All* – Assign charges to all modes of delivery.

9. *For sales orders only:* In the **Mode of delivery relation** field, select a specific mode of delivery if you set the **Mode of delivery code** field to *Table*. If you set the **Mode of delivery code** field to *Group*, select a mode of delivery group.

10. On the **Lines** FastTab, define the charges and the charge rates that the current auto charge uses. You can use the toolbar on this FastTab to add as many lines as you require. For each line, set the following fields:

    - **Currency** – Select the currency that you want to use to calculate the charge. This field applies to the *Header* and *Line* levels for sales quotation and sales order charges.

    - **Charges code** – Select the code for the charge.

    - **Category** – Select one of the following values:
        - *Fixed* – Enter the charge as a fixed amount on the line. You can use fixed charges on charges both in the order header and on the order lines.
        - *Pcs* – Base the charge on unit with no unit of measure conversion. *Pcs* in this case represents any unit of measure and not the specific *Pcs* unit of measure. You can use these charges only on order lines. They appear when you calculate the order total.
        - *Percent* – Enter the charge as a percentage on the line. You can use percentage charges on charges both in the order header and on the order lines.
        - *Intercompany percent* – Enter the charge as a percentage on the line for intercompany orders. You can use intercompany percentage charges only on order lines.
        - *External* – A third-party service that's associated with one or more shipping carriers calculates the charge.
        - *Specific unit* – Express the charge value in the unit of measure on the charge line. Unit of measure conversion is used to apply it proportionally to the unit of measure on the sales line. This category applies only to the *Line* level.
        - *Specific unit match* – Express the charge value in the unit of measure on the charge line. The unit of measure on the sales line must match this unit of measure for the charge line to be applied. No unit of measure conversion is applied. This category applies only to the *Line* level.

- **Unit** – Enter the unit that applies when the **Category** field is set to *Specific unit* or *Specific unit match*.
- **Charges value** – Enter the charge value, based on the category that you selected.
- **Charges currency code** – Specify a currency for the charge if you want to use a currency other than the currency that you specified in the **Currency** field. You can use a different currency only if the **Debit type** or **Credit type** field is set to either *Ledger account* or *Item* for the selected charges code.
- **From amount** – Specify a starting amount to apply the auto charge to. In this context, the amount refers to the order total.
- **To amount** – Specify the ending amount to apply the auto charge to. In this context, the amount refers to the order total.
- **Sales tax group** – Specify a sales tax group.
- **Site** and **Warehouse** – Specify a site and warehouse if charges should be applied only for a specific site and warehouse.
- **Keep** – Select this checkbox to keep the charges transactions after invoicing is completed, so that the charge is applied every time that you create a new invoice for the selected customer account.

For sales orders only: If you want to calculate tiered charges, see Tiered charges on sales orders for information.

Supply Chain Management provides the following optional functionality for calculating auto charges. You might need to enable and configure these features before you can use them. For more information, follow the links.

- Auto charge compounding and sequencing
- Units of measure for line-level charges

> **Tip**
>
> When configuring auto charges for accounts payable in Dynamics 365 Finance, you might see duplicate charge calculations if you set up auto charges for both specific vendors (*Table*) and all vendors (*All*). This situation occurs because the system applies all relevant auto charge configurations, regardless of hierarchy, whenever you create a new purchase order. For example, if you set up a charge code with account code *All*, the system applies that charge code to every purchase order, even if you also set up other specific vendor or group configurations.

Allocate charges from the header to a line

The following procedure shows how to allocate header-level charges to a line. Before you start this procedure, you should already have a header-level charge of the *fixed amount* type and an order where you apply that charge. Additionally, the order should already include at least one line item.

1. Open the purchase order or charge order.

2. On the Action Pane, follow one of these steps:

    - For purchase orders: On the **Purchase** tab, in the **Charges** group, select **Allocate charges**.
    - For sales orders: On the **Sell** tab, in the **Charges** group, select **Allocate charges**.

3. In the **Allocate charges to order lines** dialog box, set the following fields:

    - **Charges allocation** – Select one of the following values to specify how the charges should be allocated:
        - *Net amount* – Allocate charges according to each line amount relative to the total net amount.
        - *Quantity* – Allocate charges according to the number of units for each line relative to the total number of units.
        - *Per line* – Allocate charges equally among the total number of lines.

    - **Allocate charges to lines** – Select a value to specify whether charges should be allocated to all lines, to positive lines only, or to negative lines only.

    - **Allocate all** – Select this checkbox to allocate charges to order lines even if the charges code has a debit type other than *Item*.

    - **Received** – Select this checkbox to allocate charges only to received order lines.

    - **Stocked** – Select this checkbox to allocate charges to only inventoried order lines.

    - **Show selections and clear specific lines** – Select this checkbox to exclude specific lines from this allocation. When you select this checkbox, the **Choose lines to exclude from allocation** grid opens. This grid includes only lines that match the criteria that are defined by the **Allocate charges to lines** and **Stocked** settings. For example, if you set the **Allocate charges to lines** field to *Positive lines* and select the **Stocked** checkbox, the grid shows only lines that are both positive and inventoried. In addition, the grid automatically filters out any lines that the full quantity is already received for. While the grid is open, clear the **Include** checkbox for each line that you want to exclude from allocation.

> **Important**
>
> When you work with the **Choose lines to exclude from allocation** grid, be sure to leave the grid open until you select **Allocate**. If you close the grid before you select **Allocate**, your settings in the grid are lost. Therefore, charges are allocated based on the criteria that you previously defined.

4. Select **Allocate** to apply your settings and close the dialog box.

Reapply header auto charges

In some cases, the system reapplies header auto charges by deleting and inserting them after you update a header field.

You can set up auto charges to consider vendor charge groups or modes of delivery. Therefore, when you update the **Charges group** or **Mode of delivery** on a purchase order header, the charge might change based on the auto charge setup. When the charge needs to be recalculated, the system deletes the existing auto charge and inserts a new auto charge. The recalculation doesn't affect charges you add manually to the purchase order.

After the system allocates an auto charge from the header to a line, it doesn't track its origin (there's no reference from the line to the auto charge setup), so the charge becomes a line charge. If you then update the **Charges group** or **Mode of delivery** on a purchase order header, the system reapplies the new, recalculated header charge, but it doesn't affect the line charges. This pattern applies to both purchase order headers and sales order headers.

The following examples show how to update header-level charges and select a new **Mode of delivery** on the purchase order header. Each example assumes that you already have a header-level charge of type *fixed amount* and an order where that charge is applied. The order must already include at least one line item.

Example 1: Header auto charge value resets after changing the mode of delivery

This example shows that if you customize the value of a header auto charge and then update the mode of delivery for the purchase order, the system resets the header auto charge to its original value.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders** and open a purchase order that includes a header auto charge of type *fixed amount*.

2. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.
3. For the existing header auto charge, enter a new value in the **Charges value** field.
4. On the Action Pane, select the **Back** button to return to the purchase order.
5. Open the **Header** tab of the purchase order.
6. Expand the **Delivery** FastTab and select a new value for the **Mode of delivery** field.
7. On the Action Pane, select **Save**.
8. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note that the **Charges value** is now reset to its original auto charge value.

Example 2: Header auto charge is reapplied after allocating it to a line and then changing the mode of delivery

This example shows that if you allocate a header auto charge to a line and then update the mode of delivery for the order, the system reapplies the original header auto charge while leaving the allocated charge applied to the line.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders** and open a purchase order that includes a header auto charge of type *fixed amount*.
2. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note the header auto charges listed here.
3. On the Action Pane, select the **Back** button to return to the purchase order.
4. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Allocate charges**.
5. On the **Allocate charges to order lines** dialog, select the **Allocate all** check box. Then select **Allocate** to allocate the header auto charge to the order lines.
6. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note that the header auto charges are no longer listed because you allocated them to the line level.

7. On the Action Pane, select the **Back** button to return to the purchase order.
8. On the **Purchase order lines** FastTab, select a purchase order line.
9. On the **Purchase order lines** FastTab toolbar, select **Financials** > **Maintain charges**.

   Note that the previous header auto charge is now shown here, at the line level.
10. On the Action Pane, select the **Back** button to return to the purchase order.
11. Open the **Header** tab of the purchase order.
12. Expand the **Delivery** FastTab and select a new value for the **Mode of delivery** field.
13. On the Action Pane, select **Save**.
14. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

    Note that the original header auto charge is now reapplied to the order, even though the charge is also listed at the line level.

Auto charge compounding and sequencing

Article • 12/05/2023

Advanced auto charges let you apply specific charges to order headers and order lines, based on the customer that you're working with and/or the items that you're selling. For sales quotations and sales orders, you can also choose to compound header charges.

Header charge compounding affects the value base that's used to calculate an auto charge. All header charges (where the customer is debit or credit) that have a sequence that's equal to or lower than the sequence for a compound charge are added to the sum of line net amounts. This sum is referred to as the *value base*. The value base can be set either to *Sum of line net amounts only* or *Sum including charge amounts*. Compounding is applied only when the charge category is *Percent*.

Compounded header charges require a *charge sequence*. The charge sequence determines the order that header charges are calculated in. Charge sequences can exist only at the header level. They have an impact only when you have one or more charges that are set to compound.

Depending on how you configure the feature, interim header charge totals can be applied on top of either the sum of line net amounts, including all line charges and sales taxes, or the sum of line net amounts only. As the calculation progresses, interim header charges establish a value base that subsequent compound charges are calculated on.

You can define a default header charge sequence for your system. This charge sequence is then automatically applied to new sales quotations and sales orders.

When several header charges that have the same sequence are applied, the position of the header charges controls the order that they're applied in during compounding. The position has an impact only when one or more charges are set to compound.

Prerequisites

Before you can use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.38 or later.
- The feature that's named *Sequence and compound for customer charges* must be turned on in Feature management.

The *Sequence and compound for customer charges* feature adds new fields to the **Accounts receivable parameters** page to control the compounding. It also adds **Sequence**, **Compound**, and **Position** columns for header charges to sales quotations and sales orders.

Set up auto charge compounding and sequencing

To set up auto charge compounding and sequencing, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Prices** FastTab, set the **Find auto charges for header** option to *Yes*.
3. On the **Charges** FastTab, set the following fields:

    - **Re-search on posting** – This option controls whether header auto charges on sales orders and sales quotations are re-searched when documents are confirmed or posted. No other manually added charges are affected during the re-search process. Set this option to *Yes* to ensure that the header charges that are set up in auto charges are always applied.
    - **Combine charges on combined invoices** – The option controls how auto charges are calculated when the *Summary update* function is used to combine multiple sales orders into a single invoice. Set this option to *Yes* to first calculate the grand total of all sales orders that are included in the combined invoice and then apply the auto charge to that total. Set it to *No* to calculate a separate auto charge for each sales order that's included in a combined invoice.
    - **Value base for header charges** – Select one of the following values to specify the value base for calculating percentage-based header charges:
        - *Sum of line net amounts only* – Calculate charges based only on the sum of line amounts. This value ensures compatibility with charge calculations that were done before the *Sequence and compound for customer charges* feature was enabled in your system.
        - *Sum including charge amounts* – Calculate charges based on the sum of line amounts, including line charges. If you select this value, you can also include tax amounts in the value base by specifying tax codes that should be used to determine the tax amount. You can define this behavior for an individual auto charge line by selecting the **Include taxes in value base**

button that's added to the toolbar on the **Lines** FastTab of the **Auto charges** page when this value is selected.

The following sections provide example scenarios that show how these settings affect your calculations.

Example scenario 1: Work with auto charge compounding and sequencing

This section provides an example scenario that shows how auto charge compounding and sequencing works. It's based on the standard demo data.

Enable demo data

To work through this scenario and the other scenarios in this article by using the demo records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

Create sample auto charges

To apply a charge that's set to compound, you must first set up the auto charge. Use the following procedure to create an example auto charge. (For more information about the settings, see Automatic application of charges.)

1. Go to **Accounts receivable** > **Charges setup** > **Auto charges**.
2. In the list pane, set the **Level** field to *Header*.
3. On the Action Pane, select **New** to create an auto charges record.
4. On the header of the new record, set the following fields:
    - **Account code** – Select *All*.
    - **Item code** – Select *All*.
    - **Mode of delivery code** – Select *All*.
    - **Charge description** – Enter a name for the charge.
5. On the Action Pane, select **Save**.
6. The **Lines** FastTab should now include a blank line. If it doesn't, select **Add** on the toolbar to add one. Set the following values for this line:

- **Sequence** – Enter *1*.
- **Compound** – Clear this option.
- **Currency** – Select *USD*.
- **Charges code** – Select *Freight*.
- **Category** – Select *Fixed*.
- **Charges value** – Enter *100*.
- **From amount** – Leave this field blank.
- **To amount** – Leave this field blank.
- **GST group** – Leave this field blank.
- **Keep** – Clear this option.
- **Site** – Leave this field blank.
- **Warehouse** – Leave this field blank.

7. On the **Lines** FastTab, select **Add** on the toolbar to add a second charge line. Set the following values for it:

    - **Sequence** – Enter *2*.
    - **Compound** – Select this option.
    - **Currency** – Select *USD*.
    - **Charges code** – Select *Handling*.
    - **Category** – Select *Percent*.
    - **Charges value** – Enter *2*.
    - **From amount** – Leave this field blank.
    - **To amount** – Leave this field blank.
    - **GST group** – Leave this field blank.
    - **Keep** – Clear this option.
    - **Site** – Leave this field blank.
    - **Warehouse** – Leave this field blank.

8. On the Action Pane, select **Save**.

Create a sample sales order

The charges that you set up can now be automatically applied to a sales quotation or sales order. To apply the charges to a sales order, follow these steps.

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New** to create a sales order.

3. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).

4. The new sales order is opened. On the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**.

5. The **Maintain charges** page shows the following two lines, which come from the auto charge setup.

Expand table

Position	Sequence	Compound	Charges code	Category	Charges value
1	1	No	Freight	Fixed	100
2	2	Yes	Handling	Percent	2

Notice that the **Position** values match the **Sequence** values from the auto charge setup. **Position** values differ from **Sequence** values only in cases where there's an overlap in sequence numbering. The position is used to calculate the value base for charges that are set to compound.

In this example, a 2 percent charge is applied on top of the 100 USD fixed charge. Therefore, the total header charges equal 102 USD. The 2 percent charge also applies to each order line.

Users can change the assigned **Position**, **Sequence**, and **Compound** values for a header charge that's applied from auto charges. However, they should be careful, because these types of edits can significantly affect the calculated value base that's used for charges that are set to compound.

For example, a user changes the preceding automatically created lines so that they have the following values.

Expand table

Position	Sequence	Compound	Charges code	Category	Charges value
2	1	No	Freight	Fixed	100
1	2	No	Handling	Percent	2

Because of the updated **Position** values, the 2 percent charge is applied first, while the value base is still zero. However, because 2 percent of zero is zero, the result is no additional charge. The 100 USD fixed charge is then added to give a total header charge of just 100 USD. (The 2 percent charge still applies to each order line.)

The user then changes the lines so that they have the following values.

Expand table

Position	Sequence	Compound	Charges code	Category	Charges value
1	1	No	Freight	Fixed	100
2	2	No	Handling	Percent	2

This time, the **Position** values match the **Sequence** values from the setup. However, the **Compound** option for both charges is set to *No*. In this case, the 100 USD fixed charge is applied first, but the 2 percent handling charge doesn't affect the header charge, because it isn't set to compound, and 2 percent of zero is zero. Therefore, the total sum of header charges is just 100 USD. (The 2 percent charge still applies to each order line.)

6. Close the **Maintain charges** page by selecting the back button on the Action Pane.

7. If necessary, you can revert the edits that you made on the **Maintain charges** page to return to the default setup lines. On the Action Pane, on the **Sell** tab, in the **Calculate** group, select **Header auto charges**. This action restores only those lines that were automatically added from auto charges. It doesn't affect charge lines that were manually added to the sales order header. This action also doesn't restore any order line charges.

Position, Sequence, and Compound fields on header charges

As you saw in example scenario 1, the **Maintain charges** page includes the following fields for charge settings:

- **Position** – Use this field to prioritize the calculation of each charge line. Lines are calculated in sequence, starting with the line that has the lowest **Position** value (because the lowest position has the highest priority). This value is automatically generated for all auto charge lines, based on each line's **Sequence** value on the **Auto charges** page. However, it's still editable and can be manually updated. Each **Position** value must be unique for each order. There can be no overlaps.
- **Sequence** – This field indicates the intended position of the charge as it's set up on the **Auto charges** page. For default charge lines, the value is copied from the auto charge setup. For custom charge lines that are manually added to the **Maintain charges** page, the value is set to *0* (zero). Sequence numbers don't have to be

unique and might therefore overlap. If the auto charge setup includes overlapping sequence numbers, the system assigns unique **Position** values, starting with the most specific (customer) record. Although the **Sequence** field is editable and can be manually updated, we recommend that you keep it aligned with the **Position** value.

- **Compound** – Use this option to specify whether the line should be compounded with other header charges that have been added so far. This option applies only to charges that have a **Category** value of *Percent*. Compounding applies only to charges that are added by the auto charge setup. Although the system allows you to select the **Compound** option for manually added charge lines, compounding isn't actually performed for those lines.

> ⓘ **Note**
>
> Although the system usually prevents you from entering duplicate **Position** values, duplicates can still occur. For example, they might occur if you delete an auto charge line, add new manual charges, and then restore auto charges by selecting the **Header auto charges** action. In these cases, the system uses the record ID of each charge record to resolve the relative positions of the charges when it calculates the value base. We recommend that you avoid this scenario, because you won't be able to see how the value base was calculated.

Example scenario 2: Value base for header charges options

When the system calculates the value of a charge that has a **Category** value of *Percent*, it applies the defined percentage to the value base that it has calculated so far at that position of the calculation. The value base can consist of the net amount across all order lines or the net amount across all order lines that include line changes, both with and without sales taxes.

The following examples show how the **Value base for header charges** field that's set on the **Accounts receivable parameters** page can affect your calculations. This field is also described in the Set up auto charge compounding and sequencing section.

Sum of line amounts only

The following example shows how a value of *Sum of line amounts only* in the **Value base for header charges** field can affect header charge calculations.

1. If you haven't already done so, set up the auto charges that are specified for example scenario 1.

2. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

3. On the **Prices** tab, on the **Charges** FastTab, set the **Value base for header charges** field to *Sum of line net amounts only*.

4. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.

5. On the Action Pane, select **New** to create a sales order.

6. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).

7. The new sales order is opened. On the **Sales order lines** FastTab, add an order line for any item, and edit the **Quantity** and **Unit price** fields to ensure that the **Net amount** value for the line is 100 USD.

8. While the new order line is still selected on the **Sales order lines** FastTab, select **Financials** > **Maintain charges** on the toolbar.

9. On the **Maintain charges** page, on the Action Pane, select **New** to add a charge line. Then set the following values for it:

    - **Charge code** – Select *Freight*.
    - **Category** – Select *Fixed*.
    - **Charges value** – Enter *10*.
    - **Currency** – Select *USD*.

10. On the Action Pane, select **Save**.

11. On the Action Pane, select the back button to return to the sales order.

12. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

13. The **Totals** dialog box shows the different calculation results that apply to the current order. Notice the value that's shown for **Total Charges** is 114 USD. This value is calculated in the following way:

    Line charge fixed + *Header charge fixed* + *Header charge percentage and compound* (= 2% of *Line amount* + 2% of *Header charge with lower position*)

    10 USD + 100 USD + (2 USD [= 2% of 100 USD] + 2 USD [= 2% of 100 USD]) = 114 USD

Sum including charge amounts

The following example shows how a value of *Sum including charge amounts* in the **Value base for header charges** field can affect header charge calculations. This setting affects header charges that have a **Category** value of *Percent*, regardless of whether the **Compound** option is enabled.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Charges** FastTab, change the value of the **Value base for header charges** field to *Sum including charge amounts*.
3. Open the sales order that you created in the previous example.
4. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.
5. In the **Totals** dialog box, notice that the value that's shown for **Total Charges** is now 114.20 USD. This value is calculated in the following way:

   Line charge fixed + *Header charge fixed* + *Header charge percentage and compound* (= 2% of *Header charge with lower position* + 2% of *Line amount* + 2% of *Line charge*)

   10 USD + 100 USD + (2 USD [= 2% of 100 USD] + 2 USD [= 2% of 100 USD] + 0.20 USD [= 2% of 10 USD]) = 114.20 USD

When the **Value base for header charges** field is set to *Sum including charge amounts*, you can include selected sales taxes in the value base calculation. To set up this functionality, following these steps.

1. Go to **Accounts receivable** > **Charges setup** > **Auto charges**.
2. In the list pane, set the **Level** field to *Header*.
3. Select the auto charge that you want to set up, or create a new one.
4. On the **Lines** FastTab, select the line that you want to set up, or add a new one.
5. On the toolbar, select **Include taxes in value base**. (This toolbar button is available only when the **Value base for header charges** field is set to *Sum including charge amounts* on the **Accounts receivable parameters** page.)
6. On the **Sales tax codes in value base for auto charge** page, add a line for each sales tax code that you want to include in value base calculations for the selected auto charge line.
7. On the Action Pane, select **Save**.

Example scenario 3: Re-search on posting options

The **Re-search on posting** option ensures that header charges are assessed against the header charge setup when posting occurs. Auto charges that are set up as tiered charges are automatically assessed. The assessment compares automatically applied header charges against the auto charge setup. It ensures that all the header charges that are automatically applied to sales orders and quotations at the time of creation resemble the auto charge setup. All automatically applied header charges that were manually changed or deleted are restored. All manually added header charges are left unchanged. In other words, the option ensures that the auto charge setup is always applied.

> **Note**
>
> Tiered charges are supported only for sales orders. Therefore, they're included in the re-search only for sales orders.

The following example shows the effect of the **Re-search on posting** option.

1. If you haven't already done so, set up the auto charges that are specified for example scenario 1.
2. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
3. On the **Prices** tab, on the **Charges** FastTab, set the following values:
    - **Re-search on posting** – Set this option to *Yes*.
    - **Value base for header charges** – Select *Sum of line net amounts only*.
4. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.
5. On the Action Pane, select **New** to create a sales order.
6. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).
7. The new sales order is opened. On the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**.
8. The **Maintain charges** page shows lines that came from the auto charge setup. Use the **Delete** button on the Action Pane to delete each auto charge line, so that no

charges are listed on the page.

9. On the Action Pane, select **New** to add a charge line. Then set the following values for it:

    - **Position** – Enter *3*.
    - **Sequence** – Enter *3*.
    - **Charges code** – Select *Freight*.
    - **Category** – Select *Fixed*.
    - **Charges value** – Enter *10*.
    - **Currency** – Select *USD*.

10. On the Action Pane, select **Save**.

11. On the Action Pane, select the back button to return to the sales order.

12. On the Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

13. In the **Totals** dialog box, notice that **Total charges** shows the value of the fixed header charge that you just added (10 USD). Close the dialog box.

14. On the **Sales order lines** FastTab, add an order line for any item, and edit the **Quantity** and **Unit price** fields to ensure that the **Net amount** value for the line is 100 USD.

15. On the Action Pane, select **Save**.

16. On the Action Pane, on the **Sell** tab, in the **Generate** group, select **Confirm sales order**.

17. In the **Confirm sales order** dialog box, select **OK** to confirm the order.

18. You're returned to the sales order. On the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**.

19. On the **Maintain charges** page, notice that the two auto charges that you deleted have been reapplied on the sales order header, and that the custom line that you added is still included. This behavior occurs because the **Re-search on posting** option is enabled, and you confirmed (posted) the order. The following three lines should be shown.

Expand table

Position	Sequence	Compound	Charges code	Category	Charges value
1	1	No	Freight	Fixed	100

Position	Sequence	Compound	Charges code	Category	Charges value
2	2	Yes	Handling	Percent	2
3	3	No	Freight	Fixed	10

20. On the Action Pane, select the back button to return to the sales order.

21. On the Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

22. In the **Totals** dialog box, notice that **Total charges** now shows the calculated value of all three header charges (114 USD). This value is calculated in the following way:

    Line charge fixed + *Header charge fixed* + *Header charge percentage and compound* (= 2% of *Line amount* + 2% of *Header charge with lower position*)

    10 USD + 100 USD + (2 USD [= 2% of 100 USD] + 2 USD [= 2% of 100 USD]) = 114 USD

Example scenario 4: Combine charges on combined invoices options

The setting of the **Combine charges on combined invoices** option on the **Accounts receivable parameters** page controls how header charges are calculated when multiple sales orders are combined into a single invoice by using the *Summary update* function.

- *Yes* – First calculate the grand total of all sales orders that are included in the combined invoice. Then apply the auto charges to that total.
- *No* – Calculate header charges individually for each sales order that's included in the summary invoice. In scenarios where header charges are set up to represent per-invoice charges instead of per-sales order charges, this setting can lead to over-charging.

The following example shows the effects of the **Combine charges on combined invoices** option.

1. If you haven't already done so, set up the auto charges that are specified for example scenario 1.

2. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

3. On the **Prices** tab, on the **Charges** FastTab, set the following values:

    - **Re-search on posting** – Set this option to *Yes*.

- **Combine charges on combined invoices** – Set this option to *No*.
- **Value base for header charges** – Select *Sum of line net amounts only*.

4. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.

5. Follow these steps to create a sales order that has one sales line:
   a. On the Action Pane, select **New** to create a sales order.
   b. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).
   c. On the **Sales order lines** FastTab, add an order line for any item, and edit the **Quantity** and **Unit price** fields to ensure that the **Net amount** value for the line is 100 USD.
   d. On the Action Pane, select **Save**.

6. Repeat the previous step to create a second, identical sales order.

   In a real warehouse, warehouse workers would now pick and pack both sales orders and register their work by using the Warehouse Management mobile app. However, these steps aren't required to continue this example scenario.

7. Go back to **Sales and Marketing** > **Sales orders** > **All sales orders**.

8. Find and select the two new sales orders. Then, on the Action Pane, on the **Invoice** tab, in the **Generate** group, select **Invoice**.

9. In the **Posting invoice** dialog box, on the **Parameters** FastTab, set the **Summary update for** field to *Invoice account*.

10. On the toolbar, select **Arrange**.

11. Select **OK**.

12. Select one of the two sales orders. Then, on the Action Pane, on the **Invoice** tab, in the **Journals** group, select **Invoice**.

13. The invoice is opened. On the Action Pane, select **Charges**.

14. Notice that the header charges have been calculated for each sales order. For each sales order, a header charge of 104 USD is applied. This value is calculated as 100 USD + 2% compound (2% of the line amount [100 USD] + 2% of the fixed charge [100 USD]). Therefore, the total charges for the invoice are 2 × 104 USD = 208 USD.

15. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

16. On the **Prices** tab, on the **Charges** FastTab, change the setting of the **Combine charges on combined invoices** option from *No* to *Yes*.

17. As you did before, go to **Sales and Marketing** > **Sales orders** > **All sales orders**, and create new sales orders for the same account that have identical sales lines. Then pick and pack both sales orders.

18. Go back to **Sales and Marketing** > **Sales orders** > **All sales orders**.

19. Find and select the two new sales orders. Then, on the Action Pane, on the **Invoice** tab, in the **Generate** group, select **Invoice**.

20. In the **Posting invoice** dialog box, set the **Summary update for** field to *Invoice account*.

21. On the toolbar, select **Arrange**.

22. Select **OK**.

23. Select one of the two sales orders. Then, on the Action Pane, on the **Invoice** tab, in the **Journals** group, select **Invoice**.

24. The invoice is opened. On the Action Pane, select **Charges**.

25. Notice that the header auto charges have been re-searched and reapplied per invoice. The customer will be debited just one instance of the fixed auto charge of 100 USD instead of two instances, because the charge is now applied per invoice instead of per sales order. The total calculated charges for the invoice are 106 USD. This value is calculated as one header fixed charge of 100 USD + 2% compound (2% of the total line amounts [100 USD + 100 USD] + 2% of the fixed charge [100 USD]).

    In this setup, the fixed auto charge is applied only once (per invoice), and the percentage-based charge that's set to compound is calculated from a value base that's 100 USD less than the header charges that are calculated per sales order.

26. Go back to **Sales and Marketing** > **Sales orders** > **All sales orders**.

27. Select the first of the two new sales orders. Then, on the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**. Make a note of the charges that are shown, and then repeat this step for the second new sales order.

    Notice that, as part of combining charges on combined invoices, the auto charges are now present only on the first sales order. This behavior is by design. It ensures

that the combination of charges on combined invoices provides the correct charge calculation.

> **Note**
>
> Auto charges are applied based on the customer accounts on sales orders, not the invoice accounts on invoices. In cases where a summary update is done for sales orders for different customer accounts that have the same invoice account, and where different header charges are set up for the different customer accounts, the customer account for the *last* sales order for the summary update is the customer account that the header charges are re-searched and re-applied for when invoicing occurs.

Pricing management

The features that are described in this article work together with the Unified pricing management module. Pricing management introduces changes to the setup and search for auto charges. Therefore, it also changes some of the behavior that's described in this article. When the Unified pricing management module is enabled, charges that are set up at **Accounts receivable** > **Charges setup** don't apply. Instead, only charges that are set up on the auto charges page that's specific to the **Pricing management** module apply to sales orders and sales quotations. To set up auto charges in Pricing management, go to **Pricing management** > **During-sales pricing** > **Charges setup** > **Auto charges**.

Limitations

The capabilities for compounding charges and defining a value base that the compounding is applied to are available for sales quotations and sales orders, not purchase orders. This feature also introduces some new capabilities that don't support all scenarios. The following subsections describe the most important limitations.

Intercompany trade

The lack of compounding and sequencing support for purchase orders affects intercompany scenarios, because sales order and purchase order charges would be calculated differently. To prevent intercompany scenarios from being blocked, header charges for any sales order that fulfills a local purchase order are applied and calculated without using the compounding and sequencing features that are described in this

article. Therefore, compounding and sequencing are either applied or not applied, based on context. In intercompany scenarios, compounding and sequencing aren't applied. However, they're applied in non-intercompany scenarios.

Prorate and summary updates

Header charges can be assigned a charges code that's set to *prorate*. The ability to re-search when posting occurs, and to combine charges on combined invoices, prevents the duplication of fixed charges from auto charges. The combination of charges on combined invoices isn't supported for header charges that are set to *prorate*. Therefore, prorated header charges that are applied in a summary update scenario are always re-searched and calculated based on the individual sales orders. They aren't combined.

Tiered charge and summary updates

A header charge can be set to use **From amount** and **To amount** tiers. The tiers are evaluated based on the net amount of a sales order. When you use sequencing and compounding, tiers are always assessed against the net amount of a sales order. If the net amount of a sales order is within a tier, and if a tiered charge is calculated as a percentage, the charge is calculated based on the current value base, even though the tier was assessed based on the net amount. If you make a summary update, such as a summary invoice, when the system is configured to re-search when posting occurs, the tiers are assessed against the net amount only for the *first* sales order that's included in the summary update. The tiers aren't assessed against the net amount across *all* order lines in the summary update.

Units of measure for line-level charges

All line-level auto charges and line charges include a category that controls how and where the charge applies. The available categories include *Specific unit* and *Specific unit match*. These categories let you set up and apply line charges that are specific to the unit of measure for a line item that's either sold or purchased. They work in the following way:

- *Specific unit* – The auto charge is defined by using a specific unit (such as *ea*). The system then converts proportionally from other units if a conversion factor is available. For example, a sales line is for 2 boxes of an item where a box is defined as containing 10 ea. There's a charge of 2 USD per ea. In this case, the sales line produces a charge of 40 USD (= 2 boxes × 10 ea/box × 2 USD/ea). If no conversion factor is available, the charge isn't applied.
- *Specific unit match* – The auto charge is defined by using a specific unit (such as *ea*). However, the system applies that charge only to lines that use the same unit. For example, you set up a charge so that a line charge is added when the item is sold in smaller units (such as *ea*). However, there's no line charge for orders that are specified in larger units (such as cases).

The *Specific unit* and *Specific unit match* categories are supported for sales quotation lines, sales order lines, purchase requisition lines, request for quotation lines, and purchase order lines. Because both categories apply to both sales orders and purchase orders, they're also supported for intercompany trade.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.38 or later.
- The feature named *Unit of measure for line level charges* must be turned on in feature management. As of Supply Chain Management version 10.0.45, it's mandatory and can't be turned off.

Example scenario: Set up line-level auto charges for specific units and unit matching

This example scenario shows how to set up line-level auto charges that apply to a specific unit, or that are calculated based on unit matching.

Enable demo data

To work through this scenario by using the demo records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

Set up the auto charges

Follow these steps to set up a line charge in auto charges.

1. Go to **Accounts receivable** > **Setup** > **Charges** > **Auto charges**. (Similar steps can be completed at **Accounts payable** > **Setup** > **Charges** > **Automatic charges** and **Procurement and sourcing** > **Setup** > **Charges** > **Automatic charges**.)

2. In the list pane, set the **Level** field to *Link*.

3. On the Action Pane, select **New** to create an auto charges record.

4. On the header of the new record, set the following values:

    - **Account code** – Select *All*.
    - **Item code** – Select *All*.
    - **Mode of delivery code** – Select *All*.
    - **Charge description** – Enter a short description.

5. On the Action Pane, select **Save**.

6. The **Lines** FastTab should now include a blank line. If it doesn't, select **Add** on the toolbar to add one. Set the following values for this line:

    - **Currency** – Select *USD*.
    - **Charges code** – Select *Freight*.
    - **Category** – Select *Specific unit*.
    - **Unit** - Select *ea*.
    - **Charges value** – Enter *2*.
    - **Sales tax group** – Leave this field blank.
    - **Site** – Leave this field blank.
    - **Warehouse** – Leave this field blank.

- **Keep** – Leave this checkbox cleared.

7. On the **Lines** FastTab, select **Add** on the toolbar to add a second charge line. Set the following values for it:

    - **Currency** – Select *USD*.
    - **Charges code** – Select *Install*.
    - **Category** – Select *Specific unit match*.
    - **Unit** - Select *dz* (dozen).
    - **Charges value** – Enter *5*.
    - **Sales tax group** – Leave this field blank.
    - **Site** – Leave this field blank.
    - **Warehouse** – Leave this field blank.
    - **Keep** – Leave this checkbox cleared.

8. On the Action Pane, select **Save**.

Use the auto charges on a sales order

The charges can now be automatically applied to a sales quotation line or a sales order line. To apply the charges to a sales order line, follow these steps:

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New** to create a sales order.

3. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).

4. The new sales order is opened. On the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**.

5. If any charges are listed on the **Maintain charges** page, select them, and then select **Delete** on the Action Pane.

6. Close the **Maintain charges** page by selecting the back button on the Action Pane.

7. You're returned to the order. On the **Sales order lines** FastTab, add an order line, and set the following values for it:

    - **Item number** – Select *A0002*.

- **Quantity** – Enter *2*.
- **Unit** – Select *ea*.
- **Site** – Select *6*.
- **Unit price** – Enter *50*.

The **Net amount** field should show a calculated value of *100*.

8. While the new order line is still selected on the **Sales order lines** FastTab, select **Financials** > **Maintain charges** on the toolbar.

9. Confirm that the **Maintain charges** page shows the two auto charges that you set up earlier. Then close the page by selecting the back button on the Action Pane.

10. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

11. The **Totals** dialog box shows the different calculation results that apply to the current order. Notice that the value that's shown for **Total Charges** is 4 USD. This value is calculated in the following way:

    - There's a *Specific unit* charge of 2 USD per ea. Because the line is for the equivalent of 2 ea, this charge is 2 ea × 2 USD/ea = 4 USD.
    - There's also a *Specific unit match* charge of 5 USD per dz. However, because the unit that you're ordering in is ea, not dz, this charge doesn't apply.
    - The total charge for the line combines both charges. Therefore, the total charge is 4 USD.

12. Select **OK** to return to the sales order.

13. On the sales line, change the **Unit** value to *dz*. When you're prompted to overwrite prices and discounts, select *No*, and then select **OK**. (The system is configured to convert 1 dz to 12 ea.)

14. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

15. In the **Totals** dialog box, notice that the value that's shown for **Total Charges** is now 58 USD. This value is calculated in the following way:

    - The unit is now *dz*, and there's a *Specific unit match* charge of 5 USD per dz. Because you're now ordering two dozens, this charge is 2 dz × 5 USD/dz = 10 USD.
    - There's also a *Specific unit* charge of 2 USD per ea. Because the system is configured to convert 1 dz to 12 ea, and you're now ordering a total of two dozen items, it can

determine that the order line is for 24 ea. Therefore, this charge is 24 ea × 2 USD/ea = 48 USD.

- The total charge for the line combines both charges. Therefore, the total charge is 10 USD + 48 USD = 58 USD.

Pricing management

The features that are described in this article work together with the Unified pricing management module. Pricing management introduces changes to the setup and search of auto charges. Therefore, it also changes some of the behavior that's described in this article. When the Unified pricing management module is enabled, charges that are set up at **Accounts receivable** > **Charges setup** don't apply. Instead, only charges that are set up on the auto charges page that's specific to the **Pricing management** module apply to sales orders and sales quotations. To set up auto charges in Pricing management, go to **Pricing management** > **During-sales pricing** > **Charges setup** > **Auto charges**.

Last updated on 03/25/2026

Period charges

Article • 12/05/2023

Period charges let you charge customers when a collection of orders that were invoiced over a specified period failed to meet specific criteria. The *Period charges* feature supports the setup of period charge rules that identify these invoices and define applicable charges. Charges can be calculated based on a minimum charge amount (such as minimum delivery fee), a minimum order quantity, or a combination of both.

The *Period charges* feature introduces the following changes to your system:

- Fields are added to the **Accounts receivable parameters** page to control the period charge calculations.
- Details are added to the **Free text invoice** details page to accommodate free text invoices that are created for period charges.
- A new page that's named **Period charge rule** is added under **Accounts receivable** > **Charges setup** on the navigation pane.
- A new page that's named **Calculate period charge** is added under **Accounts receivable** > **Periodic tasks** on the navigation pane.

Prerequisites

Before you can use this feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.38 or later.
- The feature that's named *Period charges* must be turned on in Feature management. (As of Supply Chain Management version 10.0.42, it's turned on by default)

Configure period charges

The **Accounts receivable parameters** page provides several fields that control how period charge calculations work in your system. Follow these steps to configure them.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.

2. On the **Prices** tab, on the **Charges** FastTab, set the following fields:

    - **Quantity threshold source** – Select one of the following values to specify which type of lines to consider when quantity-based period charge rules are

calculated:
    - *Invoice lines* – Consider invoice line quantities. We recommend that you select this value unless specific business requirements demand otherwise.
    - *Sales order lines* – Consider sales order line quantities (including canceled sales order lines).

- **Site and warehouse source** – Select one of the following values to specify where to match site and warehouse values that are set as selection criteria in period charge rules:
    - *Invoice line* – Match values that are set on individual invoice lines (in the `CustInvoiceTrans` table). We recommend that you select this value unless specific business requirements demand otherwise.
    - *Sales order* – Match values that are set on the sales order header (in the `SalesTable` table).

- **Required charge code match** – Select whether period charge rule calculations for lines of the *Monetary threshold* or *Quantity threshold minimum amount* type require the creation of at least one invoice line charge that matches the charge code on the rule line for a free text invoice line. We recommend that you set this option to *Yes* unless specific business requirements demand otherwise.

- **Extra batch helpers** – Enter the number of batch helpers (threads) to use for load balancing when period charge calculations are run in a batch.

Manage period charge rules

Period charges are calculated and applied when you run the *Calculate period charge* batch job for a period. You can define period charge rules for a specific customer, site, or warehouse, or for groups of customers, sites, or warehouses. You can also define period charges that apply to all customers, sites, or warehouses. Follow these steps to create, edit, or delete a period charge rule.

1. Go to **Accounts receivable** > **Charges setup** > **Period charge rule**.

2. Follow one of these steps:

    - To add a new rule, select **New** on the Action Pane.
    - To edit an existing rule, select it in the list pane, and then select **Edit** on the Action Pane.
    - To delete an existing rule, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected rule, set the following fields:

    - **Name** – Enter a name for the rule.
    - **Description** – Enter a short description of the rule.
    - **From invoice date** – Select the first date when the rule is valid.
    - **To invoice date** – Select the last date when the rule is valid.
    - **Account code** – Select one of the following values to define the scope of customers (accounts) that the rule applies to:
        - *Table* – The rule applies only to the customer (account) that's selected in the **Account relation** field.
        - *All* – The rule applies to all customers (accounts).
    - **Account relation** – If you set the **Account code** field to *Table*, select the specific customer (account) that the rule applies to.
    - **Site** – Select the site where the rule applies. If the rule applies to all sites, leave this field blank. If you select a site, the rule applies only to customer invoice lines that have the same site or to invoice lines that are related to a sales order that has the same site on the sales order header.
    - **Warehouse** – Select the warehouse where the rule applies. If the rule applies to all warehouses, leave this field blank. If you select a warehouse, the rule applies only to customer invoice lines that have the same warehouse or to invoice lines that are related to a sales order that has the same warehouse on the sales order header.

4. On the **Lines** FastTab, use the buttons on the toolbar to add and remove rule lines as you require, to define the rule that you want to create. For each line, set the following fields:

    - **Type** – Select one of the following values to specify the type of charge that the rule line creates:
        - *Monetary threshold* – Calculate the monetary value of qualifying charges, establish a minimum monetary threshold for each charge type, and generate a free text invoice line that charges the shortfall to customers who don't meet the thresholds during the period.
        - *Quantity threshold* – Calculate the total purchased quantity of qualifying items, establish a minimum quantity threshold, and generate a free text invoice line that has a fixed charge for customers who don't meet the threshold during the period.

- *Quantity threshold minimum amount* – Calculate a charge based on both quantity and monetary thresholds, and generate free text invoice lines as required.

Thresholds for all three charge types are based on transaction lines. They're based on either line quantities (for sales order or invoice lines) or line monetary values (charge lines for invoice lines).

- **Monetary threshold** – Enter the monetary threshold that the rule line applies at. If the period charge calculation determines that the sum of qualifying line charges that are charged to a customer over the period is below this threshold, the system generates a free text invoice line that has a charge that equals the shortfall.

- **Currency** – Select the currency for the **Monetary threshold** field value. This currency is also used as a selection criterion. Therefore, a period charge rule line is evaluated only against charge lines for invoice lines that use the same currency. The related free text invoice line that's generated for the customer also uses this currency.

- **Charge code** – Select the type of charge that the rule line applies to (such as freight, installation, or handling).

- **Include debit charge amount only** – Control which types of invoice line charges are included in the calculation against the monetary threshold for a rule line. For rule lines where this checkbox is selected, the calculation includes only invoice line charges where the value is a debit (positive). For rule lines where this checkbox is cleared, the calculation includes all invoice line charges, regardless of the value sign (debit/positive or credit/negative).

- **Quantity threshold** – Enter the quantity threshold that the line applies at. If the period charge calculation determines that the sum of qualifying quantities that a customer ordered during the period is below this threshold, the system generates a free text invoice line that has a charge that equals the charge amount that the rule line specifies.

- **Unit** – Select the unit of measure for the **Quantity threshold** field value. This unit of measure is also used as a selection criterion. Therefore, a period charge rule line is evaluated only against order or invoice line quantities that use either the same unit or another unit that can be converted to it by using a conversion factor that's defined in the system. When unit of measure conversion is required, standard unit of measure rounding rules apply.

- **Include debit quantity only** – Control which types of sales order or invoice lines are included in the calculation against the quantity threshold for a rule line. For rule lines where this checkbox is selected, the calculation includes only sales order or invoice lines where the value is a debit (positive). For rule lines where this checkbox is cleared, the calculation includes all sales order or invoice lines, regardless of the value sign (debit/positive or credit/negative).

- **Charge amount** – The amount that a customer will be charged for a period for rule lines of the *Quantity threshold* type when the quantity threshold isn't met for a rule line. This amount appears as a fixed fee on the related free text invoice line for the relevant customer.

- **Currency for charge amount** – The currency of the charge amount for rule lines of the *Quantity threshold* type. This currency applies to the related free text invoice line and isn't used as a selection criterion.

- **Revenue account** – The revenue account that was entered on the free text invoice line that the rule line creates.

5. On the **Line details** FastTab, you can enter or view a description of the rule line that's currently selected on the **Lines** FastTab. This description is added to the related free text invoice lines that the rule line creates.

Run and schedule period charge calculations

To calculate period charges and generate free text invoice lines for customers who don't meet the criteria that your period charge rules define, you must run the *Calculate period charge* batch job. You can manually run this batch job, or you can schedule it to run automatically on a recurring basis. Follow these steps to run or schedule the *Calculate period charge* job.

1. Go to **Accounts receivable** > **Periodic tasks** > **Calculate period charge**.

2. In the **Calculate period charge** dialog box, on the **Parameters** FastTab, set the following fields:

   - **Customer account** – Select the invoice account to calculate period charges for. Only invoices for this invoice account will be considered. To calculate period charges for all accounts, leave this field blank.
   - **Rule name** – To calculate charges only for a specific rule, select the name of that rule. To calculate period charges for all rules, leave this field blank.
   - **From invoice date** – Select the first invoice date to include in the period charge calculation. If you're setting up a recurring job, you should leave this

blank and set the **Max invoice age** field instead.

- **To invoice date** – Select the last invoice date to include in the period charge calculation. If you're setting up a recurring job, you should leave this field blank and set the **Max invoice age** field instead.
- **Max invoice age** – Specify the maximum age (in days) of invoices to include in the period charge calculation. The calculation will consider all invoice lines that are this old or younger on the day when the calculation runs.
- **Days per free text invoice** – Specify the number of days that are covered by each free text invoice that the period charge calculation generates.

3. On the **Run in the background** tab, set up the background options as usual for batch jobs in Supply Chain Management. If you want the job to run periodically, select the **Recurrence** link, and define the run schedule.

4. Select **OK** to run or schedule the job.

Inspect free text invoices created by period charge calculations

The *Calculate period charge* job creates one or more free text invoices when shortfalls are found. Follow these steps to get more information about free text invoices that period charge calculations create.

1. Go to **Accounts receivable** > **Invoices** > **All free text invoices**.
2. Open the free text invoice that you want to inspect.
3. Select the free text invoice line that you want to inspect, and then, on the **Invoice lines** toolbar, select **Line invoice base**. (The **Line invoice base** page is visible only for free text invoices that are created as a result of a period charge calculation.)
4. Select the **Period charge rule line** FastTab to view details about the period charge rule that created the selected free text invoice line.
5. Select the **Lines** FastTab to view a summary of the invoice and sales order transactions that were included in the period charge evaluation for the selected free text invoice line.

For more information about free text invoices, see Create a free text invoice.

Period charge rule example scenarios

This section provides examples that show how you might set up period charge rules.

Example scenario 1

You have a period charge rule that establishes a monetary threshold freight charge of 100 US dollars (USD). It's applicable to all customers, sites, and warehouses, and has no expiration date.

- For customer US-001, multiple sales invoices are posted between January 1 and January 10, 2022. A total overall freight charge amount of 45 USD is posted on multiple sales invoices between January 1 and January 10, 2022.
- For customer US-002, a total overall freight charge amount of 105 USD is posted on multiple sales invoices between January 1 and January 10, 2022.

You now run the *Calculate period charge* batch job for all customers for the period from January 1 through January 10, 2022.

The result is a free text invoice that's generated for customer US-001. It has one invoice line for 55 USD.

Example scenario 2

You have a period charge rule that establishes a quantity threshold of 50 pcs. and a minimum charge of 30 USD. It's applicable to all customers, sites, and warehouses, and has no expiration date.

For customer US-001, multiple sales invoices are posted between January 1 and January 10, 2022. The total overall quantity is 23 pcs.

You now run the *Calculate period charge* batch job for customer US-001 for the period from January 1 through January 10, 2022.

The result is a free text invoice that's generated for customer US-001. It has one invoice line for 30 USD.

Example scenario 3

You have a period charge rule that establishes a quantity threshold of 25 pcs. and a minimum freight charge of 20 USD. It's applicable to all customers, sites, and warehouses, and has no expiration date.

For customer US-001, multiple sales invoices are posted between January 1 and January 5, 2022. The total overall quantity is 15 pcs., and the total overall freight charge is 15 USD.

You now run the *Calculate period charge* batch job for customer US-001 for the period from January 1 through January 10, 2022.

The result is a free text invoice that's generated for customer US-001. It has one invoice line for 5 USD.

Set options for how delivery mode and terms of delivery are set for purchase orders created from sales orders

You can configure how the system copies and synchronizes the delivery mode and terms of delivery between purchase orders created from sales orders and the originating sales orders. Set these options separately for sales order lines that are set up for *stocked delivery* and for sales order lines that are set up for *direct delivery*.

Prerequisites

To use the options for delivery mode and terms of delivery described in this section, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.41 or later.
- The feature that is named *Enable purch parameters to control delivery information sync on sales and purchase orders* must be turned on in feature management.

> **Note**
>
> When you turn on the *Enable purch parameters to control delivery information sync on sales and purchase orders* feature, its default settings match the behavior that was in place before the feature was introduced.

Configure options for delivery mode and terms of delivery

To configure how the delivery mode and terms of delivery are set for purchase orders that you create from sales orders in various scenarios, follow these steps:

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.

2. Open the **Delivery** tab.

3. On the **Synchronization of mode and terms of delivery** FastTab, make the following settings in the **For delivery type stock** field group. These settings apply to purchase orders that you create from *stocked delivery* sales order lines.

    - **Synchronize on creation** – Controls how the system sets the delivery mode and terms of delivery on purchase orders that you create from *stocked delivery* sales order lines. Choose one of the following options:
        - *No* – The system sets the delivery mode and terms of delivery for the *purchase order header and lines* to match the *vendor settings*.
        - *Yes* – The system sets the delivery mode and terms of delivery for the *purchase order header* from the *sales order header*. The system sets the delivery mode and terms of delivery for the *purchase order line* from the *sales order line*.
    - **Synchronize on update** – Controls whether the system synchronizes purchase orders that you create from *stocked delivery* sales order lines with the original sales order. Choose one of the following options:
        - *No* – The delivery mode and terms of delivery for the purchase order header and lines *aren't synchronized* with the original sales order. Therefore, changes you make to the purchase order don't affect the original sales order and changes you make to the original sales order don't affect the purchase order.
        - *Yes* – The delivery mode and terms of delivery for the purchase order header and lines *are synchronized* with the original sales order (in both directions). This setting only updates the *header* values when all lines on sales order are *stocked delivery*. At the *line* level, this setting applies to all *stocked delivery* sales lines (only).
    - **Copy from purchase header** – Controls whether changes you make to purchase orders that you create from *stocked delivery* sales order lines also apply to the original sales order. Unlike the **Synchronize on update** setting, this setting only applies changes in one direction—from the purchase order to the sales order. When you set **Synchronize on update** to *No*, the system sets **Copy from purchase header** to *No* and makes it read-only. When you set **Synchronize on update** to *Yes*, the **Copy from purchase header** setting takes precedence when you change the purchase order but has no effect when you change the sales order. Choose one of the following options:
        - *No* – Changes you make to the purchase order don't affect the original sales order. This setting helps to prevent problems that can occur as a result of creating multiple purchase orders from a single sales order. For example, if you update the delivery mode and terms of delivery mode on one such purchase order but not on the others, the original sales order would be out of sync with

some of its related purchase orders. If the system tried to update all related purchase orders after each change, it would cause performance problems.
    - *Yes* – Changes you make to the purchase order are also applied to the original sales order. This setting only updates the *header* values when all lines on sales order are *stocked delivery*. At the *line* level, this setting applies to all *stocked delivery* sales lines (only).

4. On the **Synchronization of mode and terms of delivery** FastTab, the **For delivery direct delivery** field group provides settings that are similar to (and named the same as) the settings provided in the **For delivery type stock** field group, except these settings apply to sales order lines that are set up for *direct delivery* instead of *stocked delivery*. Set these options as needed based on the descriptions provided in the previous step.

Create a purchase order from a sales order

This procedure shows you how to create a purchase order that's based on a sales order. The product quantities on the purchase order fulfill the demand of the originating sales order. Fulfilling sales demand this way is an alternative to a more comprehensive and optimized method of distribution requirements planning. You can run this procedure by using demo data company *USMF* or your own data.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. Select **OK**.
6. In the **Item number** field, select the drop-down button to open the lookup.
7. In the list, find and select the desired record. If you're using USMF, select *D0001*.
8. In the **Quantity** field, enter a number.
9. Select **Add line**.
10. In the **Item number** field, select the drop-down button to open the lookup.
11. In the list, find and select the desired record. If you're using USMF, select *T0020*.
12. In the list, select the link in the selected row.
13. In the **Quantity** field, enter a number.
14. Select **Save**.
15. On the Action Pane, select **Sales order**.
16. Select **Purchase order**. The **Create purchase order** page lists all the open sales order lines that the system copied from the sales order. You can review the order details, and if necessary, you can modify selected details such as purchase quantity and pricing terms, before you create the purchases.
17. Select the **Include all option**.

- If you want to generate purchase orders for only a subset of the sales order lines, select these lines individually.
- The **Vendor account** field might or might already be populated with a vendor number. If the default vendor is set up for the product (on the associated Item coverage), the system copies this vendor to the line. Otherwise, you must enter a vendor manually. In this article, regardless of whether the **Vendor account** field already contains a value or not, the following steps instruct you to select a new vendor that's different for each line.

18. In the **Vendor account** field, select the drop-down button to open the lookup.
19. In the list, find and select the desired record.
20. In the list, select the link in the selected row.
21. Select the second order line.
22. In the **Vendor account** field, select the drop-down button to open the lookup.
23. In the list, find and select the desired record.
24. In the list, select the link in the selected row.
25. Select **Validate**.
26. Select **OK**. The message informs you that one or more purchase orders are created. The system generates a separate purchase order for each vendor that you specified for the sales order lines. This means that if several sales order lines are to be supplied by the same vendor, a single purchase order with multiple lines is generated.

Review purchase orders created from sales orders

To review the purchase orders that you created from a sales order, follow these steps:

1. On the Action Pane, select **General**.
2. Select **Related orders**. The **Related orders** page lists all the orders that you created from the sales order. In this example, two purchase orders are generated for two different vendors.
3. Select the link in the **Purchase order** field. Each purchase order line is associated with the sales order line that led to the purchase. The **Product tab** in the **Line details** FastTab shows the relation to the sales order in the **Reference type**, **Reference number**, and **Reference lot** fields.
4. Expand or collapse the **Line details** section.
5. Select the **Product** tab.

    - The **Reference lot** guarantees that the costs from the current purchase are charged on the attached sales order.
    - You can go to the originating sales order by opening the link in the **Reference number** field.

Create sales orders

10/24/2025

This article describes how to create a sales order. You can use the step-by-step process in demo data company *USMF*. Typically, a sales order processor creates sales orders.

You can create a new sales order either from the **All sales orders** page or directly from the **Sales and marketing** module in the navigator. The second option offers a quicker way to create sales orders without opening the **All sales orders** page. This article describes both methods.

Enter sales order header details

1. Open the **Create sales order** dialog by doing one of the following steps:

    - Go to **Sales and marketing** > **Sales orders** > **Create sales order**.
    - Go to **Sales and marketing** > **Sales orders** > **All sales orders** and, on the Action Pane, select **New**.

2. In the **Customer account** field, select the customer you want to create a sales order for. If you're working with *USMF* demo data, select customer *US-004*.

3. Select **OK**.

Enter sales order line details

The products your organization sells might come in variants differentiated by dimensions, such as configuration, color, size, and style. Also, you might set up products to use storage dimensions, such as site, warehouse, and pallet, and tracking dimensions, such as batch and serial numbers. When you assign these dimensions, you must select the values for those dimensions on the order line. To improve order entry efficiency, consider adding the respective dimension fields to the order grid.

1. Under the **Sales order lines** section, select the **Sales order line**.

2. Select **Dimensions**.

    If you're working with *USMF* demo data, select the *Color*, *Site*, and *Warehouse* dimensions. The dimensions you select here appear in the sales order grid. To save your selections, set the **Save setup** option to *Yes*.

3. Select **OK**.

4. In the **Item number** field, select the drop-down button to open the lookup. If you're working with *USMF* demo data, select item number *T0004*.

    - If the item is part of a sales category, the item name automatically appears in the Sales category field.
    - If product dimension fields already contain a value, the value was copied from the product record where it's defined as a default product dimension. You can change the default value at any time.

5. In the **Color** field, select the drop-down button to open the lookup.

6. In the list, find and select the desired record.

7. In the **Quantity** field, enter a number.

    - If you sell the item in different units than when you purchase, produce, and store it, and you set a sales unit of measure on the product record, this value appears in the **Unit** field. You can change the value at any time.
    - If the **Site** field already contains a value, the value was copied from the order header or from the order settings that are associated with the product. You can change the value at any time. If the field is empty, select a value.
    - If the **Unit price** field already contains a value, the value was copied from a valid trade agreement, or from the product record. (The unit price can also come from a sales agreement, but the process for creating sales orders from sales agreements is different from the one shown here.) If the field is empty, enter a value.
    - The **Discount** field contains a discount amount per product unit. To calculate the total line discount amount, the discount value is multiplied by line quantity. If the **Discount** field already contains a value, the value was copied from a valid trade agreement. If the field is empty, and you want to give the customer a line discount, enter a value.
    - The **Discount percent** field contains a percentage value by which the total line gross amount is reduced. If the **Discount percent** field already contains a value, it was copied from a valid trade agreement. If the field is empty, and you want to give the customer a line discount, enter a value.
    - The **Net** amount field contains a value that's calculated based on the line's quantity and unit price adjusted by discounts. You can override the calculated value to a different one.

Review the order totals

1. On the Action Pane, select **Sales order**.

2. Select **Totals**.

   The **Totals** dialog box displays details about the entire order. This information includes the subtotal amount, which is a sum of all line net amounts adjusted for any line discounts, the total invoice amount, which is a subtotal amount adjusted for any order-level discount, charges, and sales tax, the customer credit limit situation, and more. The invoice amount is the amount that appears on the customer's invoice document.

3. Select **OK**.

> **Tip**
>
> For examples that show how sales totals and discounts are calculated when prices include and exclude sales tax, including information about how related values are shown in the **Totals** dialog box, see Calculate sales totals when prices include sales tax.

Use establishments on sales order lines

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about how to configure, default, and validate establishments on sales order lines to meet invoice compliance requirements.

Overview

The **Establishments** feature adds an establishment field at the sales order line level to support legal and fiscal compliance requirements (notably for France) while remaining globally applicable. An establishment represents an operating unit within a legal entity that buys or sells goods, and is tied to tax registration identifiers, such as SIRET or SIREN.

To enable establishments on sales order lines, enable the parameter highlighted in the following table.

Expand table

Parameter name	Parameter location in Finance	Description
Require establishment on customer invoice checkbox	**Accounts receivable** > **Setup** > **Accounts receivable parameters** > **Updates** tab > **Invoice** FastTab	When enabled, the system enforces establishment requirements on the customer invoice header. • Enables the **Establishment** field on customer invoice documents. • Applies defaulting logic to automatically populate the **Establishment** where possible, based on **Site** setup or **Financial dimensions** on the document. • Validates that an **Establishment** is specified before posting and prevents posting if the field is empty. > **NOTE**: You can't change the **Establishment** value after the invoice is posted.

This parameter controls whether an **Establishment** is required on invoices and determines when establishment-level **Registration IDs** must be enforced during invoice posting. When you enable establishment enforcement, the system validates that an applicable establishment is specified on the invoice and uses the defined applicability rules to resolve the corresponding **Registration IDs**. This validation ensures consistent identification of invoice parties at both legal entity and establishment levels and guarantees that the correct registration information is validated and immutably stored on posted invoices.

Learn more about Establishments and how they're defined in the Establishments article.

Learn more about Registration IDs in the Set up and use registration IDs article.

Why establishments matter

Invoices must include the correct establishment and related tax registration identifiers for audit and compliance. During invoice posting, the system enforces that each invoice contains one and only one establishment unless invoices are split by site. Once posted, the system stores establishment and registration IDs immutably on the invoice for compliance and audit purposes.

Where are establishments stored?

- Sales order lines contain the establishment field, which provides line-level granularity.
- Establishments aren't intended to appear on sales order header list pages because these pages are header-centric views, while establishments are line-driven.

How are establishments determined?

On a sales order line, the establishment can be derived using the following logic:

1. Site-based derivation (primary)
2. Financial dimensions (fallback or complementary)
3. Manual override by the user (allowed if defaulting fails or adjustment is needed)

If the site or relevant dimensions change, the system recalculates the establishment to stay consistent with the new context.

Default behavior

- The system defaults the establishment during sales line insert and update operations.

- For legacy or previously created unposted documents, use the **Backfill Establishments** batch job to populate establishment values instead of relying on form-load logic, to avoid performance problems.

Before an invoice can be posted:

- All sales order lines must have an establishment.
- All lines on a single invoice must share the same establishment.
- If sales order lines span multiple sites (and therefore multiple establishments), invoice posting fails unless you enable the **Split invoice by site** parameter.

Clear validation and error messages guide you toward corrective actions, such as running the backfill job or adjusting parameters.

Error handling and user guidance

You can correct error messages related to establishments by:

- Running the **Backfill Establishment on sales order lines** batch job.
- Enabling **Split invoice by site when multiple establishments are involved**.
- Manually aligning establishments on all relevant sales order lines.

Backfill establishments batch job

Use a dedicated batch job to populate establishment values on open sales order lines within a specified date range. Key characteristics of this backfill batch job include:

- Set-based processing for performance
- Security roles control (for example, Trade Sales Manager)
- Designed to address gaps in historical or legacy data

User interface considerations

- You see establishment at the sales order line level, and you can add it as a column where needed.
- To avoid performance and aggregation complexity, the establishment doesn't appear at the invoice header.
- Line-level visibility ensures clarity while avoiding costly recalculations.

Key takeaways

- Establishments are a line-level compliance construct, not a header attribute.
- Defaulting is automatic but overridable, with strong validations at invoice posting time.
- Batch backfill and actionable error messages ensure operational continuity and compliance.

Use external item identifiers to add products to orders

When you're adding an item to a sales order, you can search for it using its external item identifier or external description/name. You can define external item identifiers and descriptions for each customer, allowing you to use the customer's terminology when adding products to orders.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.45 or later.
- You must ensure that the feature named *Enable lookup based search for Sales External Item Identifier field* is turned on in feature management. As of Supply Chain Management version 10.0.49, this feature is mandatory and can't be turned off.

Specify external item identifiers for a customer

External item identifiers are set up on the account for the customer that uses them. You can add external item identifiers to a customer account by following these steps:

1. Go to **Account Receivable** > **All customers**.
2. Find and open the customer you want to set up with external item identifiers.
3. On the Action Pane, open the **Sell** tab and then select **Setup** > **External item description**.
4. The **External item description** page opens, showing the existing external item identifiers for the customer. To add a new one, select **New** on the Action Pane and then enter values for the following fields:
    - **ABC code** – If the customer has assigned an ABC inventory classification to the item, you can note that here. ABC analysis is an inventory management technique that determines the value of inventory items based on their importance to the business.
    - **Item number** – Select your standard (internal) item number for the product.

- **External item number** – Enter the external item identifier that this customer uses to identify the item you specified. Users will be able to search for this number when creating a sales order.
- **Description** – Enter the name or other short description that the customer uses to identify the item. Users will be able to search for this description when creating a sales order.
- **External item text** – Enter text that this customer uses to describe the item.
- *Other dimensions* – If the external item number is associated with other specific dimension values (such as configuration, size, color, style, and so on), then enter these dimension values in the remaining columns as needed to finish identifying the item.

5. Continue to add external item identifiers as needed. When you're done, select **Save** on the Action Pane.

Add a product to a sales order using its external item identifier

When a customer has external item identifiers defined, you can use them to quickly find and add products to sales orders. To do this, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Either create a new sales order or open an existing one that you want to add lines to. The sales order must be for a customer that has external item identifiers defined.
3. Make sure that the **External** column is visible in the grid on the **Sales order line** FastTab. If it isn't, you can add it by doing the following steps:
   a. Open the **Grid options** dropdown list, which is the button with three dots on it located at the right side of the heading row of the grid.
   b. Select **Insert columns** to open the **Insert columns** dialog.
   c. Find the row with **Field** name *External* and select the checkbox in that row.
   d. Select **Update** to apply the change and close the dialog.
4. On the **Sales order line** FastTab toolbar, select **Add line**.
5. In the **External** column for the new line, select the item that you want to use based on its external item number or description. You can either type it in the field or select it from the lookup list. The field supports *search as you type*, which filters the list based on the **External item number** and **Description** values from the external item description.
6. On selecting a value, the **Item number**, **Product name**, and other related fields are populated based on the item setup.

Copy lines between sales orders

Article • 04/03/2025

The *copy from all* feature lets you copy sales order lines between sales orders. This feature is useful when you must create an order that is similar to an existing one.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Either create a new sales order or open an existing sales order that you want to copy lines to.
3. On the Action Pane, on the **Sales order** tab, in the **Copy** group, select **From all**.
4. In the **Copy from all** dialog, on the **Parameters** FastTab, set the following fields:
    - **Quantity factor** – Specify the factor that the quantity for the selected order lines should be increased or decreased by.
    - **Invert sign** – Specify whether inverted (negative) quantities should be created for the copied lines. Set this option to *Yes* to create a return order or a negative-quantity order by reversing the sign of the copied lines.
    - **Copy charges** – Specify whether order line charges should be copied. Set this option to *Yes* to include any additional charges from the original order lines and/or header. If the **Copy order header** option is also set to *Yes*, order header charges are also copied.
    - **Recalculate price** – Specify whether the net amount of the copied lines should be recalculated based on current prices and trade agreements. Set this option to *Yes* to recalculate the prices.
    - **Copy precisely** – Specify whether the copied lines should be exact copies of the selected lines. Exact copies include all order information, such as sales tax, ledger accounts, and dimensions. Set this option to *Yes* to retain all the original details without any modifications.
    - **Delete order lines** – Specify whether previously entered order lines for the current order should be deleted before the new lines are copied. Set this option to *Yes* to replace the existing order lines with the copied lines.
    - **Copy order header** – Specify whether information from the selected order header should be copied to the current order. Set this option to *Yes* to copy order header information together with the selected order. The header information includes customer details, delivery terms, and payment terms.
5. On the **Sales orders** FastTab, specify which order lines (and possibly header information) you want to copy.

- In the **Headers** grid, find and select the sales order that you want to copy lines from. You can copy from only one order at a time.
- In the **Lines** grid, select the checkbox for each line that you want to copy. To select all the lines at once, select the checkbox in **Select all** column for the order that you selected in the **Header** grid.

> **Note**
>
> You can use the other FastTabs on the page to copy other related records and fields in a similar way.

6. Select **OK** to close the dialog.

   The selected sales order lines (and possibly header information) are now copied to the current order.

Calculate sales totals when prices include sales tax

This article provides example scenarios that show how sales totals and discounts are calculated when prices include and exclude sales tax.

Prerequisites

Enable sample data

To work through the example scenarios by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Adjust the tax rate

The example scenarios in this article assume the following setup in Microsoft Dynamics 365 Supply Chain Management:

- A sales tax code that's named *AV_CAST* has a tax rate of 50 percent.
- A sales tax group that's named *CA* includes sales tax code *AV_CAST*.
- An item sales tax group that's named *AU/VI* includes sales tax code *AV_CAST*.

The USMF sample data includes these tax codes and groups, but it uses a different tax rate for the sales tax code. To adjust the tax rate to 50 percent, follow these steps:

1. Go to **Tax** > **Indirect taxes** > **Sales tax** > **Sales tax codes**.
2. In the list pane, select sales tax code *AV_CAST* to open it.
3. On the Action Pane, on the **Sales tax code** tab, select **Values**.
4. For the row where the **Sales tax code** field is set to *AV_CAST*, set the **Value** field to *50*.

Example scenario 1: Sales total calculation when prices exclude sales tax

Follow these steps to see how sales totals are calculated when prices exclude sales tax.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. Create a sales order for customer account *US-001*.

3. Add a sales order line, and set the following values for it:

    - **Item number:** *1000*
    - **Site:** *1*
    - **Warehouse:** *11*
    - **Quantity:** *1*
    - **Unit price:** *1000*

4. While the new sales order line is still selected, on the **Line details** FastTab, on the **Setup** tab, set the following values:

    - **Item sales tax group:** *AU/VI*
    - **Sales tax group:** *CA*

5. On the Action Pane, on the **Sales order** tab, select **Totals**.

6. In the **Totals** dialog box, notice that your tax settings produce the following values:

    - **Invoice amount:** *1500*
    - **Subtotal amount:** *1000*
    - **Sales tax:** *500* (= *Subtotal amount* × 50%)

7. Select **OK** to close the dialog box.

8. Edit the sales line so that the **Discount** field is set to *100*.

9. Open the **Totals** dialog box again, and notice the following new values:

    - **Invoice amount:** *1350* (= *Unit price* − *Discount*)
    - **Subtotal amount:** *900* (= *Unit price* − *Discount*)
    - **Sales tax:** *450* (= *Subtotal amount* × 50%)
    - **Line discount:** *100*

Example scenario 2: Sales total calculation when prices include sales tax

Follow these steps to see how sales totals are calculated when prices include sales tax.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. Create a sales order for customer account *US-001*.

3. On the **Header** tab of the new sales order, on the **Setup** FastTab, set the **Prices include sales tax** option to *Yes*.

4. On the **Lines** tab, add a sales order line, and set the following values for it:

    - **Item number:** *1000*
    - **Site:** *1*
    - **Warehouse:** *11*
    - **Quantity:** *1*
    - **Unit price:** *1000*

5. While the new sales order line is still selected, on the **Line details** FastTab, on the **Setup** tab, set the following values:

    - **Item sales tax group:** *AU/VI*
    - **Sales tax group:** *CA*

6. On the Action Pane, on the **Sales order** tab, select **Totals**.

7. In the **Totals** dialog box, notice that your tax settings produce the following values:

    - **Invoice amount:** *1000*
    - **Subtotal amount:** *666.67* (= *Invoice amount − Sales tax*)
    - **Sales tax:** *333.33* (= *Subtotal amount* × 50%)

8. Select **OK** to close the dialog box.

9. Edit the sales line so that the **Discount** field is set to *100*.

10. Open the **Totals** dialog box again, and notice the following new values:

    - **Invoice amount:** *900* (= *Unit price − Discount*)
    - **Subtotal amount:** *600* (= *Invoice amount − Sales tax*)
    - **Sales tax:** *300* (= *Subtotal amount* × 50%)
    - **Line discount:** *66.67* (= *Original subtotal amount* [666.67] − *New subtotal amount* [600])

    Because tax is included in the price, the line discount doesn't equal 100. Instead, it's calculated as the difference between the gross amount without tax (calculated without the discount) and the line amount without tax (calculated to include the discount).

11. Select **OK** to close the dialog box.

The remaining steps in this example show how to apply a manual adjustment to the sales tax amount.

12. On the Action Pane, on the **Sell** tab, select **Sales tax**.
13. In the **Temporary sales tax transactions** dialog box, select the **Adjustment** tab to view the actual sales tax amount.
14. For the row where the **Sales tax code** field is set to *AV_CAST*, follow these steps:
    a. Set the **Actual sales tax amount** field to *400*.
    b. Make sure that the **Override calculated sales tax** checkbox is selected. (It should be automatically selected when you change the **Actual sales tax amount** value.)
15. Select **OK** to close the dialog box.
16. Open the **Totals** dialog box again, and notice the following new values:

    - **Invoice amount:** *900* (= *Unit price − Discount*)
    - **Subtotal amount:** *500* (= *Invoice amount − Sales tax*)
    - **Sales tax:** *400* (manually adjusted amount)
    - **Line discount:** *166.67* (= *Original subtotal amount* [666.67] − *New subtotal amount* [500])

    The same logic that was used earlier is used to calculate the discount. The discount is the difference between the gross amount without tax (ignoring the manually adjusted tax) and the line amount without tax (calculated to include a discount of 100 and the new manually adjusted tax).

Manage order holds

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article demonstrates how to place customer sales orders on hold, how to work with order hold checkouts, and how to remove order holds. An order might be placed on hold for various reasons. For example, you might hold an order until a customer address or payment method can be verified or until a manager can review the customer's credit limit. While the order on hold, it can't be processed by the warehouse for shipping.

Set up order hold codes

There could be many reasons why an order should be placed on hold. Use hold codes to set up each of the various types of holds you'd like to be able to apply to sales orders.

1. Go to **Sales and marketing** > **Setup** > **Sales orders** > **Order hold codes**.
2. Do one of the following actions:

    - To create a new hold code, select **New** on the Action Pane.
    - To edit an existing hold code, select **Edit** on the Action Pane, and then select an existing hold code on the list pane.

3. Make the following settings for your new or selected hold code:

    - **Hold code** – Enter a short name for the hold code (for example, *Call back*).
    - **Description** – Enter a short description to provide more information about the hold code (for example, *Order held waiting for customer callback*).
    - **Role** – Select the security role that a user must have to be able to remove this hold code from an order. For example, if you select *Collections agent*, only users with that role can remove this hold code from an order.
    - **Default for sales order** – Select this check box to make this hold code selected by default each time a user adds a new hold to an order.

- **Remove inventory reservations** – Select this check box to remove any physical reservations from an order when this hold code is added to it.

4. Select **Save**.

Place order on hold

To place a sales order on hold, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select the sales order you want to put on hold.
3. On the Action Pane, open the **Sales order** tab and from the **Functions** group, select **Order holds**.
4. On the Action Pane, select **New**.
5. In the **Hold code** field, select the hold code you want to apply.
6. Select **Save**.
7. Go back to the **All sales orders** list page.
8. On the grid, find the order you put on hold and note that it now shows a check mark in the **Do not process** column and a pause symbol in the **Hold** column.
9. On the Action Pane, open the **Pick and pack** tab and note that the buttons for generating picking lists and packing slips are disabled. This restriction is because the order is on hold and can't be processed further until the hold is removed.

Manage orders on hold

To manage orders on hold and remove holds, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **Open orders** > **Order holds**. The **Order holds** page functions as a workbench where you can get an overview of all the current and processed holds, and handle them and associated sales orders.
2. Use the **Filter** field and/or the **Show** drop-down list to filter the list by value and/or hold status. Then select the hold you want to change.
3. You can check out order holds. While you have a hold checked out, other users can't clear it. To check an order hold in or out, open the **Hold checkout** tab on the Action Pane and choose one of the following actions:

    - **Check out** – Select this option to check out the selected hold. The **Checked out to** column updates to show your user ID for the selected hold.
    - **Clear checkout** – Select this option to check in a hold that you previously checked out. Your user ID is removed from **Checked out to** column for the selected hold.

- **Override checkout** – Select this option to reassign a checked-out hold to another user (or yourself). The **Checked out to** column updates to show the selected user's ID.

4. When you're ready to remove the hold and allow the order to proceed to the next fulfillment step, clear it. On the Action Pane, open the **Clear hold** tab and select one of the following options:

    - **Clear holds** – If the order requires no changes, select this option to clear the holds on it.
    - **Clear and modify** – If the order requires changes, select this option to clear the holds on it and then open the order so you can modify it.
    - **Clear and submit** – Clear all holds and submit the order for further processing. This action only applies when you're using call center functionality.

Confirm sales orders

This procedure demonstrates how to confirm sales orders. You see how to confirm a single order, and how to confirm multiple orders at once. A sales order processor typically carries out these tasks.

Confirm a single sales order

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. In the list, find and select the order that you want to confirm.
3. Select the link on the sales order number to open the selected order.
4. On the Action Pane, select *Sell*.
5. Select **Confirm sales order**.
6. Expand the **Parameters** section. Make sure that the **Posting** option is set to *Yes*.
7. Set the **Print confirmation option** to *Yes*. The **Check credit limit** field specifies the method that's used to calculate a customer's remaining credit. By default, it's copied from the **Credit and collections parameters** page. If you want to skip the credit limit check when confirming a specific sales order, set the **Check credit limit** to *None*. However, even when this field is set to *None*, the credit limit check is still performed if the **Mandatory credit limit** option is selected on the customer master data.
8. Select **OK**.
9. Select **Yes**.
10. Close the page.
11. On the Action Pane, select **Options**.
12. Select **Change view**.
13. Select **Header view**. When an order is confirmed, the **Document status** is set to *Confirmation*.
14. On the Action Pane, select **Sell**.
15. Select **Sales order confirmation**.
16. Close the page.

Confirm multiple sales orders at once

1. Go to **Sales and marketing** > **Sales orders** > **Order confirmation** > **Confirm sales order**.
2. Select **Select**.

3. In the list on the **Range** tab, find and select the record that references the **Customer account** field.
4. In the **Criteria** field, find and select the customer account that has multiple orders to confirm.
5. Select **OK**.

    - The **Overview** tab displays a list of the orders that match the query criteria. These orders are included in the confirmation.
    - The **Summary update for** field in the **Parameters** section specifies the parameter by which multiple orders are summarized into one confirmation document. By default, the option is copied from the **Default values for summary update** setting on the **Accounts receivable parameters** page.

6. In the **Summary update for** field, select *Order*. The minimum parameters that are required to create summary updates are **Invoice account** and **Currency**. This requirement means that summary updates that have different invoice accounts and different currencies aren't allowed. You can set up other parameters on the **Summary update parameters** page, which is accessible from the **Accounts receivable parameters** page.
7. In the **Sales order** field, select the order number that you want to be the summary order.
8. Select **Arrange**.
9. Select **OK**.
10. Select **OK**.

Last updated on 07/01/2026

Calculate sales totals

Summarize this article for me

The *Calculate sales totals* batch job recalculates and updates aggregated metrics for sales orders and sales quotations. This critical maintenance task ensures that all summary totals, delivery metrics, and key performance indicators (KPIs) shown on inquiry pages, workspaces, and analytics dashboards remain accurate and up-to-date. The recalculation updates:

- Order-level totals
- Quotation-level totals
- Aggregated values used by workspaces, analytics, and reporting
- KPI caches across sales, retail, and commerce experiences

Use the *Calculate sales totals* job to maintain data integrity and reporting accuracy, especially after bulk data imports, mass updates to sales documents, or as part of regular system maintenance. By running this job on a scheduled basis—such as nightly or as part of month-end closing processes—you ensure that your sales teams, managers, and executives always see current, reliable totals when reviewing orders, quotations, and performance metrics.

This feature provides benefits to many parts of your organization:

- *Sales teams and order managers* get accurate order summaries and delivery information without manual calculation or delays.
- *Finance and management* rely on current KPI data for accurate reporting, forecasting, and business analysis.
- *System administrators* can control the scope and timing of recalculations to balance data accuracy with system performance.
- *E-commerce and retail operations* benefit from fresh aggregated metrics used in commerce workspaces and analytics.

This article walks you through the configurable parameters that let you control which documents to recalculate and how far back to look, explains how to schedule the job to run automatically, and provides performance best practices to ensure the job runs efficiently in your environment.

Learn more about batch jobs in Batch processing overview.

When to recalculate sales totals

Run the *Calculate sales totals* batch job in the following scenarios:

- After *bulk data imports* (data management and integrations).

- After *mass updates* to sales orders or quotations.
- As part of *month-end closing*.
- On a *nightly schedule* to maintain accurate workspace KPI totals.

Performance considerations

To keep your system running smoothly, follow these performance best practices:

- Avoid full recalculation during peak business hours.
- Run targeted recalculations by adjusting the **Ignore documents updated before (days)** parameter.
- If totals appear incorrect, check whether you have any customizations that bypass update triggers.

Set up, run, and schedule sales total calculations

To set up, run, and schedule the *Calculate sales totals* batch job, follow these steps:

1. Go to **Sales and marketing** > **Periodic tasks** > **Calculate sales totals**.

2. In the **Calculate sales totals** dialog, make the following settings on the **Parameters** FastTab:

    - **Ignore documents updated before (days)** – Enter the number of days to look back for recalculation. Only documents that were last updated *after* this date are recalculated. The system uses the following formula to calculate the cutoff date:

      Cutoff date = Today - Entered number of days

      To balance data freshness with performance for routine recalculations, we recommend that you look back 7 to 30 days. Avoid running full historical recalculations in high-volume environments unless necessary.

    - **Calculate totals for sales orders** – Set to *Yes* to recalculate aggregated totals for sales orders, including:
        - Order-level summary totals
        - Line-level aggregated contributions
        - Delivery totals
        - Remaining quantities and values
        - KPI totals used in workspaces and analytics

      Set this option to *No* only in niche scenarios where sales orders aren't part of your workflow.

- **Calculate totals for sales quotations** – Set to *Yes* to recalculate aggregated totals for sales quotations, including:
  - Quotation value summaries
  - Aggregated line-level metrics
  - Totals used in quotation inquiry and reporting

  Set this option to *No* if your organization doesn't use the sales quotation process.

- **Number of threads** – Enter the maximum number of parallel threads to use for the job (or set to zero to let the system decide automatically). If your sales totals calculations take too long, consider increasing this value. To allow more resources for other processes while calculating sales totals, reduce this value. The actual maximum number of used threads never exceeds the maximum batch threads configured for your system. The system distributes orders and quotations selected for the calculation evenly between the threads.

3. On the **Run in the background** FastTab, choose whether to run the job in batch mode and set up a recurrent schedule. Select **Recurrence** to set up the run schedule (or choose to run just once). Tips for when and how often to run this job are provided earlier in this article. Select **Alerts** to configure notifications for job completion or failures. The settings here work just as they do for other types of batch jobs in Supply Chain Management.

Pay-by-link payment with the Dynamics 365 Payment Connector for Adyen (preview)

[This article is prerelease documentation and is subject to change.]

This article explains how to set up and enable the pay-by-link payment method to capture payments for sales orders by using the Microsoft Dynamics 365 Payment Connector for Adyen. By using pay-by-link functionality, businesses can offer modern payment methods that give their customers the flexibility to choose their preferred way to pay.

By using the pay-by-link payment method, salespeople can generate payment links for their customers, which eliminates the need for customers to share sensitive card details verbally over the phone. This method enhances security and trust. By using these payment links, customers can employ modern payment methods like digital wallets that aren't feasible in traditional phone transactions. Moreover, if customers are undecided about their order, salespeople can create the orders on a payment hold. If customers make the payment within a preconfigured duration, the system releases the order for fulfillment. Otherwise, the order gets canceled.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

Set up and configure the Adyen portal and connector

Before you can set up and use the pay-by-link payment method for Supply Chain Management, the Dynamics 365 Payment Connector for Adyen must already be set up and configured for your system. Learn more in the following articles:

- Dynamics 365 Payment Connector for Adyen overview
- Set up Dynamics 365 Payment Connector for Adyen

Link your Supply Chain Management environment to a Dataverse environment

The payment notification service uses Dataverse. Therefore, to receive payment notifications, you must link your Supply Chain Management environment to a corresponding Dataverse environment. Learn more in Connect finance and operations apps with a new Microsoft Dataverse instance and Connect finance and operations apps with an existing Microsoft Dataverse instance.

Version requirements

Pay-by-link payment requires Supply Chain Management version 10.0.47 or later.

License required to set up the connector

To set up pay-by-link payment for Supply Chain Management, you must have a Dynamics 365 Commerce license.

Security roles required to set up the connector

Some of the steps for setting up pay-by-link payment require you to sign in to Supply Chain Management by using a user account that has either the *Administrator* or *Commerce Payment Administrator* security role in Microsoft Power Platform.

Set up pay-by-link payment

Enable the features required for pay by link

To enable pay-by-link payment, turn on the following features in feature management:

- *Enable unified payments experience in POS* – Must be enabled to use pay-by-link payment, but only applies to POS and doesn't affect sales orders in Supply Chain Management. Learn more in Check out faster with optimized payment flows.
- *Enable Payments Notification feature* – Enables the infrastructure to receive notifications.
- *Enable Pay By Link Payment feature* – Must be enabled to use pay-by-link payment, but only applies to POS and doesn't affect sales orders in Supply Chain Management.
- *Enable asynchronous payments for sales orders* – Enables the pay-by-link capability for sales orders in Supply Chain Management.

