    - Go to **Transportation management** > **Setup** > **Transportation standards** > **NMFC codes**.

2. Select **New** to create an NMFC code. Then set the following fields:

    - **NMFC code** – Enter the NMFC code for the commodity type.
    - **Name** – Enter a name for the NMFC code.
    - **LTL class** – Select the LTL class that is associated with the NMFC code.
    - **BOL handling unit** – Define the default handling type for the shipment.

Example: Set up NMFC codes

The following example shows how to set up two different NMFC codes that can be used with different products.

1. Follow one of these steps:

    - Go to **Warehouse management** > **Setup** > **Inventory** > **NMFC codes**.
    - Go to **Transportation management** > **Setup** > **Transportation standards** > **NMFC codes**.

2. On the Action Pane, select **New**.

3. On the new line, set the following values:

    - **NMFC code:** *92.5*
    - **Name:** *Computers*
    - **LTL class:** *92.5*
    - **BOL handling unit:** *Unit*

4. On the Action Pane, select **Save**.

5. On the Action Pane, select **New**.

6. On the new line, set the following values:

    - **NMFC code:** *125*
    - **Name:** *Phones*

- **LTL class:** *125*
- **BOL handling unit:** *Unit*

7. On the Action Pane, select **Save**.

Set up an appointment for a load

Article • 02/17/2025

This procedure shows how to set up and plan a dock appointment for an inbound or an outbound load. The appointment reflects a date and time agreed with the carrier for picking up or dropping off a load based on a sales, purchase, or transfer order. Scheduling an appointment can be done after the load has been created and is typically done by a transportation coordinator.

This feature enables transportation and warehouse managers to keep track of appointments and plan ahead to make sure that there's enough capacity to handle upcoming arrival of trucks for loading and unloading.

1. Go to one of the following pages, depending on whether you're setting up an appointment for an inbound or outbound load:

    - **Transportation management** > **Planning** > **Inbound load planning workbench**.
    - **Transportation management** > **Planning** > **Outbound load planning workbench**.

2. Select a load you want to create an appointment for. If the load doesn't appear in the list, clear the **Hide shipped and received** check box. This is especially relevant for creating an appointment for an inbound load that has already been shipped from the vendor's site.
3. From the **Loads** toolbar, select **Transportation** > **Appointment scheduling**.
4. On the Action Pane, select **New**.
5. In the **Appointment rule** field, enter or select a value. This represents the physical loading or unloading dock in your warehouse that you want to schedule the appointment for. Configure your appointment rules by going to **Transport management** > **Setup** > **Appointment scheduling** > **Appointment rules**. Define parameters such as how many docks there are per warehouse and whether they can receive inbound and/or outbound loads.
6. Select a **Planned start date/time at location** value using the local time zone at the facility. This is an appointment that has been agreed upon separately with the carrier. The **Planned end date/time at location** value is automatically populated based on the value defined in the **Duration** field of the selected appointment rule. This is the time frame during which you expect the carrier to arrive at the dock door, the warehouse to complete loading or unloading, the warehouse to print any shipping documentation, and the driver to depart. The **Planned start date/time** and the **Planned end date and time** fields represent the appointment in the

system's time zone and are automatically populated based on the selected **Planned start date/time at location**.

7. Select **Save**.
8. Select **Update status**.
9. Select **Firm**.
10. Select **Save**.
11. Close the page.

After the appointment has been scheduled, the appointment status changes to *Waiting*, which indicates that the driver has yet to check in.

Register driver check-in and check-out for an appointment

This article describes how to register driver check-in and check-out events, which represent drivers arriving to or leaving from a facility. The events can be registered using either the web client or the Warehouse Management mobile app. To learn how to add the required menu items to the Warehouse Management mobile app, go to Set up mobile devices for warehouse work.

This feature lets you keep track of whether loads have been picked up or dropped off, and to confirm whether carriers are arriving and departing within the agreed-upon appointments. It calculates and shows whether carriers are late when checking in and/or out.

Before you start, an appointment must be set up for a load.

Select or open an appointment

To select or open an appointment in the web client, follow these steps:

1. Go to **Transportation management** > **Planning** > **Dock appointment scheduling** > **Driver check-in and check-out**.
2. Set the **Display completed and canceled appointments** check box as needed, depending on whether you'd like to see previous closed appointments in the grid.
3. Select an appointment.

Register driver check-in

You can register driver check-in using either the web client or the Warehouse Management mobile app.

To check in a driver using the web client, follow these steps:

1. Select an appointment, as described previously.
2. On the Action Pane, select **Driver check-in**.
3. Enter the **Actual start date/time at location** to reflect the actual time the driver checked in.
4. Fill out the fields on the **The driver's information** dialog as needed.
5. Select **OK**.

To check in a driver using the Warehouse Management mobile app, follow these steps:

1. Select **Driver check-in**.
2. Scan or enter the load or appointment ID.
3. Select **Enter**.

If the driver check-in was registered within the scheduled appointment window, then the **Appointment status** changes to *Checked in*.

Register driver check-out

After loading or unloading has finished and the driver has left the facility, you can check out the driver using either the web client or the Warehouse Management mobile app.

To check out a driver using the web client, follow these steps:

1. Select an appointment, as described previously.
2. On the Action Pane, select **Driver check-out**.
3. Fill out the fields on the **The driver's information** dialog as needed.
4. Select **OK**.

To check out a driver using the Warehouse Management mobile app, follow these steps:

1. Select **Driver check-out**
2. Scan or enter the load or appointment ID
3. Select **Enter**

If driver check-in and check-out are done within or before the scheduled appointments, the **Appointment status** changes to *Completed*.

Appointment status

For each record listed on the **Driver check-in and check-out** page, the **Appointment status** field indicates how actual driver check-in and check-out times compare to the scheduled times. The feature also calculates and shows if carriers were late checking in and/or out.

> **Tip**
>
> Select the **Display completed and canceled appointments** check box to display closed appointments in the grid.

The following table describes the possible **Appointment status** that an appointment can have.

Expand table

Appointment status	Description
Waiting	The driver hasn't checked in but isn't yet late.
Checked in	The driver checked in but hasn't checked out and isn't yet late checking out.
Dropped trailer	The driver checked in and selected the **Dropped trailer** option.
Completed	The driver checked in and checked out on time or ahead of schedule.
Completed late	The driver checked in and checked out, but after the scheduled deadline.
Check out warning	The driver checked in but hasn't checked out, and the alert interval hasn't yet expired. To specify the alert interval, go to **Transportation Management** > **Setup** > **Transportation Management parameters**, and then, on the **General** tab, on the **Driver check-in and check out** FastTab, set the **Alert interval** field.
Late on check in	The driver hasn't checked in and is now late.
Late on check out	The driver checked in but hasn't checked out, and the alert interval has now expired.

These statuses help warehouse and transportation managers to do the following tasks:

1. Track the status of ongoing shipments, follow up with carriers on loads that deviated from the plan, and mitigate delays.
2. Identify trends in the timeliness of each carrier.
3. Identify potential problems in your own warehouse operations that are resulting in late check-outs caused by delays in loading or unloading.

Reconcile freight in transportation management

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the freight reconciliation process, which is also known as the matching process. During this process, system-generated freight bills that contain estimated freight costs are matched to actual invoices that are received from carriers. Any differences (variances) are reconciled.

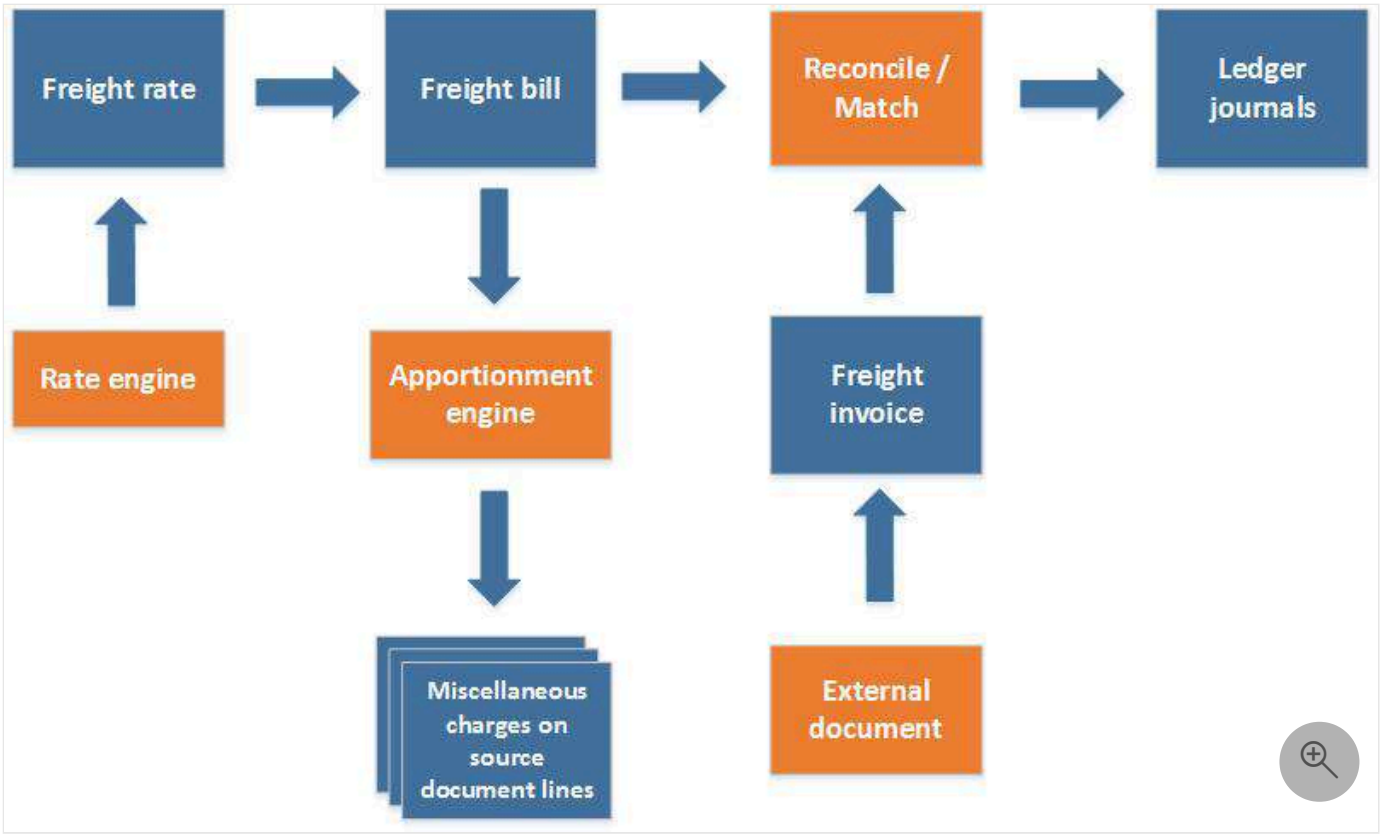
You can perform freight reconciliation manually. Alternatively, to save time and reduce manual errors, you can set it up to occur automatically.

The freight reconciliation process

The relevant shipping carrier's rate engine calculates freight rates. When a load is confirmed, a freight bill is generated, and the freight rates are transferred to it. Depending on the setup used for the regular billing process, the freight rates are apportioned as miscellaneous charges to the relevant source document (purchase order, sales order, or transfer order).

The freight reconciliation process can start as soon as the freight invoice arrives from the shipping carrier. You can receive the invoice electronically or on paper. If it's received on paper, generate an electronic invoice by using the freight bill as a template.

Freight bills and invoices must then be matched. In other words, find the freight bills that correspond to each freight invoice. You can match the invoice lines one by one (manual matching), or you can match all available invoices at once (auto matching). To handle any variances that occur between the freight bill and the invoice, use the reconciliation reason codes that are set up for both manual and automatic reconciliation.



Enable freight reconciliation

To use Transportation management (TMS) to reconcile freight, follow these steps:

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. On the **General** tab, on the **Freight reconciliation** FastTab, set the **Enable freight reconciliation** option to *Yes*.

Set up reconciliation reasons

Reconciliation reasons (or reason codes) specify accounts that are debited and credited with any variances that occur between the freight bills and invoices as a result of manual or automatic reconciliation. They're set up on the **Reconciliation reasons** page (**Transportation management** > **Setup** > **Reconciliation reasons**).

For some reason codes, you might not want to credit a specific account. Instead, you want any credit to be paid to the vendor. In this case, select the **Pay freight vendor** checkbox. Be sure that you also specify a vendor account for the carrier on the **Shipping carriers** page (**Transportation management** > **Carriers** > **Shipping carriers**).

When the ship confirm action occurs, the freight bill is generated, and freight charges are apportioned back to the original source document as miscellaneous charges. Alternatively, you

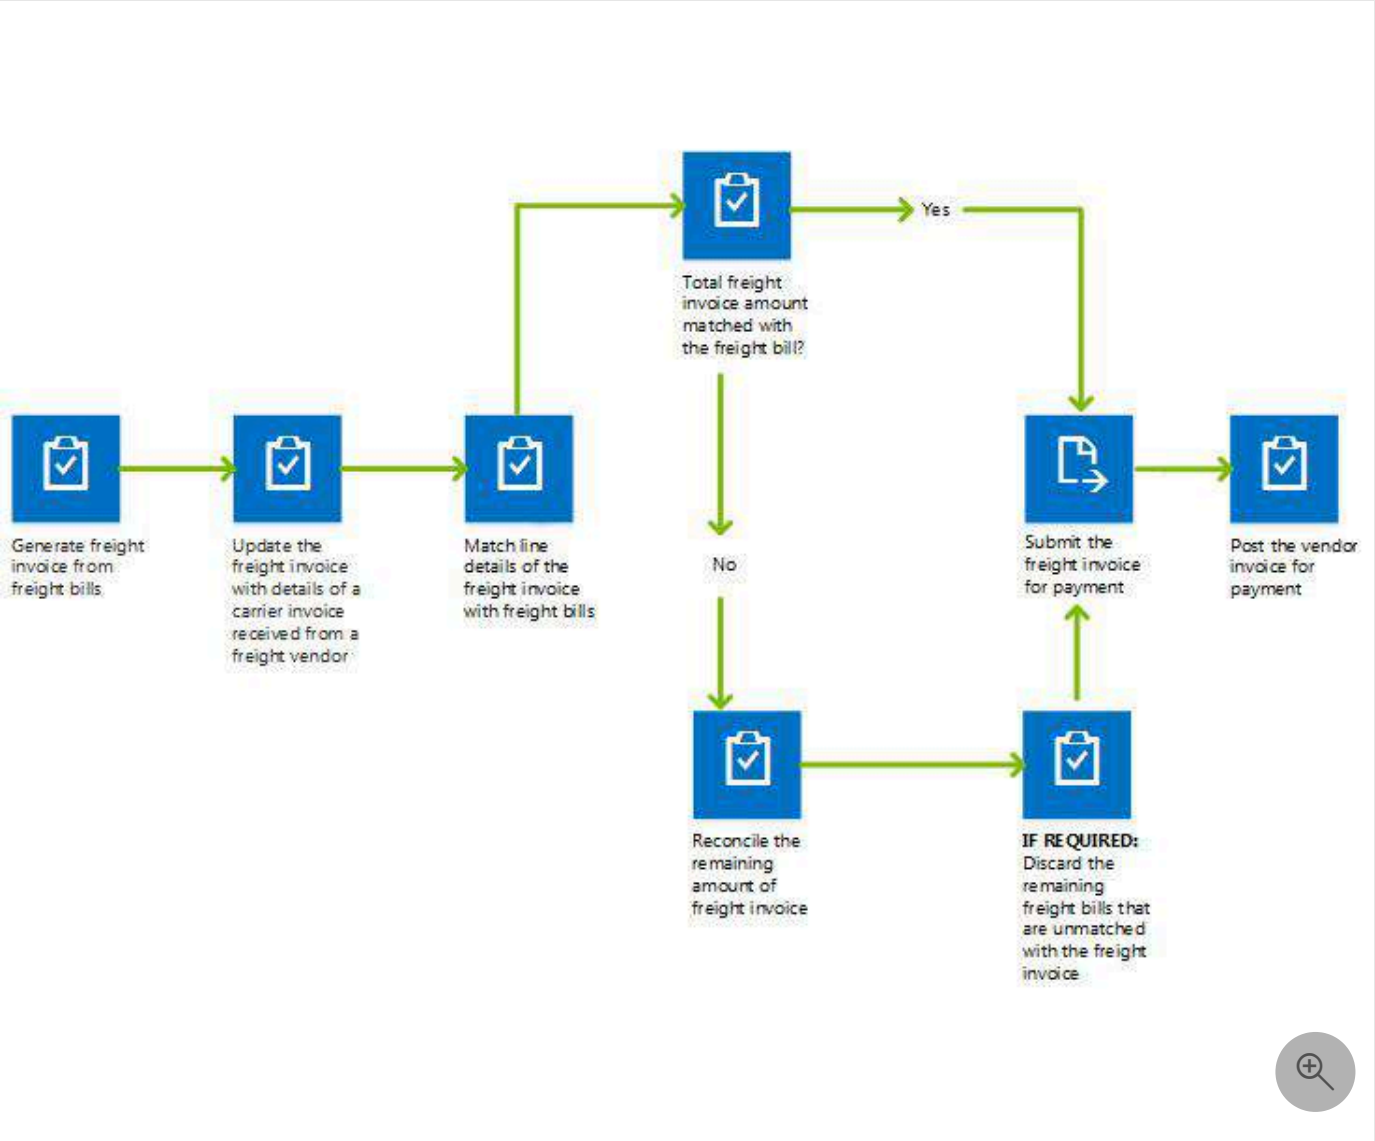
might want to charge the debit and credit accounts that are specified on the **Reconciliation reasons** page. In this case, select the **Override accounts** checkbox.

If you're reconciling freight manually, match each invoice line with the freight bill line or lines for the load that is being invoiced. Do this matching on the **Freight bill and invoice matching** page.

If the amount on the invoice line doesn't match the freight bill amount, select a reconciliation reason for the difference. If multiple reconciliations reasons apply, split the unmatched amount across them. Reconciliation reasons determine how the difference amounts are posted in the general ledger.

After the reconciliation of the whole invoice amount is accounted for, it's submitted for approval. Then the journal is posted.

The following illustration shows how to generate a freight invoice and do freight reconciliation.



Reconcile freight manually

Select a load to reconcile

1. Go to one of the following pages, depending on whether you're reconciling an inbound load or an outbound load:

    - **Transportation management** > **Planning** > **Inbound load planning workbench**.
    - **Transportation management** > **Planning** > **Outbound load planning workbench**.

2. Clear the **Hide shipped and received** checkbox.

3. In the **Load** grid, select the load that you want to reconcile.

Create a carrier invoice

If you reconcile freight manually and don't automatically receive carrier invoices, you can create an invoice based on the freight bill.

1. Select **Related information**.
2. Select **Freight bill details**.
3. Select **Generate freight bill invoice**.
4. In the **Invoice** field, enter a value.
5. Select **OK**.

Reconcile the invoice

When you reconcile a carrier invoice and a freight bill, the reconciliation is done line by line.

1. Select **Match freight bills and invoices**.
2. In the **Invoice details** section, expand the **Unmatched freight bill details** section.
3. In the list, mark the selected row.
4. Select **Match**.
5. Expand the **Matched freight bill details** section.

All freight bills that have positive amounts are available for matching. As in auto matching, you can only match freight invoices that have negative amounts to freight bills that aren't fully matched.

Submit the invoice for approval

1. Select **Submit for approval**.
2. Close the page.

3. Clear the **Hide approved** checkbox.
4. Select **Vendor invoice journals**.
5. In the **Reference journal number** field, select the link.
6. Select **Lines**.

Automatic reconciliation

If you choose to run automatic reconciliation, you must handle any invoices that the system can't match. You must then process those invoices manually before you can post all the invoices for payment.

To use automatic reconciliation, you must specify the schedule for reconciliation. You must also specify the invoices and shipping carriers to use. The automatic matching of the invoice lines and freight bills is done according to the setup of the audit master and freight bill type.

Set up vendor invoice parameters

To enable automatic creation and/or posting of a vendor invoice journal during the automatic reconciliation process, go to **Transportation management** > **Setup** > **Transportation management parameters** > **Vendor invoice**. To enable the system to create an invoice journal to reconcile any differences between the freight bill and freight invoice, turn on the **Write vendor invoice journal** parameter. To enable the system to post the invoice journal after it's approved by the user who is defined in the **Workflow user** field, turn on the **Post journal** parameter.

To run the automated match and pay batch jobs, turn on the **Automatically match and pay the freight invoice** parameter. If the **Automatically match and pay the freight invoice** parameter is turned off, but the **Enable Freight Reconciliation** parameter is turned on, you can run the manual match and pay process, and still submit vendor invoices for approval.

The **Match interval** parameter defines the schedule for automatic reconciliation or matching. If you turn on the **Automatically match and pay the freight invoice** parameter, the minimum standard recommended interval is 120 seconds.

Set up billing groups

Billing groups are user-defined categories. Set them up to reflect the categories of charges that are present on the invoices that you receive from carriers. To set them up, go to **Transportation management** > **Setup** > **Freight reconciliation** > **Billing group**, and specify a billing group ID and name. (Both fields are free-text fields.)

Set up the freight bill type

Freight bill types define how freight bills and carrier invoices should be matched. They define specific criteria, both mandatory and optional. The auto matching process considers a freight bill and an invoice only if defined mandatory criteria are populated and match on both. If optional criteria are blank on the freight bill or the invoice, the process can still consider them.

1. Go to **Transportation management** > **Setup** > **Freight reconciliation** > **Freight bill type**.
2. Select **New**.
3. In the **Freight bill type** field, enter a value.
4. In the **Engine assembly** field, enter *Microsoft.Dynamics.Ax.Tms.dll*. This assembly is the standard TMS matching engine code library.
5. In the **Engine class** field, enter *Microsoft.Dynamics.Ax.Tms.Bll.GenericNormalizer*. This class is the standard TMS matching engine class.
6. Select **New**.
7. In the **Description** field, select the value that should match on the freight bill and the carrier invoice.
8. In the **Match required** field, select one of the following values:
    - *Yes* – The value selected in the **Description** field must match on both the freight bill and the carrier invoice.
    - *No* – The value selected in the **Description** field can be blank on the freight bill or the carrier invoice.
9. Select **Save**.
10. Close the page.

Set up the freight bill type assignment

The freight bill type assignment specifies the freight bill type that is used for a carrier. The system then uses that freight bill type to determine the matching requirements when an invoice is received. If carriers ship from or to multiple sites and warehouses within the same legal entity, leave the **Site** and **Warehouse** fields blank.

1. Go to **Transportation management** > **Setup** > **Freight reconciliation** > **Freight bill type assignments**.
2. Select **New**.
3. In the **Mode** field, enter or select a value.
4. In the **Shipping carrier** field, enter or select a value.
5. In the **Freight bill type** field, select the freight bill type that you created earlier.
6. Close the page.

Set up the audit master

The audit master defines the tolerance limits for automatic freight reconciliation. In other words, it specifies how much the monetary amounts on the freight bill and the carrier invoice can differ. If the difference is outside the defined tolerance limits, reconciliation is prevented from occurring. The audit master also defines how discrepancies are handled.

1. Go to **Transportation management** > **Setup** > **Freight reconciliation** > **Audit master**.
2. Select **New**.
3. In the **Audit master ID** field, enter a value.
4. In the **Shipping carrier** field, select the same shipping carrier that you selected earlier.
5. In the **Freight bill type** field, select the freight bill type that you created earlier.
6. On the **Tolerance** FastTab, in the **Minimum tolerance level** field, enter a number.
7. In the **Maximum tolerance level** field, enter a number.
8. On the **Result** FastTab, in the **Overpayment reason code** field, enter or select a value.
9. In the **Underpayment reason code** field, enter or select a value.

   If the monetary amounts on the freight bill and the carrier invoice differ, and the difference is within the defined tolerance limits, the overpayment and underpayment reason codes specify the accounts that the difference is registered on.
10. Close the page.

You can also define exceptions if you don't want specific types of charges to be evaluated according to the same criteria as the audit master during the automatic reconciliation process.

Auto matching

When multiple freight invoices are matched to the same freight bill, the process for auto matching works in the following way:

1. All unmatched freight invoices are sorted by amount. The invoice that has the largest amount is listed first.
2. The freight invoices are matched one by one until the freight bill has no positive remaining amount.
3. Depending on the setup of the audit master and the remaining amount on the freight invoices, the remaining amount is set.

Example

You have an original freight bill (FB) for the amount of 1,500. You create three freight invoices for FB (Inv1, Inv2, and Inv3). There's one invoice line for each invoice. The following settings are used:

- **Original freight bill FB:** Amount = 1,500
- **Freight invoice Inv1:** Amount = 1,000
- **Freight invoice Inv2:** Amount = 600
- **Freight invoice Inv3:** Amount = −100

Automatic matching result

Auto matching runs in the following order:

1. Sort all freight invoices in descending order by amount: Inv1 → Inv2 → Inv3.
2. Match Inv1 with FB. Inv1 has 1,000 matched, and FB has a remaining amount of 500. Therefore, the status is set to *Partially matched*.
3. Match Inv2 with FB. Inv2 has 500 matched, and FB has a remaining amount of 0 (zero). Therefore, the status is set to *Fully matched*.
4. Because FB is now fully matched, Inv3 isn't processed.

Manual matching result

The results for manual matching vary, depending on the order of matching, as the following example cases show.

Manual matching case 1

One way to do manual matching for this example is to proceed in the following way:

1. Match FB with Inv1. FB has a remaining amount of 500. Therefore, the status is set to *Partially matched*.
2. Match Inv2 with FB. Inv2 has 500 matched, and FB has a remaining amount of 0 (zero). Therefore, the status is set to *Fully matched*.
3. When you try to manually match Inv3, you don't find any unmatched freight bills.

This case is essentially the same as auto matching.

Manual matching case 2

Another way to do manual matching for this example is to proceed in the following way:

1. Match Inv3 with FB. FB has a remaining amount of 1,600, which is the same as subtracting −100 from 1,500. Both FB and Inv3 have a matched quantity of −100.
2. Match Inv1 and Inv2 with FB, one after the other. FB is fully matched.

As this example shows, always match manually if freight invoices have negative amounts. This approach ensures that freight invoices with negative amounts can always be matched to a freight bill that wasn't fully matched, because you can control the matching sequence.

Vendor invoice journal creation when discarding freight bills

Article • 03/10/2025

This article provides guidance about how to create vendor invoice journals when you discard freight bills that are used in Microsoft Dynamics 365 Supply Chain Management.

As of Supply Chain Management version 10.0.42, you can use the **Freight bill discard vendor invoice journal creation policy** field on the **Transportation management parameters** page to control when vendor invoice journals are created. The default setting, *Only for reconciliation reasons with pay the freight vendor*, creates journals only for reconciliation reasons when functionality for paying the freight vendor is enabled.

Set up the vendor invoice journal creation policy to always create journals

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. On the **General** tab, on the **Vendor invoice** FastTab, in the **Freight bill discard vendor invoice journal creation policy** field, select *Always*.
3. Save your changes.

Landed cost module overview

The **Landed cost** module helps businesses streamline inbound shipping operations by giving users complete financial and logistical control over imported freight, from the manufacturer to the warehouse. For imported goods, landed costs can account for 40 percent or more of the total cost of each imported item. Therefore, the challenge is to provide accurate estimates for landed costs.

Businesses can use Landed cost to complete the following tasks:

- Estimate landed costs at the time of voyage creation.
- Apportion landed costs to multiple items and purchase orders in a single voyage.
- Support the transfer of goods between physical locations by recognizing landed costs.
- Recognize accruals for goods in transit.

Landed cost provides accurate and timely cost estimates for overhead landed costs. At the same time, it provides increased financial and logistical visibility into the extended supply chain. It also helps reduce the administration of costing and costing errors.

Highlights

Voyages

In Landed cost, a voyage is a distinct movement from an outbound location, through a specific set of destinations over a specified period, to a specified inbound warehouse location. Purchase orders and order lines can be added to either a single container or multiple containers for a voyage, and the costs are correctly allocated back to the item line.

Item ownership

In Microsoft Dynamics 365 Supply Chain Management, you typically receive goods at the warehouse destination and then invoice them. However, under most international trade agreements, a business takes ownership of goods from the time when they leave the original port, before they're physically received. Landed cost enables businesses to invoice goods before they're physically received. This concept is known as a *goods in transit order*. It creates a new type of order to manage the receipt of goods after the original purchase order is invoiced.

Costs

When you create a voyage in Landed cost, costs can automatically be added to it. These costs are set up in Landed cost, and various cost options and cost bases are available for them. Each cost can be set up for different levels of a voyage and apportioned to the item level through apportionment rules that support quantity, volume, weight, amount, and defined volumetric divisors. These estimated costs provide an accurate estimate of all costs for a voyage.

Landed cost then runs a preliminary posting/accrual of the estimated landed costs to ensure that an accurate calculation of estimated costs is available at the time of voyage creation. Estimated landed costs are posted together with the purchase order invoice. Actual costs are posted when the vendor invoice journal is posted.

Actual costs are reverse-estimated costs posted at the time of cost invoicing by using clearing accounts that are set up for each type of cost, such as duty, freight, and insurance. These postings follow the posting behavior that's associated with the specific item. They automatically update inventory posting, regardless of whether the posting type is first in, first out (FIFO), last in, first out (LIFO), moving weighted average, or moving average. All inventory model group posting types are supported. For moving average and standard cost posting, purchase price variance accounts are available to post the differences between estimated costs and actual costs.

Item and order tracking

As a voyage moves from the originating outbound location to the final destination warehouse, users can update each step, or *leg*, of its journey as required. For each leg, a lead time and a shipment status are identified. Confirmed receipt (or delivery) dates for movement to the next leg of the journey are also identified. Together, these delivery dates provide an estimated delivery date of the goods to the inbound warehouse. Users can change these delivery dates. In this case, the estimated delivery date of the goods is then automatically updated, based on the lead times and legs of the journey. Visibility into goods in transit by voyage and vessel is available on a per-container basis before receipt of the goods. Because the dates are updated on each purchase order line, businesses have more control over logistics and warehouse planning.

Landed cost concepts

The following table summarizes some core concepts of landed cost.

Expand table

Concept	Description
Voyage	Typically, a voyage is one vessel. However, depending on your practices and procedures, it can be one vendor or one purchase order. There are no limitations on the use of this concept.
Folio	A folio is often determined by customs regulations. It can consist of one vendor's goods for one entity/company per shipment. The goods in a folio can be in one container or spread among multiple containers.
Shipping container	Shipping containers store purchase order lines. They're a level below the shipment level. They're typically used if costs are apportioned for goods by container, or if receiving is done per container.
Shipping container type	Shipping container types can determine the price for a cost type, such as freight. They also provide useful shipping information.
Cost type	Cost types identify costs that are associated with imports, such as duty, freight, and insurance.
Auto cost	Auto costs work like trade agreements. An auto cost is linked to a voyage level.
Port	Ports are areas where goods are received and transferred from.
Vessel	A vessel is the medium that's used to transport goods, such as a ship or an airplane.
Goods in transit	Depending on settings, goods are put into an in-transit warehouse after an invoice is updated.
Activity	Activities can store each significant step of the journey between two ports. They can update dates.
Journey template	Journey templates are routes that goods take between two ports.

For a comparison of the terminology and features of the **Landed cost** and **Transportation management** (TMS) modules, see Landed cost vs. Transportation management.

Overview of the landed cost process flow

Landed cost can be run so that it generates goods-in-transit orders. Alternatively, it can be run so that it doesn't generate goods-in-transit orders. Both processes start with an inbound demand source document. Next, a new voyage is created, the source document order line is added to a container in the voyage, and costs are added to the voyage. The source document must be invoiced before estimated landed costs can be posted and a goods-in-transit order can be generated, if applicable. A vendor invoice journal must also be posted before the actual costs can be posted. Product receipt isn't always mandatory and can occur at different points in the flow.

You can date-track the delivery of a goods-in-transit order by using the **Tracking control center** page. To learn more, see Track inbound voyages and shipping container journeys. You can use the **Inquiries** feature to look up information across landed cost–enabled orders. For example, you can look up an item or container, and view related information. In addition, you can generate and view various reports by using the **Reports** functionality. To learn more, see Landed cost reports.

Setup and configuration

To use landed cost with goods-in-transit orders enabled, ensure that the following configurations are in place:

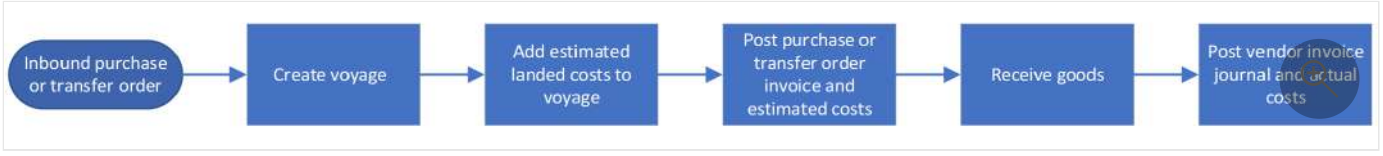
- **Goods-in-transit management** is set to *Yes* on the terms of delivery.
- Terms of delivery are set on the purchase order header.
- Additional goods-in-transit and under-delivery warehouses must be set up.

For more information, see Goods-in-transit processing and receiving.

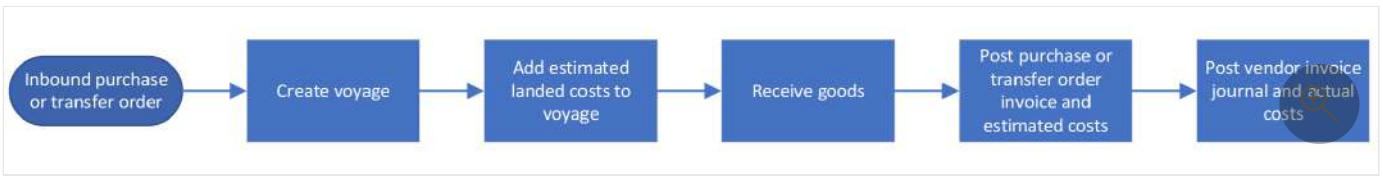
To use landed cost without goods-in-transit orders enabled, set **Goods in transit management** to *No* on the terms of delivery, and don't configure any additional warehouses. Also, you don't need to set terms of delivery on the purchase order.

The costing, financial, and inventory impact of posting estimated and actual costs depends on configurations set in the **Landed cost** module. For more information, see Landed cost parameters setup and Costing parameter values setup.

The following diagram shows the process flow for landed cost when goods-in-transit orders are enabled.



The following diagram shows the process flow for landed cost when goods-in-transit orders aren't enabled.



Create the voyage

After the voyage is created, you can add the purchase order lines to a new or existing shipping container in the voyage.

For more information, see Manage voyages, Manage shipping containers, and Manage folios.

Add the estimated landed cost to the voyage

When you use the **Find auto costs** function, the system automatically finds and adds costs to the voyage, container, item, or order, based on the auto costs setup. You can view the costs that the system adds, and you can manually edit or add any costs.

Learn more in Estimate and manage landed costs and Auto costs setup.

Post estimated costs

Post estimated costs for landed cost with purchase orders

If you use purchase orders as the inbound demand source document, then estimated landed costs are also posted when you post a purchase order invoice. Learn more in Estimate and manage landed costs.

If goods-in-transit is enabled, then the invoicing process generates the required goods-in-transit orders.

Post estimated costs for landed cost with transfer orders

Transfer orders can be used with landed cost only if goods-in-transit orders aren't enabled. In this scenario, instead of posting an invoice, you use the *Ship transfer order* functionality to post estimated costs.

Receive goods

Goods receipt for landed cost when goods-in-transit orders aren't enabled

When goods-in-transit isn't enabled, use the **Post product receipt** functionality on the purchase order. The process resembles the normal process for purchase order receiving.

For more information, see Warehouse handling of inbound loads for purchase and inbound shipment orders.

Goods receipt for landed cost when goods-in-transit orders are enabled

To receive goods when goods-in-transit orders are enabled, use goods-in-transit receiving-specific menu items in the Warehouse Management mobile app, post an arrival journal, or receive the goods via the goods-in-transit order. The receipt method you use depends on whether warehouse management processes (WMS) and serial/batch tracking are enabled.

For more information, see Goods-in-transit processing and receiving.

Processing of over and under transactions

Landed cost processes the over-receipt and under-receipt of goods. Over and under transactions occur if the quantity received from a goods-in-transit-enabled purchase order differs from the ordered quantity, and the difference exceeds configured rules and tolerances.

For more information, see Over/under transactions.

Post the vendor invoice journal

This step reflects an invoice received from the vendor in Supply Chain Management. During this step, actual costs are posted.

Limitations of the Landed cost module

Currently, the **Landed cost** module doesn't support the following items:

- Project purchase orders
- Purchase orders that include catch-weight-enabled items
- Purchase orders that include service/non-stocked items
- Non-deductible tax as part of the voyage costs
- Transfer orders with goods-in-transit orders enabled
- Direct delivery and goods in transit
    - If goods-in-transit isn't enabled for a direct delivery order, direct delivery for landed cost follows the standard behavior.
        - If goods-in-transit is enabled for a direct delivery order, the goods-in-transit processes are skipped. This condition means that the items aren't received in the goods-in-transit warehouse. Posting a purchase order invoice automatically generates the product receipt and also updates the transactions on the sales order. Also, if a purchase order that links to a direct delivery sales order is split across multiple voyages and/or shipping containers, the direct delivery processes don't work.

Last updated on 07/01/2026

Landed cost vs. Transportation management

09/19/2025

Microsoft Dynamics 365 Supply Chain Management provides two different modules for working with transportation: **Transportation management** (TMS) and **Landed cost**. This article summarizes the functionality that the two modules have in common and highlights the differences between them. Use this information to decide which module best fits your business practices. Some business practices work better with TMS, while others work best with Landed cost. Depending on your business requirements, you might choose to use one module exclusively, or you might combine the two modules.

This article isn't a comprehensive review of all the features of either module. Instead, it highlights the available functionality as it pertains to the transportation of goods from a vendor to your business's warehouse, where it can be consumed.

Terminology, reference data, and reporting differences

Terminology comparison

TMS and Landed cost use different terms for similar concepts. The following table summarizes these terms and their usage in the two modules.

Expand table

TMS term	Landed cost term	Notes
Load A *load* is a collection of shipments that are transported simultaneously on the same transportation unit (such as a truck or a ship). Loads can be either inbound or outbound.	**Voyage** Typically, a *voyage* is a single vessel that travels along a single *journey*. A voyage can contain multiple *shipping containers*, and it can also include inbound orders from different legal entities of your organization. Voyages can only be inbound.	TMS also uses the term *voyage number*, which refers to an information field where you can enter an identifier. However, no functionality is associated with the TMS field, and it's unrelated to the *voyage* concept in Landed cost.
Route	**Journey**	

TMS term	Landed cost term	Notes
A *route* is the physical path of a transport from origin to destination.	A *journey* is the physical path of a transport from origin to destination. Each voyage must be assigned to a journey.	
Route segments A route can have multiple *route segments*, each of which represents a step of the journey. A route can include multiple carriers or services, each of which is considered a route segment.	**Legs** Each journey can have multiple *legs*, each of which represents a step of the journey. A leg can be part of transportation, duty handling, or another activity.	
Containers A *container* can be any kind of package or packaging that is used by TMS.	**Shipping containers** A *shipping container* is a literal, physical shipping container, as known from container ships.	
Commodity codes In TMS (and in other places in Supply Chain Management), *commodity codes* identify types of commodities. They can affect tariffs, handling of hazardous materials, and so on.	**Commodity codes** In Landed cost, *commodity codes* are established at the level of the legal entity. They're mostly used for reporting.	Landed cost can also use the commodity codes that are used for TMS and other places in Supply Chain Management. However, the Landed cost commodity codes are used only by Landed cost.

Some reference data isn't shared

TMS and Landed cost don't share reference data for entities such as cost setup, journeys, and legs. If you use both modules, you must recreate the unshared reference data.

Intercompany reports don't work with goods in transit

The following reports don't work with the goods in transit feature that Landed cost provides:

- Intercompany goods in transit totals report
- Intercompany goods in transit transactions report

These reports assume that you put goods in transit as soon as you issue a sales packing slip, and that you take goods into inventory from transit upon receipt. However, goods in transit

aren't processed in this way. Therefore, if you use the goods in transit and intercompany features together, the results for both these reports will be incorrect.

Using the two modules together

You can use TMS for both inbound and outbound operations. Although Landed cost provides most of the same basic functionality as TMS for inbound operations, it also adds some functionality. Therefore, you might want to consider using TMS for outbound operations and Landed cost for inbound operations.

In general, we don't recommend that you use both modules together for inbound operations. Use the module that best meets your requirements. If you use the two modules together, don't share source documents between them. For example, don't use the same purchase order for both a load in TMS and a voyage in Landed cost. In particular, don't set up the system to create inbound loads automatically. If you include items from purchase orders in a voyage, you can't handle them as part of a load.

Goods in transit

One of the primary features of Landed cost is its ability to process goods in transit. Goods in transit processing lets you take financial ownership of shipped items before they're physically received at the destination warehouse. Goods in transit processing is often required for international trade.

TMS goods in transit features

TMS doesn't currently support goods in transit processing.

Landed cost goods in transit features

Goods in transit processing is a primary feature of Landed cost and provides the following functionality:

- **Goods in transit warehouses** – You can associate a goods in transit warehouse with each warehouse in Supply Chain Management. After you invoice the original purchase order, the goods are transferred to goods in transit warehouses. Items that are physically reserved in these warehouses become unavailable for consumption until they're received at their physical warehouse. Therefore, you take financial ownership of goods by invoicing the purchase order.

- **Goods in transit general ledger account** – Landed cost adds a specific general ledger posting account to the purchase order posting profile to handle goods in transit processing. This goods in transit general ledger account acts as an account of the "goods invoiced not received" type. When you invoice the original purchase order and create the goods in transit order, the direct purchase order cost posts to the goods in transit general ledger account until the goods are received at their final physical location.
- **Tracking control updates** – Goods in transit orders support tracking control functionality in Landed cost. Tracking control lets you update the expected date of arrival of goods while they're in transit. Tracking control then updates the voyage and the associated purchase order lines. The expected delivery date is then available for master planning and logistics.
- **Triggering of over/under transactions** – If a variance occurs between the expected goods on a voyage line and the actual goods that are received at the warehouse, Landed cost resolves it by creating over and/or under transactions. You can then manage these transactions, based on that way that you want to process them, through either a purchase order or a movement journal. The over and under transactions provide a link back to the voyage, the original purchase order, and the new movement journal or purchase order for the variance.
- **Goods in transit orders** – Landed cost introduces a new source document that is known as a *goods in transit order*. A goods in transit order lets you invoice the original purchase order to take financial ownership of the items. When you invoice the purchase order, the new source document is created for each purchase order line that has a combination of inventory dimensions. Goods are then physically moved to a goods in transit warehouse, where they're physically reserved against the goods in transit order and can't be consumed unless goods in transit orders are received.

Miscellaneous charges and shipment costs

One of the most important aspects of shipping and shipment management for goods is recognition of the overhead costs that are associated with shipments. These overhead costs aren't the direct inventory costs that are associated with a purchase order and a shipment or voyage. Instead, they're additional costs that the nature of the movement of the goods from the vendor to your organization introduces. These costs can include freight costs that are associated with the shipment of goods from one physical location to another, or duty costs that are associated with the import of goods from a foreign vendor.

Landed cost handles these costs by creating a new type of cost structure that is known as *auto costs*. TMS handles these costs by using miscellaneous charge functionality.

TMS charge and cost features

TMS uses miscellaneous charges to manage extra costs for loads that are allocated to the related source document lines. You can set these miscellaneous charges at the level of either the purchase order line or the purchase order header.

In TMS, you can apportion, or divide, miscellaneous charges by the weight, volume, or quantity of the inventory. Charges can be divided by freight or accessorial charges. Further development will be required to use additional apportionment methods in TMS.

Landed cost charge and cost features

Landed cost provides a set of cost functions that handle extra costs associated with the shipment of goods. These costs are known as auto costs. The system applies these costs at the time of initial shipment invoicing by using the estimated cost amount. Each cost type is managed in its own posting. After you post the actual invoices for overhead costs, the system automatically updates the estimated costs to reflect the actual costs.

You can invoice the overhead costs associated with the shipment of goods during the voyage from the port of origin or anytime after the goods are received. This capability provides greater flexibility for the consumption of goods.

The following list outlines some concepts for the charge and cost features in Landed cost:

- **Cost area** – Assign costs and charges to different levels, or *cost areas*, on a voyage. Apply the cost at the voyage level and break it down to each item in the voyage. You can also apply costs at the level of the container, purchase order, item, or transfer order. Manage each cost charge separately across the various areas and break it down to a per-item cost.
- **Apportionment methods** – Landed cost offers several apportionment methods. Apportion cost charges by quantity, dollar amount, value, weight, volume, measurement, or a user-defined volumetric measure.
- **Clearing/variance control** – Set up cost charges as their own cost code type in Landed cost. Each cost code type lets you define a clearing account for estimated costs charges, and also accrual and purchase price variance accounts for variances in estimated costs versus actual costs. When you initially post the estimated costs, the system credits the clearing account. After you post the actual invoices, the system posts the actual cost charges and debits the estimated costs out of the clearing account.

Matching freight bills and invoices

TMS bill and invoice matching features

TMS can match freight bills that contain estimated costs and invoices with the actual cost of the freight. You can receive invoices either electronically or on paper. Matching variance between the estimated cost and actual cost doesn't affect the inventory valuation.

Learn more in Reconcile freight in transportation management.

Landed cost bill and invoice matching features

Landed cost can match freight bills to estimated cost charges and can invoice the actual cost charges to the estimated costs. At the time of invoicing, the freight charges are in an invoice journal, and the system clears the estimated costs out of the clearing account. Additionally, the system posts the actual cost charges against the cost of goods sold for the item, together with the variances between the estimated charges and actual charges. This behavior allows for flexibility in the invoicing process.

Tracking

An important feature of both TMS and Landed cost is the ability to track goods and identify where they are in the journey from the point of origin to the final destination warehouse. Tracking lets you follow and update where the goods are located and when they're expected to arrive at the warehouse for consumption. In addition to the status of goods during their journey, Landed cost provides expected and actual dates for each step of the journey.

TMS tracking features

TMS provides limited features for tracking incoming loads. It shows dates and enables an integration to be built to find the exact position (for example, on the **Transportation status** page).

For each route segment, you can enter estimated schedules and arrival times.

Landed cost tracking features

Landed cost provides tracking control for each voyage, from the port of origin to the final destination. Tracking control sets the status of the voyage. The status indicates whether the voyage is sailing, at customs for inspection, or in local delivery on its way to the final warehouse. You can set the status at the level of the purchase order line, the container, and the header of the voyage. Therefore, you have more granular control.

Additionally, a confirmed expected date that's based on specified lead times is associated with each step of a journey. The confirmed and expected delivery dates are added to the purchase

order line and goods in transit orders, and you can use them for master planning and logistics. In addition to the expected dates, you can update the actual dates. The subsequent steps in a journey then update accordingly.

Multi-leg journeys

The journey concept identifies where the goods are in the process and controls the status of the goods while they're in transit. Goods can go through several legs of a journey, and you can associate various costs with a specific leg. Examples include a freight cost on the sailing of a vessel and local transport costs on the transport of goods from the port to the destination.

TMS multi-leg journey features

In TMS, you can break down routes into route segments to represent multi-leg journeys. TMS can allocate spot rates and accessorial charges to individual route segments.

Learn more in Plan freight transportation routes with multiple stops.

Landed cost multi-leg journey features

Landed cost provides a framework for moving goods from the point of origin to the destination through a series of legs, which are the stops or steps in a journey. You combine the legs to create journey templates, which define how goods move from the vendor to your organization.

In every leg of a journey, you can further define the status of each purchase order line and the lead times that are associated with it. The combined lead time for all the legs identifies the estimated delivery date. However, goods in transit processing is required for multi-leg journeys to apply. The journey of goods on a voyage is managed in a table that's specific to Landed cost.

Receiving by container

It's important to manage how goods are split and stored on a vessel. On a vessel, you can keep goods in one container or multiple containers. When you receive goods, you receive them in containers. You might receive different containers on a voyage at different times or on different dates.

Both TMS and Landed cost provide functionality for managing the receipt of goods in a container. TMS uses the concept of loads to manage the goods, purchase orders, and transfer orders that are associated with a shipment container. TMS supports receiving based on a

packaging structure received through an advance shipping notice (ASN). Landed cost uses the concept of shipping containers to process purchase orders and control overhead costs that are associated with a container on a vessel.

TMS receiving by container features

TMS supports inbound ASNs, all variants of receiving through the Warehouse Management mobile app, and all methods of receiving through the Supply Chain Management client.

Landed cost receiving by container features

To support receiving by container, Landed cost creates shipping container records and associates purchase orders with a specific shipping container by using its container ID. You can then apply overhead costs to that shipping container and break them down so that they're associated with the relevant purchase orders.

You can receive containers in Landed cost through a new type of receipt known as a *goods in transit receipt*, through arrival journals, or through mobile device receiving. When you use arrival journals, you can initialize the quantities from the goods in transit order or the original purchase order lines in the container. Landed cost provides two work types for receiving through the Warehouse Management mobile app.

Landed cost doesn't provide an ASN for the electronic receipt of goods. Additionally, it doesn't support Warehouse Management mobile app flows that process load receiving, license plate receiving, or mixed license plate receiving.

Rate shopping by vendor

Rate shopping enables a company to select a transportation vendor based on the lowest price, the fastest route, or a combination of both considerations.

TMS rate shopping features

TMS lets you identify vendor and routing solutions for inbound and outbound orders. For example, you can identify the fastest route or the least expensive rate for a shipment.

TMS provides full rate shopping and freight optimization through the rate route workbench, flexible rating options through the rating engine, a rating engine API for integration with external parties, and support for volumetric weight.

Learn more in Transportation management engines.

Landed cost rate shopping features

Landed cost provides only limited support for rate shopping by vendor. Although you can enter freight forwarder values, Landed cost doesn't compare them across multiple vendors.

Driver check-in/check-out with appointment scheduling

Driver check-in/check-out features enable the system to monitor arrivals and prevent congestion at the loading docks.

TMS driver check-in/check-out features

TMS lets you create *appointments*. An appointment represents events that occur at a dock for receiving a purchase order, shipping a sales order, or processing an inbound or outbound load on a specific date and at a specific time. Appointments ensure that docks are available for loading and unloading goods, and they help prevent situations where multiple carriers arrive at a location at the same time.

The system supports allowing drivers to check in at a specific dock door.

Landed cost driver check-in/check-out features

Landed cost can store estimates for the date and time when a container will be delivered.

Transfer orders and additional costs

Often, businesses must be able to transfer goods between warehouses. When this type of transfer occurs, costs are associated with it, and you might want to recognize those costs. In Landed cost, you can add transfer orders to a voyage or vessel to track the movement of goods from one warehouse or site to another, estimate the delivery time and expected delivery date, and add overhead costs to the transfer of goods.

TMS transfer order cost features

TMS supports the creation of freight charges that are connected to transfers. Although you can view these charges from the transfer order, the landed cost isn't added to the item cost. Freight reconciliation is supported through the creation of a freight bill that is based on these charges. This freight bill is then matched against a vendor freight invoice.

Landed cost transfer order cost features

Landed cost lets you add transfer orders to a vessel or voyage. In this way, you can add shipment costs to the voyage as inventory settlements at the time of transfer order receipt. You can invoice the overhead costs for the actual costs and track them against a voyage to update the cost of goods sold. Although transfer orders don't use goods in transit processing in the standard release, you can add them to voyages. The landed cost is added to the total cost of each item.

Turn on the Landed cost module and related features for your system

The **Landed cost** module itself is always turned on and can't be turned off, but several of its add-on features are optional. Admins can use the feature management settings to check the status of each feature and turn it on as needed. In the **Feature management** workspace in Microsoft Dynamics 365 Supply Chain Management, every feature in this table is listed under the **Transportation management** module. Preview features are marked as such; other features are generally available.

Expand table

Feature name and requirements	Feature description
Feature name: *Source document and accounting distribution support for Landed Cost* **Version required:** 10.0.34 or later	This feature for the **Landed cost** module enables landed costs to be included in the accounting distribution of purchased product receipts. Therefore, these costs can easily be identified and tracked. The feature supports the association of freight cost from Landed cost with the corresponding source documents. Therefore, it provides a more accurate and comprehensive view of the total cost of goods that are received. By helping you gain more visibility into the expenses that are associated with your purchases and transportation, this functionality allows for better cost analysis and management. Learn more in Show landed costs in the accounting distribution of product receipts. As of Supply Chain Management version 10.0.41, this feature is turned on by default.
Feature name: *Specify Goods In Transit Order when receiving via mobile device* **Version required:** 10.0.35 or later	This feature for the **Landed cost** module enables workers to select a specific goods-in-transit order for receiving when multiple goods-in-transit orders exist for the same voyage, container, item number, and purchase order number. Learn more in Specify goods-in-transit orders when receiving with a mobile device. As of Supply Chain Management version 10.0.41, this feature is turned on by default. As of version 10.0.43, it's mandatory and can't be turned off.
Feature name: *Split Goods In Transit Order quantity and assign batch/serial number when receiving via mobile device.*	This feature for the **Landed cost** module lets workers who use a mobile device assign multiple batch/serial numbers for different quantities of goods that are received from goods-in-transit orders. During the receiving process, all assigned batch/serial numbers are consolidated into one work record and processed together. Learn more in Assign batch/serial numbers when receiving with a mobile device.

Feature name and requirements	Feature description
Version required: 10.0.35 or later	As of Supply Chain Management version 10.0.41, this feature is turned on by default.
Feature name: *Match vendor invoice journal with voyage cost in different currency.* **Version required:** 10.0.36 or later	This feature for the **Landed cost** module lets users specify a currency code on the vendor invoice journal and match it with voyage cost in another currency. As of Supply Chain Management version 10.0.41, this feature is turned on by default. As of version 10.0.43, it's mandatory and can't be turned off.
Feature name: *Enable Quality Control for Goods In-Transit Order.* **Version required:** 10.0.41 or later	This feature enables organization to initiate and run quality checks against goods-in-transit orders. This proactive approach enables discrepancies or defects that might occur during transportation to be detected early, thereby ensuring that only products that meet predefined quality standards can proceed to their final destination. Learn more in Quality orders.

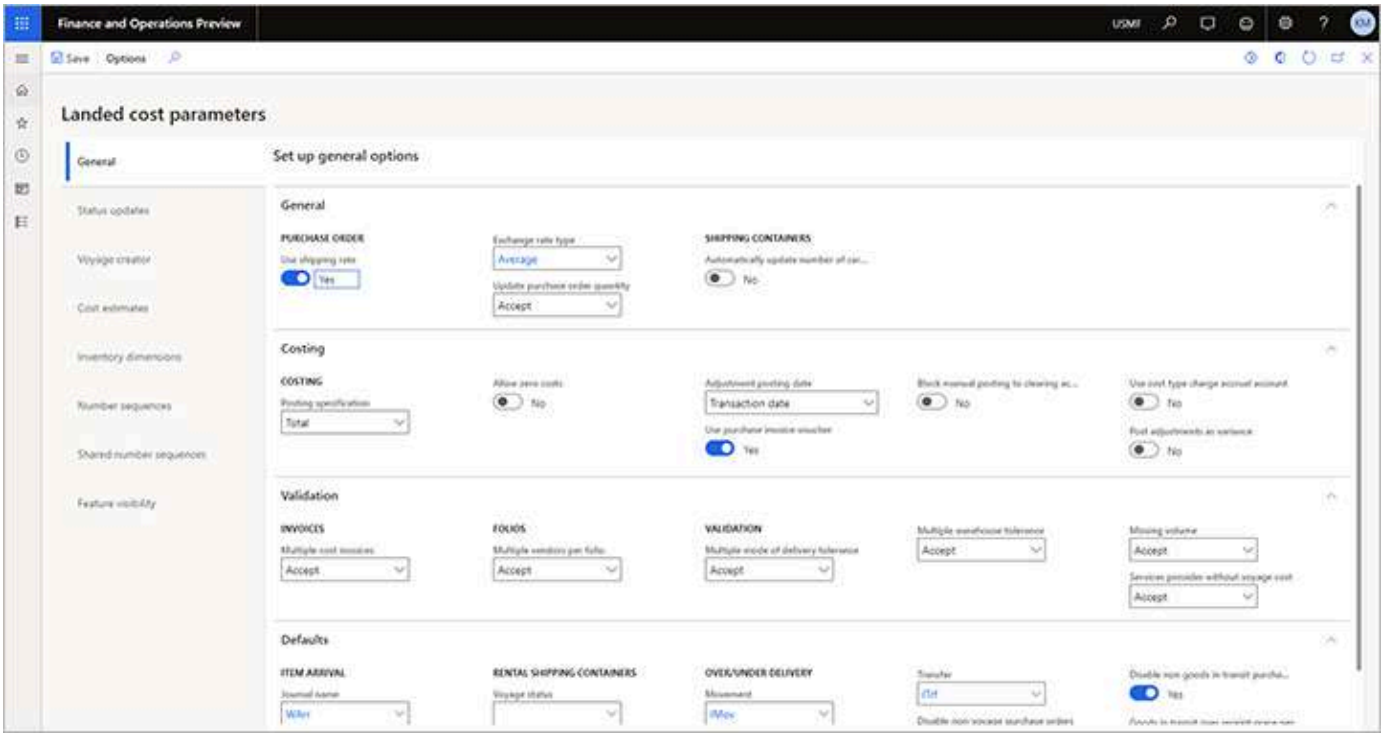
Last updated on 11/26/2025

Landed cost parameters setup

You use the **Landed cost parameters** page to set up general information and configuration settings used across the **Landed cost** module for posting, status updates, number sequences, and behavior. The parameter setup is shared across legal entities, and an administrator can modify it.

Open the Landed cost parameters page

To work with the parameters, go to **Landed cost** > **Setup** > **Landed cost parameters**, and then set the fields as described in the following subsections.



General tab

General FastTab

The following table describes the fields that are available on the **General** FastTab of the **General** tab of the **Landed cost parameters** page.

Expand table

Setting	Description
Use shipping rate	A shipping rate is set for a defined period and estimates costs of goods that use multiple currencies. Set this option to *Yes* to use a shipping rate.

Setting	Description
Exchange rate type	The default collection of exchange rates used for multi-currency calculations for a voyage and voyage costs.
Update purchase order quantity	Select what occurs if a user changes the quantity on a purchase order line: • *Accept* – The voyage quantity is automatically adjusted. • *Warning* – If the line is attached to a voyage, a warning is shown, but the voyage quantity is updated. • *Error* – If the line is attached to a voyage, an error message is shown, and the purchase order can't be updated. Therefore, the order line must first be removed from the voyage.
Automatically update number of cartons	If set to *Yes*, units are automatically updated on each voyage line.

Costing FastTab

The following table describes the fields that are available on the **Costing** FastTab of the **General** tab of the **Landed cost parameters** page.

Expand table

Setting	Description
Posting specification	Select the value adjustment in the ledger: • *Total* – A total figure is posted to the ledger. • *Item group* – The adjustment is specified per item group. • *Item number* – The adjustment is specified per item. This value provides the most detail.
Allow zero costs	Set this option to *No* to show an error if a user tries to post a cost estimate for a voyage invoice or purchase order that doesn't include a value for the expected voyage cost. The error message states that a cost of 0 (zero) can't be allocated, and invoice posting will fail. In this case, the user can manually update the estimate (or reconfigure the auto cost), and then either pull in the updated value or delete the cost if it doesn't apply. Set this option to *Yes* to allow the voyage cost to be blank. In this case, a price of 0 (zero) is allocated according to the cost area. A vendor cost invoice can then be processed against the zero-price cost when the voyage is received. Configure the estimate on the auto cost record to prevent a zero-price cost from appearing. Although this estimate isn't completely accurate, it should still be more accurate than an assumed zero cost.

Setting	Description
Adjustment posting date	When you post an Accounts payable voyage cost invoice, the settlements table (inventory adjustments) is also updated. Select the date that is set by default on the **Select voyage costs** page while you're in the invoice journal: • *Transaction date* – Use the date of the journal (posting date). • *Purchase order invoice date* – Use the financial posting date of the stock (purchase order) invoice. • *Selected date* – The user can specify a posting date. Although the date can be left blank, if it's still blank when the cost invoice is posted, the user receives an error.
Use purchase invoice voucher	When this option is set to *Yes*, cost accrual transactions use the same voucher number that is used for the purchase invoice. When it's set to *No*, the system uses the next available number for the **Costs accrual voucher** number sequence that is set up on the **Number sequences** tab of the **Landed cost parameters** page. This option has an effect only when the **Post to charge account in ledger** option is set to *Yes* on the **Invoice** tab of the **Accounts payable parameters** page.
Block manual posting to clearing account	Set this option to *Yes* to prevent posting to clearing accounts where the transaction hasn't been linked to a voyage by selecting **Functions** > **Select voyage costs** on the Action Pane of the vendor invoice journal. Set this option to *Yes* so that the voyage and clearing account are correctly settled.
Use cost type charge accrual account	When this option is set to *Yes*, the charge accrual account configured for the relevant cost type code on the **Cost type codes** page is used to accrue costs as an expense. This option has an effect only when the **Post to charge account in ledger** option is set to *Yes* on the **Invoice** tab of the **Accounts payable parameters** page.
Post adjustments as variance	When this option is set to *Yes*, it overrides the standard functionality and forces the inventory adjustment transactions that are related to variances between estimated costs and actual costs to be posted to a variance account. When this option is set to *No*, the inventory adjustment transactions that are related to variances are handled based on the configuration of the costing method and cost type code. For standard cost, variances are still posted to the variance account. For moving average, variances are posted either to the variance account or to inventory. This option has an effect only when the **Post to charge account in ledger** option is set to *Yes* on the **Invoice** tab of the **Accounts payable parameters** page.
Use cost type credit ledger account for clearing	Use this parameter to control which clearing type and account are used for landed cost posting. If set to *No*, landed cost posting always uses the landed cost clearing type and account. If set to *Yes*, landed cost posting uses the specified posting type and account value on the cost type code when **Credit type** is set to *Ledger Account*.

Validation FastTab

The following table describes the fields that are available on the **Validation** FastTab of the **General** tab of the **Landed cost parameters** page.

Expand table

Setting	Description
Multiple cost invoices	Select what occurs if more than one invoice is processed against a voyage, folio, or container for the same miscellaneous charge. • *Accept* – The system should allow multiple cost invoices. • *Warning* – A warning is shown. • *Error* – An error message is shown.
Multiple vendors per folio	Select what occurs if more than one vendor's purchase orders are added to a folio. • *Accept* – The system should allow the action. • *Warning* – A warning is shown, but the action can still be performed. • *Error* – An error message is shown, and the action is prevented. Your customs broker or local laws might mandate a specific value for this field.
Multiple mode of delivery tolerance	Select what occurs if goods from a purchase order that uses a different mode of delivery than the voyage are added to that voyage. • *Accept* – The system should allow the action. • *Warning* – A warning is shown, but the action can still be performed. • *Error* – An error message is shown, and the action is prevented.
Multiple warehouse tolerance	Select what occurs if a voyage includes several order lines that must be delivered to different warehouses. These order lines might be spread across one or more purchase orders. • *Accept* – The system should allow the action. • *Warning* – A warning is shown. • *Error* – An error message is shown.
Missing volume	Select what occurs if a user adds an item without a volume to a voyage. • *Accept* – The system should accept the item. • *Warning* – A warning is shown. • *Error* – An error message is shown. If volumes are used to calculate and apportion costs, select either *Warning* or *Error*.
Services provider without voyage cost	Select what occurs if a user tries to process an invoice for a service provider that hasn't been linked to a voyage. • *Accept* – The system should allow the action. • *Warning* – A warning is shown. • *Error* – An error message is shown. Select *Warning*.

Defaults FastTab

The following table describes the fields that are available on the **Defaults** FastTab of the **General** tab of the **Landed cost parameters** page.

Expand table

Setting	Description
Journal name	Select the default journal that the *Create arrival journal* function uses.
Voyage status	Select the status that a voyage must have before users can set up a rental shipping container for it in the system. This action typically occurs when the goods are in transit or at the dock.
Journey template	Select the default journey template to use for new rental shipping containers. You'll typically select a journey template that includes rental costs.
Movement	If the over/under quantity for a delivery is within the defined tolerance, a movement journal is automatically processed. Select the default movement journal to use. The **Offset account** field for the selected movement journal name must have a value.
Transfer	When an under-delivery is processed, the short-receipt quantity is transferred to an under-delivery warehouse. Select the default transfer journal to use.
Disable non-voyage purchase orders	Turn off the Landed cost over/under delivery functionality for purchase orders that aren't attached to a voyage.
Disable non goods in transit purchase orders	Turn off the Landed cost over/under delivery functionality for purchase orders that don't use goods in transit functionality.
Goods in transit over receipt grace period	Specify the number of days after the first receipt of a shipping container that additional over-receipts can still be completed for that shipping container.

Status updates tab

The system uses status values to indicate the status of each voyage. Voyage status values can be applied automatically to voyages via voyage tracking or periodic batch jobs. Alternatively, you can apply them manually by opening the voyage and selecting a status in the **Voyage update** group on the **Manage** tab of the Action Pane.

You can create as many voyage status values as you want. However, you must define four of them for a special purpose on the **Status updates** tab of the **Landed cost parameters** page. The following table describes the fields that are available there.

Expand table

Setting	Description
Costed	Select the voyage status that identifies that a voyage has been finalized.
In transit	Select the voyage status that identifies that a voyage is in transit.
Ready for costing	Select the voyage status that identifies that a voyage is ready for costing. This status is used when all stock purchase invoices and voyage cost invoices where the **Credit on the voyage cost** field is set to *Vendor* have been processed for the voyage. Voyages that fail the costed process have a status of *Ready for costing*.
Pre-costed	Select the voyage status that identifies that a voyage is being pre-costed. This status is used when a new cost transaction is added to a voyage after it has already been costed. New cost transactions might be added to a previously costed voyage when a second freight invoice or unexpected demurrage charge is received. This status is automatically applied when a new voyage cost is added to a costed voyage.

Voyage creator tab

The following table describes the sections on the **Voyage creator** tab of the **Landed cost parameters** page.

Expand table

Section	Description
Voyage Editor	The **Voyage Editor** section was added in Supply Chain Management version 10.0.39. It provides the following new settings: • **Generate data manually** – When this option is set to *Yes*, data shown on the **Voyage editor** page isn't updated automatically each time you change a filter value. Instead, you can change several filter values before updating the page manually, which improves page performance and user experience. • **Keep the auto-generated tracking dimension number while splitting source order line** – When this option is set to *Yes*, the system preserves the autogenerated tracking dimension number after splitting a source order line. When this option is set to *No*, the system generates a new tracking dimension number after splitting a source order line. • **Allow creating voyage in batch** – When this option is set to *Yes*, the system can use batch mode to create and update shipping containers. Creating and updating shipping containers in batch mode helps improve system performance when working with shipping containers that have many shipping lines.
Tolerances	The **Outside volume tolerance** and **Outside weight tolerance** fields define thresholds above which goods are considered over-volume and overweight. When a user adds goods on the **Voyage editor** page, if the volume or weight exceeds the value that you set here, the system shows a warning. The value of each field is expressed as a percentage of the maximum volume

Section	Description
	or weight that is set for the relevant shipping container type. Set the value between 5 and 10 percent of the maximum volume or weight. Setting these tolerances to zero means that the total weight and volume of items in lines added to the shipping container must match the values of the container type exactly. To skip the tolerance check, set the maximum volume and weight values to very large values.
Folio creation setup	The system can create multiple folios during the voyage creation process. Use this section to define when a new folio should be created. For each row in this section, the system checks the specified table and field and creates a folio for each unique field value.

Cost estimates tab

The **Cost estimates** tab of the **Landed cost parameters** page provides just one field: **Default costing version**. This field applies only when the costing method is *Standard costing*. Select the default costing version to use for the *Item cost price update* periodic task. You might have to change this setting every time that a new financial year begins.

Inventory dimensions tab

You use the **Inventory dimensions** tab of the **Landed cost parameters** page to control which available inventory dimensions show by default on each Landed cost page where dimensions are used.

Select a dimension, and then set the **Voyage lines**, **Goods in transit**, and/or **Cost estimates** option to *Yes* for each page where that dimension should appear by default. Repeat this step for other dimensions, as required.

The settings on this tab establish the default dimensions for each designated page across legal entities. However, users who are working on one of the designated pages can override the default dimensions by selecting **Inventory** > **Display dimensions** on the Action Pane.

Number sequences tab

The **Number sequences** tab of the **Landed cost parameters** page lists each type of reference number sequence that Landed cost requires, but that isn't shared across legal entities. For each reference in the list, select a number sequence code.

Shared number sequences tab

The **Shared number sequences** tab of the **Landed cost parameters** page lists each type of reference number sequence that is shared across legal entities for Landed cost. Currently, there's just one number sequence in the list. This number sequence is used for the voyage ID.

Feature visibility tab

Landed cost adds features (fields and functions) to several frequently used pages in Microsoft Dynamics 365 Supply Chain Management. These pages include pages that are related to vendor master data, released products, purchase orders, transfer orders, and warehouse setup. If you're using Landed cost, you must make those features visible everywhere before you can benefit from them. If you aren't using Landed cost, you can hide the features to keep them out of the way.

On the **Feature visibility** tab of the **Landed cost parameters** page, set the **Activate** option to *Yes* to make Landed cost features visible wherever they're available. Set it to *No* to hide the features on common pages outside Landed cost. However, even when the option is set to *No*, the module itself, including the **Landed cost parameters** page, will remain available to users who have the correct permissions to access it.

Last updated on 06/22/2026

Voyage status setup

09/19/2025

On the **Voyage statuses** page, you set up the status values that users can assign to voyages. Users can assign voyage status values to all levels of a voyage: voyage, shipping container, folio, purchase order, and item (purchase lines and transfer order lines). You can use these statuses for two purposes:

- Inform the user about the status of the voyage, shipping container, folio, purchase order, or item (purchase lines and transfer order lines).
- Limit the use of the cost area by preventing modification or deletion.

To set up your voyage statuses, go to **Landed cost** > **Setup** > **Voyage statuses**. You can add, remove, and edit statuses by using the buttons on the Action Pane.

Each cost area has its own set and hierarchy of voyage statuses. Therefore, on the **Voyage statuses** page, in the **Cost area** field, first select the cost area that you want to view or create voyage statuses for. Then, for each voyage status, set the fields that are described in the following table, as required. The status of a voyage can also change automatically by system events, such as rules that you establish by using the tracking control center.

Expand table

Field	Description
Voyage status	Enter the name of the voyage status.
Description	Enter a description of the voyage status.
Modify	Select this check box if users are allowed to modify voyages that have this status.
Delete	Select this check box if users are allowed to delete voyages that have this status.
Mandatory	Select this check box to make the voyage status mandatory, so that it can't be skipped.
Parent	Use this field to establish a hierarchy among the status values. You can only change voyage statuses (either manually or automatically) downward in the hierarchy, from a parent status to one of its child statuses.

Note

Set up only the specific voyage statuses that your organization uses. Typical voyage statuses include *Confirmed*, *Goods in transit*, *Received*, *Ready for costing*, and *Costed*. However, other statuses might be present.

Shipping container setup

09/19/2025

This article describes how to set up shipping containers for the **Landed cost** module.

Set up shipping container types

Shipping container types define the types of shipping containers that you can use during shipping and voyages.

To work with the shipping container types, go to **Landed cost** > **Containers setup** > **Shipping container types**. You can view, add, and remove records for your container types. The following table describes the fields that are available for each record.

Expand table

Field	Description
Shipping container type	Enter a unique identification name or number for the shipping container type.
Description	Enter a description of the shipping container type.
Volume	Enter the maximum volume for shipping containers of this type.
Weight	Enter the maximum weight for shipping containers of this type.
Returnable	Specify whether shipping containers of this type can be returned to the vendor after they're used during a voyage. If you set this option to *Yes*, additional costs might apply for the return of shipping containers of this type to the port of origin.

Set up shipping containers

Use shipping container records to identify each container that you use during voyages. When you create a voyage, you can select a specific container for it from the list of all the shipping container records that you define. This feature is especially useful if your company owns its own shipping containers.

You don't need to enter shipping container numbers for shipping containers that you use only one time. Instead, you can add the shipping container number when you create a voyage.

Shipping container records are used only in Landed cost. They aren't available in the standard **Transportation management** module (TMS).

To work with shipping containers, go to **Landed cost** > **Containers setup** > **Shipping containers**. There, you can view, add, and remove records for your shipping containers. The following table describes the fields that are available for each record.

Expand table

Field	Description
Shipping container	Enter a unique identification name or number for the shipping container.
Shipping container type	Select the type of shipping container. Learn more in the Set up shipping container types section earlier in this article.

> **Note**
>
> - The shipping container setup is optional. Typically, you'll use it only if your company owns its own shipping containers or often reuses the same shipping containers.
> - No check digits are calculated for shipping container numbers.

Set up unit types

Unit types provide extra groupings and identification methods for shipping containers. Use the unit type to identify the type of container that goods are packaged in, such as pallets or drums. Select a unit type when you set up a container on the **All shipping containers** page.

Unit types are used only in Landed cost. They aren't available in TMS.

To work with unit types, go to **Landed cost** > **Containers setup** > **Unit types**. You can view, add, and remove records for your unit types. The following table describes the fields that are available for each record.

Expand table

Field	Description
Unit type	Enter a unique identification name or number for the unit type.
Description	Enter a description of the unit type.

Set up refrigeration types

Refrigeration types provide extra groupings and identification methods for shipping containers, usually refrigerated containers. Select a refrigeration type when you set up a container on the **All shipping containers** page.

To work with refrigeration types, go to **Landed cost** > **Containers setup** > **Refrigeration types**. You can view, add, and remove records for your refrigeration types. The following table describes the fields that are available for each record.

Expand table

Field	Description
Refrigeration type	Enter a unique identification name or number for the refrigeration type.
Description	Enter a description of the refrigeration type.

Delivery information setup

09/19/2025

This article describes how to set up delivery information for the **Landed cost** module.

Shipping ports

Shipping ports identify where goods are being shipped from and to. For each voyage, you define a "to" port and a "from" port, based on the journey that you select for the voyage vessel. Shipping ports build the legs of a journey and the voyage activities. Typically, you define them by using the name of the city and the country/region where the physical shipping port is located.

To work with shipping ports, go to **Landed cost** > **Delivery information setup** > **Shipping ports**. There, you can view, add, and remove records for your shipping ports. The following table describes the fields that are available for each record.

Expand table

Field	Description
Shipping port	Enter a unique identification name or number for the shipping port.
Description	Enter a description of the shipping port.

Tracking control center

Use the Tracking control center to set up the lead times, status updates, and flow of information that is associated with a voyage as the shipping containers move from one leg to the next. When you create a tracking control record, you associate it with a specific leg of a journey for a voyage. When a voyage updates a leg, the associated record updates and fills in as defined. You can update tracking information for individual voyages from the **All voyages** page.

To open the Tracking control center, go to **Landed cost** > **Delivery information setup** > **Tracking control center**.

The Tracking control center shows one of three page views, depending on the value that you select in the **Create type** field in the list pane: *Blank*, *Lead time*, or *Status update*. Each create type updates a different set of information that is associated with the progress of a voyage from the point of origin to the final destination.

Common rule settings

The following table shows the fields that are available for all three create types in the Tracking control center.

Expand table

Field	Description
Source table, Source field	These fields identify a source table and field in the database. The rule loads the value in the field and then uses it in the way that other settings of the rule define.
Target table, Target field	These fields identify a destination table and field in the database. The rule loads the value in the field and then uses it (or overwrites it) in the way that other settings of the rule define.
Activity	This field identifies the type of activity that the rule applies to a shipping container that matches the rule.
Matching criteria	This field determines how the system identifies a match for a rule. In each instance, the system reviews the data in the source and destination tables to determine whether and when a field should be updated in the target table. For example, the source table is *Voyages*, and the target table is *Purchase header* or *Purchase lines*. The *Voyages* table has a **From port** value of *Hong Kong Special Administrative Region*, and the *Purchase header* table has a **From port** value of *Shanghai*. A rule is then created that has *Hong Kong Special Administrative Region* as the "from" port. In this case, the values of the **Matching criteria** field work in the following way: • **Both** – The target field isn't updated, because one of the two ports doesn't match. • **Source** – The target field is updated, because the source table's "from" port is *Hong Kong Special Administrative Region*. • **Target** – The target field isn't updated, because the destination table's "from" port is *Shanghai* (not *Hong Kong Special Administrative Region*).
Copy action	The available values are *Copy* and *Default*. Select *Copy* to copy the value in the source field to the destination field. Select *Default* to set a static value for the destination field.
Default	When the **Copy action** field is set to *Default*, the **Default** field defines the default value of the destination field. For example, if the action is related to a port update, and the **Copy action** field is set to *Default*, the **Default** field identifies a port.
Leg	This field identifies the leg of the journey that the specified action occurs for, such as loading or customs.
Service provider	If a specific service provider is used for the current status update/leg of the journey, this field identifies the service provider. Service providers are defined in the vendor account.

Lead time rules

Lead time is the estimated time that a voyage needs to complete a defined leg of a journey. The lead time for each leg of a journey helps calculate the estimated delivery date for the voyage. Enter this date in the **Confirmed delivery date** field on every purchase line in the voyage.

Use lead time rules to manage date updates. When you use a journey template for a voyage, activities are automatically generated.

To add a lead time rule to the Tracking control center, follow these steps.

1. Follow one of these steps:

    - Go to **Landed cost** > **Multi-leg journey setup** > **Legs**. Select the leg that you want to set up lead times for. On the Action Pane, select **Tracking control center**. The Tracking control center is preloaded with information about the selected leg.
    - Go to **Landed cost** > **Delivery information setup** > **Tracking control center**. You must then manually select a leg in step 4 of this procedure.

2. In the list pane, set the **Create type** field to *Lead time*.

3. On the Action Pane, select **New**.

4. If you started from the Tracking control center in step 1, set the **Leg** field to the leg that you want to create a lead time rule for. If you started from the **Legs** page, the **Leg** field is preset to the leg that you selected before you opened the Tracking control center.

    Based on the value of the **Leg** field, several fields are automatically set, as shown here:

    - **Source table:** *Container activities*
    - **Source field:** *Start date*
    - **Target table:** *Container activities*
    - **Target field:** *Estimated end date*

5. In the **Activity** field, select the activity that the current rule should apply to.

6. In the **Lead time** field, enter the lead time (in days) that should be applied when the current rule is triggered.

Status update rules

Records where the **Create type** field is set to *Status update* update the status of purchase order lines, or the status at the voyage, shipping container, or folio level. You can set the statuses

independently. Use them to inform the user or department about the stage of a voyage (such as documents received or goods in transit).

When you set the **Create type** field to *Status update*, the Tracking control center includes a **Lines** FastTab where you can define a cost area and the updated status of the voyage. For example, you have a line where the **Cost area** field is set to *Container*, and the **Voyage status** field is set to *Goods in transit*. In this case, when an order completes the specified leg, the **Voyage status** field of the shipping container updates to *Goods in Transit*.

Status updates provide the status of a voyage throughout the voyage lines and purchase order lines that are associated with that voyage. As a voyage moves through its journey from the port, sailing, and customs, to the destination warehouse, the **Voyage status** field of the voyage record provides a quick view of the stage that the items are at.

To add a status update rule to the Tracking control center, follow these steps.

1. Follow one of these steps:

    - Go to **Landed cost** > **Multi-leg journey setup** > **Legs**. Select the leg that you want to set up a status update for, and then, on the Action Pane, select **Tracking control center**. The Tracking control center is preloaded with information about the selected leg.
    - Go to **Landed cost** > **Delivery information setup** > **Tracking control center**. You must then manually select a leg in step 4 of this procedure.

2. In the list pane, set the **Create type** field to *Status update*.

3. On the Action Pane, select **New**.

4. If you started from the Tracking control center in step 1, set the **Leg** field to the leg that you want to create a status update rule for. If you started from the **Legs** page, the **Leg** field is preset to the leg that you selected before you opened the Tracking control center.

    Based on the value of the **Leg** field, several fields are automatically set, as shown here:

    - **Source table:** *Container activities*
    - **Source field:** *Actual end date*
    - **Target table:** This field is left blank.
    - **Target field:** This field is left blank.

5. In the **Activity** field, select the activity that your rule should apply to.

6. On the **Lines** FastTab, enter the status updates for each cost area.

Blank type rules

You use records that have a **Create type** value of *Blank* to override or enter a field value, based on the data of another field. A field from Landed cost will overwrite data in other areas of Microsoft Dynamics 365 Supply Chain Management, based on rules that are set up in the Tracking control center.

1. Go to **Landed cost** > **Delivery information setup** > **Tracking control center**.
2. In the list pane, set the **Create type** field to *Blank*.
3. On the Action Pane, select **New**.
4. Define the source and destination values, matching criteria, copy action, and other relevant parameters, as required for your rule.

Required tracking control setup

For every journey template, two records must be set up in the Tracking control center. Both these records have a **Create type** value of *Blank* and are used in all Landed cost implementations. They help ensure that the purchase confirmed date and goods in transit expected dates are updated for voyages and on related purchase order lines in the expected way.

The first record is required to update purchase lines. It must have the following settings:

- **Source table:** *Container activities*
- **Source field:** *Estimated end date*
- **Target table:** *Purchase lines*
- **Target field:** *Confirmed or delivery date*

The second record is required to update goods in transit transactions. It must have the following settings:

- **Source table:** *Container activities*
- **Source field:** *Estimated end date*
- **Target table:** *Goods in transit order*
- **Target field:** *Expected date*

Multi-leg journey setup

Article • 07/30/2024

This article describes how to set up multi-leg journeys for the **Landed cost** module.

Legs

Legs are used to identify separate parts of a journey. Each leg is built by selecting the "to" and "from" shipping ports, and the transportation method that is used for that leg. Lead times can be associated with each leg. Lead times can help track a shipment and can also be used to calculate the estimated delivery date of the goods on a voyage. Additionally, when a leg of a journey is completed, the status of the voyage, shipping container, and associated purchase order lines can be updated through the tracking control setup. Legs can be used by a single journey template, or they can be reused by multiple journey templates. Container loading, customs, and local transport are generally set up as legs, and a nonspecific shipping port is used for them.

To work with legs, go to **Landed cost** > **Multi-leg journey setup** > **Legs**. There, you can view, open, create, and delete records for legs. The following table describes the fields that are available for each record.

Expand table

Field	Description
Leg	Enter a unique identification name/number for the journey leg.
Description	Enter a description of the journey leg. Typically, this description identifies the "to" and "from" ports, or the step of the journey.
From port	Enter the point of origin of the goods on the leg.
To port	Enter the point of destination of the goods on the leg.
Delivery method	Enter the method of transport for the leg.

Journey templates

A journey template defines the multi-leg journey between two ports that goods travel during a voyage. The legs of the journey are combined to identify the amount of time that will be required for goods to travel from the vendor's point of origin to the final

warehouse destination. When the legs are put on the journey template in a specific order, the lead times will identify the date of each leg and status of the voyage, container, and purchase lines for the voyage. You use the Tracking control center to set up the lead times that are associated with each leg that makes up the journey template. The journey template is also used when the automatic costs of a voyage are set up. When a journey is defined, the cost that is associated with the transport of the goods can be defined on the auto costs page.

To work with journey templates, go to **Landed cost** > **Multi-leg journey setup** > **Journey templates**. There, you can view, open, create, and delete journey templates.

For each journey template, set the following fields on the header.

Expand table

Field	Description
Journey template	Enter a unique identification name/number for the journey template. The journey template typically describes the point of origin and point of destination for the journey.
Description	Enter a description of the journey template. The description typically indicates the "to" and "from" ports, and the type of travel.

In the **Lines** section, add a line for each leg of the journey, and put the lines in order. Use the **Up** and **Down** arrows on the toolbar to change the order of the lines. The following table describes the fields that are available for each line.

Expand table

Field	Description
Leg	Select a leg to add to the journey.
Description	The description of the leg.
From port	The port that is the point of origin of the goods on the leg. This port is the "to" port that is used to determine the auto costs for a voyage.
To port	The final destination port of the goods on the leg.
Mode of delivery	The mode of delivery that is used for the leg.
Journey from port	If the port that is specified for the leg is used to determine the auto costs, select this check box to identify it as the "journey from" port. This port will be shown on the voyage header.

Field	Description
Journey to port	If the port that is specified for the leg is used to determine the auto costs, select this check box to identify it as the "journey to" port. This port will be shown on the voyage header.
Shipping company	Select the shipping company that is used for the leg.

Activities

The settings on the **Activities** page establish the types of activities that can occur at the destination port of a leg. Users who work on the **All shipping containers** page can select among these values when they estimate the duration of each activity and record the actual duration for comparison purposes.

To set up your activities, go to **Landed cost** > **Multi-leg journeys setup** > **Activities**. There, you can add, remove, and edit activities by using the buttons on the Action Pane.

The following table describes the fields that are available for each activity in the grid.

Expand table

Field	Description
Activity	The name of the activity.
Description	A description of the activity.
Shipping company	The vendor account of the shipping company that is associated with the activity.

Shipping information setup

09/19/2025

This article describes how to set up shipping information for the **Landed cost** module.

Description of goods

Descriptions of goods help identify a voyage, shipping container, or folio of goods, and the goods in it. You can select a description of goods on the shipping container header or the folio header.

To work with descriptions of goods, go to **Landed cost** > **Shipping information setup** > **Description of goods**. There, you can view, open, create, and delete records for descriptions of goods. The following table describes the fields that are available for each record.

Expand table

Field	Description
Description of goods	Enter a unique identification name or number for the type of goods that use this description.
Description	Enter a description of the type of goods in this category.

Vessels

A vessel is the unique name of a ship or vessel that a shipping company or agency uses. When you create a voyage, you must always either select or enter a vessel for it. If you often use the same vessels, you can make it faster and easier to create a new voyage by creating a vessel record for each of them. This approach lets users select the vessel from a list rather than enter the name or number manually each time.

To work with vessels, go to **Landed cost** > **Shipping information setup** > **Vessels**. There, you can view, open, create, and delete records for vessels. The following table describes the fields that are available for each record.

Expand table

Field	Description
Vessel	Enter a unique identification name or number for the ship that transports goods on a voyage.

Field	Description
Description	Enter a description of the vessel. Typically, this description identifies the name of the ship and the shipping company or agent.
Mode of delivery	Select the mode of delivery that the vessel uses, such as *Air*, *Ocean*, or *Train*.

Exporters

Each exporter record identifies a vendor or exporter that you can define as the vendor for a voyage. You can associate the exporter with a voyage and use it for reporting.

To work with exporters, go to **Landed cost** > **Shipping information setup** > **Exporters**. There, you can view, open, create, and delete records for exporters. The following table describes the fields that are available for each record.

Expand table

Field	Description
Exporter	Enter a unique identification name or number for the exporter of goods that are transported on a voyage.
Description	Enter a description of the exporter. Typically, this description identifies the full name of the shipping company or agent.

Commodity codes

Use commodity codes to help with customs identification and the calculation of duty rates for goods. You can select commodity codes on the **Released products** page. Use commodity codes for reporting.

To work with commodity codes, go to **Landed cost** > **Shipping information setup** > **Commodity codes**. There, you can view, open, create, and delete records for commodity codes. The following table describes the fields that are available for each record.

Expand table

Field	Description
Commodity code	Enter a unique code for this type of commodity.
Description	Enter a description of the commodity type.

Customs description

Customs descriptions help identify goods for customs purposes. You can select a customs description on the **Released products** page or on purchase order lines.

To work with customs descriptions, go to **Landed cost** > **Shipping information setup** > **Customs description**. There, you can view, open, create, and delete records for customs descriptions. The following table describes the fields that are available for each record.

Expand table

Field	Description
Customs description	Enter a unique code for this type of customs classification. Often, this code is the official description that a customs authority provides for the description and qualitative value of the goods.
Description	Enter a description of the customs classification.

Auto costs setup

Use the **Auto costs** page to set up cost rules for various cost areas, such as voyages, shipping containers, folios, purchase orders, items, or transfer order lines. Based on these rules and the fields users select when they create records for one of the cost areas, the system calculates the costs and automatically adds them. Therefore, users don't have to manually add the costs.

To work with auto costs, go to **Landed cost** > **Costing setup** > **Auto costs**. Then set up your auto cost rules as described in the rest of this article.

Work with cost areas

Auto costs work like trade agreements or auto miscellaneous charges. Each auto cost record belongs to a specific cost level. Use the **Cost area** field in the list pane of the **Auto costs** page to select the cost area that you want to work with. The list pane shows only auto costs that belong to the currently selected cost area. Any auto cost that you create belongs to the currently selected cost area.

Cost areas enable the system to apportion costs across the purchase order lines in a cost area. For example, a cost for one shipping container apportions the value to all the products in that shipping container. If there are two or more shipping containers, the same cost type can be specified for each shipping container. Therefore, the container type can be used to find the correct auto cost.

Buttons on the Action Pane

The following table describes the buttons that are available on the Action Pane of the **Auto costs** page.

Expand table

Button	Description
Edit	Edit an existing auto cost.
New	Create an auto cost.
Delete	Delete an auto cost.

Button	Description
Copy from	Create a new auto cost record that's based on an existing record. You can then freely edit the new record. This button helps you quickly create new auto costs.
Display dimensions	Open a dialog box where you can select the inventory dimensions that are shown for the cost transactions that you view. If you clear check boxes, fewer inventory dimensions are shown for the cost transactions. Therefore, less detail is shown for the transaction. If an inventory dimension is specified for an auto cost, the auto cost applies only when the specified inventory dimension is used for the item on a voyage.

Settings on the header

The combination of settings in the header section determines when and how a specific auto cost is added to a voyage. An auto cost is applied to a voyage, shipping container, or folio only when the details of the auto cost match the details on the header of that cost area. The sum of all matching auto costs determines the estimated landed cost of a voyage. This cost is apportioned across all the items on the vessel or voyage.

The following table describes all the fields that can appear in the header section. However, the specific fields that are available vary, depending on the currently selected cost area and display dimensions.

Expand table

Field	Description
Account code	Select one of the following values: • **Table** – The cost rule applies only to a specific vendor. • **Group** – The cost rule applies to a specific vendor group. The system looks for the vendor cost type group that is associated with the vendor record. • **All** – The cost rule applies to all vendors.
Shipping company	Select the vendor or vendor group that the cost rule applies to. This field is available only if you select *Table* or *Group* in the **Account code** field.
Customs broker	Select the vendor or vendor group that the cost rule applies to. This field is available only if you select *Table* or *Group* in the **Account code** field.

Field	Description
Item code	Select one of the following values: • **Table** – The cost rule applies only to a specific item. • **Group** – The cost rule applies to a specific item group. The system looks for the item cost type group that is associated with the item record. • **All** – The cost rule applies to all items.
Item relation	Select the item or item group that the cost rule applies to. This field is available only if you select *Table* or *Group* in the **Item code** field.
Mode of delivery	Select the mode of delivery (such as air or sea) that the cost rule applies to.
Container type	The type of shipping container that the goods are shipped in. An auto cost can be applied to a voyage only if the container type in the auto cost setup matches the container type of the voyage.
From port and **To port**	The source ("from") port and destination ("to") port of the voyage. (Some shipping containers might have different "to" ports, because the voyage might stop at multiple ports.) An auto cost can be applied to a voyage only if the "from" and "to" ports in the auto cost setup match the "from" and "to" ports of the voyage.
Auto cost number	The unique identifier of the auto cost rule. The value of this field is automatically generated based on the number sequence set up on the **Landed cost parameters** page.
Inventory dimensions	Some cost areas let you include one or more item dimensions on the header (such as size, color, warehouse, and batch number). Select **Display dimensions** on the Action Pane to select the dimensions that should be included.

Settings on the Lines FastTab

On the **Lines** FastTab, add a row for each currency that can be used when a cost is applied to a purchase order line on a voyage.

For items and purchase orders, the system matches the currency of each purchase order line against the currencies specified on the **Lines** FastTab. It applies only the cost value that is set for the matching line or item. If you don't set up a line for the currency of the line or item, the auto cost isn't applied to that line or item.

For other types of cost areas, all lines on the **Lines** FastTab apply to each voyage, shipping container, folio, or transfer order line that matches the values established on the header.

The following table describes all the fields that can appear on each line. However, the specific fields that are available vary, depending on the currently selected cost area.

Expand table

Field	Description
Currency	Select the currency that the line applies to. This currency is related to the purchase order. When the system tries to find the auto costs that should be applied to a voyage and its voyage lines, it selects the line that has the same currency as the purchase order. This field is available only when the **Cost area** field is set to *Purchase order* or *Item*.
Cost type code	The cost type.
Apportionment method	The method that is used to distribute costs to lines. The following options are available: • **Percent** – The value of the **Cost value** field is a percentage that applies to the total value of goods. For example, if the **Cost value** field is set to *10*, and the total value of goods is $800, the cost value is $80 (= $800 × 10 percent). • **Quantity** – The cost is apportioned based on the quantity of goods. • **Amount** – The cost is apportioned based on value of the goods. • **Volume** – The cost is apportioned based on the volume of goods. Volume is specified on the item master. • **Weight** – The cost is apportioned based on the weight of goods. Weight is specified on the item master. • **Volumetric** – The cost is apportioned based on the volumetric measurement of goods. • **Measurement** – This option enables a measurement to be specified in the **Landed cost** module. It's often used by organizations that don't know the individual volume or weight of the goods, but that require a more accurate apportionment than the **Amount** and **Quantity** options allow for. The freight forwarder or agent provides the organization with the weight or cubic measurement, at either the item level or the purchase order level. For example, sea freight equals $900. Item A has a weight of 800 kilograms (kg) and a volume of 2 cubic meters (m^3). Item B has a weight of 100 kg and a volume of 1 m^3. Here are the results when the costs are apportioned by weight: ◦ Item A = $800 ◦ Item B = $100 Here are the results when the costs are apportioned by volume: ◦ Item A = $600 ◦ Item B = $300 **Note:** When the **Apportionment method** field is set to *Measurement*, the system uses the measurements entered for both the cost area (the shipping container) and the lines. These measurements don't necessarily have to add up to the expected total. However, if you require that they add up to the expected total, you can do a check by using the statistics to review the total

Field	Description
	measurement. The measurement prompt setting and automatic update of the measurement at the shipment or container level are set on the voyage header.
From date	Specify the start of the date range for costing, if there's a range of dates. This date is the first date when the auto cost applies.
To date	Specify the end of the date range for costing, if there's a range of dates. This date is the last date when the auto cost applies.
Category	Select the method that should be used to calculate cost. The following options are available: • **Fixed** – Cost is apportioned based on the apportionment method. • **Pieces** – Cost is allocated per piece. Therefore, the apportionment method isn't used. • **Percent** – A percentage of the goods' value is added. Therefore, the apportionment method isn't used. • **Rate** – Select this option if there are quantity breakdowns. The **Apportionment method** field for the line must be set to *Measurement*.
Broken by quantity	Select this check box to make the **Quantity breaks** button available on the **Lines** FastTab. Quantity breaks enable the cost to be broken down and the different costs to vary, depending on the quantity on the purchase order line of the voyage. This functionality is often used when the mode of delivery is air. The **Category** field for the line must be set to *Rate*. The quantity pertains to the option that is selected in the **Apportionment method** field. The cost value is up to the quantity that is entered in the **Cost value** field. For example, quantities of 45–100 kg produce a charge of $6.00 per measurement (such as kg/m^3). Quantities that exceed 100 kg produce a charge of $5.50 per measurement (such as kg/m^3).
Cost value	Enter the value of the cost.
Cost currency code	Select the currency of the cost.
Item sales tax group	Select the tax code for the cost.
Minimum cost	This field applies only if the **Broken by quantity** check box is selected. If the measurement doesn't reach this value, the minimum value is selected, regardless of the costs that are specified on the **Quantity breaks** page. For example, quantities of 0–45 kg produce a charge of $6 per measurement (kg/$m^3$). Quantities of 46–100 kg produce a charge of $5.50 per measurement (kg/m^3). If 2 kg

Field	Description
	are shipped, the quantity break creates a cost value of $12. However, if the **Minimum cost** field is set to *$100*, the final cost is $100.
Aggregate	Select this check box to allow users to move this cost from the shipping container level to the voyage level. In this case, costs can automatically be calculated at the shipping container level. However, they can also be combined and apportioned across all items in all the containers on a voyage, instead of all items in the individual shipping containers.
Linked cost type	Link the current line to another line in the same auto cost record by specifying the **Cost type code** value of the line that you want to link to. This functionality is available only when **Category** field for the current line is set to *Percent*. When the current line is linked to another line, the cost of the current line is based on the cost of the other line. For example, freight is $1,000, and you want the fuel surcharge to be 10 percent of the freight cost. In this case, the line must have a **Category** value of *Percent*, a **Cost value** value of *10%*, and a **Linked cost type** value of *Freight*.
Value adjustment and **Adjustment amount**	Use these fields to adjust the value and amount for various percentage values. They're available only when the **Cost area** field is set to *Item*. Different costing can be set up for different components of an item. One component of an item might have a different cost percentage than the other components of that item. This approach is sometimes required to value a specific portion of the goods at different rates. For example, duty for a watch is calculated at two rates: one component of the watch has a 10-percent duty rate, and a second component has a 2-percent duty rate. In this case, costing is split between the two components. The cost is calculated for the item, but the cost value is adjusted by the value of the components that have the different cost category. The cost of the remaining components can then be calculated by using the amount that the previous calculation was adjusted by. For example, component A of the watch has a cost of $9.50 and a duty of 10 percent, and component B has a cost of $0.50 and a duty of 2 percent. Therefore, the total cost is $10.00. The first entry is for the 10-percent line. It uses the following values: • **Category:** *Percent* • **Cost value:** *10* • **Value adjusted:** *Adjust by* • **Adjusted value:** *-0.50* This setup specifies that the cost of the item ($10) must be reduced by $0.50 (the price of component B) before a 10-percent duty charge is calculated. Therefore, 10 percent is applied to $9.50.

Field	Description
	The second entry is for the 2-percent line (the $0.50 that the previous entry was adjusted by). It uses the following values: • **Category:** *Percent* • **Cost value:** *2* • **Value adjusted:** *Use* • **Adjustment:** *0.50* This setup calculates the remaining duty that is payable on component B.

Costing parameter values setup

09/19/2025

When you set up the **Landed cost** module, you can define several sets of common values and related settings for each value. You can then use these values when you select specific types of costing parameter values in other parts of the app. This article explains how to set up these sets of values.

Set up cost type codes

Cost type codes determine the type of cost that you incur when goods arrive at the warehouse, or the landed costs of the voyage. Although they usually increase the value of the goods, you can also use them to accrue amounts into the ledger. Use ledger adjustments when you accrue a cost over time or during a series of voyages and offset it in a single transaction.

> **Note**
>
> If you share the cost type table across legal entities, you must also share the chart of accounts across legal entities. Otherwise, the posting transactions don't work correctly.

To set up your cost type codes, go to **Landed cost** > **Costing setup** > **Cost type codes**. Use the buttons on the Action Pane to create new cost type codes, edit existing codes, or delete a selected cost type.

The following table describes the fields that are available for each cost type code.

Expand table

Field	Description
Cost type code	Enter a name for the cost type code.
Description	Enter a description of the cost type code.
Use shipping rate	Set this option to *Yes* if the voyage exchange rate (sometimes referred to as a management rate) must be used to calculate the value of these costs. In this case, the shipping rate is used instead of the standard default or spot exchange rate to exchange foreign currency invoices.
Reporting category	This field establishes a reporting category for the cost type. You can print reports either by reporting categories or by cost type.

Field	Description
Debit type	Select whether the cost type should debit the item, the ledger account, or the vendor.
Debit posting	If you set the **Debit type** field to *Ledger account*, select the posting description.
Debit account	If you set the **Debit type** field to *Ledger account*, select the ledger account to use.
Credit type	Select whether this cost type should credit the item, the ledger account, or the vendor.
Credit posting	If you set the **Credit type** field to *Ledger account*, select the posting description.
Credit account	If you set the **Credit type** field to *Ledger account*, select the ledger account to use.
Clearing account	Select the clearing account for the cost type. Specify a separate clearing account per cost type to help with reconciliation.
Standard cost posting type	If you're using standard costing, select the posting description.
Standard cost variance account	If you're using standard costing, the account that you specify here is used to post any variance. This account uses the landed cost breakdown on the **Item prices** page. This breakdown is created by using the periodic routine to update prices. For example, the standard cost of an item is $15.00, the FOB is $13.00, and the freight is $2.00. When you receive the invoice for the stock, you receive the item at $15.00, but there's a standard price variance of $2.00 for the item, because the actual FOB is $13.00. This variance is posted to the standard price variance account that is set up in the item posting profile. Because the estimated freight is $2.00, there's no variance when the stock invoice is posted. However, when you receive the invoice for freight, the freight is $2.50 per unit. Therefore, a $0.50 variance is posted to the specified cost.
Moving average variance account	If you're using moving average costing, the account that you specify here is used to post any variance. For example, the estimated freight is $2.00. However, when you receive the invoice for freight, the freight is $2.50 per unit. Therefore, a $0.50 variance must be posted. When you set the **Post adjustments as variance** option to *Yes* on the **Landed cost parameters** page, all variances between estimated and actual shipment costs are posted to the moving average variance account that you specify here. When you set the **Post adjustments as variance** option to *No*, standard functionality is used, and the variance is applied either to inventory or to the moving average variance account that you specify here, depending on stock on hand.
Charge accrual account	Select the account that is used to accrue for cost estimates when the purchase invoice is posted. This field is used only when the **Use cost type charge accrual account** option is set to *Yes* on the **Costing** FastTab on the **General** tab of the **Landed cost parameters** page.

Field	Description
Charge account	Select the account that is used to capture the inbound transportation costs that a supplier invoiced. The amount is posted as a debit. The offset account is the stock variation account. This posting is used only when the **Post to charge account in ledger** option is set to *Yes* on the **Accounts payable parameters** page.
Variance account	The account that offsets the charge accruals when the purchase invoice is posted. This field is used only when the **Use cost type charge accrual account** option is set to *Yes* on the **Costing** FastTab on the **General** tab of the **Landed cost parameters** page.

Vendor cost type groups

Vendor cost type groups help determine how *auto cost* charges are found and applied to a voyage. Vendors that have similar import costs are linked together. For example, all vendors from emerging markets pay the same duty percentage for the same type of product that they purchase from an established market.

You can maintain vendor cost type groups by going to **Landed cost** > **Costing setup** > **Vendor cost type groups**. The **Vendor cost type groups** page provides a grid that lists all existing vendor cost type groups. You can use the buttons on the Action Pane to add, remove, and edit rows in the grid.

The following table describes the fields that are available on each row in the grid.

Expand table

Field	Description
Vendor cost type groups	Enter a unique name for the vendor cost type group, such as *Emerging markets*.
Description	Enter a description of the vendor cost type group. This description can provide details about the level or type of charge that is associated with the vendor group.

Item cost type groups

Item cost type groups help determine how *auto cost* charges are found and applied to a voyage. Similar items are linked together. For example, all items that have a duty rate of 5 percent might belong to a specific cost type group.

You can maintain item cost type groups by going to **Landed cost** > **Costing setup** > **Item cost type groups**. The **Item cost type groups** page provides a grid that lists all existing item cost

type groups. You can use the buttons on the Action Pane to add, remove, and edit rows in the grid.

The following table describes the fields that are available on each row in the grid.

Expand table

Field	Description
Item cost type groups	Enter a unique name for the item cost type group, such as *Duty 5%*.
Description	Enter a description of the item cost type group. This description can provide details about the level or type of charge that is associated with the item group.

> **Note**
>
> The item cost type links to the item through the **Cost type group** field on the **Purchase** FastTab of the item's **Released product** page.

Transfer order cost type groups

Transfer order cost type groups help determine how *auto cost* charges are found. Similar items are linked together. For example, all items that have a duty rate of 7 percent might belong to a specific cost type group.

You can maintain transfer order cost type groups by going to **Landed cost** > **Costing setup** > **Transfer order cost type groups**. The **Transfer order cost type groups** page provides a grid that lists all existing transfer order cost type groups. You can use the buttons on the Action Pane to add, remove, and edit rows in the grid.

The following table describes the settings that are available on each row in the grid.

Expand table

Field	Description
Transfer order cost type groups	Enter a unique name for the transfer order cost type group, such as *Duty 7%*.
Description	Enter a description of the transfer order cost type group. This description can provide details about the level or type of charge that is associated with the transfer order cost type group.

> **Note**
>
> The transfer order cost type links to the item through the **Transfer order cost group** field on the **Purchase** FastTab of the item's **Released product** page.

Cost templates

Use cost templates to set default values for settings that users who get the cost estimate might not know. Cost templates can help reduce complexity in the estimation process by minimizing the selections that users must make to get an accurate estimate.

To work with cost templates, go to **Landed cost** > **Costing setup** > **Cost templates**. On the **Cost templates** page, the list pane on the left shows all current cost templates. Use the buttons on the Action Pane to add, remove, and edit templates.

The following table describes the settings that are available for each template.

Expand table

Field	Description
Cost template	Enter a unique name for the cost template. The name typically describes the factor or cost multiplier for the template.
Description	Enter a description of the cost template.
Shipping company	Select the vendor account of the shipping company to associate with the cost template.
Mode of delivery	Select the mode of delivery that the cost template should use when the estimated cost of an item is calculated. This field helps determine the auto costs that are associated with the goods on the cost estimate.
Shipping container type	Select the type of shipping container type to associate with the cost template. This field helps determine the auto costs that are associated with the goods on the cost estimate.
Customs broker	Select the customs broker (vendor) to associate with the cost template. This field helps determine the auto costs that are associated with the cost estimate.
Factor	Enter a factor to apply to the final cost estimate of goods. For example, to add 10 percent to the calculated cost estimate, enter *1.10*.

Volumetric divisors

Use volumetric divisors to calculate the volumetric weight. Each shipping or freight company sets its own volumetric divisors. In addition, a company's divisors usually vary depending on the mode of delivery. For example, air and sea often have very different divisors. A company can also make its rules more complex depending on where it ships from. The system uses the following formula to find the volumetric weight: VolumetricWeight = Volume ÷ VolumetricDivisor.

For example, a package that you send by air has a volume of 3 cubic meters (m^3). The company charges by volumetric weight and applies a volumetric divisor of 6. This divisor divides the volume to determine the volumetric weight. Therefore, the volumetric weight for this example is 3 ÷ 6 = 0.5 kilograms (kg).

To set up volumetric divisors, go to **Landed cost** > **Costing setup** > **Volumetric divisors**. The **Volumetric divisors** page provides a grid that lists all existing volumetric divisors. You can use the buttons on the Action Pane to add, remove, and edit rows in the grid.

The following table describes the fields that are available on each row in the grid.

Expand table

Field	Description
Shipping company	Select the vendor account of the shipping company that you want to associate with the volumetric divisor.
Cost type code	Select the cost type code that you want to associate with the volumetric divisor. Use this field to put cost types into reporting buckets. You can print reports either by reporting categories or by cost type.
From port	Select the "from" port that you want the volumetric divisor to apply to.
Volumetric divisor	Enter the volumetric divisor value that you want to apply to the row. The volume of each package is divided by this value to determine that package's volumetric weight.

> **Note**
>
> The system uses the maximum value between **actual weight** and **volumetric weight**.

Procurement and sourcing parameters for Landed cost

The **Procurement and sourcing parameters** page has a few settings that are especially relevant when you use the **Landed cost** module. Use the **Update order lines** dialog box that is opened from the **Procurement and sourcing parameters** page to specify whether purchase order lines should automatically be updated when changes are made on the purchase order header.

To complete this setup, follow these steps:

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. On the **General** tab, select the **Update order lines** link.
3. The **Update order lines** dialog box lists the fields on the order header that can also apply automatic updates to related fields on the order lines. Set each field in the list to one of the following values:
    - **Always** – The order lines should automatically be updated when the order header is updated.
    - **Never** – The order lines should never be updated when the order header is updated.
    - **Prompt** – The user will be prompted to select whether the order lines should be updated.

Last updated on 12/30/2025

Vendor settings added for Landed cost

06/17/2025

When you enable the **Landed cost** module, several new fields are added to the existing **Vendors** page. You use these fields to set up the vendors that you'll use together with Landed cost features.

To set the relevant fields, go to **Procurement and sourcing** > **Vendors** > **All vendors**. Open an existing vendor, or create a new vendor, and then select the **Miscellaneous details** FastTab. All the new fields that the **Landed cost** module adds appear under the **Voyages** heading. The following table describes these fields.

Expand table

Field	Description
Shipping type	Select the vendor's role in relation to Landed cost: • **None** – The vendor has no specific role that is related to Landed cost. This value is the default setting, because most vendors will probably have no specific role. • **Shipping company** – The vendor is a shipping company. Vendors that have this shipping type are available for selection in the **Shipping company** field on the **Voyages** page. • **Customs broker** – The vendor is a customs broker. Vendors that have this shipping type are available for selection in the **Customs broker** field on the **Folios** page. • **Agent** – The vendor is an agent. Vendors that have this shipping type are available for selection in the **Agent** field on the **Vendors** and **Purchase orders** pages.
Cost type group	Assign the vendor to a cost type group for the purpose of selecting auto costs.
From port	Select the port of origin for the voyage.
Agent	The default agent when purchases are made from the vendor.
Import costing vendor	Indicate whether the vendor is a Landed cost vendor. **Tip:** You can use this field together with record-level security to limit the purchase orders that are shown when a voyage is created.
Shipping company	Select the default shipping company that is used when purchase orders are created for the vendor.
Services provider	Indicate whether the vendor is services provider.

Field	Description
Over/Under tolerance group	Select the default over/under tolerance group for the vendor.

Default descriptions for the general ledger

Article • 02/12/2025

Default descriptions can be used to update the **Description** field in voucher postings to the general ledger. This functionality has been enhanced to work with Landed cost.

To set up default descriptions for ledger postings, go to **Organizational administration** > **Setup** > **Default descriptions**.

The following table lists the new values that were added for the **Description** field on the **Default descriptions** page to support Landed cost.

Expand table

Description type	Notes
Import costing – Cost accrual	When a purchase order invoice is posted, a cost accrual is processed for estimate voyage costs. Default descriptions can be specified to add the voyage number to the description. Use *%4* for the shipment number.
Import costing – Goods in transit order	If you're using in-transit processing, the purchase order invoice is posted, and the goods are posted to a goods-in-transit account. Default descriptions can be specified to add the in-transit order number to the description. Use *%4* for the in-transit order number.
Inventory – close – adjustment	When the accounts payable (AP) invoice is processed for a voyage cost, an inventory adjustment is processed to estimate voyage costs. Default descriptions can be specified to add the voyage number to the description. Use *%4* for the shipment number.

For more information about how to work with the **Default descriptions** page, see Set up default descriptions for automatic posting.

Manage voyages

A voyage typically represents a vessel. However, depending on your practices and procedures, it can represent a vendor, a purchase order, or some other item that makes sense for your organization.

> **Tip**
>
> This article provides reference information that describes all of the settings available on the **Voyages** and **All voyages** pages. For step-by-step guides to creating and managing voyages, see Create a voyage and Manage a voyage, which are training units from the Work with landed cost in Dynamics 365 Supply Chain Management training module.

The All voyages page

The **All voyages** page provides voyage details, delivery and costing information, and information about items, purchase orders, and transfer orders. To open the **All voyages** page, go to **Landed cost** > **Voyages** > **All voyages**. This page shows a list of all current voyages. You can use the buttons on the Action Pane to create, delete, and work with voyages. Select any voyage in the list to view its details.

> **Note**
>
> Shipping containers and folios are linked to a voyage. Purchase lines are linked to a shipping container. In addition, costs that are entered here are apportioned to all attached purchase lines.
>
> Project purchase orders aren't supported in Landed cost.

The Action Pane of the All voyages and voyage details pages

The Action Pane of the **Voyages** page provides buttons that let you work with a selected voyage. Each button performs a single action. The Action Pane also includes tabs, each of which, in turn, provides a set of related buttons. Except where noted, all buttons and tabs are available both in the list view of the **All voyages** page and in the detailed view for a single selected voyage.

Buttons that appear directly on the Action Pane

The following table describes the buttons that are available directly on the Action Pane.

Expand table

Button	Description
New	Create a voyage.
Delete	Delete the current voyage. Only voyages that have a voyage status of *Confirmed* can be deleted. After a voyage leaves port and processes goods in transit, it can no longer be deleted.
Voyage editor	Open the **Voyage editor** page, where you can add or remove purchase lines for the voyage, create new containers, and modify details of the voyage itself. For more information about the **Voyage editor** page, see The Voyage editor page later in this article.
Voyage costs	Open the **Voyage costs** page, where you can view and add voyage costs to all goods in the voyage. When voyage costs are manually added to the voyage, they're automatically added to the **Costs inquiry** page and apportioned to each good according to the method that is specified on the **Voyage costs** page.

Buttons on the Voyage tab

The following table describes the buttons that are available on the **Voyage** tab of the Action Pane. This tab is available only when you're working in the list view of the **All voyages** page.

Expand table

Button	Description
Shipping container	Open a page that shows all the shipping containers associated with the selected voyage. There might be one container or many containers.
Folio	Open a page that shows all the folios associated with the selected voyage. There might be one folio or many folios.

Buttons on the Manage tab

The following table describes the actions that are available on the **Manage** tab of the Action Pane.

Expand table

Button	Description
Documents received	Update the voyage to set the **Documents received** option to *Yes*. You can use this button to lock the item and/or purchase line so that it can't be updated further.
In transit	Update the **Voyage status** field to the in-transit status that is set on the **Landed cost parameters** page. There's no further logic in this process. A voyage can also be updated automatically to the in-transit status, based on settings in the Tracking control center.
Ready for costing	Update the **Voyage status** field to the ready for costing status that is set on the **Landed cost parameters** page. A voyage can be costed when all the invoices have been processed (both stock invoices and voyage cost invoices) and the goods have been received. If the estimated costs associated with a voyage haven't been costed, an error occurs when you try to process the costing of a voyage.
Costed	Clean up any costing irregularities after an invoice exists for all purchase orders and voyage costs. When you select this button, the **Voyage update - Costed** dialog box appears. There, you can select to post on the standard financial date or specify a posting date, and then run the action. You can rerun the action as many times as you want. You can also use the **Voyage update - Costed** dialog box to schedule the action as a periodic task (batch job). Run the action regularly by setting it up as a batch job.
Post receipts list	Post a receipt list for all purchase order lines in the voyage.
Post product receipt	Post a product receipt for all purchase order lines in the voyage. The product receipt process for the purchase order lines associated with a voyage is used only if the goods do **not** go through goods-in-transit processing. If the goods go through goods-in-transit processing, you receive an error when you try to post the product receipt for a purchase order line.
Post invoice	Post an invoice for all purchase order lines in the voyage. If the goods on the voyage go through goods-in-transit processing, the purchase order lines are invoiced before the receiving process is done. When the original purchase order is invoiced, the goods-in-transit orders associated with the original purchase order lines are created. Those orders can then be received by the warehouse.
Ship transfer order	Post a transfer order voyage for all transfer order lines in the voyage. When this button is selected, only transfer orders are available for update.
Receive transfer order	Post a transfer order receipt for all transfer order lines in the voyage.
Receive goods in transit	Receive all order lines that are in transit in the voyage. This button is one of three options available for receiving goods in transit on a voyage. (The other two options are the **Create arrival journal** button described later in this table, and the Warehouse Management mobile app.) This option is the simplest option and processes the goods in transit out of the goods-in-transit warehouse and into the final destination warehouse. If you want more control over the process, use the arrival journal or a mobile device to process the receipt of goods.

Button	Description
Find auto costs	Find any relevant voyage costs. If these costs have already been found or updated, you receive the following message: "Un-invoiced cost lines exist. Do you want to overwrite them?" The system finds any costs that weren't associated with the voyage at the time of creation. Voyage costs that are attached to a voyage and that have been invoiced won't be overwritten.
Create arrival journal	Open the **Create arrival journal** dialog box, where you can create an arrival journal that specifies a location. The dialog box provides the following options: • **Create from goods in transit** or **Create from transfer order** – The label for this option changes depending on whether you're using the goods-in-transit process. Set it to *Yes* to open an arrival journal page that lets you process a standard arrival journal for the goods in transit associated with the voyage. If the item has already been received in the final destination warehouse, it won't be added to the arrival journal lines. • **Initialize quantity** – Set this option to *Yes* to initialize the quantity received, based on the quantity of goods that is specified on the voyage line. If the voyage line has been partially received, this quantity is the remaining quantity. Set this option to *Yes*. • **Create from order lines** – Set this option to *Yes* to take the value from the order lines. This button is one of three options available for receiving goods on a voyage. (The other options are the **Receive goods in transit** button described earlier in this table, and the Warehouse Management mobile app.)
Accrue costs	You can accrue costs where a cost type has a ledger account specified for the debit. This button is typically used when the stock is in transit, or when goods have been received and invoiced.
Aggregate costs	Move costs from the shipping container level to the voyage level. You might use this button in a shared services/shipping scenario, where multiple entities share a shipping container or carton space. For example, the voyage has a 40-foot shipping container and a 20-foot shipping container, and the apportionment is done by volume. In this case, the goods/entities that share or use the space in the 20-foot shipping container might be penalized. To fairly distribute the costs, some organizations might want to transfer the costs to the voyage and distribute them based on the voyage-level apportionment method.
Change journey template	Open a dialog box where you can change the journey template. After you change the template, the voyage costs are deleted. Therefore, you might have to select **Find auto costs** (see the description earlier in this table) or manually add costs again.

Buttons on the General tab

The following table describes the buttons that are available on the **General** tab of the Action Pane.

Expand table

Button	Description
Receipts list	Open a list of product receipts for all purchase order lines in the voyage. If no product receipt lists have been processed, this button is unavailable.
Product receipt	Open the product receipt record for the purchase order lines associated with the voyage, if that record is used. If no product receipts have been posted, this button is unavailable. The product receipt process won't be used if you're using goods-in-transit processing.
Item arrival	Open the item arrival journal, if it's used.
Tracking	Open the **Inbound tracking** page, where you can update the expected arrival date of goods in a shipping container and a voyage, and subsequently update the expected delivery dates of purchase order lines.
Costs inquiry	Open the **Costs inquiry** page, which shows all the costs of a voyage. Select **View** on the Action Pane to adjust the view. You can view any of the levels, plus the item and cost type code. Only cost type codes that are directly related to inventory transactions appear on the **Costs inquiry** page. By removing cost type codes, you can adjust the page by grouping costs together. This capability can be useful if you're using sizes and colors. The **Costs inquiry** page shows only cost type codes where the **Debit** field is set to *Item*.
Goods in transit orders	Open the **Goods in Transit orders** page, which shows the goods-in-transit records for the selected voyage only.

Lines view of the voyage details page

To open the **Lines** view, open the details page for a voyage, and then select the **Lines** tab in the upper left of the voyage heading.

Information on the Voyage header FastTab

The **Voyage header** FastTab in the **Lines** view of a voyage contains basic information that describes the voyage. Many of the fields that appear on this FastTab also appear in the **Header** view, as described later in this article.

Information on the Voyage lines FastTab

The **Voyage lines** FastTab in the **Lines** view of a voyage is related to the voyage details and costing information that apply at the voyage level. Here, you can review the shipping containers, folios, and items attached to the voyage. The price and quantity of the items on the voyage are

also shown. You can view any shipping container or folio that is listed by selecting the relevant link.

Information on the Line details FastTab

The **Line details** FastTab in the **Lines** view of a voyage provides more information about the line currently selected on the **Voyage lines** FastTab. This FastTab includes details about the position that each line occupies in the container, and its declared quantity.

Header view of the voyage details page

To open the **Header** view, open the details page for a voyage, and then select the **Header** tab in the upper left of the voyage heading.

Settings on the General FastTab

The following table describes the fields that are available on the **General** FastTab in the **Header** view of a voyage.

Expand table

Field	Description
Voyage	Enter the voyage or flight number.
Booking reference	If your shipper or shipping center provides a reference number to identify the voyage (that is, the shipper's or shipping center's internal reference), enter it here.
Vessel	Enter or select the vessel. If the vessel isn't listed as a value, you can enter the vessel ID as free text. In that case, the main table isn't updated so that the vessel ID can be selected in this field later.
External voyage ID	Enter the publicly available ID for the voyage (such as the flight number).
Master air waybill/Bill of lading	Enter the master air waybill or bill of lading number. You can specify this value when you ship by air.
House air waybill/Bill of lading	Enter the house air waybill or bill of lading for the shipping container.
Rental	Select this check box to indicate that the container is a rental container that must be returned.

Field	Description
Description	Enter a description of the voyage to make it easier to recognize.
Voyage status	The status of the voyage. Values include *Created*, *In transit*, *Documents received*, and *Costed*. This field isn't calculated based on logic. It's updated only via the posting action. The *Costed* value indicates that an invoice for the stock and all voyage costs has been received. Unless an invoice is received, a voyage can't reach a status of *Costed*.
Purchase order status	The highest status that has been reached among all the purchase orders associated with the voyage.
Documents received	A value that indicates whether your company has received all the documents associated with the voyage. To change the value, select **Documents received** in the **Voyage update** group on the **Manage** tab of the Action Pane.
Shipping company	Select the shipping company for this voyage. This field helps determine auto costs.
Name	The name of the company selected in the **Shipping company** field.
Measurement	This field enables a measurement to be specified in an auto cost. Measurements are often used by organizations that don't know the individual volume or weight of the goods, but that require a more accurate apportionment than the amount or quantity provides. The freight forwarder will provide the weight or cubic measurement, and you can put it at the level of either an item or the purchase order. It can be automatically updated if the parameter is selected, or it can be manually entered.
Measurement unit	The unit of measure that applies to the number in the **Measurement** field.
Number of pallets	Specify the number of pallets on the voyage line. This field is automatically updated if the **Automatically update number of cartons** option is set to *Yes* on the **General** tab of the **Landed cost parameters** page.

Settings on the Delivery FastTab

The following table describes the fields that are available on the **Delivery** FastTab in the **Header** view of a voyage.

Expand table

Field	Description
Created date and time	The date and time when the voyage record was created.
Ex-factory date	This field selects the earliest ex-factory date among the purchase orders that are linked to the voyage. The ex-factory date is available on the purchase order header and is updated

Field	Description
	by using the tracking control feature.
Ship date	The estimated date when the plane or vessel leaves the point of origin.
Departure date	The departure date is usually the date when the plane or vessel actually leaves the overseas port. The ship date and departure date don't have to match. The **Departure date** field is for informational purposes only. It isn't used to estimate the expected delivery date. The tracking control feature is used to estimate the expected delivery date, and this field can be set up to be filled in automatically by the tracking control feature.
In to store date	This field selects the earliest date when the goods from the purchase orders that are linked to the voyage will be available for sale.
Estimated delivery date	The estimated delivery date is usually the date when the goods are due to arrive in the warehouse. This field is for informational purposes only. It isn't used for master planning for goods. The expected delivery date on the purchase order line is used for master planning for goods on a voyage and is updated by using the tracking control feature. This field can be set up so that it's filled in by the tracking control feature.
Actual delivery date	The earliest delivery date, based on the goods that are linked to the voyage.
ETA at shipping port	Enter the date when you expect the voyage to arrive at the shipping port, based on the information provided by your shipping agent.
Original documents received	Enter the date when the original documents were received.
Broker advised	Enter the date when the broker was advised.
Original bill of lading sent	Enter the date when the original bill of lading was sent.
Goods released	Enter the date when the goods were released from customs.
Customer appointment	Enter the customer appointment date, which is the date when you expect the customer to take ownership of the goods.
Delivered at warehouse	Enter the date when the goods were delivered to the warehouse.
Verification date	Enter the verification date.
Delivery instructions	Enter the date when the delivery instructions were received.
Mode of delivery	This field provides information about the method used to deliver the voyage and the cost selection of auto costs associated with that delivery method.

Field	Description
From port	The shipping port that the voyage departs from.
To port	The shipping port where the voyage arrives. The shipping containers can have different ports, because the ship might stop at multiple ports. By verifying the "to" port at the shipping container level, you provide accurate port details for every shipping container on a voyage. The auto cost for the freight is determined based on the combination of the shipping container type, the "to" port, and the "from" port.
Local forwarder	This field is for informational purposes only. The local forwarder should be selectable from the vendor table.
Local transport date	The date that the local transport is booked for. This field can help the warehouse do its planning.
Local transport time	The time slot that the local transport is booked for. This field can help the warehouse do its planning.
Journey template	The journey template specified for the voyage. The journey template is used to enter the "to" port and "from" port of the shipping container and voyage. Those values, in turn, help identify the auto costs for the voyage.

Settings on the Other FastTab

The following table describes the fields that are available on the **Other** FastTab in the **Header** view of a voyage.

Expand table

Field	Description
Remarks	Enter additional information that is related to the voyage.
Valuation date	Select the earliest ex-factory date for the purchase orders that are linked to the voyage.
Pending voyage	Use this to indicate whether your shipment or voyage has left yet. It is for informational purposes only.
Renaming shipping containers	For voyages that have more than one container, the number of containers that haven't yet been received.

The Voyage editor page

Use the **Voyage editor** page to create voyages, create containers for a voyage, and select the purchase order and/or transfer order lines to include in each container. To open the **Voyage**

editor page, follow one of these steps:

- Go to **Landed cost** > **Voyages** > **All voyages**. To create a new voyage, select **New** on the Action Pane, fill in the **Create voyage** dialog box as needed, and then select **OK**. To edit an existing voyage, select it, and then select **Voyage editor** on the Action Pane. In both cases, the **Voyage editor** page opens and shows the new or selected voyage.
- Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**. Select the purchase order to create a voyage and container for, and then, on the Action Pane, on the **Purchase** tab, in the **Landed cost** group, select **Create new voyage**. Fill in the **Create voyage** dialog box as needed, and then select **OK** to open the **Voyage editor** page.

For information about how to use the **Voyage editor** page to create and populate containers for voyages, see Manage shipping containers. The following subsections provide an overview of the settings available on this page.

Action Pane buttons on the Voyage editor page

The following table describes the buttons that are available on the Action Pane of the **Voyage editor** page.

Expand table

Button	Description
Edit voyage header	Open the **Edit voyage** dialog box, where you can view and update header information for the current voyage. These settings are also available on the **General** FastTab in the **Header** view of the voyage details page. For a description of these fields, see Header view of the voyage details page earlier in this article.
Setup	Open a drop-down dialog box where you can select the transaction types and sites to show on the page. These criteria are combined with the criteria on the **Filters** FastTab to control which orders are listed on the **Inbound orders** FastTab.
Generate data	Update the list of orders on the **Inbound orders** FastTab, based on the current **Filters** and **Setup** settings. You must select this button to update the inbound orders list each time that you change these settings.
Display dimensions	Open a dialog box where you can select the inventory dimensions that are shown in the grid on the **Lines to select** FastTab.

The Filters FastTab

Use the **Filters** FastTab to set criteria that control which purchase and transfer orders are shown on the **Inbound orders** FastTab. The criteria that you enter here are combined with the criteria

that are provided in the **Setup** drop-down dialog box on the Action Pane. Each time that you change the **Filters** or **Setup** settings, select **Generate data** on the Action Pane to update the **Inbound orders** FastTab.

The Inbound orders FastTab

The **Inbound orders** FastTab lists the purchase and transfer orders that meet the criteria that you set on the **Filters** FastTab and in the **Setup** drop-down dialog box. Select an order that's listed here to view the lines associated with that order on the **Lines to select** FastTab. Some orders might be listed several times if they include lines that have different delivery dates.

The Lines to select FastTab

The **Lines to select** FastTab lists the lines associated with the order and delivery date that you selected on the **Inbound orders** FastTab. Select the lines that you want to include in a new or existing container for the current voyage, and then select **Add to staging list** on the toolbar to make those lines available for container assignment. Select **View staging list** to open a page where you can actually assign the lines to new or existing containers. For more information about this process, see Manage shipping containers.

The Other dates FastTab

The **Other dates** FastTab lists lines associated with the order that you selected on the **Inbound orders** FastTab, but that have different delivery dates than the selected row. These lines are for information only and can't be added to the staging list from here. To add these lines to the staging list, select the appropriate order and delivery date on the **Inbound orders** FastTab. Those lines then become available on the **Lines to select** FastTab.

Voyage update periodic tasks

The **Landed cost** module includes several voyage-related periodic tasks that can bulk-update several aspects of voyages. To run or schedule these periodic tasks, go to **Landed cost** > **Periodic tasks** > **Voyage updates**, and then select one of the following task types:

- **Documents received** – This task lets you set the **Documents received** option to *Yes* for several voyages at the same time. Use the **Filter** settings to define the set of voyages that you want to update.
- **In transit** – This task lets you set the **Voyage status** field to the in-transit status that's established on the **Landed cost parameters** page for several voyages at the same time. Use

the **Filter** settings to define the set of voyages that you want to update.

- **Ready for costing** – This task lets you set the **Voyage status** field to the ready for costing status that's established on the **Landed cost parameters** page for several voyages at the same time. You'll typically set up this task to run on a regular schedule.
- **Costed** – This task lets you set the **Voyage status** field to the costed status that's established on the **Landed cost parameters** page for several voyages at the same time, provided that they have been costed but haven't yet been updated on the voyage. You'll typically set up this task to run on a regular schedule.

Purchase order clean up periodic task

The *Purchase order clean up* periodic task deletes purchase orders that haven't been added to a voyage. It helps to reduce transaction counts and improve general performance. To run or schedule the task, go to **Landed cost** > **Periodic tasks** > **Clean up** /> **Purchase order clean up**.

Manage shipping containers

Article • 02/14/2025

Shipping containers are used to group together goods that are physically grouped together. They're also used in cases where costs must be shared only across those goods, usually because they're physically together.

Create shipping containers for voyages

You create a shipping container by opening or creating the voyage where you'll use it, and then assigning the purchase order lines that the shipping container will include. Follow these steps to create a shipping container for a voyage.

1. Follow one of these steps:

    - Go to **Landed cost** > **Voyages** > **All voyages**. To create a new voyage, select **New** on the Action Pane, fill in the **Create voyage** dialog box as needed, and then select **OK**. To edit an existing voyage, select it, and then select **Voyage editor** on the Action Pane. In both cases, the **Voyage editor** page is opened and shows the new or selected voyage.
    - Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**. Select the purchase order to create a voyage and container for, and then, on the Action Pane, on the **Purchase** tab, in the **Landed cost** group, select **Create new voyage**. Fill in the **Create voyage** dialog box as needed, and then select **OK** to open the **Voyage editor** page.

    > **Note**
    >
    > To improve performance of the **Voyage Editor** page, we recommend that you select a narrow date range and filter either by purchase or transfer order ID.

2. Use the filters at the top of the **Voyage editor** page to find the inbound order that you want to create the shipping container for. If you created the voyage from the **All purchase orders** page, the purchase order that you selected there will already be selected in the filter here. However, you can adjust the filters as you want.

3. On the Action Pane, select **Generate data** to update the list of orders on the **Inbound orders** FastTab, based on your current filter settings. (Each time that you change the filter settings, you must select **Generate data** to update the inbound order list.)

4. The **Inbound orders** FastTab shows all the qualifying purchase orders that match your filter settings. Select an inbound order to include in the new shipping container.

5. On the **Lines to select** FastTab, select the checkbox for each purchase order line that you want to include in the new shipping container.

6. Repeat steps 2 through 4 until you've found and selected all the order lines that you want to include in the new shipping container.

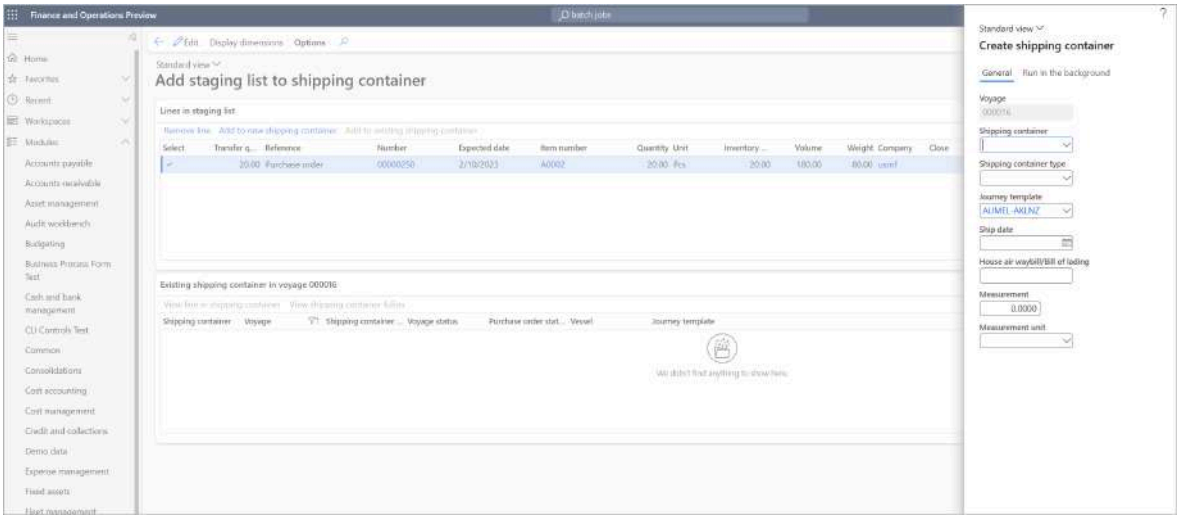
7. On the **Lines to select** FastTab, on the toolbar, select **Add to staging list**.

8. On the toolbar, select **View staging list**.

9. The **Add staging list or shipping container** page is opened. The purchase order lines that you selected are listed on the **Lines in staging list** FastTab. All the purchase order lines in this list will be added to the shipping container that you create. You can remove any line by selecting it and then selecting **Remove line** on the toolbar of the FastTab.

10. On the **Lines in staging list** FastTab, on the toolbar, select **Add to new shipping container**.

11. In the **Create shipping container** dialog box, on the **General** tab, define the new shipping container.



12. If you want to create the shipping container in batch mode, on the **Run in the background** tab, set the **Batch processing** option to *Yes*. If your container includes a large number of lines, batch mode can help improve performance compared to using the **Voyage Editor** page.

> **Note**

The **Run in the background** tab is available only if the *Enable shipping container creation and update in batch mode* feature is turned on for your system. For information about how to turn this feature on or off, see Turn on the Landed cost module and related features for your system.)

Background processing won't be activated if the transfer quantity is less than the total quantity of the related purchase order line.

13. Select **OK** to create the shipping container and add the selected purchase order lines to it.

> ⓘ **Note**
>
> If a container already exists for your selected voyage, you can add new purchase order lines to it by selecting **Add to new existing shipping container** on the **Add staging list or shipping container** page.

View shipping container lists and details

To view and process goods through the shipping container page, go to **Landed cost** > **Shipping containers** > **All shipping containers**. The **All shipping containers** page shows a list of all available shipping containers. You can use the buttons on the Action Pane to delete and manage shipping containers. Select any shipping container in the list to view its details on the **Shipping containers** page.

The upper part of the shipping container details page shows shipping container and costing information. The **Lines** section shows the folios, items, and purchase orders or transfer orders that are attached to the container.

Shipping containers Action Pane

The Action Pane on the **All shipping containers** and **Shipping containers** pages provides buttons that let you work with a selected shipping container. Each button performs a single action. The Action Pane also includes tabs, each of which, in turn, provides a set of related buttons. Except where noted, all buttons and tabs that are described in the following subsections are available both in the list view (that is, on the **All shipping containers** page) and in the detailed view (that is, on the **Shipping containers** page).

Buttons on the Manage tab

The following table describes the buttons that are available on the **Manage** tab of the Action Pane.

Expand table

Button	Descriptions
Post receipts list	Post a receipt list, or view the product receipt lists for all purchase order lines in the shipping container.
Post product receipt	Post a product receipt for all purchase order lines in the shipping container.
Post invoice	Post an invoice for all purchase order lines in the shipping container.
Ship transfer order	Post a transfer order shipment for all transfer order lines in the shipping container. Only those lines in the shipping container that are a type of transfer order appear in the dialog box.
Receive transfer order	Post a transfer order receipt for all transfer order lines in the shipping container. The receive dialog box is the simplest way to receive goods in a shipping container or voyage, and is one of three available options. You can also receive via arrival journals or mobile device processing.
Create arrival journal	You can generate an arrival journal for organizations by using advanced warehouse features. The options are *Initialize quantity* (recommended), and either *Create from goods in transit* or *Create from purchase orders*. The last two options depend on whether goods-in-transit processing is being used.
Rename	Open a dialog box where you can rename a selected shipping container.
Change journey template	Change the journey template. After you change the journey template, you might have to select **Find auto costs** or manually add costs again, because the shipment costs will be deleted.
Convert to rental	Convert a selected shipping container into a rental shipping container.

Buttons on the General tab

The following table describes the buttons that are available on the **General** tab of the Action Pane.

Expand table

Button	Descriptions
Receipts list	Post a receipt list for all purchase order lines in the shipping container.
Product Receipt	View the product receipt record, if it's used. The product receipt process will be used only if the goods don't use goods-in-transit functionality.
Item arrival	View the item arrival journal for the shipping container, if that journal is used.
Legs	Legs are used to identify separate parts of a journey. Lead times can be associated with each leg to help with shipment tracking. Learn more in Multi-leg journey setup.
Tracking	View or update shipment tracking.
Goods in transit orders	You can open the **Goods in transit** page directly from the container. That page shows the goods-in-transit records for the selected shipping container only.

Shipping container Header view

To open the **Header** view, open a shipping container, and then select the **Header** tab in the upper right of the shipping container heading.

Settings on the General FastTab

The following table describes the settings that are available on the **General** FastTab of the **Header** view of a shipping container.

Expand table

Field	Description
Shipping container	The name of the shipping container.
Voyage	The voyage that is associated with the shipping container.
Shipping container type	Enter the shipping container type. This field must be set. You can use it to determine the cost for freight, for example, by selecting the auto cost that is associated with the shipping container type.
Vessel	Enter or select the vessel. If the vessel isn't listed as a value, you can enter the vessel ID as free text. In that case, the main table isn't updated so that the vessel ID can be selected in this field later. Learn more in Vessels.
Unit type	Unit types are used as an additional means of grouping and identifying shipping containers. They're shown and selected on the shipping container

Field	Description
	page. Learn more in Set up unit types.
Refrigeration type	Refrigeration types are used as an additional means of grouping and identifying shipping containers, usually refrigerated containers. They're shown and selected on the shipping container page. Learn more in Set up refrigeration types.
Measurement	This field enables a measurement to be specified in the **Landed cost** module. Measurements are often used by organizations that don't know the individual volume or weight of goods, but that require a more accurate apportionment than the amount or quantity provides. The freight forwarder will provide the weight in kilograms or the cubic measurement, and you can put it at the level of either an item or the purchase order. It can be automatically updated if the parameter is selected, or it can be manually entered.
Measurement unit	The unit of measure that applies to the number in the **Measurement** field.
Actual weight	You can record the actual weight of the carton or container. This value can be used for verification against the maximum weight that is allowed in the setup of a shipping container.
Number of cartons	The number of cartons is automatically updated if the parameter is selected.
Description of goods	A description of goods can be selected on the shipping container or folio header. It's used to help identify a voyage, shipping container, or folio of goods. Learn more in Description of goods.
House air waybill/Bill of lading	You can specify the house air waybill or bill of lading for the shipping container.
Remarks	Additional information that is related to the shipping container.
Returnable	A value that indicates whether the shipping container can be returned after the voyage.
Voyage status	The status of the journey that is associated with the shipping container.
Purchase order status	The status of the purchase order that is associated with the shipping container.

Settings on the Delivery FastTab

The following table describes the settings that are available on the **Delivery** FastTab of the **Header** view of a shipping container.

Expand table

Field	Description
Created date and time	The date and time when the container was created.
Ex-factory date	This date is usually provided to the factory/vendor to indicate when you expect the goods to leave its premises. When you work with a factory in Asia, this date is often required instead of the date that you expect the goods by. (By contrast, for a local delivery, the date that you expect the goods by is required.) This field can be filled in from the purchase order lines in the shipping container list.
Ship date	This date can be printed on the purchase order document. It usually informs the factory/vendor about the date that the goods should be delivered to the port by. This field is for informational purposes only. It isn't used to estimate the expected delivery date of the goods in the shipping container. This field can be set so that it's automatically updated when the tracking control page is updated.
In to store date	The earliest date when the goods from the purchase orders that are linked to the voyage will be available for sale.
Estimated delivery date	Usually, the date when the goods are due to arrive in the warehouse. This field is for informational purposes only. It isn't used to calculate master planning on the purchase order lines in the shipping container. The expected delivery date on the purchase order lines is updated through tracking control. This field can be set up so that it's updated when the tracking control page is updated.
Departure date	Usually, the date when the plane or vessel actually leaves the overseas port.
ETA at shipping port	The estimated arrival date at the destination port ("to" port).
Original documents received	Optional: Update the date when the original documents were received.
Broker advised	Optional: Update the date when the broker was advised.
Original bill of lading sent	Optional: Update the date when the original bill of lading was sent.
Goods released	Optional: Update the date when the goods were released.
Customer appointment	Optional: Update the customer appointment date.
Delivered at warehouse	Optional: Update the date when the goods were delivered to the warehouse.

Field	Description
Verification date	Optional: Update the verification date.
Delivery instructions	Optional: Update the date of the delivery instructions.
From port	The port that the items will be shipped from.
To port	The port that the items will be shipped to.
Local forwarder	This field is for informational purposes only. The local forwarder should be selectable from the vendor table.
Local transport date	Enter the date that the local transport is booked for. This field can help the warehouse do its planning.
Local transport time	Enter the time slot. This field can help the warehouse do its planning.
Journey template	The journey template that is specified for the voyage. The journey template provides the details of the "to" and "from" ports, and the lead times that are associated with the tracking control of the shipping container.

Settings on the Other FastTab

The following table describes the settings that are available on the **Other** FastTab of the **Header** view of a shipping container.

Expand table

Field	Description
Rental	A value that indicates whether the shipping container is a rental shipping container. Rental costs might be associated with rental containers.
Converted to rental	A value that indicates whether the shipping container was converted to a rental shipping container. Rental costs might be associated with rental containers.
Original voyage	If the shipping container was moved to a new voyage, the original voyage.
Used	Use this to record whether a rental shipping container has been used. It is for informational purposes only.
Expected loading date	The date when the shipping container is expected to be loaded with goods.

Field	Description
Our seal number	Enter the seal number that your company uses internally for the shipping container.
Shipping company seal number	Enter the seal number that the shipping company or agent provided for the shipping container.
Examination certificate applied date	The date when an examination was requested for the shipping container.
Examination certificate received date	The date when the examination certificate was received.
Examination certificate expiry date	The date when the examination certificate will expire.
Examination certificate number	The certificate number of the certificate that was issued after an examination was done.

Shipping container Lines view

To open the **Lines** view, open a shipping container, and then select the **Lines** tab in the upper right of the shipping container heading.

Information on the Shipping container FastTab

The **Shipping container** FastTab in the **Lines** view shows information about the folio. Most of this information also appears in the **Header** view, as described earlier in this article.

Information and buttons on the Lines FastTab

The **Lines** FastTab in the **Lines** view shows details about each full or partial purchase order line that is included in the current shipping container.

The following table describes the buttons that are available on the **Lines** FastTab in the **Lines** view.

Expand table

Button	Description
Remove	Remove the selected purchase order line from the voyage.
Inventory > Transactions	View inventory transactions for the selected purchase order line. If you're using goods in transit, the original order and the goods-in-transit orders are also shown.
Inventory > Display dimensions	Open a dialog box where you can select the inventory dimensions that appear for the transactions that you view.
Refresh	Update information that is related to the line amount, weight, or volume of the selected purchase order line.

Information on the Lines details FastTab

The **Lines details** FastTab in the **Lines** view shows details about the purchase order line that is currently selected on the **Lines** FastTab.

Manage folios

Article • 02/14/2025

A folio is a subset of a container and is often determined by customs regulations. It can consist of one vendor's goods for one entity or company per shipment. The goods in a folio are managed in one container. One container can have many folios, but a folio can't be spread across several containers.

Use folios to split the goods within a container into different sections. When a container is being loaded, all the goods belonging to a folio are loaded in one go. Separate loads of purchase line items generate different folios. Therefore, a new folio is automatically created when new lines are added to a container.

To open the **All folios** page, go to **Landed cost** > **Folios** > **All folios**. This page shows a list of all current folios. You can use the buttons on the Action Pane to create, delete, and work with folios. Select any folio in the list to view its details on the **Folios** page.

Action Pane

The Action Pane on the **All folios** and **Folios** pages provides buttons that let you work with a selected folio. Each button performs a single action. The Action Pane also includes tabs, each of which, in turn, provides a set of related buttons. Except where noted, all buttons and tabs that are described in the following subsections are available both in the list view (that is, on the **All folios** page) and in the detailed view (that is, on the **Folios** page).

Buttons that appear directly on the Action Pane

The following table describes the buttons that are available directly on the Action Pane.

Expand table

Button	Description
New	Create a folio.
Delete	Delete the open or selected folio.
Voyage costs	Open the **Voyage costs** page, where you can view and add folio-level costs to all the goods in the voyage. When folio costs are manually added to the voyage, they're automatically added to the cost inquiry page and apportioned to every good according to the method that is specified on the **Voyage costs** page.

Buttons on the Manage tab

The following table describes the buttons that are available on the **Manage** tab of the Action Pane.

Expand table

Button	Description
Post receipts list	Post a receipt list for all purchase order lines in the folio.
Post product receipt	Post a product receipt for all purchase order lines in the folio.
Post invoice	Post an invoice for all purchase order lines in the folio.
Ship transfer order	Post a transfer order for all transfer order lines that are related to the current folio in the related shipment.
Receive transfer order	Post a transfer order receipt for all transfer order lines that are related to the current folio in the related shipment.
Receive goods in transit	Receive all order lines that are in transit in the folio.
Documents received	Update the setting of the **Documents received** option to *Yes*. You can use this button to lock the item and/or purchase line so that it can't be updated further.
Find auto costs	Find relevant voyage costs. If these costs have already been found or updated, you receive the following message: "Un-invoiced cost lines exist. Do you want to overwrite them?" Voyage costs that are attached to the folio and that have been invoiced won't be overwritten.
Create arrival journal	Generate an arrival journal for organizations by using advanced warehouse features. You can select **Initialize quantity** (recommended), **Create from goods in transit**, and/or **Create from purchase orders**. The last option depends on whether goods-in-transit processing is being used.
Accrue costs	Accrue costs where a cost type has a ledger account specified for the debit. This button is typically used when the stock is in transit, or when goods have been received and invoiced.

Buttons on the General tab

The following table describes the buttons that are available on the **General** tab of the Action Pane.

Expand table

Button	Description
Receipts list	Post a receipt list for all purchase order lines in the folio.
Product receipt	View the product receipt record, if it's used.
Item arrival	View the item arrival journal, if it's used.
Costs inquiry	Open the cost inquiry page to view all the costs of a voyage, including the shipping container, folio, and purchase order. You can adjust the exact view of the page by using the View action. On the cost inquiry page, you can view any of the areas, plus the item and cost type code. By removing these items, you can adjust the page by grouping together costs. This capability can be useful if you're using sizes and colors. You can change the dimensions that are shown on the page. The **Costs** page shows only cost type codes where the **Dr** entry on the **Posting** tab is set to *Item*.

Header view

To open the **Header** view, open a folio, and then select the **Header** tab in the upper right of the folio heading.

Settings on the General FastTab

The following table describes the fields that are available on the **General** FastTab of the **Header** view of a folio.

Expand table

Field	Description
Folio	The name of the folio. This name is automatically generated when the folio is created.
Voyage	The voyage that is associated with the folio.
Customs broker	Select the customs broker for the folio. Customs brokers are defined on the vendor. They enable created costs to be determined automatically.
House air waybill/Bill of lading	Specify the house air waybill or bill of lading that applies to the folio.

Field	Description
Company	The legal entity (company) that is associated with the folio.
Cargo control number	This field is used by customs departments in some countries/regions.
Measurement	This field enables a measurement to be specified in the **Landed cost** module. Measurements are often used by organizations that don't know the individual volume or weight of goods, but that require a more accurate apportionment than the amount or quantity provides. The freight forwarder will provide the weight or cubic measurement, and you can put it at the level of either an item or the purchase order. It can be automatically updated if the parameter is selected or manually entered.
Measurement unit	The unit that applies to the specified measurement.
Number of cartons	The number of cartons in the folio. This field can be automatically updated, depending on the parameter selection.
Vendor account	Select the vendor that is associated with the folio. This field is for informational purposes only. It doesn't affect any functionality.
Name	The name of the selected vendor account.
Remarks	Enter any additional information that is related to the folio.
Description of goods	Select a goods description to help identify the folio. Learn more in Description of goods.
Valuation date	This field is related to the duty entry page. The **Landed cost** module will use the customs exchange rate for the date that you set here. The default value is the date on the duty entry page.
Customs ID	Enter the customs ID. The customs departments in countries/regions provide this ID.
Tariff code	Enter a tariff code to associate with the folio. This code is typically required (and defined) by the country/region that you're shipping to.

Settings on the Delivery FastTab

The following table describes the settings that are available on the **Delivery** FastTab of the **Header** view of a folio.

Expand table

Field	Description
Folio date	Select a date to associate with the folio. The default value is the creation date of the voyage.
ETA at shipping port	The estimated time of arrival (ETA) date at the destination port ("to" port).
Estimated delivery date	Usually, the date when the goods are due to arrive in the warehouse. This field isn't used when the estimated delivery date is calculated. (The tracking control estimated delivery date is used instead.) To set this field so that the value matches the tracking control estimated delivery date, use the Tracking control center.
Original documents received	The date when the original documents were received.
Broker advised	The date when the broker was advised.
Original bill of landing sent	The date when the original bill of lading was sent.
Goods released	The date when goods were released.
Customer appointment	The customer appointment date.
Delivered at warehouse	The date when goods were delivered to the warehouse.
Verification date	The verification date.
Delivery instructions	The date when the delivery instructions were received.
From port	The port that the voyage departs from.
To port	The port where the voyage arrives. The shipping container might have a different port, because the ship might stop at multiple ports.

Settings on the Export FastTab

The following table describes the settings that are available on the **Export** FastTab of the **Header** view of a folio.

Expand table

Field	Description
Exporter	The exporter can be stored on the folio. In international trade, you might send a purchase order to one company but receive the goods from another company. Tracking and documentation are required by customs. The name and address of the exporter can be stored here.
Name	The name of the selected exporter.

Lines view

To open the **Lines** view, open a folio, and then select the **Lines** tab in the upper right of the folio heading.

Information on the Folio FastTab

The **Folio** FastTab in the **Lines** view shows information about the folio. Most of this information also appears in the **Header** view, as described earlier in this article.

Information and buttons on the Lines FastTab

The **Lines** FastTab in the **Lines** view shows details about each full or partial purchase order line that is included in the current folio.

The following table describes the buttons that are available on the **Lines** FastTab in the **Lines** view.

Expand table

Button	Description
Remove	Remove the selected purchase order line from the voyage.
Inventory > Transactions	View inventory transactions for the selected purchase order line. If you're using goods in transit, the original order and the goods-in-transit orders are also shown.
Inventory > Display dimensions	Open a dialog box where you can select the inventory dimensions that appear for the transactions that you view.
Refresh	Update information that is related to the line amount, weight, or volume of the selected purchase order line.

Information on the Lines details FastTab

The **Lines details** FastTab in the **Lines** view shows details about the purchase order line that is currently selected on the **Lines** FastTab.

Track inbound voyages and shipping container journeys

09/19/2025

The **Inbound tracking** page lets you track the progress of your voyages and shipping container journeys. Each voyage and journey is broken down by *activities*, each of which has its own row on the page. You can use the page to view and enter estimated dates and actual dates by activity.

Typically, depending on the setup in the Tracking control center, these activities automatically show the estimated landing date at the final destination. Also depending on the setup, the final date usually updates the delivery date or confirmed date on purchase order lines. For transfer order lines, you can set up the system to update the receipt date.

To open the **Inbound tracking** page, go to **Landed cost** > **Tracking** > **Inbound tracking**.

Filter the activities list

You can use the **Voyage** and **Shipping container** fields at the top of the **Inbound tracking** page to filter the page so that it shows only activities that are associated with the selected voyage and/or shipping container.

Update tracking information

To update the schedule for a voyage or journey, enter the start date for the first activity. The estimated end date of the last activity is then updated. The setup for each leg and journey template in the Tracking control center determines the estimated lead times. The estimated end dates use the lead time from the start date of the activity. Then, when you record the actual end date, the start date of the next activity updates to the same date as the previous activity's actual end date. The actual lead time updates so that comparison and analysis can be done. You can enter additional notes in the **Note** field.

The order of the activities in the grid is determined by the order of the legs in the relevant journey template. If you change the order of the legs in the attached journey, the tracking control also changes.

You can update the dates for all containers by selecting **Update start date** or **Update actual end date** on the Action Pane. Alternatively, you can enter the dates per container on the shipment. This approach allows for greater flexibility, because containers can be split in a multi-journey environment.

> **Note**
>
> The Landed cost tracking control center feature doesn't consider vendor lead times on individual purchase lines when calculating expected delivery dates.

Buttons on the Action Pane

Use the buttons on the Action Pane of the **Inbound tracking** page to work with inbound voyages and journeys. The following table describes the buttons that are available.

Expand table

Button	Description
Edit	Edit a voyage or shipping container journey.
New	Create a new voyage or shipping container journey.
Delete	Delete a selected voyage or shipping container journey.
Update start date	Update the start date of an activity for all containers in a voyage. When you update the start date of a specific activity or leg of a journey, the subsequent estimated start dates are updated based on the specified lead time.
Update actual end date	Update the end date of an activity for all containers in a voyage. When you update the end date of a specific activity, the subsequent activities are updated based on the specified lead time.
Add activities	Manually add an activity to a voyage. For example, you might add a fumigation activity. The addition might cause the confirmed delivery date of the goods in the vessel or voyage to change. When you add an activity to the journey, the estimated days aren't entered until the start date of a journey leg is updated.

Information and settings on the Overview tab

The **Overview** tab shows a list of all the activities that belong to the voyage and/or shipping container selected at the top of the page. The following table describes the fields that are available for each activity.

Expand table

Field	Description
Leg	The leg ID for the activity, as defined by the journey template.

Field	Description
Mode of delivery	The expected delivery method for the activity.
Activity	This field usually identifies the job or task that is associated with the activity. Typical examples include *Sailing* and *Clearance*.
Description	A longer description of the activity.
Start date	This field initially shows the estimated start date of the activity. However, after you enter the previous activity's actual end date, it shows the actual start date. This field is used to determine the estimated end date, based on the lead time.
Estimated end date	The system calculates the value of this field based on the start date and lead time. You usually don't edit the value directly.
Actual end date	Update this field as soon as possible after the activity occurs. The actual lead time is then updated.
Estimated days	The estimated time (in days) that is required to complete the activity.
Actual days	The actual time (in days) that is required to complete the activity.
Note	Use this field to add miscellaneous notes and details about the activity.

Information and settings on the General tab

The **General** tab shows information about the leg selected on the **Overview** tab. Although it repeats some of the information that appears on the **Overview** tab, it also includes additional information about the selected leg.

Estimate and manage landed costs

09/19/2025

The system uses your auto cost setup to estimate your landed cost. You can also define various scenarios to deliver a more accurate estimate. The system stores these scenarios so you can review them later and compare them to actual costs on a report. You can also update the item price.

Set up cost estimates

Set up cost templates

Cost templates establish default settings that users who get the estimate don't necessarily know. Templates can help reduce complexity in the estimating process by minimizing the selections that users must specify to get an accurate estimate. If you're using the standard cost model, you can use cost templates while you set up the cost of goods.

To set up your cost templates, go to **Landed cost** > **Costing setup** > **Cost templates**. On the **Cost templates** page, the list pane on the left shows all current cost templates. You can use the buttons on the Action Pane to create, delete, and edit templates.

The following table describes the fields that are available for each template.

Expand table

Field	Description
Cost template	Enter a unique name for the cost template. The name typically describes the factor or cost multiplier for the template.
Description	Enter a description of the cost template.
Shipping company	Select the shipping company that should be applied when the template is used.
Mode of delivery	Select the mode of delivery, such as sea or air, that should be applied when the template is used. This field helps determine the auto costs that are associated with the goods on a cost estimate.
Shipping container type	Select the type of shipping container that should be applied when the template is used. This field helps determine the auto costs that are associated with the goods on a cost estimate.
Customs broker	The customs broker (vendor) that should be applied when the template is used. This

Field	Description
	field helps determine the auto costs that are associated with the cost estimate.
Factor	Enter the multiplier (percentage) that should automatically be applied to the cost estimate when the template is used. For example, to add 10 percent to the calculated cost estimate, enter *1.10*.

Create a cost estimate

Use the **Cost estimate** dialog box to generate a new cost estimate that is based on a selected cost template, a selected set of items, and other details of a journey. These settings determine the estimated landed costs of goods. Use these cost estimates primarily to work with standard cost items. By adding the estimated landed costs to the standard cost of goods in inventory, you experience smaller variance transactions when you add the goods to a voyage, because the standard cost reflects the estimates of those landed costs.

To open the **Cost estimate** dialog box, go to **Landed cost** > **Periodic tasks** > **Cost estimate**. Then set the fields that are described in the following subsections. When you're finished, select **OK** to create the estimate. The **Cost estimate** page (**Landed cost** > **Inquiries** > **Cost estimates**) then appears and shows your new estimate, as described later in this article.

Settings on the Parameters tab

The following table describes the fields that are available on the **Parameters** tab of the **Cost estimate** dialog box.

Expand table

Field	Description
Cost template	Select a cost template. The settings that are associated with the selected template determine the auto costs that are applied.
Estimate date	By default, this field is set to today's date, but you can change the value. The specified date selects the appropriate sales prices, purchase prices, auto costs, and the exchange rate if a shipping rate is used.
Measurement	Costs might depend on a measurement. For example, when air freight is used, volumetric pricing might apply. If the cost depends on a measurement, enter the value of that measurement. Otherwise, set this field to *1*, unless you're certain that no apportionment occurs by using measurement. Enter a decimal value. The unit is the one that is defined in the applicable auto cost record.
Journey	Select a journey template. This field determines the correct auto costs that should be

Field	Description
template	applied.
From port	The port that the items are shipped from. This field is set based on the selected journey template.
To port	The port that the items are shipped to. This field is set based on the selected journey template.
Currency	Select the currency that the items are purchased in.
Containers	If multiple containers are typically used, specify the number of containers. The system then uses costs for multiple containers when it estimates the costs.
Folios	If multiple folios are typically used, specify the quantity. (The quantity is usually *1*.)
Site	Specify the site where the goods are delivered.

Settings on the Items tab

On the **Items** tab, you can add as many items to the estimate as you need. Use the toolbar to add items to the grid or remove items. Select **Inventory** > **Display dimensions** on the toolbar to open a dialog box where you can add dimension columns to the grid or remove columns.

The following table describes the fields that are available for each item.

Expand table

Field	Description
Item number	Select the item to determine the price for. (If the item doesn't yet exist in the system, create a dummy item, optionally attach it to a voyage item cost group, and then either leave the price blank, or create or change the price.)
Vendor account	Select the vendor to use for the estimate of this item. If a default vendor is assigned to the item, this field is automatically set.
Quantity	Select the quantity that you want to purchase.
Cost price	The system uses its pricing rules to find an initial price, but you can override that price if necessary.
Sales price	Enter the expected sales price of the goods.
Measurement	Enter a decimal value for the measurement of the goods. The unit is the one that is set up for the applicable released product.
Update item	Select this check box to update the weight or volume measurement of the released

Field	Description
weight/volume	product so that it matches the **Measurement** value that you enter for this row.
(Other dimensions)	Depending on the dimensions that you select to show, you might see additional columns of information about each item.

To view or adjust the volume and weight details for an item, select the item in the grid, and then use the fields at the bottom of the page.

Manage estimated costs

To view and edit the cost estimates that you create, go to **Landed cost** > **Inquiries** > **Cost estimates**. On the **Cost estimates** page, the list pane on the left shows all current cost estimates. You can use the buttons on the Action Pane to work with a selected estimate. You can't create a new cost estimate from the **Cost estimates** page. Instead, use the **Cost estimate** dialog box (**Landed cost** > **Periodic tasks** > **Cost estimate**), as described earlier in this article.

The **Cost estimates** page shows how each estimated cost is derived. It also shows the estimated landed cost for each item. You can modify a cost estimate by changing the cost price and currency that is associated with the various goods. You can also modify the associated voyage costs at both the voyage level and the container level. When you use this page to modify the costs, you're prompted to recalculate the estimated costs for the items in the cost estimate. When you're ready, you can use the estimates to update the cost price of the items in the cost template.

Information on the header

The top of the **Cost estimates** page shows the settings that are used to generate the selected cost estimate, as described in the previous section.

Settings and buttons on the Lines FastTab

The **Lines** FastTab lists each item that is included in the current estimate. The following table describes the fields that are available for each row.

Expand table

Field	Description
Vendor account	The vendor account that's associated with the item.
Item number	The item number.

Field	Description
Quantity	The number of items that you use to determine the cost.
Cost price	The cost price according to the trade agreement. This value is shown in the local currency.
Measurement	The individual measurement. The unit is the one that is defined for the applicable released product.
Estimated landed cost	The estimated landed cost for the total quantity.
Per unit	The estimated landed cost divided by the quantity.
(Other dimensions)	Depending on the dimensions that you select to show, you might see additional columns of information about each item.

The following table describes the buttons that are available on the toolbar on the **Lines** FastTab.

Expand table

Button	Description
Add	Add items to the cost estimate. After you add items, you must select **Recalculate** on the Action Pane.
Remove	Remove items from the cost estimate. After you remove items, you must select **Recalculate** on the Action Pane.
Voyage costs	Open a page where you can view and edit various types of voyage costs for the item.
Inventory > Display dimensions	Open a dialog box where you can add dimension columns to the grid or remove columns.

Settings on the General FastTab

The **General** FastTab shows details about the item that you selected on the **Lines** FastTab. Much of this information is repeated from the **Lines** FastTab and you can edit it in either place. You can also see additional details here. The values of the extra fields are based on the setup of the applicable released product.

Settings on the Dimension FastTab

The **Dimension** FastTab shows values for all available inventory dimensions for the item selected on the **Lines** FastTab, regardless of the dimensions that you choose to show there. Any values that you see here come from the applicable cost estimate template. You can choose to include these values in the cost estimate template.

Buttons on the Action Pane

Use the buttons on the Action Pane of the **Cost estimates** page to work with the selected cost estimate. The following table describes the buttons that are available.

Expand table

Action	Description
Cost Inquiry	View all costs for the voyage. You can view costs at the level of the individual item as required.
Update standard cost	Update the standard cost by using the default costing version that is defined on the **Landed cost parameters** page. You can override this version. **Note:** If an item has several item dimensions (for example, various sizes, colors, and configurations), but you don't select these dimensions for the estimate, the system creates a pending price for each combination. **Important:** The price breakdown is created and is used to determine the standard cost variance per landed cost.
Voyage costs	View and edit voyage costs for all goods in the shipment.
Recalculate	Update the estimated landed costs after you update, add, or remove voyage costs.
Lock	Lock the cost estimate record so that no more changes can be made.

Item cost price update

The **Item cost price update** periodic task updates all cost estimates that match the filters that you set when you run the task. The effect is similar to the effect of selecting **Update standard cost** on the Action Pane for a single estimate. However, in this case, the update applies to all matching estimates.

To run the periodic task, follow these steps.

1. Go to **Landed cost** > **Periodic tasks** > **Item cost price update**.
2. In the **Update cost price from estimate** dialog box, set the following fields as required to limit the scope of the update:

- **Version** – Update only estimates that use the specified costing version.
- **Site** – Update only estimates that use the specified site.
- **Cost template** – Update only estimates that use the specified template.
- **To port** – Update only estimates that use the specified "to" port.
- **Estimate date** – Update only estimates that have the specified date.

3. Set the options on the **Records to include** and **Run in the background** FastTab as usual for periodic tasks.

4. Select **OK** to run the task.

> ⓘ **Note**
>
> This periodic task runs successfully only if the following information is available:
>
> - Each relevant product must have a **Gross depth**, **Gross width**, and **Gross height** defined.
> - Each relevant vendor must have a **From port** defined.

Show landed costs in the accounting distribution of product receipts

This feature enables you to include landed costs in the accounting distribution of purchased product receipts. Therefore, you can more easily identify and track those costs. This feature doesn't affect the product receipt accounting logic that's used in other places in Microsoft Dynamics 365 Supply Chain Management.

Prerequisites

To use this feature, you must be running Supply Chain Management 10.0.34 or later, and you must turn on the *Source document and accounting distribution support for Landed Cost* feature in feature management.

View landed costs in the accounting distribution of product receipts

When you post a product receipt against a purchase order, Landed cost creates a source document line for each landed cost amount. The amount from Landed cost appears on the **Account distributions** page, which you can access from the product receipt.

The following illustration shows an example of accounting distributions that include landed costs.

Goods-in-transit processing and receiving

This article describes how to work with goods-in-transit orders. Only the **Landed cost** module uses this type of order. When an order or voyage is set up to use goods-in-transit processing, you don't have to wait until the goods are received in the warehouse before you can invoice them. Instead, the goods are invoiced when they leave the vendor's warehouse or port of origin, and the financial costs are recognized when the voyage begins. This functionality helps you correctly take ownership of inventory, because goods often become the property of your organization when they leave the shipping port.

When you use goods-in-transit orders, you receive the financially updated items in an interim warehouse known as a *goods-in-transit warehouse*. The goods stay in this warehouse until they can be received at the final destination warehouse (that is, the warehouse defined on the purchase order line). You can't manually remove them. When a goods-in-transit order is invoiced, goods are immediately moved to the goods-in-transit warehouse to signify the change in ownership.

As long as the items are in transit, they aren't available in inventory and can't be picked from inventory for a delivery. However, you can view the goods-in-transit inventory. You can also use the goods for master planning. In this case, use the confirmed delivery date on the purchase order line as the expected date when the inventory is available for consumption. The following sections describe the setup that is required to process inventory and voyages by using the goods-in-transit concept and functionality.

Required setup for goods-in-transit orders

Terms of delivery

When you enable the **Landed cost** module, the standard *terms of delivery* entity is enhanced to support the goods-in-transit feature.

When you set the **Goods in transit management** option to *Yes* for the applicable terms of delivery record, the goods are placed in the goods-in-transit warehouse. This action is triggered only if the inventory receipt isn't processed before an invoice is processed. When you set the delivery terms for an order to use goods in transit, users can no longer post a product receipt for the purchase order. If they try, an error occurs. The error message states that they must use the goods-in-transit functionality to proceed.

To work with delivery terms information for goods in transit, go to **Procurement and Sourcing** > **Setup** > **Distribution** > **Terms of delivery**. The following table describes the fields that the **Landed cost** module adds to the **Terms of delivery** page to support the goods-in-transit functionality. Both fields are on the **General** FastTab. For more information about the other fields on this page, see Terms of delivery (form).

Expand table

Field	Description
Shipping port mandatory	Set this option to *Yes* if a shipping port is mandatory when the delivery terms apply.
Goods in transit management	Set this option to *Yes* to use goods-in-transit management when the delivery terms apply.

Warehouses for goods in transit and under-delivery

When you enable the **Landed cost** module, the standard *warehouses* entity is enhanced to enable purchase orders to be invoiced while the goods are in a goods-in-transit warehouse.

The Landed cost module adds two new types of warehouse: *goods in transit* and *under-delivery*. You can select warehouses of both types as default warehouses. To successfully process goods-in-transit orders, you must configure both the goods-in-transit warehouse and the under-delivery warehouse on the **Warehouses** page. Then, for each default warehouse for use with Landed cost and goods in transit, ensure that the goods-in-transit warehouse and under-delivery warehouse are selected for the available warehouses of each type.

The *goods in transit* warehouse type are associated with your goods-in-transit warehouse. That warehouse is used to process the goods on goods-in-transit orders before they're received at the final destination warehouse.

When the purchase order invoice is posted for a voyage that is enabled for goods-in-transit functionality, inventory is purchased in the receiving warehouse. It's then immediately transferred to the configured goods-in-transit warehouse. This transfer signifies the change in ownership of the goods that aren't yet physically arrived at the destination warehouse.

In general, one goods-in-transit warehouse is enough for each site if Site and Warehouse are the only inventory dimensions used for inventory management. If the Location inventory dimension is also used, ensure to set up a goods-in-transit warehouse for each combination of a site and warehouse, so that the default location can also be specified.

A default receipt location must be specified for the under-delivery and goods-in-transit warehouses. Go to **Inventory management** > **Setup** > **Inventory breakdown** > **Warehouses**, and set the **Default receipt location** field.

The following table describes the fields that the **Landed cost** module adds to the **Warehouses** page to support the goods-in-transit functionality. Both fields appear on the **General** FastTab. For information about the other fields on the page, see Warehouses (form).

Expand table

Field	Description
Goods in transit warehouse	Identify the goods-in-transit warehouse that is related to the main warehouse.
Under delivery warehouse	Identify the under-delivery warehouse that is related to the main warehouse.

> **Note**
>
> Warehouses that have a **Type** value of *Goods in transit* or *Under* can't be enabled for warehouse management processes (WMS). If you try to set the **Use warehouse management processes** option to *Yes* for warehouses of one of these types, you receive the following error message: "Landed cost goods in transit warehouse and under warehouse shouldn't use warehouse management processes. Please replace it with new warehouse if warehouse management processes parameter can't be disabled."

Goods-in-transit orders

You can review and manage goods-in-transit orders directly in the **Landed cost** module. You can process goods-in-transit orders directly from the **Goods in transit orders** page. Alternatively, you can go to the voyage that is associated with the goods-in-transit orders, and process the whole voyage, shipping container, or folio. When you invoice a voyage and create goods-in-transit orders, a new goods-in-transit order is created for each combination of inventory and inventory dimensions that is associated with the purchase order line.

To manage goods in transit, Landed cost uses a two-step procedure:

1. When a purchase order is invoiced, a goods-in-transit order is created. A status of *In transit* is assigned to it.

   > **Note**

After the goods-in-transit order is created, the invoice date can't be changed.

2. The goods-in-transit order is processed on the **Goods in transit orders** page. It's then received in the warehouse that is specified on the purchase order. At that point, the status is changed to *Received*.

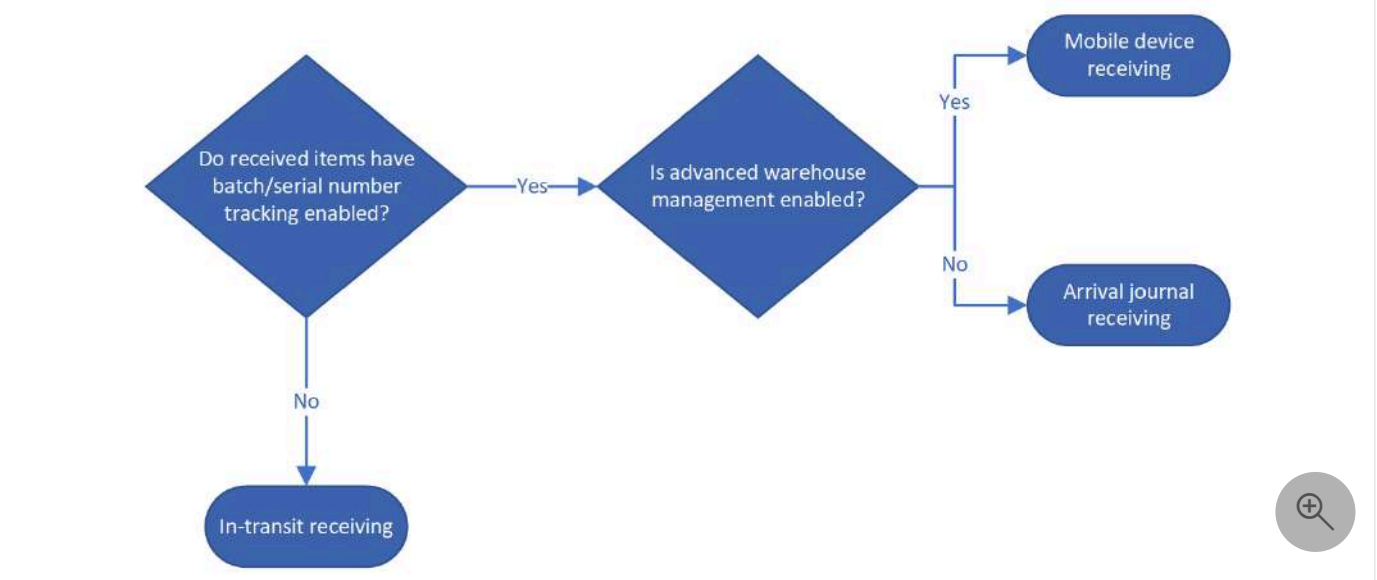
To work with goods-in-transit orders, go to **Landed cost** > **Periodic tasks** > **Goods in transit orders**.

Receiving stock from the goods-in-transit warehouse

You can receive goods from a goods-in-transit order in several ways:

- If warehouse management processes (WMS) isn't enabled for items, you can use in-transit receiving or post an arrival journal.
- If both WMS and batch/serial number tracking are enabled for items, you can use a mobile device to receive goods from a goods-in-transit order.
- If WMS is enabled for items, but batch/serial number tracking isn't, you can use a mobile device or post an arrival journal to register the receipt of goods from a goods-in-transit order.

The following illustration presents the preceding information in the form of a flow diagram to show when you should use each type of receipt method to receive goods-in-transit orders.



In-transit receiving

You can do in-transit receiving from any of the following pages:

- On the **Goods in transit orders** page, select the line, and then, on the Action Pane, select **Receive**.
- On the **All voyages** page, select or open a voyage. Then, on the Action Pane, on the **Manage** tab, in the **Goods in transit** group, select **Receive goods in transit**.
- On the **All shipping containers** page, select or open a shipping container. Then, on the Action Pane, on the **Manage** tab, in the **Goods in transit** group, select **Receive goods in transit**.
- On the **All folios** page, select or open a folio. Then, on the Action Pane, on the **Manage** tab, in the **Goods in transit** group, select **Receive goods in transit**.

> ⓘ Note
>
> In-transit receiving is normally used in situations where locations and batch/serial number tracking aren't used.

Arrival journal

You can also receive goods by creating an arrival journal. You can create an arrival journal directly from the voyage page.

1. Open the voyage, container, or folio.
2. On the Action Pane, on the **Manage** tab, in the **Functions** group, select **Create arrival journal**.
3. In the **Create arrival journal** dialog box, set the following values:
    - **Initialize quantity** – Set this option to *Yes* to set the quantity from the in-transit quantity. If this option is set to *No*, no default quantity is set from the goods-in-transit lines.
    - **Create from goods in transit** – Set this option to *Yes* to take quantities from the selected in-transit lines for the selected voyage, container, or folio.
    - **Create from order lines** – Set this option to *Yes* to set the default quantity in the arrival journal from the purchase order lines. The default quantity in the arrival journal can be set in this way only if the quantity on the purchase order line matches the quantity on the goods-in-transit order.
4. Process the arrival journal as described in Register item receipts with an item arrival journal.

Warehouse mobile device receiving

Goods can be received by using a mobile device, as long as the mobile device menu and the **Warehouse management** module are set up to receive goods on a goods-in-transit order. This section describes the setup that is associated with goods-in-transit receiving.

To set up mobile devices for goods-in-transit processing, go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

Landed cost adds the following work creation processes to the mobile device menu items to support goods-in-transit processing:

- Goods in transit item receiving
- Goods in transit item receiving and putaway

The configuration settings for these processes resemble the settings for the purchase order receive and putaway work creation processes. However, the *Goods in transit item receiving and putaway* process also adds the following field.

- **Enable shipping container complete** – If this option is set to *Yes*, when the putaway work is completed, the Warehouse Management mobile app provides a button named **Shipping container complete**. When that button is selected, the worker is asked to confirm that the container is complete. At that point, all short receipts are processed as an under transaction. The **Shipping container complete** button works just like the **Close** checkbox on the goods-in-transit order receiving page, which is used to depreciate the remaining quantity. The **Shipping container complete** button is available only for under-delivery scenarios and for the **GIT Receive and Putaway** action on the mobile device. When a goods-in-transit order is received in full or as an over-delivery, this button isn't visible.

Specify goods-in-transit orders when receiving with a mobile device

Workers using the Warehouse Management mobile app can register the receipt of goods in transit even when multiple orders are associated with the same voyage, container, item number, and purchase order number. To do so, the worker starts by entering the voyage, container, item, and order numbers, and can then select the relevant goods-in-transit order from a drop-down list.

Differences in mobile device receiving for a goods-in-transit order flow versus a standard purchase order flow

The receipt process for goods-in-transit orders via the **Landed cost** module on a mobile device isn't always consistent with the receipt process for purchase orders when Landed cost and goods-in-transit orders aren't enabled.

Here are some examples of the differences:

- The **Voyage** and **Shipping Container** fields must be set for goods-in-transit receiving. By contrast, these fields aren't needed for standard purchase order receiving.
- *Assign putaway cluster* functionality for the putaway process isn't available for goods-in-transit receiving.
- In the normal receipt process that doesn't involve goods-in-transit orders, the worker can cancel in-process work. The license plate is then automatically deregistered. By contrast, putaway work can't be canceled at mid-stage for goods-in-transit receiving. In this situation, a movement journal must be used to move items back to the receiving location. The registration must then be manually undone.

Receive goods-in-transit orders by using a mobile device when serial/batch numbers are enabled

Workers using the Warehouse Management mobile app can register batch/serial numbers when receiving goods-in-transit orders that include items enabled for batch/serial number tracking. The system consolidates the received quantity for each batch/serial number into one work process and automatically assigns the numbers to the received items.

If batch and serial numbers are known when goods are received, they can be manually specified on the device during the receipt process. When more than one serialized item is received on the Warehouse mobile device, the voyage number, shipping container, item, quantity, and license plate number must be manually entered together with each new serial number.

Alternatively, you can let the system automatically assign batch/serial numbers when you receive items that batch/serial number tracking is enabled for.

Under-receive when batch/serial number control is activated

To under-receive a serial-enabled item, let the system automatically assign batch/serial numbers. If a serial number is manually set for the quantity that is received, the remaining amount on the under-delivery warehouse can't be posted without a serial number.

Location directives

Landed cost adds a new work order type named *Goods in transit* to the **Location directives** page. Configure this work order type in the same manner as the purchase order work order types.

Work templates

This section describes features that the **Landed cost** module adds to work templates.

Goods in transit work order type

Landed cost adds a new work order type named *Goods in transit* to the **Work templates** page. Configure this work order type in the same manner as the purchase order work templates.

Work header breaks

Work templates that have a work order type of *Goods in transit* can be configured to split work headers. On the **Work templates** page, follow one of these steps:

- On the **General** tab for the template, set work header maximums. These maximums work in the same way that they work for purchase order work templates. (Learn more in purchase order work templates.)
- Use the **Work header breaks** button to define when the system should create new work headers, based on fields that are used for sorting. For example, to create a work header for each container ID, select **Edit query** on the Action Pane, and then add the **Container ID** field to the **Sorting** tab of the query editor. Fields added to the **Sorting** tab are available for selection as *grouping fields*. To set up grouping fields, select **Work header breaks** on the Action Pane, and then, for each field that you want to use as a grouping field, select the checkbox in the **Group by this field** column.

Landed cost creates an over transaction if the registered quantity exceeds the original order quantity. When a work header is completed, the system updates the status of the inventory transactions for the principal order quantity. However, it first updates the quantity that is linked to the over transaction after the principal is completely purchased.

If you cancel a work header for an over transaction that is already registered, the over transaction is first reduced by the canceled quantity. After the over transaction is reduced to a quantity of 0 (zero), the record is removed, and any additional quantities are unregistered against the principal order quantity.

Marking for goods-in-transit stock

Goods-in-transit transactions are marked to the purchase order transactions. They're then considered in inventory closing and are reflected in the inventory aging report as zero-on-hand items that have inventory value.

> **Note**
>
> If sales orders are marked to purchase orders to reserve incoming stock, goods-in-transit orders are split if a purchase order line is marked to multiple sales order lines. Any goods-in-transit order that is split must be manually received one by one.

Posting rules for landed cost

Landed cost adds two new posting rules that you can configure. Use these posting rules to financially post the direct purchase order invoice amounts and identify ownership of the goods when they leave the point of origin. This process replaces the concept of *goods received not invoiced*, because the goods are invoiced before they're received.

To work with posting profiles, go to **Inventory management** > **Setup** > **Posting** > **Posting**. On the **Purchase Order** tab, you see the following new posting rules:

- *Landed cost, goods-in-transit* – Specify the posting rules for goods-in-transit management.
- *Landed cost, cost charge accrual* – Specify the posting rules for charge account accrual.

Last updated on 06/17/2026

Process over/under transactions

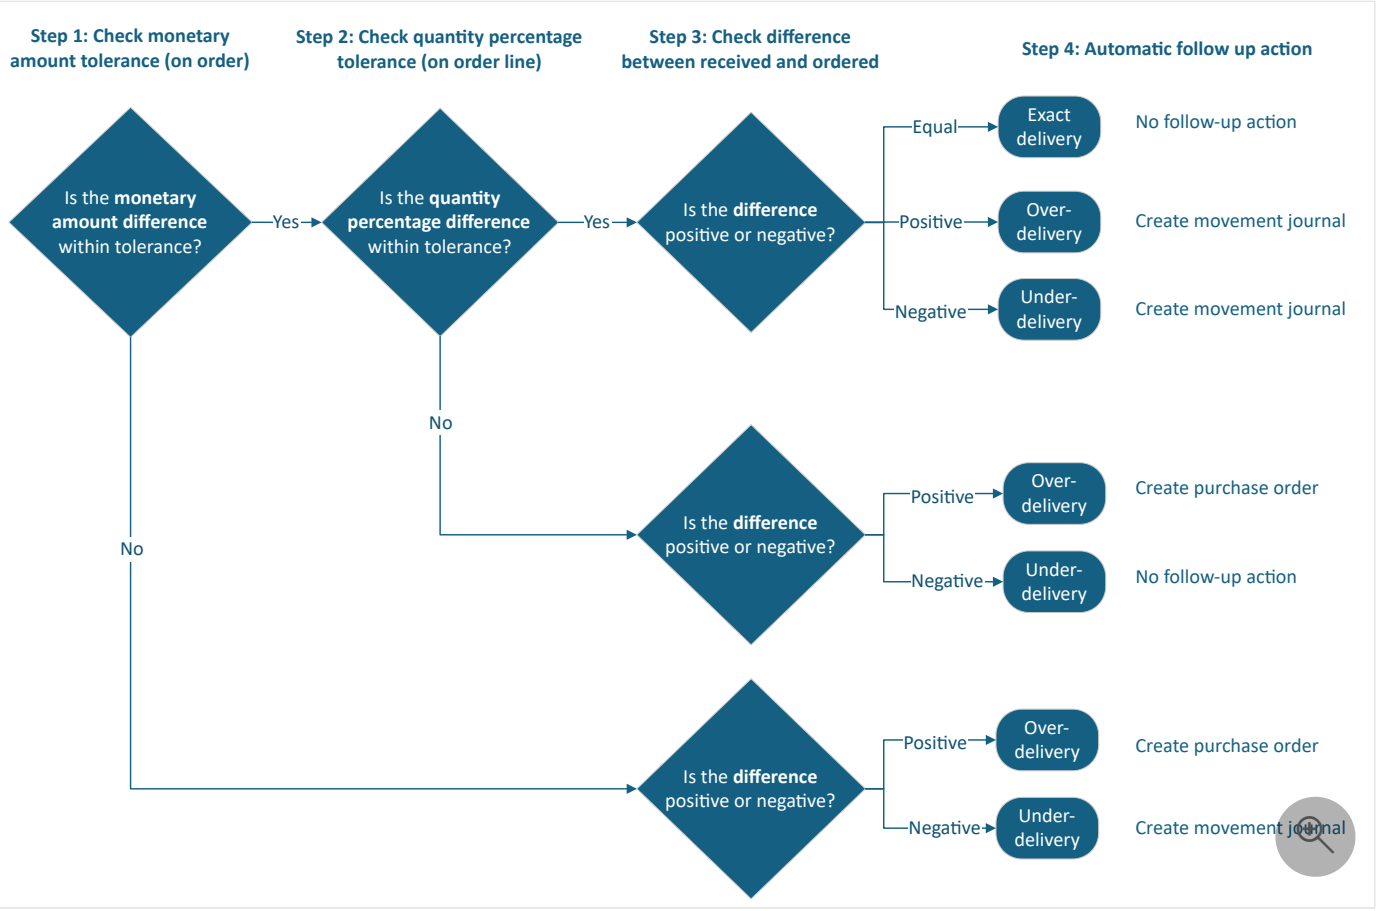
When the orders in a voyage are processed, the system expects the item quantity that is received in the final destination warehouse for consumption to match the quantity specified on the purchase order lines associated with the voyage. However, because the exact quantity on the purchase order lines isn't always received in the warehouse, the **Landed cost** module defines a set of rules that handle over-receiving and under-receiving of goods. These rules are especially important because the original purchase order has been invoiced and can no longer be modified.

By setting up the details of over/under transaction policies, you enable the system to determine how to manage the over-processing and under-processing of goods at the time of receipt. In some cases, an over/under transaction triggers an automatic action. In other cases, resolution requires manual action. You can also manually manage over and under inventory by using the **Over/under transactions** page.

Use a goods-in-transit order to handle over-deliveries and under-deliveries.

Over/under transaction process flow and examples

The following diagram shows a flowchart of the process the system uses to determine whether over/under transactions should be created.



The diagram highlights the following steps of the process:

1. When goods are received, the system compares the total monetary amount of the received purchase with the original purchase order. If there is a difference, the system determines whether it's within or outside the configured amount tolerance.
2. If the difference is within the amount tolerance, the system checks the percentage tolerance against the individual purchase order line.
3. The system determines whether the received amount or quantity is more or less than the ordered amount or quantity.
4. Based on this analysis, the system determines whether an over-delivery or an under-delivery occurred. It then takes the relevant follow-up action as required.

Use the **Over/under transactions** page to track whether the system created an over/under transaction, movement journal, and/or purchase order.

In some cases, a movement journal is automatically created in response to an over-delivery or under-delivery. This movement journal writes off or absorbs the difference between ordered and actual quantities.

In other cases, a purchase order is automatically created. For an over-delivery, the new purchase order records the additional quantity that was received. For an under-delivery, the purchase order

shows a negative quantity, so that the vendor can pay for the missing goods. This negative quantity works as a vendor return or as credit for a future order.

In cases where the system doesn't take any automatic action, you must decide whether to create a movement journal or a purchase order.

Example scenarios

Setup used in the scenarios

All four scenarios use the following setup.

The following over/under tolerances apply. (These tolerances are required so that all items can be used on the purchase order.)

- **Amount tolerance:** $100 (applied to the order)
- **Percentage tolerance:** 10% (applied to the order line)

The following purchase order exists:

- **Line 1:** 10 pcs at $100/ea
- **Line 2:** 20 pcs at $50/ea
- **Total monetary amount of the original purchase order:** $2,000

Because of this setup, any received purchase order where the total value is outside the $1,900–$2,100 threshold is processed as an over/under transaction. Any difference between the quantity of the original and received purchase order lines is considered to be within the percentage tolerance if it's within the following thresholds:

- **Line 1:** 9–11
- **Line 2:** 18–22

Scenario 1

The following items are received and, as a result, the following actions are taken (as shown in the flowchart earlier in this article):

- **Total order:** The total value of the purchase order is $2,050.
  - **Step 1:** The purchase order is *within* the amount tolerance.
- **Line 1:** 10 pcs ($1,000) are received.

    - **Step 2:** Because the exact quantity of the purchase order line was received, the order line is *within* the percentage tolerance threshold.
    - **Step 3:** The received quantity of the purchase order line *equals* the original purchase order line.
    - **Step 4:** The exact quantity of the purchase order line was received. Therefore, the system takes no action.

- **Line 2:** 21 pcs ($1,050) are received.

    - **Step 2:** The difference between the quantity of the original and received purchase order lines is *within* the percentage tolerance threshold.

    - **Step 3:** The received quantity of the purchase order line is *more than* the original purchase order line.

    - **Step 4:** An over-delivery occurred. Therefore, the system creates the following items:
        - An over transaction
        - A movement journal

Scenario 2

The following items are received and, as a result, the following actions are taken (as shown in the flowchart earlier in this article):

- **Total order:** The total value of the purchase order is $2,050.
    - **Step 1:** The purchase order is *within* the amount tolerance.

- **Line 1:** 9 pcs ($900) are received.

    - **Step 2:** The difference between the quantity of the original and received purchase order lines is *within* the percentage threshold.

    - **Step 3:** The received quantity of the purchase order line is *less than* the original purchase order line.

    - **Step 4:** An under-delivery occurred. Therefore, the system creates the following items:
        - An under transaction
        - A movement journal

- **Line 2:** 23 pcs ($1,150) are received.

- **Step 2:** The difference between the quantity of the original and received purchase order lines is *outside* the percentage threshold.
- **Step 3:** The received quantity of the purchase order line is *more than* the original purchase order line.
- **Step 4:** An over-delivery occurred. Therefore, the system creates the following items:
  - An over transaction
  - A purchase order

Scenario 3

The following items are received and, as a result, the following actions are taken (as shown in the flowchart earlier in this article):

- **Total order:** The total value of the purchase order is $1,900.
  - **Step 1:** The purchase order is *within* the amount tolerance.
- **Line 1:** 7 pcs ($700) are received.
  - **Step 2:** The difference between the quantity of the original and received purchase order lines is *outside* the percentage threshold.
  - **Step 3:** The received quantity of the purchase order line is *less than* the original purchase order line.
  - **Step 4:** An under-delivery occurred. Therefore, the system creates an under transaction.
- **Line 2:** 24 pcs ($1,200) are received.
  - **Step 2:** The difference between the quantity of the original and received purchase order lines is *outside* the percentage threshold.
  - **Step 3:** The received quantity of the purchase order line is *more than* the original purchase order line.
  - **Step 4:** An over-delivery occurred. Therefore, the system creates the following items:
    - An over transaction
    - A purchase order

Scenario 4

The following items are received and, as a result, the following actions are taken (as shown in the flowchart earlier in this article):

- **Total order:** The total value of the purchase order is $2,950.
  - **Step 1:** The purchase order is *outside* the amount tolerance. Therefore, step 2 is skipped.
- **Line 1:** 20 pcs ($2,000) are received.
  - **Step 3:** The received quantity of the purchase order line is *more than* the original purchase order line.
  - **Step 4:** An over-delivery occurred. Therefore, the system creates the following items:
    - An over transaction
    - A purchase order
- **Line 2:** 19 pcs ($950) are received.
  - **Step 3:** The received quantity of the purchase order line is *less than* the original purchase order line.
  - **Step 4:** An under-delivery occurred. Therefore, the system creates the following items:
    - An under transaction
    - A movement journal

> **Note**
>
> When an over-delivery automatically triggers the creation of a purchase order, the system also posts a product receipt. However, invoices must always be manually posted for these purchase orders.
>
> Over-delivery and under-delivery quantities don't affect the estimated landed costs. Therefore, automatic costs that are calculated for a voyage or container aren't redistributed across the actual quantities that are received.
>
> Workers who use the Warehouse Management mobile app to receive goods aren't notified when an over-delivery or under-delivery occurs.

Set up over/under transactions

To enable over/under transactions for goods-in-transit orders, you must complete the following setup:

- Set up the good-in-transit feature as described in Goods-in-transit processing and receiving.

- Ensure that a movement journal is set up and specified for the over-delivery or under-delivery in the **Over/Under Delivery** field in the **Defaults** section on the **General** tab of the **Landed cost parameters** page (**Landed cost** > **Setup** > **Landed cost parameters**). As part of this setup, define an offset account.
- Set up over/under tolerances, over/under reasons, and tolerance groups, if applicable, on the **Over/under setup** page (**Landed Cost** > **Setup** > **Over/under setup**).

Over/under tolerances

Over/under tolerances define when a difference between the actual and purchased quantities of goods creates an over/under delivery transaction. You set over-delivery and under-delivery tolerances to specify the over and under quantities or volumes that can be processed on a voyage without causing an error. If the voyage line receipt is outside these tolerances, it must be modified and resolved before the voyage line can be closed for further processing.

By setting tolerance levels, businesses can avoid unexpected expenses that might arise when they receive a smaller quantity of goods than they expected. At the same time, if businesses receive a larger quantity of goods than they expected, they can benefit from the savings and adjust the landed cost calculation accordingly.

To configure the tolerances, go to **Landed cost** > **Over/under setup** > **Over/under tolerances**. There, you can view, edit, add, and remove tolerance records. The following table describes the fields that are available for each record.

Expand table

Field	Description
Account code	Define the scope of vendors that the tolerance applies to by selecting one of the following values: • **Table** – The over/under tolerance applies only to the vendor that is selected for the row. • **Group** – The over/under tolerance applies to all vendors in the vendor tolerance group that is selected for the row. • **All** – The over/under tolerance applies to all vendors.
Account relation	Select the vendor or vendor group that the over/under tolerance applies to, depending on the value that you selected in the **Account code** field.
Item code	Define the scope of items that the tolerance applies to by selecting one of the following values: • **Table** – The over/under tolerance applies only to the item that is selected for the row.

Field	Description
	• **Group** – The over/under tolerance applies to all items in the item tolerance group that is selected for the row. • **All** – The over/under tolerance applies to all items.
Item relation	Select the item or item group that the over/under tolerance applies to, depending on the value that you selected in the **Item code** field.
Amount tolerance	Enter the amount tolerance that should be applied to a whole purchase order. This value is a monetary amount. This field is optional.
Percentage tolerance	Enter the percentage tolerance that should be applied to an individual purchase order line quantity. This field is optional.

> **Note**
>
> The system first checks whether the total amount of the received purchase order falls within the amount tolerance. If it does, the system then checks the percentage tolerance to manage over/under delivery scenarios.

Over/under reasons

When an over or under quantity is associated with a voyage line that is received, you might have to identify the reason for the over or under quantity. In this case, you can select the over-delivery or under-delivery reason on the receiving line when the goods are received.

To set up over-delivery and under-delivery reasons, go to **Landed cost** > **Over/under setup** > **Over/under reasons**. There, you can view, edit, add, and remove the available over-delivery and under-delivery reasons. The following table describes the fields that are available for each reason.

Expand table

Field	Description
Over/under reason	Enter a unique name for the reason for the over-receiving or under-receiving transaction.
Description	Enter a description of the over/under reason.
Movement	Select the movement journal that is associated with the over/under reason. This field lists all available journals that a journal type of *Movement* is associated with on the **Inventory journal names** page (**Inventory management** > **Setup** > **Journal names** > **Inventory**).

Item over/under tolerance groups

Items that have similar tolerances can be grouped together. This setup lets you set the over/under tolerance for all items in that group at the same time.

To set up item over/under tolerance groups, go to **Landed cost** > **Over/under setup** > **Item over/under tolerance groups**. There, you can view, edit, add, and remove over/under tolerance group records. The following table describes the fields that are available for each record.

Expand table

Field	Description
Over/under tolerance group	Enter a unique name for the group. Choose a name that describes the tolerance, such as *1% Var*.
Description	Enter a description of the group.

> **Note**
>
> Configure an item to be part of an over/under tolerance group by using the **Over/under tolerance group** field on the **Purchase** FastTab of the **Released product** page.

Vendor over/under tolerance groups

You can group together vendors that regularly over-deliver or under-deliver. You can then set the over/under tolerance per group.

To set up vendor over/under tolerance groups, go to **Landed cost** > **Over/under setup** > **Vendor over/under tolerance groups**. There, you can view, edit, add, and remove over/under tolerance group records. The following table describes the fields that are available for each record.

Expand table

Field	Description
Over/under groups	Enter a unique name for the group. Choose a name that describes the type of vendors that belong to the group.
Description	Enter a description of the group.

> **Note**

Configure a vendor to be part of an over/under tolerance group by using the **Over/under tolerance group** field on the **Miscellaneous details** FastTab of the **Vendor** page.

View and process over/under transactions on the Over/under transactions page

Over and under transactions are generated when the quantity of goods that is put away doesn't match the initialized quantity. The quantity in the arrival journal should be updated only with the quantity that is put away.

When the receipt of voyage lines is processed, over/under tolerances can be set for a vendor. The items are then reviewed and validated.

If a received item is inside the tolerance, the system generates a movement journal. This journal can be specified on the voyage parameters page. In addition, an over/under transaction is created. For example, the order value is $100, the receipt value is $99, and these values satisfy the tolerance rules. In this case, a negative movement journal for the under-received quantity is created.

If a received item is outside the tolerance, the system generates an over/under transaction for the difference in quantity.

To view and process over/under transactions, go to **Landed cost** > **Inquiries** > **Over/under transactions**. There, an over/under transaction is associated with all the items in a voyage that are over-received or under-received. Use the **Over/under transactions** page to resolve all over/under transactions associated with voyages.

Don't use movement or counting journals to manually resolve under-delivery warehouse transactions. Instead, use the **Over/under transactions** page to manage the under-delivery warehouse quantities.

Upper overview tab

To view your over/under transactions, select the **Overview** tab in the upper part of the **Over/under transactions** page. The following table describes the fields that are available in the grid.

Expand table

Field	Description
Over/under transaction number	The unique name of the over/under transaction record that was automatically created when the arrival journal was processed.
Voyage	The voyage that the purchase line was attached to.
Shipping container	The container that the purchase line was attached to.
Arrival journal	The arrival journal that the over/under line was generated from.
Reference	A reference to the purchase order that is associated with the over/under transaction.
Number	The purchase order that is referenced in the over/under transaction.
Vendor account	The vendor that the over or under is related to.
Goods in transit number	The goods-in-transit number, if applicable.
Item number	The item number that the over or under is related to.
Original quantity	The original quantity of the purchase order line that is attached to the shipment.
Received quantity	The quantity that was actually received.
Difference	The difference between the expected arrival journal amount and the amount that was posted in the arrival journal. A negative value indicates an over-delivery of goods.
Remaining quantity	The quantity that remains on the arrival journal line.
Over/under delivery	A value that indicates whether the quantity that was received is an over or an under.
Status	The status of the over/under transaction. Depending on the settings on the **Landed cost parameters** page, over-delivery can automatically create a movement journal for the over-delivery amount and post the journal. In this case, the over/under transaction will have a status of *Completed*. If action is required to move the goods out of the under-delivery warehouse, the record will have a status of *In process*.
Over/under reason	The reason that is associated with the over/under transaction.
Other inventory dimensions	You can show columns for additional dimensions in the grid as you require. These dimensions include batch number, inventory status, and warehouse. On the Action Pane,

Field	Description
	select **Inventory** > **Display dimensions** to open a dialog where you can select the dimensions to include.

Upper general tab

To view more information about the line that is currently selected on the upper **Overview** tab, select the **General** tab in the upper part of the **Over/under transactions** page. The information on this tab includes the values for all available dimensions. This information is pulled from the originating purchase order.

Lower overview tab

To view the document type for the row that is selected on the upper **Overview** tab, select the **Overview** tab in the lower part of the **Over/under transactions** page. The following table describes the fields that are available.

Expand table

Field	Description
New document type	This field is set to either *Movement journal* or *Purchase order*, depending on the action that is shown on the selected over/under transaction line.
Number	A reference and link to either the purchase order or the movement journal that is associated with the selected over/under transaction line.
Over/under reason	The reason that is associated with the selected over/under transaction line.
Quantity	The quantity that you selected for the purchase order or movement journal that is associated with the selected over/under transaction line.

Lower general tab

To view the over/under transaction number, lot ID, and dimension number that are associated with the selected over/under transaction line, select the **General** tab in the lower part of the **Over/under transactions** page.

Action Pane buttons for processing over/under transactions

The Action Pane on the **Over/under transactions** page provides the following commands for processing the selected transactions. Each command lets you choose how to process each

transaction.

- **Create** > **Movement** – Create and post a movement journal for the selected transaction. For under transactions, a movement journal is automatically created and posted for the difference between the expected and actual received quantity. Select this command for over transactions if you want the vendor to realize the cost difference.
- **Create** > **Purchase order** – Create a purchase order for the difference between the expected and actual received quantity of the selected transaction. Select this command for over transactions if your organization will realize the cost difference.
- **Create** > **Transfer to destination** – This command applies only to transfer orders. Select it if you want to transfer the over or under quantity to the destination warehouse.
- **Create** > **Transfer to origin** – This command applies only to transfer orders. Select it if you want to transfer the over or under quantity to the origin warehouse.

Over-receive or under-receive goods-in-transit orders when quality orders are enabled

When a goods-in-transit order is under-received, if the **Per Updated Quantity** parameter is enabled on the **Item sampling** page (**Inventory management** > **Setup** > **Quality control** > **Item sampling**), a quality order is created for the actual quantity that was received. If the parameter is disabled, a quality order is created based on the order quantity of the goods-in-transit order.

When a goods-in-transit order is over-received, the system automatically creates either a purchase order or a movement journal for the quantity that was over-delivered. In this case, a quality order is created based on the original quantity of the goods-in-transit order.

- If the system creates a purchase order, and you want the over-delivered quantity also to go through the quality check process, you must add a quality association for the new purchase order.
- If the system creates a movement journal, you can manually create a quality order for the over-delivered amount on the goods-in-transit order page.

Learn more about how to set up quality orders for Landed cost in Quality orders.

Last updated on 06/22/2026

Update tracking for put away

The *Update tracking for put away* periodic task is designed to be run as a nightly recurring batch. It identifies which voyages have received all inventory transactions, and which voyages don't have a value for the actual end date. It then sets the actual end date to the current date as required.

Container activities are created for each *leg* of a journey for each *shipping container*. These values are defined by the journey template that is selected when a voyage is created. For each container activities record, values can be set for the **Start date**, **Estimated end date**, and **Actual end date** fields. These fields can be updated when confirmation is received that a leg has begun or has been completed.

Typically, information that is related to confirmed dates is provided by a third party, such as a freight forwarder, because these actions are maintained outside Microsoft Dynamics 365 Supply Chain Management. However, information from a third party isn't required to track the arrival of goods from a journey leg into the warehouse (as marked by the putaway of goods). Therefore, tracking can be determined based on information in Dynamics 365 Supply Chain Management.

To set up and run the *Update tracking for put away* periodic task, follow these steps:

1. Go to **Landed Cost** > **Periodic tasks** > **Update tracking for put away**.

2. In the **Update tracking for put away** dialog box, in the **Parameters** section, set the following fields:

    - **Leg** – Select the unique identification name/number for the part of a journey that you want to update tracking for. The selected value must represent the arrival of the voyage at the warehouse.
    - **Activity** – Select the activity that was undertaken during the selected leg. These values are assigned per journey template line in the tracking control center.

3. To limit the set of records that should be included in the update, on the **Records to include** FastTab, select the **Filter** button. A standard query dialog box appears, where you can define selection criteria, sorting criteria, and joins. The fields work just as they do for other types of queries in Supply Chain Management. The fields here are read-only and show values that are related to your query.

4. On the **Run in the background** FastTab, set up batch and scheduling options as you require, just as you might do for other types of jobs in Supply Chain Management.

5. Select **OK** to apply your settings, and to run or schedule the update.

Landed cost inquiries

Article • 02/12/2025

Voyage line inquiries

The **Voyage lines** inquiry shows all voyage lines as they pertain to inventory. This inquiry can be used as a filter to help you find an item, purchase order, or other useful piece of information. It can also be used to identify the expected delivery date of an item that might be on one or more voyages. In this way, it can help you manage expected inventory receiving.

To open this inquiry, go to **Landed cost** > **Inquiries** > **Voyage lines**.

Overview tab

The **Overview** tab of the **Voyage lines** inquiry page includes a grid that shows basic information about each relevant voyage line. The following table describes the columns in the grid.

Expand table

Column	Description
Item number	The item for the voyage line.
Reference	The type of order (purchase order or transfer order).
Number	The purchase order number or transfer order number.
Folio	The folio that is associated with the voyage line.
Shipping container	The shipping container that is associated with the voyage line.
Voyage	The voyage that is associated with the voyage line.
Quantity	The quantity of the item for the voyage line.
(Other dimensions)	You can show columns for additional dimensions as you require. Those dimensions include batch number, inventory status, and warehouse. On the Action Pane, select **Inventory** > **Display dimensions** to open a dialog box where you can select the dimensions to include.

General tab

Select the **General** tab to view more information about the line that is currently selected on the **Overview** tab.

Dimensions tab

Select the **Dimensions** tab to view values for all available dimensions for the line that is currently selected on the **Overview** tab, regardless of the dimensions that you've selected to show on that tab.

Cost estimate inquiries

Every time that you generate a cost estimate, the estimate is added to the **Cost estimates** inquiry page. For complete details about how to generate, view, and work with cost estimates (including estimates on the inquiry page), see Estimate and manage landed costs.

Item tracking

Use the **Item tracking** page to view open purchase orders lines and their current status. Lines don't have to be associated with a voyage to appear here. However, if an item is associated with a voyage, the item tracking record line shows the voyage ID.

To open this page, go to **Landed cost** > **Inquiries** > **Tracking** > **Item tracking**.

Because your system probably contains a very large number of purchase order lines, the **Item tracking** page initially shows no records. Start by using the filter fields at the top of the page to define the set of purchase order lines that you're looking for. Then select **Update** on the Action Pane to generate the list. You can use an asterisk (*) as a wildcard character in any of the filter fields. For example, to find all purchase order lines for items that include the word "DVD" in their name, set the **Type** field to **Product name**, and enter **DVD** in the **Field value** field.

> **Note**
>
> Currently, backorders include only sales orders. Sales quotations aren't shown or considered backorders.

The following table describes the columns in the grid on the **Item tracking** page.

Expand table

Column	Description
To port	The final destination.
Confirmed	The confirmed date of the purchase order line.
Delivery Date	The delivery date of the purchase order line.
Voyage	If the line is associated with a voyage, the voyage ID.
Shipping Container	If the line is attached to a shipping container, the container ID.
Shipping port	The current port, based on the first leg in the tracking form where no actual date is set for the shipping container that is associated with the purchase order line.
Activity	The current activity, based on the first leg in the tracking form where no actual date is set for the shipping container that is associated with the purchase order line.
Estimated end date	The date when the voyage is expected to be received at the destination warehouse.
Name	The name of the vendor.
Voyage Status	The shipment status that is attached to the purchase order line.
Item number	The item number for the purchase order line.
External	The vendor's item name.
Product Name	The name of the item for the purchase order line.
Quantity	The purchase order line quantity for the purchase order line.
Unit	The unit of measure for the purchase order line.
Reference	The type of order (purchase order or transfer order)
Reference number	The purchase order number or transfer order number.
Backorder	A symbol indicates that there are sales backorders for the item.
(Other dimensions)	You can show columns for additional dimensions as you require. Those dimensions include batch number, inventory status, and warehouse. On the Action Pane, select **Display dimensions** to open a dialog box where you can select the dimensions to include.

Related information about backorders

To view more information about backorders, select the **Related information** tab on the right side of the page, and then select **Backorders**. To view even more information about a specific backorder, select the row for it, and then select the **More** link.

Individual shipping container tracking

The **Individual shipping container tracking** inquiry provides a filter that lets you find a shipping container and then identify all the voyage lines in that container.

To open this inquiry, go to **Landed cost** > **Inquiries** > **Tracking** > **Individual shipping container tracking**.

Multiple shipping container tracking

The **Multiple shipping container tracking** inquiry provides a filter that lets you find a collection of shipping containers and then identify all the voyage lines in those containers.

To open this inquiry, go to **Landed cost** > **Inquiries** > **Tracking** > **Multiple shipping container tracking**.

Landed cost reports

Article • 02/12/2025

Outstanding invoices

The outstanding invoices report contains a list of all outstanding invoices of the various cost levels that are associated with every voyage. It's used to reconcile the voyage and voyage costs together with the ledger transactions list on a regular basis. After an overhead cost has been invoiced, it's removed from the report.

To generate an outstanding invoices report, follow these steps.

1. Go to **Landed cost** > **Reports** > **Tracking** > **Outstanding invoices**.
2. In the **Outstanding invoices** dialog box, in the **As at date** field, specify a date. Any invoice that was outstanding on or before that date will be included in the output.
3. Under **Show**, select one of the following options:
    - **Cost not invoiced** – Include costs for invoiced shipments that have an estimated cost value but no actual cost.
    - **Stock not invoiced** – Include costs that have been invoiced, but that the purchase order hasn't yet been received for.
    - **All not invoiced** – Include the results of both the **Cost not invoiced** option and the **Stock not invoiced** option.
4. Set the **Include new costs** option to *Yes* to include costs that don't yet have an actual cost, and that inventory hasn't been received for. If you set it to *No*, the report will include only costs that have been invoiced.
5. In the **View** section, enable each type of detail that you want to include on the report.
6. As you do for other types of reports in Microsoft Dynamics 365 Supply Chain Management, use the **Destination** FastTab to select the output format of the report.
7. As you do for other types of reports in Supply Chain Management, use the **Records to include** FastTab to further limit the records that will be included on the report.
8. Select **OK** to generate the report.

Activity/provider analysis reports

The activity/provider analysis reports let you review the accuracy of your time estimates for each provider.

To generate an activity/provider analysis report, follow these steps.

1. Depending on the type of report that you want to create, follow one of these steps:

    - Go to **Landed cost** > **Reports** > **Analysis of activity/provider by activity**. In this case, the time estimates will be grouped by activity.
    - Go to **Landed cost** > **Reports** > **Analysis of activity/provider by provider**. In this case, the time estimates will be grouped by provider.

    Either the **Analysis of activity/provider by activity** dialog box or the **Analysis of activity/provider by provider** dialog box appears. Both dialog boxes provide the same options.

2. As you do for other types of reports in Supply Chain Management, use the **Destination** FastTab to select the output format of the report.

3. As you do for other types of reports in Supply Chain Management, use the **Records to include** FastTab to further limit the records that will be included on the report.

4. Select **OK** to generate the report.

Voyage costing reports

The voyage costing reports show the cost of the items and the import costs per folio, shipping container, or voyage, depending on the options that you select when you generate the report. Each voyage costing report lets you view the estimated cost of a voyage versus the actual cost, and it can be broken down by the several identifying factors.

To generate a voyage costing report, follow these steps.

1. Depending on the type of report that you want to create, follow one of these steps:

    - Go to **Landed cost** > **Reports** > **Costing** > **Voyage costing by individual cost**. In this case, the individual cost option will show import costs per cost area per cost type code.

- Go to **Landed cost** > **Reports** > **Costing** > **Voyage costing by reporting category**. In this case, the import cost will be broken down into the various reporting categories. Cost types are grouped by reporting categories.

Either the **Voyage costing by individual cost** dialog box or the **Voyage costing by reporting category** dialog box appears. These dialog boxes are similar. Any differences are noted in the rest of this procedure.

2. If you opened the **Voyage costing by reporting category** dialog box, in the **Cost** field, select one of the following values:

   - **Cost value** – The value is either calculated by using auto costs or manually created in the cost area.
   - **Estimated** – After the goods have been received, the estimated cost is set.
   - **Actual** – After the order has been invoiced, the actual cost is set to the cost on the invoice.
   - **Best** – The system will use whichever of the previous three options is most accurate. (We recommend that you select this option.)

3. Set the **Per item** option to *Yes* to show the cost of each item. Set it to *No* to show costs per voyage.

4. In the **View** section, select the categories to break down the cost by.

5. In the **Dimensions** section, select the dimensions to include on the report.

6. As you do for other types of reports in Supply Chain Management, use the **Destination** FastTab to select the output format of the report.

7. As you do for other types of reports in Supply Chain Management, use the **Records to include** FastTab to further limit the records that will be included on the report.

8. Select **OK** to generate the report.

Shipping container receipts list

The shipping container receipts list contains all unreceived quantities that are due on or before an expected date. Warehouse staff can use this report to identify the expected goods on a shipping container. It can also be used to manually validate goods as they are received on a shipping container.

To generate a shipping container receipts list, follow these steps.

1. Go to **Landed cost** > **Reports** > **Tracking** > **Shipping container receipts list**.
2. In the **Shipping container receipts list** dialog box, in the **Expected date** field, specify a date. Any quantities that were unreceived on or before that date will be included in the output.
3. In the **Dimensions** section, select the dimensions to include on the report.
4. As you do for other types of reports in Supply Chain Management, use the **Destination** FastTab to select the output format of the report.
5. As you do for other types of reports in Supply Chain Management, use the **Records to include** FastTab to further limit the records that will be included on the report.
6. Select **OK** to generate the report.

Expected delivery report

The expected delivery report contains basic information about the voyage, shipping container, folio, items, and expected date of delivery.

To generate an expected delivery report, follow these steps.

1. Go to **Landed cost** > **Reports** > **Tracking** > **Expected Delivery**.
2. In the **Expected delivery** dialog box, in the **Expected date** field, select the date when delivery of the goods to the final destination warehouse is expected. Any voyage line that has an expected date on or before that date, and that hasn't yet been received, will be included in the output.
3. Optional: In the **Vendor account** field, select a vendor account to include only deliveries from a specific vendor.
4. In the **Dimensions** section, select the dimensions to include on the report.
5. As you do for other types of reports in Supply Chain Management, use the **Destination** FastTab to select the output format of the report.
6. As you do for other types of reports in Supply Chain Management, use the **Records to include** FastTab to further limit the records that will be included on the report.
7. Select **OK** to generate the report.

Landed cost entities overview

The **Landed cost** module helps businesses streamline inbound shipping operations by providing complete financial and logistical control over imported freight, from the manufacturer to the warehouse. Transaction data entities for Landed cost enable external data sources (such as freight forwarder services) to create voyages and costs, and update container tracking records.

Here are some of the supported operations:

- Create and update voyage, shipping container, and folio records for existing inbound order lines.
- Create and update estimated costs for each cost area.
- Create and update shipping container activity records to capture the start date, estimated end date, and actual end date for each leg of the container's journey.
- Create vendor cost invoice allocations.

Last updated on 11/26/2025

Voyage creation entities

Article • 01/31/2025

The voyage creation data entities group together the data entities that are required to create a working voyage. You or your freight forwarder can use these data entities to create voyage, shipping container, folio, and voyage line records that reference existing purchaser order or transfer order lines.

Voyages (ITMTableEntity)

The voyage represents the journey of inbound goods and serves as the highest-level cost area in Landed cost. It contains header-level information that is related to the vessel, port of origin, and destination port. This functionality is supported by the `ITMTableEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Mode of delivery	ITMTable.DlvModeId	Nvarchar(10)	No	No

Number sequences for voyages

The shared number sequence for voyages controls the allocation of voyage IDs.

The value that is passed to the data entity as the **Voyage ID** (`ShipId`) value is used to identify an existing record for update. If that record doesn't exist, the behavior depends on whether the assigned number sequence is configured to allow for manual entry:

- If manual entry is enabled, a new record is created that uses the passed value.
- If manual entry isn't enabled, the next number in the assigned number sequence is used instead of the passed value.

During the import session, the placeholder value that is imported as the voyage ID is retained. This behavior ensures that shipping container and voyage lines that reference the placeholder are included in the voyage, and that they're updated to reflect the value that is assigned from the number sequence.

Automatic cost transactions

Automatic costs can be added to a voyage from the **Auto costs** page in Microsoft Dynamics 365 Supply Chain Management (**Landed cost** > **Costing setup** > **Auto costs**). Records for automatic costs can also be created by using cost transaction data entities for each cost area that Landed cost supports.

Automatic costs that are configured in Supply Chain Management are applied to the voyage when a voyage line is created. No costs will be visible against the record until the header record is associated with line information.

Shipping containers (ITMContainersEntity)

A shipping container represents a physical container that goods are transported in. This physical container might be a freight container for ocean freight or a single pallet for air freight. The shipping container includes header-level information that is related to the shipping container ID, seal number, and shipping container type. (The shipping container type provides dimension information.) This functionality is supported by the `ITMContainersEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Departure date	ITMContainers.ITMDepartureDate	Datetime	No	No

Voyage ID validation

The shipping container ID isn't controlled by a number sequence. It's unique only in the context of the voyage that it's used on.

If the shipping container entity (`ITMContainersEntity`) is used independently of the voyage entity (`ITMTableEntity`), the **Voyage ID** (`ShipId`) value must match an existing record in the voyage table. Otherwise, the import will fail.

If the shipping container entity (`ITMContainersEntity`) and the voyage entity (`ITMTableEntity`) are used as part of the same import session, the voyage entity must precede the creation of a shipping container. Otherwise, the **Voyage ID** (`ShipId`) value can't be successfully validated. If a placeholder value is used for the **Voyage ID** (`ShipId`) value, the association can be created only if the same placeholder is used as the **Voyage ID** (`ShipId`) value in the shipping container entity.

Other field validations

The following table shows the fields in the shipping container table (`ITMContainers`) that are validated against Landed cost setup tables. It also shows the Landed cost data entities that a freight forwarder can use to read the existing values and ensure that valid values are received in your environment.

Expand table

Field in the ITMContainers table	Landed cost data entity
Shipping container type	ITMShippingContainerTypeEntity
Description of goods	ITMGoodsDescriptionEntity
Refrigeration type	ITMShippingContainerRefrigerationTypeEntity

Folios (ITMFolioEntity)

A folio represents a grouping of items in a shipping container for the purposes of customs declarations. The folio includes header-level information that is related to the customs broker and a description of the goods. This functionality is supported by the `ITMFolioEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory

House air way/Bill of lading	ITMFolioTable.ShipHAWB	Nvarchar(20)	No	No
Voyage	ITMFolioTable.ShipId	Nvarchar(20)	No	**Yes**

Name	Mapping	Data type	Key	Mandatory
Measurement	ITMFolioTable.ShipMeasurement	Numeric(32, 6)	No	No
Measurement unit	ITMFolioTable.ShipMeasurementUnit	Int	No	No
Number of cartons	ITMFolioTable.ShipNoOfCartons	Numeric(32, 6)	No	No
Original bill of landing sent	ITMFolioTable.ShipOriginalBOLSebt	Datetime	No	No
Original documents received	ITMFolioTable.ShipOriginalDocsReceived	Datetime	No	No
Purchase order status	ITMFolioTable.ShipPurchStatus	Int	No	No
Remarks	ITMFolioTable.ShipRemarks	Nvarchar(MAX)	No	No
Voyage status	ITMFolioTable.ShipStatusId	Nvarchar(20)	No	No
Tariff code	ITMFolioTable.ShipTariffCode	Nvarchar(10)	No	No
To port	ITMFolioTable.ShipToPort	Nvarchar(20)	No	No
Valuation date	ITMFolioTable.ShipValuationDate	Datetime	No	No
Verification date	ITMFolioTable.ShipVerificationDate	Datetime	No	No
Vendor account	ITMFolioTable.VendAccount	Nvarchar(20)	No	No

Number sequences for folios

The number sequence for folios controls the allocation of folio IDs.

The value that is passed to the data entity as the **Folio ID** (`FolioId`) value is used to identify an existing record for update. If that record doesn't exist, the behavior depends on whether the assigned number sequence is configured to allow for manual entry:

- If manual entry is enabled, a new record is created that uses the passed value.
- If manual entry isn't enabled, the next number in the assigned number sequence is used instead of the passed value.

During the import session, the placeholder value that is imported as the folio ID is retained. This behavior ensures that voyage lines that reference the placeholder are correctly associated, and that they're updated to reflect the value that is assigned from the number sequence.

Field validations

The **Description of goods** field in the folio table (`ITMFolioTable`) is validated against the Landed cost setup table of the same name. A freight forwarder can use the `ITMGoodsDescriptionEntity` Landed cost data entity to read the existing values and ensure that valid values are received in your environment.

Voyage lines for purchase orders (ITMPurchaseLineEntity)

The voyage line represents a single purchase order line that is included in the voyage. This relationship is established through the **Purchase order number** and **Purchase line number** fields. The voyage line references each previous record that was created for the voyage, shipping container, and folio. This functionality is supported by the `ITMPurchaseLineEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Currency	ITMLine.CurrencyCode	Nvarchar(3)	No	No
Net amount	ITMLine.LineAmountMST	Numeric(32, 6)	No	No
Purchase line number	ITMLine.RefRecId	Numeric(32, 6)	**Yes**	No
Shipping container	ITMLine.ShipContainerId	Int	No	No
Company	ITMLine.ShipDataArea	Nvarchar(20)	**Yes**	No
Declared quantity	ITMLine.ShipDeclaredQty	Nvarchar(4)	No	No
Folio	ITMLine.ShipFolioId	Numeric(32, 6)	No	No
Voyage	ITMLine.ShipId	Nvarchar(20)	**Yes**	No
Item number	ITMLine.ShipItemId	Nvarchar(20)	No	No
Measurement	ITMLine.ShipMeasurement	Nvarchar(20)	No	No

Unit	ITMLine.UnitId	Int	No	No
Volume	ITMLine.Volume	Nvarchar(10)	No	No
Weight	ITMLine.Weight	Numeric(32, 6)	No	No

Voyage lines for transfer orders (ITMTransferLineEntity)

The voyage line represents a single transfer order line that is included in the voyage. This relationship is established through the **Transfer order number** and **Transfer line number** fields. The voyage line references each previous record that was created for the voyage, shipping container, and folio. This functionality is supported by the `ITMTransferLineEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Currency	ITMLine.CurrencyCode	Nvarchar(3)	No	No
Net amount	ITMLine.LineAmountMST	Numeric(32, 6)	No	No

Unit	ITMLine.UnitId	Int	No	No
Volume	ITMLine.Volume	Nvarchar(10)	No	No
Weight	ITMLine.Weight	Numeric(32, 6)	No	No

Reference table

Voyage lines are created through an association with an open inbound order line. This line can be on a purchase order, or it can be the receive transaction on a transfer order. The `RefTableId` field in the voyage line table (`ITMLine`) specifies which order type the line is related to by referencing the table number. If specific table numbers are referenced in the table where the data is being created, the entities are split based on those values.

The values for the reference table (`RefTableId`) and the transaction type (`TransType`) are implicit in the selection of either the Landed cost purchase line entity or the Landed cost transfer line entity.

Validation

A voyage line directly references a voyage record, a shipping container record, and a folio record. If the purchase line entity (`ITMPurchaseLinesEntity`) or transfer line entity (`ITMPurchaseLinesEntity`) is used independently of the entities that are used to create these reference records, the **Voyage ID** (`ShipId`), **Shipping container** (`ShipContainerId`), and **Folio** (`ShipFolioId`) values must match an existing record in the corresponding tables. Otherwise, the import will fail.

If either line entity is used as part of the same import session, those other entities must precede the creation of a voyage line. Otherwise, the values can't be successfully validated. If a placeholder value is used for the voyage or folio number, the association can be created only if the same placeholder is used for the voyage or folio number in the voyage line entity.

If the purchase order or transfer order line is already assigned to an existing voyage line, the new voyage line won't be created. Before the order line can be assigned to a new voyage, it must be removed from its current voyage.

Order line identification

Voyage lines directly reference the reference **Record ID** (`RefRecId`), **Inventory dimension ID** (`InventDimId`), and **Inventory transaction ID** (`InventTransId`) values. These values no longer have to be included when the data entity is used. Instead, the order line number must now be included. Together, the order line number and the order number enable each of those reference values to be identified.

Voyage line quantity

Because a voyage line is directly associated with an order line, the **Quantity** (`ShipQty`) value that is entered by using the entity requires that the values match. Validation is run against the quantity on either the purchase order line or the transfer line. If the validation fails, the record won't be processed.

Calculated fields

The **Weight** and **Volume** calculated fields accept the values that are received through the data entity. If no values are provided, the system values are used to update these fields, if system values are available. For Landed cost, the values are calculated in the following way:

- *Weight = Quantity × Item gross weight*
- *Volume = Quantity* × (*Item gross depth* × *Item gross height* × *Item gross width*)

Sequencing

Because of dependencies between the tables, the voyage record must be created first. The voyage line can be created only after the voyage, shipping container, and folios have been created.

To create a voyage without validation warnings, the system must process the entities in the following order:

1. Voyages (`ITMTableEntity`)
2. Shipping containers (`ITMContainersEntity`)
3. Folios (`ITMFolioTableEntity`)
4. Voyage lines (`ITMPurchaseLinesEntity` or `ITMTransferLinesEntity`)

Cost transaction entities

Article • 02/12/2025

Apportionment

Landed cost enables the value of a cost to be split among the contents of a cost area (voyage, shipping container, and so on) through the selection of an apportionment method. The apportionment method is set as part of the configuration of automatic costs that is based on business rules. It's pulled through as a part of the cost when a voyage line is created.

Configure the apportionment mapping for use with data entities

When a cost is created from an external source such as a freight forwarder, that external source can't specify the preferred method for apportioning the cost value. The apportionment mapping defines the default apportionment method for each cost type code. The apportionment mapping table is accessed from the **Apportionment mapping** page in Microsoft Dynamics 365 Supply Chain Management (**Landed Cost** > **Costing setup** > **Apportionment mapping**).

If a mapping combination has been defined, and a cost that matches the cost type code is created by using a cost transaction entity, the mapped apportionment method is used instead of any value was provided to the entity.

If no value is present in the mapping table, but a value has been provided to the entity, the provided value is used.

If no value exists in either the mapping table or the record that was submitted to the entity, creation fails.

Apportionment mapping (ITMApportionmentMapping)

The apportionment mapping entity (`ITMApportionmentMapping`) creates apportionment mapping relationships and enables users to create or update records.

Expand table

Name	Mapping	Data type	Key	Mandatory
Apportionment method	ITMApportionmentMapping.ApportionmentMethod	Int	No	No
Cost type code	ITMApportionmentMapping.ShipCostTypeId	Nvarchar(20)	**Yes**	No

Voyage costs (ITMCostTransVoyageEntity)

The voyage cost entity (`ITMCostTransVoyageEntity`) creates voyage cost transactions that are applied at the voyage level. During the import process, the system uses the **Category** and **Apportionment method** values that are included in the entity to determine how the value of the cost is apportioned across the contents of the voyage.

Expand table

Name	Mapping	Data type	Key	Mandatory
Apportionment method	ITMCostTrans.ApportionmentMethod	Int	No	No
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No
Cost type code	ITMCostTrans.ShipCostTypeId	Nvarchar(20)	No	No
Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Voyage	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No

Shipping container costs (ITMCostTransShippingContainerEntity)

The shipping container cost entity (`ITMCostTransShippingContainerEntity`) creates shipping container costs that are applied at the shipping container level. During the import process, the system uses the **Category** and **Apportionment method** values that are included in the entity to determine how the value of the cost is apportioned across the contents of the shipping container.

The **Aggregate**, **Leg**, and **Linked leg** fields are specific to records where the **Cost area** value is *Shipping container*. Therefore, they aren't present in data entities for other cost areas.

Expand table

Name	Mapping	Data type	Key	Mandatory
Aggregate	ITMCostTrans.AggregatedCost	Int	No	No
Apportionment method	ITMCostTrans.ApportionmentMethod	Int	No	No
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Linked leg	ITMCostTrans.LinkLegId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Shipping Container	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No
Cost type code	ITMCostTrans.ShipCostTypeId	Nvarchar(20)	No	No
Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Voyage	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Leg	ITMCostTrans.ShipLegId	Nvarchar(20)	No	No
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No

Folio costs (ITMCostTransFolioEntity)

The folio cost entity (`ITMCostTransFolioEntity`) creates cost transaction records that apply to the folio level. During the import process, the system uses the **Category** and **Apportionment method** values that are included in the entity to determine how the value of the cost is apportioned across the contents of each folio.

Expand table

Name	Mapping	Data type	Key	Mandatory
Apportionment method	ITMCostTrans.ApportionmentMethod	Int	No	No
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No
Cost type code	ITMCostTrans.ShipCostTypeId	Nvarchar(20)	No	No
Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Folio	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No

Purchase order costs (ITMCostTransPurchaseEntity)

The purchase order cost entity (`ITMCostTransPurchaseEntity`) creates cost transactions that apply to the purchaser order header. During the import process, the system uses the **Category** and **Apportionment method** values that are included in the entity to determine how the value of the cost is apportioned across the contents of each folio.

Expand table

Name	Mapping	Data type	Key	Mandatory
Apportionment	ITMCostTrans.ApportionmentMethod	Int	No	No

Name	Mapping	Data type	Key	Mandatory
method				
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Purchase order	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No
Cost type code	ITMCostTrans.ShipCostTypeId	Nvarchar(20)	No	No
Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No

Item costs (ITMCostTransItemEntity)

The item cost entity (`ITMCostTransItemEntity`) creates cost transactions that apply to the item level. This entity is specific to items on purchase order lines. The value of the cost is applied in full to the line.

The **Adjustment amount** and **Value adjustment** fields are specific to the line-level cost areas. Therefore, they aren't present in data entities for other cost areas.

Expand table

Name	Mapping	Data type	Key	Mandatory
Adjustment amount	ITMCostTrans.AdjustmentAmount	Numeric(32, 6)	No	No
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No

Name	Mapping	Data type	Key	Mandatory
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Purchase order	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Purchase order line number	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No

Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No
Value adjustment	ITMCostTrans.ValueAdjustmentMethod	Int	No	No

Transfer line costs (ITMCostTransTransferLineEntity)

The transfer line cost entity (`ITMCostTransTransferLineEntity`) creates cost transactions that apply to the transfer order line level. The value of these costs is applied in full to the transfer order line.

The **Adjustment amount** and **Value adjustment** fields are specific to the line-level cost areas. Therefore, they aren't present in data entities for other cost areas.

Expand table

Name	Mapping	Data type	Key	Mandatory
Adjustment amount	ITMCostTrans.AdjustmentAmount	Numeric(32, 6)	No	No
Cost value	ITMCostTrans.CostValue	Numeric(32, 6)	No	No
Currency	ITMCostTrans.CurrencyCode	Nvarchar(3)	No	**Yes**
Line number	ITMCostTrans.LineNum	Numeric(32, 16)	**Yes**	No

Name	Mapping	Data type	Key	Mandatory
Linked cost type	ITMCostTrans.LinkCostTypeId	Nvarchar(20)	No	No
Minimum cost	ITMCostTrans.MinCostAmount	Numeric(32, 6)	No	No
Category	ITMCostTrans.ShipCostCategory	Int	No	No
Cost type code	ITMCostTrans.ShipCostTypeId	Nvarchar(20)	No	No
Company	ITMCostTrans.ShipDataArea	Nvarchar(4)	No	**Yes**
Transfer order	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Transfer order line number	ITMCostTrans.TransRecId	Nvarchar(20)	**Yes**	No
Item sales tax group	ITMCostTrans.TaxItemGroup	Nvarchar(10)	No	No
Value adjustment	ITMCostTrans.ValueAdjustmentMethod	Int	No	No

Transaction table

A cost transaction record is associated with a cost area through the assignment of a transaction table number (`TransTableId`). When specific table identification numbers are required, the entities are split based on these values, so that an entity exists for each cost area.

The value for the transaction table (`TransTableId`) is implicit in the selection of the cost transaction entity.

Calculated fields

The following fields aren't available for insert or update when a cost transaction entity is used, because these fields are set only when specific actions are taken against the voyage record:

- **Estimated cost** – This field is set when an invoice is posted for the voyage (purchase order) or a transfer is received.
- **Estimated cost currency** – This field is set when an invoice is posted for the voyage (purchase order) or a transfer is received.
- **Actual cost** – This field is set when a vendor invoice is posted. It's associated with the cost.

Find auto costs

A **Find auto costs** button that is available for each cost area (voyage, shipping container, and so on) provides a way to update the cost transactions for that cost area from the information in the configuration tables. When you select the button for a cost area, the system clears existing costs for that cost area and creates new records, based on the current configuration of the auto cost setup tables.

Cost transaction records that are created by using a data entity are flagged as imported. These records aren't deleted when you select **Find auto costs**, because they won't be re-created from the auto cost setup tables. However, a cost transaction record that is flagged as imported can still be deleted.

Linked fields

Each cost transaction can be associated with another record in the same cost area. This association is established through the **Linked cost type** field. It enables a cost value to be calculated as a percentage of another cost.

The **Linked cost type** field can be validated only if the record that is being referenced is processed first, or if it already exists in the table. The same requirement applies to the **Linked leg** field that is used for costs in the shipping container cost area only.

Feedback

Was this page helpful? Yes No

Provide product feedback

Container activities entity

Container activities are used to track the progress of shipping containers. A record is created for each leg that is assigned to the journey template that is selected at the time of shipping container creation. Records are also created when the shipping container is created via a data entity.

Information about the progress of an in-transit shipping container is often received from an external source. The container activities entity enables an external source such as a freight forwarder to directly update the record. Therefore, no manual update of data is required.

Container activities (ITMContainerActivityEntity)

You can use the container activities entity (`ITMContainerActivityEntity`) to create additional activity records. Alternatively, a freight forwarder can pass updates for a confirmed **Actual end date** value.

Expand table

Name	Mapping	Data type	Key	Mandatory
Actual end date	ITMContainerActivityTable.ActualEndDate	Datetime	No	No
Mode of delivery	ITMContainerActivityTable.DlvModeId	Nvarchar(10)	No	No
Estimated end date	ITMContainerActivityTable.EsimatedDate	Datetime	No	No
Line number	ITMContainerActivityTable.LineNum	Numeric(32, 16)	**Yes**	No
Notes	ITMContainerActivityTable.Notes	nvarchar(MAX)	No	No
Activity	ITMContainerActivityTable.ShipActivityId	Nvarchar(10)	No	**Yes**
Shipping container	ITMContainerActivityTable.ShipContainerId	Nvarchar(20)	**Yes**	**Yes**
Voyage	ITMContainerActivityTable.ShipId	Nvarchar(20)	**Yes**	**Yes**
Leg	ITMContainerActivityTable.ShipLegId	Nvarchar(20)	No	**Yes**
Service provider	ITMContainerActivityTable.ShipServiceProvider	Nvarchar(20)	No	No
Temperature	ITMContainerActivityTable.ShipTemperature	Numeric(32, 6)	No	No
Vessel	ITMContainerActivityTable.ShipVesselId	Nvarchar(20)	No	No

Name	Mapping	Data type	Key	Mandatory
Start date	ITMContainerActivityTable.StartDate	Datetime	No	No

Tracking control

The tracking control center enables an update of a specified source field to be triggered by an update of a specified target field. If both the value of the source field and the value of the target field are updated by using the container activities entity, the target field will show the entity value. This behavior is related to tracking control records that have a **Create type** value of *Lead time*.

For cost areas that have a **Create type** value of *Status update* or *Blank* (which is a user-defined value), the system will update the voyage status or target field according to the tracking control configuration.

Calculated fields

The values of the following fields in a container activity record are calculated based on the values of other fields. Although these calculated fields aren't included in the data entity, they will be set if the fields that the calculations are based on are provided.

- **Estimated days** = **Estimated end date** – **Start date**
- **Actual days** = **Actual end date** – **Start date**

Vendor invoice entities

06/17/2025

The **Landed cost** module enables cost type codes to be configured for internal costs or externally derived costs. If a cost is external to a business, an invoice is expected from the service provider. This invoice is processed as an invoice journal that can be associated with a voyage, and the value of the invoice can be distributed across one or more costs of the voyage.

The vendor invoice entities enable the value of a journal line to be allocated across one or more costs of a voyage that share the same cost type code.

A cost can be allocated only if the invoice journal header and invoice journal lines exist.

Vendor voyage cost allocations (ITMLedgerJournalCostLinesVoyagesEntity)

The vendor voyage cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the voyage cost area. This functionality is supported by the `ITMLedgerJournalCostLinesVoyagesEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No
Voyage	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No

Vendor shipping container cost allocations (ITMLedgerJournalCostLinesContainersEntity)

The vendor shipping container cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the shipping container cost area. This functionality is supported by the `ITMLedgerJournalCostLinesContainersEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Shipping container	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No
Voyage	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No

Vendor folio cost allocations (ITMLedgerJournalCostLinesFoliosEntity)

The vendor folio cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the folio cost area. This functionality is supported by the `ITMLedgerJournalCostLinesFoliosEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Folio	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No

Name	Mapping	Data type	Key	Mandatory
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No

Vendor purchase order cost allocations (ITMLedgerJournalCostLinesPurchTableEntity)

The vendor purchase order cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the purchase order cost area. This functionality is supported by the `ITMLedgerJournalCostLinesPurchTableEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No
Purchase order	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No

Vendor item cost allocations (ITMLedgerJournalCostLinesPurchLineEntity)

The vendor item cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the item cost area. The item cost area covers costs on the purchase order line. This functionality is supported by the `ITMLedgerJournalCostLinesPurchLineEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No
Purchase order	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No
Purchase order line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No

Vendor transfer order line cost allocations (ITMLedgerJournalCostLinesTransferLineEntity)

The vendor transfer order line cost allocations data entity enables a vendor invoice line to be allocated across one or more costs that are applied to the transfer line cost area. This functionality is supported by the `ITMLedgerJournalCostLinesTransferLineEntity` entity. The following table lists the fields and mappings that make up this entity.

Expand table

Name	Mapping	Data type	Key	Mandatory
Allocated amount	ITMLedgerJournalCostLines.Amount	Numeric(32, 6)	No	No
Cost transaction line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No
Journal line number	ITMLedgerJournalCostLines.RefRecId	Numeric(32, 16)	**Yes**	No
Journal number	ITMLedgerJournalCostLines.RefRecId	Nvarchar(20)	**Yes**	No
Transfer order	ITMLedgerJournalCostLines.CostTransRefRecId	Nvarchar(20)	**Yes**	No
Transfer order line number	ITMLedgerJournalCostLines.CostTransRefRecId	Numeric(32, 16)	**Yes**	No

Reference table

Voyage cost lines have a direct association with a cost transaction record. This record includes the **Reference table ID** value. This value is unique for each cost area (voyage, shipping container, and so on). When specific table numbers are referenced for data that is created by using data entities, the entities are split based on **Reference table ID** values.

The values for the reference table (`RefTableId`) and the transaction type (`TransType`) are implicit in the selection of either the Landed cost purchase line or the Landed cost transfer line entity.

Vendor invoice journal lines (VendorInvoiceJournalLineEntity)

Before a journal line value can be allocated to one or more costs in the **Landed cost** module, the journal line must be associated with a cost area. To support this functionality, the **Landed cost** module adds some new fields to the journal lines table (`LedgerJournalTrans`).

Fields added to the vendor invoice journal line entity

The following table lists the fields that the **Landed cost** module adds to the vendor invoice journal line entity (`VendorInvoiceJournalLineEntity`). These fields enable the system to create journal lines and allocate costs against them.

Expand table

Name	Mapping	Data type	Key	Mandatory
Cost area	LedgerJournalTrans.ITMCostArea	Int	No	No
Cost type code	LedgerJournalTrans.ITMCostTypeId	Nvarchar(20)	No	No

Main/offset account

The main/offset account for an invoice journal line that is associated with a Landed cost voyage is determined by the cost type code. When the cost type code is included on the invoice journal line, the clearing account for the code will be used as either the main account or the offset account, depending on the scenario:

- **Single-line journal** – If a main account (in other words, the vendor account) is defined, and a cost type code is provided, the clearing account value for that cost type code will

be entered in the offset account.
- **Multiple-line journal** – If a main account isn't defined, but a cost type code is provided, then the clearing account value for that cost type code will be entered in the main account. The journal line that is crediting the vendor won't reference a cost type code.

Sequencing

Because of dependencies between the journal and journal lines tables, the voyage record must be created first. The voyage lines can be created only after the voyage, shipping container, and folios have been created.

To allocate a voyage invoice, the system must process the entities in the following order:

1. Invoice journal header (`VendInvoiceJournalHeaderEntity`)
2. Invoice journal line (`VendInvoiceJournalLineEntity`)
3. Landed cost allocations (`ITMLedgerJournalEntities`)

Warehouse management overview

> **Note**

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Warehouse management module lets you manage warehouse processes in manufacturing, distribution, and retail companies. This module has a wide range of features to support the warehouse facility at an optimal level, at any time. Warehouse management is fully integrated with other business processes such as transportation, manufacturing, quality control, purchase, transfer, sales, and returns.

Get started

To start working with Warehouse management, you need to complete the setup of the general warehouse parameters to support the business processes of your company.

- Go to the **Warehouse management parameters** page under **Warehouse management** > **Setup** to set up general warehouse parameters.

You must configure components for inbound and outbound warehouse process workflows according to business requirements. The most important components that you must configure are wave templates, work templates, work pools, and location directives.

- Warehouse configuration overview
- Control warehouse work by using work templates and location directives
- Set up mobile devices for warehouse work
- Set up a location directive for purchase order putaway
- Set up a work template for purchase orders

Warehouse management processes (WMS)

- Integrated support for source documents for sales orders, returns, transfer orders, production orders, and kanban
- Flexible, inbound and outbound material workflow support based on queries
- Full integration with the Manufacturing and Transportation offerings
- Full control of location stocking limits and location volumetrics

- Inventory properties controlled by inventory status
- Full batch and serial item support
- Various item receiving capabilities
- Multiple picking strategies
- Out-of-the-box support for the next generation of bar code scanners
- Pallet and container types for warehouse processes
- Advanced counting capabilities
- Label printing and label routing with Zebra ZPL support
- Business intelligence integration into Power BI
- Manual and automatic movement of inventory
- Fully integrated quality control (QMS)
- Full traceability of workers' material handling
- Outbound wave processing
- Manual packing and automatic containerization support
- Cluster picking
- Simple cross docking

Get started with setting up the Warehouse management module

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to work with the built-in wizards and checklists that can help you quickly and efficiently set up and configure the **Warehouse management** module.

Track the Warehouse management configuration processes

Use the **Warehouse implementation tasks** workspace to track your Warehouse management configuration processes. The workspace can be used during a new implementation, after an upgrade, or after a migration.

The workspace lets you create, edit, and import checklists that you can use to identify important implementation tasks and track your progress while you complete them. It lets you perform the following actions:

- Track progress by viewing all current and closed configuration tasks.
- Select hyperlinks to quickly access the configuration page that's required for each step.
- Import a default configuration checklist that includes the tasks that you must complete to get a warehouse up and running.

Open the Warehouse implementation tasks workspace

To open the workspace, go to **Warehouse management** > **Workspaces** > **Warehouse implementation tasks**.

Create an implementation project

You must first create at least one implementation task project. You can add as many projects as you need. All data that's shown in the workspace is filtered by the selected implementation task project. Follow these steps to create a project in the **Warehouse implementation tasks** workspace.

1. In the **Warehouse implementation tasks** workspace, select **New project** at the top of the page.
2. In the drop-down dialog box, set the following fields:
    - **New project** – Enter a name for the project.
    - **Copy existing project** – Select one of the following values to specify whether you want to create a new, blank project or to start from a copy of an existing project:
        - *No* – Create a new, blank project.
        - *Yes* – Copy an existing project.
3. Select **OK** to create the new project and close the drop-down dialog box.

Import the default configuration task list

Microsoft Dynamics 365 Supply Chain Management includes a default task list. This task list is a good place to start when you're planning and implementing your Warehouse management setup. Follow these steps to import it into the **Warehouse implementation tasks** workspace.

1. In the **Warehouse implementation tasks** workspace, in the **Implementation task project** field at the top of the page, select the project that you want to import tasks into.
2. On the **Tasks and status** FastTab, select **Import default tasks** on the toolbar.

    The default tasks should be loaded. However, you might receive the following error instead: "Entity Warehouse implementation tasks not found. Refresh entity list from Data import/export framework parameters form." In that case, follow these steps:

    a. Go to **System administration** > **Workspaces** > **Data management**.

    b. Select the **Framework parameters** tile.

    c. On the **Entity settings** tab, select **Refresh entity list**.

    The system adds a refresh entity job to your batch job queue and runs it as soon as it can. You might have to wait several minutes for the task to complete, depending on the number of other jobs in the queue.

d. When the refresh entity job is completed, return to the **Warehouse implementation tasks** page, and select **Import default tasks** again on the toolbar of the **Tasks and status** FastTab.

Customize the task list

After you import a task list, you can customize it as you require by adding, removing, and rearranging the tasks. You can also create a fully customized task list by starting from scratch. Use the following buttons on the toolbar of the **Tasks and status** FastTab in the **Warehouse implementation tasks** workspace to customize the list:

- **Add task** – Create a new task. This button opens the **Add task** dialog box, where you must set the following fields:
  - **Task category** – Enter the type of task.
  - **Description** – Enter a detailed description of what the user should do to complete the task.
  - **Task link** – Select the page in Supply Chain Management where the user should go to complete the task.
- **Edit task** – Edit a selected task. This button opens the **Edit task** dialog box, where you can edit the **Description** and **Task link** fields for the task. Other settings are read-only for existing tasks.
- **Remove** – Delete all selected tasks. The system prompts you to confirm the operation.
- **Move up** – Move a selected task up in the sequence order.
- **Move down** – Move a selected task down in the sequence order.

Work with the task list

When your task list is ready, follow these steps to work through it.

1. In the **Warehouse implementation tasks** workspace, expand the **Summary** FastTab for an overview of the total number of tasks and the proportion of them that has been marked as completed.
2. Expand the **Tasks and status** FastTab to view the full list and mark tasks as completed while you work.

   For each task, the following information is shown:

- **Sequence number** – The order to complete the task in. Start with the task that has the lowest number, and work upward.
- **Completed** – Select this checkbox for each task as you complete it.
- **Task category** – The type of task. Select the text to open a page where you can configure the settings that are required to complete the task.
- **Description** – Full details about what must be done to complete the task.
- **Status** – A check mark indicates that the task has been completed.
- **Completed by** – If the task has been completed, the name of the user who completed it.
- **Completed date** – If the task has been completed, the date when it was completed.

Use the following fields and buttons on the toolbar of the **Tasks and status** FastTab to find your way around the task list:

- **Filter** – To quickly find a specific task in a long list, enter a value here, and then select the column where that value should be found.
- **Hide completed tasks** or **Show completed tasks** – Select whether to hide or show tasks that have already been completed. The button label changes, depending on whether completed tasks are currently shown or hidden.

To view the full task list (including both completed and uncompleted tasks), on the **Links** FastTab, select the **All tasks** link. The page that appears is the same page that appears when you select the **Warehouse implementation tasks** tile on the **Summary** FastTab. It provides the same information as, and works like, the **Task list** FastTab on the **Warehouse implementation tasks** page.

3. Continue to work until all tasks are completed.

Warehouse management initiation wizard

The *Warehouse management initiation wizard* provides a step-by-step guide that helps you configure the most basic settings that the **Warehouse management** module requires. Use this wizard for new legal entities where you must configure the **Warehouse management** module from scratch. The wizard defines the main settings of Warehouse management parameters for you. The default task list that was described earlier in this article includes steps for setting up the prerequisites for this wizard. It also includes a step that indicates when to run this wizard. Run the wizard when you're instructed to do so in the default task list.

The following table summarizes the configurations that the wizard does.

Expand table

Configuration	Action	Description
Location types	Create	Location types are filtering options that control the different warehouse management processes. The wizard creates several location types and uses the names that you specify. After you complete the wizard, you can add, remove, and/or edit these and other location types by going to **Warehouse management** > **Setup** > **Warehouse** > **Location types**.
Location profiles	Create	Location profiles control the behavior of locations in a warehouse that's enabled for advanced warehouse management. The wizard creates several location profiles and uses the names that you specify. Each profile has a collection of default settings that you might want to customize after you complete the wizard. After you complete the wizard, you can add, remove, and/or edit these and other location profiles by going to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
Location formats	Create	Location formats are a naming system for creating unique and consistent names for the different location bin positions that are used in a warehouse. To make the components of the location, such as the aisle number, easier to identify, you might want to include separators as part of the location format. You can set the wizard to create a separate format for each location profile that it creates. Alternatively, the wizard can create a single format that is shared by all the profiles that it creates. After you complete the wizard, you can add, remove, and/or edit these and other location formats by going to **Warehouse management** > **Setup** > **Warehouse** > **Location formats**.
Inventory status	Create	Inventory statuses categorize and keep track of inventory. The wizard creates an initial inventory status value and uses the name that you specify. After you complete the wizard, you can add, remove, and/or edit this and other inventory statuses by going to **Warehouse management** > **Setup** > **Inventory** > **Inventory statuses**.
Default work user and password	Create	The default work user is used for automated work transactions. The wizard creates an initial work user and uses the user name and password that you specify. After you complete the wizard, you can add, remove, and/or edit this and other work users by going to **Warehouse management** > **Setup** > **Worker**.

Configuration	Action	Description
Mobile device menu	Create	The mobile device menu contains the menu items that the mobile device shows to warehouse workers. The wizard creates an initial mobile device menu and uses the mobile device name and description that you specify. After you complete the wizard, you can add, remove, and/or edit this and other mobile device menus by going to **Warehouse management** > **Setup** >**Mobile device** > **Mobile device menu**.
Load posting methods	Regenerate	Load posting methods are used when a load is released to the warehouse from the outbound load planning workbench. The wizard generates or regenerates the load posting methods. After you complete the wizard, you can manually regenerate and/or edit the method list by going to **Warehouse management** > **Setup** > **Load posting methods**.
Wave processing methods	Regenerate	Wave processing methods perform the actions that a wave template creates. The wizard generates or regenerates the wave processing methods. After you complete the wizard, you can manually regenerate and/or edit the method list by going to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
Warehouse management parameters	Set up	Based on settings that you specify while you run the wizard, the wizard initializes several settings on the **Warehouse management parameters** page (**Warehouse management** > **Setup** > **Warehouse management parameters**). The following values are set: • User location profile • Location types • Default work user ID • Default inventory status

Follow these steps to open and complete the *Warehouse management initiation wizard*.

1. Before you open the wizard, make sure that the following prerequisite is in place. (It should be in place if you run the wizard when you're instructed to do so in the default task list that was described earlier in this article.)

    - The user account that you're using to sign in to Supply Chain Management must be associated with a person record. (Person records are used by the **Human resources** module to manage employees.) To set up this association, go to **System administration** > **Users** > **Users**, open your user account in the list, and use the **Person** field to link the account to the correct person record. The wizard adds this person as a

warehouse worker on the **Worker** page (**Warehouse management** > **Setup** > **Worker**). It also adds the default work user ID that you specify in the wizard to the warehouse worker record. (Learn more in Mobile device user accounts.) The system uses the default work user ID when it runs some automated processes.

2. Go to **Warehouse management** > **Setup** > **Wizards** > **Warehouse management initiation wizard**.

3. The first page of the *Warehouse management initiation wizard* is the **Welcome** page. It summarizes what the wizard does. When you finish reading the summary, select **Next** to continue.

4. On the **Initialize base data** page, use the following fields to define initial settings for the **Warehouse management** module. Default values are suggested, but you can edit them as you require. If you leave any field blank, the wizard doesn't initialize the setting.

    - **Receiving** – Specify the name of the receiving location type and location profile.
    - **Staging** – Specify the name of the staging location type and location profile. The specified staging location type is also identified on the **Warehouse management parameters** page.
    - **Packing** – Specify the name of the packing location type and location profile. The specified packing location type is also identified on the **Warehouse management parameters** page.
    - **Final shipping** – Specify the name of the final shipping location type and location profile. The specified final shipping location type is also identified on the **Warehouse management parameters** page.
    - **Sorting** – Specify the name of the sorting location type and location profile. The specified sorting location type is also identified on the **Warehouse management parameters** page.
    - **User** – Specify the name of the user location type and location profile. The specified user location profile is also identified on the **Warehouse management parameters** page.
    - **Create one generic format instead of each profile** – Set this option to *No* to create a separate location format for each location profile. The name of each format is based on the values that you specify in the **Receiving**, **Staging**, **Packing**, **Final shipping**, **Sorting**, and **User** fields. Set this option to *Yes* to create one location format that applies to all the location profiles that are created. This format uses the name that you specify in the **Location format** field.

- **Location format** – If the **Create one generic format instead of each profile** option is set to *Yes*, specify the name of the shared location format.
- **Default inventory status ID** – Specify the name of the default inventory status. The specified default inventory status ID is also identified on the **Warehouse management parameters** page.
- **Default work user ID** – Specify the name of the default work user. The specified default user ID is also identified on the **Warehouse management parameters** page.
- **Default work user password** – Specify the password of the default work user.
- **Mobile device menu** – Specify the name of the mobile device menu.

5. Select **Next** to continue.

6. The **Base data setup complete** page summarizes the settings that the wizard applies, based on your input. Review the summary, and if everything looks correct, select **Finish** to apply the settings and close the wizard.

Inbound configuration wizard

The *Inbound configuration wizard* provides a step-by-step guide that helps you set up inbound operations for one or more warehouses. After you complete this wizard, the required settings are in place so that you can receive purchase orders and/or inbound shipment orders. Use this wizard for new legal entities or new warehouses where you must configure basic inbound flows. The default task list that was described earlier in this article includes steps for setting up the prerequisites for this wizard. It also includes a step that indicates when to run this wizard. Run the wizard when the default task list instructs you to do so.

The following table summarizes the configurations that the wizard does.

Expand table

Configuration	Action	Description
Locations	Create	Locations identify where items are stored, picked from, and put to in the warehouse. The wizard creates a receiving location for each warehouse that you select at the start of the wizard and uses the name and location profile that you specify in the wizard. After you complete the wizard, you can add, remove, and/or edit these and other locations by going to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.
Work classes	Create	Work classes direct and/or limit the types of work order lines that a warehouse worker can process on a mobile device. The wizard creates a single work class

Configuration	Action	Description
		and uses the name that you specify. After you complete the wizard, you can add, remove, and/or edit this and other work classes by going to **Warehouse management** > **Setup** > **Work** > **Work classes**.
Location directives	Create	Location directives identify pick and put locations for inventory movement. The wizard creates a put location directive for each warehouse that you select at the start of the wizard. It names each location directive by prefixing the name that you specify in the wizard with the name of the warehouse where the location directive applies. Each location directive that's created has a work order type of *Purchase orders* and/or *Inbound shipment order*. After you complete the wizard, you can add, remove, and/or edit these and other location directives by going to **Warehouse management** > **Setup** > **Location directives**. Learn more in Work with location directives.
Work templates	Create	Work templates create warehouse work at different points in the system. The wizard creates a work template and uses the name that you specify in the wizard. The work template has a work order type of *Purchase orders* and/or *Inbound shipment order*. After you complete the wizard, you can add, remove, and/or edit this and other work templates by going to **Warehouse management** > **Setup** > **Work** > **Work templates**.

Follow these steps to open and complete the *Inbound configuration wizard*.

1. Before you open the wizard, make sure that the following prerequisites are in place. (They should already be in place if you run the wizard when you're instructed to do so in the default task list that was described earlier in this article.)

    - Your basic configuration must be set up on the **Warehouse management parameters** page. You can complete this configuration by running the *Warehouse management initiation wizard* as described in the previous section. Alternatively, you can complete it manually by going to **Warehouse management** > **Setup** > **Warehouse management parameters**.
    - Each warehouse that you want to set up by using this wizard must already exist as a record in the system, and the **Use warehouse management processes** option must be set to *Yes* for it. You can create warehouses and set the **Use warehouse management processes** option for each of them by going to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**. Each warehouse must also be assigned to a site that exists

as a record in the system. You can create sites by going to **Warehouse management** > **Setup** > **Warehouse** > **Sites**.

2. Go to **Warehouse management** > **Setup** > **Wizards** > **Inbound configuration wizard**.

3. The first page of the *Inbound configuration wizard* is the **Welcome** page. It summarizes what the wizard does. When you finish reading the summary, select **Next** to continue.

4. The **Warehouse selection** page opens. Use it to specify the warehouses where the wizard applies. Set the **Warehouse selection** field to one of the following values, and then set the associated fields as required:

    - *All* – Configure all warehouses.
    - *Warehouse group* – Configure all the warehouses in a selected warehouse group. After you select this option, use the **Warehouse group** field to select the group that you want to configure. For more information about how to create warehouse groups, see Warehouse groups.
    - *Warehouse* – The wizard configures the warehouses selected in the grid. Only warehouses where the **Use warehouse management processes** option is set to *Yes* are listed. Select the checkbox for each warehouse that you want to set up by using the wizard.

5. Select **Next** to continue.

6. When Warehouse management only mode is enabled, use the **Work order type** section to define *purchase orders* or *inbound shipment orders* for the following setup processes.

7. The **Inbound setup** page opens. Use it to define names for different elements of the purchase or inbound shipment order process. Default values are suggested, but you can edit them as you require. Set the following fields:

    - **Purchase/Inbound work class** – Specify the name of the work class for the receiving process. This value is used in the work template.
    - **Purchase/Inbound work template** – Specify the name of the work template for the receiving process.
    - **Purchase/Inbound put location directive** – Specify the name of the put location directive for the receiving process.
    - **Receiving location** – Specify the name of the receiving location.
    - **Location profile** – Select the location profile that should be assigned to the selected receiving location.

8. Select **Next** to continue.

9. The **Inbound setup complete** page opens. It summarizes the actions that the wizard takes. Review the summary, and if everything looks correct, select **Finish** to apply the settings and close the wizard.

Outbound configuration wizard

The *Outbound configuration wizard* provides a step-by-step guide that helps you set up outbound operations for one or more warehouses. After you complete this wizard, the required settings are in place so that you can ship sales and/or outbound shipment orders. Use this wizard for new legal entities or new warehouses where you must configure basic outbound flows. The default task list that was described earlier in this article includes steps for setting up the prerequisites for this wizard. It also includes a step that indicates when to run this wizard. Run the wizard when the default task list instructs you to do so.

The following table summarizes the configurations that the wizard does.

Expand table

Configuration	Action	Description
Locations	Create	Locations identify where items are stored, picked from, and put to in the warehouse. The wizard creates several locations for each warehouse that you select at the start of the wizard and uses the names that you specify in the wizard. It associates each location with the relevant warehouse. After you complete the wizard, you can add, remove, and/or edit these and other locations by going to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.
Directive codes	Create	Directive codes link the work templates and the location directives. The wizard creates several directive codes and uses the names that you specify in the wizard. After you complete the wizard, you can add, remove, and/or edit these and other directive codes by going to **Warehouse management** > **Setup** > **Directive codes**.
Work classes	Create	Work classes direct and/or limit the types of work order lines that a warehouse worker can process on a mobile device. The wizard creates several work classes and uses the names that you specify in the wizard. After you complete the wizard, you can add, remove, and/or edit these and other work classes by going to **Warehouse management** > **Setup** > **Work** > **Work classes**.

Configuration	Action	Description
Location directives	Create	Location directives identify pick and put locations for inventory movement. The wizard creates pick and put location directives for each warehouse that you select at the start of the wizard. It names each location directive by prefixing the name that you specify in the wizard with the name of the warehouse where the location directive applies. Each location directive that's created has a work order type of *Sales orders* and/or *Outbound shipment order*. After you complete the wizard, you can add, remove, and/or edit these and other location directives by going to **Warehouse management** > **Setup** > **Location directives**. Learn more in Work with location directives.
Wave templates	Create	Wave templates define the wave execution process and set up criteria for when waves are created, run, and released. The wizard creates a wave template for each warehouse that you select at the start of the wizard. It names each wave template by prefixing the name that you specify in the wizard with the name of the warehouse where the wave template applies. Each wave template that's created has a wave template type of *Shipping*. After you complete the wizard, you can add, remove, and/or edit these and other wave templates by going to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
Work templates	Create	Work templates create warehouse work at different points in the system. The wizard creates a work template for each warehouse that you select at the start of the wizard. It names each work template by prefixing the name that you specify in the wizard with the name of the warehouse where the work template applies. Each work template that's created has a work order type of *Sales orders* and/or *Outbound shipment order*. After you complete the wizard, you can add, remove, and/or edit these and other work templates by going to **Warehouse management** > **Setup** > **Work** > **Work templates**.

Follow these steps to open and complete the *Outbound configuration wizard*.

1. Before you open the wizard, make sure that the following prerequisites are in place. (They should already be in place if you run the wizard when you're instructed to do so in the default task list that was described earlier in this article.)

    - Your basic configuration must be set up on the **Warehouse management parameters** page. You can complete this configuration by running the *Warehouse management initiation wizard* as described earlier in this article. Alternatively, you can complete it manually by going to **Warehouse management** > **Setup** > **Warehouse management parameters**.

- Each warehouse that you want to set up by using this wizard must already exist as a record in the system, and the **Use warehouse management processes** option must be set to *Yes* for it. You can create warehouses and set the **Use warehouse management processes** option for each of them by going to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**. Each warehouse must also be assigned to a site that exists as a record in the system. You can create sites by going to **Warehouse management** > **Setup** > **Warehouse** > **Sites**.

2. Go to **Warehouse management** > **Setup** > **Wizards** > **Outbound configuration wizard**.

3. The first page of the **Outbound configuration** wizard is the **Welcome** page. It summarizes what the wizard does. When you finish reading the summary, select **Next** to continue.

4. The **Warehouse selection** page opens. Use it to specify the warehouses where the wizard applies. Set the **Warehouse selection** field to one of the following values, and then set the associated fields as required:

    - *All* – Configure all warehouses.
    - *Warehouse group* – Configure all the warehouses in a selected warehouse group. After you select this option, use the **Warehouse group** field to select the group that you want to configure. For more information about how to create warehouse groups, see Warehouse groups.
    - *Warehouse* – The wizard configures the warehouses selected in the grid. Only warehouses where the **Use warehouse management processes** option is set to *Yes* are listed. Select the checkbox for each warehouse that you want to set up by using the wizard.

5. Select **Next** to continue.

6. When Warehouse management only mode is enabled, use the **Work order type** section to define *sales orders* or *outbound shipment orders* for the following setup processes.

7. On the **General warehouse** page, use the following fields to define names for outbound processes. Default values are suggested, but you can edit them as you require.

    - **Sales/Outbound work template** – Specify the name of the work template for the shipping process.
    - **Shipping wave template** – Specify the name of the wave template for the shipping process.

- **Sales/Outbound pick location directive** – Specify the name of the pick location directive for the shipping process.

8. Select **Next** to continue.

9. On the **Staging area** page, use the following fields to specify whether you use a staging area in your outbound processes and, if you do, to set up the feature. You might have to use the feature if you pick your items and then put them in a staging location where all lines of an order are held. In the staging area, items can be packed, relabeled, or loaded onto a delivery truck, and then sent out the door. Default values are suggested, but you can edit them as you require.

    - **Use staging area** – Select this checkbox if you use a staging area. If you clear this checkbox, a staging area isn't set up, and all the other fields on the page are unavailable.
    - **Location** – Specify the name of the staging location.
    - **Directive code** – Specify the name of the directive code for the shipping process. This value is used in the shipping work template and location directive to link them together.
    - **Sales/Outbound work class** – Specify the name of the work class for the shipping process. This value is used in the work template.
    - **Sales/Outbound put location directive** – Specify the name of the put location directive for the shipping process.

10. Select **Next** to continue.

11. On the **Packing preference** page, use the following fields to specify whether you use packing functionality in your outbound processes and, if you do, to set up the feature. You might have to use the feature if you pack items before you ship them. Default values are suggested, but you can edit them as you require.

    - **Would you like to pack items before shipping** – Select this checkbox if you use packing. If you select this option, you must also select the type of packing functionality that you use (manual packing or automatic packing through wave containerization). If you clear this checkbox, the system doesn't set up packing, and all the other pages that are related to packing are unavailable.

    - **Manually pack items through Pack station** – Select this checkbox if you want to use manual packing. Then set the following fields:
        - **Directive code** – Specify the name of the directive code.

    - **Sales/Outbound work class** – Specify name to use for the work class.
    - **Pack location** – Specify the name of the packing location.
    - **Sales/Outbound put location directive** – Specify the name of the put location directive for the packing process.

- **Pack items through wave containerization** – Select this checkbox if you want to use automatic packing through wave containerization. Then set the following fields:
    - **Container build template** – Specify the name of the container build template.
    - **Wave step code** – Specify the name of the wave step code. This value is used in the container build template and the wave template to link them together.

12. Select **Next** to continue. If you chose not to use packing, you skip ahead to the **Final shipping area** page of the wizard. Therefore, you can skip ahead to step 21 of this procedure. If you chose to use packing, move on to the next step.

13. On the **Container type and group** page, create or select container types for packing.

    - If you don't see the containers that you want to use, select **Add** on the toolbar, and then fill in the columns as required to create and set up the container.
    - If you selected the **Manually pack items through Pack station** option on the **Packing preference** page, you must select exactly one container type that has a maximum net weight that's more than 0 (zero).
    - If you selected the **Pack items through wave containerization** option on the **Packing preference** page, select one or more container types. Then set the **Container group** field to the name of the container group that you want to create to hold the selected container types.

14. Select **Next** to continue. If you selected the **Pack items through wave containerization** option on the **Packing preference** page, you skip ahead to the **Final shipping area** page of the wizard. Therefore, you can skip ahead to step 21 of this procedure. If you selected the **Manually pack items through Pack station** option on the **Packing preference** page, move on to the next step.

15. On the **Release container** page, set the following fields:

    - **Container packing policy** – Specify the name of the container packing policy.
    - **Container weight unit** – Select the container weight unit.
    - **Packing profile** – Specify the name of the packing profile.

16. Select one of the following options to specify what's done with the packed container:

- **Make available at the final shipping location** – Select this checkbox to move the packed container to the final shipping location after it's closed. After you select this option, you must use the **Default location for final shipment** field to define the final shipping location.
- **Create work to move container from packing station to location** – Select this checkbox to create work to move the packed container after it's closed. After you select this option, you must use the **Work template** field to define the name of the work template. Later in this procedure, you can use the **Container staging area** page to set up a staging area for this movement, as required.
- **Make available at sorting location** – Select this checkbox to move the packed container to the sorting area after it's closed. Later in this procedure, use the **Sorting area** page to set up the sorting area.

17. Select **Next** to continue. If you selected the **Make available at sorting location** option on the **Release container** page, the **Sorting area** page opens. In this case, move on to the next step. If you selected one of the other options on the **Release container** page, skip ahead to step 19.

18. On the **Sorting area** page, set the following fields:

    - **Sort location** – Specify the name of the sorting location.
    - **Outbound sorting template** – Specify the name of the outbound sorting template.
    - **Create work on position close** – Select whether you want to create work after the position is closed.
    - **Work template** – This field is shown only if you set the **Create work on position close** option to *Yes*. Use it to specify the name of the work template that's used to create the work.
    - **Sort final location** – This field is shown only if you set the **Create work on position close** option to *No*. Use it to specify the name of the final sort location.

    For more information about sorting, see Outbound sorting.

19. Select **Next** to continue. If you selected the **Create work to move container from packing station to location** option on the **Release container** page, the **Container staging area** page opens. In this case, move on to the next step. If you selected one of the other options on the **Release container** page, skip ahead to step 21.

20. On the **Container staging area** page, use the following fields to set up a staging area for staging packed items before moving them to the final shipping area. Default values are suggested, but you can edit them as you require.

- **Use staging area** – Select this checkbox if you use a staging area. If you clear this checkbox, a staging area isn't set up, and all the other fields on the page are unavailable.
- **Location** – Specify the name of the staging location.
- **Directive code** – Specify the name of the directive code for the shipping process. This value is used in the shipping work template and the location directive to link them together.
- **Packing work class** – Specify the name of the work class for the packing process. This value is used in the work template.
- **Packing put location directive** – Specify the name of the put location directive for the packing process.

21. Select **Next** to continue.

22. The **Final shipping area** page opens, regardless of which options you selected earlier. Use the following fields to define names for the final shipping area in the outbound processes. Default values are suggested, but you can edit them as you require.

    - **Location** – Specify the name of the final shipping location.
    - **Directive code** – Specify the name of the directive code for the shipping process. This value is used in the shipping work template and location directive to link them together.
    - **Packing work class** – Specify the name of the work class for the shipping process. This value is used in the work template.
    - **Packing put location directive** – Specify the name of the put location directive for the shipping process.

23. The **Warehouse setup complete** page summarizes the actions the wizard will take. Review the summary, and if everything looks correct, select **Finish** to apply the settings and close the wizard.

> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the reservation functionality in Warehouse management and provides information about how it's implemented.

The **Warehouse management** module introduces functionality for reserving items and materials. You can use the reservation functionality only for items that are enabled for warehouse management processes (WMS). However, you can use an item that is enabled for WMS in both warehouses that are enabled for WMS and warehouses that aren't enabled for WMS.

The behavior in reservation scenarios varies, depending on the warehouse setup. Later sections of this article provide more details about the differences.

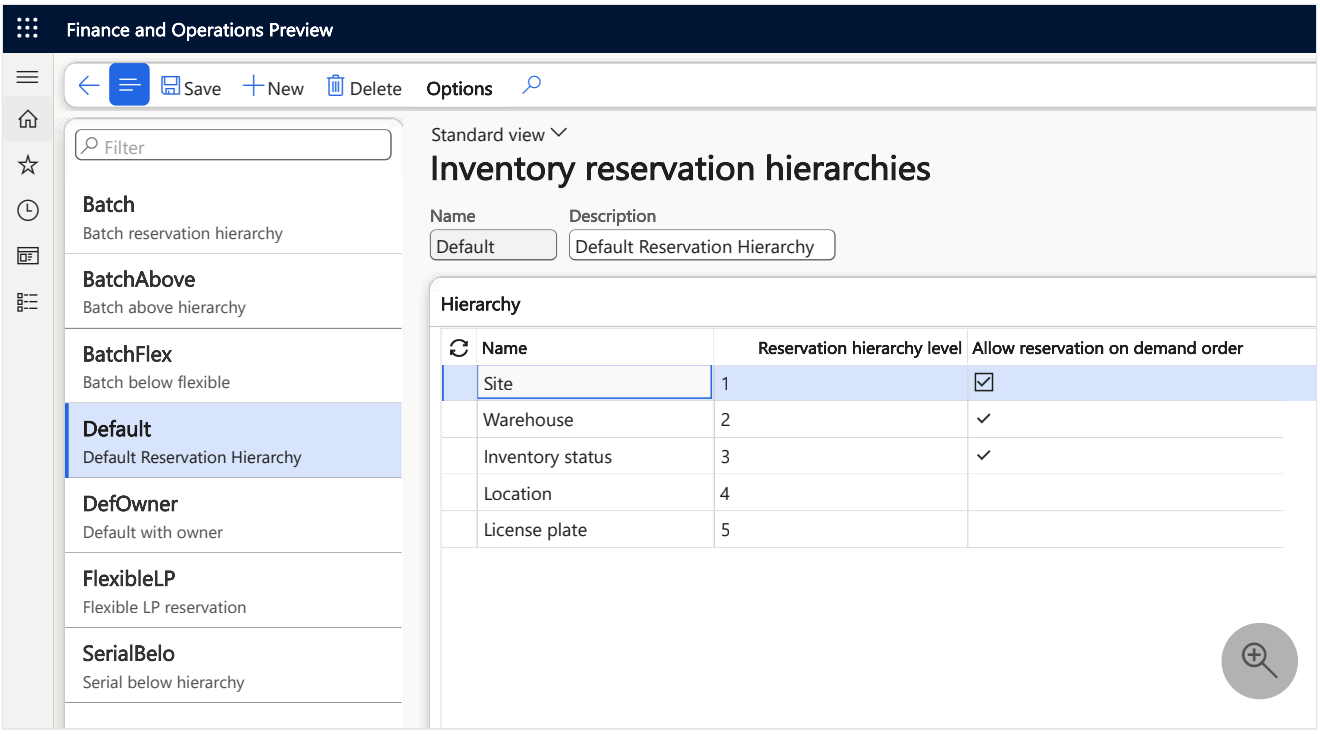
The reservation functionality is built on *reservation hierarchies* and is intended to support the following cases:

- Flexible warehouse operations
- Postponement of reservation details
- Clear separation of which inventory dimensions can be specified, and when they can be specified

Reservation hierarchies

A key component of the reservation system in the **Warehouse management** module is the reservation hierarchy. The reservation hierarchy defines the different levels where reservations can be made. Each level represents a physical inventory dimension.

The following illustration shows an example of a reservation hierarchy on the **Inventory reservation hierarchies** page. *Default* is a typical reservation hierarchy for an item that uses the Site, Warehouse, Inventory status, Location, and License plate dimensions as physical inventory dimensions.

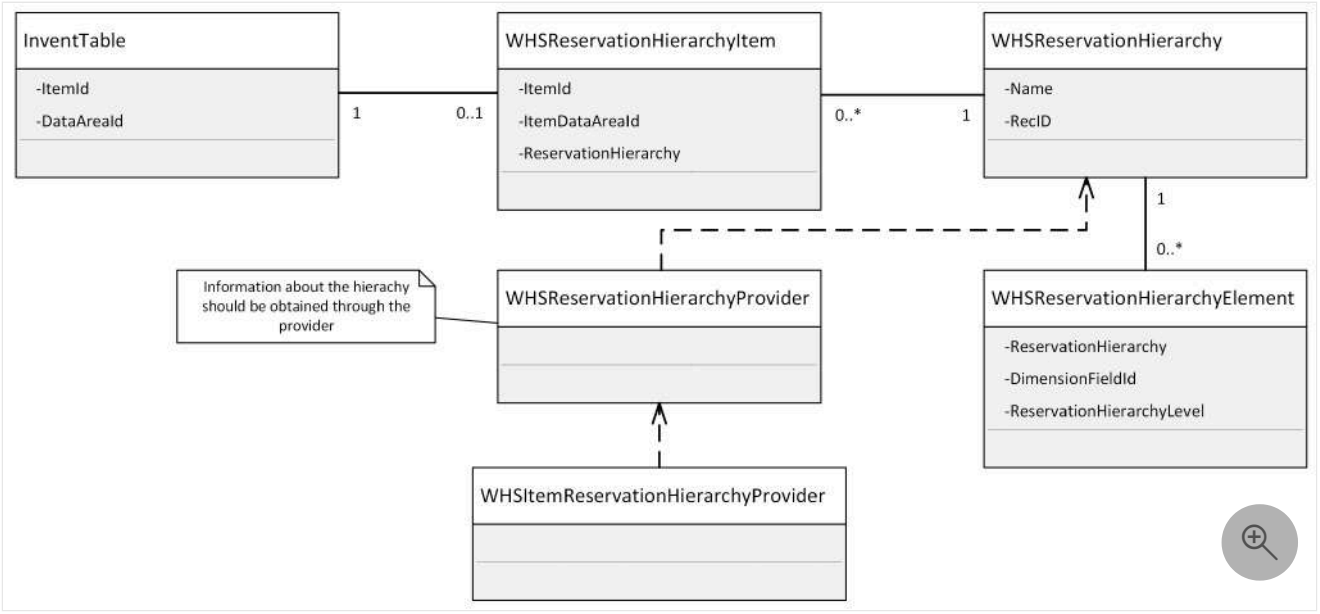


The lower the value in the **Reservation hierarchy level** column of the grid, the less specific the level is. The higher the value, the more details are required to make a reservation on the level. In the previous illustration, the **Site** level has the lowest value (*1*) and is therefore the least specific level. The **License plate** level has the highest value (*5*) and is therefore the most specific level.

The system stores information about on-hand inventory separately for each level in the reservation hierarchy.

Details about the implementation of reservation hierarchies

The following illustration shows the data model for the setup of a reservation hierarchy and its relation to the `inventTable` table.



The `WHSReservationHierarchy` and `WHSReservationHierarchyElement` tables store the definitions of reservation hierarchies. These tables are shared tables. You can associate a reservation hierarchy with one item within a company.

The `WHSReservationHierarchyProvider` class provides many APIs that are useful when you work with and query the reservation hierarchy for an item.

Making reservations on different levels

Based on the reservation hierarchy, you can make reservations on different levels without providing details about where to reserve and what dimensions to reserve on. In this way, you can postpone specific details, such as the location or license plate to make the reservation on. The location to reserve on can be determined later by the location directive.

Here are some examples:

- You make a reservation only on the site level. In this case, you can use inventory blocking to block a quantity of an item on a given site.
- You make reservations for a sales order that you created on site 4 and warehouse 42, and for the *Available* inventory status. Warehouse 42 is enabled for WMS. In this case, the reservation is made only on the inventory status level.

Impact of the reservation hierarchy setup

For WMS-enabled warehouses, the setup of reservation hierarchies greatly affects the processes for outbound orders, such as sales orders and transfer orders.

When you set up a reservation hierarchy, the key is to determine which dimensions should be positioned above the location level in the hierarchy, and which dimensions should be positioned below the location level. The following table describes the effects of arranging dimensions either above or below the location level.

Expand table

Dimension placement	Description
Dimensions above location	You must determine the inventory dimensions above the location level before you can use the Warehouse management functionality. Typically, workers make this determination during order processing, or they let the reservation system make it. If a dimension is above the location level, warehouse workers can't change it, because it's considered a strict picking requirement. For example, if the Batch number dimension is

Dimension placement	Description
	above the location level, a worker can't pick a batch that differs from the one that they were instructed to pick.
Batch above location	Process industry functionality for batches requires that the Batch number dimension is above the Location dimension in the reservation hierarchy. In this case, all functionality for first expiry, first out (FEFO), same batch reservation, batch disposition codes, and batch attributes is supported.
Dimensions below location	Both the system and warehouse workers can determine the Location dimension and the dimensions below it. Don't enter the Location dimension and any dimensions below it on sales and transfer lines if you expect work to be created. For example, if the Batch number dimension is below the Location dimension, don't specify it on the sales line. Otherwise, WMS can't create work to carry out the pick and pack operations.

On-hand representation and calculations

To support reservations on different levels, use a new method to store information about on-hand inventory for WMS-enabled items. Each level in the hierarchy corresponds to a set of physical inventory dimensions. The following information is stored for each level in the reservation hierarchy:

- The quantity that is available physical
- The quantity that is available ordered
- The quantity that is reserved physical
- The quantity that is reserved ordered

The following table shows how the data might look for an item that has 10 pieces available physical and 2 pieces reserved physical on the status level.

Expand table

Level	Site	Warehouse	Inventory status	Location	License plate	Available physical	Available ordered	Reserved physical	Reserve ordered
Item						10	10	2	0
Site	S1					10	10	2	0
Warehouse	S1	WH1				10	10	2	0
Status	S1	WH1	Good			10	10	2	0
Location	S1	WH1	Good	Bulk		12	12	0	0

Level	Site	Warehouse	Inventory status	Location	License plate	Available physical	Available ordered	Reserved physical	Reserve ordered
License plate	S1	WH1	Good	Bulk	LP1	12	12	0	0

As the table shows, reservations are tracked only on the levels that the reservation affects.

Because of the way that the system stores information about availability and reservations, you can't use the corresponding values from the `InventSum` table directly for WMS-enabled items.

On-hand calculation algorithm

The following steps provide a high-level overview of the algorithm that determines the available on-hand quantity for an item and a set of inventory dimensions:

1. Determine the available on-hand quantity based on the exact dimensions. This level is the lowest level in the hierarchy.
2. Determine the smallest available quantity from all levels above the level that was found in step 1.
3. Return the smaller of the quantities that were found in steps 1 and 2. This quantity is the available quantity.

For example, based on the data in the previous table, the available physical quantity is calculated for the following dimensions:

- **Site:** *Site1*
- **Warehouse:** *WH1*
- **Inventory status:** *Good*
- **Location:** *Bulk*

In step 1 of the algorithm, the quantity is 12, because that quantity is available on the location level. However, in step 2, the smallest quantity from the levels above the location level is 10. Therefore, in step 3, the available physical quantity is 10, because that quantity is the smaller of 12 and 10.

Calculations of on-hand quantity for work transactions are done differently. The on-hand quantity is determined only up to the location level, because work affects reservations only on the location level and below. For example, based on the data in the previous table, the available physical quantity is calculated for work on the following dimensions:

- **Site:** *Site1*
- **Warehouse:** *WH1*

- **Inventory status:** *Good*
- **Location:** *Bulk*

In this case, the available physical quantity is 12, because the quantity is determined only up to the location level.

Details about the implementation of on-hand calculations

The on-hand information is stored in a new table named `WHSInventReserve`. The `WHSInventReserveDelta` table tracks changes that the current transaction causes in the on-hand quantity. When the final commit occurs, the system updates the `WHSInventReserve` table based on the changes in the `WHSInventReserveDelta` table.

Because many scenarios involve the calculation of on-hand quantities based on `itemId`, `InventDim`, or `InventSum` records for both WMS-enabled and non-WMS-enabled items, the system provides APIs to support the calculations in a seamless way.

The following example shows how to instantiate the class that you can use to calculate availability for both WMS-enabled and non-WMS-enabled items.

X++

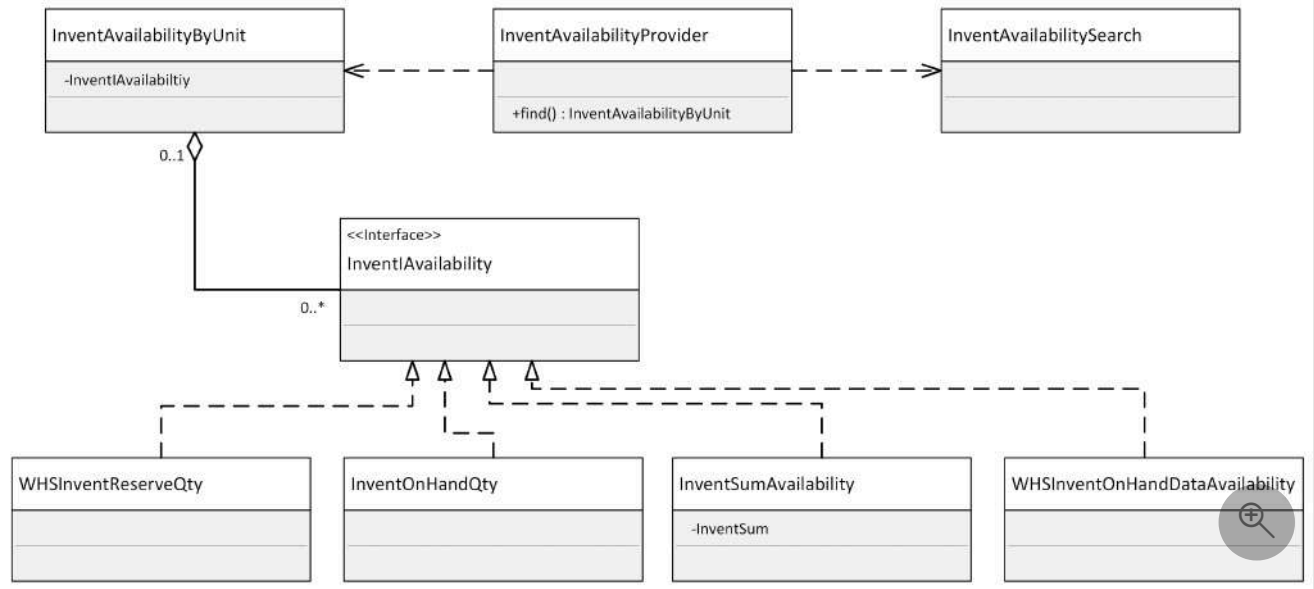
```
InventAvailabilitySearch availabilitySearch;
InventIAvailability availability;

availabilitySearch = InventAvailabilitySearch::construct();
availabilitySearch.setItemId(_itemId);
availabilitySearch.setInventDimCriteria(_inventDimCriteria, _inventDimCriteriaParm);
availabilitySearch.setInventSum(_inventSum);
availability =
InventAvailabilityProvider::construct().find(availabilitySearch).parmInventAvailabilit
y();

this.AvailOrderedCalculated = availability.availTotal();
this.AvailPhysicalCalculated = availability.availPhysical();
this.ReservPhysical = availability.reservPhysical();
this.OrderedSum = availability.orderedSum();
```

The `InventAvailabilityProvider` class provides numerous other APIs that are used to determine availability based on various types of input. The existing `InventOnHandQty` class was updated so that it also provides correct results for WMS-enabled items.

The following illustration shows the various classes and interfaces that are used to provide and encapsulate the calculations. For the sake of simplicity, some details are omitted.



Reservation strategies

To control the levels of the reservation hierarchy, the system uses the concept of *reservation strategies*. A reservation strategy determines the outcome of a reservation and the dimensions used to make the reservation. Reservation strategies are hard coded and aren't user configurable.

Each reservation strategy determines the level for the reservation. If the dimensions that the reservation system receives don't cover all the dimensions to the level that the strategy defines, the reservation system queries the on-hand availability until it reaches the required level. Then, based on the results of this query, it makes the reservation so that it covers all the required dimensions.

The reservation system chooses reservation strategies based on the following factors, among others:

- Warehouse setup
- Order type

The following table describes the reservation strategies that the reservation system uses.

Expand table

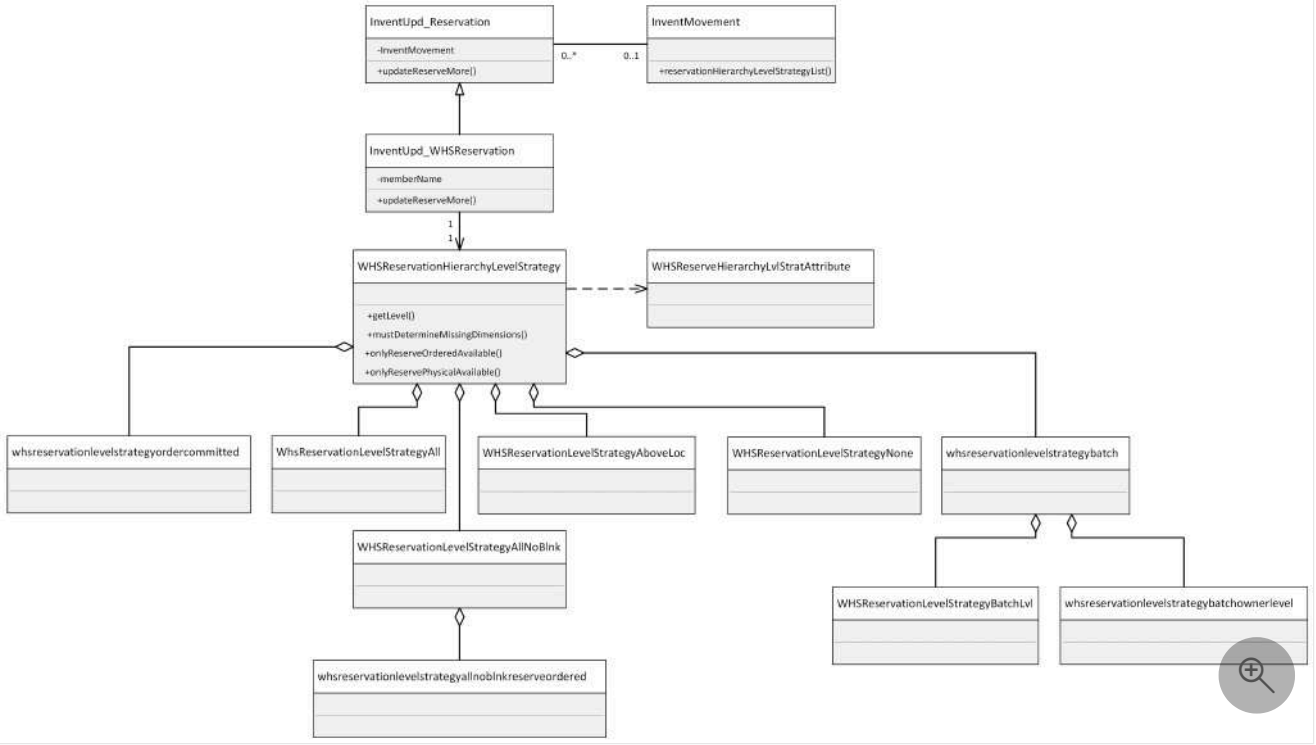
Reservation strategy	Description
None	The reservation system makes the reservation on the dimensions that it receives, if possible. Inventory blocking uses this strategy. It lets you make reservations on, for example, the site or warehouse level.
All	The reservation system makes the reservation on all the dimensions in the reservation hierarchy. This strategy is used, for example, for transfer journals or non-WMS-enabled

Reservation strategy	Description
	warehouses.
Above location	The reservation system makes the reservation only on the dimensions above the location level. This strategy is used, for example, for sales and transfer orders when reservations are made in a WMS-enabled warehouse.
All not allowed blank	The reservation system makes the reservation on the first lowest level that doesn't allow for blank issue for the inventory dimensions. This strategy enables automatic reservations on locations that aren't license plate controlled.
Batch level	This strategy is applied for items that the Batch number dimension is selected for, and that are above the Location dimension in the reservation hierarchy. This strategy is used when only reservations that are reserved ordered can be made. In that case, the reservation system attempts a reservation until the batch level.

The reservation system supports multiple reservation strategies in sequential order when it makes reservations. For example, the system uses the All and All not allowed blank strategies to make reservations for transfer journals.

Details about the implementation of reservation strategies

The following illustration shows the classes that implement reservation strategies and the main consumers of those classes. For simplicity, it omits some details.



You can easily extend the implementation because the instantiation uses the SysExtension framework.

Synchronization of dimensions between receipts and issues

When you mark or reserve order an inventory transaction, the system typically synchronizes the inventory dimensions between receipts and issues. For example, when you modify or receive a purchase order that you created based on a sales order, the system transfers the dimensions to the inventory transactions for the sales line.

For WMS-enabled items, the synchronization differs from the standard behavior. When the system creates work, it can reserve the source line transactions only up to the level above the location level. If all dimensions are synchronized, the system can't create work. Therefore, the system doesn't synchronize dimensions above the location level for all scenarios.

If both the item and the warehouse are enabled for WMS, and if the issue type is one that can generate work, such as a sales line, the system only synchronizes dimensions above the location level. Therefore, if an item uses batch numbers, and the Batch number dimension is below the location level in the reservation hierarchy, the system doesn't synchronize the batch number from receipt to issue transactions.

Details about the implementation of synchronization between receipts and issues

The logic that determines how dimensions are synchronized is implemented in the following methods on the `inventMovement` class. (However, new methods that you add might also require consideration.)

- `getInventDimForReservedTransPhysChange`
- `getInventDimForIssueTransFromReceipt`

> **Note**
>
> When products use an inventory reservation hierarchy of the *Batch-below[location]* type and are batch tracked for WMS, set a *flexible warehouse-level dimension reservation policy*. This policy ensures that you can reserve those products.
>
> Learn more about the flexible warehouse-level dimension reservation policy in **Flexible warehouse-level dimension reservation policy**.

Batch reservation policy for non-WMS warehouses

Items enabled for warehouse management processes (WMS) can be stocked non-WMS-enabled warehouses. However, if you do this, then WMS-enabled items that use a reservation hierarchy where the *Batch number* dimension is below the *Location* dimension prevent the warehouse work engine from enforcing batch-related rules during reservation. By default, this means that the reservation logic doesn't evaluate first expiry, first out (FEFO) rules, or batch disposition codes for those items in those warehouses. As a result, the system might reserve a quantity from a batch that is marked as unavailable through its batch disposition code.

To control this behavior, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **General** tab.
3. Expand the **Batches** FastTab.
4. Set **Batch reservation policy for non advanced warehouses** to one of the following values:

    - *Simple* – The system applies batch disposition code logic only when the batch is explicitly specified on the order line. The reservation engine doesn't apply FEFO rules for non-WMS-enabled warehouses. This behavior matches that of older versions of Supply Chain Management and is the default value for this setting.
    - *Advanced* – The system applies both FEFO rules and batch disposition codes during reservation and during on-hand calculations, even when no batch is specified on the order line. The system excludes batches that are assigned a disposition code with the **Batch disposition status** field set to *Unavailable* (with the *Reserve* block status applied for the order type) from automatic reservation. The user receives the standard "Cannot reserve" feedback when no other on-hand quantity is available.

5. On the Action Pane, select **Save**.

The policy applies in the following situations:

- Sales orders, including automatic reservation, manual reservations from the **Reservation** page, and release to warehouse operations.
- Items that use a reservation hierarchy where the *Batch number* dimension is below the *Location* dimension.
- Lines for warehouses where the **Use warehouse management processes** option is *No*.

The policy does *not* apply in the following situations:

- Retail sales orders.
- Items that use a reservation hierarchy where the *Batch number* dimension is above the *Location* dimension. For those items, standard reservation strategies already apply batch

disposition codes and FEFO, regardless of the **Batch reservation policy for non advanced warehouses** setting.

- WMS-enabled warehouses. For those warehouses, the warehouse work engine enforces batch disposition codes.
- Order types other than sales orders, such as transfer orders or production orders.

There's a small performance overhead when you use the *Advanced* policy because the system performs more validations during reservation and on-hand calculations. There are also scenarios where the advanced criteria can't be applied when on-hand inventory is presented in the user interface.

For information about how to set up batch disposition codes and assign them to batches, see Use batch disposition codes to mark batches as available or unavailable.

Warehouse handling of inbound loads for purchase and inbound shipment orders

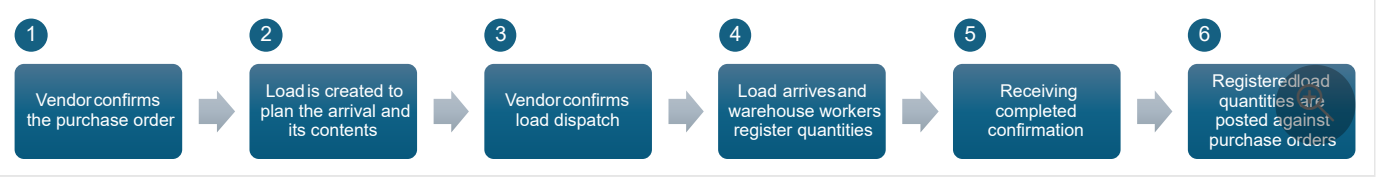
> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the warehouse handling process for inbound loads.

Each inbound load can be associated with one or more order line quantities, and your system might also contain transportation plans. For more information about how to create and manage inbound transportation, see Transportation management overview.

Overview: How inbound loads are created, registered, and received

The following high-level illustration shows an example flow for handling inbound loads for a purchase order. Note that if the purchase order originates in an enterprise resource planning (ERP) system other than Microsoft Dynamics 365 Supply Chain Management, it's represented by an *inbound shipment order* in the **Warehouse management** module.



1. **The vendor confirms the purchase order.**

   The process begins when a purchase order is entered into the system and then delivered to a vendor, who confirms the order. The purchase order/inbound shipment order must exist before you can create an inbound load record. However, you can create the inbound load even if the order isn't confirmed. For more information, see Approve and confirm purchase orders.

2. **An inbound load record is created to plan the arrival and its contents.**

   The inbound load record represents a vendor shipment of one or more orders. The load is expected to arrive at the warehouse as one physical transportation unit (such as a truckload). The inbound load record is used for planning purposes and lets the logistics coordinator track the load's progress from the vendor. It's also used to register order line quantities and manage progress through warehouse operations, such as arrival and putaway work. Loads can be created either automatically or manually. Depending on setup, the automatic creation can be done directly based on the order data or advanced shipment notice (ASN) from the vendor. For more information, see Create or modify an inbound load.

3. **The vendor confirms load dispatch.**

   When the vendor dispatches the load, the logistics coordinator at the receiving warehouse confirms the load shipment. If the receiving company is using the **Transportation management** module, inbound shipment confirmation triggers other load management processes that are associated with the inbound loads. For more information, see Confirm a load for shipping.

4. **The load arrives at the warehouse, and workers register quantities.**

   When a truckload arrives at the warehouse receiving dock, warehouse workers register the load quantities. When the **Warehouse management** module is used, workers do the registration by using mobile devices. For more information, see Product receipt against purchase orders - registration and the Register item quantities that arrive on an inbound load section.

5. **The load is updated as receive completed.**

   If the warehouse management parameter setting **Load receiving completed confirmation policy for purchase orders** is enabled, the load is updated to *Receiving completed*.

6. **Registered load quantities are posted against purchase orders.**

   After the load quantities have been registered as arrived, those quantities must be product receipt–posted to the company's inventory ledger to record the physical stock increase. Learn more in Product receipt against purchase orders - product receipt and Post registered product quantities against purchase orders.

Register item quantities that arrive on an inbound load

Dynamics 365 Supply Chain Management supports several operational approaches to recording the arrival of ordered products via loads. You can configure the system to match your specific business requirements. This section describes how to register incoming item quantities by using the Warehouse management mobile app when an inbound load arrives at the warehouse. First, warehouse workers must register the item quantities that are included in the load shipment. This workflow is available only if the following items are present in the system:

- **An inbound load record that describes the item quantities that are expected in the shipment**

Typically, the vendor confirms the inbound load record before the shipment arrives at the warehouse. Therefore, the load has a status of *Shipped*. However, warehouse workers can also register item quantities for loads that have a status of *Open* or *Received*, depending on the setup option.

- **A Warehouse management mobile app that is configured to support load receiving and all related warehouse setup enabled**

The Warehouse Management mobile app for mobile devices supports the following receiving work creation processes:

- License plate receiving (and putaway)
- Load item receiving (and putaway)
- Mixed license plate receiving (and putaway), where the **Source document line identification method** field for the mobile device menu item is set to *Load item receiving*. Learn more in Mixed license plate receiving.

> **Note**
>
> In a typical receiving flow, the system generates inbound warehouse work to take quantities that are registered in the receiving location and put them away in the regular storage locations. When mobile device menu item processes with *put away* are used, the device instructs the worker who registered the load quantity to do the putaway work as part of the receiving task. By contrast, for the other flows that are considered "two-step" processes, another warehouse worker typically processes the movement of the inbound inventory. However, many different configuration options exist to control the flow. In some cases, it might not make sense to create warehouse work. In these cases, you can configure the work policies so that they don't create inbound warehouse work. In other cases, it might make sense to include an inspection/quality process.

Handle discrepancies during registration of inbound load quantities

Warehouse workers can register a partial load quantity receipt. Each partial load quantity receipt creates a separate inventory transaction that has a receipt status of *Registered* for the registered quantity. The lot ID refers to the originating purchase order line or inbound shipment order line.

Load under-receiving

When a load arrives, if the item quantities are less than the quantities that are stated on the load record, warehouse receiving personnel can work directly in the client to acknowledge this discrepancy by reducing the quantity on the load line so that it matches the actual quantity that arrived and was registered.

Load over-receiving

Over-receiving occurs when a load arrives, and the item quantities exceed the expected load line quantity. You can control whether and to what degree over-receiving is allowed during load registration.

Use the **Load over receipt** field for the relevant mobile device menu items to control what occurs when a warehouse worker tries to register an overdelivery. This field is available for mobile device menu items that use the following types of work creation processes:

- Load item receiving (and putaway)
- Mixed license plate receiving (and putaway), where the **Source document line identification method** field is set to *Load item receiving*

The following table explains the options that are available for the **Load over receipt** field.

Expand table

Value	Description
Allow	Workers can register the receipt of quantities that exceed the remaining unregistered quantity for a selected load, but only if the total registered quantity doesn't exceed the quantity of the order line that is associated with the load (after adjustment for the overdelivery percentage).
Block	Workers can't register the receipt of quantities that exceed the remaining unregistered quantity for a selected load (after adjustment for the overdelivery percentage). A worker who tries to register the receipts receives an error and can't continue until they register a quantity that is equal to or less than the remaining unregistered load quantity.

Value	Description
	By default, the value of the overdelivery percentage on a load line is copied from the associated purchase order line. When the **Load over receipt** field is set to *Block*, the system uses the overdelivery percentage value to calculate the total quantity that can be registered for a load line. However, that value can be overwritten for individual loads as required. This behavior becomes relevant during receiving flows where some or all of the excess quantity that represents the order line overdelivery percentage is distributed disproportionately across multiple loads. Here's an example scenario: • There are multiple loads for one purchase order line. • The purchase order line has an overdelivery percentage that is more than 0 (zero). • Quantities are already registered against one or more loads without taking the overdelivery percentage into account. • The overdelivery quantity arrives on the last load. In this scenario, a mobile device can be used to register the excess quantity for the last load only if the warehouse supervisor increases the overdelivery percentage for the relevant load line from the default value to a value that is large enough so that the full overdelivery can be registered with the final load.
Block for closed loads only	Workers can over-receive load line quantities for open loads, but not for loads that have a status of *Received*.

Put away the registered quantities

When you complete the registration on the mobile device, the *Quantity receipt registration* action updates the inventory and warehouse records to show that the quantities are now in the receiving dock location and available for reservation. However, a company's warehouse operations typically require that the quantities be moved from the receiving dock to the regular warehouse storage, so that the subsequent picking processes can occur. Instructions for the putaway are captured in the putaway work that is automatically generated when the inbound load is registered as received.

When the warehouse worker completes the putaway work, the system records and tracks the result by updating several entities, as summarized in the following table.

Expand table

Entity	Updates	Note
Load	The following fields are updated: • The **Load status** value changes to *In process*. • The **Work status** value changes to *100.00% of work completed*.	The **Load status** value changes to *In process* when the worker starts the putaway task for at least one line of putaway work.
Inventory transactions of work that associated quantities have been put away for	The **Receipt** and **Location** fields, and other relevant fields, update to reflect the movement from the receiving location to the storage location.	The **Receipt state** value of the purchase order inventory transaction remains *Registered*.
Warehouse putaway	The **Work status** value changes to *Closed*.	

Mark a load as receive complete

Background processes, workers, and users can run the *Receiving completed* process to indicate that nothing more will be registered against a specific load. For more information, see Mark loads as completely received.

Post registered product quantities against purchase orders

After you register inbound product quantities in the system, you can reserve them for sales and other outbound and internal operations. However, the system doesn't yet update the inventory (interim) accounts. This update can occur only when the operations team posts the registered product receipts.

To open a page where they can post a product receipt, members of the operations team can follow any *one* of these steps:

- Open the relevant load record, and then select the **Product receipt** action.
- Go to **Warehouse management** > **Periodic tasks** > **Update product receipts**, and then, in the **Load ID** field, specify the load to post.
- Open the relevant purchase order, and then select the **Product receipt** action.
- Go to **Procurement and sourcing** > **Purchase orders** > **Receiving products** > **Posting product receipt job**.