Find your payment notification service URL

The payment notification service URL is where Adyen sends the payment notifications. You'll need this value later when you create a webhook to receive payment notifications from Adyen.

To find your payment notification service URL, follow these steps:

1. Go to **Retail and Commerce** > **Headquarters setup** > **Parameters** > **Commerce shared parameters**.
2. Open the **Payment notifications** tab.
3. Copy the value shown in the **Payment notifications end point URL** field.

> **Note**
>
> If the **Payment notifications end point URL** field is blank, then you need to connect your Supply Chain Management environment to a Dataverse environment. Learn more Connect finance and operations apps with a new Microsoft Dataverse instance and Connect finance and operations apps with an existing Microsoft Dataverse instance

Create a Microsoft Entra ID application registration

A Microsoft Entra ID application registration lets you establish OAuth credentials for the payment notification service. Payment notifications from Adyen use these credentials to communicate securely with the payment notification service. You'll need these credentials later when you create a webhook to receive payment notifications from Adyen.

Create a new Microsoft Entra ID application registration in your Azure portal by following these steps:

1. Sign in to the Azure portal by using a work or school account.
2. If your account gives you access to more than one tenant, select your account in the upper-right corner. Then set your portal session to the Microsoft Entra tenant that you want.
3. In the left pane, select the **Microsoft Entra ID** service, and then select **App registrations** > **New registration**.
4. On the **Register an application** page, enter your application's registration information:

- **Name** – Enter a meaningful application name. This name is shown to users of the app.
- **Supported account types** – Any of the available options should work.
- **Redirect URI** – You don't need this field.

5. Select **Register**.

6. After the new application is registered, on the **Overview** page, copy the values of the following properties:

   - **Application (client) ID**
   - **Directory (tenant) ID**

7. Now you must create a client secret for the application. Go to the **Certificates & secrets** section, and then select **New client secret**. Provide a description and an expiration period for the secret. Ensure that you create a business process for rotating the secret, because payment notifications fail after the secret expires. Copy the secret value, and save it for later use.

Create a webhook to receive payment notifications from Adyen

To create a new webhook to receive payment notifications from Adyen, follow these steps.

1. Go to the Adyen portal, and then go to the **Developers** section.

2. Create a standard webhook.

3. In the **Server configuration** section, in the **URL** field, paste the **Payment notifications endpoint URL** value that you copied earlier.

4. Keep the default values for the **Method** field (*JSON*) and the **Encryption protocol** field (*TLS v1.3*).

5. In the **Security** section, select **OAuth**, and enter values for the following properties:

   - **Client ID** – Enter the **Application (client) ID** value that you copied earlier from the Microsoft Entra ID application registration.
   - **Client secret** – Enter the **Secret value** value that you copied earlier from the Microsoft Entra ID application registration.
   - **URL** – Enter `https://login.microsoftonline.com/{tenantid}/oauth2/v2.0/token`. Replace *{tenantid}* with the **Directory (tenant) ID** value that you copied earlier from the Microsoft Entra ID application registration.
   - **Scope** – Enter *a013b12b-2624-40b4-b15b-b7751d733a22/.default*.

6. Generate a new hash-based message authentication code (HMAC) key and copy it. You aren't able to view this key again, so keep it somewhere safe.
7. In the **Events** section, select **Authorization**.
8. Under **Additional settings**, in the **Card** section, select the **Include card bin** and **Include Subvariant** options.
9. Leave the remaining fields set to their default values, and save the configuration.

> **Note**
>
> Don't test the configuration yet because you aren't finished setting up the system. You'll validate the configuration after the next step.

Enter the HMAC and application client ID details

Supply Chain Management uses the HMAC and application client ID details to authenticate the payment notifications sent by Adyen. To enter these details, follow these steps:

> **Important**
>
> To complete this procedure and save the configuration, sign in to Supply Chain Management by using a user account that has either the *Administrator* or *Commerce Payment Administrator* security role in Microsoft Power Platform.

1. Go to **Retail and Commerce** > **Headquarters setup** > **Parameters** > **Commerce shared parameters**.
2. Open the **Payment notifications** tab.
3. Enter the following values:
    - **Data verification HMAC key** – Enter the HMAC key that you copied earlier when setting up the webhook in the Adyen portal.
    - **Payment notifications client ID** – Enter the **Application (client) ID** value that you copied earlier from the Microsoft Entra ID application registration.
4. On the Action Pane, select **Save**.

Test the connection to the payment notification service

To test the connection, follow these steps.

1. Go to the Adyen portal.
2. Edit the webhook that you created earlier, and then select **Test configuration**. If the connection fails, review all the values that you entered when you created the webhook to validate that they're correct. If you make any changes (for example, if you change the keys), wait 20 minutes before you test the connection again. This wait time ensures that caching doesn't affect the test. If the issue persists, contact Microsoft Support.

Enable pay by link functionality for sales orders

In addition to the generic pay-by-link setup described earlier in this article, complete the following steps to enable the pay by link functionality for sales orders.

1. Go to **Accounts receivable** > **Payments setup** > **Methods of payment**.

2. Methods of payment with a **Payment type** of *Credit card* or *Electronic payment* now include a section named **Pay by link** on the **General** FastTab. For each method of payment where you want to enable pay by link, make the following settings:

    - **Allow pay by link** – Set to *Yes* to allow salespeople to create payment links for sales orders that use this method of payment. This setting is required to enable the pay by link functionality for the payment method.
    - **Allow pay later** – Set to *Yes* to allow customers to pay later, enabling scenarios where the customer needs some time to confirm the order but wants to reserve the inventory. Pay-later orders are created with a special hold code and remain on hold for a preconfigured duration (as described in the next step). If the customer makes a payment within this duration, then the order is released for fulfillment; otherwise, the order is systematically canceled. Set to *No* to disable pay-later for a payment method.

3. If you chose to enable the pay-later capability for one or more payment methods, go to **Accounts receivable** > **Setup** > **Account receivable parameters**, open the **General** tab, and make the following settings on the **Sales setup** FastTab:

    - **Hold code for payment confirmation** – Select the hold code you want to apply to pay-later orders that aren't paid yet. This hold code is automatically applied to orders that are placed on hold when the salesperson selects the **Pay later** option while creating the payment link.
    - **Order hold timeout for pending payments (minutes)** – Enter the number of minutes system should wait for payment. If the customer doesn't pay before this limit expires, then the system cancels the order.

4. Go to **Retail and Commerce** > **Retail and Commerce IT** > **Payments** > **Process asynchronous payments for sales orders**. In the dialog, expand the **Run in the background** FastTab and select **Recurrence**. Use the settings here to choose how often the system should check for customer payments (for example, every 15 minutes). Then select **OK** twice to close the dialog and save your setting. These settings schedule the *Process asynchronous payments for sales orders* batch job, which checks for customer payments and updates the status of sales orders accordingly.

Customize the behavior of payment links

This step is optional. Complete it only if you want to change the default behavior of the payment links.

1. Go to **Account receivables** > **Payments setup** > **Payment services**.
2. Open payment service for your Adyen connector.
3. On the **Payment service account** FastTab, in the **Custom settings** property, add key-value pairs for any or all of the following keys (an example is shown later in this step):

   - `PaymentLinkDuration_Orders` – Set the duration for which the payment link is valid. The default value is 24 hours.
   - `Store` – Specify which Adyen store information to include in the payment link. By default, only payment methods that don't depend on the Adyen store are shown.
   - `RequiredShopperFields` – Specify which fields the customers must enter values for before making a payment. By default, the related fields aren't shown to customers before they use the payment link.

   The system uses the default value for any keys that you don't include in the key-value pairs.

   For example, you enter the value `{"PaymentLinkDuration_Orders":"02:00", "Store":"Test_Store", "RequiredShopperFields":"email,name,phone,billingAddress,deliveryAddress"}` for the **Custom settings** property. In this case, the Adyen payment connector sets the payment link expiration to *two hours*, the payment link is associated with the *Test_Store* store, and customers must enter their *name*, *email address*, *phone number*, *delivery address*, and *billing address* before they make the payment.

   > **Tip**

To define the payment link duration to be more than one day, specify the value for the `PaymentLinkDuration` property as described in System.TimeSpan.Parse method.

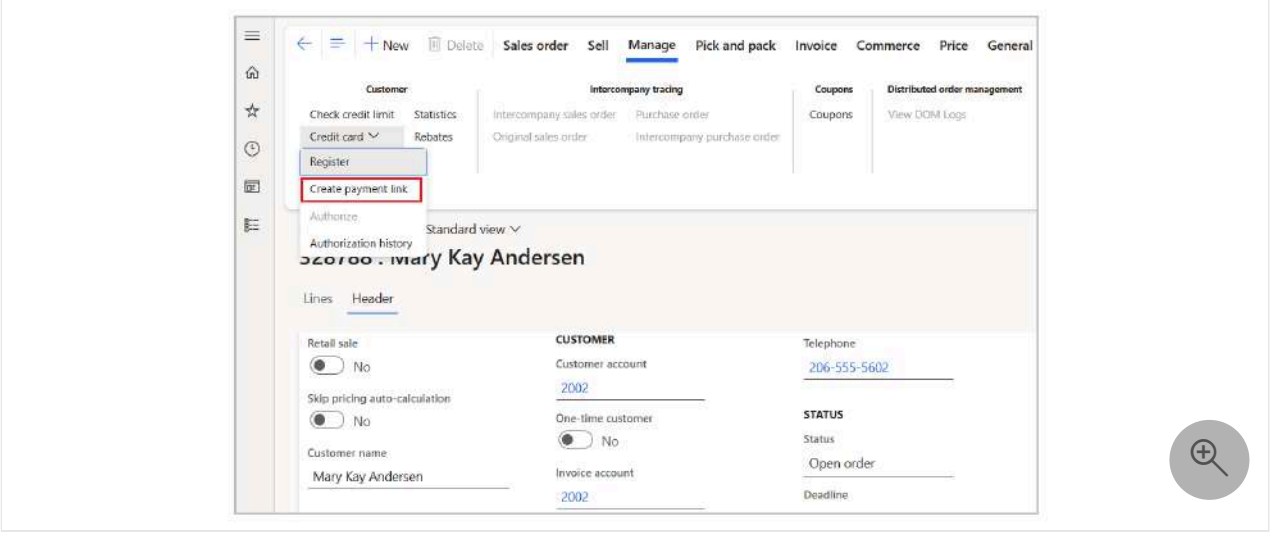
The pay-by-link user experience

The following example describes a typical end-to-end user experience for using pay by link with sales orders in Supply Chain Management.

1. A salesperson takes an order by phone and creates a sales order in Supply Chain Management.

2. When the order is ready for payment, the salesperson goes to the **Header** tab of the sales order and, on the **Price and discount** FastTab, selects a **Method of payment** for which **Allow pay by link** is set to *Yes* (as described earlier in this article). Additionally, as with credit cards, the **Settlement type** field on the **Setup** FastTab might need to be set to *None*.

3. On the Action Pane, the salesperson opens the **Manage** tab, opens the **Credit card** drop-down list, and selects **Create payment link**.



4. A page opens that the salesperson uses to create the payment link. Customer information is prepopulated.

5. After the salesperson updates the customer information as needed, they select **Create link** to create the payment link.

6. The salesperson copies the payment link and can use any available communication channel to send it to the customer.

    - If the customer requests more time to make the payment, the salesperson selects the **Pay later** button on the payment link dialog (if this functionality is enabled).

- If the customer changes their mind about the purchase, the salesperson can cancel the payment link from here.

7. The customer opens the payment link from their phone or computer to complete the payment.

8. The salesperson's screen automatically refreshes every five seconds to check for the payment. As with a credit card authorization, once the payment is received, the system associates the authorization to the order.

Manually check the payment status of a sales order

To manually check the payment status of a sales order, follow these steps.

1. In Supply Chain Management, go to the **All sales orders** page and open the sales order waiting for payment.
2. On Action Pane, open the **Sales order** tab, from the **Payments** group, select **Asynchronous payments**.
3. A page opens showing the payment links associated with the order. If a payment link status is shown as *Active*, then payments against this link are either not yet processed or the customer hasn't yet paid.

    - To refresh the current payment link status display, select **Check status** on the Action Pane.
    - To cancel a selected payment link, select **Cancel** on the Action Pane. You can only cancel a payment link if the customer hasn't yet used the link for payment.

Purge old payment authorization notifications

To save storage and keep the notifications page manageable, delete old notifications manually from the **Payment authorization notifications** page or automatically by running the **Purge payment authorization notifications data** batch job. The batch job allows you to specify the number of days that pass before notifications are deleted.

Enable critical payment notifications for Dynamics 365 Payment Connector for Adyen

You can use the asynchronous payment notification framework to receive crucial and actionable notifications from Adyen, which are then displayed in Commerce headquarters. This functionality provides the operations team with the necessary visibility to take timely actions

based on the notifications received. Learn more in Enable critical payment notifications using the Dynamics 365 Payment Connector for Adyen.

Last updated on 02/11/2026

Sales order FAQs

This article addresses frequently asked questions that come up when working with sales orders in Dynamics 365 Supply Chain Management.

Can I link a purchase order to a sales order to fulfill demand?

You can create a purchase order from a sales order. For more information, see Create a purchase order from a sales order.

Can I cancel or delete a sales order or return order?

You can cancel only sales orders and return orders that are in a *Created* state. For more information, see Cancel a return order.

Can I restore an invoiced sales order that was deleted?

If an invoiced sales order was deleted by mistake, you can restore it or view its details.

Go to **Customer account** > **Transactions** > **Original document** > **View details**. Find the invoice that you're looking for and select it to view its details. These details include the sales order reference. You should also be able to access the sales order details from that page.

How do I delete orphaned sales order records?

To clean up orphaned sales order records, run the *Sales order deletion* periodic job by going to either of the following places:

- Sales and marketing > Periodic tasks > Clean up > Delete sales orders
- Retail and commerce > Retail and commerce IT > Clean up > Delete sales orders

Is there a way to calculate commissions on invoices that are already posted?

Supply Chain Management doesn't currently support the calculation of commissions for posted invoices.

This article provides information about sales agreements. A sales agreement is a contract that commits the customer to buy products in a specific quantity or for a specific amount over time, in exchange for special prices and discounts.

A sales agreement is a contract that commits the customer to buy products in a specific quantity or for a specific amount over time, in exchange for special prices, special discounts, and other special terms, such as payment and delivery terms. The prices and discounts of the sales agreement override the prices and discounts that are stated in any trade agreements that exist.

The validity period of a sales agreement is defined by the **Effective date** and **Expiration date** fields on the agreement. A customer's sales order qualifies for the agreement terms if the requested ship date of the order is within the validity period. All sales order lines that are linked to a sales agreement contribute to fulfillment of that sales agreement.

You can create a sales order directly from a sales agreement by using the **Release order** action. Alternatively, you can select an effective sales agreement when you're taking orders (see the "Applying sales agreements in the ordering process" section of this article).

> **Note**
>
> In earlier versions, sales agreements were referred to as blanket sales orders.

Commitment types

Each line in a sales agreement expresses a commitment to sell something. In general, two categories of commitment exist:

- **Value commitment** – The customer agrees to buy products for a specific amount.

- **Quantity commitment** – The customer agrees to buy a specific quantity of products.

In addition, a contract can commit the customer to buy a specific product or products in a product category. By combining these two factors (value versus quantity, and specific products versus product categories), you get four types of commitment:

- **Product quantity commitment** – The customer agrees to buy a specific quantity of products. Lines that use this commitment type are defined by an item number, and by the quantity and unit that were agreed on. The **Amount** field isn't available.
- **Product value commitment** – The customer agrees to buy specific products for a specific amount. Lines that use this commitment type are defined by an item number and the amount that was agreed on. The **Quantity** and **Unit** fields aren't available.
- **Product category value commitment** – The customer agrees to buy products from a specific sales category for a specific amount. Lines that use this commitment type are defined by a sales category in the hierarchy of sales categories and an amount. The **Quantity** and **Unit** fields aren't available.
- **Value commitment** – The customer agrees to buy any product or products in any procurement category for a specific amount. The **Quantity** and **Unit** fields aren't available.

Lines in the same sales agreement can have different types of commitments.

Pricing terms for sales agreements

Pricing terms can vary, depending on the type of commitment. On a sales order that is linked to a sales agreement, the pricing terms from that sales agreement override any other pricing terms that apply based on trade agreements. The following table describes the price-related fields that are affected by each commitment type. "Yes" indicates that the field can be updated on an order line.

Expand table

Commitment type	Unit price	Price unit	Discount percent	Cash discount amount
Product quantity commitment	Yes	Yes	Yes	Yes
Product value commitment			Yes	
Product category value commitment			Yes	
Value commitment			Yes	

Policies for sales agreements

The following policies affect how the link between a sales agreement commitment and the corresponding sales order lines works:

- **Max is enforced** – The total quantity or amount for all order lines can't exceed the quantity or amount specified on the related commitment.
- **Price and discount is fixed** – The price on an order line and the price on the related commitment can't differ. If the price is changed on the order line, the link to the commitment is broken. If the link is broken, the order line doesn't contribute to fulfillment of the commitment.
- **Minimum release amount** and **Maximum release amount** – If an amount is specified, a message is displayed if you make any change to an order line that causes the order line to differ from the related commitment.

Fulfillment calculations for sales agreements

The **Fulfillment** tab on the **Line details** FastTab on the **Sales agreements** page shows fulfillment quantities and amounts.

In the **Fulfillment** area, you can view the total quantities and amounts for all order lines that are linked to the specified sales agreement. You can also view the remaining amount or quantity that is required to fulfill the commitment.

In the **Agreement** area, you can view the quantities and amounts from the specified sales agreement. These quantities and amounts are the total quantities and amounts that were committed.

Confirmations and version history for sales agreements

When you confirm a sales agreement, the current version of the sales agreement is stored in a history table. If you change the sales agreement, you can confirm it again to store another version of the sales agreement in the history.

If you don't confirm a sales agreement, you can still use it to create sales orders. However, history information for the sales agreement isn't stored.

You can preview or print all revisions of the confirmations. You can then share the revisions with your customer to obtain approval.

Applying sales agreements during the ordering process

If you don't release sales orders directly for a sales agreement, you can still link a sales agreement to an order during the order entry process. When you're creating a new sales order and select a sales agreement, the terms of that agreement, such as the payment terms, delivery terms, and delivery address, are applied to the order header, and the link between the agreement and the order is created. Then, on the order lines, when you select products and categories that are specified in the sales agreement, the prices and discounts are copied from that agreement. The same sales order can include both lines that aren't related to a sales agreement and lines that have a commitment for a sales agreement.

Modifying sales orders that are linked to sales agreements

If you create (release) a sales order against a sales agreement, you can modify some fields on the sales order lines only if you remove the link to the associated sales agreement lines. The following table lists some of these fields.

Expand table

Field	Description
Requested ship date	If you change the requested ship date to a date that is earlier than the **Effective date** value on the sales agreement line, you must remove the link to the sales agreement line before you can save the changed ship date. If you change the requested ship date to a date that is later than the **Expiration date** value on the sales agreement line, you must remove the link to the sales agreement line before you can save the changed ship date.
CurrencyDiscount, percentDiscountUnit, pricePrice, unitNet amount	If you change the value in any of these fields, and if the **Price and discount is fixed** check box is selected on an associated sales agreement line, a message box prompts you to save the change. Select **Yes** to remove the link to the sales agreement line and recalculate the price. Select **No** to remove the link to the sales agreement line without recalculating the price.
Net amount	If you specify an amount that exceeds the amount that is specified on a sales agreement line where the **Max is enforced** check box is selected, a message box prompts you to save the changed amount. Select **Yes** to remove the link to the sales agreement line and recalculate the price. Select **No** to remove the link to the sales agreement line without recalculating the price.
Quantity	If you specify a quantity that exceeds the quantity that is specified on a sales agreement line where the **Max is enforced** check box is selected, a message box prompts you to save the changed quantity. Select **Yes** to remove the link

Field	Description
	to the sales agreement line and recalculate the price. Select **No** to remove the link to the sales agreement line without recalculating the price.

Returning an item ordered from a sales agreement

When a customer returns a product that they ordered from a sales agreement, Supply Chain Management can find and automatically update the related sales agreement commitment to reflect the change in quantity or amount. By creating a return order that is based on the original sales order that is linked to a sales agreement, you establish a relation between the sales agreement commitment, the sales order line, and the return order invoice.

If you don't want to deduct the returned item quantity from the sales agreement commitment, use the **Remove link** control on the **Return order** page to remove the link between the return order and the sales agreement commitment. If you must reestablish the link later, select **Create link**.

> **Note**
>
> A return order can be linked to only one sales agreement. If a customer returns multiple products that they ordered from multiple sales agreements, you must create a new return order for each product and create a link to the corresponding sales agreement.

Automatic search for sales agreements

In some situations where sales orders are created indirectly, such as when you create a credit note or intercompany sales orders, you can control whether the system automatically searches for applicable sales agreements.

Financial dimensions on sales agreements

You can copy financial dimensions to either document headers or individual lines of a sales agreement. You can change the dimensions on an agreement header or agreement line at any time. In this case, the dimensions are automatically copied to the release header or release line of release orders.

Enter sales agreements

Article • 01/31/2023

This article explains how to create a sales agreement that commits one of your customers to buy a product for an agreed amount over time in exchange for special discounts. You can run this procedure in demo data company USMF or on your own data.

Set up sales agreement header

1. Go to **Sales and marketing** > **Sales agreements** > **Sales agreements**.
2. Select **New**.
3. In the **Customer account** field, select the desired record from the drop-down menu.
4. In the **Sales agreement classification** field, select the desired record from the drop-down menu.
5. Expand the **General** section.
6. In the **Default commitment** field, select **Product value commitment**. A commitment type is a mandatory criterion that you must assign to the agreement to define how the agreement contract will be fulfilled. The four predefined types let you set up the customer's commitment target, expressed as a quantity or a value. The quantity commitment type can only be applied to a specific product, but the value-based types are applicable to sales of both specific and non-specific products.
7. In the **Expiration date** field, set the date to a future date when you want the agreement to expire.
8. Select **OK**.

Set up product value commitment lines

1. Select **Add line**.
2. In the **Item number** field, select the desired record from the drop-down menu. The type of commitment that you have chosen for the agreement affects the kind of information you can enter for the agreement lines. For example, for a value-based agreement you must specify the total net amount (in the agreed currency) for which the customer commits to buys goods from you. In this example the **Quantity** and **Unit** fields on the line are unavailable because you're creating an agreement for the customer to buy a specific value of a product.

3. In the **Net amount** field, enter the monetary amount that the customer has committed to buying.
4. In the **Discount percent** field, enter a percentage value that will apply to the customer's sales order lines that are linked to this agreement.
5. Expand the **Line details** section.
6. Select **Yes** in the **Max is enforced** field.

    - Selecting **Max is enforced** means that the total amount of all the sales order lines that use the commitment's special prices, discounts and/or payment terms must not exceed the amount specified on the commitment.
    - The minimum and maximum release amounts specify a range of values that must be sold on each sales order that uses the selected agreement.

7. Expand the **Sales agreement header** section. Unless the status of the agreement is set to **Effective**, sales orders cannot be associated with the agreement and can therefore not contribute to the fulfilment of that agreement. You can change the status manually at this stage. However, the status would normally be changed when you confirm the agreement for the customer.
8. On the Action Pane, select **Sales agreement**.
9. Select **Confirmation**. Make sure that the **Mark agreement as effective** option is set to **Yes**.
10. Select **Yes** in the **Print report** field.
11. Select **OK**.
12. Close the page. The agreement is now effective. You can start linking the customer's orders to the agreement to offset against the committed target.

Fulfill sales agreements

Article • 09/29/2021

This procedure shows you how to fulfill a sales agreement by associating sales orders with it. You can run this procedure in demo data company USMF or on your own data. Before starting this guide, make sure you have an effective sales agreement of type "Product value commitment". Alternatively, you can run the task guide called "Create sales agreements".

Release a sales order from the agreement

1. Go to Sales and marketing > Sales agreements > Sales agreements.
2. In the list, open the agreement against which you want to release the order.
3. On the Action Pane, click Sales agreement.
4. Click Release order.

    - As the text on top of the Create release order page points out, the details required for the sales order lines will differ depending on whether the agreement is quantity- or value-based.
    - The agreement in this guide is of type "Product value commitment". This is why the Lines section of this page is blank. If the commitment was based on quantity, the line information would be copied from the agreement.

5. Click Create.

    - The message informs you that a sales order has been created. Since the order does not contain any lines, you must add order line details to complete the release process.

6. Close the page.
7. Close the page.
8. Go to Sales and marketing > Sales orders > All sales orders.
9. In the list, find and open the order that was created as the result of the order release in the previous task.
10. Click Add line.
11. In the Item number field, click the drop-down button to open the lookup.
12. In the Item number field, type or select the item that is specified on the associated sales agreement.
13. In the Quantity field, enter a number.

- Make sure that you enter a quantity that brings the Net amount under the value of the associated sales agreement.
- Notice that because the sales order is linked to the agreement, the negotiated discount percent is applied to the order line.

14. Click Update line.
15. Click Attached.

    - The Attached agreement page shows the ID and terms of the agreement from which the line is released.

16. Close the page.
17. On the Action Pane, click General.
18. Click Attached sales agreement.
19. Expand the Line details section.
20. Click the Fulfillment tab.

    - The Fulfillment tab shows a summary of all the sales order lines that are associated with this commitment, and their fulfillment state, as well as the amount or quantity that has not yet been released.

21. Close the page.
22. Close the page.
23. Close the page.

Apply sales agreement in the order process

1. Go to Sales and marketing > Sales orders > All sales orders.
2. Click New.
3. In the Customer account field, click the drop-down button to open the lookup.
4. In the list, find and select the customer specified on the sales agreement.
5. In the list, click the link in the selected row.
6. Expand the General section.
7. In the Sales agreement ID field, click the drop-down button to open the lookup.
8. In the list, click the link in the selected row.
9. Click Yes.
10. Click OK.
11. In the list, mark the selected row.
12. In the Item number field, click the drop-down button to open the lookup.
13. In the Item number field, type or select the item that is specified on the associated sales agreement.
14. In the list, click the link in the selected row.
15. Click Save.

16. On the Action Pane, click Pick and pack.
17. Click Post packing slip.
18. Expand the Parameters section.
19. Select Yes in the Posting field.
20. Click OK.
21. Click OK.
22. On the Action Pane, click General.
23. Click Attached sales agreement.
24. Click the Fulfillment tab.

Generate and process customer rebates

This procedure demonstrates how to process customer rebates from claim generation to the point of passing them as accruals to Accounts receivable. It walks you through a specific example to explain how the various conditions on the rebate lines affect the final amounts credited to the customer. Use the USMF demo data company, and complete the following tasks before you start the guide: (1) Go to the **Accounts receivable parameters** page, expand the **Prices** tab, and then the **Price details** tab, and check that the **Enable price details** option is set to **Yes**. (2) Go to the **Rebate agreements** page and select the customer rebate agreement: USMF-000001. If the **Workflow approval status** field isn't set to **Approved**, select **Validation** on the Action Pane to approve it.

Review a customer rebate agreement

1. Go to **Sales and marketing** > **Customer rebates** > **Rebate agreements**.

    - The next few steps look at the conditions of agreement USMF-000001. The conditions makes it easier to understand how the customer credit values are calculated later in the procedure.
    - The agreement is for an individual customer, in this example customer US-009.
    - Rebates are given to the customer when they purchase a specific product. In this case, the product has item number T0020.
    - The customer's sales performance, against which the rebate amounts are estimated, is to be accumulated on a weekly basis.
    - The setting for **Price taken from** is **Gross**, which means that the line's sales amount on which basis the claim is estimated isn't reduced by the line discount.
    - The **Rebate line break type** field shows the method for calculating rebates. In this case, the sales target against which the rebates are to be estimated is set to **Quantity**.
    - The agreement's lines specify the rebate amount type, the actual rebate value, and the thresholds. In this example, the customer qualifies for a rebate of 20 USD per unit sold, if their weekly purchases of the product fall within 1 to 50 units; and a rebate of 40 USD per unit sold, if they purchase above 50 units.

2. Close the page.

Generate rebate claims

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Click **New**. To mimic the way in which rebate claims would be generated, the next task is to create a sales order, where the product and quantity will qualify the customer in question for a rebate.
3. In the **Customer account** field, enter or select a value.
4. Click **OK**.
5. In the **Item number** field, enter or select a value.
6. Set **Quantity** to 40.
7. Under the **Sales order lines** section, select **Sales order line**.
8. Select **Price details**. If you don't see this option, it's because you didn't set the **Enable price details option** to 'Yes' before you started the guide.
9. Expand the **Rebates** section. The **Rebates** tab lists all the rebate agreements that apply to the current order line and shows the estimated rebate amount. The displayed amounts are only indications of what future rebate claims might be. The actual rebate amounts might be different depending on: the total sales volume the customer achieves under a periodic rebate agreement; whether the customer returns all or partial quantities; and whether the applicable sales order is invoiced.
10. Close the page.
11. Select **Add line**.
12. In the **Item number** field, enter or select a value.
13. Set **Quantity** to 60.
14. Click **Save**.
15. On the Action Pane, select **Invoice**.
16. Select **Invoice**.
17. Expand the **Parameters** section.
18. In the **Quantity** field, select **All**.
19. Click **OK**.
20. Click **OK**.

Process rebate claims

1. Go to **Sales and marketing** > **Customer rebates** > **Rebates**.

    - The **Rebates** page acts as a workbench where you can review, approve, and process rebate claims. You can now process the claims that were created as a result of invoicing a sales order for customer US-009, who is the subject of the rebate agreement USMF-000001.

- The first line represents a rebate claim for 800 USD, which is based on the sales of 40 units of product T0020, calculated at 20 USD per unit. This matches the conditions of the first quantity break in the rebate agreement.
- The second claim is for 2,400 USD, which is based on the sales of 60 units of product T0020, calculated at 40 USD per unit, as per the second quantity break in the agreement.
- Both claims are in the **To be calculated** state. This state means that they're associated with an agreement that tracks the customer's sales performance on a periodic basis and that they need to be recalculated to account for the total sales volume within the respective period.

2. Select **Cumulate**.
3. In the **Customer** field, enter or select a value.
4. In the **Start date** field, select today's date.
5. Select **OK**. As a result of running the **Cumulate** function, the estimated claim amount is adjusted to account for the fact that the customer's total sales volume in the relevant period is higher than when the first rebate was generated. More specifically, because the total purchased quantity reaches 100 units, the customer now qualifies for 40 USD per unit (as per the agreement's second quantity break), or 4,000 USD of total rebate amount. The difference is recorded as a new claim "adjustment" for the additional $800 USD. The status of the rebate claims that are included in the **Cumulate** update are now set to **Calculated**.
6. In the list, mark all rows.
7. Select **Approve**.
8. Select **Process**.
9. In the **Customer** field, enter or select a value.
10. Select **OK**. A message shows that the rebate was processed successfully, and the status of the claims changes to **Mark**. This status means that as a result of a Rebate accrual journal being posted:

    - The claims are now transferred to the temporary customer balance as deductions.
    - The Rebate accrual account is credited to represent the future liability towards the customer.
    - The Rebate expense account is debited, in recognition of the cost incurred in connection with the sales.

Process rebates for payment

Article • 09/29/2021

This procedure demonstrates how to convert approved and processed customer rebates to credit notes. You can use this guide in the USMF demo company. The precondition for this guide is to have one or more rebate claims which have a status of Mark. If you're using USMF you should run the "Generate and process customer rebates" guide before you start this guide.

Convert rebate claims to credit note

1. Go to All customers.
2. In the list, find and select the desired record.
3. In the list, click the link in the selected row.
4. On the Action Pane, click Collect.
5. Click Settle transactions.
6. Click Functions.
7. Click Rebate program.

    - The Rebate page lists the rebate claims that you have processed in the customer rebate workbench and that are in status Mark.

8. Click Edit.

    - Set checkmarks in the Mark field for the claims that you want to include into credit note.

9. Click Functions.
10. Click Create credit note.

    - A message appears to inform you that a journal has been posted (This is the Accounts receivable consumption journal, as specified in the Accounts receivable parameters page). This causes the real liability (credit) amount to be moved to the customer balance. This means that the customer's account has been credited, and the Rebate accrual account has been debited.

11. Close the page.
12. Click Cancel.

    - This refreshes the page so that you can see the updates.

13. On the Action Pane, click Collect.

14. Click Settle transactions.
    - Note that a transaction for negative amount, representing the total rebate amount, without invoice reference has been added to the customer balance.
15. Click Cancel.

Look up applicable prices and discounts

Article • 09/29/2021

This procedure shows how to find the price and/or discount for a product which is currently valid for a specific customer, without creating a sales order. The procedure walks through a specific example, and you need follow the example using the USMF demo company in order to select the necessary values.

Find the applicable price

1. Go to Sales and marketing > Prices and discounts > Find prices.
2. In the Customer account field, click the drop-down button to open the lookup.
3. In the list, find and select customer US-001.
4. In the list, click the link in the selected row.
5. In the Item number field, type 'T0004'.

    - By default, the Quantity field is set to 1. However, if you know the size of the order that the customer intends to place for the product in question, then enter this value instead. This information is relevant if the trade agreements with the customer have quantity breaks, that is, the product's price depends on the minimum quantity purchased.

6. In the Date field, enter a date for when the customer expects to place an order.

    - The date can be today's date or any date in the future.
    - The system now returns the price that is valid for the selected product when bought by the selected customer on the selected date with a specified quantity. In this example, if the customer US-001 bought 1 unit of product T0004 today, they would be charged 350 CAD a unit. This price comes from an existing and active trade agreement with the customer. Other fields on the page provide more details about the product price and product cost (if set up on the product master), and calculated profitability.
    - If the Show related product variants option is selected, it means that there are additional trade agreements for product's variants.

7. Click the Show related product variants checkbox.

    - A list of the product variants is shown, with information about their dimensions.

8. In the list, mark the line representing color White.

- Notice, that the product price is now different from the one displayed previously when it was not specified per dimension.

9. Click View sales prices.

    - The Price (sales) page displays all the trade agreements applicable to the product, including its variants.

10. Close the page.

Find the applicable discount

Make sure the Customer account field contains customer number US-001

1. In the Item number field, type 'T0012'.

    - Make sure the Quantity field is set to 1.
    - The following pricing details shown for product T0012 come from one or more trade agreements: The unit price is 1,000 CAD and the discount percentage is 5.

2. Set Quantity to '20'.

    - The increased order quantity causes the line discount that will be offered to the customer to change from 5 to 7 percent.
    - The Net amount is calculated based on the unit price, discount and the total quantity.

3. Click View line discount.

    - There are two line discount agreements for product T0012, specifying a 5 percent discount for an order line quantity from 1 to 10, and 7 percent discount for order quantities above 10. Note that the discounts are applied to a group of products, in this example, Group code 01, of which product T0012 is a member.

4. Close the page.

Price simulation

Article • 05/03/2022

This article provides information about price simulation for quotations. Price simulation helps you to evaluate the effect of deductions on the future sales price during the quotation process, before you commit to a specific price.

A price simulation for a quotation shows a new total amount, based on a proposed new price. A price simulation can also show a new amount for a specific line that is created in an existing quotation. You can enter a price simulation and apply it later. Alternatively, you can use the original quotation without a price simulation and make more changes as you work through the sales process with your customer.

A price simulation doesn't change the price in the quotation. If the price simulation is applied to a whole quotation, it's treated as a special discount on the quotation header. If the price simulation is applied to specific items, it's treated as a special discount on the quotation lines. The unit sales price on a quotation line that is created doesn't change when a price simulation is applied. Instead, a discount percentage that corresponds to the price reduction of the quotation line is applied. When a price simulation is applied, the unit sales price and the discount percentage are transferred to the quotation line or the quotation header.

> **Note**
>
> When you run a price simulation, only the current sales currency is used to create the simulation. However, when you view the quotation totals, you see a combination of the company currency and the sales currency.

Supplementary items that are added to quotation lines might trigger line discounts or multiline discounts. They might also trigger total discounts that change the contribution margins and contribution ratios of the quotation lines and the whole discount.

You can run multiple price simulations to track the effects of price adjustments on the targets of a quotation. By running these simulations, you can adjust the overall price of the quotation, or the price of one or more specific lines in the quotation, and then apply the price simulation that is most likely to help you close the sale.

When you create a quotation, you can set up an alert. Here are some of the ways that alerts are used:

- They can keep you informed about the status of quotations in the organization.

- They can trigger a review of a specific quotation or inform you when discount limits are exceeded.

Price simulation and discounts

To guarantee that discounts and prices are calculated correctly, be careful when you run price simulations on quotations that have discounts. Because all price simulations are treated as special discounts on the active quotation line or the whole quotation, you must track the differences in the discounts.

Types of discounts in trade agreements

Trade agreements in Supply Chain Management can have four types of price discounts. These discounts can be set up for different items, customers, or price groups, and they can be limited by date. To avoid miscalculations, you must consider trade agreements when you run price simulations. Here are the four types of discounts in trade agreements:

- **Sales price** – Separate sales prices can be specified for items. When quotation lines are created, the program searches for the correct sales price for an item and transfers it to the quotation lines. Therefore, a trade agreement that has this kind of discount doesn't affect the price simulation. The sales price that is used in the quotation line reflects the trade agreement.
- **Line discount** – Special discounts are specified for items, depending on the quantity that is ordered. Line amounts are typically reduced by the line discount before a price simulation is run. Therefore, a trade agreement that has this kind of discount affects the price simulation.
- **Multiline discount** – If the combined quantities exceed the limit that you've defined, predefined combinations of ordered items trigger a discount on the whole order. Line amounts are typically reduced by the line discount before a price simulation is run. Therefore, a trade agreement that has this kind of discount affects the price simulation.
- **Total discount** – If the combined amounts exceed the limit that you've defined, predefined ordered items trigger a discount on the whole order. The total discount is generated by the quotation lines. However, because the total discount is applied to the quotation total as a discount, it reduces the total amount of the quotation. Therefore, a trade agreement that has this kind of discount affects the price simulation.

Quotation lines and trade agreements

When you create or adjust a quotation line, line discounts are automatically calculated. The relevant sales price is found for the item, based on the trade agreement.

Price simulation examples

The following examples use price simulation for quotation headers and single line items.

Price simulation for quotation headers

You create a quotation that has the following lines:

- 10 units of item BR-12 (cost price per unit: USD 9.52, sales price per unit: USD 15.32)
- 12 units of item BR-14 (cost price per unit: USD 7.48, sales price per unit: USD 13.75)

The following table shows the quotation lines.

Expand table

	Calculation	Result
Sales quantity	10 units + 12 units	22 units
Sales value in USD	(10 × 15.32) + (12 × 13.75)	318.20
Cost value in USD	(10 × 9.52) + (12 × 7.48)	184.96
Contribution margin in USD	318.20 – 184.96	133.24
Contribution ratio	([318.20 – 184.96] ÷ 318.20) × 100	41.87%

You run a price simulation and apply a 15-percent total discount for the whole quotation, or the quotation header. The following table shows the new totals of the quotation after the price simulation is run.

Expand table

	Calculation	Result
Sales quantity	10 units + 12 units	22 units
Old sales value in USD	(10 × 15.32) + (12 × 13.75)	318.20
Old cost value in USD	(10 × 9.52) + (12 × 7.48)	184.96

	Calculation	Result
Old contribution margin in USD	318.20 – 184.96	133.24
Old contribution ratio	([318.20 – (10 × 9.52)] ÷ 318.20) × 100	41.87%
Price simulation of 15-percent total discount in USD	(15 × 318.2) ÷ 100	47.73
New sales value in USD	318.20 – 47.73	270.47
New contribution margin in USD	270.47 – 184.96	85.51
New contribution ratio	[(270.47 – 184.96) ÷ 270.47] × 100	31.61%

Price simulation for single line items

You create a quotation that has the following lines:

- 10 units of item BR-12 (cost price per unit: USD 9.52, sales price per unit: USD 15.32)
- 12 units of item BR-14 (cost price per unit: USD 7.48, sales price per unit: USD 13.75)

The following table shows the quotation lines.

Expand table

	Calculation	Result
Sales quantity	10 units + 12 units	22 units
Sales value in USD for BR-12	10 × 15.32	153.20
Sales value in USD for BR-14	12 × 13.75	165.00
Cost value in USD for BR-12	10 × 9.52	95.20
Cost value in USD for BR-14	12 × 7.48	89.76
Contribution margin in USD for BR-12	153.20 – 95.20	58.00
Contribution margin in USD for BR-14	165.00 – 89.76	75.24
Contribution ratio in USD for BR-12	[(153.20 – 95.20) ÷ 153.20] × 100	37.86
Contribution ratio in USD for BR-14	[(165.00 – 89.76) ÷ 165.00] × 100	45.60

	Calculation	Result
Total sales value in USD	(10 × 15.32) + (12 × 13.75)	318.20
Total cost value in USD	(10 × 9.52) + (12 × 7.48)	184.96
Total contribution margin in USD	318.20 – 184.96	133.24
Total contribution ratio	[(318.20 – 184.96) ÷ 318.20] × 100	41.87%

You run a price simulation and apply a 10-percent total discount to the BR-12 units. The following table shows the new totals of the quotation after the price simulation is run for the single line item.

Expand table

	Calculation	Result
Sales quantity	10 units + 12 units	22 units
Old sales value in USD for BR-12	10 × 15.32	153.20
Price simulation of 10-percent discount for BR-12	(10 × 153.2) ÷ 100	15.32
New sales value in USD for BR-12	(10 × 15.32) – 15.32	137.88
Sales value in USD for BR-14	12 × 13.75	165.00
Cost value in USD for BR-12	10 × 9.52	95.20
Cost value in USD for BR-14	12 × 7.48	89.76
New contribution margin in USD for BR-12	137.88 – 95.20	42.68
Contribution margin in USD for BR-14	165.00 – 89.76	75.24
New contribution ratio in USD for BR-12	[(137.88 – 95.20) ÷ 137.88] × 100	30.95
Contribution ratio in USD for BR-14	[(165.00 – 89.76) ÷ 165.00] × 100	45.60
New total sales value in USD	[(10 × 15.32) – 15.32] + (12 × 13.75)	302.88
Total cost value in USD	(10 × 9.52) + (12 × 7.48)	184.96
New total contribution margin in USD	302.88 – 184.96	117.92
New total contribution ratio	[(302.88 – 184.96) ÷ 302.88] × 100	38.93%

The price simulation affects only the line that it's applied to and reduces the total for that line.

Mass create sales quotations

Article • 09/29/2021

This procedure demonstrates how to efficiently create quotations offering a set of products or services that are to be sent to multiple customers. This mass quotation creation is based on quotation templates. You can run this procedure on your own data or in demo data company USMF.

Create a quotation template

1. Go to Sales and marketing > Setup > Quotations > Template groups.
2. Click New.
3. In the Group ID field, type an ID of your choice.
4. In the Description field, type a value.
5. Click Save.
6. Close the page.
7. Go to Sales and marketing > Sales quotations > All quotations.
8. Click New.
9. In the Account type field, select 'Customer'.
10. In the Customer account field, enter or select a value.
11. Click OK.

    - For a quotation to become a template you must carry out setup steps on the quotation header. This must be done before you add lines to the quotation.

12. On the Action Pane, click Options.
13. Click Change view.
14. Click Header view.
15. Expand the Setup section.
16. In the Group ID field, enter or select a value.
17. In the Template name field, type a value.
18. Select Yes in the Active field.

    - Only active templates can be used when you apply a template to a new sales quotation.

19. On the Action Pane, click Options.
20. Click Change view.
21. Click Line view.
22. In the Item field, enter or select a value.
23. In the Item field, type a value.

24. Close the page.
25. In the Discount percent field, enter a number.
26. Click Add line.
27. In the Item field, enter or select a value.
28. In the Item field, type a value.
29. Close the page.
30. In the Unit price field, enter a new price or change the current one.
31. Click Add line.
32. In the Item field, enter or select a value.
33. In the Item field, type a value.
34. Close the page.
35. In the Quantity field, enter a number.
36. In the Discount field, enter a number.
37. Click Save.

Apply the template to create a single quotation

1. Go to Sales and marketing > Sales quotations > All quotations.
    - Note that the quotation you have just created is marked as template.
2. Click New.
3. In the Account type field, select 'Customer'.
4. In the Customer account field, enter or select a value.
5. Expand the Template section.
6. In the Group ID field, enter or select a value.
7. In the Template name field, enter or select a value.
8. In the Calculation method field, select 'Based on template values'.
9. Click OK.
    - The new quotation has now been created, based on the data and terms of the template.
10. Close the page.
11. Close the page.

Apply the template to mass create quotations

1. Go to Sales and marketing > Sales quotations > Quotation update > Mass create quotations.
2. In the Account type field, select 'Customer'.

3. In the Group ID field, enter or select a value.
4. In the Template name field, enter or select a value.
5. In the Calculation method field, select 'Based on template values'.
6. Expand the Records to include section.
7. Click Filter.
8. In the Criteria field, set the filter to cover a range of customers you want to include in this mass quotation creation. Use the following format "Customer1..CustomerN.
    - For example, you could set the filter to: US-001..US-004
9. Click OK.
10. Click OK.
11. Go to Sales and marketing > Sales quotations > All quotations.
    - Verify that quotations have been created for all the customers specified in the mass update routine, as based on the selected template.

Create and edit sales quotations

This procedure demonstrates how to create and update a sales quotation.

Create a sales quotation

1. Go to **Sales and marketing** > **Sales quotations** > **All quotations**.
2. Select **New**.
3. In the **Account type** field, select 'Prospect'.
4. In the **Prospect** field, enter or select a value.
5. Expand the **General** section. Because you chose to create a quotation from the Sales and Marketing area, the type is automatically set to *Sales quotation*. To create a quotation for a project, you must access it from the **Project management and accounting** module.
6. Select **OK**. The fields and actions on the quotation lines are very similar to the ones on the sales order lines. Like sales orders, quotations can be created for a specific item or, when item number isn't known or doesn't exist at the time of quotation creation, quotations can be created for a sales category.
7. In the **Item** field, enter or select a value.
8. In the **Site** field, type a value.
9. In the **Quantity** field, enter a number. If there are valid trade agreements for the item selected on the line, the applicable price and discounts will be automatically copied to the quotation line. Make sure that the Unit price field contains a value and you can also enter discount values if you want to.
10. Select **Save**.
11. On the Action Pane, select **Sales quotation**.
12. Select **Totals**.
13. Select **OK**.
14. Select the sales quotation line.
15. On the Action Pane, select **Quotation**.
16. Select **Price simulation**.

    - In the **Run price simulation** page, you can experiment with adjusting the expected revenue or profitability of your quotation based on the desired unit price, discount amount, discount percentage, total amount, margin, or contribution ratio. When you're satisfied with the target figures, you apply the suggestion to the quotation line, and its price-related fields will be updated accordingly.

- You can create as many price simulations as you wish. When you select **New**, the price conditions from the current quotation line are copied to the page. You can then modify values in any of the price-related fields to the target ones. A change in one of the fields will trigger recalculation in all the other fields. In order for the system to calculate the sales margin and contribution ratio, the product's unit cost has to be known. Use the **Simulated prices** tab for a detailed view of the original prices, proposed changes, and their effect on the quotation totals. As a general rule, when a simulation that sets a new amount is applied to the quotation line, the system recalculates and enters a new value in the Unit price field. If the simulation is based on a new margin or a new contribution ratio, only the Net amount field is updated, and the Unit price is blank. In both cases, any discounts that were on the quotation line before simulation will be deleted.

17. On the Action Pane, select **Quotation**.
18. Select **Send quotation**.
19. Select 'Yes' in the **Print quotation** field.
20. Select **OK**. The report might take a minute to generate. Don't close the page until it finishes.

Update a sales quotation

1. Go to **Sales and marketing** > **Sales quotations** > **All quotations**.
2. On the Action Pane, select **Follow up**.
3. Select **Convert to customer**.
4. In the **Customer account** field, type a value.
5. Select **Check**. Make sure you see a message that the account number you typed in is free to use.
6. Select **OK**. The system has now created a new customer account for the prospect on the quotation.
7. Close the page.
8. On the Action Pane, select **Follow up**.
9. Select **Confirm**.
10. In the **Reason** field, enter or select a value.
11. Select **OK**.
12. On the Action Pane, select **General**.
13. Select **Sales orders**.
14. Close the page.

Product bundles overview

Product bundles enable businesses to group multiple items so that they can be priced and sold together. They provide an easy way to ensure that the correct items are always sold and priced together, but that the individual items in the bundle can also be shipped individually and revenue can be recognized against the shipped items.

A product bundle consists of a parent item and multiple component items. Order entry is quick and efficient, because users can add the whole bundle to a sales order just by adding the parent item. Picking lists and packing slips list the component items of a product bundle, but sales confirmations and sales invoices show only the parent item.

Each product bundle is represented by a physical item. However, when the sales order is confirmed, the bundle is exploded into its component items, and the selling price is allocated proportionally from the parent item to the individual component items that make up the bundle. After the bundle is exploded into its component items, the product bundle construct ensures that the sum of the component items equals the bundle net amount, so that the customer is always invoiced the correct amount for the product bundle.

This product bundle feature replaces the previous bundle feature that was part of the revenue recognition module and was deprecated in April 2023.

> **Note**
>
> Product bundles aren't supported in channels that are managed by Microsoft Dynamics 365 Commerce. These channels include e-commerce, point of sale (POS), and call centers. Items that are configured as product bundles shouldn't be added to orders or transactions that were created in Dynamics 365 Commerce channels.

Next steps

- Enable and set up product bundles
- Sell and allocate product bundles

Last updated on 07/01/2026

Enable and set up product bundles

Prerequisites

Before you can use the features described in this article, ensure your system meets the following requirements:

- To use the *Product bundle* feature, you're running Microsoft Dynamics 365 Supply Chain Management version 10.0.36 or later.
- To use the *Product bundles in journals* feature, which extends the *Product bundle* feature, you're running Supply Chain Management version 10.0.40 or later.

Turn on the product bundle features for your system

Turn on the product bundle feature

To make product bundle functionality available, turn it on for your system.

1. Go to **System administration** > **Workspaces** > **Feature management**. (For more information, see Feature management overview.)
2. On the **All** tab, use the **Filter** field to search for the feature named *Revenue recognition*.
3. If the *Revenue recognition* feature is enabled in your system, select it in the list, and then select **Disable** to disable it. You can't use this feature together with the *Product bundle* feature.
4. Use the **Filter** field to search for the feature named *Product bundles*.
5. Select the feature in the list, and then select **Enable now** to enable it.

> **Note**
>
> When you first turn on the *Product bundle* feature, the system checks whether it includes any released products where the **Revenue recognition bundle** option is set to *Yes*. If it does, the system creates a batch job that automatically upgrades the records for those products so that they work with the *Product bundle* feature. Likewise, if the system includes any uncanceled sales orders that have lines that contain revenue recognition bundle items, those sales order lines are also upgraded so that they work with the *Product bundle* feature. This behavior provides a seamless experience as you transition from using revenue recognition

bundles to using product bundles. The upgrade is done as part of a Data maintenance portal action.

Turn on the product bundles in journals feature

The *Product bundles in journals* feature extends the *Product bundle* feature. It enables the system to preserve detailed product bundle information in its database. Therefore, you can reprint original sales order confirmations and invoices even after the related sales order is deleted or archived and purged. This feature also improves the ability to exchange order confirmations and invoices electronically. Because product bundles are now represented in journals, you can electronically exchange order confirmations and invoices that include product bundles.

To make the *Product bundles in journals* feature available, you must turn it on for your system. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

1. Go to **System administration** > **Workspaces** > **Feature management**. (Learn more in Feature management overview.)
2. On the **All** tab, use the **Filter** field to search for the feature that's named *Product bundles in journals*.
3. Select the feature in the list, and then select **Enable now** to enable it.

> **Note**
>
> When you turn on the *Product bundles in journals* feature, the system creates a batch job that automatically upgrades sales confirmation journal lines, sales packing slip journal lines, and sales invoice journal lines that contain product bundles and that sales order lines exist for. As a result of this upgrade, sales confirmations and sales invoices can be reprinted correctly after sales order lines are deleted. The upgrade is done as part of a data maintenance portal action.

Set up product bundles

Bundle items are released products that include components. You set up bundle items by using the bill of materials (BOM) functionality. When a product bundle item is entered on a sales order, revenue is posted for the individual components, not for the product bundle item.

Documents that are printed for the customer (such as sales order confirmations and invoices) show only the product bundle item, not the components. However, documents that are printed

for internal use (such as sales order picking lists and packing slips) show only the components, not the product bundle item. Learn more in Sell and allocate product bundles.

Set up product bundle components

Each component item of a product bundle must be set up as a released product on the **Released products** page (**Product information management** > **Products** > **Released products**). The released products are set up in the same way as products that are included on a BOM. For example, a released product can be an item of either the *Item* type or the *Service* type, but it must be assigned to an item model group where the **Stocked product** option is set to *Yes*. Learn more in Bills of materials and formulas.

In addition, a base sales price must be set for each component. The base sales price is used to calculate the component's revenue contribution percentage. The product bundle's revenue price is then distributed to the components based on their revenue contribution percentages. Learn more in Sell and allocate product bundles.

Set up product bundle items

Set up each product bundle item as a released product on the **Released products** page (**Product information management** > **Products** > **Released products**). To identify a released product as a bundle item, set the following two fields on the released product record:

- On the **General** FastTab, set the **Product Bundle** option to *Yes*.
- On the **Engineer** FastTab, set the **Production type** field to *BOM*.

Then, assign the component items to the product bundle (BOM parent) item on the **BOM versions** page. To open this page, open the product bundle item on the **Released products** page. Then, on the Action Pane, on the **Engineer** tab, select **BOM versions**. For more information, see Bills of materials and formulas.

Sell and allocate product bundles

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to work with product bundles on sales orders and related documents. It also explains how to allocate bundle item prices to each bundle component.

A product bundle consists of a parent item (product bundle item) and multiple component items. The parent item is entered on a sales order line. Therefore, order entry is more efficient. However, the parent item is then exploded into the component items. Internal documents such as picking lists and packing slips list the component items. However, external documents such as sales order confirmations and sales invoices show only the parent item.

> **Note**
>
> Microsoft Dynamics 365 Commerce channels, such as online, point of sale (POS), and call centers, don't support the product bundle feature. The prospect-to-cash solution for Dynamics 365 Supply Chain Management and Dynamics 365 Sales doesn't support it either. Ensure that items configured as product bundles aren't added to orders or transactions that are created in Commerce channels or in the prospect-to-cash solution.

How bundle items are set up and handled

Use the bill of materials (BOM) functionality to set up bundles. For information about how to set up a bundle item, see Enable and set up product bundles.

Parent items that are flagged as product bundles are handled differently than other BOM items. Here's a list of the differences:

- You explode product bundles that are included on a sales order by confirming the order. Open the sales order, and then, on the Action Pane, on the **Sell** tab, select **Confirm sales**

order. Never explode a product bundle item from the **Sales order lines** FastTab (by selecting **Sales order line** > **Explode** > **BOM lines** on the toolbar). Otherwise, the system treats the item as a BOM instead of a product bundle.

- A sales order that contains a product bundle item must be confirmed before the picking list, packing slip, or invoice is created.
- When a product bundle is exploded through sales order confirmation, the parent item is canceled, and its unit price and discounts are allocated to the component items of the bundle.
- The sum of the component items must always equal the price of the parent item. Therefore, there are limitations on the fields that can be updated or changed for component items. For example, the unit price can't be manually changed. It also can't be indirectly changed. To help prevent scenarios such as searching and applying a new price, inventory dimensions can't be changed on the component items.
- When external-facing documents such as sales order confirmations or invoices are printed, only the parent item is shown on the printed document. The component items aren't shown.

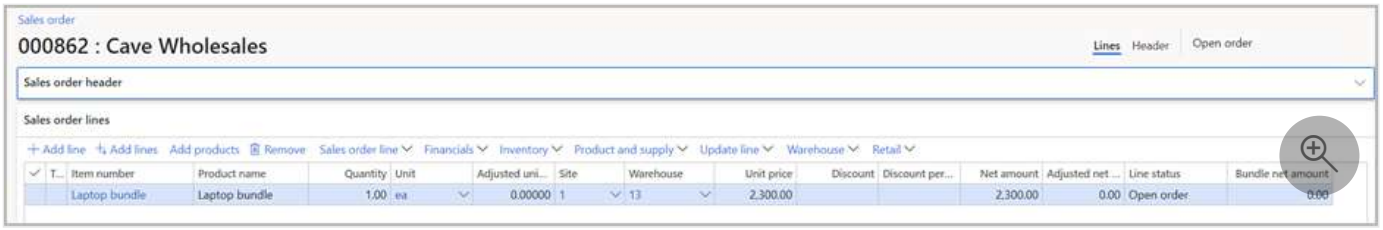
Example of a sales order that includes a product bundle

Set up a product bundle in the following way:

- **Parent item:** *Laptop bundle*
- **Component item:** 1 pcs. of item *1000* (the laptop itself), which has a base sales price of $1,900.00
- **Component item:** 1 pcs. of item *S0021* (insurance), which has a base sales price of $150.00
- **Component item:** 1 pcs. of item *Support* (support), which has a base sales price of $500.00

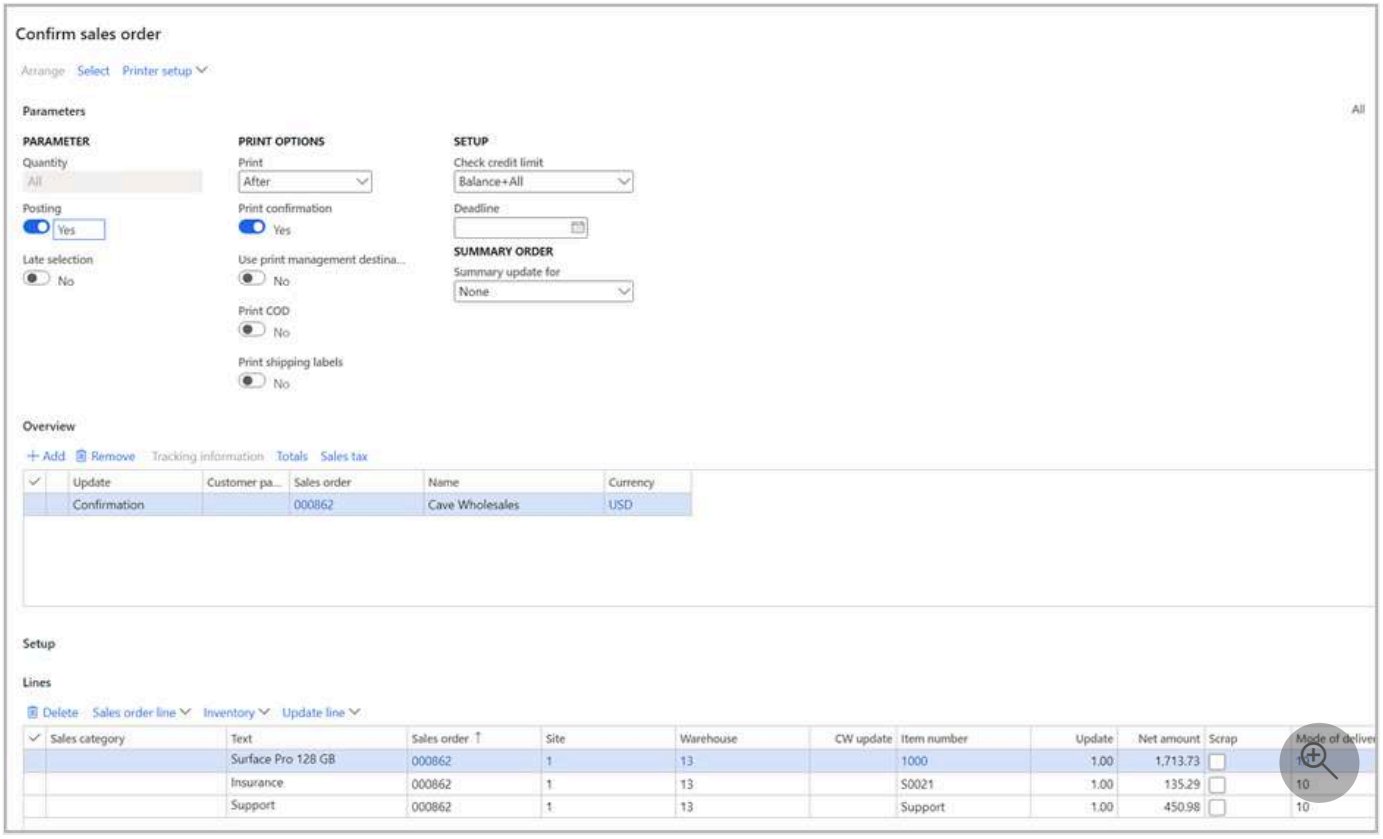
The base sales price of each component item is an essential part of the component setup. It's set on the **Sell** FastTab of the item. The base sales price is used to calculate the allocation factor when the parent item's unit price is allocated to the component items. Trade agreement sale prices are never used for this purpose.

Next, you have a sales order that includes a single sales order line for the *Laptop bundle* item. The default unit price for the parent item can be taken from numerous places, such as the trade agreement or the base sales price. For this example, $2,300 is manually entered as the unit price on the sales order, as shown in the following illustration.



Confirm the order to explode the product bundle

Because the sales order includes a product bundle item, you must confirm it. The **Confirmation sales order** dialog box shows the components of the product bundle, as shown in the following illustration.



However, because the printed confirmation report is the external-facing document for the customer, it shows only the parent item of the product bundle, as shown in the following illustration.

Item number	Description	Ship date	Quantity	Unit	Sales price	Discount	Discount percent	Amount	Print code
Laptop bundle	Laptop bundle	1/18/2021	1.00	ea	2,300.00	0.00	0.00 %	2,300.00	

This text is from the Sales Order Confirmation form notes

Currency	Sales subtotal amount	Total discount	Charges	Net amount	Sales tax	Round-off	Total
USD	2,300.00	0.00	0.00	2,300.00	16.23	0.00	2,316.23

When payment before 12/25/2020, 23.00 USD is granted in cash discount.

After you confirm the sales order, the parent item still appears on the sales order, but its status changes to *Canceled*. Additionally, the net amount is tracked in the **Bundle net amount** field. This amount is required to print the invoice, because the invoice shows the parent item, not the component items.

Allocate prices to component items

The sum of the component items must equal the **Bundle net amount** value of the parent item, because that value is the amount that's presented to the customer when the invoice is created. To ensure that the invoice matches the amounts that are posted to the general ledger, edits to the component items are limited. For example, the site and warehouse can't be changed, because those changes might trigger a price change based on a trade agreement.

Because the sum of the components doesn't match the bundle price entered on the sales order in this example, the unit prices are recalculated and allocated to the components in the following way:

- **Product bundle price entered on the sales order:** $2,300
- **Total base sales prices from components:** $1,900 + $500 + $150 = $2,550

- **Allocated price for component 1:** $2,300 × (1,900 ÷ 2,550) = $1,713.73
- **Allocated price for component 2:** $2,300 × (500 ÷ 2,550) = $450.98
- **Allocated price for component 3:** $2,300 × (150 ÷ 2,550) = $135.29

The sum of the components must equal $2,300, and it does ($1,713.73 + $450.98 + $135.29 = $2,300).

If you need to change all component items, remove the parent item. When you remove the parent item, you also remove the component items. Then, add the parent item again, and complete the required edits before you confirm the sales order.

Pick, pack, and ship the order

While the sales order is picked and packed, only the components of the product bundle appear. However, the packing slip and invoice must include a full product bundle. Otherwise, they can't be posted. For example, the dialog box shows three component items. If you try to delete one of them, you receive an error message that states that all products in the product bundle must be shipped before they can be invoiced.

Each product bundle must be shipped and invoiced as a full bundle. For example, if you change the quantity of component item *1000* to *4*, but you leave the quantity of the other component items set to *5*, the packing slip and invoice can't be posted.

You can ship and invoice a partial amount only if the quantity is reduced for all components of the bundle. For example, a quantity of *5* of the *Laptop bundle* item is entered on a sales order. After the sales order is confirmed, the three component items are shown on the sales order, and the quantity of each is *5*. By default, the quantity of each component is set to *5* during shipping and invoicing. However, you can adjust the quantity to *3* for all three component items. In this case, three full product bundles are shipped and invoiced. The remaining two product bundle items (a quantity of *2* of each of the three component items) can be shipped and invoiced later.

Invoice the sales order

The final step is to invoice the sales order. As with the sales order, the invoice dialog box shows the component items, whereas the printed invoice shows only the parent item.

The invoice journal created after posting doesn't include the parent item from the product bundle, because that item has a status of *Canceled*.

The invoice journal must not include the parent item from the product bundle, because any processes that are performed after the invoice is posted are based on that invoice journal. For

example, if you create a credit note from the **Sell** tab of the Action Pane, the credit note that's created includes the component items but not the parent item.

Product bundles in journals

The *Product bundles in journals* feature extends the *Product bundle* feature. (Learn more in Enable and set up product bundles.) It enables the system to preserve detailed product bundle information in its database. Therefore, you can reprint original sales order confirmations and invoices even after the related sales order is deleted or archived and purged. This feature also improves the ability to exchange order confirmations and invoices electronically. Because product bundles are now represented in journals, you can electronically exchange order confirmations and invoices that include product bundles.

This section describes the changes that the *Product bundles in journals* feature introduces. These changes build on the features that were described earlier in this article.

Changes in sales confirmation journals

After a sales order is confirmed, the parent item still appears on the sales order, but its status changes to *Canceled*. An additional status field, **Bundle line status**, represents the overall status across the components that are part of the product bundle. Use it to identify the overall status of the product bundle and its components on the sales order lines. A symbol in the **Type** column helps you identify which order line is a product bundle and which is a component. The net amount is tracked in the **Bundle net amount** field.

Sales confirmation journal lines now contain information that's related to product bundles. This information is presented in the **Bundle parent** column. For each component journal line that's part of a bundle, the **Bundle parent** column shows the lot ID and name of the bundle. Use the **Group by** option on the **Bundle parent** column to see which components belong to which bundle.

Product bundle information on the journal lines makes it possible to reprint sales confirmations correctly even after the sales order is deleted.

Changes in packing slip journals

Sales packing slip journal lines now contain information that's related to product bundles. This information is presented in the **Bundle parent** column. For each component journal line that's part of a bundle, the **Bundle parent** column field shows the lot ID and name of the bundle. Use

the **Group by** option on the **Bundle parent** column to see which components belong to which bundle.

Product bundle information on the journal lines makes it possible to reprint sales packing slips correctly even after the sales order is deleted.

Changes in sales invoice journals

Sales invoice journal lines now contain information related to product bundles. This information appears in the **Bundle parent** column. For each component journal line that's part of a bundle, the **Bundle parent** column field shows the lot ID and name of the bundle. Use the **Group by** option on the **Bundle parent** column to see which components belong to which bundle.

By including product bundle information on the journal lines, you can reprint sales invoices correctly even after the sales order is deleted.

Entity support for exporting sales confirmations and invoiced with bundle information

The following data entities support bundle information on journal lines for sales confirmations and sales invoices. These entities let you send sales order confirmations and sales invoices that include product bundle lines to your customers.

- **Sales order confirmation bundle parent lines** – This entity includes both root and intermediate bundle parent lines. To set criteria that define which lines are included, apply a filter on the *journal line type*. Select *bundle parent* to include only the bundle parent.
- **Sales order confirmation lines including bundle component** – This entity includes standard sales order conformation transactions and bundle components, if they're available. To set criteria that define which lines are included, apply a filter on the *journal line type*. Select *standard* to exclude any components.
- **Sales invoice bundle parent lines** – This entity includes both root and intermediate bundle parent lines. To set criteria that define which lines are included, apply a filter on the *journal line type*. Select *bundle parent* to include only the bundle parent.
- **Sales invoice lines including bundle component** – This entity includes standard invoice transactions and bundle components, if they're available. To set criteria that define which lines are included, apply a filter on the *journal line type*. Select *standard* to exclude any components.

The data that's exported through these entities resembles the data that's printed on sales confirmations and sales invoices.

Important limitations

The following important limitations apply when you use product bundle items:

- The product bundle feature isn't supported in Commerce channels, such as online, point of sale (POS), and call centers. It also isn't supported by the prospect-to-cash solution for Supply Chain Management and Sales. Don't add items that are configured as product bundles to orders or transactions created in Commerce channels or in the prospect-to-cash solution.
- Product bundle items aren't supported in intercompany orders. In a three-legged scenario, product bundle items aren't exploded during sales order confirmation on the original sales order. In a two-legged scenario, the sales order confirmation process is blocked.
- Product bundle items aren't supported in direct deliveries.
- Product bundle items aren't supported in delivery schedules.
- The delivery type of the sales order line for bundle components is always *Stock*, regardless of the direct delivery setting on the released product.
- Unless you're using the *Product bundles in journals* feature, you can reprint an invoice or sales order confirmation only if the related sales order that includes the product bundle order lines still exists. If the sales order lines were deleted, the reprinted invoices and sales order confirmations include the component items but not the parent item.
- Miscellaneous charges added to a parent item line aren't allocated to the component item lines when the parent item is exploded.

Set up intercompany trade

To enable Microsoft Dynamics 365 Supply Chain Management to run intercompany trade, set up customers and vendors to run intercompany trade. You must also set up Accounts payable, Accounts receivable, Procurement and sourcing, and Sales and marketing.

Before you set up intercompany trade

Before you set up intercompany trade, decide which customers are intercompany customers, and which vendors are intercompany vendors. For each legal entity in Microsoft Dynamics 365 Supply Chain Management, decide which trading policy to apply to the intercompany trading relation with the specific intercompany customer or vendor.

In particular, we recommend that you and your organization become familiar with the intercompany parameters.

- Discuss the implications of the setup with the managers who are responsible for intercompany trade in each legal entity.
- Set up the appropriate values for each legal entity.

Set up trading relations

To set up intercompany trade for customers and vendors, follow these steps:

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select a customer account.
3. On the Action Pane, on the **General** tab, select **Intercompany**.
4. Specify intercompany setup parameters for the customer account. These parameters include the legal entity that contains the corresponding vendor and the vendor account. The parameters also include the purchase order policies, sales order policies, value mapping, and policies for sales agreements and purchase agreements. You also specify whether to use base data values from the customer account or from the vendor account in the other legal entity.
5. Repeat steps 1 through 4 for the remaining intercompany customers in the legal entity.
6. Go to **Accounts payable** > **Vendors** > **All vendors**.
7. Select a vendor account.
8. On the Action Pane, on the **General** tab, select **Intercompany**.

9. Specify intercompany setup parameters for the vendor account. These parameters include the legal entity that contains the corresponding customer and the customer account. The parameters also include the sales order policies, purchase order policies, value mapping, and policies for purchase agreements and sales agreements. You also specify whether to use base data values from the vendor account or from the customer account in the other legal entity.
10. Repeat steps 6 through 9 for the remaining intercompany vendors in the legal entity.

Set up products

To enable products for intercompany trade, follow these steps:

1. Go to **Product information management** > **Products** > **All products and product masters**.
2. Define the products released to the legal entities where you want to do intercompany trade.

Last updated on 04/23/2026

Intercompany parameters

In an intercompany organization, you can set up parameters that determine how you trade between different legal entities. The fields that you select determine these parameters. You can select different combinations to reflect different trading scenarios.

The following two examples describe scenarios for intercompany organizations, one with two levels and one with three levels.

Example 1: Two-level intercompany chain

The intercompany organization includes the following legal entities:

- Legal entity A – Sells to external customers, but has no stock. This legal entity buys from Legal entity B.
- Legal entity B – Sells only to Legal entity A.

Both legal entities can sell to and buy from each other.

In this example, the pricing on the original sales order, which is directed to the external customer, is always based on the sales price. The pricing on the intercompany sales order and the intercompany purchase order is controlled by the internal sales or transfer pricing on the intercompany sales order in Legal entity B.

The order header information is controlled from the original sales order to the external customer. Any change on the intercompany sales order isn't synchronized to the original sales order.

In Legal entity A, on the **Intercompany** page for vendors, select **Purchase order policies**. Select the following fields in the **Original sales order (direct delivery)** field group:

- **Print packing slip automatically**
- **Post invoice automatically**
- **Print invoice automatically**

In the **Intercompany purchase order (direct delivery)** field group, select the following field:

- **Post invoice automatically**

In the **Original sales order <-> Intercompany purchase order** group, select the following fields:

- **Customer information**
- **RMA number**

In the **Intercompany purchase order <-> Intercompany sales order** field group, select the following fields:

- **Customer information**
- **RMA number**
- **Batch number**
- **Serial number**

In Legal entity B, on the **Intercompany** page for customers, select **Sales order policies**. Select the following fields in the **Intercompany sales order creation** field group:

- **Sales order numbering** : **Company + original number**
- **Allow summary update of documents for original customer**

In the **Intercompany sales order prices** field group, select the following fields:

- **Price and discount search**
- **Allow price edit**
- **Allow discount edit**

In the **Intercompany sales order > Intercompany purchase order** field group, select the following fields:

- **Batch number**
- **Serial number**

Example 2: Three-level intercompany chain

The intercompany organization includes the following legal entities:

- Legal entity A – A sales legal entity that sells to external customers and buys from Legal entity B.
- Legal entity B – A production or distribution legal entity that can't deliver products, and buys from Legal entity C.
- Legal entity C – A production or distribution legal entity that delivers products to Legal entity B.

Internal transfer pricing between Legal entities B and C is at cost from the selling legal entity at the start of the chain. It's also at cost to Legal entity A, which sells to external customers.

However, pricing on the original sales order to the external customer is always based on the sales price.

Pricing on all intercompany sales orders and intercompany purchase orders is controlled on the intercompany sales order. It's controlled at the start of the chain. Therefore, Legal entity C, which sells to Legal entity B, controls the price. Intercompany sales order pricing is based on the internal sales or transfer pricing that is set up in Legal entity C.

The order header information is controlled from the original sales order to the external customer. Any change on the intercompany orders isn't synchronized to the original sales order.

Select the following parameters:

In Legal entity A, on the **Intercompany** page for vendors, select **Purchase order policies**. Select the following fields in the **Original sales order (direct delivery)** field group:

- **Print packing slip automatically**
- **Post invoice automatically**
- **Print invoice automatically**

In the **Intercompany purchase order (direct delivery)** field group, select the following field:

- **Post invoice automatically**

In the **Original sales order** <-> **Intercompany purchase order** field group, select the following fields:

- **Customer information**
- **RMA number**

In the **Intercompany purchase order** <-> **Intercompany sales order** field group, select the following fields:

- **Customer information**
- **RMA number**
- **Batch number**
- **Serial number**

In Legal entity B, on the **Intercompany** page for customers, select **Sales order policies**. Select the following fields in the **Intercompany sales order creation** field group:

- **Sales order numbering** : **Company + original number**
- **Allow summary update of documents for original customer**

In the **Intercompany sales order** > **Intercompany purchase order** field group, select the following fields:

- **Batch number**
- **Serial number**

In the **Intercompany customer invoice posting** field group, select the following fields:

- **Unit price equal to cost price**
- **Initiate original customer invoice posting**

In Legal entity B, on the **Intercompany** page for vendors, select **Purchase order policies**. Select the following fields in the **Original sales order (direct delivery)** field group:

- **Print packing slip automatically**
- **Post invoice automatically**
- **Print invoice automatically**

In the **Intercompany purchase order (direct delivery)** field group, select the following field:

- **Post invoice automatically**

In the **Original sales order<-> Intercompany purchase order** field group, select the following fields:

- **Customer information**
- **RMA number**
- **Price and discount**

In the **Intercompany purchase order <-> Intercompany sales order** field group, select the following fields:

- **Customer information**
- **RMA number**
- **Batch number**
- **Serial number**

In Legal entity C, on the **Intercompany** page for customers, select **Sales order policies**. Select the following fields in the **Intercompany sales order creation** field group:

- **Sales order numbering** : **Number sequence code**
- **Allow summary update of documents for original customer**

In the **Intercompany sales order prices** field group, select the following field:

- **Price and discount search**

In the **Intercompany customer invoice posting** field group, select the following fields:

- **Unit price equal to cost price**
- **Initiate original customer invoice posting**

In the **Intercompany sales order** <-> **Intercompany purchase order** field group, select the following fields:

- **Batch number**
- **Serial number**

Set up vendors, customers, and items for intercompany trade

Article • 01/07/2025

To prepare your organization for intercompany trade, you must define the vendors and customers with whom you will be trading internally. You must then associate these vendors and customers with the items that you'll be purchasing or selling.

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Select the vendor to define as an intercompany vendor.
3. On the Action Pane, on the **General** tab, select **Intercompany**.
4. Specify intercompany setup parameters for the vendor account. These parameters include the customer legal entity and account, sales order policies, purchase order policies, value mapping, and purchase agreement and sales agreement policies. You also specify whether to use base data values from the vendor account or from the customer account in the other legal entity.
5. Go to **Product information management** > **Products** > **Released products**.
6. On the **Released products** list page, select the items to assign to the vendor, so that the items are available for intercompany trade. For each item, open the **Released product details** page. On the **Purchase** tab, in the **Vendor** field, type the vendor number.
7. Go to **Accounts receivable** > **Customers** > **All customers**.
8. Select the customer to define as an intercompany customer.
9. On the Action Pane, on the **General** tab, select **Intercompany**.
10. Specify intercompany setup parameters for the customer account. These parameters include the vendor legal entity and account, purchase order policies, sales order policies, value mapping, and sales agreement and purchase agreement policies. You also specify whether to use base data values from the customer account or from the vendor account in the other legal entity.
11. When you're done setting up the intercompany parameters, close the **Intercompany** page to return to the selected customer details.

12. Expand the **Miscellaneous details** FastTab and set **Create intercompany orders** to *Yes*. If you also want orders to be delivered directly to customers, set **Direct delivery** to *Yes*.

    > **Note**
    >
    > If there are some items that your organization stocks and delivers to customers, you might not want to create intercompany orders automatically, even when you have the item in stock. To inactivate the automatic generation of orders for items that you might sometimes have in stock, set **Create intercompany orders** to *No*.

13. If you want to allow extra lines to be created indirectly on a sales order, set **Create indirect order lines** to *Yes*. A user can then add lines to the original sales order from the intercompany sales order.

> **Warning**
>
> If you allow order lines to be created indirectly, you're permitting all additions to the original sales order from the intercompany sales order. Each addition is then processed through to the customer, and is added to the order and the invoice. Additionally, every document that is involved in the sale is printed and posted automatically. Users aren't alerted about the addition.

Set up charges on intercompany orders

Article • 06/03/2022

You can set up charges to be added to intercompany orders. When a charge is added to an intercompany sales order, it is automatically synchronized to the intercompany purchase order. This works both ways—from the intercompany sales order to the purchase order and the other way around.

You can also use charges to add a profit to an intercompany sales order by defining the charge as an intercompany percentage.

When you set up charges to be applied to intercompany orders, you enable the calculation of internal profit for an intercompany sales order from the net amount of the original sales order. You might want to do this if your intercompany vendor sells to you at cost price. The following procedure describes how to do this for intercompany customers. You can use the same procedure for vendors.

1. Go to **Accounts receivable** > **Setup** > **Charges** > **Customer charge groups**.
2. Create a charges group.
3. Go to **Accounts receivable** > **Customers** > **All customers**. Select customer account link. On the Action Pane, select the **Customer** tab, and then select the **Sales order** FastTab.
4. Select **Edit** on the Action Pane to enable edits to the field. In the **Charges group** field, select the intercompany charges group that you set up in step 2.
5. Go to **Accounts receivable** > **Setup** > **Charges** > **Auto charges**.
6. Set up the charges by filling in the relevant fields.
7. In the **Customer relation** field, select the intercompany charges group that you set up in step 2.
8. On the **Lines** FastTab, in the **Category** field, select **Intercompany percent**.

Set up parameters to post an intercompany order

Article • 06/03/2022

When an intercompany customer invoice is posted, you can set it up to post both the intercompany purchase order and the original customer invoice automatically.

> **Note**
>
> Before you perform this procedure, set up the print management in your organization to point to the correct invoice printer. This will make sure that the invoice for the original sales order is printed on the correct printer.

You must set up the following parameters:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**. Select sales order that you want to work with.
2. On the sales order, on the Action Pane, select **Header view** and then select the **Intercompany settings** FastTab and open it.
3. Go to the Action Pane, on the **Sales order** tab and then select **Edit**.
4. Go back to the **Intercompany settings** FastTab and select **Direct delivery** to enable direct delivery throughout the intercompany chain (all orders).
5. Select **Save** to save the sales order with the new setting. Then select **Close** to close the sales order.
6. Go to **Procurement and sourcing** > **Vendors** > **All vendors**. On the **General** tab, select **Intercompany**.
7. On the **Intercompany** page, select the **Purchase order policies** link. In the **Intercompany purchase order (direct delivery)** field group, select **Post invoice automatically** and remove the check mark from the **Print invoice automatically** field.
8. In the **Original sales order (direct delivery)** field group, select the **Post invoice automatically** field and the **Print invoice automatically** field.

Synchronize intercompany prices and discounts

Article • 06/03/2022

Discounts and prices are always synchronized between the intercompany sales order and the intercompany purchase order. You can also synchronize the price and discounts to and from the original sales order, so that all orders have the same prices and discounts. You do this from the **Intercompany** page that is accessed from the **General** tab on the **All customers** list page - either from **Sales and marketing** or from **Procurement and sourcing**.

The **Price and discount** field is synchronized to the intercompany sales order line. This means that by selecting the **Allow price edit** field and the **Allow discount edit** field, you have allowed a change between the intercompany sales order and the intercompany purchase order. A change to the unit price, price unit, or sales charge on the intercompany sales order determines the price on the intercompany purchase order line.

If the **Allow price edit** and **Allow discount edit** fields are enabled on the intercompany sales order or the intercompany purchase order, you can change the price or discount manually on either order. Otherwise, you cannot.

If the **Allow price edit** and **Allow discount edit** fields are not enabled on the intercompany sales order, you cannot make a manual change to the price (or charges) or discount on an intercompany sales order.

If the **Allow price edit** and **Allow discount edit** fields are not enabled on the intercompany purchase order, you cannot make a manual change to the price (or charges) or discount on an intercompany purchase order.

If the **Allow price edit** and **Allow discount edit** fields are enabled on both the intercompany purchase order and the intercompany sales order, you can make manual changes to both orders. However, this can cause a situation in which updates that are made by one person are overruled by updates that are made by another person in another company on the same order.

> ⓘ **Note**
>
> If you have enabled the **Price and discount** field on both the intercompany purchase order and the intercompany sales order, you are not in control of the pricing.

To avoid these types of conflicts, the best practice is to allow prices and discounts to be changed only on the intercompany sales order or the intercompany purchase order. This is accomplished by enabling the **Allow price edit** and **Allow discount edit** fields on either of these orders.

Synchronize intercompany charges

Article • 06/03/2022

Charges are synchronized only between the intercompany sales order and the intercompany purchase order, and synchronization always occurs.

If the **Allow price edit** field is selected on the intercompany purchase order or the intercompany sales order, you can add a charge manually to the intercompany sales order or the intercompany purchase order. Otherwise, you cannot.

If the **Allow price edit** field is not selected on the intercompany sales order, you cannot add a charge manually to an intercompany sales order.

If the **Allow price edit** field is not selected on the intercompany purchase order, you cannot add a charge on the intercompany purchase order.

If the **Allow price edit** field is enabled on both the intercompany purchase order and the intercompany sales order, you can add charges manually to both orders. However, this can result in many charges being added incorrectly.

To avoid these types of conflicts, the best practice is to allow charges to be added either to the intercompany sales order or the intercompany purchase order, but not both.

Synchronize intercompany customer information

Article • 06/03/2022

Customer information is synchronized if the **Customer information** field is enabled when the sales order is created or a change is made to the customer, vendor reference, or customer requisition number.

You can always change the value in these synchronization fields. However, you can only determine whether this value is copied to the other intercompany orders by selecting this parameter. If you have enabled the **Customer information** field on the intercompany sales order, a change to the intercompany sales order is synchronized to the intercompany purchase order. If you have also enabled the **Customer information** field on the intercompany purchase order, it is also synchronized back to the original sales order.