The **Product receipt** action that's available on the **Load** page (and on the equivalent page for the update job, the **Update product receipts** page) can update product receipt quantities only on

purchase order quantities that have a status of *Registered*. However, the **Product receipt** action that's available on the **Purchase order** page can include quantities in both processing statuses (*Ordered* and *Registered*). It can also control the scope of product receipt posting through additional parameters, such as *Receive now quantity* and *Registered quantity and services*.

The product receipt posting can occur only for orders that have a status of *Confirmed*. For unconfirmed purchase orders, the **Product receipt** action appears as unavailable.

Post registered quantities from the Load page

For product receipt posting of registered quantities from the **Load** page, the following prerequisites must be in place:

- The load must have at least one quantity unit that has a status of *Registered*.
- The load status must be *Shipped*.
- The purchase order that is associated with the load must have a status of *Confirmed*.

> ⓘ **Note**
>
> If the load status isn't set to *Shipped*, the system automatically confirms the load before it runs the product receipt update. (The load status is set to *Shipped* when a user registers the load's inbound shipment.)

To perform the product receipt posting of the arrival registrations associated with a selected load, the worker selects the **Product receipt** action on the **Load** page. The page that opens has the following key details:

- The **Quantity** field in the **Parameters** section on the **Settings** tab shows the *registered quantity*. No other options are available.
- The grid on the **Overview** FastTab lists all the purchase orders that are included in the selected load.
- The grid on the **Lines** FastTab lists all the order lines that have a registered quantity.

> ⓘ **Note**
>
> Quantities for order lines that appear on the **Line** tab are calculated differently, depending on whether the *Allow multiple product receipt per load* feature is available and turned on in your version of Supply Chain Management.

Expand table

Version	Calculation
Versions before version 10.0.10, and newer versions where the *Allow multiple product receipt per load* feature isn't turned on	The line quantity is the total of all registered quantities *for that purchase order line*, regardless of whether registration was done over multiple loads, independently of the load, from a mobile device, or from the client.
Version 10.0.10 and later, where the *Allow multiple product receipt per load* feature is turned on	The line quantity is the total of all registered quantities *for the load record* that the **Product receipt posting** action was initiated from.

When the user selects **OK** to confirm product receipt posting, the system makes the following key updates on appropriate entities.

Expand table

Entity	Updates
Inventory transaction of the purchase order for which line quantities are included in the posting scope	The following fields are updated (but note that there are also multiple other updates): • The **Receipt** field is set to *Received*. • The **Physical date** field is updated with the date of the posting.
Load that the user posted the product receipt from	Updates to the loads depend on the version that is used and the setting of the **Allow multiple product receipt per load** field. The rules are described in the table that appears later in this section.

The **Allow multiple product receipt per load** field lets companies choose an inbound load receiving policy. Depending on their operational flows, companies might choose to allow or disallow multiple product receipt postings for the same load. Set the **Allow multiple product receipt per load** field to one of the following values:

- **No** – Select this value if warehouse receiving clerks always register all order quantities that arrive with each load within a designated time frame. If any load quantities aren't registered, the system assumes that they didn't arrive or weren't on the load, and therefore shouldn't be considered part of the load. The product receipt posting that runs from a load uses the same assumption. In addition to product receipt–updating all the registered quantities (its main function), it declares the load complete and closed for additional processing. In this case, all load line quantities are automatically updated to the registered quantities, load

lines that have no registered quantities are deleted, and the load status is changed to *Received*.

- **Yes** – Select this value if warehouse receiving clerks require more time to register all the quantities on the load that arrived, but, in the meantime, you must perform a product receipt posting of the quantities that are already registered. In this case, the logistics manager wants to keep a load open even after the product receipt posting job runs, so that remaining load quantities can be registered and product receipt–updated to the ledger on an ongoing basis.
- **Prompt** – Select this value if your load receiving practices are mixed, and a decision is required each time that product receipt posting runs.

The following table summarizes the effects of the **Allow multiple product receipt per load** setting.

Expand table

Allow multiple product receipt per load	Load quantity	Load status	Note
When this field isn't available (versions before 10.0.10)	The load quantity is set so that it equals the registered quantity. If the load quantity is updated to 0 (zero), which means that no registration is done, the load line is deleted. If there are no load lines on the load, the load is deleted.	*Received*	If multiple loads exist for the order line's registered quantity, only the status of the load that the receipt was posted from is updated to *Received*.
No	The load quantity is set so that it equals the registered quantity that is associated with the load ID. If no load ID is recorded for the inventory transaction, the behavior matches the behavior in versions before 10.0.10.	*Received*	
Yes	No updates	*Received*, if the total registered load quantity is equal to or	

Allow multiple product receipt per load	Load quantity	Load status	Note
		more than the load quantity	
Yes	No updates	*Shipped* or *In process*, if the total registered load quantity is less than the load quantity	

After the **Load status** field is set to *Received*, no more product receipt postings can be done for that load. However, the worker can register the remaining order quantity against the received load provided the **Load line quantity over receipt** field on the mobile device menu item for the load item receiving action is set to *Allow*. (Learn more in the Load over-receiving section earlier in this article.)

For product receipt posting of additional registered load quantities against a load that has a status of *Received*, the user must run the posting action from the associated purchase order.

Post registered quantities from the Purchase order page

For product receipt posting of registered quantities from the **Purchase order** page, complete the following tasks before selecting the **Product receipt** action:

- Set the **Quantity** field in the **Parameters** section on the **Settings** tab to *Registered quantity*.
- In the **Product receipt** field, enter the numbers of the purchase orders included in the posting.

> **Note**
>
> The line quantity included in the posting scope is the total of all registered quantities for the order line, regardless of whether quantity registration is done over multiple loads, independently of the load, from a mobile device, or from the client. The same rule applies when product receipt posting runs from a load, if it's done where the **Allow multiple product receipt per load** field either isn't available or isn't enabled.

When the user selects **OK** to confirm product receipt posting, the system makes the following key updates on appropriate entities.

Expand table

Entity	Updates
Inventory transaction of the purchase order for which line quantities are included in the posting scope	The following fields are updated (but note that there are also multiple other updates): • The **Receipt** field is set to *Received*. • The **Physical date** field is updated with the date of the product receipt posting action.
Load	Updates to the loads depend on whether the **Allow multiple product receipt per load** field is available and enabled. The rules are described in the next table.

The following table summarizes the effects of the **Allow multiple product receipt per load** setting.

Expand table

Allow multiple product receipts per load	Load quantity	Load status	Note
When this field is either disabled or unavailable (in versions before 10.0.10)	No updates	No updates are done. (The status remains *Open*, *Shipped*, or *In process*.)	Because the product receipt posting is initiated from a purchase order, the updating logic doesn't have information about the association between the registered quantities within its scope and the loads that the registration was recorded against. Therefore, it can't select the load for the status update.
Enabled	No updates	One of the following actions occurs: • The status is changed to *Received* if the total received and purchased quantities of the purchase order inventory transactions are more than or equal to the quantity of the load that they're associated with. • The status remains *Open*, *Shipped*, or *In process* if the	

Allow multiple product receipts per load	Load quantity	Load status	Note
		previous condition isn't met for all the lines in the load.	

Select the appropriate product receipt posting option for your logistics operations

As described earlier, the system offers two product receipt posting options. You can access these options in the following places:

- On the **Load** page, or from the **Warehouse management** > **Periodic tasks** menu as an update job
- On the **Purchase order** page, or from the **Procurement and sourcing** > **Purchase orders** > **Receiving products** menu as an update job

Use the following functions if your company uses loads to plan and manage transportation and warehouse handling of inbound orders. These functions work with loads:

- **Load item receiving** actions on your warehouse mobile devices, to register the product quantity arrival against the load
- **Product receipt posting** actions initiated from a load, to update the inventory ledger

> **Note**
>
> You can use other quantity registration and product receipt posting functions to support the corresponding inbound operational processes. However, if you use them interchangeably with or instead of the dedicated load-focused functions, you might compromise the data accuracy of the load records and therefore the seamlessness of the load management flows.

Example scenarios

Prepare your system to run the sample scenarios

To work through the sample scenarios described in this section, first make sure that your system has all the required features turned on. The system must also have the required demo data available.

Enable sample data

To work through these scenarios by using the specified sample records and values, use a system where the standard demo data is installed. Also, select the **USMF** legal entity before you begin.

Add a menu item for receiving load items when a mobile device is used

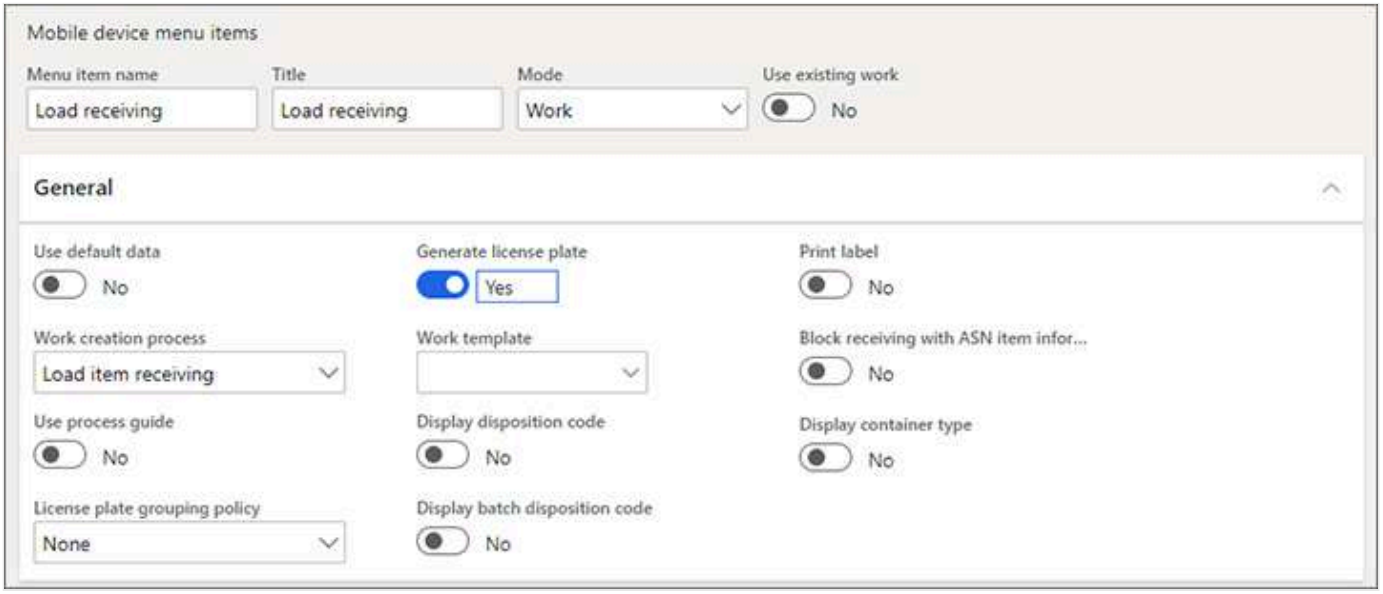
Before warehouse receiving clerks can use a mobile device to register inbound inventory that links to a load, you must create a mobile device menu item for that purpose.

In this section, you create a mobile device menu item and add it to an existing menu. A warehouse worker can then select the menu item in the Warehouse Management mobile app.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**, and make sure that your mobile device menu includes a menu item that has the following settings:

- **Mode:** *Work*
- **Work creation process:** *Load item receiving*
- **Generate license plate:** *Yes*

You can leave all other settings at their default values.



For more information about how to set up mobile device menu items, see Set up mobile devices for warehouse work.

1. After you finish setting up the menu item, go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**, and add the menu item to the menu structure for your mobile devices.

Example scenario 1: Register a load where some items are missing

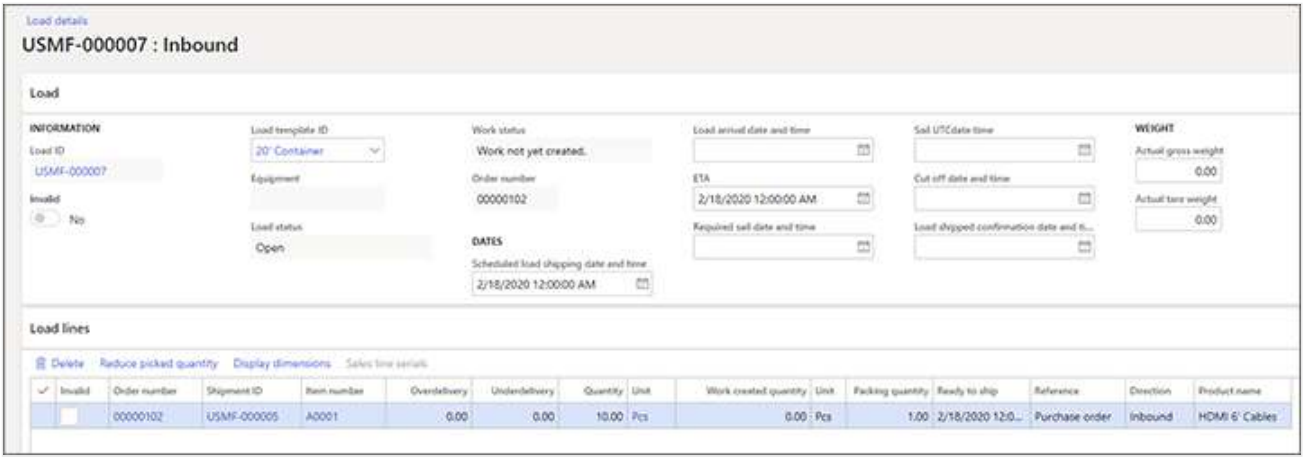
This scenario shows how to register quantities for an inbound load where not all the expected quantities are present. It then shows how to post the product receipt for the purchase order.

Create a load to plan receipt of a purchase order

In this procedure, you manually create a purchase order and an associated load. You then update the load to simulate that it shipped from the vendor (which updates the load status). Warehouse planners can then filter loads by **Load status** to find expected incoming loads.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. In **Create purchase order**, set the **Vendor account** field to *1001*.
4. Select **OK** to close the dialog box and create the purchase order.
5. The new purchase order already includes a line under **Purchase order lines**. Set the following values for this line:
    - **Item number:** *A0001*
    - **Warehouse:** *24*
    - **Quantity:** *10*
6. On the Action Pane, on the **Purchase** tab, select **Actions** > **Confirm**. The order status is now *Confirmed*.
7. On the Action Pane, on the **Warehouse** tab, select **Actions** > **Inbound load planning workbench**.
8. On the **Inbound load planning workbench** page, on the Action Pane, on the **Supply and demand** tab, select **Add** > **To new load**.
9. In **Load template assignment**, set the **Load template ID** field to *20' Container*.
10. Select **OK** to close the dialog box and return to the workbench.
11. In the **Loads** section, select **Load ID** to open the newly created load.
12. Review the load header and line details, and notice the following points:

- On the **Load** FastTab, the **Load status** field is set to *Open*.
- In the **Load lines** section, there's a single line where the **Quantity** field is set to *10* and the **Work created quantity** field is set to *0* (zero).



13. On the Action Pane, on the **Ship and receive** tab, select **Confirm** > **Inbound shipment**. Notice that the **Load status** changes to *Shipped*.

14. Make a note of the **Load ID** value, so that you can use it in the next procedure.

Register receipt of the quantities that arrived on the load

When the load arrives at the warehouse receiving dock, a receiving clerk registers the load quantities on a mobile device.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)

2. Select the *Load item receiving* menu item that you created for this scenario.

3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)

    - **Load** – Enter the load ID that you created in the previous procedure.
    - **Item** – Enter *A0001*, which is the item that is expected for this load.
    - **Qty** – Enter *9* as the actual quantity that is present on the load. Note that this quantity is less than the expected quantity.

4. Continue to go through the workflow, leaving all other fields blank or set to their default values, until your device informs you that the work is completed.

The load receiving task is now completed, and the receiving clerk can move on to their next task. However, warehouse receiving personnel eventually review the load record and can see that the

received quantity was less than the expected quantity. They can then complete the following procedure by using the web client.

1. Go to **Warehouse management** > **Loads** > **All loads**.
2. In the list, find the load that you just received. (You might have to select the **Show closed** check box to include the inbound loads that have a load status of *Shipped*.) Then select the link in the **Load ID** column to open the load.
3. In the load record, notice that the **Load status** value remains *Shipped*, but the **Work created quantity** value on the load line changes to *9*.
4. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
5. In the list, find the purchase that you just received, and then select the link in the **Purchase order** column to open the order.
6. On the **Purchase order lines** FastTab, select **Inventory** > **View** > **Transactions**.
7. Review the details of the two purchase order transactions. (You might have to personalize the **Inventory transactions** page to see the **Load ID** field to the grid.) You see two transactions:

- The transaction that has a receipt in *Registered* status represents the registration quantity of *9* that runs against a specific load by using the mobile device. The **Load ID** is associated with the transaction in question.
- The transaction that has a receipt in *Ordered* status represents the remaining unregistered order line quantity of *1*.

Product receipt–post the registered load quantities against purchase orders

In this procedure, you can perform product receipt posting of the inventory that you registered for a load. As a result, the received inventory and its related costs are added to the company's general ledger.

1. Go to **Warehouse management** > **Loads** > **All loads**.

2. In the list, find the load that you received. (You might have to select the **Show closed** check box to include the inbound loads that have a load status of *Shipped*.) Then select the link in the **Load ID** column to open the load.

3. On the Action Pane, on the **Ship and receive** tab, select **Receive** > **Product receipt**. If you're prompted to confirm the action, select **Yes**.

4. In the **Posting product receipt** dialog box, on the **Lines** FastTab, inspect the grid. You should see the purchase order line for which the quantity is registered against the selected load.

5. On the **Overview** FastTab, inspect the **Product receipt** field in the grid. Notice that it's set to a number that includes the ID of the selected load.

6. Select **OK** to post the product receipt and close the **Posting product receipt** dialog box.

7. You're returned to the load details. Notice the following points:

    - The **Load status** field is now set to *Received*.
    - On the load line, the **Quantity** value for the load changes from *10* pcs to *9* pcs to match the registered quantity, but the **Work created quantity** value remains *9*.

If the purchasing team doesn't expect the vendor to deliver the remaining order quantity of 1, it can close the order by updating the line's delivery remainder to *0*. However, if it's soon found that the missing piece arrived on the original load, warehouse personnel can perform one of the following actions:

- Register the quantity against the same load. In this case, the **Load status** field resets to *Shipped*, and the **Work created quantity** value updates to *10*. This choice is only available when the **Load line quantity over receipt** field is set to *Allow*.
- Add the quantity to a new or existing load, and process it in the usual way.
- Register and/or receive the quantity in a way that doesn't involve load handling.

Example scenario 2: Register quantities that arrive on multiple inbound loads where some items are missing

In this scenario, an inbound shipment related to a single purchase order line is split into two loads. For example, a purchase order line might be split into multiple loads because of physical load constraints on weight and/or volume.

This scenario also shows how to process multiple product receipt postings for the same load. You register quantities that arrive on multiple inbound loads, but the quantities don't match the expected quantities. You perform the cost updates that occur through the product receipt posting multiple times for the same load.

Set up load receiving policies

In this procedure, you enable multiple product receipt postings from the same load.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Loads** tab, set the **Allow multiple product receipt per load** field to *Yes*.

Create two loads to plan receipt of a purchase order

In this procedure, you create a purchase order and two loads. You then manually update each load to simulate that the vendor shipped it (which updates the load status). Warehouse planners can then filter loads by **Load status** to find expected incoming loads.

You also learn how to set the purchase order line so that you can receive a quantity that is 20 percent more than the quantity specified for the line.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. On the **Vendor** FastTab, set the **Vendor account** field to *1001*, and then select **OK**.
4. Your new purchase order is opened and includes a blank line in the **Purchase order lines** grid. Set the following values for this order line:
    - **Item number:** *A0001*
    - **Warehouse:** *24*
    - **Quantity:** *10*
5. On the **Line details** FastTab, on the **Delivery** tab, set the **Overdelivery** field to *20*.
6. On the Action Pane, on the **Purchase** tab, select **Actions** > **Confirm**. The order status is now *Confirmed*.
7. On the Action Pane, on the **Warehouse** tab, select **Actions** > **Inbound load planning workbench**.
8. On the **Inbound load planning workbench** page, on the Action Pane, on the **Supply and demand** tab, select **Add** > **To new load**.
9. In the **Load template assignment** dialog box, set the **Load template ID** field to *20' Container*. On the **Details** tab, change the **Quantity** value from *10* to *5* to partially add the purchase order line quantity.
10. Select **OK** to apply your settings and close the dialog box.

11. Repeat steps 8 through 10 to create a second load. This time, the **Quantity** field should already be set to *5*.

12. On the **Inbound load planning workbench** page, in the **Loads** grid, select the **Load ID** value for the first load that you created. The **Load details** page appears and shows the selected load. Follow these steps:
    a. On the Action Pane, on the **Ship and receive** tab, select **Confirm** > **Inbound shipment**.
    b. Notice that the **Load status** value changes to *Shipped*.
    c. Select the close button to return to the **Inbound load planning workbench** page.

13. Repeat the previous step for the second load that you created.

14. Make a note of the two **Load ID** values that appear in the **Loads** grid.

Register partial receipt of the quantities that arrived on the first load and post the registered load quantities

When loads arrive at the warehouse receiving dock, a receiving clerk registers the load quantities on a mobile device. The registered inventory that links to a load is then cost-updated in the company's general ledger by posting the purchase order product receipt, based on the load.

This procedure shows how a receiving clerk registers load quantities on a mobile device.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)

2. Select the *Load item receiving* menu item that you created for this scenario.

3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)

    - **Load** – Enter the first load ID that you created in the previous procedure.
    - **Item** – Enter *A0001*, which is the item that is expected for this load.
    - **Qty** – Enter *3*. Note that this quantity is less than the expected quantity. For this scenario, imagine that you, as the receiving clerk, don't have time to register all quantities for this load. Later in this procedure, you register the remaining pieces by repeating this step and setting the **Qty** field to *2*.

4. Continue to go through the workflow, leaving all other fields blank or set to their default values, until your device informs you that the work is completed.

5. In the web client, go to **Warehouse management** > **Loads** > **All loads**.

6. In the list, find the load that you just received, and select the **Load ID** value to open the load. Notice that the **Load status** value remains *Shipped*, but the **Work created quantity** value on the load line changes to *3*.

7. On the Action Pane, on the **Ship and receive** tab, select **Receive** > **Product receipt**. If you're prompted to confirm the action, select **Yes**.

8. In the **Posting product receipt** dialog box, review but don't change the values that are shown, and then select **OK**.

9. You're returned to the **Load details** page for your selected load. Notice the following points:

    - The **Load status** field remains set to *Shipped*.
    - On the load line, the **Quantity** value for the load remains *5* pcs, which is the original load quantity, and the **Work created quantity** value remains *3*.

10. Complete the registration of the remaining quantity on this load by repeating this procedure. However, in step 3, set the **Qty** field to *2*.

The receiving task for the first load is now completed. Two product receipt journals are created, one for each of the two product receipt updates that you ran.

Register receipt of the quantities that arrived on the second load and account for the overdelivered quantity

For this scenario, the receiving clerk inbound-registers a quantity that exceeds the quantity that exists on the load. The system permits over-receiving because it's set up to allow overdelivery.

1. Use your mobile device to sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)

2. Select the *Load item receiving* menu item that you created for this scenario.

3. Follow the data entry instructions on the screen to enter the following values. (The order might vary, depending on the mobile device or emulator that you're using.)

    - **Load** – Enter the second load ID that you created earlier.
    - **Item** – Enter *A0001*, which is the item that is expected for this load.
    - **Qty** – Enter *7*, which is the remaining quantity that the vendor is authorized to deliver as part of total purchase order quantity of 12 (where 10 is the original order quantity, and 2 is the allowed overdelivery quantity of 20 percent). Remember that 5 pcs are already registered against the first load.

The second load is now updated with the quantity of 7 and can be product receipt–updated based on this quantity.

Mark loads as completely received

Article • 04/23/2025

This article describes the options for marking loads as completely received. It also explains how the *Receiving completed* periodic task works.

Mark a load as completely received

Background processes, workers, and users can run the *Receiving completed* process to indicate that nothing more has to be registered against a specific load. Admins can schedule automatic processing by setting up a batch job as described in the following procedure. Web client users can run the process by using the **Load** or **Inbound load planning workbench** page. Workers who use the Warehouse Management mobile app can run it by using a menu item that is set up with an **Activity code** value of *Receiving completed confirmation*.

During the *Receiving completed* process, workers and users update the **Load status** and **Load receiving completed date and time** fields for the load. In addition, depending on the setting of the **Capture receiving completed packing slip** field on the **Warehouse management parameters** page, they might be able (or required) to enter a packing slip ID and a document date.

Follow these steps to specify how loads that are related to purchase orders are finalized.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Loads** tab, in the **Capture receiving completed packing slip** field, select one of the following options to specify whether users or workers must enter a packing slip ID when they confirm that receiving is completed:
    - *Never* – Workers or users are never required to enter a packing slip ID when they confirm that receiving is completed.
    - *Always* – Worker or users are always required to enter a packing slip ID and a document date for every received shipment.
    - *Optional* – Worker or users can choose whether to enter a packing slip ID when they confirm that receiving is completed. They can also leave the document date blank. (It's automatically set to the current date by default).
3. In the **Load receiving completed confirmation policy for purchase orders** field, select one of the following options:
    - *Disabled* – Loads don't indicate whether inbound receiving is completed. If you select this option, there is a risk that the *Update product receipts* cost update periodic task might run in the middle of an inbound registration process.

- *Enabled* – After the *Receiving completed* process is run, loads are updated with a **Load receiving completed date and time** value, and a **Packing slip ID** value is assigned to related shipments. The *Update product receipts* cost update periodic task checks for these values to ensure that it processes only loads that were received. This check is especially important if you allow over-receiving or under-receiving.
- *Enabled with auto post* – This option works just like the *Enabled* option, but the **Load status** value is also updated to *Received*, and the **Product receipt processing status** field on the load becomes available for use with the subsequent *Product receipt* posting process. You can't select this option if you allow multiple product receipts per load.

4. If you set the **Load receiving completed confirmation policy for purchase orders** field to *Enabled* or *Enabled with auto post*, and you want the *Receiving completed* process to run automatically, set up the *Receiving completed* periodic task as described in the next section.

> **Note**
>
> When you set up the *Update product receipts* cost update periodic task, you can use the **Load status** and **Product receipt processing status** field values as filter criteria. In addition, depending on the setting of the **Capture receiving completed packing slip** option on the **Warehouse management parameters** page, the purchase order product receipt process might be able to use the recorded packing slip ID as part of the *Update product receipts* periodic task.

Automatically run the Receiving completed process

The *Receiving completed* periodic task automatically runs the *Receiving completed* process for loads for purchase orders. To set up the task so that it runs automatically, follow these steps.

1. On the **Warehouse management parameters** page, on the **Loads** tab, set the **Load receiving completed confirmation policy for purchase orders** field to *Enabled* or *Enabled with auto post*. The *Receiving completed* periodic task is available only if the field is set to one of these values. Learn more in the Mark a load as completely received section.
2. Go to **Warehouse management** > **Periodic tasks** > **Receiving completed**.
3. In the **Receiving completed** dialog, on the **Parameters** FastTab, set the **Accept quantity exceptions** option to specify whether differences between the received quantities and the quantities on the load line should be accepted. Set the option to *No* to reject the differences and cancel the confirmation process. Set it to *Yes* to accept the differences and continue the processing.

4. On the **Records to include** FastTab, set up filters and constraints to define which loads to process. Select **Filter** to open a standard query editor dialog, where you can define selection criteria, sorting criteria, and joins. The fields work just as they do for other types of queries in Microsoft Dynamics 365 Supply Chain Management.
5. On the **Run in the background** FastTab, specify how, when, and how often to run the task. The fields work just as they do for other types of background jobs in Supply Chain Management.
6. Select **OK**.

Example: Include only loads with fully completed work

To set up the *Receiving completed* periodic task so that it includes only loads where work was fully completed, follow these steps.

1. Go to **Warehouse management** > **Periodic tasks** > **Receiving completed**.
2. On the **Records to include** FastTab, select **Filter**.
3. In the query editor dialog, on the **Joins** tab, select the **Loads** join in the list.
4. On the toolbar, select **Add table join**.
5. Set the **Show details** option to *Yes*.
6. Select the row where the **Join mode** field is set to *NotExist* and the **Table relation description** field is set to *WHSLoadTable -> WHSWorkTable*.
7. On the toolbar, select **Select**.
8. On the **Range** tab, on the toolbar, select **Add** to add a line.
9. Set the following values for the new line:
    - **Table** – Select *Work (NotExist)*.
    - **Field** – Select *Work status*.
    - **Criteria** – Select all the statuses that denote an open work record. For example, you might select *Open*, *In process*, *Pending review*, and *Combined*.
10. On the toolbar, select **Add** to add another line.
11. Set the following values for the new line:
    - **Table** – Select *Load*.
    - **Field** – Select *Load receiving completed date and time*.

- **Criteria** – Enter two double quotation marks ("") to denote an empty value.

> **Tip**
>
> Because of the **Criteria** setting on this line, the query finds only records that have an empty value in the **Load receiving completed date and time** field. As a result, the task doesn't consider loads that were already received. If you omit this setting, the task becomes slower each time that it runs.

12. Select **OK**.
13. Set other options for the task as described in the previous section.
14. Select **OK** to save and run the task.

Create or modify an inbound load

Article • 01/31/2024

This article explains how to create or modify an inbound load. You can use a purchase order or an inbound shipment order to create an inbound load either automatically or manually. You can also modify an existing inbound load by adding more lines or updating the quantities, for example.

For more information about how to use the inbound load process with transportation planning, see Transportation management overview.

Automatically create inbound loads for new purchase orders

To set up your system so that it automatically creates an inbound load for each new purchase order, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Loads** tab, set the **Automatically create at purchase order entry** option to *Yes*.

An inbound load is now automatically created each time that you create a purchase order.

Automatically create inbound loads when purchase orders are received by using the Warehouse Management mobile app

To set up your system so that it automatically creates an inbound load for purchase order lines that aren't already related to open loads, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Loads** tab, set the **Automatically create at purchase order receiving** option to *Yes*.

This option is valuable when, for example, you use the **Load receiving completed confirmation policy for purchase orders** option, but there's no process to create loads up front. Each of the registered purchase order line transactions is associated with the load ID that's created. In this way, subsequent cost update processes can be correctly

matched with the actual inventory that's registered for the warehouse. For more information about inbound flows, see Warehouse handling of inbound loads for purchase and inbound shipment orders.

Automatically create inbound loads for new inbound shipment orders

To set up your system so that it automatically creates inbound loads for new inbound shipment orders, based on the source system, order type, and/or account, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Source systems**.
2. On the **Source systems** page, you should have one record for each external system that submits inbound shipment orders to Microsoft Dynamics 365 Supply Chain Management. Follow one of these steps:
    - To add a new source system, select **New** on the Action Pane.
    - To edit an existing source system, select it in the list pane, and then select **Edit** on the Action Pane.
3. For the new or selected source system, select the **Inbound shipment order policies** FastTab. The grid might have several rows to define policies for each of several order types and/or accounts. Alternatively, the grid might have just one row that applies to all order types and accounts. Use the toolbar on the FastTab to add or remove rows in the grid as required.
4. For each row where you want to automatically create inbound loads as part of inbound shipment order message processing, set **Load synchronization policy** to *Full synchronization*.

An inbound load is now automatically created each time that you import and process an inbound shipment order for the relevant source system, order type, and account.

If you use the Warehouse management mobile app to run a receiving process against an inbound shipment order line that isn't associated with an open load, the system automatically creates a load as part of the registration process. The load ID is assigned to the related inventory transaction.

Manually create an inbound load from order lines

To manually create an inbound load, you must have at least one order line that isn't already assigned to a load.

1. Go to **Warehouse management** > **Loads** > **Inbound load planning workbench**.
2. Use the filter options at the top of the page to find the order lines that you want to assign to a load.
3. Select the **Purchase order lines** or **Inbound shipment order lines** tab, depending on the type of order lines that you're looking for.
4. Mark each order line that you want to assign to a load.
5. On the Action Pane, on the **Supply and demand** tab, select **To new load**.
6. In the **Load template assignment** dialog box, set the **Load template ID** field to the load template that you want to use.
7. Select **OK**.

Create inbound loads when you import advanced shipping notices

The system automatically creates loads when you import advanced shipping notices (ASNs).

Register items enabled for warehouse management processes using an item arrival journal

Article • 08/01/2022

This article presents a scenario that shows how to register items using the item arrival journal when you are using warehouse management processes (WMS). This would usually be done by a receiving clerk.

Enable sample data

To work through this scenario using the sample records and values specified in this article, you must be using a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

You can instead work through this scenario by substituting values from your own data provided that you have the following data available:

- You must have a confirmed purchase order with an open purchase order line.
- The item on the line must be stocked. It must not use product variants, and must not have tracking dimensions.
- The item must be associated with a storage dimension group that has warehouse management process enabled.
- The warehouse that's used must be enabled for WMS and the location that you use for receiving must be license plate controlled.

Create an item arrival journal header that uses warehouse management

The following scenario shows how to create an item arrival journal header that uses warehouse management:

1. Make sure your system contains a confirmed purchase order that fulfils the requirements outlined in the previous section. This scenario uses a purchase order for company *USMF*, vendor account *1001*, warehouse *51*, with an order line for *10 PL* (10 pallets) of item number *M9200*.

2. Make a note of the purchase order number that you will use.

3. Go to **Inventory management** > **Journal entries** > **Item arrival** > **Item arrival**.

4. Select **New** on the Action Pane.

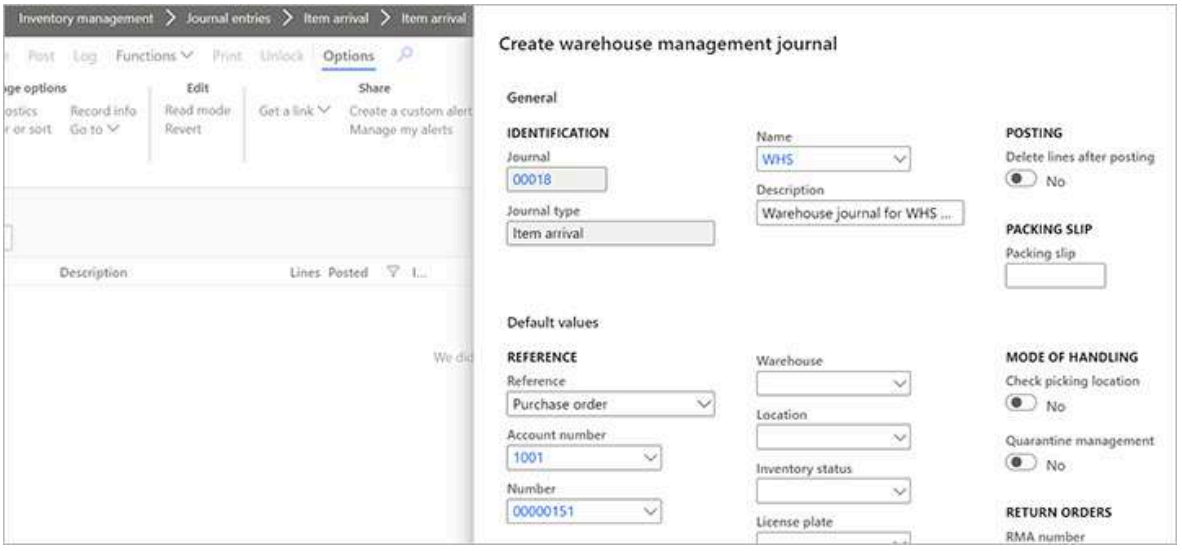
5. The **Create warehouse management journal** dialog box opens. Select a journal name in the **Name** field.

    - If you are using *USMF* sample data, select *WHS*.
    - If you're using your own data, the journal you choose must have **Check picking location** set to *No* and **Quarantine management** set to *No*.

6. Set **Reference** to *Purchase order*.

7. Set **Account number** to *1001*.

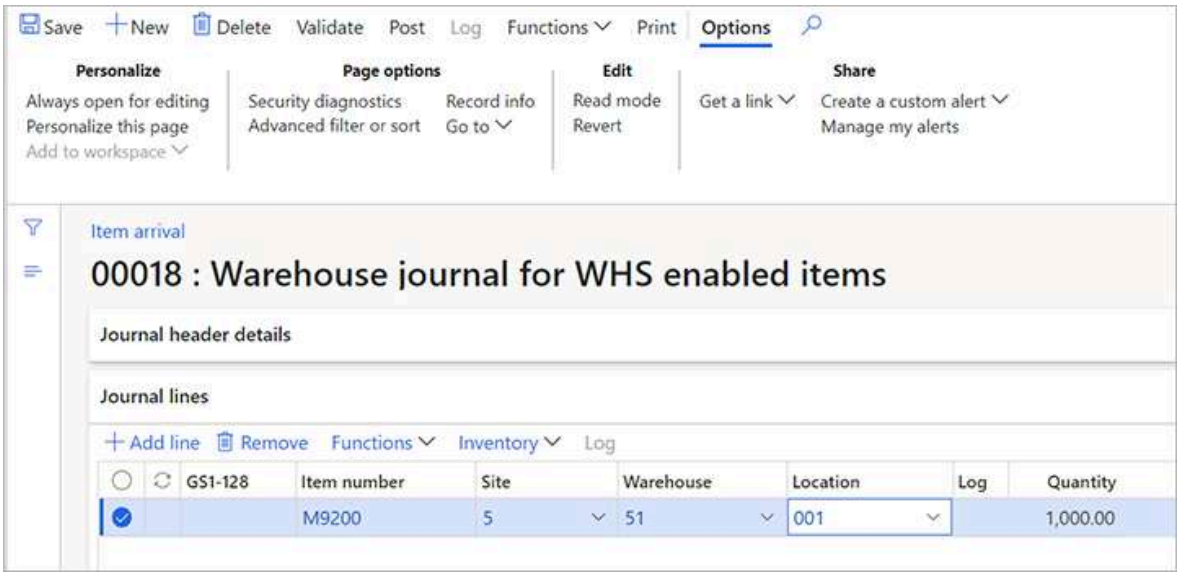
8. Set **Number** to the number of the purchase order that you identified for this exercise.



9. Select the **OK** to create the journal header.

10. In the **Journal lines** section, select **Add line** and enter the following data:

    - **Item number** – Set to *M9200*. The **Site**, **Warehouse**, and **Quantity** will get set based on the inventory transaction data for the 10 pallets (1000 ea.).
    - **Location** – Set to *001*. This specific location does not track license plates.



> **Note**
>
> The **Date** field determines the date on which the on-hand quantity of this item will be registered in the inventory.
>
> The **Lot ID** will be populated by the system if it can be uniquely identified from the information provided. Otherwise you will have to enter this manually. This is a required field, which links this registration to a specific source document line.

11. Select **Validate** on the Action Pane. This checks that the journal is ready to be posted. If the validation fails you will need to fix the errors before you can post the journal.
12. The **Check journal** dialog box opens. Select **OK**.
13. Review the message bar. There should be a message denoting that the operation was completed.
14. Select **Post** on the Action Pane.
15. The **Post journal** dialog box opens. Select **OK**.
16. Review the message bar. There should be messages denoting that the operation completed.
17. Select **Functions** > **Product receipt** on the Action Pane to update the purchase order line and post a product receipt.

Register items for a basic warehousing enabled item using an item an item arrival journal

Article • 02/12/2025

This procedure shows you how to register items using the item arrival journal when you are using "basic warehousing" in the Inventory management module. This would usually be done by a receiving clerk. You can run this procedure in demo data company USMF with the example values that are shown. If you are not using USMF, you need to have a confirmed purchase order with an open purchase order line before you start this guide. The item on the line must be stocked. And the item needs to be associated with a storage dimension group, where site and warehouse are active.

Create item arrival journal header

1. Go to **Inventory management** > **Journal entries** > **Item arrival** > **Item arrival**.
2. Select **New**.
3. In the **Name** field, type a value. If you are using USMF, you can type *WHS*. If you're using other data, the journal whose name you choose has to have the following properties: **Cheque picking location** must be set to *No*, and **Quarantine management** must be set to *No*.
4. In the **Packing slip** field, type a value. This is the packing slip ID from the packing slip issued by the vendor. Add a unique number.
5. In the **Number** field, select the purchase order.
6. Select **OK**.

Add lines to item arrival journal

1. Select **Functions**.
2. Select **Create lines**. The lines can be entered manually into this journal or created automatically. This will show you how to create this automatically.
3. Select or clear the **Initialize quantity** checkbox. This initializes the quantity on the journal lines with the quantity not registered from the purchase order line.
4. Select **OK**.

Post the journal

1. Select **Post**.
2. Select **OK**.

Generate the product receipt

1. Select **Functions**.
2. Select **Product receipt**.
3. Select **OK**.

Import inbound ASNs through data entities

Advanced shipping notices (ASNs) notify you about vendor deliveries. They help the sender describe the contents of a shipment and provide additional information about it, such as the items and packaging.

ASNs can help warehouse workers learn what is arriving so they can prepare. In addition, warehouse workers can use ASNs to match the details of a shipment to the related purchase order or inbound shipment order that was previously created.

This article presents a collection of scenarios that show, through examples, how to work with ASN files.

> **Important**
>
> *Inbound ASN* import applies only to items that are enabled for warehouse management processes (WMS). Before you can receive an ASN, a purchase or inbound shipment order must be registered in the system.

Inbound ASN

You import inbound ASNs by using the *Inbound ASN V3* and/or *Inbound ASN V5* composite data entities. These entities use the following child entities:

- Inbound load header
- Inbound shipment header
- Inbound load packing structures
- Inbound load packing structure cases
- Inbound load packing structure case lines
- Inbound load packing structure lines

The *Inbound ASN* composite data entities are intended for asynchronous integration scenarios where, for example, you can use XML file–based imports.

> **Note**

Only the *Inbound ASN V5* data entity supports inbound shipment orders. The type of order must be specified as part of the ASN data, which can be either *InboundShipmentOrder* for inbound shipment orders or *Purch* for purchase orders.

XML format for importing V3 ASNs

Supply Chain Management supports the following XML format for importing ASNs. Each node in the XML file represents an attribute from an individual entity.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSInboundLoadHeaderEntity>
        <WHSInboundShipmentHeaderEntity>
            <WHSInboundLoadPackingStructureEntity>
                <WHSInboundLoadPackingStructureCaseEntity>
                    <WHSInboundPackingStructureCaseLineV3Entity>
                    </WHSInboundPackingStructureCaseLineV3Entity>
                </WHSInboundLoadPackingStructureCaseEntity>
                <WHSInboundLoadPackingStructureLineV3Entity>
                </WHSInboundLoadPackingStructureLineV3Entity>
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
    </WHSInboundLoadHeaderEntity>
</Document>
```

Examples of using the Inbound ASN V3 entity (only for purchase orders)

The following subsections provide examples of ASN XML import files for purchase order vendor shipments for *Inbound ASN V3*.

Example 1

The following example shows an XML file for importing vendor shipments for one purchase order when no case details are included.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSInboundLoadHeaderEntity TRACTORNUMBER="0000101">
        <WHSInboundShipmentHeaderEntity VENDORSHIPMENTID="VendASN_01"
```

```
VENDORADDRESSCOUNTRYREGIONID = "USA" VENDORADDRESSSTREET = "123 Coffee Street"
VENDORADDRESSSTATEID = "WA" VENDORADDRESSCITY = "Redmond" VENDORADDRESSZIPCODE =
"98052">
            <WHSInboundLoadPackingStructureEntity LICENSEPLATENUMBER="LP_ASN_001">
                <WHSInboundLoadPackingStructureLineV3Entity
PURCHASEORDERNUMBER="00000176" ITEMNUMBER="A0001" QUANTITY="1" UNITSYMBOL="pcs" />
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
    </WHSInboundLoadHeaderEntity>
</Document>
```

Example 2

The following example shows an XML file for importing vendor shipments for one purchase order when case details are included.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSInboundLoadHeaderEntity ESTIMATEDARRIVALDATETIME="2021-04-25T11:00:00+00:00">
        <WHSInboundShipmentHeaderEntity VENDORSHIPMENTID="MVR_SNN_0004">
            <WHSInboundLoadPackingStructureEntity LICENSEPLATENUMBER="MVR_SNN_0004"
PACKEDTOTALQUANTITY="2.00">
                <WHSInboundLoadPackingStructureCaseEntity
PARENTPACKINGSTRUCTURELICENSEPLATENUMBER="MVR_SNN_0004"
LICENSEPLATENUMBER="MVR_SNN_0004A" PACKEDTOTALQUANTITY="2.00" />
                <WHSInboundLoadPackingStructureLineV3Entity
PURCHASEORDERNUMBER="00000175" ITEMNUMBER="A0001" PURCHASEORDERLINENUMBER="1"
QUANTITY="2.00" UNITSYMBOL="pcs" />
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
    </WHSInboundLoadHeaderEntity>
</Document>
```

Example 3

The following example shows an XML file for importing vendor shipments for multiple purchase orders when case details are included.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSInboundLoadHeaderEntity TRACTORNUMBER="0000101">
        <WHSInboundShipmentHeaderEntity VENDORSHIPMENTID="VendASN_01"
VENDORADDRESSCOUNTRYREGIONID = "USA" VendorAddressStreet = "123 Coffee Street"
VENDORADDRESSSTATEID = "WA" VENDORADDRESSCITY = "Redmond" VENDORADDRESSZIPCODE =
"98052">
```

```
            <WHSInboundLoadPackingStructureEntity LICENSEPLATENUMBER="LP_ASN_001">
                <WHSInboundLoadPackingStructureLineV3Entity
PURCHASEORDERNUMBER="00000176" ITEMNUMBER="A0001" QUANTITY="100" UNITSYMBOL="pcs" />
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
        <WHSInboundShipmentHeaderEntity VENDORSHIPMENTID="VendASN_02"
VENDORADDRESSCOUNTRYREGIONID = "USA" VendorAddressStreet = "123 Coffee Street"
VENDORADDRESSSTATEID = "WA" VENDORADDRESSCITY = "Redmond" VENDORADDRESSZIPCODE =
"98052">
            <WHSInboundLoadPackingStructureEntity LICENSEPLATENUMBER="LP_ASN_001">
                <WHSInboundLoadPackingStructureLineV3Entity
PURCHASEORDERNUMBER="00000177" ITEMNUMBER="A0001" QUANTITY="200" UNITSYMBOL="pcs" />
                <WHSInboundLoadPackingStructureLineV3Entity
PURCHASEORDERNUMBER="00000177" ITEMNUMBER="P0004" QUANTITY="300" UNITSYMBOL="pcs"
ITEMBATCHNUMBER="BN0001" />
            </WHSInboundLoadPackingStructureEntity>
            <WHSInboundLoadPackingStructureEntity LICENSEPLATENUMBER="LP_ASN_002">
                <WHSInboundLoadPackingStructureCaseEntity
LICENSEPLATENUMBER="LP_ASN_002_C01">
                    <WHSInboundLoadPackingStructureCaseLineV3Entity
PURCHASEORDERNUMBER="00000177" ITEMNUMBER="A0001" QUANTITY="400" UNITSYMBOL="pcs" />
                </WHSInboundLoadPackingStructureCaseEntity>
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
    </WHSInboundLoadHeaderEntity>
</Document>
```

Example of using the Inbound ASN V5 entity

This section provides an example of an ASN XML import file for inbound shipment orders that you can use with the *Inbound ASN V5* entity.

> ⓘ **Note**
>
> The *Inbound ASN V5* entity supports the `MODULE` attribute for both the `WHSInboundLoadPackingStructureEntity` element and the `WHSInboundLoadPackingStructureLineV5Entity` element. Use this attribute for both purchase orders (`MODULE="Purch"`) and inbound shipment orders (`MODULE="InboundShipmentOrder"`).

The following example shows an XML file for importing shipments for an inbound shipment order that doesn't include case details.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSInboundLoadHeaderEntity TRACTORNUMBER="0000104">
```

```
        <WHSInboundShipmentHeaderEntity VENDORSHIPMENTID="VendASN_04">
            <WHSInboundLoadPackingStructureEntity MODULE="InboundShipmentOrder"
LICENSEPLATENUMBER="LP_ASN_004">
                <WHSInboundLoadPackingStructureLineV5Entity
MODULE="InboundShipmentOrder" ORDERNUMBER="IO04" ORDERLINENUMBER="1"
ITEMNUMBER="A0001" QUANTITY="2" UNITSYMBOL="pcs"/>
            </WHSInboundLoadPackingStructureEntity>
        </WHSInboundShipmentHeaderEntity>
    </WHSInboundLoadHeaderEntity>
</Document>
```

> **Note**
>
> If you're importing an ASN for an inbound shipment order (`MODULE="InboundShipmentOrder"`), the `ORDERNUMBER` value must correspond to an external (source system) order number.

Inspect the results of importing an ASN file

Follow these steps to inspect the results of importing an ASN file.

1. Go to **Warehouse management** > **Loads** > **All loads**.
2. Find and open a load that you created as part of an ASN import.
3. On the **Load** FastTab, you see values that are based on the XML file.
4. On the **Load lines** FastTab, you see purchase order numbers and item details that are based on the XML file.
5. On the Action Pane, on the **Ship and receive** tab, in the **Receive** group, select **Packing structure** to review the packing structure of the load.
6. On the **Pallets** FastTab, you see license plates that are based on the XML file.
7. On the **Cases** FastTab, you see cases that are based on the XML file.
8. On the **Items** FastTab, you see items and quantities that are based on the XML file.

Import inbound ASNs as despatch advice messages

Advanced shipping notices (ASNs) notify you about vendor deliveries. They help the sender describe the contents of a shipment—such as the items, quantities, and packaging—so that warehouse workers can prepare to receive it.

A *despatch advice* is an inbound ASN that you import as a *despatch advice message*. Instead of creating warehouse records directly through data entities, the system queues the message and handles it asynchronously by using the message processor. This approach supports integrations where related documents must be processed in sequence, and it provides the following capabilities:

- **Message dependencies** – A despatch advice can depend on a prior message so that a source order is guaranteed to be imported *before* the ASN that references it.
- **Full-document updates** – You can correct a previously imported despatch advice by resubmitting the whole document. The document is replaced in full, and records that are no longer part of the shipment are cleaned up automatically. Learn more in Update or correct a despatch advice.

> **Important**
>
> Despatch advice messages apply only to items that are enabled for warehouse management processes (WMS). Before you can process a despatch advice, the referenced purchase order or inbound shipment order must already be registered in the system.

> **Note**
>
> The *Inbound ASN* data entities remain available for importing ASNs directly, without the message processor. Learn more in Import inbound ASNs through data entities.

Despatch advice message structure

A despatch advice message is a composite document that maps shipment details to warehouse records. It uses three entities that you import together through the *Despatch advice composite*

entity (`WHSDespatchAdviceCompositeEntity`).

Expand table

Document part	Entity	What it represents
Header	`WHSDespatchAdviceMessageEntity`	The shipment notification, including carrier, weights, and shipper address. Becomes an inbound load and shipment.
Logistic unit	`WHSDespatchAdviceLogisticUnitMessageEntity`	A physical container that's identified by a serial shipping container code (SSCC) or license plate—for example, a pallet, case, or carton.
Line item	`WHSDespatchAdviceLineItemMessageEntity`	A product inside a logistic unit, with its quantity and inventory dimensions.

Identify a despatch advice

Each despatch advice is identified by the combination of two fields on the header:

- `ShipperIdentification` – The vendor (shipper) account that the shipment comes from.
- `DespatchAdviceIdentification` – The stable business ID of the despatch advice.

Because the identification is scoped to the shipper, different vendors can independently use the same `DespatchAdviceIdentification` value. The load and shipment IDs are generated automatically during processing—you don't provide them.

Provide header, transport, and address details

Besides the required identification fields, the header (`WHSDespatchAdviceMessageEntity`) carries optional information about the shipment. Use `ReceivingWarehouseId` to specify the warehouse that receives the load, and populate any of the following groups of fields as needed.

Expand table

Group	Fields
Transport and carrier	`ShippingCarrierCode`, `ShippingCarrierGroupId`, `ShippingCarrierServiceId`, `TractorNumber`, `TrailerNumber`, `BrokerId`, `CarNumber`, `TransportationBookingNumber`, `MasterBillOfLadingId`, `ProNumber`, `SealNumber`, `InspectionSealNumber`, `VesselName`, `VoyageNumber`, `EstimatedArrivalDateTime`

Group	Fields
Weights	`ActualGrossWeight`, `ActualNetWeight`, `ActualTareWeight`, `ActualWeightUnitSymbol`
Shipment	`DeliveryTermsCode`, `ShipperReference`, `ShipperDeliveryNoteId`, `ShipperDeliveryNoteDocumentDate`
Shipper address	`ShipperAddressCountryRegionId`, `ShipperAddressStreet`, `ShipperAddressCity`, `ShipperAddressStateId`, `ShipperAddressZipCode`

Nest logistic units by using a flat list

Logistic units are provided as a *flat list* under the header rather than as nested XML elements. You express the container hierarchy (for example, cases on a pallet) by using two fields on each logistic unit:

- `LogisticUnitIdentification` – The SSCC or license plate of this container.
- `ParentLogisticUnitIdentification` – The SSCC of the container that this unit sits inside. Leave it empty for a top-level unit.

This model supports any nesting depth (pallet → case → carton) while keeping the document flat. Line items are attached to the logistic unit that physically holds them.

Provide item details for batches, catch weight, and product variants

Use the following optional fields on each line item (`WHSDespatchAdviceLineItemMessageEntity`) to describe the goods in more detail.

Expand table

Detail	Fields
Batch	`ItemBatchNumber`, `ItemBatchExpirationDate`
Catch weight	`CapturedWeight`, `CapturedWeightUnitSymbol`
Product variant dimensions	`ProductColorId`, `ProductSizeId`, `ProductStyleId`, `ProductConfigurationId`, `ProductVersionId`
Serial number	`ItemSerialNumber`

For example, the following line reports a batch-tracked item that has a batch number, an expiration date, and a color variant.

XML

```
<WHSDespatchAdviceLineItemMessageEntity ITEMNUMBER="A0001" DESPATCHEDQUANTITY="40"
DESPATCHEDQUANTITYUNITSYMBOL="ea" ITEMBATCHNUMBER="BN0001"
ITEMBATCHEXPIRATIONDATE="2027-11-11" PRODUCTCOLORID="Blue" ORDERNUMBER="00000055"
ORDERLINENUMBER="1" />
```

> **Note**
>
> For a catch-weight item, if `CapturedWeightUnitSymbol` differs from the item's catch-weight unit, the weight is converted during processing.

Integrate with a source system

When you integrate an external system with Warehouse management only mode, the despatch advice can reference the source system that sent it. In this case, the external system uses its own item numbers, which differ from the item numbers in the receiving company. The following header field enables the translation:

- `SourceSystemId` – The source system that the despatch advice comes from.

When `SourceSystemId` is specified and the logistic unit belongs to the *Inbound shipment order* module, the `ItemNumber` on each line item is treated as a *source system item number*. During processing, it's translated into the receiving company's item number through the source system item mapping (as seen on the **Source system items** page). The original source system item number is preserved on the message, and the resolved local item number is stored on the ASN item.

> **Note**
>
> If the specified `SourceSystemId` has no item mapping for a line's item number, processing fails with an error. If `SourceSystemId` is empty, the `ItemNumber` value is used as-is, with no translation.

Import a despatch advice message

Import despatch advice messages by using the *Despatch advice composite* entity through any of the following methods:

- Data management import (for example, an XML file–based import), using the *Despatch advice composite* entity
- Open Data Protocol (OData), using the individual message entities (see Import a despatch advice by using OData)
- Dataverse

The following sections show XML import files for the composite entity. Each XML element represents an entity, and each attribute represents a field.

The overall structure nests line items inside logistic units, and logistic units inside the header:

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSDespatchAdviceMessageEntity>
        <WHSDespatchAdviceLogisticUnitMessageEntity>
            <WHSDespatchAdviceLineItemMessageEntity />
        </WHSDespatchAdviceLogisticUnitMessageEntity>
    </WHSDespatchAdviceMessageEntity>
</Document>
```

> **Tip**
>
> For more example XML files, see the despatch advice test resources in the **SCMTestCommon** model.

Example 1: One pallet for a purchase order

This example imports a single license plate that contains one purchase order line. Because no module is specified, the line defaults to the *Purchase order* module, and `ORDERNUMBER` refers to a purchase order.

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSDespatchAdviceMessageEntity MESSAGEID="DA-MSG-0001"
DESPATCHADVICEIDENTIFICATION="DA-1001" SHIPPERIDENTIFICATION="US-101"
RECEIVINGWAREHOUSEID="24" ESTIMATEDARRIVALDATETIME="2026-07-20T10:00:00Z">
        <WHSDespatchAdviceLogisticUnitMessageEntity LOGISTICUNITIDENTIFICATION="LP-
0001">
            <WHSDespatchAdviceLineItemMessageEntity ITEMNUMBER="A0001"
DESPATCHEDQUANTITY="10" DESPATCHEDQUANTITYUNITSYMBOL="pcs" ORDERNUMBER="00000176"
```

```
ORDERLINENUMBER="1" />
        </WHSDespatchAdviceLogisticUnitMessageEntity>
    </WHSDespatchAdviceMessageEntity>
</Document>
```

Example 2: Two cases on a pallet

This example nests two cases inside a pallet. The pallet is a top-level logistic unit, and each case references the pallet through `PARENTLOGISTICUNITIDENTIFICATION`. Items are attached to the cases that hold them, and one line specifies a batch number.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSDespatchAdviceMessageEntity MESSAGEID="DA-MSG-0002"
DESPATCHADVICEIDENTIFICATION="DA-1002" SHIPPERIDENTIFICATION="US-101"
RECEIVINGWAREHOUSEID="24">
        <WHSDespatchAdviceLogisticUnitMessageEntity LOGISTICUNITIDENTIFICATION="PAL-
001" />
        <WHSDespatchAdviceLogisticUnitMessageEntity LOGISTICUNITIDENTIFICATION="CASE-
001" PARENTLOGISTICUNITIDENTIFICATION="PAL-001">
            <WHSDespatchAdviceLineItemMessageEntity ITEMNUMBER="A0001"
DESPATCHEDQUANTITY="12" DESPATCHEDQUANTITYUNITSYMBOL="pcs" ORDERNUMBER="00000177"
ORDERLINENUMBER="1" />
        </WHSDespatchAdviceLogisticUnitMessageEntity>
        <WHSDespatchAdviceLogisticUnitMessageEntity LOGISTICUNITIDENTIFICATION="CASE-
002" PARENTLOGISTICUNITIDENTIFICATION="PAL-001">
            <WHSDespatchAdviceLineItemMessageEntity ITEMNUMBER="P0004"
DESPATCHEDQUANTITY="20" DESPATCHEDQUANTITYUNITSYMBOL="pcs" ITEMBATCHNUMBER="BN0001"
ORDERNUMBER="00000177" ORDERLINENUMBER="2" />
        </WHSDespatchAdviceLogisticUnitMessageEntity>
    </WHSDespatchAdviceMessageEntity>
</Document>
```

Example 3: An inbound shipment order

To import a despatch advice for an inbound shipment order, set the `MODULE` attribute on the logistic unit to `InboundShipmentOrder`. In this case, `ORDERNUMBER` must be the external (source system) order number, which is mapped to the matching inbound shipment order during processing.

This example also specifies `SOURCESYSTEMID` on the header. As a result, the `ITEMNUMBER` value (`ERP-A0001`) is the source system item number and is translated into the receiving company's item number.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSDespatchAdviceMessageEntity MESSAGEID="DA-MSG-0003"
DESPATCHADVICEIDENTIFICATION="DA-1003" SHIPPERIDENTIFICATION="EXT-VENDOR-1"
SOURCESYSTEMID="ERP" RECEIVINGWAREHOUSEID="24">
        <WHSDespatchAdviceLogisticUnitMessageEntity LOGISTICUNITIDENTIFICATION="LP-
9001" MODULE="InboundShipmentOrder">
            <WHSDespatchAdviceLineItemMessageEntity ITEMNUMBER="ERP-A0001"
DESPATCHEDQUANTITY="5" DESPATCHEDQUANTITYUNITSYMBOL="pcs" ORDERNUMBER="IO04"
ORDERLINENUMBER="1" />
        </WHSDespatchAdviceLogisticUnitMessageEntity>
    </WHSDespatchAdviceMessageEntity>
</Document>
```

Import a despatch advice by using OData

Instead of importing the composite XML file, you can post a despatch advice through OData. You post to the individual message entities—first the header, then each logistic unit, and then each line item—and finally post a *Complete* action to queue the message for processing. The message processor then processes the message just as it does for an imported XML file.

Use the following entity collections:

- `DespatchAdviceMessages` – The despatch advice header.
- `DespatchAdviceLogisticUnitMessages` – The logistic units.
- `DespatchAdviceLineItemMessages` – The line items.

Each child message carries the parent keys (`ShipperIdentification`, `DespatchAdviceIdentification`, and `MessageId`, plus `LogisticUnitIdentification` for line items) so that it's linked to the correct header and logistic unit.

The following example posts the header message:

JSON

```
POST {{resource}}/data/DespatchAdviceMessages
{
    "ShipperIdentification": "US-101",
    "DespatchAdviceIdentification": "DA-1001",
    "MessageId": "DA-MSG-0001",
    "dataAreaId": "USMF",
    "ReceivingWarehouseId": "24"
}
```

The following example posts a logistic unit that belongs to the header:

JSON

```
POST {{resource}}/data/DespatchAdviceLogisticUnitMessages
{
    "ShipperIdentification": "US-101",
    "DespatchAdviceIdentification": "DA-1001",
    "MessageId": "DA-MSG-0001",
    "dataAreaId": "USMF",
    "LogisticUnitIdentification": "LP-0001"
}
```

The following example posts a line item that belongs to the logistic unit:

JSON

```
POST {{resource}}/data/DespatchAdviceLineItemMessages
{
    "ShipperIdentification": "US-101",
    "DespatchAdviceIdentification": "DA-1001",
    "MessageId": "DA-MSG-0001",
    "LogisticUnitIdentification": "LP-0001",
    "dataAreaId": "USMF",
    "ItemNumber": "A0001",
    "DespatchedQuantity": 10,
    "DespatchedQuantityUnitSymbol": "pcs",
    "OrderNumber": "00000176",
    "OrderLineNumber": 1
}
```

To queue the message for processing, post the *Complete* action for the header.

JSON