> **Note**
>
> If you have enabled the **Customer information** field on both the intercompany purchase order and the intercompany sales order, updates that are made by one person in one company are overruled by updates that are made by another person in another company on the same order.

The best practice is to enable the **Customer information** field on the intercompany purchase order. This enables synchronization between the original sales order and the intercompany purchase order and from the intercompany purchase order to the intercompany sales order.

Synchronize intercompany disposition codes

Article • 06/03/2022

To support intercompany returns, Microsoft Dynamics 365 Supply Chain Management enables you to map externally defined disposition codes to the corresponding internal disposition codes. When an intercompany chain is being set up, the disposition actions in the two companies that are mapped to each other must be the same. If they differ, the synchronization process will be unsuccessful.

About disposition codes for three-legged direct returns

Disposition codes are synchronized from the intercompany sales order line to the original sales order line. However, synchronization has only one immediate effect on the original sales order line. This effect is that miscellaneous line charges are deleted based on the disposition code and miscellaneous charge that are set up in Company A. Company A is the company that is creating the return order.

In a three-legged direct delivery chain, all disposition actions are supported on the intercompany sales order line. However, if a product is being returned to the customer, you should confirm that the delivery address in the return order matches the customer delivery address that is specified in the original order.

> **Note**
>
> Disposition codes do not exist for purchase orders. Therefore, synchronization of disposition codes from the intercompany sales order to the original return order must be performed from sales order to sales order.

Replacing returned items

If a returned item is being replaced, and a replacement order has already been created in Company B, a disposition code cannot be selected, and no additional replacement order is created in Company A.

Rules for intercompany direct deliveries

The following general rules apply to original return orders in scenarios that involve intercompany direct deliveries:

- If the underlying disposition action on the original sales order line is Credit and Scrap, Credit, or Return to Customer, the Credit disposition action is applied. However, the Return to Customer action code sets the net amount to 0 (zero) on the existing line and on the newly synchronized line from the intercompany sales order. In addition, scrap lines are never synchronized. When a line is added to an intercompany sales order, it is never synchronized for a sales order that has a positive quantity and a disposition action of Scrap (for example, Credit and Scrap or Replace and Scrap).
- An underlying disposition action of Credit and Replace or Scrap and Replace is not overruled. It is treated as a disposition action of Credit and Replace or Scrap and Replace. This rule applies even if no scrap line is created in Company A and no replacement order is created in Company B (the company that received the returned item). A replacement order is created in Company A only when a packing slip update is performed.

Creating intercompany purchase and sales orders in several companies

Microsoft Dynamics 365 Supply Chain Management isn't limited to handling only one production company and several sales companies. All companies that are set up for intercompany can be both trading companies and production companies.

If several companies can deliver the same item, you can freely choose whom to buy from, and updates are processed even if one sales order becomes several purchase orders. Usually, when you explode a bill of materials (BOM) version, demand is generated for the BOM lines in the sales order. However, neither product bundle items nor BOM explosions are supported for intercompany sales orders or intercompany purchase orders.

In the same way that you automatically create one intercompany purchase order, you can create an original sales order in your company and then have several intercompany vendor companies fulfill the order by creating more than one intercompany purchase order. Microsoft Dynamics 365 Supply Chain Management automatically creates intercompany sales orders in the vendor companies.

To do this, all the companies must be set up as trading relationships. The vendor companies must be set up in Microsoft Dynamics 365 Supply Chain Management as intercompany vendors, and they must be the primary vendor for the relevant item. On the sales order, in **Header view**, you must select the **Autocreate intercompany orders** field and the **Direct delivery** field on the **Intercompany settings** FastTab. This is the default setting.

Create the sales lines in the usual way. When you leave the record, a message appears informing you that intercompany purchase orders and intercompany sales orders are created. The message contains links to the new orders. To view the intercompany sales orders created in your vendor companies, open the original sales order and on the **General** tab, in the **Related information** group, select **References**.

If you open the intercompany purchase orders for the vendors, you see that Microsoft Dynamics 365 Supply Chain Management automatically fills in the original sales order number and the intercompany sales order number for each vendor.

Similarly, if you open the intercompany sales orders for the vendors, you see that Microsoft Dynamics 365 Supply Chain Management automatically fills in the original sales order number

and the intercompany purchase order number for each vendor.

> **Note**
>
> If the items on order exist in one of your intercompany vendor companies but not in the other, Microsoft Dynamics 365 Supply Chain Management creates the intercompany orders for the vendor company where the items exist but stops the order creation for the other company. A notification message is displayed when this happens.

Intercompany orders and return orders

This article describes how to create and update intercompany purchase orders, sales orders, return orders, purchase agreements, and sales agreements.

About intercompany orders

When you create an intercompany sales order, Microsoft Dynamics 365 Supply Chain Management automatically creates a corresponding purchase order. Similarly, when you create an intercompany purchase order, a corresponding intercompany sales order is automatically created.

This process applies to two-legged orders (transactions between two related companies) and to most three-legged orders (when an intercompany transaction originates with a sales order for an external customer).

Intercompany order example

You have two related companies. Company A is a sales subsidiary, and Company B is a distribution unit. Intercompany sales orders and purchase orders are created automatically in the following scenarios:

- When Company A creates a purchase order and the vendor is Company B, an intercompany sales order is created automatically in Company B. The two-legged order chain consists of a purchase order in Company A and an intercompany sales order in Company B.
- When Company B creates a sales order and the customer is Company A, an intercompany purchase order is created automatically in Company A. The two-legged order chain consists of a sales order in Company B and an intercompany purchase order in Company A.
- When Company A first creates a sales order for an external customer, a purchase order can be created automatically in Company A. This action prompts the automatic creation of an intercompany sales order in Company B. The three-legged order chain consists of a sales order and a purchase order in Company A and an intercompany sales order in Company B.

About intercompany return orders

You can return intercompany items much like ordinary returns. However, with intercompany items, the return order from the external customer creates an intercompany purchase order. This

purchase order leads to the automatic creation of an intercompany sales return order. You can also return an intercompany item without an external customer return order.

Intercompany return orders, similar to regular return orders, are initiated on the **Create return order** page.

In Microsoft Dynamics 365 Supply Chain Management, intercompany sales and purchase agreements are automatically updated to reflect a returned item. The sales or purchase agreement commitment for that item is automatically adjusted to reflect the change in the quantity or the amount when an item is returned.

Intercompany return order example

Company A creates a purchase order that is linked to a purchase agreement for an intercompany item. An intercompany sales order is automatically created in Company B that is linked to the corresponding sales agreement. The purchase agreement and the sales agreement are related as intercompany agreements.

Company A returns the intercompany item to Company B. Company B creates a return order for the item, and a purchase return order is automatically created in Company A. The commitments on both the purchase agreement and the sales agreement that are linked to the original orders are automatically adjusted to reflect the change in quantity or amount.

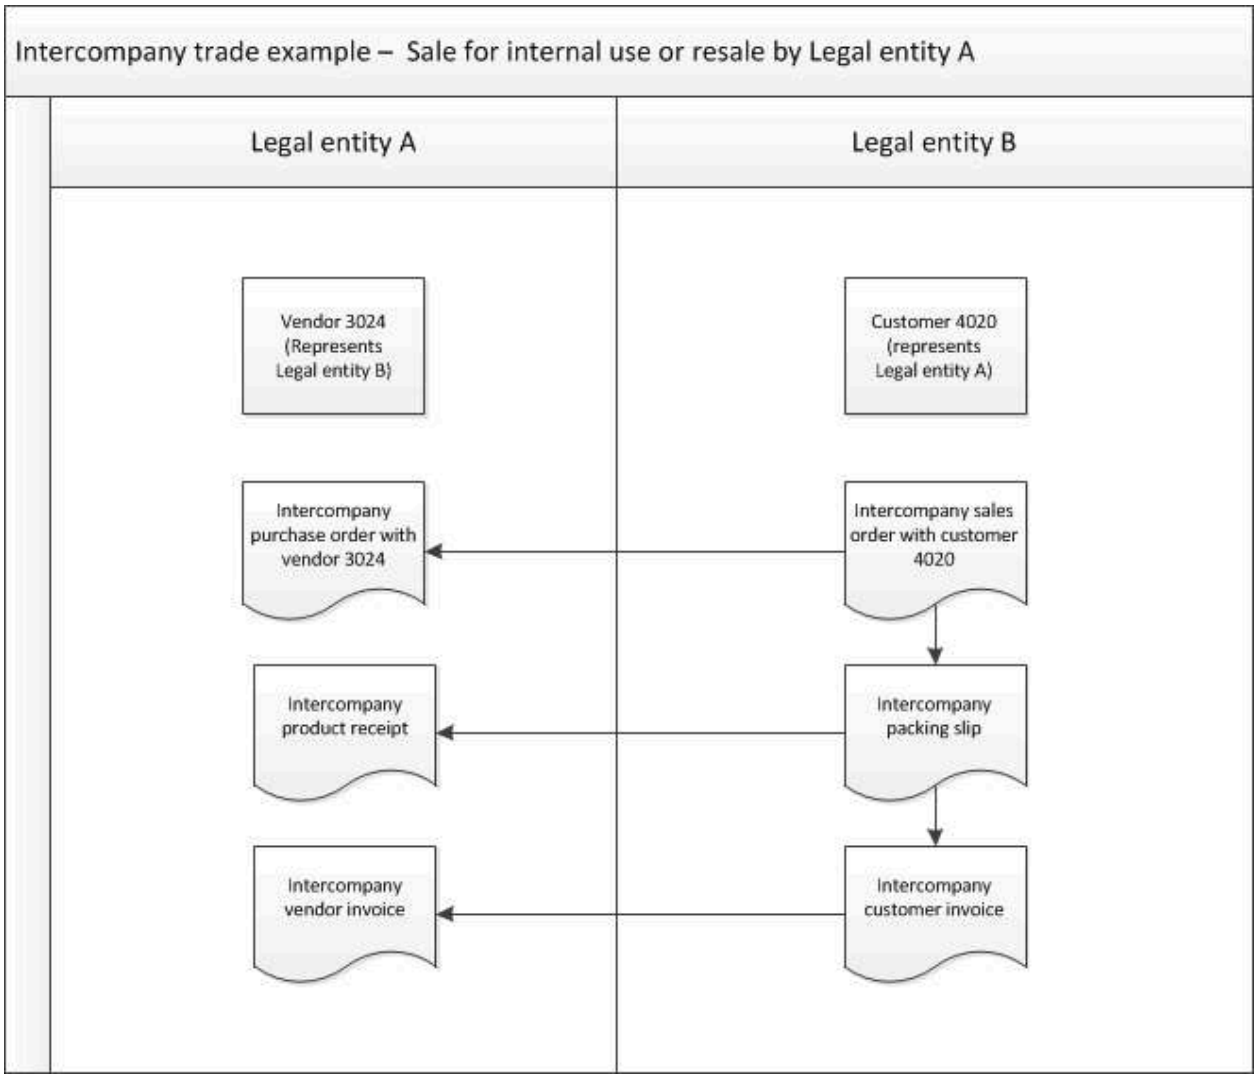
Create an intercompany sales order for internal use

Article • 06/03/2022

Typically, an intercompany sales order is created automatically, based on an intercompany purchase order. You can also manually create an intercompany sales order, which then generates an intercompany purchase order in the intercompany customer's legal entity.



Create an intercompany sales order manually

Do these steps in legal entity B, as shown in the illustration.

1. Go to **Accounts receivable** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **Sales order** to create a sales order.

3. On the **Create sales order** page, select a customer account. On the **General** FastTab, make sure that the **Intercompany** check box is selected. This indicates that the selected customer is an intercompany customer.

4. Enter or modify the information, select **OK**, and then complete the order lines as usual.

   The **Delivery address** field value is copied from the intercompany sales order header to the intercompany purchase order header. The **Item number** field value, including product dimensions, and the **Delivery date** and **Currency code** field values are copied from the intercompany sales order lines to the intercompany purchase order lines.

5. In the order header, select **Intercompany** to view the related intercompany purchase order.

6. On the order lines, select **Intercompany** to view information about on-hand inventory for intercompany trade.

> **Tip**
>
> You can view intercompany sales orders on the **Intercompany orders** page.

> **Note**
>
> When you work with intercompany, we recommend that you clear the **Delete order after invoicing** check box on the **Accounts receivable parameters** page. Otherwise, the related purchase order is deleted. We also recommend that you clear the **Delete purchase order after invoicing** check box on the **Accounts payable parameters** page.

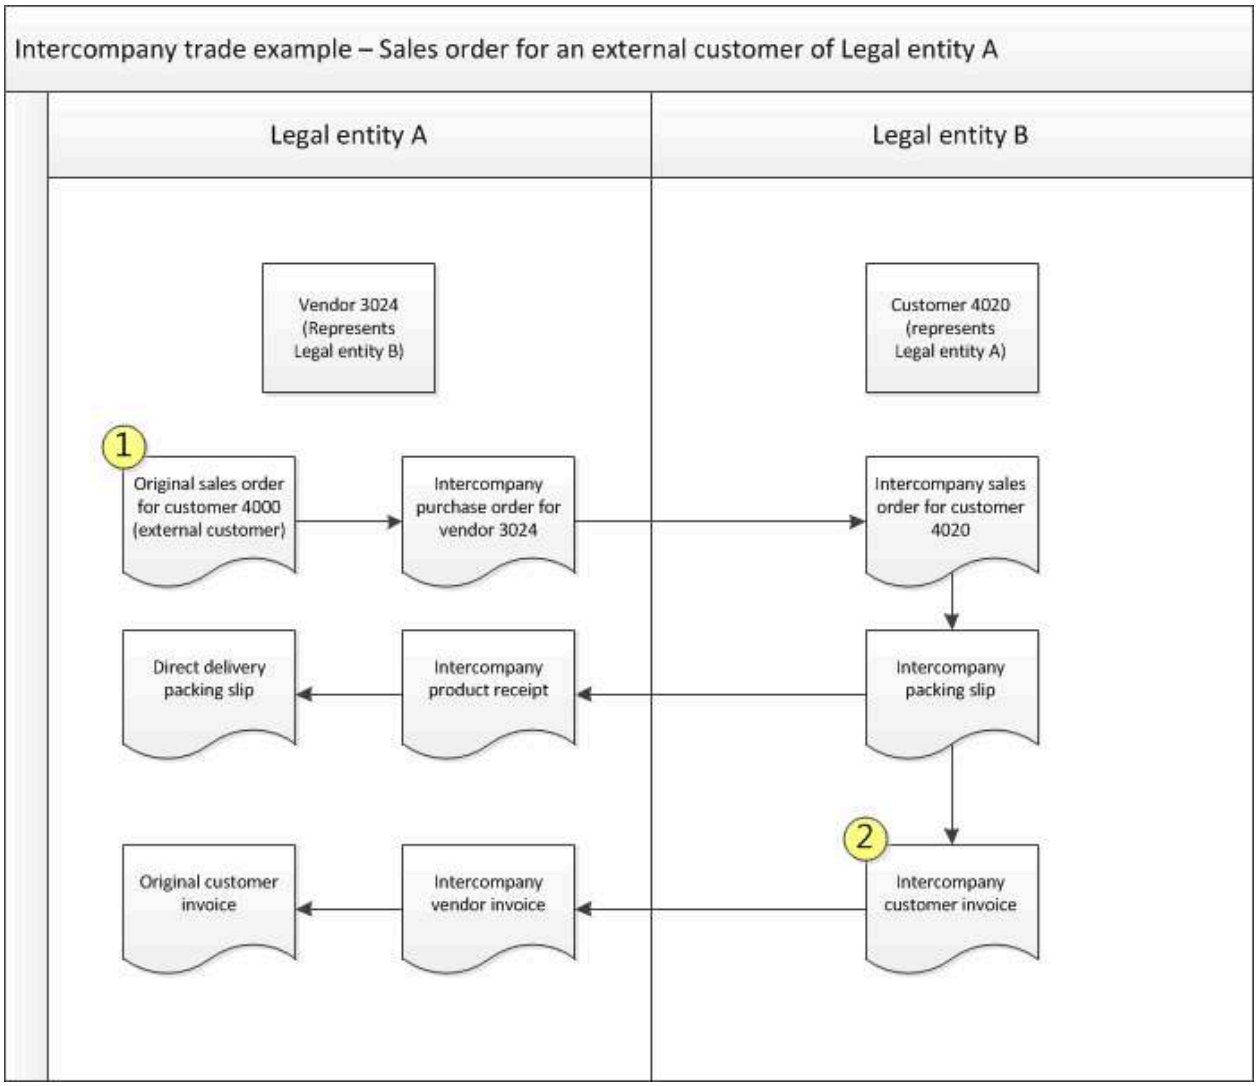
Create and invoice an intercompany sales order for an external customer

Article • 06/03/2022

You can use intercompany trade to record the sale of a product from one legal entity to another legal entity that is in the same organization.

When you create the original sales order, you can automatically create an intercompany purchase order for the intercompany vendor. This automatically creates an intercompany sales order in the intercompany vendor's legal entity.

The following illustration shows the flow of the transactions when you create a sales order for an external customer, but the product must be ordered from a different legal entity in your organization before you can deliver the product to the customer. In this case, an intercompany purchase order is created for the vendor account that represents the other legal entity. In turn, an intercompany sales order is created in the other legal entity for the customer account that represents your legal entity. When an intercompany purchase order is invoiced, the invoice for the original sales order is automatically posted, if it is a direct delivery.



If you are using direct delivery, and you select **Packing slip** in the **Quantity** field on the **Posting invoice** page, the intercompany vendor invoice is based on the intercompany product receipt that was previously posted.

Prerequisites

Before you begin, make sure that the following prerequisites are met to automatically post and print the intercompany invoices.

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. On the Action Pane, on the **General** tab, select **Intercompany**.
3. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
4. On the Action Pane, on the **General** tab, select **Intercompany**.
5. On the **Intercompany** page for either the vendor or the customer, in the **Purchase order policies** area, in the **Intercompany purchase order (direct delivery)** field group, select the **Post invoice automatically** check box.
6. In the **Purchase order policies** area, in the **Original sales order (direct delivery)** field group, select the **Post invoice automatically** check box. Select this check box

if you want the invoice for the original sales order to be automatically printed when you post the intercompany vendor invoice.

> ⓘ Note
>
> The print settings for the invoice are determined by the setup for the module, document, or transaction on the **Print management setup** page.

Create an original sales order for an external customer

Do these steps in legal entity A. This procedure corresponds to the box labeled 1 in the illustration.

1. Go to **Accounts receivable** > **Sales orders** > **All sales orders**.
2. From the **All sales orders** list page, create the original sales order. The field values are copied from the customer account to the sales order.
3. On the **Sales order** page, select **Header view** on the Action Pane.
4. On the **Intercompany settings** FastTab, select the **Autocreate intercompany orders** check box.
5. If you want the intercompany vendor to deliver the item directly to the external customer, select the **Direct delivery** check box.
6. When you have finished entering the sales order, close the **Sales order** page.

The intercompany purchase order is automatically created for all the items that have an assigned intercompany vendor, and then the intercompany sales order is created. An informational message tells you that an intercompany purchase order and intercompany sales order have been created. The message also contains links to those orders. If an item was not found, a red warning is displayed that means that the order creation process was not completed.

> ⓘ Note
>
> If you are creating several orders in different legal entities, and the items were not found in one of the legal entities, the order creation process stops, even for the legal entities that could fulfill their orders.

Invoice an intercompany sales order

When an intercompany sales order is invoiced, the corresponding intercompany purchase order is automatically invoiced. Then, if the original sales order is a direct delivery order, the original sales order is automatically invoiced.

Do these steps in legal entity B. This procedure corresponds to the box labeled 2 in the illustration.

1. Go to **Accounts receivable** > **Sales orders** > **All sales orders**.
2. On the **All sales orders** list page, select the intercompany sales order.
3. On the Action Pane, select the **Invoice** tab, and then select **Invoice**.
4. Select the **Posting** check box.
5. Select the sales order, and then select **OK**.

The customer invoice for the intercompany sales order is automatically posted in legal entity B. The intercompany vendor invoice then is automatically created and posted in legal entity A. If the original sales order is set up as a direct delivery, the customer invoice is created for the original sales order in legal entity A.

> ⓘ **Note**
>
> Previously, for intercompany sales scenarios, if the vendor invoice workflow was configured in the intercompany purchasing company, the intercompany sales order could not be successfully invoiced. Therefore, the vendor invoice workflow had to be turned off for the intercompany purchasing company.
>
> This limitation has been fixed by a recent feature in release 10.0.25. Intercompany sales orders can now be invoiced when the vendor invoice workflow is configured in the intercompany purchasing company.
>
> To enable this feature, follow these steps.
>
> 1. Select the intercompany sales legal entity.
> 2. Go to **Accounts receivable** > **Customers** > **All customers**.
> 3. Select the customer for the intercompany purchasing company.
> 4. Go to **General** > **Set up** > **Intercompany**.
> 5. On the **Purchase order policies** tab, select the **Bypass vendor invoice workflow for intercompany vendor invoices** parameter.

Intercompany reservations

Article • 06/03/2022

When you create an intercompany purchase order line directly from an original sales order line, the two lines are marked against each other. This marking controls the reservation, cost, and intercompany chain. You can view the marking on the sales order line by selecting **Inventory** > **Marking**, and then closing the dialog box that is displayed.

To remove the marking, select **Inventory** > **Remove link** on the original sales order line.

Change or delete an original intercompany sales order

Article • 06/03/2022

When you change a sales order, your changes are automatically synchronized with both the relevant intercompany purchase order and the intercompany sales order.

> **Note**
>
> Purchase orders for external vendors are not affected by any changes that you make; neither are the original sales lines that are connected to purchase-order lines for external vendors.

The following table summarizes the changes you can make and the expected results.

Expand table

Operation	Result
Delete an original sales order.	The related intercompany purchase order and the intercompany sales order are also deleted. If the status of the order is **Picking list** or later in the process, you cannot delete the sales order.
Delete an original sales-order line.	The related intercompany purchase order line and the intercompany sales order line are deleted. If the status of the order is **Picking list** or later in the process, you cannot delete the sales order line.
Add a new sales line to an original sales order.	The new sales line is created on both the intercompany purchase order and the intercompany sales order.
Change the quantity on an original sales-order line.	The quantity is synchronized with both the intercompany purchase-order line and the intercompany sales-order line. The net amount is recalculated on all the orders.
Disable direct delivery on an original sales order.	You cannot change the **Direct delivery** field on the original sales order if the intercompany sales order line has reached a minimum status of **Picking list**, **Output order**, or **Picking list journal**. The delivery address on the intercompany purchase order is changed to the standard delivery address (standard purchase order delivery address). Also, the intercompany purchase order lines are changed to the standard delivery address for the lines. Both are synchronized with the intercompany sales order and the lines. The delivery type on all lines on the original sales order is changed to **None**, and the

Operation	Result
	field is synchronized with the intercompany purchase-order lines. Purchase orders for external vendors are not affected; neither are the original sales lines that are connected to purchase-order lines for external vendors. The delivery date on the intercompany purchase order and lines – and the Requested receipt/shipping dates on the intercompany sales order and lines – are updated.
Enable direct delivery on an original sales order.	If the intercompany sales order line has reached a minimum status of **Picking list**, **Output order**, or **Picking list journal**, you cannot change the **Direct delivery** field on the original sales order. The delivery address on the intercompany purchase order is changed to the delivery address from the original sales order and synchronized with the intercompany sales order. The delivery type on all lines on the original sales order is changed to **Direct delivery**, and the field is synchronized with the intercompany purchase-order lines. The delivery address on each original sales-order line is synchronized with both the intercompany purchase-order lines and the intercompany sales-order lines. The delivery date on the intercompany purchase order and lines – and the Requested receipt/shipping dates on the intercompany sales order and lines – are updated.
Add a note to both an original sales-order header and the lines.	The note is copied to the intercompany purchase order and the intercompany sales order.
Change or delete a note.	If you change or delete a note, the corresponding note on the intercompany purchase order and the intercompany sales order is changed or deleted accordingly.

Change intercompany orders

Article • 06/03/2022

If you change an intercompany sales order or purchase order, the corresponding sales order or purchase order in the corresponding company also reflects that change.

Adding new lines

You can add new lines to an intercompany sales order and purchase order if the original sales order is part of the intercompany order chain. You can also add new lines if the original sales order is not a direct delivery. If the original sales order is a direct delivery, you can add new order lines to the intercompany sales order and purchase order only if the **Allow indirect creation** field is selected on the **Intercompany settings** FastTab on the original sales order.

Changing prices and discounts

You can change the prices and discounts if the **Allow price edit** and **Allow discount edit** check boxes are selected on the **Intercompany** page.

If you change the unit price of one of the existing lines on the intercompany sales order line, the unit price on the intercompany purchase order is also changed.

If you change any of the discount fields on the intercompany sales order line, the relevant discount fields on the intercompany purchase order are updated.

Changing and adding new charges

You can change charges if the **Allow price edit** and **Allow discount edit** check boxes are selected on the **Intercompany** page.

If you add a new charge to the intercompany sales order header and a new charge to the intercompany sales line, both charges are copied to the intercompany purchase order. Therefore, the intercompany sales order and the intercompany purchase order have the same total amount. The charges are never copied to the original sales order.

Copying a fee

To copy a fee to the original sales order, create it as a new sales line that has an item of type **Service**.

Changing quantities, and deleting intercompany purchases and sales order lines

You can change the quantity or delete an intercompany purchase order line or sales order line only if the line has been created directly from the **Sales order** or **Purchase order** form. This change makes either the intercompany purchase order or sales order or order lines the source.

Origins of orders and order lines

Intercompany orders and order lines can have one of two origins:

- **Derived** – The order was created automatically from an intercompany order chain.
- **Source** – The order was created manually by a user.

The origin is indicated on the order header of intercompany purchase orders and sales orders in the **Origin** field. This field is located on the **Intercompany settings** FastTab on the sales order and on the **Setup** FastTab on the purchase order.

The **Derived** and **Source** origins apply only to intercompany orders. The **Origin** field is blank for all other sales orders, purchase orders, and order lines. This field is also blank on the original sales order.

Example: Derived origin

You create an original sales order for an external customer. This sales order contains one order line. This original sales order creates an intercompany purchase order that contains one order line, which creates an intercompany sales order that contains one order line. The intercompany purchase order header and the order line are created automatically from the original sales order.

The value of the **Origin** field on the **Setup** FastTab of the intercompany purchase order and the **Intercompany settings** FastTab of the intercompany sales order headers is **Derived**. The value of the **Origin** field on the **Line details** tab of the purchase order and sales order lines is also **Derived**.

If an order line has an origin of **Derived**, you cannot delete the order line directly. You can delete the order line only from the source that created the order line. Also, you can

change the ordered quantity only from the source that created the order line.

If an original sales order and original sales order line is part of the intercompany order chain, you can change ordered quantities from the original sales order, and you can delete order lines from the original sales order.

Example: Source origin

You create a purchase order for an intercompany vendor. The intercompany purchase order and order line both have an origin of **Source**. Therefore, this intercompany purchase order is the controller, and the intercompany sales order that is created automatically in the vendor company has an origin of **Derived**.

Additionally, the ordered quantities of an order line that is created on the intercompany purchase order cannot be changed on the intercompany sales order. The order line can be deleted only from the intercompany purchase order. If a new line is added to the intercompany sales order, the intercompany sales order line then has an origin of **Source**.

When an original sales order is part of the intercompany order chain, you can always control the intercompany orders and intercompany order lines from the original sales order.

Intercompany batch and serial numbers

Article • 06/03/2022

Companies that use serial numbers or batch numbers to trace their items must also keep track of the serial numbers and batch numbers of picked items. The intercompany functionality automates the push/pull of serial numbers and batch numbers from one company to another. When you register the batch numbers and serial numbers for the items on an intercompany sales order, you can set up the program to push these numbers automatically to the intercompany purchase order and original sales order. You set up the relevant parameters on the **Intercompany** page for the sales order:

- If you select the **Batch number** field on the **Sales order policies** page, the batch number is synchronized to the inventory transactions on the intercompany purchase order lines when you post the packing slip of the intercompany sales order.
- If you select the **Serial number** field, the serial numbers are synchronized to the inventory transactions on the intercompany purchase order lines when you post the packing slip of the intercompany sales order.

Intercompany packing slips

Article • 06/03/2022

Generate intercompany packing slips

If you work with direct delivery, the packing slip is always generated automatically on both the intercompany purchase order and the original sales order when you generate the packing slip on the intercompany sales order. The intercompany purchase-order invoice is based on the intercompany purchase-order packing slip that was previously generated.

If you make any updates to the packing slip on the intercompany sales order, these updates are reflected on both the intercompany purchase order and the original sales order.

If you do not work with direct delivery, you must manually generate the packing slip on the intercompany sales order, the intercompany purchase order, and the original sales order.

Print intercompany packing slips

If you work with direct delivery, a packing slip can be printed automatically for the intercompany purchase order and the original sales order when you post the packing slip on the intercompany sales order.

To print packing slips automatically, on the **Intercompany** page for purchase orders, select both of the **Print packing slip automatically** fields.

If you update the packing slip on the intercompany sales order, the changes are reflected automatically on the intercompany purchase order and the original sales order.

Register payments automatically for intercompany customer invoices

Article • 06/03/2022

Microsoft Dynamics 365 Supply Chain Management creates a customer transaction when an intercompany customer invoice is posted. This customer transaction remains open until it is settled, which means that it has been paid. When the corresponding intercompany purchase order is invoice updated, a vendor transaction matching the customer transaction is created. This vendor transaction also remains open until it is settled. To reduce the risk of differences, an accounts receivable payment journal can be automatically created and posted when the accounts payable payment journal is posted.

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. On the Action Pane, on the **General** tab, select **Intercompany**.
3. To set up the intercompany accounts receivable payments on the **Intercompany** page for sales orders, select the **Sales order policies** link.
4. In the **Payment journal** field, select the accounts receivable payment journal that you want to register intercompany vendor payments to. You set this up on the **Accounts receivable parameters** page.
5. If you want to post to this journal automatically, select the **Post journal automatically** check box.

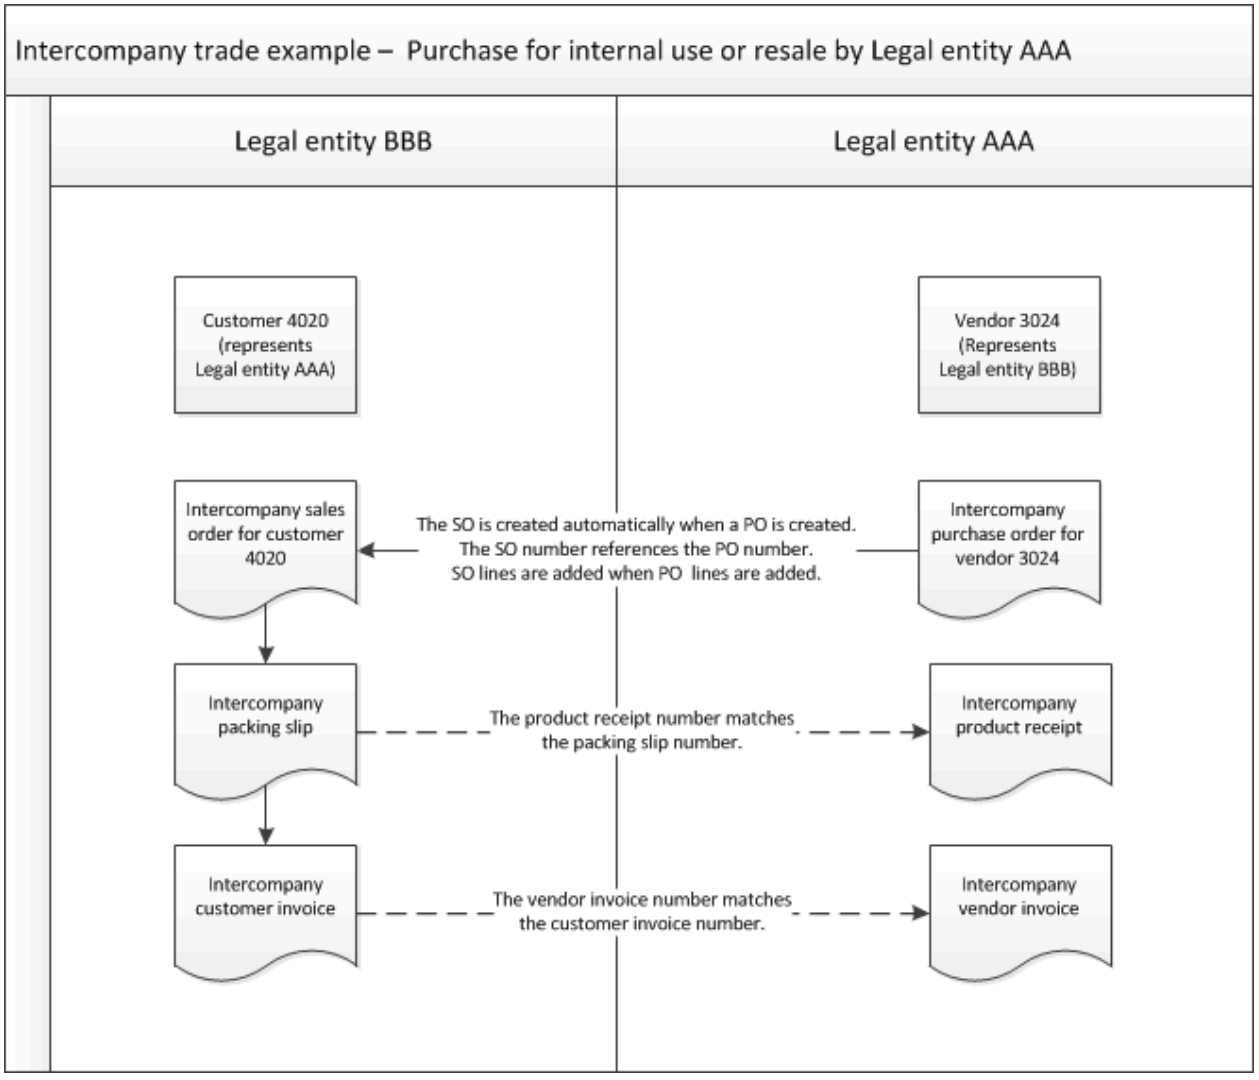
Create and invoice an intercompany purchase order for internal use

Article • 01/07/2025

You can create an intercompany purchase order for an intercompany vendor. This automatically creates an intercompany sales order at the intercompany vendor.



Create an intercompany purchase order and a corresponding intercompany sales order

Do these steps in legal entity AAA, as shown in the illustration.

1. Select **Accounts payable** > **Purchase orders** > **All purchase orders**.
2. On the **All purchase orders** list page, create a purchase order for an intercompany vendor. The field values are copied from the vendor account to the purchase order.

Because you're working with an intercompany vendor, an intercompany sales order is created in the legal entity that corresponds to the vendor. The number of the intercompany sales order can be the same as the number of the intercompany purchase order, and it can include the ID of the legal entity. The number structure that is used depends on the selection in the **Sales order numbering** field in the **Intercompany** page. For example, if you create purchase order 00029_064 in legal entity AAA, the sales order number in legal entity BBB is AAA00029_64.

An informational message tells you that an intercompany purchase order and intercompany sales order have been created. The message includes the intercompany sales order number, for your information.

3. Add line items to the purchase order. The corresponding line items are added automatically to the intercompany sales order. If an item doesn't exist in the other legal entity, a message is displayed and you can't add the item to the purchase order. To fix this problem, switch to the other legal entity and release the product to that legal entity. The item will be available to be added to sales orders in that legal entity. Then, switch back to the legal entity of the purchase order and continue adding line items.

4. When you have finished entering information for the purchase order, confirm it.

Process the intercompany packing slip and customer invoice

Do these steps in legal entity BBB, as shown in the illustration.

1. Go to **Accounts receivable** > **Sales orders** > **All sales orders**.

2. On the **All sales orders** list page, select the intercompany sales order.

3. On the Action Pane, select the **Pick and pack** tab, and then select **Packing slip**.

4. Select the **Posting** check box.

5. Select **OK**. The packing slip is posted in legal entity BBB.

6. On the **All sales orders** list page, select the intercompany sales order.

7. On the Action Pane, select the **Invoice** tab, and then select **Invoice**.

8. Select the **Posting** check box.

9. Select **OK**.

The customer invoice for the intercompany sales order is posted in legal entity BBB.

Process the intercompany product receipt and vendor invoice

Do these steps in legal entity AAA, as shown in the illustration.

1. Go to **Accounts payable** > **Purchase orders** > **All purchase orders**.
2. On the **All purchase orders** list page, select the intercompany purchase order.
3. On the Action Pane, select **Receive**, and then select **Product receipt**. The product receipt is created. The product receipt number is the same as the intercompany packing slip number.
4. Select the **Posting** check box.
5. Select **OK**.
6. On the **All purchase orders** list page, select the intercompany purchase order.
7. On the Action Pane, select **Invoice**, and then select **Invoice**. The vendor invoice is created. The vendor invoice number is the same as the intercompany customer invoice number.
8. Finish entering the vendor invoice, and then post it.

Check intercompany order price discrepancies

Article • 02/09/2024

You can use this procedure to check for price discrepancies on intercompany orders.

1. Go to **Procurement and sourcing** > **Purchase orders** > **Intercompany** > **Check intercompany order price discrepancies**.

2. Set up a batch job, if you need to, and then select **OK** to check the prices and discounts for intercompany sales orders and purchase orders. Otherwise, select **Cancel** to close the page without performing the check.

   > **Tip**
   >
   > If there are any synchronization issues or issues with the prices, these will be listed in an informational message that will be displayed. You can print the informational message for reference.

3. On the informational message, select the relevant line to open the order in the current legal entity. Open the order in the related legal entity by selecting **Intercompany**, and then **Intercompany purchase order** or **Intercompany sales order**.

   > **Note**
   >
   > To allow an update of the intercompany order:
   >
   > a. Go to **Accounts receivable** > **Customers** > **All customers**.
   > b. On the Action Pane, select the **General** tab, and then select **Intercompany**.
   > c. On the **Intercompany** page, select **Purchase order policies** or **Sales order policies**.
   > d. Select **Allow price edit** and **Allow discount edit** in both areas.

4. Open the relevant intercompany order where you want to keep the price.

5. For each order line, change the **Unit price** field for the line, and then change it back to the original value. Change the **Discount** field for the line back and forth, and change the relevant **Charges on purchases** or **Sales charges** fields back and forth. Changing the values back and forth will trigger a synchronization of the

prices, discounts, and charges from this intercompany order line to the referenced intercompany order line, so they will be automatically aligned.

> **Note**
>
> This synchronization is valid only if the intercompany sales order has not been invoiced. If the intercompany sales order has been invoice-posted and a customer invoice journal has been created, changes must be performed directly on the intercompany purchase order lines by setting the prices, discounts, and charges equal to those on the intercompany customer invoice journal. If this is not done, the intercompany purchase order cannot be invoice-posted, because there will be a mismatch in the order totals.

6. Repeat the procedure until all intercompany purchase and sales orders are synchronized.

Intercompany currency conversions

Article • 06/03/2022

When the currency code on the original sales order and the intercompany purchase order differ, the following fields are currency-converted if synchronization is enabled:

- **Unit price**
- **Sales charges** or **Charges on purchases**
- **Discount**
- **Multiline discount**

These fields are then synchronized with the intercompany sales order line.

However, because the currency on the intercompany purchase order and the intercompany sales order is always synchronized, the following fields are synchronized without using currency conversion:

- **Unit price**
- **Sales charges** or **Charges on purchases**
- **Discount**
- **Discount percent**
- **Multiline discount**
- **Multiline discount percentage**

Intercompany master scheduling

Article • 06/03/2022

Intercompany master scheduling is the means by which you calculate requirements and generate planned intercompany orders across several internal companies. Intercompany master scheduling is carried out over the number of iterations that you specify. To enable Microsoft Dynamics 365 Supply Chain Management to carry out intercompany master scheduling, you must set up master scheduling in each of your intercompany companies. This entails several iterations in which Microsoft Dynamics 365 Supply Chain Management automatically creates an intercompany purchase order; this, in turn, leads to the automatic creation of an intercompany sales order, which again leads to new demands.

You set up the intercompany master plan and the intercompany scheduling order in the **Master planning** parameters in each of the intercompany companies.

In order to propagate the demand throughout the intercompany chain, you must set parameters to ensure that planned purchase orders are automatically firmed; that is, orders cannot be changed in terms of time or quantity. Set up the **Firming time fence** on the Coverage group, or the **Firming time fence** in the Master plan. If no **Firming time fence** is set up, no intercompany purchase orders are created automatically. Only the first execution of the master scheduling results in planned orders. However, because no intercompany purchase order is created, no intercompany sales order is created, and, therefore, no more intercompany purchase orders are created, and so on.

When you start the intercompany master scheduling, Microsoft Dynamics 365 Supply Chain Management performs one master scheduling in each intercompany company; then, it performs a second master scheduling in each intercompany company, and so on, until the specified number of iterations is reached. A maximum of 30 iterations is possible; however, the more iterations that you choose, the longer the scheduling takes.

Because the master scheduling in the companies is controlled by the intercompany scheduling sequence, that is, the order in which the program prioritizes the master schedules between each intercompany company, you can start the intercompany master scheduling from any of the intercompany companies. Because the intercompany scheduling sequence determines the order in which the master scheduling is performed in the companies, it is not important where the intercompany master scheduling is started. In each iteration, the current company executes last.

> ⓘ **Note**

The best practice is to allow intercompany master scheduling to be initiated from one Microsoft Dynamics 365 Supply Chain Management company.

On the **Intercompany master scheduling** page, you can start a sequence of master scheduling, which executes a master scheduling the first time with the principle for updating the requirement calculation that you have selected for the first iteration for all the intercompany companies. Subsequent iterations use the secondary principle that you select for the next iteration, and this principle is applied until the number of iterations that you have specified is reached.

Sales returns

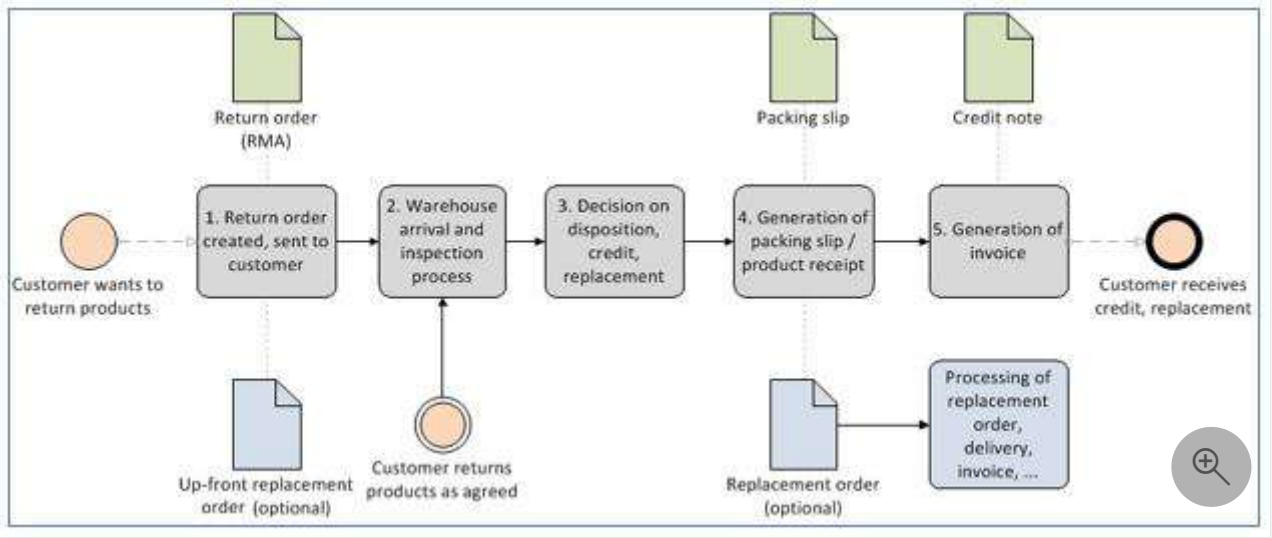
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about the process for return orders. It includes information about customer returns and their effect on costing and on-hand inventory quantities.

Customers can return items for various reasons. For example, an item might be defective, or it might not meet the customer's expectations. The return process starts when a customer issues a request to return an item. After the customer's request is received, a return order is created.

Return order process

The following illustration gives an overview of the return order process.



There are two types of return order process: physical return and credit only.

- **Physical return** – The return order authorizes the physical return of products.
- **Credit only** – The return order authorizes a customer credit but doesn't require that the customer physically return the products.

Physical return order process

1. **Create a return order.** Formally document the authorization for the customer to return any defective or unwanted products. The return order doesn't require that the company accept the returned products or provide a credit for the customer. If the return is accepted, you can authorize a replacement item to be sent before the defective item is returned.
2. **Arrive at warehouse for inspection.** Complete an initial inspection and validation against the return order document. The return order also supports quarantine of the returned items for additional inspection and quality control.
3. **Determine disposition.** Finalize the inspection process, and decide what should be done with the returned products. As part of this step, decide whether you credit the customer, reject the product return, or accept the product return, scrap the product, and then send a replacement product to the customer.
4. **Generate a packing slip.** Generate a packing slip, and commit the disposition decision that you made in step 3. Finalize the logistics processes.
5. **Generate an invoice.** Close the return order.

Credit only process

1. **Create a return order.** Formally document the authorization for the customer to receive a credit without returning the defective or unwanted products. The **Credit only** disposition code authorizes the decision to credit the customer without physical return.
2. **Generate an invoice.** Generate the credit note, and then close the return order.

Return material authorization

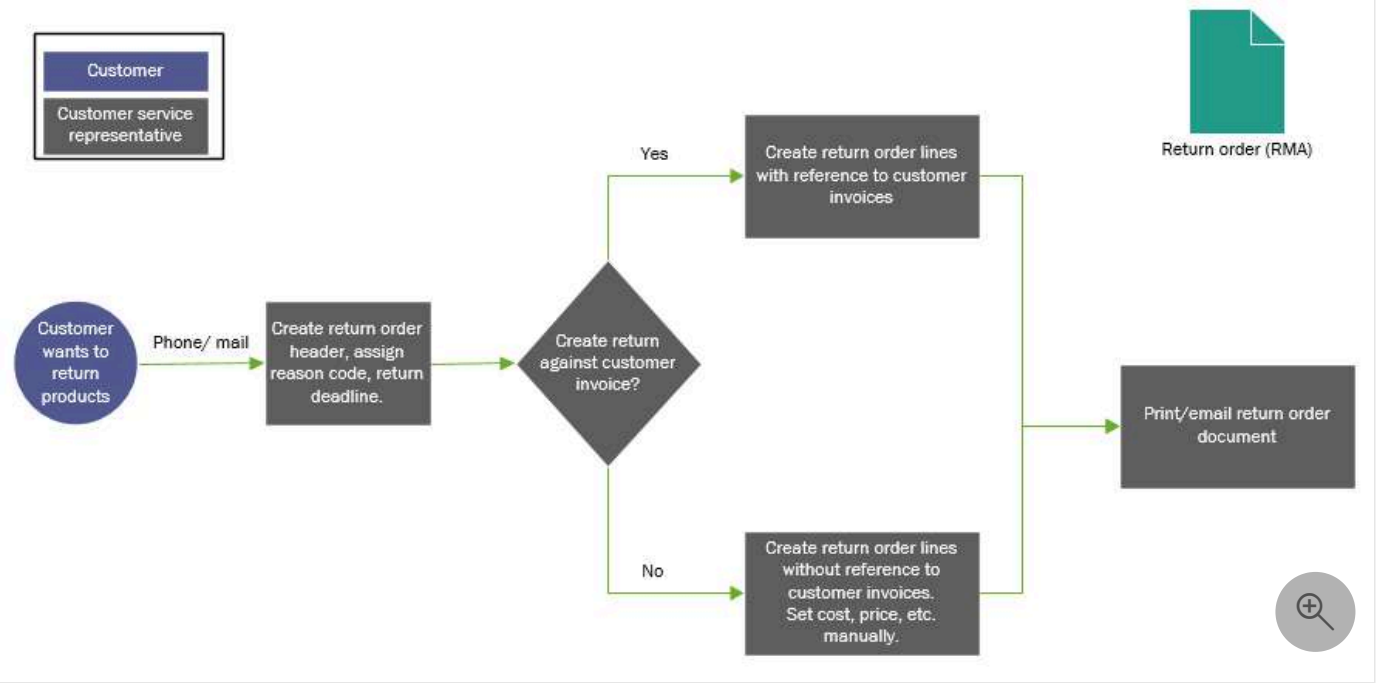
Return Material Authorization (RMA) processing builds on sales order functionality. An RMA is registered as a return order, which is created as a sales order, and may have another sales order associated with it, called a replacement order. Both sales orders link to the originating RMA number.

- **Return order** – To register an RMA, you create a return order, which is a sales order that has the assigned type, **Returned order.** Any changes that you make to the RMA information is automatically updated in the sales order. Until the return order has the status **Open**, it doesn't appear in the list of sales orders. You use RMA to handle the arrival and receipt of the returned items, as well as to authorize a credit only disposition action (see section **Disposition codes and disposition actions**). All other follow-up processes must be handled in the sales order.

- **Replacement order** – When a replacement order must be shipped to the customer, the RMA can include a second associated sales order. You can manually create the replacement order for the RMA to support immediate shipment. Alternatively, the replacement order can be created automatically after the arrival, inspection, and receipt are completed for the RMA line item that has a disposition code that indicates replacement. The replacement order has the same functionality that is associated with a sales order. For example, you can use it to configure a custom product as the replacement item, create a production order to repair a returned item, create a direct delivery purchase order to send the replacement from a vendor, or support other purposes.

Create a return order

The return order process starts when a customer contacts your organization to return a defective or unwanted product and/or to be credited. After your organization accepts the return, the return is documented by a return order. This return order becomes the focal point of the internal processing of the returned product. The following illustration shows the procedure for creating a return order.



Create a return order header

When you create a return order, you need to include the information in the following table.

Expand table

Field	Description	Comments
Customer account	A reference to the Customers table	You must provide an existing customer account.
Delivery address	The address that the item is returned to	By default, the organization's address is used. If you select a specific warehouse on the header, the delivery address changes to the delivery address of the warehouse. You can change this address on the **Return order details** page.
Site/warehouse	The site or warehouse that receives the returned product	The delivery address for the return order is determined based on the delivery address of the site or warehouse.
RMA number	The ID that is assigned to the return order	The RMA number is used as an alternate key throughout the return order process. The assigned RMA number is based on the RMA number sequence that you set up on the **Accounts receivable parameters** page.
Deadline	The last date that an item can be returned	The default value is calculated as the current date plus the period of validity. For example, if a return is valid for only 90 days from date when the return order is created, and the return order was created on May 1, the value in the field is **30-July**. The period of validity is set on the **Accounts receivable parameters** page.
Return reason code	The customer's reason for returning the product	The reason code is selected in the list of user-defined reason codes. You can update this field at any time.

Create return order lines

After you complete the return header, create return lines by using one of the following methods:

- Manually enter the item details, quantity, and other information for every return line.
- Create a return line by using the **Find sales order** function. Use this function when you create a return order. The **Find sales order** function establishes a reference from the return line to the invoiced sales order line, and retrieves line details such as item number, quantity, price, discount, and cost values from the sales line. The reference helps guarantee that, when the product is returned to the company, it's valued at the same unit cost that it was sold at. The reference also validates that return orders aren't created for a quantity that exceeds the quantity that was sold on the invoice.

> ⓘ **Note**

Return lines that have a reference to a sales order are handled as corrections to, or reversals of, the sale. For more information, see the "Post to the ledger" section, later in this article.

Charges

Fees and charges can be added to the return order through one or more of the following methods:

- Manually add charges to the return order header, the return order line, or both.
- Charges can be automatically added to the return order header as a function of the return reason code.
- Charges can be automatically added to the return order line, based on the disposition code of the line.

Charges are automatically added after a return reason code or disposition code is assigned to the line. If the reason code is changed later, the existing charge entry won't be removed, but a new charge entry might be added, based on the new reason code. When you add charges to return order lines, charges that are calculated as a percentage of the line or order value become negative when the line or line order is negative, unless the percentage is also a negative number. A charge that has a negative value represents a credit to the customer.

Return reason codes

By applying reason codes to returns, you can help make return patterns easier to analyze. Reason codes provide information about why a customer wants to return items. Some organizations have many reason codes. These organizations might group the reason codes into reason code groups to gain a better overview and for accumulated reporting.

Disposition codes and disposition actions

An important step in the return order process is assigning a disposition code to the return order line as part of arrival registration. The disposition code determines the following information:

- **The financial implications** – Should the customer be credited for the returned items, and should any charges be added to the return order line?
- **The disposition of the returned item** – Should the item be added back to inventory, scrapped, or returned to the customer?
- **The logistics of the returned item** – Should a replacement item be issued to the customer?

In addition to determining how to dispose of the returned goods, disposition codes can cause charges to be applied to the return line. They can also be used to group returns for statistical analysis. Disposition codes are defined as part of the setup of return orders. However, each disposition code must reference one of the built-in disposition actions. The following table lists the built-in disposition codes and their actions. **Important:** If an item shouldn't be returned, but the customer should still be credited, assign the **Credit only** disposition code to the return line.

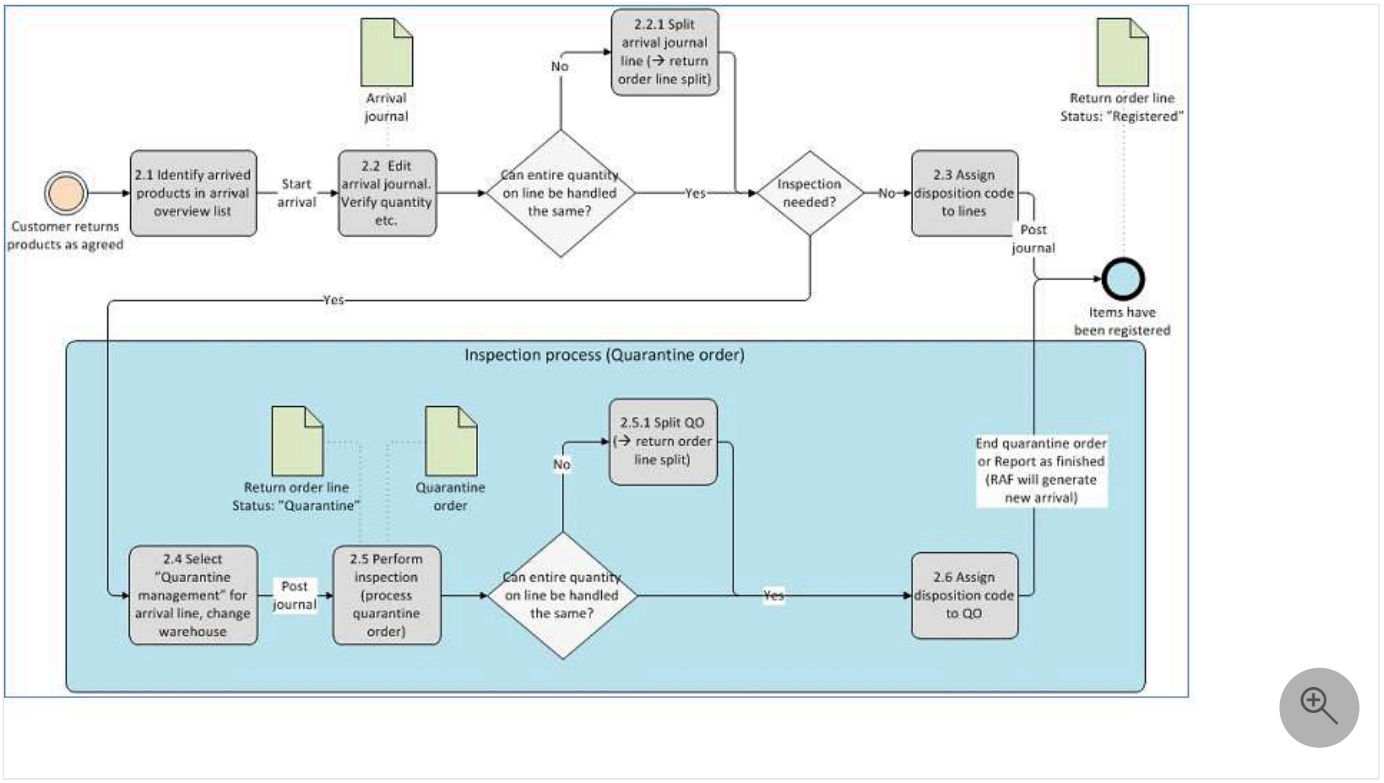
Expand table

Disposition code	Financial implications	Implications for logistics
Credit only	• The customer is credited the sales price minus any fees or charges. • Loss from scrapping the item is posted to the ledger.	The item shouldn't be returned. This disposition action is used for the following cases: • There is sufficient trust among the parties. • The cost of returning the defective item is prohibitive. • The items can't be allowed back into inventory. Because of other conditions, a physical return isn't required.
Credit	• The customer is credited the sales price minus any fees or charges. • The inventory value is increased by the cost of the returned item.	The item is returned and is added back into inventory.
Replace and credit	• The customer is credited the sales price minus any fees or charges. • Inventory value is increased by the cost of the returned item. • A separate sales order for a replacement is created and is handled separately.	The item is returned and is added back into inventory.

Disposition code	Financial implications	Implications for logistics
Replace and scrap	• Customer is credited the sales price, less any fees or charges. • Loss from scrapping the item is posted to the ledger. • A separate sales order for a replacement is created and is handled separately.	The item is returned and scrapped.
Return to customer	None, except any fees or charges.	The item is returned but is sent back to the customer after inspection. This disposition action might be used if the item is deliberately damaged, or if the warranty is voided.
Scrap	• The customer is credited the sales price minus any fees or charges. • Loss from scrapping the item is posted to the ledger.	The item is returned or scrapped.

Arrival at the warehouse for inspection

Before you can physically receive returned items into inventory by posting a packing slip, the items must go through arrival registration and an optional inspection. The following illustration gives an overview of the arrival process. The sections that follow describe each step that is shown in the illustration.



The process has several other variations that aren't covered in this article. Here are some of these variations:

- Don't use the **Arrival overview** list to create an Arrival journal. Instead, manually create the Arrival journal. Return orders have **Sales order** as the reference.
- If you're using Warehouse management, generate pallet transports. The return line has a status of **Arrived** during pallet transport.
- Register the arrival of the returned item directly from the return order line, by using the **Registration** function.

During the arrival process, returns are integrated with the general process for warehouse arrivals. The arrival process also supports the creation of quarantine orders for returned items that must undergo a separate inspection.

Identify products in the Arrival overview list

The **Arrival overview** page lists all the planned incoming arrivals.

> ⓘ **Note**
>
> You must process arrivals from return orders separately from other types of arrival transactions. After you identify an incoming package on the **Arrival overview** page (for

example, by using the accompanying RMA document), on the Action Pane, click **Start arrival** to create and initialize an Arrival journal that matches the arrival.

Edit the Arrival journal

By setting the **Quarantine management** option to **Yes**, you can create a quarantine order for the return line. If a line is sent to quarantine for inspection, you can't specify a disposition code.

If you set the **Quarantine management** option to **Yes** in the item's inventory model group, the **Quarantine management** option on the **Journal lines** page is marked for the Arrival journal line and can't be changed. If the line is sent to quarantine, you must specify the appropriate quarantine warehouse.

If the arrival line isn't sent for inspection, the warehouse arrival clerk must specify the disposition code directly on the Arrival journal line and then post the Arrival journal. If the same disposition code shouldn't be assigned to the whole quantity of the return line, or if the full quantity of the line isn't received, you must split the line. When you split an Arrival journal line, you also split the return line (**SalesLine**) and create a new lot ID. You can split the line by reducing the quantity of the Arrival journal line. When the journal is posted, a new return line is created that has a status of **Expected** for the remaining quantity. You can also split the line by clicking **Functions** > **Split**.

Process the quarantine order

If the returned products are sent for inspection at the quarantine warehouse, any additional processing is completed in a quarantine order. One quarantine order is created for each arrival line that is sent to quarantine. The disposition code indicates the result of the inspection process.

You can split a quarantine order, just as you can split the Arrival journal. If you split the quarantine order, you cause a corresponding split of the return line. After you enter the disposition code, complete the quarantine order by using either the **End** function or the **Report as finished** function. If you select **Report as finished**, a new arrival is created in the designated warehouse. You can then process this arrival by using the **Arrival overview** page.

If the arrival originates from a quarantine order, you can't change the disposition code assigned during inspection. If you complete the quarantine order by using the **End** function, the lot is automatically registered. Sometimes, an item might be sent back from quarantine to the Shipping and receiving department. For example, the quarantine inspector might not know where to store the item in inventory. In this case, you must update the corresponding packing slip to correctly register and act on the disposition code that is specified because of the quarantine.

Acknowledgment of receipt can be sent to the customer when the return line is registered. The **Return acknowledgement** report resembles the return order document. The **Return acknowledgement** report isn't journalized or otherwise registered in the system, and it isn't a required step in the return order process.

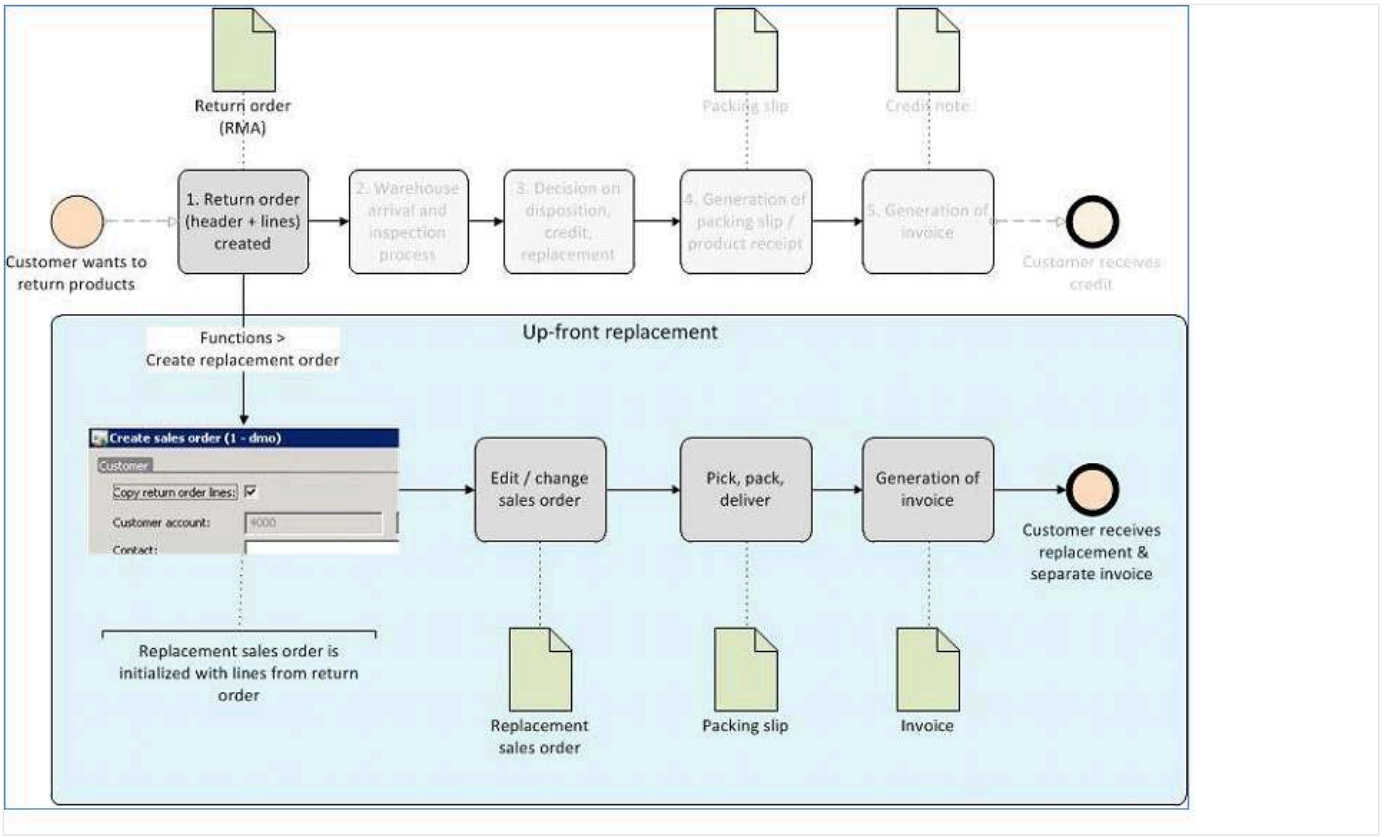
Replace a product

There are two methods for managing product replacement:

- **Up-front replacement** – Replace a product before the returned product is received from the customer.
- **Replacement by disposition code** – Automatically create a new replacement order line.

Up-front replacement

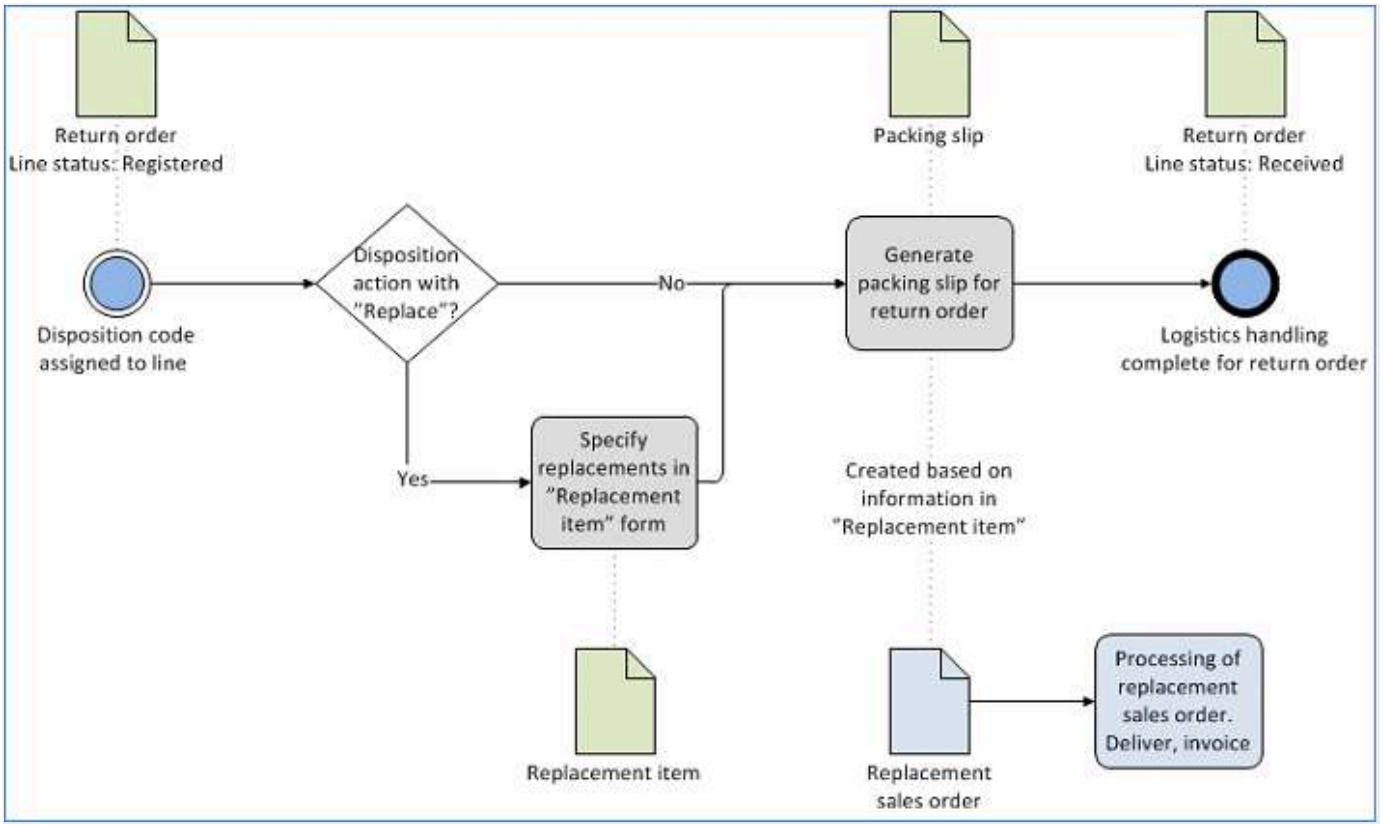
In up-front replacement, the replacement item can be delivered to the customer before the item is returned. This method is useful if, for example, the item is a machine part that can’t be removed unless a spare part is available to take its place, or if you just want your customer to have the replacement product as soon as possible. The up-front replacement order is an independent sales order. The header information is initialized from the customer, and the line information is initialized from the return order. You can edit, process, and delete the replacement order independently of the return order. When you delete a replacement order, you receive a message that the order was created as a replacement order. The following illustration shows the process for up-front replacement.



The return order includes a reference to the replacement order. If you create an up-front replacement order for a return order before the defective item is returned, you can't select disposition codes for replacement after the defective item is returned.

Replacement by disposition code

If you ship a replacement item to the customer and use the **Replace and scrap** or **Replace and credit** disposition action on the return order, use the process shown in the following illustration.



The replacement item is delivered by using an independent sales order, the replacement sales order. This sales order is created when the packing slip for the return order is generated. The order header uses information from the customer that the return order header references. The line information is collected from the data entered on the **Replacement item** page. The **Replacement item** page must be filled in for lines that have disposition actions that start with the word "replace." However, neither the quantity nor the identity of the replacement item is validated or limited. This behavior allows for cases where the customer wants the same item but in a different configuration or size, and also cases where the customers wants a completely different item. By default, you enter an identical item on the **Replacement item** page. However, you can select a different item, provided that the function is set up.

> ⓘ **Note**
>
> You can edit and delete the replacement sales order after it's created.

Generate a packing slip

Before you can receive returned items into inventory, you must update the packing slip for the order that the items belong to. Just as the invoice update process is the update of the financial transaction, the packing slip update process is the physical update of the inventory record. In other words, this process commits the changes to inventory. In the case of returns, the steps

assigned to the disposition action are implemented during the packing slip update. When you generate the packing slip, the following events occur:

- In the warehouse, the standard process performs a physical receipt. Ledger postings are generated if the inventory model group (**Post physical inventory**) and the Accounts receivable parameters (**Post packing slip in ledger**) are set appropriately.
- Items that are marked with a disposition action that contains the word "scrap" are scrapped, and the inventory loss is posted to the ledger.
- Items that are marked with the **Return to customer** disposition action are received and delivered to the customer. These items have no net effect on inventory.
- A replacement sales order is created. This sales order is based on information on the **Replacement item** page.

You can generate the packing slip only for lines that have a return status of **Registered**, and only for the full quantity on the return line. If several lines on the return order have the **Registered** status, you can generate the packing slip for a subset of the lines by deleting the other lines from the **Post packing slip** page.

Partial returns are defined in terms of return order lines, not in terms of return order shipments. Therefore, if you receive the full quantity that is indicated on one return order line, but you receive nothing from the other lines on the return order, the delivery isn't a partial delivery. However, if a return order line requires that 10 units of an item be returned, but you receive only four units, the delivery is a partial delivery. If not all the expected return items arrive, you can set the shipment aside and wait for the rest of the returned quantity to arrive. Alternatively, you can register and post the partial quantity. As part of the process for posting packing slips, you can associate the packing slip reference number from the customer’s shipping documents with the order lines. This association is optional and is for reference only. It doesn't create any transactional updates.

In general, you can skip the packing slip process and go directly to invoicing. In this case, the steps that you would have performed during packing slip generation are completed during invoicing.

Generate an invoice

Although the **Return order** page contains the information and actions that are required to handle the special logistical aspects of the return order, you must use the **Sales order** page to complete the invoicing process. Your organization can then invoice return orders and sales orders at the same time, and the same person can complete the invoicing process, as required. To view the

return order from the **Sales order** page, click the link for the sales order number to open the associated sales order. You can also find the return order on the **All Sales orders** page. Return orders are sales orders that have an order type of **Returned order**.

Credit correction

As part of the invoicing process, verify that any miscellaneous charges are correct. To make the ledger postings corrections (Storno), consider using the **Credit correction** option on the **Other** tab of the **Posting invoice** page when you post the invoice /credit note.

> ⓘ **Note**
>
> By default, the **Credit correction** option is activated if you enable the **Credit note as correction** option on the **Accounts receivable parameters** page. However, we recommend that you don't returns with Storno.

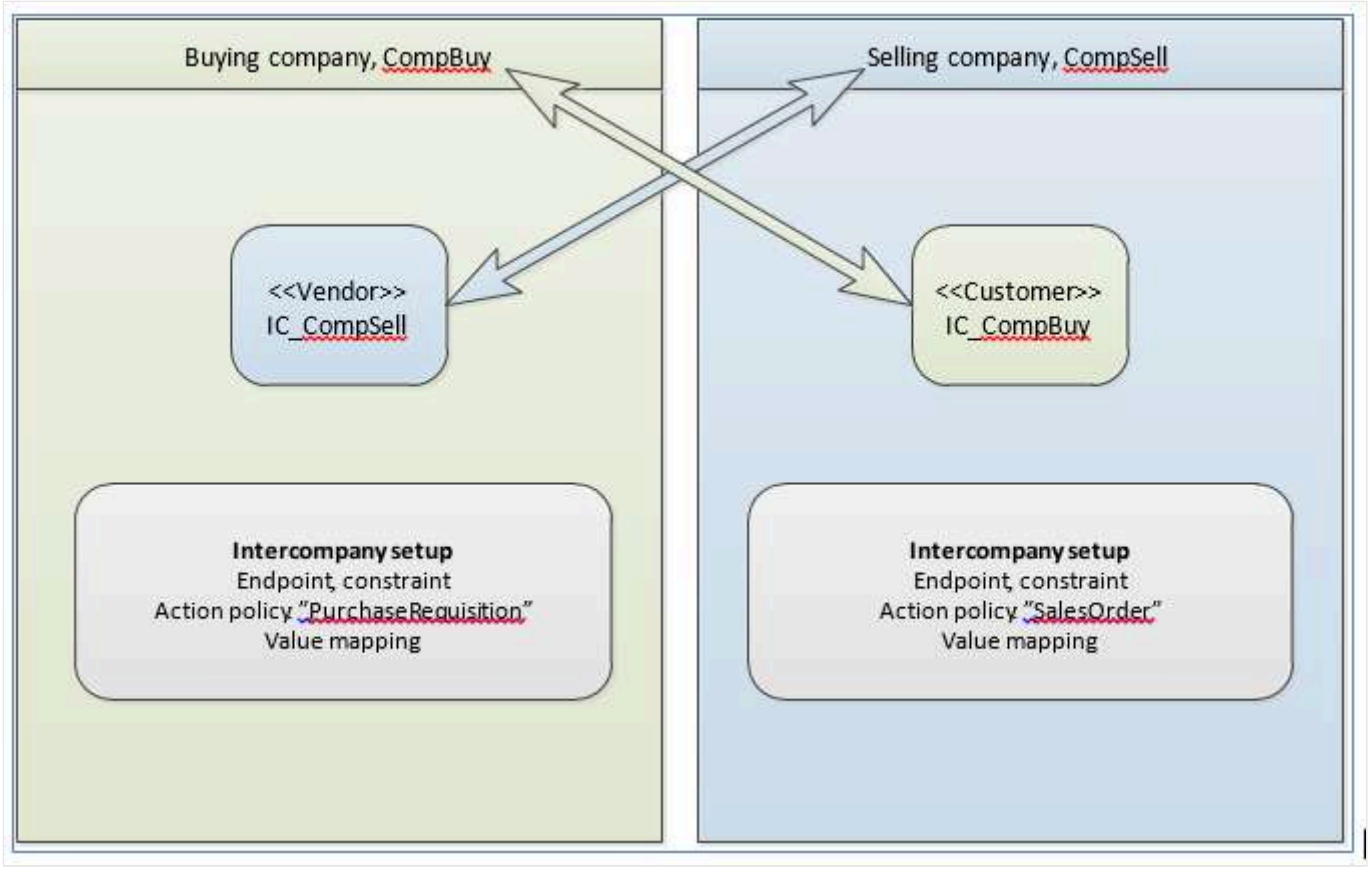
Create intercompany return orders

You can complete return orders between two companies within your organization. The following scenarios are supported:

- Simple intercompany returns between two companies that participate in an intercompany relation
- An intercompany chain that is established when a customer return order is created in the selling company
- An intercompany chain that is established when a vendor return order is created in the buying company
- Direct delivery shipment returns between an external customer and two companies that participate in an intercompany relation

Setup

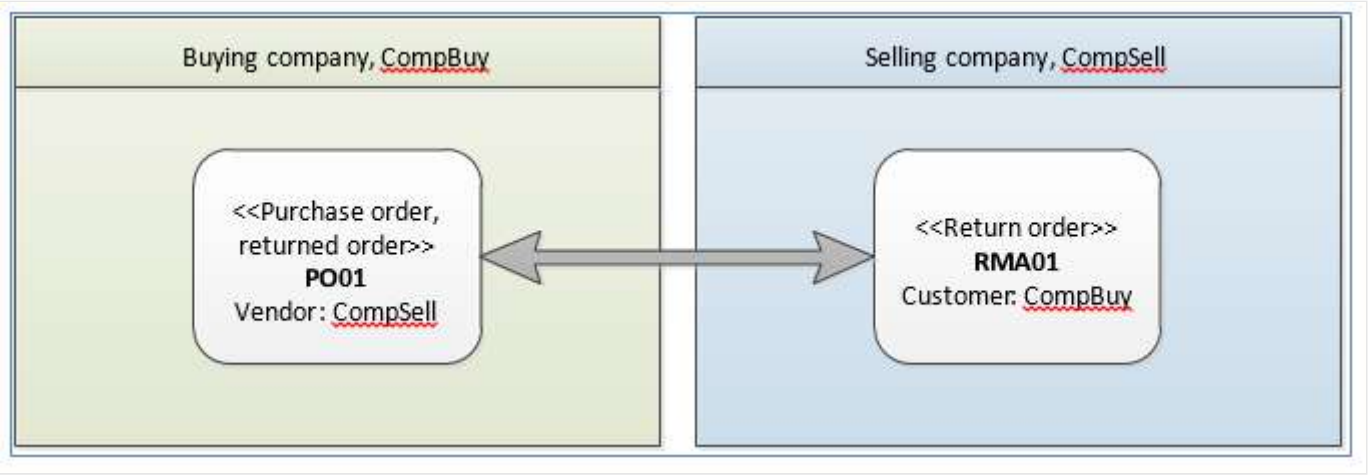
The following illustration shows the minimum setup that is required for two companies to participate in an intercompany relation and take advantage of intercompany trade.



In the following scenario, CompBuy is the buying company, and CompSell is the selling company. Usually, the selling company ships goods either to the buying company or, in direct delivery shipment scenarios, directly to the end customer. In CompBuy, the vendor IC_CompSell is defined as an intercompany endpoint that is associated with the company CompSell. At the same time, in CompSell, the customer IC_CompBuy is defined as an intercompany endpoint that is associated with the company CompBuy. The appropriate action policy details and value mappings must be defined in both companies. In a direct delivery shipment scenario, an intercompany return order, which is also an intercompany sales order, is created in the selling company. The RMA number of the intercompany return order can be picked from the RMA number sequence in CompSell, or it can be copied from the RMA number that is assigned to the original return order in CompBuy. The RMA number settings on the **PurchaseRequisition** action policy in CompBuy determine these actions. If the RMA number is synchronized, you should plan to mitigate the risk of number clashes if the two companies use the same number sequence.

Simple intercompany returns

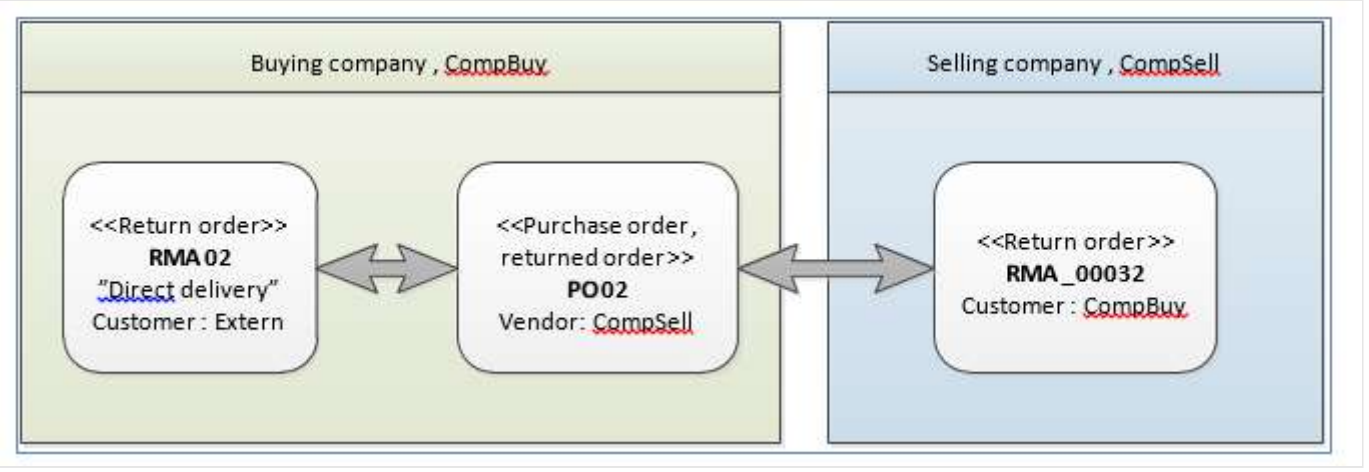
This scenario involves two companies in the same organization, as shown in the following illustration.



The order chain can be established when a vendor return order is created in the buying company or a customer return order is created in the selling company. The corresponding order is created in the other company and makes sure that the header and line information on the vendor return order reflects the settings on the customer return order. The return order that is established can either include or exclude the reference (**Find sales order**) to an existing customer invoice. The packing slips and invoices of the two orders can be processed individually. For example, you don't have to generate a packing slip for the vendor return order before you generate the packing slip for the customer return order.

Direct delivery shipment returns among three parties

This scenario can be established if a previous sale of the **Direct delivery** type is completed, and if an invoice against the customer exists in the company that interacts with the customer. In the following illustration, the company CompBuy previously sold and invoiced products to the customer Extern. The products were shipped directly from the company CompSell to the customer via an intercompany order chain.



If the customer Extern wants to return the products, a return order (RMA02) is created for the customer in the company CompBuy. To establish the intercompany chain, the return order must

be marked for direct delivery. When you use the **Find sales order** function to pick the customer invoice to return, an intercompany order chain that consists of the following documents is established:

- **Original return order:** RMA02 (company CompBuy)
- **Purchase order:** PO02 (company CompBuy)
- **Intercompany return order:** RMA_00032 (company CompSell)

After you create the direct delivery intercompany chain, all physical handling and processing of the returns must occur in context of the intercompany return order, RMA_00032 in the company CompSell. You can't receive the products in the company CompBuy. When you assign a disposition code to the intercompany return order, it synchronizes with the original return order to allow for proper invoicing of the original order.

Post to the ledger

A few important settings and parameters influence the ledger postings that are generated when the return order is invoiced:

- **Return cost price** – For inventory models other than **Standard cost**, the **Return cost price** parameter determines the cost of the item when it's accepted back into inventory or scrap it. To calculate a correct valuation of inventory, set the **Return cost price** parameter correctly. If you use the **Find sales order** function to create a return order line that has a reference to a customer invoice, the **Return cost price** value equals the cost price of the item that is sold. Otherwise, the cost price value comes from the item setup or you can enter it manually.
- **Credit correction/Storno** – The **Credit correction** parameter on the **Posting invoice** page determines whether postings are recorded as positive (DR/CR) entries or as correcting, negative entries.

In the following examples, the return cost price is represented as **Inv. Cost price**.

Example 1: The return order doesn't reference a customer invoice

The return order doesn't reference a customer invoice. The returned item is credited. The **Credit correction** parameter isn't selected when the return order invoice, or credit note, is generated.

Case 1	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	4	0%	30					12		30	12	

> ⓘ Note
>
> The item master price is used as the default value for the **Return cost price** parameter. The default price differs from the cost price at the time of inventory issue. Therefore, the implication is that a loss of 3 is incurred. Additionally, the return order doesn't include the discount that was given to the customer on the sales order. Therefore, an excessive credit occurs.

Example 2: Credit correction is selected for the return order

Example 2 is the same as example 1, but the **Credit correction** parameter is selected when the return order invoice is generated.

Case 2	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	4	0%		-30			-12		-30			-12

> ⓘ Note
>
> The ledger postings are entered as negative corrections.

Example 3: The return order line is created by using the Find sales order function

In this example, the return order line is created by using the **Find sales order** function. The **Credit correction** parameter isn't selected when the invoice is created.

Case 3	Qty	Unit price	Inv. Cost price	Line discount	Revenue		Discount		Consumption		Accounts receivable		Inventory issue	
					DR	CR	DR	CR	DR	CR	DR	CR	DR	CR
Sales order invoice	3	10	5	6%		30	1,8		15		28,2			15
Return order invoice	3	10	5	6%	30			1,8		15		28,2	15	

> ⓘ Note
>
> **Discount** and **Return cost price** are set correctly. Therefore, an exact reversal of the customer invoice occurs.

Receive unannounced sales returns

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In Microsoft Dynamics 365 Supply Chain Management, the sales return process usually starts when you create a return material authorization (RMA) order. The process of creating an RMA order supports a scenario where the reason for the return isn't immediately apparent or disclosed. The RMA order serves as the primary document that guides subsequent steps in the return process, including warehouse arrival and the receiving procedures.

However, in some business scenarios, customers might request to return products without providing advance notification or an associated order. In these scenarios, the standard RMA process is bypassed, and special considerations are made to accommodate the unplanned or unanticipated (unannounced) returns.

This article explains how to set up Supply Chain Management to support unannounced returns, and how to receive unannounced returns in the warehouse.

Prerequisites

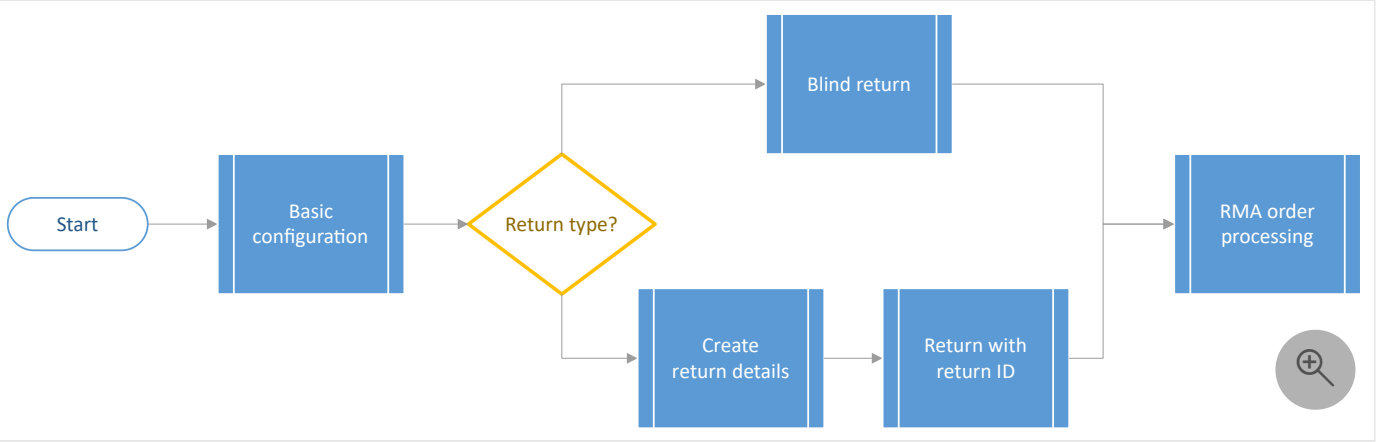
Before you can use the features described in this article, ensure your system meets the following requirements:

- To receive unannounced sales returns, you're running Supply Chain Management version 10.0.39 or later.
- To use the integration with small parcel shipping (SPS), you're running Supply Chain Management version 10.0.39 or later.
- To print license plate labels from a mobile device, you're running Supply Chain Management version 10.0.40 or later.

Receiving process for unannounced returns

The *Return item receiving* flow in the Warehouse Management mobile app supports two processes for receiving unannounced returns: *Blind return* and *Return details*.

The following illustration shows how the flow works for each process.



Blind return process

A blind return is a return where no RMA order or return details record exists in advance, and where no original sales order or shipment must be specified during receiving. During the *Return item receiving* process, workers must use the mobile app to identify and confirm the following information:

- **Customer account or Source system** – The source that returns the item. *Customer account* is used for sales return orders and *Source system* is used when using inbound shipment orders as part of the Warehouse management only mode process.
- **Item number and quantity** – The items that are returned and the quantity that's returned for each item.
- **License plate ID** – The license plate of the location where the incoming items are stored after they're received.
- **Disposition code** – Depending on the setup of the mobile device menu item, workers might be able to select a disposition code to specify what should be done with the returned products. If this option isn't shown in the app during receiving, a Supply Chain Management user must enter a disposition code when they complete the mixed license plate.

> ⓘ **Note**
>
> When running the return process for inbound shipment orders, you must also define source system disposition codes.

Return details process

The *Return details* return process uses a return details record. This record is automatically generated when an order is shipped. It contains all the information required to process a return, such as the return ID, original order ID, shipment ID, order lines, and return-until dates.

Typically, the sending company prints a return label for each outgoing shipment and delivers it together with that shipment. The return label includes a bar code that contains the return ID. Then, if a customer must return an item, they don't have to contact the sending company. Instead, they can just pack the item and attach the return label that they received together with the original shipment.

> ⓘ **Note**
>
> Only the items/variants, tracking dimensions, and quantities that are listed in the specified return details record can be returned through this process.

You can generate a return details record in two ways:

- In a *packing scenario*, the system generates a return details record after each sales order is packed into a container and the container is closed.
- In a *nonpacking scenario*, the system generates a return details record after a worker creates a shipment for a sales order and confirms it.

In both cases, the system fills in the shipment date and return-until date when it confirms the related shipment.

During the *Return item receiving* process, workers must use the mobile app to identify and confirm the following information:

- **Return ID** – The ID number of the return details record.
- **Item number and quantity** – The items that are returned and the quantity that's returned for each item.
- **License plate ID** – The license plate of the location where the incoming items are stored after they're received.
- **Disposition code** – Depending on the setup of the mobile device menu item, workers might be able to select a disposition code to specify what should be done with the returned products. If this option isn't shown in the app during receiving, a Supply Chain Management user must enter a disposition code when they complete the mixed license plate.

Set up unannounced sales return receiving

To prepare your system to receive returns without using an RMA order, you must enable the relevant features and complete several related configurations. The following subsections describe the required settings.

Enable unannounced returns

Before you can use blind returns and/or automatic generation of return details during receiving, you must follow these steps to turn on and set up each feature in your system.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.

2. If you plan to use the *Return details* return process, specify the number sequences that support this process:
   a. On the **Number Sequences** tab, find the row where the **Reference** field is set to *Return ID*. For this row, set the **Number sequence code** field to the number sequence that you want to use.
   b. Find the row where the **Reference** field is set to *Load line inventory pick*. For this row, set the **Number sequence code** field to the number sequence that you want to use.

   For more information about how to set up number sequences for these purposes, see Number sequences overview.

3. If you plan to use the *Return details* process, on the **Loads** tab, set the **Enable sales load line picking route** option to *Yes*. This setting enables load lines to be linked to sales line inventory transactions. The linking is done at the shipment level. This option uses the *Load line inventory pick* number sequence when work is completed and containers are closed.

4. On the **General** tab, on the **Returns** FastTab, set the following options:

   - **Enable return details creation** – Set this option to *Yes* to enable return details to be created when a container is closed and during shipment confirmation. This option is required only for the *Return details* process.
   - **Enable return order creation from mobile device** – Set this option to *Yes* to enable return orders to be created from a mobile device flow. The flow uses mixed license plate receiving planned lines. This option is required for both the *Return details* process and the *Blind return* process.

5. If you're using Warehouse management only mode, set up returns for each source system by following these steps:
    a. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**.
    b. From the list pane, select the source system you want to set up for returns.
    c. Make the following settings on the **Inbound shipment orders** FastTab:

        - **Enable returns process** – Set to *Yes* to enable the return process for the current source system.
        - **Number sequence code** – Select the number sequence to use to generate order numbers for inbound shipment orders.
        - **Return order type** – Enter text used to stamp the created inbound shipment order. This value is used to distinguish return orders from other inbound shipment orders.

    d. Repeat these steps for each relevant source system.

Set up disposition codes

Disposition codes are collections of rules that you can use when receiving items in Supply Chain Management. They help determine the inventory status, the work template, and the location directive for the items, based on the scanned code.

For example, when a warehouse worker uses a mobile device to receive items that are damaged, the worker scans a disposition code for damaged items.

- If you want to credit the item to your inventory and make it available for repurchase, set up a disposition code that sets the inventory status of the received item to *Available*.
- If you receive items that you can't resell and must therefore dispose of, use a disposition code for RMA scrap. This disposition code then returns a *return disposition code*.

Use disposition codes for different processes, such as *purchase order receiving*, *production order report as finished*, and *sales order return receiving*. For the *sales order return receiving* process, if the items are registered by using a mobile device, the use of disposition codes is mandatory.

Return disposition codes

To view and set up your return disposition codes, go to **Sales and Marketing** > **Setup** > **Returns** > **Disposition codes**. Define each code by specifying an ID number, an action, and a description. The action defines how items that are assigned to the code should be handled.

For more information about return disposition codes and the actions that are available, see Disposition codes and disposition actions.

Mobile device disposition codes

To set up disposition codes that you can use on a mobile device, go to **Warehouse management** > **Setup** > **Mobile device** > **Disposition codes**. Disposition codes that you create here are available to mobile devices and can support several types of operations, including returns, sales orders, and inventory management. Disposition codes for returns must be linked to a return disposition code defined at **Sales and Marketing** > **Setup** > **Returns** > **Disposition codes**, and that assigns a return action for the code.

For more information about mobile disposition codes and how to set them up, see Set up dispositions codes.

Source system disposition codes

If you're using Warehouse management only mode, you must map local dispositions codes with the *source system disposition codes* used in each relevant source systems. These codes are used when processing inbound shipment orders.

To set up source system disposition codes, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source system disposition codes**.
2. On the Action pane, select **New** to add a new code. Then make the following settings for the new code:
    - **Disposition code** – Select the local disposition code that you want to map.
    - **Source system** – Select the source system that you want to map the local disposition code to.
    - **Source system disposition code** – Enter the disposition code that is used in the source system.
3. Repeat the previous step until you set up all of the disposition codes that you need to map.

Set up return item policies

Return item policies let you control the conditions under which the system allows items to be returned. You can set policies for each item, groups of items, or all items, as you require. To set up

your policies, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Return items** > **Return item policies**.
2. On the Action Pane, select **New** to create a policy.
3. In the **Item code** field, select one of the following values to specify the scope that the new policy applies to:
    - *Table* – The return item policy applies only to a specific product.
    - *Group* – The return item policy applies to a specific product group.
    - *All* – The return item policy applies to all products.
4. In the **Item** field, if you set the **Item code** field to *Table* in the previous step, select the item number that the new policy applies to. If you set the **Item code** field to *Group*, select the item group that the new policy applies to. If you set the **Item code** field to *All*, the **Item** field is unavailable.
5. In the **Return acceptance** field, select one of the following values:
    - *Always allowed* – Items that match the selected **Item code** and **Item** values can always be returned.
    - *Never allowed* – Items that match the selected **Item code** and **Item** values can never be returned.
    - *Allowed days after shipment* – Items that match the selected **Item code** and **Item** values can be returned only for a limited time after they were sold, as defined in the **Allowed days for return** field.
6. If you set the **Return acceptance** field to *Allowed days after shipment*, set the **Allow days for return** field to the number of allowed days.
7. Repeat this procedure for each item or item group, as you require. When returns are processed, the most specific return item policy applies to each item in the return.
8. On the Action Pane, select **Save**.

Create return item receiving policies

Before you create the related mobile device menu items, define the required return item receiving policies. These policies enable each menu item to process the return correctly.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Return item receiving policies**.

2. On the Action Pane, select **New** to add a return item receiving policy.

3. Set the following fields for the new policy:

- **Return item receiving policy ID** – Enter a name for the policy, such as *Blind return* or *Return details*.
- **Description** – Enter a short description of the policy.
- **Return process** – Select the type of return process that the policy represents (*Return details* or *Blind return*).
- **Create return order** – Select the type of return order that the system should create to manage returns:
  - *Return order* – The system creates a return order for each return. Select this value if you aren't using Warehouse management only mode.
  - *Inbound shipment order* – The system creates an inbound shipment order for each return. Select this value if you're using Warehouse management only mode.
- **Return order identification** – This field is available only when the **Return process** field is set to *Blind return* and the **Create return order** field is set to *Inbound shipment order*. The way that you use it depends on the needs of your external system. (See the documentation for your external system.) Select the type of extra identifying information that the system should return to the source system when it registers a return order:
  - *None* – The system doesn't return any extra identifying information, and the app doesn't prompt the worker to enter any extra information during receiving.
  - *Account number* – The system returns an account number to help identify the return order. This value is typically the ID of the customer who is returning the items (the customer account number). The mobile app prompts the worker to scan or enter this number during receiving.
- **Return order type** – This field is available only when the **Return order identification** is available and set to *Account number*. Like the account number, the value in this field is returned to the source system when a return order is registered. It's intended to hold the name that identifies the document type for return orders in the source system. The way that you use it depends on the needs of your external system. (See the documentation for your external system.) If you leave this field blank, the value is inherited from the relevant source system configuration.

> **Important**
>
> If your source system is Dynamics 365 Supply Chain Management (as is the case when you run an external shared warehouse scenario), set the following values for your blind return policies:
>
> - **Return order identification** – Select *Account number*, and instruct workers to enter the customer ID (account number) when the mobile app prompts them during receiving.
> - **Return order type** – Enter *Return*, which is the return order type that is used in Supply Chain Management. (Alternatively, if *Return* is already specified as the default return order type for the source system, leave this field blank.)

4. If you support both types of unannounced return processes (*Return details* and *Blind return*), repeat this procedure to add a return item receiving policy for the other process.

Set up mobile device menu items to process unannounced returns

To enable workers to process unannounced returns, create a separate mobile device menu item for each type of unannounced return process (*Return details* or *Blind return*) that you support.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following fields for the new menu item:
    - **Menu item name** – Enter an internal name for the menu item, such as *Blind returns*.
    - **Title** – Enter the name that should appear for the menu item in the mobile app, such as *Blind return item receiving*.
    - **Mode** – Select *Work*.
    - **Use existing work** – Set this option to *No*.
    - **Work creation process** – Select *Return item receiving*.
    - **Barcode data policy** – Select the policy to use if multiple fields are filled in based on a single bar code scan. To learn more, see GS1 bar codes.
    - **Generate license plate** – Set this option to *Yes* to automatically create new license plates as they're needed. Set it to *No* if the worker must always select an existing license plate.

- **Display disposition code** – Select whether workers should be prompted to select a disposition code during the receiving process. The disposition code determines the inventory status, work template, and location directive for the returned items.
- **Print label** – Set this option to *Yes* to always print a license plate label after all steps in the related work template are completed (regardless of whether a print step is included in the work template). If you want to allow the work template to print the license plate label at a different point in the process, set this option to *No*. The license plate label includes a bar code that provides the ID of the license plate where the worker places the returned items. To learn more, see License plate label layouts and printing.
- **Return item receiving policy ID** – Select the item receiving policy that you created for the type of return process (*Return details* and *Blind return*) that this menu item supports.

4. If you support both types of unannounced return processes (*Return details* and *Blind return*), repeat steps 2 and 3 to create a menu item for the other process.

5. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

6. Add the new menu items to an appropriate place in your mobile device menu structure.

Integrate return label printing with small parcel shipping

Small parcel shipping (SPS) integration lets you retrieve shipping labels from the SPS carriers or carrier hubs that you integrate with your system. However, some customization is required. The integration supports preaddressed and prepaid return labels, which make returns more convenient for your customers. The return labels can include a bar code that identifies the return details record ID. Warehouse workers can then scan this bar code when the package arrives at your warehouse.

For more information about how to set up SPS integration, see Small parcel shipping.

Follow these steps to enable return details with SPS integration.

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. On the **Shipping carriers** FastTab, set the **Enable shipping label request type** option to *Yes*. This setting adds a new **Print container return shipping label rule** field to the **Container packing policies** page. Use this field to select the conditions under which return labels

should be printed as part of the container packing process. For details about how to use this setting, see the next section.

Print return labels

When you use a *Return details* return process, you must print a return label for each shipment and include that label with the shipment. The *container packing policy* that applies to each shipment establishes the printing options. Depending on the setup of your system, return labels are typically printed as part of the container closing process. However, you can manually print or reprint them for a selected return details record at any time.

The return label includes the shipping address of your returns warehouse and a bar code that contains the return details record ID. Therefore, warehouse workers can scan this bar code when the package arrives at your warehouse.

Follow these steps to configure the label printing options for a container packing policy.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container packing policies**.

2. Select or create the container packing policy that you want to set up.

3. On the **Container manifest** FastTab, set the following fields:

    - **Automatic manifest at container close** – Set this option to *Yes*.
    - **Manifest requirements for container** – Set this field to *Transportation management*.

4. On the **Carrier label printing** FastTab, set the following fields:

    - **Print container shipping label rule** – Select one of the following options to specify the rule for printing outbound shipping labels:
        - *Never* – Users can close containers without printing a shipping label.
        - *Always* – A shipping label is required. Users can't close the container unless the system can retrieve a label.
        - *If setup exists* – For containers where a shipping label setup exists, the system must retrieve the required label before users can close the container. For containers where no shipping label setup exists, users can close the container without printing a label.

    - **Print container return shipping label rule** – Select one of the following options to specify the rule for printing return labels to include in each container:
        - *Never* – Users can close containers without printing a return label.

    - *Always* – A return label is required. Users can't close the container unless the system can retrieve a label.
    - *If setup exists* – For containers where a return label setup exists, the system must retrieve the required label before users can close the container. For containers where no return label setup exists, users can close the container without printing a label.

- **Printer name** – Select the Zebra Programming Language (ZPL) printer where the system should print shipping and/or return labels when this container packing policy is used.

Follow these steps to manually print or reprint a return label for a return details record.

1. Go to **Warehouse management** > **Inquiries and reports** > **Return details**.
2. In the list pane, select the return details record that you want to print a label for.
3. On the Action Pane, select **Print** > **Return shipping label**.

The return label is printed on the printer that's specified in the relevant container packing policy that's associated with the **Container ID** value that's listed for the return details record.

Example scenarios for the sales return order creation process

This section provides example scenarios that show how to set up and process unannounced returns.

Scenario prerequisites

Before you work through the example scenarios, complete all the prerequisites described in the following subsections.

Enable sample data

To work through the example scenarios by using the sample records and values that are specified here, use a system where the standard demo data is installed. Additionally, select the **USMF** legal entity before you begin. The example scenarios use the demo data that's associated with the worker/person *Julia Funderburk*.

You can also use these scenarios as guidance for using the feature on a production system. However, in that case, substitute your own values for each setting that's described here.

Set up number sequences

You must have number sequences that generate unique return IDs and load line inventory pick numbers.

1. Go to **Organization administration** > **Number sequences** > **Number sequences**.
2. On the Action Pane, on the **Number sequence** tab, in the **New** group, select **Number sequence** to create a number sequence that generates return ID numbers.
3. Set the following values for the new number sequence:
    - **Number sequence code:** *ReturnID*
    - **Name:** *ReturnID*
    - **Scope:** *Company*
    - **Company:** *USMF*
4. On the Action Pane, select the **Back** button.
5. On the Action Pane, on the **Number sequence** tab, in the **New** group, select **Number sequence** to create a number sequence that generates load line inventory pick numbers.
6. Set the following values for the new number sequence:
    - **Number sequence code:** *LLIP*
    - **Name:** *LLIP*
    - **Scope:** *Company*
    - **Company:** *USMF*
7. On the Action Pane, select **Save**.

Enable unannounced return features

Follow these steps to enable the features that are required to support unannounced returns.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Number sequences** tab, set the **Number sequence code** field to *ReturnID*.
3. Set the **Number sequence code** field to *LLIP*.
4. On the **General** tab, turn on the **Enable return details creation** option.
5. Turn on the **Enable return order creation from mobile device** option.
6. On the **Loads** tab, turn on the **Enable sales load line picking route** option.

For information about how to configure these settings, see the Enable unannounced returns section.

Create return item policies

Follow these steps to create return item policies for the items that are used in the scenarios.

1. Go to **Warehouse management** > **Setup** > **Return items** > **Return item policies**.
2. Add a return item policy to define the conditions under which the item that's used in the scenarios can be returned.
3. Set the following values for the new policy:

    - **Item code:** *Table*
    - **Item:** *A0001*
    - **Return acceptance:** *Allowed days after shipment*
    - **Allowed days for return:** *28*

Learn more in the Set up return item policies section.

Set up return item receiving policies

Follow these steps to create return item receiving policies for the scenarios.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Return item receiving policies**.
2. Add two return item receiving policies: one for the *Blind return* process and one for the *Return details* process.

Learn more in the Create return item receiving policies section.

Set up mobile device menu items and menus

Follow these steps to create mobile device menu items for the scenarios.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Create two mobile device menu items for handling unannounced returns: one for the *Blind return* process and one for the *Return details* process.

3. Set up the new menu items in the following way:

    - Give each menu item a name that identifies the type of return that it's intended to process (for example, *Blind return receiving* or *Return details receiving*).
    - For each menu item, set the **Work creation process** field to *Return item receiving*.

- For each menu item, enable both the **Generate license plate** option and the **Display disposition code** option.
- For each menu item, set the **Return item receiving policy ID** field to the policy that matches the type of return that the menu item should handle (*blind returns* or *return details*).

4. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

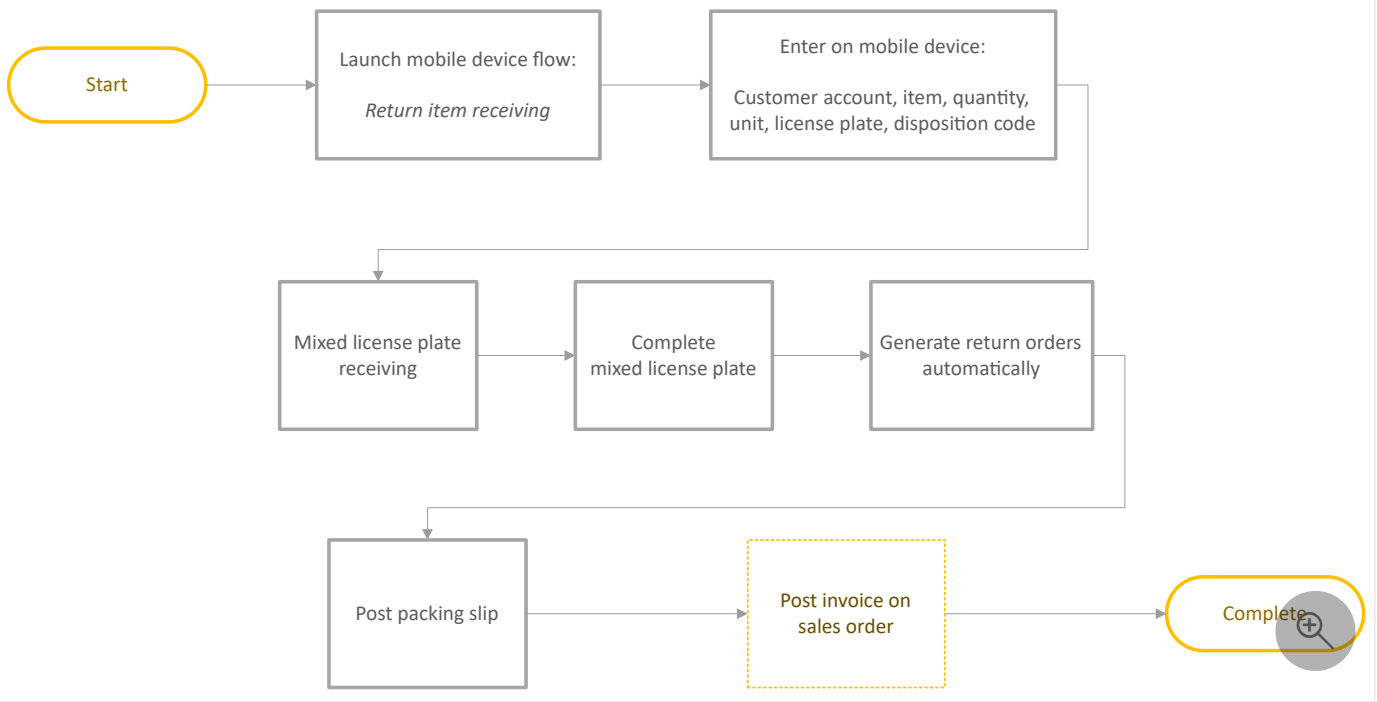
5. Add both menu items to an appropriate place in your mobile device menu structure.

Learn more in the Set up mobile device menu items section.

Example scenario 1: Customer return with a blind return policy

In the blind receiving process, warehouse workers receive return items without matching them to an original sales order or shipment. Warehouse workers just enter the customer account ID, item IDs, and quantities.

The following illustration shows a flowchart for the blind receiving process.



Use the mobile app to receive a blind return to a mixed license plate

Follow these steps to receive products to a mixed license plate in a warehouse when there's a blind return policy.

1. Open the Warehouse Management mobile app, and sign in by using *62* as the user ID and *1* as the password.
2. Open the menu item that you created for receiving blind returns (for example, **Inbound** > **Blind returns receiving**).
3. In the **Customer account** field, enter *US-003*.
4. In the **Item** field, enter or scan item number *A0001*.
5. Accept the license plate number that's suggested.
6. In the **qty** field, enter *1*.
7. In the **Disposition code** field, select *RMA Credit*.
8. Select **OK** to complete the receiving work.
9. Select **Cancel** to exit the flow and close the menu item.

> ⓘ **Note**
>
> You must exit the flow to unlock the license plate. If the license plate is locked, you can't complete mixed license plate receiving in Supply Chain Management, as described in the next section. In some setups, you can finish processing mixed license plates during the *Return item receiving* flow. However, in this scenario, you process the license plate in Supply Chain Management.

Complete mixed license plate receiving

The returned products are now on a mixed license plate for further processing. (Learn more in Mixed license plate receiving.) Follow these steps to finish receiving the returned items.

1. Go to **Warehouse Management** > **Inquiries and reports** > **Mixed license plate receiving**.
2. In the **License plate** grid, find the mixed license plate that you processed by using the mobile app.
3. On the Action Pane, on the **License plate** tab, select **Complete license plate** to complete mixed license plate receiving.

After you complete mixed license plate receiving, Supply Chain Management automatically creates an RMA order that's prepared for further downstream processing, as described in Sales

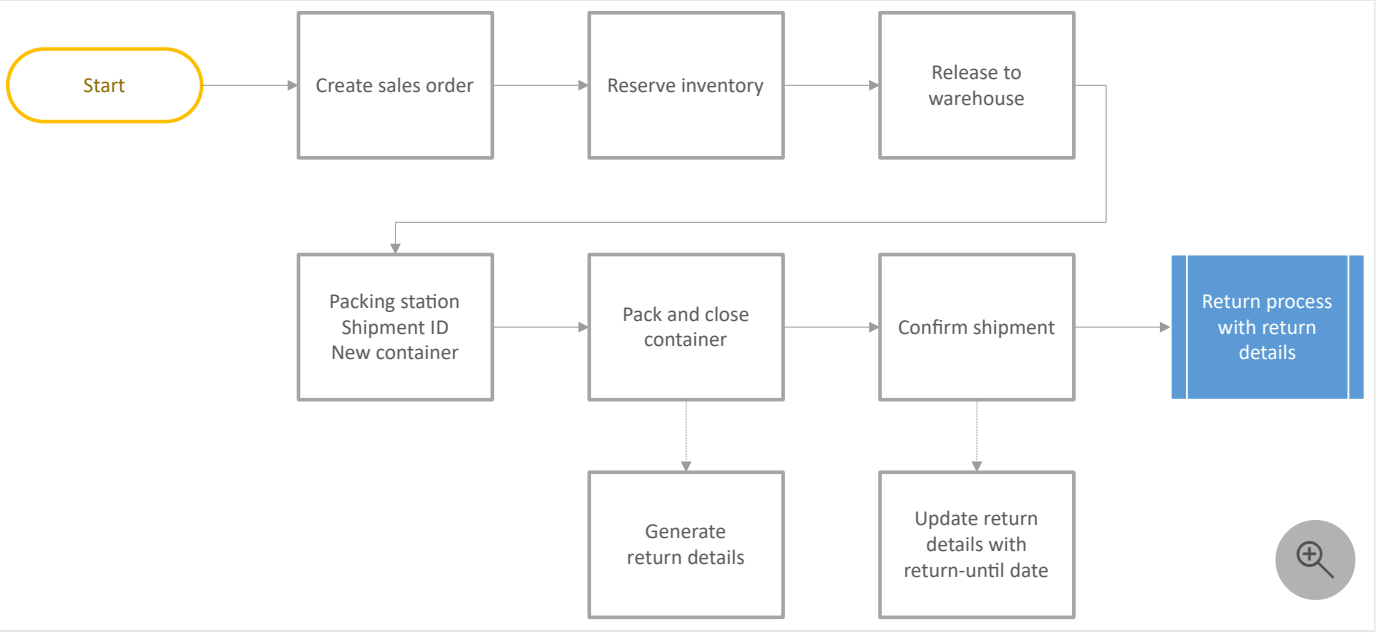
returns.

> **Tip**
>
> You can set up your mobile device menu item for processing returns to include a step that lets workers complete mixed license plate receiving directly from the mobile device while receiving the return. Then you don't need to complete this step later in the Supply Chain Management web client. To do so, create a detour item with the **Activity code** *Complete mixed license plate*. Learn more in Set up a mobile device menu item for completing mixed license plates.

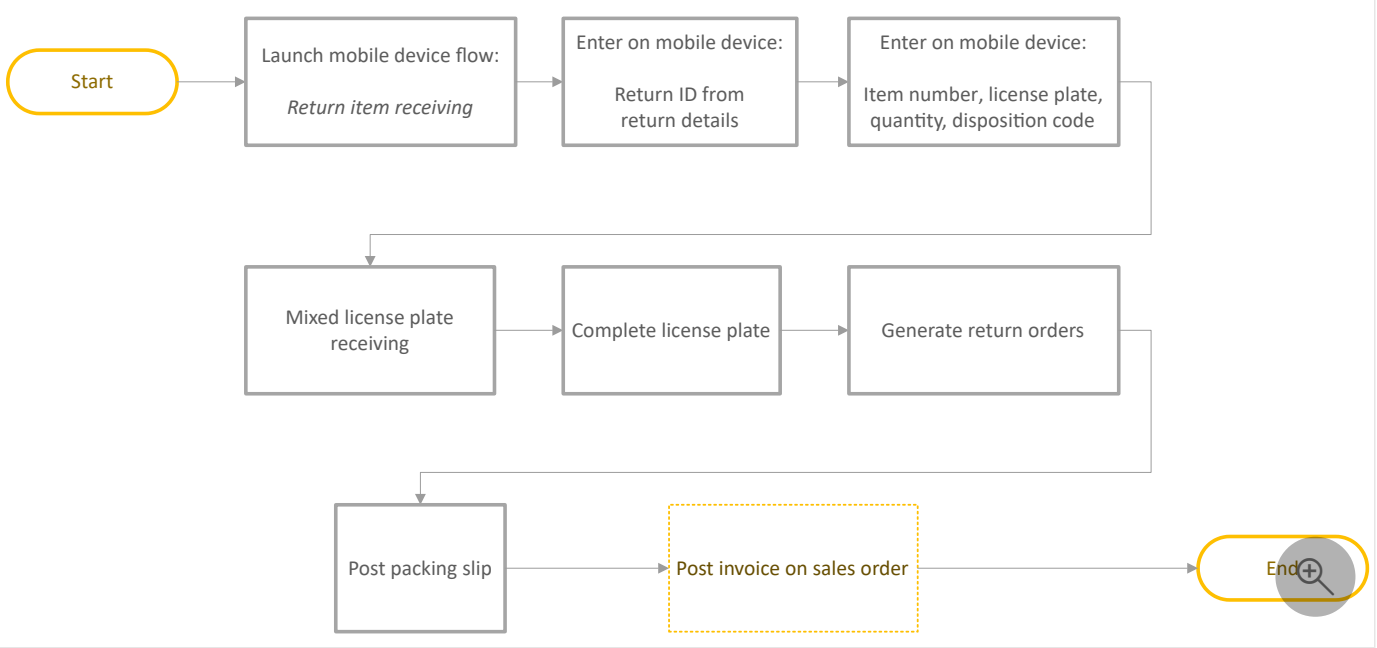
Example scenario 2: Customer return with a return details policy

For this scenario, return details are generated when an order is processed for shipment at the packing station, and matching labels are included with the shipment. If any items must be returned, the customer packs the return items, attaches the return label that they received together with the original shipment, and ships the return items back to the seller. When the returned items arrive at the seller's warehouse, a worker scans the return label and the item to get the return ID. The return ID identifies a return details record that includes the original order details. This process helps prevent fraud, inventory errors, and lost packages.

The following illustration shows the steps that are required to create a sales order and complete the work of moving the ordered items to the packing area. Workers then pack the order, and return details are generated when the container is closed.



The following illustration shows a flowchart of the receiving process where the *Return item receiving* mobile menu item is used to process a return that has return details.



Create a sales order and release it to the warehouse for packing

For this scenario, a related sales order must already exist, and the item must be shipped before the return. Therefore, you must create the required records before you can work through the related return. Follow these steps to create a sales order and complete the work of moving the ordered items to the packing area.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the **Customer account** field to *US-001*.
4. Select **OK** to close the dialog box.
5. The new sales order opens. The **Sales order lines** FastTab includes a single, blank order line. Set the following values for this line:
    - **Item number:** *A0001*
    - **Quantity:** *1*
    - **Site:** *6*
    - **Warehouse:** *62*
6. While the order line is still selected on the **Sales order lines** FastTab, select **Inventory** > **Reservation** on the toolbar.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.

8. On the Action Pane, select the **Back** button to return to the sales order.

9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**. A message shows the shipment and wave IDs for the order.

10. While the order line is still selected on the **Sales order lines** FastTab, select **Warehouse** > **Work details** on the toolbar. If you use batch processing to run your waves, you might have to wait a short time for the work to be created.

11. On the **Work** page, on the Action Pane, on the **Work** tab, select **Complete work**.

12. On the **Work completion** page, set the **User ID** field to *62*.

13. On the Action Pane, select **Validate work**.

14. When you receive a message that indicates that your work is valid, select **Complete work** on the Action Pane to complete the process of picking the inventory items and putting them in the *Pack* location.

15. Make a note of the **Shipment ID** value that's shown for the work in the upper grid.

Pack the ordered items into a container and generate return details

The inventory items are brought to the packing area and are ready to be packed into containers. Follow these steps to create a new container in the system, and to pack and close the container. After you close the container, the system automatically creates a return details record. You can reference this record later when returned items are received back into the warehouse. At this point, you can print a return label and deliver it together with the container.

1. Go to **Warehouse Management** > **Packing and containerization** > **Pack**.

2. In the **Select packing station** dialog box, set the following values:

    - **Site:** *6*
    - **Warehouse:** *62*
    - **Location:** *Pack*
    - **Packing profile ID:** *WH62*

3. Select **OK** to close the dialog box and return to the **Pack** page.

4. On the **Packing station** FastTab, in the **License plate or shipment** field, enter the shipment ID that you noted at the end of the previous procedure. Then select **Return**.
5. On the Action Pane, select **New container** to start the *container creation* process.
6. In the dialog box, set the **Container type** field to *SmallBox*. Then select **OK** to return to the **Pack** page.
7. On the **Item packing** FastTab, set the **Identifier** field to *A0001*. Then select **Return**. A quantity of *1* of item number *A0001* is moved to the container for the shipment. On the **All lines** FastTab, the line for item number *A0001* now shows a check mark in the **Complete** column.
8. On the Action Pane, select **Close container** to start the *container closing* process.
9. In the dialog box, select the **Get system weight** link to load the weight of the shipment into the **Gross weight** section. Then select **OK** to return to the **Pack** page.
10. Now that the container is closed, the system automatically creates return details. Go to **Warehouse Management** > **Inquiries and reports** > **Return details**.
11. The **Return details** page should list a new return details record that shows the order number and line item that you just packed. Make a note of the **Return ID** value for the new record. You need this value later in this scenario.
12. Go to **Warehouse Management** > **Shipments** > **All shipments**.
13. Select the shipment that has the shipment ID that you noted at the end of the previous procedure.
14. On the Action Pane, on the **Shipments** tab, select **Confirm Shipment**.

    A message shows that the shipment is confirmed.

> **Note**
>
> If you return to the **Return details** page and open the record that has the return ID that you noted earlier, the **Lines** FastTab should now show a **Return until date** value that matches the return item policy that you set for the packed item. The system automatically adds this value after you confirm the shipment.

Receive a product with return details to a mixed license plate

Follow these steps to receive returned items into the warehouse.

1. Open the Warehouse Management mobile app, and sign in by using *62* as the user ID and *1* as the password.
2. Open the menu item that you created for receiving by using the *Return details* process (for example, **Inbound** > **Return details receiving**).
3. In the **Return ID** field, enter the return ID that you noted during the previous procedure. In a real-world scenario, the warehouse worker typically scans this value from the return label that's attached to the package. (This label was sent to the customer together with the original shipment.)
4. In the **Item** field, enter or scan item number *A0001*.
5. Accept the license plate number that's suggested.
6. In the **qty** field, enter *1*.
7. In the **Disposition code** field, select *RMA Credit*.
8. Select **OK** to complete the receiving work.
9. Select **Cancel** to exit the flow and close the menu item.

> **Note**
>
> You must exit the flow to unlock the license plate. If the license plate is locked, you can't complete mixed license plate receiving in Supply Chain Management, as described in the next section. In some setups, you can finish processing mixed license plates during the *Return item receiving* flow. However, in this scenario, you process the license plate in Supply Chain Management.

Complete mixed license plate receiving

The returned products are now on a mixed license plate for further processing. (Learn more in Mixed license plate receiving.) Follow these steps to finish receiving the returned items.

1. Go to **Warehouse Management** > **Inquiries and reports** > **Mixed license plate receiving**.
2. In the **License plate** grid, find the mixed license plate that you processed by using the mobile app.

3. On the Action Pane, on the **License plate** tab, select **Complete license plate** to complete the mixed license plate receiving.

After you complete mixed license plate receiving, Supply Chain Management automatically creates an RMA order that's prepared for further downstream processing, as described in Sales returns.

> **Tip**
>
> You can set up your mobile device menu item for processing returns to include a step that lets workers complete mixed license plate receiving directly from the mobile device while receiving the return. Then you don't need to **complete this step** later in the Supply Chain Management web client. To do so, create a **detour** item with the **Activity code** *Complete mixed license plate*. Learn more in **Set up a mobile device menu item for completing mixed license plates**.

Example scenario 3: Nonpacking scenarios for return details

Use the *Return details* process for scenarios where you don't use a packing station to prepare outgoing shipments. In this case, your outgoing shipments are delivered on a pallet to the bay door, where they're packed and shipped directly. Therefore, the system doesn't generate the return details record after the container is packed and closed (from the **Pack** page in Supply Chain Management). Instead, it generates the return details record when the outbound shipment is confirmed (from the **All loads** page in Supply Chain Management). Otherwise, this scenario works in the same way as the previously described packing scenario.

For this scenario, it's important that your system is configured to create return details, generate load line inventory picking numbers, and use sales load line picking routes, as described in the Scenario prerequisites section.

Return reason codes and disposition codes

Create and use return reason codes and disposition codes to support the process for returning products.

Use a return reason code to describe the reason that the customer wants to return an item. You can assign a reason code in the **Create return orders** form.

Assign a disposition code an item is received or during the physical inspection of a returned item. Use disposition codes to describe the condition of the item. You can also use disposition codes to indicate whether additional action is required for the transaction. For example, create disposition codes for the following actions:

- Scrap the returned item and provide a replacement item to the customer.
- Return the item to inventory and credit the customer for the cost of the item.
- Repair the item and return it to the customer.

Related information

- Set up return reason codes
- Set up disposition codes

Last updated on 07/01/2026

Set up disposition codes

You can set up disposition codes to specify how to process an item returned by a customer. For example, create a disposition code named *Repair and return* to indicate that the returned item should be repaired and then returned to the customer. For more examples of disposition codes that are typically used for items returned by customers, see Specify how to dispose of returned items.

You can also set up a reason code to help explain why an item was returned. For more information about reason codes, see Set up return reason codes.

To set up a disposition code, follow these steps:

1. Go to **Sales and marketing** > **Setup** > **Sales orders** > **Returns** > **Disposition codes**.
2. Select **New** to create a new disposition code.
3. Enter a unique, descriptive name, select an action, and enter a description for the disposition code.
4. If you want to associate any customer charges with this disposition code, select the **Charges** button to open the **Set up charges** form.
5. If you want to define any external codes to match with the company's own disposition codes, select the **External codes** button to open the **External codes** form.

Set up return reason codes

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Set up return reason code groups

1. Go to **Sales and marketing** > **Setup** > **Sales orders** > **Returns** > **Return reason code groups**.
2. Select **New** to create a line for a new return reason code group.
3. In the **Return reason code group** field, type an identifier for this group.
4. In the **Description** field, type a brief phrase to explain how this group will be used.

Set up return reason codes

This procedure helps you set up return reason codes to indicate why a customer returned a product.

1. Go to **Sales and marketing** > **Setup** > **Sales orders** > **Returns** > **Return reason codes**.
2. Press CTRL + N to create a new return reason code line.
3. In the **Return reason code** field, enter text to identify this code.
4. In the **Description** field, enter text to describe the return reason code.
5. Use the **Return reason code group** drop-down list to add the code to a return reason code group.

Last updated on 07/01/2026

Specify how to dispose of returned items

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

When you handle a return order, you must specify a reason return code to identify why the product is being returned. You must also specify a disposition code and a disposition action to determine what should be done with the returned product itself.

A disposition code can be applied when you create the return order, register item arrival or packing-slip update an item arrival, and end a quarantine order.

You can define any disposition codes that you need in order to support the business processes. The following table provides a set of typically used codes to assign return-item disposition.

Expand table

Disposition type	Common code	Description
Disposal	SC	Scrap/Destroy
Disposal	DC	Donate to Charity
Disposal	TD	Third-Party Disposal
Disposal	SL	Salvage
Disposal	TS	Third-Party Sale (Secondary Markets)
Repair/Modify	RW	Rework
Repair/Modify	RF	Remanufacture/Refurbish
Repair/Modify	MD	Modify
Repair/Modify	RP	Repair
Repair/Modify	RV	Return to Vendor
Other	AI	Use as is
Other	RS	Resale

Disposition type	Common code	Description
Other	EX	Exchange
Other	MS	Miscellaneous

For each disposition code that you define, you must select a disposition action. The disposition action determines the physical and financial implications of the disposition codes. For example, the disposition action determines the physical handling of the returned item, the financial effect of the returned item, and if a replacement item must be sent to the customer. You can define an unlimited number of disposition codes according to your business needs, but there are only six predefined disposition actions that you can select from. The following table provides the disposition actions and their definitions.

Expand table

Disposition action	Description
Credit	Return the item to inventory and credit the customer.
Credit only	Credit the customer without requiring or expecting the item to be returned.
Scrap	Scrap the item and credit the customer.
Replace and credit	Return the item to inventory, create a replacement order, and credit the customer.
Replace and scrap	Scrap the item, create a replacement order, and credit the customer.
Return to customer	Reject the returned item and return it to the customer.

Select a disposition code for a quarantine order

1. Go to **Inventory management** > **Periodic** > **Quality management** > **Quarantine orders**.
2. For an existing quarantine order, select an action from the **Disposition code** field on the **Overview** tab.

Last updated on 05/07/2025

Return cost price and return lot ID

The cost of products returned to inventory is calculated by using the current cost of the products. However, you might want the cost of the returned products to equal the cost of the products at the time when you sold the products to the customer. You can set this cost by using the **Return lot ID** field on the **Line details** FastTab in the **Sales order** form.

For example, consider the following scenario. You invoice a customer. Then, the customer returns the delivered products to you. You return the products to stock. In this case, when you credit the customer for the returned products, the cost of those products is calculated by using the current cost of the products. However, if you use the **Return lot ID** field, the cost of the returned products is calculated by using the cost on the invoice of the original sale to the customer.

To use a cost other than the current cost for returns from a customer, use one of the following methods.

Method 1: Manually enter the return cost price

By default, when you add items to a return order, the items are returned to inventory at the current cost price. To specify a different return cost price, follow these steps:

1. Go to **Sales and marketing** > **Sales returns** > **All return orders**.
2. On the Action Pane, in the **New** group, select **Return order**.
3. In the **Create return order** form, select a customer account, and then select **OK**.
4. In the **Return order - RMA number: %1, %2** form, select an item, and then enter a negative quantity in the **Quantity** field.
5. Select the **Line details** FastTab.
6. On the **General** tab, enter a value in the **Return cost price** field. This value is used when the goods are returned to inventory. If you don't enter a value, the current cost price is used when the goods are returned to inventory.

Method 2: Automatically generate the cost price based on the customer invoice line

Use this method to create return lines. To use the cost of the products at the time when you sold the products to the customer, create a return order and specify a sales line to return.

1. Go to **Sales and marketing** > **Sales returns** > **All return orders**.
2. On the Action Pane, in the **New** group, select **Return order**.
3. In the **Create return order** form, select a customer account, and then select **OK**.
4. In the **Return order - RMA number: %1, %2** form, on the Action Pane, select **Find sales order**.
5. In the **Find sales order** form, select the invoice line to return, and then select **OK**.

   On the **Line details** FastTab, on the **General** tab, the **Return lot ID** field displays the value from the original sales line. Additionally, the **Return cost price** field displays the cost value from the original sales line.

Cost calculation example

When you use the **Return lot ID** field on a return order line to specify the return cost price, the cost on the return order line is used. If you run the inventory close or recalculation functionality, the cost is adjusted on the original sales line. The cost on the return order line is automatically adjusted to reflect the same cost per piece.

1. Create and release a product named Test. In the **Released product details** form, specify the following information:

   a. On the **Manage costs** FastTab, in the **Item group** field, select the **Parts** group.

   b. On the **General** FastTab, in the **Item model group** field, select **DEF**.

   c. On the **Purchase** FastTab, in the **Price** field, type 10.00 as the cost price of the item.

   d. On the Action Pane, select **Dimension groups**. In the **Storage dimension group** field, select **Site and Warehouse only**. In the **Tracking dimension group** field, select **No active tracking dimensions**.

2. Create a purchase order for 10 pieces of the Test item at 6.00 per piece, and then post an invoice for the purchase order.

   Create a second purchase order for 10 pieces of the Test item at 8.00 per piece, and then post an invoice for the purchase order.

3. Post an invoice for a sales order to sell five pieces of the Test item.

   In this case, the sales order line is costed at 35.00 (5 pieces * 7.00 average cost per piece).

4. Create a return order for the customer. In the **Find sales order** form, select the invoice line, and then select **OK**.

5. In the **Return order - RMA number: %1, %2** form, verify that a return order is generated to return the Test item. The quantity of the return order is set to -5.00.

   The **Return lot ID** field displays a lot ID. This lot ID is from the original sales order of the item that sold to the customer. The **Return cost price** field displays the cost price from the original sales line.

6. Register the receipt of the returned items.

7. Post a packing slip for the returned items.

8. Post an invoice for the return order. On the **All sales orders** list page, select a sales order for which **Returned order** is the order type.

9. Open the **Inventory transactions** form. Verify that the return is costed at 7.00 per piece by using the value in the **Return cost price** field, for a total of 35.00 in the **Cost amount** field. You can open the **Inventory transactions** form from the **Return order - RMA number: %1, %2** form. In the **Lines** grid, select **Inventory** > **Transactions**.

10. In Inventory and warehouse management, use the **Closing and adjustment** form to run the **3. Close** procedure.

    This action adjusts the cost on the original sales line that was priced at -35.00 (5 pieces * 7.00) to -30.00 (5 pieces * 6.00). This change happens because the inventory model group uses First in, First out (FIFO), and 6.00 per piece is the FIFO cost from the first purchase order. Additionally, the action adjusts the cost on the return sales line to match the cost per piece on the original sales line. Therefore, the cost of the return line is adjusted from 35.00 to 30.00.

Cancel a return order

You can cancel a return order (instead of deleting it) when you want to save a record of the planned return.

> **Note**
>
> Only return orders that have a **Return status** of *Created* can be canceled. Return orders with a **Return status** of *Open* or *Closed* can't be canceled.

1. Go to one of the following pages:
    - **Sales and marketing** > **Sales returns** > **All return orders**.
    - **Sales and marketing** > **Sales returns** > **Created return orders**.
2. Select the return order to cancel.
3. On the Action Pane, open the **Return order** tab and, from the **Maintain** group, select **Cancel order**.

Create an item replacement order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Item replacement orders are usually created after a product is returned and inspected. However, when an item must be replaced before it has been returned, or when the original item won't be returned, you can create an item replacement order immediately after you create a return order.

Create a replacement order after you receive an item that is returned

1. Go to **Sales and marketing** > **Sales returns** > **All return orders**.
2. Create a new return order, or select a returned order from the list to open the **Return order - RMA number: %1, %2** form.
3. Select **Return line**, and then select **Replacement item**.
4. Select the item to replace the returned item with. Enter the item specifications, and then select **Apply**.
5. Select **Packing slip** to generate the packing slip for the return order. A sales order is generated for the replacement item that you selected.

   After the sales order is created for the replacement item, sales agreements are automatically searched and if there's an applicable sales agreement, it's applied to the sales order.

Create a replacement order before you receive an item that will be returned

1. Go to **Sales and marketing** > **Sales returns** > **All return orders**.
2. Create a new return order, or select a return order from the list to open the **Return order - RMA number: %1, %2** form.

3. Select **Find sales order** if you want to identify the sales order for the returned item. Complete the **Find sales order** form and then select **OK** to close the form and return to the **Return order - RMA number: %1, %2** form. The sales order line for the returned item is copied to the return order.

4. Select **Replacement order** to open the **Create sales order** form.

5. Select the **Copy return order lines** check box to transfer details from the return order you selected on the **Return order - RMA number: %1, %2** form to this sales order.

6. Enter or modify details, as required.

   If you identified the sales order in step 3, and if the sales order line for the returned item is linked to a sales agreement, the identifier of the applicable sales agreement for the item replacement order will be automatically displayed in the **Sales agreement ID** field.

7. Select **OK** to close the **Create sales order** form and open the **Sales order** form, where you can continue to enter information for the new sales order. Any applicable return order lines will be copied to the new sales order.

   If the identifier of the sales agreement is automatically displayed in the **Sales agreement ID** field, then the sales agreement has been linked to the sales order header for the item replacement order. If there's an applicable commitment in the sales agreement that hasn't been fulfilled yet, and the sales order is created before the sales agreement expires, a link is established between the sales agreement line and the sales order line. Therefore, information from the sales agreement, such as item price, is copied to the new sales order line.

Delete a return order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the **Delete return order** form to delete multiple return orders.

1. Go to **Sales and marketing** > **Periodic** > **Clean up** > **Delete return orders**.
2. Select **Select** to open the **Sales update** form.
3. Specify the criteria, and then select **OK** to return to the **Delete return order** form. Return orders that have been created in the legal entity are displayed, based on the specified criteria.
4. Select the return order line to delete, and then select **OK**.
5. Select **Yes** to delete the return orders.

Pass returned items on to inspection

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

When registering a returned item, you may determine that an item should be sent for inspection before it's returned to inventory or disposed of in some other way.

1. Go to **Inventory management** > **Journals** > **Item arrival** > **Item arrival**.

   -or-

   Go to **Inventory management** > **Journals** > **Item arrival** > **Production input**.

2. On the **Location journal** form, register the receipt of an item as usual.

   > **Note**
   >
   > For information about registering the receipt of returned items, see Register the receipt of returned items.

3. On the **Default values** tab, in the **Mode of handling** area, select the **Quarantine management** box.

This prompts the system to create a quarantine order, and the person or department that performs inspections respond to this order using the **Quarantine order** form.

Post arrival journal for returned products

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To process a return, first validate the return quantity, update the quantity field in the item arrival journal. Then select a disposition code or indicate that the returned items have to be inspected. After completing these steps, you can post the item arrival journal for the return order.

1. Go to **Inventory management** > **Periodic** > **Arrival overview**.
2. In the **Setup name** filter, select **Return order**.
3. If the list of receipts is long, use the fields in the **Range** area to narrow the list.
4. Locate the line of the return order that you want to post, select its **Select for arrival** box, and then select **Start arrival**.
5. Go to **Journals** > **Show arrivals from receipts** to open the **Location journal** page.

   > **Tip**
   >
   > To view detailed information, select a journal, and then select **Lines**.

6. Make any necessary updates, and then select **Post**.

After the journal is posted, the returned items are registered in inventory, and the **Return orders** form indicates that the items have arrived at the warehouse.

Receive partial deliveries of returned items

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Partial deliveries are defined in terms of return order lines, not return order shipments.

This means that if you receive the full quantity that is indicated on one return order line, but you receive nothing from the other lines in the return order, the delivery is not a partial delivery. However, if a return order line requires 10 units of a particular item to be returned, but you receive only four, it is a partial delivery.

If a return shipment contains less than the full quantity of a return order line, you can set the shipment aside and wait for the rest of the returned quantity to arrive, or you can register and post the partial quantity.

Register and post a partial quantity

1. After you select a return order for arrival on the **Arrival overview - Warehouse: %1, Dock: %2, Journal name: %3** page, select **Start arrival** to create the arrival journal, and then select **Journals** > **Show arrivals from receipts** to open the **Location journal** page.
2. Select the line of the journal that you want to work with, and then select **Lines** to open the **Journal lines, locations** page.
3. Select the line of the item number for which only a partial quantity has arrived, and then select **Functions** > **Split** to open the **Split** page.
4. In the **Split quantity** field, enter the quantity for the total number of items that have been received, and then select **OK**.
5. On the **Journal lines, locations** page, select the line for the quantity of items that has arrived, and then select **Post**. You can post the line for the additional quantity after the items have arrived.

Register the receipt of returned items

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

There are two methods for registering the receipt of returned items. The first method is a warehouse receiving process that uses the **Arrival overview** page. The second uses the **Registration** page.

Register the receipt of returned items in the Arrival overview page

You can use the **Arrival overview** page to identify a return shipment by its Return Material Authorization (RMA) number. If a journal name is defined on the **Setup** tab, and journal lines that correspond to the lines selected on the **Arrival overview** page exist, a new journal header is created when you select **Start arrival**.

1. Go to **Inventory management** > **Periodic** > **Arrival overview**.
2. In the **Setup name** field, select **Return order**, and then select **Update**.

> **Tip**
>
> You can use the **Range** fields to narrow the search results. You can type or select the RMA number in the **RMA number** field for an exact result. To define and save a set of filters that will restrict which incoming arrivals are displayed, select the **Setup** tab. The available filters include types, warehouses, and docks.

> **Warning**
>
> Return orders cannot be mixed with other arrival types in the **Arrival overview** page. Therefore, the reference will always be sales order, but no sales order ID will be specified on the journal header.

3. In the **Receipts** grid, locate the line that matches the item being returned, and then select the check box in the **Select for arrival** column.
4. To exclude certain lines from the return receipt, such as items from the original order that were not included in the return shipment, clear the associated **Select for arrival** check boxes in the **Lines** table in the lower part of the page.
5. Select the **Start arrival** button to create an arrival journal.

   > ⓘ **Note**
   >
   > You can select multiple return orders and include them all in a single arrival process. Each return order line will be copied into a corresponding item arrival journal line.

   > ⓘ **Note**
   >
   > You can also manually create an arrival journal by using the **Item arrival** page.

6. Go to **Inventory management** > **Journals** > **Item arrival** > **Item arrival**.
7. Select the arrival journal that you just created and then select **Lines** to open the **Journal lines, locations** page.
8. On the **General** tab, adjust the number in the **Quantity** field, if it is required, and then assign a disposition code in the **Disposition code** field.

   Alternatively, you can select the **Quarantine management** check box to have the returned items sent through an inspection process in the context of a quarantine order.

   > ⓘ **Note**
   >
   > If you send the returned items through quarantine, you cannot specify a disposition code.

9. Select the **Validate** button.
10. If there are no errors in the validation process, select **Post**.

Register the receipt of returned items in the Registration page

As an alternative to using the **Arrival overview** page, you can use the **Registration** page to register the arrival of returned items.

1. Go to **Sales and marketing** > **Sales returns** > **All return orders**. Create a new return order or open the return order from the list. On the **Lines** FastTab, select the return order line. Select **Update line**, and then select **Registration**.

2. Assign a disposition code in the **Disposition code** field, and then select **OK**.

   > **Note**
   >
   > It is not possible to send the item for inspection as a quarantine order using the **Registration** page.

3. In the **Transactions** grid, select the transaction to be registered.

4. In the **Register now** grid, select **Add**. Repeat the previous two steps until all of the returned items appear in the **Register now** grid.

5. Select **Post all**.

Take returned items through inspection

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

1. Go to **Inventory management** > **Periodic** > **Quality management** > **Quarantine orders**.
2. Locate the order line that corresponds to the returned item that you are inspecting.

   > **Note**
   >
   > A quarantine order can be associated with just a single item number. If 10 items that have different item numbers are returned in a single shipment and sent to quarantine, 10 individual quarantine orders are created.

3. After examining the item, make a selection in the **Disposition code** field to indicate what should be done with the item and how to handle the related financial transaction. Examples include returning the item to stock and refunding the customer, scrapping the item and sending a replacement to the customer, or returning the item to the customer without credit.

   > **Note**
   >
   > If multiple returned items in a single item number batch cannot be assigned the same disposition code, you must split the quarantine order (**Functions** > **Split**) to assign a different disposition code to each sub-batch.

4. When you are finished with the inspection, select **Report as finished** to release the returned items and create an item arrival journal entry. The person or department that receives the items then processes the journal for the items to be returned to inventory.

   –or–

   End the quarantine order, and move the items back into inventory directly by using one of the **Inventory** functions.

5. Close the form to save your changes.

Packing slip updates for returns

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Before returned items can be received into inventory, the packing slip for the order to which they belong must be updated. Just as the invoice update process is the update to the financial transaction, the packing slip update process is the physical update of the inventory record, which means that it commits the changes to inventory. In the case of returns, the steps that are assigned to the disposition action are implemented during the packing slip update.

The packing slip update can be processed in either the item arrival journal or the return order.

As part of the process for posting packing slips, the packing slip reference number from the customer's shipping documents can be associated with the order lines. This association is optional and for reference only. It does not create any transactional updates.

If not all of the expected return items have arrived, you should include only the quantity that has been received in the packing slip update. Leave the remaining items on the order until the rest of the return shipment has arrived.

If an item is sent back from quarantine to the Shipping and Receiving department, such as when the quarantine inspector does not know where to store the item in inventory, the corresponding packing slip must be updated to correctly register and act on the disposition code that is specified as a result of the quarantine.

When you update a packing slip for a returned item that is from a sales agreement, the sales agreement commitment for that item is automatically updated to reflect the change in the quantity or the amount.

Perform invoice updates for returns

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A return order is a type of sales order that is marked as a returned order. Therefore, the **All sales orders** list page is used to generate invoices for return orders instead of the **Return orders** form. This functionality supports the business processes of organizations that choose to have return orders and sales orders invoiced at the same time and by the same person.

Because the invoice for a returned item is for a negative amount, it is called a credit note.

When you set up the invoice update for batch processing, the sales order of type **Returned order** must have a return line status of **Received**, which indicates that the order's packing slip has been updated.

Post an invoice for a return order

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Select a sales order for which **Returned order** is displayed in the **Order type** field.
3. On the Action Pane, on the **Invoice** tab, in the **Generate** group, select **Invoice**.
4. On the **Parameters** tab, select the **Posting** check box.
5. Review information in the form and make any changes that are needed.
6. Select **OK**. The credit note is posted.

Register sales commissions

Article • 01/31/2023

This article explains how sales commissions are calculated and registered. You can run this procedure in demo data company USMF or on your own data. Before starting this guide, run the guide called "Set up sales commission rules" to make sure that you have all the necessary commission calculation setup.

Take note of the customer and item numbers that you have chosen for the commission process and use them when asked to create a sales order in this guide.

Invoice a sales order that qualifies a salesperson for a commission

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the desired record from the drop-down menu.
4. Select **OK**.
5. On the Action Pane, select **Options**.
6. Select **Change view**.
7. Select **Header view**.
8. Expand the **Setup** section.

    - The value in the **Sales group** field represents a group with one or more sales representatives assigned to it. The people in the group are the ones who will receive commissions when the order is invoiced, as per predefined rates and distribution.
    - The value is copied from the Customer card, but you can change it if you wish.
    - The Sales group is also copied to the sales order line. You can change it so that it can differ from the one in the header and/or between lines.
    - The value in the **Commission group** field represents a group that you have created for one or more customers with the purpose of tracking commissions.

- The value is copied from the Customer card, but you can change it if you wish.

9. On the Action Pane, select **Options**.
10. Select **Change view**.
11. Select **Line view**.
12. In the drop down menu of the **Item number** field, select the item you have set up for commissions.
13. In the **Quantity** field, enter a number. Take note of the line's Net amount. It represents the sales revenue, which in this example is the basis for commission calculation.
14. Select **Save**.
15. On the Action Pane, select **Invoice**.
16. Select **Invoice**.
17. Expand the **Parameters** section.
18. In the **Quantity** field, select **All**.
19. Select **Yes** in the **Posting** field.
20. Select **OK**, then select **OK** in the next pane. It may take a minute or so to post the transaction. Allow the processing to complete and don't close the page.

Review the registered sales commissions

1. On the Action Pane, select **Invoice**, then select **Invoice** again.
2. On the Action Pane, select **Invoice**, then select **Commission transactions**.

    - The **Overview** tab displays lines representing the commission amounts payable to sales representatives who are associated with the invoiced sales order. Let's review the details.
    - If you used the "Set up sales commission rules" guide to set up the **Commission sales** group, there are two sales people to receive a sales commissions, and the commission is split equally between them.
    - In this example, the total amount of the commission is calculated as a percentage of the sales revenue (the net amount of order line).

3. Close the page.

4. Select **Voucher**. You can review the voucher transactions for the commission amounts that have been posted to the predefined commission expense and commission payable accounts.

Set up sales commission rules

This procedure shows you how to set up and enable sales commission calculation and tracking. The procedure shows how to create both customer and item commission groups, and then how to link a selected customer and product to the respective groups. Those groups are then used in the commission calculation setup to create a customer, item, and sales representatives combination that must be matched by the sales order to entitle the sales people to a commission. Creating customer and item commission groups are optional, as the calculation of commission can also be done for an individual customer and/or item. You can run this procedure in demo data company USMF or on your own data.

Set up commission groups and commission rates

1. Go to **Sales and marketing** > **Commissions** > **Customer groups for commission**.
2. Select **New**.
3. In the **Group** field, enter a value.
4. In the **Name** field, type a value.
5. Select **Save**.
6. Close the page.
7. Go to **Sales and marketing** > **Commissions** > **Item groups**.
8. Select **New**.
9. In the **Group** field, enter a value.
10. In the **Name** field, type a value.
11. Select **Save**.
12. Close the page.
13. Go to **Sales and marketing** > **Commissions** > **Sales groups**.

    - A Commission sales group specifies the employees in sales representative roles who are eligible to receive a commission when a customer associated with the relevant sales group buys certain items.
    - In the USMF demo data company, there's a sales group called *Sales reps US*.

14. On the Action Pane, select **General**.
15. Select **Sales rep.**. The Sales rep. page displays a list of the company's salespeople who are associated with a specific commission group. You can assign multiple sales representatives to the same group and define their respective share of the total commission fee as a percentage value. The total commission share across all employees must not exceed 100.

16. In the list, mark the selected row.
17. Select **Edit**.
18. Set **Commission share** to *50*.
19. Select **New**.
20. In the **Name** field, select the drop-down button to open the lookup.
21. Use the **Quick Filter** to find records. For example, filter on the Name field with a value of *Susan Burk*.
22. Select **Select**.
23. Set **Commission share** to *50*.
24. Select **Save**.
25. Go to **Sales and marketing** > **Commissions** > **Commission calculation**. In the **Commission calculation** page, you define the commission rate that the employee receives for a sales transaction when it contains the preset combination of customer and product. As part of the commission rate setup, specify the commission calculation basis and whether it should include or exclude discounts. You can also enter a validity period for when the commission rate is active.
26. Select **New**.
27. In the **Item code** field, select *Group*.
28. In the **Item relation** field, select the drop-down button to open the lookup.
29. In the list, find and select the group that you created earlier.
30. In the **Customer code** field, select *Group*.
31. In the **Customer relation** field, select the drop-down button to open the lookup.
32. In the list, select the group that you set up earlier.
33. In the **Sales rep. relation** field, select the drop-down button to open the lookup.
34. In the list, find and select the desired record.

    - Keep the *Before line discount* option.
    - Keep the *Revenue* option as the basis for commission value calculation.

35. In the Commission percentage field, enter a number.
36. Select **Save**.

Setting up commission posting

1. Go to **Sales and marketing** > **Commissions** > **Commission posting**. Employees receive commission fees, so set up this feature to ensure correct financial posting to the appropriate accounts in the **General ledger**. Set up this feature in the **Commission posting** page. Review the setup that's available for the current company. Typically, the commission

amounts are posted to a dedicated expense account and are offset to a dedicated payable account. If you don't have the commission posting rules set up, the system will fail to complete invoicing of a sales order that has eligible commissions.

2. Close the page.

Assign a commission group to a customer and a product

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. In the list, find and select the desired record.
3. In the list, select the link in the selected row.
4. Select **Edit**.
5. Expand the **Sales order defaults** section.
6. In the **Commission group** field, select the drop-down button to open the lookup.
7. In the list, select the group that you created earlier.
8. In the **Sales group** field, select the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. Select **Save**.
11. Go to **Product information management** > **Products** > **Released products**.
12. Use the **Filter** to find records. For example, filter on the Item number field with a value of *T0020*.
13. In the list, select the link in the selected row.
14. Select **Edit**.
15. Expand the **Sell** section.
16. In the **Commission group** field, select the drop-down button to open the lookup.
17. In the list, select the commission group that you created earlier.
18. Select **Save**.

Customer portal for Dynamics 365 Supply Chain Management overview

What is the Customer portal?

Modern supply chain systems rely on integration. They require that inventory, customer demand, and sales departments be integrated instead of residing in separate silos. The Customer portal helps organizations that run Microsoft Dynamics 365 Supply Chain Management enhance this integration and more effectively keep their customers informed.

The Customer portal is a Power Apps portals template that lets companies create an externally facing business-to-business (B2B) website for scenarios that are related to sales order processing. The template uses dual-write, Supply Chain Management, and Power Apps portals to enable external enterprise customers to view and create data from the company's Dynamics 365 environment.

The Customer portal template has all the customization capabilities that the portals feature of Power Apps offers. The template can easily be modified to represent the company's brand, add increased functionality, and change the user experience. All the functionality that the template offers out of the box can be modified as desired.

> **Important**
>
> By itself, the template isn't expected to be completely functional. It just serves as an enabler for customers who want to create an externally facing website so that enterprise customers can engage with data from Supply Chain Management.

> **Note**
>
> The Customer portal documentation is directed at admins, customizers, and system integrators who set up the Customer portal for a Supply Chain Management installation. It uses the terms *customer* and *user* to describe people who are customers of the organization that is running Supply Chain Management, and who use the final portal itself.

Video

https://learn-video.azurefd.net/vod/player?id=b39bd847-38bc-4a21-af49-a86795085fc5&locale=en-us&embedUrl=%2Fdynamics365%2Fsupply-chain%2Fsales-marketing%2Fcustomer-portal-overview

The Overview of the Customer portal template in Dynamics 365 Supply Chain Management video is included in the finance and operations playlist available on YouTube.

Who should use it?

The Customer portal is designed for companies that run Supply Chain Management and have these characteristics:

- They want to build an externally facing website that communicates order processing information (such as order status or account information) directly from their Supply Chain Management system to their enterprise customers.
- They're transitioning from Dynamics AX 2012 to Supply Chain Management and previously used the AX 2012 Customer self-service portal.

The following types of organizations aren't good candidates for implementing the Customer portal:

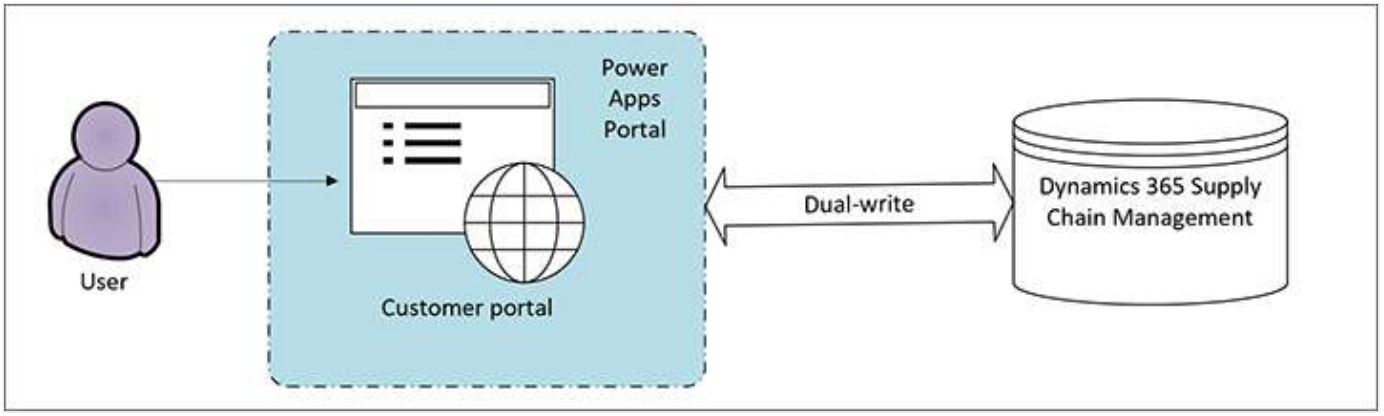
- Companies that want to build a website for non-enterprise customers. These companies should consider creating a Dynamics 365 Commerce e-commerce website.
- Companies that are already using an existing Power Apps portals website for a similar purpose. These companies don't receive any additional benefits from the Customer portal. The Customer portal is delivered as a template that acts as a guide and a starting point for customers who want to "connect the dots" between dual-write, Supply Chain Management, and Power Apps portals. If you already set up a website that serves this purpose, you might not gain much value from using the Customer portal template to reprovision that website.

How does it work?

The Customer portal is provided as a Power Apps portals template. It depends on Power Apps portals and dual-write.

Power Apps portals is a feature that lets users create an externally facing website that people from outside the organization can sign in to. Little to no coding is required to make portals. The Customer portal is one of many Dynamics 365 portal templates that are available from Microsoft.

Dual-write is an out-of-box infrastructure product that provides near-real-time interaction between customer engagements apps and finance and operations apps. Dual-write provides bidirectional integration between finance and operations apps and Microsoft Dataverse. Therefore, it provides an integrated user experience across the apps. The Customer portal depends on tables that are synced with dual-write. Before data from Supply Chain Management can be surfaced in the Customer portal, dual-write must be enabled for all the appropriate tables.



The Customer portal acts as a starting point for organizations that want to use Power Apps portals to build an externally facing website that uses data from their Supply Chain Management installation. It helps organizations connect dual-write, Supply Chain Management, and Power Apps portals.

Install, set up, and update the Customer portal

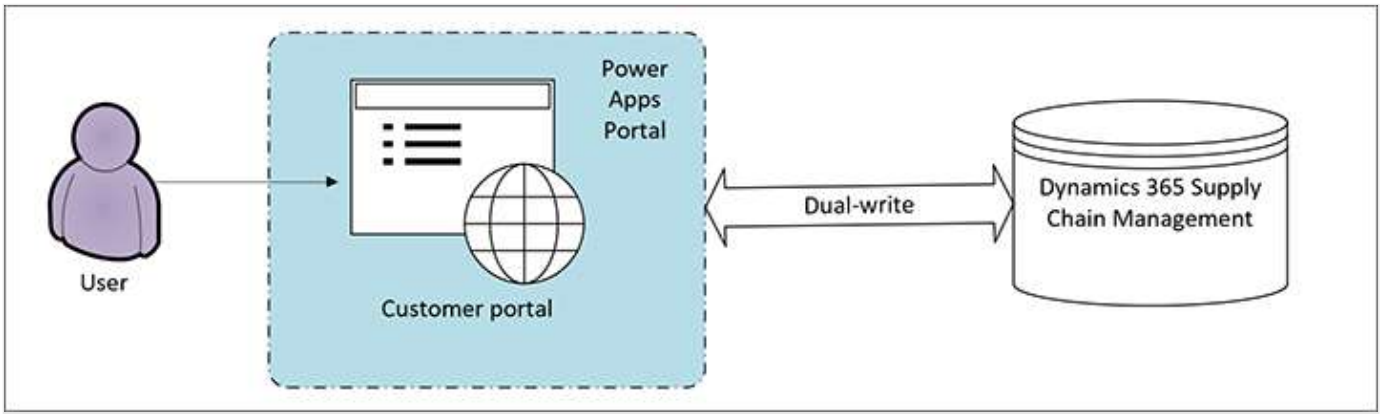
Licensing requirements

To implement the Customer portal, you need the following licenses:

- **Power Apps portals** – This license is required to host the Customer portal. Portals are licensed based on usage. For more information, see the Power Apps portals licensing requirements.
- **Dual-write** – You need the necessary licenses to enable dual-write for Supply Chain Management tables. For more information, see the system requirements for dual-write.

Dependencies on dual-write and Power Apps portals

The Customer portal depends on Power Apps portals and dual-write, as shown in the following illustration.



Unlike other features from Supply Chain Management, the Customer portal template resides in Power Apps portals. Therefore, the Customer portal is limited by the functionality and capabilities that are provided by Power Apps portals and the tables in dual-write.

Required setup to enable the Customer portal

After you ensure that you have the required licenses, set up dual-write as described in the dual-write initial synchronization instructions.

Be sure to enable the following table mappings in dual-write:

- Sales Order Header
- Sales Order Details
- Accounts
- Contacts
- Products

When you complete this setup, you can provision the Customer portal template.

Provision the Customer portal

Before you begin, make sure that you complete the required setup. Then follow these steps to provision the Customer portal.

1. Go to Power Pages.
2. Make sure that you're using the environment where you enabled dual-write.
3. On the **Templates** tab, open the **Dynamics 365** tab, and select the template named **Customer Portal**.
4. Follow the on-screen instructions.

After provisioning is completed, you can access the Customer portal on the **Active Sites** tab of the **Home** page.

> **Note**
>
> If the dual-write solution isn't installed in the environment that you're working in, you receive an error message, and the Customer portal isn't provisioned.

Update the Customer portal

Any changes that Microsoft makes to the underlying solution components automatically appear in your environment. However, the website that is provisioned in your environment doesn't automatically reflect changes made to the configuration data. You must manually apply those changes by getting the code from the new template and merging it with the provisioned website.

Related information

To learn how you can set up and customize the Customer portal, start by reviewing the following documentation for the underlying technologies:

- Power Pages documentation
- Dynamics 365 templates
- Dual-write documentation

To effectively manage your sites, you must understand the Power Pages and Microsoft Dataverse lifecycle. For more information, see the following resources:

- About Power Pages lifecycle
- Upgrade a Power Pages site
- Migrate website configuration
- Solution Lifecycle Management: Dynamics 365 for Customer Engagement apps

---

Last updated on 07/01/2026

Create and manage Customer portal users

In the out-of-box implementation, users can't self-register for websites created by using the Customer portal. To sign in and use a website, users must be invited by the admin. Users are intentionally blocked from self-registering.

Before a user can use a website, a contact record must be created for that user. This record indicates which customer account and legal entity the user belongs to. This information is essential for ensuring that the user can create and view sales orders.

When users self-register, contact records are automatically created for them. Therefore, you can't ensure that a user selects the correct customer account and legal entity. On the other hand, the invitation process lets an admin assign the correct customer account and legal entity to the contact record before an invitation is sent. If you're thinking about customizing the solution so that users can self-register, consider the possible consequences.

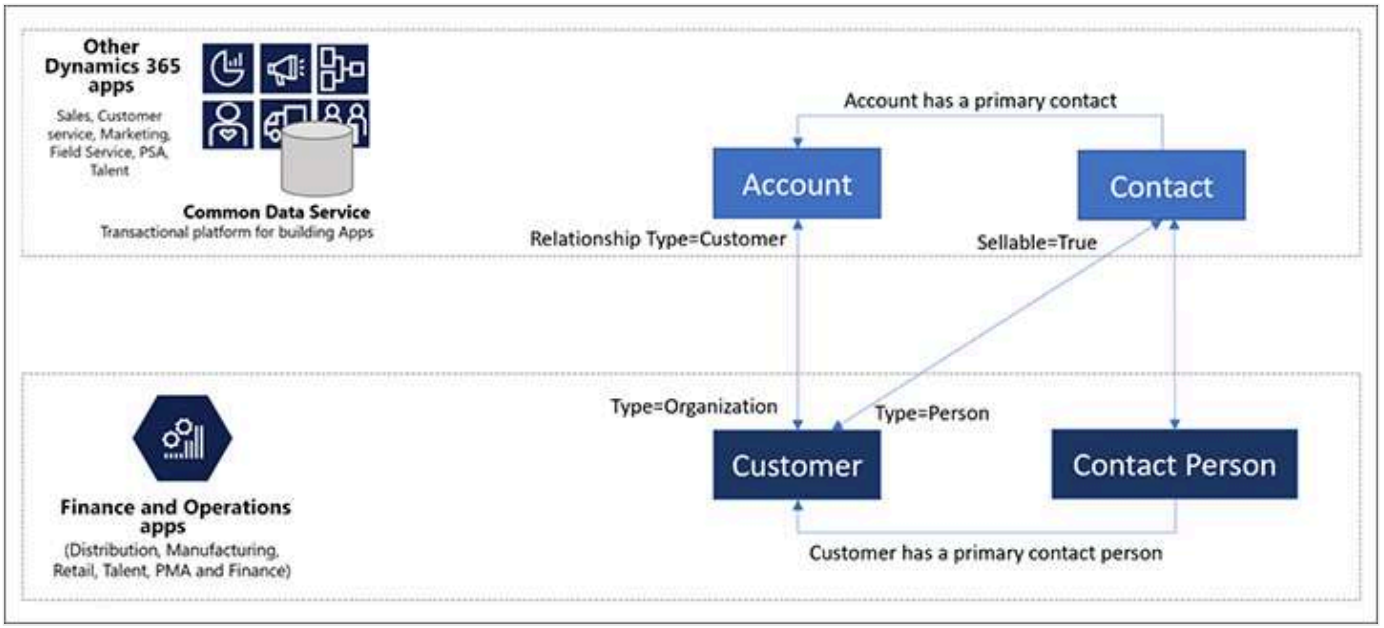
Video

https://learn-video.azurefd.net/vod/player?id=5a9d44db-29b0-429b-ad96-22951664353c&locale=en-us&embedUrl=%2Fdynamics365%2Fsupply-chain%2Fsales-marketing%2Fcustomer-portal-user-admin

The Invite customers to register and use your customer portal video (shown earlier) is included in the finance and operations playlist available on YouTube.

Prerequisite setup

Power Apps portals store contacts as records in the **Contacts** table in Microsoft Dataverse. Dual-write then syncs these records to Microsoft Dynamics 365 Supply Chain Management as required.



Before you start to invite new customers, make sure that you enable the **Contact** table mapping in dual-write.

The invitation process

To invite an existing contact to the Customer portal, follow the steps in Invite contacts to your portals in the Power Apps portals documentation.

Before you invite a customer to join the Customer portal, make sure that the customer's contact record is available and set up in the following way:

1. Set the **Company** field to the legal entity that you want the customer to belong to in Supply Chain Management.
2. Set the **Account Number** field to the customer account number that you want the user to have in Supply Chain Management.

After a contact is created, you should be able to see it in Supply Chain Management.

Learn more in Configure a contact for use on a portal in the Power Apps portals documentation.

Out-of-box web roles and table permissions

User roles in Power Apps portals are defined by web roles and table permissions. A few roles are defined for the Customer portal out of the box. You can create new roles, and you can modify or remove existing roles.

Out-of-box web roles

This section describes the web roles delivered with the Customer portal.

For more information about how to modify the out-of-box user roles, see Create web roles for portals and Add record-based security by using table permissions for portals in the Power Apps portals documentation.

Administrator

The administrator oversees and maintains the website. This person provisions and sets up the Customer portal. The administrator maintains the IT and security aspects of the portal, and makes sure that everything runs smoothly. The administrator might also customize and/or change the portal by adding new functionalities, creating new roles, and more.

Customer representative

A customer representative works for a customer company and is responsible for managing the orders that the company places. The customer representative can see all the orders that the company places and the users who placed them. Additionally, the customer representative can see information about the overall account and which contacts can place orders on behalf of that account.

Authorized users

Authorized users can place orders and view the status of the orders that they place. However, they can't view the status of orders that other users in their company place.

Unauthorized users

Unauthorized users can't view any data. They can see only public information, such as terms and conditions, and details about the company that is running the Customer portal.

Example

The following table shows which sales orders the users in each web role can see in the system.

Expand table

Sales order	Administrator	Customer representative for customer X	Authorized user: Jane	Authorized user: Sam	Unauthorized user: May
Customer X	Yes	Yes	Yes	No	No

Sales order	Administrator	Customer representative for customer X	Authorized user: Jane	Authorized user: Sam	Unauthorized user: May
Orderer: Jane					
Customer X Orderer: Sam	Yes	Yes	No	Yes	No
Customer Y Orderer: May	Yes	No	No	No	No

> **Note**
>
> Even though both Sam and Jane are contacts who work for customer X, they can see only the orders that they themselves have placed and nothing else. Although May has an order in the system but can't see that order in the Customer portal, because May is an unauthorized user. (Additionally, May must have placed the order through some channel other than the Customer portal.)