```
POST {{resource}}/data/DespatchAdviceMessages(ShipperIdentification='US-
101',DespatchAdviceIdentification='DA-1001',MessageId='DA-MSG-
0001',dataAreaId='USMF')/Microsoft.Dynamics.DataEntities.Complete?cross-company=true
```

> **Note**
>
> The `dataAreaId` value is part of the key that matches the line messages to the header. Therefore, specify it in each message. Add the `?cross-company=true` suffix only when the company differs from the user's default company that's set up on the **Microsoft Entra ID applications** page.

Update or correct a despatch advice

Despatch advice messages use *replace by new message* semantics. To update a shipment, resubmit the complete, authoritative document with the same `SHIPPERIDENTIFICATION` and `DESPATCHADVICEIDENTIFICATION`, but a new `MESSAGEID`.

When the update is processed, the header and all child records are overwritten from the new message—including empty values—and any logistic units and line items that are no longer part of the shipment are removed. There's no partial or delta update mode, so always send the full document.

Process despatch advice messages

Imported messages are queued and then handled by the message processor. To process them, schedule a batch job by following these steps:

1. Go to **System administration** > **Message processor** > **Message processor**.
2. In the **Message queue** field, select **Despatch advice messages**.
3. Specify a processing interval, and then schedule the batch job.

During processing, each message resolves or creates the inbound load and shipment, rebuilds the logistic unit hierarchy as license plates and packing structures, and creates the ASN item lines. The message status is then set to *Accepted*, or to *Failed* if a validation error occurs. For more information, see Schedule message processing by using the message processor batch job.

Monitor processing results

You can monitor despatch advice processing in the following ways:

- **Message processor messages** – Go to **System administration** > **Message processor** > **Message processor messages** to review message content, find failed messages, and reprocess them. For more information, see Message processor messages for warehouse management processes.
- **Business events** – Set up the *Despatch advice message changed status* business event so that downstream systems are alerted when a message succeeds or fails.

Inspect the results of processing a despatch advice

After a despatch advice message is accepted, follow these steps to inspect the load that it created:

1. Go to **Warehouse management** > **Loads** > **All loads**.
2. Find and open the load that was created for the despatch advice.
3. On the **Load lines** FastTab, review the order numbers, items, and quantities.
4. On the Action Pane, on the **Ship and receive** tab, in the **Receive** group, select **Packing structure** to review the license plates, cases, and items that were built from the logistic units.

Receive unannounced sales returns

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In Microsoft Dynamics 365 Supply Chain Management, the sales return process usually starts when you create a return material authorization (RMA) order. The process of creating an RMA order supports a scenario where the reason for the return isn't immediately apparent or disclosed. The RMA order serves as the primary document that guides subsequent steps in the return process, including warehouse arrival and the receiving procedures.

However, in some business scenarios, customers might request to return products without providing advance notification or an associated order. In these scenarios, the standard RMA process is bypassed, and special considerations are made to accommodate the unplanned or unanticipated (unannounced) returns.

This article explains how to set up Supply Chain Management to support unannounced returns, and how to receive unannounced returns in the warehouse.

Prerequisites

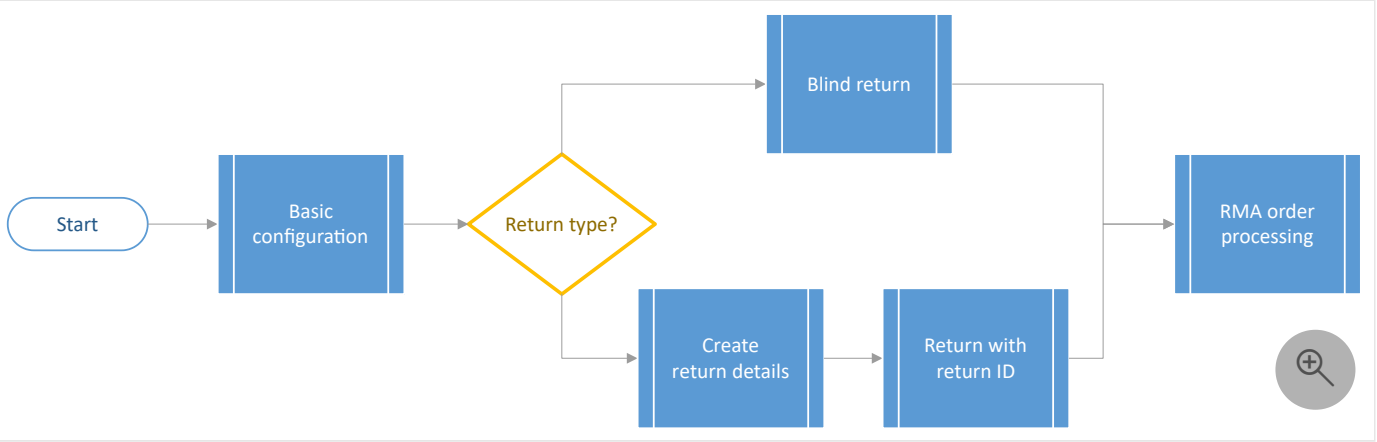
Before you can use the features described in this article, ensure your system meets the following requirements:

- To receive unannounced sales returns, you're running Supply Chain Management version 10.0.39 or later.
- To use the integration with small parcel shipping (SPS), you're running Supply Chain Management version 10.0.39 or later.
- To print license plate labels from a mobile device, you're running Supply Chain Management version 10.0.40 or later.

Receiving process for unannounced returns

The *Return item receiving* flow in the Warehouse Management mobile app supports two processes for receiving unannounced returns: *Blind return* and *Return details*.

The following illustration shows how the flow works for each process.



Blind return process

A blind return is a return where no RMA order or return details record exists in advance, and where no original sales order or shipment must be specified during receiving. During the *Return item receiving* process, workers must use the mobile app to identify and confirm the following information:

- **Customer account or Source system** – The source that returns the item. *Customer account* is used for sales return orders and *Source system* is used when using inbound shipment orders as part of the Warehouse management only mode process.
- **Item number and quantity** – The items that are returned and the quantity that's returned for each item.
- **License plate ID** – The license plate of the location where the incoming items are stored after they're received.
- **Disposition code** – Depending on the setup of the mobile device menu item, workers might be able to select a disposition code to specify what should be done with the returned products. If this option isn't shown in the app during receiving, a Supply Chain Management user must enter a disposition code when they complete the mixed license plate.

> ⓘ **Note**
>
> When running the return process for inbound shipment orders, you must also define source system disposition codes.

Return details process

The *Return details* return process uses a return details record. This record is automatically generated when an order is shipped. It contains all the information required to process a return, such as the return ID, original order ID, shipment ID, order lines, and return-until dates.

Typically, the sending company prints a return label for each outgoing shipment and delivers it together with that shipment. The return label includes a bar code that contains the return ID. Then, if a customer must return an item, they don't have to contact the sending company. Instead, they can just pack the item and attach the return label that they received together with the original shipment.

> ⓘ **Note**
>
> Only the items/variants, tracking dimensions, and quantities that are listed in the specified return details record can be returned through this process.

You can generate a return details record in two ways:

- In a *packing scenario*, the system generates a return details record after each sales order is packed into a container and the container is closed.
- In a *nonpacking scenario*, the system generates a return details record after a worker creates a shipment for a sales order and confirms it.

In both cases, the system fills in the shipment date and return-until date when it confirms the related shipment.

During the *Return item receiving* process, workers must use the mobile app to identify and confirm the following information:

- **Return ID** – The ID number of the return details record.
- **Item number and quantity** – The items that are returned and the quantity that's returned for each item.
- **License plate ID** – The license plate of the location where the incoming items are stored after they're received.
- **Disposition code** – Depending on the setup of the mobile device menu item, workers might be able to select a disposition code to specify what should be done with the returned products. If this option isn't shown in the app during receiving, a Supply Chain Management user must enter a disposition code when they complete the mixed license plate.

Set up unannounced sales return receiving

To prepare your system to receive returns without using an RMA order, you must enable the relevant features and complete several related configurations. The following subsections describe the required settings.

Enable unannounced returns

Before you can use blind returns and/or automatic generation of return details during receiving, you must follow these steps to turn on and set up each feature in your system.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.

2. If you plan to use the *Return details* return process, specify the number sequences that support this process:
   a. On the **Number Sequences** tab, find the row where the **Reference** field is set to *Return ID*. For this row, set the **Number sequence code** field to the number sequence that you want to use.
   b. Find the row where the **Reference** field is set to *Load line inventory pick*. For this row, set the **Number sequence code** field to the number sequence that you want to use.

   For more information about how to set up number sequences for these purposes, see Number sequences overview.

3. If you plan to use the *Return details* process, on the **Loads** tab, set the **Enable sales load line picking route** option to *Yes*. This setting enables load lines to be linked to sales line inventory transactions. The linking is done at the shipment level. This option uses the *Load line inventory pick* number sequence when work is completed and containers are closed.

4. On the **General** tab, on the **Returns** FastTab, set the following options:

   - **Enable return details creation** – Set this option to *Yes* to enable return details to be created when a container is closed and during shipment confirmation. This option is required only for the *Return details* process.
   - **Enable return order creation from mobile device** – Set this option to *Yes* to enable return orders to be created from a mobile device flow. The flow uses mixed license plate receiving planned lines. This option is required for both the *Return details* process and the *Blind return* process.

5. If you're using Warehouse management only mode, set up returns for each source system by following these steps:
    a. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**.
    b. From the list pane, select the source system you want to set up for returns.
    c. Make the following settings on the **Inbound shipment orders** FastTab:

        - **Enable returns process** – Set to *Yes* to enable the return process for the current source system.
        - **Number sequence code** – Select the number sequence to use to generate order numbers for inbound shipment orders.
        - **Return order type** – Enter text used to stamp the created inbound shipment order. This value is used to distinguish return orders from other inbound shipment orders.

    d. Repeat these steps for each relevant source system.

Set up disposition codes

Disposition codes are collections of rules that you can use when receiving items in Supply Chain Management. They help determine the inventory status, the work template, and the location directive for the items, based on the scanned code.

For example, when a warehouse worker uses a mobile device to receive items that are damaged, the worker scans a disposition code for damaged items.

- If you want to credit the item to your inventory and make it available for repurchase, set up a disposition code that sets the inventory status of the received item to *Available*.
- If you receive items that you can't resell and must therefore dispose of, use a disposition code for RMA scrap. This disposition code then returns a *return disposition code*.

Use disposition codes for different processes, such as *purchase order receiving*, *production order report as finished*, and *sales order return receiving*. For the *sales order return receiving* process, if the items are registered by using a mobile device, the use of disposition codes is mandatory.

Return disposition codes

To view and set up your return disposition codes, go to **Sales and Marketing** > **Setup** > **Returns** > **Disposition codes**. Define each code by specifying an ID number, an action, and a description. The action defines how items that are assigned to the code should be handled.

For more information about return disposition codes and the actions that are available, see Disposition codes and disposition actions.

Mobile device disposition codes

To set up disposition codes that you can use on a mobile device, go to **Warehouse management** > **Setup** > **Mobile device** > **Disposition codes**. Disposition codes that you create here are available to mobile devices and can support several types of operations, including returns, sales orders, and inventory management. Disposition codes for returns must be linked to a return disposition code defined at **Sales and Marketing** > **Setup** > **Returns** > **Disposition codes**, and that assigns a return action for the code.

For more information about mobile disposition codes and how to set them up, see Set up dispositions codes.

Source system disposition codes

If you're using Warehouse management only mode, you must map local dispositions codes with the *source system disposition codes* used in each relevant source systems. These codes are used when processing inbound shipment orders.

To set up source system disposition codes, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source system disposition codes**.
2. On the Action pane, select **New** to add a new code. Then make the following settings for the new code:
    - **Disposition code** – Select the local disposition code that you want to map.
    - **Source system** – Select the source system that you want to map the local disposition code to.
    - **Source system disposition code** – Enter the disposition code that is used in the source system.
3. Repeat the previous step until you set up all of the disposition codes that you need to map.

Set up return item policies

Return item policies let you control the conditions under which the system allows items to be returned. You can set policies for each item, groups of items, or all items, as you require. To set up

your policies, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Return items** > **Return item policies**.
2. On the Action Pane, select **New** to create a policy.
3. In the **Item code** field, select one of the following values to specify the scope that the new policy applies to:
    - *Table* – The return item policy applies only to a specific product.
    - *Group* – The return item policy applies to a specific product group.
    - *All* – The return item policy applies to all products.
4. In the **Item** field, if you set the **Item code** field to *Table* in the previous step, select the item number that the new policy applies to. If you set the **Item code** field to *Group*, select the item group that the new policy applies to. If you set the **Item code** field to *All*, the **Item** field is unavailable.
5. In the **Return acceptance** field, select one of the following values:
    - *Always allowed* – Items that match the selected **Item code** and **Item** values can always be returned.
    - *Never allowed* – Items that match the selected **Item code** and **Item** values can never be returned.
    - *Allowed days after shipment* – Items that match the selected **Item code** and **Item** values can be returned only for a limited time after they were sold, as defined in the **Allowed days for return** field.
6. If you set the **Return acceptance** field to *Allowed days after shipment*, set the **Allow days for return** field to the number of allowed days.
7. Repeat this procedure for each item or item group, as you require. When returns are processed, the most specific return item policy applies to each item in the return.
8. On the Action Pane, select **Save**.

Create return item receiving policies

Before you create the related mobile device menu items, define the required return item receiving policies. These policies enable each menu item to process the return correctly.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Return item receiving policies**.

2. On the Action Pane, select **New** to add a return item receiving policy.

3. Set the following fields for the new policy:

- **Return item receiving policy ID** – Enter a name for the policy, such as *Blind return* or *Return details*.
- **Description** – Enter a short description of the policy.
- **Return process** – Select the type of return process that the policy represents (*Return details* or *Blind return*).
- **Create return order** – Select the type of return order that the system should create to manage returns:
  - *Return order* – The system creates a return order for each return. Select this value if you aren't using Warehouse management only mode.
  - *Inbound shipment order* – The system creates an inbound shipment order for each return. Select this value if you're using Warehouse management only mode.
- **Return order identification** – This field is available only when the **Return process** field is set to *Blind return* and the **Create return order** field is set to *Inbound shipment order*. The way that you use it depends on the needs of your external system. (See the documentation for your external system.) Select the type of extra identifying information that the system should return to the source system when it registers a return order:
  - *None* – The system doesn't return any extra identifying information, and the app doesn't prompt the worker to enter any extra information during receiving.
  - *Account number* – The system returns an account number to help identify the return order. This value is typically the ID of the customer who is returning the items (the customer account number). The mobile app prompts the worker to scan or enter this number during receiving.
- **Return order type** – This field is available only when the **Return order identification** is available and set to *Account number*. Like the account number, the value in this field is returned to the source system when a return order is registered. It's intended to hold the name that identifies the document type for return orders in the source system. The way that you use it depends on the needs of your external system. (See the documentation for your external system.) If you leave this field blank, the value is inherited from the relevant source system configuration.

> **Important**
>
> If your source system is Dynamics 365 Supply Chain Management (as is the case when you run an external shared warehouse scenario), set the following values for your blind return policies:
>
> - **Return order identification** – Select *Account number*, and instruct workers to enter the customer ID (account number) when the mobile app prompts them during receiving.
> - **Return order type** – Enter *Return*, which is the return order type that is used in Supply Chain Management. (Alternatively, if *Return* is already specified as the default return order type for the source system, leave this field blank.)

4. If you support both types of unannounced return processes (*Return details* and *Blind return*), repeat this procedure to add a return item receiving policy for the other process.

Set up mobile device menu items to process unannounced returns

To enable workers to process unannounced returns, create a separate mobile device menu item for each type of unannounced return process (*Return details* or *Blind return*) that you support.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following fields for the new menu item:
    - **Menu item name** – Enter an internal name for the menu item, such as *Blind returns*.
    - **Title** – Enter the name that should appear for the menu item in the mobile app, such as *Blind return item receiving*.
    - **Mode** – Select *Work*.
    - **Use existing work** – Set this option to *No*.
    - **Work creation process** – Select *Return item receiving*.
    - **Barcode data policy** – Select the policy to use if multiple fields are filled in based on a single bar code scan. To learn more, see GS1 bar codes.
    - **Generate license plate** – Set this option to *Yes* to automatically create new license plates as they're needed. Set it to *No* if the worker must always select an existing license plate.

- **Display disposition code** – Select whether workers should be prompted to select a disposition code during the receiving process. The disposition code determines the inventory status, work template, and location directive for the returned items.
- **Print label** – Set this option to *Yes* to always print a license plate label after all steps in the related work template are completed (regardless of whether a print step is included in the work template). If you want to allow the work template to print the license plate label at a different point in the process, set this option to *No*. The license plate label includes a bar code that provides the ID of the license plate where the worker places the returned items. To learn more, see License plate label layouts and printing.
- **Return item receiving policy ID** – Select the item receiving policy that you created for the type of return process (*Return details* and *Blind return*) that this menu item supports.

4. If you support both types of unannounced return processes (*Return details* and *Blind return*), repeat steps 2 and 3 to create a menu item for the other process.

5. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

6. Add the new menu items to an appropriate place in your mobile device menu structure.

Integrate return label printing with small parcel shipping

Small parcel shipping (SPS) integration lets you retrieve shipping labels from the SPS carriers or carrier hubs that you integrate with your system. However, some customization is required. The integration supports preaddressed and prepaid return labels, which make returns more convenient for your customers. The return labels can include a bar code that identifies the return details record ID. Warehouse workers can then scan this bar code when the package arrives at your warehouse.

For more information about how to set up SPS integration, see Small parcel shipping.

Follow these steps to enable return details with SPS integration.

1. Go to **Transportation management** > **Setup** > **Transportation management parameters**.
2. On the **Shipping carriers** FastTab, set the **Enable shipping label request type** option to *Yes*. This setting adds a new **Print container return shipping label rule** field to the **Container packing policies** page. Use this field to select the conditions under which return labels

should be printed as part of the container packing process. For details about how to use this setting, see the next section.

Print return labels

When you use a *Return details* return process, you must print a return label for each shipment and include that label with the shipment. The *container packing policy* that applies to each shipment establishes the printing options. Depending on the setup of your system, return labels are typically printed as part of the container closing process. However, you can manually print or reprint them for a selected return details record at any time.

The return label includes the shipping address of your returns warehouse and a bar code that contains the return details record ID. Therefore, warehouse workers can scan this bar code when the package arrives at your warehouse.

Follow these steps to configure the label printing options for a container packing policy.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container packing policies**.

2. Select or create the container packing policy that you want to set up.

3. On the **Container manifest** FastTab, set the following fields:

    - **Automatic manifest at container close** – Set this option to *Yes*.
    - **Manifest requirements for container** – Set this field to *Transportation management*.

4. On the **Carrier label printing** FastTab, set the following fields:

    - **Print container shipping label rule** – Select one of the following options to specify the rule for printing outbound shipping labels:
        - *Never* – Users can close containers without printing a shipping label.
        - *Always* – A shipping label is required. Users can't close the container unless the system can retrieve a label.
        - *If setup exists* – For containers where a shipping label setup exists, the system must retrieve the required label before users can close the container. For containers where no shipping label setup exists, users can close the container without printing a label.

    - **Print container return shipping label rule** – Select one of the following options to specify the rule for printing return labels to include in each container:
        - *Never* – Users can close containers without printing a return label.

    - *Always* – A return label is required. Users can't close the container unless the system can retrieve a label.
    - *If setup exists* – For containers where a return label setup exists, the system must retrieve the required label before users can close the container. For containers where no return label setup exists, users can close the container without printing a label.

- **Printer name** – Select the Zebra Programming Language (ZPL) printer where the system should print shipping and/or return labels when this container packing policy is used.

Follow these steps to manually print or reprint a return label for a return details record.

1. Go to **Warehouse management** > **Inquiries and reports** > **Return details**.
2. In the list pane, select the return details record that you want to print a label for.
3. On the Action Pane, select **Print** > **Return shipping label**.

The return label is printed on the printer that's specified in the relevant container packing policy that's associated with the **Container ID** value that's listed for the return details record.

Example scenarios for the sales return order creation process

This section provides example scenarios that show how to set up and process unannounced returns.

Scenario prerequisites

Before you work through the example scenarios, complete all the prerequisites described in the following subsections.

Enable sample data

To work through the example scenarios by using the sample records and values that are specified here, use a system where the standard demo data is installed. Additionally, select the **USMF** legal entity before you begin. The example scenarios use the demo data that's associated with the worker/person *Julia Funderburk*.

You can also use these scenarios as guidance for using the feature on a production system. However, in that case, substitute your own values for each setting that's described here.

Set up number sequences

You must have number sequences that generate unique return IDs and load line inventory pick numbers.

1. Go to **Organization administration** > **Number sequences** > **Number sequences**.
2. On the Action Pane, on the **Number sequence** tab, in the **New** group, select **Number sequence** to create a number sequence that generates return ID numbers.
3. Set the following values for the new number sequence:
    - **Number sequence code:** *ReturnID*
    - **Name:** *ReturnID*
    - **Scope:** *Company*
    - **Company:** *USMF*
4. On the Action Pane, select the **Back** button.
5. On the Action Pane, on the **Number sequence** tab, in the **New** group, select **Number sequence** to create a number sequence that generates load line inventory pick numbers.
6. Set the following values for the new number sequence:
    - **Number sequence code:** *LLIP*
    - **Name:** *LLIP*
    - **Scope:** *Company*
    - **Company:** *USMF*
7. On the Action Pane, select **Save**.

Enable unannounced return features

Follow these steps to enable the features that are required to support unannounced returns.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Number sequences** tab, set the **Number sequence code** field to *ReturnID*.
3. Set the **Number sequence code** field to *LLIP*.
4. On the **General** tab, turn on the **Enable return details creation** option.
5. Turn on the **Enable return order creation from mobile device** option.
6. On the **Loads** tab, turn on the **Enable sales load line picking route** option.

For information about how to configure these settings, see the Enable unannounced returns section.

Create return item policies

Follow these steps to create return item policies for the items that are used in the scenarios.

1. Go to **Warehouse management** > **Setup** > **Return items** > **Return item policies**.
2. Add a return item policy to define the conditions under which the item that's used in the scenarios can be returned.
3. Set the following values for the new policy:

    - **Item code:** *Table*
    - **Item:** *A0001*
    - **Return acceptance:** *Allowed days after shipment*
    - **Allowed days for return:** *28*

Learn more in the Set up return item policies section.

Set up return item receiving policies

Follow these steps to create return item receiving policies for the scenarios.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Return item receiving policies**.
2. Add two return item receiving policies: one for the *Blind return* process and one for the *Return details* process.

Learn more in the Create return item receiving policies section.

Set up mobile device menu items and menus

Follow these steps to create mobile device menu items for the scenarios.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Create two mobile device menu items for handling unannounced returns: one for the *Blind return* process and one for the *Return details* process.

3. Set up the new menu items in the following way:

    - Give each menu item a name that identifies the type of return that it's intended to process (for example, *Blind return receiving* or *Return details receiving*).
    - For each menu item, set the **Work creation process** field to *Return item receiving*.

- For each menu item, enable both the **Generate license plate** option and the **Display disposition code** option.
- For each menu item, set the **Return item receiving policy ID** field to the policy that matches the type of return that the menu item should handle (*blind returns* or *return details*).

4. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

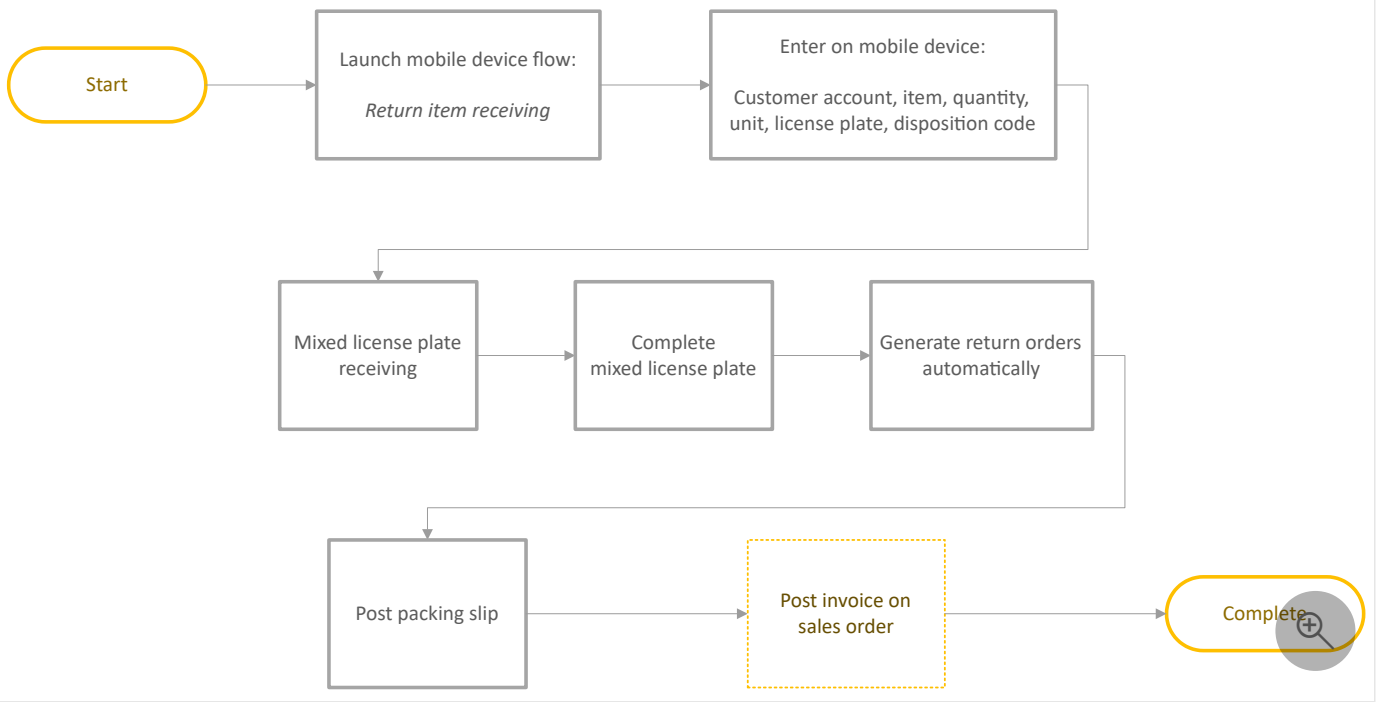
5. Add both menu items to an appropriate place in your mobile device menu structure.

Learn more in the Set up mobile device menu items section.

Example scenario 1: Customer return with a blind return policy

In the blind receiving process, warehouse workers receive return items without matching them to an original sales order or shipment. Warehouse workers just enter the customer account ID, item IDs, and quantities.

The following illustration shows a flowchart for the blind receiving process.



Use the mobile app to receive a blind return to a mixed license plate

Follow these steps to receive products to a mixed license plate in a warehouse when there's a blind return policy.

1. Open the Warehouse Management mobile app, and sign in by using *62* as the user ID and *1* as the password.
2. Open the menu item that you created for receiving blind returns (for example, **Inbound** > **Blind returns receiving**).
3. In the **Customer account** field, enter *US-003*.
4. In the **Item** field, enter or scan item number *A0001*.
5. Accept the license plate number that's suggested.
6. In the **qty** field, enter *1*.
7. In the **Disposition code** field, select *RMA Credit*.
8. Select **OK** to complete the receiving work.
9. Select **Cancel** to exit the flow and close the menu item.

> ⓘ **Note**
>
> You must exit the flow to unlock the license plate. If the license plate is locked, you can't complete mixed license plate receiving in Supply Chain Management, as described in the next section. In some setups, you can finish processing mixed license plates during the *Return item receiving* flow. However, in this scenario, you process the license plate in Supply Chain Management.

Complete mixed license plate receiving

The returned products are now on a mixed license plate for further processing. (Learn more in Mixed license plate receiving.) Follow these steps to finish receiving the returned items.

1. Go to **Warehouse Management** > **Inquiries and reports** > **Mixed license plate receiving**.
2. In the **License plate** grid, find the mixed license plate that you processed by using the mobile app.
3. On the Action Pane, on the **License plate** tab, select **Complete license plate** to complete mixed license plate receiving.

After you complete mixed license plate receiving, Supply Chain Management automatically creates an RMA order that's prepared for further downstream processing, as described in Sales

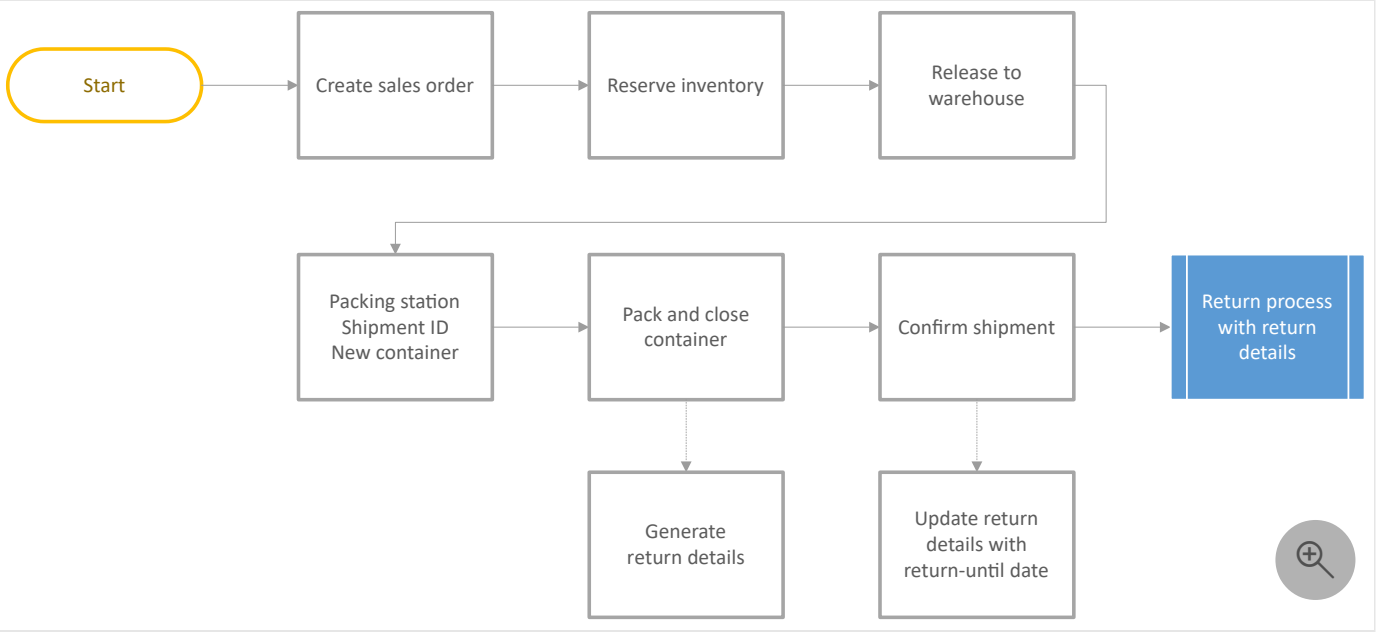
returns.

> **Tip**
>
> You can set up your mobile device menu item for processing returns to include a step that lets workers complete mixed license plate receiving directly from the mobile device while receiving the return. Then you don't need to complete this step later in the Supply Chain Management web client. To do so, create a detour item with the **Activity code** *Complete mixed license plate*. Learn more in Set up a mobile device menu item for completing mixed license plates.

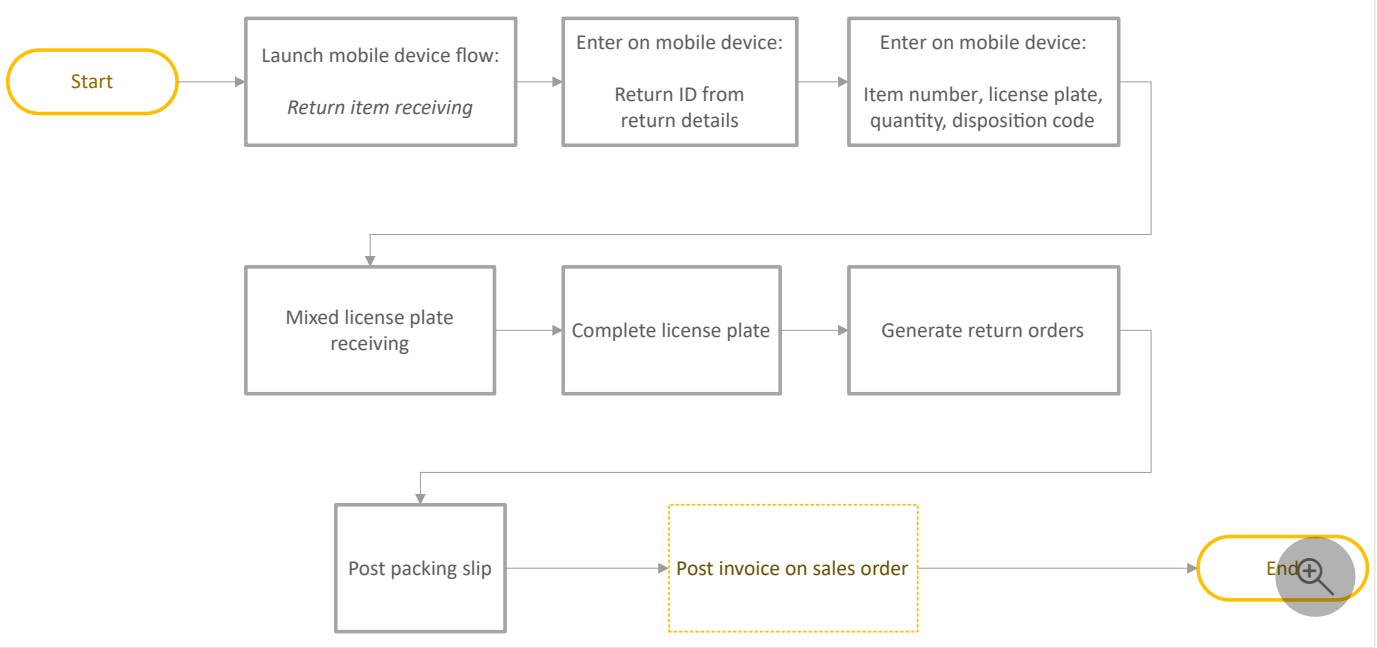
Example scenario 2: Customer return with a return details policy

For this scenario, return details are generated when an order is processed for shipment at the packing station, and matching labels are included with the shipment. If any items must be returned, the customer packs the return items, attaches the return label that they received together with the original shipment, and ships the return items back to the seller. When the returned items arrive at the seller's warehouse, a worker scans the return label and the item to get the return ID. The return ID identifies a return details record that includes the original order details. This process helps prevent fraud, inventory errors, and lost packages.

The following illustration shows the steps that are required to create a sales order and complete the work of moving the ordered items to the packing area. Workers then pack the order, and return details are generated when the container is closed.



The following illustration shows a flowchart of the receiving process where the *Return item receiving* mobile menu item is used to process a return that has return details.



Create a sales order and release it to the warehouse for packing

For this scenario, a related sales order must already exist, and the item must be shipped before the return. Therefore, you must create the required records before you can work through the related return. Follow these steps to create a sales order and complete the work of moving the ordered items to the packing area.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the **Customer account** field to *US-001*.
4. Select **OK** to close the dialog box.
5. The new sales order opens. The **Sales order lines** FastTab includes a single, blank order line. Set the following values for this line:
    - **Item number:** *A0001*
    - **Quantity:** *1*
    - **Site:** *6*
    - **Warehouse:** *62*
6. While the order line is still selected on the **Sales order lines** FastTab, select **Inventory** > **Reservation** on the toolbar.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.

8. On the Action Pane, select the **Back** button to return to the sales order.

9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**. A message shows the shipment and wave IDs for the order.

10. While the order line is still selected on the **Sales order lines** FastTab, select **Warehouse** > **Work details** on the toolbar. If you use batch processing to run your waves, you might have to wait a short time for the work to be created.

11. On the **Work** page, on the Action Pane, on the **Work** tab, select **Complete work**.

12. On the **Work completion** page, set the **User ID** field to *62*.

13. On the Action Pane, select **Validate work**.

14. When you receive a message that indicates that your work is valid, select **Complete work** on the Action Pane to complete the process of picking the inventory items and putting them in the *Pack* location.

15. Make a note of the **Shipment ID** value that's shown for the work in the upper grid.

Pack the ordered items into a container and generate return details

The inventory items are brought to the packing area and are ready to be packed into containers. Follow these steps to create a new container in the system, and to pack and close the container. After you close the container, the system automatically creates a return details record. You can reference this record later when returned items are received back into the warehouse. At this point, you can print a return label and deliver it together with the container.

1. Go to **Warehouse Management** > **Packing and containerization** > **Pack**.

2. In the **Select packing station** dialog box, set the following values:

    - **Site:** *6*
    - **Warehouse:** *62*
    - **Location:** *Pack*
    - **Packing profile ID:** *WH62*

3. Select **OK** to close the dialog box and return to the **Pack** page.

4. On the **Packing station** FastTab, in the **License plate or shipment** field, enter the shipment ID that you noted at the end of the previous procedure. Then select **Return**.
5. On the Action Pane, select **New container** to start the *container creation* process.
6. In the dialog box, set the **Container type** field to *SmallBox*. Then select **OK** to return to the **Pack** page.
7. On the **Item packing** FastTab, set the **Identifier** field to *A0001*. Then select **Return**. A quantity of *1* of item number *A0001* is moved to the container for the shipment. On the **All lines** FastTab, the line for item number *A0001* now shows a check mark in the **Complete** column.
8. On the Action Pane, select **Close container** to start the *container closing* process.
9. In the dialog box, select the **Get system weight** link to load the weight of the shipment into the **Gross weight** section. Then select **OK** to return to the **Pack** page.
10. Now that the container is closed, the system automatically creates return details. Go to **Warehouse Management** > **Inquiries and reports** > **Return details**.
11. The **Return details** page should list a new return details record that shows the order number and line item that you just packed. Make a note of the **Return ID** value for the new record. You need this value later in this scenario.
12. Go to **Warehouse Management** > **Shipments** > **All shipments**.
13. Select the shipment that has the shipment ID that you noted at the end of the previous procedure.
14. On the Action Pane, on the **Shipments** tab, select **Confirm Shipment**.

    A message shows that the shipment is confirmed.

> **Note**
>
> If you return to the **Return details** page and open the record that has the return ID that you noted earlier, the **Lines** FastTab should now show a **Return until date** value that matches the return item policy that you set for the packed item. The system automatically adds this value after you confirm the shipment.

Receive a product with return details to a mixed license plate

Follow these steps to receive returned items into the warehouse.

1. Open the Warehouse Management mobile app, and sign in by using *62* as the user ID and *1* as the password.
2. Open the menu item that you created for receiving by using the *Return details* process (for example, **Inbound** > **Return details receiving**).
3. In the **Return ID** field, enter the return ID that you noted during the previous procedure. In a real-world scenario, the warehouse worker typically scans this value from the return label that's attached to the package. (This label was sent to the customer together with the original shipment.)
4. In the **Item** field, enter or scan item number *A0001*.
5. Accept the license plate number that's suggested.
6. In the **qty** field, enter *1*.
7. In the **Disposition code** field, select *RMA Credit*.
8. Select **OK** to complete the receiving work.
9. Select **Cancel** to exit the flow and close the menu item.

> **Note**
>
> You must exit the flow to unlock the license plate. If the license plate is locked, you can't complete mixed license plate receiving in Supply Chain Management, as described in the next section. In some setups, you can finish processing mixed license plates during the *Return item receiving* flow. However, in this scenario, you process the license plate in Supply Chain Management.

Complete mixed license plate receiving

The returned products are now on a mixed license plate for further processing. (Learn more in Mixed license plate receiving.) Follow these steps to finish receiving the returned items.

1. Go to **Warehouse Management** > **Inquiries and reports** > **Mixed license plate receiving**.
2. In the **License plate** grid, find the mixed license plate that you processed by using the mobile app.

3. On the Action Pane, on the **License plate** tab, select **Complete license plate** to complete the mixed license plate receiving.

After you complete mixed license plate receiving, Supply Chain Management automatically creates an RMA order that's prepared for further downstream processing, as described in Sales returns.

> **Tip**
>
> You can set up your mobile device menu item for processing returns to include a step that lets workers complete mixed license plate receiving directly from the mobile device while receiving the return. Then you don't need to **complete this step** later in the Supply Chain Management web client. To do so, create a **detour** item with the **Activity code** *Complete mixed license plate*. Learn more in **Set up a mobile device menu item for completing mixed license plates**.

Example scenario 3: Nonpacking scenarios for return details

Use the *Return details* process for scenarios where you don't use a packing station to prepare outgoing shipments. In this case, your outgoing shipments are delivered on a pallet to the bay door, where they're packed and shipped directly. Therefore, the system doesn't generate the return details record after the container is packed and closed (from the **Pack** page in Supply Chain Management). Instead, it generates the return details record when the outbound shipment is confirmed (from the **All loads** page in Supply Chain Management). Otherwise, this scenario works in the same way as the previously described packing scenario.

For this scenario, it's important that your system is configured to create return details, generate load line inventory picking numbers, and use sales load line picking routes, as described in the Scenario prerequisites section.

Manage inbound putaway based on container types

Article • 01/06/2023

When you run warehouse receiving processes for various types of handling units (such as octabin pallets or Euro-pallets in different sizes), you can use container types to optimize the putaway process. Instead of using the item master's volumetric data to calculate the capacity of the putaway location, you can link each license plate registration to a container type that holds the physical dimension data. That data can then be used to select a valid putaway location.

Set up container types

By associating a container type with a license plate, you can control storage policies based on that container type.

Follow these steps to set up a container type.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container types**.
2. Follow one of these steps:
    - To create a new container type, select **New** on the Action Pane.
    - To edit an existing container type, select it in the list pane, and then select **Edit** on the Action Pane.
3. On the header of the new or selected record, set the following fields:
    - **Container type code** – Enter a unique name or identifier for the container type.
    - **Description** – Enter a short description of the container type.
4. On the **General** FastTab, set the following fields:
    - **Tare weight** – Enter the weight of the container when it's empty.
    - **Maximum net weight** – Enter the maximum weight of the container when it's packed.
    - **Container length**, **Container width**, **Container height**, and **Container volume** – Enter the physical dimensions of the container. These values are required for calculations of volumetric location loads, but they aren't required for calculations of location stocking limits.

- **Flexible volume dimensions** – Set this option to *Yes* if the volume depends on the container volume plus the inventory that's put into the container. Set it to *No* if the volume is considered fixed and doesn't depend on the inventory that's put into the container. This setting doesn't affect existing containerization processes.
- **Unit** – Specify the handling unit for the container, such as *Euro-pallet* or *Octabin*. This unit applies to the container standard itself, not to its dimensions (such as height and length). If you'll configure your system to use this container type to calculate location stocking limits, you must specify a unit here. When the system calculates location stocking limits, it can, as required, convert between the handling units that are used by different container types.
- **Length**, **Width**, **Height**, and **Volume** (in the **Maximums** section) – Enter the maximum physical dimensions that the container can handle.
- **Attributes** – You can define additional attributes for container types that are associated with other operations that use containers. Learn more in Containerization.

5. On the Action Pane, select **Save**.

Define allowed container type groups

Use the **Allowed container type groups** page to prevent locations from holding some container types. To limit locations to specific container types, you must associate the records on this page with a location profile.

Follow these steps to set up an allowed container type group.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Allowed container type groups**.

2. Follow one of these steps:

   - To create a new container type, select **New** on the Action Pane.
   - To edit an existing container type, select it in the list pane, and then select **Edit** on the Action Pane.

3. On the header of the new or selected record, set the following fields:

   - **Allowed container type group name** – Enter a unique name or identifier for the group.
   - **Allow unspecified container types** – Set this option to *Yes* to allow license plates that aren't associated with a container type to be put into locations in

this group. Set it to *No* if all license plates that are stored in locations in this group must be associated with a container type.

4. On the **Details** FastTab, specify the container types that can be put into locations in this group.

    - Use the **New** button to add rows to the grid and the **Delete** button to remove rows.
    - For each row, select a container type.

5. On the Action Pane, select **Save**.

Assign container type groups to location profiles

By assigning a container type group to a location profile, you ensure that only license plates that meet the criteria of that group can be put into locations where the location profile applies. You can assign a container type group only to location profiles where license plate tracking is enabled.

Follow these steps to assign a container type group to a location profile.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. Select the target profile in the list pane, and then select **Edit** on the Action Pane.
3. On the **General** FastTab, set the **Use license plate tracking** option to *Yes*.
4. In the **Allowed container type group** field, select the container type group that applies to the selected location profile.
5. On the Action Pane, select **Save**.

Define location stocking limits based on container types

Location stocking limits let you limit the amount of inventory that the system will try to store at a given location when it generates putaway work. The limits can be based on individual products or product variants, or they can be based on container types. This section described how to set up stocking limits that are based on container types. For more information about other types of location stocking limits, see Location stocking limits.

When you set up location stocking limits that are based on container types, the system checks the number of each type of container that's already stored at a location to

calculate whether there's room to add an incoming container there. During this calculation, the system can convert between different container types based on their handling units, provided that an applicable unit conversion is available (see the note later in this section).

When the system is looking for a location that has room to store an incoming container, it first evaluates the container type limits. If no matching container type constraints are found, it evaluates the settings at the product or variant level. To prevent the product-level settings from being used for a specific combination of a location profile and a container type, set up a container-based limit where the **Allow unlimited quantity** checkbox is selected.

Follow these steps to set up location stocking limits that are based on container types.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location stocking limits**.
2. On the **Container types** tab, each row in the grid defines a stocking limit that's based on a warehouse, a location, and a container type. Use the **New** and **Delete** buttons on the toolbar to add and remove rows as required. For each row, set the following fields:

    - **Warehouse** – Select the warehouse where the stocking limit for the row applies.
    - **Location profile ID** – Select the location profile that's assigned to the locations where the row applies. You can select only location profiles that an allowed container type group is assigned to.
    - **Container type** – Select the container type that the current row applies to. You can select only container types that a unit is assigned to, and that belong to the allowed container type group that's assigned to the selected location profile ID.
    - **Allow unlimited quantity** – Use this checkbox to establish a stocking limit for the warehouse, location profile, and container type that are selected for this row.
        - *Selected* – The location can contain an unlimited number of the specified container type. In this case, the stocking limit settings on the **Products** and **Product variants** tabs aren't evaluated when the current row applies.
        - *Cleared* – The location can hold only a limited number of containers of the selected type. For rows where this checkbox is cleared, you must specify the quantity that can be stocked in the location.

- **Quantity** – If the **Allow unlimited quantity** checkbox is cleared, enter the quantity limit that applies to the current row. The read-only **Unit** field specifies the handling unit that applies to the quantity that you enter. The **Unit** value is based on the unit that's assigned to the selected container type. The system will convert between compatible handling units as required.

3. On the Action Pane, select **Save**.

> **Note**
>
> Even though you can define only one unit in each location stocking limit, locations might be able to store more than one container type, depending on the unit conversion factors that are available. The system applies unit conversion to evaluate the related units.
>
> For example, you have the two handling units, *1-PL* and *1/2-PL*. Each is associated with a container type where the following unit conversion is defined: *1-PL* = 2 × *1/2-PL*. In this case, it doesn't matter whether a row on the **Container types** tab of the **Location stocking limits** page is set up so that **Quantity** = *4* and **Unit** = *1/2-PL*, or **Quantity** = *2* and **Unit** = *1-PL*. In both cases, the row will allow the following combinations of location loads.

Expand table

Number of 1/1-Pallets	Number of 1/2-Pallets	Maximum location load
2	0	Yes
1	0	No
1	1	No
1	2	Yes
0	0	No
0	1	No
0	2	No
0	3	No
0	4	Yes

Define how a default container type is assigned

The logic for assigning a container type to a license plate can be controlled through default values. You can assign a default container type at any of several levels in the system. The system then uses the following hierarchy, from most specific to most general. The most specific level where a default container type is defined will apply.

1. Existing license plate container type
2. Mobile device menu items
3. Unit sequence groups
4. Warehouse
5. Warehouse management parameters
6. (None)

Assign a default container type at the global (Warehouse management parameters) level

The default container type that's assigned at the global level (that is, on the **Warehouse management parameters** page) will apply wherever no other default container type is assigned.

Follow these steps to define the default container type at the Warehouse management parameters level.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **License plates** FastTab, in the **Default container type** field, assign a container type.
3. On the Action Pane, select **Save**.

Assign a default container type to a warehouse

Follow these steps to define the default container type at the warehouse level.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.

2. Follow one of these steps:

    - To create a new warehouse, select **New** on the Action Pane.
    - To edit an existing warehouse, select it in the list pane, and then select **Edit** on the Action Pane.

3. On the **Warehouse** FastTab, in the **Inventory** section, in the **Default container type** field, assign a container type.

4. On the Action Pane, select **Save**.

Assign default container types to units in unit sequence groups

Unit sequence groups establish a collection of units that an inventory item can be counted and stored by. For example, wine might be counted by the bottle, by the case (of 12 bottles), or by the pallet (of 84 cases). Each unit in a sequence is typically used for a different purpose, and a default container type can be assigned to each.

Follow these steps to define the default container type at the unit sequence groups level.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Unit sequence groups**.
2. Follow one of these steps:
    - To create a new group, select **New** on the Action Pane.
    - To edit an existing group, select it in the list pane, and then select **Edit** on the Action Pane.
3. On the **Line details** FastTab, either select the line where you want to assign a container type, or select **New** on the toolbar to create a new line.
4. In the **Default container type** field, assign a container type.
5. On the Action Pane, select **Save**.

Assign default container types to mobile device menu items

When workers receive a shipment, they typically use the Warehouse Management mobile app to register the incoming inventory. To begin, they select a menu item that's configured to receive a specific combination of an item, a warehouse, and/or a location. Administrators can assign a default container type for each menu item, and can control whether warehouse workers can see and edit the container type.

Follow these steps to define the default container type at the mobile device menu item level.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container types**.
2. Make a note of each **Container type code** value that you want to use as a default container type for your menu item. You'll need these codes later, and you'll have to enter them, as free text, exactly as they appear here. You won't be able to select them in a drop-down list.

3. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

4. Follow one of these steps to select or create an inbound menu item. (An inbound menu item is a menu item that's designed to help workers register arriving inventory, as established by its **Work creation process** setting.)

    - To create a new inbound menu item, select **New** on the Action Pane.
    - To edit an existing inbound menu item, select it in the list pane, and then select **Edit** on the Action Pane.

5. On the **General** FastTab, set the following fields:

    - **Use default data** – Set this option to *Yes*. The **Default data** button then becomes available on the Action Pane. You'll use that button to define one or more default container types for the menu item.
    - **Display container type** – Set this option to *Yes* if you want the default container type to be shown (and editable) in the mobile app. Set it to *No* if you want the container type to be hidden (and therefore hardcoded to the applicable default container type).

6. On the Action Pane, select **Default data**.

7. On the **Default data** page, the grid has a row for each default setting that applies to the current menu item. You can set up as many default container types as you want, each for a different combination of a warehouse and a location. Alternatively, you can set up just one default container type that applies to all warehouses and locations. For each row where you want to set up a default container type, set the following fields:

    - **Default data field** – Select *Container type*.
    - **Warehouse** – Select the destination warehouse to use with this row. Leave this field blank to create a row that applies to all warehouses where a specific default container type isn't assigned.
    - **Location** – Select the destination location to use with this row. This field lists all the locations that are available for the selected warehouse. Leave this field blank to create a row that applies to all locations in the selected warehouse where a specific default container type isn't assigned.
    - **Hardcoded value** – Enter the **Container type code** value for the container type that you want to use as the default container type for this row. Use the exact value that you noted in step 1.

8. Continue to work on the **Default data** page until you've set up all the rows that you need for the current menu item.

9. On the Action Pane, select **Save**.

Cross-dock products from receiving warehouse to stores

Article • 09/29/2021

This procedure walks through the steps to create and process a Cross-dock to distribute products from the receiving location of a purchase order to one or many stores. The user can define multiple configurations and have the system suggest how to distribute the products, or manually enter where the products are distributed to and how much gets distributed to each store. The procedure doesn't include setup of data that can be used in the Cross-dock, such as replenishment rules, organizational hierarchies, and store weights. The procedure uses the USRT demo company.

1. Go to All purchase orders.
2. Select a purchase order in the list and click the link to open the order.
3. On the Action Pane, click Retail and Commerce.
4. Click Cross docking.
5. Click Edit.
    - The category can be used to filter the items in the Lines section.
6. In the list, find and select the desired record.
7. In the Cross docking quantity field, type a value to specify how much of the quantity being purchased of the selected product should be distributed.
8. In the Additional cross docking quantity field, enter a value to specify the quantities to distribute for the available products being purchased
9. In the Distribution field, enter 'Location weight'.
    - You can select the other types to use different rules for the distribution.
10. In the Replenishment hierarchy field, select a value.
11. Select Yes in the Respect assortments field.
12. Click Calculate quantities.
13. Click Create order.
14. Click Yes.
15. In the list, find and select a warehouse that received products
16. Click Order to view the orders that got created for the selected warehouse

Set up a location directive for purchase order putaway

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up a simple location directive. The example that's shown creates a location directive to be used to determine where to put items that have been received for a purchase order.

Pre-conditions: You must create a disposition code. In this procedure, we use a disposition code called *Relabel*. If you're creating a location directive in your own data, you need to have set up warehouse management processes (WMS) for your warehouse and items.

This procedure is intended for the warehouse manager.

Create a location directive header

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the **Work order type** field, select **Purchase orders**.
3. Select **New**.
4. In the **Sequence number** field, enter a number. This is the sequence in which the location directive is processed for the selected work type. You can also modify the sequence, if needed.
5. In the **Name** field, type a value. This is the unique identifier for this directive.
6. In the **Work type** field, select **Put**. Select the type of work to be performed. For directive with work order type Purchase order, **Put** is the only supported value.
7. In the **Site** field, type a value.
8. In the **Warehouse** field, type a value. Leave the Directive code blank. Directive codes are used to link a work order line of type Put to a specific directive. For purchase orders, the location of the last work order line of type Put is resolved before the work template is determined. Therefore it isn't possible to connect the last line of a work template to a specific directive.
9. In the **Disposition code** field, type a value. The Disposition code limits the use of the location directive, so the location directive is only used if the warehouse worker enters this specific value during registration of the item using a mobile device.

10. Select **Save**.

Edit the query for directive

1. Select **Edit query**. The use of this directive is already limited to items registered in the warehouse that you specified, and with the disposition code that you specified. You can add other constraints using the query.
2. Select **OK**.

Add directive lines

1. Select **New**. This is the sequence in which the location directive lines are processed for the selected work type. You can also modify the sequence, if needed.
2. In the **From quantity** field, enter a number. This is the lowest quantity that this directive line is valid for.
3. In the **To quantity** field, enter a number.
4. In the **Unit** field, type a value. The unit the From quantity and To quantity is expressed in. If you leave this field blank the inventory unit from the item is used.
5. In the **Locate quantity** field, select an option.

    - None, or license plate quantity: The quantity registered on each license plate.
    - Unitized quantity: The entire quantity that's been registered.
    - Remaining quantity: The quantity that is yet to be registered from the purchase order line.
    - Expected quantity: The total quantity that is specified on the purchase order line.

6. Check or uncheck the **Restrict by unit** checkbox. If you select this option, and specify the unit on the **Restrict by unit** page, only items with that unit of measurement can be put into the location. For example, if the unit of measurement is PL (pallets), only items in pallets can be put into the specified location.
7. Check or uncheck the **Allow split** checkbox. This allows the directive to split the quantity across multiple locations.
8. Select **Save**.

Restrict the directive line to a specific unit

1. Select **Restrict by unit**. This button is only available when you press **Save** after you have selected the **Restrict by unit** check box.
2. In the **Unit** field, type a value.
3. Close the page.

Add a location directive action line

1. Select **New**. This is the sequence in which the location directive action lines are processed for the selected work type. You can also modify the sequence, if needed.
2. In the **Name** field, type a value. This is the unique identifier for this directive action.
3. In the **Fixed location usage** field, select an option.

    - *Fixed and non-fixed locations*: All non-fixed locations, including the product's own fixed location, are valid within the range specified in the query.
    - *Only fixed location for the product*: Fixed locations for the product are valid, and all product variants share the same set of fixed locations.
    - *Only fixed location for the product variants*: Only fixed locations specified for each product variant are valid.

4. In the **Strategy** field, select an option. Work orders of type *Purchase order* support the following strategies:

    - *None*: the item is placed at the first location that's found.
    - *Consolidate*: The item is placed in a location where similar items are already available.
    - *Empty location with no incoming work*: the item is placed in the first empty location that's found. A location is considered to be empty if it has no physical inventory and no expected incoming work.

5. Select **Save**.

Edit the query for directive action line

1. Select **Edit query**.
2. Select **Add**.
3. In the **Field** field, type *location profile ID*. In this example, we'll restrict the possible locations using a location profile ID.
4. In the **Criteria** field, type a value.
5. Select **OK**. You can continue to add directive lines and directive actions until you have covered all the possible scenarios in your warehouse.

Set up a work template for purchase orders

Article • 01/31/2023

This article describes how to set up a simple work template to be used when putting away received items. Work templates determine the set of instructions presented to the warehouse worker on a mobile device when moving items from the receiving area. You can use this procedure with the data mentioned in demo data company USMF. Before you start this guide, create a work pool ID. In this example, a work pool ID called in Inbound is used. This procedure is intended for the warehouse manager.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select **Purchase orders**.

Create a work template header

1. Select **New**.
2. In the **Sequence number** field, enter a number. This is the sequence in which the work templates are evaluated. You can modify the sequence, if needed.
3. In the **Work template** field, type a value. This is the unique identifier for this template.
4. In the **Work template description** field, type a value.

    - The **Valid** option will not be checked until you've completed all the information that's needed by the template and have then selected **Save**.
    - A work order of type **Purchase order** cannot be automatically processed, so leave the **Automatically process** option set to **No**.

5. In the **Work pool ID** field, type a value. Work pool IDs allow you to organize work into groups. The value that you set here will be the default value for any work that's created using this template.
6. In the **Work priority** field, enter `1`. This indicates the importance of the work, and the value that you set here will be the default for any work created using this template.
7. Select **Save**. You must save the work template header before the **Edit Query** button becomes available.

Set up the query for the work template

1. Select **Edit query**. We'll set a limitation that the template can only be used within a specific warehouse.
2. Select **Add**.
3. In the **Field** field of the new row, type `warehouse`.
4. In the **Criteria** field, type a value.
5. Select **OK**.
6. Select **Yes**.

Set work template details

1. Select **New**.
2. In the **Work type** field, select **Pick**.
3. In the **Work class ID** field, type `purchase`. The work class that you set here will be the default on all work lines of type Pick that are created using this template. The work class cannot be overridden from the work order lines. Work classes are used to direct and/or limit the type of work order lines a warehouse worker can process on a mobile device.
4. Select **New**.
5. In the **Work type** field, select **Put**.
6. In the **Work class ID** field, type a value. The pick and put instructions are a set. Each pick/put set must have the same work class. Use the same work class that you provided for the pick instruction.
7. Select **Save**. Note that the **Valid** checkbox is now checked.

Location product dimension mixing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Location product dimension mixing is location profile functionality that helps improve location management when product variants or products that have dimensions are used, such as in the fashion industry. It lets you decide whether configurations, colors, styles, and sizes can be mixed for a specific location profile, or whether just one of these dimensions or a combination of them can be put to the same location.

Setup

Every location in the warehouse needs to have a location profile associated with it that describes the properties of the location. Therefore, all locations that use the same location profile will be able to allow product dimension mixing after it has been set up.

Configure location profiles to allow product dimension mixing

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. In the list of location profiles, select **BULK**.
3. On the Action Pane, select **Edit**.
4. On the **General** FastTab, set the **Enable location product dimension specific mixing** option to *Yes*.

   > **Note**
   >
   > You can set this option to *Yes* only if the **Allow mixed items** option is set to *No*.

5. On the **Allowed product dimension mixing** FastTab, set the **Size** option to *Yes*. In the scenario that is described in this article, mixing can be done only for products that have different **Size** dimensions. However, other options are also available.
6. Select **Save**.

Create a new product master and product variants

1. Go to **Product information management** > **Products** > **Product masters**.
2. On the Action Pane, select **New** to create a product master.
3. In the **New product** dialog box, set the following values:
    - **Product type:** *Item*
    - **Product subtype:** *Product master*
    - **Product number:** *B0001*
    - **Product name:** *B0001 Size*
    - **Product dimension group:** *Size*
    - **Configuration technology:** *Predefined variant*
4. Select **OK**.
5. On the **Product details** page, on the **General** FastTab, set the following values:
    - **Generate variants automatically:** *Yes*
    - **Size group:** *CASUALDHIR*
6. To view the predefined variants, on the Action Pane, select **Product variants**.

    The **Product variants** page appears and shows a list of variants from the configuration of the size group.

Release products to the USMF company

1. On the Action Pane, select **Release products**.
2. On the **Select products to release** page, confirm that product number *B0001* is in the list, and then select **Next**.
3. Select **Next** to confirm the product variants to release.
4. On the **Select companies to release to** page, select *USMF*, and then select **Next** to confirm the selection.
5. On the **Confirm selection** page, select **Finish** to complete the release.

    You receive an "Operation completed" message.

Update a released product in the USMF company

1. Make sure that you're signed in to the **USMF** company.
2. Go to **Product information management** > **Products** > **Released products** to finish creating the released product.
3. Find and select item number *B0001* to open the **Released product details** page.
4. On the Action Pane, select **Edit**.
5. On the **General** FastTab, make sure that the **Item model group** field is set to *FIFO*.
6. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Dimension groups**.
7. Set the following values:
    - **Storage dimension group:** *Ware*
    - **Tracking dimension group:** *None*
8. Select **OK**.
9. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Reservation hierarchy**.
10. Set the **Reservation hierarchy** field to *Default*, and then select **OK**.
11. On the **General** FastTab, in the **Administration** section, notice that your selections have been updated.
12. On the **Purchase** FastTab, in the **Price** field, enter *10*.
13. On the **Manage costs** FastTab, in the **Item group** field, enter *Audio*.
14. On the **Purchase** FastTab, in the **Price** field, enter *10*.
15. On the **Warehouse** FastTab, in the **Unit sequence group ID** field, enter *ea*.
16. Select **Save**.

Create a location directive

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the left pane, in the **Work order type** field, select *Purchase orders*.
3. In the list, select the location directive that is named *24 PO Direct*.
4. On the **Location Directive Actions** FastTab, select **New** to add a line to the grid.

5. On the new line, set the following values:

    - **Sequence number:** *1*

      The new line should be in front of the previously existing line. To make the change, use the **Move up** and **Move down** buttons on the toolbar, or change the existing line's **Sequence number** value to *2*.

    - **Name:** *Put to BULK Location profile*
    - **Fixed location usage:** *Fixed and non-fixed locations*
    - **Allow negative inventory:** *Clear this check box (=No)*
    - **Batch enabled:** *Clear this check box (=No)*
    - **Strategy:** *None*

6. While the new line is still selected, select **Edit query** above the grid.
7. In the query dialog box, on the **Range** tab, select **Add** to add a line to the grid.
8. On the new line, set the following values:

    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Location profile ID*
    - **Criteria:** *BULK*

9. Select **OK**.
10. On the **Location directives** page, on the Action Pane, select **Save**.

> ⓘ **Note**
>
> On the **Location Directive Actions** FastTab **Strategy** field, if you use the *Consolidate* location strategy, the setup of the **Allowed product dimension mixing** FastTab on the **Location profiles** will be overridden, and items will be put to the same location even if this behavior isn't allowed by the setup.

Create a mobile device menu item

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to create a menu item to use for sorting.

3. In the header, set the following values:

    - **Menu item name:** *PO line receiving*
    - **Title:** *PO line receiving*
    - **Mode:** *Work*
    - **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

    - **Work creation process:** *Purchase order line receiving and putaway*
    - **Generate license plate:** *Yes*

5. Select **Save**.

Configure the mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. In the list of menus, select **Inbound**.
3. On the Action Pane, select **Edit**.
4. In the **Available Menus And Menu Items** list, find and select the **PO line receiving** menu item.
5. Select the right arrow button to move the **PO line receiving** menu item to the **Menu Structure** list. In this way, you add your new menu item to the selected menu.
6. Select **Save**.

Scenario

This demo scenario shows how two different product variants can be put to the same location when the location profile doesn't allow for mixed items. In this case, you will use the **Size** variant as the criterion.

Before you begin, make sure that there are empty locations in warehouse *24* that use the *BULK* location profile.

Create a purchase order

You will create a purchase order that has three lines: two lines for the same product number but different **Size** variants, and a third line for a different product that has no variants.

1. Go to **Accounts payable** > **Purchase orders** > **All purchase orders**.

2. On the Action Pane, select **New**.

3. In the **Create purchase order** dialog box, set the following values:

    - **Vendor account:** *1001*
    - **Warehouse:** *24*

4. Select **OK**.

5. The purchase order is created, and a new line is added on the **Purchase order lines** FastTab. Make a note of the purchase order number.

6. On the new line, set the following values:

    - **Item number:** *B0001*
    - **Size** *L*
    - **Quantity:** *2*

7. Select **Add line** above the grid to add a second purchase order line, and set the following values:

    - **Item number:** *B0001*
    - **Size** *XL*
    - **Quantity:** *2*

8. Select **Add line** to add a third purchase order line, and set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *1*

1.Select **Save**.

Receive purchase order lines in the Warehouse Management mobile app

1. Sign in to the Warehouse Management mobile app as a user who is enabled for warehouse *24*.

2. Select the **Inbound** menu.

3. Select **PO Line receiving**.

4. Select the **PONUM** field, and then enter the purchase order number.

5. Confirm your entry by selecting the confirm button (✓) at the bottom of the page.

6. Enter the line number from the purchase order that is being received. Select the **LINENUM** field, and then use the number pad to enter *1*.

7. Confirm your entry.

8. Enter the quantity to receive. Select the plus sign (+) button two times to increase the value in the **Qty** field to *2*.

9. Register your entry by selecting the button (✓) at the bottom of the page, and then confirm your entry by selecting the button (✓) again.

10. View the information on the **Purchase orders: Put** page. This page shows the work that has been created for the put-away (Work 1).

    The location where the received item will be put away, the license plate, the item, the size, and the quantity of the **PO Line receiving** task that you just completed are shown.

11. Confirm the put-away work.

12. Repeat the steps 4 through 11 for the purchase order line 2. However, in step 8, specify a quantity of *1*.

    New put-away work (Work 2) is created for the same location as Work 1.

13. Repeat the steps 4 through 11 again for purchase order line 2. In step 8, specify the remaining quantity of *1*.

    New put-away work (Work 3) is created for the same location as Work 1 and Work 2. This behavior occurs because the *Consolidate* location directive strategy is used, and the **Allowed product dimension mixing** FastTab on the *Bulk* **Location profiles** setup allows the **Size** variant to be mixed on a location.

14. Repeat the steps 4 through 11 for purchase order line 3. In step 8, specify a quantity of *1* for item number *A0001*.

    New put-away work (Work 4) is created for a different location than the location that is used for purchase order lines 1 and 2. This behavior occurs because the location profile doesn't allow for mixed products, but it does allow for mixed dimensions of the same product master.

15. Select the Menu button at the top of the page (sometimes referred to as the hamburger or the hamburger button), and then select **Cancel** to exit **PO Line receiving**.

> **Tip**
>
> You can repeat this scenario, but this time, set **Size** - *No* under the **Allow product dimension mixing** FastTab on the *BULK* **Location profiles**, so that none of the product

dimensions can be mixed. In this case, when you receive the purchase order, each product variant will be put to a new location.

Putaway clusters

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Putaway clusters offer a way to pick multiple license plates at the same time and then take them for putaway in different locations. This process is often referred to as a *milk run*. Putaway clusters can be very useful for retail businesses, where license plates typically aren't full pallets of inventory.

Setup for the example scenario

Cluster profiles

The putaway cluster profile determines where an item goes, based on the location assigned to the item at the time of receipt. If you need different clusters, create different putaway clusters, one for each mobile device menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Cluster profiles**.
2. On the Action Pane, select **New**.
3. In the **Header** view, set the following values:
    - **Putaway cluster profile ID:** *Cluster putaway*
    - **Putaway cluster profile ID Name:** *Cluster putaway*
    - **Cluster type:** *Putaway*
    - **Sequence number:** Accept the default value.
4. Select **Save** to make the required fields on the **General** FastTab available.
5. On the **General** FastTab, set the following values:
    - **Cluster assignment timing:** *At receipt*

This field defines whether the putaway cluster is assigned immediately when the inventory is received, or whether it should be sorted later.

- **Cluster assignment rule:** *Manual*

  This field defines whether the system automatically determines the cluster assignment or if the user assigns it manually.

- **Directive code:** Leave this field blank.

- **Putaway cluster locate:** *Receipt*

  The following values are available:
  - **Receipt** – A location is found immediately during receipt.
  - **Cluster close** – A location is found when the cluster is closed.
  - **User directed** – A location is found when the license plate is picked from the cluster for putaway. In this case, no location is specified when the putaway work is created. During the putaway itself, the user must scan the license plate or work ID to initiate the put step. The system then finds the put location again and tells the user where to put the picked quantity.

- **Putaway cluster per user:** *No*

  This field defines whether each cluster is unique per user when the clusters are automatically assigned. It's available only when the **Cluster assignment rule** field is set to *Automatic*.

- **Unit restriction:** Leave this field blank.

  This field defines the unit that must be received for the profile to be valid. If it's left blank, all units are valid.

- **Work unit break:** *Individual*

  This field defines whether all inventory is consolidated (by using the cluster ID and the license plate) onto one license plate when a cluster is closed, and whether it should be put away as a single license plate or separately on the license plates that were received. This field is unavailable when the **Putaway cluster locate** field is set to *Receipt*.

- **Cluster persists as Parent License Plate:** *No*

If this option is set to *Yes*, when the put step is completed, the cluster ID becomes a parent license plate, and all items on the cluster ID link to that parent license plate.

6. On the **Cluster sorting** FastTab, you can define putaway sorting criteria. Select **New** on the toolbar to add a line, and then set the following values:

   - **Sequence number:** Accept the default value.
   - **Field name:** *WMSLocationId*

     This field defines the field that this line uses as a sorting criterion.
   - **Sorting:** *Ascending*

     This field defines whether sorting should be done in ascending or descending order.

7. On the **Cluster work template** FastTab, select **New** on the toolbar to add a line, and then set the following values:

   - **Work order type:** *Purchase orders*
   - **Work template:** *61 PO Direct*

8. On the Action Pane, select **Save**, and then select **Edit query**.

9. In the **Cluster putaway** dialog box, on the **Range** tab, select **Add** to add a second line to the query. Then update the query lines as shown in the following table.

Expand table

Table	Derived table	Field	Criteria
Work	Work	Warehouse	*61*
Work	Work	Work ID	Leave this field blank.

10. Select **OK** to save the query and close the dialog box.

11. On the Action Pane, select **Save**, and close the page.

> **Important**
>
> Fields in the cluster profile that appear dimmed when **Generate cluster ID** is set to *Yes* are unavailable and aren't considered when this feature is used.

Mobile device menu items

Two new mobile device menu items are available for this feature. Use the **Receive and sort cluster** menu item to sort the received inventory into a putaway cluster upon receipt. Use the **Cluster putaway** menu item to put the cluster away after it is assigned.

Receive and sort cluster

Create a new mobile device menu item for receiving inventory and sorting it into a cluster. This menu item creates inbound work after inventory is received, which indicates that the receiving menu item is used for putaway clusters.

> ⓘ **Note**
>
> Use the **Receive and sort cluster** menu item with the following receiving menu items:
>
> - Purchase order line receiving
> - Purchase order item receiving
> - Load item receiving

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the **Header** view, set the following values:
    - **Menu item name:** *Receive and sort cluster*
    - **Title:** *Receive and sort cluster*
    - **Mode:** *Work*
    - **Use existing work:** *No*
4. On the **General** FastTab, set the following values:
    - **Work creation process:** *Purchase order item receiving*
    - **Generate license plate:** *Yes*
    - **Assign putaway cluster:** *Yes*

        > ⓘ **Note**

> The **Assign putaway cluster** option is available only for the one-step *Work creation process* activity for receiving.

Accept the default values for the remaining fields.

5. On the Action Pane, select **Save**.

Cluster putaway

Create a new mobile device menu item for putting the cluster away after it is assigned.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the **Header** view, set the following values:
    - **Menu item name:** *Cluster putaway*
    - **Title:** *Cluster putaway*
    - **Mode:** *Work*
    - **Use existing work:** *Yes*
4. On the **General** FastTab, set the **Directed by** field to *Cluster putaway*. Accept the default values for the remaining fields.
5. On the **Work classes** FastTab, set up the valid work class for this mobile device menu item:
    - **Work class ID:** *Purchase*
    - **Work order type:** *Purchase orders*
6. On the Action Pane, select **Save**.

Mobile device menu

Add the menu items that you just created to the inbound menu of the mobile app.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. In the menu list, select **Inbound**.
4. In the **Available menus and menu items** list, find and select **Receive and sort cluster**.

5. Select the right arrow button to move the selected menu item to the **Menu structure** list.
6. Use the up arrow or down arrow button to move the menu item into the desired position in the menu.
7. On the Action Pane, select **Save**.
8. Repeat steps 4 through 7 to add the remaining menu items:
    - Assign cluster
    - Cluster putaway

Example scenario

This scenario simulates putaway cluster processing.

Create a purchase order

1. Go to **Accounts payable** > **Purchase orders** > **All purchase orders**.
2. On the Action Pane, select **New**.
3. In **Create purchase order**, set the following values:
    - **Vendor account:** *1001*
    - **Warehouse:** *61*
4. Select **OK**.

    The **All purchase orders** page appears.
5. On the **All purchase orders** page, on the **Purchase order lines** FastTab, use the **Add line** button to add the following lines:
    - Purchase order line 1:
        - **Item number:** *A0001*
        - **Quantity:** *10*
    - Purchase order line 2:
        - **Item number:** *A0002*
        - **Quantity:** *20*
    - Purchase order line 3:

- **Item number:** *M9215*
- **Quantity:** *30*

6. On the Action Pane, select **Save**.
7. Make a note of the purchase order number.

Receive inventory and put it away from the mobile device

Receive and sort the inventory into a cluster

1. Sign in to the Warehouse Management mobile app as a user who is set up for warehouse *61*.
2. On the main menu, select **Inbound**.
3. On the **Inbound** menu, select **Receive and sort cluster**.
4. In the **Ponum** field, enter the purchase order number.
5. Select **OK** (the check mark button).
6. Select the **Item** field, enter item number *A0001*, and then select **OK**.
7. Select the **Qty** field, enter *10* by using the number pad, and then select the check mark button.
8. On the **Qty** task page, select **OK** (the check mark button) to confirm the quantity that you entered.
9. On the **Item** task page, select **OK** to confirm that item *A0001* was entered.
10. Select the **Cluster ID** field, and enter a value to assign an ID for the cluster that you're creating.

    The ID that you enter here is used when the two remaining items on the purchase order are received.
11. Select **OK**.

    The **Ponum** task page appears and shows a "Work completed" message.

    Item *A0001* is now received into the *RECV* location and assigned to the cluster ID that you entered in step 10.

12. Repeat steps 4 through 11 to receive the remaining two items from the purchase order and assign them to the cluster ID:

    - A quantity of *20* for item *A0002*
    - A quantity of *30* for item *M9215*

Close the cluster

Before you can put away the items in the cluster, ensure that the cluster is closed.

1. In Supply Chain Management, go to **Warehouse management** > **Work** > **Outbound** > **Work clusters**.

2. On the **Work clusters** page, in the **Work cluster** section, search the **Cluster ID** field for the cluster ID that you entered earlier.

3. If the cluster isn't shown, it might already be closed. To determine whether the cluster is closed, select the **Show closed work** check box, and search for the cluster ID that you entered earlier. Then follow one of these steps:

    - If the cluster is closed, skip the remaining steps of this procedure, and move on to the next procedure, Put the cluster away.
    - If the cluster isn't closed, follow the remaining steps of this procedure to manually close the cluster. Then move on to the next procedure.

4. In the **Work cluster** section, select the cluster ID that you entered earlier.

5. On the Action Pane, select **Close cluster**.

    After the cluster is closed, it no longer appears in the **Work cluster** section (unless the **Show closed work** check box is selected).

Put the cluster away

1. Sign in to the Warehouse Management mobile app as a user who is set up for warehouse *61*.

2. On the main menu, select **Inbound**.

3. On the **Inbound** menu, select **Cluster putaway**.

4. Select **Cluster ID**, and enter the cluster ID that you entered earlier for the closed cluster.

5. Select **OK**.

   The **Cluster putaway: Pick** page appears. It shows the cluster ID, the picking location, the items (the value *Multiple* is shown), and the total quantity in the cluster that must be picked.

6. Select **OK**.

   The **Cluster putaway: Put** page appears. The **Put** instructions identify the cluster ID, the put location, the items, the total quantity, and the license plate IDs for the items that are received on the cluster.

   You have the standard options to override or pass this step.

7. Select **OK** to confirm the putaway of the cluster.

   A **Cluster completed** message appears.

Notes and tips

When the cluster ID acts as the parent license plate for a nested pallet, scanning the cluster ID automatically provides the put position. You don't need to scan any other license plate, even if the license plate generation is set to manual.

Quality management for warehouse processes

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The *Quality management for warehouse processes* feature lets you integrate item sampling controls into the warehouse receiving process by using warehouse management processes (WMS). You can automatically generate warehouse work to move inventory to the quality control location, based on a percentage, a fixed quantity, or every *n*th license plate. After you complete a quality order, you can automatically generate work to move inventory to the next location in the process, depending on the quality results.

The *Quality management for warehouse processes* feature extends the capabilities of the basic quality management feature. It provides the option to create quality orders for the inventory that you send to the quality control location, although quality orders aren't always required. Therefore, it allows for a lightweight quality control process that is based on warehouse work.

Key benefits

The *Quality management for warehouse processes* feature automatically generates work as part of the receiving process, to move the inventory quantity that is required for quality control to a quality control location. If the quantity that you receive exceeds the quantity that is required for quality control (according to the item sampling setup), the system moves the excess quantity to an inbound location that is defined in the location directive setup. After the quality order is validated, the system automatically generates work to move the quantity for the quality order to a new inbound or return location, based on the validation result and the location directive setup. The automatic generation of work that has only the quantity that must be moved to and from quality control provides an integrated process experience.

> **Note**

You can still take advantage of the manual process. In the manual process, inventory movement and movement by template are used to have a warehouse worker trigger the creation of warehouse work to move inventory from a quality control location to a new location. You can also still set up an inbound location directive that moves inventory in its entirety from a receiving location to a quality control location without considering the item sampling setup.

Quality management and the Quality management for warehouse processes feature

The following illustration provides an overview of the entities that enable quality orders for warehouse processes.

Enablers: The Quality item sampling and Quality order work order types

The *Quality management for warehouse processes* feature introduces two work order types that enable the work creation process:

- **Quality item sampling** – Use this work order type to create work that moves registered inventory to quality control.
- **Quality order** – Use this work order type to create work that moves inventory from quality control to a new location, based on the location directive setup.

Work classes, location directives, and work templates

The *Quality item sampling* and *Quality order* work order types are consumed by location directives, work classes, and work templates.

Before warehouse work can be automatically generated to move inventory to quality control, you must follow these steps to set up your system.

1. Create separate work classes for the *Quality item sampling* and *Quality order* work order types. In this way, you ensure that appropriate work can be automatically generated based on the two work order types, and that this work can then be run by using the Warehouse Management mobile app.

2. Set up a work template for each work order type:

    - Set up a work template that uses the *Quality item sampling* work order type to automatically move registered inventory to a quality control location.
    - Set up a work template that uses the *Quality order* work order type to move inventory from a quality control location after quality control is completed.

3. For each work order type, set up location directives that apply the correct quality control locations that the inventory should be moved to. After quality control is completed, the location directive for the *Quality order* work order type ensures that a new destination location will be selected so that the inventory can be moved out of the quality control location.

4. Set up the relevant mobile device menu items to support the movement of received inventory to the quality control location, and the movement of inventory that passes or fails quality control from the quality control location to a new location.

For a step-by-step example that shows how to complete this setup, see the example scenario at the end of this article.

Enable a warehouse for quality management

Before the *Quality management for warehouse processes* feature can be applied for a specific warehouse, you must follow these steps to make the feature available for that warehouse.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
2. Select the warehouse to enable for quality management.
3. On the **Warehouse** FastTab, set the **Enable quality order for warehouse processes** option to *Yes*. (Note that this option can be set to *Yes* only for warehouses that use warehouse management processes (WMS).)

When the **Enable quality order for warehouse processes** option is set to *Yes*, the quality association setup controls whether the *Quality management for warehouse processes* feature is

actually applied for the selected warehouse. You can change the setting of the option to *No* at any time. In that case, the feature will no longer apply for the warehouse, regardless of the quality association setup.

Quality control

The *Quality management for warehouse processes* feature controls several key settings for quality associations and item sampling.

Quality associations

Each quality association record defines the set of tests, the acceptable quality level (AQL), and the sampling plan that apply to the quality orders that are generated. To set up a quality association record, follow these steps:

1. Go to **Inventory management** > **Setup** > **Quality control** > **Quality associations**.
2. Create or select the quality association entry for the item or group that you're working with, or for all items.
3. On the **Conditions** FastTab, set the **Applicable warehouse type** field to one of the following values:
    - **Quality management for warehouse processes only** – Activate the *Quality management for warehouse processes* feature. You can select this value only if the reference type is either *Purchase* or *Production*.
    - **All** – Inactivate the *Quality management for warehouse processes* feature. Select this value for all reference types except *Purchase* and *Production*.

> **Note**
>
> The *Quality management for warehouse processes* feature takes effect only if the item on the source document line uses warehouse management processes (WMS), and if the **Enable quality order for warehouse processes** option is set to *Yes* for the warehouse on the source document line.

As each item is registered (or reported as finished), the system determines which quality associations apply to it.

When the *Quality management for warehouse processes* feature is turned on, the applicable warehouse type is logically inserted into the fourth search group of the quality association search hierarchy. The following table provides a logical representation of the search hierarchy.

Expand table

Search group	Description
Group 1	For each quality association, check the **Reference type**, **Event type**, and **Execution match** values against the item. If there's a match against the source document line, move on to group 2.
Group 2	For each quality association, check the **Item code** value (*Table*, *Group*, or *All*) against the item. *Table* is more specific than *Group*, and *Group* is more specific than *All*. If there's a match for *Table* (a specific item), move on to group 3. If there's no match for *Table*, search for a match for *Group*. If there's no match for *Group*, *All* applies. If there's a match, move on to group 3.
Group 3	For each quality association, check the **Account code** and **Resource code** values against the item. The logic that is applied resembles the logic that is applied for the **Item code** value.
Group 4	For each quality association, check the **Applicable warehouse type** value (*Quality management for warehouse processes only* or *All*) against the item. If the **Enable quality order for warehouse processes** option is set to *Yes* for the warehouse on the source document, and the item on the source document line is set to *Use warehouse management processes*, both associations where there's a match for *Quality management for warehouse processes only* and associations where there's a match for *All* will be applicable in parallel, if both exist. If the **Enable quality order for warehouse processes** option is set to *No* for the warehouse on the source document, and the item on the source document line is set to *Use warehouse management processes*, only quality management will be applicable.

For example, you define a warehouse where the **Enable quality order for warehouse processes** option is set to *Yes*, and you have two quality associations that are defined for the *Purchase* reference type: one for all items and one for the *Registration* event type. The only difference between the two quality associations is the **Applicable warehouse type** value: it's set to *All* for one quality association and *Quality management for warehouse processes only* for the other. In this case, both quality associations are equally specific, and both are applicable.

The value of the **Test group** field for the quality associations is also a factor. This field defines the test procedure that must be applied. If the **Test group** value is the same for both associations, only one quality order is created, for the quality association where the **Applicable warehouse type** value is *Quality management for warehouse processes only*. If the **Test group** value isn't the same for both associations, two quality orders are created. The first quality order is created for the quality association where the **Applicable warehouse type** value is *Quality management for*

warehouse processes only. The second quality order is created for the quality association where the **Applicable warehouse type** value is *All*.

> **Note**
>
> The *Quality management for warehouse processes only* value is considered more specific than *All* when the criteria for the quality associations for groups 1 and 2 are the same, and when the test group is the same. Two quality orders are created only when the test groups differ.

Reference types

When the **Reference type** value is *Purchase*, and the **Applicable warehouse type** value is *Quality management for warehouse processes only*, set the **Event type** field on the **Process** FastTab to *Registration*. *Registration* is the only supported event type for the *Purchase* and *Inbound shipment order* reference types when you're using the *Quality management for warehouse processes* feature.

Quality processing policy

The *Quality management for warehouse processes* feature enables work to be created based only on item sampling. Therefore, it allows for a lightweight process. The inventory that work is created depends on the item sampling that is associated with the quality association. When the lightweight process is used, after a worker puts the quantity in the quality control location, the quality department can manually create a quality order, if a quality order is required.

The **Quality processing policy** field on the **Quality order process** FastTab controls whether a quality order is also created when work is created to move an item to the quality control location. Set this field to *Create quality order* or *Create work only*. The default value is *Create quality order*.

> **Note**
>
> Regardless of whether you create quality orders manually or automatically, the system automatically generates work to move items out of the quality control location when the quality order is marked as validated.

The creation of quality order work is unrelated to the quality association setup. If a work template exists that has a **Work order type** value of *Quality order*, and if the query criteria are met for that

work template, validation of a quality order triggers the creation of quality order work.

Referenced item sampling

Each quality association must reference an item sampling. An item sampling defines the quantity that you send for quality control. You can set it up so that it applies only to quality associations where the **Applicable warehouse type** value is *Quality management for warehouse processes only*. If the **Sampling scope** value for an item sampling is *Load* or *Shipment*, or the **Quantity specification** value is *Full license plate*, the item sampling can be referenced only by quality associations where the **Applicable warehouse type** value is *Quality management for warehouse processes only*.

If you define an item sampling that uses the *Quality management for warehouse processes only* applicable warehouse type, you receive an error if you try to reference it from a quality association that doesn't use the *Quality management for warehouse processes* feature.

> ⓘ **Note**
>
> Item sampling that uses full blocking isn't supported for quality associations where the **Applicable warehouse type** field is set to *Quality management for warehouse processes only*.

Item sampling

Item sampling controls how often you send items for quality control. The *Quality management for warehouse processes* feature introduces the concept of *item sampling scope*. The system uses the item sampling scope when it evaluates whether and how to create quality orders, quality item sampling work, and quality order work.

To set up item sampling, go to **Inventory management** > **Setup** > **Quality control** > **Item sampling**, and set the **Sampling scope** field to one of the following values:

- **Order** – The source document line is the basis for evaluating whether and how to create quality orders, quality item sampling work, and quality order work.
- **Load** – Loads are the basis for evaluating whether and how to create quality orders and work.
- **Shipment** – Shipments are the basis for evaluating whether and how to create quality orders and work.

> ⓘ **Note**

When you set the **Sampling scope** field to *Load* or *Shipment*, the system uses the load entity and shipment entities, if they're available. If they're not available, the system uses the order entity.

The *Quality management for warehouse processes* feature also introduces the *Full license plate* value for the **Quantity specification** field. This value supports the creation of quality order work and quality item sampling work, based on license plates. When you select this value, the following changes occur:

- The **Break count by item** option and the **Per nth license plate** field on the **Process** FastTab become available.
- The **Value** field on the **Sampling quantity** FastTab becomes unavailable.
- The **Per updated quantity**, **Location**, and **License plate** options are all set to *Yes,* and the settings can't be changed.

The **Break count by item** option controls whether the license plate count is evaluated per item or across all items in the sampling scope. Product variants are treated as the same item. This option also controls whether the license plate count is reset for each item.

The value of the **Per nth license plate** field controls how often quality orders are created in relation to the number of items that are registered. For example, a value of *3* sends every third item to quality control, starting with the first item. The value must be more than 0 (zero).

While workers receive items by using the Warehouse Management mobile app, the system validates whether a quality association is set up for each incoming item. If a quality association is set up, the system uses the item sampling record that is configured for that quality association to determine how it creates quality orders, quality item sampling work, and order work.

Note

When you do receipt registration in the web client (by using the small registration page or the item arrival journal), the system doesn't create quality item sampling work or order work, regardless of the setup. Instead, for items that match a quality association, the referenced item sampling controls the creation of quality orders only.

Examples of automatic generation of quality orders

The following examples show how the setup of a quality association and an associated item sampling affects the generation of quality orders when you set the **Applicable warehouse type** field to *Quality management for warehouse processes only*.

When the **Quantity specification** value is *Full license plate*, the **Per nth license plate** field controls which license plates the system creates quality item sampling work for. The first license plate always goes to quality control, and then the value of this field specifies that every *n*th license plate after that license plate should also go.

The **Reference type** value for the following examples is *Purchase*, and the **Event type** value is *Registration*.

Sampling scope	Quantity specification	Per updated quantity	Per storage dimension	Break count by item	Per nth license plate	Result
						5 EA Quality order 1 for 5 EA Purchase order work for 45 EA (putaway)

When a worker validates one of the quality orders that are shown in the preceding table, the system automatically generates quality order work to move inventory from the quality control location to the location that is defined in the location directive for the *Quality order* work order type. You can set up any location for this purpose, such as a return or storage location, depending on the test result for the quality order. For an example of this setup, see the example scenario at the end of this article.

You can reopen a quality order that you already validated, as long as the quality order work that relates to moving the inventory from the quality control location doesn't have a **Work status** value of *Closed* or *In progress*.

Process insights when multiple quality associations coexist

You can define and apply more than one quality association to the same source document line. You can set the **Applicable warehouse type** field to *Quality management for warehouse processes only* for some of those quality associations and *All* for others.

In the following example, the **Reference type** value is *Purchase*.

1. The first quality association is set up in the following way:

    - **Applicable warehouse type:** *Quality management for warehouse processes only*
    - **Item code:** *A0001*
    - **Account code:** *All*
    - **Test group:** *Enclosure*
    - **Item sampling:** *5 pcs*

2. The second quality association is set up in the following way:

    - **Applicable warehouse type:** *All*
    - **Item code:** *All*
    - **Account code:** *All*
    - **Test group:** *Enclosure*
    - **Item sampling:** *1 pcs*

3. The third quality association is set up in the following way:

    - **Applicable warehouse type:** *Quality management for warehouse processes only*
    - **Item code:** *All*
    - **Account code:** *104*
    - **Test group:** *Impedance*
    - **Item sampling:** *Every second license plate* (This setting means that the first, third, fifth, and so on, license plates that are received will create a quality order.)

4. The fourth quality association is set up in the following way:

    - **Applicable warehouse type:** *All*
    - **Item code:** *All*
    - **Account code:** *All*
    - **Test group:** *Impedance*
    - **Item sampling:** *5 pcs*

5. The fifth quality association is set up in the following way:

    - **Applicable warehouse type:** *All*
    - **Item code:** *All*
    - **Account code:** *All*
    - **Test group:** *Cone*
    - **Item sampling:** *10%*

You now create a purchase order for a quantity of 10 of item A0001 for vendor 104. Then you register a purchase order line that has a quantity of 10 as received on one license plate by using the Warehouse Management mobile app. Here's the result:

- There's one quality order from the first quality association for the *Enclosure* test group. The quantity is 5. There's no quality order from the second quality association, because the criteria for the first quality association are more specific relative to the *Enclosure* test group.

- There's one quality order for the third quality association for the *Impedance* test group. The quantity is 10. There's no quality order from the fourth quality association, because the criteria for the first quality association are more specific relative to the *Impedance* test group.
- There's one quality order for the fifth quality association for the *Cone* test group. The quantity is 1.

In connection with the creation of one quality order for each of the three quality associations, quality item sampling work is also created. The registered quantity is only 10. However, because of the item sampling setup, the sum of the quality order quantities that are created for the *Quality management for warehouse processes only* applicable warehouse type is 16, which exceeds the physical registered quantity of 10. Therefore, work won't be created for the full quality order quantities (16), because only 10 are physically available for movement to the quality control location. The priority that is used to create quality item sampling work follows the order of quality order creation:

- **First quality order (quantity = 5):** Quality item sampling work is created for 5. A quantity of 5 (10 – 5) now remains for subsequent creation of quality item sampling work.
- **Second quality order (quantity = 10):** Quality item sampling work is created for 5. A quantity of 0 (zero) now remains for subsequent creation of quality item sampling work.
- **Third quality order (quantity = 1):** No quality item sampling work is created.

As part of the process of creating the quality orders, an inventory blocking of a quantity of 10 is created. This inventory blocking is referenced against each of the three quality orders. The sum of the quality order quantities is 16.

When the quality orders are validated, the system tries to create quality order work for each quality order that is validated. Because the sum of the quality order quantities exceeds the quantity that is actually blocked and therefore available for work creation, quality order work can't be created for the full quality order quantities, as shown here. (This example continues the previous example.)

1. **Validate the second quality order that you created (quantity = 10). The system creates quality order work for a quantity of 4.**

   A change in the inventory blocking quantity triggers the creation of quality order work. Because the sum of quality order quantities was 16, validation of a quantity of 10 causes the remaining quality order quantities to be 6. The inventory blocking quantity is reduced from 10 to 6. The reduced quantity of 4 is allotted to quality order work creation.

2. **Validate the first quality order that you created (quantity = 5). The system creates quality order work for a quantity of 5.**

   A change in the inventory blocking quantity triggers the creation of quality order work. Because the sum of quality order quantities was 6, validation of a quantity of 5 causes the remaining quality order quantities to be 1. The inventory blocking quantity is reduced from 6 to 1. The reduced quantity of 5 is allotted to quality order work creation.

3. **Validate the third quality order that you created (quantity = 1). The system creates quality order work for a quantity of 1.**

   A change in the inventory blocking quantity triggers the creation of quality order work. Because the sum of quality order quantities was 1, validation of a quantity of 1 causes the remaining quality order quantities to be 0 (zero). The inventory blocking is removed (that is, the inventory blocking quantity is reduced from 1 to 0). The reduced quantity of 1 is allotted to quality order work creation.

> ⓘ **Note**
>
> The creation of quality order work depends on the inventory blocking quantity that is referenced against one or more quality orders. If the sum of the quality order quantities exceeds the referenced inventory blocking quantity, the order that you validate the quality orders in determines the creation of quality order work.

Canceling quality item sampling work

You can cancel the work that is created for quality item sampling. To control what occurs when you cancel this work, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Work** FastTab, set the **Unregister receipt when cancelling work** option to one of the following values:

   - **Yes** – When you cancel quality item sampling work, the associated quality order is deleted, and the inventory is unregistered.
   - **No** – When you cancel quality item sampling work, the associated quality order isn't deleted, and the inventory isn't unregistered.

Cross-docking

You can set up a quality association that creates item sampling work. However, when cross-docking exists in parallel with a quality association that creates quality item sampling work, if there's only enough quantity to satisfy cross-docking, the system creates only cross-docking work. In cases where the **Enable quality order for warehouse processes** option is set to *Yes* for the receiving warehouse, and the **Applicable warehouse type** field is set to *Quality management for warehouse processes only* for a quality association, the creation of quality item sampling work takes precedence over the creation of cross-docking work. If the quantity exceeds the requirement for cross-docking, the system still creates only item sampling work.

Destructive testing

You can define a test group that performs destructive testing. In the case of a destructive test, the assumption is that, regardless of the test result, the quantity of the item that is tested is destroyed as part of the test. The way that the *Quality Management for warehouse processes* feature supports destructive testing resembles the way that quality management supports it when the feature isn't turned on. Before the quality order can be validated, the quality controller must specify the pick location for the quantity that is destroyed. You can register picking from the quality order page by selecting **Inventory** > **Pick** on the Action Pane. After the pick for the quality order quantity is registered, validation can be completed.

Example scenario

Prepare the scenario

To work through this scenario, prepare your system as follows:

- Make sure that demo data is installed on the system, and select the *USMF* legal entity.
- Configure warehouse 51 to use the *Quality management for warehouse processes* feature by following these steps:

    1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
    2. Select warehouse 51.
    3. On the **Warehouse** FastTab, set the **Enable quality order for warehouse processes** option to *Yes*.

Quality-in setup – Move to the quality control location

You must now prepare a basic setup that enables your system to support the *Quality Management for warehouse processes* feature for warehouse 51. (The demo data defines a quality

management location named *QMS*. This location is referenced several times in this scenario.) You'll prepare the following elements, as described in the subsections of this section:

- Work class
- Work template
- Location directive
- Item sampling
- Quality association
- Mobile device menu items

Work class for quality-in

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. Create a work class, and set the following values:
    - **Work class ID:** *QualityIn*
    - **Description:** *Quality item sampling*
    - **Work order type:** *Quality item sampling*

Work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. Set the **Work order type** field to *Quality item sampling*.
3. Create a work template, and set the following values:
    - **Work template:** *51 Quality*
    - **Work template description:** *51 Quality*
4. Add a line to the work template, and set the following values:
    - **Work type:** *Pick*
    - **Work class ID:** *QualityIn*
5. Add a second line to the work template, and set the following values:
    - **Work type:** *Put*
    - **Work class ID:** *QualityIn*

Location directive

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. Set the **Work order type** field to *Quality item sampling*.
3. Create a location directive, and set the following values:
    - **Name:** *51 to quality*
    - **Work type:** *Put*
    - **Site:** 5
    - **Warehouse:** *51*
4. Add a line for the location directive, and set the following values:
    - **From quantity:** *1*
    - **To quantity:** *1000000*
5. Create a location directive action, and set the following value:
    - **Name:** *Quality*
6. For the new location directive action, select **Edit query**, and specify a **Range** record that has the following values:
    - **Table:** *Locations*
    - **Field:** *Location profile ID*
    - **Criteria:** *QMS*
7. Select **OK** to save the query, and save the new location directive.

Next, you must change the sequence of the existing purchase order location directives for warehouse 51. The demo data includes two location directives that have a **Work order type** value of *Purchase*: one is named *51 QMS*, and the other is named *51 PO Direct*. To ensure that the *Quality management for warehouse processes* feature is applied for warehouse 51, you must make sure that the *51 QMS* location directive isn't applied. However, instead of deleting that location directive (because you might want to use it in the future), you can just change the sequence.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. Set the **Work order type** field to *Purchase order*.
3. In the sequence list, select sequence number 5, for the *51 PO Direct* location directive.
4. Move the selected sequence up to sequence number 4.
5. Verify that sequence number of the *51 QMS* location directive is now at least 5.

Item sampling

The *Quality management for warehouse processes* feature adds some new item sampling capabilities. The **Sampling scope** value can now be *Order*, *Shipment*, or *Load*, and the **Sampling quantity** value can now be *Full license plate*.

1. Go to **Inventory management** > **Setup** > **Quality control** > **Item sampling**.
2. Create an item sampling record, and set the following values:
    - **Item sampling:** *3rd LP*
    - **Description:** *Every third license plate*
    - **Sampling Scope:** *Order*
3. On the **Sampling quantity** FastTab, set the **Quantity specification** field to *Full license plate*.
4. On the **Process** FastTab, set the **Per nth license plate** field to *3*.
5. In the **Per storage dimension** section, enable both **Warehouse** and **Inventory status**.

Quality associations

Create a quality association that uses the new item sampling.

1. Go to **Inventory management** > **Setup** > **Quality control** > **Quality associations**.
2. Create a quality association record, and set the following values:
    - **Reference type:** *Purchase*
    - **Item code:** *Table*
    - **Item:** *M9201*
    - **Site:** *5*
3. On the **Process** FastTab, set the **Event type** field to *Registration*.
4. On the **Conditions** FastTab, set the **Applicable warehouse type** field to *Quality management for warehouse processes only*.
5. On the **Quality order process** FastTab, set the **Quality processing policy** field to *Create quality order*.
6. On the **Specifications** FastTab, right-click in the **Test Group** field, and then select **View details** to open the **Test groups** page.

7. On the **Test groups** page, on the **Overview** tab of the upper grid, create a test group, and set the following values:

    - **Test Group:** *QMS*
    - **Description:** *QMS test*
    - **Acceptable quantity:** *100*
    - **Item Sampling:** *3rd LP* (Select)

8. On the **Overview** tab of the lower grid, add a record for one test, and set the following values:

    - **Sequence:** *1*
    - **Test:** *Enclosure measuring*

9. On the **Test** tab of the lower grid, set the following values:

    - **Test variables:** *Pass/Fail*
    - **Default outcome:** *Pass*

10. Save the new test group, and close the **Test groups** page.

11. Back on the **Quality associations** page, in the **Test group** field, select **QMS**.

12. Save the record.

Mobile device menu items for quality-in

To complete the setup to move goods to the quality control location, you must make the quality item sampling work available from a mobile device menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select the **Purchase Putaway** mobile device menu item.
3. On the **Work classes** FastTab, add the *QualityIn* work class ID.

Summary: Your setup to move goods to quality control

You defined a quality association that uses the *Quality management for warehouse processes* feature to trigger the creation of a quality order. You set up the work and location data for warehouse 51 to ensure that specific work is created when purchase registration is done for item M9201. This setup ensures that every third license plate that you register is moved to a quality location (*QMS*), and that a quality order is created for the license plate quantity. Everything else is moved to putaway instead of the quality control location.

Process quality management work

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Create a purchase order, and set the following values:
    - **Specify Vendor account:** *104*
    - **Warehouse:** *51*
3. Add a purchase order line, and set the following values:
    - **Item:** *M9201*
    - **Quantity:** *20*
    - **UoM:** *ea*
    - **Warehouse:** *51*
4. Write down the purchase order number, so that you can use it later.
5. Go to a mobile device or emulator that is running the Warehouse Management mobile app, and sign in to warehouse 51 by using *51* as the user ID and *1* as the password.
6. Go to **Inbound** > **Purchase Receive**, and enter the following values:
    - **PONum:** The number of the purchase order that you just created
    - **Qty:** *5*
    - **Unit:** *ea*
7. Continue to receive against the line, *5 ea* at a time, until the line is fully received. (A total of four license plates are created.)
8. Sign out of the Warehouse Management mobile app.
9. Back in the web client, go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
10. Find and open your purchase order.
11. In the **Purchase order lines** section, select the line for item number *M9201*, and then select **Purchase order lines** > **Work details**.
12. Notice that the second and third work headers that were created are regular putaway work, whereas the first and the fourth work headers are quality item sampling work. This result is

consistent with the item sampling setup, which is configured to sample every third license plate.

Move to the quality control location

You'll now move the license plates to their designated locations. The first and fourth license plates will go to the quality control location, whereas the second and third license plates will go directly to storage.

1. Go to a mobile device or emulator that is running the Warehouse Management mobile app, and sign in to warehouse 51 by using *51* as the user ID and *1* as the password.
2. Go to **Inbound** > **Purchase put away**, and put away each license plate from the previous procedure until you close all the work.

Summary: Process quality management work

You've now run the quality item sampling work for the first and fourth license plates by moving them to the quality control location. You've also put away the second and third license plates. The next step is to do the quality order testing and control.

Quality-out setup: Move from the quality control location to storage or return

When workers report quality order results, the system automatically generates work.

You'll now continue with the required base setup of the work class, work template, and location directive to enable quality management for warehouse processes. This setup ensures that the required work is created to move the quality order quantity from the quality control location to a designated warehouse location.

Work class for quality-out

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. Create a work class, and set the following values:
    - **Work class ID:** *QualityOut*
    - **Description:** *Quality Out*
    - **Work order type:** *Quality Order*

Work templates

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.

2. Change the **Work order type** value to *Quality order*.

3. Create a work template, and set the following values:

    - **Work template:** *51 quality out*
    - **Work template description:** *51 quality out*

4. Add a line, and set the following values:

    - **Work type:** *Pick*
    - **Work class ID: QualityOut**

5. Add a second line, and set the following values:

    - **Work type:** *Put*
    - **Work class ID:** *QualityOut*

Location directives

1. Go to **Warehouse management** > **Setup** > **Location directives**.

2. Change the **Work order type** value to *Quality order*.

3. Create a location directive, and set the following values:

    - **Name:** *51 Pass*
    - **Work type:** *Put*
    - **Site:** *5*
    - **Warehouse:** *51*

4. On the Action Pane, select **Edit query** to open the query editor dialog box.

5. On the **Range** tab, set the following values:

    - **Table:** *Quality orders*
    - **Field:** *Status*
    - **Criteria:** *Pass*

6. Select **OK** to save the query and close the dialog box.

7. On the **Lines** FastTab, add a line, and set the following values:

- **From quantity:** *1*
- **To quantity:** *1000000*

8. On the **Location directive actions** FastTab, add a row, and set the following value:

    - **Name:** *Pass*

9. On the **Location directive actions** FastTab, select **Edit query** to open the query editor dialog box.

10. On the **Range** tab, set the following values:

    - **Table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *Bulk*

11. Select **OK** to save the query and close the dialog box.

12. On the Action Pane, select **Save** to save the new location directive.

13. Create a second location directive, and set the following values:

    - **Name:** *51 Fail*
    - **Work type:** *Put*
    - **Site:** *5*
    - **Warehouse:** *51*

14. On the Action Pane, select **Edit query** to open the query editor dialog box.

15. On the **Range** tab, set the following values:

    - **Table:** *Quality orders*
    - **Field:** *Status*
    - **Criteria:** *Fail*

16. Select **OK** to save the query and close the dialog box.

17. On the **Lines** FastTab, add a line, and set the following values:

    - **From quantity:** *1*
    - **To quantity:** *1000000*

18. On the **Location directive actions** FastTab, add a row, and set the following value:

- **Name:** *Fail*

19. On the **Location directive actions** FastTab, select **Edit query** to open the query editor dialog box.

20. On the **Range** tab, set the following values:

    - **Table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *Return*

21. Select **OK** to save the query and close the dialog box.

22. On the Action Pane, select **Save** to save the new location directive.

Mobile device menu items for quality-out

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select the **QMS putaway** mobile device menu item.
3. On the **Work classes** FastTab, add the *QualityPut* work class ID.

Warehouse workers can now pick quality order work by using the **QMS Putaway** menu item. Goods that fail quality control can be put in a return location, and goods that pass can be put in the bulk-001 location.

Summary: Your setup to move goods from quality control

You've set up the work and location data for warehouse 51, to ensure that work is automatically created when quality orders are completed. This setup ensures that each quality-controlled license plate is moved to either a bulk location or a return location.

Process quality management work

1. Go to **Inventory management** > **Periodic tasks** > **Quality management** > **Quality orders**.

2. Select the first quality order for the quantities that you registered.

3. Select **Validate**. The status of the test updates to *Fail*.

4. Go to **Warehouse management** > **All work**.

5. Open the work that you just created, and notice that the **Work order type** value is *Quality order*. The work includes a line where the put location is *Return* and the status is *Fail*. (If the

status of the quality order were *Pass*, the put location would be *Bulk* instead.)

6. Go back to **Inventory management** > **Periodic tasks** > **Quality management** > **Quality orders**.
7. Select the second quality order for the items that you registered.
8. Select **Results** above the lower grid. Update the **Result quantity** value to *5*, and verify that the **Test result** value changes to a check mark.
9. Select **Validate**, and close the page.
10. Back on the **Quality orders** page, select **Validate**, and do the validation. The status updates to *Pass*.

    > ⓘ **Note**
    >
    > The validation event triggers the creation of the quality order work to move the quantity from the quality control location to a new location.

11. Go to **Warehouse management** > **All work**.
12. Select the work that you just created, and notice that a second quality order work header is created, where the put location is *BULK-001*.
13. Go to a mobile device or emulator that is running the Warehouse Management mobile app, and sign in to warehouse 51 by using *51* as the user ID and *1* as the password.
14. Go to **Quality** > **Put Away from QMS**, and process each of the two license plates that are related to both pieces of work, so that all work is closed.

> ⓘ **Note**
>
> Consider adding the quality-out entry to a mobile device menu item where the activity code is *Display open work list*. For an example, see the mobile device menu item that is named **Work list** in the demo data. First add the *Quality order* work class to a user-directed menu item, because this work class is required for work to be shown in the work list. Then add the *Quality order* work class to the **Work list** menu item. Users who have access to the work list can then pick and process the work that is automatically generated by quality order validation.

Quality check

Article • 04/08/2025

The *Quality check* feature lets warehouse workers do quick spot checks for quality while they receive items to the inbound dock area. These spot checks are beneficial when workers inspect packaging or other easily recognizable parts of an item. The feature guides workers to take a quick look to see whether anything is obviously faulty or damaged before they stock the inventory in its putaway location.

This feature is an alternative to the standard quality check process. It offers more flexibility and faster processing.

When you use this feature, the arrival and quality check occur in the following way:

1. When a shipment arrives, a warehouse worker registers the arrival. The worker also scans a license plate to register the location.

2. The worker does a quick quality check and records the result (pass or fail) for that license plate.

3. One of the following actions occurs:

    - If the quality check is passed, the license plate is accepted and guided to a receiving location, as usual.
    - If the quality check is failed, the license plate is rejected, and existing putaway work for it is redirected to an alternate location for further inspection. A new quality order is created. To view the quality order that is created from the failed quality check, go to **Inventory management** > **Periodic tasks** > **Quality management** > **Quality orders**.

This process can also be set up so that all scanned license plates are immediately diverted to the quality check location.

> ⓘ **Note**
>
> For license plate, serial number, or any other dimension to be automatically populated on the **Inventory dimensions** tab of a quality order, they must be turned on for the relevant record on the **Item sampling** page **Process** FastTab (**Inventory management** > **Setup** > **Quality control** > **Item sampling**). Learn more in Quality management item sampling.

Turn the Quality check feature on or off

To use the functionality described in this article, the *Quality check* feature must be turned on for your system. As of Supply Chain Management 10.0.25, this feature is mandatory and can't be turned off. If you're running a version older than 10.0.25, then admins can turn this functionality on or off by searching for the *Quality check* feature in the Feature management workspace.

Set up the feature for the example scenario

This section provides guidelines and an example that shows how to set up the *Quality check* feature and prepare sample data for the example scenario that is provided later in this article.

Make sample data available

To work through the example scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Quality check template

The quality check template defines the rules for doing quick spot checks for quality at the time of receiving.

1. Go to **Warehouse management** > **Setup** > **Work** > **Quality check template**.
2. Select **New** to add a template to the grid.
3. Set the following values to define the new template:
    - **Quality check template name:** *Dock check*

      Enter a name that identifies the policies applied for this template.
    - **Acceptance policy:** *Prompt user*

      Specify whether users should be prompted to accept or reject the quality of the inventory while they process the work, or whether the quality should automatically be rejected. The available options are *Auto reject* and *Prompt user*.
    - **Quality processing policy:** *Create quality order*

      Select the policy that should be used when the quality of the inventory is rejected. The following options are available:
        - *Create work only* – Just create work to facilitate inventory movement.

    - *Create quality order* – Create a quality order to facilitate quality tests.

- **Test group:** *Enclosure*

  Specify the test group that should be used in the quality order that is created. Test groups are set up in the **Inventory management** module.

  Leave the **Destructive text** option turned off for the test group. This option defines whether the sample will be destroyed as part of the tests in the test group. If a destructive test is used, the system generates an inventory transaction when a quality order is created for an item. The new inventory transaction predicts the inventory reduction for the test quantity. The inventory reduction occurs when the quality order is completed through the validation step. The inventory transaction is identified as a quality order.

Work class – Quality check

Work classes are used to direct and/or limit the type of work order lines that warehouse workers can process on a mobile device.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. Select **New** to create a work class.
3. In the header, set the following values:

   - **Work class ID:** *QC Check*

     Enter a name that identifies the work class.

   - **Description:** *QC Check*

     Enter a short description that indicates what the work class is used for.

   - **Work order type:** *Quality in quality check*

     Select the type of work order that is created by the work class. When you set up quality control work, always select *Quality in quality check*.

4. On the **Valid put location types** FastTab, leave the **Location type** field blank.

   If you select a location type, you limit the locations where items can be put after they're picked. This field is used when a location directive tries to resolve the location, or when a warehouse worker manually specifies the location for the mobile device menu item.

For more information about work classes and how to create them, see Create a work class.

Work template

Work templates let you define the work operations that must be performed in the warehouse. Typically, warehouse work operations consist of a pair of actions: a warehouse worker picks on-hand inventory up in one location and then puts the picked inventory down in another location. A work template for quality control defines the work operations for doing quality checks.

Purchase orders

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the header, set the **Work order type** field to *Purchase orders*.
3. On the Action Pane, select **Edit**.
4. Select a work template that should include a quality check step. In the **Overview** section, in the **Work template** field, select *51 PO Receipt*.
5. In the **Work template details** section, notice that the grid has two existing lines: one for *Pick* and one for *Put*.
6. In the **Work template details** section, select **New** to add a row for quality control to the grid. Notice that the **Line number** field for the new line is set to *3*.
7. On the new line, set the following values. Accept the default values for the remaining fields.

    - **Work type:** *Quality check*
    - **Work class ID:** *Purchase*
    - **Quality check template name:** *Dock check*

      Select the unique ID for the work class. You use this value to configure the menu items on the mobile device and the types of work that those menu items can process.

8. On the Action Pane, select **Save** to save your work so far.

   You receive an informational message that states, "Invalid - Quality check must come directly after a pick." Therefore, you must change the **Line number** value for the line that you just added.

9. Follow these steps to change the **Line number** value for the new line:

a. In the **Work template details** section, select the line where the **Work type** field is set to *Quality check*.
b. Select the **Move up** or **Move down** button to move the *Quality check* line so that it's after the *Pick* line.

10. On the Action Pane, select **Save**.

Quality in quality check

Next, create a work template for the quality check.

1. In the header of the **Work templates** page, change the value of the **Work order type** field to *Quality in quality check*.
2. On the Action Pane, select **New** to add a row to the grid in the **Overview** section.
3. In the new row, set the following values:
    - **Work template:** *51 Quality Check*

      Enter a name for the template.
    - **Work template description:** *51 Quality Check*
4. On the Action Pane, select **Save** to make the **Work template details** section available.
5. While the new template is still selected in the **Overview** section, select **New** in the **Work template details** section to add a row to the grid there.
6. In the new row, set the following values:
    - **Work type:** *Pick*
    - **Work class ID:** *QC Check*

      Select the name of the work class that you created earlier for quality control work.
7. In the **Work template details** section, select **New** again to add another row.
8. In the new row, set the following values:
    - **Work type:** *Put*
    - **Work class ID:** *QC Check*

      Select the name of the work class that you created earlier for quality control work.
9. On the Action Pane, select **Save**.

For more information about work templates, see Control warehouse work by using work templates and location directives

Location directive – Quality failures

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items will be picked and where the picked items will be put. You must configure a location directive rule to define how failed quality checks will be handled.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the left pane, set the **Work order type** field to *Purchase orders* to work with location directives of that type.
3. On the Action Pane, select **New** to create a location directive for quality checks.
4. In the header, set the following values:
    - **Sequence number:** Accept the default value.
    - **Name:** *51 To Quality*
5. On the **Location directives** FastTab, set the following values. Accept the default values for the remaining fields.
    - **Work type:** *Put*
    - **Site:** *5*
    - **Warehouse:** *51*
6. On the Action Pane, select **Save** to save your directive and make the **Lines** FastTab available.
7. On the **Lines** FastTab, select **New** to add a line to the grid.
8. On the new line, set the following values. Accept the default values for the remaining fields.
    - **From quantity:** *1*
    - **To quantity:** *1000000*
9. On the Action Pane, select **Save** to save the new line and make the **Location directive actions** FastTab available.
10. While the new line is still selected on the **Lines** FastTab, select **New** on the **Location directive actions** FastTab to add a row to the grid there, so that you can set up an action

for the line.

11. In the new row, set the **Name** field to *Quality*. Accept the default values for the remaining fields.

12. On the Action Pane, select **Save** to make the **Edit query** button on the **Location directive actions** FastTab available.

13. While the line that you just added is still selected on the **Location directive actions** FastTab, select **Edit query** to open a dialog box where you can edit the query for the action.

14. On the **Range** tab, select **Add** to add a row to the query.

15. In the new row, set the following values:

    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Location*
    - **Criteria:** *QMS*

    The *QMS* location is a warehouse location for quality.

16. Select **OK** to close the dialog box.

17. You must now change the sequence of purchase order location directives for warehouse *51*. Save the new *51 To Quality* location directive, refresh the page, and select the location directive in the list. Then use the **Move up** and **Move down** buttons on the Action Pane to put the location directive for warehouse *51* in the following order. (Before you select **Move up** or **Move down**, you must select a location directive in the list.)
    a. 51 To Quality
    b. 51 PO Direct
    c. 51 QMS

Mobile device menu items

Configure a menu item so that mobile devices can perform the **Quality Check** function.

Purchase putaway

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. In the list, select the **Purchase put-away** menu item.

3. On the Action Pane, select **Edit**.

4. In the **Work classes** section, select **New** to add a row to the grid.
5. In the new row, set the following values:
    - **Work class ID:** *QC Check*

      Enter the name of the work class that you created earlier for quality control work.
    - **Work order type:** *Quality in quality check*
6. On the Action Pane, select **Save**.

Purchase order line receiving

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
    - **Menu item name:** *PO line receiving*
    - **Title:** *PO line receiving*
    - **Mode:** *Work*
    - **Use existing work:** *No*
4. On the **General** FastTab, set the following values. Accept the default values for the remaining fields.
    - **Work creation process:** *Purchase order line receiving and put away*
    - **Generate license plate:** *Yes*
    - **Work template:** *51 PO Receipt*
5. On the Action Pane, select **Save**.

Add the menu item to a mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. In the left pane, select the **Inbound** menu.
3. On the Action Pane, select **Edit**.
4. In the **Available menus and menu items** column, select the new **PO line receiving** menu item.
5. Select the right arrow button to move **PO line receiving** to the **Menu structure** column.
6. In the **Menu structure** column, select **PO line receiving**, and then select the up arrow or down arrow button to move the menu item to the desired position on the mobile device menu.

7. On the Action Pane, select **Save**.

Example scenario

After you've made all the previously described sample data available and set it up, you can work through this scenario to try out the *Quality check* feature. The values that are shown in this scenario assume that you're working with the standard demo data, that you selected the **USMF** legal entity, and that you prepared the sample records that are described earlier in this article. This scenario also serves as an example that shows how the feature can be used in a production setting.

Create a purchase order

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Create purchase order** dialog box, set the following values:
    - **Vendor account:** *104*
    - **Warehouse:** *51*
4. Select **OK** to close the dialog box and open the new purchase order.
5. On the **Purchase order lines** FastTab, the grid contains a new, blank line. On this line, set the following values:
    - **Item number:** *M9203*
    - **Quantity:** *3*
    - **Unit:** *PL*
6. On the Action Pane, select **Save**.

Process quality check receiving

After the purchase order has been created, it can be received by using the **PO line receiving** menu item and the functionality of the *Quality check* feature.

Receive pallet 1

1. Sign in to the Warehouse Management mobile app as a user for warehouse *51*. (Enter *51* as the user ID and *1* as the password.)

2. Go to **Inbound** > **PO line receiving**.

3. In the **PONUM** field, enter the purchase order number.

4. Confirm the purchase order number.

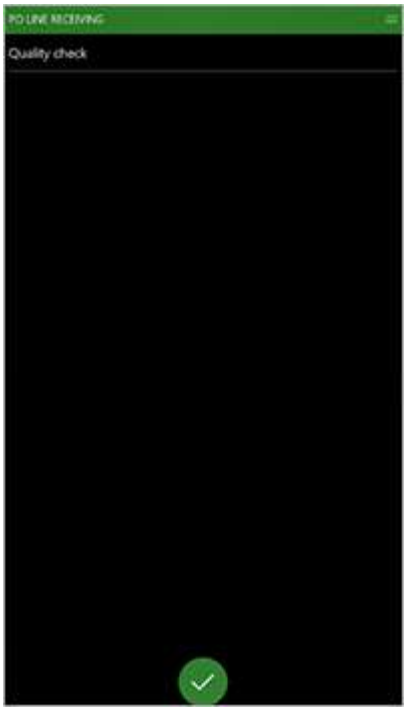
5. In the **LINENUM** field, enter the number of the purchase order line that is being received. Because the order has only one line in this scenario, you'll enter *1* in the **LINENUM** field for each receiving step.

6. Confirm the line number.

7. In the **QTY** field, enter the quantity to receive. Because the purchase order is for three pallets (*PL*) in this scenario, and there are three receiving steps, you'll enter *1* in the **QTY** field for each receiving step.

8. Confirm the quantity.

   The **Quality check** page that appears has no entry fields. It has only the confirmation (check mark) button at the bottom and the Menu button (≡) at the top. (The Menu button is sometimes referred to as the hamburger or the hamburger button.) To expedite the quality check process, when the pallet passes the quality check, the user just confirms the **Quality check** page.



9. Select the confirmation button to pass the quality check for pallet 1 from line 1.

   The **Purchase orders: Put** page that appears shows details of the put work:

   - **LOC:** The system determined location

This location is the designated putaway location for purchase order receiving.

- **LP:** The system-generated License plate ID
- **Item:** *M9203*
- **Qty:** *1 PL: 100 ea*

The item description is also shown.

10. Confirm the putaway work.

    On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.

Receive pallet 2

For this scenario, pallet 2 will be rejected.

1. In the **LINENUM** field, enter *1*, and confirm the line number.
2. The **QTY** field is now available. Enter *1*, and confirm the quantity.

   The **Quality check** page appears. For this receipt, the pallet will be rejected for quality, and it will be put into the *QMS* quality location.
3. Select the Menu button (≡) at the top of the page, and then, on the menu, select **Reject**.
4. On the **Task** page that appears, enter **QMS** as the *Put* location to send the pallet to for further inspection.

   The **Quality in quality check: Put** page that appears shows details of the put work:

   - **LOC:** *QMS*

     This location is the designated putaway location for rejected quality receiving.
   - **LP:** The system-generated License plate ID
   - **Item:** *M9203*
   - **Qty:** *1 PL: 100 ea*

   The item description is also shown.
5. Confirm the putaway work.

On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.

You've now completed the quality check and created a quality order for the rejected pallet. To view the order that was created, go to **Inventory management** > **Periodic tasks** > **Quality management** > **Quality orders**.

Quality order testing can now be processed. Quality testing isn't covered in this article.

For more information about quality management, see Quality management overview

Receive pallet 3

For this scenario, pallet 3 will be accepted.

1. In the **LINENUM** field, enter *1*, and confirm the line number.
2. The **QTY** field is now available. Enter *1*, and confirm the quantity.

   The **Quality check** page appears. For this receipt, the pallet will be accepted for quality, and it will be put into a bulk putaway location.
3. Select the confirmation button to pass the quality check.

   The **Purchase orders: Put** page that appears shows details of the put work:

   - **LOC:** The system determined location

     This location is the designated putaway location for purchase order receiving.
   - **LP:** The system-generated License plate ID
   - **Item:** *M9203*
   - **Qty:** *1 PL: 100 ea*

   The item description is also shown.
4. Confirm the putaway work.

   On the **Task** page for purchase order line receiving, you receive a "Work Completed" message. The **LINENUM** field is available so that you can start to receive the next pallet.
5. Select the Menu button (≡) at the top of the page, and then, on the menu, select **Cancel** to return to the menu.

You can now close the mobile app.

Warehouse handling of outbound loads for sales, transfer, and outbound shipment orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the warehouse handling process for outbound loads for sales orders, transfer orders, and outbound shipment orders.

An *outbound load* is a set of shipments from a warehouse that are destined for various locations, such as customer addresses or other warehouses. Usually, outbound loads are linked to a physical delivery vehicle, such as a shipping container or truck.

An outbound load is a component of the warehouse management outbound procedure, which involves organizing, picking, packaging, and sending goods to complete orders. You can form outbound loads manually or automatically. Their creation depends on predefined outbound operations that influence their dependencies and functional effects.

Each outbound load can be associated with one or more order line quantities for sales orders, transfer orders, and outbound shipment orders. Your system might also contain transportation plans. Learn more about how to create and manage outbound transportation in Transportation management overview.

Outbound shipment processing policies

To manage the process of shipping your orders, apply an *outbound shipment processing policy* where you set up the desired flow for your shipments.

The following settings are configured on the **Outbound shipment processing policies** page (**Warehouse management** > **Setup** > **Shipping** > **Outbound shipment processing policies**):

- **Fill entire shipment** – Choose what to do if work creation fails for one or more lines in a shipment (for example, due to location directive failures). This feature only checks for work creation failures and doesn't check whether the full ordered quantity can be fulfilled. Choose one of the following options:
  - *Enabled*: If work creation fails for any line in a shipment, exclude that entire shipment from the wave (create no work for that shipment), regardless of the setting for each customer.
  - *Disabled*: If work creation fails for one or more lines in a shipment, skip those lines but still create work for all of the other lines, regardless of the setting for each customer.
  - *Respect customer settings*: Respect the **Fill entire shipment** setting defined for each customer.

- **Enforce shipment to order matching** – Choose whether the policy should permit just one shipment to be related to each outbound order, or whether multiple shipments per order should be allowed. Select one of the following values:
  - *No* – Allow multiple shipments per outbound order.
  - *Yes* (Supply Chain Management version 10.0.46 and later) – Allow just one shipment per outbound order. In version 10.0.46 and later, when you confirm a shipment, the policy instructs the system to update the delivery remainder on the source order line to reflect the quantity that was actually shipped. If you later reverse the shipment, the delivery remainder is restored to the original ordered quantity.
  - *Yes* (Supply Chain Management version 10.0.45 and earlier) – Allow just one shipment per outbound order. In version 10.0.45 and earlier, if the shipped quantity differs from the ordered quantity, you must manually update the delivery remainder to match the shipped quantity before you confirm the shipment.

  > ⓘ **Note**
  >
  > If you use Warehouse management only mode with external shared warehouses, your source system must be configured to use an outbound shipment processing policy where **Enforce shipment to order matching** is set to *Yes* because that functionality is set up on the source system that is related to the externally managed warehouse.

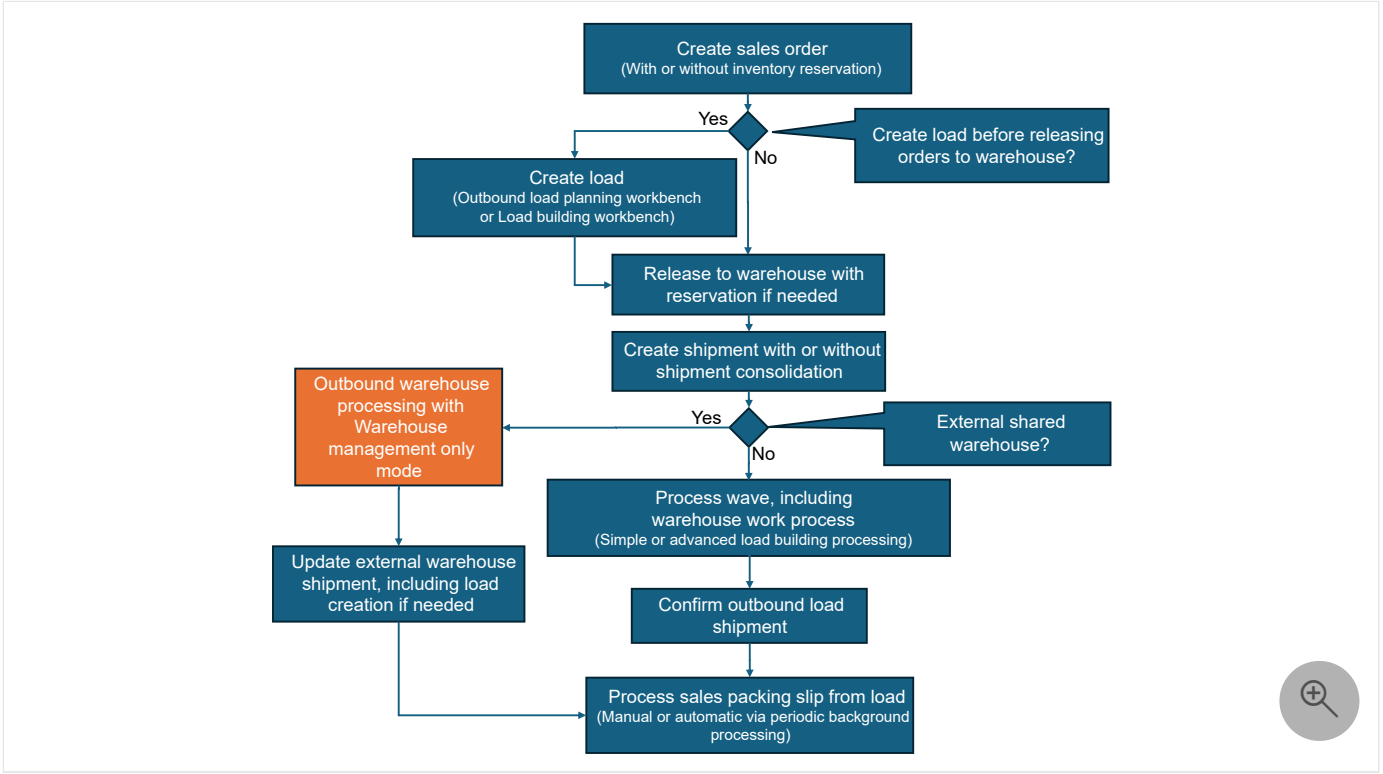
Define default outbound shipment processing policies

Assign an outbound shipment processing policy to each shipment. Assign the default policy in any of the following ways:

- **By order** – Assign policies that you set up on outbound orders to all shipments that you create from those orders.
- **By customer** – Assign a policy to a customer. Outbound orders that you create for that customer inherit the policy. The policy then propagates to shipments that you create from those orders.
- **By source system** – This method is related to Warehouse management only mode. All shipments that come from a source system inherit the policy that you assign to that system.

How outbound loads are created, registered, and shipped

The following illustration provides an overview of the outbound load handling process. It uses outbound loads for sales orders as an example. If the order lines must be processed by an externally managed warehouse, the outbound flow branches off and proceeds exclusively through the Warehouse management only mode process via *outbound shipment orders*. Learn more about this method in Warehouse management only mode with external shared warehouses.



Sales order creation

This process begins when sales orders are created. Reservations for order lines can be set up to occur automatically, they can be performed manually, or they can be delayed according to system setup preferences.

Create a load before the release to a warehouse

A sales order must exist before an outbound load can be generated. Nevertheless, you can define outbound loads before running the release to warehouse procedure.

Use the Outbound load planning workbench and Load building workbench processes to select the order lines and quantities that comprise a load.

Release to warehouse

The release to warehouse process creates *load lines* and groups them into *shipments*. The shipment consolidation process allows for automated shipment consolidation. Shipments that are related to an externally managed warehouse are locked by setting the **Outbound shipment processing ownership** value to *External* until updated order data is returned.

Wave and warehouse work processing

The system generates picking work through *wave processing* and can create loads as required. An available *wave template* must exist to determine whether the advanced load building method is used.

Work templates determine how work is performed for each warehouse process. *Location directives* specify the pick and put locations for inventory movements. Learn more in Control warehouse work by using work templates and location directives.

Warehouse *work* controls any warehouse operation that a warehouse worker or material handling system performs. Typically, warehouse work operations consist of at least two consecutive actions: a *pick* and a *put* of inventory.

Outbound load shipment confirmation

When you complete all the warehouse tasks for a load, run the shipment confirmation procedure. This procedure updates the **Load status** value to *Shipped*. It also changes the **Load packing slip background posting status** value from *None* to *Queued*. Depending on the configuration, you can run this process as part of an automated background process.

> **Note**
>
> When you use the **confirm and transfer** capability, the system can create a new load for any load lines that aren't fully picked.

Generate an outbound ASN

When you ship a load, the system can generate an *outbound advanced shipping notice (ASN)* to notify a customer or downstream warehouse about the shipment. By default, the outbound ASN is generated from the load's *shipments* and *load lines*, which reference the originating sales order lines as they were defined when the order was released. This default generation is true even when the warehouse is enabled for warehouse management processes (WMS). Downstream warehouse execution work, such as picking, sorting, or packing into containers, doesn't change the packing structure of the outbound ASN.

> **Note**
>
> When a transfer order ships from one WMS-enabled warehouse to another, the system uses the outbound shipment data to create a corresponding **inbound ASN** at the destination warehouse. The inbound ASN includes the license plate packing structure to support **license plate receiving** when the goods arrive.

Load packing slip posting

When you process the *packing slip* from a load, the system updates the related sales order line transactions to *Deducted*. At that point, the invoicing process can begin. The *Load packing slip posting* scheduled task (**Warehouse management** > **Periodic** > **Load packing slip posting**) processes *Shipped* outbound loads where the **Load packing slip background posting status** value is set to *Queued*. After successful posting, the system changes the status to *None*. If any errors occur during posting, the status is changed to *Error* instead. For more information about failed postings, you can review the details in the information log that is generated for the batch job.

Although the background posting procedure requires a status of *Queued*, you can manually post a load packing slip even if the status is *Error*. After successful posting, the status is changed to *None*.

To enable the *Load packing slip posting* task to work in the background, you must configure appropriate settings on the **Packing slip posting parameters** page (**Warehouse management** > **Setup** > **Inventory** > **Packing slip posting parameters**). Because this task runs in the background, within a batch job, avoid printing to the screen if printing is included in the process.

> **Tip**
>
> To enable automatic distribution of sales packing slips for each shipment, based on the predetermined values, set the **Packing slip creation policy** value to *Shipment* for the load, and supply **Preallocated packing slip ID** and **Preallocated packing slip document date** values for each associated shipment in the *Packing slip posting parameters* section.
>
> This process automatically applies when the **externally managed warehouse** process is run.

Flexible warehouse-level dimension reservation policy

When an inventory reservation hierarchy of the *Batch-below[location]* type is associated with products, businesses that sell batch-tracked products and run their logistics as operations that are enabled for the warehouse management processes (WMS) can't reserve specific batches of those products for customer sales orders.

In a similar way, specific license plates can't be reserved for products on sales orders when those products are associated with the default reservation hierarchy.

This article describes the inventory reservation policy that lets these businesses reserve specific batches or license plates, even when the products are associated with a *Batch-below[location]* reservation hierarchy.

Inventory reservation hierarchy

This section summarizes the existing inventory reservation hierarchy.

The inventory reservation hierarchy dictates that, as far as storage dimensions are concerned, the demand order carries the mandatory dimensions of site, warehouse, and inventory status. In other words, the mandatory dimensions are all the dimensions above the location dimension in the reservation hierarchy, while the warehouse logic is responsible for assigning a location to the requested quantities and reserving the location. In the interactions between the demand order and the warehouse operations, the demand order is expected to indicate where the order must be shipped from (that is, what site and warehouse). The warehouse then relies on its logic to find the required quantity in the warehouse premises.

However, to reflect the operational model of the business, tracking dimensions (batch and serial numbers) are subject to more flexibility. An inventory reservation hierarchy can accommodate

scenarios where the following conditions apply:

- The business relies on its warehouse operations to manage picking of quantities that have batch or serial numbers *after* the quantities are found in the warehousing storage space. This model is often referred to as *Batch-below[location]* or *Serial-below[location]*. It's typically used when a product's batch or serial number identification isn't important to the customers who place the demand with the selling company.
- The business relies on its warehouse operations to manage picking of quantities that have batch or serial numbers *before* the quantities are found in the warehousing storage space. If batch or serial numbers are necessary as part of a customer's order specification, they are recorded on the demand order, and the warehouse operations that find the quantities in the warehouse aren't allowed to change them. This model is referred to as *Batch-above[location]* or *Serial-above[location]*. Because the dimensions above location are the specific requirements for the demands that must be fulfilled, the warehouse logic doesn't allocate them. These dimensions **must** always be specified on the demand order or in the related reservations.

In these scenarios, the challenge is that only one inventory reservation hierarchy can be assigned to each released product. Therefore, for the WMS to handle tracked items, after the hierarchy assignment determines when the batch or serial number should be reserved (either when the demand order is taken or during the warehouse picking work), this timing can't be changed on an ad-hoc basis.

Flexible reservation for batch-tracked items

Business scenario

In this scenario, a company uses an inventory strategy where finished goods are tracked by batch numbers. This company also uses the WMS workload. Because this workload has well-equipped logic for planning and running warehouse picking and shipping operations for batch-enabled items, most of the finished items are associated with a *Batch-below[location]* inventory reservation hierarchy. The advantage of this type of operational setup is that decisions (which are effectively reservation decisions) about which batches to pick and where to put them in the warehouse are postponed until the warehouse picking operations start. They aren't made when the customer's order is placed.

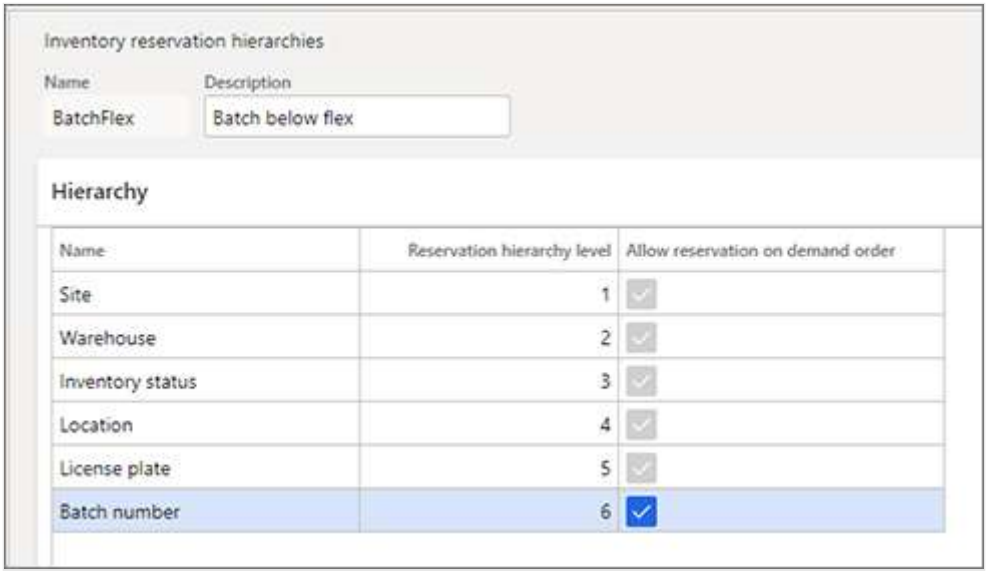
Although the *Batch-below[location]* reservation hierarchy serves the company's business goals well, many of the company's established customers require the same batch that they previously purchased when they reorder products. Therefore, the company is looking for flexibility in the

way that the batch reservation rules are handled, so that, depending on the customers' demand for the same item, the following behaviors occur:

- A batch number can be recorded and reserved when the order is taken by the sales processor, and it can't be changed during warehouse operations and/or taken by other demands. This behavior helps guarantee that the batch number that was ordered is shipped to the customer.
- If the batch number isn't important to the customer, the warehouse operations can determine a batch number during picking work, after sales order registration and reservation have been done.

Allow reservation of a specific batch on the sales order

To accommodate the desired flexibility in the batch reservation behavior for items that are associated with a *Batch-below[location]* inventory reservation hierarchy, inventory managers must select the **Allow reservation on demand order** check box for the **Batch number** level on the **Inventory reservation hierarchies** page.



When the **Batch number** level in the hierarchy is selected, all dimensions above that level and up through the **Location** level are automatically selected. (By default, all dimensions above the **Location** level are preselected.) This behavior reflects the logic where all dimensions in the range between the batch number and location are also automatically reserved after you reserve a specific batch number on the order line.

> ⓘ **Note**
>
> The **Allow reservation on demand order** check box applies only to reservation hierarchy levels that are below the warehouse location dimension.

Batch number and **License plate** are the only levels in the hierarchy that are open for the flexible reservation policy. In other words, you can't select the **Allow reservation on demand order** check box for the **Location** or **Serial number** level.

If your reservation hierarchy includes the serial number dimension (which must always be below the **Batch number** level), and if you turn on batch-specific reservation for the batch number, the system continues to handle serial number reservation and picking operations, based on the rules that apply to the *Serial-below[location]* reservation policy.

At any point, you can allow batch-specific reservation for an existing *Batch-below[location]* reservation hierarchy in your deployment. This change doesn't affect any reservations and open warehouse work that were created before the change occurred. However, you can't clear the **Allow reservation on demand order** check box if inventory transactions of the **Reserved ordered**, **Reserved physical**, or **Ordered** issue type exist for one or more items that are associated with that reservation hierarchy.

> ⓘ **Note**
>
> If an item's existing reservation hierarchy doesn't allow batch specification on the order, you can reassign it to a reservation hierarchy that does allow batch specification, provided that the hierarchy level structure is the same in both hierarchies. Use the **Change reservation hierarchy for items** function to do the reassignment. This change might be relevant when you want to prevent flexible batch reservation for a subset of batch-tracked items but allow it for the rest of the product portfolio.

Regardless of whether you select the **Allow reservation on demand order** check box, if you don't want to reserve a specific batch number for the item on an order line, default warehouse operations logic that is valid for a *Batch-below[location]* reservation hierarchy still applies.

Reserve a specific batch number for a customer order

After a batch-tracked item's *Batch-below[location]* inventory reservation hierarchy is set up to allow reservation of specific batch numbers on sales orders, sales order processors can take customer orders for the same item in one of the following ways, depending on the customer's request:

- **Enter order details without specifying a batch number** – Use this approach when the product's batch specification isn't important to the customer. All existing processes that are

associated with handling an order of this type in the system remain unchanged. No additional considerations are required on the part of users.

- **Enter order details and reserve a specific batch number** – Use this approach when the customer requests a specific batch. Typically, customers request a specific batch when they're reordering a product that they previously purchased. This type of batch-specific reservation is referred to as *order-committed reservation*.

The following set of rules is valid when quantities are processed, and a batch number is committed to a specific order:

- To allow reservation of a specific batch number for an item under the *Batch-below[location]* reservation policy, the system must reserve all dimensions up through location. This range typically includes the license plate dimension.
- Location directives aren't used when picking work is created for a sales line that uses order-committed batch reservation.
- During warehouse processing of work for order-committed batches, neither the user nor the system is allowed to change the batch number. This processing includes exception handling.

The following example shows the end-to-end flow.

Example scenario: Batch number allocation

For this example, install demo data, and use the **USMF** demo data company.

Set up an inventory reservation hierarchy to allow batch-specific reservation

1. Go to **Warehouse management** > **Setup** > **Inventory** > **Reservation hierarchy**.
2. Select **New**.
3. In the **Name** field, enter a name, such as **BatchFlex**.
4. In the **Description** field, enter a description, such as **Batch below flexible**.
5. In the **Selected** field, select **Serial number** and **Owner**, and then select the left arrow button to move them to the **Available** field.
6. Select **OK**.
7. In the row for the **Batch number** dimension level, select the **Allow reservation on demand order** check box. The **License plate** and **Location** levels are automatically selected, and you can't clear the check boxes for them.
8. Select **Save**.

Create a new released product

1. Set the product's three master data parameters by using these values:
    - In the **Storage dimension group** field, select **Ware**.
    - In the **Tracking dimension group** field, select **Batch-Phy**.
    - In the **Reservation hierarchy** field, select **BatchFlex**.
2. Create two batch numbers, such as **B11** and **B22**.
3. Add item quantities to on-hand stock by using the following values.

Expand table

Warehouse	Batch number	Location	License plate	Quantity
24	B11	BULK-001	None	10
24	B11	FL-001	LP11	10
24	B22	FL-002	LP22	10

Enter sales order details

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New**.
3. On the sales order header, in the **Customer account** field, enter **US-003**.
4. Add a line for the new item, and enter **10** as the quantity. Make sure that the **Warehouse** field is set to **24**.
5. On the **Sales order lines** FastTab, select **Inventory**. In the **Maintain** group, select **Batch reservation**. The **Batch reservation** page shows a list of batches that are available for reservation for the order line. For this example, it shows a quantity of **20** for batch number **B11** and a quantity of **10** for batch number **B22**. Note that you can't access the **Batch reservation** page from a line if the item on that line is associated with *Batch-below[location]* reservation hierarchy unless it's set up to allow batch-specific reservation.

    > ⓘ **Note**
    >
    > To reserve a specific batch for a sales order, use the **Batch reservation** page.

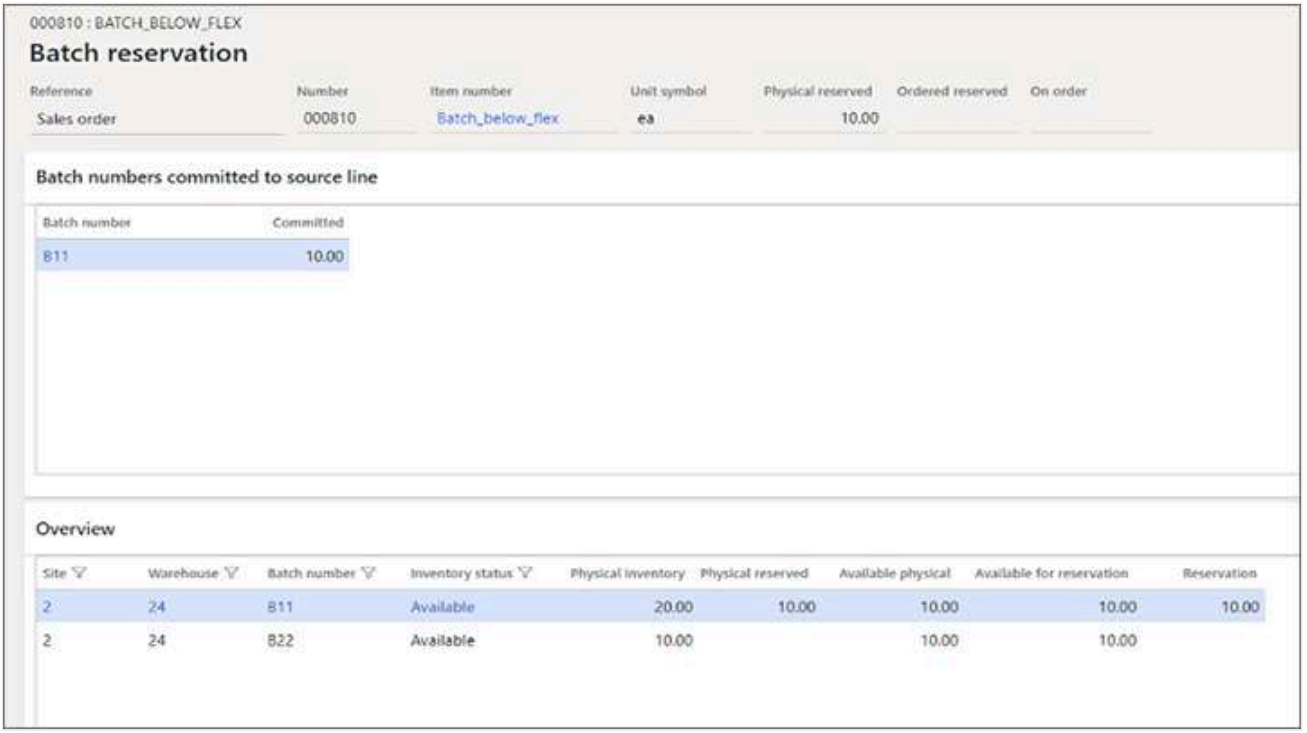
If you enter the batch number directly on the sales order line, the system behaves as though you entered a specific batch value for an item that is subject to the *Batch-below[location]* reservation policy. When you save the line, you receive a warning message. If you confirm that the batch number should be specified directly on the order line, the line isn't handled by the regular warehouse management logic.

If you reserve the quantity from the **Reservation** page, no specific batch is reserved, and the execution of warehouse operations for the line follows the rules that are applicable under the *Batch-below[location]* reservation policy.

In general, you work with this page in the same way for items that have an associated reservation hierarchy of the *Batch-above[location]* type. However, the following exceptions apply:

- The **Batch numbers committed to source line** FastTab shows the batch numbers that are reserved for the order line. The batch values in the grid are shown throughout the fulfillment cycle of the order line, including the warehouse processing stages. By contrast, on the **Overview** FastTab, regular order line reservation (that is, reservation that is done for the dimensions above the **Location** level) is shown in the grid up to the point when warehouse work is created. The work entity then takes over the line reservation, and the line reservation no longer appears on the page. The **Batch numbers committed to source line** FastTab helps guarantee that the sales order processor can view the batch numbers that were committed to the customer's order at any point during its lifecycle, up through invoicing.
- In addition to reserving a specific batch, a user can manually select the batch's specific location and license plate instead of letting the system automatically select them. This capability is related to the design of the order-committed batch reservation mechanism. As mentioned earlier, when a batch number is reserved for an item under the *Batch-below[location]* reservation policy, the system must reserve all dimensions up through location. Therefore, warehouse work carries the same storage dimensions that the users who worked with the orders reserved, and it might not always represent the item storage placement that is convenient, or even possible, for picking operations. If order processors are aware of the warehouse constraints, they might want to manually select the specific locations and license plates when they reserve a batch. In this case, the user must use the **Display dimensions** functionality on the page header, and must add the location and license plate in the grid on the **Overview** FastTab.

6. On the **Batch reservation** page, select the line for batch **B11**, and then select **Reserve line**. There's no designated logic for assigning locations and license plates during automatic reservation. You can manually enter the quantity in the **Reservation** field. Notice that, on the **Batch numbers committed to source line** FastTab, batch **B11** is shown as **Committed**.



> ⓘ **Note**
>
> Reservation of the quantity on a sales order line can be done across multiple batches. Likewise, reservation of the same batch can be done against multiple locations and license plates (if license plates are enabled for the locations).
>
> Reservation of a specific batch for the quantity on a sales order line can also be partial. For example, the total quantity of 100 units can be reserved so that a specific batch is committed to 20 units, whereas 80 units are reserved at the site and warehouse levels for any available batch. In this case, the WMS handles picking operations by using two separate work lines.

7. Go to **Product information management** > **Products** > **Released products**. Select your item, and then select **Manage inventory** > **View** > **Transactions**.

8. Review the item's inventory transactions that are related to the sales order line reservation.

    - A transaction where the **Reference** field is set to **Sales order** and the **Issue** field is set to **Reserved physical** represents the order line reservation for the inventory dimensions above the **Location** level. According to the item's inventory reservation hierarchy, those dimensions are site, warehouse, and inventory status.
    - A transaction where the **Reference** field is set to **Order-committed reservation** and the **Issue** field is set to **Reserved physical** represents the order line reservation for the specific batch and all inventory dimensions above it. According to the item's inventory reservation hierarchy, those dimensions are batch number and location. In this example, the location is **Bulk-001**.

9. On the sales order header, select **Warehouse** > **Actions** > **Release to warehouse**. The order line is now waved, and a load and work are created.

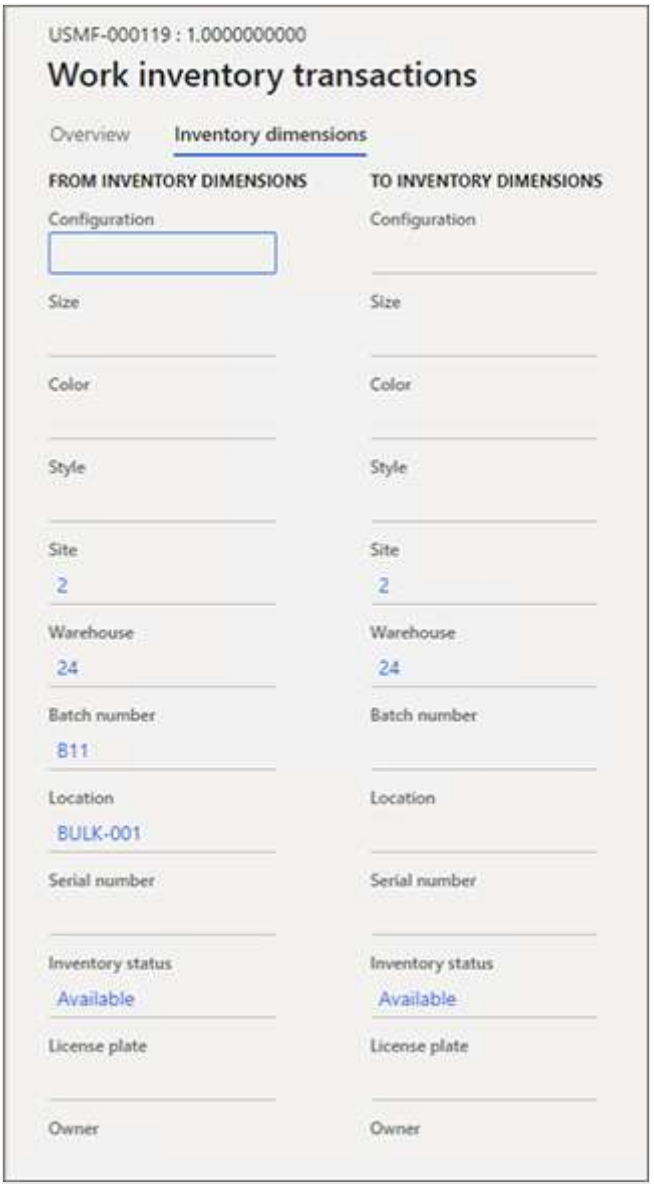
Review and process warehouse work that has order-committed batch numbers

1. On the **Sales order lines** FastTab, select **Warehouse** > **Work details**.

    The work that handles the picking operation for batch quantities that are committed to the sales order line has the following characteristics:

    - To create work, the system uses work templates but not location directives. All the standard settings that are defined for work templates, such as a maximum number of pick lines or a specific unit of measure, are applied to determine when new work should be created. However, the rules that are associated with location directives for identifying pick locations aren't considered, because the order-committed reservation already specifies all the inventory dimensions. Those inventory dimensions include the dimensions at the warehouse storage level. Therefore, the work inherits those dimensions without having to consult location directives.
    - The batch number doesn't appear on the pick line (as is the case for the work line that is created for an item that has an associated *Batch-above[location]* reservation hierarchy). Instead, the **from** batch number and all other storage dimensions appear

on the work line's work inventory transaction that is referenced from the associated inventory transactions.



- After work is created, the item's inventory transaction where the **Reference** field is set to **Order-committed reservation** is removed. The inventory transaction where the **Reference** field is set to **Work** now holds the physical reservation on all the quantity's inventory dimensions.

Warehouse operations can proceed to handle execution of the work in the usual manner. However, the instructions on the mobile device instruct the worker to pick a specific batch number. In warehouse environments where locations are license plate–controlled, after a worker reaches a location that stores the same batch on multiple license plates, they can pick from any license plate that isn't already reserved (for example, by another order-committed reservation or work that originates from a reservation of that type).

If it turns out to be impractical to pick from the location that is specified on the work line, the warehouse operators can use one of the following actions to redirect picking of the specific batch from a more convenient location:

- The standard **Override location** action on a mobile device (provided that the warehouse worker's **Allow pick location override** setting is enabled)
- The **Change location** action on the **Work list details** page.

2. On the mobile device, finish picking and putting the work.

   The quantity of **10** for batch number **B11** is now picked for the sales order line and put in the **Baydoor** location. At this point, it's ready to be loaded onto the truck and dispatched to the customer's address.

Flexible license plate reservation

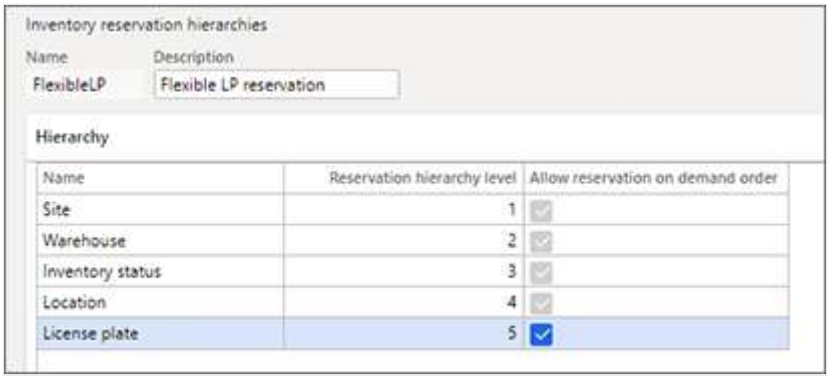
Business scenario

In this scenario, a company uses warehouse management and work processing, and handles load planning at the level of individual pallets/containers outside Supply Chain Management before work is created. These containers are represented by license plates in the inventory dimensions. Therefore, for this approach, specific license plates must be pre-assigned to sales order lines before picking work is done. The company is looking for flexibility in the way that the license plate reservation rules are handled, so that the following behaviors occur:

- A license plate is recorded and reserved when the sales processor takes the order, and other demands can't take it. This behavior helps guarantee that the planned license plate is shipped to the customer.
- If the license plate isn't already assigned to a sales order line, warehouse personnel can select a license plate during picking work, after sales order registration and reservation are completed.

Reserve a specific license plate on the sales order

To enable license plate reservation on an order, select the **Allow reservation on demand order** check box for the **License plate** level on the **Inventory reservation hierarchies** page for the hierarchy that is associated with the relevant item.



You can enable license plate reservation on the order at any point in your deployment. This change doesn't affect any reservations or open warehouse work created before the change. However, you can't clear the **Allow reservation on demand order** check box if open outbound inventory transactions that have an issue status of *On order*, *Reserved ordered*, or *Reserved physical* exist for one or more items that are associated with that reservation hierarchy.

Even if you select the **Allow reservation on demand order** check box for the **License plate** level, it's still possible *not* to reserve a specific license plate on the order. In this case, the default warehouse operations logic that is valid for the reservation hierarchy applies.

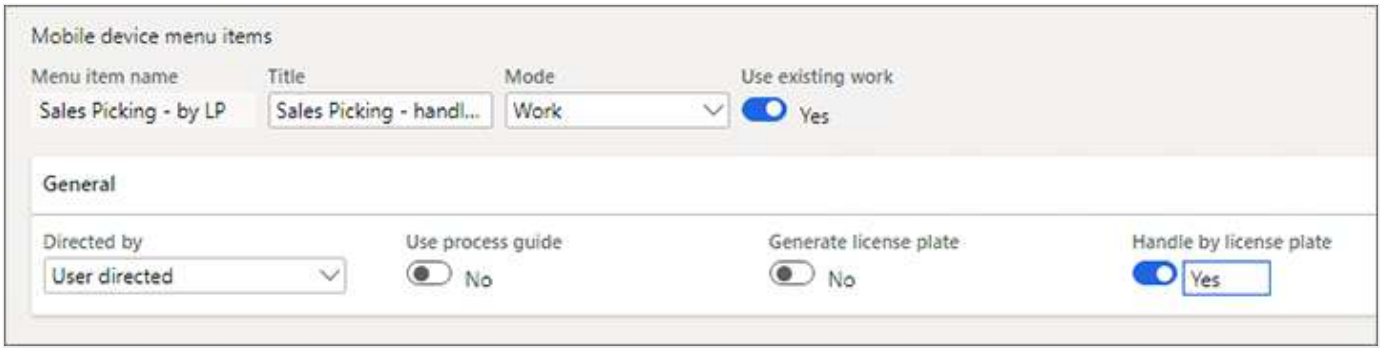
To reserve a specific license plate, use an Open Data Protocol (OData) process. In the application, you can make this reservation directly from a sales order by using the **Order-committed reservations per license plate** option of the **Open in Excel** command. In the entity data that opens in the Excel add-in, enter the following reservation-related data and then select **Publish** to send the data back to Supply Chain Management:

- Reference (Only the *Sales order* value is supported.)
- Order number (The value can be derived from the lot.)
- Lot ID
- License plate
- Quantity

If you must reserve a specific license plate for a batch-tracked item, use the **Batch reservation** page, as described in the Enter sales order details section.

When the sales order line that uses an order-committed license plate reservation is processed by warehouse operations, location directives aren't used.

If a warehouse work item consists of lines that equal a complete pallet and have license plate–committed quantities, you can optimize the picking process by using a mobile device menu item where the **Handle by license plate** option is set to *Yes*. A warehouse worker can then scan a license plate to complete a pick instead of having to scan the items from the work one by one.



Because the **Handle by license plate** functionality doesn't support work that covers multiple pallets, it's better to have a separate work item for different license plates. To use this approach, add the **Order-committed license plate ID** field as a work header break on the **Work template** page.

> **Note**
>
> For the order-committed work creation process, an "order-committed inventory dimension" value is assigned to the picking work lines, and you can't view the license plate value directly. When you set up a mobile device menu item, only the *User directed* process is supported.

Example scenario: Set up and process an order-committed license plate reservation

This scenario shows how to set up and process an order-committed license plate reservation.

Make demo data available

This scenario refers to values and records that are included in the standard demo data that Supply Chain Management provides. To work through the scenario by using the values provided here, use an environment where the demo data is installed. Also, set the legal entity to **USMF** before you begin.

Create an inventory reservation hierarchy that allows for license plate reservation

1. Go to **Warehouse management** > **Setup** > **Inventory** > **Reservation hierarchy**.
2. Select **New**.
3. In the **Name** field, enter a value (for example, *FlexibleLP*).
4. In the **Description** field, enter a value (for example, *Flexible LP reservation*).

5. In the **Selected** list, select **Batch number**, **Serial number**, and **Owner**.
6. Select the **Remove** button to move the selected records to the **Available** list.
7. Select **OK**.
8. In the row for the **License plate** dimension level, select the **Allow reservation on demand order** check box. The **Location** level is automatically selected, and you can't clear the check box for it.
9. Select **Save**.

Create two released products

1. Go to **Product information management** > **Products** > **Released products**.

2. On the Action Pane, select **New**.

3. In the **New released product** dialog box, enter the following values:

   - **Product number:** *Item1*
   - **Item number:** *Item1*
   - **Item model group:** *FIFO*
   - **Item group:** *Audio*
   - **Storage dimension group:** *Ware*
   - **Tracking dimension group:** *None*
   - **Reservation hierarchy:** *FlexibleLP*

4. Select **OK** to create the product and close the dialog box.

5. The new product opens. On the **Warehouse** FastTab, set the **Unit sequence group ID** field to *ea*.

6. Repeat the previous steps to create a second product that has the same settings, but set the **Product number** and **Item number** fields to *Item2*.

7. On the Action Pane, on the **Manage inventory** tab, in the **View** group, select **On-hand inventory**. Then select **Quantity adjustment**.

8. Adjust the on-hand inventory of the new items as specified in the following table.

Expand table

Item	Warehouse	Location	License plate	Quantity
Item1	24	FL-010	LP01	10

Item	Warehouse	Location	License plate	Quantity
Item1	24	FL-011	LP02	10
Item2	24	FL-010	LP01	5
Item2	24	FL-011	LP02	5

> ⓘ **Note**
>
> You must create the two license plates and use locations that allow for mixed items, such as *FL-010* and *FL-011*.

Create a sales order and reserve a specific license plate

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New**.
3. In **Create sales order**, set the following values:
   - **Customer account:** *US-001*
   - **Warehouse:** *24*
4. Select **OK** to close **Create sales order** and open the new sales order.
5. On the **Sales order lines** FastTab, add a line that has the following settings:
   - **Item number:** *Item1*
   - **Quantity:** *10*
6. Add a second sales order line that has the following settings:
   - **Item number:** *Item2*
   - **Quantity:** *5*
7. Select **Save**.
8. On the **Line details** FastTab, on the **Setup** tab, make a note of the **Lot ID** value for each line. You need these values to reserve specific license plates.

> ⓘ **Note**

To reserve a specific license plate, use the **Order-committed reservations per license plate** data entity. To reserve a batch-tracked item on a specific license plate, you can also use the **Batch reservation** page, as described in the Enter sales order details section.

If you enter the license plate directly on the sales order line and confirm it to the system, warehouse management processing isn't used for the line.

9. Select **Open in Microsoft Office**, select **Order-committed reservations per license plate**, and download the file.
10. Open the downloaded file in Excel, and select **Enable editing** to enable the Excel add-in to run.
11. If you're running the Excel add-in for the first time, select **Trust this Add-in**.
12. If you're prompted to sign in, select **Sign in**, and then sign in by using the same credentials that you used to sign in to Supply Chain Management.
13. To reserve an item on a specific license plate, in the Excel add-in, select **New** to add a reservation line, and then set the following values:
    - **Lot ID:** Enter the **Lot ID** value that you found for the sales order line for *Item1*.
    - **License plate:** *LP02*
    - **ReservedInventoryQuantity:** *10*
14. Select **New** to add another reservation line, and set the following values:
    - **Lot ID:** Enter the **Lot ID** value you found for the sales order line for *Item2*.
    - **License plate:** *LP02*
    - **ReservedInventoryQuantity:** *5*
15. In the Excel add-in, select **Publish** to send the data back to Supply Chain Management.

    ⓘ **Note**

    The reservation line appears in the system only if publishing completes without errors.

16. Go back to Supply Chain Management.

17. To review the item's reservation, on the **Sales order lines** FastTab, on the **Inventory** menu, select **Maintain** > **Reservation**. Notice that, for the sales order line for *Item1*, inventory of *10* is reserved, and for the sales order line for *Item2*, inventory of *5* is reserved.

18. To review inventory transactions that are related to the sales order line reservation, on the **Sales order lines** FastTab, on the **Inventory** menu, select **View** > **Transactions**. Notice that there are two transactions that are related to the reservation: one where the **Reference** field is set to *Sales order* and one where the **Reference** field is set to *Order-committed reservation*.

    > ⓘ **Note**
    >
    > A transaction where the **Reference** field is set to *Sales order* represents the order line reservation for inventory dimensions that are above the **Location** level (site, warehouse, and inventory status). A transaction where the **Reference** field is set to *Order-committed reservation* represents the order line reservation for the specific license plate and location.

19. To release the sales order, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

Review and process warehouse work with order-committed license plates assigned

1. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Work details**.

    When you reserve a specific batch, the system doesn't use location directives when it creates the work for the sales order that uses license plate reservation. Because the order-committed reservation specifies all the inventory dimensions, including the location, you don't need to use location directives, because those inventory dimensions are entered in the work. They appear in the **From inventory dimensions** section on the **Work inventory transactions** page.

    > ⓘ **Note**
    >
    > After the work is created, the item's inventory transaction where the **Reference** field is set to *Order-committed reservation* is removed. The inventory transaction where the **Reference** field is set to *Work* now holds the physical reservation for all the quantity's inventory dimensions.

2. On the mobile device, finish picking and putting the work by using a menu item where the **Handle by license plate** check box is selected.

   > **Note**
   >
   > The **Handle by license plate** functionality helps you process the whole license plate. If you must process part of the license plate, you can't use this functionality.
   >
   > Generate separate work for each license plate. To perform this task, use the **Work header breaks** feature on the **Work template** page.

   License plate *LP02* is now picked for sales order lines and put to the *Baydoor* location. At this point, it's ready to be loaded and dispatched to the customer.

Exception handling of warehouse work that has order-committed batch numbers

Warehouse work for picking order-committed batch numbers is subject to the same standard warehouse exception handling and actions as regular work. In general, the open work or work line can be canceled, interrupted because a user location is full, it can be short-picked, and it can be updated because of a movement. Likewise, the picked quantity of work that is already complete can be reduced, or the work can be reversed.

The following key rule applies to all these exception handling actions: the batch number reserved for the customer can never be replaced with a different batch number, but its storage dimensions (location and license plate) can be changed through either a manual update by the user or an automatic update by the system. The automatic update is based on the same random assignment of storage dimensions that applied when a specific batch was automatically reserved but no storage dimensions were specified.

Example scenario

An example of this scenario is a situation where you unpick previously completed work by using the **Reduce picked quantity** function. This example assumes that you already completed the steps described in Example scenario: Batch number allocation. It continues from that example.

1. Go to **Warehouse management** > **Loads** > **Active loads**.
2. Select the load that was created in connection with the shipment of your sales order.
3. From the **Load order lines** FastTab, select **Reduce picked quantity**.

4. On **Reduce picked quantity**, in the **Move to location** field, select **FL-001**.
5. In the **Move to license plate** field, select **LP33**.
6. In the grid, in the **Inventory quantity to unpick** field, enter **10**.
7. Select **OK**.

Here are the results of the unpicking action:

- The status of the previously closed work is set to **Canceled**.
- New work of the **Inventory movement** type is created for the unpicked quantity of **10** for batch number **B11**. This work represents the movement from the **Baydoor** location to license plate **LP33** in location **FL-001**. The status is set to **Closed**.
- The system re-reserves the batch number that was originally ordered, and assigns the location and license plate IDs. This process is equivalent to running the **Reserve line** function for the order line for a given batch number. As a result, batch **B11** is shown as committed on the **Batch numbers committed to source line** FastTab of the **Batch reservation** page, and the **Reservation** field contains a quantity of **10** for batch number **B11**. Additionally, the **Location** field is set to **FL-001**, and the **License plate** field is set to **LP11**. (You can add these fields to the grid if they aren't visible.)

The following tables provide an overview that shows how the system handles order-committed batch reservation for specific warehouse actions. To interpret the content in the tables, assume that each warehouse action runs in the context of existing warehouse work that originates from an order-committed batch reservation, or that execution of each warehouse action affects work of that type.

> **Note**
>
> In these tables, the **Batch quantity is available** column indicates whether a batch quantity is available in addition to the quantity that is either already reserved for the current order-committed reservations or already reserved by the warehouse work that originates from reservations of that type.

Override the pick location on the open work

Expand table

Key setup parameter	Batch quantity is available	Key user steps	Warehouse work	Order-committed batch reservation
The **Allow pick location override** option is enabled on the worker.	Yes	1. Select the **Override location** menu item on the Warehouse Management mobile app when you start picking work. 2. Select **Suggest**. 3. Confirm the new location that is suggested based on batch quantity availability.	On the current work, the following actions occur: • The location on the pick line is updated to the new location. If the location is license plate–controlled, a random license plate is assigned to the work inventory transaction, and the worker can pick from any license plate that has available quantity. • If the quantity is found on more than one license plate in the new location, the original pick line is split into multiple lines to match each license plate.	Not applicable
	No	1. Select the **Override location** menu item on the Warehouse Management mobile app when you start picking work. 2. Manually enter a location.	The **Override location** action isn't possible. It fails, and an error is thrown.	Not applicable

The quantity is re-reserved for the same batch. The system randomly assigns a location and license plate (if the location is license plate–controlled) where the quantity is available.

Key setup parameter	Batch quantity is available	Key user steps	Warehouse work	Order-committed batch reservation
		3. Select **Inventory status change**. 4. Set the **Inventory status** field to **Blocking**.		
	No	See the previous row.	Inventory status changes aren't allowed for quantities that are reserved for work.	Inventory status changes aren't allowed.

Limitations

- The flexible warehouse-level dimension reservation functionality doesn't support the following features:
  - Catch weight management
  - Physical negative inventory
  - Reservation against ordered supply
  - Transfer orders and raw material picking
- The container consolidation rule for packing by directive unit has limitations. For order-committed reservations, don't use container build templates where the **Pack by directive unit** field is enabled. In the current design, location directives aren't used when warehouse work is created. Therefore, only the lowest unit in the unit sequence group (the inventory unit) is applied during the containerization wave step.

Next steps

- Batch numbers in Warehouse management
- Reserve the same batch for a sales order
- Pick oldest batch on a mobile device
- Batch, serial, and license plate confirmation

Last updated on 04/28/2026

Release to warehouse

This article provides details about the release to warehouse process. It describes entities that are created when you release an order to the warehouse and options that you can use to initiate the process.

Release to warehouse overview

Release to warehouse is the process of making inventory ready for dispatch processing. When you release an order to the warehouse, the system creates load lines and shipments. If automatic wave processing is set up, loads and required work are also created. The configuration of the entities that are involved depends on the system settings. This section of the article reviews the entities that are created during the release to warehouse process and the system settings that define them.

A *shipment* is a group of order lines for the same customer/receiver or the same delivery address.

A *load* is a group of order lines that are grouped together, and that typically go out on a single truck, rail car, or other mode of transport. A load can have one or many shipments. You can manually create a load by adding order lines to a new load. In this case, order lines are assigned to the load before the release to warehouse process is initiated. Therefore, they can be released only from the **Outbound load planning workbench** page.

Warehouse *work* is any warehouse operation that is performed by a warehouse worker. Typically, warehouse work operations consist of at least two consecutive actions: a warehouse worker picks up on-hand inventory in one location and then puts it away in another location.

When orders are released to the warehouse, the system creates *load lines* and groups them into shipments. The shipment consolidation process allows for automated shipment consolidation during the release to warehouse process. Learn more in Shipment consolidation policies overview.

The system uses *waves* to create picking work and loads for shipment. A *wave template* must be available for the type of wave that you want to create and for the warehouse of the order line. Wave templates of the *Shipping* type are used to ship items for sales orders and transfer orders.

Each wave template contains *wave methods*. Wave methods perform actions such as creating work for the wave or creating loads. For example, a wave template for shipping waves can