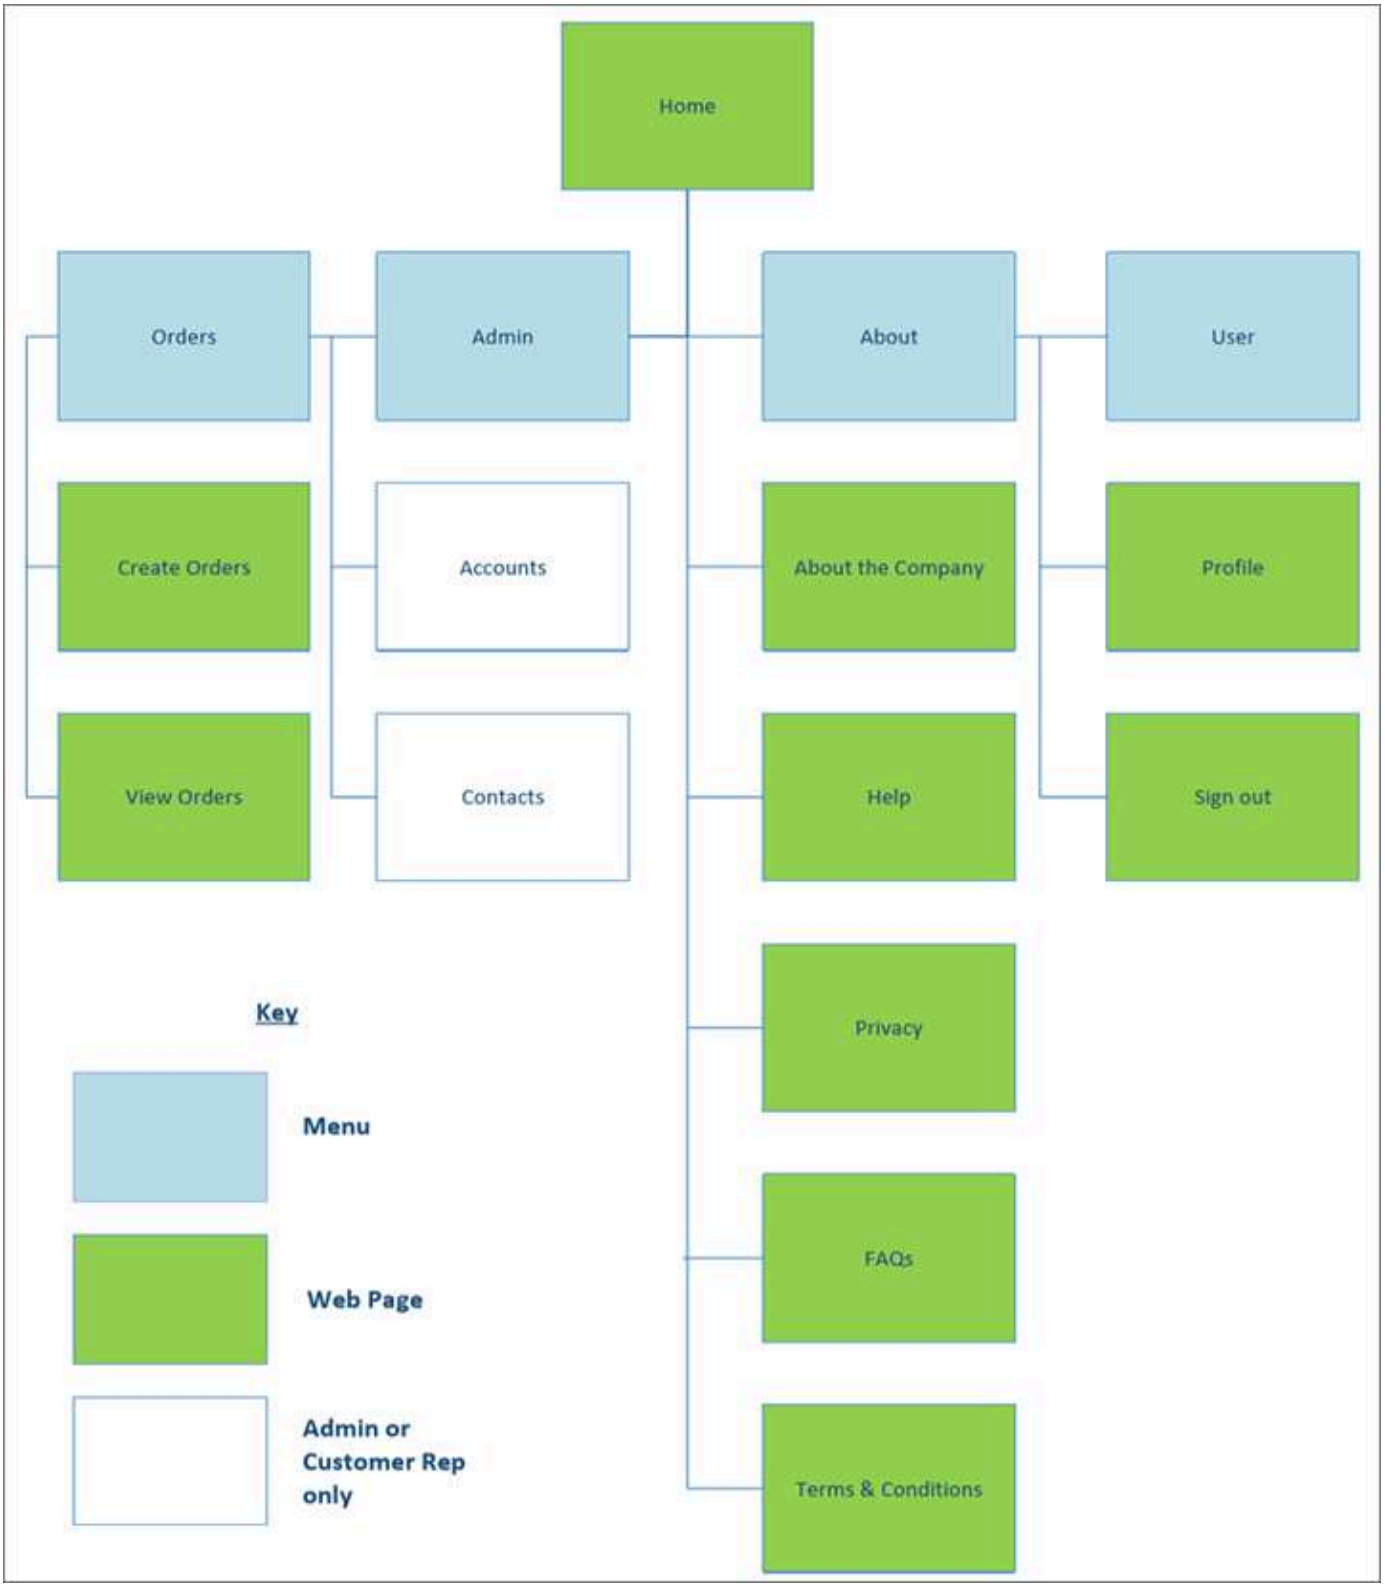
Customize and use the Customer portal

This article describes the different pages that available in the Customer portal out of the box. It explains what the pages do and how you can customize them.

The Customer portal offers a few webpages and actions out of the box. The following site map provides an overview of those webpages and actions, and the roles that can perform the actions.



Typical customizations

The following articles will help you learn the basics about Power Apps portals and how you can customize portals:

- Work with templates – This article provides a general overview of how Power Apps portals works and how you can do simple customizations of portals.
- Manage portal content – This article explains how you can manage and customize the content that you surface in your portal.
- Edit CSS – This article helps you make more complex customizations to the user interface (UI) of your portal.
- Create a theme for your portal – This article helps you create a UI theme for your portal.
- Create and expose portal content easily – This article helps you manage the underlying data and tables that you use for your portal.
- Configure a contact for use on a portal – This article explains how to create and customize user roles, and how security and authentication work in Power Apps portals.
- Configure notes for table forms and web forms on portals – This article explains how to add documents and additional storage to your portal.
- Error handling for portal website – This article explains how to view portal error logs and store them in your Microsoft Azure Blob storage account.

Customize the order creation process

When a user submits an order by using the Customer portal, the order is automatically synced to the corresponding Dynamics 365 Supply Chain Management environment. Because the user is an external customer, some required information is intentionally hidden from them. This information will automatically be filled in when the form is submitted.

This section shows how you should set up contacts to avoid errors. It explains fields that are automatically set and how you can modify the value of those fields if you must.

The out-of-box order creation process

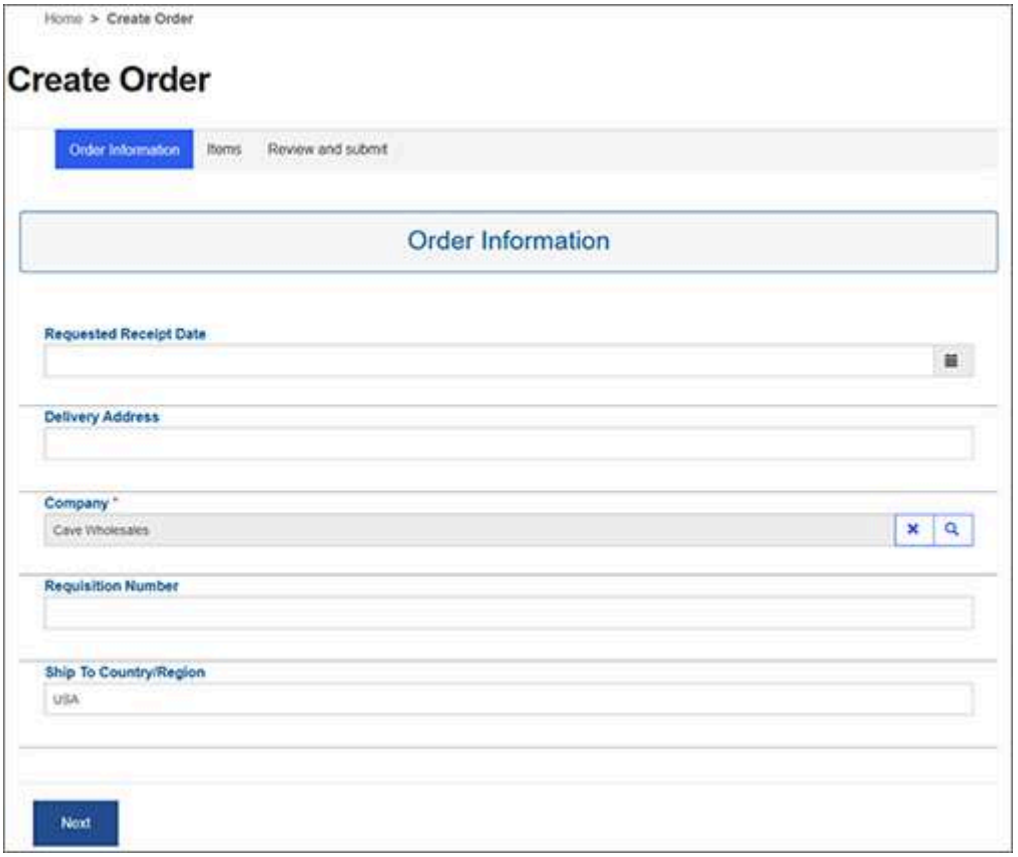
Here are the standard steps for submitting an order from the Customer portal.

1. On the home page, select the **Create order** tile to open the **Create Order** wizard.

2. On the **Order Information** page, set the following fields:

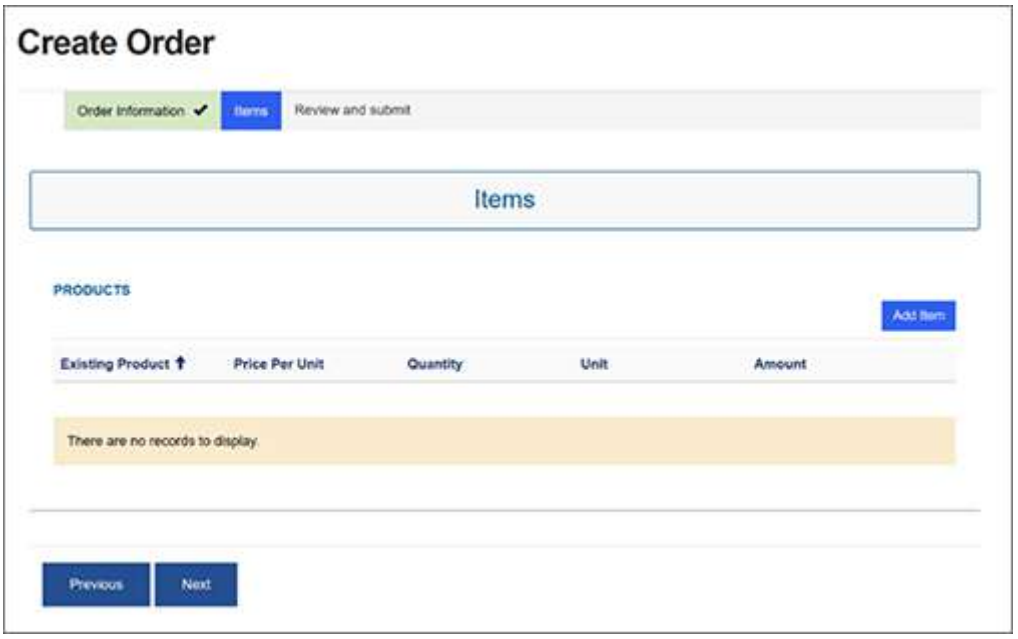
    - **Requested receipt date** – Specify the date of delivery.

- **Delivery address** – Enter the address that the order should be delivered to.
- **Company** – Select the name of the customer company. This field is automatically set for non-admin users.
- **Requisition number** – Enter the requisition number of the order. This field isn't required.
- **Ship to country/region** – Enter the country or region that the items will be delivered to. This field is automatically set for non-admin users.



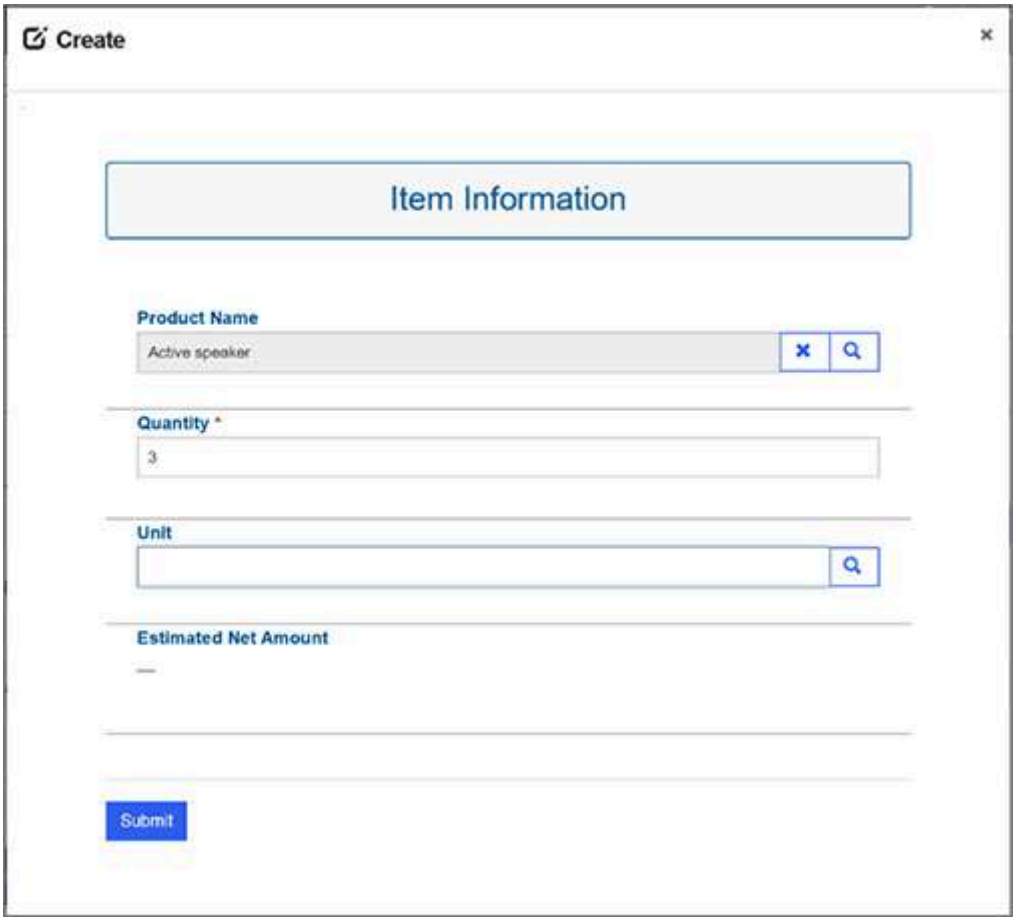
3. Select **Next**.

4. On the **Items** page, select **Add Item**.



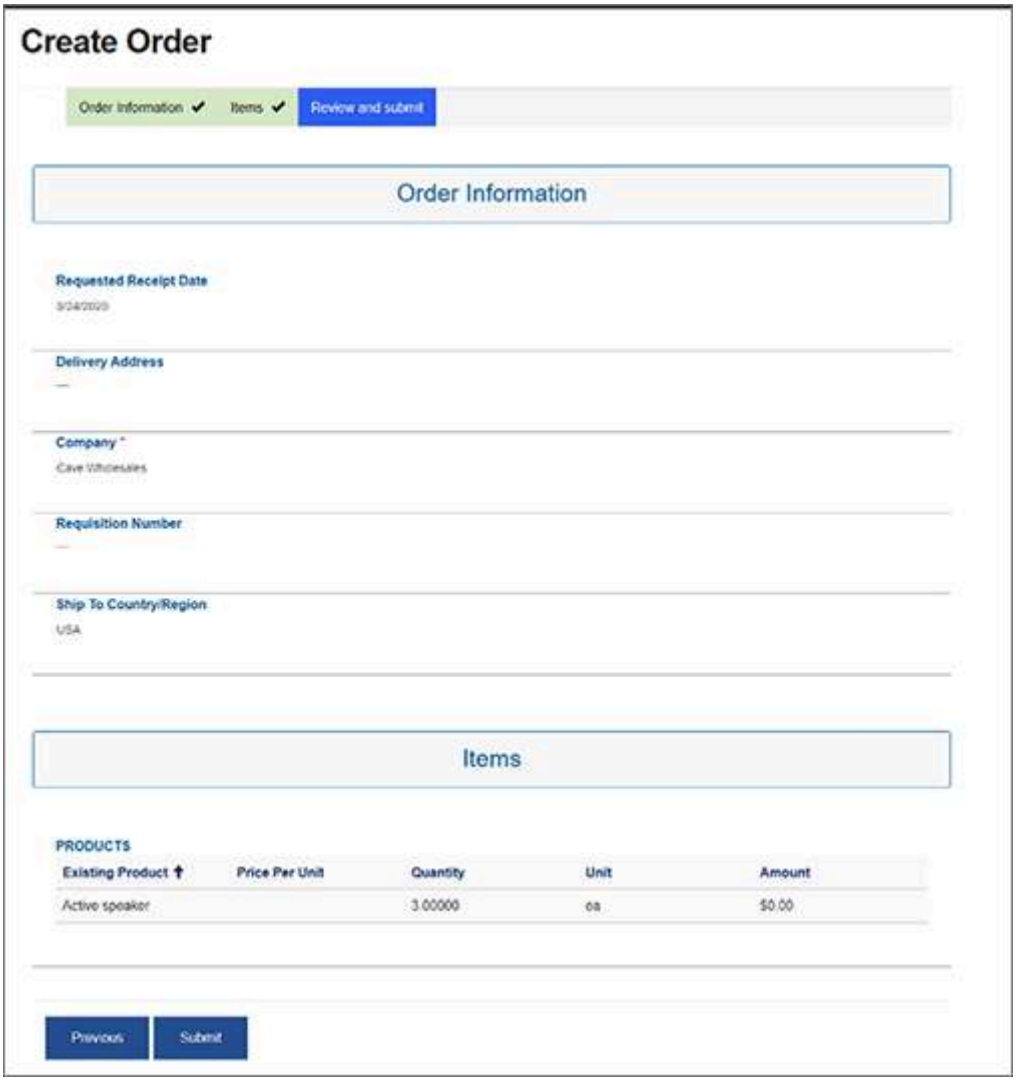
5. In the **Item Information** dialog box, set the following fields:

- **Product Name** – Find and select a product to add to the order.
- **Quantity** – Enter the quantity of the selected product.
- **Unit** – Specify the unit of measure (for example, **ea.**, **kgs**, or **box**).
- **Estimated net amount** – The value is calculated as the estimated price of the item × the quantity for the selected unit.



6. Select **Submit** to add the item to the order.

7. Repeat steps 4 through 6 until you've added all the items that you want to order.
8. When you've finished adding items, select **Next** on the **Items** page.
9. The **Order Information** page provides a summary of the order. Review the order contents and delivery details. If everything looks correct, select **Submit** to submit the order.



Standard data setup

To help ensure a smooth user experience, the Customer portal automatically fills in values for several required fields. These values are based on information in the contact record of the customer who is submitting the order.

For each contact row that belongs to a customer who will use the Customer portal to submit orders, values must be specified for the following required fields. Otherwise, errors will occur.

- **Company** – The legal entity that the order belongs to
- **Potential customer** – The customer account that is associated with the order
- **Price list** – The custom price list for the customer

- **Currency** – The currency of the price
- **Ship to country/region** – The country or region that the items will be delivered to

The following fields are automatically set for the sales order table:

- **Language** – The language of the order (By default, the value is taken from the contact record.)
- **Ship to country/region** – The country or region that the items will be delivered to (By default, the value is taken from the contact record.)
- **Contact person** – The user who can be contacted for information about the order (By default, the value is taken from the contact record.)
- **Company** – The legal entity that the order belongs to (By default, the value is taken from the contact record.)
- **Potential customer** – The customer account that is associated with the order (By default, the value is taken from the contact record.)
- **Invoice customer** – The billing account of the order (The default value is the potential customer from the contact record.)
- **Sales order name** – The name of the sales order (The default value is **sales order**.)
- **Currency** – The currency of the price (By default, the value is taken from the contact record.)
- **Price list** – The custom price list for the customer (By default, the value is taken from the contact record.)
- **Delivery address description** – The delivery address of the sales order (The default value is **delivery address description**.)

Modify the order creation process

You can freely modify the appearance and UI of the Customer portal if you don't change the basic order creation process. If you want to change the order creation process, there are a few points that you must keep in mind.

Don't remove the following columns from the sales order table in Microsoft Dataverse, because they are required to create a sales order in dual-write:

- **Company** – The legal entity that the order belongs to
- **Name** – The name of the sales order
- **Currency** – The currency of the price
- **Price list** – The custom price list for the customer
- **Ship to country/region** – The country or region that the items will be delivered to
- **Potential customer** – The customer account that is associated with the order

- **Language** – The language of the order (Typically, this language is the language of the potential customer.)
- **Delivery address description** – The delivery address of the sales order

For items, the following columns are required:

- **Product** – The product to order
- **Quantity** – The quantity of the selected product
- **Unit** – The unit of measure (for example, **ea.**, **kgs**, or **box**)
- **Ship to country/region** – The country or region of delivery
- **Delivery address description** – The delivery address of the order

You must make sure that your Customer portal somehow submits values for all these columns.

If you want to add columns to the page, or remove columns, see Create or edit quick create forms for a streamlined data entry experience.

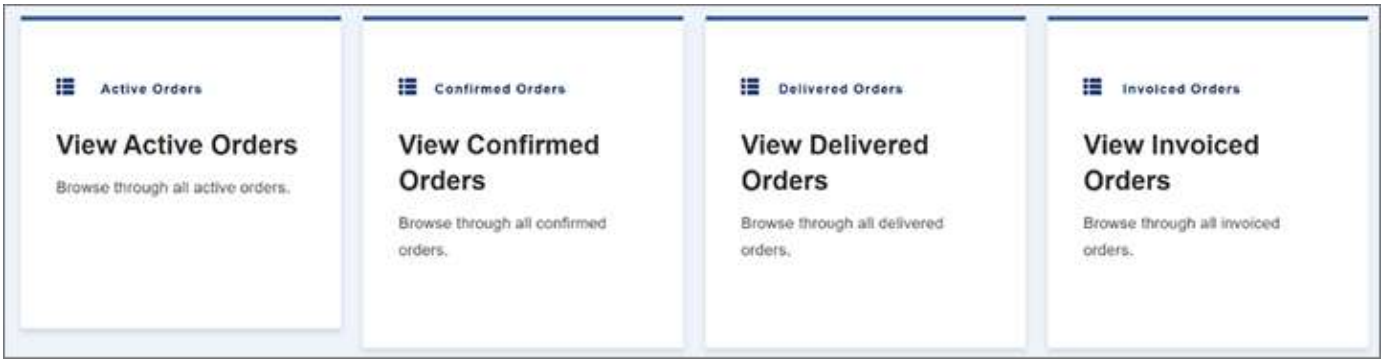
If you want to change how columns are preset and how values are set when the page is saved, see the following information in the Power Apps portals documentation:

- Prepopulate field
- Set Value On Save

Customize the home page

All the controls in the Customer portal are built-in Power Apps portals controls. You can customize them by following the steps in Compose a page in the Power Apps portals documentation.

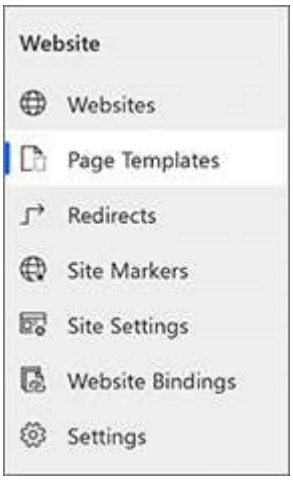
The only custom control that is included in the Customer portal template is used to create the tiles on the home page.



To modify the tiles, follow these steps:

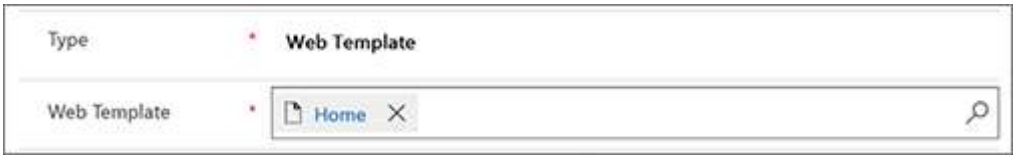
1. Open the Portal Management app.

2. In the navigation pane on the left, select **Page Templates**.



3. Select the page template that is named **Home**.

4. In the **Web Template** field, select the **Home** link to open the source code for that page.



5. You should now see all the source code for the home page and can modify it as you require.

Resources

To learn more about how you can set up and customize the Customer portal, see the following resources:

- Power Apps portals documentation
- Dual-write documentation
- About portal lifecycle
- Upgrade a portal
- Migrate portal configuration
- Solution Lifecycle Management: Dynamics 365 for Customer Engagement apps

Last updated on 12/30/2025

Approved customer lists

You might sell products and services on a recurring basis to specific customers or groups of customers who are preapproved for these purchases based on their previous and ongoing business relationship. By preapproving customers, you expedite the sales order process and shipment of the product. In addition, you ensure that the product is sold only to customers who are authorized to buy it and prevent it from being sold to other customers.

For example, you're a manufacturer of apple juice. One of your long-time customers, Super Club, can buy only its own privately labeled products. Super Club sells these products at both its Super Club warehouse location and its retail location, Super Mart. Therefore, you sell Super Club's privately labeled apple juice cases only to Super Club Warehouse and Super Mart. This product can't be sold to any other customer.

Prerequisites

To use the features that this article describes, your system must meet the following requirements:

- Run Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later.
- Turn on the following features in Feature management. As of Supply Chain Management version 10.0.47, both features are turned on by default.
  - *Advanced quality management* (As of Supply Chain Management version 10.0.49, this feature is mandatory and can't be turned off.)
  - *Approved customer list*

Set up approved customers

To authorize an approved customer or customer group for recurring sales, or to limit who you can sell a given product to, use the **Approved customer list setup** page to set up a relationship between the customer or customer group and an item or item group.

As part of the process of setting up a customer/item relationship, you specify the type of relationship. The following types are available:

- A specific customer is authorized to buy a specific item.
- A specific customer is authorized to buy any item in a specific item group.
- A customer group is authorized to buy a specific item.

- A customer group is authorized to buy any item in a specific item group. (A relationship of this type is known as a *group-to-group* relationship.)

In addition, you set up the approved customer list (ACL) check method to define what occurs if a customer tries to buy an item that it isn't authorized to buy.

Set up the ACL check method

When you approve a product for a customer by setting up a customer/item relationship, you also set up the ACL check method at both the customer level and the item level. The ACL check method is used to validate the combination of the customer and the item. In other words, it confirms that the customer is authorized to buy the item.

To set up the ACL check method for products and customers, follow these steps:

- Go to **Product information management** > **Products** > **Released products**. On the **Sell** FastTab, in the **Approved customer list check method** field, select the method.
- Go to **Sales and marketing** > **Customers** > **All customers**. On the **Sales order defaults** FastTab, in the **Approved customer list check method** field, select the method.

The ACL check method defines the action that is taken if you select a customer and/or an item that isn't listed in the item's approved customer list. It also confirms that the transaction date is within the effective approval period that is specified for the customer and the item. You can set up the ACL check method either to issue a warning or to prevent the transaction from being processed.

The following ACI check methods are available:

- *No check* – No validation is done. Therefore, any customer or item that you select is allowed.
- *Warning only* – A warning message is shown, but you can continue with the transaction.
- *Not allowed* – An error message is shown, and you're prevented from continuing with the transaction.

The ACL check method is applicable to the following document types:

- Sales agreements
- Sales quotations
- Sales orders

Based on the ACL check method, only items that are authorized for the selected customer account are permitted for the document.

> **Note**
>
> The system validates sales quotations and sales agreements when they are confirmed. This behavior differs from sales orders, which are validated when they are added.

Set up approved customer lists

To set up and maintain customers who are authorized to buy one or more products, use the **Approved customer list setup** page. To open this page, go to one of the following locations:

- **Product information management** > **Setup** > **Approved customer list** > **Approved customer list setup**
- **Sales and marketing** > **Setup** > **Approved customer list** > **Approved customer list setup**

Then use the buttons and fields described in the following subsections.

Buttons on the approved customer list setup page

- **New** – Add a relationship between an approved customer or customer group and an approved item or item group.
- **Delete** – Remove a relationship between an approved customer or customer group and an approved item or item group.
- **Edit** – Edit the effective and expiration dates for a customer's approval period.
- **View** – Select a view option to find approved items or item groups within the customer's effective date range. The two view options also include approved items that never expire.
  - *Current* – Show records that have an effective date before the current date.
  - *All* – Show all records.

Fields on the approved customer list setup page

- **Item code** – Select or review the item relationship code that the item is approved for. The following values are available:
  - *Table* – A specific item.
  - *Group* – An approved item group.
  - *All* – All items.
- **Item relation** – Select or review the identifier of the approved item or item group.

- **Customer code** – Select or review the customer relationship code that the item is approved for. The following values are available:
  - *Table* – A specific customer.
  - *Group* – An approved customer group.
  - *All* – All customers.
- **Customer relation** – Select or review the identifier of the approved customer or customer group.
- **Effective** – Select or review the effective date when the approved customer list's approval to buy the item or items begins. The default value is the current date.
- **Expiration** – Select or review the date when the approved customer list's approval to buy the item or items expires. The default value is *Never*.

Set up approved customer groups and approved item groups

Set up groups of customers and groups of items to expedite the approval process when the same set of items is approved for a specific customer, a group of customers, or all customers. If the approved item group is associated with an approved customer group, every customer in that customer group is authorized to buy every item in that item group. To set up the groups, go to the following locations:

- **Sales and marketing** > **Setup** > **Approved customer list** > **Approved customer groups**
- **Product information management** > **Setup** > **Approved customer list** > **Approved item groups**

View and maintain approved items from the customer account

From the customer record, you have different options for viewing and maintaining approved items for the customer account.

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. Select the customer that you want to set up.
3. On the Action Pane, on the **Sell** tab, in the **Approved customer** group, select one of the following buttons:

- **Setup** – Open a view of the **Approved customer list** page that is filtered by the customer account. When you create a line item in this context, you just have to specify approved items or item groups. The customer account is fixed to the account that you opened the list from.
- **Approved items** – Open the **Approved customer list by customer** page, which shows the items that are approved for the customer account. The list on this page resembles the list on the **Approved customer list** page, but it shows the item numbers of all items that are defined in approved item groups. Use the **Effective** and **Expiration** fields to filter the list based on a specific effective date or expiration date.
- **Effective period** – Open the **Approved customer list expiration** page, which shows items that are approved for the customer. By default, the list shows approved items that have an expiration date, and the date in the **As of** field is set to the current date. Therefore, the list shows approved items where the approval is still effective as of the current date. You can change the date to a different date in the future. If you want the list also to show approved items that have no expiration date, select **Include never expired**.

View and maintain approved customers from the released product master

From the product master, you have different options for viewing and maintaining approved customers.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product that you want to set up.
3. On the Action Pane, on the **Sell** tab, in the **Approved customer** group, select one of the following buttons:

    - **Setup** – Open a view of the **Approved customer list** page that is filtered by the customer account. When you create a line item in this context, you only have to specify approved items or item groups. The customer account is fixed to the account that you opened the list from.
    - **Approved customers** – Open the **Approved customer list by item** page, which shows the customers that are approved for the item. The list on this page resembles the list on the **Approved customer list** page, but it shows the customer account numbers of all customers that are defined in approved customer groups. Use the **Effective** and **Expiration** fields to filter the list based on a specific effective date or expiration date.

- **Effective period** – Open the **Approved customer list expiration** page, which shows customers that are approved for the item. By default, the list shows approved customers that have an expiration date, and the date in the **As of** field is set to the current date. Therefore, the list shows approved customers where the approval is still effective as of the current date. You can change the date to a different date in the future. If you want the list also to show approved customers that have no expiration date, select **Include never expired**.

Configure date validation for the approved customer list

When you enter effective and expiration dates for an approved customer list record, validation is done only if the ACL check method is set to *Warning only* or *Not allowed*. (It doesn't validate them if the method is set to *No check*.) The dates are validated for the different documents, based on the setting of the **Date type** field on the **Sales and marketing parameters** page. This field specifies which date on the document is validated against the approved customer list record. The following values are available:

- *Today* – The current date or the system date.
- *Requested ship date* – The requested ship date on the sales order.
- *Requested receipt date* – The requested receipt date on the sales order.
- *Order date* – The date when the order was placed.

Therefore, you can validate the sales order against the approved customer list when the order is expected to be shipped, when it's expected to be received, or when it's placed. The *Today* and *Order date* values usually produce the same result.

Last updated on 07/27/2026

Credit limits for customers

Setting a credit limit lets you specify the maximum amount of credit to extend to your customers. If a credit limit is specified, it's checked automatically when a user attempts to update a document. If the credit limit is exceeded, a message is displayed to the user.

> **Important**
>
> The credit limit functionality described in this article is only available when the *Credit management* feature is *turned off* in Feature management. *Credit management* is on by default and requires blocking rules to be set up to check customer credit limits. For more information about the *Credit management* feature, see Credit management parameters setup.

This article provides an overview of how credit limits work and answers the following questions:

- What documents and processes can I check credit limits for?
- Where do I configure the way that the customer's remaining credit is calculated?
- Where is information about a customer's remaining credit used?
- Where do I specify whether identification is required for credit to be extended to a customer, and also the credit limit amount that requires identification?
- Where do I specify whether to display a warning or error if the credit limit is exceeded?
- How do I specify the credit limit for a specific customer?
- How do I check credit limits manually on sales orders?

What documents and processes can I check credit limits for?

Use the **Accounts receivable parameters** page to specify which documents to check credit limits for. You must be a member of the System administrator (-SYSADMIN-) security role to make changes in this page. You can check credit limits for the following documents and processes:

- Invoices for sales orders, when you post the invoices
- Packing slips for sales orders, when you update packing slips
- Sales orders, when you add lines in the **Sales order** page
- Sales orders, when they're created through a service

- Free text invoices, when you post the invoices

Credit limits are automatically checked if either of the following options is set:

- In the **Accounts receivable parameters** page, the **Credit limit type** field is set to anything other than **None**. Credit limits are checked for all customers.
- In the **Accounts receivable parameters** page, the **Credit limit type** field is set to **None** but **Mandatory credit limit** is selected for a customer in the **Customers** page. Credit limits are checked only for specific customers.

To check credit limits for the following documents, you must specify additional settings.

Expand table

Document	Additional setting
Free text invoice	On the **Accounts receivable parameters** page, in the **Credit rating** area, select **Check credit limit on free text invoice**.
Sales order (manually entered)	On the **Accounts receivable parameters** page, in the **Credit rating** area, select **Check credit limit on sales order**.
Sales order (electronically received)	On the **Accounts receivable parameters** page, in the **AIF** area, select **Check credit limit for sales orders**.

Where do I configure the way that a customer's remaining credit is calculated?

You can configure Supply Chain Management to calculate a customer's remaining credit in any of the following ways:

- Compare the credit limit against the customer balance.
- Compare the credit limit against the customer balance and packing slip amounts.
- Compare the credit limit against the customer balance and all open transaction activity. This includes packing slip amounts and sales order amounts.

Use the **Accounts receivable parameters** page to specify the information to compare to. You must be a member of the System administrator (-SYSADMIN-) security role to make changes in this page. In the **Credit limit type** field, select whether to perform credit limit checks and what transaction information to include when the credit limit is checked. Select from the following options:

- **None** – Don't check credit limits. You can override this option for a specific customer by selecting the **Mandatory credit limit** check box in the **Customers** page. If you do this, the credit limit is checked against the customer balance.
- **Balance** – The credit limit is checked against the customer balance.
- **Balance + packing slip or product receipt** – The credit limit is checked against the customer balance and deliveries.
- **Balance+All** – The credit limit is checked against the customer balance, deliveries, and open orders.

Where is information about a customer's remaining credit used?

Information about a customer's balance and remaining credit amount is calculated and stored when you create an aging snapshot, and is displayed in the **Collections** page. The amounts that are displayed in the **Collections** page might not include all transaction activity until a new aging snapshot is created. Learn more in Collections and credit in Accounts receivable.

Depending on the documents that are selected, information about a customer's balance and remaining credit amount is calculated when sales orders, packing slips, and customer invoices are updated. If the amount of the document that you're working with would cause the credit limit to be exceeded, a message is displayed.

Where do I specify whether identification is required for credit to be extended to a customer, and also the credit limit that requires identification?

Use the **Accounts receivable parameters** page to specify whether to require identification and the credit limit amount limit that requires identification. You must be a member of the System administrator (-SYSADMIN-) security role to make changes in this page.

Expand table

Field	Description
Require identification with credit	Select the type of identification that must be entered for customers to whom your legal entity extends credit. The option that you select in this field determines when and what type of information is required in the **Government identification** fields on the **Customers** page:

Field	Description
	• *No* – No government-issued identification is required, regardless of the customer's credit limit. • *Yes* – A government-issued license number or other government-issued identification is required if the customer's credit limit is higher than or equal to zero. • *Minimum limit* – A government-issued license number or other government-issued identification is required if the customer's credit limit is higher than or equal to the limit that you enter in the **Limit** field in this page.
Limit	Enter the credit limit at which a government-issued license number or other identification is required for customers. For example, type 2000 to require that an identification number, such as a driver's license number, must be entered for customers who have a credit limit of 2,000 or higher. This field is available if you selected Minimum limit in the Require identification with credit field.

Where do I specify whether to display a warning or error if the credit limit is exceeded?

Use the **Accounts receivable parameters** page to specify whether to display a warning or error if the credit limit is exceeded. This warning or error is displayed when a user enters or posts information, or it's included in a log if an electronic service processes the documents. You must be a member of the System administrator (-SYSADMIN-) security role to make changes on this page.

Expand table

Field	Description
Message when exceeding credit limit (in the Credit rating area)	Select how messages about credit limits being exceeded are displayed to users. Select from the following options: • *Error* – An error message is displayed. This usually stops the current operation and the conflict must be resolved before the process can continue. • *Warning* – A warning message is displayed, but the process can continue.
Message when exceeding credit limit (in the AIF area)	Select how messages about credit limits being exceeded are delivered in a log. Select from the following options: • *Error* – An error message is displayed in the **Exceptions** page, and the document isn't processed until the error is resolved. • *Warning* – A warning message is displayed in the **Exceptions** page, but the process can continue.

How do I specify the credit limit amount for a specific customer?

Use the **Customers** page to specify the credit limit amount for a specific customer. You must be a member of a security role that has the Maintain customer master (CustCustomersMaintain) duty assigned to it to make changes in this page.

1. Go to **Accounts receivable** > **Customers** > **All customers** and open a customer account.
2. In the **Customers** page, on the Action Pane, select **Edit**.
3. Enter a currency amount in the **Credit limit** field. This value must be higher than zero (0), and is used as the credit limit amount.
4. If required, enter a license number or other government-issued identification in the **Government identification** field.

> **Note**
>
> In the **Accounts receivable parameters** page, you typically select a credit limit type. However, if the credit limit type is set to **None**, you must also select the **Mandatory credit limit** check box in the **Customers** page to check the customer's credit limit against the customer's balance. For more information about credit limit types, see "What documents and processes can I check credit limits for?" in this article.

How do I manually check credit limits on sales orders?

Sometimes, you need to manually check a customer's credit limit. For example, you might check a customer's credit limit before you start entering a sales order. Use the **Sales order** page to manually check credit limits. You must be a member of a security role that has the Maintain sales order (SalesOrderMaintain) duty assigned to it to make changes in this page.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders** and open a sales order.
2. In the **Sales order** page, on the Action Pane, on the **Manage** tab, select **Check credit limit**.

Trade allowance management

Article • 01/07/2025

Trade allowance management helps companies manage sales promotion programs that offer "pay-for-performance" monetary rewards to customers that achieve volume and behavioral goals. The feature's capabilities are designed for companies that focus on comprehensive promote-to-profit processes, from promotion fund budgeting and allocation, to allowance contract setup, to claims creation and processing, to payment processing, to promotion effectiveness analysis.

This article will provide a broad overview of the Trade allowance management feature and will familiarize you with the typical set of tasks that are involved in managing a sales promotion program. Several types of users who have operational and decision making responsibilities are expected to use this functionality to achieve their respective goals:

- Allocating discretionary funds to the selected accounts, and setting up trade allowance agreements for promotions, based on bill-backs and one-off lump sum payments (for an agreed service)
- Running the negotiated promotion contracts through ongoing sales and generating bill-back claims
- Calculating, approving, and processing the generated claims, and passing them on to Accounts receivable (A/R) as deductions for payment settlement
- Reconciling the customer's short-pay with the deduction that is due
- Tracking use of the promotional fund, and evaluating program profitability and effectiveness

Audience and purpose

The information in this document is intended for business decision makers in enterprise companies, in positions such as purchase manager, chief financial officer (CFO), and accounting manager, who have the following responsibilities:

- High-level budgets and fund allocation
- Planning and analyzing sales promotions
- Managing staff that processes bill-back claims, runs payments based on Merchandising events, and settles short-pays and deductions

People in these roles are looking for ways to achieve these goals:

- Better use marketing promotional funds.
- Flexibly accommodate different types of promotion programs and allowances.

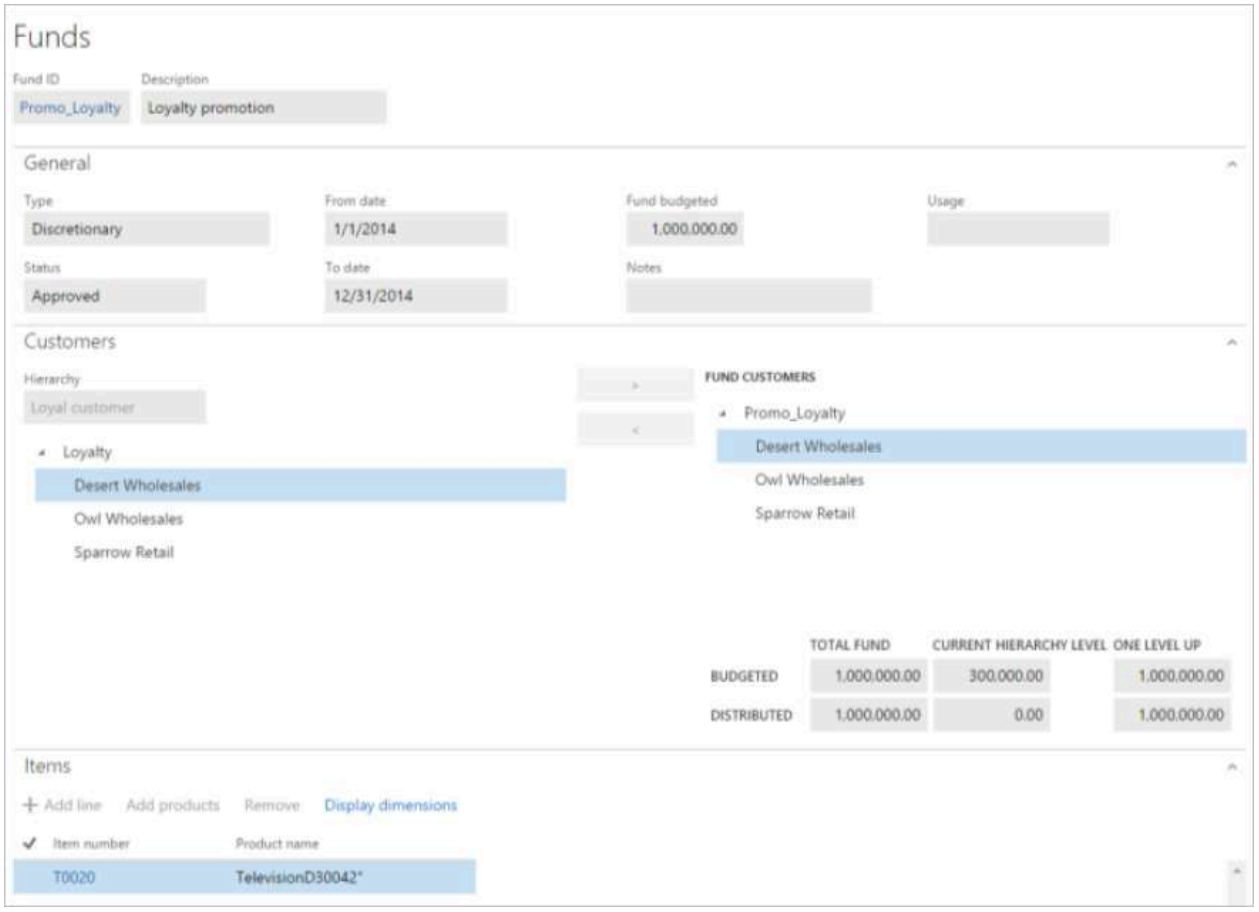
- Reduce the administrative burden and errors that are associated with monitoring promotion performance and processing claims.
- Improve cash flow forecasts by accruing for future liability.
- Have a quantified basis for ongoing and future negotiations with customers about promotions.

Promotional fund and Trade allowance agreement

A trade allowance agreement is an incentive program where pay-for-performance monetary rewards are offered to customers that achieve specific volume targets and/or behavioral goals. Promotional funds are budgeted expenditures. In that way, the promotional campaigns can be captured.

Promotional fund

Funds that are allocated to trade allowance agreements are recorded on the **Funds** page. To open the **Funds** page, select **Sales and marketing** > **Trade allowances** > **Funds** > **Funds**.



On the **Funds** page, you can view the details of promotional funds.

The **General** FastTab shows the period that the fund is valid for and its budgeted amount. In order for the fund to be allocated to the promotion agreement, the **Status** field must have a value of *Approved*.

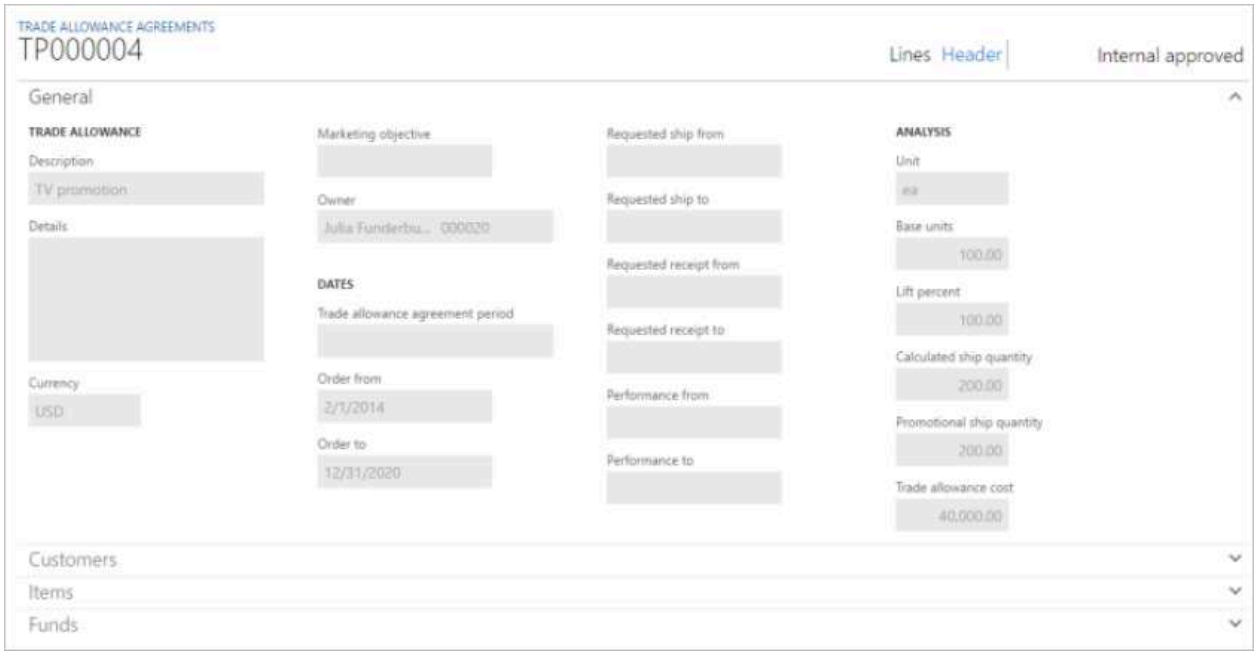
The **Customers** FastTab shows the customer hierarchy. To select the customers that the fund targets, drag them so that they are under **Fund customers**. This FastTab also shows how the total amount of the fund is distributed.

The **Items** FastTab shows the items that are included in the promotion.

Trade allowance agreement

After the fund definition is in place, the next step in promotion planning is to register promotion contracts (which are known as trade allowance agreements), allocate funds, and define performance goals for each Merchandising event.

Trade allowance agreements are recorded on the **Trade allowance agreements** page. To open the **Trade allowance agreements** page, select **Sales and marketing** > **Trade allowances** > **Trade allowance agreements**.



Header

Select **Header** to switch to the Header view.

On the **General** FastTab, the **Order to** and **Order from** fields define the period when the agreement is valid. An approval status of *Internal approved* for the agreement indicates that the agreement isn't yet valid and can't be applied during sales order processing.

The **Analysis** section of the **General** FastTab contains important fields that define the quantities and costs that are used for promotion evaluation:

- The **Base units** field specifies the quantity of products that must be sold to the selected customers before the promotion is applied.
- The **Calculated ship quantity** value is calculated based on the **Lift percent** value, which is a planned target increase for this promotion.
- The **Trade allowance cost** field is calculated based on the quantities of the various events in the trade allowance agreement.

On the **Customers** FastTab, in the list on the left, you can select and view customer groups, which are set up as predefined hierarchies. You can then select the whole hierarchy or specific accounts as targets for the allowance agreement.

On the **Items** FastTab, as on the **Items** FastTab of the **Funds** page, products are added to the agreement to associate its sales with the allowance that was agreed on.

On the **Funds** FastTab, you can view the promotion funds that are associated with this contract. You can also view the contract's event cost allocation. An event cost allocation of 100 percent means that this promotion will be financed exclusively from one fund. Alternatively, a promotion agreement can draw on several funds, and can use equal or differential percentage allocation.

Lines

Next, select **Lines** to switch to the Lines view.

The **Merchandising events** tab shows the types of events covered by an agreement. There are three types: bill back, lump sum, and off-invoice.

When you select the merchandising event and then select the **Amounts** tab, the details for the event are found.

In the **Trade allowance lines** section, you specify the quantity or amount ranges that the customer must achieve for definitions to obtain the rewards.

For merchandising events of the *Bill back* type, the upper section the **Amounts** tab defines the rules that the bill back will be applied, generated, and paid under. For example, the rules might specify the following conditions for the bill back claim:

- It's based on the creation date of the sales order (the **Calculation date type** value is *Created*).
- It's calculated based on the sales order line's amount before discounts, not the net amount, which includes discounts (the **Taken from** value is *Gross*).
- It's based on the volume of the sold products, not the amount (the **Rebate line break type** value is *Quantity*).
- It's calculated per period of a month (the **Cumulate sales by** value is *Month*).
- It's settled as a deduction, not by using A/P (the **Payment type** value is *Customer deductions*).

For merchandising events of the *Lump sum* type, the **Amounts** tab shows the quantity that will be paid to the customer in the form of a deduction when the customer achieves specific performance. An approval status of *Open* indicates that the lump sum hasn't yet been paid.

To apply the agreement to sales orders that meet the agreement's conditions, the agreement's status must be *Confirmed*.

Perform sales under the planned merchandising event and generate bill-back claims

When you create a sales order that has lines that fulfill the requirements of the agreement, you can view the related information on the **Sales order** page by selecting **Sales order line** > **View** > **Price details**.

On the **Price details** page, on the **Rebates** FastTab, the sales clerk can see a bill back from the valid trade allowance agreement (the rebate program ID is shown) and the total amount that is applied to the line. This amount is also shown in the **Rebate amount** field in the **Margin estimation** section of the **Price details** page.

When the sales invoice is posted, a corresponding bill-back claim is generated for each invoice line.

> ⓘ Note
>
> To see the **Price details** page, on the **Accounts receivable parameters** page, on the **Prices** tab, select the **Enable price details** check box. I

Process claims and pass them as deductions to A/R

The next steps in the process for handling bill-backs are to review, calculate, and approve claims, and then convert them into deductions.

The Bill back workbench is where the promotion agreement owner periodically reviews and processes the claims that are generated. It's also where the A/R administrator converts the approved claims into deductions or regular payments, depending on the payment method for the claim.

On the **Bill back workbench** page, you can review the claim lines. If the claims are in *To be recalculated* status, they must be recalculated for any cumulative effect.

Recalculate claims

To recalculate the claims, on the Action Pane, select **Cumulate**. Then, in the **Cumulate rebates** dialog box, select the customer.

As a result of the recalculation, the program generates new claims for the amounts to adjust the original claims to the qualifying amount per unit. One adjustment claim is generated for each unique combination of a customer, an item, a currency, a unit of measure, inventory dimensions, financial dimensions, and a sales tax group. These adjustment claims have the same reference to the sales order and invoice number as the

claims that are being adjusted (that is, the claims that were originally created from the sales document). Unlike the original claim, the adjustment claim doesn't have values in the fields that describe the original sales order line's amounts and quantity.

After the recalculation is completed, the status of the claims is changed to **Calculated**. To approve the claims, on the Action Pane, select **Approve**.

Process claims and pass them to A/R

The claims are now ready for A/R processing. To process them, on the Action Pane, select **Process**.

Upon processing the claims, the status has changed to *Mark* and indicates that a journal posting (the journal that is posted is the Rebate accrual journal, as specified in the A/R parameters) has caused the following events to occur:

- The claims have been transferred to the temporary customer balance as deductions.
- The rebate accrual account has been credited to represent the future liability for the customer.
- The rebate expense account has been debited to recognize the cost that was incurred in connection with the sales.

To complete the process, the A/R clerk must now handle the accrual deductions by transferring them to the customers balance as a credit note (liability).

To start the task, on the Action Pane of the **Customer** page, select **Collect** > **Settle transactions**. Then, on the **Settle transactions** page, select **Functions** > **Bill back program**. This rebate page shows all the bill-back claims that were previously processed.

If you want to create a credit note, select the **Mark** check box for all lines, and then select **Functions** > **Create credit note**.

Upon credit note creation, a journal is posted. (The journal that is posted is the AR consumption journal, as specified in the A/R parameters.) As a result, the real liability (credit) amount has been moved to the customer balance. Financially, this situation implies that the following events have occurred:

- The customer's receivable account has been credited.
- The rebate accrual account has been debited.

To approve a merchandising event of the *Lump sum* type, select the event on the **Trade allowance agreements** page, and then, on the **Amount** tab, select **Approve**.

Settle the deduction that is due and the customer short-pay by using the Deduction workbench

Often, in anticipation of bill-backs, customers choose to short-pay selected invoices. To prevent payment reconciliation issues in the future, the A/R clerk registers those short-pays as deductions when they record the actual customer payments. Then, on the Deduction workbench, those customer deductions can easily be settled against the claim amounts that are due from the company.

To register a customer's short-pay in the Payment journal, select **Accounts receivable** > **Payments** > **Payment journal**, and create a new payment journal. Then, on the Action Pane, select **Deductions**. On the **Deduction** page, you can create and track the amount that was short-paid.

The collection manager is now responsible for settling the open credit note transaction and the short-pay transaction against each other in the Deduction workbench.

To manage deductions, select **Sales and marketing** > **Trade allowances** > **Deductions** > **Deduction workbench**. The upper section of the page contains lines that represent the short-pays from the customer. The lower section of the page contains the customers open credit transactions.

To settle the deduction against the open transaction, mark the deduction line, and then, on the Open transactions tab, mark the line. On the Action Pane, select Maintain > Match.

The status of the originating claims is now set to **Completed**.

Analyze the effectiveness of the promotion and fund consumption

To get an overview of the program's key statistics and fund use, you can use several reports and analytical views that are available in Trade allowance management.

On the **Trade allowance activity** page, the **Overview** tab shows the main details of the trade allowance agreement. The other tabs show more specific details about the associated documents, payments, and other events that are related to the program.

The **Summary** tab shows the total quantity of products that have been sold under the promotion, the sales amount that has been invoiced, and the bill-backs and lump sums

that have been paid.

The **Bill back credits** tab contains the details of individual bill-backs that have been credited to the customer.

To get a more analytical overview of the various performance measures for the promotion, you can use the **Analysis** view. To go to the **Analysis** view, select **Sales and marketing** > **Trade allowances** > **Trade allowance agreements**. On the Action Pane, select **Analysis**.

To get a more analytical overview of the various performance measures for the promotion, you can use the **Analysis** view. To go to the **Analysis** view, select **Sales and marketing** > **Trade allowances** > **Trade allowance agreements**. On the Action Pane, select **Analysis**.

Feedback

Was this page helpful? Yes No

Provide product feedback

Create a new trade agreement

This procedure shows you how to create a trade agreement where you register a new product sales price that you agreed on with a specific customer. You can run this procedure in demo data company USMF or on your own data. If you're using your own data, before you start this guide, make sure that a trade agreement journal name exists where the **Default relation** is set to *Price (sales)*.

Create and post a new trade agreement journal

1. Go to **Sales and marketing** > **Prices and discounts** > **Trade agreement journals**.
2. Select **New**.
3. In the **Name** field, select the drop-down button to open the lookup.
4. In the list, find and select the desired record.
5. On Action Pane, select **Lines**.
6. In the **Party code type** field, select *Table*. In this example, you're updating the price for a specific customer, which means you must choose *Table*. If you were updating the product's list price, you would select *All*, so that the new price is valid for all customers. If you were differentiating prices among different customer segments, then you would select *Group*. To select *Group*, you must have set up customer price groups.
7. In the **Account selection** field, select the drop-down button to open the lookup.
8. In the list, find and select the desired record.
9. In the **Product code type** field, select *Table*. When you're entering a trade agreement of type *Price (sales)*, you must select *Table* in the **Product code type** field. This requirement exists because a price is an absolute value and can't be the same for all products or a group of products.
10. In the **Item relation** field, select the drop-down button to open the lookup.
11. In the list, select the product you want to include in the agreement. Make a note of which product you selected.
12. In the **From** field, enter a minimum quantity.

    - If the customer has to order a minimum quantity before they can qualify for the new price, specify that quantity here.
    - Enter a value in the **To** field to specify the maximum quantity above which the agreement's price isn't valid. If you offer prices and discounts based on multiple

quantity breaks, specify each quantity bracket as a pair of minimum and maximum quantity in the **From** and **To** fields respectively.

13. In the **Amount in currency field**, enter a price.
14. Under the **Details** section, in the **From date** field, enter a date from which this agreement is valid.
15. Select **Save**.
16. Select **Validate**.
17. Select **Validate selected lines**.
18. Select **OK**.
19. Select **Post**.
20. Select **OK**.

View trade agreements for a product

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the product whose price you just updated.
3. On the Action Pane, select **Sell**.
4. Select **View trade agreements**. Review the details of the price trade agreement you just created.
5. Close the page.

Export posted trade agreement lines

Article • 05/07/2025

This article provides step-by-step instructions on how to export posted trade agreement lines. Standard data entities don't support the direct export of posted trade agreement lines. This article describes how to convert posted trade agreement lines to unposted lines, which makes them exportable.

Convert posted trade agreement lines

To convert posted trade agreement lines into unposted lines, follow these steps.

1. Open the list of active trade agreement lines for your vendor or customer.

    - For *purchase trade agreements*, go to **Accounts payable** > **Vendors** > **All vendors**. Select the vendor you want to work with. On the Action Pane, open the **Procurement** tab and, from the **Agreements** group, select **Trade agreements**.

    - For *sales trade agreements*, go to **Accounts receivable** > **Customers** > **All customers**. Select the customers you want to work with. On the Action Pane, open the **Sell** tab and, from the **Trade agreements** group, select **Agreements**.

2. Select the lines you want to convert for eventual export.

3. On the Action Pane, select **Edit selected lines**.

4. In the dialog, set the **Name** field to the name of the journal that you want to assign to your selected lines.

5. Select **OK**. This action converts the active price trade agreement lines into open trade agreement lines, which are now exportable.

Export the open trade agreement lines

After you've converted the relevant lines to open trade agreements, you'll be able to export them using the standard data management features of Supply Chain Management. You can export data from this entity to any supported data format (such as comma-separated values (CSV) or Microsoft Excel).

1. Go to **System administration** > **Workspaces** > **Data management**.

2. In the **Import / Export** section, select the **Export** tile.

3. On the **Export** page, enter a **Group name** for the job.

4. On the **Selected entities** FastTab toolbar, select **Add entity**.

5. In the **Add entity** drop-down dialog, set the following fields:

    - **Entity name** – Select *Open purchase price journal lines V2* or *Open sales price journal lines V2*.
    - **Target data format** – Select the format to export data to.

6. Select **Add** to add the new row, and then select **Close** to close the dialog box.

7. On the Action Pane, select **Save**.

8. On the Action Pane, open the **Export options** tab and select **Export now**.

9. The **Execution summary** page opens. Here you can view the status of your export job and a list of the entities that were exported. In the **Entity processing status** section, select the *Open purchase price journal lines V2* or *Open sales price journal lines V2* entity in the list, and then select **Download file** to download the data that was exported from that entity.

For more information about how to use data management to export data, see Data import and export jobs overview.

Clean up resources

After exporting the data, ensure that any temporary journal entries used for the conversion process are deleted or archived to maintain data integrity and avoid clutter in your system.

Recalculate line net amounts when importing sales orders and quotations

Article • 08/23/2023

This article describes whether and how the system recalculates line net amounts when sales orders and quotations are imported. It also explains how you can control the behavior in different versions of Microsoft Dynamics 365 Supply Chain Management.

How updates to net line amounts are calculated on import

Supply Chain Management version 10.0.23 introduced bugfix 604418. This bugfix changed the conditions under which the **Net amount** field on a line can be updated or recalculated when updates to existing sales orders and quotations are imported. In version 10.0.29, you can replace this bugfix by turning on the *Calculate line net amount on import* feature. This feature has a similar effect, but it provides a global setting that lets you return to the old behavior if you must. Although the new behavior makes the system work in a more intuitive manner, it can produce unexpected results in specific scenarios where all the following conditions are met:

- Data that updates existing records is imported through the *Sales order lines V2*, *Sales quotation lines V2*, or *Return order lines* entity by using Open Data Protocol (OData), including situations where you use dual-write, import/export through Excel, and some third-party integrations.
- Trade agreement evaluation policies that are in place establish a change policy that restricts updates to the **Net amount** field on sales order lines, sales quotation lines, and/or return order lines. Note that for return order lines, the **Net amount** field is always calculated and can't be set manually.
- The imported data includes changes to the **Net amount** field on lines, or changes (such as unit price, quantity, or discount) that will cause the value of the **Net amount** field on lines to be recalculated for one or more existing line records.

In these specific scenarios, the effect of the trade agreement evaluation policy is to put a restriction on updates to the **Net amount** field on the line. This restriction is known as a *change policy*. Because of this policy, when you use the user interface to edit or recalculate the field, the system prompts you to confirm whether you want to make the change. However, when you import a record, the system must make the choice for you. Before version 10.0.23, the system always left the line net amount unchanged, unless the incoming line net amount is 0 (zero). However, in newer versions, the system always

updates or recalculates the net amount as needed, unless it's explicitly instructed not to do so. Although the new behavior is more logical, it might cause issues for you if you're already running processes or integrations that assume the older behavior. This article describes how to revert to the old behavior if you must.

Control calculations of line net amounts in versions 10.0.29 and later

Supply Chain Management version 10.0.29 introduced a feature that is named *Calculate line net amount on import*. This feature adds an option that is named **Calculate line net amount** to the **Accounts receivable parameters** page. This option lets you select between the new and legacy behaviors for calculating line net amounts on import.

Turn the Calculate line net amount on import feature on or off

When you update to version 10.0.29, the *Calculate line net amount on import* feature is turned on by default, and the new **Calculate line net amount** option is initially set to *Yes*. The *Yes* setting corresponds to the new standard behavior. It matches the system behavior when the feature is turned off, except in the case of the functionality of the CalculateLineAmount parameter, as described later in this article. The *No* setting matches the system behavior before version 10.0.23 and is provided mainly to support legacy integration scenarios.

As of Supply Chain Management version 10.0.36, the feature is mandatory and can't be turned off. If you're running a version older than 10.0.36, then admins can turn this functionality on or off by searching for the *Calculate line net amount on import* feature in the Feature management workspace.

Set the Calculate line net amount option

When the *Calculate line net amount on import* feature is turned on, you can set the **Calculate line net amount** option by following these steps.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Line net amount calculation through integration** FastTab, set the **Calculate line net amount** option to one of the following values:
    - *Yes* – The system will always recalculate and update line amounts when needed. (Therefore, it will ignore the trade agreement evaluation policy.)

- *No* – If the existing or incoming net amount for any line is 0 (zero), the value for that line is recalculated based on other values (such as the unit price, quantity, and discount). If the existing or incoming net amount differs from 0 (zero), and a change policy is set on the **Net amount** field on the line, the field isn't recalculated or updated, even when incoming changes to the line price, quantity, and/or discount would imply that the line total should be recalculated. This behavior matches that of version 10.0.22.

How the Calculate line net amount on import feature affects the CalculateLineAmount parameter

When the *Calculate line net amount on import* feature is turned on, the value of the `CalculateLineAmount` parameter for the `SalesLine` and `SalesQuotationLine` tables has no effect. Instead, the behavior is controlled globally by the **Calculate line net amount** option that is described in the previous section. Therefore, when the feature is turned on, you must not take any dependency on the `CalculateLineAmount` value.

When the *Calculate line net amount on import* feature is turned off, the `CalculateLineAmount` parameter for the `SalesLine` and `SalesQuotationLine` tables works as it does in Supply Chain Management versions 10.0.23 through 10.0.28, as described in the next section.

Control line net amount calculations in versions 10.0.28 and earlier

When bugfix 604418 was introduced in version 10.0.23, it became possible to select how each relevant data entity should behave when a line net amount was edited or had to be recalculated because of other changes (such as an updated item price). You could control this behavior by setting the new `CalculateLineAmount` parameter for each line to one of the following values in the imported file:

- **`CalculateLineAmount`** = ***1*** – The **Net amount** field on the line is always recalculated and updated, regardless of whether a change policy is set for the field, and regardless of the value of the incoming or existing line net amount.
- **`CalculateLineAmount`** = ***0*** – If the existing or incoming net amount for any line is 0 (zero), the value for that line is recalculated based on other values (such as the unit price, quantity, and discount). If the existing or incoming net amount differs from 0 (zero), and a change policy is set on the **Net amount** field on the line, the field isn't recalculated or updated.

The system behavior depends on your version of Supply Chain Management:

- In version 10.0.22 and earlier, the system always behaves as though `CalculateLineAmount` is set to *0*, and there is no way to make it behave as though `CalculateLineAmount` is set to *1*.
- In versions 10.0.23 through 10.0.28, the system behaves as though `CalculateLineAmount` is set to *1* for all lines where it isn't explicitly set to *0* in the import file.

Schedule sales history data cleanup

As part of its standard operation, Microsoft Dynamics 365 Supply Chain Management generates and stores sales history update data on an ongoing basis. Over time, a large amount of outdated sales history data might accumulate in your system. This accumulated data can cause performance and functional issues when documents that are related to sales orders are posted. (These documents include sales order confirmations, sales packing slips, sales picking lists, and invoices). Therefore, you should set up and schedule the *Sales update history cleanup* periodic task to run at a regular interval. This task removes all sales history update data that is no longer needed.

If you use the *Sales update history cleanup* periodic task, enable the *Sales history cleanup performance improvements* feature, which makes the task run more effectively. (Nevertheless, you can also run the task without enabling this feature.)

Sales history cleanup performance improvements

The **Sales update history cleanup** periodic batch job can take a long time if it runs infrequently on environments with a high volume of sales updates. In these situations, the *Sales history cleanup performance improvements* feature can help reduce the run duration and improve reliability.

The feature improves the existing cleanup job in the following ways:

- It splits the clean-up into batches (you can change the batch size through customizations).
- It runs for a maximum of two hours (you can change the duration through customizations).
- Where possible, it leverages database capabilities to minimize locking contention and avoid joining transactional tables during cleanup.

After enabling the feature, the **Sales update history cleanup** batch job (**Sales and marketing** > **Period tasks** > **Cleanup** > **Sales update history cleanup**) runs as it did before, but with better performance and for a maximum of two hours. This condition means it might need to run several times to clean up all the data for a specific retention time frame.

This feature must be enabled on your system for you to use it. As of version 10.0.41, this feature is turned on by default. As of Supply Chain Management version 10.0.43, it's mandatory and can't be turned off. If you're running a version older than 10.0.43, admins can turn this functionality on

or off by searching for the *Sales history cleanup performance improvements* feature in the Feature management workspace.

Set up and schedule the Sales history cleanup periodic task

To set up and schedule the *Sales history cleanup* periodic task, follow these steps:

1. Analyze your business needs to determine how many days of historic sales order posting data you must keep. Run the cleanup task every three months and a maximum of every six months.

2. Go to **Sales and marketing** > **Period tasks** > **Cleanup** > **Sales update history cleanup**.

3. In the **Clean up sales update history** dialog box, on the **Parameters** FastTab, set the following fields:

    - **Clean up** – Select one of the following values to specify the type of records to clean up:
        - **Executed** – Delete only records that are fully processed. Because you likely have no further use for these records, this option is the safest.
        - **Executed and erroneous** – Delete both fully processed records and records where an error occurred. This option is the most commonly used. You might want to inspect and even fix erroneous records instead of having them automatically cleaned up. However, many companies choose to clean up these records too after about a month, because they're probably no longer relevant by that time.
        - **All** – Delete executed, erroneous, and waiting records. Waiting records are valid but aren't yet fully processed. In most cases, you probably don't want them to be deleted automatically. However, in some situations, you might choose to have them automatically deleted after a specific amount of time has passed.

    - **Retain records based on age** – Specify whether you want to clean up records based on their age on the day when the task runs or delete records that were created before a fixed date. If you're scheduling the cleanup as a recurring task, set this option to *Yes*, because the age is always calculated relative to the date when the task runs.
        - Set this option to *Yes* to enable the **Maximum age** field. Use this field to specify the maximum age of the records to keep each time that the task runs. The **Created until** field is ignored.

    - Set this option to *No* to enable the **Created until** field. Use this field to specify the oldest creation date of the records to keep when the task runs. The **Maximum age** field is ignored.

- **Created until** – This setting applies only when the **Retain records based on age** option is set to *No*. Specify the oldest creation date of the records to keep when the task runs. Records that were created before this date are deleted.

- **Maximum age** – This setting applies only when the **Retain records based on age** option is set to *Yes*. Specify the maximum age (in days) of the records to keep each time that the task runs. Older records are deleted.

4. On the **Run in the background** FastTab, specify how, when, and how often the task runs. Use these settings to implement the schedule that you determined in step 1. The fields work just as they do for other types of batch jobs in Supply Chain Management.

5. Select **OK** to apply your settings and close the dialog box.

Service management overview

07/10/2025

Use the Service management module to establish service agreements and service subscriptions, handle service orders and customer inquiries, and to manage and analyze the delivery of services to customers. You can use service agreements to define the resources that are used in a typical service visit. You can also use service agreements to view how those resources are invoiced to the customer. A service agreement can also include a service level agreement that specifies standard response times, and offers tools to record the actual time.

You can create service orders to manage information about scheduled and unscheduled visits by a service technician to a customer site. Service orders include information such as:

- The number hours required to complete the task
- The type of service or repair
- The item to repair, including details about the symptoms and diagnosis
- Any expenses and fees related to the service or repair

You can receive, process, and dispatch service requests. After you create a service order, you can use service stages to monitor progress and specify rules that control what actions are enabled in each stage. When a service order is complete, you can sign off on the order to confirm that it's complete, and then post the order to start the invoice process.

Use the reporting tools to monitor service order margins and subscription transactions, and print work descriptions and work receipts.

Business processes

The following diagram illustrates the high level business processes for the Service management module, and shows where service processes integrate with other modules.

Important tasks	Primary pages	Popular reports
Fulfill service agreements	Service agreements	Service order margin
Handle customer inquiries	Service orders	Work description
	Dispatch board	Transaction – subscription
		Subscription fee transactions

Integration of Service management

Service management can be integrated with the following modules:

- Sales and marketing overview
- Human resources

Service agreements overview

07/10/2025

Service agreement groups are useful for sorting and filtering service agreements. Use service agreement groups to group service agreements by, for example, company size, geographical location, or industry type. Alternatively, you can use agreement groups to group service agreements by the level of service offered to a customer.

In the **Service agreement group** field on the **Service management parameters** page, you can define a default service agreement group. This group is suggested when you create a new service agreement.

Example

- You can group your service agreements according to the level of service offered.
- The three agreement groups you have set up in your company are Gold, Silver, and Bronze.
- A new service account manager has been employed in your company. The service manager is responsible for dealing with all clients in the Gold agreement group. You can filter agreement records on the Gold agreement group to find all of the agreements for which you must specify the new service manager as the person in charge.

Next steps

- Create service agreement groups

Create service agreements

07/10/2025

This article describes how to use features in the Service management, Project management, and Accounting modules to create service agreements.

Create a service agreement from Service management

1. Navigate to **Service management**.
2. Select **Service agreements** to create a new service agreement line in the page header.
3. Select **New**. Enter a description, select a reference to a project in the **Project ID** field, and fill in the rest of the fields and lines for the service agreement. Select **Save**.
4. On the **Relations** tab, select **Service objects** or **Service tasks** to create service object relations or service task relations for the service agreement. The service objects and tasks that you have created relations for can be attached on the lines of the service agreement.
5. In the lower half of the page, create service agreement lines by copying lines from a service template, another service agreement, or manually creating the service-agreement lines.

> **Note**
>
> If you copy lines into the service agreement from another service agreement, you can indicate whether you also want to copy service object and service task relations. If you copy these relations, they are added to any existing relations on the service agreement. If you copy service-agreement lines from a service template, the service-object and service-task relations are automatically copied as service-object relations and service-task relations on the new service-agreement lines.

Create service agreement lines manually

1. From the **Service agreements** page, add a service agreement line in the lines grid.
2. Enter the appropriate information for the service agreement line.
3. Select **Save** to save the line, and then close the page.

Create a service agreement from Project

1. Select **Project management and accounting**.

2. Select **All projects**.
3. Select the project from the list.
4. On the Action Pane, select **Manage**. In the **New** Action group, select **Service** and select **Service agreement**.
5. Follow the steps in the section titled **Create a service agreement** as described earlier in this article to enter the project reference.

Related information

- Develop and establish service agreements overview

Create service agreement groups

Article • 01/06/2025

Service agreement groups are useful for sorting and filtering service agreements.

1. Go to **Service management** > **Setup** > **Service agreements** > **Service agreement groups**.
2. On the Action Pane, select **New** to create a new service agreement group.
3. In the **Service agreement group** field, enter an ID for the service agreement group.
4. In the **Description** field, enter a description for the service agreement group.
5. In the **Service level agreement** field, select the agreement that applies to the group.
6. Close the page to save your changes.

> **Note**
>
> If a service agreement group is defined in the **Service agreement group** field of the **Service management parameters** page, the program suggests this group for all new service agreements that you create.

Service intervals

Article • 01/06/2025

The service agreement interval indicates the frequency with which service order lines are created for service agreement lines when you create service orders automatically.

When you create service orders automatically, service order lines are created according to the interval that you have specified for the service agreement line from the start date of the agreement line.

If the **Interval** field of a service agreement line on the **Service agreements** page is blank, the line is a one-time event, and it isn't used to create service orders repeatedly.

Example

This example illustrates how a service interval affects service agreement lines and service order lines on a service order.

Create a service agreement

First, you create a service agreement and set the **Combine service orders** option to *By service agreement*.

1. Select **Service agreements**
2. On the Action Pane, on the **Service agreement** tab, in the **New** group, select **Service agreement** to create a new service agreement.
3. Enter a description, select a project in the **Project ID** field, and enter a date in the **Start date** field.
4. In the **Combine service orders** field, select *By service agreement*.

You have now created the following service agreement:

Expand table

Project	Start date
Your project	The date you specified for the project. In this example, the current date is used.

Create a service agreement line

Next, you create a service agreement line that has the transaction type *Hour*.

To complete this part of the example, you must create a service interval of 10 days on the **Service intervals** page.

1. Select the service agreement that you just created.
2. On the **Lines** FastTab, select the **Add** button to create a new line in the lower pane of the **Service agreements** page.
3. In the **Transaction type** field, select *Hour*.
4. In the **Worker** field, select the worker who will deliver the service.
5. In the **Service interval** field, select the 10 days interval.

You have now created a service agreement line with the following information:

Expand table

Transaction type	Start date	Service interval
Hour	The current date.	Every 10 days
Worker	The worker who will perform the service.	

There's no time window specified for the line.

Create planned service orders

You can now create planned service orders and service order lines for the coming month.

1. On the **Service agreements** page, on the Action Pane, on the **Deliver** tab, select **Planned service orders**.
2. On the **Create service orders** page, enter the current date in the **From date** field and a date that is one month from the current date in the **To date** field.
3. Set the **Hour** slider to *Yes*.
4. Select **OK**.

Because there's no grouping on the service order (defined by the **By service agreement** option in the **Combine service orders** field), one service order line is created per service order.

Service orders created

Three service order lines were created within the time frame that you specified in the **Create service orders** dialog box. You can view the service order lines on the **Service agreements** page (Action Pane > **Deliver** tab > **View** button).

Set up service intervals

Article • 01/30/2025

Service interval indicates the frequency with which service order lines are created for service agreement lines when you create service orders.

1. Go to **Service management** > **Setup** > **Service agreements** > **Service intervals**.
2. On the Action Pane, select **New**.
3. Enter the ID and description of the service interval.
4. In the **Range** field, select the range.
5. In the **Frequency** field, type the frequency. The frequency is the factor by which you must multiply the range to obtain the interval for a service agreement.
6. On the Action Pane, select **Save**.

Example

You want to create a service interval of 10 days, so you take the following steps.

1. Go to **Service management** > **Setup** > **Service agreements** > **Service intervals**.
2. On the Action Pane, select **New**.
3. Enter the ID and description of the service interval.
4. In the **Range** field, select *Daily*.
5. In the **Frequency** field, type *10*.
6. On the Action Pane, select **Save**.

Time windows

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can use time windows to optimize the scheduling of service order lines. You can set up the system so that it automatically creates service orders. Based on the criteria specified by a time window, you can connect as many service order lines as possible to as few service orders as possible.

Time windows specify how far a service order line can move from its calculated date. The calculated date is the date when the service order line was scheduled to occur. The date is based on its interval setting and the service period that you defined on the **Create service orders** page. You define a time window by using the values in the following table.

Expand table

Method	Description
Week	The date that the service order line can be moved to any open day in the same week as the initial calculated date.
Month	The date that the service order line can be moved to any open day in the same month as the initial calculated date. For example, the calculated date for a service order line is February 15, 2017. The service order line can be scheduled for any weekday between February 1 and February 28, 2017.
Manual	You define the maximum number of days before or after the initial calculated date that the service order line can be moved.

If you don't specify a time window for a service agreement line, the service order line that is derived from the service agreement must be on the exact date for which it was originally scheduled.

Create a service template group

07/10/2025

You can use service template groups to sort and filter service templates.

1. Go to **Service management** > **Setup** > **Service agreements** > **Service template groups**.
2. Create a new service template group.
3. Enter the group ID, a description, and a parent service template group, if there is one.
4. Save the service template group.
5. Set the **Tree control** slider to *Yes* to open the tree view and view the service template groups either as a hierarchy in a tree view or as an overview.

Service tasks overview

07/10/2025

Use service tasks to describe the task to be completed during a service order. Both technicians and customers can see this information.

You create service tasks on the **Service tasks** page, and you associate service tasks with a specific service agreement or service order by creating service task relations. Every time that you create a service task relation, you can create the following:

- Internal notes for the task, such as detailed technical requests for the task that are important for the technician to know.
- External notes that the customer can see. These might provide a less technical explanation of the task that is being completed, according to the agreement between the customer and the service company.

When you have set up a service task relation between a service task and a service order or service agreement, you can specify this service task when you create service order lines or service agreement lines for the current service order or service agreement.

When you generate service orders from a service agreement, you can use the service tasks that are assigned to each service agreement line to group service order lines into service orders.

Create a service task

1. Go to **Service management** > **Setup** > **Service tasks**.
2. Create a new line.
3. Enter the service ID and description.

Example

A technician must complete two jobs on a gearbox (service object GB-1234) at a customer site. A service agreement is created for the customer, and several transactions are associated with the jobs. The service agreement and service agreement lines for the two jobs are as follows:

Service agreement

Expand table

Project	Service agreement	Description	Group
9012	000008_001	Inspection and routine replacement – GB-1234	Premium

Service agreement lines

Expand table

Description	Transaction type	Service object	Service task
Inspection and cleaning	Hour	GB-1234	I/C - GB1234
Travel	Expense	GB-1234	I/C - GB1234
Materials	Item	GB-1234	I/C - GB1234
Routine replacement	Hour	GB-1234	RR - GB1234
GR-1	Item	GB-1234	RR - GB1234
GR-5	Item	GB-1234	RR - GB1234

The service agreement lines for the two jobs have two service tasks attached to them. The service tasks determine the transactions that belong to each job. In the first case, service task I/C - GB1234 identifies all the service agreement lines that are involved in the inspection and cleaning of object GB-1234. In the second case, service task RR - GB1234 identifies all the service agreement lines that are involved in completing a routine replacement job.

The service task relations that connect the service tasks to the specific agreement are as follows:

Service tasks

Expand table

Service task	Description	Internal note	External note
I/C - GB1234	Inspection of gearbox GB-1234	Visual and mechanical inspection and cleaning of gearbox GB-1234	Routine inspection of gearbox
RR - GB1234	Routine replacement of parts in GB-1234	Routine service replacement of GR-1 and GR-5 components (for gearboxes manufactured before 2002, also replace GR-2 component)	Routine replacement of parts

Group service orders

When you create service orders automatically, you can use service tasks as grouping criteria. To group service orders by service tasks, define on the service agreement that service orders that are based on the service agreement should be grouped by service task ID as their initial grouping criteria.

Group by service task

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. On the **Setup** tab, select **By service task** in the **Combine service orders** field.

Create service task relations

Article • 01/30/2025

You can associate service tasks with service agreements or service orders in order to describe the service task to be completed for the agreement or order. This information is available to service technicians and customers.

Create a relation with a service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select an existing service agreement, or create a new service agreement.
3. On the Action Pane, select the **Service tasks** button.
4. On the **Service tasks** page, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service task to the service agreement.
5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.
6. Close the page to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service agreement. You can now specify these service tasks for any attached agreement lines.

A service tasks relation that is created on a service agreement is available from all service orders that are attached to the service agreement.

Create a relation with a service order

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select an existing service order, or create a new service order.
3. On the Action Pane, select the **Service tasks** button.
4. From the **Service tasks** page, select **New** to create a new line, and then select a service task from the **Service task** list to attach the service tasks to the service order.

5. On the **Description** tab, enter any internal or external note descriptions in the free text fields.

6. Close the page to save the record.

Repeat this procedure until you have created all the necessary service task relations for the service order. You can now select the service task for which you have created the relation when you create service order lines.

Service task relations that are created on a service order are available on the specific service order.

Service objects overview

07/10/2025

Service objects are a customer's assets and products for which you can perform a service. Depending on the type of service you provide, objects can be tangible or intangible:

- Tangible objects are things, such as a machine or a building, on which you can perform a physical service task.

  A tangible service object can also be an inventory item that you create on the Released product details page. Depending on the inventory dimension group that you attach to the item, you can create a service object to a level of detail that includes the item serial number. This is useful when you must keep track of the exact item that the service object represents.

  A tangible service object can also be an item that isn't directly related to a company's direct production or supply chain. For example, a tool kit that is used for repairs in a service order can be a service object that isn't included in inventory. In this case, you don't register it as an inventory item.

- Intangible objects are nonphysical things, such as a set of accounts or a legal document, on which you can perform a service task.

Example of an intangible service object

Company A maintains the financial records for several small companies. One of Company A's clients is the local football team, for which Company A does the weekly bookkeeping and annual audit of the club's accounts. The club's accounts are set up on the Service objects page and specified as the object in the service agreement. There are two service agreement lines for the object. Line 1 is weekly bookkeeping with a weekly interval assigned to the line, and line 2 is the annual audit with a yearly interval assigned to it.

Attach inventory items to service objects

07/10/2025

This article explains how to attach an inventory item to a service object. When you attach an item to a service object, you can control and report the service activities that are performed for the item.

Before you can attach items to service objects, you must create the items on the **Released product details** page.

Use the following steps to attach an inventory item to a service object:

1. Go to **Service management** > **Setup** > **Service objects** > **Service objects**.
2. In the **Item number** field, select the item to attach to the service object.
3. Save the service object.

The item is now attached to the service object, and any inventory dimensions specified for the item are also copied to the service object.

Related information

- Service objects overview

Service object groups

Article • 01/30/2025

Object groups are useful for sorting and filtering the data about objects for reports and statistics. For example, you can group objects by geographical location or by type.

Group by geographical location

You can use this grouping method to show where the various different objects that your company services are located. Grouping objects by geographical location can also be useful if, for example, you must identify the objects that your company already provides services for in a particular country/region.

Example of grouping by geographical location

A customer from Belgium calls your service center and wants to create a service agreement for an object, ABC. You have attached an object group for geographical location, Belgium, to all objects that are serviced in Belgium. By using this group as a filter, you can quickly search to see whether you already have a record for ABC in the program, or whether you must set up a new object.

Group by type

You can use this grouping method to show the types of objects that your company services. Grouping objects by type can also be useful if, for example, you want to create a new object based on similar objects that already exist in the program.

Example of grouping by type

A customer calls and wants to set up a service agreement for an air conditioning machine, HIJ. You don't already have a record for this machine. However, you have set up an object group titled Air Conditioners, and you have attached this group to all air conditioning objects. Therefore, you can quickly search for and identify all other air conditioning machines and use the template information from these objects to create service agreement lines for HIJ. By using object groups in this manner, you can quickly set up new objects and determine the service tasks that must be performed on them.

Create service object groups

Create groups that you can assign service objects to. Service objects are inventory items and other products for which services are performed. By grouping service objects, you can create reports for similar and related service objects. For example, a service object group might consist of two service objects: One service object is a kit, and the second service object is the service to install the kit.

To create service object groups, follow these steps:

1. Go to **Service management** > **Setup** > **Service objects** > **Service object groups**.
2. Select **New** to create a new service object group.
3. Enter a unique name for the service object group and, optionally, a description.

You can assign service objects to the group by using the **Service objects** page.

Service object relations

07/10/2025

You can create service object relations between a service object and a service agreement or service order. When you create a relation, you attach the service object to the service agreement or service order.

After the relation is created, you can attach the service object to any lines on the service agreement or service order.

Template BOMs

You can also specify a template BOM for the object relation. The template BOM is a bill of materials for the object on which you perform service. If you replace a component part of the service object during a service visit, you can register this change in the service BOM by using the **Service objects** page.

Example

You create a service agreement for servicing two elevators at a customer site. The service agreement has the identifier ID SAL-001.

The elevators are set up on the Service objects page as objects, EL-S/1000 and EL-L/1000.

You attach the service objects, EL-S/1000 and EL-L/1000, to the service agreement.

You want to register changes in the BOM for the service object as you replace component parts of the object, so you attach a service BOM to the service object relation, as described in the following table.

Expand table

Service object	Relation – Service agreement	Service BOM
EL-S/1000	ID SAL-001	BOM-EL-S/1000
EL-L/1000	ID SAL-001	BOM-EL-L/1000

Because there are service object relations for the agreement, you can now create service agreement lines with these objects, as shown in the following table.

Expand table

Transaction type	Category	Service object
Hour	Inspection	EL-S/1000
Hour	Gear box cleaning	EL-S/1000
Item	Cleaning materials	EL-S/1000
Hour	Inspection	EL-L/1000
Hour	Gearbox cleaning	EL-L/1000
Item	Cleaning materials	EL-L/1000

On a service visit, you have to replace the gearbox for elevator EL-S/1000. To replace a component part of the object, you can access the BOM Designer by using the service object relation that you set up for the current service agreement.

Access the BOM Designer by using a service object relation

1. Go to Service agreements.
2. Open a service agreement, or select **Service agreement** to create a service agreement.
3. Select the **Setup** tab.
4. Select **Service objects** to attach a template BOM to the service agreement.
5. On the **Service objects** page, select **Designer** to open the Designer page to modify the template BOM.

Automatically created service orders

If you automatically create service orders for a service agreement, the service object relations in the agreement are also created in the service orders.

Create service object relations

07/10/2025

This article describes how to create service object relations for a service agreement and a service order. When you a create service object relation, you associate the service object to a service agreement or service order. When a customer requests service for an item that is a service object, you can select the service object from the list of service object relations.

Create a service object relation for a service agreement

Use the following steps to create a service object relation for a service agreement:

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. In the **Service agreements** list, select an existing service agreement, or select **New** to create a new service agreement.
3. On the **Service agreements** page, on the Action Pane, on the **Service agreement** tab, in the **Relations** group, select **Service objects**.
4. On the **Service objects** page, select **New**, and then select a service object for this service agreement.
5. To assign a template bill of materials (BOM) to the service agreement, select **Functions**, and then select **Attach template BOM**. On the **Select template BOM** page, in the **Template BOM** field, select a template.

Create a service object relation for a service order

Use the following steps to create a service object relation for a service order:

1. Go to **Service management** > **Service orders** > **Service orders**.
2. In the **Service orders** list, select an existing service order, or create a new service order.
3. On the **Service orders** page, on the Action Pane, on the **Service order** tab, in the **Relations** group, select **Service objects**.
4. On the **Service objects** page, select **New**, and then select a service object for this service order.

5. To assign a template BOM to the service agreement, select **Functions**, and then select **Attach template BOM**. On the **Select template BOM** page, in the **Template BOM** field, select a template.

Template BOMs

07/10/2025

A template bill of materials (BOM) provides you with a standardized list of components for service objects that are serviced regularly. The components that are listed in the template BOM represent the individual subcomponents of the service object. By applying a template BOM to a service object, you can keep a record of the subcomponents that were replaced on the service object.

To apply a template BOM to a service agreement or a service order, you attach it to a service object relation.

> **Note**
>
> You can apply only one template BOM to a service object.

Create a template BOM

The following table contains information about the various methods that you can use to create a template BOM.

Expand table

Method	Description
Production	The template BOM is based on a production order. This option is applicable only if you operate in a production environment. The benefit is that you have a current, detailed listing of the components that make up an item.
Item BOM	The template BOM is based on an item BOM. The item BOM, unlike the production BOM, is a static list of the components that make up an item.
Existing template	The template is based on an existing template BOM.
Manual	If you know what spare parts are typically replaced on a service object, you can create your template BOM manually. This method helps make sure that the components that are included in the template reflect the actual requirements of your workplace.

Apply the template BOM to a service agreement or service order

You can apply a template BOM to a service agreement, a service order, or both. The service agreement usually covers a long-term relationship with a customer. The history of replacements that is recorded in the service BOM is useful data to have for the service agreement.

You can also apply a template BOM to a service order to record the history of the service that was performed on a service object.

Copy the history of a service BOM

You can copy the history of a service BOM line from one service agreement to another service agreement. By copying the service history between service agreements, you can preserve the record of replacements for an item.

Example

You set up a three-year service agreement for a customer's car. During that period, the customer becomes accustomed to the good service that the company provides. Therefore, after the agreement expires, the customer wants to set up a new one. You're now able to negotiate a more favorable agreement for the company. Because the record of replaced components might be useful in the future, you copy the history of the service BOM to the new agreement.

Modify the template BOM

If a template BOM hasn't been attached to a service object, you can modify or delete lines in it. After the template BOM is attached to a service object, you can modify only the local version of the BOM. If you want to duplicate the setup of a local version of a template BOM, you can create a new template BOM based on the local version. Learn more in Modify a Service BOM.

If you replace an item in the BOM, you can register the replacement on the BOM line in the BOM designer. Optionally, you can create a service order line for the replacement object. If you create a service order line, you can invoice the replacement item. If you don't create a service order line for a replacement, the replacement registration is kept to track the history of the service object.

Change how information on the BOM line is displayed

You can change the way that information on the BOM line is displayed for all template and service BOMs. The changes are applied to all template BOMs and service BOMs.

Set up number sequences for template BOMs

To use template BOMs, you must set up two number sequences. Set up one number sequence for the template BOM and one for the BOM history line number.

> **Note**
>
> Number sequences are used to allocate identifiers to records that require them. Before you can assign a number sequence to a template BOM or a BOM history line number, you must set up number sequences codes.

Set up number sequences

1. On the **Number sequences** list page, create number sequences for template BOMs and the BOM history line number.
2. Go to **Service management** > **Setup** > **Service management parameters**.
3. Select **Number sequences**, and then select a number sequence code for the number sequence references that you created on the **Number sequences** page.
4. Close the page to save your changes.

> **Note**
>
> The BOM history line number is used by the system to associate the transactions in the BOM history with a service agreement or service order. The number is not displayed in the user interface.

Create a template BOM

07/10/2025

You can create a template bill of materials (BOM) by using any of the following methods. For all methods, the **From date** and **To date** fields are optional and for information only.

Create a template BOM manually

1. Go to **Service management** > **Setup** > **Service objects** > **Template BOMs**.
2. Select **New** to open the **Create template BOM** page.
3. Under **Copy BOM lines from reference**, select the **Manual** option.
4. In the **Item number** field, enter an item of the type **BOM**.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new, blank template BOM is created.

Create a template BOM based on another template BOM

1. Go to **Service management** > **Setup** > **Service objects** > **Template BOMs**.
2. Select **New** to open the **Create template BOM** page.
3. Under **Copy BOM lines from reference**, select the **Template BOM** option.
4. In the **Reference number** field, select an existing template BOM to copy to your new template BOM.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines in the original template BOM.

Create a template BOM based on an item BOM

1. Go to **Service management** > **Setup** > **Service objects** > **Template BOMs**.
2. Select **New** to open the **Create template BOM** page.

3. Under **Copy BOM lines from reference**, select **BOM**.
4. In the **Reference number** field, select a BOM version. An item of the type BOM is copied to the **Item number**.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines of the BOM listed in **Bills of materials**.

Create a template BOM based on a production BOM

1. Go to **Service management** > **Setup** > **Service objects** > **Template BOMs**.
2. Select **New** to open the **Create template BOM** page.
3. Under **Copy BOM lines from reference**, select **Production**.
4. In the **Reference number** field, select a production BOM.
5. In the **Name** field, enter a name for the template.
6. In the **From date** and **To date** fields, enter a date interval in which the template BOM is active.
7. Select **OK**.

A new template BOM is created by using lines that correspond to the lines of the BOM listed in **BOM**.

Attach templates to service objects

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A template bill of materials (BOM) can be attached to a service object relation. The service object relation can then be associated with either service orders or service agreements.

1. Go to **Service management** > **Setup** > **Service objects** > **Service objects**.
2. Select a service object.
3. Select **Service agreements** or **Service orders** to display the service agreements or service orders that the service object has been associated with.
4. Select a service agreement or a service order, select **Functions**, and then select **Attach template BOM**.
5. Select the template BOM to attach to the object.

> **Tip**
>
> To move an attached BOM to another service object or to delete an attached BOM, on the **Service objects** page, select **Functions**, and then select **Move service BOM** or **Delete service BOM**.

Reason codes for service orders

07/10/2025

You can use reason codes to help explain the status of a service order when the stage of a service order is updated. For example, if you cancel a service order, you can select a reason code for the cancellation.

To view information about reason codes that are used to track the progress of service orders, run the Service order progress report. This report lists all service orders, regardless of their stage, and the reason codes that are specified when a service order stage is updated.

Turn reason codes on or off

Reason codes are optional. You can decide whether to require a reason code when you update a service order to a specific service stage.

1. Go to **Service management** > **Setup** > **Service orders** > **Service stages**.
2. On the **Service stages** page, select a service stage, and then select the **Reason** check box for the service stage.
3. Close the page to save your changes.

Related information

- Set up service order stages

Service order stages

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can set up stages for a service order to define the tasks that must be completed, the order in which they are completed, and the workers who are responsible for completing them. By defining the stages for a service order and assigning them to workers, you can control the flow of a service order through the tasks that various people perform in the service organization. The sequence of stages must include an initial stage.

You can also define the actions that are permitted at each stage. For example, if you clear the **Post** check box for all stages except the final stage, you prevent any service orders from being posted before the service orders are processed through the complete sequence of stages.

Branching in service order stages

When you set up a service stage, you can create multiple options, or branches, to select from for the next service stage. All the branches that you create are available to select from when the initial stage is completed. For example, you set up *Planning* as an initial stage. You create two stages named *In process* and *Cancel*, and then select *Planning* as the parent for them. You assign the *Planning* stage to sales order. When the planning stage for the sales order is completed, you can select the *In process* stage if the sales order is ready to work on, or you can select the *Cancel* stage if the sales order is canceled.

Set up service order stages

07/10/2025

1. Go to **Service management** > **Setup** > **Service orders** > **Service stages**.
2. Select **New** to create a new record.
3. In the **Service stage** and **Description** fields, specify a service stage ID and description.
4. Select the appropriate parameters for the stage.
5. Select the parent stage for the current stage or leave the **Parent** field blank if the stage is the initial stage in the stage setup.

> **Note**
>
> You can't modify the **Parent** field after you save the stage. Instead, you can delete the record and create the record again with a different selection in the **Parent** field.
>
> Also, you can only create one stage with a blank **Parent** field. That is, only one initial stage is permitted.

Create reason codes

07/10/2025

1. Go to **Service management** > **Setup** > **Service orders** > **Stage reason codes**.
2. Select **New** to create a new reason code.
3. Select **Save** to save the reason code.

When you're prompted for a reason code to explain why you're updating a stage of the service order, you can select any of the reason codes that you create here.

Service level agreements overview

07/10/2025

A service level agreement (SLA) is an agreement between a service company and a service customer. In a SLA, the customer agrees to a minimum response time based on when the service company records the issue and when the issue is resolved.

A SLA enforces a standard level of service that is offered to customers, and also makes it transparent to a service company when a service job should be completed.

Any number of SLAs can be created to offer service customers different levels of service.

Create a service level agreement

1. Go to **Service management** > **Setup** > **Service agreements** > **Service level agreements**.
2. Type a name for the service level agreement in the **Service level agreement** field.
3. Type the time that you want to allow for completion of service calls that are attached to the service level agreement. Then select a calendar if you want to base the service level agreement on a specific calendar.

Apply a service level agreement

The SLA is applied directly to a service agreement.

Service orders that you create manually and attach to a service agreement that has an SLA are measured against that SLA.

Service orders that you create automatically aren't attached to an SLA.

Apply the service level agreement to the service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select the service agreement that you want to apply the SLA to, and then select **Edit** on the Action Pane.
3. In the **Service level agreement** field, select the SLA that you want to assign.

Apply the service level agreement to the service agreement group

1. Go to **Service management** > **Setup** > **Service agreements** > **Service agreement groups**.
2. In the **Service level agreement** field, select the SLA that you want to assign.

Track time on a service order against an SLA

When you create a new service order for a service agreement that an SLA is assigned to, the time interval for the delivery of the service is initiated, and the system starts to track the delivery time. Additionally, you can set the following options:

- You can start and stop time recording on the service order to register the total amount of time that is spent on service orders.
- You can monitor compliance with the time interval that is set in the service level agreement.
- You can define reason codes that must be set if the time interval of the service level agreement is exceeded.

Related information

- View compliance with service level agreements

Subscription sales prices

Article • 01/30/2025

When you create a subscription, the sales price is derived from the sales price setup that was created on the **Sales price (subscription)** page.

On the **Sales price (subscription)** page, you can create sales prices for a specific subscription or you can create sales prices that apply more broadly. For a sales price to be applied to a subscription, the period code and the currency of the subscription must be identical to the period code and the currency of the sales price.

If the period code and currency are identical for the subscription and the sales price, subscription sales prices are selected on the basis of the priorities listed in the following table. A blank cell in the table indicates an empty field and an X indicates a value that is equal to the value in the subscription from which the transaction is generated.

Expand table

Priority	Category	Project ID	Subscription	Sales currency	Period code
1	X	X	X	X	X
2		X	X	X	X
3	X		X	X	X
4			X	X	X
5	X	X		X	X
6		X		X	X
7	X			X	X
8				X	X

When a subscription fee is created, the sales price with the greatest level of detail, as noted in the table above, is selected as the subscription sales price.

Update and index subscription sales prices

You can update the subscription sales price by updating the base price or the index. You can update by a percentage or to a new value.

Subscription fee sales prices

When you create a subscription fee, the sales price is based on the sales price setup of the subscription. You can either use the base price from the subscription price setup or create indexed sales prices.

Example

You want to set up subscription sales prices of EUR 500 for a new project 9030. On the **Sales price (subscription)** page, you create a subscription sales price line as indicated in the following table.

Expand table

Valid from	Category	Project	Subscription	Period code	Sales currency	Sales price
28-08-2006		9030		Month	EUR	500

Note that the **Category** and **Subscription** fields are empty.

You then create the following subscriptions.

Expand table

Service subscription	Project	Subscription group	Category	Currency	Period code
00020_135	9030	Sub1	SubCat1	EUR	Monthly
00021_135	9030	Sub1	SubCat2	EUR	Monthly

Now you create subscription fees for both subscriptions in the subscription group Sub1:

1. Go to **Service management** > **Setup** > **Service subscriptions** > **Subscription groups**.
2. On the **Subscription groups** page, select **Function** > **Create subscription fee**.
3. On the **Create subscription fee** page, enter the appropriate information. Learn more in Create subscription fee transactions.

Subscription fees that have a sales price of EUR 500 are created for both subscriptions, as shown in the following table.

Expand table

Project date	Service subscription	Project	Category	Start date	End date	Sales currency	Sales price
28-08-2006	00020_135	9030	SubCat1	01-01-2007	31-03-2007	EUR	500
28-08-2006	00021_135	9030	SubCat2	01-01-2007	31-03-2007	EUR	500

Later, you decide that you want to specify sales prices for the category SubCat1 for project 9030. Therefore, you create a new sales price line that has a sales price of EUR 550 for the combination of project 9030 and fee category SubCat1. There are now two subscription sales price lines for project 9030, as shown in the following table.

Expand table

Valid from	Category	Project	Subscription	Period code	Currency	Sales price
28-08-2007		9030		Month	EUR	500
28-08-2007	SubCat1	9030		Month	EUR	550

You repeat the procedure described above to create subscription fees for both subscriptions in the subscription group Sub1. The following table shows the transactions that are created for each subscription that is attached to the subscription group.

Expand table

Project date	Subscription	Project	Category	Start date	End date	Sales currency	Sales price
28-07-2007	00020_135	9030	SubCat1	01-01-2008	31-03-2008	EUR	550
28-07-2008	00021_135	9030	SubCat2	01-01-2008	31-03-2008	EUR	500

In the first transaction for subscription 00020_135, the sales price of EUR 550 derives from the subscription sales price that is set up for the combination of the specific project and category. In the second transaction for subscription 00021_135, the sales price of EUR 500 is used as the project subscription sales price because there's no price set up for the combination of project 9030 and category SubCat2.

Subscription groups

Article • 08/26/2024

Subscriptions share the following information, which is defined for the subscription group:

- Number sequence code for the subscription, if any.
- The invoicing period for which subscription transactions are created. For example, if the **Invoicing** period code on the **Subscription groups** page is set to **Quarterly**, transactions for all subscriptions that are attached to the subscription group are created on a quarterly basis.
- How frequently the subscription is to be accrued, if at all.

You can also complete the following tasks for all subscriptions that are attached to the subscription group:

- Create subscription transactions.
- Update the base price or the index for the subscriptions.
- Post accrued revenue for subscription transactions.

Related information

- Set up subscription groups

Use stage reason codes

07/10/2025

You use a reason code to indicate why a service level agreement (SLA) has been canceled, or why a service order has exceeded the time limit that is you define in the SLA.

You can also specify that a reason code is required when an SLA is canceled, or when the time limit exceeds the time that is specified in the SLA for the service order.

If you have specified that a reason code is required, you must enter a reason code in the following situations:

- When a service order is moved to a stage that stops time recording against the SLA for the service order
- When the service order is signed off
- When time recording is manually stopped

Set up reason codes

1. Go to **Service management** > **Setup** > **Service orders** > **Stage reason codes**.
2. On the **Stage reason codes** page, select **New** to create a new reason code.
3. In the **Stage reason code** field, enter a unique stage reason code.
4. In the **Description** field, enter a description of the stage reason code.
5. Close the page to save your changes.

Require reason codes when a service level agreement is canceled

1. Go to **Service management** > **Setup** > **Service management parameters**.
2. On the **Service management parameters** page, select the **General** link, and then select the **Reason code on canceling** check box.

Require reason codes when a service order exceeds the time limit that is set by the service level agreement

1. Go to **Service management** > **Setup** > **Service management parameters**.
2. On the **Service management parameters** page, select the **General** link, and then select the **Reason code on exceeding time** check box.

Related information

- Start and stop time recording on a service order

Integration for service agreements and projects

07/10/2025

When you work with service agreements and service agreement lines, you use data that is set up in the following areas in **Project management and accounting**.

Project prices

The cost and the sales price for a service agreement transaction are derived from the cost price setup that applies to the project that is attached to the service agreement. Cost and sales prices can be set up by project, employee, and category.

Project validation

The projects, employees, and categories that are available for selection on a service agreement line can be limited by the validation setup in **Project management and accounting**. By using the validation setup, you can combine employees, projects, and categories for control access.

Project line properties

A line property is entered automatically for a service agreement line.

Line properties are created on the **Line properties** page in **Project management and accounting**. The line property that is entered on a service agreement is attached to the project that is selected for the service agreement and inherited subsequently by the service agreement line.

Default offset accounts

If you enter an expense transaction, a default expense offset account is selected automatically for the transaction. The default expense account is set up for the project that is attached to the current service agreement.

Project categories

The categories that are available for service agreement lines are set up on the **Project categories** page in **Project management and accounting**.

> **Note**
>
> Categories that have the **Active in journals** check box selected on the **Project** tab on the **Project categories** page are available for selection. However, if the **Inactive categories** check box is selected on the **Journals** tab on the **Project management and accounting parameters** page, all categories are available for selection.

Project parameters

If the **Terminated workers** field on the **Journals** tab on the **Project management and accounting parameters** page is selected, you can select inactive employees and active employees on the **Service agreements** and **Service orders** pages.

Also, you can enable the **Start time** and **End time** fields on the **Project** tab on the **Service orders** page to enter starting and ending times on service order lines.

Enable the starting and ending time feature for service orders

1. Select **Project management and accounting** > **Setup** > **Project management and accounting parameters**.
2. Select the **Journals** tab, and then select the **Show start/end times** check box.
3. Select **Project management and accounting** > **Setup** > **Journals** > **Journal names**.
4. Select the journal name that is attached to the service order.
5. Select the **General** tab, and then select the **Show start/end times** check box.

> **Note**
>
> Select the journal name for the service order in the **Hour** field on the **Journals** tab of the **Service management parameters** page.

Repair management

07/10/2025

For repair management you can group problems systematically. This is to help with the suggestion of solutions that have been successful in the past.

You set up symptoms, diagnosis, and resolution settings. All these can later be applied when you receive a similar item for repair. You can also set up repair stages that can follow the progress of a repair issue.

Setting up repair management

Use the following setup pages to enter information that will be used to specify the symptoms, the diagnosis, and the resolution, of the repair.

- **Service management** > **Setup** > **Repair** > **Conditions**.
- **Service management** > **Setup** > **Repair** > **Symptom areas**.
- **Service management** > **Setup** > **Repair** > **Diagnosis areas**.
- **Service management** > **Setup** > **Repair** > **Resolutions**.
- **Service management** > **Setup** > **Repair** > **Repair stages**.

Symptoms and conditions

Symptoms are how the customer characterizes the problem. Symptoms include the customer observations that indicate the need for repair.

You can set up symptom areas, symptom codes, and conditions. The symptom area covers the area of malfunction, and the symptom code covers the malfunction symptom. The condition describes the situation or environment that is present when the problem occurs.

Example

A computer is brought in for repair because the hard drive fails after an extended period of use. The hard drive failure causes a blue screen error. The technician who receives the computer enters the following symptoms and conditions:

- The symptom area is the hard drive.
- The symptom code is the blue screen error.
- The condition is that the hard drive fails after extended use.

Diagnosis and resolutions

The diagnosis and resolution fields are statements from the repair perspective. These are the steps that a technician went through to investigate the problem.

The diagnosis area covers the operation that must occur to solve the issue. The diagnosis code is how the problem was handled, and the resolution could be that the item was repaired, replaced, or the order was canceled by the customer. For example, if the computer is repaired, the diagnosis area could be *defective part*, the diagnosis code could be *new video card installed*, and the resolution could be *replaced*.

Repair stages

Repair stages state the progress of the repair process. The repair stage has a **Finished** sign-off parameter that indicates that the repair line has been completed, and the finishing date and time has been recorded.

Applying repair management

To apply repair management to an item, the item must be set up with a service object relation on a service order. From the service order you can then create a repair line with information about the current issue. On the repair line you define the service object that is in repair and information about symptoms, diagnosis, and execution. You can also create a note for the repair line.

You can create repair lines for each step in the repair process.

Create a repair line on a service order

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select the service order with the service object that needs repair.
3. Select **Repair** > **Repair lines** to open the **Repair lines** page.
4. Select **New** to create a new line.
5. Select a service object. You can select any service object that has been set up with an object relation on the service order.
6. Select any of the preset symptoms, diagnosis, and execution values that are relevant in the repair line and then select the **Note** tab to create a note on the repair line, if needed.
7. Select **Save** to save the new repair line. The **Created date and time** field in the **General** tab of the **Repair lines** page is updated with the time of saving.

Tracking progress and resolving a repair issue

You can set the repair stages of a repair line to track the progress of the repair.

When a repair issue is resolved, you can close the repair line. Set the repair stage to a stage with a **Finished** property enabled. The current date and time is registered as the finish time on the line.

Close a repair line for a resolved issue

1. Open the **Repair lines** page. Follow the procedure earlier in this article to create a repair line.
2. Select the repair line with the repair issue that you want to close.
3. In the **Repair stage** field, select a stage with the **Finished** property enabled.

Work with customer service overview

Article • 01/06/2025

Customer service supports professional, service-based companies and manufacturing service organizations.

Customer service includes the following functionality:

- Key processes for service management, such as service agreements, service orders, and return management
- An advanced setup for repair management that includes tracking of repairs and versioning for bills of materials (BOMs)
- Support for employee roles, such as service manager, dispatcher, and service technician or service consultant
- Service subscriptions, which can generate periodic streams of revenue that are independent of the frequency of service
- Service-level agreements that support a differentiated customer base

The articles in this section provide an overview of the Customer service business process and each business process component. They also list the pages that are associated with each business process component, and they discuss the tasks that are associated with each business process component.

Develop and establish service agreements overview

07/10/2025

Service agreements let you define the resources that are used in a typical service visit and how those resources are invoiced to the customer.

Every service agreement is attached to a project through which transactions are posted and invoiced. However, you can also invoice service order transactions directly through the project without first having to connect the service order to a service agreement. You might decide to do this if the service order is for a one-time-only service visit and the need for processing the service transactions quickly outweighs the need for maintaining detailed service-agreement information about the customer over a period of time.

Service agreement

In each service agreement, you must specify a project, a service-agreement ID, and a service-agreement group. The service-agreement group can be used to sort and organize service agreements.

A service agreement header contains settings that apply to all attached agreement lines, including:

- Whether the service agreement is suspended
- The duration of the service agreement
- How service-order lines are to be combined into service orders
- Whether the service agreement is a template

If the service agreement is suspended, you can't generate service orders from the service agreement.

In the service-agreement header, you also set up all the service objects and service tasks that can be used with the service agreement by entering the specific service tasks or service objects that are to be attached to the various lines of the agreement.

From the service-agreement header, you can also copy service-agreement lines or service-template lines into the current service agreement.

You can suspend service agreements and stop individual service agreement lines.

If you select the **Suspended** check box on a service agreement, you can't:

- Create service orders automatically or manually from the service agreement.

If you select the **Stopped** check box on a service agreement line, you can't:

- Create service orders automatically or manually from the service agreement line.
- Copy the service agreement line into another service agreement or service order.

> **Note**
>
> If a service agreement is suspended, all the attached lines are stopped, regardless of their individual status.

Service-agreement lines

Each service-agreement line describes in detail the content of the proposed service work. The lines contain the following settings:

- The transaction type and the description of the transaction type
- The employee who performs the service work
- The objects on which service must be performed for the service agreement
- The frequency with which work is performed and associated item, expense, and fee transactions are registered
- The time window within which service-order lines can be grouped into a service order
- The service tasks that are used to group sets of agreement lines together into work tasks and to summarize for service technicians and customers what service task is to be provided
- Whether a line is stopped (if a line is stopped, you can't create service orders for that individual line)
- Project settings, such as the category and the line property

- Create service agreements

Create service agreements

07/10/2025

This article describes how to use features in the Service management, Project management, and Accounting modules to create service agreements.

Create a service agreement from Service management

1. Navigate to **Service management**.
2. Select **Service agreements** to create a new service agreement line in the page header.
3. Select **New**. Enter a description, select a reference to a project in the **Project ID** field, and fill in the rest of the fields and lines for the service agreement. Select **Save**.
4. On the **Relations** tab, select **Service objects** or **Service tasks** to create service object relations or service task relations for the service agreement. The service objects and tasks that you have created relations for can be attached on the lines of the service agreement.
5. In the lower half of the page, create service agreement lines by copying lines from a service template, another service agreement, or manually creating the service-agreement lines.

> **Note**
>
> If you copy lines into the service agreement from another service agreement, you can indicate whether you also want to copy service object and service task relations. If you copy these relations, they are added to any existing relations on the service agreement. If you copy service-agreement lines from a service template, the service-object and service-task relations are automatically copied as service-object relations and service-task relations on the new service-agreement lines.

Create service agreement lines manually

1. From the **Service agreements** page, add a service agreement line in the lines grid.
2. Enter the appropriate information for the service agreement line.
3. Select **Save** to save the line, and then close the page.

Create a service agreement from Project

1. Select **Project management and accounting**.

2. Select **All projects**.
3. Select the project from the list.
4. On the Action Pane, select **Manage**. In the **New** Action group, select **Service** and select **Service agreement**.
5. Follow the steps in the section titled **Create a service agreement** as described earlier in this article to enter the project reference.

Service subscriptions

Article • 01/30/2025

Subscriptions are based on a time-and-materials project. You can create subscriptions from a project, from the **Service subscriptions** page, or by using a service subscription group.

For each subscription, you can create an optional number of subscription fees. The subscription fees are the transactions that you invoice to the customer.

A period code indicates the extent of the subscription fee period, or the intervals at which the subscription should be invoiced.

The period code is defined in the service subscription group. It is defined for the subscriptions through the service subscription group. Any new subscription fee that you create has a suggested start date. This is the start date of the period, if it is the first period that is created, or the end of the previous period, if it is the second or later period.

Service templates

Article • 06/03/2022

You can define a service agreement as a template and copy the lines of the template later into another service agreement or into a service order.

Example

A customer for whom you provide service has identical service elevators at five different locations.

You want to set up five service agreements for the customer, one for each site. To limit repetitive setup work, and to make sure that the setup information in the service agreements is identical, you create a service agreement and specify it as a template for the service work on the elevators.

You can now copy the template lines into the five new service agreements, so that each service agreement is populated with the lines from the template.

Create a template

When you create a service template, you create a service agreement, create the required lines on it, and attach the service agreement to a service-template group.

> ⓘ **Note**
>
> A service agreement can be defined as a template only if it has no service orders attached to it. Also, no service orders can be generated from a service agreement that is defined as a template.

Copy template lines

You can copy template lines from a service template into another service agreement or into a service order.

When you copy template lines into your service orders or service agreements, your template groups are displayed in a tree view in which each group can be expanded. This display lets you view each template and template line.

It is easier to determine the service-template lines that you want to copy if you have grouped the templates under names that reflect the use of the templates.

Copy service templates lines

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Template information can be copied to either a service agreement or a service order.

Copy service template lines into a service agreement

1. Select **Service agreements**.
2. Select a service agreement to open the **Service agreements** page.
3. Select **Template lines** to open the **Copy service template lines** page.
4. On the **Tree control** tab, expand the tree, find the template that contains the lines that you want to copy to the service agreement, and then select the service template.
5. On the **Lines** tab, select the **Select** check box for the service template lines that you want to copy.
6. Select **OK**.
7. Close the pages to save your changes.

The service template lines are now copied to the service agreement, together with the attached service object and service task relations.

Copy service template lines into a service order

1. Select **Service orders**.
2. Select a service order to open the **Service orders** page.
3. Select Copy > Copy template lines to open the **Copy service template lines** page.
4. On the **Tree control** tab, expand the tree, find the template that contains the lines that you want to copy to the service order, and then select the service template.
5. On the **Lines** tab, select the **Select** check box for the service template lines that you want to copy.
6. Select **OK**.
7. Close the pages to save your changes.

The service template lines are now copied to the new service order, together with the attached service object and service task relations.

Manage template BOMs on object relations

07/10/2025

Attach a template BOM to a service object

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select the service agreement in which you want to attach a template BOM to an object relation.
3. Select **Setup** > **Service objects**.
4. On the **Service objects** page, select the object to attach a template BOM to, and then select **Functions** > **Attach template BOM**.
5. In the **Select template BOM** dialog box, select a template BOM, and then select **OK**.
6. Close the pages to save your changes.

Delete a service BOM from a service object

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select the service agreement in which you want to delete a service BOM from an object relation.
3. Select **Setup** > **Service objects**.
4. On the **Service objects** page, select the object that has the service BOM to delete, and then select **Functions** > **Delete service BOM**.
5. Close the pages to save your changes.

Move the service BOM history from one service agreement to another

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select the service agreement to move a service BOM from.
3. Select **Setup** > **Service objects**.

4. On the **Service objects** page, select the object that has the service BOM to move, and then select **Functions** > **Move service BOM**.
5. On the **Select service object relation** page, select the service object relation to move the service BOM to, and then select **OK**.
6. Close the pages to save your changes.

Modify the information displayed for a BOM line

1. Go to **Service management** > **Setup** > **Service objects** > **Template BOMs**.
2. Select a template BOM, and then select **Designer**.
3. Select the **Setup** tab. In the **BOM** area, select the check boxes for the information to display on the BOM lines of your service BOMs and template BOMs.
4. Close the pages to save your changes.

Indexed sales prices

Article • 01/06/2025

You set up the index for a subscription sales price when you create a subscription fee.

On the **Create subscription fee** page, set the **Get pricing from** field to **Indexed base price**, and then multiply the base price by the percentage in the **Percent price change** field to get the sales price of the subscription transaction.

For example, if the base price is EUR 1,000, and the index is 110, the sales price is EUR 1,100.

Reduce the days on subscription fees

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To reduce the number of days of an existing subscription fee, you can create a new transaction in which you remove the period of time that should no longer be part of the subscription fee interval.

Reduce the days on a subscription fee

1. Go to **Service management** > **Service subscriptions** > **All service subscriptions**. Select the service subscription, and on the Action Pane, select **Subscription fees**
2. In the **Subscription type** field, select **Reduction days**.
3. Use the **From date** field and the **To date** fields to define the date interval of the subscription fee that you want to remove from the subscription fee period, and then select **OK**.

To view the transaction that was created, on the **Subscription** page, select **Fee transactions**.

Example

If a subscription transaction period runs from January 1 to January 31, and you want to reduce the period by 10 days, create a new transaction in which the reduction period is January 1 to January 10. (The reduction period could also be January 5 to January 15, or any other ten day period).

Also, if the **From date** on the reduction period is January 21 (31 minus 10), you could set the **To date** to any date after January 31, and 10 days will still be removed from the fee transaction period.

Related information

- Reduction days example

Last updated on 05/07/2025

Reduction days example

Article • 08/15/2024

You have created a subscription transaction for a customer's maintenance subscription, as described in the following table.

Expand table

From date	To date	Subscription	Subscription type	Project	Category	Sales currency	Sales price
March 01, 2011	March 31, 2011	NR-2	**Regular**	9013	SubCat2	EUR	200.00

The customer reports that it does not need service coverage for two days (March 10 and March 11). You agree to reduce the subscription by these two days.

You create a new transaction of the **Reduction days** type, as described in the following table.

Expand table

From date	To date	Subscription	Subscription type	Project	Category	Sales currency	Sales price
March 10, 2011	March 11, 2011	NR-2	**Reduction days**	9013	SubCat2	EUR	-12.90

When the transactions for March 2011 are invoiced, the sales price of EUR 200 is reduced by EUR 12.90. The chargeable amount for the subscription transaction is therefore EUR 187.10, and two transactions are invoiced at a total of EUR 187.10.

Update and index subscription sales prices

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

1. Go to **Service management** > **Service subscriptions** > **All service subscriptions**.
2. Select the subscription to update the index or base price for.
3. Select **Index**. In the **Change** field, indicate how to update the base price or index, and whether the update must use a percentage or a new value. You can select from the following options:
    - **Index by a percentage**
    - **Index to**
    - **Base price by percentage**
    - **Base price to**
4. Select **OK**.

The base price or index of the subscription is updated with the specified value.

Start and stop time recording on a service order

07/10/2025

Use this procedure to start and stop time recording for a service order for which a service level agreement is defined.

Start time recording

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select the **Service order** tab. On the Action Pane, in the **Service level agreement** group, select **Start**.
3. Enter the date and time that the time recording should be started.

Stop time recording

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select the **Service order** tab. On the Action Pane, in the **Service level agreement** group, select **Stop**.
3. Enter the date and time that the time recording should be stopped.
4. Select **Add a revocation reason**, and select a reason code in the **Stage reason code** list to provide a reason for stopping the time recording.

> ⓘ **Note**
>
> If **Reason code on exceeding time** is selected on the **Service management parameters** page, you must provide a reason code before you can stop the time recording.

View the start time and duration of a service order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can view when the work on the service order was started and when the service order is going to be completed.

You can also view when the time recording for a service order was started and stopped. When a service order is stopped, the time at which the service order must be completed is postponed.

View the start time for a service order

1. Go to **Service management** > **Service orders** > **Service orders**. Select an order to open the details page.
2. On the **General** tab, view the time that the work was started for a service order in the **Start time** field.

View the time remaining to complete a service order

1. Go to **Service management** > **Service orders** > **Service orders**. Select an order to open the details page.
2. On the **General** tab, view the time remaining to complete a service order in the **Latest completion time** field.

View the start time and stop time recording entries for a service order

1. Go to **Service management** > **Service orders** > **Service orders**. Select an order to open the details page.
2. On the Action Pane, select the **Dispatch** tab > **Time recording** to open the **SLA time recording** page and view the time recording entries for the service order.

Last updated on 05/07/2025

View stage reason codes

View and modify the list of stage reasons for a service order. Use stage reasons to indicate the reason for the status of a service order. For example, you can create a **Canceled** stage that is assigned a reason code of **Canceled by the customer**.

- Go to **Service management** > **Service orders** > **Service orders**. Open a service order.
- On the **Service orders** page, on the Action Pane, on the **Dispatch** tab, select **Stage reasons**.
- On the **Stage reasons** page, select **New** to create a new stage reason code.

Last updated on 07/01/2026

View compliance with service level agreements

07/10/2025

View compliance with a service level agreement

1. Go to **Service management** > **Service orders** > **Service orders**. Open the details page for the order.
2. On the **General** tab, in the **Compliance** field, view the percentage of time that was spent on the service order compared to the time frame specified in the service level agreement.

> **Tip**
>
> If the value in the **Compliance** field is larger than 100, the time limit of the service level agreement was exceeded.

Related information

Service orders

07/10/2025

A service order represents a visit that a service technician makes to a customer site on a specific date. Each service order consists of one or more service order lines. Service order lines represent the hours of work that must be performed by the service technician, and the related items, expenses, and fees.

You can attach tasks and objects to a service order line. You can then group service order lines by task or by object. You can also attach items that are listed in inventory to service order lines.

Create service orders

You can create service orders based on a service agreement and the lines that are contained in that agreement. However, you can create service orders that are associated with a service agreement only in the period that is specified in the agreement. For example, if a service agreement is valid for the 2011 calendar year, you can create service orders for the agreement from January 1, 2011, and December 31, 2011.

You can also create service orders individually, without associating them with an agreement. These service orders can be used to handle unscheduled or one-time service visits. For example, in the month of March, your customer wants service to be performed on two machines, in addition to the machines that are specified in the service agreement. For this task, you create service orders but do not associate them with an agreement.

> ⓘ **Note**
>
> To create service orders that are not associated with a service agreement, you must select the **Allow without service agreement** check box on the **Service management parameters** page.

Scenario

The following scenario describes another situation where it is useful to create a service order that is not associated with a service agreement.

The company dispatcher receives a call requesting emergency service on an elevator. There is no time to set up a service agreement and a project for the service. Therefore, the dispatcher creates a service order directly on the **Service orders** page, attaches the service order to an existing project, and creates the service order lines. The dispatcher also creates a task or object

relation for an existing service order, to record work that is not related to the service agreement. Learn more in Create service orders manually and Create service task relations.

Monitor the progress of service orders

To monitor the progress of a sales order through the different teams and work processes, you can set up a system of stages and reason codes for service orders. For each stage, you can specify the actions that are allowed. Learn more in Create reason codes.

Example

A service order is approved by the dispatcher. The dispatcher updates the stage of the service order and specifies a reason code that indicates that the service order has been released to the service technician. The technician goes to the customer site and performs the service.

Specify item requirements for service orders

You can specify the inventory items that are required for service orders. However, the service order must be associated with a project. Item requirements for service orders are processed through a project.

Example

The service orders that are created from the service agreement are processed by the dispatcher. For the first service order, the dispatcher realizes that the service technician requires an important spare part that is not in the on-hand inventory. Therefore, the dispatcher creates an item requirement for the spare part directly from the service order.

Move and post lines

A service technician returns from a service visit, and then modifies and updates the service order lines. During the service visit, the technician performed a service job that was scheduled for the next service visit. Therefore, the technician moves the lines from the next service visit to the current service visit. The technician then posts the service order. Learn more in Move service order lines.

Cancel service orders

One of the other service orders that was generated for the month of January becomes obsolete, because the job is canceled. Therefore, the service dispatcher cancels the service order. Learn more in Cancel service orders.

Post from projects

At the end of each week, the dispatcher wants to post all service orders that are attached to a specific project. Therefore, the dispatcher locates the relevant project on the **Projects** page and posts the service orders that have been completed.

Delete service orders

During the second half of the year, your customer decides that the service visits are too infrequent. You must create a new, more frequent series of service visits for the remaining time on the service agreement. Therefore, you must delete the existing service orders and create new service orders. Learn more in Delete service orders.

Automatically create service orders

Article • 03/17/2025

You can generate service orders that are based on a service agreement for the valid period of the service agreement.

The service orders that you generate from a service agreement are all attached to the service agreement.

Service orders are generated automatically from the following settings:

- The service agreement interval that is set up in the service agreement lines. The service agreement interval indicates the frequency that service-order lines are created. Learn more in Service intervals.
- The period that you specify to define the service period in the **From date** and **To date** fields on the **Create service orders** page. Learn more in Create service orders automatically.
- The **Combine service orders** option on the service agreement header. This option defines whether service order lines generated from a service agreement, combines service orders according to employee, service task, service object, or service agreement. Learn more in Combine service orders.
- The **Time window** option on the service agreement line. The time window defines how far a service order line can move relative to its calculated date. Learn more in Time windows.

> **Note**
>
> If the day that is specified for a service order isn't open in the calendar selected on the **Service management parameters** page, a message indicates that there's a calendar conflict. You can safely ignore the message; the service order will still be created even though the day is closed on the calendar.

Example 1

The service agreement lasts from January 1, 2012 until December 31, 2012. If the service period that you specify on the **Create service orders** page is from November 1, 2012 until February 1, 2013, service orders are created from November 1, 2012 until December 31, 2012.

Example 2

The service agreement lasts from January 1, 2012 until December 31, 2012. Two service agreement lines are attached to the service agreement. The first service agreement line has a starting date on January 2, 2012 and an ending date on March 1, 2012. The second service agreement line has a starting date on April 1, 2012 and an ending date on December 31, 2012. You specify a period on the **Create service orders** page that is from October 1, 2012 until December 31, 2012. Therefore, service orders are generated only for the second agreement line, because the starting date and ending date of the first agreement line are before the period that you specified for the service order.

Service status and progress field interaction

Article • 05/02/2022

On the **Service orders** page, the **Progress** field on the service order header reflects the status of the whole service order, and the **Status** reports the status of individual service order lines.

Expand table

Progress	Line 1 Status	Line 2 Status	Line 3 Status
In process	Created	Created	Created
In process	Canceled	Created	Created
In process	Created	Canceled	Posted
Canceled	Canceled	Canceled	Canceled
Posted	Posted	Posted	Posted
Posted	Posted	Canceled	Canceled

The progress of a service order is in process if all lines have the status **Created**; it is still in process if some of the lines have a status of **Canceled** or **Posted**.

If all lines in a service order are marked as **Posted**, the progress of the status order is **Posted**. If some lines are **Posted** and some are **Canceled**, the progress is still **Posted**.

Create service orders automatically

07/10/2025

You can create service orders for one service agreement or for several service agreements. When they're created, you can view your service orders on the **Service orders** page.

Service orders are created only for the valid period of the service agreement. If the interval that you specify on the **Create service orders** page is before the starting date or after the ending date of the service agreement, service orders are created only for the part of the interval that is within the service agreement dates.

When you create service orders manually or automatically from the service agreement line, the service order must be in the time interval that is defined by the starting and ending dates for the line, unless you don't specify an ending date on the line.

Create service orders automatically for a service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select a service agreement.
3. On the Action Pane, select the **Deliver** tab, and then select **Planned service orders**.
4. Specify dates in the **From date** and **To date** fields to define the service period.
5. Set **Show Infolog** to *Yes* to generate an Action center message that displays a list of the service orders that are created.
6. Select transaction types in the **Include transaction types** field group. The transaction types represent the lines that are created in the service agreement, and each transaction type that you select generates several service orders, depending on the service interval that is specified on the service agreement line.
7. To create any service orders that are missing from continuous series of service orders, set **Continuous** to *Yes*.
8. Select **OK**.

Create service orders automatically for several service agreements

1. Go to **Service management** > **Periodic** > **Service orders** > **Create service orders**.
2. Select **Select** to make selections to add or remove criteria to use to create service orders.
3. Select **OK**.

Create item requirements for service orders

Article • 01/06/2025

You can create a service order to track and manage services that you provide to your customers. If you need to reserve specific items for a service order, you can create inventory item requirements for it. An item requirement can be immediately consumed from inventory, or it can initiate a production order for the item.

By using an item requirement instead of an item transaction, you can plan for delivery just before the item is actually used, create a purchase order, include the item in the trade-agreement framework, and include the item requirement in production planning.

Item requirements for service orders are processed through a project. To create an item requirement on a service order, the service order must be assigned to a project. After you create an item requirement for a service order, you can view the item requirement on the **Projects** page for the selected project.

Create an item requirement for a service order

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select the service order that you want to create an item requirement for.
3. On the Action Pane, on the **Dispatch** tab, select **Item requirement**.
4. On the **Item requirements** page, enter information for the required item.

Create an item requirement for a service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Open the service agreement for which you want to create an item requirement.
3. On the **Lines** FastTab, select **Add** to create a new line.
4. In the **Transaction type** field, select *Item*.
5. In the **Item setup** field, select *Item requirement*.
6. In the **Item number** field, select the item that is required for the service agreement.
7. On the **Line details** FastTab, on the **Product dimensions** tab, in the **Site** field, select the inventory site for the item.
8. To create a service order from the agreement line, on the **Lines** FastTab, select **Create service orders**, and then enter the relevant information on the **Create**

service orders page.

Service order item requirements

Article • 01/06/2025

You can create a service order to track and manage services that you provide to your customers. If you need to reserve specific items for a service order, you can create inventory item requirements for it. An item requirement can be immediately consumed from inventory, or it can initiate a production order for the item.

By using an item requirement instead of an item transaction, you can plan for delivery just before the item is actually used, create a purchase order, include the item in the trade-agreement framework, and include the item requirement in production planning.

Item requirements for service orders are processed through a project. To create an item requirement on a service order, the service order must be attached to a project.

As soon as an item requirement is created for a service order, it can be viewed from **Project** in the individual service order or through the **Sales order** page.

View an item requirement from a service order

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select **Dispatch**, and then select **Item requirement** to open the **Item requirements** page.
3. Select the **Project** tab, and check the **Service order** field to see the service orders of the item requirement.

Delete service orders with item requirements

If an item requirement is created on a service order, you can't delete the service order. You must delete the item requirement before you can delete the service order.

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select **Dispatch**, and then select **Item requirement** to open the **Item requirements** page. This page lists the item requirements that are created on the service order.
3. Select the item requirement to delete, and then select **Delete**.

–or–

1. Go to **Project management and accounting** > **Projects** > **All projects**.
2. Open the project that has the service order in which an item requirement is created.

3. On the **Projects** page, in the right pane, select **Item requirements**. The **Item requirements** page lists the item requirements that are associated with the selected project.
4. Select the item requirement to delete, and then select **Delete**.

Add an address to a service order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to add a customer address to a service order. When you create a service order, the address information is transferred from the project that the service order is attached to. However, you can select an alternative location from addresses that are already entered in Microsoft Dynamics AX for customers, vendors, sites, warehouses, service orders, and projects.

You can also create a new address. By default, the new address is transferred to the project. However, you can specify that the new address is only relevant for this instance of the service. If you do, the new address is not transferred to the project.

Create a customer address for a service order

To add an address to a service order, follow these steps:

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Open the service order that you want to create an address for.
3. Open the **Header** tab.
4. Expand the **Address** FastTab, and then select **Add address** from the FastTab toolbar.
5. In the **New address** dialog, enter a unique name for the address and complete the remaining fields.

   > **Warning**
   >
   > If you enter the same name as an existing address, the information that you enter in the remaining fields will overwrite information for the existing address.

6. Select **OK** to copy the new address to your service order.

Specify an alternative address on a service order

To add an alternative address to a service order, follow these steps:

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Open the service order that you want to enter an alternative address for.
3. Open the **Header** tab.
4. Expand the **Address** FastTab, and then select **Other address** from the FastTab toolbar.
5. In the **Address selection** dialog, select **Service orders** from the drop-down list above the grid.
6. Select an address, and then select **OK** to copy it to your service order.

Subscription workflow overview

Article • 06/03/2022

You are the subscriptions administrator for a light company that offers subscriptions for lighting rig maintenance. A customer contacts your company to purchase a yearly subscription for lighting rig maintenance.

Setting up subscriptions

To set up a subscription, you must first create a subscription group for the new service agreement or verify that a subscription group exists. If a subscription group exists, you must set it up to invoice the customer yearly and to accrue sales revenue every month of the year. For more information about how to set up subscriptions, see Set up subscription groups.

After the subscription group is created, you can create the subscription. For more information about how to create service subscriptions, see Create service subscriptions from a subscription group.

Create and modify subscription transactions

After you set up the subscription, you create the subscription fee transaction for the first invoicing period, which is one year. The transactions are of the **Regular** type. Therefore, you can only create subscription transactions where the from date and the to date correspond to periods that were previously created on the **Period types** page. For more information about fee transactions, see Create subscription fee transactions.

After you set up the subscription for your customer, you remember that they have negotiated a 10 percent discount on all list prices for service offerings. Therefore, you must reduce the price of the transaction fee that you created.

Later in the day, your customer contact calls to say that, although they still want the service agreement for the lighting rig, they plan to introduce a new lighting rig later in the year. Therefore, they only need maintenance coverage until October 2013. To reduce the number of months for the customer's subscription, you create a new subscription fee transaction of the **Reduction days** type. For more information about how to reduce days, see Reduce the days on subscription fees.

Invoice and accrue subscription transactions

You have now finished setting up the subscription, and you are ready to invoice your customer for it. For more information about how to invoice subscriptions, see Invoice subscription transactions.

Two days later, your customer calls to say that the subscription should be invoiced in U.S. dollars, not Euros. Therefore, you create a credit note, and you also create a new subscription transaction in the correct currency. For more information about how to credit subscription transactions, see Credit subscription transactions.

At the end of each month, one month's revenue can be accrued from the customer's subscription to the profit and loss account and the WIP accounts. For more information about how to accrue revenue for subscriptions, see Accrue subscription revenue.

Combine service orders

Article • 01/06/2025

When you create service order lines automatically on the **Service agreements** page, you can choose one of the following options to specify how you want to group them:

- **By service agreement**
- **By service task**
- **By employee**
- **By service object**

Example

You create a service agreement that has a start date on 03-31-2007. In the **Combine service orders** field, you specify **By service object**. You then create the following service agreement lines:

Expand table

Agreement line number	Transaction type	Description	Interval	Service object	Start date
1	**Hour**	SAL1	Weekly	X-1	04-01-2007
2	**Hour**	SAL2	Biweekly	X-2	04-01-2007
3	**Hour**	SAL3	Weekly	X-2	04-01-2007

You don't specify time windows for any of the service agreement lines. Therefore, the service order lines won't move from the calculated day on which they fall.

Next, you generate service order lines from the **Create service orders** page from 04-01-2007 until 04-30-2007.

In total, 10 service orders are created. Because the combined setting that you selected was **By service object**, all service orders that are created have only service order lines with one specific service object. Service order lines that are generated from the service agreement and have the same service date and object are combined on the same service order.

> **Note**
>
> In this example, the calendar that is specified on the **Service management parameters** page has no closed days.

Additional grouping of service order lines into service orders occurs according to any time window that you specify on the service agreement lines.

Create service subscriptions from a project

Article • 01/30/2025

You can create a service subscription from a project in **Project management and accounting**.

1. Go to **Project management and accounting** > **Projects** > **All projects**. Open the project that you want to create a subscription for.
2. On the **Projects** page, on the Action Pane, on the **Manage** tab, select **Service** > **Service subscription**.
3. On the **Subscription** page, in the **Service subscription** field, enter a unique identification number. The project number is entered automatically into the subscription for the selected project.
4. Enter the remaining information on the page.

You can now create subscription transactions for the subscription.

> **Note**
>
> If you have set up a number sequence for the subscription group, a subscription ID is generated automatically for the subscription when you specify the subscription group.

Service activities

Article • 01/06/2025

Create service activities to define and maintain tasks in a service order. A service order can include one or more service activities to be performed by a worker.

Service activities are defined on the **Activity types** page (go to **Sales and marketing** > **Setup** > **Activities** > **Activity types**). After you set up activities, you can add them to service orders automatically based on the related service agreement, or you can manually add activities when you add lines to a service order.

You can view the status of service activities on the **Dispatch board** page. You can also reassign activities from one worker to another worker in that page.

Dispatch board

A dispatch board is the central location from which you can view the status of activities in a service order. You can perform the following tasks in a dispatch board:

- Filter and view service activities in a certain date range.
- Identify the priority of a service activity, and distinguish among service priority levels based on a color scheme that you set up.
- Review the workers that are assigned to a dispatch team.
- Modify the service times and assigned technicians for a service activity.
- Review the list of service activities that have not been dispatched.

To work with the dispatch board, follow these steps:

1. Go to **Service management** > **Perform periodic tasks** > **Dispatch board**.
2. On the Action Pane, select **Adjust view settings** and then use the **Adjust view settings** dialog to select the date range and other options for the service activities you want to see.
3. In the grid, select the service activity you want to work with.
4. Navigate through the tabs in the bottom panel to view and modify the details of the selected service activity.

Set up a preferred technician

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can select any worker as a preferred technician for a service agreement or service order. However, it is a good idea to add the worker to the appropriate dispatch team so that the worker is included on the **Dispatch board**.

Assign employee to a dispatch team

1. Go to **Human resources** > **Workers** > **Workers**. Select a worker to open the worker details page. On the Action Pane, select **Setup** >**Dispatch team** to open the **Dispatch workers** page.
2. In the **Dispatch team** field, select the team to assign the worker to.

Assign a preferred technician to a service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**. Select a service agreement to open the details page.
2. On the **General** tab, select the **Preferred technician** field, and then select a member of the appropriate dispatch team as the preferred technician for the service agreement.

Assign a preferred technician to a service order

1. Go to **Service management** > **Periodic** > **Dispatch board**.

   > **Note**
   >
   > On the **Dispatch board** page, specify a date range for dispatch activities to view. Also, specify whether to display closed activities and whether to limit the dispatch

activity list to teams that you belong to or are authorized to monitor. Select **OK** to open the **Dispatch board**.

2. Select the line of the service activity to modify.
3. On the **Related** tab, use the **Worker** list to assign a member of the appropriate dispatch team as the preferred technician for the service call.

Set up dispatch teams

07/10/2025

This article describes how to create a dispatch team. After you create a dispatch team, you can assign workers to the team. When you create a service order, you can then relate a member of a dispatch team to an activity in the service order.

1. Go to **Service management** > **Setup** > **Dispatch teams**.
2. On the **Dispatch teams** page, select **New** to create a new team.
3. In the **Dispatch team** field, enter a unique name for the dispatch team.
4. In the **Owner** field, select the employee who is responsible for this team.

   > ⓘ **Note**
   >
   > You can select only employees in this field. You can't select vendors.

5. Optional: In the **Description** field, enter a brief description for this dispatch team.

> ⓘ **Note**
>
> You can assign a worker to this dispatch team on the **Worker** page. Learn more in Set up a preferred technician.

View dispatch teams

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Service orders on the **Dispatch board** page are grouped by dispatch team.

1. Go to **Service management** > **Periodic** > **Dispatch board**.
2. On the Action Pane, select **Adjust view settings**.
3. The **Adjust view settings** dialog opens. Select a date range, and then select **OK**.
4. On the **Dispatch board** page, in the Gantt chart at the top of the page, expand a team list to review the names of the workers on the team. You can also view details about the service activities that are assigned to each worker.

For information about how to assign a worker to a team, see Set up a preferred technician.

Monitor service activities

Article • 01/06/2025

The **Dispatch board** page provides an at-a-glance status update for the various scheduled service activities, and tools for tracking the general flow of service orders in your company.

> **Tip**
>
> To view details about a service activity, select it in the Gantt chart at the top of the **Dispatch board** page, right-select, and then select **Information**.

By using the tools in this page, you can sort service orders by date, priority, or type of service activity, view the priority levels that are assigned to service orders, and review which activities are assigned to individual service orders.

If you must redistribute service activity assignments, you can move the graphical representation of a service activity to assign it to a different employee or a different date and time.

Example

While monitoring the day's service activity, you notice that John, a service technician, is running behind schedule on assigned service calls. You also notice that the last call in John's list must be completed by the end of the day to meet service level agreement requirements. By using the drag-and-drop functionality of the Gantt chart, you can reassign that service call to Meg, who has completed service calls ahead of schedule.

Open the Dispatch board page

Go to **Service management** > **Periodic** > **Dispatch board**.

Reassign activities

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to reassign service activities from one worker to another worker. You can reassign service activities from one worker to another worker even if those workers are assigned to different dispatch teams.

Use the following steps to reassign an activity to another worker:

1. Go to **Service management** > **Periodic** > **Dispatch board**.
2. In the **From date** and **To date** fields, enter dates to define the time period to view activities for.
3. Select whether to view closed activities and dispatch information for related teams, and then select **OK**.
4. On the **Dispatch board** page, select **Advanced** to display only the Gantt chart at the top of the page. Select **Simple** to display the Gantt chart and the tabs on the page.
5. Expand each dispatch team list.
6. Use either of the following steps to reassign an activity:
    - Select a color-coded graphic that represents the service activity to reassign. Press the SHIFT key, and then move the color-coded graphic to the row for another employee.
    - On the **All** tab, **Team** tab, **Undispatched** tab, or **Related** tab, in the **Worker** field, enter the name of the worker who is replacing the current worker for the activity.

Reverse changes in a dispatch board

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to reverse unsaved modifications that you make in a dispatch board. For example, you assign a worker to a service activity, save the information, and then later decide to assign a different worker to the service activity. You modify the worker in the dispatch board, and then, before saving the change, learn that the worker just assigned is not available. You can reverse the unsaved modification so that the original worker is reassigned to the service order.

Use the following steps to reverse unsaved changes in a dispatch board:

1. Go to **Service management** > **Periodic** > **Dispatch board**.
2. On the **Dispatch board** page, enter relevant information in the fields, and then select **OK**.
3. To reverse the most recent change that is not saved, select **Undo**.
4. To reverse a series of changes that are not saved, continue selecting **Undo** until each change that you want to discard is reversed.

Modify a Service BOM

Article • 01/30/2025

You can record the history of an element in a service bill of materials (BOM). Every time that you update a BOM line, a history line is created in the **History** pane. The history line shows the current state of the BOM line.

Update a service BOM element

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select **Edit** to open the **Service agreements** details page.
3. On the Action Pane, select **Service objects** to open the **Service objects** page.
4. Select the object to update a BOM line for, and then select **Designer**.
5. On the **Designer** page, select the BOM line to update, and then select **Edit BOM line**.

   > ⓘ Note
   >
   > On the **Setup** tab, select the **Edit when adding** check box if you want the **Edit BOM line** page to open when you drag a line into the service BOM.

6. In the **Quantity** field, enter the quantity.
7. If you want to create a service order line for the replacement item, which can then be invoiced, select the **Create service order line** check box.
8. Select **OK** to close the page.

Delete a service BOM line

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select **Edit** to open the **Service agreements** details page.
3. On the Action Pane, select **Service objects** to open the **Service objects** page.
4. Select the object to delete a service BOM line from, and then select **Designer**.

5. On the **Designer** page, select the BOM line to delete, and then select **Delete BOM line**.

Credit subscription transactions

Article • 01/06/2025

1. Go to **Service management** > **Service subscriptions** > **All service subscriptions**.
2. Select the subscription attached to the subscription transaction for which you want to create a credit note.
3. Select the **Analyze** tab, and then select the **Fee transactions** button on the Action Pane.
4. From the **Fee transactions** page, select the transaction for which you want to create a credit note.
5. Select **Functions** > **Select for credit note**.
6. From the **Select for credit note** page, select the transaction that you want to credit and then select **OK**.

> **Note**
>
> When you create the credit note, make sure that you select **Credit notes**. This is found in the **Invoicing method** list in the **Create invoice** dialog box.

If the **Reverse accruals on crediting** field on the **Service management parameters** page is set to *Manual*, you have to reverse each accrued revenue transaction individually before you create a credit note proposal for the transaction.

Create subscription fee transactions

07/10/2025

1. Go to **Service management** > **Service subscriptions** > **All service subscriptions**.
2. On the **All service subscriptions** list page, select the subscription for which you want to create a subscription fee transaction.
3. On the Action Pane, on the **Subscription** tab, select **Subscription fees**.
4. On the **Create subscription fee** page, enter the appropriate information in the fields.
5. Select **OK**.

Accruing subscriptions

Article • 03/17/2025

With service subscriptions, you manually accrue revenue in the periods following the date when you invoiced a fee transaction.

Accrual periods are created for the invoice period that you set up for the subscription fee, and the accrual periods are based on the period code of the subscription.

You can accrue and reverse accrued revenue.

Reverse accruals of credit amounts

If you credit invoiced subscription amounts, you can use two methods to reverse the accrual amounts:

- You can reverse each accrued revenue transaction individually before you create the credit note proposal for the transaction. This is the manual method. (manual)
- You can have the accrued amounts reversed on the date where the credit note is posted or on the original posting date of the accrual.

Learn more in Subscription parameters (form).

Setup requirements

To accrue revenue, make sure that the following data requirements are met:

Account setup

The **WIP - subscription** and the **Accrued revenue - subscription** accounts must be set up in the **Project** module.

When you post accrued revenue, the **WIP - subscription** account is debited with the accrual amount, and the **Accrued revenue - subscription** account is credited with the accrual amount.

Set up accounts for accrual of subscription revenue

1. Go to **Project management and accounting** > **Setup** > **Posting** > **Ledger posting setup**.
2. Select the **Revenue accounts** tab, and select **WIP - subscription** or **Accrued revenue - subscription** to set up the accounts.

Subscription group setup

To be able to accrue revenue for subscriptions, the **Accrue revenue** check box must be selected. This is found on the **Subscription groups** page for the group that is attached to the subscription. Go to **Service management** > **Setup** > **Service subscriptions** > **Subscription groups**.

Enable revenue accrual on a subscription group

Go to **Service management** > **Setup** > **Service subscriptions** > **Subscription groups**.

Periods

You must set up an invoicing period code. Unless you want to accrue revenue in the same time intervals as you use for invoicing, you must also set up an accrual period.

The following table provides an overview of which accrual periods can be set up for each invoicing period:

Expand table

Invoicing period	Accrual period
Years	• Years • Quarter • Month • Day
Quarter	• Quarter • Month • Day
Month	• Month • Day

Invoicing period	Accrual period
Week	• Day
Day	• Day

Setting up the invoicing period is a mandatory part of the overall subscription group setup. You can decide whether to also set up an accrual period for the subscription group. If you set up an accrual period for the subscription group, this period is suggested in the **Period code** field. This field is found on the **Accrue subscription revenue** page, when you accrue subscription revenue. However, the accrual period is optional information about the subscription group.

> ⓘ Note
>
> Use the following path to open the **Accrue subscription revenue** page. Go to **Service management** > **Periodic** > **Service subscriptions** > **Accrue subscription revenue**.

Transactions

You can control the number of ledger transactions that are created when you post accrued revenue. On subscriptions, define if the ledger transactions should be created as a total or per line.

Specify the level of posting details to display for accrued transactions

1. Go to **Project management and accounting** > **Setup** > **Project management and accounting parameters**.
2. On the **Financial** tab, in the **Invoice** field, select **Total** or **Line**.

Move service order lines

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Open the service order that contains the lines that you want to move to another service order.
3. On the **Service orders** page, on the Action Pane, click the **Move lines** button.
4. On the **Move service order lines** page, in the **Service order** field, select the service order that you want to move the lines to.
5. Select the **Delete empty service order** check box to delete the service order that you moved the service order lines from.
6. Select **OK**.

> **Note**
>
> You can move service order lines only between service orders that are attached to the same service agreement.

Cancel service orders

Article • 01/06/2025

You can cancel a service order or service order line from the service order itself, or you can cancel multiple service orders by running a periodic job.

> **Note**
>
> Service orders cannot be canceled if the stage of the service order does not allow cancellation, if the service order has item requirements, or if the service order has already been posted.

Cancel a service order on the Service orders page

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select the service order.
3. On the Action Pane, open the **Service order** tab and select **Cancel order**.

Cancel a service order line

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Open the service order that contains the line you want to cancel.
3. On the **Lines** FastTab, select the service order line that you want to cancel.
4. On the **Lines** FastTab toolbar, select **Cancel order line** to change the status of the line to *Canceled*.

> **Tip**
>
> To reverse the cancellation of a service order line and change the status back to *Created*, select **Revoke cancel** on the toolbar.

Cancel or uncancel multiple service orders

1. Go to **Service management** > **Perform periodic tasks** > **Service orders** > **Cancel service orders**.
2. Make the following settings on the Parameters FastTab:

- **Show Infolog** – Set to *Yes* to generate an Action center message that lists the canceled or uncanceled service orders.
- **Revoke cancel** – Set to *No* to cancel the selected service orders (already *Canceled* orders aren't affected). Set to *Yes* to uncancel the selected service orders (*In process* orders aren't affected).

3. Select **Filter**.
4. In the **Inquiry** dialog, on the **Range** tab, set the criteria to select the service orders that you want to cancel or uncancel.
5. Select **OK** to close the **Inquiry** dialog.
6. Select **OK**.

The selected service orders are either canceled or uncanceled. Uncanceled orders have their *Canceled* status reversed to *In process*.

Create service orders manually

Article • 01/06/2025

You can create service orders manually by using a service agreement or by using the **Service orders** page. You can also create a service order from a project.

> **Tip**
>
> You can use automated processes to create service orders.

Create a service order manually from a service agreement

1. Go to **Service management** > **Service agreements** > **Service agreements**.
2. Select a service agreement or create a new service agreement.
3. Select the **Deliver** tab and in the **Create** group select **Planned service orders** to open the **Create service orders** page.

Create a service order manually on the Service orders page

1. Go to **Service management** > **Service orders** > **Service orders**.
2. Select **New** to create a new service order.
3. Create service order lines for the service order.

> **Note**
>
> If the **Allow without service agreement** check box on the **Service management parameters** page is selected, you can post the transactions from the service order lines without attaching the service order to a service agreement. If the check box is cleared, you must attach the manually created service order to a project before posting the service order lines.

Create a service order from a project

1. Go to **Project management and accounting** > **Projects** > **All projects**.

2. On the **Projects** page, on the Action Pane, select the **Manage** tab > select **Service** > **Service orders**.
3. Follow the previous procedure to create a service order manually on the **Service orders** page. The **Project ID** field displays the project reference.

> ⓘ Note
>
> If the **Allow without service agreement** check box on the **Service management parameters** page is selected, you can post the transactions from the service order lines without attaching the service order to a service agreement. If the check box is cleared, you must attach the manually created service order to a project before posting the service order lines.

Create a service order from the Sales order page

You can create a service order from the **Sales orders** page by using the **Create a new service order based on the sales order** wizard.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Open the relevant sales order.
3. On the **Sales order** tab, select **Service order** to start the **Create a new service order based on the sales order** wizard.
4. Select **Next** >, and then complete the following steps on the **Select agreement for service order** page:
    - Use the **Service agreement** field to select the service agreement with which the new service order should be associated.
    - Optional: Use the **Project ID** field to associate this service order with a particular project.
5. Select **Next** >, and then complete the following steps on the **Create service order** page:
    - Enter a date and time for the service call to begin in the **Preferred service time** field.
    - Optional: Modify the text in the **Description** field. By default, this field contains the description of the service agreement that you selected on the previous page.

- In the **Responsible** field, select the ID of the employee who is responsible for the agreement, and if you know what it is, enter the ID of the customer's preferred technician for the service call.
- In the **Contact ID** field, select the person in the customer's company who should be contacted regarding this service order.

6. Select **Next** >, and then select **Finish**.

Invoice subscription transactions

07/10/2025

1. Go to **Service management** > **Service subscriptions** > **All service subscriptions**.
2. Select a service subscription and then select **Edit** or select **Subscription** to create a service subscription.
3. Select **Analyze** > **Fee transactions**.
4. Select the fee transaction or fee transactions to invoice, and then select **Functions** > **Invoice proposal** to open the **Invoice proposals** page.
5. Select **Create invoice** and enter the appropriate parameters on the **Create invoice** page
6. Select **OK** to create the invoice proposal on the **Invoice proposals** page.
7. Verify the contents of the invoice. Select **Post invoice** to open the **Post invoice** page to post the invoice. You can also print the invoice from the **Post invoice** page.

Traceability overview (preview)

10/28/2025

[This article is prerelease documentation and is subject to change.]

Companies face increasing pressure to comply with legislation, such as the EU and German Supply Chain Act. This pressure is especially high when recalling defective and potentially unsafe products or linking products with certain documents. The Traceability Add-in for Dynamics 365 Supply Chain Management lets you collect business and industry-specific data across the product value chain. You can use this data for regulation audits and compliance processes. Beyond compliance, Traceability also enables companies to meet a wide range of business objectives, including efficiency, resilience, responsiveness, and sustainability.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Features and benefits

Traceability enables you to trace raw materials and subassemblies in a product and track the usage and disposal over the full value chain. As a result, it helps you meet a wider range of business objectives, including efficiency, resilience, responsiveness, and sustainability.

Traceability follows products and goods as they move through the supply chain. It collects information about the provenance of inputs, supplier sourcing practices, and conversion processes. It provides the following features and benefits:

- **Accurate tracking** – Track and document the chain of custody based on individual identifiers, such as serial numbers or batch numbers, across the entire value chain and throughout the full lifecycle of an item.
- **As-built BOM registration** – Document composition genealogy information (as-built bill of materials (BOM)) and activity events, such as procurement, production, and distribution, against each serial and batch number. You can trace all the way back to find the origin of each single part.

- **Forward and backward search** – Use the where-used functionality to track the consumption of materials throughout your entire value chain. You can find finished or semi-finished goods that could be impacted by a defective component.
- **Public API** – Integrate with external systems by using the robust Traceability API. While this integration requires some initial setup and configuration, it offers a high degree of flexibility and customization to cater to specific business needs.
- **Integration with the production floor execution interface** – Production floor workers can register the serial numbers and batch numbers of each component and each finished good.

Join the Traceability group on Microsoft Viva Engage

For more help and support, join the Traceability add-in for Dynamics 365 Supply Chain Management community on Viva Engage. In this group, you can find the following resources:

- On the **Conversations** tab, you can read conversation threads, ask questions, share experiences, and connect with other users. The group includes consultants, Microsoft partners, Microsoft product team members, and other experts and users who can share tips, help answer questions, and provide guidance.
- On the **Files** tab, you can find presentations, videos, tutorials, and hands-on labs that help you learn more about Traceability.

Install, update, or uninstall Traceability (preview)

Summarize this article for me

[This article is prerelease documentation and is subject to change.]

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article describes how to install, update, or uninstall the various components of the Traceability Add-in for Dynamics 365 Supply Chain Management.

Prerequisites

To use Traceability, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 (build 10.0.1935.80) or higher.
- Your Supply Chain Management installation must be running on one of the following types of environments:
  - Tier-2 environment
  - A Unified Developer Experience (UDE) environment copied from a tier-2 environment that didn't have Traceability installed. Copying an environment with Traceability already installed isn't supported.
- The Dynamics 365 app named *Dynamics 365 Finance and Operations Platform Tools* must be installed for your environment in Power Platform admin center.

Turn on features in Supply Chain Management

To use Traceability together with Dynamics 365 Supply Chain Management, you must enable the following features in feature management:

- *Tracked components* – Enables component tracking in Supply Chain Management. As of Supply Chain Management version 10.0.45, this feature is turned on by default.

- *(Preview) Traceability* – Integrates Traceability with the component tracking features in Supply Chain Management.

Microsoft Azure configuration

Register a new Microsoft Entra application

1. Sign in to the Azure portal.
2. Search for or navigate to the **App registrations** page.
3. On the toolbar, select **New registration**.
4. Fill out the **Register and application** page and select **Register**. For more information about these settings, see Quickstart: Register an application with the Microsoft identity platform.
5. Your new app registration opens. On the left navigation pane, select **Overview**. Copy the following values to a temporary text file. You'll need them later.

    - **Application (client) ID**
    - **Directory (tenant) ID**

Create client secrets for the new Microsoft Entra application

1. In the Azure portal, open the application you registered in the previous section.
2. In the left navigation pane, select **Manage** > **Certificates & secrets**.
3. On the **Certificates & secrets** page, select **New client secret**.
4. In the **Add a client secret** dialog, enter a description and choose an expiration date for the secret. Then select **Add**.
5. The **Certificates & secrets** page now includes your new secret. Copy the **Value** and **Secret ID** of the secret and store it in a secure location. You'll need these values later when setting up communication with the API.

    > **Important**
    >
    > The **Value** is only displayed once, so you won't be able to retrieve it again after closing this page.

Install and configure the Traceability app in Power Apps

The Traceability app is part of the Traceability Add-in for Dynamics 365 Supply Chain Management. It's a Power Apps application that provides a user interface for configuring and using the Traceability Add-in. When you install the Traceability app in Power Apps, the system also installs the necessary add-in components in Supply Chain Management.

To install the Traceability app in Power Apps, complete the following steps.

1. Sign in to the Power Platform admin center.
2. On the left navigation pane, select **Resources** > **Dynamics 365 apps**.
3. Find the *Dynamics 365 Supply Chain Traceability* app on the **Dynamics 365 apps** page. Select **More application actions** (the **...** button) for the app and then select **Manage**.
4. The **Install Dynamics 365 Supply Chain Traceability** dialog opens. Make the following settings:
   - **Select an environment** – Select the environment where you want to set up the app.
   - **Enter application ID of service** – Enter the Application (client) ID that you copied after you registered the Microsoft Entra application.
   - **Enter tenant ID of service** – Enter the Directory (tenant) ID that you copied after you registered the Microsoft Entra application.
   - **I agree to the terms of service** – Select this checkbox.

   > **Note**
   >
   > If you don't see the **Enter application ID of service** and/or **Enter tenant ID of service** fields, contact the Traceability product team at d365-sct-team@microsoft.com.

5. Select **Install**.
6. When installation is complete, you should see that an app called *Dynamics 365 Supply Chain Traceability* is shown with a status of *Installed* in the list of **Dynamics 365 apps** for your environment.
7. On the left navigation pane, select **Environments**.
8. Open the environment where you installed the Traceability app.
9. On the **Generative AI features** tile, check to make sure that **Move data across regions** is set to *Allowed*. If it isn't, then follow these steps to allow it:

- Select the **Edit** link on the **Generative AI features** tile.
- In the **Generative AI features** dialog, select the **Move data across regions** checkbox
- Select **Save** to close the dialog.

Update the Traceability app in Power Apps

This section describes how to check for updates to the Traceability app and how to apply them.

1. Sign in to the Power Platform admin center.
2. On the left navigation pane, select **Environments**.
3. Open the environment where you want to update the Traceability app.
4. From the **Resources** tile, select **Dynamics 365 apps**.
5. Find the app called *Dynamics 365 Supply Chain Traceability* in the list and check its **Status**. If the **Status** is *Installed*, then the app is up to date and you can skip the rest of this procedure. If the **Status** is *Update available*, continue with this procedure to apply the update.
6. Select **More application actions** (the **...** button) next to the app name to open a menu, then select **Update**.
7. The **Update Dynamics 365 Supply Chain Traceability** dialog opens. Select **I agree to the terms of service** and then select **Update**.
8. When the update is complete, you should see that the *Dynamics 365 Supply Chain Traceability* app now shows a **Status** of *Installed*.
9. Open the Power Apps maker portal.
10. On the left navigation pane, select **Solutions**.
11. On the **Solutions** page, select **All**.
12. On the toolbar, select **Publish all customizations**.

Uninstall the Traceability Add-in from Supply Chain Management

The Traceability Add-in is automatically installed on your Supply Chain Management environment when you install the Traceability app in Power Apps. However, to uninstall the add-in, you must use Microsoft Dynamics Lifecycle Services by following these steps:

1. Sign in to Lifecycle Services.
2. Open the page for managing your Supply Chain Management environment.
3. In the **Environment add-ins** section, on the **Traceability service** tile, select **Uninstall**.

Uninstall the Traceability app from Power Apps

To remove the Traceability app from your Power Apps environment, complete the following steps:

1. Sign in to Power Platform maker.
2. On the left navigation pane, select **Solutions**.
3. The **Solutions** page opens. Open the **Managed** tab.
4. Find and delete each of the following solutions. To delete a solution, select the **Commands** button next to its name and then select **Delete**.

    - *Dynamics 365 Supply Chain Traceability anchor solution*
    - *Dynamics 365 Supply Chain Traceability portal solution*
    - *Dynamics 365 Supply Chain Traceability controls solution*
    - *Dynamics 365 Supply Chain Traceability Plugins solution*
    - *Supply chain traceability integration - authorization*
    - *Dynamics 365 Supply Chain Traceability common solution*

    > **Important**
    >
    > You must delete *Dynamics 365 Supply Chain Traceability common solution* last.

Last updated on 03/10/2026

Traceability security roles in Power Apps (preview)

Article • 09/13/2024

[This article is prerelease documentation and is subject to change.]

The Traceability Add-in for Dynamics 365 Supply Chain Management uses the *System Administrator* and *Finance and Operations Basic User* Power Platform security roles to control access to Traceability app features.

Use the Power Platform admin center to grant Traceability permissions to the following types of users:

- **Administrator users** – Assign the default *System Administrator* role, as provided, to users who need to configure the Traceability app with full access.
- **Business users** – Assign the *Finance and Operations Basic User* role to business users who only need inquiry access.

For more information about how to complete these steps, see Assign a security role to a user, Save time creating a security role by copying one, and Create or edit a security role to manage access.

Configure Traceability (preview)

[This article is prerelease documentation and is subject to change.]

This article describes how to configure the Traceability Add-in.

API endpoint

The Traceability Add-in for Supply Chain Management provides an API endpoint that you can use to exchange messages with external systems. It lets you integrate Traceability with other systems, such as enterprise resource planning (ERP) systems, warehouse management systems, and quality management systems. To use the API, you need to know the URL of the endpoint. To find it, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **System**.
3. On the **General** tab of the **System** page, you can find the API endpoint URL in the **Endpoint** field. Use the **Copy** button to copy the URL to the clipboard.

Exclude products from Traceability

If you have products that don't need to be traced, you can choose to exclude them from the Traceability Add-in. All products that aren't on the exclude list are traced.

To exclude or reinclude a product, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Exclude product**.
3. The **Exclude product** page opens, showing a list of currently excluded products (if any). Use the buttons in the toolbar to add, remove, or edit rows in the list. For each row, make the following settings:

    - **Company** – Specify the legal entity (company) of the product that shouldn't be traced.
    - **Item number** – Specify the item number of the product that shouldn't be traced.

> ⓘ **Note**
>
> Your settings here only affect activity events that occur after you make the change. Activity events that occurred for a product before you added it to the exclude list continue to be included in Traceability. Activity events that occurred for a product while it was on the

exclude list are never included in Traceability, even after you remove the product from the list.

Configure activities that Traceability traces

All activities throughout the logistics process are logged as *activity events*. Activity events include *goods receipt*, *consumption*, *registration*, and so on.

You can make the following configuration settings for each activity:

- Enable and disable activity events traced at the company level.
- Map original activities and activity types to specific activity codes.

> **Note**
>
> Your configuration settings only affect activity events that occur after you make the change. Events that occurred for an activity before you added it to the activities list never appear in Traceability. Events that occurred for an activity while it was on the activities list continue to be included in Traceability even after you remove the activity from the list.

To configure activities that Traceability traces, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Activity**.
3. The **Activity** page opens, showing a list of activities currently configured for your environment. Use the buttons in the toolbar to add, remove, or edit rows in the list. For each row, make the following settings:
    - **Activity code** – Enter a name that identifies the activity to users. Traceability displays this name to identify the activity when users make a genealogy trace.
    - **Activity type** – Select the type of activity, as it should be shown to users (for example, *Sales*, *Purchase*, *Production*, *Quality*, *Warehouse*, *Maintenance*, or *Transportation*). Traceability displays this value to identify the activity when users make a genealogy trace.
    - **Source activity type** – Select the activity type reported by the source system (for example, *Sales*, *Purchase*, *Production*, *Quality*, *Warehouse*, *Maintenance*, or *Transportation*). See the table after this procedure for a list of source activity types and codes by Supply Chain Management.
    - **Source activity code** – Enter the activity code reported by the source system. See the table after this procedure for a list of source activity types and codes by Supply

Chain Management.

- **Company** – Specify the legal entity of the activity to be traced. Enter an asterisk (*) to trace the activity for all companies.
- **Trace or Not** – Set to *True* for activities that should be traced. Set to *False*, for activities that shouldn't be traced.