contain methods for creating loads, allocating lines to waves, replenishment, and creating picking work for the wave. The wave template establishes settings that define how the wave is generated and processed, which steps users must do manually, and which steps the system does automatically. Learn more in Wave templates. Therefore, depending on the configuration of your wave template, either a wave is automatically created, processed, and released when you release an order to warehouse, or users manually perform some or all of those actions after release to warehouse is complete.

When a wave is processed, the system creates picking work, based on a suitable *work template* and *location directive*, and makes that work available on mobile devices. The work template determines how the work is performed for each warehouse process, and the location directive specifies the pick and put locations for inventory movement. Learn more in Control warehouse work by using work templates and location directives.

> **Note**
>
> By default, waves are processed in batch mode.

During wave processing, the system usually creates a new load for each shipment that no load is assigned to. If you want the system to assign unassigned shipments to existing loads instead, you can use the advanced wave load building functionality. Learn more in Advanced load building during wave.

On the **Sales orders**, **Transfer orders**, and **Outbound shipment orders** pages, you can review the entities created for order lines during the release to warehouse process.

- **All sales orders** page:
  - On the **Sales order lines** FastTab, select **Warehouse**, and then, on the menu, select **Shipment details** to open related shipments, **Load details** to open related loads, or **Work details** to open related work details.
  - On the **Line details** FastTab, select the **Load** tab to review related loads.
- **Transfer orders** page:
  - On the Action Pane, on the **Ship** tab, select **Shipment details** to open related shipments or **Load details** to open related loads.
  - On the **Transfer order lines** FastTab, select **Work details** to open related work details.
- **Outbound shipment orders** page:

- On the **Outbound shipment order lines** FastTab, select **Warehouse**, and then, on the menu, select **Shipment details** to open related shipments, **Load details** to open related loads, or **Work details** to open related work details.

In conclusion, when an order is released to the warehouse, the most automated flow works in the following way:

1. The system creates a shipment for the order and a wave.
2. The wave is processed.
3. The system creates a load and a work ID.

Depending on wave templates, work templates, and location directives settings, some steps in this flow might become manual. However, the overall flow remains the same.

You have several options for how you release an order to the warehouse. You can perform the operation manually, or you can set up a batch job. The remaining sections of this article review, in detail, the various ways that you can perform a release to warehouse operation.

Manual release to the warehouse from the Sales orders, Transfer orders, and Outbound shipment orders pages

You can release an order to the warehouse directly from the **Sales orders**, **Transfer orders**, or **Outbound shipment orders** page, by selecting **Release to warehouse**.

- On the **Sales orders** page, the button is on the **Warehouse** tab of the Action Pane.
- On the **Transfer orders** page, the button is on the **Ship** tab of the Action Pane.
- On the **Outbound shipment orders** page, the button is on the **Warehouse** tab of the Action Pane.

While you're viewing the list pages, you can select multiple records. In this way, you can release several orders simultaneously.

Manual release to the warehouse from the Release to warehouse pages

The system provides pages where you can review lines for multiple orders and release them to the warehouse:

- **Release sales orders to warehouse** (**Warehouse management** > **Release to warehouse** > **Release sales orders to warehouse**) – This page lets you work with sales orders only.

However, it provides better performance than the **Release to warehouse** page.

- **Release transfer orders to warehouse** (**Warehouse management** > **Release to warehouse** > **Release transfer orders to warehouse**) – This page lets you work with transfer orders only. However, it provides better performance than the **Release to warehouse** page.
- **Release outbound shipment orders to warehouse** (**Warehouse management** > **Release outbound shipment orders to warehouse** > **Release to warehouse**) – This page lets you work with outbound shipment orders only.
- **Release to warehouse** (**Warehouse management** > **Release to warehouse** > **Release to warehouse**) – This page lets you work with both sales orders and transfer orders. However, it provides slower performance than the pages that handle specific order types. This page will soon be deprecated.

All the pages provide similar functionality, as described in the rest of this section. All of them let you select order lines or whole orders, and then release them to the warehouse.

Each of the pages consists of an upper section, where you can select order lines, and a lower section, where you can initiate the release to warehouse process. Use filters in the upper section to search for the order lines that you want to release. The **Release to warehouse** page provides a separate tab for sales orders and transfer orders in the upper section, whereas each of the specific pages shows just one type of order.

The toolbar in the upper section includes the following buttons for selecting order lines to release to the warehouse:

- **Add** – Select one or more order lines in the upper section, and then select this button to those lines to the lower section.
- **Add all** – Add all lines from the upper section to the lower section.
- **Add order** – Select an order, and then select this button to add all lines from that order to the lower section.

After you finish adding lines to the lower section, mark each line that you want to release. Then select **Release to warehouse** on the toolbar to release those lines to the warehouse.

Manual release to the warehouse from the Outbound load planning workbench page

You can also manually release orders to the warehouse by using the **Outbound load planning workbench** page. This page lets you organize order lines into loads and then release those loads to the warehouse.

To open the **Outbound load planning workbench** page, go to **Warehouse management** > **Loads** > **Outbound load planning workbench**. You can also open it from the **Sales orders**, **Transfer orders**, and **Outbound shipment orders** pages. In the upper section of the page, you can select to view the following information:

- Shipments
- Sales lines
- Transfer lines
- Outbound shipment order lines
- Transportation request lines (To view this information, you must enable *In transit planning*.)

On each tab, select lines, and then add them to a new or existing load. You can filter the available lines by opening the **Filters** tab in the Action Pane and then selecting **Load planning filters**. Learn more in Load planning filters.

The **Supply and demand** tab on the Action Pane includes the following buttons for adding order lines in the upper section to a load:

- **To new load** – Select order lines in the upper section, and then select this button to create a new load and add those lines to it.
- **To existing load** – Select order lines in the upper section, and then select this button to add those lines to an existing load.
- **Entire order to new load** – Select orders, and then select this button to create a new load and add all lines from those orders to it.
- **Entire order to existing load** – Select an order, and then select this button to add all lines from that order to an existing load.

In the lower section, you can review the loads that are created. To release loads to the warehouse, select them, and then select **Release** > **Release to warehouse** on the toolbar. If you're using automatic wave processing, because loads are already assigned to order lines, the system creates shipments and work IDs when the release to warehouse operation is performed.

Automatic release to the warehouse

To automatically release orders to the warehouse, use the **Automatic release of sales orders**, **Automatic release of transfer orders**, and **Automatic release of outbound shipment orders** jobs.

To set up the batch job that releases sales orders, follow these steps:

1. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of sales orders**.

2. In the **Automatic release of sales orders** dialog box, on the **Parameters** FastTab, set the following fields:

    - **Quantity to release** – Select whether the whole quantity (*All*), only the physically reserved quantity (*Physically reserved*), or only the physically reserved and cross dock quantity (*Reserved physically and cross dock*) should be released to the warehouse.

    - **Allow release of partially released orders** – Specify whether remaining quantities for partially released orders should be released to the warehouse.

    - **Keep reservations on release failure** – Specify whether quantities that were automatically reserved for a sales order should remain reserved if the release to warehouse process fails.

    - **Group releases by customer** – Specify whether the system processes release to warehouse operations separately for each customer or releases all sales orders at the same time. When this option is set to *Yes*, the system collects all the sales order lines for a selected customer, releases those orders to the warehouse, and then processes the next customer. When this option is set to *No*, the system releases all available sales order lines in a single release to warehouse operation. Enabling this option can help improve the performance and resilience of the release to warehouse process. However, be careful when you use this option together with wave templates that are configured to process waves at release to warehouse, because this combination might generate many single-customer waves, each of which has work generated for that customer only. If you want to generate work that combines shipments for multiple customers, either turn off the *Group releases by customer* option or configure your wave templates to use postponed processing.

        > ⓘ **Note**
        >
        > The **Group releases by customer** field appears only in legal entities that have at least one shipment consolidation policy configured. This option affects how the system groups releases when it consolidates shipments, and shipment consolidation policies are company-specific. To make the field appear, configure a shipment consolidation policy by going to **Warehouse management** > **Setup** >

Shipments > **Shipment consolidation policy**. Learn more in Configure shipment consolidation policies.

- **Locked order handling** – Select how the system should handle sales orders that are currently locked because they're being edited by other users or processes:
  - *Wait for orders to unlock* – The system should wait for the orders to become unlocked before it releases them to the warehouse. In this case, the release to warehouse process might take more time.
  - *Skip locked orders* – The system should skip locked orders.
- **Valid order types** – Select the types of sales orders to include in the batch.
- **Credit limit type** – Select whether credit limits checks should be done during the release to warehouse process and, if the checks should be done, the transaction information to include in them.

3. To control which orders should be processed, on the **Records to include** FastTab, select **Filter**. A standard query dialog appears, where you can define selection criteria, sorting criteria, and joins. The fields work just as they work for other types of queries in Microsoft Dynamics 365 Supply Chain Management.
4. On the **Run in the background** FastTab, choose whether the job should run in batch mode, and/or set up a recurrent schedule. The fields work just as they work for other types of background jobs in Supply Chain Management.
5. Select **OK** to apply your settings and initiate the release to warehouse process.

To set up the batch job that releases transfer orders, follow the steps.

1. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of transfer orders**.
2. In the **Automatic release of transfer orders** dialog box, on the **Parameters** FastTab, set the following fields:
   - **Quantity to release** – Select whether the whole quantity (*All*), only the physically reserved quantity (*Physically reserved*), or only the physically reserved and cross dock quantity (*Reserved physically and cross dock*) should be released to the warehouse.
   - **Allow release of partially released orders** – Specify whether remaining quantities for partially released orders should be released to the warehouse.

- **Group releases by destination warehouse** – Specify whether the system should release all transfer orders at the same time, or whether it should group transfer order lines by destination warehouse and then release each group to the warehouse separately.

To set up the batch job that releases outbound shipment orders, follow these steps:

1. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of outbound shipment orders**.

2. In the **Automatic release of outbound shipment orders** dialog box, on the **Parameters** FastTab, set the following fields:

    - **Quantity to release** – elect whether the whole quantity (*All*), only the physically reserved quantity (*Physically reserved*), or only the physically reserved and cross dock quantity (*Reserved physically and cross dock*) should be released to the warehouse.
    - **Allow release of partially released orders** – Specify whether remaining quantities for partially released orders should be released to the warehouse.

3. To control which orders should be processed, on the **Records to include** FastTab, select **Filter**. A standard query dialog appears, where you can define selection criteria, sorting criteria, and joins. The fields work just as they work for other types of queries in Supply Chain Management.

4. On the **Run in the background** FastTab, choose whether the job should run in batch mode, and/or set up a schedule for recurrence. The fields work just as they work for other types of background jobs in Supply Chain Management.

5. Select **OK** to apply your settings and initiate the release to warehouse process.

Restrict to sales unit

Article • 03/10/2025

This article describes the *Restrict to sales unit* functionality and provides an example scenario.

The *Restrict to sales unit* functionality is designed to ensure that products are sold in a specific, predefined unit. This functionality applies exclusively to sales orders. It specifies the exact unit that a product should be sold in. If the reservation of a product on a sales order leads to incomplete sales units, the release of the sales order to the warehouse is blocked. An error message indicates that the sales order can't be processed because of the incomplete sales units.

To configure the *Restrict to sales unit* functionality for a product, follow these steps.

1. Go to **Product information management** > **Products**.
2. In the list, select a product to view the product details.
3. On the **Warehouse** FastTab, in the **Release to warehouse** section, in the **Restrict to unit** field, select *Sales unit*.
4. Select **Save**.

> ⓘ **Important**
>
> The **Unit** field on the **Sell** FastTab of the product details defines the sales unit that the *Restrict to sales unit* functionality uses.

Example: Releasing a sales order with conversion of units

This example is based on the following scenario:

- Product *item-one* has *Pieces* as the inventory unit.
- The sales unit is *Box*.
- A conversion defines *1 Box* as equal to *5 Pieces*.
- The **Restrict to unit** field is set to *Sales unit*.
- There is a sales order for *10 Pieces* or product *item-one*.

When the sales order is released to the warehouse, the outcome depends on the reserved quantity:

- If the reserved quantity is the full quantity, *10 Pieces*, the sales order is successfully released to the warehouse.
- If the reserved quantity is *7 Pieces*, the result is one full box and almost half of the other box. In this case, the release of the sales order to the warehouse fails, and the customer receives an error message.

> **Note**
>
> There is an exception to the expected behavior of the *Restrict to sales unit* functionality. If the *Automatic release of sales orders* functionality is enabled, and the **Quantity to release** option is set to *All*, the *Restrict to sales unit* functionality is ignored.
>
> Learn more about the *Automatic release of sales orders* functionality in Automatic release to the warehouse.

Partial shipment of a transport load

By setting up partial shipment of loads, you can handle loads where the capacity can't be determined until all the sales lines have been added to a load. The process can then be finalized when the exact pallet count is known. Therefore, you don't have to decide which pallets will be assigned to which transport until the moment when a transport is being physically loaded out of the staged inventory.

This feature offers an alternative to the enforcement of a more rigid structure, where you must determine which pallets will be assigned to which transport before picking work or loading work can be created. Instead, users can configure individual loads for a partial shipment confirmation. The transport loading processes for those loads can then occur. Therefore, the transportation planning department can plan loads without having to consider the capacity of individual transports.

At the time of loading, workers can define a new transport load that a pallet can be loaded to. Alternatively, they can identify an existing transport load. This data can be recorded via a mobile device. Therefore, several warehouse workers can load inventory from the same loads or different loads onto the same truck. The loads can then be fully or partially shipped.

> ⓘ **Note**
>
> In order to load inventory from a load to a specific transport load and partially ship the load, work must be generated by using a loading class in a work template. Ordinary picking work of the **Picking** type can't be loaded to a transport load such as a truck.

Set up transport loads for partial shipment

The setup for partial shipment of loads consists of the following two procedures.

Set the loading strategy

You must enable partial loading by setting the loading strategy. You can set the loading strategy after you've created a load.

1. Select **Warehouse management** > **Loads** > **All loads**.
2. Select a load, and then click **Header**.

3. In the **Loading strategy** field, select **Partial load shipping allowed**.

Create a menu item for loading of transport loads

You must create a new menu item that enables transport loads to be loaded. A transport load lets you group work lines from one load or multiple loads. Everything that is added to the transport load can then be shipped by using a mobile scanner.

1. Select **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**, and then, in the **Mode** field, select **Work**.
3. Set the **Use existing work** option to **Yes**.
4. On the **General** tab, in the **Directed by** field, select **Transport loading**.
5. To enable shipment confirmation on a mobile scanner, in the **Allowed ship confirmation type** field, select **Transport load**.

Confirm shipment of a transport load from the client

This setup lets you confirm a transport load that includes a full load or a partially loaded load to be shipped.

1. Select **Warehouse management** > **Loads** > **Transport loads**.
2. On the Action Pane, on the **Ship and receive** tab, in the **Confirm** group, select **Transport**.

Batch release of partially reserved transfer orders

Article • 07/29/2024

The functionality for batch release of partially reserved transfer orders lets you partially release transfer orders to a warehouse by using a batch job. Because you have the option to release a partial quantity, you don't have to wait for the whole order quantity to be available in the warehouse before you release an order.

The release of orders to a warehouse is a warehouse management processes (WMS) process. This process involves activities, such as picking, packing, and shipping, that a warehouse worker can perform by using a mobile device.

Where it applies

For this functionality, transfer orders are released to a warehouse by using a batch job. This functionality is useful when you don't have enough inventory in the warehouse, but you still want to transfer items from one warehouse to another.

How it is set up

Specify fulfillment criteria for transfer orders and sales orders

Before an order can be partially released to a warehouse in a batch, the fulfillment criteria must be met. These fulfillment criteria are determined by the fulfillment policy.

Fulfillment policies for transfer orders and sales orders are specified at the company level. Depending on the setup of the fulfillment policy, the release of orders in a batch will be accepted or rejected. The orders will then be processed accordingly.

- To create fulfillment policies for transfer orders and sales orders, go to **Warehouse management** > **Setup** > **Release to warehouse** > **Fulfillment policies**, and create a fulfillment policy by entering a name and a description.
- To specify a fulfillment rate, a value type, and the message that is shown if the fulfillment policy is violated, go to **Warehouse management** > **Setup** > **Release to warehouse** > **Fulfillment policies**, and set the **Fulfillment rate**, **Value type**, and **Fulfillment violation message** fields.

Set the fulfillment policies for transfer orders and sales orders

- To set the fulfillment policies for transfer orders, go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters**, and then, on the **Transfer orders** tab, in the **Warehouse management** section, select a transfer order fulfillment policy.
- To set the fulfillment policies for sales orders, go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**, and then, on the **Warehouse management** tab, select a sales order fulfillment policy.

Allow release in a batch and specify the quantity that should be released in a batch

A batch job is used to release orders to a warehouse in a batch. The parameters that distinguish the orders that should be run in a batch job are set on the batch job itself.

The **Quantity** parameter specifies whether the whole quantity or the physically reserved quantity should be released in the batch. The **Allow release of partially released orders** parameter determines whether orders in the batch should be accepted or rejected if they were partially released earlier.

- To set the **Quantity** and **Allow release of partially released orders** parameters for transfer orders, go to **Warehouse management** > **Release to warehouse** > **Automatic release of transfer orders**.
- To set the **Quantity** and **Allow release of partially released orders** parameters for sales orders, go to **Warehouse management** > **Release to warehouse** > **Automatic release of sales orders**.
- To set the **Quantity** and **Allow release of partially released orders** parameters for outbound shipment orders, go to **Warehouse management** > **Release to warehouse** > **Automatic release of outbound shipment orders**.

Set up cluster picking

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to enable workers to use their mobile devices to group picking work into clusters, so that they can pick items from a single location for multiple work orders at the same time. This process is called *cluster picking*.

About cluster picking

After you release work orders to the warehouse, the worker can use a mobile device to assign the orders to a cluster. The cluster organizes the picking work for the worker. When you assign a work order to a cluster, the worker must use cluster picking to perform the picking work for the order. The worker can't use other picking methods. If you mistakenly assign a work order to a cluster, the worker must break the cluster and then re-create it.

If needed, a worker can pass a cluster to another worker. This action changes the cluster status to Passed. When the worker uses a mobile device to indicate that the picking and put away work is completed, the shipment or load must be confirmed in the client.

Enable cluster picking

To enable cluster picking, set up the following components:

- **Cluster profiles** – Specify whether to automatically generate cluster IDs, the number of positions to use, when to break clusters, and how to sequence and verify the picking work.
- **Work templates** – Define how to create the picking work for cluster picking.
- **Location directives** – Specify where to pick items from, and where to put them.
- **Mobile device menu items** – Configure a mobile device menu item to use existing work that cluster picking directs. Then add the menu item to a mobile device menu so that it displays on mobile devices.

- **Warehouse management parameters** – Specify the number sequence to use if you want to generate identifiers for clusters.

Set up a cluster profile

To set up a cluster profile, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Cluster profiles**.
2. Select a profile to edit or select **New** to create a new one.
3. In the header of the new or selected record, set a **Cluster profile ID**, **Name**, **Cluster type**, and **Sequence number**. The **Cluster type** specifies for which warehouse operation the cluster profile should be applied. The **Sequence number** determines the order in which the cluster profiles are applied if you have multiple profiles.
4. On the **General** FastTab, set up your profile options. Tooltips explain the purpose of each field. To see a tooltip, hover your mouse pointer over a field. Learn more about the **Cluster picking strategy** setting in the Cluster picking strategy section.
5. On the **Cluster sorting** FastTab, use the toolbar to add and remove sorting criteria for the cluster. The sorting criteria control the order in which the worker performs the work. You can add as many criteria as needed. For each row, make the following settings:

    - **Sequence number** – Enter a number to define the order in which the sorting criteria are processed.
    - **Field name** – Select the field that determines the sorting. For example, if you select the *WMSLocationId* field, the work is sorted by location.
    - **Sorting** – Select one of the following options:
        - *Ascending* – Work is sequenced in ascending order based on the sorting criteria. For example, if you use the *WMSLocationId* field as sorting criteria, and your location IDs are 1, 2, 3, and 4, workers pick from location 4 first.
        - *Descending* – Work is sequenced in descending order based on the sorting criteria. For example, if you use the *WMSLocationId* field as sorting criteria, and your location IDs are 1, 2, 3, and 4, workers pick from location 1 first.

Item confirmation

When you apply cluster picking, item confirmation is crucial to verify the items that you add to clusters. You can verify items in cluster picking during the cluster picking process. The setup is based on the product bar code setup.

Set up item verification with cluster picking

To enable workers to verify each item they pick during the cluster picking process, you must turn on product confirmation for the relevant mobile device menu item. Follow these steps to set it up:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the list pane, select the menu item you want to set up.
3. On the Action Pane, select **Work confirmation setup**.
4. Do one of the following actions:

    - If a line exists for the **Work type** you want to set up, select it and then select **Edit** on the Action Pane.
    - If an appropriate line doesn't exist, select **New** on the Action Pane and then set the **Work type** to the appropriate type.

5. Mark the **Product confirm** check box for your new or selected line. This step allows workers to verify each piece of inventory by using the mobile device.

> ⓘ **Note**
>
> If you have multiple work records for an item that has **Material picking in license plate locations** set to *Staging*, the Warehouse Management mobile app might show the error message "Current work is frozen" during the cluster picking process. As a workaround, either make sure that you only pick inventory from locations that aren't license plate tracked for the raw material cluster picking process or set **Material picking in license plate locations** to *Order picking* for these items. Learn more in Release a production order.

Cluster picking strategy

The cluster picking strategy controls whether workers pick inventory for all cluster positions at a location in a single step, or handle each position individually. Set this option as part of the cluster profile.

Prerequisites

To use the cluster picking strategy feature, you must be running Supply Chain Management version 10.0.48 or later.

Choose a cluster picking strategy

To set the cluster picking strategy for a selected cluster profile, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Cluster profiles**.
2. Select the profile you want to set a strategy for. Set up the profile as described in the Set up a cluster profile section.
3. On the **General** FastTab, set the **Cluster picking strategy** to one of the following options:

    - *Process by location* – At each pick location, the worker picks the total quantity across all cluster positions in a single step. The system then presents a sort step where the worker distributes the picked quantity to each position. You can fully customize cluster sort criteria. This strategy is the default.
    - *Process by position (tracked items)* – At each pick location, the worker handles each cluster position one at a time, but only for items tracked by batch or serial number that are below the location level. The *Process by location* strategy still applies to non-tracked items at the same location.
    - *Process by position (all items)* – At each pick location, the worker handles every cluster position one at a time, regardless of whether the item has tracking dimensions.

> ⓘ **Note**
>
> When you select *Process by position (tracked items)*, the system excludes serial-tracked items where the serial number is captured at *packing* from by-position processing. Because the serial number isn't required until packing rather than picking, those items continue to use the *Process by location* flow.

How the strategy affects the picking flow

With the default *Process by location* strategy, the picking sequence at a single location looks like this:

1. The worker arrives at the pick location.
2. The mobile device shows the *total* quantity to pick for all cluster positions at that location.
3. The worker picks the consolidated quantity in a single scan.
4. The device presents the sort step. The worker distributes the picked quantity to each cluster position.
5. The worker moves to the next location.

For items without tracking dimensions, this flow is efficient. For batch- or serial-tracked items, however, the sort step requires the worker to assign specific batch or serial numbers to specific

positions, which can be complex and error-prone.

With either *Process by position* option, the sort step is eliminated:

1. The worker arrives at the pick location.
2. The device shows the pick screen for the *first* cluster position, displaying only the quantity needed for that position.
3. The worker picks the quantity and confirms.
4. The device advances to the next position at the same location, if applicable.
5. Steps 3 and 4 repeat until all positions at the location are complete.
6. The worker moves to the next location.

Because each pick step is already tied to a specific position, batch and serial numbers are captured per position at the moment of picking. No post-pick distribution is needed.

Cluster picking strategy example

Consider a cluster with two positions picking a serial-tracked item:

- **Position 1** — Sales order 1, requires 1 unit
- **Position 2** — Sales order 2, requires 2 units

When you use the *Process by location* strategy, work proceeds as follows:

Expand table

Step	Screen prompt	Worker action
1	Pick 3 units from location A-01-01	Scans item and license plate
2	Sort: assign quantity to Position 1	Enters 1, confirms 1 unit
3	Sort: assign quantity to Position 2	Enters 2, confirms 2 units
4	Put cluster to staging	Confirms location

When you use either *Process by position* strategy (tracked items or all items), work proceeds as follows:

Expand table

Step	Screen prompt	Worker action
1	Position 1 – Pick 1 unit from location A-01-01	Scans item and serial number

Step	Screen prompt	Worker action
2	Confirm Position 1	Confirms position
3	Position 2 – Pick 2 units from location A-01-01	Scans item and serial numbers
4	Confirm Position 2	Confirms position
5	Put cluster to staging	Confirms location

Effect of strategy on cluster sorting criteria

The cluster sort criteria (configured under **Cluster sorting** on the cluster profile) behave differently depending on the selected strategy.

Expand table

Strategy	Sort criteria
Process by location	Fully customizable
Process by position (tracked items)	Auto-set: Location > Item number > Work ID > Line number (all ascending)
Process by position (all items)	Auto-set: Location > Item number > Work ID > Line number (all ascending)

> **Important**
>
> When you save a cluster profile with *Process by position (tracked items)* or *Process by position (all items)* selected, the system automatically deletes any existing sort criteria and creates the following four default sort fields:
>
> 1. Location (ascending)
> 2. Item number (ascending)
> 3. Work ID (ascending)
> 4. Line number (ascending)
>
> You can manually edit these sort criteria after they're created. However, changing the sort order can lead to a suboptimal picking route. For example, if the sort criteria no longer group work by location first, the system might direct the worker to pick one position at a location, then travel to a different location for another position, and then return to the

original location to pick the remaining position there. This change results in unnecessary travel between locations.

If you switch back to *Process by location* after previously using a *Process by position* strategy, the auto-created sort criteria remain in place. You can then edit or remove them as needed.

Cluster position full

Article • 02/01/2023

The *Cluster position full* feature offers an alternative to more rigid enforcement of work break rules when cluster picking is used, because it enables a larger margin of error in the volumetric constraints of containers or totes. In a common scenario, not all items on a work order fit into a selected container. Warehouse workers who are cluster picking have few options in this scenario: they must either change to a larger container size or work with their supervisor to come up with a different solution.

This feature introduces the ability to run the **Full** button on one of the work units in a cluster. In older versions, this option was available only for regular order picking, not for cluster picking. However, this feature differs from the standard **Full** button in that it cancels the remaining work. It doesn't suggest that the user add another bin to the same cluster, and it doesn't automatically create new work.

Turn the Cluster position full feature on or off

To use the functionality described in this article, the *Cluster position full* feature must be turned on for your system. As of Supply Chain Management 10.0.25, this feature is mandatory and can't be turned off. If you're running a version older than 10.0.25, then admins can turn this functionality on or off by searching for the *Cluster position full* feature in the Feature management workspace.

Setup

This section provides guidelines, and an example that shows how to set up and use the *Cluster position full* feature.

Make sample data available

To work through the example scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use the example scenario as guidance for working with this feature on a production system. However, in that case, you must substitute your own values for the settings that are described here.

Cluster profiles

You must specify whether cluster IDs are automatically generated, how many positions are used, when clusters are broken, and how the picking work is sequenced and verified.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Cluster profiles**.
2. In the list pane, select the **Create Cluster** record.
3. On the **General** FastTab, verify the following values:
    - **Generate cluster ID:** *Yes*
    - **Activate positions:** *Yes*
    - **Number of positions:** *2*
    - **Position name:** *Numeric*
    - **Break cluster at:** *Put*
    - **Sort verification type:** *Position scan*
4. In the **Cluster sorting** FastTab. The grid should be blank (that is, it should contain no lines).

Work templates

You must define how the picking work for cluster picking is created.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. At the top of the page, set the **Work order type** field to *Sales orders*.
3. Make sure that the following work templates from the demo data are listed. If they aren't available, you won't be able to complete the scenario.
    - 61 SO Stage
    - 61 SO Cluster pick

Location directives

You must specify where items are picked from and where they are put.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the list header, set the **Work order type** field to *Sales orders*.
3. Make sure that the following sales order directives from the demo data are listed. If they aren't available, you won't be able to complete the scenario.

- 61 Cluster pick
- 61 SO Pick order

Mobile device menu items

You must configure a mobile device menu item to use existing work that is directed by cluster picking. In the mobile device menu item for cluster picking, the **Allow splitting of work** parameter must be turned on, and the *SO Pick* work class must be added.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. In the list pane, select the **Cluster Pick Create** record.

3. Select **Edit** in the Action pane.

4. On the **General** FastTab, set the following values:

   - **Directed by:** *Cluster picking*
   - **Generate license plate:** *Yes*
   - **Allow splitting of work:** *Yes*
   - **Cluster profile ID:** *Create Cluster*

   Accept the default values for all other fields.

5. On the **Work classes** FastTab, add the following two lines, as required:

   - Line 1 (usually present in demo data):
     - **Work class ID:** *Sales*
     - **Work order type:** *Sales orders*

   - Line 2 (probably not present in demo data):
     - **Work class ID:** *SO Pick*
     - **Work order type:** *Sales orders*

6. Go to **Work confirmation setup** in the Action pane.

7. Select **Edit**.

8. Enter the following values on the line in grid.

   - **Work type** - *Pick*
   - **Product confirmation** - *Select the check box*

9. Select **Save** in the Action pane and close the page.

Create picking work

Before you can start cluster picking, you must create some outbound work. The cluster profile that you created earlier specifies two cluster positions. Therefore, at least two work IDs must be created for sales order picking. For this scenario, transactions will occur in warehouse *61*, and they will use items *L0101* and *T0100*. The demo data should have enough on-hand inventory of these items. Make sure that you have enough inventory to complete the transactions.

Create sales order 1

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create sales order 1.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-010*
    - **Warehouse:** *61*
4. Select **OK**.
5. The new sales order is opened. On the **Sales order lines** FastTab, add a line that has the following settings:
    - **Item number:** *T0100*
    - **Quantity:** *5*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
7. On the **Sales order lines** FastTab, add a second line that has the following settings:
    - **Item number:** *L0101*
    - **Quantity:** *20*
8. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
9. For each line that you just added, follow these steps to reserve inventory:
    a. Select the line to reserve.
    b. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
    c. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.

d. Close the **Reservation** page.

10. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

    When the release is completed, you receive informational messages that show the wave and load IDs that were created.

Create sales order 2

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create sales order 2.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-011*
    - **Warehouse:** *61*
4. Select **OK**.
5. The new sales order is opened. On the **Sales order lines** FastTab, add a line that has the following settings:
    - **Item number:** *L0101*
    - **Quantity:** *20*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
7. On the **Sales order lines** FastTab, add a second line that has the following settings:
    - **Item number:** *T0100*
    - **Quantity:** *2*
8. On the **Line details** FastTab, on the **Delivery** tab, set the **Confirmed ship date** field to today's date.
9. For each line that you just added, follow these steps to reserve inventory:
    a. Select the line to reserve.
    b. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
    c. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
    d. Close the **Reservation** page.
10. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

When the release is completed, you receive informational messages that show the wave and load IDs that were created.

Get work IDs and license plate numbers

Two work IDs should have been created, each of which has two pick lines. Follow these steps to find the work IDs and license plate assignments.

1. Go to **Warehouse management** > **Work** > **Work details**.
2. In the **Overview** grid, search the **Order number** column for the two sales orders that you just created. For each sales order, make a note of the corresponding work ID.
3. Select the row for each sales order to show related information in the **Lines** grid. Make a note of the location that each item will be picked from.
4. Go to **Inventory management** > **Inquiries and reports** > **On-hand list**.
5. On the Action Pane, select **Dimensions** to open the **Dimension display** dialog box.
6. Make sure that the **License plate**, **Warehouse**, and **Item number** check boxes are selected, and then select **OK**.
7. In the **Filter** pane, set the following filters:
    - **Item number** – **is one of** – *L0101* and *T100*
    - **Warehouse** – **begins with** – *61*
8. Make a note of the **License plate** values that are shown.

Example scenario

Mobile device flow execution – Work confirmation setup for the product

1. Sign in to the Warehouse Management mobile app as a user in warehouse *61*.
2. Go to **Outbound** > **Cluster pick create**.

    The **TASK: Assign work to Cluster** page appears.
3. Enter the work ID for sales order 1 to assign it to cluster position 1.

4. Select **OK** (check mark symbol).
5. Enter the work ID for sales order 2 to assign it to cluster position 2.
6. Select **OK** (check mark symbol).

   The **TASK: Cluster Pick Create: Pick** page appears and shows *Item L0101 2 PL*.

Because the cluster profile set the number of positions to 2, the system automatically directs you to the first consolidate pick: two pallets (PL) of item *L0101*.

At any time during the following steps, you can select the **Details** tab to view additional information about the task, such as the picking location.

1. Set the **ITEM** field to *L0101*. This confirms the item number, which is required for this menu item (you configured this earlier by selecting **Work confirmation setup** from the **Mobile device menu item** page when you created this menu item).
2. Enter the license plate number that is associated with the item in the location that is being picked. You will pick two pallets.
3. Set the **LP** field to *LP_PICK_01*.
4. Select **OK** (check mark symbol).

   The **TASK: Sort: Cluster Pick Create** page appears. Here, you will sort the two picked pallets into a pick position. This position might be a tote or container that is used to separate the picked inventory by sales order.

5. View the details that are shown for the item (*L0101*) and quantity (*20* ea) that will be sorted into position 1 (for sales order 1).
6. Set the **POSITION NA** field to *1*.
7. Select **OK** (check mark symbol).
8. View the details that are shown for the item (*L0101*) and quantity (*20* ea) that will be sorted into position 2 (for sales order 2).
9. Set the **POSITION NA** field to *2*.
10. Select **OK** (check mark symbol).

    The **TASK: Cluster Pick Create: Pick** page appears and shows *Item T0100 7 ea*.

In this scenario, position 1 can't accept the full quantity of items that must be picked to fulfill sales order 1. A position must be marked as full. In this scenario, you will do a

partial pick of the second item. The second item will be partially picked for position 1, and new work will be created to pick the remaining quantity to fulfill the order.

1. Select the Menu button (sometimes referred to as the hamburger or the hamburger button), and then select **Position full**.
2. Identify the position that is full, and select *1*.
3. Select **OK** (check mark symbol).
4. Enter the pick quantity that can still be picked into position 1. The system can determine which item number is being picked.
5. Enter *2*.
6. Select **OK** (check mark symbol).
7. Confirm the item number to complete the pick of the remaining item into position 2.
8. Set the **ITEM** field to *T0100*.
9. Select **OK** (check mark symbol).
10. Enter the license plate that the item is being picked from by setting the **LP** field to *LPREPL04*.
11. Select **OK** (check mark symbol).
12. View the details that are shown for the item (*T0100*) and quantity (*2* ea) that will be sorted into position 2 (for sales order 2).
13. Set the **POSITION NA** field to *2*.
14. Select **OK** (check mark symbol).
15. View the details that are shown for the item (*T0100*) and quantity (*2* ea) that will be sorted into position 1 (for sales order 1).
16. Set the **POSITION NA** field to *1*.
17. Select **OK** (check mark symbol).

    The **TASK: Cluster Pick Create: Put** page appears.

In this scenario, the cluster pick has been completed, and the user is directed to put away the picked items from position 1 and position 2 into staging location *STAGE01*.

1. Review the information on the page. It shows that a total quantity of *44* will be put to the staging location.
2. Select **OK** (check mark symbol).

   You receive a "Cluster Completed" message.

You can now use the **Sales Picking** menu item to pick the remaining quantity. You can then use the **Sales loading** menu item to move the items from the staging location to the loading dock.

System-directed cluster picking

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Cluster picking is a piece picking process that lets you pick items for multiple orders at the same time by clustering them into pick clusters. You then have to visit the pick location only one time. Typically, this functionality is used with small order picking or quantities that are less than case quantities.

When system-directed cluster picking is set up, you can cluster-pick work headers, based on a system-generated cluster. The system cluster-picks orders up to the number of positions that is specified in the cluster profile. Therefore, you can pick multiple orders at the same time without having to manually create a cluster.

System-directed cluster picking offers an alternative to manual cluster building, where a cluster profile is used to create a cluster. Several setup-related lines must be defined in the cluster profile before it's used:

- **Number of positions** corresponds to the number of orders that will be put on a cluster. Therefore, it corresponds to the number of totes.
- **Break cluster** determines when the cluster should be broken.
- **Generate cluster ID** controls whether the cluster ID will be generated by the system or entered by the user.
- **Sort verification type** determines whether position verification is required.

A new mobile device menu item is used for system-directed cluster picking. The **Cluster profile ID** must be specified for the selected **Directed by** option. Additionally, the system-directed work sequence queries can group orders based on company-specific criteria. Therefore, you can further optimize the assignment of work orders by specifying customized sorting criteria using the system-directed work sequence queries.

When system-directed cluster picking is enabled, warehouse workers are presented with a cluster where picking orders have been preassigned to cluster positions. Therefore, workers can start to pick an item for multiple work orders by visiting the pick location only one time. The picking process for system-directed cluster picking is the same as the process for user-directed cluster picking.

Set up system-directed cluster picking

Create cluster profiles

Cluster profiles control how the system creates each cluster. If different clusters are required, a different cluster profile should be created for each mobile device menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Cluster profiles**.
2. Select **New**.
3. In the **Cluster profile ID** field, enter **2 Position**.
4. In the **Name** field, enter **2 Position**.
5. On the **General** FastTab, enter the following information:
    - **Generate cluster ID** - Select **Yes**. This option determines whether the cluster ID is automatically created by the system, or whether the user will create it at the start of picking.
    - **Activate positions** - Select **Yes**. This option determines whether the position names are automatically generated based on the position name setup. If this option is set to **No**, the license plate ID for the position is used.
    - **Number of positions** - Select **2**. This field determines the maximum number of positions that the cluster can have (that is, the maximum number of boxes, totes, and so on).
    - **Position name** - Select **Numeric** so that positions are named by using continuous numbers. If you select **Alphabetical**, the positions are named in alphabetical order.
    - **Break cluster at** - Select **Put**. This field determines when the cluster is broken.
    - **Sort verification type** - Select **Position scan**. This field determines whether the put-to-position step is verified.
6. On the **Cluster sorting** FastTab, you define sorting criteria by creating a new line and enter the following information:
    - **Sequence number** - Select **1**. This field determines the sequence that the system sorts by. A value is entered automatically, but you can change it if needed.
    - **Field name** - Enter **WMSLocationId**. This field determines the field that the line uses for sorting criteria.
    - **Sorting** - Select **Ascending**. This field defines whether the sorting is done in ascending or descending order.

Create a mobile device menu item

To create a new mobile device menu item for system-directed cluster picking and link the cluster profile ID to the mobile device menu item, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**.
3. In the header section, enter the following information:
    - **Menu item name** - SD Cluster
    - **Title** - SD Cluster
    - **Mode** - Work
    - **Use existing work** - Yes
4. On the **General** FastTab, enter the following information:
    - **Directed by** - System directed cluster picking
    - **Generate license plate** - Yes
    - **Cluster profile ID** - 2 Position
5. On the **Work classes** FastTab, set up the valid work class for this mobile device menu item by setting the following fields:
    - **Work class ID** - Sales
    - **Work order type** - Sales orders
6. In the **Mobile device menu items** Action Pane, select **System directed work sequence queries** and follow these steps to specify a new system-directed work sequence query:
    - Select **New** in the Action Pane.
    - **Sequence number** - 1
    - **Description** - Work priority – Work ID
7. On the Action Pane select **Edit query**
8. Select the **Sorting** tab
9. Select **Add** to add a new line, then enter the following:
    - **Table** - Work
    - **Derived table** - Work
    - **Field** - Work priority
    - **Search direction** - Ascending
10. Select **Add** to add a second line, then enter the following:
    - **Table** - Work

- **Derived table** - Work
- **Field** - Work ID
- **Search direction** - Ascending

11. The system will now sort work IDs in the cluster, first by work priority and then by work ID.

Set up a mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Add the **SD Cluster** menu item that you just created to a Mobile device menu.
3. Select the **Outbound** menu.
4. Select **Edit** from the Action Pane.
5. Scroll until you find **SD Cluster**.
6. Select **SD Cluster**, the arrow pointing to the **Menu Structure** list will be enabled.
7. Select the **arrow** button to move the **SD Cluster** menu item into the **Outbound** menu structure.
8. Select **SD Cluster** from the **Menu Structure** list, then select the **UP** or **DOWN** arrows to move the menu item into the desired position on the mobile device menu.

Scenario

Create picking work

Before you can set up system-directed cluster picking, you must create eligible outbound work. The cluster profile that you created earlier specifies two cluster positions. Therefore, you must create at least two work IDs. In this scenario you will create two sales orders, reserve inventory, release the sales orders to the warehouse, and then manually process the wave.

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.
2. Select **New** in the Action Pane to create the first sales order.

    - The **Create sales order** menu opens, enter the following information:
        - On the **Customer** FastTab, enter **Customer account** - **US-004**.
        - On the **General** FastTab, enter **Warehouse** - **62**.
        - Select **OK** to close the menu and create the sales order.
    - On the **Sales order lines** FastTab, select **Add line** if a new line is not automatically added and enter the following:
        - **Item number** - A0001
        - **Quantity** - 1
        - Select **Add line** to add a second line.

    - **Item number** - A0002
    - **Quantity** - 3
  - Reserve inventory for both of the lines that you just created.
    - Select **Line 1**.
    - On the **Sales order lines** Action Pane, select **Inventory**, and then select **Reservation** from the list.
    - On the **Reservation** form, select **Reserve lot** to reserve the inventory.
    - Close the **Reservation** form when the reservation is completed.
    - Repeat these steps to reserve inventory for **Line 2**.
3. Select **New** in the Action Pane to create the second sales order

   - The **Create sales order** menu opens, enter the following information:
     - On the **Customer** FastTab, enter **Customer account** - **US-005**.
     - On the **General** FastTab, enter **Warehouse** - **62**.
     - Select **OK** to close the menu and create the sales order
   - On the **Sales order lines** FastTab, select **Add line** if a new line is not automatically added and enter the following information:
     - **Item number** - A0001
     - **Quantity** - 4
     - Select **Add line** to add a second line.
     - **Item number** - A0002
     - **Quantity** - 2
   - Reserve inventory for both lines that you just created.
     - Select **Line 1**.
     - On the **Sales order lines** Action Pane, select **Inventory**, and then select **Reservation** from the list.
     - On the **Reservation** form, select **Reserve lot** to reserve the inventory.
     - Close the **Reservation** form when the reservation is completed.
     - Repeat these steps to reserve inventory for **Line 2**.
   - Close the sales order and return to the **All sales orders** list page.

4. Find the two sales orders you just created (you may need to refresh the page). In the table, select both sales orders using the section check mark.

   - In the **All sales orders** Action Pane, select the **Warehouse** tab.
   - In the **Actions** group, select **Release to warehouse** to release both sales orders to the warehouse.

5. When the release to warehouse process is completed, an informational message will be displayed.

   - Shipments will be created for each sales order.

- A wave will be created and both shipments will be assigned to the wave. Make note of the **Wave ID**.

6. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.

   - In the **All waves** list find and select the **Wave ID** that you created in the previous step.
   - In the Action Pane, select the **Wave** tab,
   - In the **Wave** group, select **Process** to process the wave and create **Work**.
   - Informational messages will be generated when processing has been completed, indicating that work has been created and the wave has been posted.

7. **Optional**: Go to **Warehouse management** > **Work** > **Work details** to view the work created. Two different work IDs are created. Each work ID has two pick lines.

Run the mobile device flow

1. Sign in to the mobile device for a user in warehouse **62**.

2. On the **Main Menu**, select **Outbound**.

3. On the **Outbound** menu, select **SD Cluster** to initiate the pick.

   - A cluster is created, and the two work IDs that you created earlier are attached. If you created more than two work IDs, only the first two are added to the cluster. Notice that the work IDs are added to the cluster in ascending order, as you specified in the query setup.

   > ⓘ **Note**
   >
   > The new cluster is automatically created only if enough additional work IDs were previously created. Otherwise, the following message is shown: "Not enough work can be found for cluster."

   - After you select the menu, the first pick screen appears. The system aggregates all matching pick lines from the two work IDs and directs you to visit the pick location one time, so that you can satisfy both orders by using one pick. This process is done in the same way as the process for user-directed cluster picking.

4. Confirm the first picking location and item by selecting **OK**.

   - The quantity of the pick will be the total of the item displayed on the sales orders in the cluster.

5. Enter the position name (Numeric or Alphabetical) to confirm that the item quantity picked for the position were put in the correct position.
6. Repeat this process until all item quantities have been picked and put in the correct position.
7. The last step on the mobile device is to **Put** the cluster in the final location. Select **OK**
    - When the put operation is confirmed, the cluster is closed and broken, based on the value that you set for the **Break cluster at** field in the cluster profile. Work IDs are also closed.
8. A "Cluster complete" message is shown on the mobile device.

Over-picking for sales orders and transfer orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article presents a scenario that shows how to enable either a specific worker or all workers to over-pick. The over-picking process allows for controlled over-picking during the picking work.

Warehouse over-picking is a simple concept. The system allows workers to pick more items than are specified for an order. However, it still considers the overdelivery limit that is set at the line level for the transfer order or sales order. If that limit is exceeded, the Warehouse Management app notifies the workers that they are exceeding the overdelivery limit.

The over-pick feature helps minimizes maintenance and also helps your setup remain flexible. You can define one or more mobile device menu items and enable over-picking for only some of them. You can also prevent selected workers from over-picking sales orders and/or transfer orders without having to change the menu items. Instead, you can turn off one or both of those capabilities in the relevant worker setups.

The over-pick feature can help workers save time and effort when they pick and ship items. For example, the feature enables workers to perform these tasks:

- Compensate for shrinkage during picking or shipment.
- Avoid having to unpack some packaging material during the picking process.
- Compensate for item damage during transportation.
- Ship a quantity or unit-of-measure variance.
- Minimize breaking of quantities on license plates.
- Avoid material waste and scarcity of expensive materials.
- Measure the picked quantity after picking (for example, through lorry weighting).

> **Important**
>
> The over-pick feature only applies when picking and processing sales orders, transfer orders, production order raw materials, and batch order raw materials. Replenishment

doesn't support over-picking. When replenishment work is run, the system won't allow workers to over-pick.

This scenario in this article shows how to set up and use the over-pick feature.

Scenario prerequisite: Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to *USMF* before you begin.

Scenario setup

Before you work through the example scenario, you must enable over-picking for both the relevant worker and the relevant menu item.

Set up a worker to allow for over-picking

Here is the general procedure for configuring a worker to enable over-picking for sales orders and transfer orders separately. This configuration controls which picking worker can do the over-picking, and whether that worker can do over-picking for both transfer orders and sales orders.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. In the list pane, select **Julia Funderburk**.
3. On the **Users** FastTab, select the row that has the following values. If no existing row has these values, create it.
    - **User ID:** *24*
    - **User name:** *WH 24*
    - **Default warehouse:** *24*
    - **Menu name:** *Main*
4. On the **Work** FastTab, set the following values for user *24* if they aren't already set:
    - **Allow sales over picking:** *Yes*
    - **Allow transfer order over picking:** *Yes*

Set up a mobile device menu item to allow for over-picking

Here is the general procedure for configuring a mobile device menu item to enable over-picking. Depending on your business requirements for the permission level of the worker who will use the mobile device menu, some parameters might be turned on or off.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the list pane, select the record that is named *Sales Picking*. If no existing record has this name, create it. Confirm or set the following values for the record:
    - **Menu item name:** *Sales Picking*
    - **Title:** *Sales Picking*
    - **Mode:** *Work*
    - **Use existing work:** *Yes*
    - **Directed by:** *User directed*
    - **Override target license plate:** *Yes*
    - **Override license plate during put:** *Yes*
    - **Keep work locked by user:** *Yes*
    - **Allow over pick:** *Yes*

> ⓘ **Important**
>
> After the relevant parameters for both the worker and the mobile device menu item are enabled, over-picking can be processed only through the mobile device.

Example scenario

After the prerequisites, worker setup, and menu item setup are in place, you're ready to work with the feature.

Create a sales order that allows for overdelivery

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a new sales order.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-001*
    - **Warehouse:** *24*

4. Select **OK**.
5. The new sales order is opened. On the **Sales order lines** FastTab, add a line that has the following settings:
    - **Item number:** *A0001*
    - **Quantity:** *10*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Overdelivery** field to *10*.
7. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
8. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
9. Close the **Reservation** page.
10. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

When the release is completed, you receive informational messages that show the wave and load IDs that were created.

Get the work ID and license plate number for the new order

When you released the sales order to the warehouse, the system should have created a new work ID that has one pick line. Follow these steps to find the work ID and license plate assignment.

1. Go to **Warehouse management** > **Work** > **Work details**.
2. In the **Overview** grid, search the **Order number** column for the sales order that you just created. For that sales order, make a note of the corresponding work ID.
3. Select the row for the new sales order to show related information in the **Lines** grid. Make a note of the location that the item will be picked from.
4. Go to **Inventory management** > **Inquiries and reports** > **On-hand list**.
5. On the Action Pane, select **Dimensions**.
6. In the **Dimension display** dialog box, make sure that the **License plate**, **Warehouse**, and **Item number** checkboxes are selected, and then select **OK**.
7. In the **Filter** pane, set the following filters:
    - **Item number** – **is one of** – *A0001*
    - **Warehouse** – **begins with** – *24*

8. Select **Apply**.
9. Make a note of the **License plate** values that are shown.

Over-pick the order by using the Warehouse Management mobile app

1. Sign in to the Warehouse Management mobile app as a user in warehouse *24*.
2. Go to **Outbound** > **Sales Picking**.
3. In the **Scan work ID or license plate** field, enter the work ID that was created for the sales order.
4. Select **OK** (check mark symbol).
5. Select **Over pick**.
6. Set the **Pick Qty** field to *14*.
7. Select **OK** (check mark symbol).

   On the **Over pick** page, you receive the following message: "Overdelivery of line is 40.00 percent, but the allowed overdelivery is only 10.00 percent." This message indicates that the pick quantity that you entered exceeds the overdelivery limit. The overdelivery limit for the sales order line is 10 percent. Therefore, for a specified quantity of 10, you can over-pick by only 1, for a total pick quantity of 11.
8. Set the **Pick Qty** field to *11*.
9. Select **OK** (check mark symbol).
10. In the **License plate** field, enter the license plate that you made a note of in the previous section.
11. In the **Target license plate** field, enter a target license plate. Notice that the picking location (*FLOOR-001*), item (*A0001*), and quantity (*11 pcs*) are shown.
12. Select **OK** (check mark symbol).
13. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *BAYDOOR* location.
14. Select **OK** (check mark symbol).

On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message. This message indicates that the work ID of the sales order has been completed, and the over-picked quantity doesn't exceed the overdelivery limit of 10 percent.

Over-pick materials for production and batch orders

09/19/2025

This article explains how warehouse managers can configure Microsoft Dynamics 365 Supply Chain Management to allow and set limits on over-picking of raw materials. Over-picking occurs when a worker picks slightly more material than is specified for a production order. Over-picking can be relevant in situations where it's more efficient for workers to over-pick by rounding up to the nearest packing unit, or where it's more efficient to pick the full content of nearly empty locations to free up space.

This feature lets workers who use the Warehouse Management mobile app over-pick raw materials for production orders when they must. Workers are notified if they exceed the over-picking thresholds that the warehouse manager sets.

> **Important**
>
> - The over-pick feature only applies when picking and processing sales orders, transfer orders, production order raw materials, and batch order raw materials. Replenishment doesn't support over-picking. When replenishment work is run, the system doesn't allow workers to over-pick.
> - All products that use this feature must be enabled for warehouse management processes (WMS).

Set up over-picking for production and batch orders

Use the following procedures to set up over-picking for production and batch orders.

Enable over-picking for a worker

Follow these steps to enable over-picking for a worker.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. Select the worker that you want to enable the feature for.
3. On the **Users** FastTab, select the user account that should be allowed to over-pick.
4. On the **Work** FastTab, set the **Allow production over picking** option to *Yes*.

Enable over-picking for a mobile device menu item

Follow these steps to enable over-picking for a mobile device menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select a mobile device menu item in the list pane, or create a new one. For the new or selected item, the grid on the **Work classes** FastTab must include a row where the **Work order type** field is set to *Raw material picking*. (If you're working with USMF demo data, you can select the mobile device menu item that's named *Production pick*.)
3. On the **General** FastTab, set the **Allow over pick** option to *Yes*.

Set an allowed threshold for over-picking

For each product, you can define an over-picking threshold to control the extent to which a worker can over-pick the product. You can override the threshold for products that are included in a bill of materials (BOM). When you create a production order for a product, the over-picking threshold for each item on that product's BOM comes from either the item itself or the override value set in the product BOM (if available). The threshold is defined as a percentage of the quantity that's designated for the production order.

Set the over-picking threshold for a product

Follow these steps to set the over-picking threshold for a product.

1. Go to **Product Information management** > **Products** > **Released products**.
2. Open the product that you want to set the over-picking threshold for.
3. On the **Warehouse** FastTab, set the **Material over picking (%)** field to the over-picking threshold that you want to allow.

Override the over-picking threshold on a BOM line

When you add a product to a BOM line, the system initially copies that product's over-picking threshold to the BOM line. Follow these steps to override the over-picking threshold for a specific BOM line.

1. Go to **Product Information management** > **Bill of materials and formulas** > **Bill of materials**.
2. Open the BOM where you want to override the over-picking threshold.
3. On the **Bill of material lines** FastTab, select the BOM line that you want to override the over-picking threshold for.

4. On the **Line details** FastTab, on the **Setup** tab, set the following fields:

    - **Override** – Set this option to *Yes*.
    - **Material over-picking (%)** – Enter the new over-picking threshold. When this BOM line is used in a production order, the threshold that you set here overrides the default threshold that's set on the product.

Set policies for staging and over-picking

Warehouse managers can set up policies that define how material should be allocated when it's picked from license-plate-controlled and non-license-plate-controlled locations.

Set the policy for over-picking in license-plate-controlled locations

Follow these steps to set the policy for over-picking in license-plate-controlled locations.

1. Go to **Product Information management** > **Products** > **Released products**.

2. Select the product that you want to set up.

3. On the **Warehouse** FastTab, set the **Material picking in license plate controlled locations** field to one of the following values:

    - *Staging* – The full quantity of the scanned license plate is staged to the production input location. The original estimated quantity is allocated to the production order, and the remaining quantity on the license plate is left unallocated at the production input location. When you use this policy, the over-picking option isn't available in the workflow for raw material picking on the Warehouse Management mobile app.
    - *Order picking* – The full picked quantity is allocated to the production order.

Set the policy for over-picking in non-license-plate-controlled locations

Follow these steps to set the policy for over-picking in non-license-plate-controlled locations.

1. Go to **Product Information management** > **Products** > **Released products**.

2. Select the product that you want to set up.

3. On the **Warehouse** FastTab, set the **Material picking in non-license plate controlled locations** field to one of the following values:

- *Staging* – The original estimated quantity is allocated to the production order, and the remaining quantity is left unallocated at the production input location.
- *Order picking* – The full picked quantity is allocated to the production order.

Set different dimensions for packing and storage

Some items are packed or stored in such a way that you need to track physical dimensions differently for each of several different processes. The *Packaging product dimensions* feature lets you set up one or several types of dimensions for each product. Each dimension type provides a set of physical measurements (weight, width, depth, and height), and establishes the process where those physical measurement values apply. When you enable this feature, your system supports the following types of dimensions:

- *Storage* - Storage dimensions work with location volumetrics to determine how many of each item can be stored in various warehouse locations.
- *Packing* - Packing dimensions work during containerization and the manual packing process to determine how many of each item fits in various container types.
- *Nested packing* - Nested packing dimensions work when the packing process contains multiple levels.

Set up *storage* dimensions by using the **Physical dimension** page in Supply Chain Management. All processes use these dimensions when the packing and nested packing dimensions aren't specified.

Set up *packing* and *nested packing* dimensions by using the **Physical product dimensions** page.

This article provides a scenario that illustrates how to use this feature.

Example scenario

Set up the scenario

Before you run the example scenario, prepare your system as described in this section.

Enable demo data

To work through this scenario using the demo records and values that are specified here, use a system where the standard demo data is installed. Also, select the *USMF* legal entity before you begin.

Add a new physical dimension to a product

Add a new physical dimension for a product by following these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product with **Item number** *A0001*.
3. On the Action Pane, open the **Manage inventory** tab. From the **Warehouse** group, select **Physical product dimensions**.
4. The **Physical product dimensions** page opens. On the Action Pane, select **New** to add a new dimension to the grid with the following settings:

    - **Physical dimension type** - *Packing*
    - **Physical unit** - *pcs*
    - **Weight** - *4*
    - **Weight unit** - *kg*
    - **Depth** - *3*
    - **Height** - *4*
    - **Width** - *3*
    - **Length** - *cm*
    - **Volume unit** - *cm3*

The **Volume** field is automatically calculated based on your **Depth**, **Height**, and **Width** settings.

Create a new container type

Go to **Warehouse management** > **Setup** > **Containers** > **Container types** and create a new record with the following settings:

- **Container type code** - *Short Box*
- **Description** - *Short Box*
- **Maximum net weight** - *50*
- **Volume** - *144*
- **Length** - *6*
- **Width** - *6*
- **Height** - *4*

Create a container group

Go to **Warehouse management** > **Setup** > **Containers** > **Container groups** and create a new record with the following settings:

- **Container group ID** - *Short Box*

- **Description** - *Short Box*

Add a new line to the **Details** section. Set the **Container type** to *Short Box*.

Set up a container build template

Go to **Warehouse management** > **Setup** > **Containers** > **Container build templates** and select **Boxes**. Change the **Container group ID** to *Short Box*.

Run the scenario

After you prepare your system as described in the previous section, you're ready to run the scenario as described in the next section.

Create a sales order and create a shipment

In this process, you create a shipment based on the item *packing* dimensions, for which the height is less than 3.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In **Create sales order**, set the following values:
    - **Customer account:** *US-001*
    - **Warehouse:** *63*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order opens. It includes a new, empty line in the grid on the **Sales order lines** FastTab. On this line, set the following values:
    - **Item number:** *A0001*
    - **Quantity:** *5*
6. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
8. Close the page.
9. On the Action Pane, open the **Warehouse** tab and select **Release to warehouse** to create work for the warehouse.

10. On the **Sales order lines** FastTab, select **Warehouse** > **Shipment details**.

11. On the Action Pane, open the **Transportation** tab and select **View containers**. Confirm that the item was containerized into the two *Short Box* containers.

Place an item into storage

1. Open the mobile device, sign in to warehouse 63, and go to **Inventory** > **Adjust In**.
2. Enter **Loc** = *SHORT-01*. Make a new license plate with **Item** = *A0001* and **Quantity** = *1 pcs*.
3. Select **OK**. You receive the error "Location SHORT-01 failed because item A0001 doesn't fit in location's specified dimensions." This error occurs because the *Storage* type dimensions of the product are larger than the dimensions specified on the location profile.

Last updated on 05/29/2026

Batch, serial, license plate, and location confirmation

Article • 02/24/2025

Batch confirmation allows workers using a mobile device to confirm that the correct batch is being picked. For *Batch-above[location]* items (where batch-above indicates that batch is placed higher than location in the search hierarchy) the worker must verify that the batch that is picked matches the batch on the work line.

Serial confirmation allows workers using a mobile device to confirm that the correct serial number is being picked. For *Serial-above[location]* items (where the serial-above indicates that serial is placed higher than location in the search hierarchy) the worker must verify that the serial that is picked matches the serial on the work line.

License plate confirmation allows workers using a mobile device to confirm that the correct license plate is being picked. When picking work from a stage location, the worker must verify that the license plate picked matches the license plate that is associated with the work. If the work is started by scanning a license plate, this confirmation step is skipped.

Location confirmation allows workers using a mobile device to confirm that the correct location is being used when performing any of the work types available. During these tasks, the worker must verify that the location matches the one associated with the work. The worker is prompted to enter the check digit for the location, but if no check digit is associated with the location, this step is skipped.

Where it applies

Confirmation applies in the following scenarios:

- Batch confirmation applies to the initial pick work for *Batch-above[location]* items.
- Serial confirmation applies to the initial pick work for *Serial-above[location]* items.
- License plate confirmation applies to picks from stage locations.
- Location confirmation only applies when the location is filled automatically by the system.

> **ⓘ Important**
>
> Replenishment isn't supported for license plate confirmation. When executing replenishment work, no license plate confirmation step is created.

For location confirmation, the location confirmation step is skipped if the location is manually entered on the mobile device. For example, during the manual inventory movement process, the location isn't confirmed even if it's enabled in the menu item.

> **Important**
>
> If the entire quantity from a location or license plate is picked, the worker isn't asked to confirm the batch or serial numbers, regardless of how many batch or serial numbers are available on hand. This is standard tracking behavior that can't be overridden. For more information, see Warehouse mobile device tracking dimensions and license plate picking behavior.

Set up batch, serial, license plate and location confirmation

You can configure batch, serial, license plate, and location confirmation from the **Mobile device menu items** page.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the list pane, select the menu item that you want to set up.
3. On the Action Pane, select **Work confirmation setup**.
4. The **Work confirmation setup** page opens.
5. To add rows for each work type, use the buttons on the Action Pane. Select the check box for each type of confirmation required by the current menu item.
    - For rows with a **Work type** of *Pick*, you can only select the batch, serial, license plate confirmation options, and location confirmation.
    - For rows with any other **Work type**, you can select the location confirmation option, but the batch, serial, and license plate confirmation options aren't available.

> **Important**
>
> If the **Auto submit** option is enabled, the other options can't be activated.

Warehouse mobile device tracking dimensions and license plate picking behavior

One of the design goals of the warehouse mobile device picking flows is to minimize the amount scanning and keying required from the worker. To this end, some fields on the mobile device are either prepopulated value or skipped entirely. This article explains some of these cases. Some behaviors differ based on which warehouse mobile device flow you're using and how your on-hand inventory looks in terms of license plates and tracking dimension combinations.

Picking and target license plates

When a worker picks an item, the system moves that inventory to the *user* location. The user location must always be license plate tracked. Several factors influence the system behavior. For example, whether the picking location is license plate tracked, whether the used mobile device menu item has the **Generate license plate** and **Override target license plate** options enabled, and so on. After a target license plate is chosen, it usually can't be changed and it continues to be used for all the subsequent pick work lines from the same work record. The entered target license plate doesn't need to exist in the system before use. If the relevant record didn't exist before, the system creates it. You can use an existing license plate as a target license plate provided it doesn't have any on-hand inventory on it. You can't have the same license plate with on-hand inventory at two different warehouse locations.

If a worker picks from a location that isn't license plate tracked, the worker must enter the target license plate. The system can also automatically generate this target license plate, provided the mobile device menu item being used has the **Generate license plate** option enabled. In that case, the worker is prompted to confirm the generated license plate or to choose a new one. The **Override target license plate** setting isn't used in this case.

If a worker picks from a location that is license plate tracked, the behavior depends on how much of the total license plate quantity is picked.

- If the worker picks the full quantity from the license plate, that license plate is automatically used as the target, and the worker isn't asked to enter or confirm the target license plate. You can change this behavior by using the **Override target license plate** setting on the

mobile device menu item. If that setting is enabled, the worker can change the target license plate. The **Generate license plate** setting isn't used in this case.

- If the worker should only pick part of quantity from the license plate, a different target license plate is needed. This case is basically the same as the one when picking is performed from a location that isn't license plate tracked.

Tracking dimensions (batch number and serial number)

When an item has tracking dimensions enabled (batch number or serial number), the system usually needs to know exactly which batch or serial number is picked, regardless of the reservation hierarchy used. For batch numbers, this requirement is always true, but for serial numbers, it can depend on the **Capture serial number** setting on the item's **Tracking dimension group**. If **Capture serial number** is set to *Picking*, the worker must use the mobile device to capture the serial number during the picking process, even though blank receipt and issue are allowed. If **Capture serial number** is set to *Packing*, the worker captures the serial number later, during the packing process, instead of when picking. If the field is set to *None*, which is the default setting, the system behaves in the standard way, which is described in the next paragraph. A special case occurs when **Active in sales process** is enabled. In this case, serial numbers aren't saved in the inventory transactions, but in a separate table. This behavior is similar to the *Picking* and *Packing* ones described previously.

You can't change the standard tracking behavior described in this paragraph by using configuration settings. It's the same for both batch and serial numbers (provided the serial number doesn't have **Active in sales process** enabled and **Capture serial number** is set to *None*). If the whole quantity from a location or license plate is picked, the worker isn't asked to enter batch or serial numbers, regardless of how many batch or serial numbers are available on-hand. As mentioned previously, this behavior is designed to minimize the number of interactions required from the worker on the mobile device. In case the worker should only pick part of the quantity available at a location or license plate, the worker is prompted to enter each picked batch and/or serial number because the system can't otherwise know which of the available numbers were picked.

Create transfer orders from the warehouse app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This feature enables warehouse workers to create and process transfer orders directly from the Warehouse Management mobile app. The worker starts by selecting the destination warehouse. Then, they can scan one or more license plates by using the app to add license plates to the transfer order. When the warehouse worker selects **Complete order**, a batch job creates the required transfer order and order lines based on the on-hand inventory registered for those license plates.

Set up a mobile device menu item to create transfer orders

Here are general guidelines for setting up a mobile device menu item for creating a transfer order. Depending on your business requirements for the level of automation to set when users create transfer orders from the floor, different configurations are enabled. This scenario describes one such configuration.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New** to add a new menu item. Then make the following settings to get started:
    - **Menu item name** – Assign a name as it should appear in Supply Chain Management.
    - **Title** – Assign a menu name as it should be presented to workers in the Warehouse Management mobile app.
    - **Mode** – Set to *Indirect* (this menu item doesn't create work).
    - **Activity code** – Set to *Create transfer order from license plates* to enable the warehouse workers to create a transfer order based on one or more scanned license plates.

3. Use the **Transfer order line creation policy** setting to control how transfer order lines are created by this menu item. The lines are created or updated based on the on-hand inventory registered for the scanned license plates. Choose one of the following values:

    - *No reservation* – The transfer order lines aren't reserved.
    - *License plate guided with line reservation* – The transfer order lines are reserved and use the License plate guided strategy option, which stores the relevant license plate IDs associated with the order lines. Located license plate ID values can therefore be used as part of the work creation process for the transfer order lines.

4. Use the **Outbound shipment policy** setting to add more automation to the outbound transfer order shipment process, as needed. When a worker selects the **Complete order** button, the app creates the *Complete order* warehouse app event, which saves the value you choose here in the **Outbound shipment policy** field for each line in the current transfer order. Later, when the event queue is processed by a batch job to create the transfer order, the batch job reads the value stored in this field and might control how that job processes each line. Choose one of the following values:

    - *None* – No automated processing is done.
    - *Release to warehouse* – Automates the release to warehouse process.
    - *Ship confirm* – Automates the ship confirmation process.
    - *Release and ship confirm* – Automates both the release to warehouse and ship confirmation processes.

5. Use the **Validate license plate policy** setting to decide whether the system should validate the license plate when creating a transfer order. Choose one of the following values:

    - *None* – Don't validate the license plate.
    - *Error* – Check whether the selected license plate is a valid target for open or in-process work and whether it contains any items with blocking status.

> ⓘ **Note**
>
> The **Validate license plate policy** setting is intended to help speed up the process, which is why it's set to skip license plate validation by default (*None*). The *None* value assumes that the warehouse worker knows whether the license plate can be transferred to another warehouse.

Add the mobile device menu item to a menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Select **Edit**.
3. Select an existing menu following selection of the new menu item under **Available menus and menu items**. Add the menu item by selecting the right-arrow button.

Create a transfer order based on license plates

The Warehouse Management mobile app has a simple process for creating transfer orders based on license plates. To do this, the worker follows these steps by using the Warehouse Management mobile app:

1. Create the transfer order and identify the destination warehouse.
2. Identify each license plate to ship.
3. Select **Complete order**.

> **Note**
>
> Multiple workers can assign license plates intended for the same transfer order by using the **Select transfer order** button to select an existing, unprocessed, transfer order number from the warehouse app event queue. For information about how to find the transfer order number values, see Inquire into the warehouse app events.

Example scenario

This scenario provides an overview of the process for getting transfer orders created and automatically processed based on the on-hand inventory registered on the selected license plates.

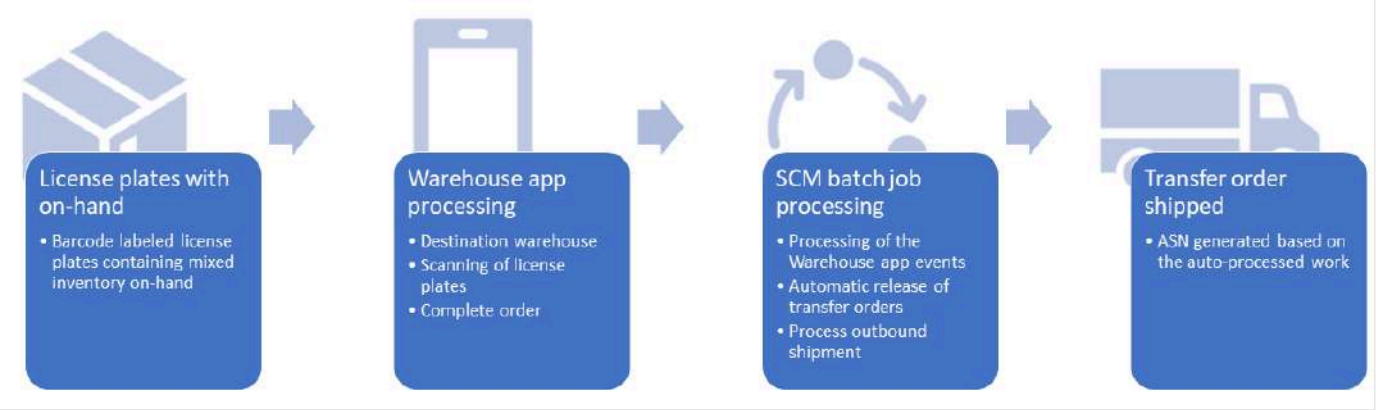
To work through this scenario by using the values suggested, you must work on a system with demo data installed and select the *USMF* legal entity before you begin.

This scenario assumes that you already set up the warehouse app event processing capability.

In addition to setting up the create transfer order in the mobile device menu items, additional templates, location directives, and batch jobs must also be set up and enabled.

Example scenario blueprint

You're a retailer and have multiple license plates, each containing a mix of items placed at a specific location within one of your warehouses (*Warehouse 51*). You want to enable the process that allows workers to create a transfer order to another warehouse (*Warehouse 61*) for a collection of scanned license plates. You automatically ship-update the transfer order as soon as the last license plate for the order is identified.



Create a mobile device menu item for creating transfer orders

This section explains how to create a new mobile device menu item for creating transfer orders. Set the **Mode** to *Indirect* and the **Activity code** to *Create transfer order from license plates*.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, enter the name *Create TO*.
4. In the **Title** field, enter the description *Create TO*.
5. In the **Mode** field, select *Indirect*.
6. In the **Activity code**, select *Create transfer order from license plates*
7. In the **Order line creation policy**, select *License plate guided with line reservation*.
8. In the **Outbound shipment policy**, select *Release and ship confirm*.
9. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
10. Select **Edit**.
11. Select the existing **Inventory** menu. Under **Available menus and menu items**, select the new menu item. Add the menu item into the **Inventory** menu by selecting the right-arrow button.

Set up work templates to auto process and break work by located license plate

This section explains how to enable a work template to automatically process the work created by the template when a wave is released.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select *Transfer issue*.
3. Select **New** to create a new work template.
4. In the **Work template** field, enter *51 Auto process LP*.
5. In the **Work template description** field, enter *51 Auto process LP*.
6. Select the **Automatically process** check box. Select this check box to enable automation steps.
7. In the demo data, a work template named *51 Transfer* already exists. Edit the **Sequence number** field so that the new work template has a lower sequence number than the existing work template *51 Transfer*.
8. Select **Save** in the toolbar to enable the **Work Template Details** FastTab.
9. In the **Work Template Details** FastTab, select **New** in the toolbar. You add two lines.
10. In the **Work type** field, select *Pick*.
11. In the **Work class ID** field, select *TransfOut*.
12. Select **New** in the **Work Template Details** toolbar.
13. In the **Work type** field, select *Put*.
14. In the **Work class ID** field, select *TransfOut*.
15. Select **Save** to enable the **Directive code** field.
16. On the **Work type** *Put* line, select **Directive code** *Baydoor*. Make sure this new work template gets the lowest **Sequence number**.
17. In the toolbar, select **Edit query** to open the query editor.
18. In the **Range** tab, select **Add**.
19. On the line added, in **Field** select *Warehouse*.
20. In the **Criteria** field, select *51*.
21. Select the **Sorting** tab.
22. Select **Add** and set **Field** to *Located license plate ID*. Selecting this field enables the toolbar button **Work header breaks**.
23. Select **OK** followed by **Yes** to reset the grouping and return to the **Work templates** page.
24. Select **Work header breaks** and enable the **Group by this field** for the **Located license plate ID** and close.

> ⓘ **Note**
>
> Not all setup can be auto processed. For example, catch weight items and the use of mixed tracking dimensions.

Set up location directives for the license plate guided strategy

This section explains how to set up a location directive pick process to use the **License plate guided** strategy.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. Select **Edit**.
3. In the navigation list header, select the **Work order type** *Transfer issue*.
4. In the navigation list, select the existing location directive **51 TO Pick**.
5. In the **Lines** FastTab, select the **Allow split** checkbox.
6. In the **Location Directive Actions** FastTab select **New** to add a new action line.
7. In the **Name** field, enter *LP Guided*.
8. In the **Strategy** field, select *License plate guided*. This action needs the lowest sequence number.
9. Select **Save** in the toolbar.
10. Select the **Refresh** page icon from the toolbar.
11. In the **Location Directive Actions** FastTab, select the line *TOPick*.
12. In the **Location Directive Actions** toolbar, select **Move down** to change the sequence number to be greater than the sequence number for the *LP Guided* action just created.

> ⓘ **Note**
>
> The License plate guided strategy tries to reserve and create picking work against the locations that hold the requested license plates and are associated with the transfer order lines. If this isn't possible and you still want to create picking work, fall back to another location directive action strategy. You might also need to search for inventory in another area of the warehouse, depending on your business process needs.

Set up a batch job to process warehouse app events

This section explains how to set up a scheduled batch job to process warehouse app events.

1. Go to **Warehouse management** > **Periodic tasks** > **Process warehouse app events**.
2. In the dialog box, enable **Batch processing** under the **Run in background** section.
3. Select **Recurrence** and set up the batch job to process based on the interval needed for your business.
4. Select **OK** to return to the main dialog.
5. Select **OK** in the main dialog to add the job to the batch queue.

Set up a batch job to release transfer orders automatically

This section explains how to set up a scheduled batch job to release the transfer orders that are marked as *Ready to release*.

1. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of transfer orders**.
2. In the dialog box, expand the **Records to include** section.
3. Select **Filter** under the **Records to include** section.
4. In the **WHSTransferAutoRTWQuery** query page, **Range** tab, select **Add** to add a new line to the query.
5. In the new line **Table** field, select the drop-down menu and select the table **Transfer line release to warehouse**.
6. In the **Field** drop-down menu, select **Outbound shipment policy**.
7. In the **Criteria** field, select **Release and ship confirm**.
8. In the line where **Field** is set to *From warehouse*, in the **Criteria** field, select *51*.
9. Select **OK** to return to the main dialog box.
10. Expand the **Run in the background** section to set up batch processing.
11. Enable **Batch processing** under the **Run in background** section.
12. Select **Recurrence** and set up the batch job to process based on the interval needed for your business.
13. Select **OK** to return to the main dialog.
14. Select **OK** in the main dialog to add the batch job to the batch queue.

Set up the "Process outbound shipment" batch job

This section explains how to set up a scheduled batch job to run the outbound shipment confirmation for loads ready to ship related to transfer order lines that are marked as *Ready to ship*.

1. Go to **Warehouse management** > **Periodic tasks** > **Process outbound shipments**.
2. Expand the **Records to include** section.
3. Select **Filter**.
4. In the **WHSLoadShipConfirm** query, select the **Joins** tab.
5. Expand the table hierarchy so that **Loads** and **Load details** are expanded.
6. Select the **Load details** table.
7. Select the **Add table join** button.
8. In the list of table relations, filter or search on the **Relation** column for *Transfer order lines (Reference)*.
9. Focus on the table relation in the list, and then select the **Select** button.

10. Select the **Transfer order lines** table.
11. Select the **Add table join** button.
12. In the list of table relations, filter or search on the **Relation** column for *Invent Transfer Additional Fields (Record-ID)*.
13. Focus on the table relation in the list, and then select the **Select** button.
14. Select the **Range** tab.
15. In the **Range** query tables, you'll set up three query criteria ranges. Select the **Add** button to add a line.
16. Add a range for the table **Loads**. Set **Field** to *Load status* and set **Criteria** to *Loaded*.
17. Add another range for the table **Invent Transfer Additional Fields**. Set **Field** to *Outbound shipment policy* and set **Criteria** to *Release and ship confirm*.
18. Add another range for the table **Load details**. Set **Field** to *Reference* and set **Criteria** to *Transfer order shipment*.
19. Select **OK** to return to the main dialog box.
20. Expand the **Run in the background** section.
21. Enable **Batch processing**.
22. Select **Recurrence** and set up the batch job to process based on the interval needed for your business.
23. Select **OK** to return to the main dialog.
24. Select **OK** in the main dialog to add the batch job to the batch queue.

> **Note**
>
> For more information, see Confirm outbound shipments from batch jobs.

Processing the example for "Create transfer order from the warehouse app"

Add on-hand inventory to a license plate

For this scenario, you need a license plate that contains physical available inventory on hand.

Expand table

Item	Warehouse	Inventory status	Location	License plate	Quantity
A0001	51	Available	LP-010	LP10	1
A0002	51	Available	LP-010	LP10	2

Add physical inventory on-hand quantities by using the following values:

> **Note**
>
> You need to create the license plate and use locations that allow you to carry mixed items, such as LP-010.

Create and process transfer orders from the warehouse app

1. Open the app and sign in as user *51*. The current user warehouse is 51.
2. Select the menu item **Create TO** from the menu location you added it to during setup.
3. Start the creation of a transfer order by entering the destination warehouse (To warehouse) in the **Warehouse** field. Enter *61*. The new transfer order goes from current warehouse 51 (From warehouse) to the destination warehouse *61*.
4. Select **OK**.
5. Scan a license plate ID in the **License plate** field. Enter the license plate of the inventory added in an earlier step, *LP10*.
6. Select **OK**.
7. Select the menu button and then select **Complete order** to finalize the warehouse app transfer order creation.

For the mentioned example, two **Warehouse app events** (*Create transfer order* and *Complete transfer order*) are used.

Inquire into the warehouse app events

You can view the event queue and event messages generated by the Warehouse Management mobile app by going to **Warehouse management** > **Enquiries and reports** > **Mobile device logs** > **Warehouse app events**.

The *Create transfer order* event messages receive the status *Waiting*, which means that the **Process warehouse app events** batch job doesn't pick up and process the event messages. As soon as the event message updates to status *Queued*, the batch job processes the events. This process happens at the same time as the creation of the *Complete transfer order* event (when a worker selects the **Complete order** button on the Warehouse Management mobile app). When the *Create transfer order* event messages are processed, the status updates to *Completed* or *Failed*. When the *Complete transfer order* status updates to *Completed*, all the related events are deleted from the queue.

Because the **Warehouse app events** for the creation of transfer order data aren't processed by the batch job before the messages update to status *Queued*, you need to look up the requested transfer order numbers as part of the **Identifier** field. The **Identifier** field is in the header of the **Warehouse app events** page.

As part of the warehouse event processing, the creation of the transfer order line might fail. In this case, the state of the event message updates to *Failed* and you can use the **Batch log** information to learn why and take action to correct any problems.

Typical issues could be related to missing setup for the process, like a missing transit warehouse for the *Create transfer order* event. In an example like this, you add a transit warehouse to the shipping warehouse and use the **Reset** option to change the status for all the warehouse app event messages from *Failed* to *Queued*, which means that the batch job processes the event messages again after the correction of the setup data.

Within production environments, the exceptions are more process related, such as having a requested license plate, which at the batch job processing time is empty and thereby no transfer order lines are created. This failed event message can either be removed by using the **Delete** option or you can add the needed physical on-hand on the license plate and use the **Reset** option for all the related event messages.

Learn more in Warehouse app event processing.

Follow up on the example scenario processing

During this scenario, the following occurred:

1. Using the Warehouse Management mobile app, you selected a menu item that uses the activity code **Create transfer order from license plates**.
2. The app prompted you to select the destination warehouse for the transfer order. The source warehouse is always the one you currently sign into as a Worker.
3. On the selection of the destination warehouse, the system reserved an ID number for the upcoming transfer order (based on the transfer-order number sequence defined on your system) but didn't create the transfer order yet.
4. When you scanned the license plate *LP10* containing on-hand inventory that should be moved to the new warehouse, a **Warehouse app event** was added to the events queue to be processed later. The warehouse event contained message details about the scan, including the intended transfer-order number.
5. On the Warehouse Management mobile app when the **Complete order** button is selected, a new warehouse app event, **Complete transfer order**, is created and the related existing

event, **Create transfer order**, changes status to **Queued**.

6. On the back end, the **Process warehouse app events batch job** picks up the **Queued** event and collects the on-hand related to the scanned license plate. Based on the on-hand the actual transfer order record and associated lines get created. The job also populates the **Outbound shipment policy** field for the transfer order with the value based on the configured *Release and ship confirm* and linked the license plate against the lines for the **License plate guided** strategy.
7. Based on the transfer order line **Outbound shipment policy** field value the **Automatic release of transfer orders batch job** query now results in releasing the transfer order to the shipping warehouse. And due to the setup for the used **Wave template**, **Work template**, and **Location directives** the work gets auto processes, resulting in the **Load status** being updated to *Loaded*.
8. The **Process outbound shipment batch job** is executed for the load, resulting in the transfer order being shipped and the Advance Shipment Notice (ASN) is generated.
9. The timing of all these events depends on the **Recurrence** settings for the batch jobs created.

Frequently asked questions

Warehouse Management mobile app processes

Why can't I see the menu button "Complete order"?

You must have at least one license plate assigned to the transfer order.

Can several Warehouse Management mobile app users add license plates to the same transfer order at the same time?

Yes, several warehouse workers can scan license plates into the same transfer order.

Can the same license plate be added to different transfer orders?

No, a license plate can only be added to one transfer order at a time.

After I select the "Complete order" button, can I add more license plates for that transfer order?

No, you can't add more license plates to a transfer order that has a **Complete transfer order** warehouse app event.

How can I find existing transfer orders to use through the "Select transfer order" button in the Warehouse Management mobile app, if the order isn't yet created in the backend system?

By using the data inquiry capability, workers can look up transfer order numbers in the Warehouse Management mobile app. For example, you could create a detour mobile device menu item that queries for the data displayed on the web client's **Warehouse app events** page (`WHSMobileDeviceQueueMessageCollection`) as part of the *Select order - MobileDeviceQueueMessageCollectionIdentifierId* step. The transfer order number matches the value shown in the **Identifier** field. To learn more, see Inquire into the warehouse app events.

Can I manually select the transfer order number to use from the Warehouse Management mobile app?

The app supports only autogenerated transfer order numbers through number sequences. See also the answer to the previous question regarding how to set up the **Select transfer order** button. For more information about how to find transfer order numbers, see Inquire into the warehouse app events.

Background processing

How should I clean up records in my warehouse app events queue message tables?

You can view and maintain these records on the **Warehouse app events** page. For more information, see Inquire into the warehouse app events.

Why isn't the transfer order "Receipt date" updated according to my "Delivery date control" setup?

The transfer orders are created without using the **Delivery date control** capabilities.

Can I use a license plate that has physical negative inventory on hand?

This feature supports only positive physical on-hand quantities at the license plate level. However, you can have physical negative on-hand quantities at the higher warehouse and inventory-status levels when you assign license plates to transfer orders.

Last updated on 05/06/2026

Piece picking confirmation

08/18/2025

Piece picking confirmation allows workers to use a mobile device to confirm each piece of inventory registered during picking or counting work. In this context, *confirm* means that the worker verifies the quantity of each item by scanning a bar code or manually entering the information on the device. For picks, workers can confirm the quantity of work to be processed up to the quantity that is specified on the work to be picked. For counting work, workers can scan the inventory they're counting and track the total amount.

When you enable piece picking, product confirmation is also required. For picking work, you can set the maximum number of pieces that workers can be required to confirm while doing picking work. The maximum quantity is based on the current work unit that is being processed. The counting work type doesn't allow a maximum.

The system considers both the quantity and unit of measure (UOM) that is stored in a scanned bar code. This functionality works for receiving inbound flows (including mixed license plate receiving, purchase order item, transfer order item, and load item). It also works for piece picking, where scanning a bar code quantity adds the quantity to the total number of confirmed pieces and converts between the UOM on the bar code and the work unit. When a worker scans a bar code quantity, the system checks the UOM on the bar code, confirms whether the quantity is allowed for counting on the sequence group and, if so, adds the quantity to the total count.

Where piece picking applies

Piece picking works for all counting work and for the initial pick for any type of work. Piece picking doesn't apply for items that are controlled by serial numbers or for production or kanban picks from a license plate location where the item is set to staging.

Ways to confirm a product

There are two ways to confirm a product during piece picking:

- **Scanning a bar code** – Workers can scan a bar code, which can include quantity information depending on the configuration. If the bar code specifies a quantity, the system automatically adds that amount to the total confirmed pieces. If the bar code doesn't include quantity information, the worker is prompted to enter the quantity manually.

- **Manual entry** – Workers can manually enter the item number to confirm the product. In this case, they must also manually enter the quantity being picked or counted. This method is useful when bar codes aren't configured.

Enable bar code scanning for products

To allow workers to scan bar codes to confirm a product, make sure the **Scanning** option is enabled for each relevant product. To enable the **Scanning** option, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the desired product.
3. On the Action Pane, open the **Manage inventory** tab and, from the **Warehouse** group, select **Bar codes**.
4. On the Action Pane, select **Edit**.
5. Select the desired bar code.
6. Open the **General** tab.
7. Set **Scanning** to *Yes*.
8. On the Action Pane, select **Save**.

Learn more in Create a bar code for a product.

Set up piece picking

To set up piece picking, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Find and select the mobile device menu item that you want to configure.
3. On the Action Pane, select **Work confirmation setup**.
4. Use the buttons on the Action Pane, to add, remove, or edit confirmation settings for each work type as needed. For rows with a **Work type** of *Pick* or *Counting*, make the following settings:

    - **Piece picking confirmation** – Select this check box to allow workers to confirm each piece of inventory from the mobile device. While this box is selected, the **Product confirmation** checkbox is also selected automatically.
    - **Maximum number of pieces** – Enter the maximum number of pieces that workers can be required to confirm while doing picking work. For example, if the **Maximum number of pieces** is set to *1*, the system will prompt the worker to confirm only one product. After confirming the first piece, the worker can manually enter the remaining quantity without additional confirmation prompts. Set to *0* to remove the maximum limit, which means that workers will be prompted to scan or enter values

as many times as needed until the entire picking quantity has been confirmed. This setting is only available when **Work type** is *Pick* and **Piece picking confirmation** is enabled.

Packing materials and fees

Article • 06/03/2022

Packing material fees are paid to a recycling company at specific intervals. An amount is paid, per unit of weight, for each material that a packing unit consists of. Although packing material fees are calculated and reported, no ledger transactions are posted, because the fees aren't considered taxes that must be paid to an authority.

Packing material weights and fees are calculated for sales order lines and purchase order lines.

You can define one or more packing units for a single item, a group of items (packing group), or all items. A packing unit consists of the packing materials, their weights, and the number of items that are included in the packing unit. A packing material code is assigned to each type of packing material that is defined. Based on the packing material code, you can specify a price for a specific period. The packing material fee is calculated based on this information.

> **Note**
>
> Even if your company doesn't pay packing material fees, you can use the functionality to calculate statistics for the weights of packing materials.

Set up packing material allocation

Before you can calculate packing material weights, packing material fees, or both, you must turn on the calculation and define which materials and fees apply to which items.

1. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters**.
2. On the **General** tab, in the **Packing material** section, set the **Calculate packing material fees** option to **Yes**.
3. Go to **Inventory management** > **Setup** > **Packing material** > **Packing groups**, and create all the packing groups that you use. All the items in a packing group will use the same packing material allocation. If you don't use packing groups, you can skip this step.

   > **Tip**

After you've created your packing groups, can assign a group to each product as you require. Go to **Product information management** > **Products** > **Released products**, select a product, and then, on the **Manage inventory** FastTab, in the **Packing group** field, select the appropriate packing group.

4. Go to **Inventory management** > **Setup** > **Packing material** > **Packing material codes**, define each type of packing material that you use, and specify the unit that the packing material is consumed in when you prepare shipments.

5. Go to **Inventory management** > **Setup** > **Packing material** > **Packing material fees**, and set a fee for each type of packing material that you just defined. Fees are calculated based on the price per unit that is consumed.

6. To allocate packing materials to items, go to **Inventory management** > **Setup** > **Packing material** > **Packaging material allocation**, and create allocations. You can create as many allocations as you require. You can allocate packing materials for individual items, groups of items (packing groups), or all items, depending on how detailed your allocations should be.

   For each allocation that you create, follow these steps.

   a. On the **General** FastTab, set the following fields:

   - **Item code** – Select the scope of the allocation:
     - **Table** – Create an allocation for a single specific item.
     - **Group** – Create an allocation for all the items the belong to a packing group that is defined on the **Packing groups** page.
     - **All** – Create an allocation for all items.

     > ⓘ **Note**
     >
     > Usually, you should make all your allocations at the same level (**Table**, **Group**, or **All**). If you use more than one level, the most specific matching allocation will be used for each item. (The **Table** level takes precedence over the **Group** level, and both those levels take precedence over the **All** level.)

   - **Item relation** – If you're allocating for a single item, select the item. If you're allocating for a group of items, select the packing group. If you're allocating for all items, leave this field blank.

- **Configuration**, **Size**, **Color**, and **Style** – Enter values for these dimensions as you require, to further define the item that you're allocating for.
- **Packing unit** – Select the unit that the item is packaged in when the packing material is used. This unit might differ from the unit that the item is purchased and stored in.
- **Packing unit factor** – Enter the conversion factor that is used to convert from the inventory unit to the packing unit. (The conversion uses the formula *Packing units = Item units × Packing unit factor*.)

b. On the **Packing material** FastTab, add a line for each piece of packing material that is required for the current allocation. On each line, specify the type of material (as defined on the **Packing material codes** page) and the amount of it that is consumed for each shipped unit of the current item.

Packing units on sales order lines

After you've turned on the calculation for packing material fees and set up your allocations, the system verifies that packing units are specified for each item that is added to a sales order. It then calculates any fees that are required. When an item is added to a sales order, one of the following steps occurs:

- **If a packing allocation applies to the item:** The system updates the sales order line with the specified packing unit and the packing unit quantity. (The packing unit quantity is calculated by using the formula *Packing unit quantity = Ordered quantity ÷ Number of items in the selected packing unit*.)
- **If no packing allocation applies to the item:** You can manually enter a packing unit and a packing unit quantity on the sales order line.

You can also change the packing unit and the packing unit quantity when you post the sales order line. This capability is relevant if the sales order line is only partly delivered or partly invoiced.

When you invoice the sales order, the system creates packing material transactions. Packing material transactions contain the weights of the packing materials for the sales line. You can modify the transactions after you invoice them. You can then create new transactions.

Packing units on purchase order lines

The system doesn't create packing material transactions for purchase order lines. Instead, you manually create transactions for invoiced purchase order lines on the **Packing material transactions** page.

Set up license numbers for customers that are charged packing material fees

If the sales orders for a specific customer should include charges for the packing materials that are used for each order, follow these steps.

1. Go to **Accounts receivable** > **Customers** > **All customers**.
2. Select the customer that should be charged for packing materials.
3. On the **Invoice and delivery** FastTab, set the following fields:
    - In the **Sales tax** section, in the **Packing duty license number** field, enter the company's license number.
    - In the **Packing material fee** section, in the **License number** field, enter the company's license number.

Now, when you create and invoice a sales order that includes one or more items that use packing materials, the invoice will show the packing material fees.

For customers that should not pay packing material fees, follow these same steps, but clear the license numbers from the **Packing duty license number** and **License number** fields. Invoices for customers that don't pay packing material fees show the weights of the packing materials, but they don't show the fees.

To generate a report that shows all the packing material fees that your company will owe for a specific period, go to **Inventory management** > **Inquiries and reports** > **Packing material reports** > **Packing material fee calculation**, specify a range of dates, and then select **OK**.

Print packing material weights on invoices

You can print packing material weights on an invoice and indicate who pays the related fees. The weights are summarized by packaging code.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Updates** tab, on the **Invoice** FastTab, set the **Print packing material weight** option to **Yes**.

Pack containers for shipment

The container packing process lets you validate inventory items and pack them into containers. During this process, warehouse workers typically pick inventory items from bulk storage areas and move them to a packing area. Multiple warehouse workers check the item quantities and types, and assign them to appropriate container sizes. When a container is fully packed, workers close it and move it to the outbound dock area, where it's made ready for shipment.

Containers represent physical structures that items are packed in, and you can track container information in the system. This information can be useful during transportation planning, especially if you calculate shipping charges based on containers. Before you ship, you can view the number of containers that are used in a shipment, the types of containers that are used, and the physical dimensions of each container, such as the total volume and weight.

You can use several related outbound warehouse capabilities with containers. For more information, see the following articles:

- Wave containerization
- Outbound sorting
- Small parcel shipping
- Confirm and transfer
- Set different dimensions for packing and storage
- Packing work for packing outbound containers and processing shipments
- Packing containers with the Warehouse Management mobile app
- Example scenario – Pack containers with the Warehouse Management mobile app
- Container label layouts and printing

Set up your warehouse to use manual packing operations

Organize your outbound operations in one of two ways:

- **Wave creation and processing** – Workers pick items based on outbound warehouse work. They then put the items directly in an outbound shipping location, where they're ready for immediate shipment. For information about how to set up and use this process, see Wave creation and processing.

- **Manual packing at packing stations** – This process has an additional operation between the picking and shipping operations. Instead of putting the inventory in a *bay door shipping location*, workers put it in a *packing location*. They then manage the packing process at the packing station by using the **Pack** page in the web client. To enable this process, you must configure your system as described in this section.

Set up warehouse locations for packing

You need at least one packing location where workers put inventory items so they can be packed into containers. For more information about how to create warehouse locations, see Configure locations in a WMS-enabled warehouse. The following subsections describe how to create and set up packing locations.

Set up location types for packing

You must define a *location type* for the packing locations. Use location types as filtering options to control the different warehouse management processes. The name of each location type typically describes something about how that location type should be used. Associate the location type that you set up here with each location used for packing operations.

Follow these steps to set up a location type.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location types**.
2. On the Action Pane, select **New** to add a location type to the grid.
3. Set the following fields for the new location type:
    - **Location type** – Enter a name for the location type. Each name must be unique and should describe something about how the location type is intended to be used.
    - **Description** – Enter a short description of the location type.

Inform the system about the packing location type

After you create a location type, set up your system to recognize it as the location type to use for packing operations.

Follow these steps to set the location type that is used for packing operations.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**
2. On the **General** tab, on the **Location types** FastTab, set the **Packing location type** field to the location type that you use to identify packing stations.

> **Note**
>
> If you're upgrading from a version of Microsoft Dynamics AX, the *In packing* status is removed from shipments and loads, because it didn't work consistently and caused redundant data. Therefore, the **In shipments** and **Loads in packing** list pages are deprecated. Track containers that must be packed at the location level.
>
> In previous versions, you defined the packing location by using the **Profile ID for packing location** field on the **Packing** tab of the **Warehouse management parameters** page to specify a *location profile*. In the current version, use the **Packing location type** field on the **General** tab of the **Warehouse management parameters** page to specify a *location type*, as described in this article. The new field is better aligned with the process for identifying staging locations and final shipping locations.
>
> Although you can continue to use the old **Profile ID for packing location** field, start using the new **Packing location type** field instead, because the old field will be eventually deprecated.
>
> If you clear the setting of the old **Profile ID for packing location** field and then save the page, the field is permanently disabled. For installations where the **Profile ID for packing location** field is never used, it's always disabled. After you clear the setting of the **Profile ID for packing location** field, use the settings that are described in this article to set up and identify your packing location.

Set up location profiles for packing locations

Each *location profile* establishes information and rules that apply to the associated locations. Because you need at least one location to use for packing operations, you must create a location profile for it in addition to a location type. Each profile can be used by any number of locations. Locations that are used for packing must be set up to track license plates.

Follow these steps to set up a location profile for a packing location.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. Either select an existing profile from the list pane or select **New** on the Action Pane to create a new one.
3. On the header of the new or selected profile, set the following fields:

- **Location profile ID** – Enter a unique ID for the profile.
- **Name** – Enter a descriptive name for the profile.

4. On the **General** FastTab, set the following fields:

    - **Location format** – Select the location format to use for the current location. Location formats are a naming system that is used to create unique and consistent names for the different location bin positions that are used in a warehouse. If you don't already have the format that you need, you can create it by going to **Warehouse management** > **Setup** > **Warehouse** > **Location formats**. Learn more in Configure locations in a WMS-enabled warehouse.
    - **Location type** – Select the location type that is set up as the packing location type on the **Warehouse management parameters** page, as described earlier in this article.
    - **Use license plate tracking** – For packing locations, set this option to *Yes*. The system must be able to track license plate IDs at packing locations, so that it can control the packing process.
    - **Allow negative inventory** – For packing locations, set this option to *No*.
    - **Allow mixed items** – For packing locations, set this option to *Yes*. This setting is required because many different item numbers are typically brought to the packing locations at the same time.
    - **Allow mixed inventory statuses** – For packing locations, set this option to *Yes*. This setting is required because items that have different inventory statuses are typically brought to the packing locations at the same time.
    - **Allow mixed inventory batches** – For packing locations, set this option to *Yes*. This option is automatically set to *Yes* whenever the **Allow mixed items** option is set to *Yes*.

Set up packing locations

You must have at least one *location* where workers put inventory items that must be packed into containers.

Follow these steps to add a packing location.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.

2. On the Action Pane, select **New** to add a location.

3. Set the following fields for the new location:

    - **Warehouse** – Specify the warehouse where the packing location must exist.
    - **Location** – Enter a name for the new location.

- **Location profile ID** – Specify the ID that you created in the previous section.

Set up the packing process

This section describes how to configure settings that enable the packing process and let workers pack inventory into containers.

Set up container packing policies

Each *container packing policy* defines how to process a container. Each time you create a new container, select a container packing policy to apply to it.

Follow these steps to set up a container packing policy.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container packing policies**.

2. Either select an existing policy from the list pane or select **New** on the Action Pane to create a new one.

3. On the header of the new or selected policy, set the following fields:

    - **Container packing policy** – Enter a unique name for the policy.
    - **Description** – Enter a descriptive name for the policy.

4. On the **Overview** tab, set the following fields. These fields specify what actions to take when the container closes, whether to operate with or without work creation, and when to release the container from the packing station.

    - **Weight unit** – Select the default unit of measure to use when a container is closed and manifested. Typically, this unit of measure is the unit of measure that a scale at the packing station uses. This field applies to policies with or without work creation.

    - **Container closing policy** – Select one of the following options to define what should occur when the container is closed:
        - *Automatic release* – The container is considered released from the packing station, and the action that is specified in the **Container release policy** field is triggered.
        - *Delayed release* – The container isn't immediately released from the packing station. A warehouse worker must manually release it later.
        - *Optional* – While a worker is closing the container, they can choose whether the container should be released.

If the packing station mainly handles single containers that ship directly to customers, the most natural approach is to release the containers immediately. If the packing station handles shipments that consist of multiple containers or even pallets, it's probably best to delay the release until the whole shipment or pallet is packed and ready for pickup.

- **Container release policy** – Select one of the following options to define what occurs when the container is released from the packing location:
  - *Make available at final shipping location* – Update the container to the final shipping location. If you select this option, use the **Default location for final shipment** field to specify a preferred location for the container after it's closed.
  - *Create work to move container from packing station* – Create work to move the container from the packing station to the staging area or directly to the bay door. Use the **Work template** field to specify the work template that should be applied when work is created for the container.
  - *Assign container to outbound sorting position* – This option is used with the outbound sorting capability.

  In most cases, create work to move containers, because this approach better represents the actual manual processes in the warehouse. However, for simple scenarios, or situations where the packing station is located directly in the bay door area, it might be preferable for the container to be immediately available at the final shipping location.

- **Work template** – Select the work template that should be applied when work is created for the container. This field is available only when the **Container release policy** field is set to *Create work to move container from packing station* and related to a work order type that is named *Packed container picking*. Learn more in Work templates and location directives.

5. On the **Warehouse selection** FastTab, set the following fields:

- **Warehouse selection** – Select one of the following values:
  - *All* – Use this policy for all warehouses where a more specific policy isn't assigned.
  - *Warehouse group* – Use this policy for all warehouses in the warehouse group that's selected in the **Warehouse group** field.
  - *Warehouse* – Use this policy only for the specific warehouse that's selected in the **Warehouse** field.

- **Warehouse** – If the **Warehouse selection** field is set to *Warehouse*, select the warehouse where the packing policy applies.
- **Warehouse group** – If the **Warehouse selection** field is set to *Warehouse group*, select the warehouse group where the packing policy applies. For more information about how to set up warehouse groups, see Warehouse groups.
- **Default location for final shipment** – Specify the preferred location for the container after it's closed. This field is available only when the **Container release policy** field is set to *Make available at final shipping location* and the **Warehouse selection** field is set to *Warehouse*.
- **Default location for sorting** – This field is used with the outbound sorting capability. It's available only when the **Warehouse selection** field is set to *Warehouse*.

In the remaining steps, you'll configure settings that are related to *manifesting*. Manifesting is the process of specifying the weight of a container, container group, or shipment, together with the tracking ID that's received from a transportation provider. Dynamics 365 Supply Chain Management doesn't integrate with external transportation provider systems. Instead, warehouse workers must print labels that are received from the transportation provider and then scan a tracking number when they complete the manifest procedure.

Because manifest requirements vary from customer to customer, and even from shipment to shipment, packing policies allow for significant flexibility in the workflow. You can set up manifests for containers, container groups, and shipments in any combination.

If you're using a multilevel manifest procedure, workers must manifest all containers before they manifest the related container group, and they must manifest all container groups before they manifest the related shipment.

6. On the **Container manifest** FastTab, set the following fields:

- **Automatic manifest at container close** – Set this option to *Yes* to apply manifest information as part of the container closing process. If you aren't using transportation integration, you must manually record the information.
- **Manifest requirements for container** – Select one of the following options:
  - *None* – No manifesting process will be used.
  - *Manual* – Manifesting is required by the packing workflow. The system doesn't allow a container to be closed or released until manifesting is completed.

    - *Transportation management* – Manifesting will be done through Transportation management (TMS) rate engines. Because this option requires custom development to implement a specific engine for the transportation provider, it doesn't work out of the box in the current version.

- **Print container contents** – Set this option to *Yes* to automatically print the container contents report when a container is registered as closed. You can also print the report on demand.

7. On the **Container group manifest** FastTab, in the **Manifest requirements for container group** field, select one of the following options:

    - *None* – The container group manifest won't be included as a requirement in the packing workflow.
    - *Manual* – The packing workflow includes the container group manifest as a requirement. All containers that are included in the group must be closed before the group can be manifested. Select this option if you're required to complete a manifest for every container group that is packed at the packing station. Typically, select this option if containers are packed on a pallet and the whole pallet is manifested.

    > ⓘ **Note**
    >
    > The current version doesn't support manifest reports for container groups, and there's no TMS engine support for container groups.

8. On the **Shipment manifest** FastTab, set the following fields:

    - **Manifest requirements for shipment** – Select one of the following options:
        - *None* – The shipment manifest won't be included as a requirement in the packing workflow.
        - *Manual* – The packing workflow includes the shipment manifest as a requirement. No container for a shipment can be released until manifesting is completed.
        - *Transportation management* – Manifesting is done through TMS rate engines. Because this option requires custom development to implement a specific engine for the transportation provider, it won't work out of the box in the current version.

    Shipment manifesting should be enabled if you're required to complete a manifest for the whole shipment that is packed at the packing station. It's typically used when one

consolidated manifest is required even though the shipment consists of multiple containers or container groups.

- **Print packing slip** – Set this option to *Yes* to automatically print the packing slip as part of the shipment manifest. You can also print the packing slip on demand.

- **Print packing slip asynchronously** – This option is available only when the **Print packing slip** option is set to *Yes*. Set this option to *Yes* to process sales packing slips asynchronously by using the message processor. In this case, the system queues sales packing slip postings to the message processors by using messages of the *Run packing slip for container* type to the *Warehouse* queue. This setting requires that you also set the **Packing slip posting parameters ID** field. For more information about how to set up and use the message processor, and how to schedule the batch job that's required to process the messages, see Monitor and control message processor messages.

- **Packing slip posting parameters ID** – This setting applies when the **Print packing slip asynchronously** option is set to *Yes*. You must define at least one set of parameter settings on the **Packing slip posting parameters** page (**Warehouse management** > **Setup** > **Inventory** > **Packing slip posting parameters**) and select the ID for the set of settings that you want to use here. The parameter settings are used when the last container for a shipment is closed. Warehouse workers aren't prompted to confirm the values. If you're using the *Container closing* process for the Warehouse Management mobile app, this process is the only one that's supported for automatic posting of packing slips.

Set up container types

During the manual packing process, containers must be created before items can be packed into them. Each container must be based on a *container type*, which defines a container's maximum physical volume and weight capacity.

Follow these steps to create a container type.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container types**.

2. On the Action Pane, select **New** to add a container type.

3. Set the following fields for the new container type:

    - **Container type code** – Enter a unique ID for the container type.

- **Description** – Enter a description of the new container type.
- **Tare weight** – Enter the actual or estimated weight of the container.
- **Maximum net weight** – Enter the maximum weight that the container can hold.

4. In the **Container dimensions** section, enter the physical dimensions of the container itself in the **Length**, **Width**, **Height**, and **Volume** fields.

5. In the **Maximums** section, enter the maximum physical dimensions that the container can handle in the **Length**, **Width**, **Height**, and **Volume** fields.

6. You can define additional attributes for container types that are associated with other operations that use containers. To learn more, see Containerization.

> **Note**
>
> For the manual packing process, the system uses only the value of the **Maximum net weight** field and the value of the **Volume** field in the **Maximums** section.

Set up packing profiles

Packing profiles are required for the packing process. They can be selected or set by default when you start a packing operation on the **Pack** page.

Follow these steps to set up a packing profile.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing profiles**.

2. Either select an existing profile from the list pane or select **New** on the Action Pane to create a new one.

3. Make the following settings for your new or selected profile:

   - **Packing profile ID** – Enter a short ID for the profile.
   - **Description** – Enter a description of the packing profile.
   - **Container packing policy** – Select the packing policy that applies to the profile. For more information, see the Set up container packing policies section of this article.
   - **Container ID mode** – Select whether to automatically generate a container ID on creating a container, or whether to manually create it.
   - **Container type** – Select the container type that's used by default when a new container is created.

- **Autocreate container at container close** – Select this checkbox to automatically create a new container if the previous container is closed, and one or more lines remain in the current shipment.
- **Print container label at container creation** – Select this checkbox to automatically print a container label when a new container is created. For more information about how to set up your container label layouts, see Container label layouts and printing.
- **Prevent editing container ID** – Select this check box to prevent automatically assigned container IDs from being edited.
- **Prevent container creation without items to pack** – Select this checkbox to prevent containers from being created when there aren't any items to pack for a given shipment and packing location.

Set up warehouse workers

Every user or worker who packs containers by using the **Pack** page of the web client or the *Packing* activity code in the Warehouse Management mobile app must have a user account that's associated with a *worker/person* record that has the required security access rights assigned. For more information about how to set up users, see Create new users.

Follow these steps to set up a *worker/person* record for the packing process.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. On the Action Pane, select **New** to add a work user.
3. Set the **Worker** field to the existing worker record defined in the **Human resources** module for the user who completes the packing process.
4. On the **Profile** FastTab, set the following fields:
    - **Container packing policy** – Select a container packing policy that defines how containers at the packing station should be processed. The container packing policy that you select is preselected for the worker when they open the packing station. For more information, see the following blog post: Improved packing functionality.
    - **Packing profile ID** – Select a packing profile ID that defines the packing policy and container settings that should be used. If the selected packing profile ID is associated with a container packing policy, you can't change the setting of the **Container packing policy** field on this page.

5. On the **Default packing station** FastTab, select the default site, warehouse, and location that apply to the worker.

6. If the worker uses the Warehouse Management mobile app to manage and register their container packing work, on the **Users** FastTab, set up one or more accounts that the worker can use to sign in to the app. Learn more in Mobile device user accounts.

Example scenario

This section provides an example scenario that shows how to create an order and pack the items.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this scenario as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

Sign in as a user that can do packing work

Sign in to Supply Chain Management by using a user account that has the permissions required to pack containers. The user *Julia Funderburk* is included as part of the demo data and has the required permissions. This user has the user ID *Admin*.

Create a sales order and complete the work

Follow these steps to create a sales order and complete the work of moving the ordered items to the packing station.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New**.

3. In the **Create sales order** dialog box, in the **Customer account** field, select *US-005*.

4. Select **OK** to close the dialog box.

5. The new sales order is opened and includes a single, empty line on the **Sales order lines** FastTab. Set the following values for the new order line:

- **Item number:** *A0001*
- **Quantity:** *2*
- **Site:** *6*
- **Warehouse:** *62*

6. While the order line is still selected, select **Inventory** > **Reservation** on the toolbar of the **Sales order lines** FastTab.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.

8. Close the **Reservation** page to return to the sales order.

9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

   A message shows the shipment and wave IDs for the order.

10. While the order line is still selected, select **Warehouse** > **Work details** on the toolbar of the **Sales order lines** FastTab. If you use batch processing to run your waves, you might have to wait a short time for the work to be created.

11. On the **Work** page, on the Action Pane, on the **Work** tab, select **Complete work**.

12. On the **Work completion** page, set the **User ID** field to *62*.

13. On the Action Pane, select **Validate work**.

14. When you receive a message that indicates that your work is valid, select **Complete work** to complete the process of picking the inventory items and putting them in the *Pack* location.

15. Make a note of the **Shipment ID** value that is shown for the work in the upper grid.

Pack the ordered items into a container

The inventory items are now at the packing area and are ready to be packed into containers. Follow these steps to create a new container in the system and pack it.

1. Go to **Warehouse management** > **Packing and containerization** > **Pack**.

2. In the **Select packing station** dialog box, set the following values:

   - **Site:** *6*
   - **Warehouse:** *62*

- **Location:** *Pack*
- **Packing profile ID:** *WH62*

3. Select **OK**.

4. On the **Pack** page, in the **License plate or shipment** field, enter the shipment ID that you noted earlier. You should now see the remaining unpacked items on the **Open lines** FastTab.

5. On the Action Pane, select **New container** to create a container in the system.

6. In the **ID of the new container** dialog box, set the **Container type** field to *SmallBox*.

7. Select **OK** to create the container.

8. Select **OK** to return to the **Pack** page. The **Open containers** FastTab now shows the **Container ID** value of the container that you created.

9. For this scenario, pack just one of the ordered items. On the **Item packing** FastTab, set the following values:

   - **Quantity:** *1.00*
   - **Identifier:** *A0001*

   Immediately after you select the **Identifier** value, the page updates the **Open lines** and **All lines** FastTabs to indicate that one item is packed. You should now have packed one of the two pieces of item *A0001*.

10. On the Action Pane, select **Close container**.

11. In the **Close container** dialog box, select **Get system weight** to fill in the default **Gross weight** value.

12. Select **OK** to close the container.

> **Tip**
>
> You can view containers in various ways based on context. For example, when you pack a shipment, it's often useful to view either containers that are part of the shipment or all containers that are physically at a packing station. The **Packing station** page has buttons that you can use to view all open and closed containers at a packing station. These views aren't restricted to a specific shipment. They can be very helpful in situations where one

worker is packing a container, and another worker is manifesting and releasing the container.

A consolidated view of all containers is also available. This view is useful mostly for users who work outside the context of a single packing station. To see it, go to **Warehouse management** > **Packing and containerization** > **Containers**.

Last updated on 04/22/2026

Packing work for packing outbound containers and processing shipments

This article describes the *Packing* work order type, which manages work for packing containers and supports partial shipments of packed containers that are related to loads where inventory items remain unpacked. Packing work lets you use confirm and transfer functionality to confirm outbound shipments that are associated with containers.

Packing work is automatically created when inventory that is related to source document work is put in locations of the *Packing location* type. The work consists of two lines, one for *Pick* and one for *Put*, and is automatically maintained as part of a container close/reopen process.

> **Note**
>
> In Supply Chain Management version 10.0.45 and later, the Warehouse Management mobile app can record the worker IDs of workers that use it to do packing work. Learn more in Create containers, Close containers, and Pack inventory into containers.

For more information about how to set up and use the container packing process, see Pack containers for shipment.

Set up a location for packing work

Use the following procedure to set up packing locations. For each location, you can select whether the system automatically creates packing work.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing station setup**.
2. On the Action Pane, select **New** to add a packing station setup record.
3. In the new record, set the following fields:
    - **Warehouse** – Select or enter the warehouse where the packing location is located.
    - **Location** – Select or enter the packing location. This location must be assigned to a location profile that uses the location type that is configured as the packing location type for your company on the **Warehouse management parameters** page. Learn more in Pack containers for shipment.

- **Create packing work** – Select this checkbox to create packing work each time that items are delivered to the packing location. The work includes links to related load lines, so that partial loads can be packed and shipped.

> ⊗ **Caution**
>
> Before enabling the **Create packing work** option, make sure the packing station is empty (no items are present).

Example scenario

This example scenario shows how to process an outbound sales order flow by packing a container and shipping a partial load.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this scenario as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

Configure packing work for warehouse packing location

To get started, you must configure the *Packing* work process for a specific warehouse and location.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing station setup**.
2. On the Action Pane, select **New** to add a setup record.
3. In the new record, set the following values:
    - **Warehouse:** *62*
    - **Location:** *Pack*
    - **Create packing work:** *Yes*
4. Close the **Packing station setup** page.

Create a load template that allows partial shipping

To enable a load to be delivered over multiple shipments, associate it with a load template that allows partial shipping. Follow these steps to create the required template.

1. Go to **Warehouse management** > **Setup** > **Load** > **Load templates**.
2. On the Action Pane, select **New** to add a setup record.
3. In the new record, set the following values:
    - **Load template ID:** *Partial*
    - **Allow load split during ship confirm:** *Yes*
4. Close the **Load templates** page.

Learn more in Confirm and transfer.

Process a sales order

Follow these steps to process a sales order and partially ship it.

1. Complete the example scenario that is provided in Pack containers for shipment. During that scenario, you create a sales order for two pieces of one item. You then pack just one of the pieces into a container and close the container. Make a note of the shipment ID that you create, as instructed in the scenario.
2. Go to **Warehouse management** > **Work** > **All work**.
3. In the filter area, select the **Show closed work** checkbox. Then enter the shipment ID in the **Filter** field, and select to filter by **Shipment ID** value. You should now see three work headers. One is for the sales order picking work and has a status of *Closed*. Two are for the packing process: one is related to the closed container and has a status of *Closed*, and the other is related to the unpacked remaining item and has a status of *Open*.
4. Select the **Load ID** value for any of the work headers to open **Load details** page for the load.
5. Switch to the **Header** view.
6. On the **General** FastTab, select the **Edit** button for the **Load template ID** field. Then select the partial shipping load template that you created for this scenario (*Partial*).
7. On the Action Pane, on the **Ship and receive** tab, in the **Confirm** group, select **Outbound shipment**.
8. In the **Ship confirm** dialog box, select the **Split quantity to new load** option.
9. Select **OK**.

You shipped one container that is related to the original load, and the system creates a new load for the remaining items that must still be packed into containers.

Packing containers with the Warehouse Management mobile app

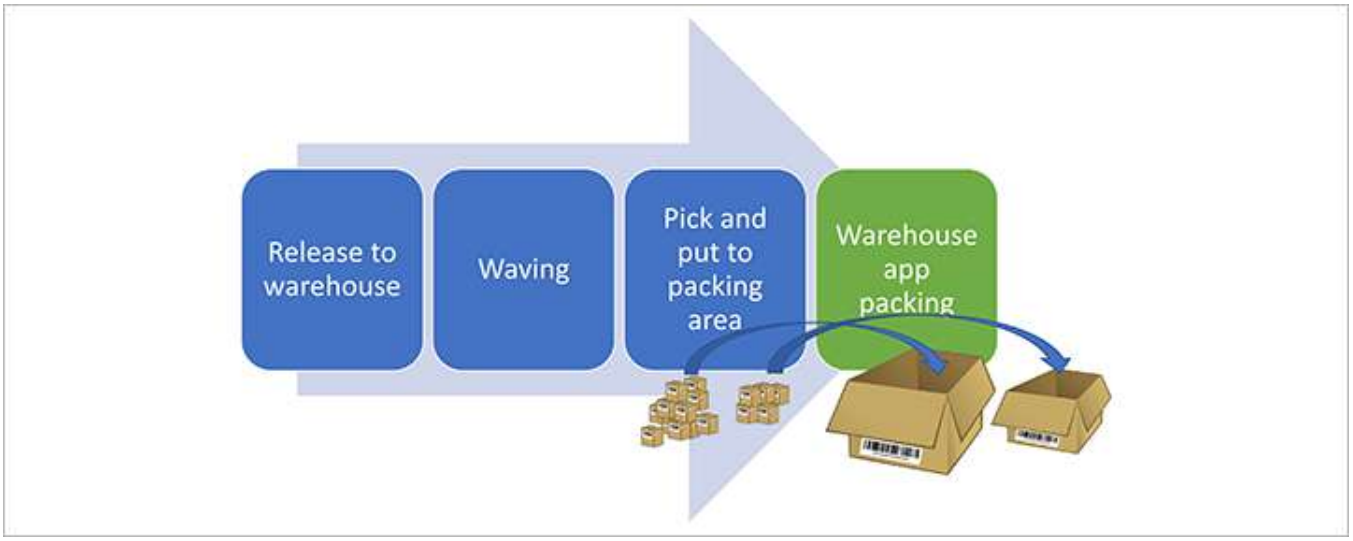
07/29/2025

Traditionally, warehouse workers have performed packing activities at a specific packing station that is configured in Microsoft Dynamics 365 Supply Chain Management, and they've used a process that is optimized for shipments of small to medium-sized parcels. To help improve efficiency in larger packing areas, and to better support the packing and shipment of larger items, the Dynamics 365 Warehouse Management mobile app provides a mobile packing experience that gives workers the freedom to move around while they perform their packing activities.

This article describes how to use the shipment container packing process in the Warehouse Management mobile app. This process can be used in combination with the process on the **Pack** page in the Supply Chain Management web client. For more information about the warehouse management packing process, see Pack containers for shipment.

The Warehouse Management mobile app packing process

As soon as the shipment inventory items have been brought forward to the packing area, workers can start the *Pack inventory into containers* process in the Warehouse Management mobile app.



To take advantage of all the supported packing processes in the Warehouse Management mobile app, you must set up the following mobile device menu items:

- **Pack inventory into containers** – This menu item is used for the main process of packing items into containers.
- **Container creation** – This menu item is used to create containers that shipment items will be packed into.
- **Container closing** – This menu item is used to close the shipment containers.
- **Container deletion** - This menu item is used to delete a container.
- **Print container label** - This menu item is used to manually print a container label.

We recommend that you use the detour functionality. This functionality makes Warehouse Management mobile app operations easier by embedding the *Container creation* and *Container closing* processes into the **Pack inventory into containers** menu item, especially when manual container creation and closing operations are used. We also recommend that you add several lookup options to the Warehouse Management mobile app by using data inquiries in combination with the detour functionality. This approach is especially effective in situations where bar codes are unreadable or missing.

Pack inventory into containers

The *Pack inventory into containers* process is controlled by the mobile device container packing policies that are associated with the relevant mobile device menu items. You can set up the system to require that workers manually specify and confirm the required information during the packing process. Alternatively, you can set up the system so that it automatically finds and applies the required data.

The process requires the following information (at a minimum):

- **Packing location** – This value identifies the location where the container is created. You can assign a default value for each worker by going to **Warehouse management** > **Setup** > **Worker** and/or by setting up a detour to look up the value.
- **Shipment ID** or **License plate ID** – These values are used to validate which inventory items should be packed. The process depends on the mobile device menu item's **Packing policy ID** setting.

Record and view container line packing details (preview)

[This section is prerelease documentation and is subject to change.]

When workers use the Warehouse Management mobile app to pack items into containers, the system can record container line packing details (such as worker IDs and packed quantities). This functionality can be useful, for example, if you have multiple workers processing a container line and you want to keep track of who did what.

> **Note**
>
> The functionality described in this section requires Supply Chain Management version 10.0.45 or later.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

To enable this functionality, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **Packing** tab.
3. Set **Create container line packing details** to *Yes*.

To view the logs created when **Create container line packing details** is set to *Yes*, follow these steps:

1. Go to **Warehouse management** > **Packing and containerization** > **Containers**.
2. On the upper pane, select the container you want to inspect.
3. Do one of the following steps:

    - To view details for all the container lines in the selected container, select **Container lines packing details** on the Action Pane.
    - To view details for a single container line, select the line in the lower pane and then select **Container line packing details** on the lower pane toolbar.

> **Important**
>
> A default container packing policy must be assigned to each relevant worker on the **Worker** page (**Warehouse management** > **Setup** > **Worker**).

Create containers

To create containers by using the Warehouse Management mobile app, workers must have the following information:

- **Packing location** – This value identifies the location where the container is created. You can assign a default value for each worker by going to **Warehouse management** > **Setup** > **Worker** and/or by setting up a detour to look up the value. When the *Create container* function is called from a detour that has a location, you can pass the value.
- **Shipment ID** – This value is used to validate which inventory items should be packed into the container. (You can assign a default value by setting up a detour.)
- **Container type ID** – This value is used to identify the maximum physical volume and maximum weight capacity of the container.
- **Container ID** – This value is a unique number that identifies the shipping container.

In Supply Chain Management version 10.0.45 and later, the system records the ID of the worker who created the container. To view this information, go to **Warehouse management** > **Packing and containerization** > **Containers** and inspect the **Created by** field.

> **Tip**
>
> The **Created by** field might not be shown. If you don't see it on your system, then you can add it by opening the **Grid options** menu (shown as a button with three dots at the right side of the grid heading) and selecting **Insert columns** .

> **Important**
>
> A default container packing policy must be assigned to each relevant worker on the **Worker** page (**Warehouse management** > **Setup** > **Worker**).

Close containers

Workers can trigger the *Container closing* process directly, by using a Warehouse Management mobile app menu. Alternatively, you can set up a detour to embed the process into the **Pack inventory into containers** menu item. During the *Container closing* process, the following values must be specified:

- **Container ID** – The container that is being closed.
- **Weight** – The weight of the container. The system assigns a default value, based on the item master weight definition.

In Supply Chain Management version 10.0.45 and later, the system records the ID of the worker who closed the container. To view this information, go to **Warehouse management** > **Packing and containerization** > **Containers** and inspect the **Closed by** field.

> **Tip**
>
> The **Close by** field might not be shown. If you don't see it on your system, then you can add it by opening the **Grid options** menu (shown as a button with three dots at the right side of the grid heading) and selecting **Insert columns** .

Supported and unsupported processes

The following table shows which processes are and aren't supported when the container packing process in the Warehouse Management mobile app is used instead of the **Pack** page in the Supply Chain management web client. Some rows use parentheses in the *Supported in the mobile app* column. These parentheses indicate either a partial-yes or partial-no status, which is clarified in the *Notes* column.

Expand table

Logic	Supported in the mobile app	Notes
Items enabled for **Catch weight**	No	
Identification of license plate/shipment	Yes	When you use a mobile device menu item without a **Packing policy ID** value (or when you use a packing policy where the **Starting step** field is set to *Scan shipment ID first*), the system will let workers pack physical on-hand inventory from multiple license plates by automatically selecting the "from" license plate. However, if you use a packing policy where the **Starting step** field is set to *Scan license plate ID first*, only physical on-hand inventory that's related to the selected license plate can be packed.
Identification of tracking dimensions	Yes	When you use a mobile device menu item without a **Packing policy ID** value (or when you use a packing policy where the **Capture tracking dimensions** field is set to *Skip capturing*), workers won't be asked to specify the tracking dimensions while they pack. However, if serial numbers are used, and the tracking dimensions group is set to capture serial at packing, workers will always have to specify the serial number. If you use a packing policy where the **Capture tracking dimensions** field is set to *Capture one by one*, the system won't enter default tracking dimensions. Therefore, workers will always have to specify the tracking dimensions.
Identification of product variant	Yes	

Logic	Supported in the mobile app	Notes
dimensions		
Identification via GS1 bar code scanning	Yes	You don't have to provide the quantity to pack (`QtyToPack`) as part of a primary input field. Instead, the system will automatically set the quantity to pack to a default value as part of the packing flow. Therefore, if you're using bar codes that include quantities, the GS1 bar code setup must have the **Allow overwriting** checkbox selected for the *QtyToPack* application identifier in the relevant bar code data policy.
Identification item via bar code setup	(Yes)	However, quantity and unit (piece-by-piece) scanning isn't supported.
New container	Yes	Containers can be created either automatically by using the *Autocreate container at container close* process or manually by using the **Container creation** mobile device menu item. The menu item also captures the container type and enters a default number sequence if the **Container ID mode** field is set to *Auto*.
Print container label	Yes	Labels can be printed either automatically during the *Container creation* process or manually by using either the **Print container label** mobile device menu or the **Containers** page in the web client. For more information about how to set up label printing, see Container label layouts and printing.
Close container	Yes	Containers can be closed by using the **Container closing** mobile device menu item, which also captures the weight.
Release container	No	The release of containers depends on the container closing policy. It isn't available as a mobile device menu option. Workers can't trigger or confirm a release by using the mobile app.
Reopen container	No	
Delete container lines	No	
Delete container	Yes	Containers can be deleted by using the **Container deletion** mobile device menu item. The container must be in the *Open* state, but it can have packed container lines. Those lines will also be deleted.
Change container packing policy	No	The default policy that is assigned to each worker on the **Worker** page (**Warehouse management** > **Setup** > **Worker**) is always used.
Release shipment	No	
Work details	(Yes)	You can make this information visible (read-only) by setting up a data inquiry detour.

Logic	Supported in the mobile app	Notes
Containers for shipment (Open/Closed)	(Yes)	You can make this information visible (read-only) by setting up a data inquiry detour.
Shipment details	(Yes)	You can make this information visible (read-only) by setting up a data inquiry detour.
Display dimensions	(No)	You can make this information visible (read-only) by setting up a data inquiry detour. However, capture of dimensions isn't supported.
Manifest containers	No	Only automatic manifesting setup is supported
Unmanifest containers	No	
Manifest container group	No	No weight capturing process is supported.
Unmanifest container group	No	
Manifest shipment	No	No weight capturing process is supported.
Unmanifest shipment	No	
Transport route rate details	(No)	You can make this information visible (read-only) by setting up a data inquiry detour.
Transport shipment accessorial charges	(No)	You can make this information visible (read-only) by setting up a data inquiry detour.
Transport status	(No)	You can make this information visible (read-only) by setting up a data inquiry detour.
Print packing slip	(Yes)	The setting for automatically processing sales packing slips as part of closing the last container for a shipment is supported by using the *Print packing slip asynchronously* process on the container packing policy.
Print container content	(No)	Only automatic printing (as part of the *Container closing* process) can be set up.
Print shipping label	(No)	Only automatic printing (as part of the *Container closing* process) can be set up.

Logic	Supported in the mobile app	Notes
Pack (all shipment items)	No	Each item number must be identified and packed individually.
Pack items (based on defined quantity)	(Yes)	However, items can be packed only *after* the item number has been identified by updating the quantity as part of the *Pack inventory into containers* process.
Container group license plate ID with delayed work creation	No	No group license plate ID can be specified. It isn't possible to close a container that has a **Container group license plate ID** value assigned.
Container type creation	No	

Next steps

- Learn how to set up mobile device container packing policies, which let you control the packing process that's supported by the Warehouse Management mobile app. See Mobile device container packing policies.
- Work through an example that shows how to set up and use this feature. See Example scenario – Pack containers with the Warehouse Management mobile app.
- Learn how to set up container labels and print them from the mobile app. See Container label layouts and printing.

Mobile device container packing policies

Article • 11/27/2024

Mobile device container packing policies let you control the packing process that's supported by the Warehouse Management mobile app.

For more information about how packing containers work with the Warehouse Management mobile app, see Packing containers with the Warehouse Management mobile app. For an example that shows how to set up and use this functionality, see Example scenario – Pack containers with the Warehouse Management mobile app.

Set up mobile device container packing policies

Follow these steps to set up your mobile device container packing policies.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Mobile device container packing policies**.

2. Follow one of these steps:

    - To create a new policy, select **New** on the Action Pane.
    - To edit an existing policy, select it in the list pane, and then select **Edit** on the Action Pane.
    - To delete an existing policy, select it in the list pane, and then select **Delete** on the Action Pane.

3. If you're creating or editing a policy, on the header of the new or selected policy, set the following fields:

    - **Packing policy ID** – Enter a unique name for the policy.
    - **Description** – Enter a short description of the policy.

4. On the **General** FastTab, set the following fields:

    - **Capture tracking dimensions** – Select one of the following options to indicate whether the worker must specify tracking dimensions in the *Pack inventory into containers* flow on the warehouse mobile device:
        - *Skip capturing* – The worker won't be asked to specify tracking dimensions during packing. However, if serial numbers are used, and the tracking

dimensions group is set to capture serial numbers at packing, the worker will be asked to specify the serial number.
    - *Capture one by one* – Tracking dimensions won't be set by default. Therefore, the worker will always have to specify them.

- **Starting step** – Select the first step that's shown in the *Pack inventory into containers* flow on the warehouse mobile device. (The step will be shown after the worker signs in to the packing station.)
    - *Scan shipment ID first* – The worker will be asked to scan a shipment ID. This option enables workers to pack items from multiple license plates as required.
    - *Scan license plate ID first* – The worker will be asked to scan the license plate ID. When you use this option, all items that will be packed must be found on the specified license plate. If the license plate contains items from multiple shipments, the worker will be prompted to specify which shipment to pack for.

- **Item selection** – Select which items will be packed in the *Pack inventory into containers* flow on the warehouse mobile device:
    - *Select item to pack* – The worker will be asked to scan an item to pack.
    - *Pack all remaining* – The worker will pack items for the specified shipment or license plate into the container. You can't use this option when tracking dimensions are captured.

- **Close container automatically** – This option is available only when the **Item selection** field is set to *Pack all remaining*. Set it to *Yes* to automatically close the container after all the items are packed. Because the worker won't be able to update the weight before they close the container, the weight from the item master data will be used.

- **Create container automatically** – This option is available only when the **Item selection** field is set to *Pack all remaining*. Set it to *Yes* to automatically create a new container at the start of the packing process. For this functionality to work, the following conditions must be met:
    - On the **Worker** page (**Warehouse Management** > **Setup** > **Worker**), in the worker record for each relevant worker, the **Packing profile ID** field must be set.
    - In the selected **Packing profile ID** record for each relevant worker, a **Container type** value must be assigned, and the **Container ID mode** field must be set to *Auto*.

5. On the Action Pane, select **Save**.

Assign a container packing policy to a mobile device menu item

For a mobile device container packing policy to take effect, you must assign it to each mobile device menu item where it applies. Follow these steps to assign a container packing policy a menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Follow one of these steps:

    - To create a new menu item, select **New** on the Action Pane.
    - To edit an existing menu item, select it in the list pane, and then select **Edit** on the Action Pane.

3. On the header of the new or selected menu item, set the following fields:

    - **Menu item name** – Enter a unique internal name for the menu item.
    - **Title** – Enter the display name that will be shown for the menu item in the mobile app.
    - **Mode** – This field must be set to *Indirect*.

4. On the **General** FastTab, set the following fields:

    - **Activity code** – This field must be set to *Pack inventory into containers*.
    - **Packing policy ID** – Select the mobile device container packing policy to use with the menu item.

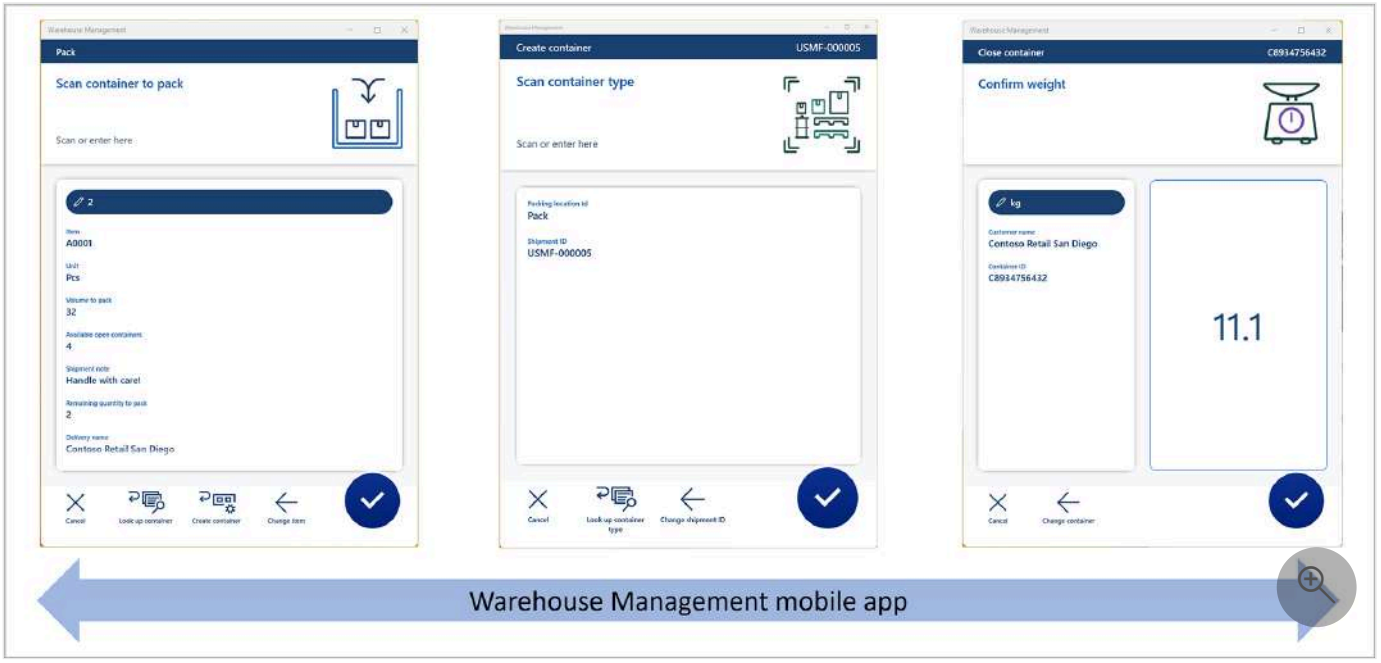
Example scenario – Pack containers with the Warehouse Management mobile app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an example scenario that shows how to set up a Warehouse Management mobile app packing flow, and how to use the flow in the Warehouse Management mobile app to process a simple outbound sales order by packing a container and closing it. The scenario takes advantage of the detour and data inquiry capabilities of the mobile app. For more information about the feature that enables this functionality, see Pack containers using the Warehouse Management mobile app.

The following illustration shows the packing functionality that this scenario adds to the mobile app.



You can establish a packing flow by creating mobile device menu items and detour handling. The example scenario that's provided in this article explains the menu items that aren't enclosed in parentheses in the following table.

Expand table

Pack inventory into containers	Container creation	Container closing	(Print container label)	(Container deletion)
Look up location	Look up container type	Look up container	(Look up container)	(Look up container)
Look up shipment				
Look up item				
Look up container				

Prerequisites

Use the Warehouse Management mobile app version 2.0.37.0 or later

To see the newest icons and user experience (UX) enhancements that are related to the mobile app packing process, you must use Warehouse Management mobile app version 2.0.37.0 or later.

Make sure the required fields are available to the app

Before you start to configure detours for the mobile application, make sure the required mobile application fields are set up on your system. Go to **Warehouse management** > **Setup** > **Mobile device** > **Warehouse app field names** and, if the list is empty, select **Create default setup** on the Action Pane. The default fields are then synchronized and made available for use with detours.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin. You can also use this scenario as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

The example scenario uses the demo data that is associated with the worker/person *Julia Funderburk*.

Set up a worker to pack containers

For each worker that uses the Warehouse Management mobile app to pack containers, you must set up a container packing policy and a packing profile ID as described in the following procedure.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. On the Action Pane, select **Edit**.
3. In the list pane, select *Julia Funderburk*.
4. On the **Profile** FastTab, set the following values:
    - **Container packing policy:** Select *WH62Close*. This policy moves containers to the *Baydoor* location when they're closed.
    - **Packing profile ID:** Select *WH62*. This profile doesn't create warehouse work after a container is closed. It also doesn't post a sales packing slip when the last container for a shipment is closed. For more information about how to set up this process, see Set up container packing policies.
5. On the **Default packing station** FastTab, set the following values:
    - **Site:** Select *6*. This site is the site for the warehouse that is used in this scenario.
    - **Warehouse:** Select *62*. This warehouse is already enabled for the packing process in the demo data.
    - **Location:** Select *Pack*. The Warehouse Management mobile app always prompts workers to confirm this value. Workers can edit it as required. If you don't provide a default packing location, workers must always scan or look up the packing location. You can enable that functionality by using the data inquiry capability.
6. On the Action Pane, select **Save**.

> ⓘ **Note**
>
> You can set up the system to automatically print container labels when a new container record is created. Learn more in **Container label layouts and printing**.

Create a mobile device menu item for packing inventory into containers

Follow these steps to create a mobile device menu item that workers can use to pack inventory into containers.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name** – Enter *Packing*. This value is the internal name for the menu item.
    - **Title** – Enter *Packing*. This value is the display name of the menu item in the mobile app.
    - **Mode** – Select *Indirect*.
    - **Activity code** – Select *Pack inventory into containers*.
    - **Packing policy ID** – Leave this field blank. The default process is used.
4. On the Action Pane, select **Save**.

> **Tip**
>
> To control other aspects of the packing process, create a packing policy and use the **Packing policy ID** field to assign it to your menu device menu item. For more information, see Mobile device container packing policies.

Create a mobile device menu item for creating containers

Follow these steps to create a mobile device menu item that workers can use to create containers.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** Enter *Create container*.
    - **Title:** Enter *Create container*.
    - **Mode:** Select *Indirect*.
    - **Activity code:** Select *Container creation*.

4. On the Action Pane, select **Save**.

Create a mobile device menu item for closing containers

Follow these steps to create a mobile device menu item that workers can use to close containers.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** Enter *Close container*.
    - **Title:** Enter *Close container*.
    - **Mode:** Select *Indirect*.
    - **Activity code:** Select *Container closing*.
4. On the Action Pane, select **Save**.

Add the three new mobile device menu items to the menu

After you create the required mobile device menu items, add them to the mobile device menu, so that workers can access them.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. In the list pane, select *Outbound*.
4. In the **Available menus and menu items** column, select the new *Packing* mobile device menu item, and then select the **Add** button (right arrow) to move it into the **Menu structure** column.
5. Repeat the previous step for the other two new menu items: *Create container* and *Close container*.
6. On the Action Pane, select **Save**.

Add a detour for creating a container

The setup that you completed so far now enables workers to use the mobile app to pack items into containers. However, because workers must be able to access the *Create container* and *Close*

container processes directly from the menu, you can streamline the process further. You add a detour so that workers can create containers from within the packing flow.

Follow these steps to enable new containers to be created on the packing flow page that prompts workers to scan the container that they want to pack.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the **Filter** field, enter *ContainerIdToPack* to open a drop-down list that shows possible searches. Select *Step ID:* "*ContainerIdToPack*" in the list.
3. In the grid, select the record. Then, on the Action Pane, select **Add step configuration**.
4. In the drop-down dialog box, set the **Menu item** field to *Packing*, and then select **OK**.
5. The details page for the new step configuration appears. (The name of the page is **Packing : ContainerIdToPack**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Create container* (one of the menu items that you created for this scenario).
7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.
8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.
9. In the **Select fields to send** dialog box, in the **Send from packing** section, set the following values for the blank row that's added:

    - **Copy from Packing:** *Location*
    - **Paste in Create container:** *Location*
    - **Auto submit:** *Selected* (Use this setting so that the worker doesn't have to confirm the value.)

    > ⓘ **Note**
    >
    > If the expected fields aren't shown in the dialog box, make sure the default mobile application fields are created in your system, as noted in the **prerequisites**.

10. Select **Add** on the toolbar to add another row. Then set the following values for it:

- **Copy from Packing:** *Shipment*
- **Paste in Create container:** *Shipment*
- **Auto submit:** *Selected*

11. In the **Bring back from create container** section, set the following values for the blank row that's added:

    - **Copy from Create container:** *Container ID*
    - **Paste in Packing:** *Container ID*
    - **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

12. Select **Add** on the toolbar to add another row. Then set the following values for it:

    - **Copy from Create container:** *Refresh* (This setting automatically updates the page after a return from the detour.)
    - **Paste in Packing:** *Refresh* (This setting triggers the update logic.)
    - **Auto submit:** *Selected* (This setting automatically updates the page so that, for example, the **Available open containers** field is updated.)

13. Select **OK** to close the dialog box.

14. Close the page.

> ⓘ **Note**
>
> Only Warehouse Management mobile app pages that contain the **Refresh** option can be used to trigger an automatic page refresh as part of a detour process. Therefore, you must include a row where both the **Copy from Create container** field and the **Paste in Packing** field are set to *Refresh*, and the **Auto submit** option is selected.

Add a detour for closing a container

Add another detour so that workers can close a container from within the packing flow.

Follow these steps to enable containers to be closed on the packing flow page that prompts workers to scan an item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.

2. In the **Filter** field, enter *ItemId* to open a drop-down list that shows possible searches. Select *Step ID: "ItemId"* in the list.

3. In the grid, select the record. Then, on the Action Pane, select **Add step configuration**.
4. In the drop-down dialog box, set the **Menu item** field to *Packing*, and then select **OK**.
5. The details page for the new step configuration appears. (The name of the page is **Packing : ItemId**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Close container* (one of the menu items that you created for this scenario).
7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.
8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.
9. In the **Select fields to send** dialog box, in the **Send from packing** section, set the following values for the blank row that's added:
    - **Copy from Packing:** *Location*
    - **Paste in Close container:** *Location*
    - **Auto submit:** *Cleared* (Use this setting to give workers the opportunity to inspect the location and choose whether to look up a container ID.)
10. Select **Add** on the toolbar to add another row. Then set the following values for it:
    - **Copy from Packing:** *Shipment*
    - **Paste in Close container:** *Shipment*
    - **Auto submit:** *Cleared* (Use this setting to give workers the opportunity to inspect the shipment and choose whether to look up a container ID.)
11. In the **Bring back from create container** section, don't add anything, because you don't want to pass any values back from this detour.
12. Select **OK** to close the dialog box.
13. Close the page.

Create the five lookup menu items

The setup that you completed so far enables workers to use the mobile app to pack inventory into containers. However, you can still add more lookup logic by using the data inquiry capability as part of the process. You add the following lookup mobile device menu items:

- **Look up location** – This menu item inquires about packing locations that inventory should be packed from.
- **Look up shipment** – This menu item inquires about shipments that must be packed.
- **Look up item** – This menu item inquires about item numbers that must be packed.
- **Look up container type** – This menu item inquires about container types for the container creation process.
- **Look up container** – This menu item inquires about containers that must be closed.

The following subsections explain how to set up these menu items.

Create a mobile device menu item to look up a location

Many different lookup capabilities enable lookups for packing locations. This section provides an example that shows how to set up a simple lookup to find locations that are related to a specific location profile. This lookup filters locations that are used for packing operations.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** *Look up location*
    - **Title:** *Look up location*
    - **Mode:** *Indirect*
4. On the **General** FastTab, set the following values:
    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *WMSLocation* (You want to look up warehouse locations based on, for example, a location profile ID.)
5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table. In this case, use the locations table. You can join to related tables as required.
6. In the query editor dialog box, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
Locations	Locations	Warehouse	
Locations	Locations	Location profile ID	PACK

In this query, the **Warehouse** field is automatically assigned based on the worker's current warehouse.

7. If you want to specify how the list should be sorted, set up the sorting on the **Sorting** tab.
8. Select **OK**.
9. In addition to defining the query, select which fields to show on the cards on the inquiry list page. Therefore, on the Action Pane, select **Field list**.
10. On the **Field list** page, set the following values:
    - **Display field 1:** *wMSLocationId* (This field value is used as the header for each card.)
    - **Display field 2:** *inventLocationId*
    - **Display field 3:** *LocProfileId*
    - **Display field 4:** *whsDisplayQty()*
    - **Display field 5:** *whsDisplayItemId()*
11. On the Action Pane, select **Save**. Then close the page.

Create a mobile device menu item to look up a shipment

Many different lookup capabilities enable lookups for shipments. This section provides an example that shows how to set up a simple lookup to find active shipments.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** *Look up shipment*
    - **Title:** *Look up shipment*
    - **Mode:** *Indirect*
4. On the **General** FastTab, set the following values:
    - **Activity code:** *Data inquiry*

- **Use process guide:** *Yes* (This value is automatically selected.)
- **Table name:** *WHSShipmentTable*

5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table. In this case, use the locations table. You can join to related tables as required.

6. In the query editor, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
Shipments	Shipments	Warehouse	
Shipments	Shipments	Shipment status	Open, Waved, "In process"

In this query, the **Warehouse** field is automatically assigned based on the worker's current warehouse.

7. If you want to specify how the list should be sorted, set up the sorting on the **Sorting** tab.

8. Select **OK**.

9. In addition to defining the query, select which fields to show on the cards on the inquiry list page. Therefore, on the Action Pane, select **Field list**.

10. On the **Field list** page, set the following values:

- **Display field 1:** *ShipmentId* (This field value is used as the header for each card.)
- **Display field 2:** *ShipmentStatus*
- **Display field 3:** *displayDeliveryName()*
- **Display field 4:** *displayNumberOfContainers()*
- **Display field 5:** *displayNumberOfLoadLines()*
- **Display field 6:** *displayTotalVolume()*
- **Display field 7:** *displayTotalWeight()*
- **Display field 8:** *displayShipmentDateTime()*

11. On the Action Pane, select **Save**. Then close the page.

Create a mobile device menu item to look up an item

Many different lookup capabilities enable lookups for item information. This section provides an example that shows how to look up item information based on load lines. However, you can filter

based on a wildcard search instead. You can also use the packing work feature to look up or join to closed put work lines for work that brings inventory to a packing area.

In this example, a simple lookup is filtered based on the shipment ID that was previously captured as part of the packing process.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** *Look up item*
    - **Title:** *Look up item*
    - **Mode:** *Indirect*
4. On the **General** FastTab, set the following values:
    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *WHSLoadLine*
5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table. In this case, use the locations table. You can join to related tables as required.
6. In the query editor, on the **Range** tab, make sure that only the following line appears in the grid.

Expand table

Table	Derived table	Field	Criteria
Load details	Load details	Shipment ID	

7. Select **OK**.
8. In addition to defining the query, select which fields to show on the cards on the inquiry list page. Therefore, on the Action Pane, select **Field list**.
9. On the **Field list** page, set the following values:
    - **Display field 1:** *ItemId* (This field value is used as the header for each card.)
    - **Display field 2:** *displayItemName()*
    - **Display field 3:** *displayCustName()*

- **Display field 4:** *displayInventQty()*
- **Display field 5:** *displayInventUOM()*

10. On the Action Pane, select **Save**. Then close the page.

Create a mobile device menu item to look up a container type

Many different lookup capabilities enable lookups for container types. This section provides an example that shows how to set up a lookup to find all container types.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** *Look up container type*
    - **Title:** *Look up container type*
    - **Mode:** *Indirect*
4. On the **General** FastTab, set the following values:
    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *WHSContainerType*
5. On the Action Pane, select **Edit query** to define a query that is based on the selected base table. In this case, you use the container type table. You can join to related tables as required.
6. In the query editor, on the **Range** tab, add the following line to the grid.

    Expand table

Table	Derived table	Field	Criteria
Container types	Container types	Container type code	*

    The wildcard character (*) in the **Criteria** field causes all container types to be shown.
7. If you want to specify how the list should be sorted, set up the sorting on the **Sorting** tab. In this example, you might want to sort on the **Maximum volume** field.
8. Select **OK**.

9. In addition to defining the query, select which fields to show on the cards on the inquiry list page. Therefore, on the Action Pane, select **Field list**.

10. On the **Field list** page, set the following values:

    - **Display field 1:** *ContainerTypeCode* (This field value is used as the header for each card.)
    - **Display field 2:** *Description*
    - **Display field 3:** *MaxVolume*
    - **Display field 4:** *MaxWeight*
    - **Display field 5:** *Height*
    - **Display field 6:** *Length*
    - **Display field 7:** *Width*
    - **Display field 8:** *FlexibleVolumeDimensions*

11. On the Action Pane, select **Save**. Then close the page.

Create a mobile device menu item to look up a container

Many different lookup capabilities enable lookups for containers. In this example, a new menu item is configured to find active containers in the current packing location related to the shipment that you're currently packing.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New** to add a mobile device menu item.

3. Set the following values for the new menu item:

    - **Menu item name:** *Look up container*
    - **Title:** *Look up container*
    - **Mode:** *Indirect*

4. On the **General** FastTab, set the following values:

    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *WHSContainerWarehouseLocationView* (By using this view, you enable the lookup to be limited so that it shows only containers for a specific packing location that is related to a specific shipment.)

5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table (in this case, the location table). You can join to related tables as required.

6. In the query editor, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
WHSContainerWarehouseLocationView	WHSContainerWarehouseLocationView	Warehouse	
WHSContainerWarehouseLocationView	WHSContainerWarehouseLocationView	Location	
WHSContainerWarehouseLocationView	WHSContainerWarehouseLocationView	Shipment ID	
WHSContainerWarehouseLocationView	WHSContainerWarehouseLocationView	Container status	!Closed

In this query, the **Warehouse**, **Location**, and **Shipment ID** fields are automatically set based on the detour setup.

7. If you want to specify how the list should be sorted, set up the sorting on the **Sorting** tab.

8. Select **OK**.

9. In addition to defining the query, select which fields to show on the cards on the inquiry list page. Therefore, on the Action Pane, select **Field list**.

10. On the **Field list** page, set the following values:

    - **Display field 1:** *ContainerId* (This field value is used as the header for each card.)
    - **Display field 2:** *ContainerStatus*
    - **Display field 3:** *Weight*
    - **Display field 4:** *WeightUOM*
    - **Display field 5:** *ContainerNum*
    - **Display field 6:** *ContainerReleased*
    - **Display field 7:** *ContainerTypeCode*

11. On the Action Pane, select **Save**. Then close the page.

Add the new mobile device menu items to a menu

The new mobile device menu items can be added to the mobile device menu. You need to complete this task before you can use the menu items as part of a detour process. In this example, you create a new submenu and add the new menu items to it.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **New**.
3. On the header of the new record, set the following values:
    - **Name:** *Inquire*
    - **Description:** *Inquire*
4. In the **Available menus and menu items** column, select the new *Look up container* mobile device menu item, and then select the **Add** button (right arrow) to move it into the **Menu structure** column.
5. Repeat the previous step for the other four new lookup menu items: *Look up container type*, *Look up item*, *Look up location*, and *Look up shipment*.
6. On the Action Pane, select **Save**.
7. In the list pane on the left, select the *Main* menu.
8. In the **Available menus and menu items** list, in the **Menus** section, select your new *Inquire* menu. Then select the **Add** button (right arrow) to move that item into the **Menu structure** list.

    > **Tip**
    >
    > Workers can only access menu items that are included in the menu assigned to their mobile device user account (or a submenu of that menu). This restriction also applies to menu items that are intended for use as detours, but which you might not want workers to access directly from the menu. In this case, add the detour items to the relevant menus and then hide the items. To hide an item included in a menu, right-click on it in the **Menu structure** column and select **Hide**. To show an item that is currently hidden, right-click on it and select **Show**.

Configure detours in your mobile device steps

To complete the setup, use the detour configuration on the **Mobile device steps** page to add the five new mobile device menu items to existing menu item flows.

In this example, you complete these tasks:

- Add *Look up location* to the *Packing - Scan packing location* step.
- Add *Look up shipment* to the *Packing - Scan shipment* step.
- Add *Look up item* to the *Packing - Scan item* step.
- Add *Look up container* to the *Packing - Scan container to pack* step.
- Add *Look up container type* to the *Create container - Scan container type* step.
- Add *Look up container* to the *Close container - Scan container* step.

Add the Look up location menu item as a detour for packing

Follow these steps to add the **Look up location** menu item as a detour.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the **Filter** field, enter *PackingLocationId* to open a drop-down list that shows possible searches. Then select *Step ID: "PackingLocationId"* in the list.
3. In the grid, select the record. Then, on the Action Pane, select **Add step configuration**.
4. In the drop-down dialog box, set the **Menu item** field to *Packing*, and then select **OK**.
5. The details page for the new step configuration appears. (The name of the page is **Packing : PackingLocationId**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up location* (one of the lookup menu items that you created for this scenario).
7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.
8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.
9. In the **Select fields to send** dialog box, in the **Send from packing** section, don't add anything, because you don't want to pass any values to this detour menu item.
10. In the **Bring back from create container** section, set the following values for the blank row that's added:

- **Copy from Look up location:** *Location*
- **Paste in Packing:** *Location*
- **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

11. Select **OK** to close the dialog box.

12. Close the page.

Add the Look up shipment menu item as a detour for packing

Follow these steps to add the **Look up shipment** menu item as a detour.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.

2. In the **Filter** field, enter *ShipmentId* to open a drop-down list that shows possible searches. Then select *Step ID: "ShipmentId"* in the list.

3. In the grid, select the record. Then, on the Action Pane, select **Add step configuration**.

4. In the drop-down dialog box, set the **Menu item** field to *Packing*, and then select **OK**.

5. The details page for the new step configuration appears. (The name of the page is **Packing : ShipmentId**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.

6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up shipment* (one of the lookup menu items that you created for this scenario).

7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.

8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.

9. In the **Select fields to send** dialog box, in the **Send from packing** section, don't add anything, because you don't want to pass any values to this detour menu item.

10. In the **Bring back from create container** section, set the following values for the blank row that's added:

    - **Copy from Look up location:** *Shipment ID*
    - **Paste in Packing:** *Shipment*
    - **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

11. Select **OK** to close the dialog box.

12. Close the page.

Add the Look up item menu item as a detour for packing

Follow these steps to add the **Look up item** menu item as a detour.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the **Filter** field, enter *ItemId* to open a drop-down list that shows possible searches. Then select *Step ID: "ItemId"* in the list.
3. In the grid, find the record that has a value of *Packing* in the **Menu item name** column, and select the link in the **Menu item name** column. This record is present because you already added a detour for this step of the packing process. You add another detour for it.