4. On the toolbar, select **Save**.

The following table lists the source activity codes and types supported by the tracked component feature.

Expand table

Source activity code	Source activity type	Integration scenario
PurchaseGoodsReceipt	Purchase	Goods receipt of purchase order.
ProductionReportFinished	Production	Component consumption during manufacturing assembly.
ProductionPickingList	Production	Finished goods produced during production.
ProductionPickingListPartialReverse	Production	Partial reverse picking list of component consumption.
ProductionReportFinishedPartialReverse	Production	Partial reverse report as finished.
ProductionPickingListFullReverse	Production	Full reverse picking list of component consumption.
ProductionReportFinishedFullReverse	Production	Full reverse report as finished.

Configure data collection fields that are traced in Traceability

Data collection captures various types of information at the activity code level, including document reference, order number, site, warehouse, and location. This data enhances track-and-trace capabilities and supports insights in reports like *Find items*. With this functionality, you can do the following actions:

- Create data collection fields.
- Assign data collection fields to specific companies and activity codes.
- Enable or disable data collection tracking.

> **Note**
>
> Certain data collection fields, such as Document reference, Site, and Location, are preassigned to all companies for out-of-the-box integration with Supply Chain Management. To avoid disrupting this integration, don't modify the following predefined fields: Document reference, Journal number, Reference type, Order number, Vendor account, Vendor name, Site, Warehouse, Location, or Operator.

To configure data collection fields that are traced in Traceability, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Data collections**.
3. Select the **Add** button on the menu bar to open the initial screen for creating a data collection field.
4. Make the following settings for the new data collection field:

    - **Name** – Enter the name of the data collection field. The integrated systems use this value to identify the specific field.
    - **Description** – Provide a brief description of the data collection field.
    - **Data collection ID** – Enter the internal ID of the data collection configuration record. This value uniquely represents the data collection field in storage. You can specify it manually or allow the system to generate it automatically.
    - **Data type** – Define the type of data the field can store. The following options are available:
        - *Text* – Accepts alphanumeric values.
        - *Number* – Accepts integer and decimal values, both positive and negative.
        - *Boolean* – Maps business values to system values *True* or *False*.
        - *Enum* – Lets you define a list of predefined values.
    - **UoM (unit of measure)** – Specify the unit of measure for the data collection field.
    - **Assignment** – Assign the data collection field to multiple entities. For each assignment, make the following settings:
        - **Activity** – Select a combination of activity type and activity code defined in the activity configuration for the assignment.
        - **Company code** – Specify the company code where the data collection field is assigned.
    - **Status (track or not)** – Set to *On* to track the data collection field. Set to *Off* to disable tracking.

Open the Traceability app (preview)

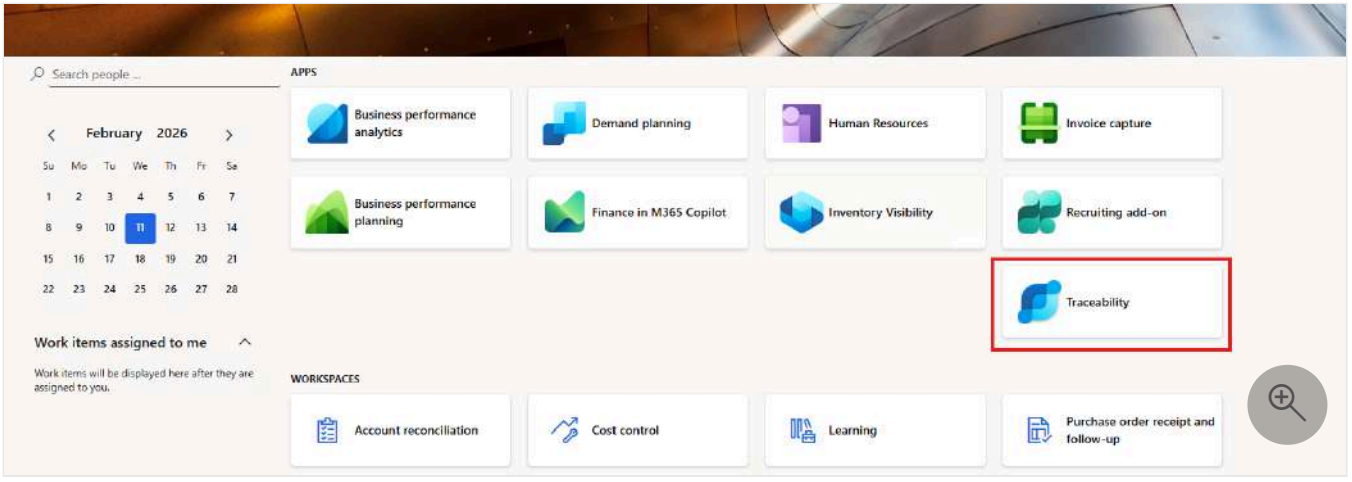
Summarize this article for me

[This article is prerelease documentation and is subject to change.]

You can access the Traceability app in two ways: from Supply Chain Management or from Power Platform. This article describes both methods.

Access Traceability from Supply Chain Management

When you enable the *(Preview) Traceability* feature in feature management, the system adds a **Traceability** tile to the **Apps** section of the **Home** page of Supply Chain Management, as shown in the following image. To open the Traceability app, select the tile.



Access Traceability from Power Platform

Follow these steps to open the Traceability app from Power Platform after you install it in your environment.

1. Sign in to Power Platform maker.
2. On the left navigation pane, select **Apps**. The **Apps** page opens.
3. Open the **My apps** tab. Look for the app with a **Name** of *Traceability*. If you don't see it on the **My apps** tab, switch to the **All** tab and look for it there.
4. Hover your mouse over the *Traceability* app to reveal the **Play** button next to it. Select the **Play** button to run the app.

Traceability app quick start (preview)

[This article is prerelease documentation and is subject to change.]

This article describes how to verify, import, and remove demo data. It also explains how to use demo data to explore the capabilities of the Traceability app in Power Apps.

Verify demo data

Usually, the installation process automatically installs demo data when you first install the Traceability Add-in for Dynamics 365 Supply Chain Management.

To check whether your system has demo data, follow these steps.

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Activity**.
3. Verify that the configuration settings shown in the following table appear on the **Activity** page.

Expand table

Company	Activity Code	Activity Type	Source Activity Code	Source Activity Type	Track or not
USMF	Goods Receipt	Production	Goods Receipt	Production	TRUE
USMF	Consumption	Production	Consumption	Production	TRUE

If the configuration settings don't appear, import the demo data as described in the next section.

Import demo data

If you want to explore Traceability by using demo data but don't have the data, follow these steps to import it.

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Home** > **Get started**.
3. In the **Manage environment data** section, on the **Import demo data** tile, select **Import demo data**.
4. Wait until the import process is complete. The process might take several minutes.

Delete all data

When you're done exploring the demo data, you can remove it from your system, along with all other data that's been collected since you started using Traceability.

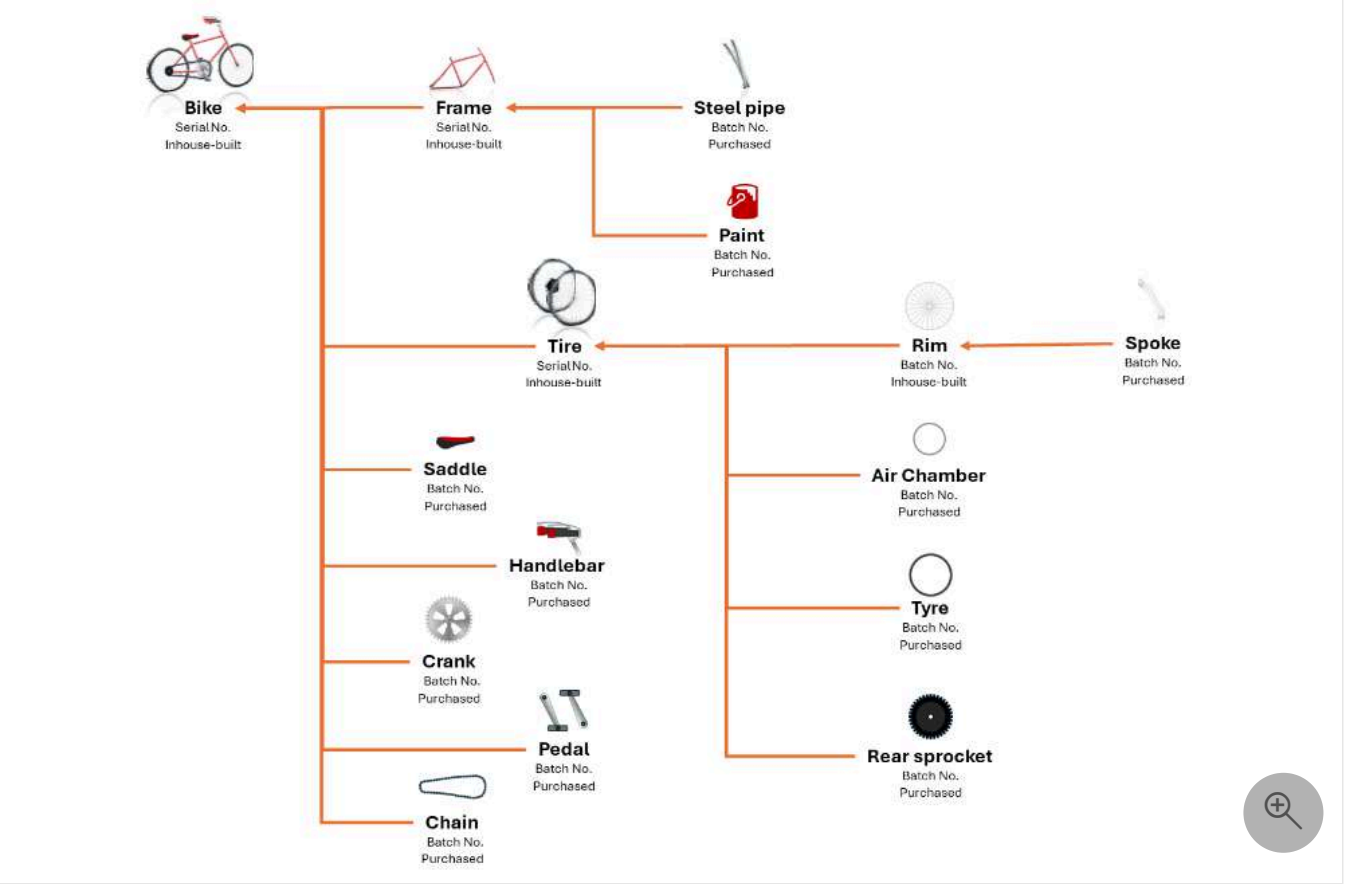
> ⚠ **Warning**
>
> This procedure removes *all* data from the Traceability Add-in for Supply Chain Management, not just the demo data. Be sure you want to delete all data before you proceed.

To delete all data from the Traceability Add-in, follow these steps.

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Home** > **Get started**.
3. In the **Manage environment data** section, on the **Delete all data** tile, select **Delete all data**.
4. Wait until the import process is complete. This process might take several minutes.

Demo data model

The demo data describes the components of a manufactured bicycle. The following illustration shows the bill of materials (BOM) structure of the bicycle.



Explore the demo data

This section shows how to explore the capabilities of the Traceability app by using the demo data. It describes several common scenarios.

1. Open the Traceability app in Power Apps.

2. On the left navigation pane, select **Trace** > **Genealogy trace**.

3. Make a *backwards search*, which lets you enter a unique identifier of a finished good to retrieve its genealogy, activity, and data collection.

   Use the search field to look for a specific serial number of a finished good. For example, use the serial number *bike-s0001* or *bike-s0002* to find the genealogy tree of a bike from the demo data.

4. Traceability shows a genealogy tree for the serial number you entered. Now you can do an *activity verification* by following these steps:
   a. Select the node for the bike in the genealogy tree.
   b. Select the **View detail** button for your selected node to open a dialog.
   c. Open the **Activities** tab in the dialog. Activity events are displayed in reverse chronological order. For example, you might see five activities for *Consumption* and one activity for *Goods receipt*.

5. Do a *forward search* to see the higher-level assembly related to a selected genealogy tree node. Follow these steps:
   a. Select the paint-demo node in the genealogy tree.
   b. Select the **Trace** button for your selected node. The app now shows a high-level genealogy list.

6. Try out the *table views*. Until now, you've been working on the **Graphic view** tab. The table views provide another way to view and explore your data. Try the following options:

   - Select **Table view - composition** to do a backward search.
   - Select **Table view – where used** to do a forward search.

Last updated on 11/20/2025

Work with the Traceability app (preview)

[This article is prerelease documentation and is subject to change.]

The Traceability app lets you search for specific batch and serial numbers and analyze the genealogy of your products. This article describes the basics of how to work with it.

In-app learning

The Traceability app provides in-app learning to help you get started. To access the in-app learning, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Get started**.
3. A collection of links to videos and tutorials is shown. Select each link that you're interested in.

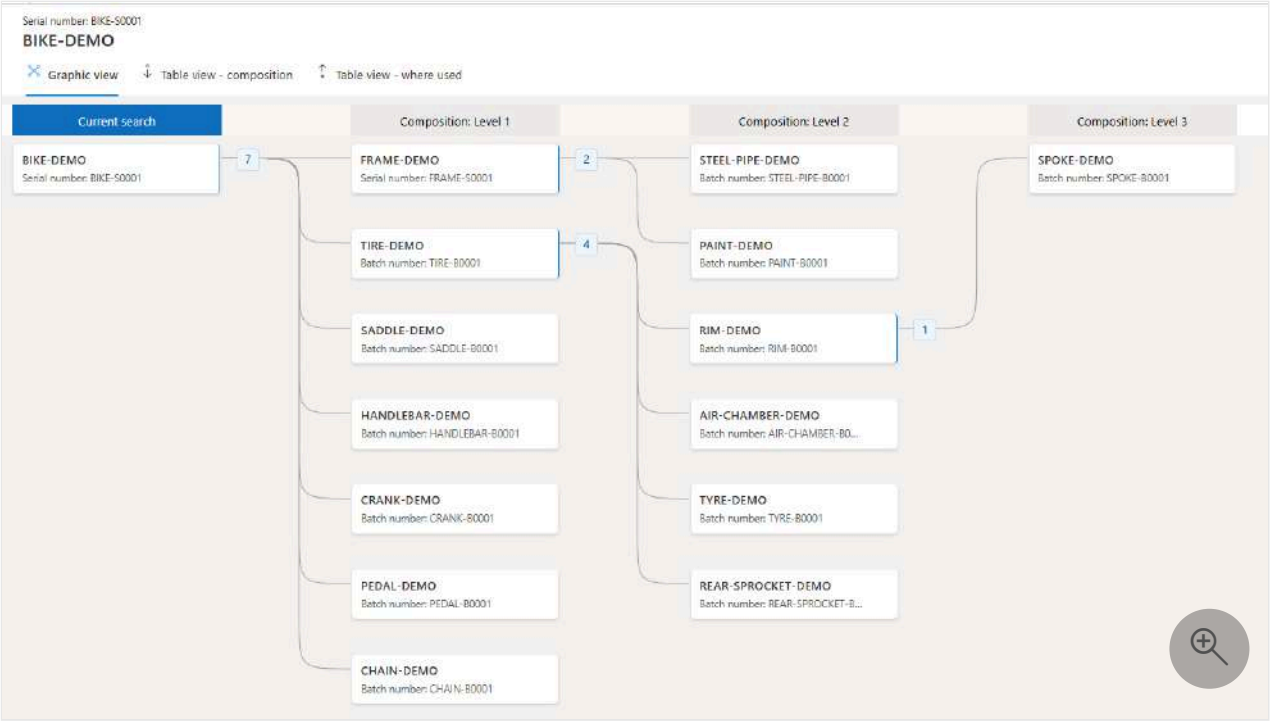
Backward search

Backward searches let you retrieve the full history of a single product.

- In maintenance, repair, and operations (MRO) scenarios, backward search helps maintenance workers retrieve repair logs and component genealogy associated with a specific serial number for root cause analysis.
- Backward search retrieves component genealogy data that can help you decide whether all components included in a specific product were sourced sustainably (environmentally friendly).

To make a backward search, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Trace** > **Genealogy trace**.
3. In the search form, enter a unique identifier (such as a serial, batch, asset, or lot number) of a finished good to retrieve its genealogy, activity, and data collection. (If you're exploring the app using sample data, search for *bike-s0001*.)
4. Traceability shows a genealogy tree for the serial number you entered.



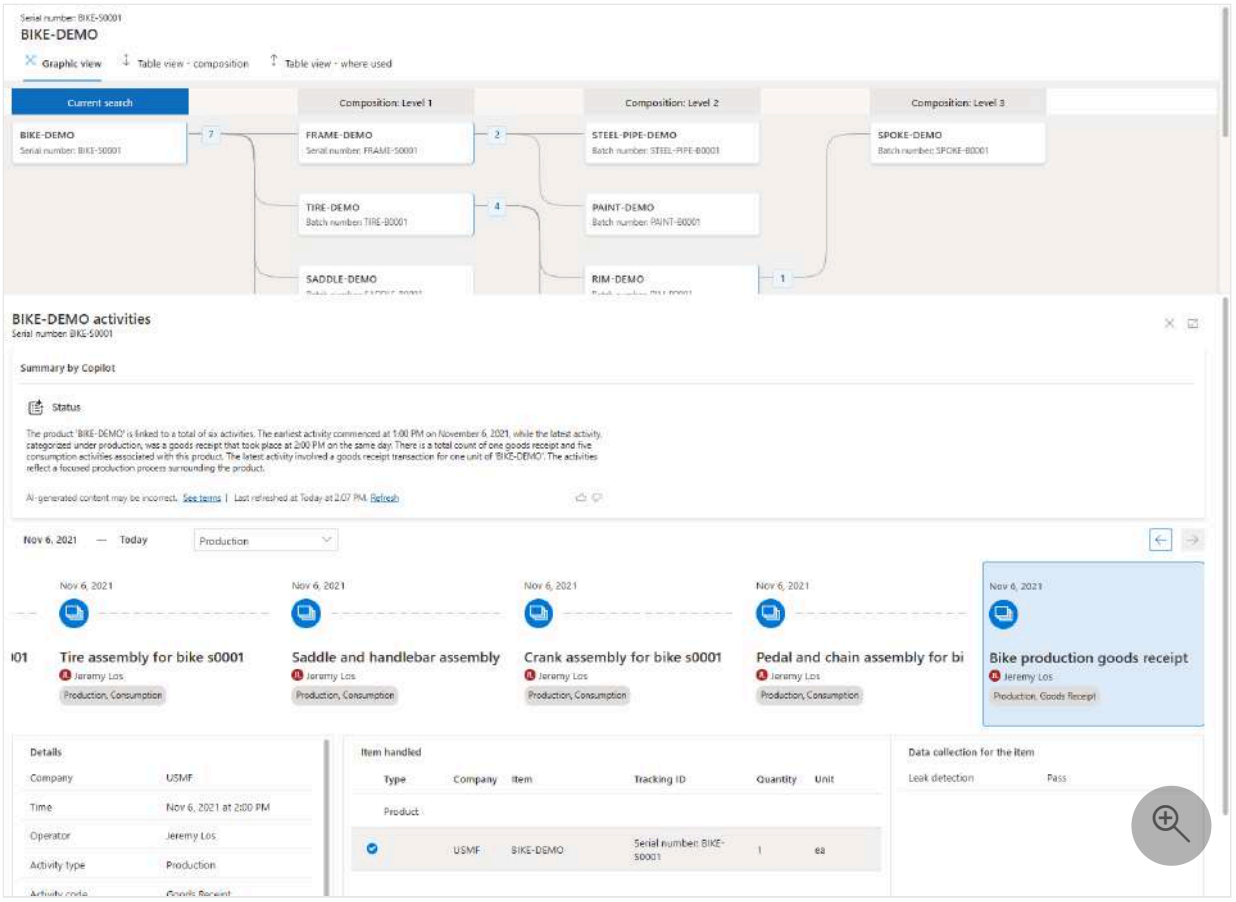
5. Now you can do an *activity verification* by following these steps:

   a. Select a node in the genealogy tree.

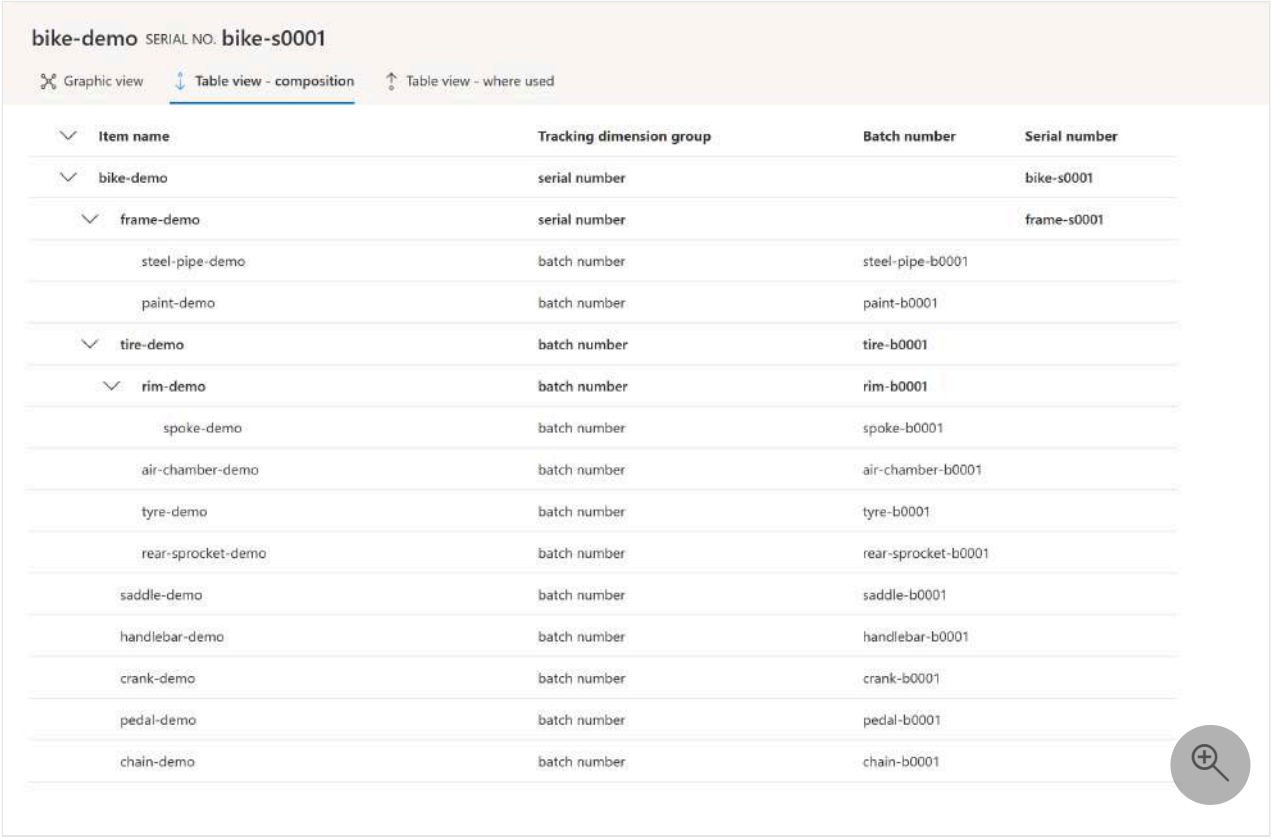
   b. Select the **View activities** button for your selected node to open a dialog.

   c. A Copilot-generated summary gives you a quick overview of the tracked object's history.

   d. Below the summary, all activity events are displayed in reverse chronological order. For example, you might see five activities for *Consumption* and one activity for *Goods receipt*.



6. Until now, you've been working on the **Graphic view** tab. The table views provide another way to view and explore your data. Select **Table view - composition** to see a table view of your backward search.



Forward (where-used) search

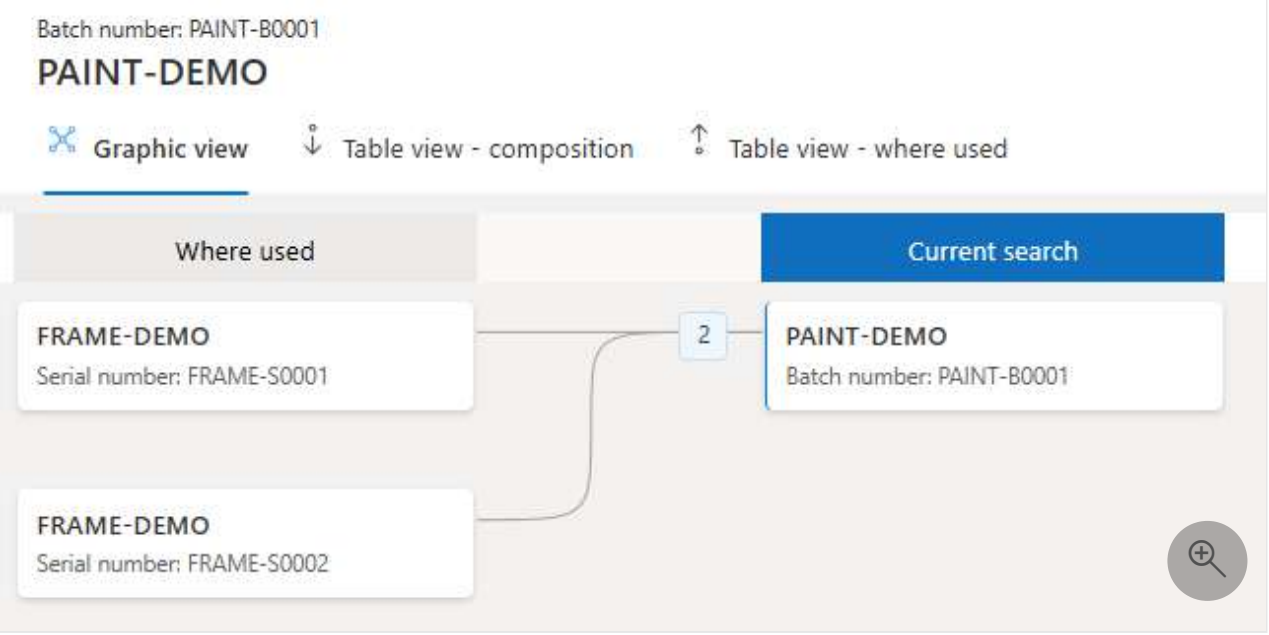
Forward searches help you locate the batch or serial number of finished products that contain semi-products or raw materials with a specific batch or serial number.

In recall scenarios, manufacturers can find the batch or serial number of specific impacted finished goods and then run a specific, accurate recall that minimizes the loss.

For example, in the electric vehicles industry, manufacturers can use the serial number of a battery that's going out of service to locate the cars that use it. They can then offer recycling and warranty services to the affected customers.

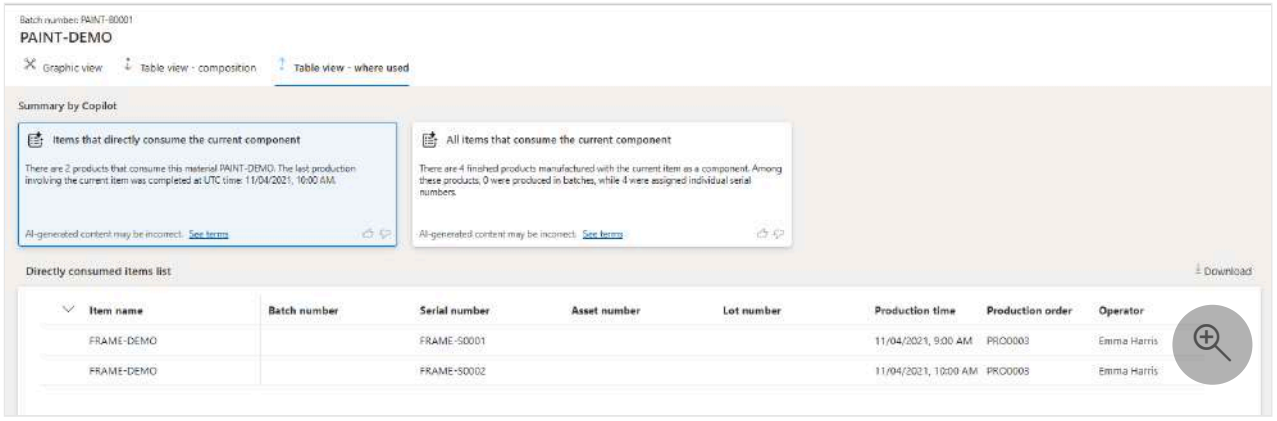
To make a forward search, follow these steps:

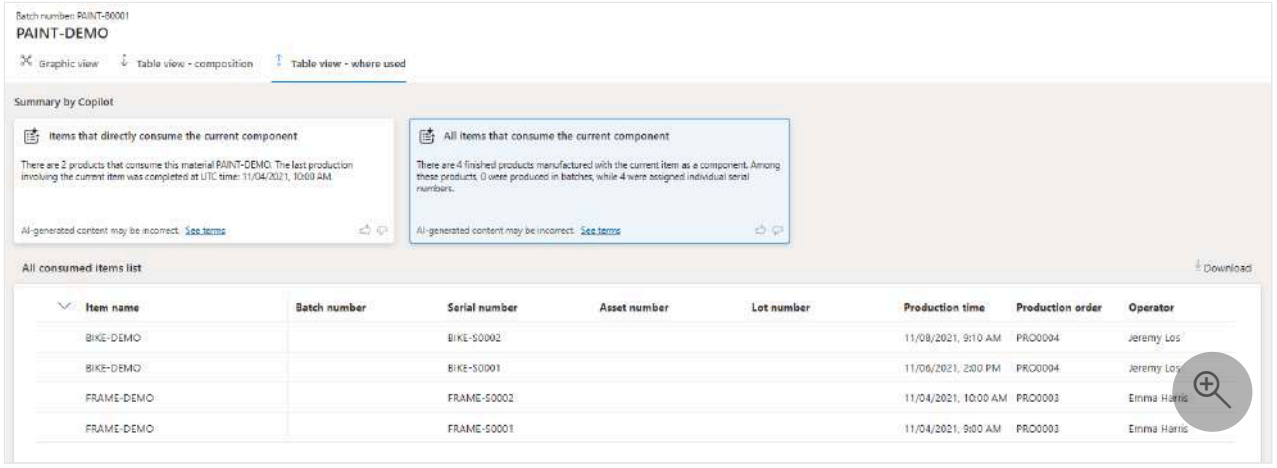
1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Trace** > **Genealogy trace**.
3. Enter a unique identifier of a raw material or semi-product to see the higher-level assembly related to a selected genealogy tree node.



4. Select the relevant node in the genealogy tree.
5. Select the **Trace** button for your selected node. The app now shows a high-level genealogy list.
6. Until now, you've been working on the **Graphic view** tab. The table views provide another way to view and explore your data. Select **Table view – where used** to see a table view of your forward search. Two copilot-generated summaries are provided here: one that summarizes items that directly consume the selected material and another that

summarizes all items that consume the selected material. To see a full list of items associated with either summary, select the appropriate summary.





Find items

The *Find items* report helps you locate serial and batch numbers based on activity codes and data collection values. For example, you can search for finished goods received during a specific period or find all finished goods with a specific data collection value within a defined time range.

To make a find-items search, follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Trace** > **Find items**.
3. Enter values for the following search fields as needed:

    - **Company** – The company associated with the activity you're looking for.
    - **Item** – The item number of the item you're looking for.
    - **Time period** – The time range during which the activity and data collection occurred.
    - **Filters** – Detailed search filters. You can set one or both of the following filters here:

    - **Activity** – The activity code you're looking for.
    - **Data collection** – The data collection field and value you're looking for.

4. Select the **Search** button to search for items that match your search criteria.

5. The system returns the serial and batch numbers along with detailed information.

6. You can verify the results in the **Backward search**.

Monitor and fix failed transactions

Use the *Troubleshooting* report to monitor failed transactions related to the out-of-the-box integration between Traceability and Supply Chain Management.

To monitor failed transactions, follow these steps:

1. Open the Traceability app in Power Apps.

2. On the left navigation pane, select **Trace** > **Failed transaction queue**.

3. A list of failed transactions opens. Each listed transaction shows the following information:

    - **Data** – The content of the failed message.
    - **Error message** – A description of the reason for the failure.
    - **Created on** – The UTC timestamp when the record was created.
    - **Modified on** – The UTC timestamp when the record was last modified.

4. To learn more about a listed transaction, select it and then select **Edit** on the menu bar. The system displays detailed information.

5. Based on the error description, you can either correct the configuration or update the data in the **Data** field.

6. After applying a correction, select the message and then select **Post** on the menu bar to resubmit the failed transaction for processing.

Integrate Traceability with Supply Chain Management (preview)

Summarize this article for me

[This article is prerelease documentation and is subject to change.]

Traceability can integrate seamlessly with Dynamics 365 Supply Chain Management through configuration only.

Integrate Traceability with the purchase goods receipt

The Traceability Add-in for Dynamics 365 Supply Chain Management provides out-of-the-box integration with the purchase goods receipt in Supply Chain Management.

Prerequisites for integrating with the purchase goods receipt

To integrate Traceability with the purchase goods receipt, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.
- The *(Preview) Traceability* feature must be turned on in feature management:

Configure activities in Traceability for integrating with the purchase goods receipt

You must configure Traceability to recognize the activity codes that Supply Chain Management submits. Follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Activity**.
3. The **Activity** page opens. Make sure the following activity codes are available. Learn more in Configure Traceability.

Expand table

Source activity code	Source activity type	Integration Scenario
PurchaseGoodsReceipt	Purchase	Product receipt of purchase order

4. On the toolbar, select **Save**.

Post product receipts of purchase orders

When you post a purchase order product receipt for batch-managed or serialized products in Supply Chain Management, the system automatically sends the corresponding goods receipt event to Traceability.

Integrate Traceability with tracked components in Supply Chain Management

The Traceability Add-in for Dynamics 365 Supply Chain Management provides out-of-the-box integration with the tracked components feature in Dynamics 365 Supply Chain Management.

Shop floor operators using the production floor execution interface can associate the unique ID (serial or batch number) of finished products with the unique ID (serial or batch number) of raw materials. This association is integrated into Traceability for insight processing. Managers can also use the Supply Chain Management web client to view and register serial and batch number information for components and finished goods.

Prerequisites for integrating with tracked components

To integrate Traceability with the tracked components feature Supply Chain Management, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.
- The following features must be turned on in feature management:
  - *(Preview) Traceability*
  - *Tracked components* (As of Supply Chain Management version 10.0.45, this feature is turned on by default.)

Configure activities in Traceability for integrating with tracked components

You must configure Traceability to recognize the activity codes that Supply Chain Management submits. Follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Activity**.
3. The **Activity** page opens. Make sure the following activity codes are available. For more information about these settings, see Configure Traceability.

Expand table

Source activity code	Source activity type	Integration Scenario
ProductionReportFinished	Production	Components consumed during manufacturing assembly.
ProductionPickingList	Production	Finished goods produced during production.

4. On the toolbar, select **Save**.

Configure Supply Chain Management to record batch and serial numbers

Set up your Supply Chain Management system to record batch and serial numbers for raw materials and finished goods. The following procedure summarizes the configuration settings you should use.

1. Set up a number sequence code for *Product component match ID*.
   a. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters** and open the **Number sequences** tab.
   b. Set up a number sequence code for *Product component match ID*.
2. Enable tracked components for bills of materials.
   a. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters** and open the **Bills of materials** tab.
   b. Set **Enable tracked components** to *Yes*.
3. Create tracked component policy.
   a. Go to **Production control** > **Setup** > **Production** > **Tracked components policy**.
   b. Create a **Tracked components policy**.
   c. Set **Use tracked components** to *Yes*.
4. Associate the tracked component policy to finished products and components.

a. Go to **Product information management** > **Products** > **Released products** .
b. Open the product you want to set up.
c. On the **Manage inventory** FastTab, set **Tracked components policy** to the name of the tracked components policy you created earlier.

5. Add the *Tracked components* action to relevant areas of the production floor execution interface.
   a. Go to **Production control** > **Setup** > **Manufacturing execution** > **Configure production floor execution**.
   b. Select a relevant configuration and, from the Action Pane, select **Design tabs**. Add the *Tracked components* action to each relevant tab and toolbar. Repeat this step for each relevant configuration.

   If you're using *USMF* demo data, open the **Default** configuration, select the *Active jobs* design tab, and add the *Tracked components* action to the **Primary toolbar**.

   For more information about these settings, see Design the production floor execution interface.

Register and view batch and serial numbers for finished products and their components

Workers can register batch and serial numbers for finished products and their components from the production floor execution interface. For details, see Register batch/serial numbers for finished products and their components.

Managers can register and review batch and serial numbers for finished products and their components by using the Supply Chain Management web client. For details, see Register and track batch/serial numbers for finished products and their components.

Integrate Traceability with sales goods issues

The Traceability Add-in for Dynamics 365 Supply Chain Management provides out-of-the-box integration with sales goods issues in Supply Chain Management.

Prerequisites for integrating with sales goods issues

To integrate Traceability with sales goods issues, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.

- The following features must be turned on in feature management:
  - *(Preview) Traceability*

Configure activities in Traceability for integrating with sales goods issues

You must configure Traceability to recognize the activity codes that Supply Chain Management submits. Follow these steps:

1. Open the Traceability app in Power Apps.
2. On the left navigation pane, select **Settings** > **Activity**.
3. The **Activity** page opens. Make sure the following activity code is available. Learn more in Configure Traceability.

Expand table

Source activity code	Source activity type	Integration Scenario
SalesGoodsIssue	Sales	Post packing slip of sales order

4. On the toolbar, select **Save**.

Post packing slips of sales orders

When you post a sales order packing slip for a batch-managed or serialized product in Supply Chain Management, the system automatically sends the corresponding goods issue event to Traceability.

Last updated on 02/11/2026

Traceability API (preview)

Summarize this article for me

[This article is prerelease documentation and is subject to change.]

This article describes how to integrate the Traceability Add-in for Dynamics 365 Supply Chain Management with external systems through its API.

Authentication

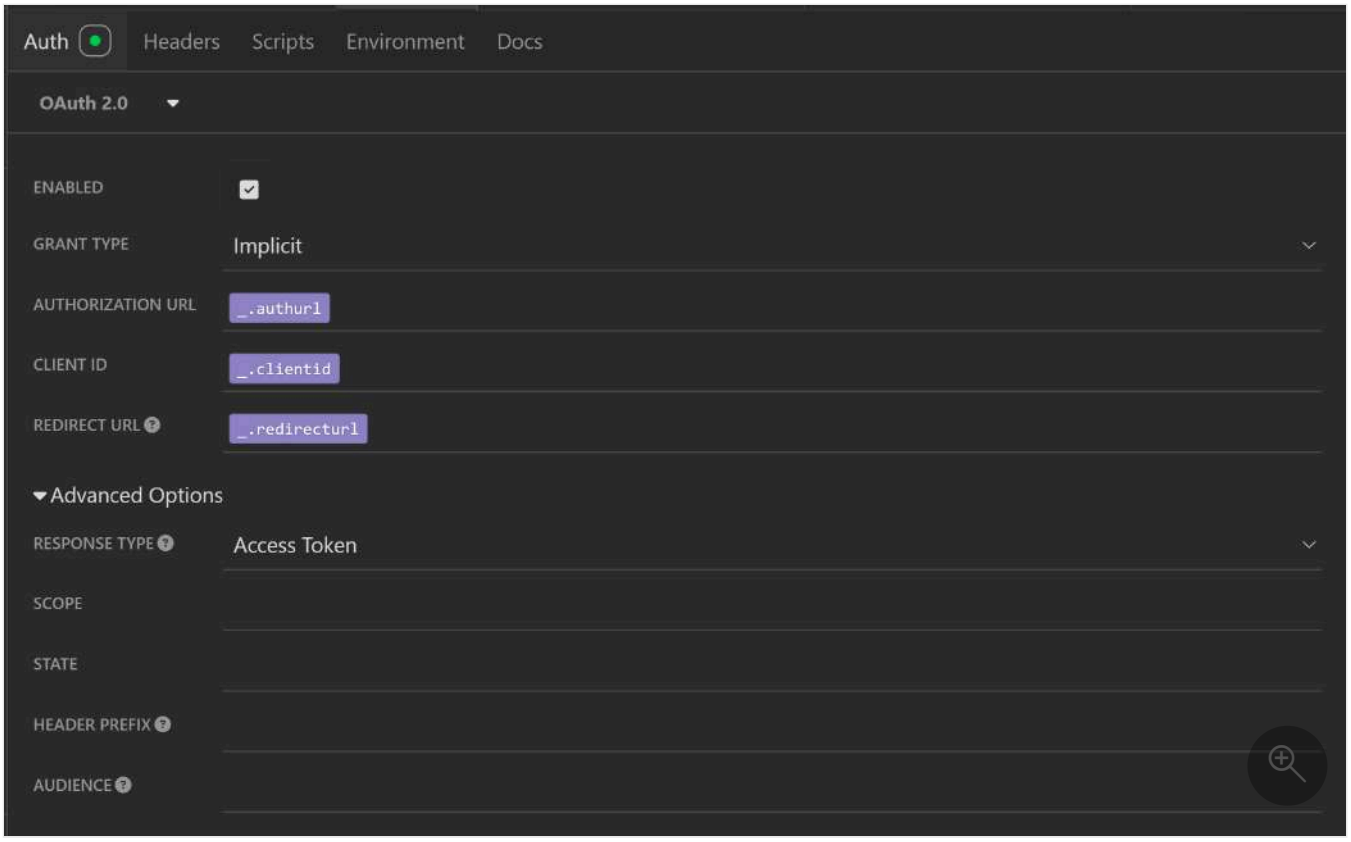
The platform security token is required to call the Traceability public API. The following example uses an Insomnia configuration. Learn more in Use Insomnia with Dataverse Web API.

Use Insomnia to fetch a Microsoft Entra token by submitting an HTTP request that has the following properties:

Expand table

Key	Value
Grant type	Implicit
Authorization URL	`https://login.microsoftonline.com/common/oauth2/authorize?resource={Traceability URL}`. Where *{Traceability URL}* is the URL for your Traceability installation, which resembles `https://operationsxxx.crm.dynamics.com`
Client ID	The Application ID (client ID) registered in Azure portal.
Response type	Access Token

The following image shows an example of an Insomnia configuration. You can configure the keys mentioned in the previous table into the **Auth** tag of a specific HTTP request in Insomnia.



You can create the following JSON file as global environment for an Insomnia project. The `version` and `webapiurl` fields are used to build the path of the specific API.

Available APIs

The following table lists the APIs available for Traceability.

Expand table

Path	Method	Description
/api/data/v9.0/msdyn_sctquerytrace_v1	Post	Query by tracking ID

The remaining sections provide detailed information about each API.

Single query API

This API accepts queries for traceability information and returns genealogy, activity, and data collection information.

- **Path** – Specify the traceability URL. For example: `https://operationsxxx.crm.dynamics.com/api/data/v9.0/msdyn_sctquerytrace_v1`
- **Method** – `POST`

Single query request payload

txt

```
{
    "tracingDirection": "Forward/Backward",
    "eventDetailOption": "EventIdOnly",
    "traceNodeOption": "BuildNodeDictionary",
    "shouldGenerateSummary": true/false,
    "itemNumber": "BIKE-DEMO",
    "serialNumber": "BIKE-S0001",
    "batchNumber": "",
    "company": "USMF",
    "trackingId": "",
    "shouldIncludeEvents": true/false
}
```

Single query request field descriptions

Expand table

Field	Description
`tracingDirection`	Controls the search direction: *Backward* or *Forward*. *Backward* means from top finished good to raw materials; *Forward* means from raw materials to top finished good.
`trackingId`	Key value for the genealogy node. It's a combination of the `itemNumber`, `company`, `batchNumber`, and `serialNumber`.
`company`	The company of the top finished good. For Supply Chain Management, this field maps to the legal entity.
`itemNumber`	The item number of the top finished good.
`serialNumber`	The serial number of the top finished good.
`batchNumber`	The batch number of the top finished good.
`ShouldIncludeEvents`	Controls whether event details should be included. Default is *false*.

Field	Description
`ShouldGenerateSummary`	Set to *True* to include the copilot summary for where-used search.
`ShouldIncludeEvents`	Specify one of the following values: • *EventIdOnly* – Put event ID as a property of the trace node. • *EventInTrace* – Put event details as a property of the trace node. • *EventInDictionary* – Put event IDs as a property of the trace node, return a map whose key is an event ID and the value is the event details.
`TraceNodeOption`	Specify one of the following values: • *BuildNodeGraph* – Render the result as a tree. • *BuildNodeDictionary* – Render the result as a tracking node dictionary, where the key is a tracking ID and the value is the node details.

Single query response header field descriptions

Expand table

Field	Description
`TracingDirection`	Controls the search direction: *Backward* or *Forward*. *Backward* means from top finished good to raw materials; *Forward* means from raw materials to top finished good. Only returns one level above or below the result.

Single query response root element field descriptions

Expand table

Field	Description
`trackingId`	Key value for the genealogy node. It's a combination of the `itemId`, `companyCode`, `batchId`, and `serialId`.

Single query response events element field descriptions

Expand table

Field	Description
`eventId`	Unique identifier for the event (`SerialId`/`BatchId`). Duplicate values aren't allowed. The system generates this value if no value is provided.

Field	Description
`companyCode`	The company code of the top finished good. For Supply Chain Management, this field maps to the legal entity.
`operator`	The operator who executed the activity event. The value can be a user ID, employee ID, or similar.
`description`	Activity event description.
`activityType`	Refers to a predefined activity type (*Purchase*, *Sales*, *Production*, and so on).
`activityCode`	Refers to a configured activity type (*GoodsReceipt*, *Add*, *Remove*, and so on).
`dateTime`	Date and time the activity event occurred.
<data collection name>	These fields are used to collect customization values.

Single query response productTransaction element field descriptions

Expand table

Field	Description
`transactionId`	Unique identifier for the transaction. Duplicate values aren't allowed.
`itemId`	Item number of the top finished good.
`trackingId`	Key value for the genealogy node. It's a combination of `itemId`, `companyCode`, `batchId`, and `serialId`.
`serialId`	Serial number of the top finished good.
`batchId`	Batch number of the top finished good.
`quantity`	Operation quantity of the top finished good.
`unitOfMeasure`	Unit of measure of the received quantity.

Single query response consumptionTransactions element field descriptions

Expand table

Field	Description
`transactionId`	Unique identifier for the transaction. Duplicate values aren't allowed.
`itemId`	Item number of the component.
`trackingId`	Key value for the genealogy node. It's a combination of `itemId`, `companyCode`, `batchId`, and `serialId`.
`serialId`	Serial number of the component.
`batchId`	Batch number of the component.
`quantity`	The consumption quantity of the component.
`unitOfMeasure`	Unit of measure of the consumption quantity.

Single query request example

Query the result of finished goods *BIKE-S001*.

Single query request example request payload

JSON

```
{
    "tracingDirection": "Forward",
    "eventDetailOption": "EventIdOnly",
    "traceNodeOption": "BuildNodeDictionary",
    "shouldGenerateSummary": false,
    "itemNumber": "BIKE-DEMO",
    "serialNumber": "BIKE-S0001",
    "batchNumber": "",
    "company": "USMF",
    "trackingId": "",
    "shouldIncludeEvents": false
}
```

Single query request example API response

}
```

Last updated on 02/11/2026

Transportation management overview

07/31/2025

This article gives an overview of the transportation management functionality in Supply Chain Management.

Transportation management lets you use your company's transportation, and also lets you identify vendor and routing solutions for inbound and outbound orders. For example, you can identify the fastest route or the least expensive rate for a shipment. The following table describes the main scenarios for using Transportation management.

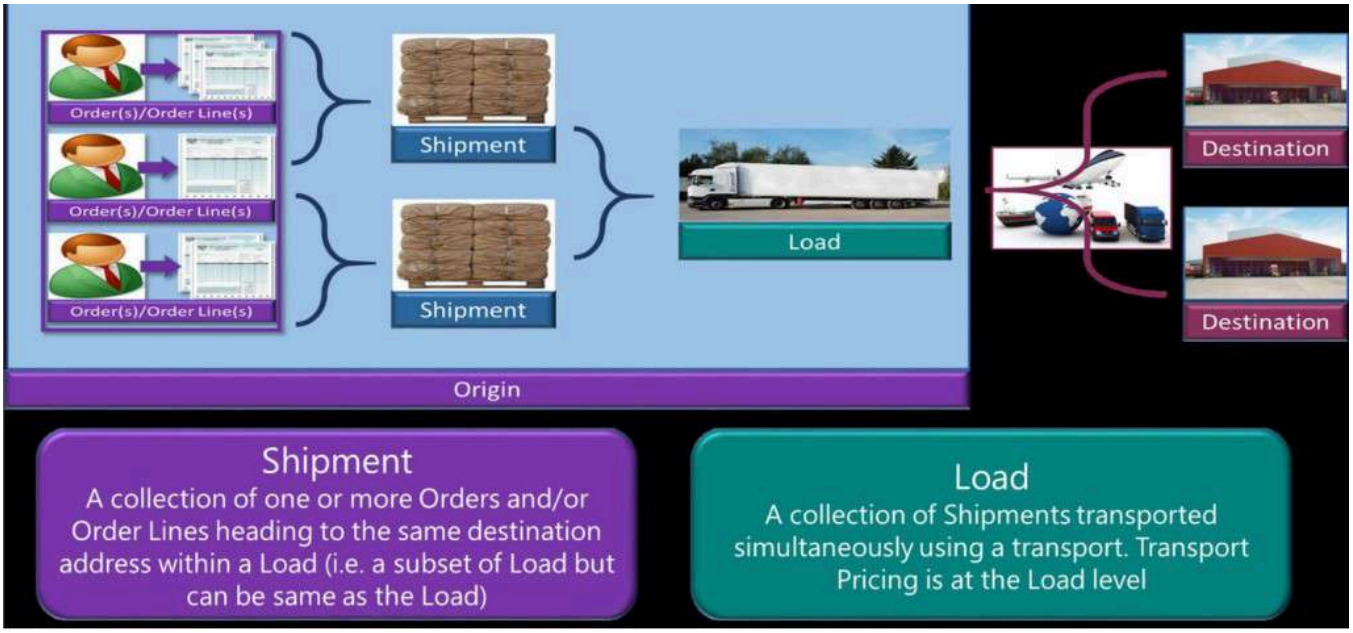
Expand table

Scenario	How Transportation management can help
Use external logistics providers for transportation activities.	Use Transportation management for inbound and/or outbound transportation.
The company's own fleet is available for delivery/pickup, and delivery charges are passed on to customers.	For the outbound processes, you can use Transportation management to determine the transportation charges and pass them on to customers. However, the carrier invoice reconciliation process isn't required.
The company's own fleet is available for delivery/pickup, but delivery charges aren't passed on to customers, because product prices include transportation.	Many of the settings and features of Transportation management aren't required. However, you can use Transportation management to determine the transportation rates and adjust the sales price accordingly.
Logistics service is provided by another legal entity in the same company.	You can use Transportation management by treating the other legal entity like any other shipping carrier. You can't automate the economic transactions between legal entities. Therefore, you must handle these transactions manually (for example, by creating a purchase order). In the legal entity that provides the logistics services, Transportation management can be used to determine transportation rates.

Planning transportation in Supply Chain Management

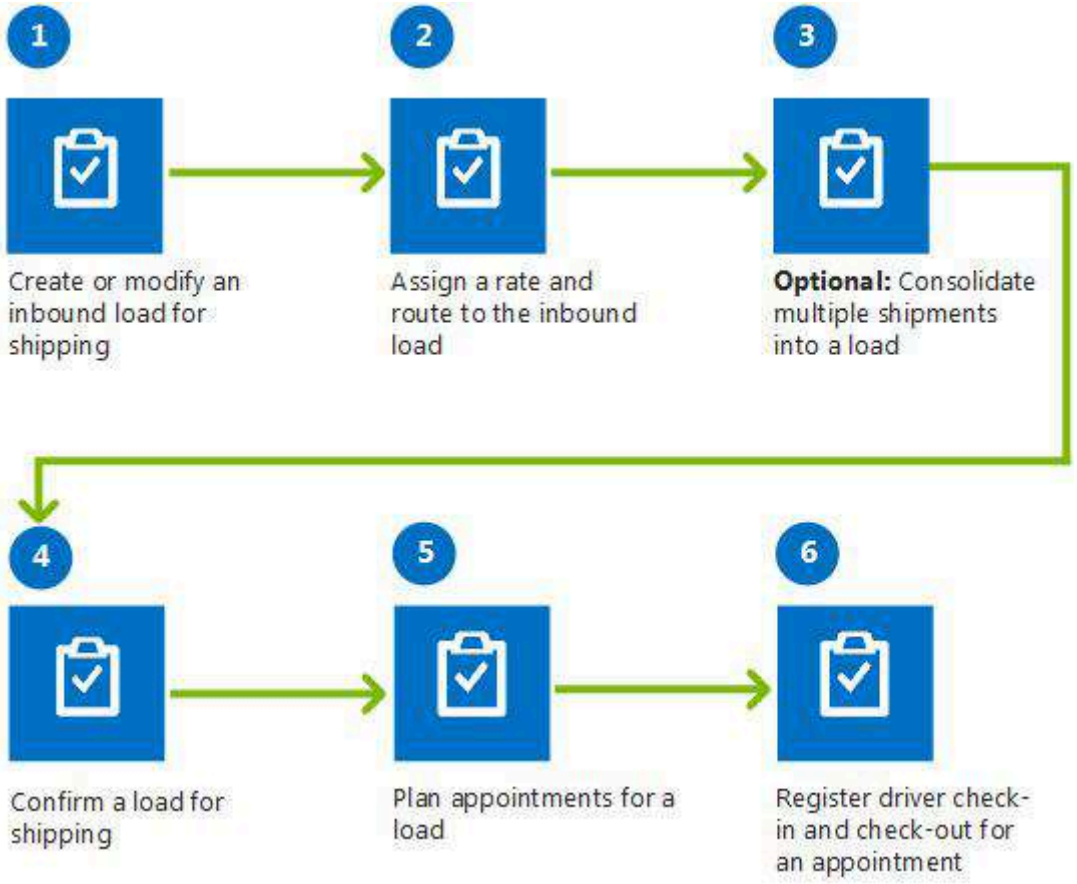
In Transportation management, transportation planning can be based either on orders or on the shipments that are created based on those orders. The shipments always exist at some

point in time but aren't required for transportation planning. Transfer orders are part of the outbound scenario and can be planned together with sales orders.



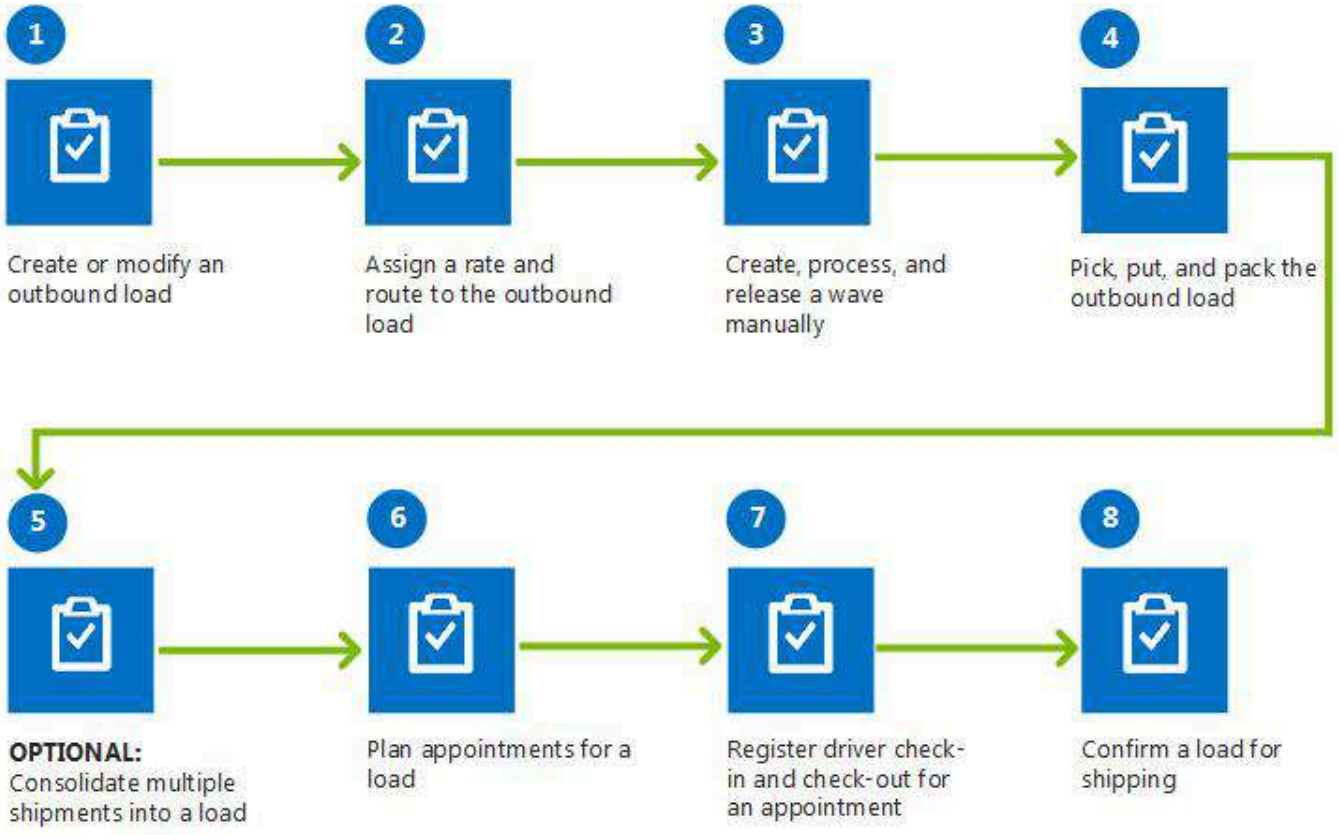
Inbound transportation

When you order items from a vendor, and the items must be delivered to your warehouse, you might want to arrange the transport of the items yourself. You can use Supply Chain Management to plan the transportation and receipt of the inbound load. The following illustration shows the business process flow for planning transportation for an inbound load.



Outbound transportation

You can plan and process an outbound load to ship specific items from a company's warehouse to a customer. You can use Supply Chain Management to plan the transportation and shipping of an outbound load. The following illustration shows the business process flow for planning and processing outbound loads for shipping.



Load building

Supply Chain Management provides a load-building strategy called the *Volume-based load building strategy*. This strategy lets you use the maximum values that are specified for height and weight in the load template, or you can override the settings by entering new values. To use this strategy, select it in the **Load building strategy** field on the **Setup** FastTab on the **Load building workbench** page. In addition, you can add your own load-building strategies by creating a new class in the Application Object Tree (AOT).

White papers

The following white papers explore various aspects of transportation management in Dynamics 365 Supply Chain Management:

- Transportation management engines
- Implementing and deploying Transportation management engines

Transportation management engines

07/31/2025

Transportation management engines define the logic that is used to generate and process transportation rates in Transportation management.

A transportation management engine calculates tasks, such as the carrier's transportation rate. The engine system lets you change calculation strategies at runtime, based on data in Supply Chain Management. A transportation management engine resembles a plug-in that is related to a particular carrier contract.

What engines are available?

The following table shows the transportation management engines that are available.

Expand table

Transportation management engine	Description
Rate engine	Calculates rates.
Generic engine	Simple auxiliary engines that are used by other engines that don't require data from Supply Chain Management, for example, an apportionment engine. Apportionment engines are used to reduce the final costs of transportation to specific orders and lines, based on dimensions, such as volume and weight.
Mileage engine	Calculates the transportation distance.
Transit time engine	Calculates the time that is required to travel from the start to the end destination.
Zone engine	Calculates the zone based on the current address and calculates the number of zones that must be crossed in order to travel from address A to address B.
Freight bill type	Standardizes the freight invoice and the freight bill lines and is used for automatic freight bill matching.

What engines must be configured to rate a shipment?

To rate a shipment using a specific carrier, you must configure multiple transportation management engines. The **Rate engine** is required, but other transportation management

engines might be required to support the **Rate engine**. For example, the **Rate engine** can be used to retrieve data from the **Mileage engine** to calculate the rate based on mileage between the source and the destination.

What's required to initialize a transportation management engine?

A transportation management engine requires that you set up initialization data in order to function in a specific way. The setup can include the following types of data:

- References to other transportation management engines. For details, see the configuration example in this section.
- References to .NET types that are used by the transportation management engine.
- Simple configuration data.

In most cases, you can select the **Parameters** button in the transportation management engine's setup forms to configure the initialization data. **Example of the configuration of a rate engine that references a mileage engine** The following example shows the setup that is required for a rate engine that is based on the .NET engine type `Microsoft.Dynamics.Ax.Tms.Bll.MileageRateEngine` and references a mileage engine.

Expand table

Parameter	Description
`RateBaseAssigner`	The .NET type that interprets the rate base assignment data for a particular schema. The syntax of the parameter value consists of two segments delimited by a vertical bar.
`MileageEngineCode`	Mileage engine code that identifies the mileage engine record in the database.
`ApportionmentEngine`	Generic engine code that identifies the apportionment engine in the database.

How is metadata used in transportation management engines?

Transportation management engines that rely on data that is defined in Supply Chain Management can use different data schemas. The transportation management system enables different transportation management engines to use the same generic physical database tables. To make sure that run-time interpretation of engine data is correct, you can define metadata for the database tables. This reduces the cost of building new transportation

management engines because additional table and form structures aren't required in Operations.

What can be used as search data in rate calculations?

The metadata configuration controls the data you use when calculating rates. For example, if you want to search for rates based on postal codes you must set up metadata based on the lookup type of a postal code.

Do all engine configurations require metadata?

No, transportation management engines that are used to retrieve the data that is required for rate calculation from external systems don't need metadata. The rate data for these engines can be retrieved from external transportation carrier systems, usually through a web service. For example, can use a mileage engine that retrieves data directly from Bing maps so that you don't need a metadata for this engine.

> **Note**
>
> The transportation management engines that are delivered with Supply Chain Management rely on data that is retrieved from the application. Engines that connect to external systems aren't included. However, the engine-based extensibility model lets you build extensions using Visual Studio Tools.

How do I configure metadata for a transportation management engine?

Metadata for transportation management engines is configured differently for the different types of engines.

Expand table

Transportation management engine	Metadata configuration
Rate engine	Requires a **Rate base type**. The rate base type contains metadata for the rate base data and the rate base assignment data. The type of rate engine determines the structure of rate base metadata. The type of rate base assigner associated with rate

Transportation management engine	Metadata configuration
	engine determines the structure of its rate base assignment metadata. You set up the rate base type of a rate engine on the **Rate engine** page and on the **Rate master** page.
Zone engine	Requires metadata to be set up directly on the zone master.
Transit time engine and **Mileage engine**	Retrieves the metadata directly from the mileage engine's configuration setup form.

Example of metadata for a rate engine

The transportation management engine requires identification of the origin address, the destination state and country/region, and the start and end point of the shipment. By using these requirements, the metadata would look like the data in the following table. The table also includes information about what type of input data is required.

Expand table

Sequence	Name	Field type	Data type	Lookup type	Mandatory
1	Origin postal code	Assignment	String	Postal Code	Selected
2	Destination state	Assignment	String	State	
3	Destination start postal code	Assignment	String	Postal Code	Selected
4	Destination end postal code	Assignment	String	Postal Code	Selected
5	Destination country	Assignment	String	Country/region	

> **Note**
>
> The transportation management engines delivered with Supply Chain Management rely on postal codes. They don't support longitude and latitude data. If you need to use longitude and latitude data, then you must develop a custom engine. Learn more in Create a new transportation management engine.

White paper

For more information, download the following white paper (written to support AX2012, but still applies for Dynamics 365 Supply Chain Management)

- Transportation management engines

Create a new transportation management engine

Summarize this article for me

> **Note**

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article describes how to create a new transportation management engine in Dynamics 365 Supply Chain Management.

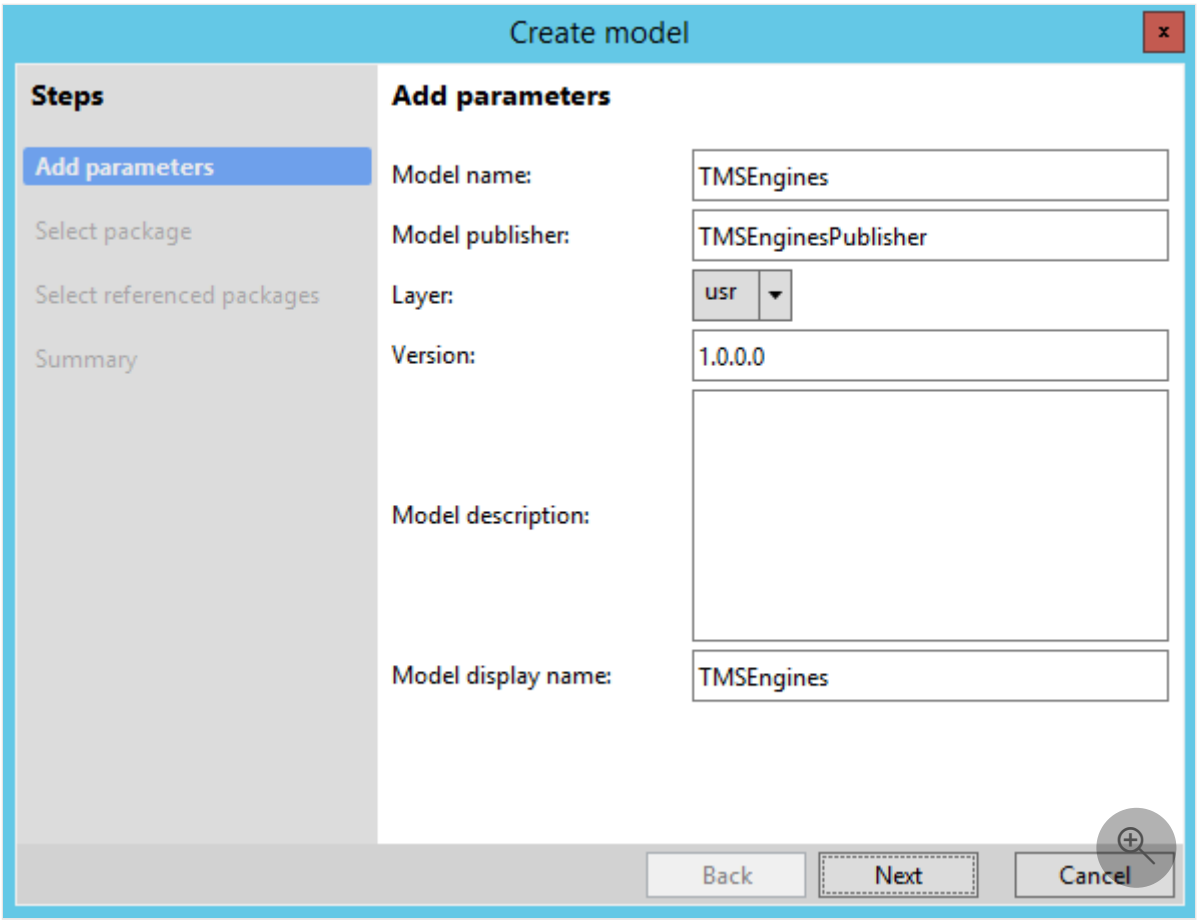
Transportation management (TMS) engines define the logic that generates and processes transportation rates in Transportation management. Supply Chain Management provides several different engine types that calculate different parameters, such as rates, transit times, and the number of zones crossed during transit. This article explains how to use the Microsoft Visual Studio development environment together with Supply Chain Management development tools to create and deploy a new TMS engine, and then how to set up the engine in Operations. For more information about the engines, see Transportation management engines.

Create a new TMS engine

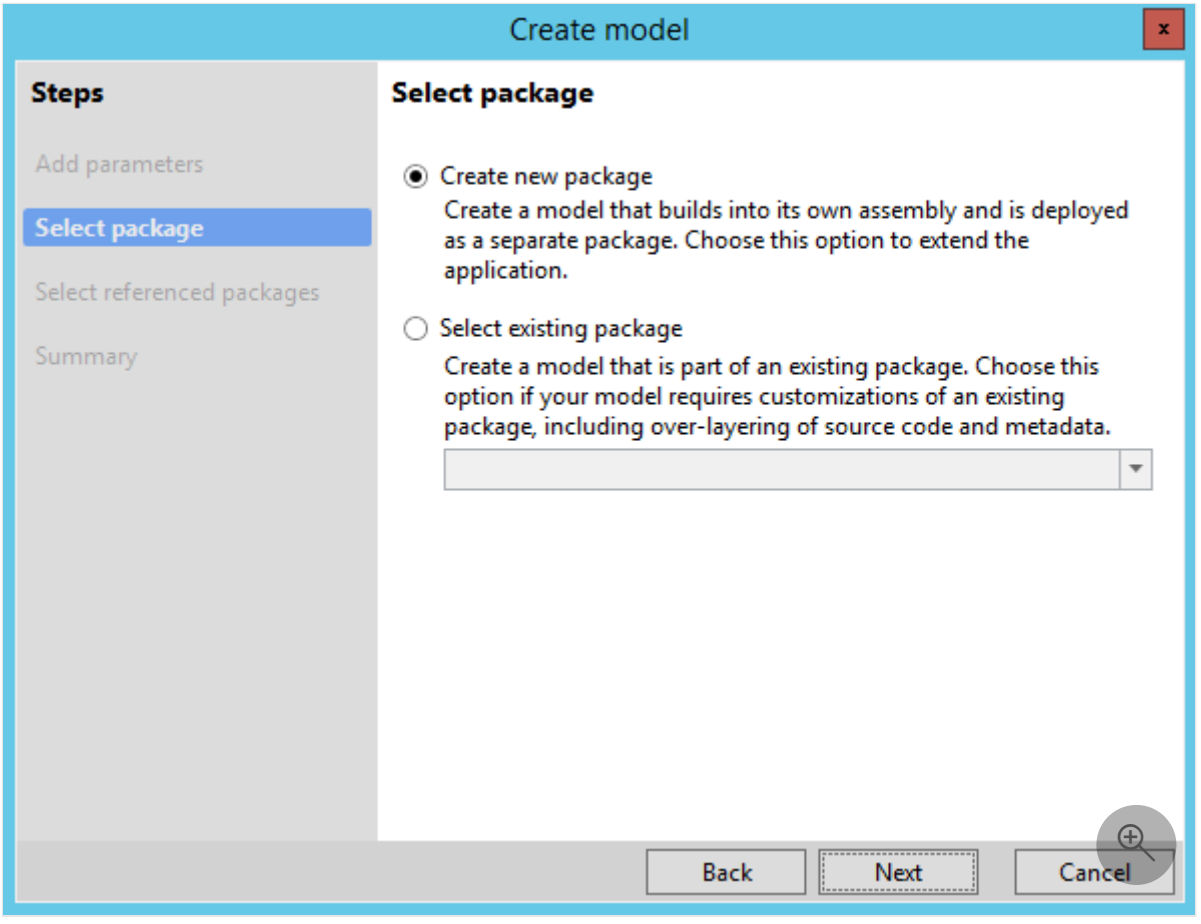
This section explains how to create a class library that has a TMS engine implementation, and how to reference it from a Supply Chain Management model.

1. To deploy your new engines, you must have a model that contains the engines. On the **Dynamics 365** > **Model Management** menu, select **Create model** to create a new model.

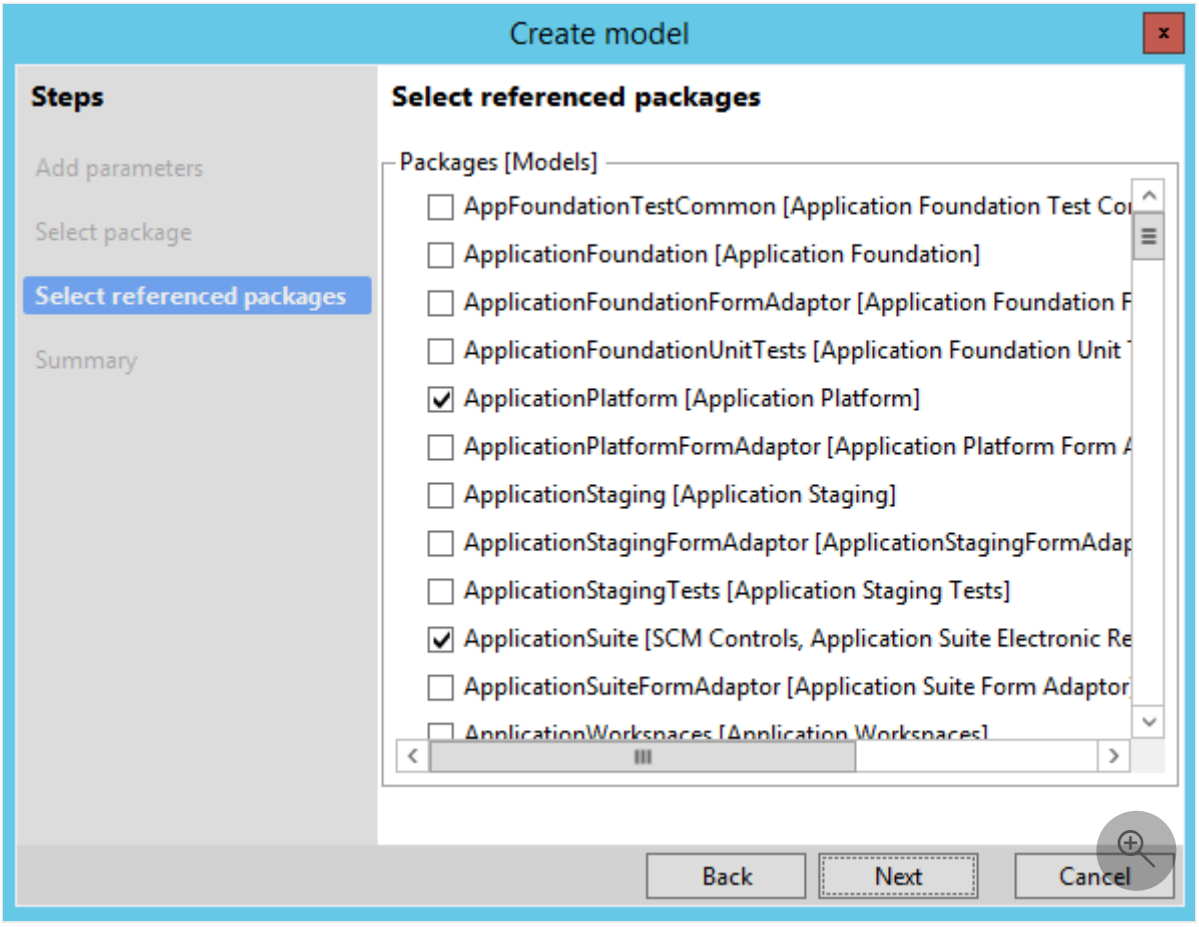
On the first page of the **Create model** wizard, name the model *TMSEngines*.



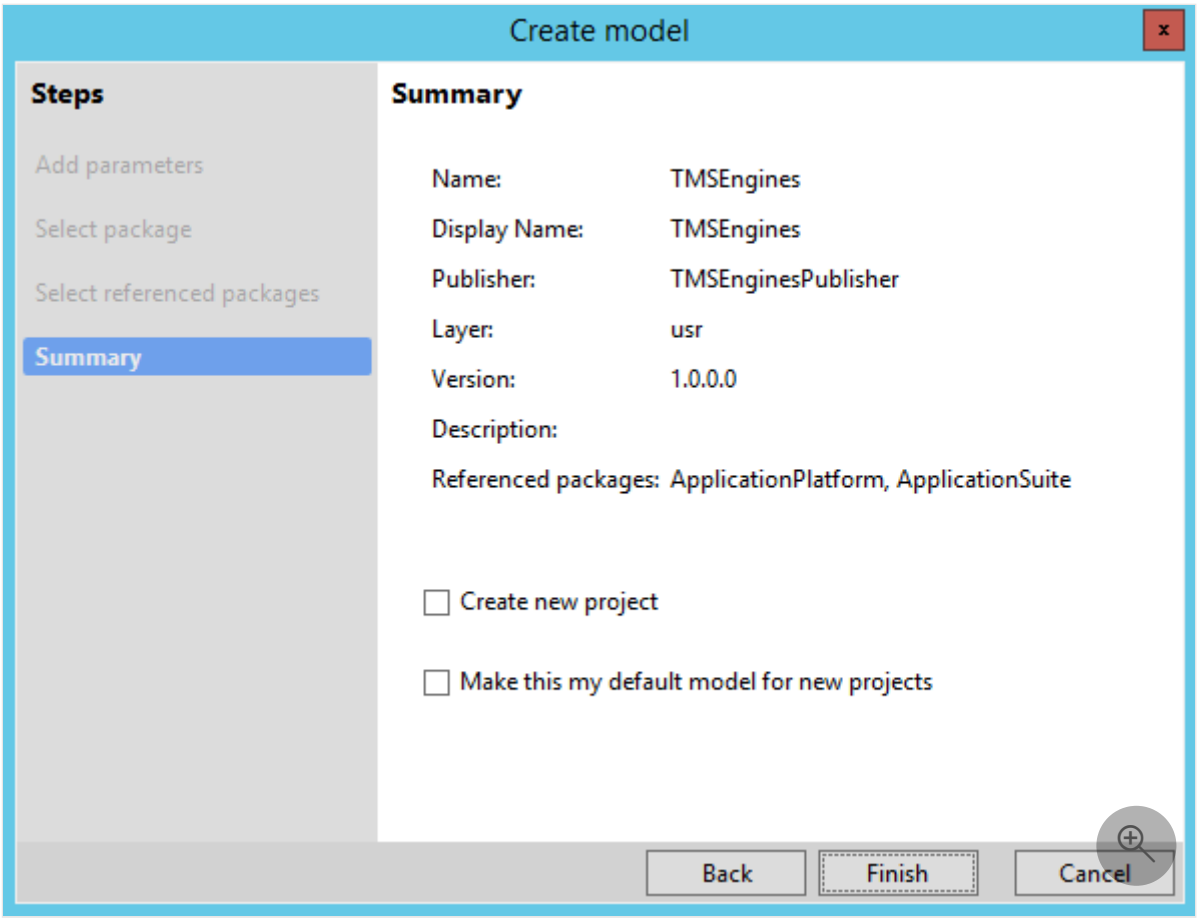
2. On the next page, select **Create new package**.



3. On the next page, select the **ApplicationSuite** model to reference. (The *ApplicationPlatform* model is preselected.)



4. On the next page, select **Finish** to confirm the creation of a new model.



5. In a new solution, create a new Supply Chain Management project, and name it *TMSThirdParty*. The framework must be set to *.NET Framework 4.8* or newer. Double check that the project's file (`TMSThirdParty.rnrproj`) specifies the correct .NET Framework version. If it doesn't, update it directly in the file to `<TargetFrameworkVersion>v4.8</TargetFrameworkVersion>`. In the project properties, set the project's model to *TMSEngines*.

6. Add a new C# *Class Library (.NET Framework)* to your solution, and name it *ThirdPartyTMSEngines*. The framework must be set to *.NET Framework 4.8* or newer and must match the settings on the *TMSThirdParty* project.

7. In the *ThirdPartyTMSEngines* project, add references to Supply Chain Management–specific assemblies specified in the following list.

   > **ⓘ Important**
   >
   > The **Copy Local** property for all the references in this list must be set to *False*. Otherwise, you risk producing runtime issues where the engine class might not be found or the assembly might not load correctly.

   - Application assemblies that enable X++ types to be referenced. These assemblies can be found in the following locations. [Packages root] is the path of the location

where all the deployed assemblies are placed, such as `C:\Packages`.

```text
[Packages
root]\ApplicationPlatform\bin\Dynamics.AX.ApplicationPlatform.dll
[Packages
root]\ApplicationFoundation\bin\Dynamics.AX.ApplicationFoundation.dll
[Packages root]\ApplicationSuite\bin\Dynamics.AX.ApplicationSuite.dll
```

- Framework assemblies that enable access to data, LINQ, and auxiliary functions. All these assemblies can be found in [Packages root]\bin.

```text
Microsoft.Dynamics.ApplicationPlatform.Environment.dll
Microsoft.Dynamics.AX.Data.Core.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.AdoNet.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Interface.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Msil.dll
Microsoft.Dynamics.AX.Server.Core.dll
Microsoft.Dynamics.AX.Xpp.AxShared.dll
Microsoft.Dynamics.AX.Xpp.Support.dll
```

- The core TMS assembly (which contains engines) and the TMS base assembly (which contains helpers, constants, data transfer class definitions, and so on). These assemblies can be found in the following locations.

```text
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.dll
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.Base.dll
```

8. Rename the C# class that is automatically generated in the *ThirdPartyTMSEngines* project to `SampleRatingEngine`.

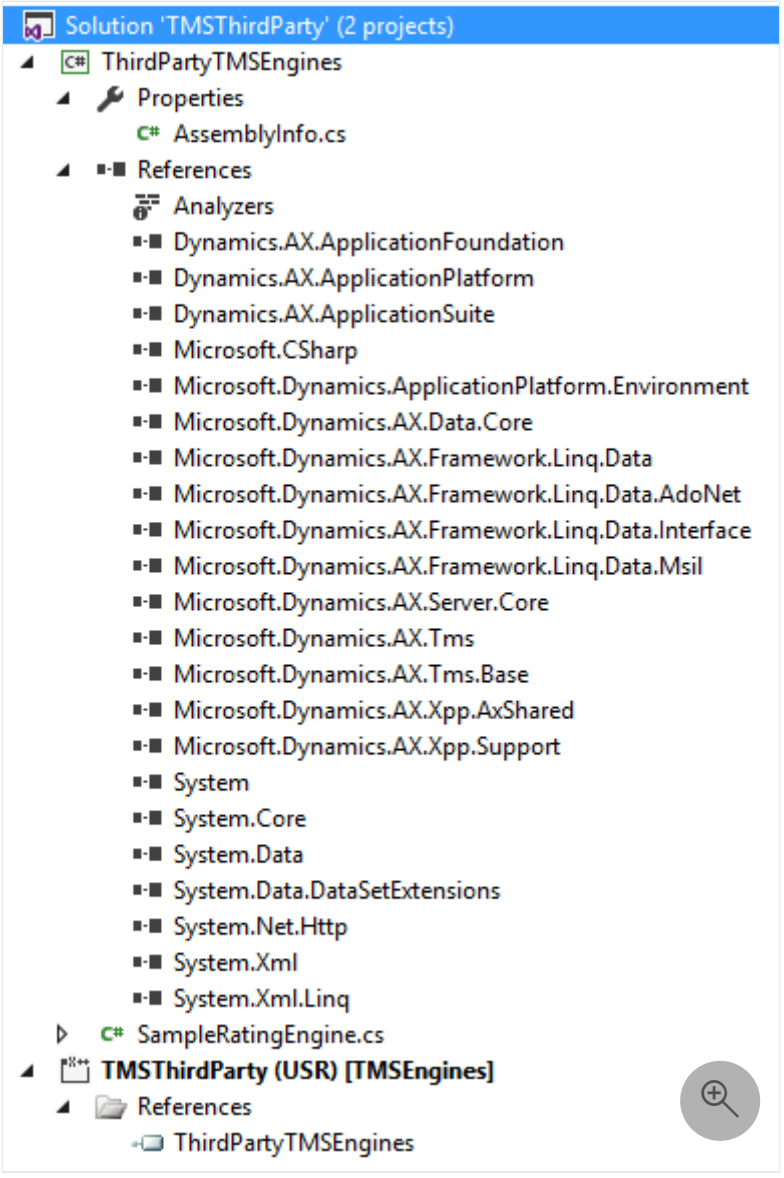
9. Implement the engine. Because you're creating a rate engine in this example, inherit from the base class for rate engines. The base class implements most of the rate engine interface (`TMSFwkIRateEngine`). You just have to implement the rate method. To keep this example simple, make this method register a hard-coded rate of 100. You can create engines that implement any of the engine interfaces, such as `TMSFwkIAccessorialEngine`. All the engine interfaces are defined in X++.

```C#
```

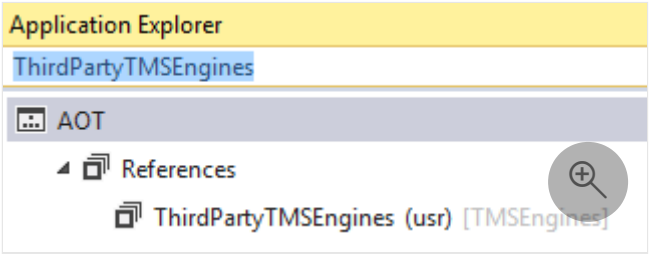
```
namespace ThirdPartyTMSEngines
{
    using Dynamics.AX.Application;
    using Microsoft.Dynamics.Ax.Tms.Base.Data;
    using Microsoft.Dynamics.Ax.Tms.Base.Utility;
    using Microsoft.Dynamics.Ax.Tms.Bll;
    using System.Xml.Linq;
    public class SampleRatingEngine : BaseRateEngine
    {
        public override RatingDto rate(TmsTransactionFacade
_transactionFacade, XElement _shipment, string _rateMasterCode)
        {
           XElement re =
shipment.RetrieveOrCreateRatingEntity(this.RatingDto);
           re.AddRate(TmsRateType.Rate, 100);
           return this.RatingDto;
        }
    }
}
```

10. Build the solution.

11. Add a new reference to the *TMSThirdParty* project. The reference should point to the *ThirdPartyTMSEngines* project. When you finish, your solution should look like this.



12. Build the solution. Verify that the new library appears in the **References** node in Application Explorer.



> **Note**
>
> If you're testing the new engine directly in the development environment, you might also need to build the entire *TMSEngines* model from **Extensions** > **Dynamics 365** > **Build models**. This might resolve the issue if the engine assembly couldn't be found.

Deploy the TMS engine as a package

One way to deploy third-party TMS engines is through a deployment package. To deploy the engine as a package, follow these steps:

1. In Visual Studio, go to **Extensions** > **Dynamics 365** > **Deploy** > **Create Deployment Package** and create a deployment package for the new model you created as described in Create a new TMS engine.

2. In Microsoft Dynamics Lifecycle Services, go to **Asset Library** > **Software deployable package**. Select **Add** to add the deployment package you created to Lifecycle Services.

3. After the validation completes, go to **Environments** > **{Your Environment ID}** > **Maintain** > **Apply updates**, select the deployable package, and apply it.

> **Note**
>
> If the system warns you that you don't have permission to deploy packages on Lifecycle Services, contact your Lifecycle Services administrator for support.

Set up the TMS engine in Supply Chain Management

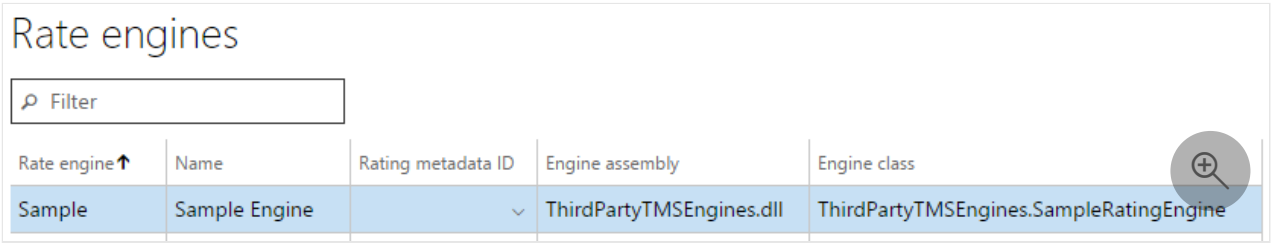
This section explains how to set up Supply Chain Management to use a TMS engine, and shows how the new engine that you created is used in rate shopping. The example in this section uses the USMF demo data company.

1. Create a new engine as described in Create a new TMS engine.

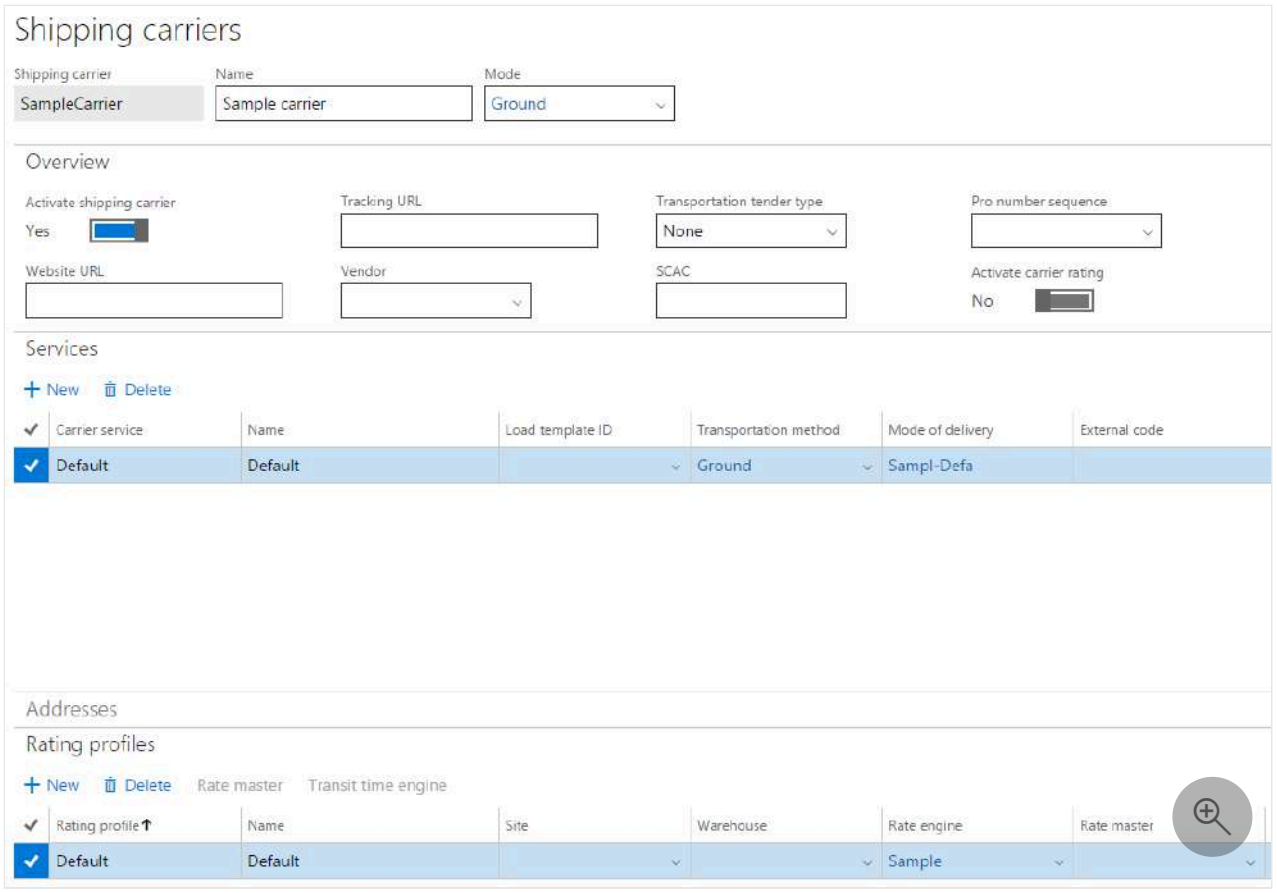
2. Build your solution.

3. Deploy the TMS engine DLL file through a deployment package, as described in Deploy the TMS engine as a package.

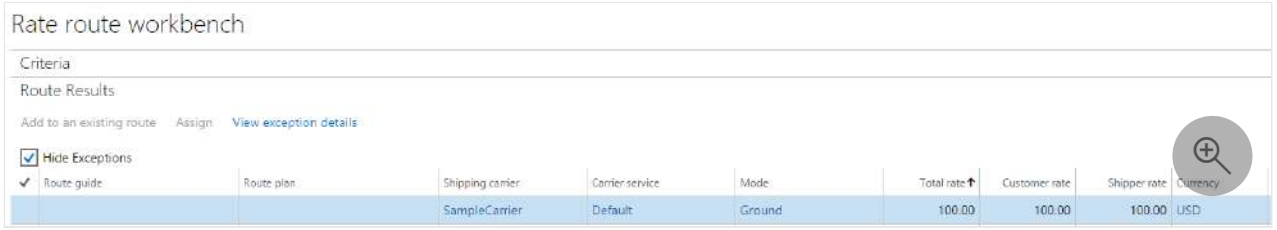
4. In Supply Chain Management, on the **Rate engines** page, create a new rating engine. The engine should point to the engine assembly produced by building the engine class library and the engine class that you implemented.



5. Create a shipping carrier that uses the Sample rate engine. Because our engine doesn't use any data, you don't have to assign a rate master.



6. On the **Rate route workbench** page, select **Rate shop**. You should see a rate of 100.00 from SampleCarrier, as shown in the following screenshot. In this example, you're rate shopping for a route from warehouse 24 to customer US-004. However, but because the rate is hard-coded, you always see a rate of 100.00.



Tips and tricks

- If you're using development tools for Supply Chain Management, it's useful to add a new project to your solution. If you set this project as your startup project and start a debugging session, you can debug both X++ and C# code in the same debugging session.
- Every time that you change and recompile your *ThirdPartyTMSEngines* project, you must deploy through a deployment package. Otherwise, you might run using a stale assembly.

- After you execute TMS-specific operations in Supply Chain Management, the Internet Information Services (IIS) worker process might lock the *ThirdPartyTMSEngines* assembly so that the assembly can't be updated. In this case, restart the w3svc process.

Whitepaper

For more information, download the following white paper (written to support AX2012, but still partially applies for Dynamics 365 Supply Chain Management):

- Implementing and deploying Transportation management engines

Set up shipping carriers

07/31/2025

This article shows how to set up a shipping carrier and define details such as service, shipment mode, transportation tender, transportation constraints, and shipping rate. A transportation coordinator can then assign a shipping carrier to an inbound or outbound load.

Create a new shipping carrier

1. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.
2. Select **New** on the Action Pane.
3. In the **Shipping carrier** field, type a value.
4. In the **Name** field, type a value.
5. In the **Mode** field, select an option from the drop-down menu.

Fill in the general information for the shipping carrier

1. Toggle the expansion of the **Overview** section.
2. Check or uncheck the **Activate shipping carrier** checkbox.
3. In the **Vendor account** field, select an option from the drop-down menu. Select the vendor account to assign the shipping carrier to.
4. In the **Transportation tender type** field, select an option. Select **Manual** to use the Transportation Tender page, or select **EDI** to update the tender by using Electronic Data Interchange (EDI).
5. Check or uncheck the **Activate carrier rating** checkbox.

> ⓘ **Note**
>
> It's possible to confirm shipment of a load that doesn't have a rating applied (for example, if no rate is assigned to it).

Create the necessary services for the shipping carrier

1. Toggle the expansion of the **Services** section.
2. Select **New**.

3. In the **Carrier service** field, type a value.
4. In the **Name** field, type a value.
5. In the **Load template ID** field, select a load template to associate with the service. The load template defines the maximum measurements for weight and volume of an entire load. For example, the load template might represent the size of a container or truck. Load template IDs are also specified in load building templates and when using the load building workbench, which helps you apply load building strategies to create loads. As a result, the system is able to match each new load to a suitable shipping carrier service by comparing the specified load template IDs.
6. In the **Transportation method** field, select an option from the drop-down menu.

Set up the address for the carrier (optional)

1. Toggle the expansion of the **Addresses** section.
2. Select **New**.
3. In the **Name or description** field, type a value.
4. In the **Country/region** field, select an option from the drop-down menu.
5. In the **ZIP/postal code** field, select an option from the drop-down menu.
6. In the **Street** field, type a value.
7. Select **OK**.

Set up the rating profile for the shipping carrier

1. Toggle the expansion of the **Rating profiles** section.
2. Select **New**.
3. In the **Rating profile** field, type a value.
4. In the **Name** field, type a value.
5. In the **Site** field, select an option from the drop-down menu.
6. In the **Warehouse** field, select an option from the drop-down menu.
7. In the **Rate engine** field, select an option from the drop-down menu. Select the Rate engine that is in accordance with the contract that you have with the carrier.
8. In the **Rate master** field, select an option from the drop-down menu.
9. In the **Transit time engine** field, select an option from the drop-down menu.
10. Select **Save**.

Associate a fuel index with a carrier as an accessorial charge

06/17/2025

This guide shows how to create an accessorial assignment, carrier accessorial charge, and accessorial master for fuel surcharge. It also shows how to associate a carrier fuel index with a carrier. A carrier fuel index must already exist before you run this guide (learn more in Set up a carrier fuel index). These setup tasks are typically done by a logistics manager.

Create an accessorial master

1. Go to **Transportation management** > **Setup** > **Rating** > **Accessorial masters**.
2. Select **New**.
3. In the **Accessorial master** field, type a value.
4. In the **Name** field, type a value.
5. Select **Save**.

Create a carrier accessorial charge

1. Go to **Transportation management** > **Setup** > **Rating** > **Carrier accessorial charges**.
2. Select **New**.
3. In the **Carrier accessorial ID** field, type a value.
4. In the **Shipping carrier** field, find and select the desired record.
5. In the **Carrier service** field, select the link in the selected row.
6. In the **Accessorial master** field, select the desired record.
7. Select **Save**.

Create an accessorial assignment

1. Select **Accessorial assignments**.
2. Select **New**.
3. In the **Name** field, type a value.
4. Expand the **Criteria** FastTab. Here, you can choose to always apply the fuel surcharge or, for this example, choose that it only applies within a certain region.
5. In the **ZIP/postal code from** field, type a value.
6. In the **ZIP/postal code to** field, type a value.
7. Expand the **Calculation** FastTab. Here, you can specify how to calculate the fuel surcharge. This calculation depends on the accessorial unit that you chose as the base for your

calculation.

8. In the **Accessorial fee type** field, select a fee type (such as *Fuel surcharge*).
9. In the **Accessorial unit** field, select a unit (such as *Mileage*).
10. In the **Region** field, select the link in the selected row.
11. Select **Save**.

Update the carrier rating profile

1. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.
2. In the list, find and select the desired record.
3. Expand the **Rating profiles** FastTab.
4. Select **Edit**.
5. In the **Carrier fuel index** field, select the link in the selected row.
6. Select **Save**.

Carrier groups

06/17/2025

A carrier group is a collection of shipping carriers and carrier services. Each carrier group specifies the preferred sequence for the shipping carriers and carrier services that belong to it.

When multiple shipping carriers and carrier services exist for the same route segment, you can specify a carrier group instead of a specific shipping carrier and carrier service in the route plan or route guide.

Create a carrier group

1. Go to **Transportation management** > **Setup** > **Carriers** > **Carrier group**.
2. Select **New**.
3. In the **Carrier group** field, enter a unique identifier (ID) for the group.
4. In the **Name** field, enter a descriptive name for the group.
5. On the **Details** FastTab, add a row, and select a shipping carrier and a carrier service for it. Repeat this step until you've added as many carriers as you require for the group.
6. Close the page.

Transportation management number sequence

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the **Number sequences** page in the transportation management module to set up various pro numbers. Carriers use pro numbers to organize and track the progress of each shipment.

Create a number sequence for a pro number

To create a number sequence for a pro number, follow these steps:

1. Go to **Transportation management** > **Setup** > **Carriers** > **Number sequences**.
2. Select **New** to create a new number sequence.
3. Enter a unique ID and descriptive name for the number sequence.
4. In the **Number sequence type** field, select *Pro number*.
5. In the **Check digit** field, select *Check digit*, which is up as a generic engine.
6. On the **Sequence** FastTab, provide information about the sequence.
7. Close the page.

Learn more about how to work with number sequences in Number sequences overview.

Link a number sequence to a shipping carrier

To link a number sequence to a carrier, follow these steps:

1. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.
2. Select a shipping carrier.
3. Select **Edit**.
4. On the **Overview** FastTab, select an option in the **Pro number sequence** field.
5. Close the page.

Pro number generation mode

The pro number generation mode controls how the system allocates pro numbers.

> **Tip**
>
> If your high-volume processes (such as release to warehouse) run slowly when you're using pro numbers, use the *Performance optimized* pro number generation mode to help improve throughput.

Prerequisites

You must be running Supply Chain Management version 10.0.47 or higher to use this feature.

Choose the pro number generation mode

To choose the pro number generation mode, follow these steps:

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. Open the **General** tab.
3. On the **Performance settings** FastTab, set **Pro number generation mode** to one of the following values:

    - *Default* – Generate pro numbers inside the current business transaction (*transaction scoped*). The system keeps the number only if the process finishes successfully. If you cancel, or if an error stops the process, the system puts back the number and reuses it. This option enforces continuous sequencing but can increase locking under high parallel load.
    - *Performance optimized* – Generate the number on a separate connection (*isolated*). This option reduces locking and improves throughput under high load, but numbers aren't recycled if the business process later fails.

Last updated on 01/27/2026

Transportation management statuses

06/17/2025

Set up master codes for transportation statuses to interpret codes that are provided by your shipping carriers. This lets you integrate with shipping carriers to provide a status. The transportation status that you provide for a transportation master status code can help you track the status of a load, shipment, or container. The specific transportation status for a load, shipment, or container can only be updated through data integration and not manually through the user interface.

Create a transportation status

To create a transportation status, follow these steps:

1. Go to **Transportation management** > **Setup** > **Transportation status masters**.
2. Select **New** to create a transportation status master.
3. In the **Transportation status master** field, enter a unique code for the transportation status.
4. In the **Transportation type** field, select either *Shipping carrier* or *Hub* as the type of transportation.
5. Enter a name and transportation status.
6. Close the page.

Map a transportation status to a carrier status

To map a transportation status to a carrier status, follow these steps:

1. Go to **Transportation management** > **Setup** > **Carriers** > **Carrier transportation status**.
2. Select **New** to map a code from a shipping carrier to a transportation status master code.
3. Select the unique ID for the shipping carrier and the carrier service.
4. Select the transportation status code that you want to map to the selected shipping carrier's code.
5. Enter the external code that is used by the shipping carrier.
6. Close the page.

Transportation management zone master

Article • 02/12/2025

Transport management lets you divide geographic locations into zones. Dividing locations into zones can help to:

- **Simplify transportation pricing** – Zone-wise pricing can be simpler than individual location-based pricing, especially when transportation locations are scattered.
- **Optimize load planning** – By consolidating loads by zones.
- **Optimize route planning** – By assigning specific route plans to specific zones.

You define zones based on the metadata field values (such as country/region, zip code range, or carrier service) that qualify each zone. Zone definitions aren't required if your transportation pricing doesn't employ a zone concept.

Load templates

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

When you create a new load, you can assign a load template. The load template contains information about equipment, and about measures such as the height, width, depth, and volume of the load.

This article describes how to set up load templates, and how to associate a load template with a new load.

Set up a load template

1. Go to **Transportation management** > **Setup** > **Load Building** > **Load template**.
2. On the Action Pane, select **New** to add a new template or **Edit** to edit an existing template.
3. In the row for the new or existing template, set the following fields:
    - **Load template ID** – Enter a unique identifier (ID) for the load template.
    - **Equipment** – Select the equipment that you want to use to ship the load.
    - **Load height**, **Load width**, and **Load depth** – Enter the dimensions of the load.
    - **Max. allowed load volume** and **Max. allowed load weight** – Enter the maximum allowed volume and weight of the load.
    - **Maximum allowed gross weight** – Enter the maximum allowed gross weight of the load. A load's gross weight includes both its tare weight and its loading weight.
    - **Maximum number of freight pieces allowed** – Enter the maximum number of freight pieces that the load can contain.
    - **Stack load on floor** – Select this check box to use floor loading. In a floor loading scenario, boxes are stacked floor to ceiling and wall to wall inside the container, to maximize capacity.
4. On the Action Pane, select **Save**.

Associate a load template with a new load

1. Go to one of the following pages, depending on whether you're setting up an inbound or outbound load:

    - **Transportation management** > **Planning** > **Inbound load planning workbench**.
    - **Transportation management** > **Planning** > **Outbound load planning workbench**.

2. In the upper part of the page, select one of the following tabs, depending on the type of source document that you're creating a load for: **Shipments**, **Sales lines**, **Transfer lines**, or **Purchase order lines**.

3. Select the specific document to plan the load for.

4. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**.

5. In the **Load template** dialog box, in the **Load template ID** field, select the template to apply.

6. Select **OK** to apply the template.

Set up a carrier fuel index

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This guide shows how to create a fuel index region, a fuel index, and a carrier fuel index. The fuel index region specifies which region the fuel index applies to, and the fuel index specifies a fuel price for a particular period of time. To reflect the change in fuel prices over time, you can associate multiple fuel indexes with a carrier. A transportation coordinator normally performs these tasks. You can use this procedure in demo data company *USMF* or with your own data.

Create a fuel index region

First, you need to create the different regions where you operate and calculate different fuel surcharges by following these steps:

1. Go to **Transportation management** > **Setup** > **Fuel indexes** > **Fuel index regions**.
2. Select **New**.
3. In the **Region** field, type a value.
4. In the **Name** field, type a value.
5. Select **Save**.

Create a fuel index

For the regions you set up, enter the current prices for the fuel by following these steps:

1. Go to **Transportation management** > **Setup** > **Fuel indexes** > **Fuel indexes**.
2. Select **New**.
3. In the **Region** field, select the region.
4. In the **Price per gallon** field, enter a number.
5. In the **Effective start date and time** field, enter a date and time.
6. Select **Save**.

Create a carrier fuel index

1. Go to **Transportation management** > **Setup** > **Fuel indexes** > **Carrier fuel indexes**.

2. Select **New**.
3. In the **Carrier fuel index** field, enter a value.
4. In the **Description** field, enter a value.
5. Select **New**.
6. In the **Effective start date and time** field, enter a date and time.
7. In the **PPG from** field, enter a number. If you're working with *USMF* sample data, enter *1.95*.
8. In the **PPG to** field, enter a number. If you're working with *USMF* sample data, set the PPG To field to *2*.
9. In the **Percentage** field, enter a number. If you're working with *USMF* sample data, set the percentage to *3*.
10. In the **Currency** field, select the currency.
11. Select **Save**.

Set up a transportation tender

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure shows how to set up a transportation tender. This task is typically done by a transportation coordinator.

1. Go to one of the following pages, depending on whether you're setting up a transportation tender for an inbound or outbound load:
    - **Transportation management** > **Planning** > **Inbound load planning workbench**.
    - **Transportation management** > **Planning** > **Outbound load planning workbench**.
2. Clear the **Hide shipped and received** check box.
3. In the **Loads** grid, select a load.
4. On the **Loads** toolbar, select **Rating and routing** > **Routes**.
5. On the Action Pane, select **Transportation tenders**.
6. On the Action Pane, select **New**.
7. Expand the **General** FastTab.
8. In the **Requested rates** field, enter a number.
9. On the Action Pane, select **Save**.
10. On the Action Pane, select **Update status** > **Submit**.
11. Select a route.

Last updated on 11/19/2025

Rating profiles

Article • 05/26/2025

A rating profile resembles a logistics contract (but not a legal contract). It's used to determine transportation tariffs for loads.

Each rating profile is unique to a shipping carrier. In the profile, you associate the shipping carrier with a rate master. The rate master defines the rate base assignment and the rate base. The rate base determines the rate of the carrier.

You can set up a rating profile by using a generic page that shows an overview of all existing rating profiles. Alternatively, you can set up a rating profile directly from the shipping carrier. In both cases, the information that you set up for the rating profile is the same.

Create or edit a rating profile on the Rating profiles page

On the **Rating profiles** page, you can review all available rating profiles. You can also edit existing profiles and create new profiles.

1. Go to **Transportation management** > **Setup** > **Rating** > **Rating profile**.
2. On the Action Pane, select **New** to add a new rating profile to the grid, or select **Edit** to edit an existing profile.
3. In the row for the new or existing rating profile, set the following fields:
    - **Rating profile**: Enter a unique identifier (ID) for the rating profile.
    - **Name**: Enter a descriptive name for the rating profile.
    - **Shipping carrier**: Select a shipping carrier. The rating profile that you're setting up is also shown on the **Shipping carriers** page for the selected carrier.
    - **Site** and **Warehouse**: Select a site and warehouse.
    - **Rate engine**: Select the rate engine for the rating profile.
    - **Rate master**: Select the rate master for the rating profile. You can use the rate master to define a rate base type and a rate base. Learn more in Set up rate masters, rate bases, and break masters.
    - **Transit time engine**: Select the transit time engine for the rating profile.
    - **Carrier fuel index**: Select the carrier fuel index for the rating profile.
    - **Effect start date and time** and **Effective end date and time**: Define the period when the rating profile should be active.
4. On the Action Pane, select **Save**.

Create a rating profile directly on the Shipping carriers page

1. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.
2. Select a shipping carrier in the list.
3. On the **Rating profiles** FastTab, select **New** to create a rating profile.
4. Set the fields for the new rating profile. These fields correspond to the fields on the **Rating profiles** page, as described in previous section of this article.

> **Note**
>
> Profiles that are created on the **Shipping carriers** page are also shown on the **Rating profiles** page.

Set up rate masters, rate bases, and break masters

Article • 05/26/2025

This article explains how to set up rates that are returned when using the rate route workbench as part of load planning or building. Rate engines use the configuration of rating profiles, rate masters, rate base assignments, rate bases, and break masters to determine the query structure. The logistics manager usually sets up these options based on the contracts signed with the carriers.

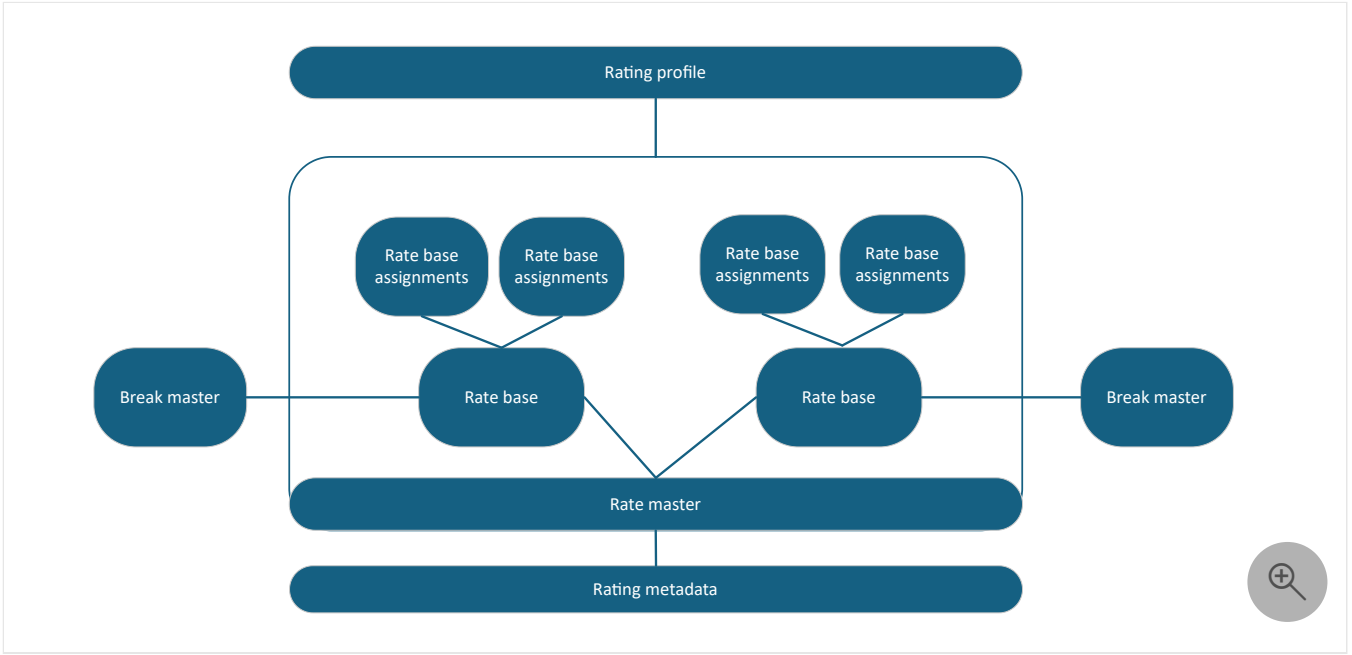
Because of the relationships between each of these rating elements, they must be configured in the following order:

1. Set up rating metadata. Learn more in How is metadata used in transportation management engines?.
2. Set up a break master.
3. Set up a rate master and associate it to one rating metadata ID. For each rate master, you must do the following:

    - Set up one or multiple rate bases, each based on one break master.
    - Set up one or multiple rate base assignments.

After this, you must set up a rating profile, which is unique to a shipping carrier and is associated with one rate master. Learn more in Rating profiles.

The following illustration shows the relationship between and the hierarchy of elements that make up rating in transportation management. You must configure rating from the bottom up.



> ⓘ Note
>
> The descriptions in this article relate to standard engines and might not fully apply to custom engines.

Set up a break master

Break masters define a pricing structure and its breakpoints. The pricing structure uses tiered pricing that is based on the break unit used by the engine. If the shipping carrier charges a certain rate per unit of distance or weight, for example, the break master can reflect this in the rate base.

1. Go to **Transportation management** > **Setup** > **Rating** > **Break master**.
2. On the Action Pane, select **New**.
3. Enter the following values in the header of the new record.

    - **Break master**: Enter a unique identifier for break master.
    - **Name**: Enter a descriptive name for the break master.

4. Enter the following values on the **General** FastTab.

    - **Data type**: Select the data type used to define the breakpoints (*string*, *integer, or *real*).
    - **Comparison**: Enter the operator used when evaluating the breakpoints (typically <, for *less than*, but you can enter any comparison operator in this field).
    - **Break unit**: Enter the unit or measure used to define the breakpoints (for example kgs/lbs or kms/miles). Ideally, the break unit should match the unit of the engine.

5. On the **Details** FastTab, create as many breaks as are needed for your pricing structure. For each row, enter a **Value** using the **Data type** and **Break unit** you specified on the **General** FastTab.
6. Select **Save**.

> ⓘ Note
>
> The **Comparison** and **Break unit** fields don't affect the standard engine behavior. They're only provided for informational purposes.

Set up a rate master

Rate masters represent carrier rates. Each rate master can be associated with only one rating metadata ID but can have multiple rate bases and rate base assignments.

1. Go to **Transportation management** > **Setup** > **Rating** > **Rate master**.
2. On the Action Pane, select **New**.
3. Enter the following values in the header of the new record.

    - **Rate master**: Enter a unique identifier for rate master.
    - **Name**: Enter a descriptive name for the rate master.

4. On the **Overview** FastTab, set **Rating metadata ID** to the rating metadata ID record that applies for this rate master. The rating metadata ID determines the data needed for the rate master. It defines the metadata expected by the transportation management engine using this rate master. Learn more in How do I configure metadata for a transportation management engine?.

Set up a rate base

The rate base defines the prices charged by the carrier at each breakpoint defined in an associated break master. You can set up one or multiple rate bases for each rate master to reflect the carrier pricing structure based on factors such as mileage and/or weight.

1. Go to **Transportation management** > **Setup** > **Rating** > **Rate master**.
2. Select the rate master that you want to add a rate base to.
3. On the Action Pane, select **Rate base**.
4. On the Action Pane, select **New**.
5. Enter the following values in the header of the new record.

    - **Rate base**: Enter a unique identifier for rate base.
    - **Name**: Enter a descriptive name for the rate base.

6. Make the following settings on the **General** FastTab.

    - **Rate master**: Shows the rate master record that you selected previously. This is the master you're creating a rate base for. You can change this value to move a selected rate base to another rate master if needed.
    - **Break master**: Select the break master that defines the pricing structure and breakpoints for this rate base.
    - **Minimum charge**: Specify the lowest amount that can be charged for a shipment, regardless of the calculated rate based on other criteria such as distance, weight, or volume. This ensures that the carrier receives a minimum payment for their services,

even if the calculated rate would otherwise be lower. The minimum charge defined here on the **General** FastTab applies if a minimum charge hasn't been set on the **Details** FastTab for a given line.

- **Maximum charge**: Set an upper limit on the amount that can be charged for a shipment for the rate base. This ensures that the cost for shipping doesn't exceed a specified threshold, regardless of the calculated rate based on other criteria such as distance, weight, or volume. The maximum charge defined here on the **General** FastTab applies if a maximum charge isn't set on the **Details** FastTab for a given line.
- **Currency**: If a currency different from the accounting currency is to be used for the rate base, then select that currency here.

7. On the **Details** FastTab, you can specify a pricing structure for the price break points defined in the break master. The columns available here depend on how the break master and rating metadata for the rate base are configured. For example, if the break master is set to *mileage*, you can set up one rate for less than 100 miles, and another for less than 200, and so on. Select **New** to add a new row to the grid. Then enter values for the following settings for the new row to define the price that applies at each breakpoint. The following are standard columns available in all rate bases, irrespective of the break master and rating metadata configuration:

   - **Minimum charge**: Specify the lowest amount that can be charged for a shipment for the specific rate base line. If a minimum charge is defined here on the **Details** FastTab, it applies even if a different minimum charge is defined on the **General** FastTab.

   - **Maximum charge**: Set an upper limit on the amount that can be charged for a shipment for the rate base. If a maximum charge is defined here on the **Details** FastTab, it applies even if a different maximum charge is defined on the **General** FastTab.

   - **Effective start date and time**: Set the first date and time where the rate applies.

   - **Effective end date and time**: Set the last date and time where the rate applies.

     > **Important**
     >
     > Avoid setting up rate bases with overlapping effective dates and times for matching detail lines.

8. Fill out the remaining fields in the new row to define the rate that applies at each break point.

9. The **Search** FastTab shows information from the **Details** FastTab. Select a line in the **Search** table to view matching values from the **Details** FastTab.

10. On the Action Pane, select **Save**.

Set up rate base assignments

Rate base assignments allow you to create several different price points for each carrier depending on destinations, services, or different rate bases. Rate base assignments define which rate base to apply. Use the **Rate base assignments** FastTab to define the rate base assignment for each rate master.

1. Go to **Transportation management** > **Setup** > **Rating** > **Rate master**.

2. On the **Rate base assignments** FastTab toolbar, select **New** to add a new row to the grid. Then enter values for the following settings for the new row. The columns available here depend on the setup of the rate base assignment metadata, as selected in the **Rating metadata ID** field. The following are standard columns that are always provided.

    - **Name**: Specify a unique identifier for the rate base assignment.
    - **Rate base**: Define the basis on which the rates are calculated.
    - **Service**: Specify the type of service associated with the rate base assignment. It could refer to different levels of service such as standard, expedited, or overnight delivery. The services listed are based on how your shipping carrier services are configured.
    - **Effective start date and time**: Specify the date and time when the rate base assignment becomes active. This setting ensures that the rates are applied correctly from the specified start time.
    - **Effective end date and time**: Specify the date and time when the rate base assignment expires. This setting helps you manage the validity period of the rates and ensures that outdated rates aren't applied.

    > **Important**
    >
    > Avoid setting up rate bases with overlapping effective dates and times for matching detail lines.

3. On the Action Pane, select **Save**.

Transportation management miscellaneous charges

Article • 01/31/2025

As with all miscellaneous charges, transportation-generated charges must be associated with a charge code. Otherwise, they won't be added back to the order as a miscellaneous charge. The **Charges code** determines how the charge is accounted for in relation to the order and order line where it's added.

Go to **Transportation management** > **Setup** > **Rating** > **Miscellaneous charges** to define the qualifying criteria that determine when a specific **Charges code** is applied to a charge.

You should have at least one setup for each relevant **Charges module** setting (*Customer* and *Vendor*) where the **Miscellaneous charge type** is set to *None*. If this setup is missing, the miscellaneous charge won't be added to the order.

Set up hub accessorial charges and accessorial masters

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure shows how to create an accessorial master for a hub and use that master to create a hub accessorial charge. A transportation coordinator typically performs this setup.

Set up a hub master

1. Go to **Transportation management** > **Setup** > **Rating** > **Accessorial masters**.
2. Select **New**.
3. In the **Accessorial master** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **Accessorial type** field, select *Hub*.
6. Select **Save**.

Set up a hub accessorial charge

1. Go to **Transportation management** > **Setup** > **Rating** > **Hub accessorial charges**.
2. Select **New**.
3. In the **Hub accessorial ID field**, enter a value.
4. In the **Hub** field, find and select the desired record.
5. In the **Hub position** field, select an option. You can either create the charge as a pickup or drop-off. Depending on your selection, the charge applies to the corresponding transportation segment on your route.
6. In the **Accessorial master** field, select the master you just created.
7. Select **Save**.

Last updated on 11/20/2025

Set up accessorial assignments

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure shows how to set up an accessorial assignment. A transportation coordinator typically performs this task. Before you follow the procedure, complete the instructions in Set up hub accessorial charges and accessorial masters.

Set up Accessorial assignment

1. Go to **Transportation management** > **Setup** > **Rating** > **Accessorial assignments**.
2. Select **New**.
3. In the **Name** field, type a value.
4. Expand the **Details** section.
5. In the **Hub** field, select the hub that you created an accessorial master for when you completed the procedure in Set up hub accessorial charges and accessorial masters.
6. In the **Hub accessorial ID** field, select the link in the selected row.
7. Expand the **Criteria** section. Here, you can choose the exact criteria for when the charge should apply, based on the different values offered here.
8. Set the **Always apply** option to *Yes*.
9. In the **Accessorial assignment level** field, select an option.
10. Expand the **Calculation** section.
11. In the **Accessorial fee type** field, select *Flat*. The accessorial fee type determines how to calculate the actual charge. In this example, it's a flat charge.
12. In the **Accessorial fee** field, enter a number.
13. Select **Save**.

Last updated on 11/20/2025

Transportation management modes and methods

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The transportation management mode represents the type of transport that the carrier uses for freight deliveries, such as less than load (LTL), truckload (TL), or parcel. The transportation method represents the form of transport that the carrier uses for freight deliveries, such as air, ground, ocean, or rail.

Modes and transportation methods are used in several contexts. Only modes are used in route plans, while both modes and transportation methods are used when setting up shipping carriers and carrier services. No explicit relationship or hierarchy exists between modes and transportation methods.

Create a mode

To create a mode, follow these steps:

1. Go to **Transportation management** > **Setup** > **Carriers** > **Mode**.
2. Select **New** to create a new mode.
3. Enter a unique ID and a descriptive name for the mode.
4. Close the page.

Create a transportation method

To create a transportation method, follow these steps:

1. Go to **Transportation management** > **Setup** > **Carriers** > **Transportation methods**.
2. Select **New** to create a new transportation method.
3. Enter a unique ID and descriptive name for the transportation method.
4. Close the page.

Last updated on 11/19/2025

Assign shipments to related route segments

06/17/2025

This article describes how to configure the system to apportion freight costs for multi-segment scheduled routes that use the inbound and outbound logistic process. It also describes how this feature works.

Enable the feature

To configure the system to apportion freight costs for multi-segment scheduled routes, follow these steps:

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. Open the **General** tab.
3. On the **Shipment** FastTab, set **Assign shipment to related route segments** to *Yes*.
4. On the Action Pane, select **Save**.

How shipments are assigned to route segments

This feature enables the system to apportion shipment freight costs more accurately, including for loads where multiple shipments are delivered to different segment destinations along a single route. It assigns each shipment to the most suitable route segment, based on the destination addresses of the shipment and segment. The feature then calculates each shipment's freight cost as a proportion of the load's total freight cost, based on the shipment's relative weight, volume, quantity, and distance traveled.

This feature enables correct freight cost apportionment for multi-segment scheduled routes that use the inbound and outbound logistic process. Therefore, you can evaluate the true profitability of sales orders by apportioning freight cost at the item line level. This feature provides a fair and trusted foundation for the billing of freight cost. It also reflects the cost of inbound freight in the material valuation of stock.

This feature applies only to shipments that are managed by using the **Transportation management** (TMS) module.

Set up transportation constraints for an item

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure sets up a transportation constraint to prevent a selected item from being transported through a selected hub. A Transportation coordinator typically carries out this task.

Create an item constraint

1. Go to **Transportation management** > **Setup** > **Routing** > **Constraints**.
2. Open the **Item** tab.
3. On the toolbar, select **New**. Enter values for the following columns of the new row:

    - **Item constraint** – Enter a unique identifier for the constraint.
    - **Name** – Enter a name for the constraint.
    - **Site** – Select the site where the constraint applies.
    - **Warehouse** – Select a warehouse where the constraint applies.
    - **Item number** – Select the item number the constraint applies to.

4. With the new row still selected, make the following settings at the bottom of the page:

    - **Shipping carrier** – Select the shipping carrier the constraint applies to.
    - **Carrier service** – Select the carrier service the constraint applies to.
    - **Mode** – Select the mode of delivery where the constraint applies.
    - **Transportation method** – Select the transportation method where the constraint applies.
    - **Hub** – Select the hub where the constraint applies.
    - **Constraint action** – Select the type of constraint to apply.
    - **Effective start date** – Select the first date where the constraint applies.
    - **Effective end date** – Select the last date where the constraint applies.

5. Select **Save**.
6. Close the page.

Plan freight transportation routes with multiple stops

Article • 01/31/2025

This article describes the various elements that you use to plan transportation routes in Dynamics 365 Supply Chain Management.

You can use route plans and route guides for complex transportation routes that have multiple stops. If you regularly use the same route, you can set up a scheduled route.

Route plans

A route plan contains route segments that provide information about the stops that are visited on the route and the carriers that are used for each segment. You must define the stops on the route as hubs. A hub can be a vendor, a warehouse, a customer, or even just a reloading place where you change carrier. For each segment, you can define "spot rates" for various charges. Here are some examples:

- Charges for traveling to the given segments
- Charges for picking up the goods
- Charges for dropping off the goods

Each route plan must be associated with a route guide.

Route guides

A route guide defines the criteria for matching a load to a specific route plan. For example, you can specify an origin hub and a destination hub, limits for the container volume or weight, and a shipping carrier, service, or group. Route guides are available on the **Rate route workbench** page, where loads can be matched to routes either manually or automatically. If the route guide is for a scheduled route, it's also available on the **Load building workbench** page.

Scheduled routes

A scheduled route is a predefined route plan that has a schedule for the shipping dates. Scheduled routes and nonscheduled routes differ in the way that loads are assigned to them. If you assign a nonscheduled route by using the **Rate route workbench**, only the load and the route guide are validated. If you assign a scheduled route, the dates and

addresses from the orders and the hubs, and the date on the route plan, are also considered. You don't have to use the **Rate route workbench** page to manually assign loads to a scheduled route. Instead, you can use the Load building workbench to suggest that loads be built based on the customer addresses and delivery dates from sales orders for a given scheduled route. For scheduled routes, the route plan has fixed origin and destination hubs. Typically, the shipping carrier and service are the same for all segments, but they can differ. The destination hubs are created by using the postal codes of the customers that are visited on the route. Several route schedules can be defined for one route plan. The route plan must be associated with a route guide. However, for scheduled routes, the plan can be associated with only one route guide. The route schedule is used only to create the actual routes on the **Route schedule** page. You can use the default load template when you propose loads on the Load building workbench.

Load building workbench

The Load building workbench uses the customer addresses and delivery dates from sales orders, and the scheduled routes that are available, to propose a load. By default, the values from the route are entered on the workbench. However, you can select a "from" date that is earlier than the "from" date on the route. When a load is proposed, the delivery address and delivery date of all open sales orders are checked. A sales order is proposed for a load if the postal code of the delivery address matches the postal code of a hub in the route plan, and if the delivery date is within the range that is selected in the criteria. The capacity of the load template is also considered. Only one load is proposed at a time. If you have a sales order that isn't included, you might have to use a different load template (for example, a load template for a bigger truck or container) or plan an extra delivery.

Sustainable transportation planning

Supply Chain Management offers sustainable transportation planning by integrating with Microsoft Sustainability Manager for the calculation of carbon emissions.

Sustainable transportation planning can help companies reduce their carbon footprint by optimizing routes, reducing fuel consumption, minimizing empty miles, and increasing the use of lower-emission transportation modes. Companies can achieve better visibility, control, and automation for their transportation operations. By reducing fuel consumption and carbon emissions, companies can minimize their environmental impact and play a part in combatting climate change. In addition, by demonstrating a

commitment to sustainability, companies can improve their brand image and attract environmentally conscious customers.

- **System integration** – The integration between Supply Chain Management and Microsoft Sustainability Manager uses REST APIs. Therefore, data can flow seamlessly between the two systems, and organizations can track sustainability metrics alongside their other business processes.
- **Carbon emission calculation** – Microsoft Sustainability Manager uses the route data from Supply Chain Management to offer various data models and services that can help organizations calculate and analyze transportation-related carbon emissions. The route data can be used to calculate emissions from different modes of transportation, including cars, trucks, planes, and ships.
- **Route planning with carbon dioxide equivalent (CO2e) results** – After Microsoft Sustainability Manager returns the calculated emissions for each mode of transportation, you can compare them to determine which mode emits the least carbon dioxide. You can select the most eco-friendly route, based on the emissions calculation, or select the mode of transportation that has the lowest carbon emissions in the transportation management rate and route workbench.

Provide product feedback

Load building workbench

The load building workbench lets you apply load building strategies when you create loads.

Create a load building strategy

Use load building strategies to automatically build loads. This capability is beneficial in the following situations:

- If you regularly ship a specific set of products, load strategies help save time because you don't have to build the same load every time.
- If you want to avoid half-full loads to maximize efficiency, load strategies can help fill each load as much as possible.

A load building strategy class named `TMSLoadBuildingVolumeStrategy` provides a load building strategy named *Volume-based load building strategy*. This strategy lets you use the maximum values that are specified for height and weight in the load template, or you can override the settings by entering new values. This strategy is the only strategy included out of the box. (However, you might have some custom strategies.)

To use the out-of-box *Volume-based load building strategy* strategy, select it in the **Load building strategy** field on the **Load building workbench** page (**Transportation management** > **Planning** > **Load building workbench**).

To create a load building strategy, follow these steps:

1. Go to **Transportation management** > **Setup** > **Load building** > **Load building strategies**.
2. On the Action Pane, select **Generate class list** to make sure that you have the latest versions of all available classes.
3. On the Action Pane, select **New**.
4. Enter a unique name for the strategy, select the load building strategy class for it, and enter a description.
5. On the Action Pane, select **Save**.
6. On the Action Pane, select **Parameters**.
7. On the **Load building strategy parameters** page, select **Volume capacity** in the list, and then, in the **Value** field, enter the percentage of the load's total volume capacity that should be applied for the new load building strategy.

8. Select **Weight capacity** in the list, and then, in the **Value** field, enter the percentage of the load's total weight capacity that should be applied for the new load building strategy.
9. Close the **Load building strategy parameters** page.
10. Close the **Load building strategies** page.

You can now assign the load building strategy to a load building template. Alternatively, you can use it directly in the load building workbench.

Use a load building strategy in the load building workbench

1. Go to **Transportation management** > **Planning** > **Load building workbench**.
2. Follow one of these steps:
    - Select a strategy in the **Load building strategy** field.
    - If you define a load building template and assign the load building strategy to it, on the Action Pane, on the **Manage templates** tab, select **Apply template**. Then, in the **Apply load building template** drop-down dialog box, select a template in the **Load building template name** field.
3. On the **Load templates sequence** FastTab, select one or more load templates. The workbench tries to fit the load into these types of containers, in the sequence that you specify. Typically, put the smallest containers at the top of the list to ensure that the smallest possible container is selected first.
4. On the Action Pane, select **Propose loads**.
5. Review the proposed loads and proposed load lines.
6. On the Action Pane, select **Create loads** to create loads that are based on the source document lines on the **Proposed load lines** FastTab.
7. Close the **Load building workbench** page.

Integrate with Microsoft Sustainability Manager

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to integrate Microsoft Dynamics 365 Supply Chain Management with Microsoft Sustainability Manager. The integration lets you accurately calculate carbon emissions during rate and route planning in transportation management. Therefore, transportation planners can make informed decisions and strategically assign environmentally friendly transportation service providers to each load.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Dynamics 365 Supply Chain Management version 10.0.38 or later.
- You must have a valid subscription for Microsoft Sustainability Manager.
- You must be running Microsoft Sustainability Manager version 2.14.0.355 or later.
- The feature that's named *Integrate Microsoft Sustainability Manager with transportation management* must be turned on in Feature management. As of Supply Chain Management version 10.0.43, this feature is turned on by default. As of version 10.0.45, it's mandatory and can't be turned off.

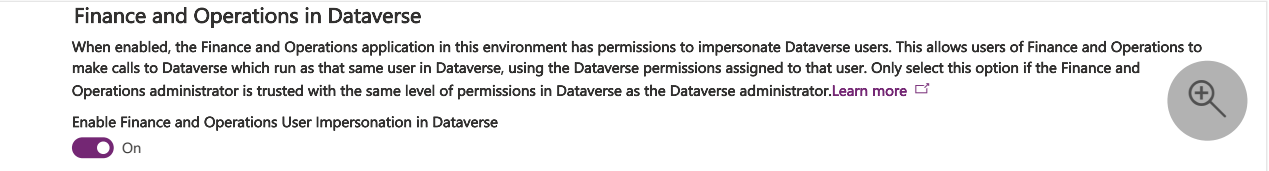
Enable impersonation in Microsoft Power Platform

To enable the two systems to communicate with each other, you must enable impersonation for Microsoft finance and operations apps in Microsoft Power Platform.

1. Sign in to Power Platform admin center.
2. On the left navigation pane, go to **Environment**, and then open the environment where you're running Microsoft Sustainability Manager.
3. On the toolbar, select **Settings**.

4. Expand **Product**, and select **Features**.

5. Under **Finance and Operations in Dataverse**, set the **Enable Finance and Operations User Impersonation in Dataverse** option to *On*.



6. Save your changes.

Map transportation modes in Supply Chain Management

To enable carbon emission calculations, you must map the transportation methods in Supply Chain Management to the transportation modes (vehicle types) in Microsoft Sustainability Manager.

1. Sign in to Supply Chain Management.

2. Go to **Transportation management** > **Setup** > **Carriers** > **Transportation methods**.

3. For each transportation method that's listed on the page, use the **Transportation Mode in Microsoft Sustainability Manager** field to identify the matching transportation mode in Microsoft Sustainability Manager.

   > **Note**
   >
   > The transportation modes that are listed in the **Transportation Mode in Microsoft Sustainability Manager** field are taken from United States Environment Protection Agency Greenhouse Gas Emissions Factors Hub (EPA GHG Emissions Factors Hub). Microsoft Sustainability Manager uses these modes in its transportation and distribution calculation model. Learn more in GHG Emissions Factors Hub.

4. On the Action Pane, select **Save**.

Validate the connection and enable the integration scenario

To complete the setup, you must validate the connection and enable the integration scenario.

1. In Supply Chain Management, go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. On the **Microsoft Cloud for Sustainability integration configuration** tab, select **Validate connection** to check whether your Microsoft Power Platform environment is correctly set up and ready for the integration.
3. When the validation is completed, in the **Model name** field, select the model that best matches the transportation scenario that you want to calculate carbon emissions for:
    - *None* – This value indicates that you haven't yet selected a model. When this value is selected, emission calculations are disabled.
    - *Downstream transportation and distribution* – This model includes emissions that are generated by the transportation and distribution of sold products in vehicles that the reporting organization doesn't own or control.
    - *Upstream transportation and distribution* – This model includes emissions that are generated by third-party transportation and distribution services and emissions that are generated by the transportation and distribution of purchased products.

    > **Note**
    >
    > For information about how Microsoft Sustainability Manager calculates Scope 3 emissions, see Categories 4 and 9: Upstream and downstream transportation and distribution.

4. Set the **Enable McFS integration** option to *Yes*.
5. Select **Save**.

Plan loads using hub consolidation overview

Article • 01/31/2025

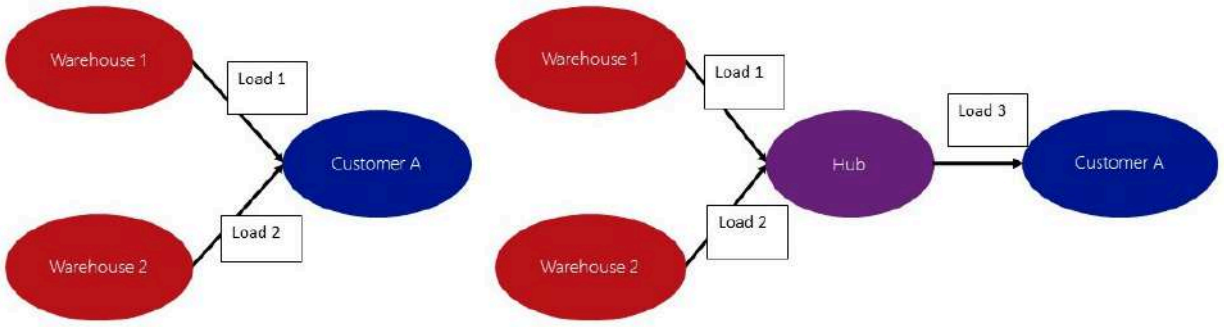
This article describes the feature for consolidating shipments in a hub when you deliver goods from different warehouses to the same customer, or when you receive goods from multiple vendors in the same warehouse.

It can be useful to consolidate shipments in a hub when you deliver goods from different warehouses to the same customer, or when goods are delivered from multiple vendors to the same warehouse.

Building loads

Before you can use hub consolidation, you must enable the **In transit planning** option on the **Transportation management parameters** page. You must also create the hubs where consolidation will occur.

The following diagram shows an example of hub consolidation. In this case, sales orders from different warehouses are going to the same customer. The basic loads are created based on sales orders in the usual way, by using the **Outbound load planning workbench** page.



To consolidate the two loads in a hub before they're delivered to the customer, on the **Outbound load planning workbench** page, in the **Transportation** field, select **Hub consolidation**. When you select the correct hub for each load, the loads will have the hub as the *drop off* destination. You'll also have two *transportation request lines* in the **Supply and Demand** section on the **Outbound load planning workbench** page. You can then add these two lines to a new load. This new load will have both sales order lines, and will also have the hub as the *pick up* address and customer A as the *drop off*

destination. The three loads are then ready to be rated and routed like any other load. You can select whatever shipping carrier the system suggests for each load.

You can use a similar method to consolidate loads for multiple transfer orders. In this case, customer A in the preceding diagram is a warehouse.

Alternatively, you can consolidate loads for multiple purchase orders, where the loads are delivered from different vendors to the same warehouse. In this case, you would work on the **Inbound load planning workbench** page instead of the **Outbound load planning workbench** page.

You can have more than one consolidation hub, and can consolidate in multiple hubs for more loads that come from different warehouses. After you build your basic loads and use the hub consolidation option, you build the new loads by using the consolidated transportation request lines. You then rate and route your loads.

Feedback

Was this page helpful? Yes No

Provide product feedback

Plan loads and shipments by using the outbound load planning workbench

This article shows how to use the outbound load planning workbench to create a load for a sales order. As a prerequisite, create the sales order first. This procedure is part of the daily work for the transportation coordinator. The demo data company used to create this procedure is USMF.

Create a sales order

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Select **New**.
3. In the **Customer account** field, select the drop-down button to open the lookup.
4. Select account *US-004*.
5. Select **OK**.
6. In the **Item number** field, select the drop-down button to open the lookup.
7. Select item *A0001*. *A0001* is enabled for transportation management.
8. In the **Site** field, select the drop-down button to open the lookup, and then select an item.
9. In the **Quantity** field, enter a number.
10. In the **Warehouse** field, type *24* for this example. This warehouse is enabled for transportation management and warehouse management processes (WMS).
11. Select **Save**.
12. Close the page.

Create a new load

1. Go to **Transportation management** > **Planning** > **Outbound load planning workbench**.
2. Select the **Sales lines** tab. Now you build the load for the sales order that you just created. Loads can be built based on supply and demand from purchase orders, transfer orders, and sales orders.
3. On the Action Pane, select **Supply and demand**.
4. Select **To new load**.
5. In the **Load template ID** field, select the drop-down button to open the lookup. The load template defines maximum measurements for weight and volume of the entire load. For example, the load template might represent the size of a container or truck. Select an item.
6. Select **OK**.

Rate and route the load

1. Select **Rating and routing**.
2. Select **Rate route workbench**.
3. Select **Rate shop**.
4. In the list, find and select the desired record.
5. Select **Assign**.
6. Close the page.

Load planning filters

Set up custom filters to control which types of lines show in the **Outbound load planning workbench**. For example, you can choose to only show fully reserved transfer order lines. Follow these steps to set up one or more load planning workbench filters.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**. (You can also open the workbench from the **Sales orders**, **Transfer orders**, and **Outbound shipment orders** pages.)

2. On the Action Pane, open the **Filters** tab and select **Load planning filters**.

3. On the Action Pane, select **New** to add a new load planning filter to the grid. Then make the following settings for the new line:

    - **Load planning filter code** – Enter a unique name for the filter.
    - **Description** – Enter a short description of the filter.
    - **Load planning filter type** – Choose the type of lines the filter should apply to (*Load*, *Sales order*, *Transfer order*, *Shipment*, or *Outbound shipment orders*). For example, if you want to set up a filter that only shows fully reserved transfer order lines, select *Transfer order*.

4. On the Action Pane, select **Save**.

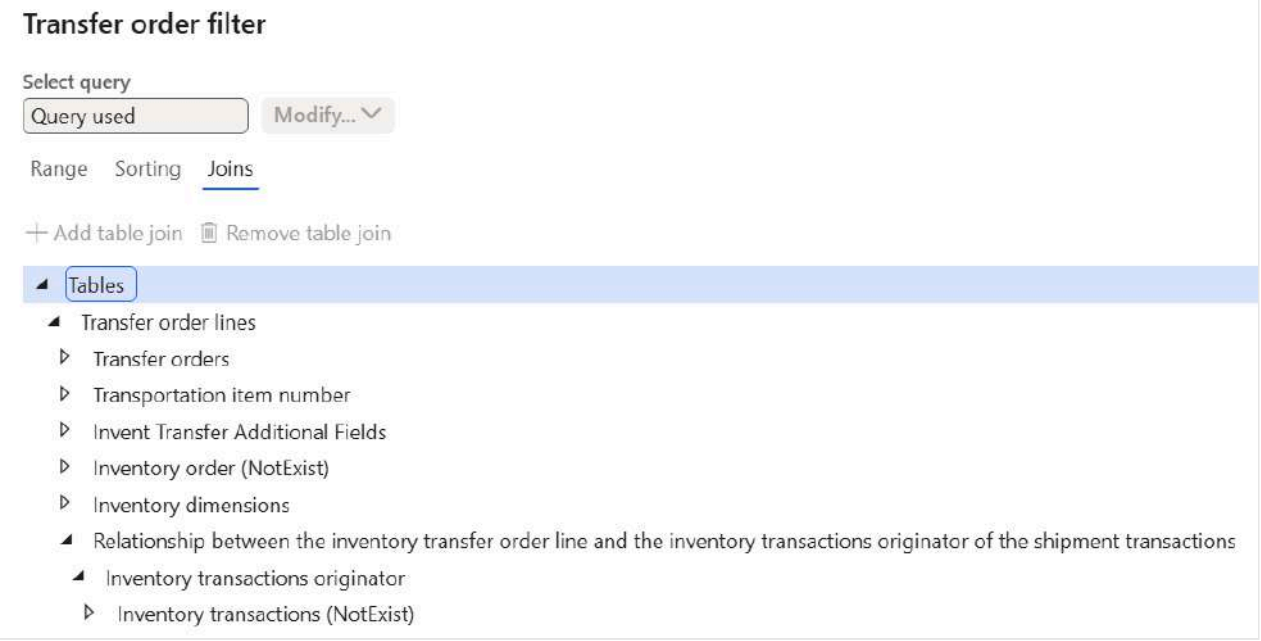
5. With the new filter selected in the grid, select **Edit query** on the Action Pane. A standard query editor opens, where you can define the filter criteria that you want to apply. Here's an example of how to set up a filter to show only fully reserved transfer order lines:

    a. Open the **Joins** tab. Select the *Transfer order lines* node and then select **Add table join** from the toolbar. Find and select the row with a **Relation** of *Relationship between the*

inventory transfer order line and the inventory transactions originator of the shipment transactions (Line number) (with **Join mode** *1:n*). Then select **Select** on the toolbar.

b. Select the new *Relationship between the inventory transfer order line and the inventory transactions originator of the shipment transactions* node and then select **Add table join** from the toolbar. Find and select the row with a **Relation** of *Inventory transactions originator (Inventory transactions originator)*. Then select **Select** on the toolbar.

c. Select the new *Inventory transactions originator* node and then select **Add table join** from the toolbar. Make sure that **Show details** is set to *Yes*. Find and select the row with a **Relation** of *Inventory transactions (NotExist Record-ID)* and a **Relation source** of *InventTrans : InventTransOrigin*. Then select **Select** on the toolbar. Your **Joins** tab should now resemble the following screenshot.



d. Open the **Range** tab. Add a new row to the grid with the following settings:

- **Table** – Select *Inventory transactions (NotExist)*.
- **Field** – Select *Issue status*.
- **Criteria** – Enter *!Reserved physical*, which means "not *Reserved physical*."

These settings result in a filter that only includes transfer order lines with an inventory transactions status of *Reserved Physical*, which are the fully reserved lines. Your **Range** tab should now resemble the following screenshot.

e. Select **OK** to save the query.

6. Select the **Back** button to go back to the **Outbound load planning workbench** page.

7. Open the tab you created your filter for (for example, the **Transfer lines** tab). Then set **Supply and demand filter** to the filter you just created. The page is now filtered according to the criteria you defined for the selected filter.

8. If you want to apply the new filter by default when you open the workbench, then on the Action Pane, open the **Filters** tab and select **Set as default**.

USMCA certification of origin

07/10/2025

This feature lets you print the certification of origin documents required by the United States-Mexico-Canada Agreement (USMCA).

The *USMCA certification of origin document* contains the minimum data elements required for declaration. Some data elements can be pre-filled before printing while others must be filled in manually after printing. To obtain preferential tariff treatment, the document must be completed and in the possession of the importer at the time the declaration is made. The document may be completed by the importer, exporter, or producer.

You can print the document for a single shipment from the **All shipments** list page or from the **Shipment details** page.

The document is only accessible when the country/region on the primary address for the legal entity is the United States.

Depending on the document print selection, the document can be pre-filled with data from your system. It is possible to change or add data to the printed document by exporting the printed document to an editable format, such as Microsoft Word. After export, you can apply any required changes before a declaration is made.

Turn the USMCA feature on or off

To use this feature, it must be turned on for your system. As of Supply Chain Management version 10.0.29, the feature is turned on by default. Admins can turn this functionality on or off by searching for the *USMCA certification of origin document* feature in the Feature management workspace.

Document content

The USMCA certification of origin document contains the following data elements:

- Address elements
- Role of the certifying party
- Single shipment
- Invoices
- Blanket period
- Item details
- Certifier signature

- Number of pages

For more information about each of these elements and how their values are found, see the remaining sections in this article.

Print a USMCA certification of origin document

To print a USMCA certification of origin document for a shipment, do the following:

1. Do one of the following:

    - Go to **Transportation management** > **Planning** > **Shipments** > **All shipments** and select the shipment you want to print the document for.
    - Open the **Shipment details** page for the shipment you want to print the document for (there are several ways to get here, including from the **All shipments** page).

2. On the Action Pane, open the **Shipments** tab and, from the **Print** group, select **USMCA certificate of origin**.
3. The **Certificate or origin** dialog box opens. Make the settings described in the following subsections and then select **OK** to generate the document.
4. A preview of the document opens. Use the commands provided on the Action Pane to print or export the document as needed.

Certifying party

Use the **Certifying party** drop-down list to identify the type of party that is printing the document. Specify whether the certifying party is the *Exporter*, *Exporter and Producer*, *Producer*, or *Importer*; or leave it blank if the certifying party is none of these. The option you select determines what is printed in the address sections of the document.

The **Certifying party** that you choose will be included in the printed document.

The document can be printed for both inbound and outbound shipments. Select *Importer* as **Certifying party** for inbound shipments only.

The following table describes the types of information that are included in the document based on the **Certifying party** that you choose.

Expand table

Certifying party	Description
[Blank]	Adds the following details to the document:

Certifying party	Description
	• **Certifier details**: Uses the address details for the shipping warehouse, if available; otherwise, it uses the shipping site address, if available; otherwise, it uses the address of the legal entity (company) selected in Supply Chain Management. • **Exporter details**: Blank • **Producer details**: Blank • **Importer details**: Blank
Exporter	Adds the following details to the document: • **Certifier details**: Uses the address details for the shipping warehouse, if available; otherwise, it uses the shipping site address, if available; otherwise, it uses the address of the legal entity (company) selected in Supply Chain Management. • **Exporter details**: Uses the address details for the legal entity. • **Producer details**: Blank • **Importer details**: Uses the invoice account for the related sales order.
Exporter and Producer	Adds the following details to the document: • **Certifier details**: Uses the address details for the shipping warehouse, if available; otherwise, it uses the shipping site address, if available; otherwise, it uses the address of the legal entity (company) selected in Supply Chain Management. • **Exporter details**: Uses the address details for the legal entity. • **Producer details**: Uses the address details for the legal entity. • **Importer details**: Uses the invoice account for the related sales order.
Importer	Adds the following details to the document: • **Certifier details**: Uses the address details for the shipping warehouse, if available; otherwise, it uses the shipping site address, if available; otherwise, it uses the address of the legal entity (company) selected in Supply Chain Management. • **Exporter details**: Blank • **Producer details**: Blank • **Importer details**: Uses the address details for the legal entity.
Producer	Adds the following details to the document: • **Certifier details**: Uses the address details for the shipping warehouse, if available; otherwise, it uses the shipping site address, if available; otherwise, it uses the address of the legal entity selected in Supply Chain Management. • **Exporter details**: Blank • **Producer details**: Uses the address details for the legal entity. • **Importer details**: Blank

Has various producers

The **Certifying party** drop-down list controls the text to be used for the producer details in the document. Choose one of the following:

- *Various producers* - Prints the text "Various" in the producer details.
- *Available upon request* - Prints the text "Available upon request by the importing authorities" in the producer details.

When the **Certifying party** is set to *Exporter and Producer* or *Producer*, then the **Has various producers** setting is overruled, and the producer address details will be the same as the certifier.

Blanket period

Use the **Blanket period from** and **Blanket period to** settings to establish a blanket period, during which the document will cover multiple shipments of identical goods, even though the document is printed for only one shipment. You can set the blanket period dates without any constraints, and it will be added to the document. You can also leave these settings blank or set them in the past.

Is single shipment

In the **Certificate of origin** dialog box, set **Is single shipment** to one of the following:

- *Yes* - Adds "Single Shipment: Yes" next to the invoice number.
- *No* - Adds nothing.

Other information included in the document

In addition to the optional elements that you select using the **Certificate or origin** dialog box, the USMCA certification of origin document will include the information and custom fields summarized in the following subsections. Some of this information must be entered manually after you generate the document.

Invoice number

The IDs of sales invoices related to shipments are printed on the document irrespective of the blanket period. Invoice numbers are printed irrespective of the **Is single shipment** selection.

Item details

The document provides several sections that list specific item details, which are:

- **SKU number**: Prints the item number of the released product.
- **Description**: Prints either the description or name for the released product. If a description in the user's language exists, then this is printed. If no such description exists, then the name in the user's language is printed. If that name doesn't exist, then the item name is printed.
- **Harmonized System (HS) Tariff Classification**: Prints the Harmonized Tariff Schedule associated to the product. You can set up these schedules by going to **Transportation Management** > **Setup** > **Transportation standard** > **Harmonized Tariff Schedules**.
- **Origin criterion**: You must manually enter data in this section the first time you release the document.
- **Country of origin**: Prints the country of origin, which you apply by going to **Product information management** > **Setup** > **Product compliance** > **Country of origin**. (Learn more in Country of origin.) The International Organization for Standardization (ISO) code for the country of origin is printed, based on the country/region of destination in the shipment delivery address and the item. If no country of origin data is set up, the value reverts to the setting that is found at **Released product** > **Foreign trade** > **Origin**. If no country of origin data is found there, you must manually enter the country of origin after you generate the document.

Certifier signature and date

You must enter this manually after generating the document.

Consists of number of pages

The user signing the certification must manually enter the number of pages (for verification) after generating the document.

Page numbers

Current page and number of pages printed at the bottom of the document.

Commercial invoices

This article describes how to create and print a commercial invoice when you use transportation management processes (TMS).

A commercial invoice is required for the export and import clearance process. It's used for customs, the calculation of tariffs, and the declaration of international commercial terms. Commercial invoices aren't usually required for shipments between European Union (EU) countries/regions, but only between EU countries/regions and non-EU countries/regions. A few countries/regions require that the commercial invoice be on a specific form. However, for most countries/regions, either the seller version or the exporter version is acceptable, provided that all the pertinent information is included.

You can print the commercial invoice for a single shipment from the **All shipments** list page or the **Shipment details** page.

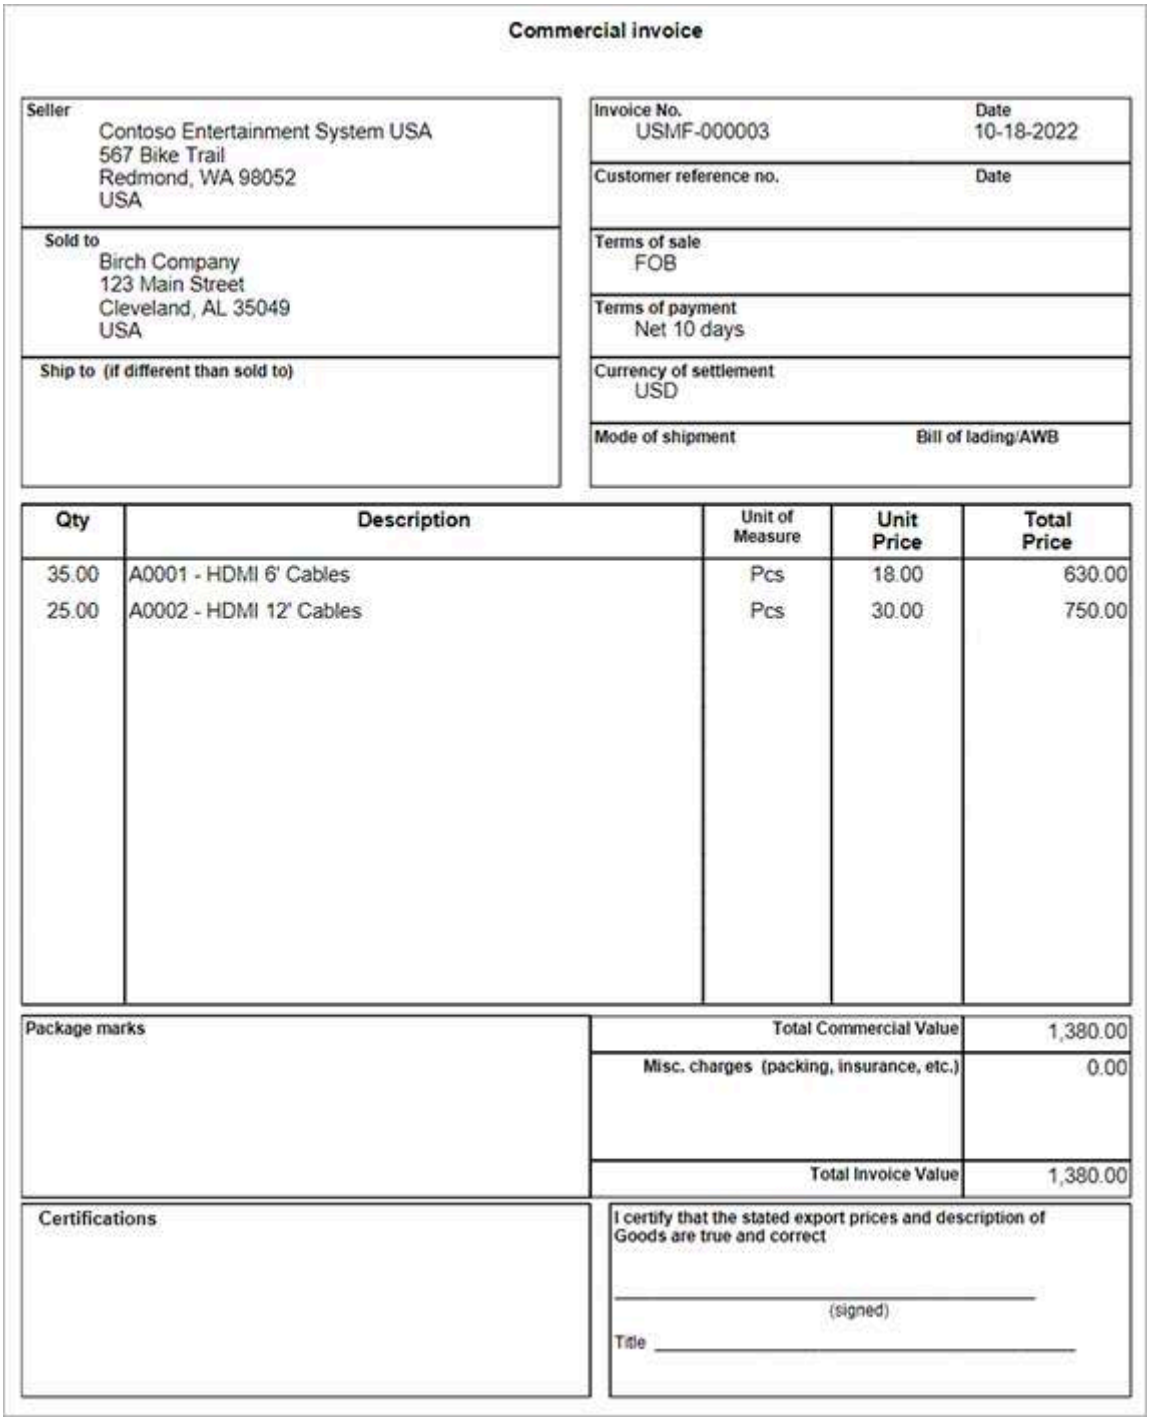
Document content

The commercial invoice includes the following information, which is prefilled from the shipment that the invoice applies to:

- Invoice number and date
- Seller
- Sold-to address
- Ship-to address
- International commercial terms (Incoterms) (listed as **Terms of sale**)
- Payment terms
- Currency of settlement
- Mode of shipment
- Product details (including quantity, description, unit of measure, unit price, and total price)
- Total commercial value
- Miscellaneous charges
- Total invoice value

If you must change or add data to the commercial invoice, export the generated document to an editable format, such as Microsoft Word. You can then apply any required changes before a declaration is made.

The following illustration shows an example of a commercial invoice.



Commercial invoice

Seller Contoso Entertainment System USA 567 Bike Trail Redmond, WA 98052 USA	**Invoice No.** USMF-000003 **Date** 10-18-2022
	Customer reference no. **Date**
Sold to Birch Company 123 Main Street Cleveland, AL 35049 USA	**Terms of sale** FOB
	Terms of payment Net 10 days
Ship to (if different than sold to)	**Currency of settlement** USD
	Mode of shipment **Bill of lading/AWB**

Qty	Description	Unit of Measure	Unit Price	Total Price
35.00	A0001 - HDMI 6' Cables	Pcs	18.00	630.00
25.00	A0002 - HDMI 12' Cables	Pcs	30.00	750.00

Package marks	**Total Commercial Value**	1,380.00
	Misc. charges (packing, insurance, etc.)	0.00
	Total Invoice Value	1,380.00

Certifications	I certify that the stated export prices and description of Goods are true and correct _____ (signed) Title _____

Print a commercial invoice

To print a commercial invoice for a shipment, follow these steps:

1. Follow one of these steps to identify the shipment that you want to print a commercial invoice for:

    - Go to **Transportation management** > **Planning** > **Shipments** > **All shipments**, and select the shipment that you want to print the commercial invoice for.

- Open the **Shipment details** page for the shipment that you want to print the commercial invoice for. There are several ways to open this page (for example, from the **All shipments** page).

2. On the Action Pane, on the **Shipments** tab, in the **Print** group, select **Commercial invoice**.
3. A preview of the document is shown. Use the commands on the Action Pane to print or export the document as you require.

Create a bill of lading

08/02/2025

This article describes how to create a bill of lading when using warehouse management processes (WMS).

A bill of lading is a legal document between the company that ships the items and the carrier. The document accompanies the shipped items, and it serves as a receipt of shipment when the items are delivered at the destination. If you're using warehouse management, there are two ways to generate a bill of lading:

- Create the report manually, using the **Bill of lading** page.
- Generate the report from the **Outbound load planning workbench** or **Inbound load planning workbench**, depending on whether the load is inbound or outbound.

If you generate the bill of lading from the **Outbound load planning workbench** or **Inbound load planning workbench**, the load status must be *Shipped*. If there's more than one shipment in the load, a bill of lading is created for each shipment. After a bill of lading has been created, you can make changes to it on the **Bill of lading** page.

Master bill of lading

If there's more than one shipment in the load, you can generate a master bill of lading. This has the same layout and information as a bill of lading, but contains the summarized content for all the shipments. If the **Create a master bill of lading when there's more than one shipment on a load** option is set to *Yes* on the **Transportation management parameters** page, a master bill of lading is automatically generated if you create a bill of lading from the **Outbound load planning workbench** or **Inbound load planning workbench**, and there's more than one shipment. You can also get a list of the bills of lading by selecting **Related information** > **Bill of lading**. If you're creating bills of lading manually, you can create a master bill of lading on the **Bill of lading** page.

Include container weight and volume on load

06/17/2025

The functionality for including the container weight and volume on a load provides a clear representation of the total weight and volume of containers and items in a load.

A load contains one or more shipments, and these shipments contain distinct items that belong to one or more sales orders. The items are stored inside a container, and containers are loaded on a load. Items outside a container can also be part of a load. Based on these conditions, the system calculates values for the weight and volume on the load by considering the weight and volume of both containers and items.

Where it's used

The functionality for including the container weight and volume on a load applies in transportation management processes. For example, the values are used on the **Rate route workbench** page, where they help define the rate and route for loads. They're also used for transportation tenders and driver check-in.

When creating a load on the **Rate route workbench** page, you can also see and track capacity utilization against the maximum weight and volume of the chosen load template. On the **Load template assignment** dialog that opens when creating a load, the **Details**, **Weight**, and **Volume** tabs show the total quantity, weight, and volume of the load respectively. The **Weight** and **Volume** tabs also show how close you're to the maximum defined weight and volume for the selected load template, and the system notifies you if you exceed either the maximum allowable weight or volume.

If the calculated values aren't precise, you can adjust them by entering the actual values for the weight and volume on the load.

How it's set up

The number of containers considered for a load is calculated based on the weight, volume, and percentage of the container used.

- To set the weight and volume for a container, go to **Warehouse management** > **Setup** > **Containers** > **Container types**.
- To set the container utilization percentage, go to **Warehouse management** > **Setup** > **Containers** > **Container groups**. Then enter a value in the **Container utilization**

percentage field.

To learn more about how to set up the dimensions of a load template, go to Load templates.

The units used for weight and volume are based on the configured system units for the specific legal entity.

Transportation management discounts

Transportation management lets you set up discounts to be applied on top of the transportation price calculated by the rating engine. You can specify each discount either as a percentage of charges or as a fixed amount.

To set up discounts for transportation management, go to **Transportation management** > **Setup** > **Rating** > **Discounts**.

You can choose whether to pass the discount on to your customer (by setting the discount type to customer) or to retain it in the company (by setting the discount type to shipper). This lets you define a setup in which you earn a margin on the calculated freight charges.

You can set up multiple qualifiers for each discount, such as carrier, carrier service, delivery terms, customer, destination, and more.

Less than truckload (LTL) classes

A less than truckload (LTL) class is a freight shipping class that classifies items for shipment. Generally, every type of product or commodity has a National Motor Freight Classification (NMFC) code that corresponds to a specific freight class number for LTL shipments. LTL freight classes represent categories of items, whereas NMFC codes relate to specific commodities in each of the 18 freight classes.

This feature lets you use your system to perform the following tasks:

- Define the LTL freight classes that your company uses.
- Assign each LTL class to an NMFC code on the **NMFC Codes** page. Learn more in Work with NMFC codes in Dynamics 365 Supply Chain Management.
- Assign an NMFC code (and therefore its associated LTL code) to each product on the **Products** page.
- Accurately assess the LTL class of each product that you assign an NMFC code to.
- Determine packing requirements for each LTL class by checking the international LTL standards. In this way, you ensure that your products are well protected and safely shipped.
- Get accurate shipping estimates, based on the LTL freight class for each product.

This article describes how to create LTL classes in Microsoft Dynamics 365 Supply Chain Management.

Create an LTL class

To create an LTL class, follow these steps:

1. Follow one of these steps:

    - Go to **Warehouse management** > **Setup** > **Inventory** > **LTL classes**.
    - Go to **Transportation management** > **Setup** > **Transportation standards** > **LTL classes**.

2. On the Action Pane, select **New** to create an LTL class. Then set the following fields:

    - **LTL class** – Enter your company's internal LTL class identifier (ID) for the commodity type. Most companies use the international standard. In that case, the value of this field matches the value of the **Class** field. However, if your company uses its own standard, enter a code that conforms to that standard.

- **Name** – Enter a descriptive name that helps you and other users select the correct LTL class for each NMFC code.
- **Class** – Enter the international standard LTL class ID for the commodity type. The code that you enter here must conform to the official standard.

Example: Set up LTL classes

The following example shows how to set up two different LTL classes that you can use with different types of products.

1. Go to **Warehouse management** > **Setup** > **Inventory** > **LTL classes** or **Transportation management** > **Setup** > **Transportation standards** > **LTL classes**.
2. On the Action Pane, select **New**.
3. On the new line, set the following values:
    - **LTL class:** *92.5*
    - **Name:** *Computers, monitors, refrigerators*
    - **Class:** *92.5*
4. On the Action Pane, select **Save**.
5. On the Action Pane, select **New**.
6. On the new line, set the following values:
    - **LTL class:** *125*
    - **Name:** *Small household appliances*
    - **Class:** *125*
7. On the Action Pane, select **Save**.

Work with NMFC codes in Dynamics 365 Supply Chain Management

National Motor Freight Classification (NMFC) codes help you classify items that can be shipped. The NMFC code is a designation that is used to group commodities. It enables transport companies to evaluate goods for shipment by classifying items based on considerations such as truck fit, loading issues, handling issues, and perishability. Commodities are grouped into one of 18 freight classes by using a range of numbers from 50 to 500. The class that a commodity is grouped into is based on an evaluation of four transportation characteristics: density, stowability, handling, and liability. Together, these characteristics establish the commodity's transportability.

An NMFC code is associated with every less than truckload (LTL) shipping item. For example, a laptop might be assigned an NMFC that is classed at 2.5, whereas electrical cords might be assigned an NMFC that is classed at 65.

This feature can help workers use NMFC codes to classify LTL shipping items. Here are some examples:

- If your company includes a freight description on the bill of lading (BOL), the carrier will have some idea what the freight is. Freight is an important classification because many transportation companies base their whole business model on the types of freight that they ship.
- This classification might be essential to your company because it's used to determine the cost of a given load.
- Your company can identify the profitability of an LTL logistics and transportation company.

This article describes how to work with NMFC codes in Microsoft Dynamics 365 Supply Chain Management.

Prerequisites

Before you can create NMFC codes, you must set up all the LTL freight classes that must be mapped to them. LTL freight classes represent categories of items, whereas NMFC codes are related to specific commodities in each of the 18 freight classes. For more information about how to work with LTL classes, see Less than truckload (LTL) classes.

Create an NMFC code

To create an NMFC code, follow these steps:

1. Follow one of these steps:

    - Go to **Warehouse management** > **Setup** > **Inventory** > **NMFC codes**.