4. The details page for the new step configuration appears. (The name of the page is **Packing : ItemId**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
5. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up item* (one of the lookup menu items that you created for this scenario).
6. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.
7. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.
8. In the **Select fields to send** dialog box, in the **Send from packing** section, set the following values for the blank row that's added:
    - **Copy from Packing:** *Shipment*
    - **Paste in Look up item:** *Shipment ID*
    - **Auto submit:** *Selected* (Use this setting so that the worker doesn't have to confirm the value.)
9. In the **Bring back from look up item** section, set the following values for the blank row that's added:
    - **Copy from Look up item:** *Item number*
    - **Paste in Packing:** *Item*
    - **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)
10. Select **OK** to close the dialog box.

11. Close the page.

Add the Look up container menu item as a detour for packing

Follow these steps to add the **Look up container** menu item as a detour.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the **Filter** field, enter *ContainerIdToPack* to open a drop-down list that shows possible searches. Then select *Step ID:* "*ContainerIdToPack*" in the list.
3. In the grid, find the record that has a value of *Packing* in the **Menu item name** column, and select the link in the **Menu item name** column. This record is present because you already added a detour for this step of the packing process. You add another detour for it.
4. The details page for the new step configuration appears. (The name of the page is **Packing : ContainerIdToPack**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
5. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up container* (one of the lookup menu items that you created for this scenario).
6. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.
7. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.
8. In the **Select fields to send** dialog box, in the **Send from packing** section, set the following values for the blank row that's added:
    - **Copy from Packing:** *Location*
    - **Paste in Look up container:** *Location*
    - **Auto submit:** *Selected* (Use this setting so that the worker doesn't have to confirm the value.)
9. Select **Add** on the toolbar to add another row. Then set the following values for it:
    - **Copy from Packing:** *Shipment*
    - **Paste in Look up container:** *Shipment ID*
    - **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)
10. In the **Bring back from look up container** section, set the following values for the blank row that's added:

- **Copy from Look up container:** *Container ID*
- **Paste in Packing:** *Container ID*
- **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

11. Select **OK** to close the dialog box.

12. Close the page.

Add the Look up container type menu item as a detour for creating containers

Follow these steps to add the *Look up container type* menu item as a detour:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.

2. In the **Filter** field, enter *ContainerTypeToCreateContainer* to open a drop-down list that shows possible searches. Then select *Step ID:* "*ContainerTypeToCreateContainer*" in the list.

3. In the grid, select the record. Then, on the Action Pane, select **Add step configuration**.

4. In the drop-down dialog box that appears, set the **Menu item** field to *Create container*, and then select **OK**.

5. The details page for the new step configuration appears. (The name of the page is **Create container : ContainerTypeToCreateContainer**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.

6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up container type* (one of the lookup menu items that you created for this scenario).

7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.

8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.

9. In the **Select fields to send** dialog box, in the **Send from packing** section, don't add anything, because you don't want to pass any values to this detour menu item.

10. In the **Bring back from look up container type** section, set the following values for the blank row that's added:

    - **Copy from Look up location:** *Container type code*
    - **Paste in Packing:** *Container type code*

- **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

11. Select **OK** to close the dialog box.

12. Close the page.

Add the Look up container menu item as a detour for closing containers

Follow these steps to add the *Look up container* menu item as a detour:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.

2. In the **Filter** field, enter *ContainerId* to open a drop-down list that shows possible searches. Then select *Step ID:* "*ContainerId*" in the list.

3. In the grid, select the record that has a value of *ContainerId* in the **Step ID** column. Then, on the Action Pane, select **Add step configuration**.

4. In the drop-down dialog box that appears, set the **Menu item** field to *Close container*, and then select **OK**.

5. The details page for the new step configuration appears. (The name of the page is **Close container : ContainerId**.) On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.

6. In the **Add detour** dialog box, in the **Available detours** list, find and select *Look up container* (one of the lookup menu items that you created for this scenario).

7. Select **OK** to close the dialog box and add the selected menu item to the list of available detours.

8. Select the new detour, and then select **Select fields to send** on the FastTab toolbar.

9. In the **Select fields to send** dialog box, in the **Send from close container** section, set the following values for the blank row that's added:

    - **Copy from Packing:** *Location*
    - **Paste in Look up container:** *Location*
    - **Auto submit:** *Selected* (Use this setting so that the worker doesn't have to confirm the value.)

10. Select **Add** on the toolbar to add another row. Then set the following values for it:

- **Copy from Packing:** *Shipment*
- **Paste in Look up container:** *Shipment ID*
- **Auto submit:** *Selected* (Use this setting so that the worker doesn't have to confirm the value.)

11. In the **Bring back from look up container** section, set the following values for the blank row that's added:

    - **Copy from Look up container:** *Container ID*
    - **Paste in Packing:** *Container ID*
    - **Auto submit:** *Cleared* (Use this setting so that the worker can confirm the value.)

12. Select **OK** to close the dialog box.

13. Close the page.

Create a sales order and complete the work

Follow these steps to create a sales order and complete the work of moving the ordered items to the packing area.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New**.

3. In the **Create sales order** dialog box, in the **Customer account** field, select *US-005*.

4. Select **OK** to close the dialog box.

5. The new sales order opens and includes a single, blank line on the **Sales order lines** FastTab. Set the following values for the new order line:

    - **Item number:** *A0001*
    - **Quantity:** *2*
    - **Site:** *6*
    - **Warehouse:** *62*

6. While the order line is still selected on the **Sales order lines** FastTab, select **Inventory** > **Reservation** on the toolbar.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.

8. Close the **Reservation** page to return to the sales order.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**. A message shows the shipment and wave IDs for the order.
10. While the order line is still selected on the **Sales order lines** FastTab, select **Warehouse** > **Work details** on the toolbar. If you use batch processing to run your waves, you might have to wait a short time for the work to be created.
11. On the **Work** page, on the Action Pane, on the **Work** tab, select **Complete work**.
12. On the **Work completion** page, set the **User ID** field to *62*.
13. On the Action Pane, select **Validate work**.
14. When you receive a message that indicates that your work is valid, select **Complete work** on the Action Pane to complete the process of picking the inventory items and putting them in the *Pack* location.
15. Make a note of the **Shipment ID** value that is shown for the work in the upper grid.

Pack the ordered items into a container

The inventory items are brought to the packing area and they're ready to pack into containers. Follow these steps to create a new container in the system, and to pack and close the container.

1. Open the Warehouse Management mobile app, and sign in by using *62* as the user ID.
2. Open the **Packing** menu item.
3. Confirm that the **Packing location** field is set to *Pack*.
4. Enter or scan the **Shipment ID** value that appears when you complete the work.
5. Enter or scan *A0001* as the item.
6. Use the **Create container** detour button to jump to the *Container creation* process.
7. Enter or scan *Box-Large* as the container type.
8. Confirm the number sequence container ID, based on the *Container ID mode* setup. This step creates a new container for the shipment and returns to the main packing flow.
9. Enter or scan the new **Container ID** value to pack the 2 pcs of item *A0001* into the container. If you must update the case quantity, select the **Quantity** field, and edit the value before you confirm the **Container ID** value.
10. Use the **Close container** detour button to jump to the *Container closing* process.
11. Enter or scan the **Container ID** value to select the container to close.

12. Confirm the system weight for the two items that are packed into the box. To update the weight manually, select the weight value, and modify it before you confirm.
13. On the Action Pane, select **Close container**.
14. In the **Close container** dialog box, select **Get system weight** to fill in the default **Gross weight** value.
15. Select **OK** to close the container.

> **Note**
>
> The different field values shown on Warehouse Management mobile app pages can be sorted and highlighted by using the Promoted fields capability.

> **Tip**
>
> As part of the process, consider using packing work to pack outbound containers and process shipments, including adding different types of data inquiry menu items for this data.

Set up short picking item reallocation

This procedure shows how to enable warehouse workers to quickly find alternative locations isn’t sufficient inventory at the location they’re directed to.

A **Work exception** controls the reallocation process, and the warehouse **worker** uses it.

You can use automatic, manual, or both reallocation processes:

- Automatic reallocation - Location directives determine if the goods are available at another location. If possible, the work is updated and the warehouse user is directed to the alternative location.
- Manual reallocation - The warehouse user can select from one or more locations with unreserved quantities of goods.
- Automatic and manual - If the system can't perform an automatic reallocation, and locations are available with unreserved quantities, the user is prompted to select a location.

Set up work exceptions

Define several work exceptions with different item reallocation policies so the warehouse worker can choose one based on the needs of the shipment that they're processing.

This procedure uses the USMF demo data company.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work exceptions**.
2. Select **New**.
3. In the **Work exception code** field, enter a value. This value is the title of the exception. For example, Short picking manual.
4. In the **Description** field, enter a value. This value is a short description of the usage of this exception. For example, Short picking - item not available.
5. In the **Exception** type field, select **Short pick**.
6. Select the **Adjust inventory** check box. If selected, inventory automatically adjusts to 0 at the short picked location.
7. In the **Default adjustment type code** field, enter or select a value. For example, in USMF you can select **Remove Res Adj Out**. Each Adjustment type code contains four characteristics: name, description, inventory journal name, and **Remove reservations**. If **Remove reservations** is enabled, the short-picked order line's reservations are removed.

8. In the **Item reallocation** field, select a value, such as Manual. If you select Manual, or Automatic and Manual, enable the warehouse worker to use manual reallocation.

Set up a worker to use manual item reallocation

This procedure uses the USMF demo data company.

1. Close the page.
2. Go to **Warehouse management** > **Setup** > **Worker**.
3. Select **Edit**.
4. In the list, select a worker. For example, Julia Funderburk.
5. Expand the **Users** FastTab.
6. In the list, select a **User ID**. For example, 24.
7. Expand the **Work** FastTab.
8. Select **Yes** in the **Allow manual item reallocation** field.

System-directed work sequencing

10/03/2025

System-directed work sequencing lets you sort and filter the work orders that the system presents to users for execution. It's helpful in scenarios where additional criteria (such as the time of shipping, the picking zone, the location profile, or a combination of various criteria) are required to drive the warehouse picking process.

This functionality extends the current system-directed picking functionality by adding a system-directed query order, where you can set up a sequence and one or more queries that evaluate all work orders that are created. The system captures and presents only work orders that meet the criteria that you specify in the setup of the mobile device menu item.

Therefore, this functionality allows for further optimization of warehouse picking processes as it identifies work orders that match the specified criteria, assigns them to the correct mobile device menu item, and then presents them to a worker, based on a specific skill set, picking equipment, or other requirement.

> **Note**
>
> If you need different criteria, use multiple mobile device menu items.

Setup

Make demo data available

To work through the scenario by using the values that are presented in this article, you must work on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity. The scenario uses warehouse *51* from the demo data.

> **Important**
>
> Before you release the orders to the warehouse, make sure that the pick locations have enough inventory for all the items on the orders.
>
> Default USMF data should support this scenario. If you aren't using demo data, review the **Location directive** setting to learn which picking locations are used for sales order picking. If you must adjust the inventory, you can create manual movements, use replenishment, or use any other flow.

Set up a mobile device menu item

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the list of mobile device menu items, select **Sales Picking – System**. The required menu item should already exist.
3. Confirm the following settings:
    - On the **General** FastTab, set the **Directed by** field to *System directed*.
    - On the **Work classes** FastTab, confirm the following settings:

Expand table

Work class ID	Work order type
Sales	Sales orders
SO Pick	Sales orders

4. On the Action Pane, select **System directed work sequence queries**.
5. Select **Edit**.
6. Delete the existing line, and then confirm the action by selecting **Yes**.
7. On the Action Pane, select **New** to create a line.
8. On the new line, set the following values:
    - **Sequence number:** *1*
    - **Description field:** *Work quantity less than 20 and Descending*
9. Select **Save**.
10. On the Action Pane, select **Edit Query**.
11. On the **Joins** tab, expand the join hierarchy to show the **Work lines** table.
12. Select the **Work lines** table join.
13. Select **Add table join**.
14. In the list that appears, find and select the row that has the following settings:
    - **Join mode:** *n:1*
    - **Relation:** *Locations (Location)*

15. Select **Select**.

    The system adds locations to the table join.

16. On the **Sorting** tab, select **Add** to add a line.

17. On the new line, set the following values:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Work quantity* (In the message box that appears, select **Yes** to add sorting to this field.)
    - **Search direction:** *Descending*

18. Select the **Range** tab.

    If you want to include only specific work criteria in the sequencing, specify them on the **Range** tab. In this example, you want to include only work where the quantity is less than 20 ea (the lowest unit of measure).

    Notice that some lines are already included. Don't remove those lines.

19. Select **Add** to add a line.

20. On the new line, set the following values:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Inventory work quantity*
    - **Criteria:** *<20* (less than 20)

21. Select **Add** to add another line.

22. On the new line, set the following values:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Work type*
    - **Criteria:** *Pick*

23. Select **Add** to add another line.

24. On the new line, set the following values:

    - **Table:** *Locations*
    - **Derived table:** *Locations*

- **Field:** *Location profile ID*
- **Criteria:** *!STAGE*

> **Important**
>
> Be sure to include the exclamation point (*!*) in front of *STAGE*.

25. Select **OK** to save and close the query.
26. Select **Save**.
27. Close the page to return to the **Mobile device menu items** page.

> **Note**
>
> This setup defines the criteria that the system uses to feed eligible work to the mobile device menu item. If you add more criteria lines to the query, the system uses the query line with the lowest sequence number first. In other words, the user sees all eligible work for sequence number 1 first, then all work for sequence number 2. Therefore, if a specific range and sorting must be used together, specify them in the same system-directed work sequence query.
>
> This setup captures any work that has at least one line where the quantity is less than 20 ea. Therefore, if the work has a line where the quantity is exactly 20 ea or more than 20 ea, it's valid, provided that it also has at least one line where the quantity is less than 20 ea.

Location directives

If you use default Contoso data, you don't need to change the query for the location directive action. However, to make sure that the location directives capture the items on the sales orders when you apply the feature in a non-Contoso environment, create a new location directive. To verify the settings in the demo environment, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the **Work order type** field, select *Sales orders*.
3. Select the location directive named *51 Pick*.
4. On the **Location Directive Actions** FastTab, select the line for the **Pick** action.
5. Select **Edit query** above the grid.

6. Review the **Range** query.
    a. Find the line where the **Field** field is set to *Location*.
    b. Make sure that the **Criteria** field is blank (that is, there are no restrictions).

Scenario

Create sales order picking work

Before you run system-directed picking, create some outbound work. For this scenario, create four sales orders that are based on the specified system-directed work sequence queries.

You reserve inventory quantities for each sales order. Therefore, you can't withdraw reserved inventory from the warehouse for other orders unless you cancel the inventory reservation, or part of the inventory reservation.

You then release each sales order to the warehouse to create the outbound work.

Sales order 1

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New** to create sales order 1.
3. In the **Create sales order** dialog box, set the following values:
    - In the **Customer** section, set the **Customer account** field to *US-004*.
    - In the **General** section, set the **Warehouse** field to *51*.
4. Select **OK** to close the dialog box. Make a note of the sales order number.
5. Add a line to the new sales order, and set the following values:
    - **Item number:** *M9200*
    - **Quantity:** *20*
6. On the **Inventory** menu above the grid, select **Reservation**.
7. On the **Reservation** page, select **Reserve lot** to reserve the inventory.
8. Close the **Reservation** page.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse** to create work for the warehouse.

You receive informational messages that show the wave ID and shipment IDs that were created for the sales order.

Sales order 2

1. On the Action Pane, select **New** to create sales order 2.
2. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-007*
    - **Warehouse:** *51*
3. Select **OK** to close the dialog box. Make a note of the sales order number.
4. Add a line to the new sales order, and set the following values:
    - **Item number:** *M9200*
    - **Quantity:** *5*
5. Select **Add line** to add a second line, and set the following values:
    - **Item number:** *M9201*
    - **Quantity:** *1*
6. Reserve inventory for both lines.
7. Release the order to the warehouse.

Sales order 3

1. On the Action Pane, select **New** to create sales order 3.
2. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-009*
    - **Warehouse:** *51*
3. Select **OK** to close the dialog box. Make a note of the sales order number.
4. Add a line to the new sales order, and set the following values:
    - **Item number:** *M9200*
    - **Quantity:** *7*
5. Select **Add line** to add a second line, and set the following values:

- **Item number:** *M9202*
- **Quantity:** *8*

6. Reserve inventory for both lines.

7. Release the order to the warehouse.

Sales order 4

1. On the Action Pane, select **New** to create sales order 4.

2. In the **Create sales order** dialog box, set the following values:

   - **Customer account:** *US-010*
   - **Warehouse:** *51*

3. Select **OK** to close the dialog box. Make a note of the sales order number.

4. Add a line to the new sales order, and set the following values:

   - **Item number:** *M9200*
   - **Quantity:** *25*

5. Select **Add line** to add a second line, and set the following values:

   - **Item number:** *M9202*
   - **Quantity:** *10*

6. Reserve inventory for both lines.

7. Release the order to the warehouse.

Get work IDs for the work that you created

1. Go to **Warehouse management** > **Work** > **Work details**.

2. Filter on the **Warehouse** field so that only work for warehouse *51* is shown.

3. Four work IDs are created. Make a note of the work ID for each sales order.

Expand table

Sales order ID	Work ID	Work quantity
Sales Order 1	Work ID 1	20 ea

Sales order ID	Work ID	Work quantity
Sales Order 2	Work ID 2	6 ea (sum of both lines)
Sales Order 3	Work ID 3	15 ea (sum of both lines)
Sales Order 4	Work ID 4	35 ea (sum of both lines)

Before you run the flow on the mobile device, make sure that only the work that you just created is in *Open* status for warehouse *51* and the *Sales order* work order type. Otherwise, the results of the test might vary, because the system-direct picking includes all eligible work.

1. Go to **Warehouse management** > **Work** > **Outbound** > **Open sales work**.
2. In the **Open sales work** grid, filter on the **Warehouse** field so that only work for warehouse *51* is shown.
3. Confirm that only the four work IDs that you created earlier are shown.
4. Close the **Work** page.

Mobile device flow execution

Based on the setup, the system feeds the user work sorted from the highest work line quantity to the lowest. The quantity on every line is less than 20.

Remember that this setup captures any work that has at least one line where the quantity is less than 20. Therefore, if the work has another line where the quantity is exactly 20 or more than 20, it's also valid.

Mobile app

1. Sign in to the warehousing app as a user in warehouse *51*.

2. Go to **Outbound** > **Sales Picking - System**.

   The pick step for work ID *4* is presented. This work ID is presented first because of the setup of the system-directed query order, where you specified that work is sequenced based on descending work line quantity.

3. Complete the required pick and put to close the work ID.

   Next, work ID *3* is presented. One of its work lines is next in the sequence, based on the work line quantity.

4. Complete the pick and put to close the work ID.

   Next, work ID *2* is presented. This work's pick line is next in the sequence.

5. Complete the pick and put to close the work ID.

   No further work is presented to you. Work ID *1* isn't eligible for this mobile device menu item, because the query specifies that work headers are considered only if the quantity on the work lines is less than 20.

Tips

The system-directed work sequence queries are *inclusive*. Remember this fact for some setups. For example, you want a specific menu item to process only work where the work unit is *ea*, and you specify that restriction on the **Range** tab of the query. In this case, the worker receives all work where at least one work line has the work unit set to *ea*. Therefore, this work might also include work where work lines have a work unit other than *ea* (such as *box* or *pallet*). The query excludes only work where no work line has the work unit set to *ea*.

Therefore, in the example from this scenario, the query also captured work ID *4*. When you created it, you added two lines: one for 25 ea and another for 10 ea. The work was still presented to the user, because at least one work line has a quantity of less than 20 ea.

Depending on the scenario, you can prevent this behavior by using work breaks.

Pick line grouping

Pick line grouping enables you to combine multiple work lines that have the same item and location into a single pick. The user sees this pick on the mobile device. Warehouse workers can follow the most efficient instructions, but the system still maintains required work line separation for different containers, orders, and other categories.

Set up pick line grouping

Create a mobile device menu item

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the **Menu item name** field, enter *Sales group line picking*.
4. In the **Title** field, enter *Sales group line picking*. This title appears on the mobile device menu.
5. In the **Mode** field, select *Work*.
6. Set the **Use existing work** option to *Yes*.
7. On the **General** FastTab, set the following values:
    - In the **Directed by** field, select *User directed*.
    - Set the **Generate license plate** option to *Yes*.
    - Set the **Group pick** option to *Yes*.
    - Accept the default values for the remaining options.
8. Follow these steps to configure the valid work classes for the mobile device menu item:
    a. On the **Work classes** FastTab, select **New**.
    b. In the **Work class ID** field, select either *Sales* or *SO Pick*, depending on the warehouse that you use. For this scenario, select *SO Pick*.

    The **Work order type** field is automatically set to *Sales orders*.

Set up a mobile device menu

Follow these steps to add the menu item that you just created to the **Outbound** menu.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. The list pane shows all existing mobile device menus. Select *Outbound* in the list.
4. In the **Available menus and menu items** list, find and select the *Sales group line picking* menu item that you created.
5. Select the right arrow button to move the *Sales group line picking* menu item to the **Menu structure** list.
6. Use the up arrow and down arrow buttons to move the menu item into the desired position in the menu structure.
7. On the Action Pane, select **Save**.

Set up a work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select *Sales orders*.
3. In the **Overview** grid, find and select the work template to use with this function. For this scenario, select the *51 Pick to stage* template.
4. On the Action Pane, select **Edit query**.
5. In the query editor dialog box, on the **Sorting** tab, select **Add**, and then set the following values for the new row:
    - In the **Table** column, select *Temporary work transactions*.
    - In the **Derived table** column, select *Temporary work transactions*.
    - In the **Field** column, select *Item number*.
    - In the **Search direction** column, select *Ascending*.
6. Select **OK** to close the dialog box and save your selection.
7. You receive the following message: "Grouping will be reset, continue?" Select **Yes** to continue.

> **ⓘ Important**
>
> For the pick line grouping functionality to work, the work lines must be sorted by item ID. If lines that have the same items aren't sequenced one after another, they aren't grouped.

Example

Create picking work

Before you can set up pick line grouping, you must create some eligible outbound work.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. Select **New** to create a sales order.

3. In the **Customer account** field, select *US-004*.

4. On the **General** FastTab, in the **Warehouse** field, select *51*.

5. Select **OK**.

6. On the **Sales order lines** FastTab, add the following six lines:

   - **Line 1:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *3*.
   - **Line 2:** In the **Item number** field, select *M9201*. In the **Quantity** field, enter *3*.
   - **Line 3:** In the **Item number** field, select *M9202*. In the **Quantity** field, enter *2*.
   - **Line 4:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *1*.
   - **Line 5:** In the **Item number** field, select *M9200*. In the **Quantity** field, enter *3*.
   - **Line 6:** In the **Item number** field, select *M9202*. In the **Quantity** field, enter *7*.

   Here is a summary of the total quantities for each item:

   - **Item M9200:** *7* each
   - **Item M9201:** *3* each
   - **Item M9202:** *9* each

7. Before you release the orders to the warehouse, make sure that the pick locations have enough inventory for all the items on all the orders. Review the **Location directive** setting to determine which picking locations are used for sales order picking. If you're using the Contoso demo data environment for warehouse *51*, confirm that there is available inventory.

   You must now reserve the inventory for each line.

8. On the **Sales order lines** FastTab, select one of the lines that must be reserved.

9. On the **Inventory** menu above the grid, select **Reservation**.

10. On the **Reservation** page, on the Action Pane, select **Reserve lot** to apply the reservation. Then close the page.

11. Repeat steps 8 through 10 for the remaining lines that must be reserved.

    You must now release the sales order to the warehouse.

12. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

    You receive a message that states that a shipment and a wave are created, and that the wave is submitted to run in a batch.

    When the wave and all downstream jobs are completed, a work ID is created for work that has six lines. The lines are sorted by item number.

13. Go to **Warehouse management** > **Work** > **All work** to view the work that you created. Make a note of the **Work ID** value, because you need it in the next procedure.

Initiate picking from the mobile device

1. Sign in to the mobile device as a user who is set up for warehouse *51*.

2. On the mobile device, select the menu that includes the new mobile device menu item. For this scenario, select **Outbound**.

3. Select the **Sales group line picking** menu item to initiate the pick.

4. Enter the **Work ID** value that you noted in the previous procedure.

   You see a pick step where all pick lines for item *M9200* are grouped, and you receive an instruction to pick *7* each of item *M9200*.

   > **ⓘ Important**
   >
   > On the mobile device, the pick work for the three pick work lines is aggregated into one picking step for the user.

5. Confirm the pick step.

6. Go to the work page for the work ID, and notice that all three pick lines for item *M9200* are closed simultaneously.

7. Go back to the mobile device, and continue to pick. Work line 4 for item *M9201* is presented. Because there's only one work line on the order, nothing is left to aggregate.
8. Confirm the pick step.
9. The last pick step on the mobile device aggregates the last two pick lines from the work order.
10. Complete the pick step for *9* each of item *M9202*.
11. Confirm the put step and any additional pick/put pairs to complete the work.

> **Important**
>
> - You can group work lines only if they're in sequence.
> - The following functionality isn't supported:
>   - Catch-weight items (If there are any catch-weight items on the work, you receive an error message before you start to pick.)
>   - Piece picking
>   - Work lines that have unfinished replenishment work
>   - Over-picking
>   - Short picking with item reallocation

Warehouse slotting

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Several warehouse slotting features help warehouse managers intelligently plan picking locations before they release orders to the warehouse and create picking work.

The *Warehouse slotting* feature lets you consolidate demand by item and unit of measure from orders that have a status of *Ordered*, *Reserved*, or *Released*. You can apply generated demand to locations used for picking, based on quantity, unit, physical dimensions, fixed locations, and more. After the slotting plan is established, you can create replenishment work to bring the appropriate amount of inventory to each location.

The *Warehouse slotting for transfer orders* feature lets warehouse managers replenish picking locations, based on demand from transfer orders that aren't yet released to the warehouse. It ensures that picking locations include all the items that are required for the transfer orders after they're released to the warehouse.

The *Warehouse slotting allocation enhancements* feature adds an option for the template lines that the *Warehouse slotting* feature uses. The option enables the system to consider existing on-hand inventory at a target location. Therefore, the system might generate fewer replenishments for slotting.

Set up warehouse slotting

To use warehouse slotting, set up the following elements in your system:

- Slotting unit of measure tiers
- Directive codes
- Slotting templates
- Location directives

Create unit-of-measure tiers for slotting

Unit-of-measure tiers enable you to group multiple units of measure together for slotting. For example, if multiple sizes of boxes are all picked from the same box picking area, you can create one tier for all the sizes. **A line must be created for each unit of measure that you want to include in the tier.**

1. Go to **Warehouse management** > **Setup** > **Replenishment** > **Slotting unit of measure tiers**.
2. Select **New**.
3. In the header, set the following values:
    - **Unit of measure tier:** *EaBoxPl*
    - **Description:** *Each box pallet*
4. Select **Save**.
5. On the **Units of measure** FastTab, select **New** to add a line to the grid.
6. On the new line, set the following values:
    - **Unit:** *Box*
    - **Description:** Leave this field blank. It's filled in automatically when you save your changes.
    - **Unit class:** *Quantity*
7. Select **New** to add a second line to the grid.
8. On the new line, set the following values:
    - **Unit:** *ea*
    - **Description:** Leave this field blank. It's filled in automatically when you save your changes.
    - **Unit class:** *Quantity*
9. Select **New** to add a third line to the grid.
10. On the new line, set the following values:
    - **Unit:** *PL*
    - **Description:** Leave this field blank. It's filled in automatically when you save your changes.

- **Unit class:** *Quantity*

11. Select **Save** to save the tier.

Create a directive code for slotting

Select the directive code to associate with a template.

1. Go to **Warehouse management** > **Setup** > **Directive codes**.
2. On the Action Pane, select **New**.
3. In the **Directive code** field, enter *Slotting*.
4. In the **Directive description** field, enter *Slotting*.

Set up slotting templates

Each slotting template controls how inventory is assigned to locations for a specific warehouse. Each template must include a line for each slotting specification. Use the procedures in this section to set up slotting templates.

1. Go to **Warehouse management** > **Setup** > **Replenishment** > **Slotting templates**.
2. Select **New** to create a template.

Next, set up the template header, slotting specifications, and location directives, as explained in the following subsections. The setup for slotting for transfer orders resembles the setup for slotting for sales orders, but the **Demand type** field is set to *Transfer orders* instead of *Sales order*.

Set up the header for a sales order slotting template

1. In the header for the template, set the following values:

    - **Slotting template:** *61*
    - **Description:** *61*
    - **Demand type:** *Sales order*

      > ⓘ **Note**
      >
      > Currently, *Sales orders*, *Transfer orders*, and *Outbound shipment orders* are the only demand types that are supported.

    - **Demand strategy:** *Ordered*

The following values are available in this field:
    - **Ordered** – The full ordered quantity on the sales order is considered demand.
    - **Reserved** – Only the sales order line quantities that are reserved (physical and ordered) are considered demand.
    - **Released** – The released quantity is considered demand.

- **Allow wave demand to use unreserved quantities:** *Yes*

2. Use the **Warehouse selection** fast tab to specify the warehouse where the slotting template applies.

    - **Warehouse selection** – Select one of the following values:
        - *All* – Use the slotting template for all warehouses.
        - *Warehouse group* – Use the slotting template for all warehouses in the warehouse group selected in the **Warehouse group** field.
        - *Warehouse* – Use the slotting template only for the specific warehouse selected in the **Warehouse** field.

    - **Warehouse** – If the **Warehouse selection** field is set to *Warehouse*, select the warehouse where the slotting template applies.

    - **Warehouse group** – If the **Warehouse selection** field is set to *Warehouse group*, select the warehouse group where the slotting template applies. For more information about how to set up warehouse groups, see Warehouse groups.

    For this scenario, set the following values:

    - **Warehouse selection:** *Warehouse*
    - **Warehouse:** *61*

You can also specify a query to narrow the scope of the demand that is evaluated.

Set up slotting specifications for each template

For each sales order template that you create, add a line for each slotting specification.

1. On the **Slotting template details** FastTab, select **New** to create a template line.

2. On the new line, set the following values:

    - **Sequence:** *1*

    - **Description:** *Fixed location*

- **Minimum quantity:** *1*

  This field defines the minimum quantity of demand that is required for the line.

- **Maximum quantity:** *1000000*

  This field defines the maximum quantity of demand that is valid for the line.

- **Unit:** Leave this field blank.

  This field defines the unit of measure that the minimum and maximum quantities refer to.

- **Unit of Measure Tier:** *EaBoxPl*

  This field defines the units of measure of demand that are valid for the line. (Learn more in the Set up unit-of-measure tiers for slotting section earlier in this article.)

- **Assign slot criteria:** *Consider qty*

  The following values are available in this field:
  - **Assume empty** – The system assumes that all locations in the picking area are empty and doesn't check those locations for inventory.
  - **Consider qty** – The system checks the locations in the picking area for inventory and skips any locations that aren't empty.
  - **Consider on-hand** – The system checks whether any target location contains unreserved quantities for the item on the demand line. If the quantity is large enough to satisfy at least one unit of the demand line, the generated slotting plan record is reduced by the available amount. For example, if the demand is 10 cases, and one case is on hand, the located demand is nine cases. If the demand is 10 cases, and one each is on hand, the located demand is 10 cases.

- **Directive code:** *Slotting*

  This field defines the location directive used to find the picking location of the replenishment work.

- **Overflow location:** Leave this field blank.

  This field defines the location that inventory that is put to if a location can't be found for the quantity when the line is processed.

- **Allow let up:** *Yes*

When this option is set to *Yes*, if any demand can't be slotted, movement work is created to take inventory out of locations where there is inventory, but where nothing was slotted. The template is then run again. This time, it ignores the inventory in the locations. This functionality works best when the **Assign slot criteria** field is set to *Consider qty*.

- **Fixed location usage:** *Only fixed locations for the product*

  The following values are available in this field:
  - **Fixed and non-fixed locations** – The system isn't limited to using only fixed locations.
  - **Only fixed locations for the product** – The system slots only to locations that are fixed locations for the product.
  - **Only fixed locations for the product variant** – The system slots only to locations that are fixed locations for the product variant.

> ⓘ **Note**
>
> If the slotting template contains at least one line where the **Assign slot criteria** field is set to *Consider on-hand*, the system no longer allows let-ups for any line in the template.

1. Select **Save**.

2. Select **New** to create a second template line.

3. On the new line, set the following values:

   - **Sequence:** *2*
   - **Description:** *Other*
   - **Minimum Qty:** *1*
   - **Maximum Qty:** *1000000*
   - **Unit:** Leave this field blank.
   - **Unit of measure tier:** *EaBoxPl*
   - **Assign slot criteria:** *Consider qty*
   - **Directive code:** *Slotting*
   - **Overflow location:** Leave this field blank.
   - **Allow let up:** *Yes*
   - **Use fixed locations:** *Fixed and non-fixed locations*

In the query for the second line, specify the criteria that determine what locations the demand for that line can be slotted to.

4. Select the line where the **Sequence** field is set to *2*.
5. Select **Select slot locations** in the FastTab toolbar (this button is labeled **Edit query** in Supply Chain Management version 10.0.43 and earlier).
6. On the **Range** tab, select **Add** to add a line to the grid.
7. On the new line, set the following values:
    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Location profile ID*
    - **Criteria:** *Pick-06* (Select the double plus sign [++] in the field to expand the list, and then select *Pick-06 - Picking Site 6*.)
8. Select **OK**.

Set up location directives

Set up at least one location directive to support slotting picks. Use the procedures in this section to set up a new *replenishment location directive* for slotting picks.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the left pane, in the **Work order type** field, select *Replenishment*.
3. On the Action Pane, select **New**.
4. In the header for the new location directive, in the **Name** field, enter *61 Slotting pick*.
5. In the **Sequence number** field, accept the default value.

Configure the Location directives FastTab

1. On the **Location directives** FastTab, set the following values. Accept the default values for all other fields.
    - **Work type:** *Pick*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Directive code:** *Slotting*
2. Select **Save** to make the **Lines** FastTab available.

Configure the Lines FastTab

1. On the **Lines** FastTab, select **New** to create a line.
2. On the new line, set the following values.
    - **From quantity:** *0*
    - **To quantity:** *1000000*
3. Accept the default values for the remaining fields.
4. Select **Save** to make the **Location Directive Actions** FastTab available.

Configure the Location Directive Actions FastTab

1. On the **Location Directive Actions** FastTab, select **New** to create a line.
2. On the new line, set the following values. Accept the default values for all other fields.
    - **Sequence number:** Accept the default value.
    - **Name:** *Bulk*
    - **Strategy:** *None*
3. Accept the default values for the remaining fields.
4. Select **Save** to make the **Edit query** button available.

Edit the query

1. On the **Location Directive Actions** FastTab, select **Edit query**.
2. On the **Range** tab, select **Add** to add a line to the grid.
3. On the new line, set the following values:
    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *Bulk* (Select the double plus sign [++] in the field to expand the list, and then select *Bulk*.)
4. Select **OK**.

Scenario

Set up the scenario

For this scenario, use the built-in sample data, and create the records described in this section.

Use the USMF sample data

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Create demand

Follow these steps to create the demand that you apply slotting to.

1. Go to **Sales and marketing** > **Sales orders** > **All sales order**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, in the **Customer account** field, select *US-007*.
4. In the **Warehouse** field, select *61*.
5. Select **OK**.
6. The new sales order opens. It includes an empty line on the **Sales order lines** FastTab. On this line, set the following values:
    - **Item:** *L0101*
    - **Quantity:** *20*
7. Select **Add line** to add a new line, and set the following values:
    - **Item:** *T0100*
    - **Quantity:** *8*
8. Select **Save**.
9. Select **New** to create a second sales order.
10. In the **Create sales order** dialog box, in the **Customer account** field, select *US-008*.
11. In the **Warehouse** field, select *61*.

12. The new sales order opens. It includes an empty line on the **Sales order lines** FastTab. On this line, set the following values:

    - **Item:** *T0100*
    - **Quantity:** *1*

13. Select **Save**.

Walk through a typical slotting scenario

After all the prerequisite elements are in place, as described in the previous section, you're ready to try out the feature by working through each exercise in this section.

Generate demand

1. Go to **Warehouse management** > **Setup** > **Replenishment** > **Slotting templates**, and select the slotting template that you created earlier.
2. On the Action Pane, select **Generate demand**. This command evaluates all demand in the system that matches the slotting template query. The total demand across all orders is then consolidated onto one line per quantity/unit of measure. An informational message appears when the process is completed.

Slotting demand

The *slotting demand* shows the results of demand generation, based on the setup of the slotting template.

- On the Action Pane, select **Slotting demand** to view the results from the **Generate demand** command. The lines in the slotting demand can be edited. You can delete a line, add a new line, or edit the line details.

> ⓘ **Note**
>
> You can edit demand manually, or you can import it from an external system by using data management. Whatever is in the slotting demand is used in the next step, regardless of where it came from.

Locate demand

After you generate the demand, use the **Locate demand** command to generate the *slotting plan*.

- On the Action Pane, select **Locate demand**. The slotting process runs. An informational message appears when the process is completed.

Slotting plan

The slotting plan shows the location that each item/quantity was assigned to, whether overflow was used, whether let-up work was created, and the template line that was used. *Any demand that couldn't be slotted is highlighted in red.*

- On the Action Pane, select **Slotting plan** to view the results.

> ⓘ **Note**
>
> - The **Generate demand**, **Locate demand**, and **Run replenishment** processes now run in a sandbox. (These processes are available from the Action Pane on the **Slotting templates** page.)
> - The **Generate demand**, **Locate demand**, and **Run replenishment** processes have a lock to ensure that they can't be triggered at the same time. Otherwise, the data use could be deleted.
> - The **Generate demand** and **Locate demand** processes show a warning if the run didn't generate records, or if the records are missing information.
> - When you select **Slotting plan**, the page doesn't have **New**, **Edit**, or **Delete** buttons on the Action Pane, because the data source can't be edited.
> - When you select **Run replenishment**, the system validates the selected slot template and processes.

Create replenishment

After the slotting plan is created, you must create *replenishment work*, based on the plan.

- On the Action Pane, select **Run replenishment**. An informational message appears when the process is completed. This message indicates the number of headers that were created for the work build ID.

Location directives for use are identified based on the directive code specified on each template line.

Tips

Set up automatic slotting

After all the required elements are in place, set up slotting to run automatically by following these steps.

1. Go to **Warehouse management** > **Replenishment** > **Run slotting**.
2. Specify the slotting steps to run. Select one or more of the following slotting steps:
    - Generate demand
    - Locate demand
    - Create replenishment work

    > **Note**
    >
    > The slotting steps are progressive. If you want to select *Locate demand*, you must first select *Generate demand*.

3. Specify the slotting template to use.
4. Set the recurrence to run automatically, if you want.

For the exercises in the scenario, don't set up automatic slotting.

Location directive inventory picking aging

10/03/2025

This article explains how to use first in, first out (FIFO) and last in, first out (LIFO) location directive strategies during picking. These strategies work in conjunction with the aging dates that are recorded for locations to track when inventory first entered the warehouse. The *Location directive inventory picking aging* feature uses the date on the location to determine aging. The *Warehouse location status* feature updates the date on the location, based on the date from the license plate.

You can use FIFO and LIFO strategies to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where an expiration date isn't available to use for sorting.

When inventory is first received or created in the warehouse, the system updates the relevant license plate so that the current date is shown as the aging date. This date is then used by the location directive strategies to identify the oldest or newest inventory in the warehouse. If inventory is moved to a location that isn't tracked by license plate, the location itself is updated with aging information, and this information will then be used by the strategies.

Feature requirements

To use this feature, you must set the **Enable location status** option set to *Yes* for every location profile that is used to store inventory. To set this option for a location profile, go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**, and select the location profile. You can find the option on the **General** FastTab.

Feature scenarios

This section provides examples that show how to set up and use FIFO and LIFO strategies.

> **Tip**
>
> This section provides two scenarios, one for FIFO and one for LIFO. The procedures that are provided assume that you will do both scenarios, in order. We recommend that you do both scenarios, so that you can experience the differences between the two strategies.

Make sample data available

To work through these scenarios by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

You can also use these scenarios as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

Set up the scenarios

The demo data requires setup and inventory adjustments to support the scenarios. Follow these steps to create the inventory data that is required to work through the FIFO and LIFO scenarios.

1. Sign in to a system where demo data is installed, and select the *USMF* legal entity.
2. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
3. On the Action Pane, select **Edit**.
4. In the list of location profiles, select **FLOOR-05**.
5. On the **General** FastTab, set the **Enable location status** option to *Yes*.
6. Select **Save**.
7. Go to **Warehouse management** > **Setup** > **Location directives**.
8. In the list of location directives, select **63 Pick containerization**.
9. Select **Edit** to put the page into edit mode.
10. On the **Location directive actions** FastTab, find the line where the **Sequence number** field is set to *1*, and follow one of these steps:
    - If you're setting up a FIFO scenario, change the value of the **Strategy** field to *Location aging FIFO*.
    - If you're setting up a LIFO scenario, change the value of the **Strategy** field to *Location aging LIFO*.
11. On the **Location directive actions** FastTab, select **Edit query**.
12. In the query dialog box, on the **Range** tab, select **Add** to add a line, and then set the following values:
    - **Table:** *Locations*

- **Derived table:** *Locations*
- **Field:** *Zone ID*
- **Criteria:** *Floor*

13. Select **OK** to apply your settings and close the query dialog box.

14. Select **Save** to save your changes to the location directive.

15. On a mobile device or in the *Dynamics 365 Supply Chain Management - Warehousing* app on your PC, follow these steps to remove existing inventory from the warehouse location to support the scenarios:
    a. Sign in to warehouse *63* by using the appropriate user ID and password.
    b. On the main menu, select **Quality**.
    c. On the **Quality management** menu, select **Scrap**.
    d. On the **Scrap** page, select the **LOC/LP** field, and then enter *63_1*.
    e. Select **Enter** or **OK**.
    f. Confirm the **Scrap** details for **Adjustment out** by selecting **Enter** or **OK**.

    When the license plate inventory is adjusted out, you receive a "Work Completed" message.

    These steps leave inventory in two locations in the demo data. Each location has a different aging date. Location *FL-001* has an aging date of April 15, 2017, and location *FL-002* has an aging date of January 29, 2017. Both locations contain item *A0001*.

    To view this data, go to **Inventory management** > **Inquiries and reports** > **On-hand list**, and then filter on warehouse *63* and item *A0001*. In the rows where the **Location** field is set to *FL-001* or *FL-002*, select a line that has a positive **Physical inventory** value, and then, on the Action Pane, select **Transactions**. The **Physical date** field will show a date that corresponds to one of the previously mentioned aging dates.

Scenario 1: Set up and use FIFO location aging

The FIFO strategy finds the location that contains the oldest aging date, and it allocates picking based on that aging date.

1. If you haven't already done so, prepare the sample data that is required for this scenario.

2. Go to **Sales and marketing** > **Sales order** > **All sales orders**.

3. Select **New**.

4. In the **Create sales order** dialog box, set the following values:

    - On the **Customer** FastTab, set the **Customer account** field to *US-001*.

- On the **General** FastTab, set the **Warehouse** field to *63*.

5. Select **OK** to create the sales order and close the dialog box.
6. The new sales order is opened. It includes a new, empty row in the grid on the **Sales order lines** FastTab. For this order line, set the **Item number** field to *A0001* and the **Quantity** field to *1*.
7. On the **Inventory** menu above the grid, select **Reservation**.
8. On the **Reservation** page, select **Reserve lot** to reserve the ordered quantity of this item from inventory at the selected warehouse.
9. Close the **Reservation** page.
10. On the **Sales order** page, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. You receive informational messages. The system creates a shipment, adds it to a new load, and creates the required work.
11. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Work details** to open the work that was created for this sales order. Notice that the line where the **Work type** value is *Pick* shows a **Location** value of *FL-002*. This location contains the license plate that has the oldest aging date (FIFO).
12. Select **Warehouse** > **Shipment details**.
13. On the **General** FastTab, make a note of the wave ID, so that you can use it in scenario 2.

Scenario 2: Set up and use LIFO location aging

The LIFO strategy finds the location that contains the newest aging date, and it allocates picking based on that aging date. In scenario 2, you will edit the setup for scenario 1 (FIFO), and reuse the sales order and wave that were created during that scenario.

1. Before you start this scenario, set up and complete the full FIFO scenario as described in the previous section. In this scenario, you will reuse the wave and most of the setup that were created for that scenario.
2. Edit the **63 Pick containerization** location directive so that it uses the *Location aging LIFO* strategy, as described in the first part of the Set up the scenarios procedure.

   Next, you will modify the wave that was created for the sales order in scenario 1, so that is uses the *Location aging LIFO* strategy.
3. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.

4. Select and open the wave that contains the order that you created for the FIFO scenario.
5. On the Action Pane, on the **Work** tab, select **Cancel** to cancel the work that you created for the FIFO scenario.
6. On the Action Pane, on the **Wave** tab, in the **Wave** group, select **Process**.
7. When the processing is completed, on the Action Pane, on the **Wave** tab, in the **Related information** group, select **Work** to open the work that was created for this wave.
8. On the **Work** page, on the **Overview** tab, there should be two lines. Select the line where the **Work status** field is set to *Open*.
9. Notice that the line where the **Work type** value is *Pick* shows a **Location** value of *FL-001*. This location contains the license plate that has the newest aging date (LIFO).

In these scenarios, you've seen how the location aging strategy directs work to the inventory location that has either the oldest inventory or the newest inventory, depending on the selected strategy.

Anchoring

Article • 06/03/2022

This article provides details about the anchoring process. It describes the configuration that is required and the logic that is run when a warehouse worker changes either the staging location or the loading location.

The anchoring feature lets you override the staging or loading location. All open puts will then be directed to the new staging or loading location that you specify.

This feature can help workers be more efficient while they ship goods. Here are some examples:

- A worker who must put items for order 1 in a staging location by dock 1 can't complete this operation because a previous load hasn't cleared the location. Instead of waiting for the dock 1 staging location to become available, the worker decides to use the staging location for dock 2. Therefore, the worker overrides the suggested staging location. The put location for all remaining items for the work is then updated to the dock 2 staging location.
- A worker who must perform multiple picks for the same delivery can be sure that all put items are assembled in the same place. Therefore, less time is required to load the items into the truck.

You configure anchoring for mobile device menu items by using the **Anchor** option. If you set this option to *Yes*, you can use the **Anchor by** field to specify whether you want to anchor by shipment or load. If you set the **Anchor by** field to *Shipment*, subsequent open puts will be changed to the new location for that shipment. If you set it to *Load*, subsequent open puts will be changed to the new location for that load.

> **ⓘ Important**
>
> The location for subsequent open puts will be changed only on the work lines that are generated from the same work template line. In other words, the system will anchor the put lines that originate from the same work template line.

This article provides a scenario that shows how anchoring works. During the scenario, you will create a set of sales orders and release them to the warehouse. You will then override the suggested staging location and verify that all the remaining put-away work is directed to the new location.

Scenario prerequisite: Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to *USMF* before you begin.

Scenario setup

Before you work through the example scenario, you must enable anchoring for the relevant mobile device menu item.

Set up a mobile device menu item to enable anchoring

Follow these steps to enable anchoring for a mobile device menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the list pane, select the record that is named *Sales Picking*. If no existing record has this name, create it. Confirm or set the following values for the record:
    - **Menu item name:** *Sales Picking*
    - **Title:** *Sales Picking*
    - **Mode:** *Work*
    - **Use existing work:** *Yes*
    - **Directed by:** *User directed*
    - **Anchoring:** *Yes*

      This setting causes the system to anchor multiple work order lines together during sales picking.
    - **Anchor by:** *Load*

      This setting causes the system to anchor by load.
    - **Override target license plate:** *Yes*

- **Override license plate during put:** *Yes*
- **Keep work locked by user:** *Yes*
- **Allow over pick:** *Yes*

Set up a work template to enable staging

Follow these steps to configure a work template to enable staging. This configuration will support the scenario where a worker puts items for an order in a staging location.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select *Sales orders*.
3. In the grid, select the **61 SO Stage** work template.
4. In the **Work Template Details** section, make sure that the following lines exist and are configured as shown here:
    - Line 1:
        - **Work type:** *Pick*
        - **Mandatory:** Selected (= *Yes*)
        - **Work class ID:** *SO Pick*
    - Line 2:
        - **Work type:** *Put*
        - **Mandatory:** Selected (= *Yes*)
        - **Directive code:** *Stage*
        - **Work class ID:** *SO Pick*
    - Line 3:
        - **Work type:** *Pick*
        - **Mandatory:** Selected (= *Yes*)
        - **Stop work:** *Yes*
        - **Work class ID:** *SO Load*
    - Line 4:
        - **Work type:** *Put*
        - **Mandatory:** Selected (= *Yes*)
        - **Directive code:** *Baydoor*
        - **Work class ID:** *SO Load*
5. On the Action Pane, select **Edit query** to open the query editor.

6. On the **Range** tab, make sure that the following line is present:

    - **Table:** *Temporary work transactions*
    - **Derived Table:** *Temporary work transactions*
    - **Field:** *Warehouse*
    - **Criteria:** *61*

7. On the **Sorting** tab, make sure that the following line is present:

    - **Table:** *Temporary work transactions*
    - **Derived Table:** *Temporary work transactions*
    - **Field:** *Shipment ID*
    - **Search direction:** *Ascending*

8. Select **OK** to apply your settings and close the query editor. Accept the changes if you're prompted.

9. On the Action Pane, select **Work header breaks**.

10. On the line where the **Field name** field is set to *Shipment ID*, make sure that the **Group by this field** checkbox is selected.

Set up license plates, locations, and inventory

Before you create sales orders and shipments, you must ensure that the required locations, license plates, and inventory exist.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **License plates**, and create two license plates:

    - MyLP1
    - MyLP2

2. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**, and create the following locations if they aren't already present.

Expand table

Warehouse	Location	Location profile ID	Zone ID
61	06A01R2S1B	PICK-06	FLOOR
61	06A01R3S1B	PICK-06	FLOOR
61	STAGE01	STAGE	*(Blank)*

Warehouse	Location	Location profile ID	Zone ID
61	STAGE02	STAGE	*(Blank)*
61	STAGE03	STAGE	*(Blank)*
61	STAGE04	STAGE	*(Blank)*

3. Make sure that the following inventory is available. If you must adjust the inventory, you can create manual movements, use replenishment, or use any other flow.

Expand table

Item number	Quantity	Warehouse	Location	License plate
A0001	100	61	06A01R2S1B	MyLP1
A0002	100	61	06A01R3S1B	MyLP2

Create demand

Before you can try the anchoring functionality, you must create some demand. For this scenario, you will create three sales orders for the same customer.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create the first sales order.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-001*
    - **Warehouse:** *61*
4. Select **OK**.
5. The new sales order is opened. It includes a blank line on the **Sales order lines** FastTab. Set the following values for this line:
    - **Item number:** *A0001*
    - **Quantity:** *1*
6. On the toolbar, select **Add line** to add a second sales order line, and set the following values for it:
    - **Item number:** *A0002*

- **Quantity:** *1*

7. Follow these steps for each sales line on the order to reserve inventory for it:
   a. On the **Sales order lines** FastTab, select a sales order line.
   b. On the toolbar, select **Inventory** > **Reservation**.
   c. On the **Reservation** page, select **Reserve lot**, and then close the page.
   d. On the Action Pane, select **Save**.

8. Repeat steps 2 through 6 to create a second sales order. Set the following values for it:

   - In the **Create sales order** dialog box:
     - **Customer account:** *US-001*
     - **Warehouse:** *61*

   - On sales order line 1:
     - **Item number:** *A0001*
     - **Quantity:** *2*

   - On sales order line 2:
     - **Item number:** *A0002*
     - **Quantity:** *2*

9. Repeat step 7 to reserve each line on sales order 2.

10. Repeat steps 2 through 6 to create a third sales order. Set the following values for it:

    - In the **Create sales order** dialog box:
      - **Customer account:** *US-001*
      - **Warehouse:** *61*

    - On sales order line 1:
      - **Item number:** *A0001*
      - **Quantity:** *3*

    - On sales order line 2:
      - **Item number:** *A0002*
      - **Quantity:** *3*

11. Repeat step 7 to reserve each line on sales order 3.

Use the outbound load planning workbench to create a load and release it to the warehouse

Follow these steps to create a load for the orders that you created for this scenario and then release it to the warehouse.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.
2. On the **Sales lines** tab, find and select all the sales order lines for sales order 1 and sales order 2.
3. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**.
4. In the **Load template assignment** dialog box, in the **Load template ID** field, select a load template, such as *Stnd Load Template*.
5. Select **OK** to close the dialog box.
6. In the **Loads** section, find and select the load that you created.
7. On the toolbar, select **Release** > **Release to warehouse**.
8. In the **Release load to warehouse** dialog box, select **OK** to release the selected load to the warehouse.
9. Go to **Warehouse management** > **Work** > **All work** to view the work that was created. You should find two new work IDs, one for each shipment. Each work ID has pick and put lines that bring inventory from the picking locations to the staging location and from the staging location to the baydoor. Make a note of the **Work ID** value for the first shipment, because you will need it in the next procedure.

Sales order picking to the staging location for the first shipment

1. Sign in to the Warehouse Management mobile app as a worker in warehouse *61*. (In the standard demo data, you can sign in by using *61* as the user ID and *1* as the password.)

2. On the main menu, select **Outbound**.

3. On the **Outbound** menu, select **Sales Picking**.

4. Select the **ID** field, and then enter the work ID for the first shipment.

5. Confirm your entry.

6. In the **LP** field, enter a license plate number for the first item (*MyLP1*).

7. Confirm your entry.

8. In the **Target LP** field, enter any number (the targe license plate doesn't have to exist already).

You will pick all lines that were created from the processed wave to the same target license plate.

9. Confirm your entry.
10. In the **LP** field, enter a license plate number for the second item (*MyLP2*).
11. Confirm your entry.

    Imagine that the worker has now collected the order, but when they get to the staging location that specified in the work, they find that the space is already occupied. However, the worker can see that another nearby location (*STAGE03*) is available. Therefore, they will request to change the staging location. Because the anchoring feature is enabled, the system will then automatically update the staging location for this and all related work.

12. Select **Override Loc** to override the suggested staging location.
13. In the **Work exceptions** field, specify *Staging lane changed*.
14. In the **Location** field, enter a new staging location (*STAGE03*).
15. Confirm your entry. You receive a "Work completed" message.
16. Go to **Warehouse management** > **Work** > **All work**.
17. Open the work ID for the first shipment. Verify that the staging location was updated to the new location (*STAGE03*) that was defined by using the mobile device.
18. Open the work ID for the second shipment. Verify that the staging location was updated to new staging location (*STAGE03*) because of the anchoring setup.

> **Note**
>
> The location for all the remaining open put work lines that have the same staging location and that were generated from the same work template line will be updated to the new location.

Use the outbound load planning workbench to add the new sales order to the existing load

Follow these steps to add an order to the load and then release it to the warehouse.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.
2. On the **Sales lines** tab, find and select all the sales order lines for sales order 3.
3. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To existing load** to add the selected order lines to an existing load.
4. Select **OK** to close the dialog box.
5. In the **Loads** section, find and select the load from the previous steps.
6. Select **Release** > **Release to warehouse**.
7. In the **Release load to warehouse** dialog box, select **OK** to release the selected load to the warehouse.
8. Go to **Warehouse management** > **Work** > **All work** to view the work that was created. Make a note of the **Work ID** value, because you will need it in the next procedure.

Sales order picking to the staging location for the third shipment

1. Sign in to the mobile app as a worker in warehouse *61*.
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sales Picking**.
4. Select the **ID** field, and then enter the work ID for the third shipment.
5. Confirm your entry.
6. In the **LP** field, enter a license plate number for the first item (*MyLP1*).
7. Confirm your entry.
8. In the **Target LP** field, enter any number (the targe license plate doesn't have to exist already).
9. Confirm your entry.
10. In the **LP** field, enter a license plate number for the second item (*MyLP2*).
11. Confirm your entry.

    As for the first load, imagine that the worker finds that the specified staging location isn't available. Therefore, they want to use a different staging location (*STAGE04*).
12. Select **Override Loc** to override the suggested staging location.

13. In the **Work exceptions** field, specify *Staging lane changed*.
14. In the **Location** field, enter a new staging location (*STAGE04*).
15. Confirm your entry. You receive a "Work completed" message.
16. Go to **Warehouse management** > **Work** > **All work**.
17. Open the work ID for the first shipment. Verify that the staging location wasn't updated to the new staging location (*STAGE04*) because the remaining open put line doesn't correspond to the work template line of the completed put line.
18. Open the work ID for the second shipment. Verify that the staging location wasn't updated to the new staging location (*STAGE04*) because the staging location doesn't correspond to the staging location of the completed put line. In other words, the completed put work line and the remaining open work line have different staging locations and, in this case, only lines that have the same staging locations are updated.
19. Open the work ID for the third shipment. Verify that the staging location was updated to the new staging location (*STAGE04*).

Outbound sorting

Article • 03/03/2023

This functionality makes it easier to handle small containers and helps warehouse workers better plan and organize pallet capacity in the truck. When you use outbound sorting, you can sort packed containers to the correct pallet after they have been at a packing station. You can also build a packing hierarchy.

This functionality lets you build pallets from containers that are packed through the packing functionality. The container isn't sent to the final shipping location as it is in the original packing flow. Instead, workers can close the container and move it to a sort type location. They can then sort containers to positions, each of which has a license plate (LP). After the containers have been sorted, work can be created to send the whole LP to the final shipping dock or stage locations, based on location directives or your own requirements. Additionally, the action of closing of the sort position can immediately move the inventory to the final shipping location and pick it to the order.

Turn on the Outbound sorting feature

To use this feature, it must be turned on for your system. As of Supply Chain Management version 10.0.32, this feature is mandatory and can't be turned off. If you are running a version older than 10.0.32, then admins can turn this functionality on or off by searching for the *Outbound sorting* feature in the **Feature management** workspace.

Setup

For this scenario, you must use standard **USMF** demo data and warehouse *62*. You must also complete the setup that is described in the following subsections.

Set up a wave template

This setup automatically processes the wave and creates work when a line is released to the warehouse.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. In the template list, select **Warehouse 62**.
3. On the **General** FastTab, make sure that the **Process wave at release to warehouse** option is set to *Yes*.

Set up a worker

The packing station is considered a location. Warehouse workers who sign in at the packing station see and work on only shipments and containers that are planned at that specific packing location. A user who signs in to Microsoft Dynamics 365 must be set up as a worker in Warehouse management. If the user's name doesn't appear in the list of work users, use the following procedure to add it.

> ⓘ **Note**
>
> These steps assume that the user already exists in the system and has been associated as an employee or worker in the **Human Resources** module.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. Select **New**.
3. In the **Worker** field, select the target user in the list of employees.
4. Select **Select**.
5. On the Action Pane, select **Save**.
6. On the **Users** FastTab, select **New** to create a mobile device account, and set the following values for it:
    - **User ID:** Enter a unique ID.
    - **User name:** Enter a name for the ID.
    - **Default warehouse:** *62*
    - **Menu name:** *Main*
7. On the Action Pane, select **Save**.
8. The **Set password** dialog box appears, where you can create a simple password that the user can use to sign in to the mobile app. Set the following values:
    - **Password:** Enter a simple password.
    - **Confirm password:** Enter the same password again.
9. Select **Set password**.

    A notification in the Action Center informs you that the password has been set for the user that you created.

Create a location type

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location types**.
2. On the Action Pane, select **New** to create a location type, and set the following values for it:
    - **Location type:** *SORT*
    - **Description:** *Sort*
3. On the Action Pane, select **Save**.

Set up Warehouse management parameters

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Location types** FastTab, set the **Sorting location type** field to *SORT*.
3. On the Action Pane, select **Save**.

Set up a location profile

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
    - **Location profile ID:** *Sorting*
    - **Name:** *Sorting*
4. On the **General** FastTab, set the following values:
    - **Location format:** *ASRB* (Aisle-Rack-Shelf-Bin)
    - **Location type:** *SORT*
    - **Use license plate tracking:** *Yes*
    - **Allow mixed items:** *Yes* (When you set this option to *Yes*, the **Allow mixed inventory batches** option is automatically set to *Yes* and can't be changed independently.)
5. Select **Save**.

Set up a location

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.

2. In the header, clear the **Generate check digits for location** check box.

3. On the Action Pane, select **New** to create a location, and set the following values for it:

    - **Warehouse:** *62*
    - **Location:** *SORT*
    - **Location profile ID:** *SORTING*

4. Select **Save**.

Set up an outbound sorting template

The outbound sorting template determines whether work is created out of the sort location, and whether sorting is done manually or automatically.

For this scenario, you will create an outbound sorting template to build pallets after the packing station.

1. Go to **Warehouse Management** > **Setup** > **Packing** > **Outbound sorting template**.

2. On the Action Pane, select **New**.

3. In the header of the new template, set the following values:

    - **Outbound sorting template ID:** *AutoWork*
    - **Description:** *Auto Work Creation*
    - **Outbound sorting template type:** *Container*

4. Use the **Warehouse selection** FastTab to specify the warehouse and location where the outbound sorting template will apply.

    - **Warehouse selection** – Select one of the following values:
        - *All* – Use the outbound sorting template for all warehouses.
        - *Warehouse group* – Use the outbound sorting template for all warehouses in the warehouse group that's selected in the **Warehouse group** field.
        - *Warehouse* – Use the outbound sorting template only for the specific warehouse that's selected in the **Warehouse** field.

    - **Warehouse** and **Location** – If the **Warehouse selection** field is set to *Warehouse*, select the warehouse and the location where the outbound sorting template applies.

- **Warehouse group** – If the **Warehouse selection** field is set to *Warehouse group*, select the warehouse group where the outbound sorting template applies. For more information about how to set up warehouse groups, see Warehouse groups.

For this scenario, set the following values:

- **Warehouse selection:** *Warehouse*
- **Warehouse:** *62*
- **Location:** *SORT*

5. On the **General** FastTab, set the following values:

   - **Sort verification:** *Position scan*

   - **Create work on position close:** *Yes*

     If this option is set to *Yes*, when the position is closed, work will be created to move inventory to the final shipping location. If it's set to *No*, inventory will immediately be picked to the order when the position is closed.

   - **Position assignment:** *Automatic*

     If this field is set to *Manual*, the user must always indicate which position the inventory should be sorted to. If it's set to *Automatic*, the system will automatically guide the inventory to a position whenever it can, based on the sort template breaks.

6. Select **Save** to make the **Edit query** button on the Action Pane available.

7. On the Action Pane, select **Edit Query**.

8. In the query editor, on the **Sorting** tab, add a line that has the following values:

   - **Table:** *Shipments*

   - **Derived table:** *Shipments*

   - **Field:** *Carrier service*

     When you select this value, you might receive the following message: "Field Carrier service is not an index field. Do you want to add sorting on this?" Select **Yes**.

   - **Search direction:** *Ascending*

9. Select **OK**.

10. You might receive the following message: "Grouping will be reset, continue?" Select **Yes**.

    The **Outbound sorting template breaks** button on the Action Pane becomes available.

11. On the Action Pane, select **Outbound sorting template breaks**.

12. In the **Outbound sorting criteria** dialog box, set the following values:

    - **Reference table name:** *Shipments*
    - **Reference field name:** *Carrier service*
    - **Group by field:** Select this check box to group shipments by carrier service.

13. Select **OK** to save your settings and close the dialog box.

Set up container packing policies

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container packing policies**.

2. On the Action Pane, select **New**.

3. In the header of the new policy, set the following values:

    - **Container packing policy:** *Sort*
    - **Description:** *Sort*

4. On the **Overview** FastTab, set the following values:

    - **Warehouse:** *62*
    - **Default location for sorting:** *SORT*
    - **Weight unit:** *kg*
    - **Container closing policy:** *Automatic release*
    - **Container release policy:** *Assign container to outbound sorting position*

5. Select **Save**.

Set up packing profiles

Create a new packing profile that will be used together with the sorting functionality.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing profiles**.

2. On the Action Pane, select **New** to create a line, and set the following values for it:

- **Packing profile ID:** *Sort*
- **Description:** *Sort*
- **Container packing policy:** *Sort*
- **Container ID mode:** *Auto*
- **Container type:** *Box-Large*
- **Auto create container at container close:** Cleared (= *No*)

3. Select **Save**.

Set up work classes

Set up a work class that will be used together with sorting.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. On the Action Pane, select **New** to create a work class for sorting, and set the following values for it:
    - **Work class ID:** *Sort*
    - **Description:** *Sort*
    - **Work order type:** *Sorted inventory picking*
3. Select **Save**.

Set up mobile device menu items

Set up a new pallet menu item

Create a mobile device menu item to build pallets during sorting.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
    - **Menu item name:** *Pallet build*
    - **Title:** *Pallet build*
    - **Mode:** *Indirect*
    - **Use existing work:** *No*
4. On the **General** FastTab, set the following values:

- **Activity code:** *Outbound sorting*

  When this field is set to *Outbound sorting*, the **Outbound sorting template ID** field is shown.

- **Use process guide:** *Yes*

  When the **Activity code** field is set to *Outbound sorting*, this option is automatically set to *Yes*.

- **Outbound sorting template ID:** *AutoWork*

5. Select **Save**.

Set up a new loading menu item

Next, create a menu item that lets users move the sorted inventory items to the shipping location.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
   - **Menu item name:** *Load from Sorting*
   - **Title:** *Load from Sorting*
   - **Mode:** *Work*
   - **Use existing work:** *Yes*
4. On the **General** FastTab, set the **Directed by** field to *User directed*.
5. On the **Work classes** FastTab, select **New**, and then set the following values:
   - **Work class ID:** *SORT*
   - **Work order type:** *Sorted inventory picking*
6. Select **Save**.

Set up the mobile device menu

You must now add the new menu items to the mobile device menu.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Select the **Outbound** menu.

3. On the Action Pane, select **Edit**.
4. In the **Available menus and menu items** column, find and select **Pallet build**.
5. Select the right arrow button to move **Pallet build** to the **Menu structure** column.
6. Use the up arrow and down arrow buttons to put the **Pallet build** menu item in the desired position on the mobile device menu.
7. Select **Save**.
8. Repeat this procedure to add the **Load from Sorting** menu item to the **Outbound** menu.

Set up location directives

Location directives are rules that help identify pick and put locations for inventory movement. You must now create a rule to manage the sorting work.

Set up a single-SKU directive

1. Go to **Warehouse management** > **Setup** > **Location directives**.

2. In the left pane, change the value of the **Work order type** field to *Sorted inventory picking*.

3. On the Action Pane, select **New**.

4. In the header, set the following values:

    - **Sequence:** *1*
    - **Name:** *Baydoor*

5. On the **Location directives** FastTab, set the following values:

    - **Work type:** *Put*
    - **Site:** *6*
    - **Warehouse:** *62*
    - **Multiple SKU:** *No*

6. Select **Save** to make the toolbar on the **Lines** FastTab available.

7. On the **Lines** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

    - **Sequence:** *1*
    - **From:** *0*
    - **To:** *1,000,000*

8. Select **Save** to make the toolbar on the **Location Directive Actions** FastTab available.

9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

    - **Sequence:** *1*
    - **Name:** *Baydoor*

10. Select **Save**.

11. On the **Location Directive Actions** FastTab, select **Edit query**.

12. In the query editor, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.

13. Select **OK** to save your settings and close the query editor.

Set up a multiple-SKU directive

1. Go to **Warehouse management** > **Setup** > **Location directives**.

2. In the left pane, change the value of the **Work order type** field to *Sorted inventory picking*.

3. On the Action Pane, select **New**.

4. In the header, set the following values:

    - **Sequence:** *2*
    - **Name:** *Baydoor Multi*

5. On the **Location directives** FastTab, set the following values:

    - **Work type:** *Put*
    - **Site:** *6*
    - **Warehouse:** *62*
    - **Multiple SKU:** *Yes*

6. Select **Save** to make the toolbar on the **Lines** FastTab available.

7. On the **Lines** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

    - **Sequence:** *1*
    - **From:** *0*

- **To:** *1,000,000*

8. Select **Save** to make the toolbar on the **Location Directive Actions** FastTab available.

9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values on the new line. Accept the default values for all the other fields.

    - **Sequence:** *1*
    - **Name:** *Baydoor Multi*

10. Select **Save**.

11. On the **Location Directive Actions** FastTab, select **Edit query**.

12. In the query editor, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.

13. Select **OK** to save your settings and close the query editor.

Set up work templates

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.

2. Change the value of the **Work order type** field to *Sorted inventory picking*.

3. On the Action Pane, select **New** to create a work template.

4. On the **Overview** tab, set the following values:

    - **Sequence:** *1*
    - **Work template:** *Sort*
    - **Work template description:** *Sort*

5. Select **Save** to make the **Work Template Details** FastTab available.

6. On the **Work Template Details** FastTab, select **New** to add a line, and then set the following values for it:

    - **Work type:** *Pick*
    - **Work class ID:** *SORT*

7. Select **New** again to add a second line, and then set the following values for it:

    - **Work type:** *Put*
    - **Work class ID:** *SORT*

8. Select **Save**.

Scenario

This scenario simulates a situation where packed containers should automatically be sorted to different positions (pallets) after the packing station, depending on the shipping carrier service. After all items from the load are packed and sorted by address, the pallets will be moved to the bay door.

Create sales orders and picking work

Create sales order 1

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-005*
    - **Warehouse:** *62*
4. Select **OK** to close the dialog box.

    The new sales order is opened.
5. Switch to the **Header** view.
6. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
    - **Shipping carrier:** *Air cargo*
    - **Carrier service:** *Air*
7. Switch to the **Lines** view.
8. If a new, empty line isn't automatically added to the grid on the **Sales order lines** FastTab, select **Add line** to add one.
9. On the new order line, set the following values:
    - **Item number:** *A0001*
    - **Quantity:** *2*
10. While the new order line is still selected on the **Sales order lines** FastTab, on the **Inventory** menu above the grid, select **Reservation**.

11. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
12. Close the **Reservation** page to return to the sales order.
13. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
14. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID and shipment ID numbers.

Sales order 2

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-006*
    - **Warehouse:** *62*
4. Select **OK** to close the dialog box.
5. The new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. Set the following values on this order line:
    - **Item:** *A0001*
    - **Quantity:** *1*
6. On the **Line details** FastTab, on the **Delivery** tab, set the **Mode of delivery** field to *Flowe-STD*.
7. On the **Sales order lines** FastTab, select **Add line**, and then set the following values on the second order line:
    - **Item:** *A0002*
    - **Quantity:** *1*
8. On the **Line details** FastTab, on the **Delivery** tab, change the value of the **Mode of delivery** field to *Air C-Air*.
9. On the **Sales order lines** FastTab, select the first order line. Then, on the **Inventory** menu above the grid, select **Reservation**.

10. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
11. Close the **Reservation** page to return to the sales order.
12. On the **Sales order lines** FastTab, select the second order line. Then, on the **Inventory** menu above the grid, select **Reservation**.
13. On the **Reservation** page, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
14. Close the **Reservation** page to return to the sales order.
15. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
16. You receive an informational message that shows the shipment and wave for this order. Notice that two wave ID numbers and two shipment ID numbers have been created, one for each mode of delivery for the sales order lines.

Get the work IDs from the work details

1. Go to **Warehouse management** > **Work** > **Work details**.
2. The page shows the work IDs that have been created from sales orders. Use the wave IDs and shipment IDs from the sales orders that you created to find the work ID for each wave and shipment. Make a note of those work IDs, because you will need them in the next steps. Notice that two work IDs were created for the second sales order. If different items are picked from different locations, separate word IDs are generated.

Pick items for the sales orders

Complete the created work by using the mobile device to move the items to the pack station.

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sales Picking**.
4. In the **ID** field, enter the work ID that was created for sales order 1.
5. Select **OK**.

6. On the **Sales orders - Pick** page, enter a target LP that was created for sales order 1. Notice that the picking location (*bulk-001*), item (*A0001*), and quantity (*2 pcs*) are shown.

7. Select **OK**.

8. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.

9. Select **OK**.

   On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message, which indicates that the work ID from sales order 1 has been completed.

   You will now pick sales order 2.

10. In the **ID** field, enter the work ID that was created for sales order 2, where line 1 has item *A0001*.

11. Select **OK**.

12. On the **Sales orders - Pick** page, enter a target LP. Notice that the picking location (*bulk-001*), item (*A0001*), and quantity (*1 pcs*) are shown.

13. Select **OK**.

14. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.

15. Select **OK**.

    On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message. This message indicates that the work ID from line 1 of sales order 2 has been completed.

16. In the **ID** field, enter the work ID that was created for sales order 2, where line 2 has item *A0002*.

17. Select **OK**.

18. On the **Sales orders - Pick** page, enter a target LP. Notice that the picking location (*bulk-002*), item (*A0001*), and quantity (*1 pcs*) are shown.

19. Select **OK**.

20. Review the information on the **Sales orders - Put** page. The **Loc** field should indicate that the picked items are going to the *Pack* location.

21. Select **OK**.

    On the **Scan a work ID / license plate ID** page, you receive a "Work Completed" message. This message indicates that the work ID from line 2 of sales order 2 has been completed.

Pack sales orders into containers

Pack sales order 1 into containers

1. Go to **Warehouse management** > **Packing and containerization** > **Pack**.

   The **Select packing station** dialog box appears. By default, the **Worker** field should be set to the name of the worker that you set up earlier.

2. Set the following values to view and work on shipments and containers that are planned at the specific packing location:

   - **Site:** *6*
   - **Warehouse:** *62*
   - **Location:** *Pack*
   - **Packing profile ID:** *Sort*

3. Select **OK** to close the dialog box.

4. On the **Pack** page, in the **License plate or shipment** field, enter the target LP for sales order 1. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.

5. On the Action Pane, select **New container**.

6. Accept all the default settings, and select **OK**. Make a note of the container ID.

7. On the **Item packing** FastTab, set the following values:

   - **Quantity:** *1*
   - **Identifier:** Item *A0001*

8. On the Action Pane, select **Close container**.

9. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.

10. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

11. Create a second container to add the second item from the LP for sales order 1 to a new container.

12. On the Action Pane, select **New container**.

13. Accept all the default settings, and select **OK**. Make a note of the container ID.

14. On the **Item packing** FastTab, set the following values:

    - **Quantity:** *1*
    - **Identifier:** Item *A0001*

15. On the Action Pane, select **Close container**.

16. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.

17. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

Pack sales order 2 into containers

1. On the **Pack** page, in the **License plate or shipment** field, enter the target LP for line 1 of sales order 2. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.

2. On the Action Pane, select **New container**.

3. Accept all the default settings, and select **OK**. Make a note of the container ID.

4. On the **Item packing** FastTab, set the following values:

    - **Quantity:** *1*
    - **Identifier:** Item *A0001*

5. On the Action Pane, select **Close container**.

6. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.

7. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

8. In the **License plate or shipment** field, enter the target LP for line 2 of the sales order 2. Then select the **Tab** or **Enter** key on your keyboard to move out of the field.

9. On the Action Pane, select **New container**.

10. Accept all the default settings, and select **OK**. Make a note of the container ID.
11. On the **Item packing** FastTab, set the following values:
    - **Quantity:** *1*
    - **Identifier field:** Item *A0002*
12. On the Action Pane, select **Close container**.
13. In the **Close container** dialog box, select **Get system weight** to have the system update the **Gross weight** field.
14. Select **OK**. The container is moved to the *SORT* location and is ready for sorting.

To view the container details, go to **Warehouse management** > **Packing and containerization** > **Containers**, and search for the container IDs that were created during packing.

Sort the containers

> **Important**
>
> When you access the **Pallet build** menu item on the mobile app to do outbound sorting, you will see a button that is labeled **Full**. *Don't use the **Full** button to sort or close the position.*
>
> The **Full** button is provided by default and can't be disabled or removed from the page. It isn't used for the *Outbound sorting* feature.

Sort the first container

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Pallet build**.
4. In the **LP/Con** field, enter the first container ID that is associated with sales order 1.
5. Select **OK**.
6. Because no sort positions currently exist, you must specify one. In the **Sort position ID** field, enter *SP01*.

7. Because no LP is currently associated with sort position *SP01*, you must specify one. In the **LP** field, enter *PLP01*.
8. Select **OK**.
9. Because sort position validation is turned on, you must enter the sort position ID again. In the **Sort Position ID** field, enter *SP01*.
10. Select **OK**.

    You receive a "Work completed" message.

> **Tip**
>
> To view the sort position and the LP in it, go to **Warehouse management** > **Packing and containerization** > **Outbound sorting position assignments**.
>
> The **Outbound sorting position assignments** page shows all the sort positions that are currently active. The **Sort position transactions** field shows the LP that is associated with each sort position, and the containers that are in the sort position. Notice that one sort position currently exists, and that the **Sort position criteria** FastTab shows a criterion of **Shipment – Carrier service - Air**.

Sort the remaining containers

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Pallet build**.
4. In the **LP/Con** field, enter the second container ID that is associated with sales order 1.
5. Select **OK**. Because the sorting template is set up to sort automatically, and a sort position that has matching criteria already exists, you're automatically directed to the correct sort position.
6. Select **OK**.
7. Confirm the sort position ID to indicate that the inventory is in the correct place. In the **Sort Position ID** field, enter *SP01*.

8. Select **OK**.

   Work is completed on the second container from sales order 1. You will now sort the remaining containers from sales order 2.

9. In the **LP/Con** field, enter the container ID of the container from sales order 2 that holds item *A0001*. Because the carrier service differs, you're prompted to enter a new sort position and assign an LP to that position. Use sort position *SP02* and LP *PLP02*.

10. Select **OK**.

11. Confirm the sort position by entering *SP02* in the **Sort Position ID** field.

12. Select **OK**.

    Work is completed on the container.

13. In the **LP/Con** field, enter the container ID for the remaining container from sales order 2 that holds item *A0002*. Because the carrier service is the same as the carrier service for sales order 1, the system shows the existing sort position that has matching criteria.

14. Select **OK**.

15. Confirm the sort position by entering *SP01* in the **Sort Position ID** field.

16. Select **OK**.

    Work is completed on the container.

Close the outbound sorting positions

When all inventory has been sorted, the position must be closed before work can be created. Sorted inventory picking work will be created to take the inventory to the bay door.

Close a position from the mobile device

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).

2. On the main menu, select **Outbound**.

3. On the **Outbound** menu, select **Pallet build**.

4. In the **LP/Con** field, enter a container ID that was sorted to sort position *SP01*.
5. Select **OK**.
6. You receive the following message: "The container is already sorted to position SP01. Close the position?" Select **Close**.

   Work is completed.

Close a position from outbound sorting position assignments

1. Go to **Warehouse management** > **Packing and containerization** > **Outbound sorting position assignments**.
2. In the left column, select **SP02**. This outbound sorting position row is the one that you will close.
3. On the Action Pane, select **Close position**. The sorting position record is closed and is no longer shown.

   > **Tip**
   >
   > To show all closed position records, select the **Show closed** check box.

Sorted inventory picking

You must complete the sorted inventory picking work. When it's completed, the inventory will be picked to the sales order. At that point, all other warehouse processes apply.

1. On the mobile device, sign in to warehouse *62* by using the user ID that you created for this scenario (or the user ID of an existing demo data user).
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Load from Sorting**.
4. Enter the target LP ID from the first sort position, *SP01*. Set the **ID** field to *PLP01*.
5. Select **OK**.
6. The **Sorted inventory picking: Pick** page shows the pick work that must be done. Pick from the *SORT* location and target LP *PLP01*, which has multiple items and a quantity of *3*.

7. Select **OK**.
8. The **Sorted inventory picking: Put** page shows the put work that must be done. Put to the *Baydoor* location and target LP *PLP01*, which has multiple items and a quantity of *3*.
9. Select **OK**.

   Work is completed.
10. Enter the target license plate ID from the second sort position, *SP02*. Set the **ID** field to *PLP02*.
11. Select **OK**.
12. The **Sorted inventory picking: Pick** page shows the pick work that must be done. Pick from the *SORT* location and target LP *PLP02*, which has multiple items and a quantity of *1*.
13. Select **OK**.
14. The **Sorted inventory picking: Put** page shows the put work that must be done. Put to the *Baydoor* location and target LP *PLP02*, which has multiple items and a quantity of *1*.
15. Select **OK**.

    Work is completed.

From this point forward, all other warehouse processes apply.

Put to wall - put to store

Article • 02/01/2023

The *Put to wall - put to store* functionality lets you handle scenarios where you must consolidate a product to a prepack staging area, based on configurable criteria. Because this functionality allows for picking to a single target license plate and can use more put positions than cluster picking, companies that ship to stores or handle small items will benefit from decreased picking time.

The workflow for this functionality directs picked product to a sorting location for distribution into various types of containers. Generally, each sorting location includes multiple sort positions. Each sort position is assigned according to the criteria that are set by the business process. Typical criteria are the final destination, shipment, or load. After a product arrives, it's distributed to each sort position, based on the quantity that is associated with the order, destination, shipment, or load. When a container is full or complete, it's moved to a staging location or a shipping location for further handling, depending on the business process.

This warehousing functionality is also referred to by other names, such as put-to-light and break opens.

Turn on the Outbound sorting feature

To use the *Put to wall - put to store* functionality, two features must be turned on for your system. Admins can use the feature management settings to check the status of these features and turn them on if necessary. Both of the following features are required:

- *Outbound sorting* (As of Supply Chain Management version 10.0.32, this feature is mandatory and can't be turned off.)
- *Organization wide wave step code* (As of Supply Chain Management version 10.0.32, this feature is mandatory and can't be turned off.)

Setup

For this demo, standard Contoso data and warehouse *62* are used. Some additions that are noted later are also used.

Location type

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location types**.
2. On the Action Pane, select **New** to create a location type for sorting.
3. Set the following values:
    - **Location type:** *SORT*
    - **Description:** *Sort*
4. Select **Save**.

Warehouse management parameters

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Location types** FastTab, in the **Sorting location type** field, enter *SORT*.
3. Select **Save**.

Location profile

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. On the Action Pane, select **New** to create a location profile for the sorting location.
3. In the header, set the following values:
    - **Location profile ID:** *Sort*
    - **Name:** *Sort*
4. On the **General** FastTab, set the following values:
    - **Location format:** *PACK*
    - **Location type:** *SORT*
    - **Use license plate tracking:** *Yes*
    - **Allow mixed items:** *Yes*
    - **Allow mixed inventory statuses:** *Yes*
5. Select **Save**.

Locations

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.
2. Clear the **Generate check digits for location** check box.

3. On the Action Pane, select **New**, and then set the following values:

    - **Warehouse:** *62*
    - **Location:** *Sort*
    - **Location profile ID:** *Sort*

4. Select **Save**.

Packing profiles

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing profiles**.

2. On the Action Pane, select **New**, and then set the following values:

    - **Packing profile ID:** *Sort*
    - **Description:** *Sort*
    - **Container packing policy:** Leave this field blank.
    - **Container ID mode:** *Auto*
    - **Container type:** *PALLET 48X48*
    - **Autocreate container at container close:** Leave this field blank.

3. Select **Save**.

Wave step codes

If the *Organization wide wave step code* feature is turned on for your system, set up the following code.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave step codes**.

2. On the Action Pane, select **New**, and then set the following values:

    - **Wave step code:** *Sort*
    - **Wave step description:** *Sort*
    - **Wave step type:** *Sort template*

3. Select **Save**.

Outbound sorting template

The sorting template controls whether sort positions are created, what criteria are used, and other attributes of the sorting process.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Outbound sorting template**.

2. On the Action Pane, select **New** to create a sorting template.

3. In the header of the new template, set the following values:

    - **Outbound sorting template ID:** *Wave Sort*
    - **Description:** *Wave sort*
    - **Sort template type:** *Wave demand*

      This field defines the process that the sorting template is used for. The following values are available:
        - **Wave demand** – The sorting template is used for the *Put to wall* process. This template type is used to bypass the pack station and process inventory directly out of the wave. You can use this type only if the **sorting** wave process method is included in the wave template.
        - **Container** – The sorting template is used for the *Pallet building after packing* process. This template type is used to process containers that are closed at the pack station and must be sorted onto pallets.
    - **Warehouse:** *62*
    - **Location:** *Sort*

4. On the **General** FastTab, set the following values:

    - **Sort verification:** *Position scan*

      This field defines the verification that is required during sorting. The following values are available:
        - None
        - License plate scan
        - Position scan
    - **Create work on position close:** *Yes*

      If this option is set to *Yes*, when the position is closed, work will be created to move inventory to the final shipping location. If it's set to *No*, inventory will immediately be picked to the order when the position is closed.
    - **Position assignment:** *Manual*

This field defines the type of position assignment. The following values are available:
  - **Manual** – The user must always indicate which position the inventory should be sorted to.
  - **Automatic** – The system will automatically guide the inventory to a position whenever it can, based on the sort template breaks.

- **Assign sort position criteria:** *Only use empty position*

  This field controls whether inventory that is already present on sort positions is taken into account when a position is assigned for the demand. The following values are available:
  - **Only use empty position** – Positions that already have inventory associated with them will be taken into account
  - **Assume position empty** – Any inventory that is already on the position will be disregarded during assignment. All available positions will be used.

- **Wave step code:** *Sort*

  If the *Organization wide wave step code* feature is turned on, the *Sort* wave step code must also be set up in wave step codes.

- **Auto close sort position:** *Yes*

  If this option is set to *Yes*, the sort position will automatically be closed when all work that comes to the position has been completed.

- **Number of sort positions:** *3*

  This field defines the maximum number of sort positions that the system will create.

- **Sort position prefix:** *SP-*

  This field defines the prefix that the system assigns before the position number.

- **Auto pack sort position:** *Yes*

  If this option is set to *Yes*, the inventory on the sort position will be packed into a container when the position is closed.

- **Packing profile ID:** *Sort*

  This field defines the packing profile that will be used when the sort position is packed into a container.

5. On the Action Pane, select **Edit query** to specify the criteria that are used for this sorting template.
6. In the query dialog box, on the **Sorting** tab, select **New** to add a line, and then set the following values:
    - **Table:** *Load details*
    - **Derived table:** *Load details*
    - **Field:** *Shipment ID*
    - **Search direction:** *Ascending*
7. Select **OK**.
8. You might receive the following message: "Grouping will be reset, continue?" Select **Yes**.

    The **Outbound sorting template breaks** button on the Action Pane becomes available.
9. On the Action Pane, select **Outbound sorting template breaks**.
10. Select the **Group by field** check box to group by shipment ID.

    This setting will create one sort position per shipment that is a container in the wave.
11. Select **OK**.

Wave process methods

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. On the Action Pane, select **Regenerate methods**.

    The **sorting** method is added to the list of available methods, and the *Shipping* wave template type is selected for it.

Wave templates

Edit the wave template that is used for wave demand sorting.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. In the **Wave template type** field, select *Shipping*.
3. Select the existing **62 Shipping default** template.

4. On the Action Pane, select **Edit**.

5. On the **General** FastTab, make the following changes:

    - Set the **Process wave at release to warehouse** option to *No*.
    - Set the **Assign to open waves** option to *Yes*.

6. On the **Methods** FastTab, set up the **sorting** method:
    a. In the **Remaining Methods** grid, select **sorting**.
    b. Select the right arrow button to move **sorting** to the **Selected Methods** grid.
    c. In the **Selected Methods** grid, select **sorting**.
    d. Set the **Wave step code** field to *Sort*.

7. Select **Save**.

Mobile device menu items

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New**.

3. In the header, set the following values:

    - **Menu item name:** *Sort*
    - **Title:** *Sort*
    - **Mode:** *Indirect*
    - **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

    - **Activity code:** *Outbound sorting*
    - **Use process guide:** *Yes* (default value)
    - **Outbound sorting template ID:** *Wave Sort*

5. Select **Save**.

Mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. In the list of menus, select **Outbound**.
3. On the Action Pane, select **Edit**.
4. In the **Available Menus And Menu Items** grid, find and select the **Sort** menu item that you just created.

5. Select the right arrow button to move **Sort** to the **Menu Structure** grid. In this way, you add the menu item to the **Outbound** menu.
6. Select **Save**.

Location directives

You must create location directives to guide the work that is created after the sorting is completed.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the **Work order type** field, select *Sorted inventory picking*.
3. On the Action Pane, select **New**.
4. In the header, set the following values:
    - **Sequence:** *1*
    - **Name:** *Put to Baydoor*
5. On the **Location directives** FastTab, set the following values:
    - **Work type:** *Put*
    - **Site:** *6*
    - **Warehouse:** *62*
    - **Directive code:** Leave this field blank.
    - **Multiple SKU:** *No*
6. Select **Save** to make the **Lines** FastTab available.
7. On the **Lines** FastTab, select **New**, and then set the following values. Accept the default values for all the other fields.
    - **Sequence number:** *1*
    - **From quantity:** *0*
    - **To quantity:** *1000000*
8. Select **Save** to make the **Location Directive Actions** FastTab available.
9. On the **Location Directive Actions** FastTab, select **New**, and then set the following values. Accept the default values for all the other fields.
    - **Sequence number:** *1*
    - **Name:** *Baydoor*

10. Select **Save** to make the **Edit query** button on the **Location Directive Actions** FastTab available.
11. On the **Location Directive Actions** FastTab, select **Edit query**.
12. In the query dialog box, on the **Range** tab, find the row where the **Field** field is set to *Location*. Set the **Criteria** field for this row to *Baydoor*.
13. Select **OK** to confirm the edit.

Work classes

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. On the Action Pane, select **New**.
3. In the header, set the following values:
    - **Work class ID:** *Sorting*
    - **Description:** *Sorting*
    - **Work order type:** *Sorted inventory picking*
4. Select **Save**.

Work templates

1. Go to **Warehouse management** > **Work** > **Work templates**.
2. In the **Work order type** field, select *Sales orders*.
3. In the grid, select the **62 Pick to pack** work template.
4. On the Action Pane, select **Work header breaks**.
5. On the Action Pane, select **Edit**.
6. On the line where the **Field name** field is set to *Shipment ID*, clear the **Group by this field** check box.
7. Select **Save**, and then close the **Work header breaks** dialog box.
8. In the **Work order type** field, select *Sorted inventory picking*.
9. Select **New** to create a work template.

10. In the **Overview** section, set the following values. Accept the default values for all the other fields.

    - **Work template:** *Sorted picking*
    - **Work template description:** *Sorted picking*

11. Select **Save** to make the **Work Template Details** section available.

12. In the **Work Template Details** section, you will create two lines. Select **New**, and then set the following values for line 1:

    - **Work type:** *Pick*
    - **Mandatory:** Selected (= *Yes*)
    - **Work class ID:** *Sorting*

13. Select **New** again, and then set the following values for line 2:

    - **Work type:** *Put*
    - **Mandatory:** Selected (= *Yes*)
    - **Work class ID:** *Sorting*

14. Select **Save**.

Example scenario

This scenario simulates a situation where the warehouse stores small items in locations and must pack them into boxes before they are shipped, and where packing station functionality isn't really suitable. Workers pick orders for multiple customers and different addresses at the same time to increase the picking speed. After picking has been completed, the workers arrive at the sorting location, where the picked items can be sorted to the correct box, based on required criteria. In this example, the shipment ID will be used to determine the correct box, because each shipment has a different address. After all items from the load are packed and sorted by shipment, the boxes will be moved to the staging area and eventually loaded onto a truck.

Before you start the scenario, make sure that all standard warehouse functionality is set up correctly for your warehouse. Standard Contoso warehouse *62* is used for this purpose. Standard configurations haven't been changed, besides what is described in the setup.

Create demand

Before the functionality can be demonstrated, you must create some demand. For this scenario, you will create three sales orders for three different customers to simulate different delivery addresses. In this way, you will create three separate shipments.

Before you create sales orders and shipments, make sure that the pick locations have enough inventory for all the items on the orders. Review the location directive settings to confirm the picking locations that are used for sales order picking. If you must adjust the inventory, you can create manual movements, use replenishment, or use any other flow. Then reserve the inventory.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a sales order for order 1.
3. In the **Create sales order** dialog box, set the following values:
    - **Customer:** *US-001*
    - **Warehouse:** *62*
4. Select **OK**.
5. A new line is added to the **Sales order lines** FastTab. Set the following values:
    - **Item number:** *A0001*
    - **Quantity:** *5*
6. Select **Add line** to add a second line, and set the following values:
    - **Item number:** *A0002*
    - **Quantity:** *10*
7. Repeat the following steps for each sales line on the order to reserve inventory for it:
    a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
    b. On the **Reservation** page, select **Reserve lot**, and then close the page.
    c. Select **Save**.
8. Select **New** to create a sales order for order 2.
9. In the **Create sales order** dialog box, set the following values:
    - **Customer:** *US-004*
    - **Warehouse:** *62*
10. Select **OK**.
11. A new line is added to the **Sales order lines** FastTab. Set the following values:

- **Item number:** *A0001*
- **Quantity:** *7*

12. Select **Add line** to add a second line, and set the following values:

    - **Item number:** *A0002*
    - **Quantity:** *3*

13. Repeat the following steps for each sales line on the order to reserve inventory for it:
    a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
    b. On the **Reservation** page, select **Reserve lot**, and then close the page.
    c. Select **Save**.

14. Select **New** to create a sales order for order 3.

15. In the **Create sales order** dialog box, set the following values:

    - **Customer:** *US-007*
    - **Warehouse:** *62*

16. Select **OK**.

17. A new line is added to the **Sales order lines** FastTab. Set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *8*

18. Follow these steps to reserve inventory for the sales line:
    a. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.
    b. On the **Reservation** page, select **Reserve lot**, and then close the page.
    c. Select **Save**.

Complete the following procedure to release each sales order to the warehouse. Three different shipments will be created. You will then add all three shipments to one new wave.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. In the grid, select the first sales order that you created.

3. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

   You receive an informational message that shows the wave ID and shipment ID that were created.

4. Repeat the previous steps to release sales orders 2 and 3 to the warehouse. Notice that the informational message that you receive indicates that a shipment has been added to the wave that was created when you released sales order 1.

5. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.

6. Select the wave ID that was created from the release of the sales orders to open the **Waves** page. This page shows the wave details. The **Wave lines** FastTab shows the shipments that were created.

   You must now create work to bring items from the picking locations to the sorting location.

7. On the Action Pane, select **Process**.

   During wave processing, the sorting method will use the sorting template to assign the inventory to sort positions. When wave processing is completed, you receive an informational message that states that the wave has been posted and work has been created.

8. On the Action Pane, on the **Wave** tab, in the **Related information** group, select **Work** to view the work that was created. Make a note of the work ID.

9. Go to **Warehouse management** > **Packing and containerization** > **Outbound sorting position assignments**.

10. In the left column, you can view the outbound sorting position that was created for each shipment.

11. On the **Sort position criteria** FastTab, you can view the shipment ID for that position.

One work ID has been created to bring inventory from the picking locations to the sorting location. To complete the work, you will need the work ID that was created during wave processing.

Sales order picking to the sorting location

1. Sign in to the mobile app as a worker in warehouse *62*.

2. On the main menu, select **Outbound**.

3. On the **Outbound** menu, select **Sales Picking**.

4. Select the **ID** field, and then enter the work ID from the wave processing.
5. Confirm your entry.

   Next, you're prompted to enter a target license plate (LP). Notice that line 1 from sales order 1 is what must be picked and added to the target license plate. The item number, quantity, item description, and pick location are shown.
6. In the **Target LP** field, enter a license plate number.

   You will pick all lines that were created from the processed wave onto the same target license plate.
7. Confirm your entry.

   The mobile app now presents a series of **Pick** pages that point you to the picking location, and to the item and quantity that must be picked. After the picked item is added to the license plate, you will confirm the pick work. The last page will be the work to put the picked items into the sorting location.
8. Confirm the first pick work.
9. The next pick work is shown. Confirm the pick.
10. Continue to confirm the remaining pick work.
11. The last step is to complete the put work. Confirm the put-away to the sorting location.

    You receive a "Work completed" message.
12. Exit **Sales Picking** on the mobile app.

Sorting/put-to-wall

Now that all inventory has been put to the sorting location, it must be sorted to the correct sort position.

1. Sign in to the mobile app.
2. On the main menu, select **Outbound**.
3. On the **Outbound** menu, select **Sort** to start to sort the items.
4. In the **LP/CON** field, enter the target license plate of the picked sales order work.
5. Confirm your entry.

6. Enter the item number to sort first.

7. The system determines the first sort position that should be shown. Confirm the sort position.

8. You're prompted to assign a license plate to the sort position. Select the **LP** field, enter a license plate number, and then confirm your entry.

   Because the sort position is related to the shipment ID, you will sort the picked items into a license plate that is specific to the outbound shipment and sales order.

   The next page shows the item ID, quantity, sort position ID, and the "from" (picking) and "to" (sorting) license plate IDs. The information on this page instructs you to sort the specified item and quantities from the picking license plate into the sorting license plate.

9. Confirm the sort position.

10. Sort the items in the first sort position. When you've finished, the system directs you to the next sort position.

11. Repeat this process for all picked lines on the work order. You should also use this process when there are multiple pick lines that have the same item number.

    As you repeat this process for all items, the system evaluates the criteria from the next scanned item (work line) and determines which sorting position it should be put to. You're automatically directed to put the item to the correct sort position. Depending on the confirmation setup, you're also directed to confirm this action by entering the position number or license plate ID.

    > ⓘ **Note**
    >
    > If automatic sorting is turned on, manual override isn't available.

12. When you've finished, in Microsoft Dynamics 365 Supply Chain Management, open the **Outbound sorting position assignments** page to review the status of the positions.

    - If positions are closed automatically, select **Show closed** to show the closed positions.
    - Notice that sort position transactions are shown. The item and quantity that were processed through the position are shown.

When you set up the outbound sorting template, you set the **Auto close sort position** option to *Yes*. Therefore, the position is automatically closed after the last expected inventory is put to it. The sort positions are in **Closed** status, and work has been created to move the sorted inventory to *Baydoor* location.

13. Complete the sorted inventory picking work to move the inventory to the shipping location. When the inventory is ready, ship-confirm it.

> ⓘ **Note**
>
> For sorted inventory picking work to be processed correctly, a mobile device menu item that has a work class ID where the **Work order type** field is set to *Sorted inventory picking* should be used for the movement and loading process.

Manually close a position (optional)

If sort positions should be closed manually, the **Auto close sort position** option for the outbound sorting template must be set to *No*, and closing must be done before inventory can be moved to the bay door area. Positions can be closed in various ways:

- Via the Warehouse Management mobile app:
  - The user can scan one of the items that are already on the position and then select **Close** to close the position.
  - If the user scans a container that has already been sorted container, an error message is shown. However, the user can still continue to close the position.
- From the Microsoft Dynamics 365 Supply Chain Management **Outbound sorting position assignments** page:
  - The user can select the outbound sorting position record and then select **Close position** on the Action Pane.

Tips

- Items can't be moved between positions after they have been assigned to one. The system evaluates how many of each item should go to a specific position.
- Sorts template can be configured to automatically create containers when positions are closed. This approach will create standard container ID structure that is based on the specified packing profile.

> ⓘ **Important**

After movement work has been created from the sorting location, you must not cancel the work. Otherwise, the position and the containers in it will be deleted from the system and unavailable for further processing. The inventory will also be removed.

Outbound workload visualization

Advanced setup capabilities that are accessible from the **Outbound workload visualization** page let warehouse managers and supervisors create custom workload charts that can be used to monitor the progress of current work and the amount of it that remains. Warehouse managers can create multiple views and set up automatic refresh as they require. Outbound workload visualizations are suitable for display on warehouse performance pages.

This functionality can be used to track the progress of picking work. The feature is integrated with labor management, and if labor management is set up, outbound workload visualizations can show a calculation of the number of hours that remain for the picking work that is shown (filtered).

Set up outbound workload visualizations

To set up your visualizations, you create a collection of filters (views) and design each filter so that it shows a different type of analysis. You use the **Configure filters** page to design the filters.

To set up an outbound workload visualization, follow these steps:

1. Go to **Warehouse management** > **Warehouse monitoring reports** > **Outbound workload visualization**.

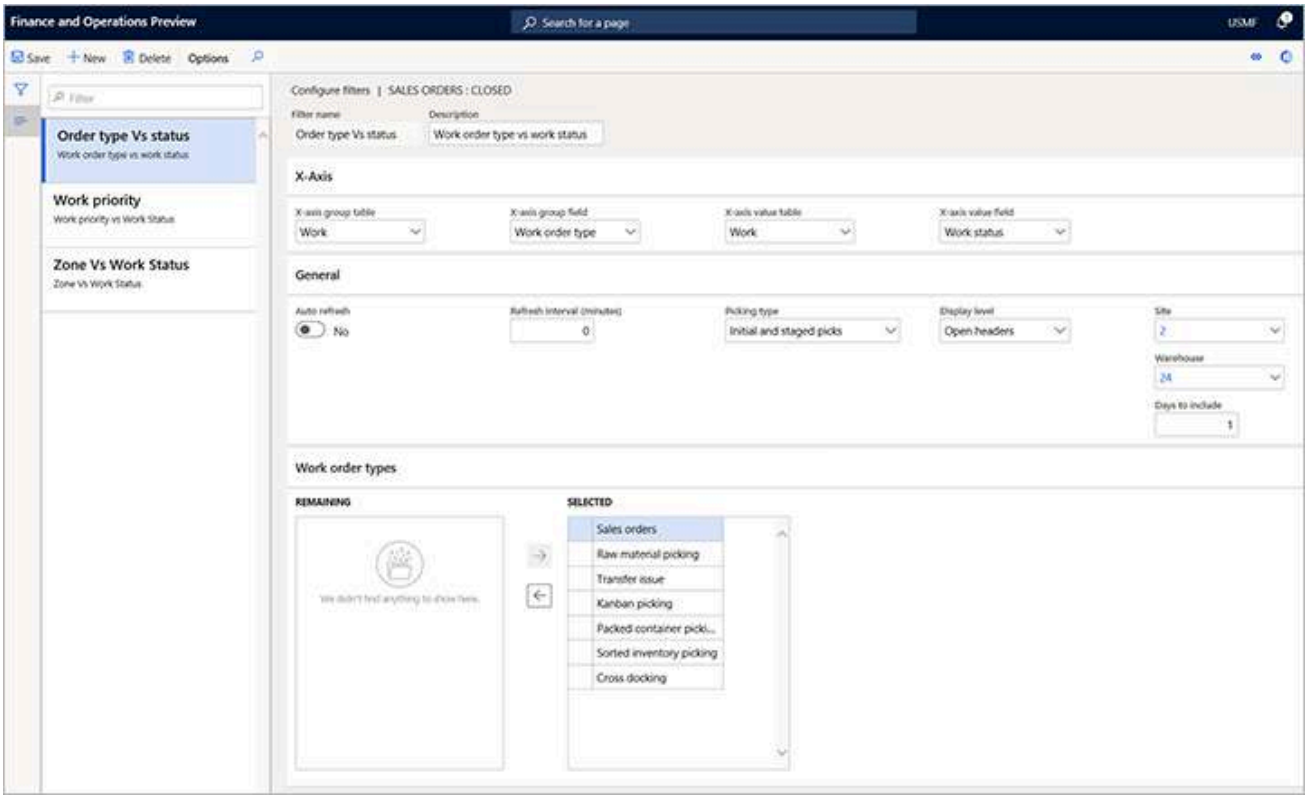
   The **Outbound workload visualization** page appears. After you create some filters, this page will show your visualization. You can create as many filters as you want. All the filters that you create are saved under your user account, so that you can use them later. In other words, each user will have their own set of filters that they created. Those filters won't be shared with other users.

2. On the **Outbound workload visualization** page, on the Action Pane, on the **Filters** tab, select **Configure filters**.

3. On the **Configure filters** page, on the Action Pane, select **New** to add a filter, and then set the following fields for it:

   - **X-axis group table** – Select the table that contains the field that should be used to group the X-axis values.
   - **X-axis group field** – From among the fields of the table that you selected in the **X-axis group table** field, select the field that should be used to group the X-axis values.

- **X-axis value table** – Select the table that contains the field that should be used to further analyze the groups.
- **X-axis value field** – From among the fields of the table that you selected in the **X-axis value table** field, select the field that provides the values that should be analyzed for each group.
- **Auto-refresh** – Select whether the visualization should automatically be refreshed.
- **Refresh interval (minutes)** – Enter the number of minutes between automatic refreshes.
- **Display level** – Select whether the chart should show open lines or open header counts.
- **Picking type** – If you set the **Display level** field to *Open lines*, select whether the count of open work lines in the chart should include initial picks, staged picks, or both initial picks and staged picks.
- **Site** – Select the site to load the chart for.
- **Warehouse** – Select the warehouse to load the chart for.
- **Days to include** – Enter the number of days in the past that the chart should be generated for.
- **Work order type** – Select the outbound work order types to filter on.

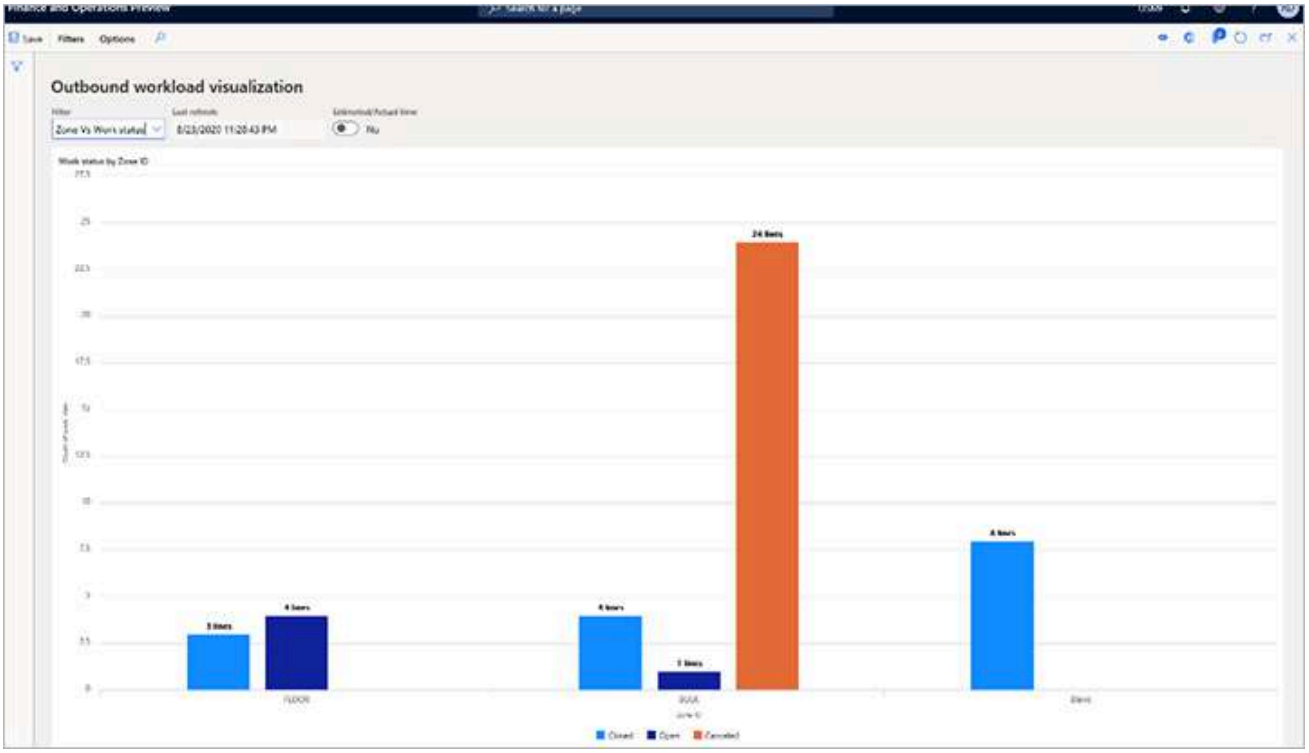


4. Close the **Configure filters** page to return to the **Outbound workload visualizations** page.

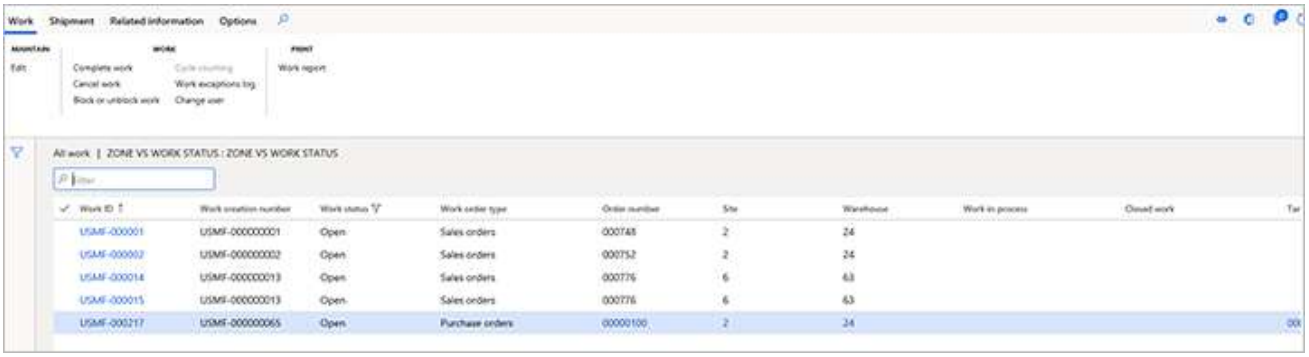
The **Outbound workload visualizations** page now shows data, based on your new filter settings. Your new filter is now available and is selected in the **Filter** field. The following

fields are available at the top of the chart:

- **Filter** – This field includes all the filters that you've created so far. Select a filter to view its data in the chart.
- **Last refreshed** – This field shows the date and time when the information in the chart was last updated.
- **Estimated/actual time** – If labor standards are set up in your system, set this option to *Yes* to show accumulated estimated picking times at the top of each column in the chart. If you aren't using labor standards, this option is unavailable.



5. Select any bar in the chart to view the associated work line details.

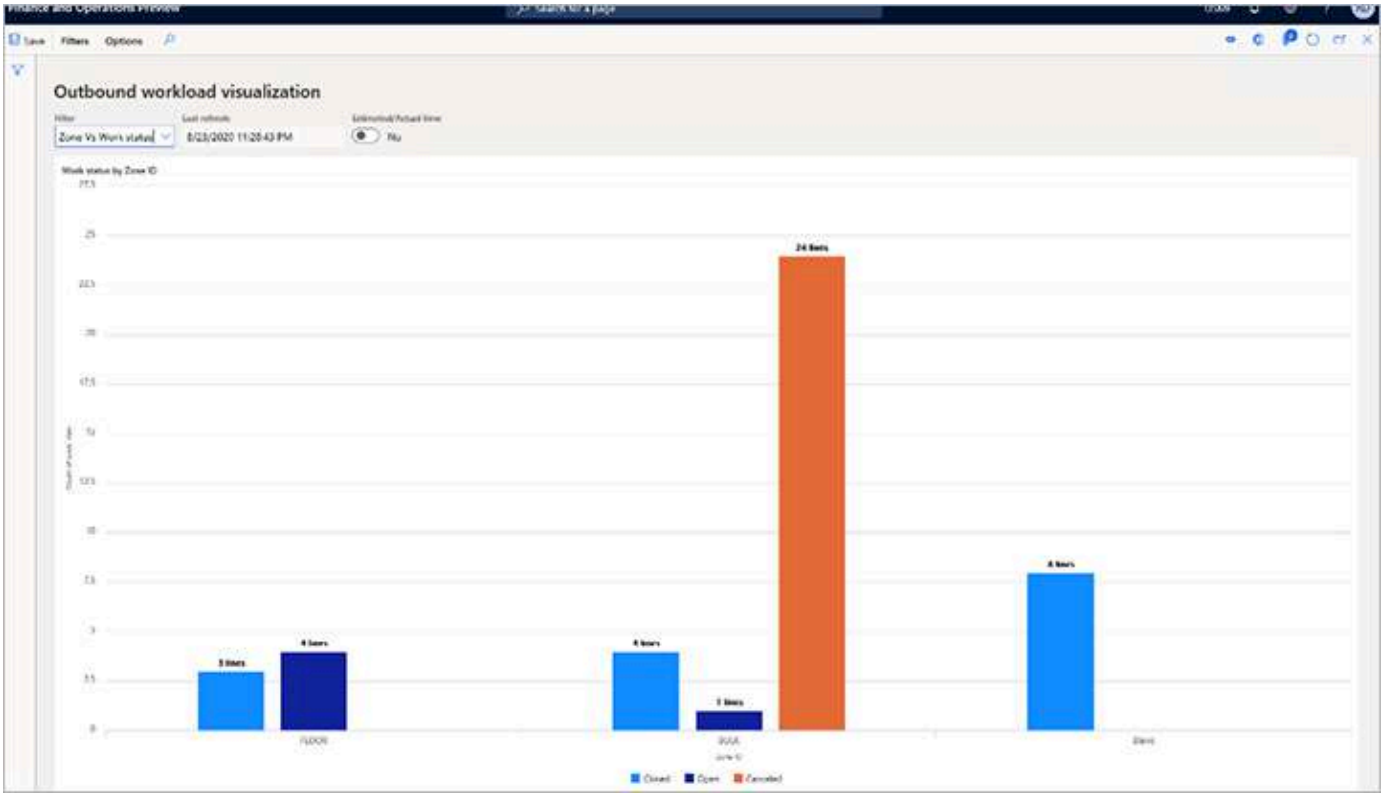


Example: Outbound workload visualization for zones

For this example, you want to set up a visualization that shows work lines for each zone, and the status of each work line (*Open*, *Closed*, or *Canceled*). In this case, you can set up a filter that has the following settings:

- **Filter name** – Enter a name for this filter (such as *Zone vs. work status*).
- **Description** – Enter a short description for this filter (such as *Zone vs. work status*).
- **X-axis group table** – Select *Locations*.
- **X-axis group** – Select *Zone ID*.
- **X-axis value table** – Select *Work*, because you want to view work per zone.
- **X-axis value field** – Select *Work status*, because you want to view work status.
- **Auto refresh** – Select whether the visualization should automatically be refreshed.
- **Picking type** – Select *Initial picks and staged picks*, because you want to include both initial picks and picks from staging locations. In other words, you essentially want to include all the pick work lines that you have.
- **Display level** – Select *Open lines*, because you want to view the information per line, not per work header.

The following illustration shows an example of the resulting chart.



This chart shows two zones that are named **FLOOR** and **BULK**, plus a zone that is named **Blank**. The **Blank** zone represents all work lines that aren't members of any zones. The chart always shows all unrelated filtered data as **Blank**, to provide as much visibility as possible. In the **FLOOR** zone, the chart shows three closed lines and four open lines. In the **BULK** zone, the chart shows four closed lines, one open line, and 24 canceled lines. Finally, the chart shows eight closed lines that aren't part of any zone and are therefore listed as **Blank**.

Manually handle sales and transfer line picking exceptions

10/03/2025

Manual handling of sales and transfer line picking exceptions enables administrators to fix issues that are caused by corrupted sales and transfer order data. It lets trusted users manually pick (or unpick) inventory transactions that are related to sales and transfer order lines while warehouse processes are already in progress.

The functionality that is described here should be used only in cases where the system can't finish processing the warehouse processes stack in the usual way. By default, only users who have a system admin role are allowed to use it. However, you can grant access to it by assigning the *Pick sales lines manually* privilege to other roles as you require.

Correct transactions related to sales or transfer order lines

Use the following procedure to correct transactions that are related to sales or transfer order lines.

1. Follow one of these steps, depending on the type of order that you must correct:

    - To correct a transaction that is related to a sales order, go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Pick sales line manually**.
    - To correct a transaction that is related to a transfer order, go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Pick transfer lines manually**.

2. On the **Pick sales lines manually** or **Pick transfer lines manually** page, use the filters at the top of the grid to find the line that you're looking for, and then select the target order line in the upper grid.

3. Use the **Inventory transactions**, **Load lines**, **Work lines** and **Container lines** tabs in the lower section to view more information about the selected line. The information on these tabs gives a basic overview of the related warehouse processes and their statuses.

4. On the Action Pane, select **Pick** to open the selected order line on the **Pick** page for inventory transactions. You can complete this step even for order lines that have already been released to the warehouse. (Usually, order lines that have been released to the warehouse can't be opened on the **Pick** page.)

> **Note**
>
> You might receive various warnings when you open the **Pick** page. Take any action that these warnings recommend. For example, you might receive a warning about order lines that are linked to warehouse work. In this case, it makes sense to try to cancel the work by using the standard cancel work functionality before you do manually correction.

5. Select the line in the **Transactions** grid, and then select **Add picking line** on the **Transactions** toolbar.

6. The selected line is moved to the **Picking lines** grid. Set appropriate values for any columns that are missing required information. (For example, specify the location and license plate that the item should be picked/un-picked from.)

7. Select **Confirm pick all** on the **Picking lines** toolbar.

Correct load line quantities

Use the following procedure to correct a load line quantity.

1. Follow one of these steps, depending on the type of order that you must correct:

    - To correct a transaction that is related to a sales order, go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Pick sales line manually**.
    - To correct a transaction that is related to a transfer order, go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Pick transfer lines manually**.

2. On the **Pick sales lines manually** or **Pick transfer lines manually** page, use the filters at the top of the grid to find the line that you're looking for, and then select the target order line in the upper grid.

3. On the **Load lines** tab in the lower section, select **Correct load lines manually** on the toolbar.

4. On the **Correct load lines manually** page, in the **Inventory transactions** grid, review the inventory transactions that are related to the selected load line.

5. In the upper grid, correct the load line quantities in the following columns as required:

    - **Work created quantity**
    - **Picked quantity**
    - **Planned cross docking quantity**

The system will validate any changes that you make to these columns.

Cancel warehouse work for exception handling

The cancel work functionality in Microsoft Dynamics 365 Supply Chain Management lets the admin user cancel specific warehouse work that is currently in progress, but that is blocked by the system or can't be completed because of exceptional circumstances. This functionality is an attractive and secure alternative to SQL corrective scripts that fix inconsistent data. However, whereas these scripts are typically requested from IT professionals, the cancel work functionality can be used by users in the company who have admin rights.

You can access the cancel work functionality at **Warehouse management** > **Periodic tasks** > **Clean up** > **Cancel work**. In the **Cancel work** dialog box, specify the work ID of the work to cancel, and then select **OK**.

Warehouse work that can be canceled

During warehouse picking operations, a worker might encounter situations where they have registered quantities as picked from a storage location to their user location, but then they can't register the put operation. Inconsistent warehouse data is often, but not always, the reason why work is blocked.

Unlike the regular cancel functionality that can be accessed by using the **Cancel** button on the work header, the cancel work functionality doesn't require that the last completed work line be a work line of the **put** type. In other words, for the cancel work functionality, cancellation logic can be run even if the item quantity on a work line is in a user location.

> ⓘ **Note**
>
> For work that must be canceled for operational reasons, warehouse users must continue to use the regular cancel functionality on the work page.

Only work of the **Sales**, **Transfer issue**, **Raw material picking**, or **Replenishment** type can be canceled by using the cancel work functionality. Cancellation logic won't be run for frozen raw material picking work or work that can be canceled by using the regular cancel functionality (see the preceding note).

To unblock the work, the system cancels any remaining work lines and fixes the warehouse data that is associated with the work ID that the user specified. Any regular warehouse-handling operations that involve the affected item quantity can then resume.

To put the affected item in a specific location after the work is canceled, the user must use an inventory movement or quantity adjustment operation on a mobile device.

Serial number capturing

Article • 03/05/2025

This article explains how to use the **Capture serial number** field on the **Tracking dimension groups** page for items that use the warehouse management processes. Depending on the setting of this field, the actual serial number value on inventory transactions (on-hand inventory) isn't populated until later in the process, even if serial numbers are activated for the items.

The following articles describe a similar, but slightly different, serial number setting for cases where **Active in sales process** is enabled:

- Working with serialized items
- Serial Number Tracking for Service and Warranty in Microsoft Dynamics AX R3 - Microsoft Dynamics 365 Blog
- Enable picking of sales serial number items with R3 warehouse management processes - Microsoft Dynamics 365 Blog
- How to use Serial Sales picking with Warehouse Management processing in Dynamics AX 2012 - Microsoft Dynamics 365 Blog

Capture the serial number during picking

Your business process might require that the exact serial number that is picked for a sales or transfer order is known at the time of picking. To enable this setup, go to the tracking dimension group, select **Serial number**, and set the **Capture serial number** field to *Picking*.

> **Note**
>
> When the field is set to *Picking*, the **Blank receipt allowed** and **Blank issue allowed** fields are automatically selected, and the settings can't be changed.

In this case, when on-hand inventory is added, the user isn't prompted to enter the serial number during warehouse inbound processes such as purchase order receiving on the warehouse mobile device. Instead, the user specifies the serial number during the picking process, such as when sales picking work is completed on the warehouse mobile device. At this point, the serial number is added to the inventory transactions (on-hand inventory).

Capture the serial number during packing

Your business process might require that the exact serial number that is picked for a sales or transfer order is known at the time of packing. To enable this setup, go to the tracking dimension group, select **Serial number**, and set the **Capture serial number** field to *Packing*.

> **Note**
>
> When the field is set to *Packing*, the **Blank receipt allowed** and **Blank issue allowed** fields are automatically selected, and the settings can't be changed.

In this case, when on-hand inventory is added, the user isn't prompted to enter the serial number during warehouse inbound processes such as purchase order receiving on the warehouse mobile device. Instead, the user specifies the serial number during the packing process, such as when the items are packed into containers on the **Pack** page. At this point, the serial number is added to the inventory transactions (on-hand inventory).

Don't capture the serial number

The default setting for the **Capture serial number** field is *None*. In this case, the user isn't prompted to capture the serial number during either the picking process or the packing process. Instead, the serial number is captured during the receiving process, even if **Blank receipt allowed** is enabled. The serial number must be part of the inventory transactions (on-hand inventory) from the very beginning.

> **Note**
>
> Depending on other settings, the user might not be prompted to capture the serial number during the receiving process if it was generated in some other way. For example, the user isn't prompted to capture the serial number if automatic generation of serial numbers is enabled through the tracking number group.

Replenishment overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the replenishment strategies that are available for warehouses that use the functionality in Warehouse management. The information in this article doesn't apply to the warehousing solution that's available in Inventory management.

The following replenishment strategies are available:

- **Wave demand replenishment** – This strategy creates replenishment work for outbound orders or loads if inventory isn't available when the wave creates work. For example, replenishment work can be created if the quantity that is required for a sales order isn't available when a wave is processed.
- **Min/Max replenishment** – This strategy uses minimum and maximum stocking limits to determine when locations should be replenished. The item and location criteria define the inventory that is evaluated for replenishment. Min/Max replenishment templates are the primary mechanism for maintaining optimal levels in picking locations. To help guarantee that enough pick face inventory is available to meet wave demand, you can use demand replenishment as a supplement between Min/Max replenishment cycles.
- **Load demand replenishment** – This strategy sums the demand for several loads and creates the replenishment work that is required in order to stock the relevant picking locations. This strategy helps guarantee that the loads that are created can be picked in the warehouse after they're released.
- **Immediate replenishment** – This strategy replenishes inventory before a wave is run if allocation fails for a location directive line that has a replenishment template.

All four strategies create replenishment work, based on a replenishment template.

Wave demand replenishment

Wave demand replenishment creates replenishment work, based on demand, if the quantity that is required for production orders, kanbans, outbound orders, or loads isn't available when a wave creates work. The replenishment template contains information about the item criteria, the unit of measure, the demand increment, and the location.

Location directives are used to determine which location should be replenished. You link these location directives to the replenishment template by using the **Directive code** field. If you don't set the **Directive code** field, queries are used to determine which location directive should be used. If you don't specify a directive code in the replenishment template, and the location directive has a directive code, the location directive is ignored, even if the query on the location directive is correct. Pick location directives are used to determine where to get inventory for the replenishment.

In addition to creating a template, you must specify some replenishment settings in the wave template. The wave template should contain a wave step for replenishment that runs only if an item isn't successfully allocated. This replenishment wave step uses a wave step code to determine which replenishment template should be used. In addition to having a wave step for replenishment, you must make sure that **Replenish** is selected in the **Methods** section of the wave template.

The **Replenishment template** page includes an **Allow wave demand to use unreserved quantities** check box. Select this check box if demand replenishment should be able to deduct unreserved quantities from work that is generated from the selected replenishment template. To enable demand replenishment templates to use this logic, select this check box for every existing replenishment template. When demand replenishment is triggered in the warehouse, it deducts the demand from existing replenishment work that has unreserved quantities, if the work originates from replenishment templates where the **Allow wave demand to use unreserved quantities** check box is selected.

Replenishment unit is the minimum unit to replenish. This must be a whole number that is a multiple of the unit. The system rounds up to the highest unit possible when creating work.

Demand replenishment is supported for sales orders, transfer orders, production orders, and kanbans.

Min/Max replenishment

In Min/Max replenishment, the system replenishes stock so that it's between the minimum and maximum limits that you set. Typically, this process runs once every day to help guarantee that all picking locations are filled to the maximum level before picking starts.

The minimum and maximum amounts are set in a replenishment template. Many of the other settings in the template resemble the settings in templates that are used in Wave demand replenishment. The template should contain one line for each item and location. When you run replenishment by using the batch job, the system evaluates whether replenishment is required by using the sequence that the lines are organized in.

The Min/Max replenishment strategy can't replenish an empty location unless you set the location as the fixed location for the item. If the location that must be replenished isn't a fixed location, the system can't determine which item to replenish. Therefore, at least some on-hand quantity is required before replenishment occurs.

Load demand replenishment

Load demand replenishment sums the demand for several loads and creates the replenishment work that's required to stock the relevant picking locations. Load demand replenishment resembles Wave demand replenishment in many ways. The main difference is how and when Load demand replenishment and Wave demand replenishment run. Like Min/Max replenishment, you run Load demand replenishment by using a batch job. To set up the batch job, on the **Load demand replenishment** page, select the replenishment template to use, and set a filter query to specify which loads are used to determine the demand. The location query defines the locations that the system subtracts any available quantity from to meet the aggregated demand of the loads.

Immediate replenishment

Instead of having to sum demand at the end of an allocation process and do replenishment on the basis of the summed up quantity, you can apply the Immediate replenishment strategy. When you use this strategy, the system can replenish inventory immediately after a location directive line fails. Therefore, you can set up the replenishment so that it's restricted by specific units, and so that it uses quantities that are set for specific locations.

Replenishment prerequisites

Expand table

Prerequisite	Description
Item	You must enable the item for warehouse management processes (WMS).
Warehouse	You must enable the warehouse for warehouse management processes (WMS). To enable a warehouse for WMS, on the **Warehouses** page, select the warehouse, and then select the **Use warehouse management processes** option.
Replenishment templates	You must set up at least one replenishment template for Min/Max replenishment, Wave demand replenishment, or Load demand replenishment.
Locations	You must create locations and connect them to a location profile.

Prerequisite	Description
Location profiles	You need location profiles to create locations.
Location directives	You need location directives to guide work to the locations where replenishment is required and to the locations that inventory is sourced from.
Work templates	You need work templates of the **Replenishment** type to create replenishment work so that inventory can be moved to the desired locations.

Last updated on 11/20/2025

Immediate replenishment

Immediate replenishment lets you replenish inventory immediately after a location directive line fails to allocate inventory. The replenishment is based on a single line in the setup of the location directive. If inventory isn't on hand in the unit of measure that is specified by that line, replenishment of that unit of measure occurs immediately.

Immediate replenishment provides an alternative to the method where the allocation of inventory is based on more lines in the location directive, and where the demand is summed at the end of the allocation and replenished in the unit of measure that is specified by the last line in the location directive.

The benefits of using immediate replenishment are that replenishment can be limited by specific units and the quantity can be directed to specific locations.

Business scenario

For example, you have a warehouse that has separate picking areas for the "box" and "each" units of measure. You want to optimize the picking process by picking as many boxes as possible and then picking any remaining quantity that is less than a box from the "each" area.

In this case, you can use immediate replenishment. In the location directive, you can set up immediate replenishment for boxes so that demand replenishment is used as soon as there is a shortage of boxes that can be picked for the demand quantity. In this way, you optimize the picking process so that picking includes as many boxes as possible. Immediate replenishment will generate replenishment of the boxes, and the demand won't be passed on so that the quantities are picked in the "each" unit of measure. In other words, only the quantities that are supposed to be picked in the "each" unit of measure (that is, quantities that are less than a box) will be picked from the "each" area. If a shortage occurs in the "box" area, you can pick as many boxes as possible out of the total demand. The remaining quantities will then be picked from the "each" area.

Where it applies

Immediate replenishment is used during wave execution if allocation fails for a location directive line that a replenishment template is set for.

Set up immediate replenishment

- Go to **Warehouse management** > **Setup** > **Location directives**, and then, on the **Lines** tab, in the **Immediate replenishment template** list, select a replenishment template for wave demand.

The replenishment template is applied if the location directive line fails to allocate a dedicated unit of measure.

Troubleshooting

If immediate replenishment is selected for a location directive line, but no replenishment work is generated when you use demand replenishment templates for that location directive line, two main causes must be investigated:

- Make sure that the demand replenishment template that is applied is set up to use the correct location templates and work templates of the **Replenishment** type.
- Make sure that there is enough on-hand inventory at the locations where the demand replenishment template searches for on-hand inventory for replenishment.

Replenishment with withdrawal kanbans

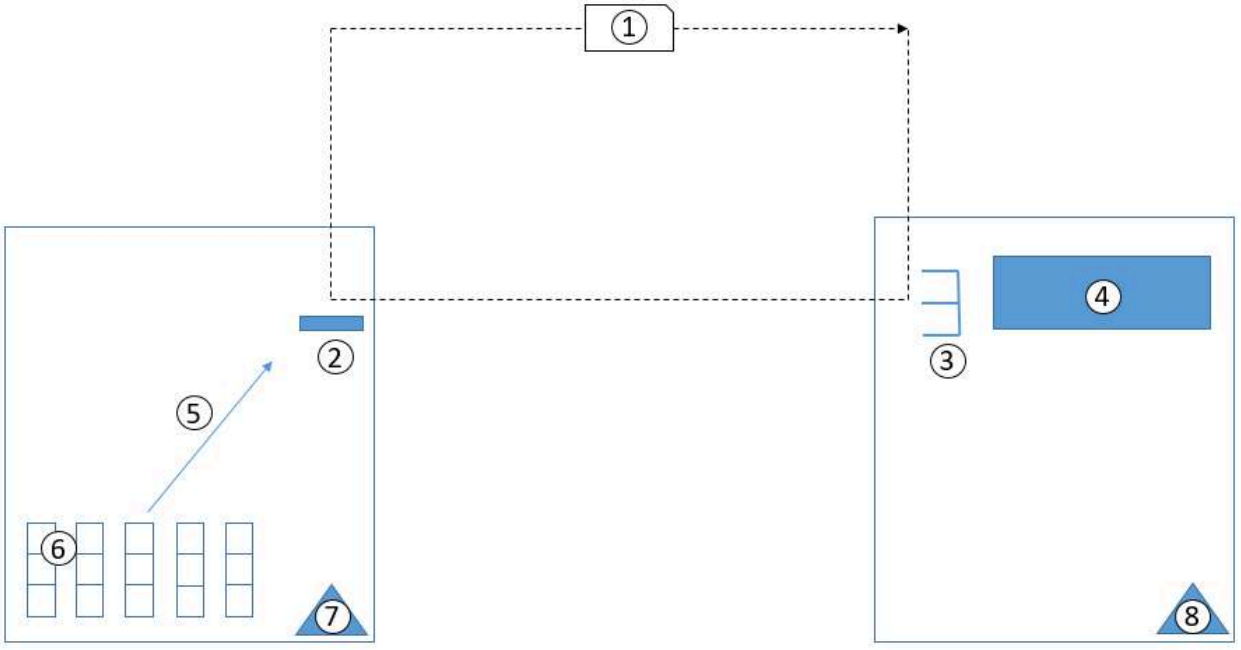
Article • 06/03/2022

This article describes how the withdrawal kanban is used for material replenishment for manufacturing activities.

Workflow for material replenishment that uses the withdrawal kanban

The withdrawal kanban can be used to move a kanban of a single item between warehouses and production locations where the material is consumed. The withdrawal kanban supports a pull-based solution for material replenishment, where a pull signal is required in order to trigger supply for a specific demand.

The following scenario shows a pull-based replenishment system where a pull signal triggers the creation of a kanban to replenish material for a production process.



1. Withdrawal kanban
2. Kanban “from” location and put location for warehouse work
3. Kanban “to” location and production input location
4. Manufacturing process
5. Warehouse work for kanban picking
6. Warehouse locations for raw material
7. Material warehouse
8. Manufacturing warehouse

In this scenario, a manufacturing process (4) consumes material from a production input location (3) in the manufacturing warehouse (8). When a handling unit of the material (kanban) is consumed, it's registered as empty. A replenishment signal is created for the item origin, and a new kanban (1) is created. In this case, the item origin consists of locations in the material warehouse (7). The material for the kanban is picked and put to a location (2) in the same warehouse. When the material is picked, it's ready to be transferred from location 2 to the production input location (3) in the manufacturing warehouse (8).

Configure warehouse work for kanban picking for the withdrawal kanban

To enable raw material picking for the withdrawal kanban, configure wave templates, work templates, and location directives for the **Kanban picking** work order type. This work order type doesn't just support the picking process for the withdrawal kanban. It also supports the picking process for the manufacturing kanban. However, you can configure a separate picking process for each type of kanban by separating the wave templates, work templates, and location directives. To separate the wave templates, work templates, and location directives, set criteria on the activity type (**Process** or **Transfer**) in the queries for those entities.

Configure the withdrawal kanban

The transfer activity that is used for the withdrawal kanban is configured as part of an activated activity plan in a Lean production flow. As part of the configuration of the transfer activity, you specify the "from" and "to" locations for the transfer. After you configure the transfer activity, you can assign it to a kanban rule of the **Withdrawal** type. The kanban rule sets the policies and configurations for the withdrawal kanban. The quantity of the kanban defines how many units of the handling unit the kanban carries during the transfer process. The fixed kanban quantity is used when the Fixed replenishment strategy is selected. This quantity defines how many kanbans that are required in order to prevent stock or build inventory from running out at the source of demand. The fixed quantity can be calculated based on actual demand, historical demand, and service levels. The following two scenarios describe how you can manage material replenishment that uses the withdrawal kanban.

Scenario 1: Replenish a production input location by using a fixed withdrawal kanban

A manufacturing process consumes a purchased raw material from a production input location that is in the production warehouse. When the raw material is received from the vendor, it's stored in locations in the material warehouse. Because the demand for the material is considered stable over a period, it's set up to supply the production in a fixed quantity kanban flow. When a kanban is consumed at the production input location, an empty signal is registered, and a new kanban of the same type is added to the flow.

The empty signal can be configured to occur automatically when a kanban is completed. Alternatively, the empty signal can be set up as a manual interaction that is given either from the Kanban transfer board or from a menu on the hand-held device. The Kanban transfer board is the workspace where all activities in the kanban life cycle are managed.

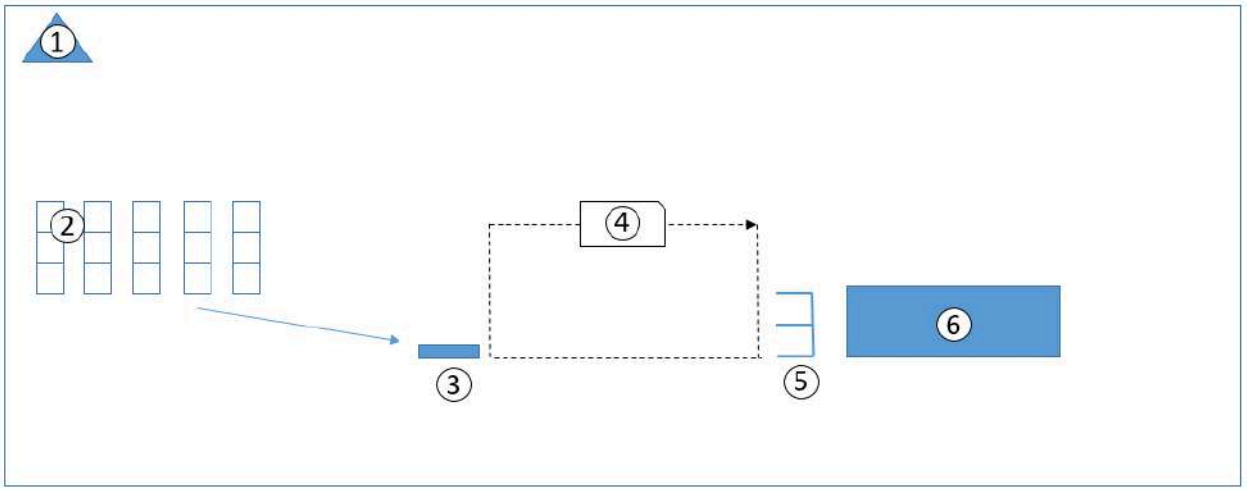
When the kanban is created, a wave line for the raw material is added to a kanban wave for the material warehouse. In the picking list section of the Kanban transfer board, the status of the material and related warehouse processes can be monitored from wave creation to work creation, until the material is on-hand in the "transfer from" location and is ready to be transferred to the production input locations. The kanban can be completed either from the Kanban transfer board or from a menu on the hand-held device.

In this scenario, the picking work in the material warehouse is processed as one activity. The transfer activity between the material warehouse and the production warehouse is processed as a separate activity. This approach can be useful if, for example, there is a large physical distance between the two warehouses. In this case, the kanban transfer activity can represent a truck load.

If the distance between the warehouse locations and the production input location is small, it might be more efficient to include the transfer activity in the picking process. Then, after the material is picked, it can be put directly to the production input location. To support this process, you configure the transfer activity so that it's automatically completed when the pick work of the withdrawal kanban is processed.

Scenario 2: Automatically complete the transfer activity when kanban picking work is processed

In the following scenario, the transfer activity of the withdrawal kanban is configured to transfer between two locations in the same warehouse. The transfer activity of the withdrawal kanban is set up so that it's completed automatically.



1. Shared warehouse for raw materials and production
2. Warehouse locations for raw materials
3. Kanban “from” location and put location for warehouse work
4. Withdrawal kanban
5. Production input location
6. Manufacturing process

After a kanban is consumed at the production input location, the kanban is reported as empty, and a new kanban is added to the flow. When the kanban is created, a wave line is added to a kanban wave. When the kanban wave is processed, warehouse work for kanban picking is created. The warehouse worker processes the work for kanban picking and is directed by the work to pick the material for the kanban in a warehouse location. As this warehouse worker confirms the pick, the kanban is automatically completed, and the warehouse worker is guided to the put the material to the production input location.

Set up a min-max replenishment process

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article shows how to set up a replenishment process that uses the minimum/maximum replenishment strategy. When inventory falls below the minimum level, the system creates work to replenish the location. This article also shows how to use fixed picking locations to allow restocking even if inventory falls below the minimum level, and how to enable the replenishment process to run regularly using a batch job. A warehouse manager typically carries out these tasks. You can run these procedures by using the USMF demo data company with the example values provided here, or you can run them on your own data. If you're using your own data, make sure that you have a warehouse that's enabled for warehouse management processes (WMS).

> **Caution**
>
> When the following conditions are met, the system might create replenishment work that results in a conflict when processing that work:
>
> - The system is replenishing batch-tracked items.
> - Your reservation hierarchy has the *Batch number* dimension below the *Location* dimension.
> - Mixing of batch numbers isn't allowed at the put location.
>
> The conflict might occur because only *batch above location* items are assigned batch-number information on work lines and the *Replenishment* location directive's *Put* work type isn't used.

Create a fixed picking location

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Fixed locations**. This task is optional for min-max replenishment, but if you use a fixed picking location, it allows the

replenishment of stock even if it falls below the minimum level, because the system can determine which items need replenishment, even when none are left.

2. Select **New**.
3. In the **Item number** field, enter or select a value. If you're using USMF, you can select item *A0001*.
4. In the **Site** field, enter or select a value. If you're using USMF, you can select site *2*.
5. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse *24*.
6. In the **Location** field, enter or select a value. If you're using USMF, you can select *CP-003*.
7. Close the page.

Create a replenishment location directive

1. Go to **Warehouse management** > **Setup** > **Location directives**. Location directives are used to determine where items should be picked from in the replenishment process.
2. In the **Work order type** field, select *Replenishment*.
3. On the Action Pane, select **New**.
4. In the **Name** field, type a value.
5. In the **Work type** field, select *Pick*.
6. In the **Site** field, enter or select a value. If you're using USMF, you can select site *2*.
7. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse *24*.
8. Select **Save**.
9. In the **Lines** section, select **New**.
10. In the list, mark the selected row.
11. In the **To quantity** field, enter a number. For example, you can set it to *9999*.
12. Select the **Allow split** checkbox. If you select this option, the work creation process allows work line quantities to be split across multiple locations.
13. Select **Save**.
14. In the **Location directive Actions** section, select **New**.
15. In the list, mark the selected row.
16. In the **Name** field, type a value.
17. Select **Save**.
18. On the Action Pane, select **Edit query**. Edit this query to add restrictions on where inventory can be selected from in the replenishment process. For example, you can use it to limit selection to inventory in the Bulk area of the warehouse.
19. Select **OK**.

20. Close the page.

Create a replenishment work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**. The work template guides the system in creating min/max replenishment work. At a minimum, it must include a work template line for a pick and a put. The work template shows as Invalid until all the necessary information has been filled in.
2. In the **Work order type** field, select *Replenishment*.
3. On the Action Pane, select **New**.
4. In the **Work template** field, type a value.
5. Select **Save**.
6. In the **Work template details**, select **New**.
7. In the **Work type** field, select *Pick*.
8. In the **Work class ID** field, enter or select a value. This should be a work class related to replenishment. If you're using USMF, select *Replenish*.
9. In the **Work template details**, select **New**.
10. In the list, mark the selected row.
11. In the **Work type** field, select *Put*.
12. In the **Work class ID** field, enter or select a value.
13. Select **Save**.
14. Close the page.

> ⓘ **Note**
>
> When you use a replenishment template with **Replenishment type** set to *Minimum or maximum*, the location to replenish is defined as part of the replenishment template's setup and not by the location directive's *Put* work type.

Create a new replenishment template

1. Go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**. The replenishment template is used to define the items and quantities, and the location to replenish.
2. On the Action Pane, select **New**.
3. In the **Replenish template** field, type a value. Give the template a name to indicate that it's for min/max replenishment.

4. In the **Description** field, type a value.
5. Select the **Allow wave demand to use unreserved quantities** checkbox. If you select this option, it enables wave demand replenishment to consume quantities that are related to min/max replenishment. For example, this might be useful if the min/max replenishment work isn't processed immediately, to avoid unnecessary demand replenishment work from being created.
6. In the **Replenishment template details**, select **New**.
7. In the **Sequence number** field, enter a number.
8. In the **Description** field, type a value.
9. In the list, mark the selected row.
10. In the **Replenishment unit** field, enter or select a value. For example, select pcs. This setting is mandatory. It allows you to specify a different unit of measurement for replenishment work compared to the unit specified for the minimum and maximum stock levels in this template.
11. In the **Work template** field, enter or select a value. Choose the work template that you created earlier.
12. In the **Minimum quantity** field, enter a number. Select the minimum quantity that should trigger replenishment. For example, set this to 50. You can leave this set to zero if you're replenishing a fixed location and the **Replenish empty fixed locations** option is set to *Yes*. Also select the **Replenish only fixed locations** option for performance reasons.
13. In the **Maximum quantity** field, enter a number. For example, set this to 100.
14. In the **Unit** field, enter or select a value. Assign the unit for the minimum and maximum quantities. For example, set this to pcs.
15. Select the **Replenish empty fixed locations** checkbox. Select this checkbox to replenish fixed locations when they're empty. Otherwise, the only the locations where there's a quantity on hand are replenished.
16. Select the **Replenish only fixed locations** checkbox.
17. Select **Select products**. Use this to define which products should be replenished. If the Fixed picking locations option is selected, you also need to define the locations in this query. Variant-specific queries are available, as well as product-specific queries.
18. Select the **Items** row.
19. In the **Criteria** field, type a value. Select the items that should be replenished at the fixed locations. For example, type A* to select all item numbers beginning with A.
20. Select **Add**. Add the Location entity (unless it already exists) to be able to restrict the replenishment work to the fixed picking locations within a specific area of the warehouse.
21. In the list, mark the selected row.
22. Set the **Table** field to *Locations*.

23. In the **Field** field, select *Location profile ID*.
24. In the **Criteria** field, enter or select a value.
25. Select **OK**.
26. Close the page.

Set the replenishment process to run as a batch job

1. Go to **Warehouse management** > **Replenishment** > **Replenishments**. The **Replenishments** page allows you to set up replenishment to run as a batch job, or to require that it's started manually.
2. Select **Filter**.
3. In the list, mark the selected row.
4. In the **Criteria** field, enter or select a value.
5. Select **OK**.
6. Expand the **Run in the background** section.
7. Set the **Batch processing** option to *Yes*.
8. Select **Recurrence**.
9. Select the **No end date** option.
10. Set the **Recurrence pattern**. For example, select Days.
11. Select **OK**.
12. Select **OK**.

Zone threshold replenishment

Article • 08/23/2022

Zone-based replenishment uses a minimum/maximum (min/max) replenishment strategy, but it evaluates whole warehouse zones instead of just individual locations. Therefore, warehouse managers can more quickly learn when additional inventory is required in a picking zone.

The setup for this feature resembles the setup for location-based replenishment. However, when you set up a template for min/max replenishment, you can also specify whether the threshold should be evaluated per location or per zone. If you set up evaluation that is based on zones, you must add specific zones to the zone selection query.

Like location-based min/max replenishment, zone-based min/max replenishment is based the setup of a minimum inventory threshold that triggers the creation of replenishment work for selected items. This replenishment work will increase inventory up to the specified maximum threshold for the zone.

> **Note**
>
> Zone replenishment processes for product variants aren't supported in the current release.

Unlike location-based min/max replenishment, zone-based min/max replenishment doesn't require fixed locations to evaluate whether locations should store a specific item. Therefore, zone-based replenishment lets you use min/max replenishment even if you don't have fixed locations for each item or item variant in the warehouse. When a quantity in the zone falls below the specified minimum threshold, replenishment work is created. Location directives will determine which specific location the inventory should be put into.

Turn on the Zone threshold replenishment feature

Before you can use the *Zone threshold replenishment* feature, it must be turned on for your system. Admins can use the feature management settings to check the status of the feature and turn it on if it's required. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Warehouse management*
- **Feature name:** *Zone threshold replenishment*

Set up zone-based replenishment

To set up zone-based replenishment, you must configure several parts of the system. This section introduces the various settings and provides demo data values that you can enter if you want to work through the scenario at the end of this article.

Set up directive codes

Directive codes let you be more specific when you define the location template that is used in a work template. Each code establishes a common value that you can refer to when you configure each type of template.

View and edit directive codes

To view or edit your directive codes, go to **Warehouse management** > **Setup** > **Directive codes**.

Prepare demo data directive codes

This example shows how to prepare a directive code. If you're planning to work through the scenario at the end of this article, use the demo data values that are provided here. Otherwise, use your own values.

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management** > **Setup** > **Directive codes**.
3. On the Action Pane, select **New** to add a row to the grid.
4. In the new row, set the following values:
    - **Directive code:** *Zone replen*
    - **Directive description:** *Zone replenishment*
5. Select **Save** to save the new code.

Set up replenishment templates

Min/max replenishment templates are the primary mechanism for maintaining optimal levels in picking locations. In these templates, you must set up the rules that will be used to replenish inventory in the warehouse. The replenishment that the templates can be used for includes zone-based replenishment.

View and edit replenishment templates

A replenishment template is a set of rules that control when and how a location is replenished. You select a template to control when and how replenishment is done. To view or edit your replenishment templates, go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**.

Prepare a demo data replenishment template

This example shows how to prepare a replenishment template. If you're planning to work through the scenario at the end of this article, use the demo data values that are provided here. Otherwise, use your own values.

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**.
3. Select **Edit** to put the page into edit mode.
4. On the Action Pane, select **New** to add a row to the **Overview** grid.
5. In the new row, set the following values. Accept the default values for all other fields.
    - **Replenish template:** *Zone min/max replen*
    - **Description:** *Zone min/max replenishment*
    - **Replenishment type:** *Minimum or maximum*
6. Select **Save**.
7. While the new row is still selected in the **Overview** grid, select **New** above the **Replenishment Template Details** grid to add a row that is associated with the *Zone Min/Max replen* replenishment template that you just created.
8. In the new row, set the following values:
    - **Sequence number:** Enter *1*.
    - **Description:** Enter *Pick zone replenishment*.

- **Replenishment unit:** Select *ea*.
- **Request type:** Leave this field blank.
- **Directive code:** This field links the replenishment template with a location directive. Select the demo data directive code that you created earlier (*Zone replen*).
- **Work template:** Leave this field blank.
- **Minimum quantity:** This field sets the quantity that replenishment will be triggered at. Enter *50*.
- **Maximum quantity:** This field sets the maximum quantity of an item that can be present in a zone. Generated replenishment work will increase inventory to this quantity. Enter *150*.
- **Unit:** This field sets the unit for the minimum and maximum values. Select *ea*.
- **Demand increment:** Select *Round up*.
- **Replenish empty fixed locations:** Select this check box.
- **Replenish only fixed locations:** Clear this check box.
- **Product query mode:** Select *Product query*.
- **Replenishment threshold scope:** This field defines whether the template should evaluate by zone or by specific location. Select *Zone*.
- **Warehouse:** Select *61*.

9. Select **Select products** above the **Replenishment Template Details** grid.

10. In the **Product query** dialog box, on the **Range** tab, select **Add** to add a row to the grid.

11. In the new row, set the following values:

    - **Table:** *Items*
    - **Derived table:** *Items*
    - **Field:** *Item number*
    - **Criteria:** *A0001*

12. Select **OK** to save your query and close the dialog box.

13. Select **Select zones to replenish** above the **Replenishment Template Details** grid.

14. In the **Zone query** dialog box, on the **Range** tab, add a row to the grid.

15. In the new row, set the following values:

    - **Table:** *Warehouse zone*
    - **Derived table:** *Warehouse zone*
    - **Field:** *Zone ID*
    - **Criteria:** *FLOOR*

16. Select **OK** to save your query and close the dialog box.

Set up location directives

Unlike location-based min/max replenishment, zone-based min/max replenishment requires that you set up both pick location directives and put location directives, because the system evaluates the whole zone instead of just the pick location for outbound work.

View and edit location directives

To view or edit your location directives, go to **Warehouse management** > **Setup** > **Location directives**.

For examples that show how to use the settings to create the required pick location directives and put location directives, see the next section.

Prepare demo data location directives

To prepare demo data so that it can be used in the scenario at the end of this article, you must create two location directives: one for pick and one for put.

Create a replenishment pick directive

1. Select the **USMF** legal entity to work with the demo data.
2. Go to **Warehouse management** > **Setup** > **Location directives**.
3. In the left pane, set the **Work order type** field to *Replenishment*.
4. On the Action Pane, select **New** to create a new directive.
5. Set the following values:
    - **Sequence number:** Accept the default value.
    - **Name:** Enter *Zone pick*.
    - **Work type:** Select *Pick*.
    - **Site:** Select *6*.
    - **Warehouse:** Select *61*.
    - **Directive code:** Leave this field blank.
    - **Multi SKU:** Set this option to *No*.
6. Select **Save** to create a directive that has the settings that you've configured so far.

7. On the **Lines** FastTab, select **New** to add a line to the grid.

8. On the new line, set the following values:

    - **Sequence number:** Enter *1*.
    - **From quantity:** Enter *0*.
    - **To quantity:** Enter *10000000*.
    - **Unit:** Leave this field blank.
    - **Locate quantity:** Select *None*.
    - **Restrict by unit:** Clear this check box.
    - **Round up to unit:** Clear this check box.
    - **Locate packing quantity:** Clear this check box.
    - **Allow split:** Select this check box.

9. Select **Save** to save the new line.

10. While your new line is still selected in the **Lines** grid, select **New** on the **Location Directive Actions** FastTab to add a row to the grid.

11. In the new row, set the following values:

    - **Sequence number:** Enter *1*.
    - **Name:** Enter *Pick from bulk*.
    - **Fixed location usage:** Select *Fixed and non-fixed locations*.
    - **Allow negative inventory:** Clear this check box.
    - **Batch enabled:** Clear this check box.
    - **Strategy:** Select *None*.

12. Select **Save** to save the new action.

13. While your new action still selected, select **Edit query** above the **Location Directive Actions** grid.

14. A query dialog box appears, where you can select the locations to replenish from. On the **Range** tab, select **Add** to add a row to the grid.

15. In the new row, set the following values:

    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *BULK*

16. Select **OK** to save your query and close the dialog box.

17. Select **Save** to save your location directive.

Create a replenishment put directive

1. On the **Location directives** page, in the left pane, make sure that the **Work order type** field is still set to *Replenishment*.

2. On the Action Pane, select **New** to create another new directive.

3. Set the following values:

    - **Sequence number:** Accept the default value.
    - **Name:** Enter *Zone put*.
    - **Work order type:** Select *Put*.
    - **Site:** Select *6*.
    - **Warehouse:** Select *61*.
    - **Directive code:** Select *Zone replen* to link this location directive with the replenishment template that you created earlier by using the code that you created earlier.
    - **Multi SKU:** Set this option to *No*.

4. Select **Save** to create a directive that has the settings that you've configured so far.

5. On the **Lines** FastTab, select **New** to add a line to the grid.

6. On the new line, set the following values:

    - **Sequence number:** Enter *1*.
    - **From quantity:** Enter *0*.
    - **To quantity:** Enter *10000000*.
    - **Unit:** Leave this field blank.
    - **Locate quantity:** Select *None*.
    - **Restrict by unit:** Clear this check box.
    - **Round up to unit:** Clear this check box.
    - **Locate packing quantity:** Clear this check box.
    - **Allow split:** Select this check box.

7. Select **Save** to save the new line.

8. While your new line is still selected in the **Lines** grid, select **New** on the **Location Directive Actions** FastTab to add a row to the grid.

9. In the new row, set the following values:

    - **Sequence number:** Enter *1*.

- **Name:** Enter *Zone put*.
- **Fixed location usage:** Select *Fixed and non-fixed locations*.
- **Allow negative inventory:** Clear this check box.
- **Batch enabled:** Clear this check box.
- **Strategy:** Select *Consolidate*.

10. Select **Save** to save the new action.

11. While your new action is still selected, select **Edit query** above the **Location Directive Actions** grid.

12. A query dialog box appears, where you can select the zone to replenish to. This zone should be the same zone that is specified in the replenishment template. On the **Range** tab, select **Add** to add a row to the grid.

13. In the new row, set the following values:

    - **Table:** *Locations*
    - **Derived table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *FLOOR*

14. Select **OK** to save your query and close the dialog box.

15. Select **Save** to save your location directive.

Scenario

This section provides a sample scenario that shows how to work with the feature.

Prepare the sample data that is required for the sample scenario

Before you start to work through the scenario, you must activate sample data and set up the feature as described in this section and in the previous sections of this article.

Use the USMF legal entity

To work through the scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Prepare additional sample data

After you've selected the **USMF** legal entity, add the additional sample data that is required, as described in the Set up zone-based replenishment section earlier in this article.

Check your on-hand inventory

Follow these steps to make sure that your system includes enough inventory to support the sample scenario.

1. Make sure that there is on-hand inventory for item *A0001* at two different locations in the pick zone (*FLOOR*) that is specified in the replenishment template. However, the total inventory should be less than the required minimum quantity (*50*) that is specified on the replenishment template. In this way, you can simulate how the calculation occurs for the whole zone instead of just for a single location. **Use any of the warehouse processes to adjust inventory as required.**

2. Make sure that there is enough inventory for item *A0001* at a bulk location that is specified in the zone pick location directive where the replenishment work should pick the items from zone ID *BULK*. The total inventory must be more than the required maximum quantity (*150*) that is specified in the replenishment template.

3. Optional but recommended: Follow these steps to create an inventory adjustment journal:

    a. Go to **Inventory management** > **Journal entries** > **Items** > **Inventory adjustment**.

    b. Select **New**.

    c. In the **Create inventory journal** dialog box, in the **Warehouse** field, select *61*.

    d. Select **OK**.

    e. On the **Journal lines** FastTab, use the **New** button to add three lines to the grid, and set the following values. After you've finished setting up each line, select **Save**.

        - **Line 1:**
            - **Item number:** *A0001*
            - **Site:** *6*
            - **Warehouse:** *61*
            - **Location:** *02A01R1S1B*

    - **License plate:** Select an existing license plate in the list, or create a new license plate.
    - **Quantity:** *1000*

- **Line 2:**
    - **Item number:** *A0001*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Location:** *07A01R2S1B*
    - **License plate:** Select an existing license plate in the list, or create a new license plate.
    - **Quantity:** *15*

- **Line 3:**
    - **Item number:** *A0001*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Location:** *07A01R1S1B*
    - **License plate:** Select an existing license plate in the list, or create a new license plate.
    - **Quantity:** *10*

f. On the Action Pane, select **Validate**. Address any errors that are found before you move on to the next step.

g. On the Action Pane, select **Post** to post the inventory to the warehouse.

Sample scenario: Run zone-based min/max replenishment

After all the prerequisite sample data is in place, you can trigger replenishment by following these steps.

1. Go to **Warehouse management** > **Replenishment** > **Replenishments**.

2. In the **Replenishment** dialog box, on the **Records to include** FastTab, select **Filter**.

3. In the **Inquiry** dialog box, on the **Range** tab, edit the default table row in the following way:

    - **Table:** Select *Replenishment templates*.
    - **Derived table:** Select *Replenishment templates*.
    - **Field:** Select *Replenishment template*.

- **Criteria:** Select *Zone min/max replen*. This replenishment template is the replenishment template that you created while you were preparing the demo data for this scenario.

4. Select **OK** to save the query and go back to the **Replenishment** dialog box.
5. Select **OK** to run the replenishment template.

Replenishment work is now created to pick inventory from the *BULK* zone and replenish it to the *FLOOR* zone.

Notes and tips

Here are a few notes and tips for working with the feature:

- To set up replenishment work that goes to the desired zone, you can link the replenishment template lines and location directives in either of the following ways:
  - Edit the location directive header query, and filter the selected replenishment template lines.
  - Use a directive code on the replenishment template line, and match it to the put location directive.
- If you're using dynamic locations, replenishment work will be created either for the first available location or for a location that already contains inventory, if the location directive action is set up to use the **Consolidate** strategy.
- If you're using fixed locations instead of zones, you should use standard min/max replenishment.

Replenishment strategies

> **Note**
>

The templates defined on the **Replenishment templates** page include wave demand replenishment template lines that you use to select how replenishment is done. Each line now includes a **Replenishment strategy** field.

The *Wave demand quantity* strategy is the default strategy. It's the replenishment strategy that was used before the introduction of the **Replenishment strategy** field. It uses the replenishment location directives to find locations that can be replenished. It then replenishes those locations until the demand is covered.

The *Maximum location capacity* strategy introduces some new functionality. Like the *Wave demand quantity* strategy, this strategy uses the replenishment location directives to find locations that can be replenished, and then it replenishes those locations until the demand is covered. It differs from the *Wave demand quantity* strategy in that all the replenished locations are replenished to their maximum capacity, as defined by the location stocking limits. The *Maximum location capacity* strategy tries to create work to bring in the requested quantity, plus some extra quantity, to fill the locations that are being replenished. However, in some cases, that attempt might fail. For example, the bulk locations might not have enough inventory to cover the extra quantity. In these cases, the system detects the failure and tries to recover.

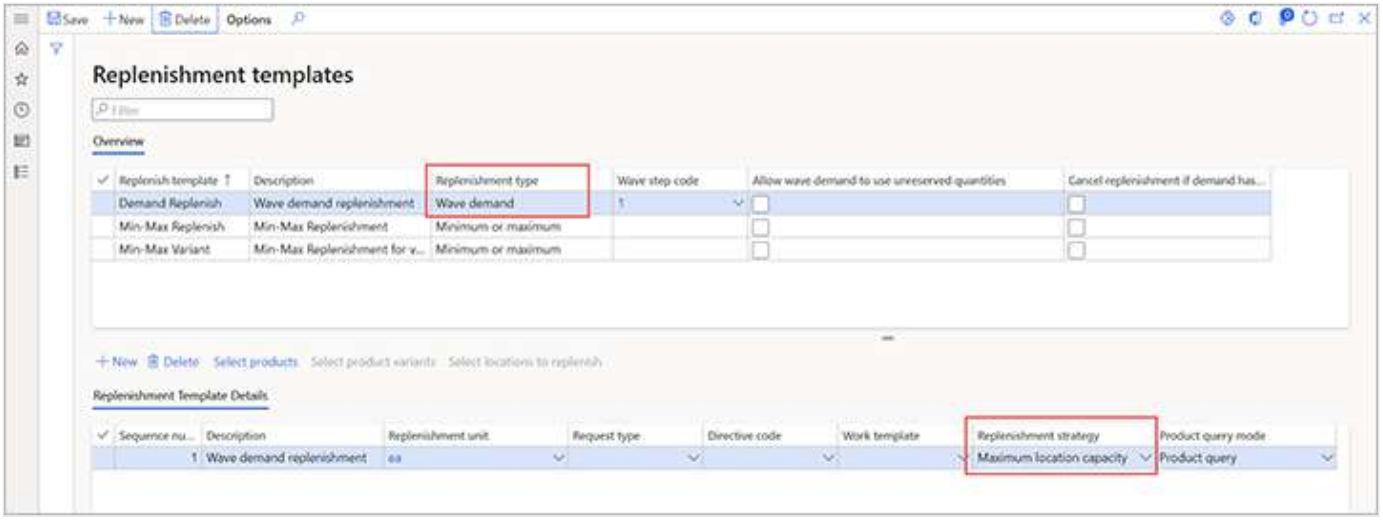
Peak season is one example of a situation where the *Maximum location capacity* strategy is preferable to the *Wave demand quantity* strategy. During peak season, some items might be selling at high volume. Therefore, you might want to proactively replenish the relevant picking locations as much as possible, to reduce the number of work IDs that are created for replenishment.

> **Important**

To take full advantage of the *Maximum location capacity* strategy, you must redefine the stocking limits for the relevant locations. Otherwise, this strategy works just like the *Wave demand quantity* strategy.

Set up replenishment strategies

To access the templates, go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**. In the **Overview** section, select or create a wave demand replenishment template where the **Replenishment type** field is set to *Wave demand*. Then set up the replenishment template lines in the **Replenishment template details** section. For each line, in the **Replenishment strategy** field, select the replenishment strategy that you want to use.



If the **Replenishment strategy** column doesn't appear in the grid in the **Replenishment template details** section, make sure that the feature is turned on, and that the selected replenishment template has a replenishment type of *Wave demand*.

> **Note**
>
> The *Wave demand quantity* strategy is the default strategy. Therefore, you just need to update the replenishment template lines where you want to use the *Maximum location capacity* strategy instead.

Example scenarios

Example 1

For this example, there's only one replenishment template that has only one replenishment template line.

You create a sales order for 130 pieces (pcs) of item A0001. Before you release the order to the warehouse, ensure to set up the warehouse in the following way:

- There's only one bulk location, and it has 500 pcs of available on-hand inventory.
- There are three pick locations, each of which has a stocking limit of 100 pcs. (Remember that stocking limits are required for the *Maximum location capacity* strategy.)
- The replenishment put locations are the same as the sales pick locations.
- The replenishment unit is a box (1 box = 20 pcs).

At the time of the order, the following inventory is on hand at the sales pick locations:

- **Pick-001:** 20 pcs (1 box)
- **Pick-002:** 0 pcs
- **Pick-003:** 0 pcs

Initially, set the replenishment strategy to *Wave demand quantity*.

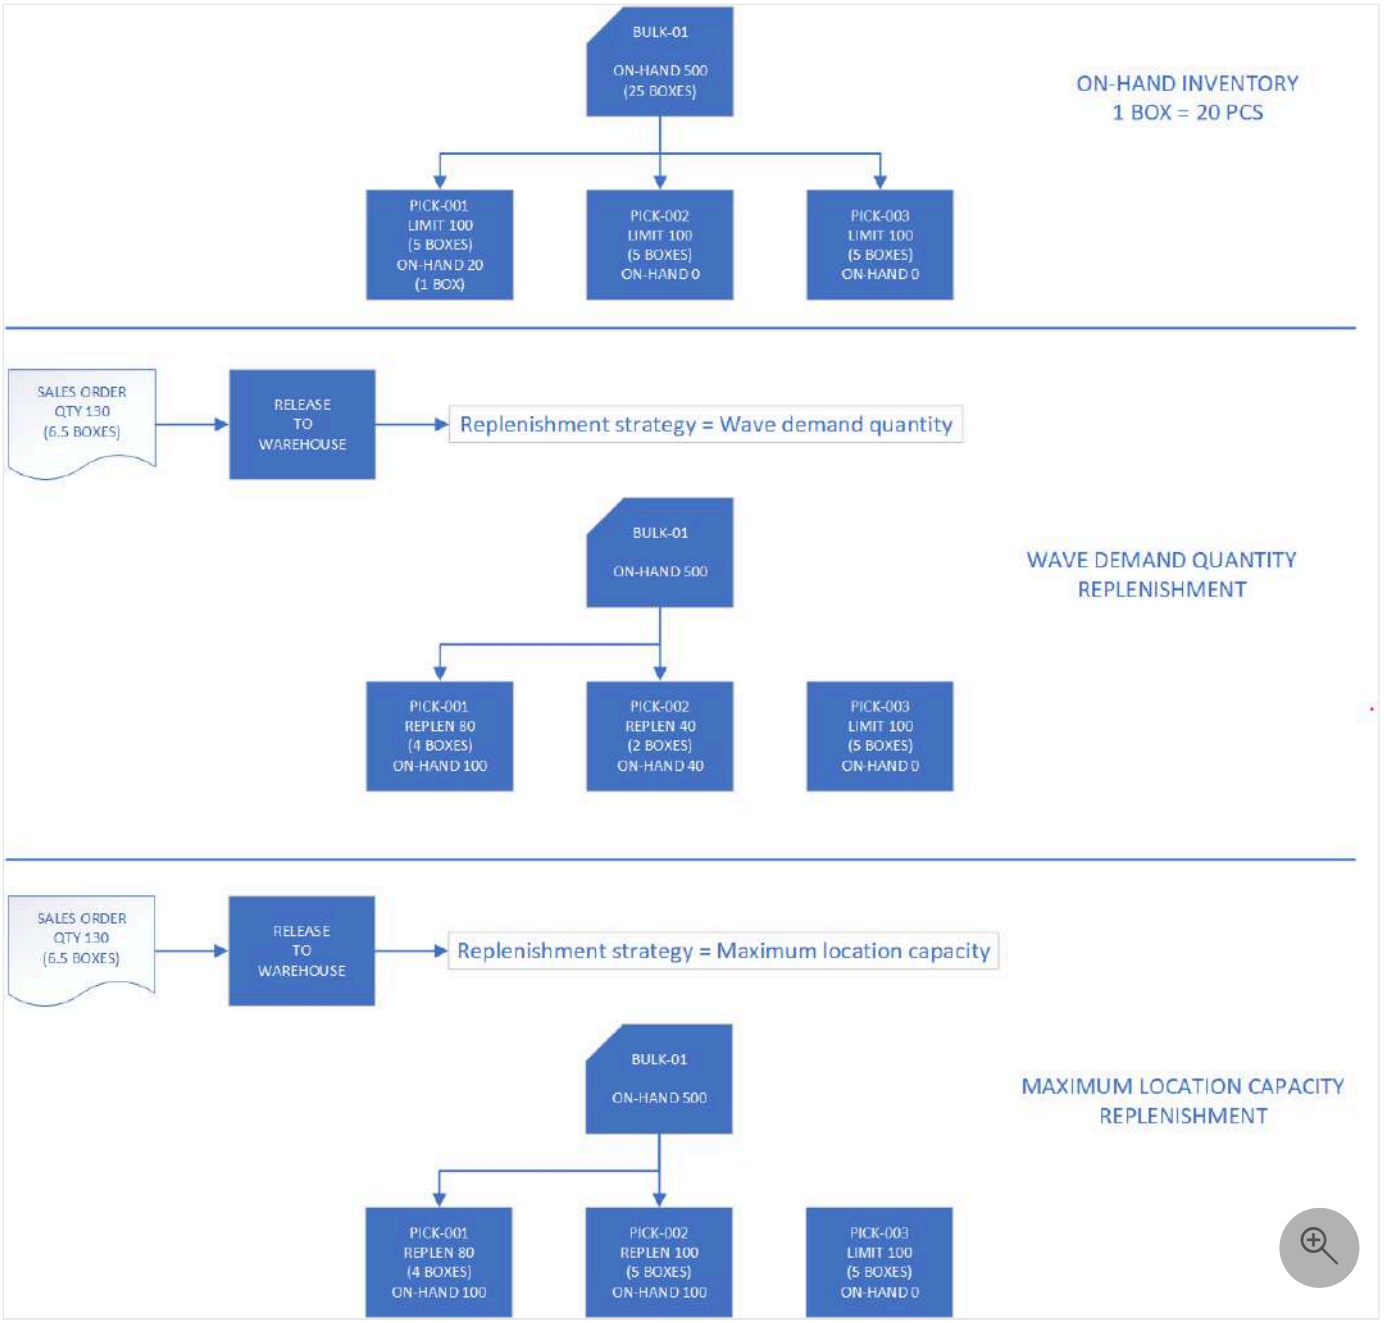
After you release the sales order to the warehouse, and wave processing runs for the wave, you get the following replenishment work:

- **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
- **Replenishment work 2:** Pick 2 boxes from the bulk location, and put them in location pick-002.

You get two replenishment work IDs because you must replenish two locations, and multi-puts aren't supported.

If you set the replenishment strategy to *Maximum location capacity* instead, you get the following replenishment work:

- **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
- **Replenishment work 2:** Pick 5 boxes from the bulk location, and put them in location pick-002.



Example 2

This example shows what happens when the bulk location doesn't have enough inventory to cover the extra quantity. It uses the same scenario as example 1, but the bulk location has 160 pcs (8 boxes).

The *Wave demand quantity* strategy creates the same work that it did in example 1.

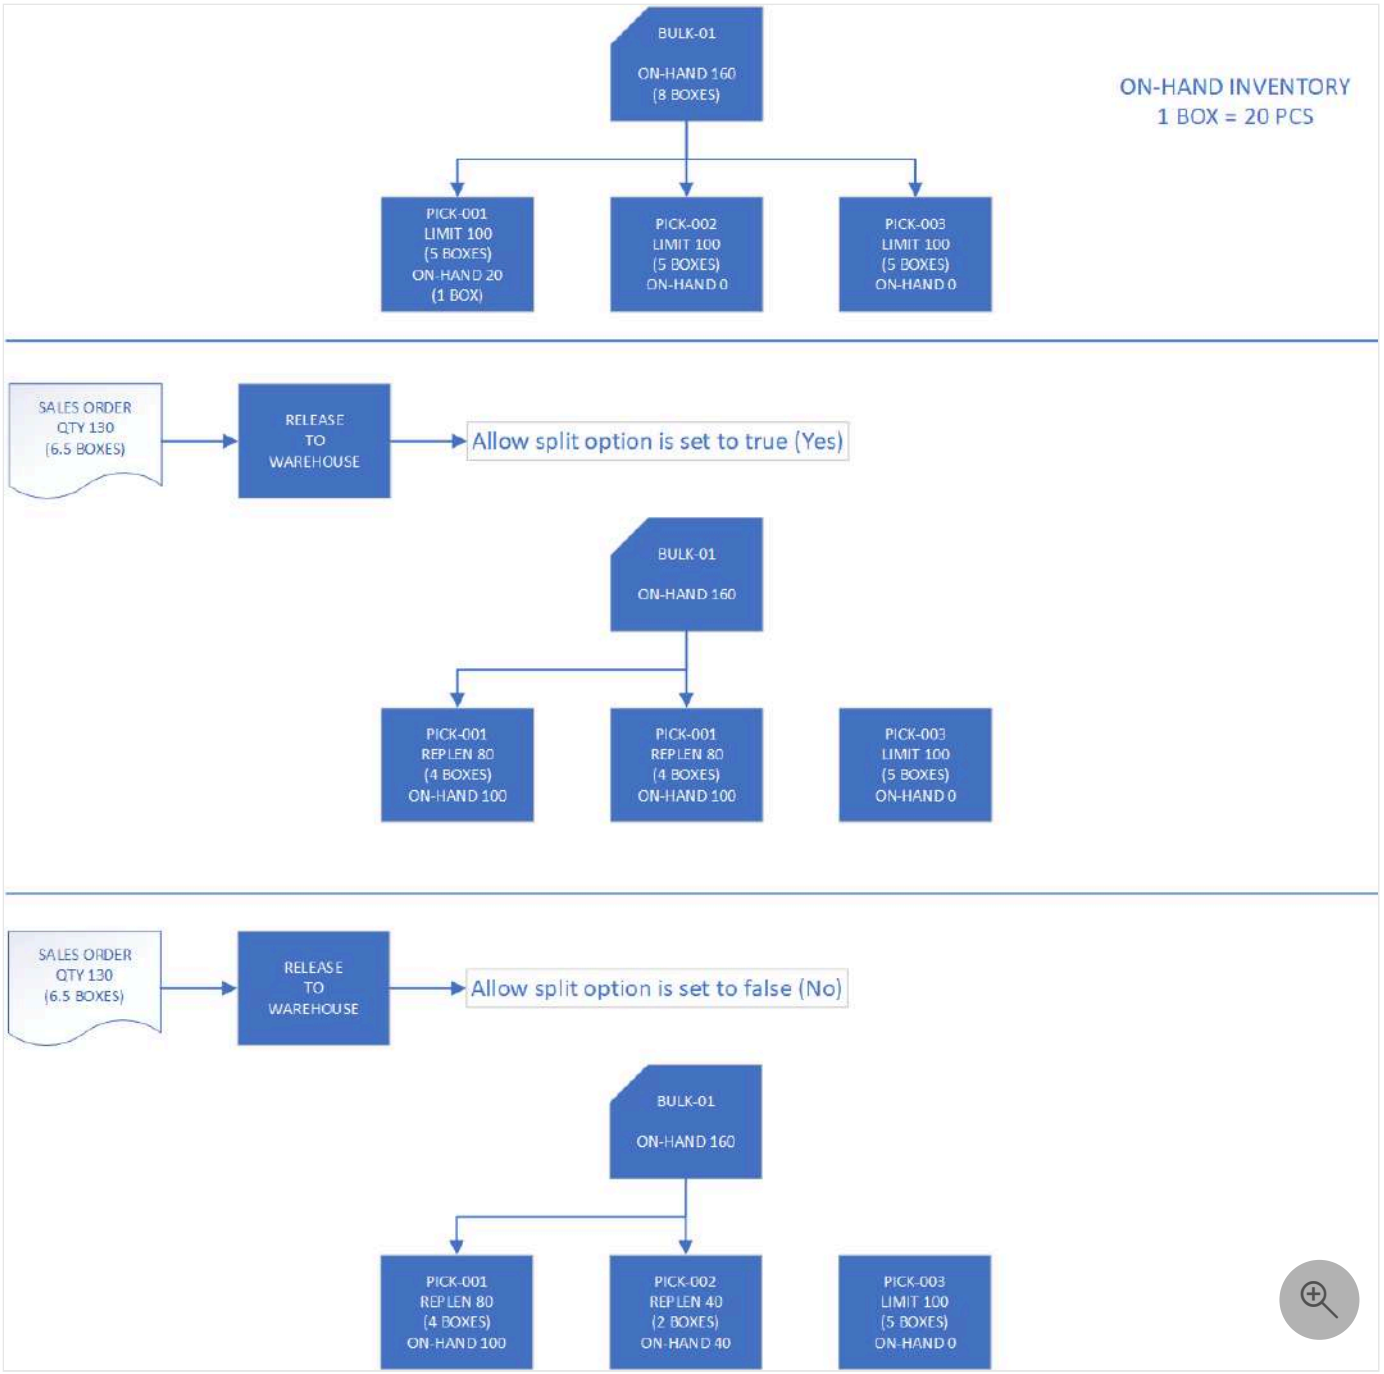
However, because the *Maximum location capacity* strategy tries to create the work IDs as it did in example 1, it might fail. At that point, the system tries to recover.

Depending on the setting of the **Allow split** option on the location directives for replenishment picking, two outcomes are possible:

- If the **Allow split** option is set to *Yes*, the following replenishment work is created:
  - **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
  - **Replenishment work 2:** Pick 4 boxes from the bulk location, and put them in location pick-002.

- If the **Allow split** option is set to *No*, the following replenishment work is created:
  - **Replenishment work 1:** Pick 4 boxes from the bulk location, and put them in location pick-001.
  - **Replenishment work 2:** Pick 2 boxes from the bulk location, and put them in location pick-002.

The outcomes differ because of the information that is available when you create the work. When the **Allow split** is set to *Yes* on the location directives for replenishment picking, you know that you managed to find 160 pcs. Therefore, you can create work for that quantity. However, when the **Allow split** option is set to *No*, you don't know about the existence of the 160 pcs. Because the extra quantity that you decided to replenish was 3 boxes, you drop that extra quantity and try the original quantity again.



Therefore, to get the maximum quantity to the replenished locations, set the **Allow split** option to *Yes* on the location directives for replenishment picking.

Replenishment over location capacity

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Some high-volume or space-constrained warehouses must ship more quantity of an item in a day than can fit in the picking location. The *Replenishment over location capacity* feature enables all replenishment work required for the day to be created and manages the availability of that replenishment work to ensure that the picking location doesn't runs out of inventory or go above capacity.

The feature enables more replenishment work to be created than can fit in a location, and it blocks replenishment work from being completed when the location is full. As inventory in the picking location drops below a configurable threshold, more replenishment work is made available.

Set up the feature for the example scenario

This section provides guidelines and an example that shows how to set up this feature and prepare sample data for the example scenario that is provided later in this article.

Enable sample data

To work through the example scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

Location profile

Enable the replenish over capacity functionality on the location profile.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations profiles**.
2. In the left pane, select *PICK-06*.
3. On the Action Pane, select **Edit**.

4. On the **Replenishment** FastTab, set the following values:

- **Exceed Location Capacity:** *Yes*

  When enabled, the maximum capacity of the location is allowed to be exceeded by replenishment work. This also enables other fields on the **Replenishment** FastTab.

  This parameter only enables the feature. For it to have an effect, you must also set the **Work availability threshold type**, **Overflow quantity**, and **Overflow unit**.

- **Work availability threshold type:** *Quantity*

  This field defines the method that is used to determine when more work should be released. You can release by either quantity or a percentage:

  - *Percent* – Select this option to use percentage capacity that is based on stocking limits or volumetrics. Selecting this option enables the **Overflow percentage** field, and disables the two quantity related fields, **Overflow quantity** and **Overflow unit**.

    You can use this option if the picking locations use volumetrics.

    If this option is selected, set the **Overflow percentage** field to the percentage at which more replenishment work will be made available.

  - *Quantity* – Select this option to use a specific quantity value. Selecting this option disables the **Overflow percentage** field and enables **Overflow quantity** and **Overflow unit** fields.

    Use this option when you aren't using volumetrics for the locations that are being replenished, or when you have consistent quantities at which you want more inventory to be brought to the location.

    If this option is selected, set the **Overflow quantity** and **Overflow unit** fields to the quantity and unit at which more replenishment work should be made available.

- **Overflow quantity:** *0.65*

  This field defines the quantity at which the location overflows.

  Work is available whenever the sum of the on-hand quantity in the location and the work quantity is below this value. Any replenishment work above this value is blocked and must be manually unblocked.

  Location stocking limits are considered when the work quantity is calculated.

- **Overflow unit:** *PL*

  This field defines the unit that is associated with the overflow quantity.

  In this case, more replenishment work is made available when the location gets down to 0.65 pallet (PL).

- **Overflow percentage**

  This field defines the percentage at which the location overflows.

  Work is available whenever the sum of the on-hand quantity in the location and the work quantity is below this percentage. Any replenishment work quantity percentage above this value is blocked and must be manually unblocked.

  Location stocking limits are considered when the work quantity percentage is calculated. If no location stocking limits are defined, the system calculates the work quantity percentage by volume if volume constraints are defined for the location profile.

> ⓘ **Important**
>
> If you're using the demo data for the *USMF* legal entity and previously turned on the *Location license plate positioning* feature, you must turn off the **Enable license plate positioning** setting for the *BULK-06* location profile to complete the mobile steps in the example scenario.

> ⓘ **Note**
>
> Location profile replenishment settings only affect replenishment work. Other types of work are still subject to configured stocking limits.

Wave step code

1. Go to **Warehouse Management** > **Setup** > **Waves** > **Wave step codes**.
2. Select **New**, and set the following values:
   - **Wave step code:** *Replen*
   - **Wave step description:** *Replenishment*
   - **Wave step type:** *Replenishment*
3. Select **Save**.

Replenishment template

Replenishment templates are a set of rules that control when and how a location is replenished.

1. Go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**.
2. On the Action Pane, select **Edit**.
3. In the **Overview** section, select the line where the **Replenish template** field is set to *Demand replenish*.
4. Set the following values:
    - **Wave step code:** *Replen*
    - **Allow wave demand to use unreserved quantities:** *Yes*
5. Select **Save**.

Wave template

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. In the left pane, set the **Wave template type** field to *Shipping*.
3. Select template *61 Shipping* in the list.
4. On the Action Pane, select **Edit**.
5. On the **General** FastTab, set the **Automate replenishment work release** option to *Yes*.

    Set this option to *Yes* to create demand-based replenishment work and release it automatically. You must add the replenishment wave method to the wave template and create a replenishment template of the *Wave demand* type. Set up a replenishment template on the **Replenishment templates** page. To set up a replenishment template, you must add the replenish method to the wave template.
6. On the **Methods** FastTab, in the **Selected methods** column, find the following line:
    - **Method name:** *replenish*
    - **Name:** *Replenishment*
7. Set the **Wave step code** field for this line to *Replen*.
8. Select **Save**.

Example scenario

After you've made all the previously described sample data available and set it up, you can work through this scenario to try out the *Replenishment over location capacity* feature. The values that are shown in this scenario assume that you're working with the standard demo data, that you selected the *USMF* legal entity, and that you prepared the sample records that are described earlier in this article. This scenario also serves as an example that shows how the feature can be used in a production setting.

Create replenishment work

Create sales order 1

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New** to open a dialog box for creating a new sales order.
3. In the dialog box, set the following values:
    - **Customer account:** *US-007*
    - **Warehouse:** *61*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:
    - **Item number:** *T0100*
    - **Quantity:** *40*
6. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
7. On the **Reservation** page, select **Reserve lot**.
8. Close the page.
9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

    You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

    You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

Create sales order 2

1. On the **All sales orders** page, on the Action Pane, select **New** to open a dialog box for creating a new sales order.
2. In the dialog box, set the following value:
    - **Customer account:** *US-001*
    - **Warehouse:** *61*
3. Select **OK** to create the sales order and close the dialog box.
4. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:
    - **Item number:** *T0100*
    - **Quantity:** *60*
5. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.
6. On the **Reservation** page, select **Reserve lot**.
7. Close the page.
8. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

    You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

    You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

Create sales order 3

1. On the **All sales orders** page, on the Action Pane, select **New** to open a dialog box for creating a new sales order.
2. In the dialog box, set the following values:
    - **Customer account:** *US-004*
    - **Warehouse:** *61*
3. Select **OK** to create the sales order and close the dialog box.
4. The new sales order is opened. It includes a new, empty line on the **Sales order lines** FastTab. On this line, set the following values:

- **Item number:** *T0100*
- **Quantity:** *30*

5. On the **Sales order lines** FastTab, select **Inventory** > **Reservation**.

6. On the **Reservation** page, select **Reserve lot**.

7. Close the page.

8. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

   You receive informational messages that show the wave and shipment IDs that were created. A replenishment wave is also created.

   You also receive a warning message that states, "Work ID XXXX cannot be unblocked because it has unfinished replenishment work."

View work details

1. Go to **Warehouse management** > **Work** > **Work details**.

2. In the **Overview** section, filter the **Warehouse** column for warehouse *61*.

3. You should see that seven work IDs were created for the three demand sales orders.

   - Three of the seven work IDs have a **Work order type** value of *Replenishment*, and four have a **Work order type** value of *Sales orders*.

   - All three work IDs that have a **Work order type** value of *Replenishment* have the same *Pick* and *Put* locations in the **Lines** section:
     - **Pick:** *02A01R5S1B*
     - **Put:** *06A01R2S1B*

   - Two work IDs were created for sales order 1.

4. Make a note of the work IDs for the sales orders.

Depending on your on-hand quantities, the work quantities that are created might vary slightly. However, overall, the work headers that are created should match this scenario example.

On-hand inventory license plate ID

Later in this scenario, you'll use the Warehouse Management mobile app (or an emulator), where you must identify the license plate to complete the picking and replenishment scenarios.

To find the license plate IDs that you'll need later, follow these steps.

1. Go to **Inventory management** > **Inquiries and reports** > **On-hand list**.
2. Select the **Show filters** button to open the filter pane.
3. Enter the following filtering criteria to get the license plates for the scenario. Use the *begins with* filter.
    - **Item number:** *T0100*
    - **Warehouse:** *61*
4. Select **Apply**.
5. On the Action Pane, select **Dimensions**.
6. In the **Dimensions display** dialog box, in the **Storage Dimensions** section, select all the values.
7. In the **Transactions** section, select **Item number** and **Quantity <> 0**.
8. When you've finished, select **OK** to close the dialog box.
9. The **On-hand** grid shows the license plate numbers for item *T0100* in each location. Make a note of the license plate that is in each location, because you'll need this information later.
10. Close the page.

Process steps

You'll perform the warehouse location replenishment for the first two work IDs. Work on the third replenishment work is blocked until the inventory level in the picking location falls below the threshold.

Replenishment

1. Sign in to the Warehouse Management mobile app as a user in warehouse *61*. (Enter *61* as the user ID and *1* as the password.)
2. Go to **Inventory** > **Replenishment**.

    You're prompted to complete the first replenishment work. The item number, quantity, and location to pick from are shown.
3. In the **LP** field, enter the license plate number for the item in the location that is shown.

4. Select the **OK** button (check mark symbol).

   The system generates a target license plate number for the new license plate for the picked item.

5. Select **OK** to confirm the value.

   Put work is shown that instructs the user to put the target license plate into the replenishment location. The **Put** location should be *06A01R2S1B*.

6. Confirm the put details, and select **OK**.

   You receive a "Work Completed" message, and the details of the next replenishment pick task are shown: the item number, quantity, and location to pick from. The picking location is the same as the first replenishment location. Therefore, the license plate has the same license plate ID that was used for the first replenishment work task.

7. Repeat the preceding steps to complete the replenishment work for the second work task. The quantity and target license plate differs from the quantity and target license plate for the first work task.

After the second replenishment work is completed, you receive a "Work Completed" message. The mobile device also informs you that there's no work available, even though some replenishment work remains. This behavior occurs because the replenishment work has an availability status of *Held* and is therefore marked as *Blocked*.

The *Held* status was triggered because the location profile for the picking location that the work is being assigned to has an **Overflow quantity** value of *0.65 PL*. The two previous replenishment work tasks filled the location almost to its overflow limit for item *T0100*. (The unit conversion for the item is *1 PL = 100 ea*.) Therefore, the remaining replenishment work would cause the location to exceed its overflow limit.

Until enough inventory is picked from the location to bring it below the work release threshold on the mobile device menu item, this replenishment work will remain blocked.

Sales order pick

Before the remaining replenishment work task can be completed, the picking location must be depleted of inventory to a level where the remaining replenishment work can be unblocked. In other words, the sum of the quantity of on-hand inventory in the location and the replenishment quantity can't exceed the **Overflow quantity** value. When this sum is less than the overflow quantity, the remaining replenishment work is unblocked.

1. Sign in to the Warehouse Management mobile app as a user in warehouse *61*. (Enter *61* as the user ID and *1* as the password.)
2. Go to **Outbound** > **Sales Picking**.
3. Enter the first work ID for sales order 1.

   Refer to the work IDs for sales orders that you made a note of earlier, on the **Work details** page. The work ID that you enter here will generate pick work for a quantity of 10 ea from two separate locations.
4. Select **OK**.

   The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from for the first location.
5. In the **LP** field, enter the license plate number for the item in the location that is shown.
6. Select the **OK** button (check mark symbol).

   The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from for the next location.
7. In the **LP** field, enter the license plate number for the item in the location that is shown.
8. Select the **OK** button (check mark symbol).

   The **Sales orders: Put** page instructs you to put away both the completed picking works to the outbound staging location.
9. Select **OK**.

   You receive a "Work Completed" message.
10. Enter the second work ID for sales order 1.

    There's only one pick task for this work ID.
11. Select **OK**.

    The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.
12. In the **LP** field, enter the license plate number for the item in the location that is shown.

    The license plate that you specify should be one of the system-generated license plates from the replenishment work tasks. To make sure that you capture the correct license

plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

13. Select the **OK** button (check mark symbol).
14. Confirm the instructions for the put task to the outbound staging location.
15. Select **OK**.

    You receive a "Work Completed" message.

Sales order 2 is blocked from picking because the replenishment task that it's linked to isn't completed. Currently, there's still a quantity of 30 ea in the picking location, and the replenishment quantity for sales order 2 is 60 ea. The sum of the on-hand inventory and the replenishment inventory (90 ea) exceeds the overflow quantity of 0.65 PL (or 65 ea). Before the replenishment work can be completed, sales order 3 must be picked.

1. Enter the work ID for sales order 3.

   There's only one pick task for this work ID.

2. Select **OK**.

   The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.

3. In the **LP** field, enter the license plate number for the item in the location that is shown.

   The license plate that you specify should be one of the system-generated license plates from the replenishment work tasks. To make sure that you capture the correct license plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

4. Select the **OK** button (check mark symbol).
5. Confirm the instructions for the put task to the outbound staging location.
6. Select **OK**.

   You receive a "Work Completed" message.

As soon as the sum of the on-hand quantity in the picking location and the replenishment quantity is below the threshold, you'll be able to process the remaining replenishment work.

Return to the **Work details** page, and notice that the replenishment work availability for the final piece of replenishment (for sales order 2) is *Open*, because there's now enough space in the location to accept the replenishment.

You can now process this replenishment work via the mobile device.

1. Go to **Inventory** > **Replenishment**.

   You're prompted to complete the remaining replenishment work. The item number, quantity, and location to pick from are shown.

2. In the **LP** field, enter the license plate number for the item in the location that is shown.

3. Select the **OK** button (check mark symbol).

   The system generates a target license plate number for the new license plate for the picked item.

4. Select **OK** to confirm the value.

   Put work is shown that instructs the user to put the target license plate into the replenishment location. The **Put** location should be *06A01R2S1B*.

5. Confirm the put details, and select **OK**.

   You receive "Work Completed" and "No Work Available" messages.

You can now pick sales order 2. It became unblocked when the replenishment work that is linked to the sales order was completed.

1. Enter the work ID for sales order 2.

   There's only one pick task for this work ID.

2. Select **OK**.

   The **Sales orders: Pick** task page shows the item number, quantity, and location to pick from.

3. In the **LP** field, enter the license plate number for the item in the location that is shown.

   The license plate that you specify should be the system-generated license plate from the replenishment work task. To make sure that you capture the correct license plate ID, check the inventory on the **On-hand list** page for the item, location, and quantity.

4. Select the **OK** button (check mark symbol).

5. Confirm the instructions for the put task to the outbound staging location.

6. Select **OK**.

   You receive a "Work Completed" message.

Notes and tips

- This functionality works with all types of replenishment: wave demand, min/max, load demand, and slotting.
- You can manually override the replenishment work availability for each work header from the **Work details** page if you want.
- When the system sets the replenishment work availability, it considers any inventory that is already in the location before any work is completed.
- Each piece of sales order work is linked to a specific replenishment work. There's no corresponding sales work availability functionality.

Last updated on 10/03/2025

Confirm and transfer

09/24/2025

The *Confirm and transfer* feature lets workers ship loads out of the warehouse before they complete all the work that's associated with those loads. This functionality supports scenarios where the full load doesn't fit onto a single truck, or where some of the load should leave the warehouse before the rest of the load is ready for shipment. In these scenarios, the remaining products can be transferred to a new load and therefore to a new truck. Because you can use this feature with loads that are otherwise intended to require full-load shipment, it provides extra flexibility so that transport managers can solve nonstandard or unforeseen scenarios.

You can choose what the system should do when confirming a load where not all load lines are fully picked.

You can set the system to either ask the worker what to do, or run batch jobs to automatically do the following actions:

- Split the load (add the unfulfilled quantity to a new load)
- Cancel the unfulfilled quantity

Splitting the load

You can select the default split method for loads in the load template details and in the single load details. Systems set up to support load splitting handle scenarios where planned and partially loaded loads need to change because of new or changing circumstances.

The client includes logic that enables a partially loaded load to be closed and confirmed as shipped. If this rollover is required and the setup allows for it, all remaining shipments and load lines (including full or partial line quantities) roll over to a newly created load and shipment. New shipments and loads are automatically created based on the initial criteria for shipment and load creation, and their main attributes remain unchanged. You can also automatically cancel remaining quantities if a work order isn't yet created and you want to cancel these quantities.

When you split a load, the *Confirm and transfer* feature performs the following actions:

- Creates new loads and shipments as required. Each load or shipment has most of the same attributes as the original load or shipment. The exception is the load status, which is recalculated based on the work status.
- Informs you when a new load is created. It also notifies you about the ID of the new load.
- Updates the load lines, work headers, and work lines that were split with the new load and shipment information.

- Maintains the shipment and updates only the load references if a whole shipment is being split. Creates a new shipment if the shipment must be split.

You can split only loads that meet all the following criteria:

- One or more load lines have picked quantities.
- The load status is less than loaded.
- There's no load line data. (This data is created through license plate consolidation on the staging location, and the *Confirm and transfer* feature doesn't support license plate consolidation.)
- No inventory is currently awaiting packing at a packing location. (To be able to split loads with the *Confirm and transfer* feature for inventory that you picked to the pack station but didn't yet pack and move to staging locations, follow the configuration steps detailed in Packing work for packing outbound containers and processing shipments).

Cancelling the load

When you cancel remaining quantities, the process removes any load line quantities that aren't picked and that don't have noncanceled work associated with them from the load. If any work is in process, you can only split the load. You can't cancel remaining quantities.

> **Note**
>
> Use the *Confirm and transfer* feature in situations where you usually plan and create loads ahead of time, but exceptions sometimes occur in which the load doesn't fit the available transport (such as a truck).

Set up confirm and transfer

You must enable *Confirm and transfer* functionality for every load template where you want to use it. Depending on your requirements, you might also want to prepare your work templates to support the feature. This section describes how to set up the feature and also describes the settings you need if you're planning to work through the example scenario that is provided later in this article.

Prepare your load templates

1. Go to **Warehouse management** > **Setup** > **Load** > **Load templates**.
2. Do one of the following steps:

- To edit an existing template, select **Edit** on the Action Pane.
- To create a new template, select **New** on the Action Pane.

3. Set up your new or selected template as usual, and then select the **Allow load split during ship confirm** check box for each template where you want to enable this feature. Every load that you create by using that template inherits this functionality. (If you're planning to work through the scenario provided later in this article, and are working with the *USMF* demo data, select this check box for the *20' Container* load template.)

4. On the Action Pane, select **Save**.

5. For each template that you save with the **Allow load split during ship confirm** checkbox selected, set **Load split shipment confirmation policy** to one of the following values to control what the system should do when confirming a load where not all load lines are fully picked:

   - *Manual selection* – Display a dialog that asks the worker to choose whether to add the remaining quantities to a new load or cancel the incomplete quantities. A batch job can't perform this action.
   - *Split quantity to a new load* – Automatically add the unfulfilled quantity to a new load. A batch job can perform this action.
   - *Cancel unfulfilled quantity* – Automatically cancel the remaining quantity. A batch job can perform this action.

   (If you're planning to work through the scenario provided later in this article, and are working with the *USMF* demo data, then set **Load split shipment confirmation policy** to *Manual selection* for the *20' Container* load template.)

Prepare your work templates

This setup isn't required in all situations. The example that is shown here ensures that work can be broken by shipment to support the example scenario that is provided later in this article. You can also use other methods to achieve this result.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.

2. In the grid in the upper part of the page, select an existing work template where you want to set up the *Confirm and transfer* feature. (If you plan to work through the scenario provided later in this article, and you're working with the *USMF* demo data, select the *51 Pick to stage* work template.) Alternatively, create a new work template.

3. On the Action Pane, select **Edit query** to open the **Sales** dialog box.

4. In the **Sales** dialog box, on the **Sorting** tab, select **Add** to add a row to the grid.

5. In the new row, set the following values:

    - **Table:** *Temporary work transactions*
    - **Derived table:** *Temporary work transactions*
    - **Field:** *Shipment ID*
    - **Search direction:** *Ascending*

6. Select **OK** to save your settings and close the **Sales** dialog box.

7. If you receive a message that states that grouping is reset, select **Yes** to continue.

8. In the grid in the upper part of the **Work templates** page, select the template that you just edited, and then, on the Action Pane, select **Work header breaks**.

9. On the Action Pane, select **Edit** to put the page into edit mode.

10. In the grid, set the following values:

    - **Table name:** *Temporary work transactions*
    - **Field name:** *Shipment ID*
    - **Group by this field:** Select this check box.

11. On the Action Pane, select **Save**.

12. Close the page.

Scenario

This scenario shows an example where the picking process isn't yet completed, but the items that you picked so far must be loaded onto a truck and shipped anyway. Therefore, you can split the unpicked load lines onto a new load. All the data relationships automatically update.

> ⓘ **Note**
>
> The specific values that are described in this scenario are based on the *USMF* demo data. Use this demo data while you're demonstrating or learning how to use the feature. If you don't use the *USMF* demo data, substitute your own values as required.

Step 1: Create a load that has multiple load lines

Before you can use this functionality, you must have a load that contains multiple load lines. You must also make sure that the pick locations have enough inventory for all the items on the sales orders that you create. Review the setup of the location directive (**Warehouse**

management > **Setup** > **Location directives**), and make a note of the picking locations that are used for sales order picking. If you must adjust the inventory, create manual movements, use replenishment, or use any other flow, as required.

To create a qualifying load, first create three sales orders by following these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New** to open the **Create sales order** dialog box.
3. In the **Create sales order** dialog box, set the following values (at a minimum):
    - On the **Customer** FastTab, set the **Customer account** field to *US-004* (*Cave Wholesales*).
    - On the **General** FastTab, set the **Warehouse** field to *51*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. Your new sales order opens. In the **Sales order lines** grid, add a line that has the following values:
    - **Item number:** *M9200*
    - **Quantity:** *40*
    - **Unit:** *ea*
6. On the **Inventory** menu above the grid, select **Reservation**.
7. On the Action Pane, select **Reserve lot** to open the **Reservation** page.
8. Reserve the inventory on the sales line, and then close the **Reservation** page.
9. Repeat steps 1 through 4 to add a second sales order for the same customer and warehouse.
10. Add two sales lines that have the following values. After you add each line, reserve inventory for it as described in steps 6 through 8.
    - **Line 1:** Set the **Item number** field to *M9200*, the **Quantity** field to *30*, and the **Unit** field to *ea*.
    - **Line 2:** Set the **Item number** field to *M9201*, the **Quantity** field to *20*, and the **Unit** field to *ea*.
11. Repeat steps 1 through 4 to add a third sales order for the same customer and warehouse.
12. Add two sales lines that have the following values. After you add each line, reserve inventory for it as described in steps 6 through 8.

- **Line 1:** Set the **Item number** field to *M9201*, the **Quantity** field to *20*, and the **Unit** field to *ea*.
- **Line 2:** Set the **Item number** field to *M9202*, the **Quantity** field to *60*, and the **Unit** field to *ea*.

Outbound load planning workbench

The outbound load planning workbench uses the load template ID to build the shipments and release the sales order lines to the warehouse.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.
2. In the **Warehouse** field, select *51*.

   You'll now build the load for the sales orders that you created.
3. On the **Sales lines** tab, in the grid, select the sales lines for the new sales orders.
4. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**.
5. In the **Load template assignment** dialog box, in the **Load template ID** field, select *20' Container*.
6. Select **OK**.
7. In the **Loads** section of the **Outbound load planning workbench** page, in the grid, find the newly created load ID for warehouse *51*. Scroll right until you see the **Allow load split during ship confirm** column. The check box should be selected for your load.

   > ⓘ **Note**
   >
   > The default setting for **Allow load split during ship confirm** comes from the load template used to create the load. The **Load split shipment confirmation policy** setting is also inherited from the template but isn't shown on the **Outbound load planning workbench** page. To change the policy for a load, open its **Load details** page (for example, by selecting its **Load ID** in the grid here).
8. Select the load.
9. On the **Release** menu above the grid, select **Release to warehouse** to create work.
10. In the **Release load to warehouse** dialog box, verify that the **Records to include** FastTab shows your load ID.

11. Select **OK**.

    You might receive a "Processing operation" message while the system creates the shipments and work.

12. In the **Loads** section of the **Outbound load planning workbench** page, your load should now have a load status of *Waved*. Select the load, and then, on the **Related information** menu above the grid, select **Wave details** to view the shipment IDs that were created. When you're done, close the **Waves** page.

13. In the **Loads** section of the **Outbound load planning workbench** page, select the load, and then, on the **Related information** menu above the grid, select **Work details** to view the work that was created for the sales orders.

14. Make a note of the work IDs that were created. You might have to scroll right to see the sales order number and shipment ID that are associated with the work ID.

Step 2: Set up the execution flow for mobile devices

Mobile device tasks require worker input, such as the work ID or license plate ID. In the fields, this information typically appears for warehouse workers as bar codes on documentation, packaging, or racking. To complete the mobile device steps for scenarios, make sure that you identify the work IDs for the transactions, and the license plate IDs for the item and location in the transactions.

1. Sign in to the mobile device by using a user ID and password for warehouse *51*.

2. Select **Outbound**.

3. Select **Sales Picking**.

4. Enter the work ID or the license plate ID. Enter the work ID for the first sales order, then select **Enter**.

5. In the **Loc** field, enter the location that is shown to confirm the picking location. Then select **Enter**.

6. In the **LP** field, enter the license plate ID. The license plate ID must match the item, warehouse, and location of the item that you're picking from the selected location. When you're done, select **Enter**.

7. In the **Item** field, enter the item number to confirm the item that you're picking, then select **Enter**.

8. In the **Qty** field, enter the quantity of the item that you're picking, then select **Enter**.

9. In the **Target LP** field, enter a target license plate ID. Target license plates are user-defined. Be sure to enter a license plate ID that you can remember. We recommend that you use the current date plus a two-digit sequence (YYMMDD##) as the format, such as *19112301*. When you're done, select **Enter**.

10. Review the information that is shown. This information is the *Pick* information that now becomes the *Put* data for the put transaction. When you're done, select **Enter**.

    - You receive a **Work Completed** message.

11. Repeat steps 4 through 10 for the work ID of the second sales order.

The next step is to load the two picked license plates to the truck.

1. Sign in to the mobile device by using a user ID and password for warehouse *51*.
2. Select **Outbound**.
3. Select **Sales Loading**.
4. Enter the target license plate ID that you created for the first work ID in the previous procedure. Then select **Enter** to put the target license plate into the *STAGE* location.
5. Enter the target license plate ID again, then select **Enter** to put the license plate into the *BAYDOOR* location.
6. Repeat steps 4 through 5 for the target license plate ID that you created for the second work ID.

The two work IDs are now closed (loaded).

Step 3: Confirm the outbound shipment

In this step, you confirm the two sales orders and the work that you completed for the load to ship the picked items. You also create a new load for the unpicked items. You can confirm the outbound shipment from the **Outbound load planning workbench**, **All loads**, or **Load details** page.

> ⓘ **Note**
>
> If you're running Supply Chain Management version 10.0.41 or older, you can only split loads from the **Load details** page.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.

2. In the **Loads** section, in the grid, select the row for the load ID that you created.

3. Select the load ID link to open the **Load details** page.

4. On the Action Pane, on the **Ship and receive** tab, in the **Confirm** group, select **Outbound shipment** to initiate the confirmation.

5. Because the **Load split shipment confirmation policy** for the load template used to create this load is set to *Manual selection*, the **Ship confirm** dialog is shown. In the **Load split method during ship confirm** field, select *Split quantity to new load*.

6. Select **OK**.

   You might receive a *Processing operation* message. You might also receive informational messages that indicate that the shipment for your load is confirmed, and that a new load is created from the split quantity.

7. Refresh the **Outbound load planning workbench** page to see the newly created load.

You can confirm that transaction relations are updated in the following ways:

- The remaining (unprocessed) shipment and shipment lines are updated with the new load ID.
- The sales order is linked to the new load ID.
- The original load doesn't include the remaining load lines.
- The remaining work is updated with the new load ID.
- The wave remains the same.
- The status of the new load is correctly updated. (If the work status is *In process*, the load status is also *In process*.)

Confirm and transfer and Partial shipment of transport load features

The *Confirm and transfer* and *Partial shipment of a transport load* features both focus on flexibility in different aspects of the warehousing process. The *Partial shipment of transport load* feature enables flexibility in planning and loading, while the *Confirm and transfer* feature enables flexibility in ship-confirming a load. You can use these features alone or together.

Both features allow for more adaptable handling of transport loads, accommodating partial shipments and incomplete work scenarios. For example, you can plan loads without considering specific containers or trucks. After releasing these loads to the warehouse, workers can use mobile devices to assign loads in real-time as it makes sense, loading inventory from the same or different loads onto the same truck. This flexibility allows for partial shipments based on real-time loading decisions. Once a truck is full, workers can use the *Confirm and transfer* feature to close and complete an incomplete load and optionally split or cancel remaining quantities. This way, warehouse workers can make real-time decisions on load

assignments and shipment confirmations, optimizing the use of transport capacity, and warehouse operations can proceed without delays.

Notes and tips

- In Supply Chain Management version 10.0.42 and later, you can use a batch job to split loads where the **Allow load split during ship confirm** option is set to *Yes* and **Load split shipment confirmation policy** is set to *Split quantity to a new load* or *Cancel unfulfilled quantity*.
- You can change the load shipment confirmation policy for an individual load after you create it but before the loading process starts. To do so, open its **Load details** page, set **Allow load split during ship confirm** to *Yes* and then select the desired value in the **Load split shipment confirmation policy** field.
- The **Split quantity to new load** option also works when some of the remaining work headers have a status of *In process*. Therefore, you can still use the functionality even if workers are already running the pick orders.
- If you select **Cancel unfulfilled quantity** while there's remaining work that has a status of *Open* or *In progress*, you receive the following error message: "Unable to cancel remaining qty for load. Work exists for load."
- If you select **Cancel unfulfilled quantity** when there's no remaining work but there are unreleased load lines on the load, you receive the following error message: "The shipment for load couldn't be confirmed because the quantity for item exceeds the percentage that is defined for under delivery." To avoid this error, you can set the **Under delivery** percentage on the unreleased load line to *100*. Unreleased lines aren't moved to a new load, but the current load is confirmed with under delivery. In this case, you can't rerelease the original order, so you have to handle it in some other way.

Confirm outbound shipments from batch jobs

10/03/2025

This article describes how to set up a batch job that automatically confirms outbound transfer-order shipments for ready-to-ship loads. The batch job described here only applies to transfer order shipments, not to sales orders.

Process outbound shipments

To set up a scheduled batch job to run the outbound shipment confirmation for loads that are ready to ship:

1. Go to **Warehouse management** > **Periodic tasks** > **Process outbound shipments**.
2. The **Confirm shipment** dialog box opens. On the **Records to include** FastTab, select **Filter**.
3. The query editor dialog box opens. On the **Range** tab, add a row with the following values:

    - **Table** - *Loads*
    - **Derived table** - *Loads*
    - **Field** - *Load status*
    - **Criteria** - *Loaded*

4. Select **OK** to return to the **Confirm shipment** dialog box.
5. On the **Run in the background** FastTab, set **Batch processing** to **Yes**.
6. On the **Run in the background** FastTab, select **Recurrence**.
7. The **Define recurrence** dialog box opens. Set the run schedule as needed for your business.
8. Select **OK** to return to the **Confirm shipment** dialog box.
9. Select **OK** on the **Confirm shipment** dialog box to add the batch job to the batch queue.

Learn more in Batch processing overview.

Advanced load building during wave

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Advanced wave load building automatically assigns shipments to existing waves during wave execution. Therefore, you can create meaningful loads that represent trucks without having to use the outbound load planning workbench. This capability is useful for businesses that want to use the concept of loads to track and plan the shipment of goods in a truck/trailer, but that don't want to manually create those loads every day.

During wave processing, the system usually creates a new load for each shipment that no load is assigned to. However, when advanced wave load building is turned on, the system assigns each unassigned shipment to an existing load (if an appropriate load exists), and new loads are created only when they're required. Advanced wave load building automatically creates the new loads, based on criteria that you define.

To use the feature, you must set up the system in the following way:

- Create *wave templates* that include the *buildLoads* method. This method makes advanced wave load building available for waves that use those templates.
- Set up *load build templates*, each of which is linked to a specific wave template and method. Load build templates control which load (existing or new) the load lines that are being waved are added to. You can combine or separate shipments, based on criteria such as the load template, equipment, and other field values on the load line.
- Define *load mix groups* to control which items should and shouldn't be combined on a single load. You also specify whether the restriction should produce a warning or an error, and whether the volumetric restriction of the load template should be evaluated.

Prepare data to work through the scenario

Make sample data available

To work through this demo by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

You can also use this demo as guidance for using this feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Make sure that the scenario setup includes enough available inventory

If you're working with the *USMF* demo data, you must first make sure that your system is set up so that there's enough inventory at each relevant location. For this demo, the expectation is that the following inventory is available in warehouse *62*:

- **Item A0001:** 10 pcs
- **Item A0002:** 10 pcs
- **Item M9200:** 10 ea

Item **M9200** must be added to the warehouse. Complete the procedures in the following subsections to add the item inventory.

Create a new license plate ID

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **License plates**.
2. On the Action Pane, select **New**.
3. In the new row, in the **License plate** field, enter *LP6203*.
4. Select **Save**.

Create a standard cost for item M9200 in site 6

1. Go to **Product information management** > **Products** > **Released products**.
2. Search on **M9200**.
3. Select the row for the item, and then, on the Action Pane, on the **Manage costs** tab, in the **Set up** group, select **Item price**.
4. On the **Item price** page, select the **Pending prices** tab.
5. On the Action Pane, select **New**.
6. On the new line, set the following values:
    - **Costing type:** *Planned cost*
    - **Price type:** *Cost*
    - **Version:** *10*

- **Site:** *6*
- **Price:** *1.60*

7. On the Action Pane, select **Save**.
8. On the Action Pane, select **Activate pending price(s)**.
9. Select the **Active prices** tab to verify that the new cost price for site *6* has been added.

Create inventory in warehouse 62

1. Go to **Inventory management** > **Journal entries** > **Items** > **Inventory adjustment**.
2. On the Action Pane, select **New**.
3. In the **Create inventory journal** dialog box, on the **Overview** FastTab, in the **Warehouse** field, enter *62*. Accept the default values in all the other fields.
4. Select **OK** to close the dialog box.
5. The **Inventory adjustment** page is opened. On the **Journal lines** FastTab, select **New** to add a line.
6. On the new line, set the following values. Accept the default values in all the other fields.

    - **Item number:** *M9200*
    - **Location:** *bulk-003*
    - **Quantity:** Change the value to *10*.

7. On the Action Pane, select **Save**.
8. On the Action Pane, select **Validate** to check for errors.
9. In the **Check journal** dialog box, select **OK** to start the check. You receive a message when the check is completed.
10. On the Action Pane, select **Post** to commit the inventory adjustment.
11. In the **Post journal** dialog box, select **OK** to start the posting. You receive a message when the posting is completed.

Set up advanced wave load building

Regenerate wave process methods

You might have to regenerate your wave process methods to make the load building method (*buildLoads*) available.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. Verify that *buildLoads* is present in the list. If it isn't present, select **Regenerate methods** on the Action Pane to add it.

Set up wave templates

To take advantage of advanced wave load building, you must include the *buildLoads* method in each relevant wave template.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select a wave template.

   If you're working with the *USMF* demo data, select the *62 Shipping Default* template.
3. On the Action Pane, select **Edit** to put the page into edit mode.
4. On the **Methods** FastTab, in the **Remaining methods** grid, select the *buildLoads* method.
5. Select the right arrow button to move the *buildLoads* method to the **Selected methods** grid.
6. To assign a **Wave step code** value for the *buildLoads* method, you must first create a code on the **Wave step codes** page. You can use any value that you want, but be sure to make a note of it, because you'll need it later. Follow these steps to create code *WSC2112*:
   a. In the row for the *buildLoads* method, right-click the down arrow in the **Wave step code** field, and then select **View details**.
   b. On the **Wave step codes** page, on the Action Pane, select **New**.
   c. In the **Wave step code** field, enter *WSC2112*.
   d. In the **Wave step description** field, enter *WSC2112*.
   e. In the **Wave step type** field, select *Load Building*.
7. Select **Save**, and close the page.
8. In the row for the *buildLoads* method, in the **Wave step code** field, select the code that you just created (*WSC2112*).
9. On the Action Pane, select **Save**.

> ⓘ **Note**

Wave step codes are codes that users can set up and use to link specific instances of wave methods to corresponding templates. The templates include templates for replenishment, containerization, label printing, load building, and sorting.

When wave step codes aren't used, users must enter free text to reference a specific template from the wave method instance. Free text is prone to errors, because users must make sure that the wave step text that they add for a specific wave step method in a wave template exactly matches the wave step text in the target template.

Wave step codes for a specific wave step type are set up on a separate page. For every instance of a wave step method in a wave template that requires a wave step code, the wave step code must be selected in a drop-down list. Selection in a drop-down list replaces free text entry and helps reduce the risk and impact of human error. Setup codes are used to link a wave step method in a wave template to a target template for the method.

Set up load mix groups

Load mix groups establish rules for the types of items that can be combined on a single load. You can set up as many load mix groups as you require. However, to use advanced wave load building, you must have at least one. Follow these steps to create a load mix group.

1. Go to **Warehouse management** > **Setup** > **Load** > **Load mix groups**.
2. On the Action Pane, select **New** to create a load group.
3. In the **Load mix group ID** field, enter a name for the new group.

   If you're working with the *USMF* demo data, set the following values:

   - **Load mix group ID:** *TV*
   - **Description:** *TV*
4. On the Action Pane, select **Save** to make the **Load mix group criteria** FastTab available.
5. On the **Load mix group criteria** FastTab, select **New** to add a row to the grid.
6. In the new row, set the desired values in each field. These values determine the item groups that are considered for the load mix.

   If you're working with the *USMF* demo data, select *TV&Video* in the **Item group** field.
7. On the Action Pane, select **Save** to make the **Load mix group constraints** FastTab available.

8. On the **Load mix group constraints** FastTab, select **New** to add a row to the grid.
9. In the new row, set the desired values in each field.

   If you're working with the *USMF* demo data, set the following values:

   - **Item group:** *CarAudio*
   - **Load build action:** *Restrict* (This value prevents items that belong to the *CarAudio* item group from being on the same load as items that belong to the *TV&Video* item group.)
10. Continue to work with the rules until you've added all the criteria and constraints that you require for the load mix group.

If you're working with the *USMF* demo data, you've now finished this setup.

Set up load build templates

You can set up as many load build templates as you require. However, to use advanced wave load building, you must have at least one. Follow these steps to create a load build template.

1. Go to **Warehouse Management** > **Setup** > **Load** > **Wave load building templates**.
2. On the Action Pane, select **New** to add a row to the grid.
3. In the new row, set the following values.

Expand table

Field	Description	Value in the USMF demo data
Sequence number	The order that the template will be evaluated in.	*1*
Load build template name	Enter the unique identifier of the load build template. You should enter the name of the template that you created or updated earlier in this setup.	*62 Shipping Default*
Wave step code	Enter the wave step code to use to link the template to a wave method. You should enter the code that you selected for the *buildLoads* method when you set up the wave template earlier in this setup.	*WSC2112*
Load template ID	Select the load template to use when new loads are created and to match against when assigning to existing loads. The load	*Stnd Load Template*

Field	Description	Value in the USMF demo data
	template defines the maximum weight and volume that are permitted for the whole load.	
Equipment	The equipment to match against when assigning to existing loads and to enter on new loads that are created.	Leave this field blank.
Load mix group ID	Select the load mix group to use if the item is allowed on the load. The mix group establishes rules for the types of items that can be combined on a single load. You should select one of the mix groups that you created earlier in this setup.	*TV*
Use open loads	Select whether existing open loads should be added. The following options are available: • **None** – Don't add open loads to any existing loads. • **Any** – Add open loads to any existing loads that are valid for the line. • **Assigned** – Add open loads to the load that is assigned to the wave.	*Any*
Create loads	Specify whether new loads should be created if no existing loads match the criteria.	Selected (= *Yes*)
Allow load line split	Specify whether a single load line can be split across multiple loads if the full line exceeds the maximum capacity (**Quantity**) of the load template.	Cleared (= *No*)
Validate volumetrics	Specify whether load building should check the weight and volume as each load line is added, to ensure that the volumetric limits of the load template are respected.	Cleared (= *No*)

> **Note**
>
> The **Allow load line split** field only splits based on a quantity limit, not volume or weight limits. It's different from the **Allow load split during ship confirm** field used by load templates. Learn more at Confirm and transfer.

4. On the Action Pane, select **Save** to make the **Edit query** option available.

5. On the Action Pane, select **Edit query** to open a dialog box for editing the query.

6. In the dialog box, on the **Sorting** tab, select **Add** to add a row to the grid.

7. In the new row, define the sorting rules that you want to use. For example, set the following values to sort the search results in ascending order by order number:

    - **Table:** *Load details*
    - **Derived table:** *Load details*
    - **Field:** *Order number*
    - **Search direction:** *Ascending*

8. Select **OK** to save your changes and close the dialog box.

9. On the **Break by** FastTab, set rules to control how your loads are split up. Typically, you might break on custom fields that have been extended onto the load line, such as **Route**, **Tour**, or **Run**. For example, to create one load per order number, select the **Break by** check box for the row that has the following values:

    - **Reference table name:** *Load details*
    - **Reference field name:** *Order number*

Scenario

This scenario shows how the settings that were described earlier in this article affect warehouse operations while a sales order is processed. This scenario uses the *USMF* demo data together with other demo values that are provided in those setup instructions.

Create sales orders

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New** to open the **Create sales order** dialog box.

3. In the dialog box, set the following values:

    - On the **Customer** FastTab, set the **Customer account** field to *US-007*.
    - On the **General** FastTab, set the **Warehouse** field to *62*.

4. Select **OK** to create the sales order and close the dialog box.

5. Your new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. On this new line, set the **Item number** field to *A0001* and the **Quantity** field to *1*.

6. On the **Inventory** menu above the grid, select **Reservation**.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot**.

8. Select the **Close** button (**X**) in the upper-right corner of the page to return to the sales order.

9. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. The system creates a shipment and adds it to a new load, because no existing load contains load lines that have this order number.

   You receive informational messages that indicate the work, wave, and shipment that are created for this order.

10. To confirm the load, shipment, and work details on the sales line, select the line, and then, on the **Warehouse** menu above the grid, select **Load details**, **Shipment details**, or **Work details**.

11. In the sales order that you just created, on the **Sales order lines** FastTab, select **Add line** to add another line.

12. On the new line, set the **Item number** field to *A0002* and the **Quantity** field to *1*.

13. Repeat lines 6 through 9 to reserve the line and release it to the warehouse. The system creates a **new** shipment for the line that you added. However, because you're using advanced wave load building, the system adds that shipment and load line to the existing wave. If you weren't using advanced wave load building, the system would create a new load for the shipment.

14. In the sales order that you just created, on the **Sales order lines** FastTab, select **Add line** to add another line.

15. On the new line, set the **Item number** field to *M9200* and the **Quantity** field to *1*.

16. Repeat lines 6 through 9 to reserve the line and release it to the warehouse. As before, the system creates a **new** shipment for the line that you added. However, because the item is from the **CarAudio** item group, it **fails to pass the constraints that you set up for the load mix group**. Therefore, it's **added to a new load**. If you hadn't specified a load mix group on the load build template, this shipment would have been added to the first load.

Release to warehouse rule

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The *Release to warehouse rule* feature provides flexibility during release to the warehouse. It adds a configuration option for each warehouse. Use this option to specify whether partially reserved order lines can be released for that warehouse. This feature works together with advanced cross-docking functionality in situations where part of an order line quantity is marked against a supply source, but the remaining part can be processed in the warehouse. Therefore, the line can be released so that warehouse processing of the available inventory quantity can continue.

Set the release to warehouse rule for each warehouse

To set the release to warehouse rule for each warehouse, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
2. Select the warehouse to configure.
3. Select **Edit** to put the page into edit mode.
4. On the **Warehouse** FastTab, in the **Reservations** section, the **Requirement for inventory reservation** field controls whether partial release of orders is allowed. Select one of the following values:

    - *Not applicable* – When you turn on and initialize the feature, this value is automatically assigned to all warehouses that aren't enabled for warehouse management. You can't change it. This value isn't available for warehouses that are enabled for warehouse management.
    - *Allow partial reservation* – Order lines can be released when any quantity is reserved. The system evaluates whether the unreserved quantity should be marked for advanced cross-docking and marks that quantity as required. If no marking exists, the system creates work only for the reserved quantity. When you turn on and initialize the

feature, the system automatically assigns this value to all warehouses that are enabled for warehouse management. This value isn't available for warehouses that aren't enabled for warehouse management.

- *Require full reservation* – Order lines can be released only if the whole quantity is reserved. They can't be released if the total quantity isn't either physically reserved or planned for cross-docking. This value isn't available for warehouses that aren't enabled for warehouse management.

5. Select **Save**.

Scenarios

This section provides two scenarios that you can work through to learn what the feature does and how to use it.

Make sample data available

To work through these scenarios by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use these scenarios as guidance for the feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Scenario 1: Require full release (no planned cross-docking)

This scenario shows how the feature works for warehouses that are set to **Require full reservation**.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
2. For warehouse *62*, set the **Requirement for inventory reservation** field to **Require full reservation**, as described in the Set the release to warehouse rule for each warehouse section earlier in this article.
3. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
4. Select **New** to create a sales order.
5. In **Create sales order**, set the following values:

- On the **Customer** FastTab, set the **Customer account** field to *US-004*.
- On the **General** FastTab, set the **Warehouse** field to *62*.

6. Select **OK** to create the new sales order and close the dialog box.
7. Your new sales order is opened. It includes an empty line in the grid in the **Sales order lines** section. On this line, set the following values:
   - **Item number:** *A0001*
   - **Quantity:** *2*
8. Select **Add line** to add a new line, and set the following values:
   - **Item number:** *A0002*
   - **Quantity:** *2*
9. Select the first order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
10. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.
11. Close the **Reservation** page to return to the sales order.
12. Don't reserve the second order line.
13. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.
14. Notice that you receive the following error message: "The full quantity must be physically reserved." Therefore, the system doesn't create any work, shipment, or load for the order.

    > ⓘ **Note**
    >
    > You receive the same error message if you partially reserve the second line.

Scenario 2: Allow partial release

This scenario shows how the feature works for warehouses that are set to **Allow partial release**.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
2. For warehouse *62*, set the **Requirement for inventory reservation** field to **Allow partial reservation**, as described in the Set the release to warehouse rule for each warehouse

section earlier in this article.

3. As you did in the previous scenario, go to **Sales and marketing** > **Sales orders** > **All sales orders**, and create a sales order for customer account *US-004* from warehouse *62*. Add the following two order lines:

    - **Line 1:** Set the **Item number** field to *A0001*, the **Quantity** field to *2*, and the **Unit** field to *Pcs*.
    - **Line 2:** Set the **Item number** field to *A0002*, the **Quantity** field to *2*, and the **Unit** field to *Pcs*.

4. As you did in the previous scenario, reserve the full quantity for order line 1, but don't reserve order line 2.

5. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

6. Notice that you don't receive an error message this time. Instead, the system creates work, shipments, and loads as required, and shows the results.

7. To view the shipment, load, and work information, use the options on the **Warehouse** menu above the grid:

    - **Line 1:** Three options are available: **Shipment details**, **Load details**, and **Work details**. Select each option to view the details of the shipment, load, and work that were created when the order was released to the warehouse.
    - **Line 2:** Only the **Work details** option is available. Select it, and notice that no work has been created, because no inventory was reserved. Therefore, no shipment or load was created either.

> ⓘ **Note**
>
> The same result is expected when the second line is partially reserved. In this case, work is created for the reserved line quantity but not for the unreserved quantity.

Small parcel shipping

Summarize this article for me

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

The small parcel shipping (SPS) feature enables Microsoft Dynamics 365 Supply Chain Management to interact directly with shipping carriers by providing a framework for communication through carrier APIs. This functionality is useful when you're shipping individual sales orders via commercial shipping carriers instead of using container shipping or less-than-truckload (LTL) shipping.

The SPS feature interacts with your shipping carrier through a dedicated *rate engine*. Your organization must develop this rate engine in collaboration with your carrier or carrier hub service. The rate engine enables Supply Chain Management to submit details about a packed container to your carrier, and then receive a shipping label, shipping rate, and tracking number back from that carrier.

The shipping rate that is returned is added to the associated sales order as a miscellaneous charge. The shipping label that is returned can then automatically be printed by using a Zebra Programming Language (ZPL) printer and applied to the shipment. The carrier will scan this shipping label when it picks up the packages at your warehouse.

Prepare your system to support SPS

Before you can start to use SPS functionality, you must add your rate engine and set up the **Transportation management** and **Warehouse management** modules to support it.

Deploy and set up rate engines

Supply Chain Management doesn't include any rate engines. You must obtain or create any rate engines that you require, and then add them to your system. However, Microsoft provides a demo rate engine that you can use for testing.

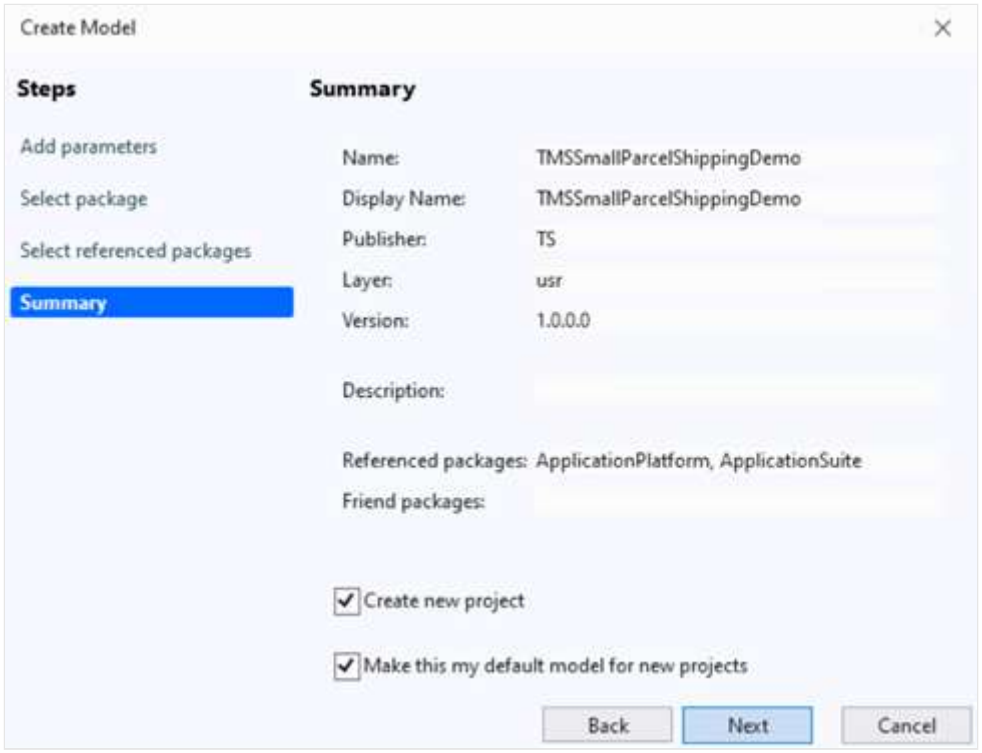
Download and deploy the demo rate engine

Follow these steps to download and deploy the demo rate engine.

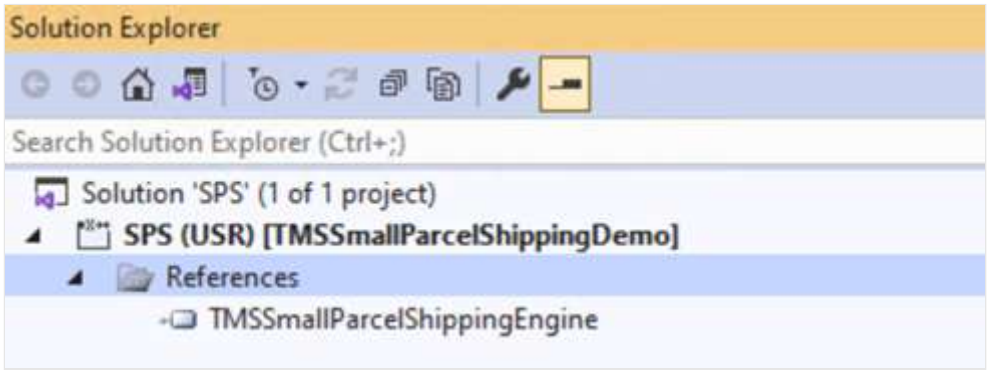
1. On GitHub, download the dynamic-link library (DLL) for the demo rate engine.

2. In Visual Studio, go to **Extensions** > **Dynamics 365** > **Model Management** > **Create Model**.

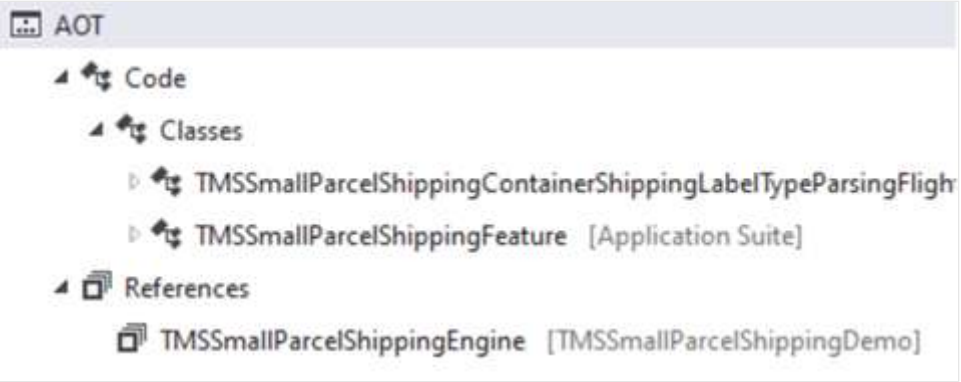
3. Create a new model called *TMSSmallParcelShippingDemo* and make it reference the *ApplicationSuite* and *ApplicationPlatform* models in the select referenced packages step.



4. Create a project in the new model and add the downloaded `TMSSmallParcelShippingEngine.dll` file to the references for the new project.



5. On the **Solution Explorer** pane, right-click and select **Build Solution** to compile the project and make sure the reference is added to the AOT node.



6. Go to **Extensions** > **Dynamics 365** > **Deploy** > **Create Deployment Package** and create a deployment package for the new model.

7. In Microsoft Dynamics Lifecycle Services, go to **Asset Library** > **Software deployable package**. Select **Add** to add the deployment package you created to Lifecycle Services.

8. After the validation completes, go to **Environments** > **{Your Environment ID}** > **Maintain** > **Apply updates**, select the deployable package, and apply.

> **Note**
>
> If the system warns you that you don't have permission to deploy packages on Lifecycle Services, contact your Lifecycle Services administrator for support.

Create and deploy functional rate engines

For information about how to create and deploy functional rate engines so that they can be used in a production or test environment, see the following articles:

- Create a new transportation management engine
- Set up transportation management engines

Set up a rate engine in Supply Chain Management

After you've created and deployed a rate engine for SPS, follow these steps to set it up.

1. Go to **Transportation management** > **Setup** > **Engines** > **Rate engine**.

2. On the Action Pane, select **New** to add a row to the grid.

3. In the new row, set the following fields:

    - **Rating engine** – Enter a unique name for the rate engine. If you're using the demo rate engine, enter *Demo rate engine*.

- **Name** – Enter a short description of the rate engine. If you're using the demo rate engine, enter *Demo rate engine*.
- **Rating metadata ID** – Select the basis that should be used to calculate your rate. For example, your rate might be calculated based on distance. If you're using the demo rate engine, you can leave this field blank.
- **Engine assembly** – Enter the file name of the DLL package that you deployed. If you're using the demo rate engine, enter *TMSSmallParcelShippingEngine.dll*.
- **Engine class** – Enter the class name that was established for your rate engine. If you're using the demo rate engine, enter *TMSSmallParcelShippingEngine.SmallParcelShippingRateEngine*.

Example scenario

This example scenario shows how to set up and use SPS after you've prepared your system as described earlier in this article. This scenario uses the previously mentioned demo rate engine.

Make demo data available

To work through this scenario by using the demo records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

Set up the scenario

For this example scenario, you must have a demo carrier, carrier group, packing policy, and packing profile. The following subsections explain how to prepare the records that are required for the scenario. In a production scenario, the setup process typically resembles the process that is described here. However, you'll set different values.

Set up carriers

Follow these steps to set up a carrier.

1. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.
2. On the Action Pane, select **New** to add a carrier.
3. On the header, set the following values:
    - **Shipping carrier:** *Demo Carrier*
    - **Name:** *Demo Carrier*

- **Mode:** *Ground*

4. On the **Overview** FastTab, set the following values:

    - **Activate shipping carrier:** *Yes*
    - **Activate carrier rating:** *Yes*

5. On the **Services** FastTab, select **New** to add a service to the grid.

6. Set the following values for the new service:

    - **Carrier service:** *Demo carrier service*
    - **Name:** *Demo carrier service*
    - **Transportation method:** *Ground*

    Enter arbitrary values for all the other fields, as required. (When you save the new shipping carrier record, a new mode of delivery will be created, and the **Mode of delivery** field will be set automatically.)

7. On the **Rating profiles** FastTab, select **New** to add a rating profile to the grid.

8. Set the following values for the new profile:

    - **Rating profile:** *Demo carrier service*
    - **Name:** *Demo carrier service*
    - **Rate engine:** *Demo rate engine*

    Enter arbitrary values for all the other fields, as required.

9. On the Action Pane, select **Save**.

For more information about how to set up carriers, see Set up shipping carriers.

Set up carrier service accounts

Follow these steps to set up a carrier service account.

1. Go to **Transportation management** > **Setup** > **Rating** > **Carrier service account**.

2. On the Action Pane, select **New** to add a carrier service account.

3. Set the following values for the new account:

    - **Shipping Carrier:** *Demo Carrier*
    - **Carrier service:** *Demo carrier service*

- **Carrier customer account number:** The carrier customer account number that is used to verify and authenticate the connection to the shipping carrier. Your carrier will provide this value. If you're using the demo service, you can enter an arbitrary value.
- **Site:** *6*
- **Warehouse:** *62*

> ⓘ Note
>
> Often, the **Carrier customer account number** value is the only value that is required to authenticate the connection. However, if your carrier requires additional authentication parameters, your organization should customize this page to add extra fields as appropriate.

Set up a container packing policy

Follow these steps to set up a container packing policy.

1. If you haven't already set up a ZPL printer definition, use the Document Routing Agent application to set it up. Learn more in Document printing overview and related articles.
2. Go to **Warehouse Management** > **Setup** > **Containers** > **Container packing policies**.
3. On the Action Pane, select **New** to add a container packing policy.
4. On the header of the new policy, set the following values:
    - **Container packing policy:** *Demo packing policy*
    - **Description:** A description of the policy
5. On the **Overview** FastTab, set the following values:
    - **Warehouse:** *62*
    - **Default location for final shipment:** *Baydoor*
    - **Weight unit:** *KG*
    - **Container closing policy:** *Automatic release*
    - **Container release policy:** *Make available at final shipping location*
6. On the **Container manifest** FastTab, set the following values:
    - **Automatic manifest at container close:** *Yes*
    - **Manifest requirements for container:** *Transportation management*
    - **Print container contents:** *No*

7. On the **Carrier label printing** FastTab, set the following values:

    - **Print container shipping label:** *Always*
    - **Printer name:** The name of the ZPL printer that should print shipping labels

Set up a packing profile

Follow these steps to set up a packing profile.

1. Go to **Warehouse Management** > **Setup** > **Packing** > **Packing profiles**.

2. On the Action Pane, select **New** to add a packing profile to the grid.

3. Set the following values for the new profile:

    - **Packing profile ID:** *Demo packing profile*
    - **Description:** A description of the profile
    - **Container packing policy:** *Demo packing policy*
    - **Container ID mode:** *Auto*
    - **Container type:** *SmallBox*

Set up a customer to use the SPS carrier

Follow these steps to set up a customer so that it can use the carrier that you created.

1. Go to **Accounts receivable** > **customers** > **All customers**.

2. In the grid, find and select customer *US-027*.

3. On the Action Pane, on the **General** tab, in the **Set up** group, select **Carrier customer accounts**.

4. On the **Carrier customer accounts** page, on the Action Pane, select **New** to add an account to the grid.

5. Set the following values for the new account:

    - **Shipping carrier:** *Demo Carrier*
    - **Carrier customer account number:** *12345* (The value isn't important for this scenario, but it will be referred to in the next section.)

Go through the example scenario

After you've set up all the sample data as described in the previous section, you're ready to go through the example scenario.

Create a sales order and process the work

Follow these steps to create a sales order.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the **Customer account** field to *US-027*.
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order is opened. On the **Sales order header** FastTab, set the **Carrier customer account number** field to the value that you selected for this customer earlier (*12345*).
6. In the **Sales order lines** section, add a sales line, and set the following values for it:
    - **Item number:** *A0002*
    - **Quantity:** *1*
    - **Site:** *6*
    - **Warehouse:** *62*
7. Switch to the **Header** view.
8. On the **Delivery** FastTab, set the following values:
    - **Shipping carrier:** *Demo Carrier*
    - **Carrier service:** *Demo carrier service*
9. Switch back to the **Lines** view. If you're prompted to update the mode of delivery for the sales lines, select **Yes**.
10. In the **Sales order lines** section, select the order line that you set up earlier, and then select **Inventory** > **Reservation**.
11. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.
12. Close the **Reservation** page to return to the sales order.
13. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

Work is created to move items from the picking location to the packing station.

14. In the **Sales order lines** section, select **Warehouse** > **Shipment details**.
15. On the **Shipment details** page, make a note of the shipment ID. You'll need it when you pack the pack the shipment at the packing station.
16. Close the **Shipment details** page to return to the sales order.
17. Make a note of the sales order number, and then go to **Warehouse management** > **Work** > **All work**.
18. Use the sales order number to find and select the work that was created for the order.
19. On the Action Pane, on the **Work** tab, select **Complete work**.
20. On the **Work completion** page, in the **User ID** field, select a user ID. Then, on the Action Pane, select **Validate work**.
21. If the work passes validation, select **Complete work** on the Action Pane.

    The work is marked as completed to simulate the movement of items to the packing station.

Pack the shipment

Follow these steps to pack the shipment.

1. Go to **Warehouse management** > **Setup** > **Worker**, and make sure that your user account is associated with a worker account for warehouse management.
2. Go to **Warehouse management** > **Picking and containerization** > **Pack**.
3. In the **Select packing station** dialog box, set the following values:

    - **Site:** *6*
    - **Warehouse:** *62*
    - **Location:** *Pack*
    - **Packing profile ID:** *Demo packing profile*

4. Select **OK**.
5. The **Pack** page appears. In a production scenario, a worker will scan a license plate or shipment ID. However, for this scenario, open the **All shipments** page, and look up the shipment number for the shipment that you just created. Then enter this value in the

License plate or shipment field on the **Pack** page. Alternatively, enter the shipment ID that you made a note of earlier.

6. On the Action Pane, select **New container**.
7. The dialog box that appears shows details about the new container. Leave the default values, and then select **OK**.
8. On the **Pack** page, on the **Item packing** FastTab, in the **Identifier** field, select *A0002* to pack that item. The item is added to the container.
9. On the Action Pane, select **Containers for shipment**.

   The **Containers for shipment** page that appears has a row for the container that you just created. However, the **Container manifest ID** field in that row is currently blank, because you haven't yet received the shipping label and tracking number from the carrier.
10. On the Action Pane, select **Close container**.
11. In the **Close container** dialog box, set the **Gross weight** field to *1 kg*, and then select **OK**.

    The shipping label should now be printed on the ZPL printer that you selected earlier. It should resemble the following example.

12. Notice that the **Container manifest ID** and **Total freight** values have been added as received from the carrier.

Shipment consolidation policies overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Shipment consolidation policies allow for automated shipment consolidation during automated and manual release to the warehouse.

Shipment consolidation policies are used for the following functionality:

- The automated release-to-warehouse batch jobs
- The **Release to warehouse** command on a sales order, transfer order, or outbound shipment order
- The dedicated **Release to warehouse** pages
- The **Release to warehouse** command on the **Outbound load planning workbench** page
- The manual consolidation of shipments on the **Consolidate shipments** and **Shipment consolidation workbench** pages

Before shipment consolidation policies were introduced, the consolidation function existed as a setting at the warehouse level. All orders for all customers from a single warehouse were treated as though they had the same consolidation requirements. Shipment consolidation policies add support for scenarios where different organizations have different requirements for shipment consolidation.

Queries are used to identify the shipment consolidation policy that applies, and then an editable set of fields determines how the load lines are grouped at the shipment level. (This pattern resembles the pattern that wave templates follow.) In addition, a **Consolidate with existing shipments** option has been added to each policy. When this option is turned on, the *Release to warehouse* procedure finds shipments for consolidation by searching among existing shipments that were created based on the same consolidation policy. In this case, the system will select an existing shipment or load instead of creating a new one. However, the system will only consolidate with existing shipments that have a status of *Open*; shipments that belong to a wave release with a status of *Released* or higher won't be considered as targets for consolidation.

You can use the various **Release to warehouse** pages to manually override the applicable consolidation policy in the same way that you can override fulfillment policies.

You can use the **Release** > **Release to warehouse** command on the **Outbound load planning workbench** page to build outbound loads that are based on sales, transfer, and outbound shipment order lines before you do the release to the warehouse. These loads use the same consolidation logic that was introduced together with the consolidation of shipment policies.

You can use the **Shipment consolidation workbench** page to consolidate existing shipments that haven't yet been confirmed but have already been released to the warehouse. This functionality supports scenarios where the automated release process, which has its own shipment consolidation, is run multiple times a day, but potential additional consolidations are manually identified before the shipment to carriers is completed during the confirmation process. This functionality lets you consolidate outbound shipments that are created from sales, transfer, or outbound shipment order lines at any time after the shipments are released to the warehouse but before they are confirmed.

The **Shipment consolidation workbench** page works like the load building workbench, where you can assess multiple shipments at the same time and assign a non-consolidated order to a specific shipment. You can apply shipment consolidation templates to assess proposed consolidations multiple times and confirm them. Some rules are implemented to prevent unauthorized consolidation and to warn you about possible errors.

Shipment consolidation policies functionality

This section describes the pages, commands, and features that are part of the *Shipment consolidation policies* feature.

Shipment consolidation policies page

Policies are differentiated by work order type. The **Sales orders** type represents *Sales order* shipments, the **Transfer orders** type represents *Transfer issue* shipments, and the **Outbound shipment order** type represents *Outbound shipment order* shipments.

Every shipment consolidation policy has a query that defines when it's applied and a sequence number that determines the execution order. Consolidation is applied for each unique combination of the selected fields. An additional parameter, which is provided, is used for consolidation with existing (open) shipments. The policies are evaluated and applied every time that a new shipment is created (before wave processing).

If a policy is missing any mandatory fields, or if it includes any prohibited fields, the policy is marked as not valid in the **Selected** section. The lists of mandatory and prohibited fields are hard-coded and can be extended.

The following list shows the mandatory fields. Because shipments are always split based on these fields, you can't group multiple shipments that have different values for these fields.

- For sales orders:
  - **Account number:** *WHSShipmentTable.AccountNum*
  - **Delivery recipient:** *WHSShipmentTable.DeliveryName*
  - **Postal address (RecId):** *WHSShipmentTable.DeliveryPostalAddress*
  - **Warehouse:** *WHSShipmentTable.InventLocationId*

- For transfer orders:
  - **From warehouse:** *InventTransferTable.InventLocationIdFrom*
  - **To warehouse:** *InventTransferTable.InventLocationIdTo*

- For outbound shipment orders:
  - **Account number:** *WHSShipmentTable.AccountNum*
  - **Delivery recipient:** *WHSShipmentTable.DeliveryName*
  - **Postal address (RecId):** *WHSShipmentTable.DeliveryPostalAddress*
  - **Warehouse:** *WHSShipmentTable.InventLocationId*
  - **Source system:** *WHSShipmentTable.SourceSystem*

The following fields are unavailable for all document types. These fields aren't visible in the user interface (UI), and they can't be used for consolidation.

- **Shipment ID:** *WHSShipmentTable.ShipmentId*
- **Status:** *WHSShipmentTable.ShipmentStatus*
- **Shipment consolidation policy:** *WHSShipmentTable.ShipConsolidationPolicyName*
- **Work transaction type:** *WHSShipmentTable.WorkTransType*
- **Wave ID:** *WHSShipmentTable.WaveId*
- **Load ID:** *WHSShipmentTable.LoadId*
- **Shipment ID:** *WHSLoadLine.ShipmentId*
- **Load ID:** *WHSLoadLine.LoadId*

By default, when you create a policy, the set of mandatory fields is used as the consolidation fields. However, you can modify the list by using left arrow and right arrow buttons. (The process resembles the process for selecting methods in wave templates.)

The values that users select for these fields are used for all newly created shipments, or they're added to existing shipments during consolidation with those shipments. When two shipments have the same value for a field that is selected for consolidation of those shipments, the shipments are consolidated. The same principle applies for all subsequent consolidation fields that are selected. If the values differ, the second shipment is discarded and is selected for a new shipment. The automated consolidation process consists of creating all the unique combinations of values for the shipment consolidation fields and then assigning a shipment to the relevant combination.

Unselected fields are ignored during the consolidation process. If two shipments have different values for an unselected field, the field is cleared (that is, it's set to blank). If both shipments have the same value for an unselected field, the field is filled in.

The list of consolidation fields (that is, fields that are cleared if they have different values) is hard-coded. The list contains all fields that are initialized from a sales order or transfer order line when a new shipment is created. In other words, if a field isn't initialized from a sales order or transfer order line, it's ignored when new data is added to an existing shipment.

Release to warehouse page

- A field in the lower grid shows the applied consolidation policy.
- A button lets you manually select and/or override the consolidation policy.

Release to warehouse command on the Outbound load planning workbench page

- The logic is adjusted so that it applied consolidation policies.
- Shipments are consolidated only within a single load.

Consolidate shipments page

- The search for similar shipments (that is, candidates for consolidation) is changed so that it uses fields selected in the shipment consolidation policy.
- Fields that have different values in different shipments are set to blank.

Shipment consolidation workbench page

- You can open this page from the **Release to warehouse** menu in the **Warehouse management** module.

- The algorithm analyzes existing shipments that aren't yet shipped. It then proposes consolidation, based on fields selected in the consolidation policies.

Comparison of functionality

The following table summarizes how shipment consolidation works when you don't use shipment consolidation policies and when you do use them.

Expand table

Without shipment consolidation policies	**With shipment consolidation policies**
Not applicable	Sales or transfer shipments selected for consolidation must have the same consolidation policy as the shipment being created, or they must be assigned to an open shipment when the **Consolidate with existing shipments** option is turned on.
The *Release to warehouse* procedure doesn't search among existing shipments to find a shipment for consolidation. Only shipments created by a current instance of the *Release to warehouse* procedure creates are used to find a shipment for consolidation.	If the **Consolidate with existing shipments** option is turned on for a consolidation policy that is currently in use, the *Release to warehouse* procedure searches among existing shipments that were created based on the same consolidation policy to find a shipment for consolidation. Therefore, if you have two policies, a shipment being created based on policy 2 is never consolidated with a shipment that was created based on policy 1.
Not applicable	If a list of consolidation policy fields is empty, or if a policy can't be found, a new shipment is created for each sales order or transfer order line.
The following consolidation field defines the unique combination of values that is used to consolidate shipments for a *transfer line*. (All other fields are ignored.) • Order number (OrderNum)	The following consolidation fields define the unique combination of values that is used to consolidate shipments for a *transfer line*. (All other fields are ignored.) • Order number (OrderNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • ISO country code (CountryRegionISOCode) • Address (Address) • Site (InventSiteId) • Warehouse (InventLocationId) • Shipping carrier (CarrierCode) • Carrier service (CarrierServiceCode) • Mode of delivery (ModeCode) * • Carrier group (CarrierGroupCode) • Delivery terms (DlvTermId)

Without shipment consolidation policies	With shipment consolidation policies
	These fields are the only fields that are available and initialized when a new shipment is created. * Note: The *ModeCode* is the **Mode** assigned to the **Shipping carrier** selected for a transfer line (not the **Mode of delivery** selected for a transfer line). If you choose to include *Mode of delivery (ModeCode)* among your consolidation criteria, the system only consolidates transfer lines with the same **Mode** value provided **Shipping carrier**, **Carrier service**, and **Mode of delivery** are all defined for the line (regardless of their values). In addition, the system also consolidates all transfer lines where the **Mode** is blank.
The following consolidation fields define the unique combination of values that is used to consolidate shipments for a *sales line*. (All other fields are ignored.) • Order number (OrderNum) • Customer reference (CustomerRef) • Customer requisition (CustomerReq) • Delivery terms (DlvTermId)	The following consolidation fields define the unique combination of values that is used to consolidate shipments for a *sales line*. (All other fields are ignored.) • Order number (OrderNum) • Account number (AccountNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • ISO country code (CountryRegionISOCode) • Address (Address) • Site (InventSiteId) • Warehouse (InventLocationId) • Shipping carrier (CarrierCode) • Carrier service (CarrierServiceCode) • Mode of delivery (ModeCode) * • Carrier group (CarrierGroupCode) • Broker ID (BrokerCode) • Direction (LoadDirection) • Delivery terms (DlvTermId) • Customer reference (CustomerRef) • Customer requisition (CustomerReq) These fields are the only fields that are available and initialized when a new shipment is created. * Note: The *ModeCode* is the **Mode** assigned to the **Shipping carrier** selected for a sales line (not the **Mode of delivery** selected for a sales line). If you choose to include *Mode of delivery (ModeCode)* among your consolidation criteria, the system only consolidates sales lines with the same **Mode** value provided **Shipping carrier**, **Carrier service**, and **Mode of delivery** are all defined for the line (regardless of their values). In addition, the system also consolidates all sales lines where the **Mode** is blank.

Without shipment consolidation policies	With shipment consolidation policies
Not applicable	The following consolidation fields are mandatory for a *sales line* and can't be removed: • Account number (AccountNum) • Delivery recipient (DeliveryName) • Postal address (DeliveryPostalAddress) • Warehouse (InventLocationId) By default, these fields are assigned when a new policy is created. They can't be removed.
The *Release of loads to warehouse* procedure on the **Outbound load planning workbench** page uses its own separate code to create shipments and waves.	Shipment consolidation policies are applied to determine which fields should be evaluated for consolidation. Shipments are consolidated only within a single load.
You manually select **Consolidate shipments** on the **All shipments** page and then select a target "base" shipment. The filter suggests any existing shipments that have matching values for several key fields.	You manually select **Consolidate shipments** on the **All shipments** page and then select a target "base" shipment. The system suggests other existing shipments by matching the values of several key fields that are configured for the relevant shipment consolidation policies.
You can use the **Consolidate shipments** command on the **All shipments** page for only a single shipment.	The **Shipment consolidation workbench** page helps you find a set of shipments that aren't yet in a shipped state. These shipments are analyzed based on several key fields that are configured in your shipment consolidation policies. Any shipments where the values of these fields match are suggested for consolidation. You can manually maintain the consolidation by removing shipments from suggested consolidations and/or by adding shipments to them. Several types of errors can occur, but you can override some of them.
Design note: The *Automatic release of sales orders to warehouse* procedure splits sales lines into groups. Each group has its own unique **ReleaseToWarehouseId** value and is processed separately by the *Release to warehouse* procedure. This procedure creates new work regardless of the work break setup.	**Design note:** The *Automatic release of sales orders to warehouse* procedure assigns the same **ReleaseToWarehouseId** value to all sales lines that are being processed. All sales lines are processed by the *Release to warehouse* procedure at the same time. To ensure the earlier behavior, you must configure work break per shipment ID.

Configure shipment consolidation policies

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The shipment consolidation process that uses shipment consolidation policies automates shipment consolidation during automated and manual release to the warehouse. After you turn on this feature, you must configure your initial policies. If you don't configure any policies, each sales line generates a separate shipment that has a single load line.

The scenarios in this article show how to set up default and custom shipment consolidation policies.

Scenario: Configure custom shipment consolidation policies

This scenario provides an example that shows how to set up custom shipment consolidation policies and then test them by using demo data. Custom policies can support complex business requirements where shipment consolidation depends on several conditions. For each example policy later in this scenario, a short description of the business case is included. Set up these example policies in a sequence that ensures a pyramid-like evaluation of the queries. (In other words, the policies that have the most conditions are evaluated as having the highest priority.)

Make demo data available

This scenario references values and records included in the standard demo data that's provided for Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to *USMF* before you begin.

Prepare master data for this scenario

Before you can go through the exercises in this scenario, you must prepare the master data that is required to do the filtering, as described in the following subsections. These prerequisites also apply to the scenarios that are listed in the Example scenarios of how to use shipment consolidation policies section.

Create two new product filter codes

1. Go to **Warehouse management** > **Setup** > **Product filters** > **Product filters**, and add two product filters:

    - Product filter 1:
        - **Filter code:** *Flammable*
        - **Filter title:** *Code 4*
    - Product filter 2:
        - **Filter code:** *Explosive*
        - **Filter title:** *Code 4*

2. Go to **Product information management** > **Products** > **Released products**.
3. Open the product that has item number *M9200*. The product that you select must be enabled for advanced warehouse (WMS) processes, and this product is pre-enabled for WMS processes in the **USMF** demo data.
4. On the **Warehouse** FastTab, set the **Code 4** field to *Flammable*.
5. Close the page.
6. Open the product that has item number *M9201*. This product is also pre-enabled for WMS processes in the **USMF** demo data.
7. On the **Warehouse** FastTab, set the **Code 4** field to *Explosive*.
8. Close the page.

Create a new transportation mode of delivery

1. Go to **Transportation management** > **Setup** > **Carriers** > **Mode**.
2. Create a transportation mode for use in consolidation queries, and name it *Airways*.
3. Go to **Transportation management** > **Setup** > **Carriers** > **Shipping carriers**.

4. Create a carrier that has the following settings:

    - **Shipping carrier:** *Airways*
    - **Name:** *Airways*
    - **Mode:** *Airways*

5. On the **Services** FastTab for the new carrier, add a row that has the following settings:

    - **Carrier service:** *Air*
    - **Transportation method:** *Air*

6. On the Action Pane, select **Save**.

    > ⓘ **Note**
    >
    > When you save the new carrier, the **Mode of delivery** field for the new row in the **Services** grid is automatically set to *Airwa-Air*. When you use the *Airwa-Air* mode of delivery for a sales order, the *Airways* transportation mode is used for related shipments.

Create an order pool

1. Go to **Sales and marketing** > **Setup** > **Sales orders** > **Order pools**.

2. Create an order pool that you can use for the consolidation query. This order pool should have the following settings:

    - **Pool:** Enter an integer that isn't already used by any other pool.
    - **Name:** *ShipCons*

3. Go to **Sales and marketing** > **Customers** > **All customers**.

4. Open the customer that has account number *US-003*.

5. On the **Sales order defaults** FastTab, set the **Sales order pool** field to the order pool that you just created.

6. Close the page, and then repeat steps 4 and 5 for the customer that has account number *US-004*.

Create example policy 1

In this example, you create a *Customer+Mode* policy for the following business case:

- The policy queries for a specific customer account (*US-001*) and a specific mode of delivery (*Airwa-Air*).
- Consolidation with open shipments is turned off.
- Consolidation is done per order ID. (In other words, there are separate shipments per order, warehouse, and so on.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
    - **Policy name:** *CustomerMode*
    - **Policy description:** *Customer account and mode of delivery*
4. Leave the **Consolidate with open shipments** option set to *No*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, in the grid, find the row where the **Field** field is set to *Customer account*, and set the **Criteria** field for that row to *US-001*.
10. Select **Add** to add a row that has the following settings to the grid:
    - **Table:** *Order lines*
    - **Derived table:** *Order lines*
    - **Field:** *Mode of delivery*
    - **Criteria:** *Airwa-Air*
11. Select **OK** to close the dialog box.

> **Note**
>
> For this business case, order lines for customer *US-001* that use the *Airwa-Air* mode of delivery aren't consolidated across orders. Use this policy first in a sequence, in cases where shipments for all other modes of delivery are consolidated for this customer.

Create example policy 2

In this example, you create a *Hazardous goods* policy for the following business case:

- The policy queries for a specific filter code (*hazardous*) and a specific mode of delivery (*Airwa-Air*).
- Consolidation with open shipments is turned on.
- Consolidation is done across orders. (In other words, there are separate shipments per account, warehouse, and so on, but only within the item group that is specified in the query.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
    - **Policy name:** *Item type*
    - **Policy description:** *Consolidate the same type of item across orders*
4. Set the **Consolidate with open shipments** option to *Yes*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Joins** tab, expand and select **Tables** > **Load details** in the tree.

10. Select **Add table join**.
11. In the grid of relations that appears, find and select the row where the **Relation** field is set to *Warehouse item number (Item number)*, and then select **Select**.
12. On the **Range** tab, select **Add** to add a row that has the following settings to the grid:
    - **Table:** *Warehouse item number*
    - **Derived table:** *Warehouse item number*
    - **Field:** *Code 4*
    - **Criteria:** *Flammable*
13. Select **OK** to close the dialog box.

> ⓘ **Note**
>
> For this business case, all order lines where items have a specific filter code (that is, the filter code where the **Code 4** field is set to *Flammable*) consolidated with other items of the same type across orders. If there's an open shipment for the same account, warehouse, and group of items, the new lines are attached to it.

Create example policy 3

In this example, you create a *Customers' requirements* policy that you can use for the following business case:

- The policy queries for a specific customer account.
- Consolidation with open shipments is turned on.
- Consolidation is done across orders but is based on customer requisitions. (In other words, multiple orders are grouped into shipments, based on the same customer requisition number and warehouse.)

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:

- **Policy name:** *CustomerOrderNo*
- **Policy description:** *Consolidate lines based on customer PO*

4. Set the **Consolidate with open shipments** option to *Yes*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Customer requisition*.
7. Select the **Add** button to move the field to the **Selected fields** list.
8. In the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
9. Select the **Add** button to move the field to the **Selected fields** list.
10. On the Action Pane, select **Edit query**.
11. In the query editor dialog box, on the **Range** tab, find the row where the **Field** field is set to *Customer account*, and set the **Criteria** field for that row to *US-001*.
12. Select **OK** to close the dialog box.

> ⓘ **Note**
>
> For this business case, all order lines where sales orders have the same customer requisition number are consolidated into one shipment, regardless of the sales order number. (The customer requisition number is used as the customer's purchase order [PO] number.) If there's an open shipment for the same account, warehouse, and customer requisition, the new lines are attached to it. Use this policy if the customer sends additional order lines that have the same PO number several times during a day and wants all the lines to be grouped into one shipment. (In other words, there's one bill of lading and one packing slip.)

Create example policy 4

In this example, you create a *Customers allowing consolidation* policy for the following business case:

- The policy queries a specific order pool to identify customers who accept consolidated shipments.

- Consolidation with open shipments is turned off.
- You can override the rule on a sales order by selecting a different order pool.

Follow these steps to create the shipment consolidation policy for this business case.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
    - **Policy name:** *Order pool*
    - **Policy description:** *Consolidate across orders based on order pool*
4. Leave the **Consolidate with open shipments** option set to *No*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** list, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, select **Add** to add a row that has the following settings to the grid:
    - **Table:** *Sales orders*
    - **Derived table:** *Sales orders*
    - **Field:** *Pool*
    - **Criteria:** *ShipCons*
10. Select **OK** to close the dialog box.

> ⓘ **Note**
>
> For this business case, all order lines where sales orders belong to the same order pool consolidated into one shipment across sales orders for the same account, warehouse, and transportation mode of delivery. Instead of the order pool, you can use any other field to distinguish a group of customers and use the sales order header by default. Use this

approach if the customer, not the warehouse, drives the need for consolidation. (In the earlier consolidation logic, the warehouse drove the need for consolidation.)

Create example policy 5

In this example, you create a *Warehouses allowing consolidation* policy for the following business case:

- The policy queries a specific order pool to identify warehouses that can consolidate shipments.
- Consolidation with open shipments is turned off.

Typically, you can use default policies to address this business case. However, you can also manually create similar policies by following these steps.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. On the Action Pane, select **New** to create a policy that has the following settings:
    - **Policy name:** *Cross-order*
    - **Policy description:** *Cross-order consolidation for specific warehouses*
4. Leave the **Consolidate with open shipments** option set to *No*.
5. On the Action Pane, select **Save**.
6. On the **Consolidation fields** FastTab, in the **Remaining fields** field, select the row where the **Field name** field is set to *Mode of delivery*.
7. Select the **Add** button to move the field to the **Selected fields** list.
8. On the Action Pane, select **Edit query**.
9. In the query editor dialog box, on the **Range** tab, find the row where the **Field** field is set to *Warehouse*, and set the **Criteria** field for that row to *61, 63*.
10. Select **OK** to close the dialog box.

Set the order

After you create all your policies, establish the order in which they're applied. To use a pyramid-like approach, where the policies that have the most conditions are evaluated as having the highest priority, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. Set the **Policy type** field to *Sales orders*.
3. Select each policy that's listed in the left column, and then use the **Move up** and **Move down** buttons on the Action Pane to arrange the policies in the following order:
   a. CustomerMode
   b. Item type
   c. CustomerOrderNo
   d. Order pool
   e. Cross-order
   f. Default

Example scenarios of how to use shipment consolidation policies

The following scenarios illustrate how you can use the shipment consolidation policies that you created while reading this article. Each scenario walks you through a shipment consolidation process that uses shipment consolidation policies during automated or manual release to the warehouse:

- Scenario 1: Consolidate shipments when they are released to the warehouse by using Automatic release of sales orders
- Scenario 2: Consolidate shipments when the shipment consolidation policy is overridden from the Release to warehouse page
- Scenario 3: Consolidate shipments by releasing to warehouse from the outbound load planning workbench
- Scenario 4: Consolidate shipments by using the shipment consolidation workbench
- Scenario 5: Consolidate shipments manually by using the Consolidate shipments page

Consolidate shipments released to the warehouse using automatic release of sales orders

Article • 09/08/2022

This article presents a scenario where multiple orders are released to the warehouse in the same automated release-to-warehouse periodic procedure. The orders will automatically be consolidated into shipments, based on rules that are defined as shipment consolidation policies.

During the scenario, you will create sets of sales orders and release each set to the warehouse. You will then review the shipments that are created or updated during shipment consolidation, based on the configured policies.

Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in Configure shipment consolidation policies, and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable** > **Orders** > **All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales order 1-1

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales order 1-2

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales order 1-3

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *10*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Add a second order line that has the following settings:

    - **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)

- **Quantity:** *1.00*
- **Mode of delivery:** *Airwa-Air*

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-002*

2. Add an order line that has the following settings:

    - **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
    - **Quantity:** *1.00*

3. Add a second order line that has the following settings:

    - **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

Create order set 3

Sales order 3-1

1. Create a sales order that has the following settings:

    - **Customer account:** *US-002*

2. Add an order line that has the following settings:

    - **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
    - **Quantity:** *1.00*

3. Add a second order line that has the following settings:

    - **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

Note

This order is identical to the two orders that you created for order set 2. However, it's listed as its own order set because you will release it separately later in this scenario.

Create order set 4

Sales order 4-1

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *1*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Create order set 5

Sales orders 5-1 and 5-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *2*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales order 5-3

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *1*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)

- **Quantity:** *1.00*

Create order set 6

Sales orders 6-1 and 6-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-003*
    - **Customer requisition:** *2*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales orders 6-3 and 6-4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-004*
    - **Customer requisition:** *1*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales orders 6-5 and 6-6

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Pool:** *ShipCons*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Sales orders 6-7 and 6-8

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Pool:** Leave this field blank.

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

Automatic release of sales orders to the warehouse

For each set of sales orders that you created earlier, you will complete a procedure for automatic release to the warehouse. In each case, you will work through the basic release-to-warehouse procedure that is provided here.

Basic release-to-warehouse procedure

For each set of sales orders that you created earlier, you will complete the three procedures that are outlined in the following subsections.

Update the wave template that will be used during release

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Set the **Wave template type** field to *Shipping*.
3. Find and select the wave template that is associated with the warehouse that you used in the order sets that you created for this scenario. For example, if you used warehouse *24*, select the **24 Shipping Default** wave template. If you used warehouse *61*, select the **61 Shipping** wave template.
4. On the Action Pane, select **Edit**.
5. Set the **Process wave at release to warehouse** option to *No*.

Release to the warehouse

1. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of sales orders**.

2. Set the **Quantity to release** field to *All*.

3. On the **Records to include** FastTab, select **Filter** to open the query dialog box.
4. On the **Range** tab, select **Add** to add a row that has the following settings to the grid:
    - **Table:** *Sales order*
    - **Derived table:** *Sales order*
    - **Field:** *Sales order*
    - **Criteria:** Enter a comma-separated list of the sales order numbers from the desired order set.
5. Select **OK** to save your query.
6. Select **OK** to start the *Automatic release to warehouse* procedure.

Review the shipment that is created or updated

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Release sales orders from order set 1

Follow the basic release-to-warehouse procedure to release the sales orders from order set 1.

When you've finished, you should see that two shipments were created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.
- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Release sales orders from order set 2

Follow the basic release-to-warehouse procedure to release the sales orders from order set 2.

When you've finished, you should see that three shipments were created:

- The first shipment contains *Flammable* items.

- Each of the other two shipments contains one line that has the *Explosive* item.

Release sales orders from order set 3

Follow the basic release-to-warehouse procedure to release the sales orders from order set 3.

When you've finished, you should see that the following actions occurred:

- One existing shipment (the shipment that was created when order set 2 was released to the warehouse) was updated. A line that has the *Flammable* item was added.
- One new shipment was created that contains the *Explosive* item.

Release sales orders from order set 4

Follow the basic release-to-warehouse procedure to release the sales orders from order set 4.

When you've finished, you should see that one existing shipment (where the **Customer requisition** field is set to *1*) was updated. One new line was added to it.

Release sales orders from order set 5

Follow the basic release-to-warehouse procedure to release the sales orders from order set 5.

When you've finished, you should see that the following actions occurred:

- One existing shipment (where the **Customer requisition** field is set to *1*) was updated. A line from sales order 5-3 (where the **Customer requisition** field is set to *1*) was added to it.
- One new shipment was created, where lines from sales orders 5-1 and 5-2 are grouped into one shipment.

Release sales orders from order set 6

Follow the basic release-to-warehouse procedure to release the sales orders from order set 6.

When you've finished, you should see that four shipments were created:

- Lines from two orders for customer *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 6-5 and 6-6 for customer *US-007* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 6-7 and 6-8 for customer *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

Consolidate shipments when the shipment consolidation policy is overridden

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article presents a scenario where one or more sales lines must be manually released to the warehouse from the **Release sales orders to warehouse** page, and the system-defined shipment consolidation policy must be overridden before the release. An override of the shipment consolidation policy might be required if, for example, an order that isn't usually consolidated with open shipments must be consolidated with open shipments.

During the scenario, you will create a set of sales orders and then override the default shipment consolidation policy before you release the orders to the warehouse.

Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in Configure shipment consolidation policies, and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

1. Go to **Accounts receivable** > **Orders** > **All sales orders**, and create three identical sales orders that have the following settings:

    - **Customer account:** *US-002*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the sales orders from the Release sales orders to warehouse page

Follow these steps to override the shipment consolidation policy during the release to the warehouse.

1. Go to **Warehouse management** > **Release to warehouse** > **Release sales orders to warehouse**.
2. In the upper pane, select the first sales order that you created for this scenario.
3. Select **Add** to add the line to the release to the warehouse. Notice that the *Default* shipment consolidation policy is applied in the bottom pane.
4. In the bottom pane, select **Select new shipment consolidation policy**.
5. Select a policy that allows for consolidation with other open shipments of the same policy. For example, select the *CustomerOrderNo* policy.
6. Select **Release to warehouse**.
7. Select the second and third sales orders that you created for this scenario.
8. Select **Add** to add the lines to the release to the warehouse. Notice that the *Default* policy is applied in the bottom pane.
9. Select the second line, and then, in the **Select new shipment consolidation policy** field, select the *CustomerOrderNo* policy.
10. Select **Release to warehouse** for both lines.

Verify the shipments

Two shipments should have been created:

- The first shipment contains two lines and was created by using the *CustomerOrderNo* shipment consolidation policy.

- The second shipment contains one line and was created by using the *Default* shipment consolidation policy.

Follow these steps to review the shipments that were created.

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select the required shipment.
3. In the **Shipment consolidation policy** field, review the consolidation policy that was used when the shipment was created.

Consolidate shipments by releasing to warehouse from the outbound load planning workbench

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article presents a scenario where multiple orders are released to the warehouse in the same load and are then automatically consolidated into shipments.

Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in Configure shipment consolidation policies, and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable** > **Orders** > **All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales order 1-1

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-2

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-3

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *10*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

    - **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

5. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-002*

2. Add an order line that has the following settings:

    - **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

    - **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

5. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 3

Sales orders 3-1 and 3-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *1*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 3-3 and 3-4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *2*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create order set 4

Sales orders 4-1 and 4-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-003*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-3 and 4-4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-004*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-5 and 4-6

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Pool:** *ShipCons*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-7 and 4-8

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Pool:** Leave this field blank.

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Use the Outbound load planning workbench to create loads and release them to the warehouse

Follow these steps to create a load for each order set that you created for this scenario and then release it to the warehouse.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.
2. On the **Sales lines** tab, find and select all the sales order lines from one of the order sets that you created for this scenario.
3. On the Action Pane, on the **Supply and demand** tab, select **Add** > **To new load** to add the selected order lines to a new Load.
4. In the **Load template assignment** dialog box, in the **Load template ID** field, select a load template, such as *Stnd Load Template*.
5. Select **OK** to close the dialog box.
6. In the **Loads** section, find and select the load that you just created.
7. Select **Release** > **Release to warehouse** to release the selected load to the warehouse.
8. Repeat this procedure for the other three order sets that you created for this scenario.

Verify the shipments

The following procedure lets you verify the shipments that have been created or updated as a result of shipment consolidation. Use it to review each order set that you created for this scenario, and then review the subsections that follow to make sure that you've obtained the expected results.

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Release order set 1 in one load

Two shipments should have been created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.

- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Release order set 2 in one load

Three shipments should have been created:

- The first shipment contains the *Flammable* items.
- Each of the other two shipments contains one line that has the *Explosive* item.

Release order set 3 in one load

Two shipments should have been created:

- The first shipment contains order lines from the sales order where the **Customer requisition** field is set to *1*.
- The second shipment contains order lines from sales order where the **Customer requisition** field is set to *2*.

Release order set 4 in one load

Four shipments should have been created:

- Lines from two orders for customer account *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer account *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-5 and 4-6 for customer account *US-007* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-7 and 4-8 for customer account *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

Consolidate shipments by using the shipment consolidation workbench

10/03/2025

This article presents a scenario where multiple orders are released to the warehouse and then consolidated into shipments later by using the shipment consolidation workbench.

Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to *USMF* before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in Configure shipment consolidation policies, and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable** > **Orders** > **All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create order set 1

Sales orders 1-1 and 1-2

1. Create two identical sales orders that have the following settings:

- **Customer account:** *US-001*
- **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales order 1-3

1. Create a sales order that has the following settings:

    - **Customer account:** *US-001*
    - **Mode of delivery:** *10*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

    - **Item number:** *A0002* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

5. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 2

Sales orders 2-1 and 2-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-002*
    - **Mode of delivery:** *Airwa-Air*

2. Add an order line that has the following settings:

- **Item number:** *M9200* (an item where the **Code 4** filter is set to *Flammable*)
- **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

4. Add a second order line that has the following settings:

    - **Item number:** *M9201* (an item where the **Code 4** filter is set to *Explosive*)
    - **Quantity:** *1.00*
    - **Mode of delivery:** *Airwa-Air*

5. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the second order line.

Create order set 3

Sales orders 3-1 and 3-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *1*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 3-3 and 3-4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-001*
    - **Customer requisition:** *2*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create order set 4

Sales orders 4-1 and 4-2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-003*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-3 and 4-4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-004*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-5 and 4-6

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Site:** *6*
    - **Warehouse:** *61*
    - **Pool:** *ShipCons*

2. Add an order line that has the following settings:

- **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
- **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Sales orders 4-7 and 4-8

1. Create two identical sales orders that have the following settings:

   - **Customer account:** *US-007*
   - **Site:** *6*
   - **Warehouse:** *61*
   - **Pool:** Leave this field blank.

2. Add an order line that has the following settings:

   - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
   - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the orders to the warehouse

Follow these steps to release each sales order that you created for this scenario to the warehouse.

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Find and select the sales order to release.
3. On the Action Pane, on the **Warehouse** tab, select **Actions** > **Release to warehouse** to release the selected sales order.
4. Repeat this procedure for every other sales order that you created for this scenario.

Consolidate the shipments by using the shipment consolidation workbench

1. Go to **Warehouse management** > **Release to warehouse** > **Shipment consolidation workbench**.

2. On the Action Pane, select **Edit query**.

3. In the query editor dialog box, on the **Range** tab, select **Add** to add a row that has the following settings to the grid:

    - **Table:** *Sales orders*
    - **Field:** *Sales order*
    - **Criteria:** Enter a comma-separated list of the sales order numbers for each order set that you created for this scenario.

4. Select **OK** to save your query and close the dialog box.

5. On the Action Pane, select **Consolidate shipments**.

6. Select all the shipments, and then, on the Action Pane, select **Consolidate**.

Verify the shipments

The following procedure lets you verify the shipments that have been created or updated as a result of shipment consolidation. Use it to review each order set that you created for this scenario, and then review the subsections that follow to make sure that you've obtained the expected results.

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select the required shipment.
3. If a consolidation policy was used when the shipment was created or updated, you should see it in the **Shipment consolidation policy** field.

Related shipments for order set 1

Two shipments should have been created:

- The first shipment contains three lines and was created by using the *CustomerMode* shipment consolidation policy.
- The second shipment, which doesn't use the *Airways* transportation mode of delivery, was created by using the *CustomerOrderNo* shipment consolidation policy.

Related shipments for order set 2

Three shipments should have been created:

- The first shipment contains *Flammable* items.
- Each of the other two shipments contains one line that has the *Explosive* item.

Related shipments for order set 3

Two shipments should have been created:

- The first shipment contains order lines from the sales order where the **Customer requisition** field is set to *1*.
- The second shipment contains order lines from sales order where the **Customer requisition** field is set to *2*.

Related shipments for order set 4

Four shipments should have been created:

- Lines from two orders for customer *US-003* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from two orders for customer *US-004* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-5 and 4-6 for customer *US-007* were grouped into one shipment by using the *Order pool* shipment consolidation policy.
- Lines from sales orders 4-7 and 4-8 for customer *US-007* were grouped into one shipment by using the *CrossOrder* shipment consolidation policy.

Consolidate shipments manually by using the Consolidate shipments page

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article presents a scenario where multiple orders are released to the warehouse and then consolidated later by using the **Consolidate shipments** page.

Make demo data available

The scenario in this article references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Set up shipment consolidation policies and product filters

The scenario that is described here assumes that you've already turned on the feature, done the exercises in Configure shipment consolidation policies, and created the policies and other records that are described there. Be sure to do those exercises before you continue with this scenario.

Create the sales orders for this scenario

Start by creating a collection of sales orders that you can work with. You must work with a warehouse that is enabled for advanced warehouse (WMS) processes. Unless a different warehouse is explicitly mentioned, that same warehouse must be used for each of the following sets of orders.

Go to **Accounts receivable** > **Orders** > **All sales orders**, and create a collection of sales orders that have the settings that are described in the following subsections.

Create sales orders 1 and 2

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Pool:** *ShipCons*

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Create sales orders 3 and 4

1. Create two identical sales orders that have the following settings:

    - **Customer account:** *US-007*
    - **Pool:** Leave this field blank.

2. Add an order line that has the following settings:

    - **Item number:** *A0001* (an item that no **Code 4** filter is assigned to)
    - **Quantity:** *1.00*

3. Select **Inventory** > **Reservation**, and then, on the Action Pane, select **Reserve lot** to reserve the order line.

Release the orders to the warehouse

Follow these steps to release each sales order that you created for this scenario to the warehouse.

1. Go to **Accounts receivable** > **Orders** > **All sales orders**.
2. Find and select the sales order to release.
3. On the Action Pane, on the **Warehouse** tab, select **Actions** > **Release to warehouse** to release the selected sales order.
4. Repeat this procedure for every other sales order that you created for this scenario.

Consolidate shipments

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select a shipment that was created when sales order 1 was released to the warehouse. (Its **Shipment consolidation policy** field should be set to *Order pool*.)
3. On the Action Pane, on the **Shipments** tab, select **Shipments** > **Consolidate shipments**.
4. Verify the shipments that are suggested for consolidation. Only one shipment that has the same policy should be suggested for consolidation.
5. Close the **Shipment consolidation** page.
6. Find and select a shipment that was created when sales order 3 was released to the warehouse. (Its **Shipment consolidation policy** field should be set to *Default*.)
7. On the Action Pane, on the **Shipments** tab, select **Shipments** > **Consolidate shipments**.
8. Verify that no shipments are suggested for consolidation.
9. Select **Show filters**.
10. In the **Filters** pane, remove the **Order number** filter, and then select **Apply**.
11. Verify the shipments that are suggested for consolidation. Only one shipment that has the same policy should be suggested for consolidation.

Wave creation and processing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to create, process, and release a wave to create picking work for a load, shipment, production order, or kanban order. You can create waves for the following types of orders:

- **Sales orders**, **Transfer orders**, and **Outbound shipment orders** – Use shipping waves to include lines from sales orders, transfer orders, and outbound shipment orders. When an order is released to the warehouse, you can include its order lines in the wave.
- **Production orders** – Use production waves to include lines from the bill of materials (BOM) for a product.
- **Kanban orders** – Kanban waves include picking list lines from kanban orders.

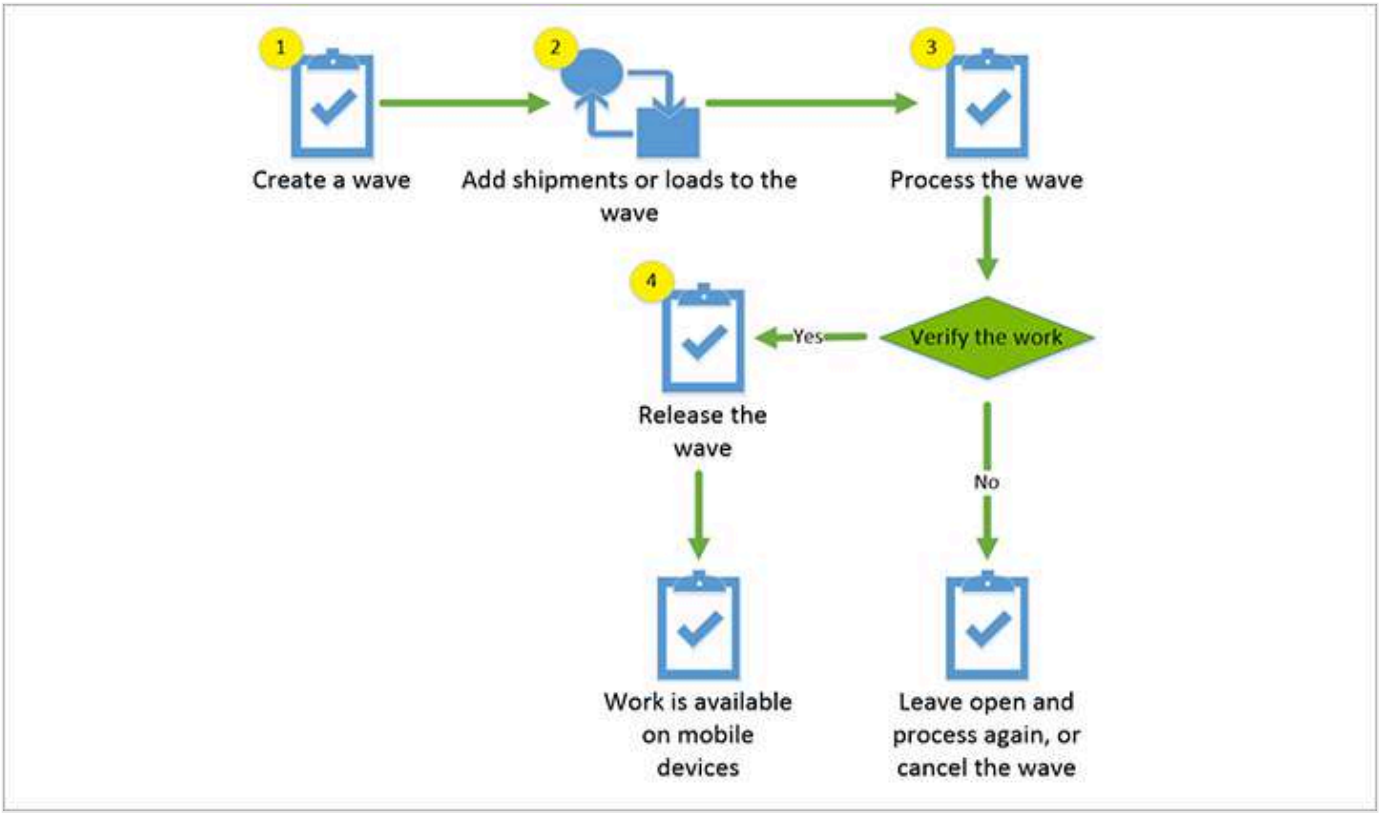
For sales orders and kanban orders, inventory must be reserved before the order is released to the warehouse. Otherwise, the items or allocation lines can't be processed in a wave. However, production orders are slightly more flexible. For production orders, you can choose either of the following options:

- Require that all materials are reserved before an order can be released to the warehouse.
- Allow production orders to be released to the warehouse even though all materials can't be reserved. If you select this option, you must manually repeat the release to warehouse process when the additional materials become available. For example, this option is useful if you have the materials that you need to start a production, and can wait until the additional materials become available.

You can specify which of these production order options to use by default by using the **Requirement for material reservation** field on the **Production control parameters** page. However, you can change the setting for each specific production order as needed. For more information, see Warehouse parameters for wave processing.

Create and process a wave

The following diagram shows the flow for how shipping waves are created, processed, and released. The numbers correspond to the sections later in this article.



Prerequisites

Before you start, a wave template must be available for the type of wave you want to create (shipping, production, or kanban). The wave template establishes many settings for how the wave is generated and processed, including which steps must be done manually and which steps are done automatically. Learn more in Wave templates.

Create a wave

Automatically create waves based on warehouse and order type

To automatically create waves, set up Wave templates that apply to each relevant order type and warehouse. Make sure each template has the **Automate wave creation** option set to *Yes*.

Manually create waves

To manually create a wave, follow these steps:

1. Make sure that the relevant Wave templates aren't set to automatically create a wave for the warehouse and order types where you want to create waves manually.

2. Depending on the type of wave you want to create, go to one of the following locations:

    - Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**. On the Action Pane, select **Wave**.
    - Go to **Warehouse management** > **Outbound waves** > **Production waves** > **All production waves**. On the Action Pane, select **Production wave**.
    - Go to **Warehouse management** > **Outbound waves** > **Kanban waves** > **All kanban waves**. On the Action Pane, select **Create wave**.

3. In the **Description** field, enter a short description of the wave. This description should indicate what you're processing in the wave.

4. In the **Wave template name** field, select the wave template for the type of wave to create. The wave template contains the wave methods that perform actions such as creating work for the wave. For example, the wave template for shipping waves can contain methods for creating loads, allocating lines to waves, replenishment, and creating picking work for the wave.

5. If you want to use wave attributes as additional query criteria for the wave, select the attributes in the **Wave attributes** fields.

Specify what to include in a wave

After you create a wave, add content to it.

> ⓘ **Note**
>
> If needed, you can add lines to a wave even after it’s processed as long as it’s not released.

Automatically specify what to include in a wave

To create waves automatically, set up Wave templates that apply for each relevant order type and warehouse. Make sure each template has the **Automate wave creation** option set to *Yes*. Alternatively, your template could automatically assign lines to any qualifying open wave if the **Assign to open waves** option is set to *Yes*.

Manually specify what to include in a wave

When a wave is created but isn't yet released, you can manually specify what to include in it. To add lines to a wave manually:

1. Depending on the type of wave to add lines to, go to one of the following locations:

    - Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**. On the Action Pane, select **Wave**.
    - Go to **Warehouse management** > **Outbound waves** > **Production waves** > **All production waves**. On the Action Pane, select **Production wave**.
    - Go to **Warehouse management** > **Outbound waves** > **Kanban waves** > **All kanban waves**. On the Action Pane, select **Create wave**.

2. Select the wave. On the Action Pane, select one of the following options:

    - **Maintain shipments**
    - **Maintain productions**
    - **Maintain kanban job picking lists**

3. In the upper part of the window, select the line to add to the wave, and then select **Add to wave**. The line moves to the **Wave lines** FastTab.

    Repeat this step for each line to add. To add all lines, select **Add all**.

    > **Tip**
    >
    > For shipment waves, you can quickly find a specific order by selecting a custom filter in the **Wave filter code** field. Wave filter codes contain query criteria for shipments created in the **Wave filters** form. This field isn't available for production waves or kanban waves. A green check mark in the **On wave** column indicates that the shipment is added to the wave.

Process the wave to create the picking work

After you create a wave and add all required lines, you're ready to process it and create the corresponding picking work.

Automatically process a wave

To automatically process a wave, set up the relevant Wave templates with the automatic processing options you need.

Manually process a wave

You can process a wave only when the **Wave status** is *Created*. After you process a wave, the **Wave status** changes to *Held*.

To manually process a wave that contains all required content, follow these steps:

1. Depending on the type of wave to process, do one of the following steps:

    - Select **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**. On the Action Pane, select **Wave**.
    - Select **Warehouse management** > **Outbound waves** > **Production waves** > **All production waves**. On the Action Pane, select **Production wave**.
    - Select **Warehouse management** > **Outbound waves** > **Kanban waves** > **All kanban waves**. On the Action Pane, select **Create wave**.

2. Select the wave to process. On the Action Pane, select **Process**.

Release the wave to the warehouse to start picking and packing

You must process a wave before you can release it. When you release the wave, the picking work is available in the warehouse. You can cancel a wave after it is released, and add more lines, but you can't change the lines.

Automatically release a wave

To automatically process a wave, set up the relevant Wave templates with the automatic processing options you need.

Manually release a wave

To release a wave manually, follow these steps:

1. Depending on the type of wave to release, do one of the following:

    - Select **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**. On the Action Pane, select **Wave**.
    - Select **Warehouse management** > **Outbound waves** > **Production waves** > **All production waves**. On the Action Pane, select **Production wave**.
    - Select **Warehouse management** > **Outbound waves** > **Kanban waves** > **All kanban waves**. On the Action Pane, select **Create wave**.

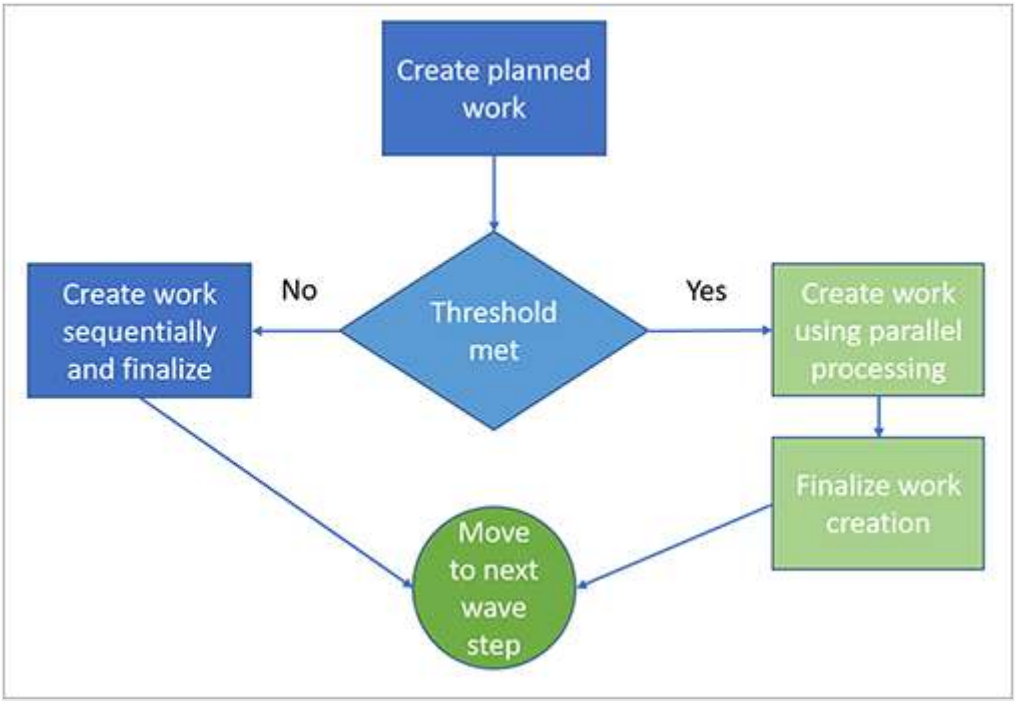
2. Select the wave to release. On the Action Pane, select **Release wave**.

Containerize a wave

Automated containerization creates containers and the picking work for shipments when a wave is processed. For details about how to set it up, see Containerization.

Work with the scheduled work creation

The following flowchart shows how planned work is created during wave processing.



Planned work

The **Planned work details** page (**Warehouse management** > **Work** > **Planned work details**) shows information about the planned work, which is initially created during wave processing. The following **Process status** values are available:

- **Queued** - The planned work is waiting to be used to create work.
- **Completed** - The planned work is used to create work.
- **Failed** – The wave processing failed. The planned work can be in a **Failed** state with or without related actual work. When the actual work creation process fails, the actual work remains in status *Cancelled*.

Batch job for the work creation process

To view the batch jobs for processing waves, select **Batch jobs** on the Action Pane on the **All waves** page.

From here, you can view all the batch task details for each of the batch job IDs.

Cancel a wave

If needed, you can cancel a wave that you processed. To cancel a wave, and the picking work that's created, follow these steps:

1. Depending on the type of wave to cancel, go to one of the following locations:

    - **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
    - **Warehouse management** > **Outbound waves** > **Production waves** > **All production waves**.
    - **Warehouse management** > **Outbound waves** > **Kanban waves** > **All kanban waves**.

2. Select the wave to cancel. On the Action Pane, on the **Work** tab, select **Cancel**.

Review wave batch job details

Use the **Wave batch job details** page to inspect the batch jobs and related tasks associated with any wave. This is especially useful for troubleshooting a wave that has failed. Without this feature, only administrators will typically have access to batch job details. The **Wave batch job details** page can be made available to non-admin users and provides a read-only view of batch jobs and related tasks.

Use the Wave batch job details page

The **Wave batch job details** page combines batch jobs and batch job tasks. You can investigate all the wave steps without needing to navigate back and forth between a single batch job and the batch tasks list. The page also provides access to the batch log and, if you have the required permissions, provides a link to the **Batch jobs** page.

To open this page, select a wave on any of several different wave pages and then select **Wave batch job details** from the Action Pane.

Review load validation and error messages

During wave processing, the system validates and displays the status for each load line in the wave. If no warnings occur, it continues to the next wave step. If warnings do occur, it shows the

following error after it finishes validating the entire wave:

> Found invalid load lines in wave. Please remove the invalid load lines.

You can review the final status of each load line in the wave and correct all warnings before trying again. This process lets you address all the warnings at once before reprocessing the wave. (In previous releases, the system stopped processing the wave after the first warning, so you could only fix warnings one at a time.)

The way the system displays your wave processing status messages depends on how you set the **Create wave processing history log** option on the **Warehouse management parameters** page.

- When **Create wave processing history log** is set to *No*, the load line status messages are shown in the Action center.
- When **Create wave processing history log** is set to *Yes*, the load line status messages are shown on the **Wave processing history log** page. To view the log, go to **Warehouse management** > **Outbound waves** > **Wave processing history log**.

Reprint and void wave labels

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to manage labels that are generated by wave processing. (For a detailed description and configuration instructions, see Configure wave label printing.)

You can reprint wave labels at any time. For example, you might have to print a single label if an existing label was lost or damaged. Alternatively, a warehouse worker or supervisor might have to reprint a whole roll of labels if the number and/or composition of a whole series of wave labels has changed (for example, because of inventory shortage or other reasons). Often, even if only the number of cartons has changed, the whole roll must be reprinted to keep the total number accurate in the "Carton X of Y" section of each label.

The reprint wave labels feature supports the following functionality:

- Reprint labels from both the warehousing app and the rich client.
- Void labels and simultaneously reprint them. (The ability to void labels is embedded in short pick scenarios, for example.)
- Clean up the wave label history.

This article presents a collection of scenarios that show, through examples, how to work with the reprint wave labels feature.

> **Important**
>
> To work through the scenarios that are presented in this article, you must first turn on and configure the relevant wave printing features, as described in Configure wave label printing. Several of the scenarios in this article also require that you first work through the scenarios in that article to generate prerequisite sample data.

Scenario 1: Reprint labels from the web client

You can view and reprint wave labels from the following pages. On the Action Pane of each page, on the **Shipments** tab, in the **Related information** group, select **Wave labels**.

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

To reprint a wave label from the web client, follow these steps.

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave to reprint labels from.
3. On the Action Pane, on the **Wave** tab, in the **Print** group, select **Wave labels**.
4. Follow one or both of the following steps:
    - To reprint the label, select a printer in the **Printer name** field. (Leave this field blank if you just want to update the wave label details, without reprinting the label.)
    - To update the label, select the **Update wave label details** check box. (Leave this check box cleared if you just want to reprint the previous label.)

    > ⓘ **Note**
    >
    > Every time that a wave label is printed or reprinted, its data is converted through the appropriate wave label layout, and all placeholders are replaced with actual values. The resulting string is stored as a record in the wave label history. If the **Update wave label details** check box is cleared, the stored Zebra Programming Language (ZPL) data is used when a label is reprinted. If the **Update wave label details** check box is selected, a new string is generated. The existing wave labels are also recalculated, and any excess labels (for example, if the related work lines have been canceled or modified) are marked as **Voided** and aren't reprinted.

5. Select **OK** to confirm your selection.

Scenario 2: Reprint labels from the warehousing app

This scenario typically applies if a label roll has been lost or damaged. It provides an example that shows how to set up mobile device menu items that will let workers reprint single and multiple labels. It then shows how to use those new menu items while you're working on a mobile device.

Set up the required menu items and menu for the mobile device

Before workers can reprint labels from a mobile device, you must set up menu items to provide this functionality and then add those items to the warehousing app menu.

Create new mobile device menu items

Follow these steps to create a new collection of menu items for reprinting labels from the warehousing app.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Create a menu item, and set the following values for it:

    - **Menu item name:** *Reprint single wave label*
    - **Title:** *Reprint single wave label*
    - **Mode:** *Indirect*
    - **Activity code:** *Reprint single wave label*

3. Create a second menu item, and set the following values for it:

    - **Menu item name:** *Reprint labels (Item)*
    - **Title:** *Reprint wave labels (Item)*
    - **Mode:** *Indirect*
    - **Activity code:** *Reprint multiple wave labels*
    - **Display work list grouping filter:** *Yes*
    - **System grouping field:** *ShipmentID*
    - **System grouping label:** *Shipment ID*
    - **Print mode:** *Product*

4. On the Action Pane, select **Field list** to open a page where you can select the fields that will be shown to help workers identify the correct label roll.

5. You can show up to seven fields. Use the drop-down lists to select the field that is shown in each available position. Leave any fields that you don't require blank.

    Here is an example:

    - **Display field:** *LabelItemId*
    - **Display field 2:** *LabelItemName*
    - **Display field 3:** *InventQty*
    - **Display field 4:** *LabelUnitId*

6. Close the page.

7. Create a third menu item, and set the following values for it:

    - **Menu item name:** *Reprint labels (Enum)*
    - **Title:** *Reprint wave labels (Enum)*
    - **Mode:** *Indirect**
    - **Activity code:** *Reprint multiple wave labels*
    - **Display work list grouping filter:** *Yes*
    - **System grouping field:** *ShipmentID*
    - **System grouping label:** *Shipment ID*
    - **Print mode:** *Enumeration*

8. On the Action Pane, select **Field list**, and then use the drop-down lists to select the fields that will be shown to help workers identify the correct label roll (for example, *LabelItemId*, *LabelItemName*, *InventQty*, *LabelUnitId*, and *NumberOfLabels*).

9. Close the page.

10. Create a fourth menu item, and set the following values for it:

    - **Menu item name:** *Reprint labels (by last)*
    - **Title:** *Reprint wave labels (by last)*
    - **Mode:** *Indirect*
    - **Activity code:** *Reprint multiple wave labels*
    - **Display work list grouping filter:** *Yes*
    - **System grouping field:** *ShipmentID*
    - **System grouping label:** *Shipment ID*
    - **Print mode:** *Last good wave label ID*

11. On the Action Pane, select **Field list**, and then use the drop-down lists to select the fields that will be shown to help workers identify the correct label roll (for example, *LabelItemId*, *LabelItemName*, *InventQty*, *LabelUnitId*, and *NumberOfLabels*).

12. Close the page.

Set up the mobile device menu

Follow these steps to add your new menu items to the warehousing app menu.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Select an existing **Outbound** menu.
3. In the list on the left, find the reprint menu items that you just created, and then use the right arrow button to add them to the list on the right.

4. Close the page.

Use cases

The use cases that are provided here give examples that show how to use the various mobile device menu items that you set up to enable workers to reprint wave labels.

Before you work through these use cases, the following prerequisites must be in place:

- Demo data must be installed, and you must select the **USMF** legal entity.
- Wave label printing must be configured, and some labels must be generated, as described in Configure wave label printing.

Use case 2.1: A single wave label is scratched and must be reprinted

1. Sign in to the warehousing app as a user who access to warehouse *62*. (In the standard demo data, you can sign in by using the user ID *62* and the password *1*.)
2. Go to **Outbound** > **Reprint single wave label**.
3. Enter or scan the wave label ID.
4. Select the printer to reprint on.
5. Select **OK** to confirm the action.

Use case 2.2: Several labels for boxes of the same item were damaged and must be reprinted. Each label has a product bar code, but no enumeration or SSCC number

1. Sign in to the warehousing app as a user who has access to warehouse *62*. (In the standard demo data, you can sign in by using the user ID *62* and the password *1*.)
2. Go to **Outbound** > **Reprint labels (Item)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Scan the product bar code from an existing label to confirm that the correct line has been selected.
6. Enter the number of labels to reprint.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Use case 2.3: Several labels for boxes weren't printed because of a printer jam. Because the labels have enumeration, you can define the carton range to reprint

1. Sign in to the warehousing app as a user who has access to warehouse *62*. (In the standard demo data, you can sign in by using the user ID *62* and the password *1*.)
2. Go to **Outbound** > **Reprint labels (Enum)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Enter the first carton to reprint a label for.
6. Enter the last carton to reprint a label for. Alternatively, leave this field blank to reprint labels for all cartons after the specified first carton.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Use case 2.4: Several labels for boxes weren't printed because of a printer jam. The last good label has a wave label ID that is printed as a bar code

1. Sign in to the warehousing app as a user who has access to warehouse *62*. (In the standard demo data, you can sign in by using the user ID *62* and the password *1*.)
2. Go to **Outbound** > **Reprint labels (by last)**.
3. Enter or scan the shipment ID.
4. Select the tile that has the correct label roll to reprint from.
5. Enter or scan the wave label ID of the last good wave label. The app identifies the next label in the sequence as the first carton that a label will be reprinted for.
6. Enter the last carton to reprint a label for. Alternatively, leave this field blank to reprint labels for all cartons after the specified first carton.
7. Select the printer to reprint on.
8. Select **OK** to confirm the action.

Scenario 3: Short pick and reprint

Before you work through this scenario, the following prerequisites must be in place:

- Demo data must be installed, and you must select the **USMF** legal entity.
- Wave label printing must be configured, and some labels must be generated, as described in Configure wave label printing.

Set up work exceptions

Work exceptions control the behavior of short picking. Follow these steps to set up a work exception.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work exceptions**.

2. Create a record that has the following settings:

    - **Work exception code:** *Short pick and print*
    - **Exception type:** *Short pick*
    - **Suggest wave labels reprint:** *Yes*

Void and reprint after a short pick

1. Sign in to the warehousing app as a user who has access to warehouse *62*. (In the standard demo data, you can sign in by using the user ID *62* and the password *1*.)
2. Open a work processing flow for the sales order work that was created when wave labels were originally printed.
3. Select **Short pick**.
4. Select the work exception code that you created for this scenario.
5. If you selected the correct exception, the **Void and reprint** check box should be available. Select this box and confirm. When confirmed, the label roll sequence identified by the **Label build ID** field is recalculated based on the changed work line quantity. It's then reprinted on the specified printer.

Work policies

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up the system and the Warehouse Management mobile app to support work policies. Use this functionality to quickly register inventory without creating putaway work when you receive purchase or transfer orders, or when you complete manufacturing processes. This article provides general information. For detailed information related to license plate receiving, see License plate receiving via the Warehouse Management mobile app.

A work policy controls whether warehouse work is created when a manufactured item is reported as finished, or when goods are received by using the Warehouse Management mobile app. Set up each work policy by defining the conditions where it applies: the work order types and processes, the inventory location, and (optionally) the products. For example, a purchase order for product *A0001* must be received in location *RECV* in warehouse *24*. Later, the product is consumed in another process at location *RECV*. In this case, set up a work policy to prevent putaway work from being created when a worker reports product *A0001* as received in location *RECV*.

> **Note**
>
> - For a work policy to be active, you must define at least one location for it on the **Inventory locations** FastTab of the **Work policies** page.
> - You can't specify the same location for multiple work policies.
> - The **Print label** option for mobile device menu items doesn't print a license plate label unless work was created.

The Work policies page

To set up work policies, go to **Warehouse management** > **Setup** > **Work** > **Work policies**. Then, on each FastTab, set the fields as described in the following subsections.

The Work order types FastTab

On the **Work order types** FastTab, add all the work order types and the related work processes that the work policy applies to. The following work order types and related work processes are supported for work policies.

Expand table

Work order type	Work process
Raw material picking	All related processes
Co-product and by-product put away	All related processes
Finished goods putaway	All related processes
Transfer receipt	License plate receiving (and putaway)
Purchase orders	• License plate receiving (and putaway) • Load item receiving (and putaway) • Purchase order line receiving (and putaway) • Purchase order item receiving (and putaway)
Inbound shipment order	• License plate receiving (and putaway) • Load item receiving (and putaway) • Inbound shipment order line receiving (and putaway) • Inbound shipment order item receiving (and putaway)

To set up a work policy so that it applies to several work processes of the same work order type, add a separate line for each work process to the grid.

For each line in the grid, set the **Work creation method** field to one of the following values:

- **Never** – The work policy prevents warehouse work from being created for the selected work order type and related work process.
- **Cross docking** – The work policy creates cross-docking work by using the policy that you select in the **Cross docking policy name** field.

The Inventory locations FastTab

On the **Inventory locations** FastTab, add all the locations where this work policy should be applied. If you don't associate any location with a work policy, the work policy isn't applied to any process.

You can't specify the same location for multiple work policies.

You can use a warehouse location assigned to a location profile where the **Use license plate tracking** option is turned off. In this case, workers directly register the on-hand inventory.

The Products FastTab

On the **Products** tab, set the **Product selection** field to control which products the policy applies to:

- **All** – The policy applies to all products.
- **Selected** – The policy applies only to products listed in the grid. Use the toolbar on the **Products** FastTab to add products to the grid or remove them from the grid.

Default and custom "to" locations

Mobile device menu items that use the following work creation processes provide the **Use default data** option. This option lets you assign a custom "to" location to one or more menu items. (This option was already available for some other types of menu items.)

- License plate receiving (and putaway)
- Load item receiving (and putaway)
- Purchase order line receiving (and putaway)
- Purchase order item receiving (and putaway)
- Inbound shipment order line receiving (and putaway)
- Inbound shipment order item receiving (and putaway)

The **To location** setting for a menu item overrides the default receiving location for the warehouse, for all orders that are processed by using that menu item.

To set up a mobile device menu item to support receiving at a custom location, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select or create a menu item that uses one of the work creation processes that are listed earlier in this section.

3. On the **General** FastTab, set the **Use default data** option to **Yes**.

4. On the Action Pane, select **Default data**.

5. On the **Default data** page, set the following values:

    - **Default data field:** Set this field to *To location*.
    - **Warehouse:** Select the destination warehouse to use with this menu item.
    - **Location:** This field lists all the location IDs that are available for the selected warehouse. However, the setting of this field doesn't actually have any effect. Therefore, you can leave it blank. Nevertheless, you can use the list to confirm the ID that you must enter in the **Hardcoded value** field.
    - **Hardcoded value:** Enter the location ID for the receiving location that applies to this menu item.

> **Tip**
>
> You can apply a work policy only if the relevant work policy setup lists all the receiving locations. This requirement applies regardless of whether you're using the default warehouse receiving location or a custom "to" location.

Example scenario: Warehouse receiving

All products that are received by the *Purchase order item receiving (and putaway)* process must be registered in location *FL-001*, and they must be available in warehouse *24*. However, work should not be created. Products that are received by any other process (that is, by using other mobile device menu items) should be registered at the default warehouse receiving location (*RECV*), and work should be created as usual. (This scenario doesn't show the default receiving setup.)

This scenario requires the following elements:

- A work policy for the *Purchase order item receiving (and putaway)* process in location *FL-001*, for all products
- A mobile device menu item that has default data, and that sets the **To location** field to *FL-001*

Prerequisites

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a work policy

1. Go to **Warehouse management** > **Setup** > **Work** > **Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No purchase item putaway work*.
4. Select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
    - **Work order type:** *Purchase orders*
    - **Work process:** *Purchase order item receiving (and putaway)*
    - **Work creation method:** *Never*
    - **Cross docking policy name:** Leave this field blank.
6. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:
    - **Warehouse:** *24*
    - **Location:** *FL-001*
7. On the **Products** FastTab, set the **Product selection** field to *All*.
8. Select **Save**.

Set up a mobile device menu item to change the receiving location

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the left pane, select the existing **Purchase receive** menu item.
3. On the **General** FastTab, set the **Use default data** option to *Yes*.
4. Select **Save**.

5. On the Action Pane, select **Default data**.

6. On the **Default data** page, on the Action Pane, select **New** to add a row to the grid, and then set the following values for the new row:

    - **Default data field:** *To location*
    - **Warehouse:** *24*
    - **Location:** Leave this field blank.
    - **Hardcoded value:** *FL-001*

7. Select **Save**.

Receive a purchase order without creating work

The example in this section shows how to receive a purchase order item, but without creating work, at a location that differs from the default receiving location set up for the warehouse. This example uses the work policy and mobile device item that you created earlier in this scenario.

Create a purchase order

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.

2. Select **New**.

3. In **Create purchase order**, set the following values:

    - **Vendor account:** *US-101*
    - **Site:** *2*
    - **Warehouse:** *24*

4. Select **OK** to close the dialog box and open the new purchase order.

5. On the **Purchase order lines** FastTab, set the following values for the empty row:

    - **Item number:** *A0001*
    - **Quantity:** *1*

6. Select **Save**.

7. Make a note of the purchase order number.

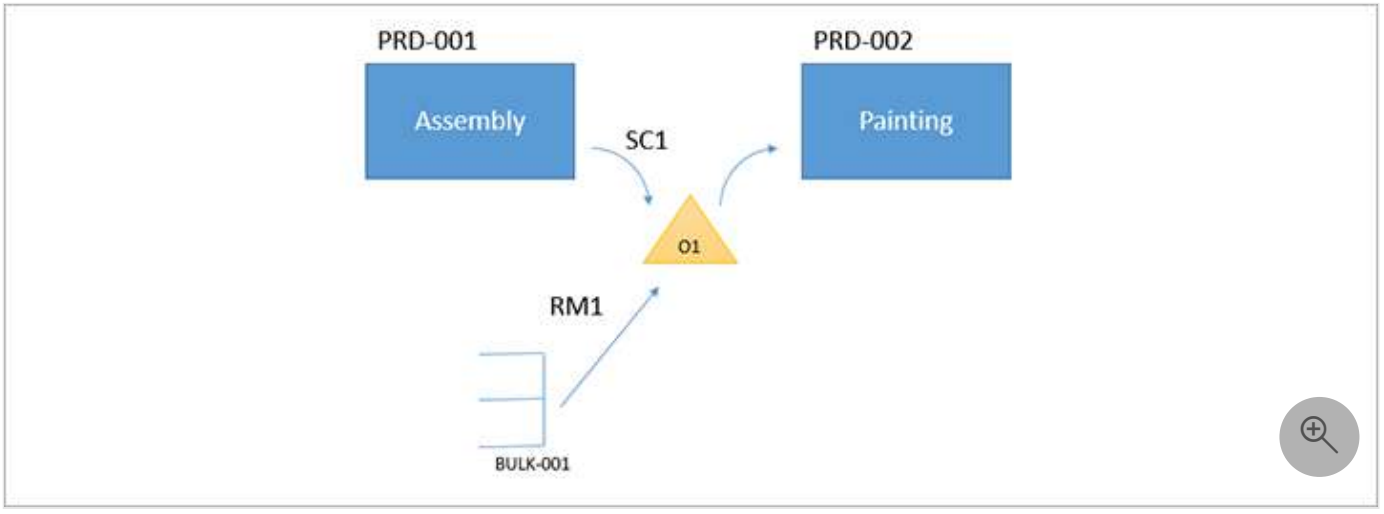
Receive a purchase order

1. On the mobile device, sign in to warehouse *24* by using *24* as the user ID and *1* as the password.
2. Select **Inbound**.
3. Select **Purchase receive**. The **Location** field should be set to *FL-001*.
4. Enter the purchase order number for the purchase order that you created in the previous procedure.
5. In the **Item number** field, enter *A0001*.
6. Select **OK**.
7. In the **Quantity** field, enter *1*.
8. Select **OK**.

The purchase order is now received, but no work is associated with it. The on-hand inventory is updated, and a quantity of *1* of item *A0001* is now available at location *FL-001*.

Example scenario: Manufacturing

In the following example, there are two production orders, *PRD-001* and *PRD-002*. Production order *PRD-001* has an operation named *Assembly*, where product *SC1* is reported as finished to location *001*. Production order *PRD-002* has an operation named *Painting* and consumes product *SC1* from location *001*. Production order *PRD-002* also consumes raw material *RM1* from location *001*. Raw material *RM1* is stored in warehouse location *BULK-001* and is picked to location *001* by warehouse work for raw material picking. The picking work is generated when production *PRD-002* is released.



When you plan to configure a warehouse work policy for this scenario, consider the following points:

- You don't need warehouse work for putaway of finished goods when you report product *SC1* as finished from production order *PRD-001* to location *001*. The reason is that the

Painting operation for production order *PRD-002* consumes product *SC1* at the same location.
- You need warehouse work for raw material picking to move raw material *RM1* from warehouse location *BULK-001* to location *001*.

Here is an example of a work policy that you can set up, based on these considerations:

- **Work policy name:** *No putaway work*
- **Work order types:** *Finished goods put away* and *Co-product and by-product put away*
- **Inventory locations:** Warehouse *51* and location *001*
- **Products:** *SC1*

The following example scenario provides step-by-step instructions for setting up the warehouse work policy for this scenario.

Example scenario: Report as finished to a location that isn't license plate–controlled

This scenario shows an example where a production order is reported as finished to a location that isn't license plate–controlled.

This scenario uses the standard demo data. Therefore, if you want to work through it by using the values that are provided here, you must work on a system where demo data is installed. Additionally, you must select the **USMF** legal entity.

Set up a warehouse work policy

Warehouse processes don't always include warehouse work. By defining a work policy, you can prevent the creation of work for raw material picking and putaway of finished goods for a set of products at specific locations.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work policies**.
2. Select **New**.
3. In the **Work policy name** field, enter *No putaway work*.
4. On the Action Pane, select **Save**.
5. On the **Work order types** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

- **Work order type:** *Finished goods put away*
- **Work process:** *All related work processes*
- **Work creation method:** *Never*
- **Cross docking policy name:** Leave this field blank.

6. Select **Add** again to add a second row to the grid, and then set the following values for the new row:

   - **Work order type:** *Co-product and by-product put away*
   - **Work process:** *All related work processes*
   - **Work creation method:** *Never*
   - **Cross docking policy name:** Leave this field blank.

7. On the **Inventory locations** FastTab, select **Add** to add a row to the grid, and then set the following values for the new row:

   - **Warehouse:** *51*
   - **Location:** *001*

8. On the **Products** FastTab, set the **Product selection** field to *Selected*.

9. On the **Products** FastTab, select **Add** to add a row to the grid.

10. In the new row, set the **Item number** field to *L0101*.

11. On the Action Pane, select **Save**.

Set up an output location

1. Go to **Organization administration** > **Resources** > **Resource groups**.

2. In the left pane, select resource group **5102**.

3. On the **General** FastTab, set the following values:

   - **Output warehouse:** *51*
   - **Output location:** *001*

4. On the Action Pane, select **Save**.

> ⓘ **Note**

Location *001* isn't a license plate–controlled location. You can set up an output location that isn't license plate–controlled only if an applicable work policy exists for the location.

Create a production order and report it as finished

1. Go to **Production control** > **Production orders** > **All production orders**.
2. On the Action Pane, select **New production order**.
3. In the **Create production order** dialog box, set the **Item number** field to *L0101*.
4. Select **Create** to create the order and close the dialog box.

   A new production order is added to the grid on the **All production orders** page.

   Keep the new production order selected.
5. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**.
6. In the **Estimate** dialog box, read the estimate, and then select **OK** to close the dialog box.
7. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**.
8. In the **Start** dialog box, on the **General** tab, set the **Automatic BOM consumption** field to *Never*.
9. Select **OK** to save your setting and close the dialog box.
10. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Report as finished**.
11. In the **Report as finished** dialog box, on the **General** tab, set the **Accept error** option to *Yes*.
12. Select **OK** to save your setting and close the dialog box.
13. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**.

When the production order is reported as finished, no work is generated for putaway. This behavior occurs because a work policy is defined that prevents work from being generated when product *L0101* is reported as finished to location *001*.

More information

For more information about mobile device menu items, see Set up mobile devices for warehouse work.

For more information about license plate receiving and work policies, see License plate receiving via the Warehouse Management mobile app.

For more information about inbound load management, see Warehouse handling of inbound loads for purchase orders.

Movement of inventory with associated work in Warehouse management

Article • 04/01/2021

Using movement of inventory, you can decide which warehouse workers are allowed to move reserved inventory. This provides a flexibility in regulated warehouses where you can decide to not allow a worker to choose a new pick location for pick work that is already created. It also allows a warehouse manager to control which capabilities some less experienced workers should have.

The flexibility to manage the daily operations of warehouse workers can be useful in scenarios such as these:

Scenario 1

A company has a relatively small receiving area, and it's congested with pallets and boxes awaiting put away. A large shipment is expected on the current day, so the receiving clerk decides to clear up the receiving area by moving some of the pallets to a secondary inbound staging area.

Scenario 2

An experienced warehouse worker notices an opportunity in a warehouse to consolidate items in one location instead of having them divided across three nearby locations with little quantity on each. The worker wants to consolidate the quantity by moving items from each of these locations into the same location and onto the same license plate.

Scenario 3

A pallet is awaiting shipment in a staging location, such as STAGE01, which is near BAYDOOR01. However, due to a change of plans the truck is scheduled to arrive at BAYDOOR04. The shipping clerk is aware of this and needs to ensure that the truck does not have to wait to be loaded from STAGE01. The shipping clerk decides to move the items in that shipment from STAGE01 to STAGE04, which is closer to the new destination.

Current limitations

The work reservations that you can move are limited to Sales order, Transfer order issue, Transfer order receipt, Purchase order, and Replenishment work.

Moving items is restricted to prevent splitting of work lines. This means that if you have a work line for 100 pcs of item A from location Loc1, you won't be able to move only 30 pcs of item A from there to another location. This would lead to a split of the existing work line to 30 and 70, because the locations are now different.

For staging scenarios, where the license plate you move the goods from or the license plate you move the goods to, are set as a Target LP for a work order, only movement of the entire LP is allowed, so as not to break up the Target LP.

Only the ad hoc movement is currently supported. That means that you will not be able to move reserved inventory through the movement by template mobile device menu items.

Set up permission to move reserved inventory for individual workers

For the worker who is allowed to move reserved inventory, select the **Allow movement of inventory with work associated** check box under **Warehouse management** > **Setup** > **Worker**.

Create a work class

Article • 09/29/2021

This procedure shows you how to set up a work class. Work classes are used to direct and/or limit the type of work order lines that a warehouse worker can process on a mobile device. The lines that a worker can process are determined from the work classes on the mobile device menu items that the warehouse worker has access to and the work class that's specified on the work lines. Work classes can also be used to validate the put location for a work order line. You can run this procedure in demo data company USMF or on your own data. This procedure is intended for the warehouse manager.

1. Go to Warehouse management > Setup > Work > Work classes.
2. Click New.
3. In the Work class ID field, type a value.
4. In the Description field, type a value.
5. In the Work order type field, select an option.
6. Click New.
7. In the Location type field, type a value.

    - If you select a location type, this sets a restriction on where items can be put after they've been picked. This setting is used when a location directive tries to resolve the location, or if a warehouse worker manually provides the location for the mobile device menu item.

8. Close the page.

Manage warehouse workers

This article describes how to use the Warehouse Management mobile app to help control and monitor the work that employees carry out in your warehouses.

When you use the functionality in Warehouse management, all warehouse worker operations are referred to as *work*. You record work such as picking, moving, and counting on-hand inventory by using mobile devices. Before a warehouse worker can perform work, they must be associated with a worker in Human resources. Each **Worker** account can have multiple warehouse work users associated with it. Those work users can work in different warehouses and can have different levels of access to the various mobile device menus. You can think of the warehouse work users as multiple logons for the selected worker. Each work user has a default warehouse, and specific workflows are exposed by the menu items available to that work user.

To create a new work user, on the **Workers** page, on the **General** tab, in the **Warehouses** section, select **Worker**. You must specify a user ID, a user name, a default warehouse, and a menu name. This menu is loaded when the user signs in to the Warehouse Mobile Device Portal, and it lets you define which menu items the user has access to.

As part of the setup for each work user, you can also define specific process workflows. For example, you can use the **Is a cycle count supervisor** field to specify whether the user can process adjustments to cycle counting discrepancies during a counting operation, or whether these adjustments must first be reviewed by another person.

Defining labor standards

The **Labor standards** page lets you define the calculation methods that the system uses to calculate the estimated time that a particular type of work should require. You can set this definition on a generic level or on a specific level. For example, you can define the time that should be required to process a sales order pick per weight for a specific unit definition when a specific picking process is used. At the same time, you can record the time, based on another calculation method, for the put operation of the on-hand inventory that is picked.

To enable the labor standards that you defined, select the **Allow labor standards** option for each warehouse where labor standards are used.

Monitoring and controlling warehouse work

Use the **All work** page to monitor and maintain all work that is planned, in progress, and completed. From this page, you can update various processes, such as warehouse work user assignments and work priority. You can also drill down into the details that are related to the work header and work lines to gain an understanding of the expected or completed work processes.

If you enable the **Labor standards** option, you can see the calculated estimated time for the work. When the work is processed, the actual time is shown for each work operation. In this way, you can compare the estimated time calculations to the actual time.

You can use the estimated time in the rules for automatically splitting work during work creation. In this way, you can load balance work, based on the expected time to complete the tasks.

Analyzing the time used to process work items can help drive improvements in the warehouse workers' efficiency. The following reports are available to help with this analysis:

- **Labor by user** – This report shows worker productivity, based on actual times against expected times.
- **Labor by work transaction type** – You can use this report to investigate inefficiencies in specific warehouse processes. For example, you notice that picks for transfer orders are taking longer this week than in previous weeks. You can then use this information for further investigation.

Deferred processing of warehouse work

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the functionality that makes deferred processing of put operations for warehouse work available in Dynamics 365 Supply Chain Management.

The deferred processing functionality lets warehouse workers continue to do other work while the put operation is processed in the background. Deferred processing is useful when many work lines must be processed and the worker can let that work be processed asynchronously. It's also useful when the server can have ad-hoc or unplanned increases in processing time, and the increased processing time might affect the user's productivity.

Background processing is achieved by using the SysOperation framework. Learn more in SysOperation Framework Overview.

Configuring the work processing policies

To use deferred processing, you must configure and use a work processing policy.

Policies are configured on the **Work processing policies** page. The following table describes the fields on that page.

Expand table

Field	Description
Work processing policy name	The name of the work processing policy.
Work order type	The work order type that the policy is applied to.
Operation	The operation that is processed by using the policy.
Work processing method	The method that is used to process the work line. If the method is set to **Immediate**, the behavior resembles the behavior when no work processing policies are used to process

Field	Description
	the line. If the method is set to **Deferred**, deferred processing that uses the batch framework is used.
Deferred processing threshold	A value of **0** (zero) indicates that there is no threshold. In this case, deferred processing is used if it can be used. If the specific threshold calculation is below the threshold, the Immediate method is used. Otherwise, the Deferred method is used if it can be used. For sales and transfer-related work, the threshold is calculated as the number of associated source load lines that are being processed for the work. For replenishment work, the threshold is calculated as the number of work lines that are being replenished by the work. By setting a threshold of, for example, **5** for sales, smaller works that have fewer than five initial source load lines won't use deferred processing, but larger works will use it. The threshold has an effect only if the work processing method is set to **Deferred**.
Deferred processing batch group	The batch group that is used for processing.

For deferred put-processing, the following work order types are supported: sales order, transfer order issue, replenishment, and packed container picking. (Deferred put-processing for packed container picking work requires Supply Chain Management version 10.0.45 or higher.)

Assigning the work creation policy

The work creation policy can be assigned in the warehouse management parameters. It can also be assigned at the level of individual warehouses. If the policy is assigned to a warehouse, it's applied only to work that is created for that warehouse. If no policy is assigned at the warehouse level, the policy from the warehouse management parameters is applied.

Viewing the deferred put processing tasks

You can view deferred put processing tasks on the **Deferred put processing tasks** page.

By default, the **Completed** tasks are shown.

Expand table

Field	Description
Status	The status of the task.
Batch job status	The status of the related batch job. If the batch job has been processed, the batch history contains the log and information from the batch job.

Here is an explanation of the possible statuses:

- **Awaiting** – The related batch job is awaiting processing on the batch server.
- **Failed** – The processing failed. The task can be reprocessed by using the **Process deferred put** action, or it can be canceled by using the **Cancel deferred put** action.
- **Completed** – The job was completed.

Impact on closed work dates

When deferred put processing is used, the closed work date is set as the created date/time of the deferred put processing tasks. The closed work date is used because it's the best estimate for when the put operation was completed.

Reprocessing a failed task

You can reprocess a failed task by selecting it on the page and then selecting **Process deferred put**. Reprocessing corresponds to a situation where the user completes the put-away from the mobile device as if it was set for immediate processing.

Canceling failed tasks

Only failed tasks can be canceled. When you cancel a task, you can assign it to a new user. Alternatively, the task can remain assigned to the user who processed the work. Cancellation corresponds to a situation where the work is brought back to the mobile device as if the last pick step was just completed and the work must be put away. However, the user will be able to determine that the work is "different," because it will have only a put-away step, and the location will correspond to the location that the first user who processed the work had as a final put location.

When a task is canceled, the work is no longer blocked by the deferred put processing blocking reason. It can be reprocessed by using the mobile device.

The task record is deleted when the task canceled.

Configuring the mobile device menu to skip the deferred processing policy

You can configure the mobile device menu item so that the deferred processing policy isn't used. The work is then processed as it is when no deferred processing policy is used. This functionality lets a supervisor use a specific menu item where deferred put isn't used. To

configure it, set the **Deferred put processing policy** field to **Override settings and process put synchronously**.

Restrictions when the deferred put processing isn't applied

There are several scenarios where deferred put processing isn't applied even though the policy is configured. Here are some examples:

- Manual work completion is used.
- The work is completed by using auto-completion.
- Audit templates are used.

Monitoring the deferred processing tasks from the Outbound work monitoring workspace

The **Outbound work monitoring** workspace has two tiles that help you monitor deferred put processing tasks:

- **Failed deferred put processing tasks** – This tile shows the number of failed tasks. If there are failed tasks, the warehouse manager must either reprocess them or cancel them, because they won't be reprocessed automatically.
- **Awaiting deferred put processing tasks** – This tile shows the number of tasks that have been in the **Awaiting** status for more than 10 minutes. If the tile shows a number, it might indicate that an issue occurred during batch processing. You can manually process the **Awaiting** tasks. If the batch job for a task is processed later, it will just fail, because it has already been processed. There will be no impact.

Deleting completed tasks

You can delete deferred put processing tasks that have been completed by selecting them and deleting them on the page.

- Deferred processing of manual inventory movement operation

Last updated on 07/16/2025

Deferred processing of manual inventory movement

This article describes how to use deferred processing of manual inventory movement in Microsoft Dynamics 365 Supply Chain Management.

Deferred processing lets warehouse workers continue to do other work while a put operation is processed in the background. Deferred processing is useful when the server can have occasional or unplanned increases in processing time, and the increased processing time might affect worker productivity. The *Inventory movement* work type has now been added to the set of work types that this feature supports.

Background processing is achieved by using the Process warehouse app events feature.

Configure the work processing policies

To use deferred processing, you must set up and use a work processing policy. For deferred put processing, the Deferred processing of warehouse work feature supports the following work types: *Sales order*, *Transfer order issue*, and *Replenishment*. The *Deferred processing of manual inventory movement operation* features adds a new work type: *Inventory movement*.

To set up a work processing policy, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Work** > **Work processing policies**.
2. Either select an existing policy in the list, or create a new policy by selecting **New** on the Action Pane. The header of every policy has the following fields:
    - **Work processing policy name** – The name of the work processing policy.
    - **Description** – A description of the work processing policy.
3. On the **Processing rules** FastTab, set up the collection of rules that the policy will apply. Use the buttons on the toolbar to add or remove rules as you require. For each rule, set the following fields:
    - **Work order type** – Select the work type that the policy applies to.
    - **Operation** – Select the operation that the policy is used to process. If you selected *Inventory movement* in the **Work order type** field, you don't have to set this field, because both pick operations and put operations are processed as a single event.

- **Work processing method** – Select the method that is used to process the work line. If you select *Immediate*, the behavior resembles the behavior when no work processing policies are used to process the line. If you select *Deferred*, the system will apply deferred processing that uses the batch framework.
- **Deferred processing threshold** – If you set this field to *0* (zero), there is no threshold. In this case, the *Deferred* processing method is used if possible. If the specific threshold calculation is below the threshold, the *Immediate* method is used. Otherwise, the *Deferred* method is used if possible. For sales and transfer-related work, the threshold is calculated as the number of associated source load lines that are being processed for the work. For replenishment work, the threshold is calculated as the number of work lines that are being replenished by the work. By setting a threshold of, for example, *5* for sales, you ensure that smaller works that have fewer than five initial source load lines won't use deferred processing, but larger works will use it. The threshold has an effect only if the **Work processing method** field is set to *Deferred*.
- **Deferred processing batch group** – Specify the batch group that is used for processing. If you selected *Inventory movement* in the **Work order type** field, you don't have to set this field, because the batch group is selected in the **Process warehouse app events** dialog box.

Assign the work creation policy

For details about how to assign a work creation policy, see Deferred processing of warehouse work.

Set up a batch job to process warehouse app events

To use the *Deferred processing of manual inventory movement operation* process, set up a scheduled batch job.

1. Go to **Warehouse management** > **Periodic tasks** > **Process warehouse app events**.
2. In the **Process warehouse app events** dialog box, on the **Run in background** FastTab, set the **Batch processing** option to *Yes*.
3. Select **Recurrence**, and set up a run schedule that meets the requirements of your business.
4. Select **OK** in each dialog box.

Inquire about the warehouse app events

You can view the event queue and event messages that the warehouse app generates by going to **Warehouse management** > **Enquiries and reports** > **Mobile device logs** > **Warehouse app events**.

The *Inventory movement* event messages will have a status of *Queued* when they are first created. This status indicates that the **Process warehouse app events** batch job will pick up the event messages and process them. When the status is updated to *Completed*, all the related events are deleted from the queue.

All the *Inventory movement* events are accumulated under one collection per event type and warehouse.

The batch job will process the warehouse app events according to the recurrence that is set up in the **Process warehouse app events** dialog box. Therefore, until a message is processed, you can find the warehouse ID by looking in the **Identifier** field.

The details of the message contain the details of the movement (for example, the "from" and "to" locations).

Learn more in Warehouse app event processing.

Configure the mobile device menu to skip the deferred processing policy

For details about how to configure the mobile device menu to skip the deferred processing policy, see Deferred processing of warehouse work.

Impact on closed work dates

For details about the impact on closed work dates, see Deferred processing of warehouse work.

Cross-docking from production orders to outbound docks

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to manage the process of cross-docking material that is being reported as finished from a production line to an outbound transportation dock.

Introduction

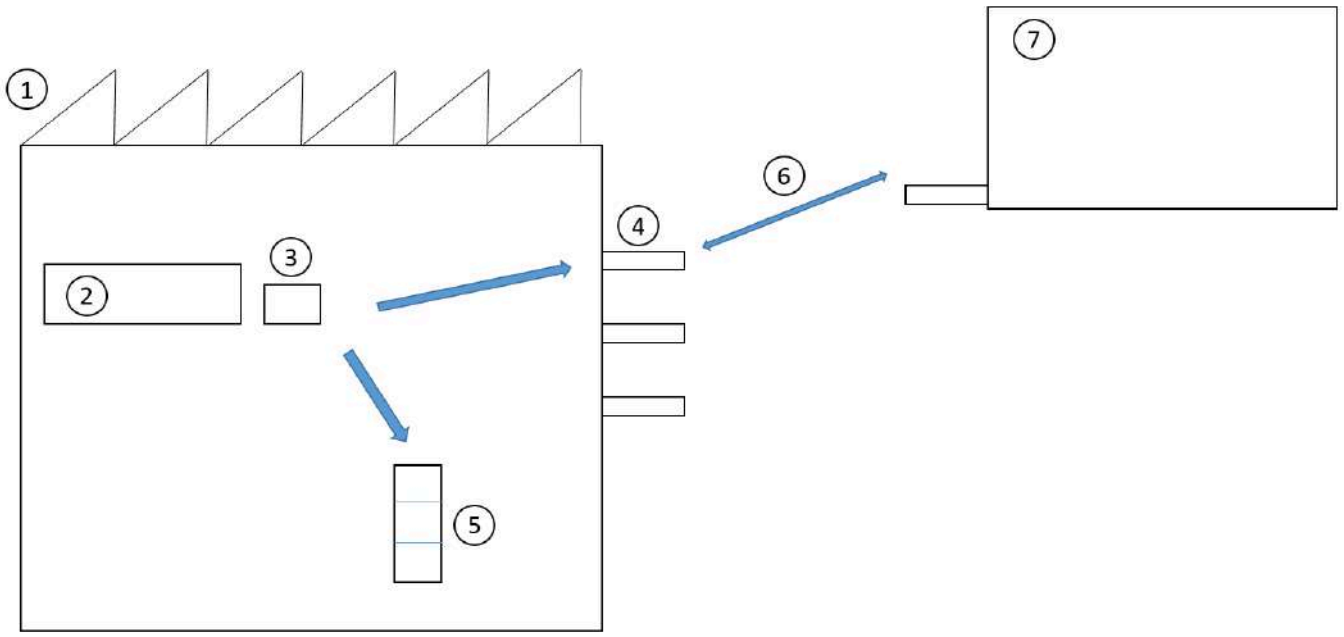
Cross-docking from production to an outbound location is relevant for manufacturers who produce high volume and ideally want to ship the finished products as soon as they are reported as finished from the production lines. The purpose is to ship the products to distribution centers that are physically located close to the customer demand, rather than build up inventory at the manufacturing site.

In case there is no immediate demand for a product, it must be put away to warehouse locations on the manufacturing site. This process is also known as *opportunistic cross-docking*, which indicates that if there is a demand for shipping the product, then this opportunity should be used instead of putting the product away for internal storage.

The following example shows three variations of a flow that starts at the end of the production line (2).

A product is reported as finished to the production output location (3) and a fork lift driver will pick up the pallet at this location (3).

- If there is a planned activity (6) for transferring the product from manufacturing (1) to a distribution center (7), then the truck driver will be directed by the system to put the pallet by a bay-door location (4).
- If a trailer is already assigned to the bay door, the truck driver will be directed to load the product directly to the trailer.
- If there is no planned activity for transferring the product, the fork lift driver will be directed to put the product away to a location in the internal warehouse (5).



Configure cross-docking

You configure the cross-docking process in **work policies**. A work policy includes a work order type, location, and product. In the following example, cross-docking is configured for product X and location Y.

Work order types

- Work order type: Finished goods put way
- Work creation method: Cross docking
- Cross docking policy name: Transfer orders

Inventory locations

- Warehouse: 51
- Location: Y

Products

- Item number: X

Currently, cross-docking can be configured for only two work order types:

- Finished goods put away
- Co-product and by-product put away

In the **cross-docking policy**, you define which document types are applicable for cross-docking. Currently, the only document type that is supported is **Transfer orders**. The following example shows the configuration of a cross-docking policy.

Cross-docking policy name: Transfer order

- Sequence number: 10
  - Work order type: Transfer issue
- Cross docking demand requires location: False
- Cross docking strategy: Date and time

Sequence number

The **sequence number** indicates the priority of the document type. Currently, **Transfer issue** is the only type that is supported. Therefore, the sequence number will become relevant only when more work order types are supported.

Cross-docking policy

The cross-docking policy also sets the policy for the prioritization of transfer order demand. For example, if multiple transfer orders exist for the same product, the scheduled date and time that are set on the load, and associated with the transfer order, determine the prioritization between the orders. The scheduled date and time can be set directly on the load, or they can be set on an **appointment schedule** that is associated with the load. The prioritization is determined by the cross-docking strategy. Currently, there is only one strategy: **Date and time**.

Cross-docking demand requires location

In the cross-docking policy, you can set up a criterion to require that transfer orders have an assigned location in order to be eligible for cross-docking. This criterion is set in the **Cross docking demand requires location** field. The location on the appointment schedule that is associated with the load is used as the final location for the goods that are being cross-docked. The final location for the goods that are being cross-docked is determined by the location directive for **Transfer issue** for the **Put** work order type. You might find it useful to set the **Cross docking demand requires location** field in a scenario where the finished goods should be cross-docked only if a trailer is assigned to a bay door. In this scenario, the goods are moved directly from the production line into the trailer. When a trailer is assigned to the bay door, a user will assign the location to the appointment schedule and will therefore make the location applicable for cross-docking. The following sections walk you through two examples.

Scenario 1 – Cross-docking from production to transfer orders

After a product is reported as finished at the production line it is transferred to a bay-door location where it is loaded to a truck and transferred to a distribution center. Use company USMF.

1. Enable a new number sequence for cross-docking. Go to the **Number sequences** page, and select the **Generate** button. A wizard will guide you through the process.
2. Create a cross-docking policy. Go to the **Cross docking policy** page, and create a new policy that is named **Cross docking to transfer order**. Note that the only work order type that you can select is **Transfer issue**, and the only cross-docking strategy that is available is **Date and time**.
3. Create a work policy. Go to the **Work policies** page, and create a new work policy that is named **Cross Dock L0101**.
4. Set up loads so that they are created automatically for transfer orders. In the warehouse parameters, set up loads so that they are created automatically when transfer orders are created. A load is a prerequisite for making the transfer order eligible for cross-docking.
5. Set up the item load mapping. Go to the **Item load mapping** page, and set up a standard load template for the **CarAudio** item group. This mapping will automatically insert the load template on the load when the transfer order is created.
6. Create a transfer order. Create the transfer order for item number L0101. Quantity = 20.
7. Release the transfer order from the outbound load planning workbench. On the **Ship** tab, select the menu item for the outbound load planning workbench and on the **Release** menu of the load line, select **Release to warehouse**. An open wave line of type **Transfer issue** now exists for the transfer order.
8. Create a production order. Go to the **Production order** list page, and create a production order for product L0101. Quantity = 20. Estimate and start the production order. Note that the **Post picking list now** field remains set to **No**.
9. Report as finished from the mobile device. Go to the mobile device portal and select menu item **Report as finished and put away**. Now report as finished L0101 from the handheld device. Quantity = 10. Note that the put location is **BAYDOOR**. This location is found from the **Transfer issue** location directive for the **Put** work order type. Also notice that work of the type **Transfer issue** has been created and completed. Go to the transfer order work details to verify the work.
10. Now report additional 10 pieces from the mobile device. Note that the put location again is **BAYDOOR**. Also notice that a new work of type **Transfer issue** has been created for the 10 pieces.
11. Now try to start 20 pieces more on the production order and then try to report 20 ea as finished by using the handheld device. This time, location **LP-001** is suggested as the put location. This location is found from the location directive for **Finished goods put away**. This location directive is being used, because no opportunity for cross-docking exists. The

transfer order for LP-001 was completely fulfilled by the two cross-docking activities in step 9 and 10. Notice that work of the type **Finished goods put away** was created and processed.

Scenario 2 - Cross-docking from production to transfer orders with an appointment schedule

After a product is reported as finished at the production line it is transferred to a bay-door location that is identified by an appointment schedule for the bay-door locations. Use company USMF.

1. Change the cross-docking policy. Change the cross-docking policy that you created in scenario 1 by selecting the **Cross docking demand requires location** check box.
2. Create a new transfer order.
3. Open the **Outbound load planning workbench**.
4. From the outbound load planning workbench, go to the **Loads** section, and select **Appointment schedule** on the **Transportation** menu to create a new appointment schedule. Note that the appointment schedule has a reference to the transfer order in the **Order number** field. In the **Planned start date/time at location** field, you can set the date and time for the appointment. This date and time will be used when cross-docking demand is prioritized during the cross-docking process. The date and time that you set in this field will update the **Scheduled load shipping date and time** field on the corresponding load. The location on the **Shipping details** FastTab determines the location that the transfer order is shipped on.
5. On the **Outbound load planning workbench** release to the warehouse.
6. Create a production order for item number **L0101**, and set the status to **Started**, with a quantity of 20.
7. Report as finished from the mobile device.
8. Go to the mobile device portal, and select the **Report as finished and put away** menu item.
9. Report item number **L0101** as finished from the handheld device. Note that the put location is now **BAYDOOR 2**. This location is found from the appointment schedule instead of the **Transfer receipt** location directive.

Related information

- The cross docking scenario is supported for batch and serial controlled items, both with the batch and serial number dimensions defined above and below location in the reservation hierarchy.

Auto-release shipment for cross-docking

Article • 06/28/2022

This article describes a cross-docking strategy that lets you automatically release a demand order to the warehouse when the production order that supplies the demand quantity is reported as finished. In this way, the quantity that is required for fulfillment of the demand order is moved directly from the production output location to the outbound location.

Cross-docking is a warehouse handling flow where the quantity that is required to fulfill an outbound order is directed to the order's outbound dock or staging area from the location where the inbound order was received. (The inbound order can be a purchase order, a transfer order, or a production order.) Whereas the Advanced cross-docking feature supports all supply and demand orders, and it requires that the outbound demand be released before the cross-dock opportunity is identified, the Auto-release shipment feature has these characteristics:

- It supports only production orders as supply, and only sales orders and transfer orders as demand.
- The cross-docking operation can be started even if the demand order wasn't released to the warehouse before the supply receipt was registered (that is, before the production was reported as finished).

This cross-docking functionality has two advantages:

- The warehouse operations can skip the step of putting away quantities of finished goods to the regular warehouse storage area if those quantities will just be picked up again to fulfill the outbound order. Instead, the quantities can be moved one time, from the output location to a packing/shipping location. In this way, the functionality helps minimize the number of times that stock is handled and, ultimately, helps maximize time and space savings on the warehouse shop floor.
- The warehouse operations can postpone the release of sales orders and transfer orders to the warehouse until the output of finished goods for the associated production order is reported as finished. This advantage might be especially relevant in make-to-order production environments, where manufacturing lead times tend to be longer than the lead times in make-to-stock environments.

Prerequisites

Expand table

Prerequisite	Description
Item	The item must be enabled for warehouse management processes (WMS). **Note:** Catch-weight-enabled items can't be included in the cross-docking processes.
Warehouse	The warehouse must be enabled for warehouse management processes (WMS).
Cross-docking templates	At least one cross-docking template that uses the **At supply receipt** demand release policy must be set up for a given warehouse.
Work class	A cross-docking work class ID must be created for the **Cross docking** work order type.
Work templates	Work templates of the **Cross docking** work order type are required to create cross-docking pick and put work.
Location directives	Location directives of the **Cross docking** work order type are required to guide put work in the locations where sales order quantities will be packed and shipped.
Marking between a demand order and a production order	The warehouse system can trigger automatic release of the outbound order shipment and create cross-docking work from the output location at the report-as-finished action only if sales orders and transfer orders are reserved and marked against a production order.

Example cross-docking flow

A typical cross-docking flow consists of the following main steps.

1. A sales order taker creates a sales order for a make-to-order product. Typically, the requested quantity isn't on hand and must first be produced.

2. The sales order taker creates a production order directly from the sales order line. In this way, the sales order taker reserves and marks the sales order quantity against the production order quantity.

   Alternatively, a production planner specifies that the marking must be updated when planned orders are being firmed.

3. The production order goes through the following steps:
   a. A production planner estimates and releases the production order. (Estimation includes raw material reservation, and the release includes the release to a

warehouse.)
   b. A warehouse worker starts and completes raw material picking from the storage location to the production input location, according to the production pick work.
   c. A shop floor operator starts the production order.
   d. In the last operation, a machine operator uses the mobile device to report the production order as finished.

4. The system uses the setup to identify the cross-docking event for the two linked orders and then completes these tasks:
   a. Automatically release the associated sales order to a warehouse to create a shipment.
   b. Automatically create cross-docking work that has instructions to pick the finished goods from the output location and move them to the outbound location that the cross-docking location directives assigned to the sales order.
   c. Prompt a machine operator to complete the cross-docking work immediately after the production order is reported as finished.

5. After the cross-docking work is completed, and quantities are loaded onto the vehicle, an outbound warehouse planner confirms the sales shipment.

Example scenario

For this scenario, you must have demo data installed, and you must use the **USMF** demo data company.

Set up cross-docking that uses the auto-release shipment feature

Cross-docking template

1. Go to **Warehouse management** > **Setup** > **Work** > **Cross docking templates**.
2. Select **New**.
3. In the **Sequence number** field, enter **1**.
4. In the **Cross docking template ID** field, enter a name, such as **XDock_RAF**.
5. In the **Demand release policy** field, select **At supply receipt**.

6. In the **Warehouse** field, enter the number of the warehouse where you want to set up the cross-docking process. For this example, select **51**.

> ⓘ Note
>
> As soon as you select **At supply receipt** as the demand release policy for the template, all other fields on the page become unavailable. Likewise, you can't define any supply sources. This behavior occurs because cross-docking that uses the auto-release shipment feature supports only production orders as supply sources, and it requires that a marking exist between sales orders and production orders. If you select **Before supply receipt** as the demand release policy, the fields on the **Planning** and **Supply sources** tabs are available and can be edited.

Work classes

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. Select **New**.
3. In the **Work class ID** field, enter a name, such as **CrossDock**.
4. In the **Work order type** field, select **Cross docking**.

To limit the types of locations where cross-docked finished goods can be put, you can specify one or more valid location types.

Work templates

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select **Cross docking**.
3. Select **New**.
4. In the **Sequence number** field, enter **1**.
5. In the **Work template** field, enter a name, such as **CrossDock_51**.
6. Select **Save**.
7. In the **Work Template Details** section, select **New**.
8. For the new line, in the **Work type** field, select **Pick**. In the **Work class ID** field, select **CrossDock**.
9. Select **New**.
10. For the new line, in the **Work type** field, select **Put**. In the **Work class ID** field, select **CrossDock**.

Location directives

A standard put-away process for finished goods requires a **Put** location directive to guide the movement of picked production quantities to a regular storage space. Likewise, you must set up a cross-docking **Put** location directive to instruct the work to put the finished quantity in a designated outbound location that services the shipment of the associated sales order.

For cross-docking, as for regular put-away of finished goods, you don't have to create a location directive for the pick work action, because the output location is given. Additionally, this output location is expected to be set up either as the default output location on one of the resource-related records (that is, the resource, resource group relation, or resource group) or as a default production finished goods location for a warehouse.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the **Work order type** field, select **Cross docking**.
3. Select **New**.
4. In the **Sequence number** field, enter **1**.
5. In the **Name** field, enter a name, such as **Baydoor**.
6. In the **Work type** field, select **Put**.
7. In the **Site** field, select **5**.
8. In the **Warehouse** field, select **51**.
9. On the **Lines** FastTab, select **New**.
10. In the **To quantity** field, enter the maximum quantity of the range, such as **1000000**.
11. Select **Save**.
12. On the **Location Directives Actions** FastTab, select **New**.
13. In the **Name** field, enter a name, such as **Baydoor**.
14. Select **Save**.
15. You can use the standard query facility to limit put locations to one or more specific locations. Select **Edit query**, and select **51** as the criterion for the **Warehouse** field in the **Locations** table.

Cross-dock finished goods to the outbound location

To cross-dock the quantity of finished goods to the outbound location of the associated sales order, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. Select **New**.

3. For the sales order header, select customer account **US-001** and a warehouse that is set up for cross-docking that uses the auto-release shipment feature.

4. Add a line for a finished product, and enter **10** as the quantity.

5. In the **Sales order lines** section, select **Product and supply** > **Production order**.

6. In the **Create production order** dialog box, review the default values, and then select **Create**. A new production order is created and linked to the sales order (that is, it's reserved and marked).

7. Optional: Change the value of the **Quantity** field so that it's more than the value that is required to fulfill the sales order. When the production quantity is reported as finished, the system will create cross-docking work for the marked quantity and put-away work for the remaining quantity, according to the regular procedure for handling the put-away of finished goods.

   As was mentioned earlier, a marking must exist between the sales order and the production order. Otherwise, the cross-docking won't work. A marking can be created in the multiple ways:

   - The system can automatically create the marking in the following situations:
     - The production order is manually created directly from the sales order line (see step 6).
     - Planned production orders are firmed, and the **Update marking** field is set to **Standard**.
   - The user can manually create the marking by opening the **Marking** page from the demand order line.

   > ⓘ **Note**
   >
   > A marking can't be manually created for items that are set up to use standard and weighted average as inventory models.

8. On the **Production order** page, on the Action Pane, on the **Production order** tab, in the **Process** group, select **Estimate**, and then select **OK**. The order is estimated, and the raw material quantity is reserved for the production.

9. On the Action Pane, on the **Production order** tab, in the **Process** group, select **Release**, and then select **OK**. Warehouse pick work is created for the raw materials.

10. Open and review the work. On the Action Pane, on the **Warehouse** tab, in the **General** group, select **Work details**. Make a note of the work ID.

11. Sign in to the Warehouse Management mobile app to run work in warehouse 51.
12. Go to **Production** > **Production pick**.
13. Enter the work ID to start and complete the raw material picking.

    After the work is reported as finished, the quantity of raw materials is available in the production input location (**005** in USMF demo data), and execution of the production order can start.
14. On the **Production order** page, on the Action Pane, on the **Production order** tab, in the **Process** group, select **Start**, and then select **OK**.
15. In the app, go to **Production** > **RAF and put away**.
16. In the **Prod ID** field, enter the production order number and other mandatory details, and then select **OK**.

Notice that the following events occur:

- The release to a warehouse is triggered for the linked sales order.
- Based on the release, shipment and cross-docking work is created. This work instructs the warehouse operator to pick the quantities that are required to fulfill the sales order line and put them in the outbound location that specified in the cross-docking location directive.
- If the production order quantity is more than the quantity that is required by the sales order, regular put-away work is created. This work instructs the warehouse operator to pick the quantity of finished goods that remains after cross-docking and move it to regular storage, according to the location directive.

Planned cross-docking

06/17/2025

This article describes advanced planned cross-docking. Cross-docking is a warehouse process where the inventory quantity that is required for an order is directed straight from receipt or creation to the correct outbound dock or staging area. All remaining inventory from the inbound source is directed to the correct storage location through the regular put-away process.

Cross-docking lets workers skip inbound put-away and outbound picking of inventory that is already marked for an outbound order. Therefore, the number of times that inventory is touched is minimized, where possible. Additionally, because there's less interaction with the system, time and space savings on the warehouse shop floor are increased.

Before you can run cross-docking, you must configure a new cross-docking template, where the supply source and other sets of requirements for cross-docking are specified. As the outbound order is created, the line must be marked against an inbound order that contains the same item. You can select the directive code field on the cross-docking template, similar to the way you set up replenishment and purchase orders.

At the time of inbound order receiving, the cross-docking setup automatically identifies the need for cross-docking and creates the movement work for the required quantity, based on the setup of the location directive.

> ⓘ **Note**
>
> Inventory transactions are *not* unregistered when crossing-dock work is canceled, even if the setting for this capability is turned on in Warehouse management parameters.

Setup

Regenerate load posting methods

Planned cross-docking is implemented as a load posting method. After you turn on the feature, you must regenerate the methods.

1. Go to **Warehouse management** > **Setup** > **Load posting methods**.
2. On the Action Pane, select **Regenerate methods**.

When regeneration is completed, you should see a method that has a **Method name** value of *planCrossDocking*.

3. Close the page.

Create a cross-docking template

1. Go to **Warehouse management** > **Setup** > **Work** > **Cross docking templates**.
2. On the Action Pane, select **New** to create a template.
3. In the header, set the following values:

    - **Sequence:** *1*

      This field defines the order that templates are evaluated in.

    - **Cross docking template ID:** *51*
    - **Description:** *Warehouse 51*
    - **Demand release policy:** *Before supply receipt*

4. Use the **Warehouse selection** fast tab to specify the warehouse where the cross docking template will apply.

    - **Warehouse selection** – Select one of the following values:
        - *All* – Use the cross docking template for all warehouses.
        - *Warehouse group* – Use the cross docking template for all warehouses in the warehouse group that's selected in the **Warehouse group** field.
        - *Warehouse* – Use the cross docking template only for the specific warehouse that's selected in the **Warehouse** field.
    - **Warehouse** – If the **Warehouse selection** field is set to *Warehouse*, select the warehouse where the cross docking template applies.
    - **Warehouse group** – If the **Warehouse selection** field is set to *Warehouse group*, select the warehouse group where the cross docking template applies. For more information about how to set up warehouse groups, see Warehouse groups.

    For this scenario, set the following values:

    - **Warehouse selection:** *Warehouse*
    - **Warehouse:** *51*

5. The setup on the **Planning** FastTab controls how the template works. Set the following values:

    - **Demand requirements:** *None*

      This field defines the requirements of the demand inventory. If the demand must be linked to the supply before release, select *Marking*. If the demand must be order-reserved against the supply before release, select *Order reservation*.

    - **Locating type:** *Shipment locations*

      This field defines whether the cross-docking work should use the staging/load locations from the shipment, or whether it should use location directives to find its own staging/load locations.

    - **Work template:** Leave this field blank.

      This field defines the work template that should be used when cross-docking work is created.

    - **Revalidate on supply receipt:** *No*

      This option defines whether the supply should be revalidated during receipt. If this option is set to *Yes*, both the maximum time window and the expiration days range are checked.

    - **Directive code:** Leave this field blank

      This option is enabled by the *Cross docking templates with location directives* feature (as of Supply Chain Management version 10.0.29, the feature is turned on by default). The system uses location directives to help determine the best location to move cross-docking inventory to. You can set it up by assigning a directive code to each relevant cross-docking template. If a directive code is set, the system will search location directives by directive code when work is generated. In this way, you can limit location directives that are used for a particular cross-docking template.

    - **Validate time window:** *Yes*

      This option defines whether the maximum time window should be evaluated when a supply source is selected. If this option is set to *Yes*, the fields that are related to the maximum and minimum time windows become available.

    - **Maximum time window:** *5*

      This field defines the maximum period that is allowed between supply arrival and demand departure.

- **Maximum time window unit:** *Days*
- **Minimum time window:** *0*

  This field defines the minimum period that is allowed between supply arrival and demand departure.

- **Minimum time window unit:** *Days*
- **Expiration days range:** *0*

  First expiry first out (FEFO) criteria: This field defines the maximum number of days between the expiration date of the first-expiring batch that is currently in the warehouse and the batch that is being received.

6. On the **Supply sources** FastTab, you specify the types of supply that are valid for this template. Select **New**, and then set the following values:

   - **Sequence number:** *1*
   - **Supply source:** *Purchase order*

> ⓘ **Note**
>
> You can set up a query to control when a specific cross docking template is used. The query for cross docking templates has only the `InventTable` (standard items) table and the inner-joined `WHSInventTable` (warehouse management processes (WMS) items) table. If you want to add other tables to the query, you can join them by using only *exist joins* or *not exist joins*. When you filter on the joined tables, a record from the main table is retrieved for each matching record in the joined table. If the join type is *exist join*, the search ends after the first match has been found. For example, if you join the sales order line table to the items table, the system validates and returns items for which at least one sales order line has the defined condition. Essentially, the data is fetched from the parent (items) table, not from the child (sales order line) table. Therefore, filtering by source documents such as sales order lines or customers can't be done out of the box.

Create a work class

1. Go to **Warehouse management** > **Setup** > **Work** > **Work classes**.
2. On the Action Pane, select **New** to create a work class.
3. Set the following values:

- **Work class ID:** *CrossDock*
- **Description:** *Cross Dock*
- **Work order type:** *Cross docking*

Create a work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. Set the **Work order type** field to *Cross docking*.
3. On the Action Pane, select **New** to add a line to the **Overview** tab.
4. On the new line, set the following values:
    - **Sequence number:** *1*
    - **Work template:** *51 Cross Dock*
    - **Work template description:** *51 Cross Dock*
5. Select **Save** to make the **Work Template Details** FastTab available.
6. On the **Work Template Details** FastTab, select **New** to add a line to the grid.
7. On the new line, set the following values:
    - **Work type:** *Pick*
    - **Work class ID:** *CrossDock*
8. Select **New** to add another line, and set the following values on it:
    - **Work type:** *Put*
    - **Work class ID:** *CrossDock*
9. Select **Save**, and confirm that the **Valid** check box is selected for the *51 Cross Dock* template.
10. Optional: Select **Edit query** if you want to set criteria to control when and where the work template is used.

    You can set up a query to control when a specific work template is used. For example, you can specify that a template can be used for work only at a specific location. If you want the cross docking work template to be applied at a specific location, you must filter on the **Start location** field, not the **Location** field, because work creation for the inbound processes (purchase, cross docking, and replenishment) starts from the put line. When work is created, the location directive sets the **Location** field to the put location. However, the pick location is stored in the **Start location** field.

> ⓘ **Note**
>
> The work class IDs for the *Pick* and *Put* work types must be the same.

Create location directives

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the left pane, set the **Work order type** field to *Cross docking*.
3. On the Action Pane, select **New**, and set the following values:
    - **Sequence number:** *1*
    - **Name:** *51 Cross Dock Put*
    - **Work type:** *Put*
    - **Site:** *5*
    - **Warehouse:** *51*
4. Select **Save** to make the **Lines** FastTab available.
5. On the **Lines** FastTab, select **New** to add a line to the grid.
6. On the new line, set the following values:
    - **From quantity:** *1*
    - **To quantity:** *1,000,000*
7. Select **Save** to make the **Location Directive Actions** FastTab available.
8. On the **Location Directive Actions** FastTab, select **New** to add a line to the grid.
9. On the new line, set the following values:
    - **Name:** *Baydoor*
    - **Fixed location usage:** *Fixed and non-fixed locations*
10. Select **Save** to make the **Edit query** button on the **Location Directive Actions** toolbar available.
11. Select **Edit query** to open the query editor.
12. On the **Range** tab, make sure that the following two lines are configured:
    - Line 1:
        - **Table:** *Locations*

    - **Derived Table:** *Locations*
    - **Field:** *Warehouse*
    - **Criteria:** *51*

- Line 2:
    - **Table:** *Locations*
    - **Derived Table:** *Locations*
    - **Field:** *Location*
    - **Criteria:** *Baydoor*

13. Select **OK** to close the query editor.

Create a mobile device menu item

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. In the list of menu items in the left pane, select **Purchase Put-away**.
3. Select **Edit**.
4. On the **Work classes** FastTab, select **New** to add a line to the grid.
5. On the new line, set the following values:

    - **Work class ID:** *CrossDock*
    - **Work order type:** *Cross docking*

6. Select **Save**.

Scenario

Create a purchase order

Follow these steps to create a purchase order as a source of supply.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Create purchase order** dialog box, set the following values:

    - **Vendor account:** *104*
    - **Warehouse:** *51*

4. Select **OK**, and make a note of the order number.

5. A new line is added to the **Purchase order lines** FastTab. On this line, set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *5*

Create a sales order

Follow these steps to create a sales order as a source of demand.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the following values:

    - **Customer account:** *US-002*
    - **Warehouse:** *51*

4. Select **OK**.
5. A new line is added to the **Sales order lines** FastTab. On this line, set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *3*

Create planned cross-docking

Follow these steps to create the planned cross-docking from the sales order.

1. In the **Sales order details** page for the sales order that you just created, on the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

    The release to warehouse action creates a shipment and load line for the sales order line, and tries to allocate inventory.

    You receive an informational message. You also receive the following warning message: "No work was created for wave XXXX. See the work creation history log for details." This behavior is expected, because there's no inventory in the warehouse.

2. On the **Sales order lines** FastTab, on the **Warehouse** menu, select **Shipment details**.

    The **Shipment details** page appears and shows the shipment that was created for the sales order.

3. On the **Load lines** FastTab, notice that the **Planned cross docking quantity** field is set to *3*. Because no inventory was available in the warehouse, but a valid supply source will arrive within the time window that is defined in the cross-docking template, the cross-docking quantity was created.

4. On the **Load lines** FastTab, select **Planned cross docking** to view the details of the cross-docking that was created.

Process the cross-docking

Purchase order receiving on the warehousing mobile app

The system will receive the quantity of 5 from the purchase order into the receiving location and create two pieces of work.

The first work ID that is created has a **Work order type** value of *Cross docking* and is linked to the sales order. It has a quantity of 3 and is directed to the final shipping location so that it can be shipped out immediately.

The second work ID that is created has a **Work order type** value of *Purchase orders* and is linked to the purchase order. It has the remaining quantity of 2 that wasn't cross-docked and is directed to put-away to storage.

1. Sign in to the mobile device as a user in warehouse *51*.

2. Go to **Inbound** > **Purchase Receive**.

3. In the **PONum** field, enter your purchase order number.

4. In the **Qty** field, enter *5*.

5. Select **OK**.

6. On the next page, set the **Item** field to *A0001*.

7. Select **OK**.

8. On the next page, confirm the **PONum**, **Item**, and **Qty** values by selecting **OK**.

   You receive a "Work Completed" message.

9. Select **Cancel** to exit.

Put-away to cross-docking and bulk

Currently, both work IDs have the same target license plate. To complete the next steps, you must get the work ID and the target license plate ID. You can get this information from the work details for the purchase order line and the sales order line. Alternately, you can go to **Warehouse management** > **Work** > **Work details** and filter for work where the **Warehouse** value is *51*.

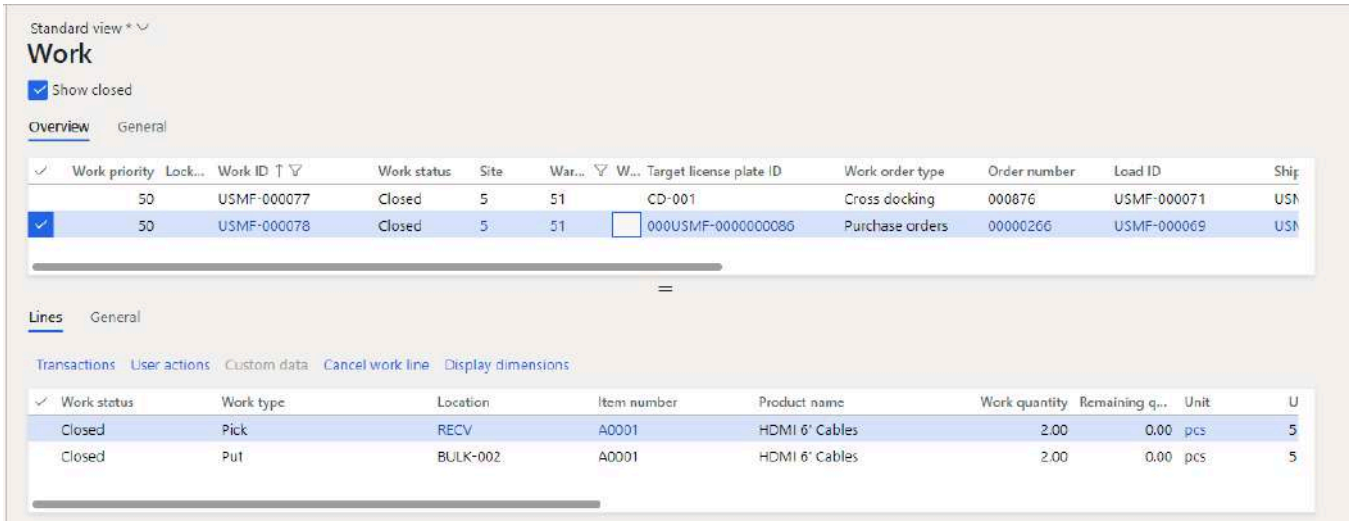
1. On the mobile device, go to **Inbound** > **Purchase put-away**, and enter the target license plate from the work.
2. In the **ID** field, enter the target license plate ID from the work details.

   The cross-docking pick page shows the picking location (*RECV*), target license plate (*license plate*), item (*A0001*), and quantity (*3*).
3. Select **OK**.
4. In the **Target LP** field, enter a target license plate for the license plate ID that should be put (cross-docked) to the shipping location. You can select any license plate ID of your choice.
5. Select **OK**.
6. On the next page, in the **ID** field, enter the target license plate ID.
7. Select **OK**.
8. Confirm the work for picking the remaining quantity of 2, and then select **OK**.
9. On the next page, select **Done** to end the picking process and begin the put-away process.

   The mobile app presents you with the location and license plate to put the item to.
10. Confirm the bulk storage **Put** by selecting **OK**.
11. On the next page, confirm the cross-docking **Put** by selecting **OK**.

    You receive a "Work Completed" message.
12. Select **Cancel** to exit.

The following illustration shows how the completed cross-docking work might appear in Microsoft Dynamics 365 Supply Chain Management.



Note

If you're using warehouse management only mode (which uses inbound and outbound shipment orders), use the source system setup to define whether the release to warehouse process should convert cross docking requests (*Outbound shipment order line cross docking*) to markings before it evaluates planned cross-docking templates where the **Demand requirements** field is set to *Marking*.

To use this logic, specify the requested cross docking quantities as part of the *Outbound shipment order line cross docking* message data (`OutboundShipmentOrderLineCrossDockMessages`) that's linked to the *Inbound shipment order lines* message data (`InboundShipmentOrderLineMessages`) by setting the same value in the `CrossDockSourceID` field. You can monitor this data on the **Cross dock requests** tab on the **Line details** FastTab of the **Outbound shipment orders** page.

Reason codes for inventory counting

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Reason codes help you analyze the results of a counting process and any discrepancies that occur during that process. You can specify the reason for doing the count, such as a broken pallet or a stock adjustment that is based on inventory samples. At the same time, use the adjustment functionality to post the value of on-hand inventory adjustments to the appropriate offset account, based on the reason for each inventory adjustment.

Recommendation

Before you set up the system, define a strategy for working with reason codes. For example, try to answer the following questions:

- Should reason codes be mandatory on warehouses?
- Should reason codes be mandatory or optional on some items?
- How many reason codes do you require?
- Do you need to preselect a limited list of reason codes for adjustments?
- How should users of bar code scanners use reason codes? Should the reason codes be preselected, mandatory, or not editable?
- Do warehouse workers require different reason code behavior on mobile scanners? If yes, you can create more menu items and assign them to different people.
- Should the reason codes drive financial offset account posting?

Set up reason codes

Set up reason code policies

Create multiple reason code policies to control when and how counting reason codes are applied. Each reason code policy can have one of two counting reason code types (*Optional* or

Mandatory). Use counting reason code policies at the warehouse level or the item level.

To create a reason code policy, follow these steps:

1. Go to **Inventory management** > **Setup** > **Inventory** > **Counting reason code policies**.
2. On the Action Pane, select **New** to add a policy to the grid.
3. Set the **Name** field for the new policy.
4. In the **Counting reason code type** field, select either *Mandatory* or *Optional* to specify whether selection of a reason code should be optional or mandatory in one of the following inventory adjustment processes:
    - Cycle Count (mobile device)
    - Spot Count (mobile device)
    - Threshold Count (mobile device)
    - Adjustment In (mobile device)
    - Adjustment Out (mobile device)
    - Counting Journal (rich client)
    - Quantity adjustment/Online counting (rich client)

Set up reason code policies both for individual warehouses and for products. The reason code setup for a product can overrule the setup for the product's warehouse.

> ⓘ **Note**
>
> For warehouses and items where the **Counting reason code policy** field is set to *Mandatory*, the counting journal can't be completed and closed until a reason code is provided. For more information, see the next section.

Assign counting reason code policies to warehouses

To assign a counting reason code policy to a warehouse, follow these steps:

1. Go to **Inventory management** > **Setup** > **Inventory breakdown** > **Warehouses**.
2. Select a warehouse in the list pane.
3. On the Action Pane, on the **Warehouse** tab, in the **Set Up** group, select **Counting reason code policy**. Then, in the **Assign counting reason code policy** drop-down dialog box, follow

one of these steps:

- To use the policy setup for each item to determine whether counting journals are mandatory for it, enter no value (or delete the existing value).
- To require a reason code on counting journals for the warehouse, select a reason policy where the **Counting reason code type** field is set to *Mandatory*.
- If a reason code is optional on counting journals for the warehouse, select a reason policy where the **Counting reason code type** field is set to *Optional*.

Assign counting reason code policies to products

To assign a counting reason code policy to a product, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select a product in the grid.
3. On the Action Pane, on the **Product** tab, in the **Set Up** group, select **Counting reason code policy**. Then, in the **Assign counting reason code policy** drop-down dialog box, follow one of these steps:

    - To use the policy setup for the warehouse to determine whether counting journals are mandatory for the product, enter no value (or delete the existing value).
    - To require a reason code on counting journals for the product, select a reason policy where the **Counting reason code type** field is set to *Mandatory*. This setting overrides any reason code setting at the warehouse level.
    - If a reason code is optional on counting journals for the product, select a reason policy where the **Counting reason code type** field is set to *Optional*. This setting overrides any reason code setting at the warehouse level.

Set up counting reason codes

To set up your counting reason codes, follow these steps:

1. Go to **Inventory management** > **Setup** > **Inventory** > **Counting reason codes**.
2. On the Action Pane, select **New** to add a row to the grid.
3. Set the **Counting reason code** and **Description** fields for the new row.
4. To assign an offset account, enter or select a value in the **Offset account** field.

> **Note**
>
> If you assign an offset account to a counting reason code, when you post a counting journal that uses the counting reason code, the value is posted against the assigned offset account instead of the default inventory posting profile account.

Set up counting reason code groups

Use *counting reason code groups* as part of the *Adjustment in* and *Adjustment out* menu items in the Warehouse Management mobile app to limit the list of counting reason codes. For more information about counting reason code groups, see the Set up mobile device menu items for adjustment in and adjustment out section later in this article.

1. Go to **Inventory management** > **Setup** > **Inventory** > **Counting reason code groups**.
2. On the Action Pane, select **New** to add a group.
3. Set the **Counting reason group** and **Group description** fields for the new group.
4. On the Action Pane, select **Save**.
5. In the **Details** section, select **New** on the toolbar to add a row to the grid. Then set the **Counting reason code** field for the new row.
6. Repeat the previous step to assign more codes as required. To remove a code from the group, select it, and then select **Delete** on the toolbar.

Set up reason codes for mobile device menu items

You can configure reason codes for the following on-hand adjustment types:

- Cycle Count
- Spot Count
- Threshold Count
- Adjustment In
- Adjustment Out

In most cases, you can define the following information for each relevant mobile device menu item:

- Whether the reason code is shown to the mobile device worker during counting.
- The default reason code that is shown on a mobile device menu item.
- Whether the user can edit the reason code.

Set up mobile device menu items for a counting process

To set up a mobile device menu item for a counting process, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select the relevant menu item in the list pane, or create a new menu item.
3. On the Action Pane, select **Cycle counting**.
4. In the **Default counting reason code** field, set the default reason code that should be recorded when the mobile device menu item is used to do counting.
5. In the **Display counting reason code** field, select one of the following values:
    - *Line* – Show the reason code after each variance is recorded.
    - *Hide* – Don't show the reason code.
6. Set the **Edit counting reason code** to *Yes* to allow the worker to edit the reason code when it's shown on the mobile device during counting. Set it to *No* to prevent the worker from editing the code.

> ⓘ **Note**
>
> You can enable the **Cycle counting** button on any mobile device menu item where counting can be done. Examples include the menu items for spot counts, user-directed work, and system-directed work.

Set up mobile device menu items for adjustment in and adjustment out

To set up a mobile device menu item for adjustment in or adjustment out, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to create a menu item.
3. Set the **Mobile item name** and **Title** fields for the new menu item.
4. Set the **Mode** field to *Work*.
5. Set the **Use existing work** option to *No*.
6. In the **Work creation process** field, select *Adjustment in* or *Adjustment out*.

7. On the **General** FastTab, set the following fields. (All these fields are added when you select *Adjustment in* or *Adjustment out* in the **Work creation process** field.)

    - **Use process guide** – If you're creating an *Adjustment out* process, be sure to set this option to *Yes*. If you're creating an *Adjustment in* process, this option is always set to *Yes*.

    - **Default counting reason code** – Set the default reason code that should be recorded when the mobile device menu item is used to do counting.

    - **Display counting reason code** – Select one of the following values:
        - *Line* – Show the reason code after each variance is recorded.
        - *Hide* – Don't show the reason code.

    - **Edit counting reason code** – Set this option to *Yes* to allow the worker to edit the reason code when it's shown on the mobile device during counting. Set it to *No* to prevent the worker from editing the code.

    - **Counting reason code group** – Select a reason code group if you want to limit the list of options that is presented to workers. For information about how to set up reason code groups, see the Set up counting reason code groups section earlier in this article.

> **Note**
>
> When you assign a counting reason code group to *Adjustment in* and *Adjustment out* menu items where the **Use process guide** option is set to *Yes*, you get a limited list of the counting reason codes as part of the processing in the Warehouse Management mobile app.
>
> The **Use process guide** option can also help prevent large adjustment quantities from occurring by mistake. (For example, a worker might accidentally scan a bar code of an item number instead of a quantity value.) To set up this functionality, set the **Use process guide** option to *Yes* for each relevant menu item. Then go to **Warehouse management** > **Setup** > **Worker**, and set the **Adjustment quantity limit** field for each relevant warehouse worker to specify the maximum adjustment quantity that the worker can register.

Processing that uses counting reason codes

When workers use the Warehouse Management mobile app, the app records the reason codes. Unless a counting approval process is defined, the recorded reason codes are immediately used as part of the counting journal posting that follows.

Cycle count approvals

Before a count is approved, the worker can change the reason code that is associated with the count. When the count is approved, the reason code is entered on the counting journal lines.

Modify reason codes for cycle count approvals

To modify a cycle count approval, follow these steps:

1. Go to **Warehouse management** > **Cycle counting** > **Cycle count work pending review**.
2. Select a cycle count in the grid.
3. On the Action Pane, on the **Work** tab, select **Cycle counting**. Then, in the **Reason code** field, select a new reason code.

Reason codes are added to the journal lines in counting journals of the *Counting journal* type.

1. Go to **Inventory management** > **Journal entries** > **Item counting** > **Counting**.
2. In the line details of the counting journal, in the **Counting reason code** field, select the reason code that matches your current situation.

View the reason codes recorded in the counting history

To view the reason codes that are recorded in the counting history, follow these steps:

1. Go to **Inventory management** > **Inquiries and reports** > **Counting history**.
2. Select an item count record in the list pane.
3. In the **Counting reason code** field, view the counting history that's recorded through a reason code.

Use reason codes for quantity adjustment or online counting

To use a reason code for a quantity adjustment or online counting, follow these steps:

1. Go to **Inventory management** > **Inquiries and reports** > **On-hand list**.
2. On the Action Pane, select **Quantity adjustment**.
3. Select **Quantity adjustment**, and then, in the **Counting reason code** field, select a reason code.

Inventory blocking

08/14/2025

This article describes how to work with inventory blocking, which is part of the quality inspection process in Supply Chain Management. You can use inventory blocking to prevent items from being processed or consumed.

You can block inventory items in the following ways:

- Manually
- By creating a quality order
- By using a process that generates a quality order
- By using inventory status blocking

Blocking items manually

You can block a quantity of an item by creating a transaction on the **Inventory blocking** page. Only items that are available as on-hand inventory can be blocked manually. For manually blocked quantities, you must decide whether planning activities include expected receipts as an expected on-hand quantity. Expected receipts are blocked items that you expect to be available as on-hand inventory after inspection is completed. You can maintain the expected date. By default, the **Expected receipts** option is selected for items that are blocked through a quality order. You can cancel a manual block on a quantity by deleting the transaction on the **Inventory blocking** page.

Blocking items by creating a quality order

You can specify items that must be inspected by creating a quality order on the **Quality orders** page. When you create a quality order, the quantity that you specify for an item is blocked. The sampling plan that is associated with a quality order controls only the quantity of items that must be inspected, not the quantity that is blocked. The quantity that is entered on the quality order is the quantity that is blocked, regardless of the quantity that the sampling plan specifies should be sent for inspection.

> **Note**
>
> Master planning doesn't support using both the batch expiry date and blocking inventory status features. This could result in double exclusion of on-hand inventory, which can occur during master planning. We recommend that you rely on batch disposition codes, instead of inventory status, for blocking expired batches.

Blocking items by using a process that generates a quality order

If a quality process specifies that an item must be inspected, a quantity of the item is blocked automatically. Therefore, when a quality order is generated automatically, the item sampling plan that is associated with the quality order controls both the quantity of items that is blocked and the quantity that must be inspected. If the **Full blocking** option on the **Item sampling** page is selected, the full quantity of, for example, a purchase order line is blocked during inspection, regardless of the item sampling quantity.

Example

In the following example, a quality order is generated when a purchase order packing slip is posted. On the **Quality associations** page, you specified that posting of a purchase order packing slip is the process that activates a quality order.

Expand table

Setup	User action	Result
A quality association specifies that a quality order must be generated when a purchase order packing slip is posted. The item sampling setup of the quality order specifies that 10 percent of the quantity on the purchase order line must be inspected. Furthermore, because the **Full blocking** option selected in the item sampling setup, the full quantity of the purchase order line must be blocked during inspection, regardless of the quantity that is sent for inspection.	The packing slip is posted.	A quality order is generated. Ten percent of the purchase order quantity for the item is sent to inspection. The full quantity of the purchase order line is blocked.

Blocking items by using inventory status blocking

You can specify which inventory statuses are blocking statuses by using the **Inventory blocking** parameter on the **Inventory statuses** page. You can't use inventory statuses as blocking statuses for production orders, sales orders, transfer orders, outbound transactions, or project integrations. For outbound work, use items that have an available inventory status. If items have a status of **Broken**, and master planning is run on those items, the items are considered missing, and inventory is automatically replenished.

Take care when blocking items that use both inventory status blocking and quality order blocking

You can create a quality order associated with inventory having an inventory status that has its **Inventory blocking** parameter enabled. In this case, the quality order generates an extra inventory blocking record in addition to the one created by the inventory status. Because the quality order inventory blocking will have the parameter **Expected receipts** enabled, this generates an extra *Ordered inventory* transaction that is also blocked by its inventory status. This combination can lead to difficulties in understanding the meaning of generated inventory transactions, because it will appear as though the total blocked quantity is in excess of the total quantity on hand. Let us examine the transactions on an example of a receipt of 10 pieces of item A0001 with a quality order generated to sample 1 piece. The behavior also depends on

whether the option **Reserve ordered items** is enabled on the **Inventory and warehouse management parameters** page.

> **Note**
>
> If you're using inventory status blocking and quality orders together, we strongly recommend having the **Reserve ordered items** option enabled.

Example with "Reserve ordered items" enabled

When **Reserve ordered items** is enabled, all inventory blocking transactions has a status of either *Reserved physical* or *Reserved ordered*.

Expand table

Inventory transaction reference	Receipt	Issue	Quantity	Site	Warehouse	Inventory status	Location	License plate	Comment
Purchase order	Purchased		10 Pcs	2	24	Blocking	RECV	receiptLp1	
Inventory blocking		Reserved physical	-9 Pcs	2	24	Blocking			Transaction generated by the inventory status blocking
Inventory blocking		Reserved physical	-1 Pcs	2	24	Blocking	RECV	receiptLp1	Transaction generated by the quality order sampling blocking
Inventory blocking	Ordered		1 Pcs	2	24	Blocking	RECV	receiptLp1	Expected receipts from the quality order sampling blocking
Inventory blocking		Reserved ordered	1 Pcs	2	24	Blocking			Transaction generated by the inventory status blocking

Example with "Reserve ordered items" disabled

When **Reserve ordered items** is disabled, the expected receipts can't be reserved because they are in status *Ordered*, so some blocking are left in status *On order*.

Expand table

Inventory transaction reference	Receipt	Issue	Quantity	Site	Warehouse	Inventory Status	Location	License Plate	Comment
Purchase order	Purchased		10 Pcs	2	24	Blocking	RECV	receiptLp1	
Inventory blocking		Reserved physical	-9 Pcs	2	24	Blocking			Transaction generated by the inventory status blocking
Inventory blocking		Reserved physical	-1 Pcs	2	24	Blocking	RECV	receiptLp1	Transaction generated by the quality order sampling blocking
Inventory blocking	Ordered		1 Pcs	2	24	Blocking	RECV	receiptLp1	Expected receipts from the quality order sampling blocking
Inventory blocking		On order	1 Pcs	2	24	Blocking	RECV	receiptLp1	Transaction generated by the inventory status blocking

Note the difference in transaction status and dimensions between the two cases. For this reason, we recommend enabling the **Reserve ordered items** option.

Expected receipts from quality orders that sample blocked inventory are disabled

To simplify the inventory transactions when quality orders that sample inventory are blocked as a consequence of inventory status, the system disables expected receipts from such quality orders. Because inventory status blocking immediately blocks the expected receipt, there's no reduction of on-hand inventory because of this.

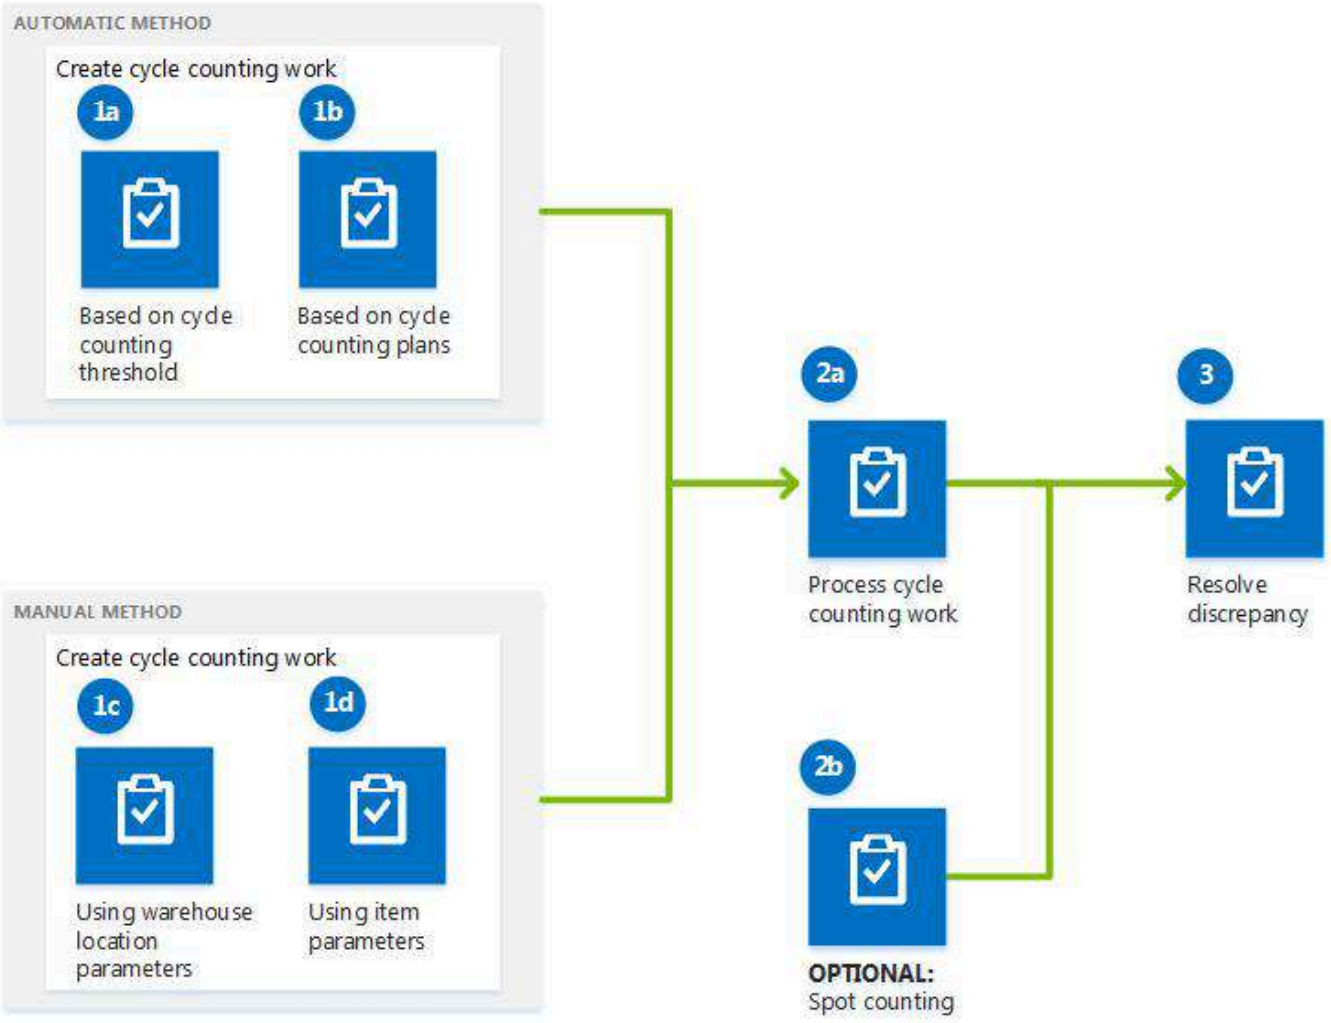
This article describes how you can use cycle counting with the warehousing solution that's available in Warehouse management. This article doesn't apply to the warehousing solution that's available in Inventory management.

Cycle counting is a warehouse process that you can use to audit on-hand inventory items. The cycle counting process involves three steps:

1. **Create cycle counting work** – You can automatically create cycle counting work based on threshold parameters for items or by using a cycle counting plan. Alternatively, you can manually create cycle counting work by using the item or warehouse parameters on the **Cycle count work by item** page or the **Cycle count work by location** page.
2. **Process the cycle count** – After creating cycle counting work, you count items in a warehouse location and use a mobile device to enter the result in Dynamics 365 Supply Chain Management. Alternatively, you can count items in a warehouse location without creating cycle counting work. This process is referred to as *spot cycle counting*.
3. **Resolve differences in the counted value** – After a cycle count, any items that have differences in the counted value have a work status of *Pending review* on the **All work** page. You can resolve these differences on the **Cycle count work pending review** page.

The following illustration shows the cycle counting process.



Cycle counting prerequisites

The following table shows the prerequisites that must be in place before you can use cycle counting.

Expand table

Prerequisite	Description
Item	The item must be enabled for warehouse management processes (WMS).
Warehouse	The warehouse must be enabled for warehouse management processes (WMS). To enable the warehouse for WMS, on the **Warehouses** page, select the warehouse, and then select the **Use warehouse management processes** option. To enable workers to move pallets during a cycle count, on the **Warehouse management** FastTab, select the **Allow pallet moves during cycle counting** option.
Work pools	Optional: Create a work pool to segregate the warehouse work, based on the type of work (in this case, cycle counting work).

Prerequisite	Description
Locations	Enable cycle counting for locations. To enable cycle counting for a warehouse location, on the **Location profiles** page, select the **Allow cycle counting** option.
Warehouse management parameters	Set up parameters for cycle counting. On the **Warehouse management parameters** page, specify the default adjustment type code, work class ID, and work priority for cycle counting.

Mobile device	• Create a menu item for one of the following methods on the **Mobile device menu items** page:
	  ◦ User directed cycle counting
	  ◦ System directed cycle counting
	  ◦ Cycle count grouping
	  ◦ Spot cycle counting
	• Set up a menu for the mobile device.
	• Create a work user account, and assign a mobile device menu to the work user ID.

Related setup task	Set up a cycle counting plan for a warehouse location.

Automatically create cycle counting work

You can schedule recurring creation of cycle counting work by setting up cycle counting thresholds or cycle counting plans.

- A cycle counting threshold indicates the quantity or percentage limit of inventory items. The system automatically creates cycle counting work when the threshold limit is reached.
- A cycle counting plan creates cycle counting work either immediately or periodically through a batch job. When cycle counting work is created, the counting work line includes information about the location to count. The on-hand inventory that is associated with this location isn't blocked, and is therefore available for reservation and outbound processing, even though open counting work exists.

Create cycle counting work based on threshold parameters for items

You can configure the system to create cycle counting work when the number of items falls below a specific threshold value in a location. For example, there are 60 items in a location that has a cycle counting threshold of 40. During a sales order transaction, a worker picks 25 items from the location and puts them in a staging location. Because the new item count, 35, is less

than the threshold quantity, the system automatically creates cycle counting work for the location.

Schedule cycle counting work

You can schedule cycle counting plans to create cycle counting work immediately or periodically. By setting up cycle counting plans, you can control the work pool that cycle counting work is created for, the maximum number of cycle counts that are created for items in different locations, and the number of days before a warehouse location is counted again. For example, an item is available in three locations in the warehouse, and the maximum number of cycle counts is set to *2*. In this case, when you run the cycle counting plan, two cycle counts are created for the two locations where the item is present. As another example, you set the number of days between cycle counts to *5*. In this case, cycle counting work is created every five days. However, if you process cycle counting work on day 3, the next cycle counting work is created five days after the last cycle counting was processed, on day 8.

Create cycle counting work manually

To create cycle counting work manually, use the **Cycle count work by item** or **Cycle count work by location** page. You can specify the maximum number of cycle counts to create. For example, if the warehouse manager specifies a value of *5*, the system creates cycle counting work for five locations, even if the item is present in 10 locations. You can also select a work pool ID to assign to the cycle counting work IDs that the system creates. When you process a work pool ID for cycle counting, you process the cycle counting work IDs that are assigned to the work pool as a group.

> **Note**
>
> When cycle counting work is created, it's always created for the whole location. This rule applies regardless of which method you use to create cycle counting work (for example, manual or automatic) or which query you use (the query is only used to select which locations to create cycle counting work for). That means that neither the item nor the tracking dimensions are set on the work line. The **Cycle counting transactions** page creates information about the specific item and tracking dimensions when a worker starts the counting process on a mobile device. The only exception is the *Partial location* cycle counting process, which supports counting based on item or product variant (learn more in Define partial location cycle counting process).

Perform a cycle count by using a mobile device

The Warehouse Management mobile app provides the following methods for processing cycle counting work:

- **User directed** – The worker specifies a cycle counting work ID that has a status of *Open*.
- **System directed** – Supply Chain Management assigns a cycle counting work ID to the worker.
- **Cycle count grouping** – The worker groups cycle counting work IDs that are specific to a particular location, zone, or work pool.
- **Spot cycle counting** – The worker counts items in a warehouse location at any time, even if no open cycle counting work exists for that location. To initiate spot cycle counting in a location, the worker enters the location ID. If no open cycle counting work exists for that location, then the system creates a new work record for spot cycle counting. If open cycle counting work does exist for the location, then the existing work record is used for spot cycle counting.

The following example shows how you can perform spot cycle counting by using the Warehouse Management mobile app. The instructions that workers see on the device vary, depending on the setup of the menu item for spot cycle counting.

1. On the mobile device, select the menu item to process spot cycle counting work.
2. Register the location to perform spot cycle counting for.
3. Register and confirm the item number and the counted item quantity. The status of the cycle counting work is updated to either *Pending review* or *Closed* on the **All work** page, depending on the parameters that are set on the **Worker** page.
4. Repeat step 3 as needed to count the remaining items in the location, and confirm that no additional items are available for counting.

> **Note**
>
> - Counting workflows in the mobile app provide an **Add LP or item** button, which lets workers count on-hand inventory that the system doesn't expect, though with a few limitations. For example, in license-plate controlled locations, you can only count each license plate once. As a result, when counting batch-tracked items, workers can only count one batch per license plate. Similarly, if a license plate contains multiple items, only one of those items can be counted.
> - If the unit sequence group for an item has multiple units enabled for cycle counting, workers are asked to provide a quantity for each unit and the system adds these quantities together. For example, if an item has a unit sequence group with *boxes* and *pieces*, then the worker is prompted to enter the number of boxes (for example, 2 boxes) and then the number of pieces (for example, 5 pieces). If the unit

conversion between boxes and pieces is 10, the total counted quantity is 25 pieces. This design enables workers to count full boxes first and then any leftover pieces afterwards. If there are only full boxes, the worker should enter zero when asked for the number of pieces.

- The system never shows the expected quantity to count. This design prevents intentional miscounts. To allow the user to double-check the count, use the **Number of attempts** setting on the mobile device menu item (select **Cycle counting** on the Action Pane). This setting allows a worker to repeat a count when necessary.
- The **Skip** button shown during the *System directed* cycle counting mobile device flow doesn't just skip the item that is currently being counted. Instead, it skips the entire cycle counting work record and goes to the next available record. If no other cycle counting work record is available, the app stays on the current work record and shows an error message stating that no other work is available. This behavior is also true for the *Partial location* cycle counting flow, where the **Skip** button changes to the next available cycle counting work record. Because there can't be two *Open*, *In process*, or *Pending review* cycle counting work records for the same location, selecting the **Skip** button nearly always results in skipping counting at the current location and changing to the next one.
- To prevent accidental selection, the **Cancel** button isn't shown during *cycle counting* mobile workflows.

Resolve cycle counting differences

A cycle counting difference occurs in the following scenarios if the **Is a cycle count supervisor** option is set to *No* for a work user ID:

- The counted value isn't within the deviation limits specified in the **Maximum percentage limit** or **Maximum quantity limit** fields on the **Work users** page. For example, the on-hand inventory quantity in a location is *50*, and the deviation limit for the work user is *10*. If the worker enters a value that isn't between *40* and *60*, a difference occurs.
- The counted value differs from the on-hand inventory quantity, and no deviation limits are set.

You can adjust differences in the counted value and then accept the counted value on the **Cycle count pending review** page. You can verify the modified count of the item quantity on the **On hand by location** page. The counted value is rejected if you don't approve the difference.

Define cycle counting

Cycle counting is a warehouse process that you can use to audit on-hand inventory items. This task recording shows how to set up the default counting work priority, enable a mobile device menu item to process both picking and counting operations, enable a counting threshold trigger when a location becomes empty, and enable a cycle counting plan for a specific item in a specific warehouse. Typically, a warehouse manager performs these tasks. You can go through this procedure in the USMF demo data company or in your own data.

Set the priority of counting work

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Select the **Cycle counting** tab.
3. In the **Default cycle count work priority** field, enter a number. This step changes the priority of cycle counting work compared to other types of work in the warehouse. By entering a number that's lower than the number for other types of work, you raise the priority of the cycle counting work.
4. Select **Save**.
5. Close the page.

Enable the mobile device

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, enter a value.
4. In the **Title** field, enter a value.
5. In the **Mode** field, select **Work**.
6. Set the **Use existing work** option to **Yes**. When you set this option to **Yes**, the system looks for existing work when the mobile device menu item is used.
7. In the **Directed by** field, select **System directed**. When you select **System directed**, the warehouse worker is directed to open work that is in defined work classes. (You create these work classes next.)
8. Expand the **Work classes** FastTab. Next, you create two work classes to use with this mobile device menu item. When the menu item is used, these work classes are queried, and the work with the highest priority is shown to the user.
9. Select **New**.

10. In the **Work class ID** field, select a value.
11. Select **New**.
12. In the **Work class ID** field, select a value.
13. In the Action Pane, select **Save**.
14. Close the page.
15. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
16. In the list, find and select the desired record.
17. In the tree, select **the menu item that you just created**.
18. Select **Edit**.
19. Select the arrow to add the menu item to the menu.
20. Select **Save**.

Create a counting threshold

1. Go to **Warehouse management** > **Setup** > **Cycle counting** > **Cycle count thresholds**.
2. Select **New**.
3. In the **Cycle counting threshold ID** field, enter a value.
4. Set the **Process cycle counting immediately** option to **Yes**.
5. In the **Description** field, enter a value.
6. Select **Save**.
7. Select **Select locations**.
8. In the list, select the row.
9. In the **Criteria** field, select a value.
10. Click **OK**.
11. Close the page.

Create a cycle count plan

1. Go to **Warehouse management** > **Setup** > **Cycle counting** > **Cycle count plans**.
2. Select **New**.
3. In the **Cycle counting plan ID** field, enter a value.
4. In the **Description** field, enter a value.
5. In the **Maximum number of cycle counts** field, enter a number.
6. Select **Save**.
7. Select **Select locations**.
8. In the list, select the row.
9. In the **Criteria** field, select a value.
10. Click **OK**.

11. In the **Days between cycle counting** field, enter a number. For example, if you set the **Days between cycle counting** field to 5, the cycle counting work is created every five days. However, if cycle counting work is processed on day three, the next cycle counting work is created five days after the last cycle counting was processed, on day 8.
12. Select **Save**.
13. Select **New**.
14. In the **Sequence number** field, enter a number. The sort is from the smallest number to the largest number. The value must be more than 0 (zero).
15. In the list, select the row.
16. In the **Description** field, enter a value.
17. Select **Save**.
18. Select **Define product** query.
19. In the list, select the row.
20. In the **Criteria** field, enter or select a value.
21. Click **OK**.
22. Close the page.

Partial location cycle counting

Cycle count plans guide the actual counting operations. You can request that only specific products and product variants be counted instead of all on-hand inventory in a location.

By using cycle count plans to create counting work, you can guide the actual counting operations. You can request that only specific products and product variants be counted instead of all on-hand inventory in a location. By filtering on specific products, the warehouse manager can reduce review overhead, avoid consolidation mistakes, and save time.

How to configure partial location cycle counting

When you use the warehouse work process for counting operations, a work header is created for each location. When you define the cycle count plan, you can use the **Select locations** query to limit the cycle counting work that is created. When you select products for the cycle count plan, you can select both product and product variant queries to refine what is counted.

You can associate a **work template** with a cycle count plan to define how the cycle count work should be created. The work template for counting operations is directly referenced from the cycle count plan.

When you define the work template details, you can use the **Work line breaks** option to specify whether the counting work lines must be grouped by item number or product variant number. This setup is required if you want to count on-hand inventory only for specific products in a location. The cycle counting work lines that are created have the level of information that you define here, and the guided counting operation is handled based on this level.

If you associate cycle count plans with work templates by using the **Work line breaks** option, the **Partial cycle count** field is selected for the cycle counting work that is created, and multiple cycle counting work lines are created based on the definition of the work template.

Before partial cycle count work can be processed, you must, at a minimum, select **Display item number** for the mobile device menu item as part of the cycle counting setup. The warehouse operator is asked to record only counting information that is related to the counting lines (item numbers and product dimensions). All other on-hand inventory is ignored for this counting process.

> ⓘ **Note**

If your mobile device menu item has **Directed by** set to *System directed*, you must also set up system-directed work sequencing for that menu item. Without at least one system-directed work sequence query, the mobile device returns *No work available* even when open cycle count work exists. The work classes on the menu item only filter the results returned by the sequence queries—they don't retrieve work on their own.

For the partial cycle count process, the **Last cycle count** date and time aren't updated for the location, even though all the items on hand at a given location are counted. The partial cycle count doesn't consider the parameter **Days between cycle counting** on the **Cycle count plans** page. Partial cycle count doesn't support simultaneous counting of multiple items at the same location. Partial cycle count functionality might result in the same location being counted multiple times for an item when **Process cycle counting plan** is run. To avoid that scenario, specify filters in the **Select locations** field.

> **Note**
>
> The Warehouse Management mobile app doesn't provide the **Add LP or item** button when you use the partial cycle count process.

Example

For this example, only item number A0001 is counted in warehouse 61.

1. A new work template for cycle counting is created. Use the **Work line breaks** option to group counting work lines by item number. Therefore, the cycle counting work has lines per item number. You can also group the lines by product variant number.
2. A new cycle counting plan is created that references the newly created work template. The cycle counting plan includes all locations in warehouse 61 (**Select locations** query) that hold inventory for item number A0001. The selection of specific products is defined in the **Cycle count product selections** section.
3. Select products for cycle counting plans by setting the **Empty locations** field to **Exclude empty**. When the cycle counting plan is processed, the partial cycle count work for item number A0001 is created. You can perform the actual counting process by using a mobile device menu item for guided cycle counting.

Define partial location cycle counting process

Article • 01/22/2025

When you use cycle count plans to create counting work, you can guide the actual counting operations by requesting that only specific products and product variants be counted instead of all on-hand inventory at the location. By filtering on specific products, the warehouse manager can reduce review overhead, help prevent consolidation mistakes, and save time. Typically, a warehouse manager performs the setup tasks.

Create a cycle counting work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. In the **Work order type** field, select *Cycle counting*.
3. Select **New**.
4. In the **Sequence number** field, enter a number. The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
5. In the list, mark the selected row.
6. In the **Work template** field, type a value.
7. In the **Work template** description field, type a value.
8. In the **Work pool ID** field, enter or select a value.
9. In the **Work priority** field, enter a number.
10. Select **Save**.
11. Select **New**.
12. In the list, mark the selected row.
13. In the **Work type** field, select *Counting*.
14. In the **Work class ID** field, enter or select a value.
15. Select **Save**.
16. Select **Work line breaks**.
17. Select **New**.
18. In the **Sequence number** field, enter a number. The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
19. Select **Save**.
20. Close the page.
21. Close the page.

Create a cycle counting plan

1. Go to **Warehouse management** > **Setup** > **Cycle counting** > **Cycle count plans**.
2. Select **New**.
3. In the **Cycle counting plan ID** field, type a value.
4. In the **Description** field, type a value.
5. In the **Maximum number of cycle counts** field, enter a number.
6. In the **Work template** field, enter or select a value.
7. Select **New**.
8. In the **Sequence number** field, enter a number. The sort order is from the smallest number to the largest number. The value must be more than 0 (zero).
9. In the **Description** field, type a value.
10. Select **Save**.
11. Select **Define product query**.
12. In the list, mark the selected row.
13. In the **Criteria** field, enter or select a value.
14. Select **OK**.
15. Close the page.

This article provides a collection of scenarios that explore the cycle counting features of Microsoft Dynamics 365 Supply Chain Management. It first describes the requirements for your existing Supply Chain Management environment. It then explains how to configure cycle counting and describes all the cycle counting stages. When you finish, you should have a good understanding of cycle counting, including guided cycle counting, blind cycle counting, spot cycle counting, cycle count thresholds, and cycle count plans.

Prerequisites

Make demo data available

Each scenario in this article references values and records included in the standard demo data provided for Supply Chain Management. If you want to use the values provided here as you work through the scenarios, be sure to work in an environment where the demo data is installed. Set the legal entity (company) to **USMF** before you begin.

Prepare demo data for the scenarios

Follow these steps to confirm that all the demo data required for the scenarios is available in the USMF company in your system. Create any records or values that are missing.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. In the list pane, select **Julia Funderburk**.
3. On the **Users** FastTab, select the row that has the following values. If no existing row has these values, create it.
    - **User ID:** *61*

- **User name:** *WH61*
- **Default warehouse:** *61*
- **Menu name:** *Main*

4. On the **Work** FastTab, set the following values for user *61* if they aren't already set:

    - **Is a cycle count supervisor:** *No*
    - **Maximum percentage limit:** *0*
    - **Maximum quantity limit:** *0*
    - **Maximum value limit:** *0*

5. Go to **Warehouse management** > **Setup** > **Work** > **Work pools**.

6. Work pools segregate warehouse work, based on the type of work (in this case, cycle counting work). Make sure that a record exists that has the following settings:

    - **Work pool ID:** *CycleCount*
    - **Description:** *Cycle Count*

7. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

8. In the list pane, select the record that is named *Cycle Count*. If no existing record has this name, create it. Confirm or set the following values for the record:

    - **Menu item name:** *Cycle Count*
    - **Title:** *Cycle Count Guided*
    - **Mode:** *Work*
    - **Use existing work:** *Yes*
    - **Directed by:** *System directed* (This value indicates that Supply Chain Management assigns a cycle counting work ID to the worker.)
    - **Display inventory status:** *Yes*

9. On the Action Pane, select **Cycle counting**.

10. In the **Mobile device cycle counting** dialog box, confirm or set the following values:

    - **Display item number:** *Yes*
    - **Display license plate:** *Yes*
    - **Number of attempts:** *1*

11. Select **OK** to close the dialog box.

12. In the list pane, select the record that is named *Cycle Count Blind*. If no existing record has this name, create it. Confirm or set the following values for the record:

    - **Menu item name:** *Cycle Count Blind*
    - **Title:** *Cycle Count Blind*
    - **Mode:** *Work*
    - **Use existing work:** *Yes*
    - **Directed by:** *Cycle count grouping* (This value indicates that the worker can group cycle counting work IDs that are specific to a location, zone, or work pool.)

13. On the Action Pane, select **Cycle counting**.

14. In the **Mobile device cycle counting** dialog box, confirm or set the following values:

    - **Display item number:** *No*
    - **Display license plate:** *No*
    - **Number of attempts:** *0*

15. Select **OK** to close the dialog box.

16. In the list pane, select the record named *Spot Counting*. If no existing record has this name, create it. Confirm or set the following values for the record:

    - **Menu item name:** *Spot Counting*
    - **Title:** *Spot Counting*
    - **Mode:** *Work*
    - **Use existing work:** *No*
    - **Work creation process:** *Spot cycle counting* (This value indicates that the worker can count items in a warehouse location at any time, even if no open cycle counting work exists for that location. To initiate spot cycle counting in a location, the worker enters the location ID. If no open cycle counting work exists for that location, the system creates a new work record for spot cycle counting. If open cycle counting work exists for the location, the existing work record is used for spot cycle counting.)

17. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.

18. In the list pane, select the record named *Inventory*. If no existing record has this name, create it. Confirm that the following cycle counting menu items appear in the **Menu structure** column:

    - Cycle Count

- Cycle Count Blind
- Spot counting

19. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.

20. On the **Cycle counting** tab, set the following values:

    - **Default cycle counting adjustment type:** *Cycle Count* (This field specifies the journal type that is posted when cycle counting is done.)
    - **Default cycle counting work class ID:** *CCount* (This field specifies the work class that is used for cycle counting.)
    - **Default cycle count work priority:** *50* (This field sets the priority that cycle counting work has relative to other types of work in the warehouse. By entering a number that's lower than the number entered for other types of work, you raise the priority of the cycle counting work.)

21. Go to **Warehouse management** > **Setup** > **Inventory** > **Adjustment types**.

22. The **Adjustment types** page lets you create codes for the different in and out adjustments that might occur. Confirm that a record exists that has the following settings:

    - **Inventory adjustment type:** *Cycle Count*
    - **Description:** *Cycle Count*
    - **Name:** *ICnt*

23. Go to **Warehouse management** > **Setup** > **Warehouse setup** > **Warehouses**.

24. In the list pane, select warehouse *61*. If no existing record has this name, create it.

25. On the **Warehouse** FastTab, set the following values:

    - **Use warehouse management process:** *Yes* (This value enables the warehouse for warehouse management processes (WMS).)
    - **Allow license plate moves during cycle counting:** *Yes* (This value enables workers to move license plates during a cycle count.)

Scenario 1: Guided cycle counting

Before the guided cycle counting can occur, you must create some work. This work guides the assigned person through the warehouse, from location to location, to complete the counts set up in the work.

Create cycle counting work for scenario 1

Follow these steps to create cycle counting work for item location *01A02R2S2B* (BULK-06) in warehouse *61*.

1. Go to **Warehouse management** > **Cycle counting** > **Cycle count work by location**.
2. In the **Create cycle count work by location** dialog box, set the **Work pool ID** field to *CycleCount*.
3. On the **Records to include** FastTab, select **Filter**.
4. In the query editor dialog box, on the **Range** tab, follow these steps:
    - For the row where the **Field** field is set to *Warehouse*, set the **Criteria** field to *61*.
    - For the row where the **Field** field is set to *Location*, set the **Criteria** field to *01A02R2S2B*.
5. Select **OK** to close the query editor dialog box.
6. Select **OK** to close the **Create cycle count work by location** dialog box.

    When the work creation process finishes, a message appears in the Action center.
7. Go to **Warehouse management** > **Work** > **Work details**.
8. Find the newly created work by setting a filter on the **Work pool ID** column to find records that have a value of *CycleCount*.

Does cycle counting work for scenario 1

After you create the cycle counting work, you do the work by counting items in a warehouse location and then using a mobile device to enter the results in Supply Chain Management. Follow these steps to do the cycle counting work in the Warehouse Management mobile app.

1. Sign in to the Warehouse Management mobile app as the work user that you set up in the Prepare demo data for the scenarios section earlier in this article. For the example in this article, the user is named *Julia Funderburk* and is set up for warehouse *61*. (The USMF demo data should let you sign in as this work user by entering *61* as the user ID and *1* as the password.)
2. On the main menu, select **Inventory**.

3. On the **Inventory** menu, select **Cycle Count Guided**.
4. Select the **Qty** field, enter *9* by using the number pad, and then select **OK** (the check mark button).
5. The system expects you to enter a count of 10 pieces for this item, location, and license plate. Therefore, you're asked to recount. Select the **Qty** field, enter *9* again by using the number pad, and then select **OK** (the check mark button). On the second attempt, your count is accepted.

   > ⓘ **Note**
   >
   > When the system detects a difference between the expected on-hand quantity and the quantity that you entered, it asks you to count a second time because the **Number of attempts** field is set to *1* for the **Cycle Count Guided** mobile device menu item. You're guided to a specific item number and license plate number because both the **Display item number** option and the **Display license plate** option are set to *Yes* for the mobile device menu item.

6. Select **OK** (the check mark button).

Review the cycle counting differences for scenario 1

Follow these steps to review the cycle counting differences.

1. Return to Supply Chain Management.
2. Go to **Warehouse management** > **Work** > **Work details**.
3. Find and select the cycle counting work that you looked at earlier. (For example, set a filter on the **Work pool ID** column to find records that have a value of *CycleCount*.) Notice that the **Work status** field for this work is now set to *Pending review*.

   > ⓘ **Note**
   >
   > For the work user account that you used to do the counting work, the **Cycle count supervisor** option is set to *No*, and the **Maximum percentage limit**, **Maximum quantity limit**, and **Maximum value limit** fields are all set to *0* (zero). Therefore, all counting differences that this user reports must be manually approved, and the **Work status** field for the related work is set to *Pending review*. If the counted value were

within the deviation limits (as specified in the **Maximum percentage limit** or **Maximum quantity limit** fields on the **Work users** page), or if the **Cycle count supervisor** option were set to *Yes* for the user, the work would have automatically been closed. When a cycle count supervisor adds a new item or license plate, the count is automatically approved. For other users, the cycle counting work is assigned the *Pending review* work status, regardless of the **Maximum percentage limit**, **Maximum quantity limit**, and **Maximum value limit** settings.

4. On the Action Pane, on the **Work** tab, select **Cycle counting**.
5. On the Action Pane, select **Accept count**.

   The difference is posted by using the standard counting journal, and a new work order is created.
6. On the **Cycle counting transactions** page, on the Action Pane, select **Derived work** to find the work that was created for the approved difference.

Scenario 2: Blind cycle counting

This scenario requires that scenario 1 already be completed in your system.

Create cycle counting work for scenario 2

Before the blind cycle counting can occur, you must create some work. Follow these steps to create cycle counting work for item location *01A02R2S2B* (BULK-06) in warehouse *61*.

1. Go to **Warehouse management** > **Cycle counting** > **Cycle count work by item**.
2. In the **Create cycle count work by item** dialog box, set the **Work pool ID** field to *CycleCount*.
3. On the **Records to include** FastTab, select **Filter**.
4. In the query editor dialog box, on the **Range** tab, add three rows that have the following settings:

   - Row 1:
     - **Table:** *Items*
     - **Field:** *Item number*
     - **Criteria:** *L0101*

- Row 2:
  - **Table:** *Inventory dimensions*
  - **Field:** *Warehouse*
  - **Criteria:** *61*
- Row 3:
  - **Table:** *Inventory dimensions*
  - **Field:** *Location*
  - **Criteria:** *01A02R2S2B*

5. Select **OK** to close the query editor dialog box.
6. Select **OK** to close the **Create cycle count work by item** dialog box.

   When the work creation process finishes, you receive an informational message.

Do cycle counting work for scenario 2

After you create the cycle counting work, follow these steps to do the work in the Warehouse Management mobile app.

1. Sign in to the Warehouse Management mobile app as the work user that you set up in the Prepare demo data for the scenarios section earlier in this article. For the example in this article, the user is named *Julia Funderburk* and is set up for warehouse *61*. (The USMF demo data should let you sign in as this work user by entering *61* as the user ID and *1* as the password.)
2. On the main menu, select **Inventory**.
3. On the **Inventory** menu, select **Cycle Count Blind**.
4. Select the **Zone ID** field, enter *BULK06*, and then select **OK** (the check mark button).
5. Select the **Item** field, enter *L0101*, and then select **OK** (the check mark button).
6. Select the **License plate** field, enter *LP_BULK_06_01*, and then select **OK** (the check mark button).
7. Select the **Qty** field, enter *10*, and then select **OK** (the check mark button).

> ⓘ **Note**

> Even though the system detected a difference between the expected on-hand quantity and the quantity that you scanned, it didn't ask you to count a second time because the **Number of attempts** field is set to *0* (zero) for the **Cycle Count Blind** mobile device menu item. You were asked to scan the item number and license plate because both the **Display item number** option and the **Display license plate** option are set to *No* for the mobile device menu item.

8. Select **OK** (the check mark button).

Review the cycle counting differences for scenario 2

Follow these steps to review the cycle counting differences.

1. Return to Supply Chain Management.
2. Go to **Warehouse management** > **Common** > **Work** > **Cycle count work pending review**.
3. On the Action Pane, on the **Work** tab, select **Cycle counting**.
4. On the Action Pane, select **Reject count**.

   Because the counting difference was rejected, the work is closed.

Scenario 3: Spot cycle counting

The on-hand record states that there's an on-hand quantity of item *L0101* at location *01A02R2S2B*. The warehouse worker is at location *01A02R2S1B*. Although this location should be empty, it's full. Therefore, the warehouse worker immediately does a spot count of this location.

Do cycle counting work for scenario 3

Follow these steps to do the cycle counting work in the Warehouse Management mobile app.

1. Sign in to the Warehouse Management mobile app as the work user that you set up in the Prepare demo data for the scenarios section earlier in this article. For the example in this article, the user is named *Julia Funderburk* and is set up for warehouse *61*. (The USMF demo data should let you sign in as this work user by entering *61* as the user ID and *1* as the password.)
2. On the main menu, select **Inventory**.

3. On the **Inventory** menu, select **Spot counting**.
4. Select the **Location** field, enter *01A02R2S1B*, and then select **OK** (the check mark button).

   The system detects that the location is empty in Supply Chain Management.
5. Select **Add LP or Item**.
6. Select the **Item** field, enter *L0101*, and then select **OK** (the check mark button).
7. Select the **License plate** field, enter *LP_BULK_06_01*, and then select **OK** (the check mark button).
8. Select the **Qty** field, enter *9*, and then select **OK** (the check mark button).

   Because the system detects that the specified license plate is already available at another location in Supply Chain Management, that license plate is moved to the current location. Therefore, the system asks you to confirm the movement.
9. Select **OK** (the check mark button).

Review the cycle counting differences for scenario 3

Follow these steps to review the counting results.

1. Return to Supply Chain Management.
2. Go to **Warehouse management** > **Common** > **Work details**.
3. Select the **Show closed** checkbox at the top of the grid.
4. Set the filter for the **Work order type** column to *Inventory movement*.

   The system automatically detected this count as an inventory movement. This movement is permitted because the **Allow license plate moves during cycle counting** option is set to *Yes* for warehouse *61* on the **Warehouses** page.

Scenario 4: Define cycle count thresholds

One way to create cycle counting work is to use thresholds. A cycle count threshold indicates the quantity or percentage limit of inventory items. The cycle counting work is automatically created when the threshold is reached.

For example, there are 60 items in a location that has a cycle count threshold of 40. During a sales order transaction, 25 items are picked from the location and put in a staging location. Because the new item count, 35, is less than the threshold quantity, the cycle counting work is automatically created for the location.

Follow these steps to set up cycle count thresholds.

1. Go to **Warehouse management** > **Setup** > **Cycle counting** > **Cycle count thresholds**.
2. On the Action Pane, select **New** to create a threshold, and set the following values for it:
    - **Cycle counting threshold ID:** *L0101*
    - **Description:** *Threshold L0101*
    - **Threshold quantity:** *2*
    - **Unit:** *ea*
    - **Capacity threshold based on percentage:** *0.00*
    - **Cycle counting threshold type:** *Quantity*
    - **Process cycle count immediately:** *Yes*
    - **Days between cycle counting:** *1*
    - **Work pool ID:** *CycleCount*
3. On the Action Pane, select **Select items**.
4. In the query editor dialog box, on the **Range** tab, find the row where the **Field** field is set to *Item number*. Set the **Criteria** field for that row to *L0101*.
5. Select **OK** to close the query editor dialog box.

    You defined a cycle count threshold for item *L0101*.

The cycle counting work is created for item *L0101* at any location if the on-hand quantity is less than 2, and if the date of the last cycle count for the location isn't today.

Scenario 5: Define cycle count plans

Cycle count plans let you automate the creation of cycle counting work. Set up each cycle count plan with specific item and location queries. When the batch job runs, it creates cycle counting work for all locations that match the item and location criteria, up to the maximum number of counts specified for the plan. When the cycle counting work is created, the counting work line includes information about the location that needs to count. The on-hand inventory that is

associated with that location isn't blocked. Therefore, it's available for reservation and outbound processing, even though open counting work exists.

Follow these steps to set up a cycle count plan.

1. Go to **Warehouse management** > **Setup** > **Cycle counting** > **Cycle count plans**.
2. On the Action Pane, select **New** to add a row to the grid, and set the following values for it:
    - **Cycle counting plan ID:** *BULK06*
    - **Description:** *Counting of location for BULK06*
    - **Work pool ID:** *CycleCount*
    - **Maximum number of cycle counts:** *10*
    - **Days between cycle counting:** *10*
    - **Empty locations:** *Exclude empty*
    - **Work template:** Leave this field blank.
3. On the Action Pane, select **Select locations**.
4. A standard query editor dialog box appears. On the **Range** tab, add a row, and set the following values for it:
    - **Table:** *Locations*
    - **Field:** *Zone ID*
    - **Criteria:** *BULK06*
5. Select **OK** to close the query editor dialog box.
6. On the Action Pane, select **Process cycle counting plan**.
7. In the **Cycle count plans** dialog box, on the **Run in the background** FastTab, set the **Batch processing** option to *Yes*.
8. Select **Recurrence**.
9. In the **Define recurrence** dialog box, set up the batch job so that it begins immediately and runs once every minute, and so that there's no end date.
10. Select **OK** to close the **Define recurrence** dialog box.
11. Select **OK** to close the **Cycle count plans** dialog box.

    A message informs you that the job was added to the batch queue.

12. Go to **Warehouse management** > **Common** > **Cycle count scheduling**. The plan begins immediately and creates counting work. Because counting work isn't completed, the **Status** field is set to *In process*. After one minute, the value in the **Total cycle counts** column changes to *1*.

    > **Note**
    >
    > The cycle count work isn't created if the number of days since the last cycle counting is less than the value that you set for the **Days between cycle counting** field for the cycle counting plan. For example, if the **Days between cycle counting** field is set to *5*, the cycle counting work is created every five days. However, if the cycle counting work is processed on day 3, the next cycle counting work is created five days after the last cycle counting was processed, on day 8.

13. On Action Pane, select **Work** to view the counting work that was created.

Warehouse management on-hand entries cleanup job

The performance of queries that calculate on-hand inventory depends on the number of records in the tables. To improve performance, reduce the number of records the database must consider.

This article describes the on-hand entries cleanup job, which deletes unneeded records in the `InventSum` and `WHSInventReserve` tables. These tables store on-hand information for items that are enabled for warehouse management processing. (These items are referred to as WMS items.) Deleting these records can significantly improve the performance of on-hand calculations.

What the cleanup job does

The on-hand entries cleanup job deletes any records in the `WHSInventReserve` and `InventSum` tables where all the field values are *0* (zero). These records can be deleted because they don't contribute to the on-hand information. The job deletes only records that are below the **Location** level.

If you allow negative physical inventory, the cleanup job might not be able to delete all the relevant entries. This limitation exists because the job must account for a special scenario where a license plate has multiple serial numbers, and one of those serial numbers becomes negative. For example, the system shows zero on hand at the license plate level when a license plate has +1 pcs of serial number 1 and –1 pcs of serial number 2. For this special scenario, the job performs a breadth-first deletion, where it tries to delete from lower levels first.

Schedule and configure the cleanup job

You can find the on-hand entries cleanup job at **Inventory management** > **Periodic tasks** > **Clean up** > **Warehouse management on-hand entries cleanup**. Use the standard job settings to control the scope and schedule for running the job. In addition, the following settings are provided:

- **Delete if not updated for this many days** – Enter the minimum number of days that the job should wait before it deletes an on-hand entry that drops to zero quantity. Use this setting to help reduce the risk of deleting on-hand entries that are still in use. If you want cleanup to occur as soon as possible, either enter *0* (zero) or leave the field blank.

- **Maximum execution time (hours)** – Enter the maximum execution time of the cleanup job, in hours. If the job isn't completed before this time passes, it saves the work that it completed so far and then closes itself. This capability is especially relevant for implementations that have high inventory use. In these cases, schedule the job to run at times when the system load is as light as possible. If you want the batch job to continue to run until it's completed, either enter *0* (zero) or leave the field blank.

Although you can run the job during regular business hours, run it outside working hours. In this way, you help prevent conflicts that can occur if a user is working with a record that the job is also cleaning up.

If the job tries to delete a record for an item while another user is using that record, a deadlock error occurs for either the cleanup job or the user.

When the job runs, it has a commit size of 100. In other words, it tries to commit one time for every 100 deletions. However, because some deletions are set-based, there might be scenarios where more than 100 records can be deleted in the same transaction. Therefore, lock escalations can still sometimes occur.

Possible user impact

Users might be affected if the on-hand entries cleanup job deletes all the records for a given level, such as the license plate level. In this case, the functionality for seeing that inventory was previously available on-hand at a license plate might not work as expected because the relevant on-hand entries are no longer available. Users can experience this issue in the following situations:

- On the **On-hand list**, when the user deselects the condition **Quantity <> 0** or selects the condition **Closed transactions** in the **Dimensions display** settings.
- In a **Physical inventory by inventory dimension** report for past periods, when the user sets the **As of date** parameter.

However, the performance improvement that the cleanup job provides should make up for these small losses in functionality.

Inventory journals

08/29/2025

This article describes how you can use inventory journals to post various types of physical inventory transactions.

In Supply Chain Management, use inventory journals to post physical inventory transactions of various types, such as the posting of issues and receipts, inventory movements, the creation of bills of materials (BOMs), and the reconciliation of physical inventory. All these inventory journals work in a similar way, but they're divided into different types.

Types of inventory journals

The following types of inventory journals are available:

- Movement
- Inventory adjustment
- Transfer
- BOM
- Item arrival
- Production input
- Counting
- Tag counting

Movement

When you use an inventory movement journal, you can add cost to an item when you add inventory, but you must manually allocate the extra cost to a particular general ledger account by specifying a general ledger offset account when you create the journal. This inventory journal type is useful if you want to overwrite the default posting accounts.

Inventory adjustment

When you use an inventory adjustment journal, you can add cost to an item when you add inventory. The extra cost is automatically posted to a specific general ledger account, based on the setup of the item group posting profile. Use this inventory journal type to update gains and losses to inventory quantities when the item should keep its default general ledger offset account. When you post an inventory adjustment journal, you post an inventory receipt or issue, change the inventory values, and create ledger transactions.

Transfer

Use transfer journals to transfer items between stocking locations, batches, or product variants without associating any cost implications. For example, you can transfer items from one warehouse to another warehouse within the same company. When you use a transfer journal, you must specify both the "from" and "to" inventory dimensions (for example, for Site and Warehouse). The on-hand inventory for the defined inventory dimensions changes accordingly. Inventory transfers reflect the immediate movement of material. In-transit inventory isn't tracked. If you need to track in-transit inventory, use a transfer order instead. When you post a transfer journal, two inventory transactions are created for each journal line:

- An inventory issue at the "from" location.
- An inventory receipt at the "to" location.

BOM

When you report a BOM as finished, you can create a BOM journal. By using a BOM journal, you can post the BOM directly. This posting generates an inventory receipt of the product, together with an associated BOM and an inventory issue of the products that are included in the BOM. This inventory journal type is useful in simple or high-volume production scenarios where routes aren't required.

Item arrival

Use the item arrival journal to register the receipt of items (for example, from purchase orders). You can create an item arrival journal as part of arrival management from the **Arrival overview** page, or you can manually create a journal entry from the **Item arrival** page. If you enable the item arrival journal name to check for picking locations, Supply Chain Management looks for a location for received items and, if there's room, generates location destinations for the incoming items.

Production input

Production input journals work like the item arrival journals but are used for production orders.

Counting

Counting journals let you correct the current on-hand inventory that is registered for items or groups of items, and then post the actual physical count, so that you can make the adjustments that are required to reconcile the differences. You can associate counting policies with counting groups to help group items that have various characteristics, so that those items

can be included in a counting journal. For example, you can set up counting groups to count items that have a specific frequency, or to count items when stock falls to a particular level. For information about how to define counting groups, see Define inventory counting processes.

Tag counting

Use tag counting journals to assign a numbered tag to a count lot. The tag contains a tag number, item number, and item quantity. To ensure that a tag is used only one time, and that all tags are used, every item number has a unique set of tags with its own number sequence. You can set three status values for each tag:

- **Used** – The item number is counted for this tag.
- **Voided** – The item number is voided for this tag.
- **Missing** – The item number is missing for this tag.

When you post a tag counting journal, you create a new counting journal based on the tag counting journal lines. For more information about tag counting, see Inventory tag counting.

Working with journals

Only one user at a time can access a journal. If several users need to access journals at the same time to create journal lines, they must select journals that aren't currently being used. This approach prevents information from being overwritten. In situations where multiple departments use the same journal type, it's helpful to create multiple journal names (for example, one per department). It can also be helpful to divide journals so that each posting routine is entered in its own unique inventory journal. For posting routines that are associated with inventory transactions, create one journal for periodic inventory adjustments and another for inventory counting.

Posting journal lines

You can post the journal lines that you create at any time until you lock an item from additional transactions. The data that you enter in a journal remains in that journal, even if you close the journal without posting the lines.

Data entity support for inventory journals

Data entities support the following types of integration scenarios:

- Synchronous service (OData)
- Asynchronous integration

Learn more in Data entities.

> **Note**
>
> Not all inventory journals are OData-enabled, so you can't use the Excel data connector to get data published, updated, and imported back to Supply Chain Management.

Another difference between the journal data entities is the ability to use composite entities that include both the header and line data. Currently, you can use the composite entities for:

- Inventory adjustment journal
- Inventory movement journal

These two inventory journals only support the *Initialize stock* scenario as part of a data management import project:

- When you don't specify a journal header number but specify a number sequence for the journal type, the import job automatically creates journal headers per 1,000 lines. For example, importing 2,020 lines results in the following three journal headers:
  - Header 1: contains 1,000 lines
  - Header 2: contains 1,000 lines
  - Header 3: contains 20 lines
- The import process assumes that unique line information exists per inventory dimension, which can be a product, storage, and tracking dimension. Therefore, you can't import journal lines where only the date field differs on the lines within the same import project.

Inventory locations

Inventory locations determine where you store and pick items in warehouses that don't use warehouse management processes (WMS).

This article applies to features in the Inventory management module. It doesn't apply to features in the Warehouse management module.

The term location refers to the place that items are stored and drawn from.

For each location, you can also specify the place the item is inserted. By default, they're the same. Items are usually inserted and drawn from the same side of a location, but not always. For example, items that are stored in live storage racks are inserted from one aisle and drawn from another. The main input is given by a location name, which is usually determined by its coordinates: warehouse, aisle, rack, shelf, and bin. You can enter this name or ID manually or generate it from the location coordinates. For example, `01-02-03-4` represents aisle 1, rack 2, shelf 3, and bin 4 in the Inventory locations page.

Location properties

A location has the following characteristics:

- Size (height, width, depth, and thereby volume)
- Warehouse, aisle, rack, shelf, and bin position
- Location type (bulk location, picking location, inbound dock, outbound dock, production input location, inspection location, or kanban supermarket)

Check text can be used in online systems to verify that the operator has selected the correct location for a specific item. This check text can be created manually or by default.

Sort codes

Use sort codes to optimize the handling of picking lines, which describe the information that is required for picking items from inventory, including the picking order. Sort codes can be specified by the aisle and other coordinates, or assigned manually for the location.

Blocked locations

Occasionally, you might want to indicate that a location is blocked for a period of time, for example, to allow for repairs. At other times, you might want to indicate blocking of only the input or only output.

Tree structure

In the Inventory locations page, you can view the warehouse layout in a tree structure based on the coordinates of inventory locations, in a defined display format.

Maintain inventory locations via the warehouse form

You can copy locations from one warehouse to another and create locations through a wizard. Before running the wizard, make sure that you define the default location names on the **Warehouse** page.

Inventory statuses

This article describes how to use inventory statuses to categorize and keep track of inventory.

Set up and use inventory statuses

You can use inventory statuses to categorize inventory. You can then initiate appropriate actions, such as replenishment or putaway work.

Here are some examples of ways that you can use inventory statuses:

- Create inventory statuses for on-hand inventory, inbound transactions, and outbound transactions.
- Specify a default inventory status for warehouse transactions.
- Change an inventory status for items before arrival, during arrival, or when the items are put away during inventory movement.
- Use an inventory status to price items that are returned and to plan item coverage during master planning.

An inventory status is one of the dimensions in the storage dimension group. Inventory statuses can be categorized as available or unavailable, and you can use the **Inventory blocking** parameter to block items that have an unavailable inventory status. Items that have a blocked status are considered physical inventory, and they can't be used on a production order, sales order, transfer order, or outbound transaction.

You can use warehouse items that have either available or unavailable inventory statuses for inbound work. For example, you create an available status that is named *Ready*, an unavailable status that is named *Damaged*, and a blocked status that is named *Blocked*. When you create a purchase order for received or returned items, if any items are damaged or broken, you can change the inventory status of those items to *Damaged* on the purchase order line. After these items are received, the status is automatically set to *Blocked*. If you scan the damaged items by using a mobile device, Supply Chain Management can use location directives and work templates to show information about an appropriate location or range of locations where you can put away those items. For returned items, an issue type of *Reservation* is created on the **Inventory transactions** page.

You can specify which inventory statuses are blocking statuses by using the **Inventory blocking** check boxes on the **Inventory statuses** page. You can't use inventory statuses as blocking

statuses for sales orders, transfer orders, or project integrations.

For outbound work, you can use different nonblocking inventory statuses to control which inventory to reserve against. If you have items that have a status of *Blocking*, and master planning is run on these items, the items are considered missing, and inventory is automatically replenished. Furthermore, for quality orders associated with outbound work, it isn't possible to update the **Inventory status** as part of the quality order validation.

> **Note**
>
> You can't change the status of inventory at locations where open work exists. For example, if you did a purchase receive for an item, but didn't do the putaway step, then open work would exist for the receiving location and you would get an error if you tried to change the status of inventory at that location. Completing or cancelling the related work would allow you to change the status.
>
> Usually, the status of on-hand inventory related to open warehouse work is only changed by workers using the Warehouse Management mobile app, for example while executing a movement process.

After you set up inventory statuses, you can set the default inventory status for a site, item, and warehouse. You can also set a default status for sales, transfer, and purchase orders. The default status for sales orders and outbound transfer order can't have the **Inventory blocking** option set to *Yes*. The inventory status that is inherited from the default settings on a site, warehouse, item, purchase order, transfer order, or sales order can be changed by using the mobile device, or on the purchase order, sales order, or transfer order line.

To plan coverage for items that have an available inventory status, select the **Coverage plan by dimension** option for a storage dimension on the **Storage dimension groups** page. When you open the **Item Coverage** wizard, items that have an available status appear on the **Status** page. To create coverage settings for these items, select the inventory status ID for the available inventory statuses. Based on the coverage settings, you can calculate the item requirements and forecast the supply and demand of available items during master planning. You can't create an item coverage setup that has a blocked inventory status. Alternatively, use the **Item coverage** page to create or modify the item coverage parameters.

Change inventory statuses

You can change inventory statuses either by using the **On-hand by location** page or by using a batch job.

To change inventory status of individually selected records, follow these steps:

1. Go to **Warehouse management** > **Inquiries and reports** > **On-hand by location**.
2. Use the **Site**, **Warehouse**, and **Location** fields to find the relevant location.
3. On the **Locations** tab, select the location.
4. On the **On-hand** tab, select the relevant records, and then select the **Inventory status change** button.

To set up a batch job task that selects and updates records, follow these steps:

1. Go to **Warehouse management** > **Periodic tasks** > **Warehouse management inventory status change**.
2. On the **Parameters** FastTab, set **To inventory status** to the status value you want to update the selected records to.
3. On the **Records to include** FastTab, select the **Filter** button and set up a query that selects which records to change.
4. On the **Run in background** FastTab, set **Batch processing** to *Yes*. If you want to run the job at a regular interval, select **Recurrence** and assign the interval.

Inventory tag counting

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about tag counting, which you use to compare the actual contents of a warehouse with the on-hand inventory.

By creating lines on the **Tag counting** page, you place a tag number on each inventory item, such as a number from 1 to 500. During the count, you enter the item number and the quantity on a corresponding tag. This tag can then be used as the basis for input in the tag counting journal.

After you post the tag counting journal, a new counting journal is created on the **Counting** page. The new journal is based on the tag counting journal lines that you created.

To tag-count items by a specific inventory dimension, select the dimension on the **Display dimension** page that is displayed when you create the tag counting journal. For example, to count items in a specific warehouse, select the **Warehouse** check box. If **Lock items during count** on the **General** tab of the **Inventory and warehouse management parameters** page is set to *Yes*, items can't be physically updated during counting. However, items in tag counting journals aren't locked during counting. Inventory transactions aren't created until the tag counting lines are posted and transferred to a counting journal. If tags are entered randomly, and you want to identify missing tags, select the **Tag** column header to sort the lines by tag.

Work line details

10/03/2025

The **Work line details** page shows a comprehensive, sortable, and filterable list of the individual work lines in your system. It provides a complete overview of work that is being planned and executed in the warehouse. You can easily switch between viewing all work lines and viewing only open work lines. Details that are provided for each line include the work status, item number, location, work quantity, load ID, and shipment ID.

Open and use the Work line details page

To view the list of work line details, go to **Warehouse management** > **Work** > **Work line details**. From here, you can perform the following actions:

- Use the **Filter** field to search for lines that have a specific value for any available parameter. (Available parameters include many parameters that aren't shown as columns in the grid.)
- Use the **Show closed** check box to show or hide closed lines.
- Select **Display dimensions** to open the **Dimensions display** dialog box, where you can choose to show or hide various dimension columns in the grid.
- Select any column heading to open a menu where you can choose to sort or filter the list by values in that column.
- Select a work line, and then select **Change location** to open a dialog box where you can change the location for that work line. The location that you specify will override the setup of the location directive.
- Select a work line, and then select **Cancel work line** to open a dialog box where you can partially or fully reduce the quantity of that work line.
- Adjust quantities.
- View the transactions behind any work line.

Try out the feature

This section provides a three-part demo that shows how to work with work line details.

Make sample data available

To work through this demo by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this demo as guidance when you work on a production system. However, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Verify that the scenario setup includes enough available inventory

If you're working with the **USMF** demo data, you should first make sure that your system is set up so that enough inventory is available at each relevant pick location. For this demo, the expectation is that you have the following inventory available:

- **Item M9200:** 45 ea. (or more)
- **Item M9202:** 10 ea. (or more)

Follow these steps to verify that enough inventory is available and to make any adjustments that are required.

1. Go to **Warehouse management** > **Setup** > **Location directives**, and determine which picking locations are used for sales order picking at warehouse 51. (Learn more in Control warehouse work by using work templates and location directives.)
2. Check the inventory levels at the relevant locations.
3. Adjust inventory as required. You can create manual movements, use replenishment, or apply any other flow to adjust the inventory.

Part 1: Create picking work

Before you start to create work, make sure that your warehouse is set up to respond to work requests in the expected manner.

Follow these steps to create some picking work.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

2. Select **New** to open the **Create sales order** dialog box.

3. In the **Create sales order** dialog box, set the following values:

    - On the **Customer** FastTab, set the **Customer account** field to *US-001*.
    - On the **General** FastTab, set the **Warehouse** field to *51*.

4. Select **OK** to create the sales order and close the dialog box.

5. Your new sales order is opened. It includes a new, empty row in the **Sales order lines** grid. On this order line, set the following values:

- **Item number:** *M9200*
- **Quantity:** *20*
- **Unit:** *ea*

6. Select the new order line, and then, on the **Inventory** menu, select **Reservation** to open the **Reservation** page.

7. On the **Reservation** page, select **Reserve lot** to reserve the selected line's full quantity in the warehouse.

8. Close the **Reservation** page to return to the sales order.

9. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**. The system creates a shipment, adds it to a new load, and creates the required work.

10. Create a second sales order for the same customer account and warehouse that you used for the first order. Add the following two order lines to this order:

    - **Line 1:** Set the **Item number** field to *M9200*, the **Quantity** field to *25*, and the **Unit** field to *ea*.
    - **Line 2:** Set the **Item number** field to *M9202*, the **Quantity** field to *10*, and the **Unit** field to *ea*.

11. Repeat steps 6 through 8 to reserve the inventory for each order line (one at a time), and then repeat step 9 to release the order to the warehouse.

Part 2: Change the location for a work line

1. Go to **Warehouse management** > **Work** > **Work line details**.
2. Find and select one of the work lines that you created for this demo.
3. Select **Change location** to open the **Select new location** dialog box.
4. In the **Select new location** dialog box, in the **Location** field, select a new location for the work line.
5. Select **OK** to apply your change and close the dialog box.

> ⓘ **Important**
>
> You can submit location changes only if the new location has enough inventory available (for a pick), or if it passes location-type validation (for a put).

Part 3: Change the quantity of a work line or cancel a work line

1. Go to **Warehouse management** > **Work** > **Work line details**.
2. Find and select one of the work lines that you created for this demo. Note that you can cancel or change quantities only for work lines where the work type is *pick*.
3. Select **Cancel work line** to open the **Quantity to cancel** dialog box.
4. In the **Quantity to cancel** dialog box, change the value in the **Quantity** field to specify the quantity that should be *subtracted from* the quantity that is currently specified for the line. By default, the **Quantity** field shows the full quantity.
    - If you cancel the full quantity, the **Work status** value will be changed to *Canceled*, but the **Work quantity** field will still show the original value.
    - If you cancel just part of the quantity, the **Work quantity** field will be updated to show the new value, but the **Work status** value won't change.
5. Select **OK** to apply your change and close the dialog box.

> ⓘ **Important**
>
> If you cancel just part of the quantity for a work line, you must also remove the obsolete quantity from the load line. Otherwise, unless under-delivery is set up correctly, the load line can't be ship-confirmed.

Work blocking and blocking reasons

Work blocking provides a standard way to block or unblock warehouse work. The system prevents blocked work from being processed until it's unblocked. You can block work records automatically when certain conditions are met and you can also block them manually at any time. Multiple reasons can cause work to be blocked, and in some cases, a single work record can be blocked for several reasons at once. The system provides visibility into the reasons why a work record is blocked. You can only block work records with the status *Open*. This article describes the work blocking functionality and reasons.

Supported work blocking reasons

The following work blocking reasons are supported:

- **Unprocessed replenishment work** – The work is blocked because it's linked to an unprocessed replenishment work record.
- **Held wave** – The work is blocked by a wave with status *Held*.
- **Unprocessed production over pick work** – The work is blocked because it's linked to an unprocessed staging over-pick work record.
- **Unprocessed deferred put operation** – The work is blocked by an unprocessed deferred-put processing task.
- **Split work** – The work is blocked because it's being split.
- **Replenishment overflow capacity** – The replenishment work is blocked because it would overflow the capacity of the put location.
- **Processing wave** – The work is blocked by a processing wave.
- **Undefined reason** – The work is blocked for an undefined reason.

No other blocking reasons are supported.

View blocked work and blocking reasons

To find all blocked work and check the reasons why each of them blocked, follow these steps:

1. Go to **Warehouse management** > **Work** > **All work**.
2. Blocked work records show a check mark in the **Blocked wave** column. You can use the column filter to find all blocked work records at once.

3. To see the reasons why a work record is shown as blocked, select the link in the **Work ID** column to open the **Work details** page for that work record. Then open the **Blocking reasons** tab, which shows all blocking reasons for that work record, along with who blocked it and the date and time when each reason was applied.

> **Tip**
>
> If you only want to find work that is blocked by replenishment work, you can go to **Warehouse management** > **Work** > **Outbound** > **Work blocked by replenishment work**.

Manually block or unblock work

You can manually block work at any time. Manually blocked work shows a blocking reason of *Undefined reason*.

You can manually unblock work that is currently blocked for one of the following reasons:

- Held wave
- Undefined reason
- Replenishment overflow capacity

To manually block or unblock work, go to **Warehouse management** > **Work** > **All work** and select one or more work records that you want to block or unblock. Then, on the Action Pane, select **Block work** or **Unblock work**.

The system automatically unblocks work that is blocked for other reasons when the blocking reason is resolved.

Location license plate positioning

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

License plate location positioning shows where a license plate is located in a multi-pallet location, such as a location that uses double-deep pallet racking.

This feature adds a sequence number to each license plate that is put into a storage location. This sequence number orders the license plates in the storage location. The feature intelligently supports scenarios where customers use a gravity racking system and must know, for picking purposes, which license plate is front-facing.

This article presents a scenario that shows how to set up and use the feature.

Example scenario

Make sample data available

To work through this scenario by using the values that are suggested in this article, you must work on a system where sample data is installed. Additionally, you must select the **USMF** legal entity before you start.

Set up the feature for this scenario

Complete the following procedures to set up the *Location license plate positioning* feature for the scenario presented in this article.

Location profiles

The feature must be turned on in the location profile for every location where it's used.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.

2. In the list of location profiles in the left pane, select **BULK-06**.
3. On the **General** FastTab, the feature adds two new options. Set the following values:
    - **Enable license plate position:** *Yes*

      When this option is set to *Yes*, the license plate position is maintained for license plates in the location.

    - **Display mobile device LP position:** *Yes*

      When this option is set to *Yes*, the license plate position is shown to mobile device users during adjustment and counting. You can change the setting of this option only when the feature is turned on.
4. Select **Save**.

Location directives

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the left pane, make sure that the **Work order type** field is set to *Sales orders*.
3. In the list of location directives, select **61 SO Pick order**.
4. On the Action Pane, select **Edit**.
5. On the **Lines** FastTab, select the line that has a **Sequence number** value of *2*.
6. On the **Location Directive Actions** FastTab, select the line that has a **Name** value of *Pick for less than pallet* (it should be the only line), and change its **Sequence number** value to *2*.
7. Select **New** above the grid to add a line for a new location directive action.
8. On the new line, set the following values:
    - **Sequence number:** *1*
    - **Name:** *Pick position 1*
9. While the new line is still selected, select **Edit query** above the grid.
10. In the query editor, select the **Joins** tab.
11. Expand the **Locations** table join to show the join to the **Inventory dimensions** table.

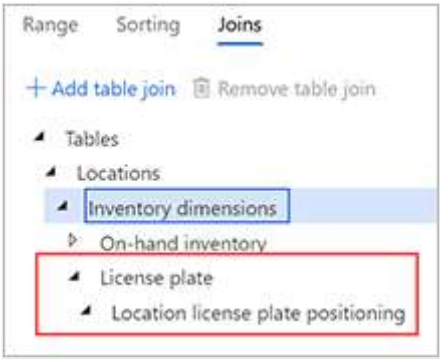
12. Expand the **Inventory dimensions** table join to show the join to the **On-hand inventory** table.

13. Select **Inventory dimensions**, and then select **Add table join**.

14. In the list of tables that appears, in the **Relation** column, select **License plate (License plate)**. Then select **Select** to add **License plate** to the **Inventory dimensions** table join.

15. While **License plate** is still selected, select **Add table join**.

16. In the list of tables that appears, in the **Relation** column, select **Location license plate positioning (License plate)**. Then select **Select** to add **Location license plate positioning** to the **Inventory dimensions** table join.



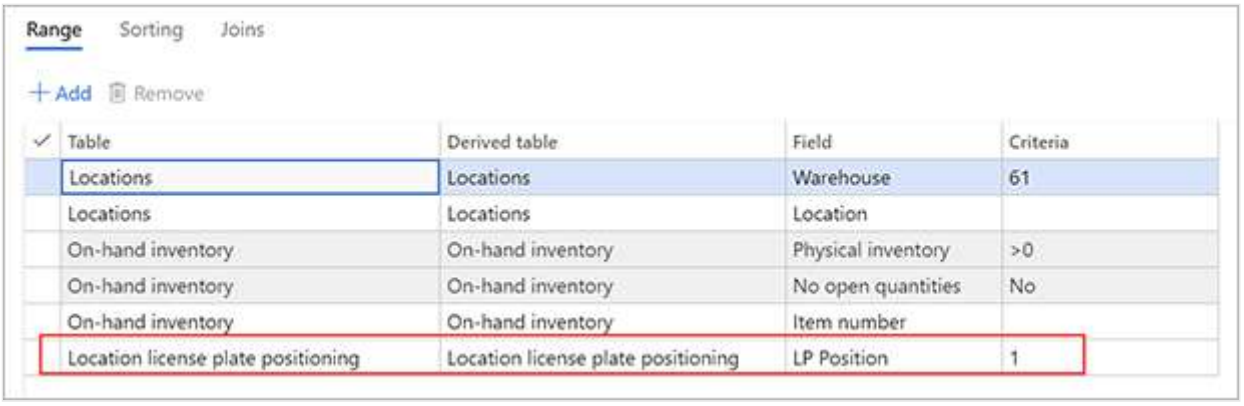
17. Select **OK** to confirm the updated joined tables and close the query editor.

18. On the **Location Directive Actions** FastTab, select **Edit query** again to reopen to the query editor.

19. On the **Range** tab, select **Add** to add a line to the grid.

20. On the new line, set the following values:

    - **Table:** *Location license plate positioning*
    - **Derived table:** *Location license plate positioning*
    - **Field:** *LP Position*
    - **Criteria:** *1*



21. Select **OK** to confirm your changes and close the query editor.

Set up sample data for this scenario

For this scenario, the user must sign in to the warehousing mobile app by using a worker who is set up for warehouse *61* to perform work. The user must also complete transactions.

Because the *Location license plate positioning* feature adds a new identifier for license plate positions in a location, you must first create some data to support the scenario.

Spot-count the first location

1. Open the warehousing mobile app, and sign in to warehouse *61*.
2. Go to **Inventory** > **Spot Counting**.
3. On the **Spot Counting** page, set the **Location** field to *01A01R1S1B*.
4. Select **OK**.

   The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"
5. Select **Refresh** to add a count in the location.
6. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0001*.
7. Select **OK**.
8. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1001* (or any other license plate number of your choice).

   The **Cycle Count: Add New LP or Item** page shows **License Plate Position 1**.

9. Select **OK**.

   You must now specify the quantity of the item that is counted on the license plate.

10. Set the **Qty** field to *10*.

11. Select **OK**.

    The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

12. Select **Refresh** to add another count in the location.

13. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0002*.

14. Select **OK**.

15. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1002* (or any other license plate number of your choice, provided that it differs from the license plate number that you specified earlier).

16. Change the license plate position by setting the **LP Position** field to *2*.

17. Select **OK**.

18. Specify the quantity of the item counted on the license plate by setting the **Qty** field to *10*.

19. Select **OK**.

    The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

20. Select **OK**.

Work is now completed.

Spot-count the second location

1. On the **Spot Counting** page, set the **Location** field to *01A01R1S2B*.

2. Select **OK**.

   The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"

3. Select **Refresh** to add a count in the location.
4. On the **Cycle Count: Add New LP or Item** page, select the **Item** field, and then enter the value *A0002*.
5. Select **OK**.
6. On the **Cycle Count: Add New LP or Item** page, select the **LP** field, and then enter the value *LP1003* (or any other license plate number of your choice, provided that it differs from the both the license plate numbers that you specified in the previous procedure).

   The **Cycle Count: Add New LP or Item** page shows **License Plate Position 1**.
7. Select **OK**.
8. Specify the quantity of the item counted on the license plate by setting the **Qty** field to *10*.
9. Select **OK**.

   The page shows the location that you entered. It also shows the following message: "Location complete, add new LP or Item?"
10. Select **OK**.

Work is now completed.

Work details

> **Note**
>
> Spot counts from the mobile app create cycle counting work in Microsoft Dynamics 365. The work requires that the counts be accepted before posting them to inventory.

1. Sign in to Dynamics 365 Supply Chain Management.
2. Go to **Warehouse management** > **Work** > **Work details**.
3. On the **Overview** tab, look for the lines that have the following values:

   - **Work order type:** *Cycle counting*
   - **Warehouse:** *61*
   - **Work status:** *Pending review*

Two work IDs should exist for these lines. The counts for both these work IDs must be accepted.

4. In the grid, select the first work ID for the *Cycle counting* work order type.
5. On the Action Pane, on **Work** tab, in the **Work** group, select **Cycle counting**.

   Two lines are shown, one for each item and license plate. The values in the **Counted quantity**, **Location**, **License plate**, and **Item** fields should match the count entries that you created on the mobile device. If any of these fields aren't visible, select **Display dimensions** on the Action Pane to add them to the grid.
6. Select both lines.
7. On the Action Pane, select **Accept count**.
8. You receive a "Posting - Journal" message. Select **Message details** to view the posted journal number.
9. Close the message details.
10. Refresh the **Work** page.

    The first work ID is closed and no longer shown.

    > **Tip**
    >
    > To view closed work, select the **Show closed** check box above the grid.

    You now accept the work for the license plate in the *01A01R1S2B* location.
11. On the **Overview** tab, select the second work ID for the *Cycle counting* work order type.
12. On the Action Pane, on **Work** tab, in the **Work** group, select **Cycle counting**.

    One line is shown, for the item and license plate. The values in the **Counted quantity**, **Location**, **License plate**, and **Item** fields match the count entries that you created on the mobile device.
13. Select the line.
14. On the Action Pane, select **Accept count**.

15. You receive a "Posting - Journal" message. Select **Message details** to view the posted journal number.
16. Close the message details.
17. Refresh the **Work** page.

    The second work ID is closed and no longer shown.

    > **Tip**
    >
    > To view closed work, select the **Show closed** check box above the grid.

On-hand by location

1. Go to **Warehouse management** > **Enquiries and reports** > **On-hand by location**.
2. Set the following values:

    - **Site:** *6*
    - **Warehouse:** *61*
    - **Refresh across locations:** *Yes*

3. You see that location *01A01R1S1B* has two license plates:

    - **A0001**, where the **LP Position** field is set to *1*
    - **A0002**, where the **LP Position** field is set to *2*

4. You see that location *01A01R1S2B* has one license plate:

    - **A0002**, where the **LP Position** field is set to *1*

Sales order scenario

After the *Location license plate positioning* feature is set up and the inventory is staged, create a sales order to generate picking work. The picking work directs the warehouse worker to pick item *A0002* from the inventory location where the pallet ID is in position *1*.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, enter the following values:

- **Customer account:** *US-004*
- **Warehouse:** *61*

4. Select **OK**.

5. A new line is added to the grid on the **Sales order lines** FastTab. On this new line, enter the following values:

   - **Item number:** *A0002*
   - **Quantity:** *1*

6. On the **Inventory** menu above the grid, select **Reservation**.

7. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve inventory for the order line.

8. Close the **Reservation** page.

9. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

   You receive an informational message that indicates the wave ID and shipment ID that were created for the order.

10. On the **Sales order lines** FastTab, on the **Warehouse** menu above the grid, select **Work details**.

11. The **Work** page appears and shows the work that was created for the sales line. Make a note of the work ID that is shown.

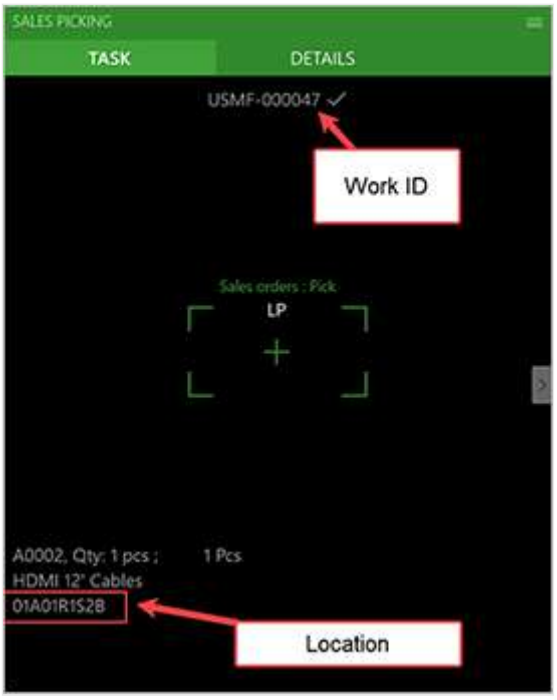
Sales picking scenario

1. Open the mobile app, and sign in to warehouse *61*.

2. Go to **Outbound** > **Sales picking**.

3. On **Scan a work ID / license plate ID**, select the **ID** field, and then enter the work ID from the sales line.

4. The picking work directs you to pick item *A0002* from location *01A01R1S2B*. You receive this instruction because item *A0002* is on a license plate that is in position *1* in that location.



5. Enter the license plate ID that you created for the location, and then follow the prompts to pick the sales order.

Change work pool on work

10/03/2025

You can use work pools to organize work into groups. For example, you can create a work pool to classify work that occurs in a specific warehouse location.

The *Change work pool on work* feature adds a **Change work pool** button to the Action Pane for work items. Therefore, warehouse managers can easily change the work pool of existing work. This feature lets managers react quickly to changes on the warehouse shop floor, and it helps improve their ability to adapt to changing situations and the need to transfer work to another work pool.

Set up the Change work pool on work feature

To use this feature, you must have some work pools set up. You might also set up your work templates so that they automatically assign a pool. If you want to work through the example scenario that is provided later in this article, set up your system as described in this section.

Set up work pools

Work pools let you organize work items by type. To work with the *Change work pool on work* feature, you must have at least two work pools available. To view and add work pools, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work pools**.
2. If you're working with demo data from the **USMF** company and will work through the example scenario later in this article, add two work pools that have the following settings:
    - Work pool 1:
        - **Work pool ID:** *Webshop*
        - **Description:** *Web Shop*
    - Work pool 2:
        - **Work pool ID:** *CallCenter*
        - **Description:** *Call Center*
3. On the Action Pane, select **Save**.

Set up work templates

For each of your work templates, you can set a default work pool, as you require. For each relevant template, you assign a work pool in the **Work pool ID** column. In this case, all work items that are generated by using a given template automatically inherit the assigned work pool. If you're working with the demo data from the **USMF** company and will work through the example scenario later in this article, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. On the Action Pane, select **Edit** to put the page into editing mode.
3. Edit the template by setting the following values:
    - **Work template:** *62 Pick to pack*
    - **Work pool ID:** *Webshop*
4. Select **Save**.

Example scenario

This scenario shows how to change the stream of processing for an existing work item by changing its work pool. It uses demo data from the **USMF** company and the settings that were suggested earlier in this article.

Create a sales order and release it to the warehouse

1. Confirm that there is enough on-hand inventory for items *A0001* and *A0002* in warehouse *62*. Go to **Inventory management** > **Inquiries and reports** > **On-hand list**, and edit the filters as shown here:
    - The **Warehouse** value begins with *62*.
    - The **Item number** value is either *A001* or *A002*.

    Demo data should have a quantity of 10 each.

    Next, you must create a sales order.
2. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
3. On the Action Pane, select **New**.
4. In the **Create sales order** dialog box, set the following values:
    - **Customer account:** *US-007*
    - **Warehouse:** *62*

5. Select **OK** to create the sales order and close the dialog box.
6. The new sales order is opened. It should include a new, empty line in the grid on the **Sales order lines** FastTab. On this line, set the following values:
    - **Item number:** *A0001*
    - **Quantity:** *2*
7. On the **Inventory** menu above the grid, select **Reservation**.
8. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
9. Close the page.
10. On the **Sales order lines** FastTab, select **Add line** to add another line to your sales order. On this line, set the following values:
    - **Item number:** *A0002*
    - **Quantity:** *2*
11. On the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the inventory.
13. Close the page.
14. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.
15. You receive informational messages that show the wave ID and shipment ID that were created from the release. Make a note of the wave ID.

Review the outbound wave

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. In the grid, search for the wave ID that was created from the release of the sales order.
3. Select the wave ID to view the details.
4. On the **Wave lines** FastTab, make sure that a shipment ID is shown for the sales order.

> **Tip**

If the **Process wave at release to warehouse** option is set to *No* in the setup for the shipping wave template, you must manually process the wave by selecting **Process** from the **Wave** tab on the Action Pane to create work.

5. Make sure that the wave has been processed. This processing creates the required work.

View work details and change the work pool

You can use the **Work details** page to view the work that was created and to manage the work pool.

1. Go to **Warehouse management** > **Work** > **Work details**.
2. Select the row for the work that was just created. The **Order number** column will show the sales order number.

   The **Work pool ID** field will be set to the work pool ID that was set up in the work template.

   > **Tip**
   >
   > If you don't see the **Work pool ID** field, add the column to the grid, and then refresh the page.

3. To change the work pool that is associated with the work ID, on the Action Pane, on the **Work** tab, select **Change Work pool ID**.
4. In the **Change work pool** dialog box, on the **Parameters** FastTab, in the **Work pool ID** field, select *CallCenter*.
5. Select **OK** to apply your change.
6. Notice that the value of the **Work pool ID** field has now been changed to *CallCenter*.

> **Important**
>
> When the **Change work pool** dialog box appears, the **Work pool ID** field might be blank by default. If the field is blank when you select **OK** to apply changes, you will remove the work pool completely from the work.

In addition to switching work pools, you can use this procedure to add a work pool to any work item that doesn't have one, or to remove a work pool from any work item that does have one.

Item consolidation - location utilization

10/03/2025

This article provides information about functionality that makes it easy for warehouse managers to view and filter the volumetric utilization of locations across the warehouse. Managers can select locations and create inventory movement work directly from the **Item Consolidation** page to consolidate items and therefore make better use of warehouse space.

Warehouse location status

The following four fields on the **Locations** page track information about the current state of the location:

- **Item number** – The item that is currently in the location. If the location contains multiple items, this field will be blank.
- **Last activity date and time** – The timestamp of the last warehouse transaction that was performed against the location.
- **Aging date** – The date when the inventory in the location was brought into the warehouse. This date is calculated based on the license plate aging date. Although this date is accurate for license plate–tracked locations, it might not be accurate for locations that aren't license plate–tracked.
- **Location status** – The status of the location. Four values are available:
  - *Undetermined* – The location profile doesn't track status. Therefore, the current status is unknown.
  - *Empty* – No inventory is currently in the location.
  - *Picking* – Outbound transactions have been performed against the location after it was last empty.
  - *Storage* – Only inbound transactions have been performed since the location was last empty.

These fields let warehouse managers get a better overview of the status of the locations in the warehouse. They also allow for more advanced reporting and filtering.

Set up item consolidation and location utilization

This section describes how to prepare your system to use item consolidation and location utilization. The procedures use sample values from the standard demo data. If you plan to work through the example scenario that is provided later in this article, select the **USMF** legal entity

(which contains the standard demo data), and create each record that is described in this section. If you don't plan to work through the example scenario, the values that are provided here can be considered examples of the types of setup that you must complete to use the features.

Released product

1. Go to **Product information management** > **Products** > **Released products**.
2. In the **Item number** field, select *M9201*, and open the details page.
3. On the Action Pane, on the **Manage inventory** tab, in the **Warehouse** group, select **Physical dimensions**.
4. On the **Physical dimension** page, on the Action Pane, select **New**.

   A new line is added to the grid. The **Item number** field is preset.
5. In the **Unit** field, select *ea*. The remaining fields on the line are automatically set.
6. Select **Save**, and close the page.

Location profile

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. In the list of location profiles, select **FLOOR-05**.
3. On the Action Pane, select **Edit**.
4. On the **General** FastTab, make sure that both the following options are set to *Yes*:
   - Enable item in location
   - Enable location status
5. Select **Save**.

> **Important**
>
> If the **Enable item in location** and **Enable location status** options were already set to *Yes*, skip ahead to the instructions for setting up the **Dimensions** FastTab in step 10. If the options weren't already set to *Yes*, you must run a consistency check for the **Warehouse management** module after you manually set them. In this case, continue to the next step.

6. To run the consistency check, go to **System administration** > **Periodic tasks** > **Database** > **Consistency check**.

7. In the **Consistency check** dialog box, set the following values:

    - **Module:** *Warehouse management*
    - **Check/Fix:** *Check*
    - **From date:** Leave this field blank.
    - **Warehouse location status consistency check:** Select this check box.

8. Select **OK**.

    > **Tip**
    >
    > When the consistency check is completed, you receive a notification. Open the Action Center to view the message. Select **Message details** to view the details.
    >
    > If the message for the consistency check states, "Incorrect location status information found for location XXXX in warehouse XX," you must run the consistency check again. This time, set the **Check/Fix** field to *Fix error*. View the messages to make sure that no errors were found.

9. You must now finish setting up the location profile. Go back to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**, select location profile **FLOOR-05**, and then, on the Action Pane, select **Edit**.

10. On the **Dimensions** FastTab, set the following values:

    - **Volume utilization percentage:** *100*
    - **Volumetric method used for inventory location:** *Use location volume*
    - **Actual location height:** *10*
    - **Actual location width:** *10*
    - **Actual location depth:** *10*
    - **Maximum weight:** *100*

11. Select **Save**.

Mobile device menu items

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New** to create a menu item for sorting.

3. In the header, set the following values:

- **Menu item name:** *Adjust In*
- **Title:** *Adjust In*
- **Mode:** *Work*
- **Use existing work:** *No*

4. On the **General** FastTab, set the following values:

    - **Work creation process:** *Adjustment in*
    - **Inventory adjustment types:** *Adjust in*

5. Select **Save**.

Mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. In the list of menus, select **Inventory**.
3. On the Action Pane, select **Edit**.
4. In the **Available Menus And Menu Items** list, find and select the **Adjust In** menu item.
5. Select the right arrow button to move **Adjust In** to the **Menu Structure** list. In this way, you add the new menu item to the selected menu.
6. Select **Save**.

Movement types

1. Go to **Warehouse management** > **Setup** > **Inventory** > **Movement types**.

2. On the Action Pane, select **New**, and then set the following values:

    - **Movement type code:** *CONSOLIDATE*
    - **Description:** *Consolidate locations*
    - **Work class ID:** *InvMov*

3. Select **Save**.

Example scenario

The following scenario uses the Warehouse Management mobile app to make an inventory *adjustment in* to two locations in the warehouse.

Add inventory to locations

1. Sign in to the mobile device as a user who is set up for warehouse *51*.

2. Go to **Inventory** > **Adjust In**.

   You will now enter the first location adjustment.

3. In the **Adjustment in** task, select the location to make the inventory adjustment for. In the **LOC** field, select *LP-001*.

4. Confirm the location.

5. Create a license plate ID for the item that will be added to the location. In the **LP** field, enter *LP00101*.

6. Confirm the license plate.

7. Enter the item that will be added to the license plate. In the **ITEM** field, enter *M9201*.

8. Confirm the item.

9. Enter the quantity of the item that will be added. In the **QTY** field, enter *10*.

10. Confirm the quantity.

    You receive a "Work Completed" message. You will now enter the second location adjustment.

11. In the **Adjustment in** task, select the location to make the inventory adjustment for. In the **LOC** field, select *LP-002*.

12. Confirm the location.

13. Create a license plate ID for the item that will be added to the location. In the **LP** field, enter *LP00201*.

14. Confirm the license plate.

15. Enter the item that will be added to the license plate. In the **ITEM** field, enter *M9201*.

16. Confirm the item.

17. Enter the quantity of the item that will be added. In the **QTY** field, enter *15*.

18. Confirm the quantity.

    You receive a "Work Completed" message.

19. Select the Menu button (sometimes referred to as the hamburger or the hamburger button), and then select **Cancel** to exit the **Adjustment in** task.

Consolidate locations

1. Go to **Warehouse management** > **Periodic tasks** > **Item consolidation**.
2. In the header, select a warehouse to do the consolidation for. In the **Warehouse** field, enter *51*.

   A record is shown for each location where item *M9201* was adjusted. The **Utilization percentage** column shows the volumetric utilization of each location.
3. To consolidate inventory, select all the locations that must be consolidated, and then, on the Action Pane, select **Consolidate Inventory**.
4. In the **Consolidate inventory** dialog box, specify the location and movement type that should be used to create the work for inventory movement. Set the following values:

   - **Location:** *LP-001*
   - **Movement type code:** *CONSOLIDATE*
5. Select **OK**.
6. You receive an informational message that shows the movement work that was created. Make a note of the movement work ID.

View movement work

1. Go to **Warehouse management** > **Work** > **Work details**.
2. View the work that was created. Use the movement work ID from the inventory consolidation to filter or search the work grid.

   In this scenario, an existing location that had inventory was used as the inventory consolidation location. Therefore, only one work ID was created.

   > ⓘ **Note**
   >
   > The system creates one work ID for each move that must be completed. If you specify a location that already contains inventory, only one work ID is created. If you specify a new location, two work IDs are created.

Work split

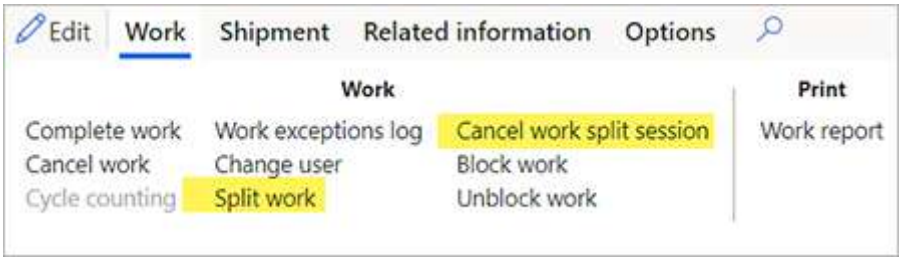
Work split functionality lets you split large work IDs (that is, work orders that have several lines) into several smaller work IDs that you can then assign to multiple warehouse workers. In this way, the same work creation number can be picked simultaneously by several warehouse workers.

> **ⓘ Important**
>
> You can split only work orders that have a status of *Open* or *In-progress*.

Enhancements to the Work details and All work pages

The *Work split* feature adds the following two buttons to the **Work** tab on the Action Pane of the **Work details** and **All work** pages:

- **Split work** – Split the current work ID into multiple smaller work IDs that can be processed by separate workers.
- **Cancel work split session** – Cancel the work split session, and make the work available for processing.



> **ⓘ Important**
>
> The **Split work** button won't be available if any of the following conditions are met:
>
> - The work status is something other than *Open* or *In progress*.
> - A container ID is associated with the work ID. (A container can't be systematically split, because it requires physical actions.)
> - The work is associated with a cluster.
> - The work order type is something other than one of the following types:

    - Sales orders
    - Raw material picking
    - Transfer issue

- The work is currently being split by another user. If you try to open the splitting page for work that is already being split by another user, you receive the following error message: "The work with ID #### is currently being split. Retry in a few minutes. If you continue to receive this message, contact a supervisor."

A new work blocking reason, *Split work*, indicates when the work ID is in the process of being split. It's shown both on the **Split work** page and in the Warehouse Management mobile app if a user tries to run the work. When blocking reasons are used, the name of the **Blocked wave** field from the work ID is changed to **Blocked**.

Initiate a work split

The feature adds a new **Split work** page that lets users split work lines from the work ID. When the page is first opened, it shows lines that have a work status of *Open* and that are available to be split. On the Action Pane, select **Split work** to process the selected work.

To split work, follow these steps:

1. Open one of the following work pages:

    - **Work details** (**Warehouse management** > **Work** > **Work details**)
    - **All work** (**Warehouse management** > **Work** > **All work**)

2. In the grid, select a work ID to split. The **Work order type** field must be set to one of the following values:

    - Sales orders
    - Raw material picking
    - Transfer issue

3. On the Action Pane, on the **Work** tab, in the **Work** group, select **Split work**.

    The **Split work** page appears and shows the work lines that are open and available to be split. By default, only available work lines are shown. To view all lines for the work ID (for example, lines that have a work type of *Put*), select the **Show all lines** check box above the grid.

The following message is shown: "Users can't process lines of the work until you finish splitting and close this page."

The **Work blocking reason** field for the current work will be set to *Split work*, and the work will be blocked.

4. Select the lines to remove from the current work ID and add to a new work ID. The following events occur:

    - When you split the work, the selected line or lines from the original work ID are canceled and then copied to a new work ID.

    - The existing work template structure and the location of the put (and also future pick/put pairs) are preserved. Values for the following work ID fields are copied from the original work to the new work:
        - Load ID
        - Shipment ID
        - Work order type
        - Order number
        - Site
        - Warehouse
        - Work priority
        - Work pool ID
        - Wave ID
        - Work creation number

    - The following fields aren't copied to the new work ID:
        - **Work ID** – A new work ID is generated from the appropriate number sequence.
        - **Work status** – This field is set to *Open*.
        - **Locked by** – This field is initially set to blank.
        - **Target license plate ID** – This field is left blank.
        - **Created date and time** – This field is set to the current date and time.

- **Blocked wave/frozen** – This field is recomputed for the original work ID and the new work ID.

5. On the Action Pane, select **Split work**.

While the work is being split, the following message is shown: "Processing operation - Split work". While this message is visible, you can cancel the operation by selecting **Cancel** in the message box.

If the **Show all lines** check box is cleared, the line that was split off and canceled will no longer appear in the grid. If the check box is selected, you should see that the value of the **Work status** field for that line has changed to *Canceled*.

The following notification is shown to indicate that the new work ID has been created: "Work #### has been created by splitting off from original work ####."

Other work lines from the original work ID (such as *Put* lines) will be adjusted as required to reflect the lines of work that have been canceled. For example, if the original work ID had a *Put* line for a quantity of 15, and *Pick* lines that have a total quantity of 10 were canceled, the new *Put* quantity on the original work ID will now be 5.

The new work won't immediately be assigned to any user. However, you can assign it to a user now, as required, by using the standard functionality of the **Work details** page.

> **Important**
>
> You can split only work IDs that contain two or more available work lines. If you select **Split work** when there is only one work line, you will receive the following error message: "At least one work line must remain on initial work." In this case, no splitting will occur.

Finish a work split

To finish splitting work, the *Split work* blocking reason must be removed. There are two ways to complete this step:

- The user who is splitting the work closes the **Split work** page by selecting the **Close** button (**X**) in the upper-right corner. When the page is closed, the *Split Work* blocking reason will be removed. The *Blocked* state of this work will be recomputed and, if there are no remaining blocking reasons for this work, the work will be unblocked.

- Any user opens the work ID and selects the **Cancel work split session** button on the Action Pane. The *Split work* blocking reason will be removed, and the *Blocked* state of this work will be recomputed, just as when the **Split work** page is closed.

After the *Split work* blocking reason is removed, the work can be run on the mobile device, provided that the **Blocked** state is set to *No* on the work ID.

User blocking on the Warehouse Management mobile app

If you try to use the Warehouse Management mobile app to run picking work against a work ID that is being split, you will receive the following error message: "The work with ID #### is currently being split." If you receive this message, select **Cancel**. You can then continue to process other work.

Other blocked operations

Any operations that modify work lines, work inventory transactions, or replenishment links that are related to work that is being split will fail, and the following error message will be shown: "The work with ID #### is currently being split."

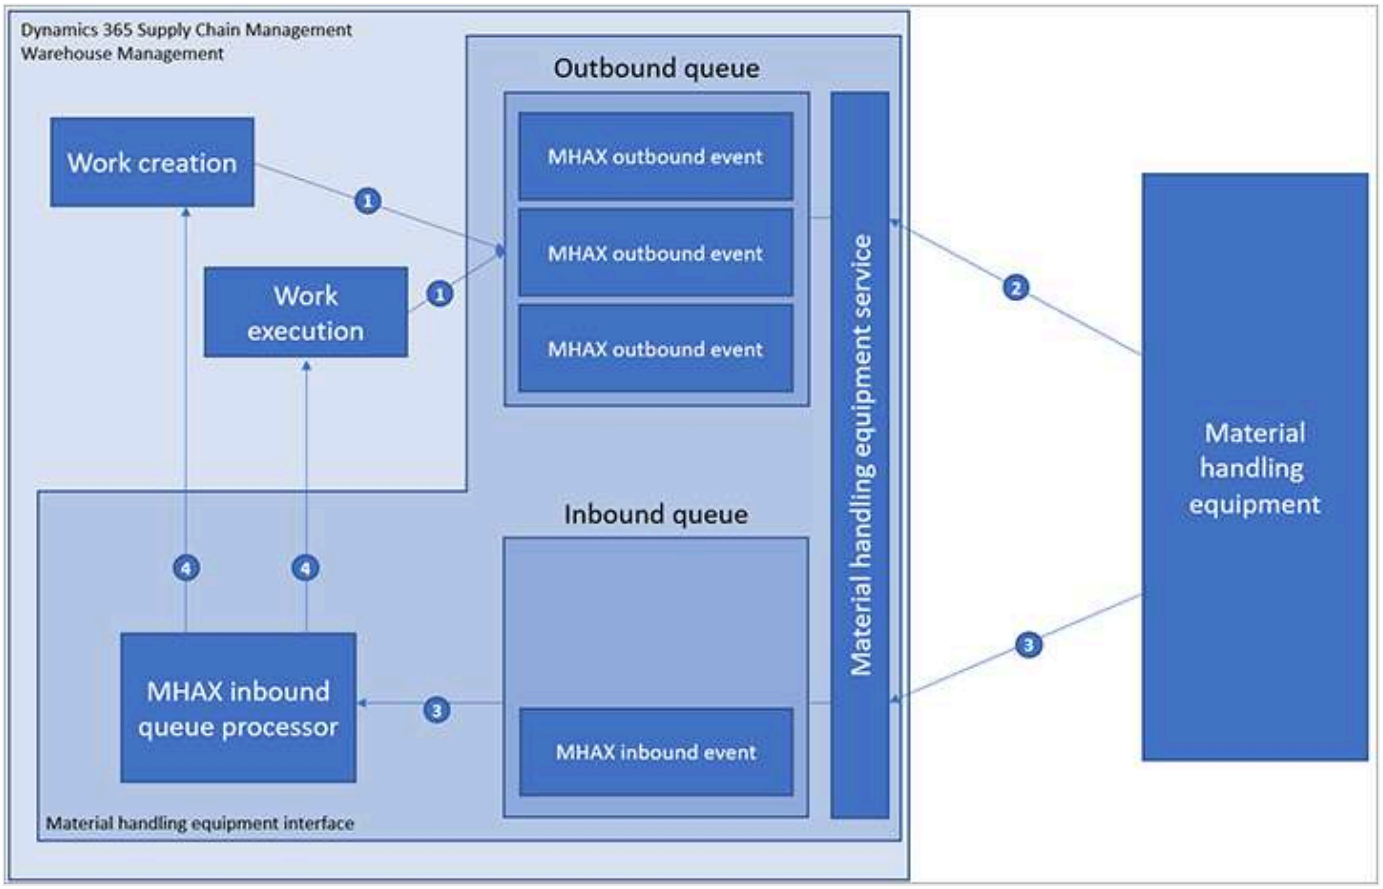
Last updated on 12/30/2025

Material handling equipment interface (MHAX)

You can use the *material handling equipment interface* (MHAX) to connect external physical material handling (MH) systems to a warehouse that is managed by warehouse management processes (WMS) in Microsoft Dynamics 365 Supply Chain Management. The interface between the WMS and MH systems consists of two queues: one for outbound events (WMS to MH) and one for inbound events (MH to WMS). The WMS system generates outbound events based on work lines that are created during various work creation and execution processes. The MH system then regularly polls the WMS system for new events and processes the responses. After the MH system has finished handling the events in accordance with work instructions, it sends inbound events, such as work line completion and short picking.

> **Important**
>
> By enabling this feature, your data might be shared with the third-party services that you select. You control what data is shared with the third-party (if any). Your use of the third-party services is your responsibility and is governed by terms agreed between you and the third party. Your privacy is important to us. To learn more, read our Privacy Statement.

The following illustration shows the various elements and the order that processes occur in when you use MHAX integration.



Here's an explanation of the interactions that are shown in the previous illustration:

1. During work creation or work execution, outbound events are created in the outbound queue.
2. The MH equipment connects to the MH equipment service, polls for any new events that are relevant to it, and processes those events.
3. When the MH equipment is ready to report back, it connects to the service again and submits inbound events. The queue processor immediately processes those events.
4. Based on the inbound event data, the queue processor might run existing work, modify it, or create new work.

Turn on the MHAX feature

Before you can use the MHAX feature, turn on its configuration key.

1. Put your system into maintenance mode, as described in Maintenance mode.
2. Go to **System administration** > **Setup** > **License configuration**.
3. Expand **Trade** > **Warehouse and Transportation management**, and then select the **Material handling equipment interface** check box.
4. Turn off maintenance mode, as described in Maintenance mode.

Set MHAX parameters

Set a few general parameters on the **Material handling equipment interface parameters** page to configure the feature.

1. Go to **Material handling equipment interface > Setup > Material handling equipment interface parameters**.

2. On the **General** tab, set the following fields:

    - **User mappings** – Map system users to their related warehouse workers. The system users call the inbound queue service. Selected workers are assigned the work operations (picks and puts) that are processed through the inbound queue. Work operations are performed in the default warehoues of each worker.
    - **Enable inbound message ID** – When you set this option to *Yes*, if a duplicate inbound message ID is received, the message is rejected and an error message is displayed that states the message already exists. When you set this option to *No*, duplicate inbound message IDs are allowed.
    - **Enable manual inbound message creation** – When you set this option to *Yes*, you can simulate inbound messages by creating a record directly from the **Inbound queue** page.

3. On the **Number sequences** tab, select the system-wide number sequences that generate unique IDs for the inbound queue items, outbound queue items, and work line pairs.

Outbound events

At specific points during work creation or work execution, the system determines whether it must generate outbound events to send to the MH system. If a subscription is configured for a specific point during warehouse processing, the system generates the event according to the setup of the subscription.

Structure of outbound events

Each outbound event is uniquely identified by an outbound queue ID. The outbound transaction type determines the type of the event. The warehouse and the ID of the subscription that generated the event are also recorded on the event.

To carry data to the MH system, the outbound event contains 10 fields for data (**data01** through **data10**). These data fields have a one-to-one (1:1) mapping to existing database fields. Specifically, they are extracted from fields in the work line and work header tables. The fields can be freely selected. You set them up when you create the subscription.

Besides the 10 data fields that have a 1:1 mapping to existing database fields, the event can contain an additional data field that is known as the *payload*. The contents of this field are generated by custom X++ code that is known as a *payload generator*. Any payload generator that should be used is set up in the subscription.

To ensure that the MH system receives each outbound queue ID only one time, a status field is used to specify whether an event is ready to be sent to the external material handling system (*Ready* status) or has already been sent (*Sent* status).

Outbound queue subscriptions

Before any events are generated, a subscription must be set up to tell the MHAX feature whether and how to generate events. Generated events are tagged by the subscription identifier. Therefore, multiple MH systems can connect to the same WMS system but keep their events separate. When the MHAX service is polled for new events, a subscription is one of the available options for retrieving the events.

To create a subscription, go to **Material handling equipment interface** > **Setup** > **Subscriptions**. For each subscription, the following parameters are available:

- **Subscription ID** – A unique name that identifies the subscription.
- **Description** – A free-text description of the subscription.
- **Warehouse** – The specific warehouses that events should be filtered by.
- **Outbound transaction type** – The type of events that the subscription should contain.
- **Payload generator** – An optional code extension that can enter additional information in the **Payload** field of the outbound event.

You can associate a query with each subscription. This query filters work lines and headers to further limit the work that uses the subscription to generate events. To add a query to a subscription, select the **Run query** check box for the relevant subscription on the **Subscriptions** page, and then select **Edit query** on the Action Pane. The standard Supply Chain Management query editor appears.

In addition, the subscription includes a *subscription map* that maps fields from either the work header or the work line to some or all of the 10 free data fields of the outbound event, as required. To return information to the MHAX service, typically include the work line record ID or the *work line pair ID*. (The work line pair ID is a new property that enables the system to use a single return command to process pick and put lines.) The remaining fields depend on the use case. Some examples are provided later in this article.

To set up a subscription map, select the relevant subscription on the **Subscriptions** page, and then select **Subscription map** on the Action Pane. In the **Subscription map** dialog box that appears, you can assign a table and field for each available data field as you require.

Outbound event types

This section describes the various event types that are available. (Event types are also known as *transaction types*.) It also explains when each type of event is created in the WMS system.

Work creation events (WorkCreation)

Work creation events are created after work is generated by the application. This behavior applies to most types of work creation processes, most notably to the creation of picking and replenishment work. In general, if work is created in an *Open* state, which indicates that the work is ready to be run by a worker, a work creation event is generated. In addition, work creation events are generated for basic movement work (not movement by template work), even though that work isn't created as open work.

A notable exception to this behavior is cycle counting work, which isn't currently supported. Stock counts in the MH system are outside the scope of MHAX, and the results of counts must be imported into an inventory counting journal.

After work is created, the MHAX service processes the generated work lines and assigns a work line pair ID to all generated work lines for each work header. The objective is to group all the pick work lines with the successive puts under one work line pair ID. (The groups correspond to pick/put pairs in work templates.) In this way, a single ID can be used to report work completion for all related pick and put lines. The grouping process starts with the first line and then continues with the same ID until it encounters a successive pair of put/pick work lines. The running ID is assigned to the put line of that pair. A new ID is then used for the pick line of the pair onward. This process continues until it processes all lines that belong to the work header.

As a special feature of work creation events, if the **Blocked wave** option is set to *Yes* on the work header, the events that are generated will have a status of *Blocked* instead of the usual status of *Ready* that is used to send them to the MH system. The **Blocked wave** flag on the work header indicates that the work header isn't yet ready for workers to run, perhaps because of unfinished replenishment work. When the **Blocked wave** flag is cleared, events that have already been generated are unblocked and are available for the MH system to retrieve from the queue.

Work initiation events (WorkInitiation)

Work initiation events are triggered when the work status changes from *Open* to *In process* during work update.

Work completion events (WorkCompletion)

Work completion events are triggered when the work status changes from *In process* to *Closed* during work update.

Work cancellation events (WorkCancel)

Work cancellation events are triggered when the work status changes from any status besides *Canceled* to *Canceled* during work update. In addition, all other events that are related to the work header are deleted from the queue for all subscriptions. In this way, external systems are prevented from processing events that aren't required.

Pick/put completion events (PickCompletion/PutCompletion)

Pick/put completion events are triggered when the status of the pick/put line changes from *In process* to *Closed* during work line update.

Monitor the outbound queue

To review your outbound queue, go to **Material handling equipment interface** > **Common** > **Outbound queue**. The **Outbound queue** page lists every outbound queue item and its status. Select a queue item to view its details. These details include the item's transaction type, the subscription that it used, and values for each data field (**data01** through **data10**) and the payload.

Clean up the outbound queue

Eventually, your outbound queue starts to fill with queue items that are already sent. To remove these items, go to **Material handling equipment interface** > **Periodic tasks** > **Cleanup** > **Outbound queue cleanup**.

Inbound events

This section describes the various types of inbound events that the MH system can report back to the WMS system. It also explains data must be supplied by the MH system, and what each inbound event does in the WMS system.

Structure of inbound events

When an inbound event is submitted, the external system must supply the inbound transaction type together with up to 10 parameters (**data01** through **data10**). Optional validation can make sure that the MHAX service doesn't receive the same inbound event more than one time. To enable this validation, each inbound event must have a unique message ID. If a duplicate message ID is received, and if the **Enable inbound message ID** option is set to *Yes* on the **Material handling equipment interface parameters** page, the message is rejected. An error message states that the message already exists.

In addition to the incoming data fields, the system assigns a unique inbound queue ID to the event.

Inbound event types

This section describes the inbound event types (transaction types) that are supported and the data that must be supplied for events to be processed.

Work-confirm events (WorkConfirm)

Work-confirm events require that the incoming data fields include the following information:

- **data01** – The work line pair ID.
- **data02** – The work line record ID (`RecId` value).

  > ⓘ **Note**
  >
  > *Either* the **data01** field *or* the **data02** field must be present.

- **data03** – The ID of the license plate to pick from.
- **data04** – The work header's target license plate ID.

If the work line pair ID is provided, all pick, put, or custom work lines that are marked by the work line pair ID, and that have a status of *Open* or *In process*, are run sequentially. If a work line record ID (`RecId` value) is provided, the work line must be a pick, put, or custom work line with a status of *Open* or *In process*.

Pick lines from license plate–controlled locations require that the **data03** specify the license plate that should be picked from, regardless of whether the lines are marked by the work line record ID or the work line pair ID. The **data04** field must specify the work header's target license plate for the pick.

Put lines don't accept further information. They are run based only on the current work line's location and the work's target license plate. If the put must be done to a different location, change the location of the work line as described in the Override events section later in this article.

Custom work lines don't require or support any additional information in the inbound event.

Short pick events (ShortPick)

Short pick events require that the incoming data fields include the following information:

- **data02** – The work record ID (`RecId` value).
- **data03** – The ID of the license plate to pick from.
- **data04** – The quantity to pick.
- **data05** – The short pick exception code that's linked to a *Work exception* record where the **Exception type** value is *Short pick*.
- **data06** – The work header's target license plate ID. This ID can be left blank when it's set up to be automatically generated.

> ⓘ Note
>
> The **data01** field isn't used for short pick events.

This event resembles the work confirmation event, but it applies only to pick lines.

Override events (Override)

Override events require that the incoming data fields include the following information:

- **data01** – The work record ID (`RecId` value).
- **data02** – The new location ID.

The work line must have a status of either *Open* or *In process*, and the new location must exist.

License plate receipt events (LPReceipt)

License plate receipt events require that the incoming data fields include the following information:

- **data01** – The ID of the inbound license plate to receive.

The system performs a license plate receiving operation, based on the license plate that is passed in as the value of the **data01** field.

Monitor the inbound queue

To review your inbound queue, go to **Material handling equipment interface** > **Common** > **Inbound queue**. The **Inbound queue** page lists every inbound queue item and its status. Select a queue item to view its details. These details include the item's transaction type, the message ID, and values for each data field (**data01** through **data10**).

If an error or another type of log item occurs while processing inbound events, you can inspect the log by selecting **Error log** on the Action Pane.

Inbound event processing

Inbound events are first written to the database and are then immediately (synchronously) run. If an error occurs during processing, the event is still written to the queue, but the status is set to *Errored*. The MHAX service returns an error message to the MH system and stores the error log in the inbound event record for later investigation.

Events that have a status of *Errored* can be reprocessed later if the error condition is fixed. To reprocess them, follow one of these steps:

- Go to **Material handling equipment interface** > **Common** > **Inbound queue**. Select the relevant inbound queue, and then select **Reprocess** on the Action Pane.
- Go to **Material handling equipment interface** > **Common** > **Reprocess errored inbound queue**. A standard batch job dialog box appears. There, you can set up a record filter, and schedule or run a batch job to reprocess the queue.

All work operations (picks and puts) run by using the worker who is selected in the **User ID** field on the **Material handling equipment interface parameters** page.

Clean up the inbound queue

Eventually, your inbound queue fills with queue items that are already processed. To remove these items, go to **Material handling equipment interface** > **Periodic tasks** > **Cleanup** > **Inbound queue cleanup**.

Get a quick overview by using the queue manager

To get a quick overview of all the activity that's related to your inbound and outbound queues, go to **Material handling equipment interface** > **Workspaces** > **Queue manager**. The **Queue manager** page provides a set of tabs and tiles that you can use to monitor and explore your queues. It also provides useful links to most of the other pages that are mentioned in this article.

Connect to the MHAX service

MHAX is implemented as a custom service. Therefore, it's accessible via SOAP and REST calls. Here are the addresses of the SOAP and REST endpoints:

- **SOAP:** `https://base_environment_URL/soap/services/WMHEServices`
- **REST:** `https://base_environment_URL/api/services/WMHEServices/WMHEService`

Retrieve messages from the outbound queue

To retrieve messages from the outbound queue, use one of the following methods:

- Use `readOutboundSubscriptionQueue` to retrieve the events based on the subscription ID.
- Use `readOutboundWarehouseQueue` to retrieve the events based on the event type and warehouse ID across multiple subscriptions.

Last updated on 05/06/2026

What's new or changed in the Warehouse Management mobile app

This article lists new features, fixes, improvements, and known issues for each released version of the Warehouse Management mobile app for Microsoft Dynamics 365 Supply Chain Management. It lists changes for each version released since the general availability (GA) release of version 4. Notes for older versions are available in Warehouse Management mobile app release notes archive.

Starting with version 4.1.1.0, every V4 and later release is tagged with its publication date. Publication dates determine whether a release is within the rolling 12-month support window that applies to V4 and all later releases. Learn more in Support policy for the Warehouse Management mobile app.

> **Note**
>
> The publication date listed for each version marks the day the release becomes available in AppCenter and the day progressive rollout to the app stores (Microsoft Store, Google Play, and Apple App Store) begins. Because rollout is gradual, the update might not appear on every device on that exact date. Availability in each store can take several additional days to reach all users.

> **Tip**
>
> For upcoming release dates, see **Warehouse Management mobile app release schedule**. That article also describes optional ways to validate a release before it reaches your warehouse floor.

Release notes for version 4.1.6.0 (September 2, 2026)

Version 4.1.6.0 is a hotfix release.

Bug fixes in version 4.1.6.0

- **Spinner control** – Fixed an issue where the spinner control reset the entered value to *0* when a worker entered a value that was greater than *20*.

Improvements in version 4.1.6.0

- **External numeric keypads** – You can now use an external numeric keypad (numpad) to enter digits in the app.

Release notes for version 4.1.5.0 (August 25, 2026)

Version 4.1.5.0 is a cumulative update that includes new features, improvements, and a broad set of fixes.

New features in version 4.1.5.0

- **Camera scanning** – The camera scanner now recognizes more barcode formats. No configuration is required because the additional formats are detected automatically. You can also set the color and thickness of the scan frame that outlines the scanning area.
- **Notification sounds** – You can now select a separate sound for success, failure, and warning notifications. A duplicate re-scan sound setting was also removed.
- **ProGlove arm scanners** – Added the first version of the bridge for ProGlove arm scanners. Scanner input, including image capture, is now connected to the form flow. Learn more in Advanced bar code scanner configuration.
- **Client settings** – Added an editable **Client settings** option for connections. Use these settings in enterprise environments that have specific requirements, such as environments that require Transport Layer Security (TLS) 1.2 or that require workers to sign in every time they start the app. New connections now use user name and password authentication by default.

Improvements in version 4.1.5.0

- **App startup** – Reduced the work that the app does while it starts, and reduced the size of the fonts and scripts that it loads. The app now starts faster.
- **Step pages** – Reduced the number of times that a step page redraws itself, so that steps respond faster when values change.
- **Sign-in performance (Android)** – Removed unnecessary authentication token renewals that added delay to routine requests.
- **Network communication** – Improved how the app communicates with the server. Network behavior can now be adjusted centrally, without a new app version.

- **Details cards** – Details cards are now scrollable by default.
- **Android 16** – The app and its native modules now target Android 16 (API level 36), which meets current Google Play requirements.
- **Authentication libraries** – Updated the Microsoft Authentication Library (MSAL) and OneAuth libraries to supported versions.
- **Security** – Applied multiple security fixes and dependency updates.
- **Performance telemetry** – Round-trip telemetry now matches the measurements that Warehouse Management mobile app version 3 reports, so that you can compare performance between the two versions. Telemetry now also measures how long warehouse tasks take, not just how long the server takes to respond.
- **Telemetry quality** – Numeric values are now recorded correctly in flow telemetry, and less irrelevant data is logged. Therefore, meaningful signals are easier to find.
- **Accessibility** – Improved screen reader support and navigation across menus, work cards, the welcome screen, combo boxes, version information, headers, and announcements of selected items.
- **VoiceOver (iOS)** – Improved VoiceOver support, especially in combo box dialog boxes.

Bug fixes in version 4.1.5.0

All platforms

- **Submitted data** – Fixed an issue where values on the current page could be altered when the page was submitted to the server.
- **Duplicate work** – Fixed an issue where the app resent a submitted page after a timeout or a gateway error, without notifying the worker. This behavior could cause warehouse work to be completed twice.
- **Escaped characters** – Fixed an issue where server responses that contained escaped characters were shown incorrectly.
- **Single sign-on (SSO)** – Fixed a *broker no result* error that prevented workers from signing in.
- **App startup** – Fixed an issue where a failure in a single part of the app prevented the whole app from starting.
- **Error messages** – Fixed an issue where the app showed a generic failure message instead of the error message that the server returned.
- **Error page** – Fixed the layout, icon placement, and animation order on the error page. The page now adjusts correctly when the window is resized.
- **Calculator** – Fixed an issue where the calculator dropped digits during fast entry.
- **Spinner control** – Fixed an issue where the spinner didn't respond to tap and drag gestures on desktop devices.

- **Dialog boxes** – Fixed an issue where a dialog box closed when a worker selected the content inside it.
- **Promoted fields** – Fixed the formatting of promoted fields and corrected default values that were outside the allowed range. Both now match version 3 behavior.

Windows

- **Network failures** – Fixed an issue where the app couldn't reach the Supply Chain Management server or the Microsoft sign-in pages.
- **Blank page on startup** – Fixed an issue where the app showed a blank white page when it started, including when several RemoteApp sessions ran at the same time.
- **Camera scanning** – Fixed an issue where the camera scanner incorrectly decoded barcodes that contained group separators.
- **Layout and display** – Fixed the position of the app window, corrected rendering in high-contrast mode, and fixed an issue where the read-only spinner control cut off long numbers.

Android

- **Sign out** – Fixed an issue where signing out didn't sign the worker out completely. The app now clears both the account and the web session of the identity provider. Therefore, the next sign-in correctly prompts for credentials instead of reusing the previous identity.
- **Barcode scanning** – Fixed an issue where some barcodes couldn't be scanned, because several formats were ignored.
- **Diagnostic files** – Fixed an issue where diagnostic files were saved to a location where mobile mass deployment (MDM) solutions couldn't retrieve them from locked-down kiosk devices.

iOS

- **Barcode scanning** – Fixed an issue where some barcodes couldn't be scanned. Barcode detection now uses Apple Vision.
- **Scan frame** – Fixed an issue where the scan frame appeared in the wrong position.

Release notes for version 4.1.4.0 (May 28, 2026)

Version 4.1.4.0 is a minor update that includes the following features and fixes:

New features in version 4.1.4.0

- **Camera improvements** – Added support for Code 39 Mod 43 barcodes.

Bug fixes in version 4.1.4.0

- **Right-to-left (RTL) support** – Corrected layout and formatting issues for right-to-left languages.
- **Submit spinner** – Resolved a UI hang and glitch that occurred when submitting forms.
- **Keyboard focus** – Fixed an issue where the virtual keyboard didn't automatically trigger when typing started.
- **Encoding** – Resolved character rendering and text corruption issues.
- **On-premises** – Fixed issues affecting on-premises deployments on Android and iOS.
- **AppCenter distribution** – Resolved issues experienced by users downloading the `.msixbundle` from AppCenter.

Release notes for version 4.1.3.0 (May 18, 2026)

Version 4.1.3.0 is a minor update that includes the following fixes and improvements:

Bug fixes in version 4.1.3.0

- **Label encoding** – Fixed an encoding issue that caused incorrect signs to display on labels.
- **Quantity selector** – Improved performance of the quantity selector and resolved a concurrency issue.
- **Calculator** – Fixed an issue where typing in the calculator reopened the calculator instead of continuing input.

Improvements in version 4.1.3.0

- **Right-to-left (RTL) support** – Improved support for right-to-left languages.

Release notes for version 4.1.2.0 (May 6, 2026)

Version 4.1.2.0 is a minor update that includes the following fixes and improvements:

Bug fixes in version 4.1.2.0

- **Components fields** – Fixed an issue that caused `data=1` to appear in some edge case scenarios.

Improvements in version 4.1.2.0

- **Diagnostics** – Added the option to clean up authentication data from the **Diagnostics** page.

- **Windows MDM** – Expanded mobile device management (MDM) configuration collection to support a broader range of MDM providers on Windows.

Release notes for version 4.1.1.0 (April 30, 2026)

Version 4.1.1.0 focuses on performance, small-screen layouts, scanning reliability, and a broad set of platform-specific bug fixes.

> **Important**
>
> Starting on **May 1, 2027**, version 4 (V4) and every later release of the Warehouse Management mobile app follow a rolling 12-month support window. Microsoft accepts support cases only for releases that were published within the previous 12 months. This policy applies to every release from V4 onward, regardless of whether it's a major, minor, or patch version. The app continues to run on out-of-window releases, but support cases require an in-window version. This policy is critical to maintain the quality, security, and platform compatibility of the app. Learn more in Support policy for the Warehouse Management mobile app.

Improvements in version 4.1.1.0

- **Performance enhancements** – Faster response times for the calculator, quantity fields, and overall touch interactions.
- **Small-screen optimization** – Improved layout and rendering for displays around 640 px, optimized for truck-mounted devices.
- **Brokered authentication (optional)** – Fixed edge-case issues and updated the technical documentation. This feature remains optional.

Scanning and input improvements

- **New scanning engine** – A dedicated global listener now handles hardware scans, so you get improved reliability. This change also addresses navigation issues on hardware that uses arrow keys.
- **Dialog support** – Scans work correctly while error, confirmation, or option dialogs are displayed.
- **Duplicate scan protection** – Prevents double actions on devices that send the same barcode through multiple channels.

- **GS1 barcode support** – Batch numbers that contain GS1 separators (`0x1D`) are now handled correctly, resolving previous disconnection issues.
- **Navigation fixes** – Restored arrow-key navigation for processes such as Sales picking, and fixed rescanning during quantity confirmation.

Bug fixes in version 4.1.1.0

Layout and display

- **Pallet building** – The **Done** button is now visible on small or nonmaximized windows. You can access the **Correct**, **Cancel**, and **Done** actions without resizing.
- **Calculator** – Fixed layout problems when using landscape mode on small screens.

Windows

- **Spinner control** – Fixed a problem where the spinner could stop between values. It now snaps correctly.
- **Authentication** – Resolved a crash during sign-in caused by an unhandled exception.
- **Clipboard** – Removed the unnecessary *Allow paste* prompt when selecting input fields.
- **MDM** – Implemented mobile device management (MDM) read of configurations for Windows.

iOS

- **Calculator** – Fixed a problem where the calculator opened automatically without user interaction.

Localization

- **Spanish (ES)** – Fixed a problem where trailing or embedded zeros were removed from production and work quantities. Behavior now matches en-US formatting.

Release notes for version 4.0.39.0

This update includes critical fixes for authentication workflows, significant battery life optimizations, and expanded hardware support across Android, iOS, and Windows.

New features in version 4.0.39.0

- **Scrollable details card** – Added the option to turn on scrolling for details cards so workers can view more information on one screen without collapsing sections. The scrollable details card is designed for larger screens; on smaller devices, the feature might not work as expected. On smaller screens, switching to landscape mode might reduce the available space, which could affect scrolling behavior.

Improvements in version 4.0.39.0

- **Battery consumption** – Optimized background processes and resource management, resulting in an approximate 9% reduction in battery usage during standard operation.
- **Authentication and connectivity** – Resolved a caching issue where the application incorrectly reused legacy connection data. This fix prevents missing connections and the need to restart the app manually.
- **MDM detection** – Improved mobile device management (MDM) detection resilience by extending the polling interval for policy checks.
- **Telemetry** – Corrected a reporting error in connection-performance telemetry. Connection speed and latency data are now accurately measured and logged.
- **Device compatibility** – Relaxed hardware and software requirements to enable installation on a broader range of legacy and modern devices.
- **Windows navigation** – Added support for the Esc key on Windows to facilitate quicker navigation and menu exits.
- **Legacy pages** – Implemented targeted performance enhancements for legacy UI pages to reduce load times and input lag.

Fixes in version 4.0.39.0

- **Entra brokered authentication** – Resolved a critical issue on Android that prevented Microsoft Entra brokered authentication from completing successfully.
- **iOS scanning** – Fixed a focus-management glitch where success notifications (toast messages) prevented the scanner from immediately returning to a ready state on iOS devices.
- **iOS UI layout** – Corrected a layout issue on the **Edit connection** page where the system keyboard obscured action buttons at the bottom of the screen on iOS devices.
- **Step banner** – Fixed a bug where the step banner displayed a generic *Scan or enter here* placeholder instead of the context-specific value defined in the step.
- **Stability** – Resolved an issue within the animation library that caused intermittent application crashes, particularly on older hardware.

- **Blind cycle counting** – Fixed a logic error that caused duplicate error messages to be displayed consecutively.

Version 4.0.38.0

Version 4.0.38.0 includes the following fixes and improvements:

- Fixed an issue that caused pages to render incorrectly when users navigated from the **Item inquiry** page to a custom page.
- Fixed an issue where the **Back** button didn't clear previously selected data when navigating between **Item inquiry** pages.
- Fixed an issue where some mobile mass deployment (MDM) solutions couldn't push connection settings, such as those specified in the **ConnectionsJson** field in Microsoft Intune, to the app.
- Fixed an issue where browser shortcuts appeared when users scanned a value.
- Improved the diagnostic file collection flow. Users can now share or save the diagnostic file in a local folder, which is useful when using kiosk mode.
- Fixed an issue where users couldn't scan a license plate on the **Confirm** page when running *Movement* flows. Only the last character of the barcode was shown.
- Fixed an issue in the *Movement* flow where a previous value could be shown in the step banner on the wrong step.
- Fixed a visual issue where **Work list** tile headers that contained special characters weren't displayed correctly.

Version 4.0.37.0

Version 4.0.37.0 includes the following fix:

- Fixed an issue where users had to enter a complete email address when the domain name was present in the connection configuration.

Version 4.0.36.0

Version 4.0.36.0 includes the following fixes and improvements:

- Fixed an issue that caused fields on the **Custom legacy** page to display incorrectly.
- Added support for on-premises environments on iOS.
- Fixed an issue where duplicate names in the XML caused connection failures.
- Fixed an issue where the Copilot summary didn't refresh.

- Fixed an issue where popup list item names were parsed incorrectly, causing an error.
- Fixed an issue where spinner values reset incorrectly after an error occurred.
- Fixed an issue where sending multiple requests caused an application error.
- Improved error messages to provide better clarity for users.
- Improved authentication for on-premises environments on Windows. If you experience problems with a previously working on-premises authentication on Windows, edit the connection and set broker No.
- Fixed an issue where the pull-to-refresh gesture on the work list page didn't refresh correctly.

Version 4.0.35.0

Version 4.0.35.0 includes the following fixes and improvements:

- Fixed an issue in the Sales picking flow where the corresponding quantity value was selected incorrectly.

Version 4.0.34.0

Version 4.0.34.0 includes the following fixes and improvements:

- Fixed an issue that caused installation failure on Windows devices when using a mobile mass deployment (MDM) solution.

Version 4.0.33.0

Version 4.0.33.0 includes the following fixes and improvements:

- Corrected the requirements listed on the Google Play store, which previously stated that near-field communication (NFC) and camera hardware were required. You can install and use the app on devices that don't include these features.
- Resolved a calculator issue that caused a process-guide error when users selected the submit button.

Version 4.0.32.0

Version 4.0.32.0 includes the following fixes and improvements:

- Aligned authentication with Warehouse Management mobile app version 4.0.29.
- Fixed an issue that caused some apps to crash in the previous version.

Version 4.0.31.0

Version 4.0.31.0 includes the following fixes and improvements:

- Fixed an issue that caused some apps to crash in the previous version.
- Added options to check Wi-Fi status, export HAR files, and view logs.
- The app now sends meaningful Wi-Fi telemetry data to Application Insights.
- Fixed several critical crash scenarios, including a gesture-related crash on older devices.
- Fixed an issue where the *Confirm location* placeholder wasn't visible when scanning with the device camera.
- Fixed a visual issue where the focus indicator on work list cards was invisible in light mode.
- Added a **Diagnostics** button to the main menu to improve accessibility.
- Fixed an issue where losing the internet connection redirected users to the sign-in page instead of the page where the connection was lost.
- Resolved an authentication issue that required users to sign in a second time.

Version 4.0.30.0

Version 4.0.30.0 includes the following fixes and improvements:

- Fixed an authentication problem on on-premises Windows installations.
- Improved transitions when navigating between pages.
- Fixed an issue where the work list search field wasn't cleared after refreshing the page.
- Fixed an issue where step instructions didn't remember the *Don't show again* selection when two menu items had the same name.
- Improved Wi-Fi diagnostics through better request handling and clearer error reporting.
- Fixed a concurrency-related problem that could cause sign out failures.
- Fixed an issue on custom legacy pages where fields could appear in the wrong order or show incorrect values after edits.
- Added a loading spinner for long-running sign out operations.

Version 4.0.29.0

Version 4.0.29.0 includes the following fixes and improvements:

- Fixed an authentication failure that occurred when multiple connections used the same client ID. The failure showed an incorrect redirect URL.
- Fixed an issue that affected deployment of the app to iOS devices when using a mobile mass deployment (MDM) solution.

- Improved support for Microsoft Entra Conditional Access.
- Added support for ProGlove devices.
- Added support for haptic feedback through external wearable devices.

Version 4.0.28.0

Version 4.0.28.0 includes the following fixes and improvements:

- Fixed an issue where pulling down to refresh didn't update the work list cards.
- Enabled brokered authentication for Android, iOS, and Windows, which supports features such as Microsoft Entra Conditional Access.
- Added an option on Android to use a new redirect URI, which is required for Microsoft Entra Conditional Access.
- Improved camera-based barcode scanning by adding camera zoom and augmented-reality assisted barcode focusing.
- Fixed problems with hardware keyboard detection.
- Added support for keycode mapping.
- Fixed an issue that prevented non-numerical placeholders from appearing in the step banner.
- Fixed an issue affecting image setup for product and master variants.
- Corrected case-sensitive redirect URI matching on Android.
- Fixed an issue where entering a large digit in the calculator caused the delete button to move offscreen.
- Improved localization across the app.

Version 4.0.27.0

Version 4.0.27.0 includes the following fixes and improvements:

- Fixed an issue where pressing Enter on the scanner hardware keyboard didn't submit the value.
- Fixed a bug that added an extra pipe character when submitting a value.
- Fixed an issue where entering a long digit in the calculator caused the backspace to move unexpectedly.
- Implemented security enhancements.
- Fixed a problem where the device token expired one hour after signing in with device code authentication.
- Improved hardware keyboard functionality.

- Fixed an issue where resizing the screen in Windows changed the order of footer action buttons.
- Added the connection name to the worker sign-in page for better usability.
- Fixed an iOS issue where the calculator appeared unexpectedly during the sales picking flow.
- Fixed a crash that occurred when scrolling through a work list with many cards.
- Fixed an issue where signing out as a default user required reentering the device code for authentication.

Version 4.0.26.0

Version 4.0.26.0 includes the following fixes and improvements:

- Fixed an issue where old values weren't removed after scanning items from a work list.
- Fixed a bug that caused the page to autosubmit when a worker pressed the physical scan button on a device during a summary step.
- Fixed mobile mass deployment (MDM) property retrieval to handle case differences in `connection.json` files.
- Enhanced Windows security.

Version 4.0.25.0

Version 4.0.25.0 includes the following fixes and improvements:

- Resolved a rendering issue on the **Item Inquiry** page.
- Fixed a server request timeout that occurred after the quantity spinner component reset incorrectly when you navigate between pages.
- Stopped the quantity spinner from flickering when it landed between two values.
- Enhanced diagnostic tools for improved troubleshooting.
- Improved translation quality across the app.
- Refined device code error messages for greater clarity.
- Fixed a synchronization issue between the calculator and quantity spinner when using a comma as the decimal separator.

Version 4.0.24.0

Version 4.0.24.0 of the Warehouse Management mobile app is the first general availability (GA) release of version 4 for all supported platforms (Microsoft Windows, Google Android, and Apple iOS) in all supported regions. Version 4 introduces many new features and improvements that

enhance your warehouse management experience. Learn more at Migrate the Warehouse Management mobile app from V3 to V4.

Older versions

Notes for versions older than Version 4 are available in the Warehouse Management mobile app release notes archive.

Last updated on 09/02/2026

Install the Warehouse Management mobile app

This article explains how to download and install the Warehouse Management mobile app on each of your mobile devices, and how to configure the app to connect to your Microsoft Dynamics 365 Supply Chain Management environment. You can configure each device manually, or you can distribute connection settings through your mobile device management (MDM) provider, a file, or a QR code. To compare those options, see Choose how to distribute connection settings.

The Warehouse Management mobile app is only for your internal business use. You may not republish or distribute the Warehouse Management mobile app externally in any app store or similar distribution service.

Operating system requirements

The Warehouse Management mobile app is available for Microsoft Windows, Google Android, and Apple iOS operating systems. To use the app, your mobile devices must have one of the following operating systems installed:

- Windows 10 May 2020 update 1904.1 or later
- Android 7.0 or later
- iOS 13.0 or later

Get the Warehouse Management mobile app

For smaller deployments, you'll typically install the app on each device from the relevant store. Then, manually configure the connection to the environments that you're using.

For larger deployments, automate app deployment and configuration. This approach is more convenient if you manage many devices. For example, use a mobile device management and mobile application management solution such as Microsoft Intune. For information about how to mass deploy installations and updates for the Warehouse Management mobile app, see Mass deploy the mobile app with user-based authentication.

Install the app from an app store

The easiest way to install the app on a single device is to install it from an app store. The store always provides the latest generally available version. Microsoft Intune can also fetch apps from the app stores. Use one of the following links to install the app from an app store:

- **Windows:** Warehouse Management on Microsoft Store
- **Android:** Warehouse Management on Google Play Store
- **iOS:** Warehouse Management on the Apple App Store

Download the app from Microsoft App Center

Instead of installing the app from an app store, you can download it from the Microsoft App Center. The App Center provides installable packages that you can sideload. In addition to the current version, the App Center also lets you download previous versions and might provide preview versions with upcoming features that you can try out. To download current, previous, or preview versions of the Warehouse Management mobile app from Microsoft App Center, use one of the following links:

- **Windows:** Warehouse Management (Windows)

  For instructions about how to install a downloaded package on a Windows device and then set up the required certificates, see Install a Build from App Center.

- **Android:** Warehouse Management (Android)

  A few extra steps might be required to install it. For details, see Testing Android Apps.

- **Android (ARMv7 / armeabi-v7a):** Warehouse Management (Android armeabi-v7a)

  This release targets older Android devices that use 32-bit ARMv7 processors and require a build compiled for the `armeabi-v7a` ABI. Install this package on devices that can't run the standard 64-bit Android release.

- **iOS:** The iOS version of the app is only available through App Store.

For information about how to install a build downloaded from the App Center, see Install a build.

The Warehouse Management mobile app isn't available in app stores in China. However, you can download it from Microsoft App Center and use it along with Dynamics 365 Supply Chain Management operated by 21Vianet in China.

Decide which authentication methods you'll use

Because the Warehouse Management mobile app has read and write access to some of your Supply Chain Management data, each device must authenticate with Supply Chain Management. The app supports several authentication methods. Before you start to deploy the app, learn about the available authentication methods and decide which one you want to use.

After a device authenticates with Supply Chain Management, each worker who uses that device signs in by using their Supply Chain Management worker account. The app loads the worker's personal preferences, such as their default warehouse and app preferences. Therefore, different workers can sign in and out for each shift, while the device itself remains authenticated with Supply Chain Management.

For details about each authentication method and how to set it up, see User-based authentication for the Warehouse Management mobile app.

> **Important**
>
> Use **username/password authentication** for all new and existing deployments. It works without any configuration, and no companion app is required. **Device code flow** remains available for existing deployments, but Microsoft no longer recommends it.

If a device is lost or compromised, see Remove access for a device that uses user-based authentication.

> **Note**
>
> Shared Device Mode authentication isn't currently supported for the Warehouse Management mobile app.

Choose how to distribute connection settings

Every device needs the same connection settings, expressed in JavaScript Object Notation (JSON) format. What differs is how you deliver that JSON to each device. To find your method, ask yourself the following questions:

1. **Do you use a mobile device management (MDM) provider, such as Microsoft Intune?** If you do, use *MDM managed configuration*. It's the only method that requires no setup work on the device itself, and it works on all three platforms.

2. **No MDM provider?** Use a *QR code*. It also works on all three platforms, and it's the practical choice for Android and iOS devices, which restrict file access.
3. **Do you deploy to Windows devices and already push files or run scripts on them?** You can use a *JSON file* instead.
4. **Are you setting up a single device or troubleshooting one?** Enter the settings with *manual input*.

Expand table

Method	When to use it	Platform support	Work required on each device
MDM managed configuration (`ConnectionsJson` key)	You manage devices with an MDM provider. The provider pushes connection settings through app configuration policies, without touching the device file system.	Android, iOS, Windows	None
QR code	You don't use an MDM provider, or you set up devices individually. The app scans a QR code that contains the connection JSON.	Android, iOS, Windows	Scan a code
JSON file (*connections.json*)	You can place files on the device file system.	Windows; Android only through **Add from file** (see the following note)	None, if you use the default file name and location
Manual input	You're setting up a single device or troubleshooting a connection.	Android, iOS, Windows	Type each setting

> **Important**
>
> **Android limitation:** Starting with Android 11, scoped storage prevents external tools (MDM file push, file managers, and USB transfer) from writing to the app's private folder. Therefore, a *connections.json* file can't be delivered to the default path on Android.
>
> On Android, use *MDM managed configuration* or a *QR code* instead. To import a file on a single device, use the app's **Add from file** option, and select a JSON file from an accessible location, such as the downloads folder.

Create a connection settings file or QR code

All the methods except manual input use the same JSON. For the parameters that you can specify, an example file, and the file name and location rules, see Connection settings reference for the Warehouse Management mobile app.

After you create the settings, import them on the device as described in the next section.

Import the connection settings on a device

Follow these steps to import connection settings from a file or a QR code.

1. Start the Warehouse Management mobile app on your mobile device. The first time that you start the app, a welcome message appears. Select **Connect**.
2. If you're importing the connection settings from a file and you used the default name and location when you saved the file, the app might find the file automatically. In this case, skip ahead to step 4. Otherwise, select **Set up connection**, and then continue to step 3.
3. In the **Connection setup** dialog, select **Add from file** or **Add from QR code**, depending on how you want to import the settings:
    - If you're importing the connection settings from a file, select **Add from file**, browse to the file on your local device, and select it. If you select a custom location, the app stores it and automatically uses it the next time.
    - If you're importing the connection settings by scanning a QR code, select **Add from QR code**. The app prompts you for permission to use the device's camera. After you give permission, the camera starts, so that you can use it for scanning. Depending on the quality of the device's camera and the complexity of the QR code, you might find it difficult to get a correct scan. In that case, try to reduce the complexity of the QR code by generating only one connection per QR code. (Currently, you can use only the device's camera to scan the QR code.)
4. After the connection settings load successfully, the selected connection appears.
5. The app connects to your Supply Chain Management server and shows the sign-in page.

Manually configure the application

If you don't have a file or QR code, you can manually configure the app on the device so that it connects to the Supply Chain Management server through the Microsoft Entra ID application.

1. Start the Warehouse Management mobile app on your mobile device.

2. If the app starts in **Demo mode**, select **Connection settings**. If the **Sign-in** page appears when the app starts, select **Change connection**.

3. Select **Set up connection**.

4. Select **Input manually**. The **New Connection** page appears and shows the settings that you need to enter manually.

5. Enter the following information:

   - **Connection name** – Enter a name for the new connection. This name appears in the **Select connection** field the next time you open the connection settings. The name you enter must be unique. (In other words, it must differ from all other connection names that are stored on your device, if any other connection names are stored there.)

   - **Environment URL** – Specify the root URL of Supply Chain Management.

     > **Important**
     > - Don't end this value with a slash (/).
     > - Ensure that the HTTPS (SSL) certificate is valid.

   - **Company** – Enter the legal entity (company) in Supply Chain Management that you want the application to connect to.

   - **Authentication method** – Select one of the following values to specify the method that you use to authenticate with Supply Chain Management. The method that you select here must match the setup of the app in Azure.
     - *Username and password* (recommended) – Ask the worker to enter a user name and password. This option also supports brokered authentication and single sign-on, which are optional.
     - *Device code* (not recommended) – Authenticate by using the device code flow. If a device is still configured this way, reconfigure it to use *Username and password*.

   - **Cloud** – Specify the type of Microsoft Entra ID app registration to authenticate with:
     - *Azure Global* (recommended) – Authenticate by using the global Microsoft Entra ID application that's registered and maintained by Microsoft. This option supports most scenarios, including Microsoft Entra Conditional Access. You don't have to register or maintain your own Microsoft Entra ID app, and you don't have to enter a client ID or tenant.

    - *Manual* – Authenticate through your own custom Microsoft Entra ID app registration. Use this option only when the global application doesn't apply to your deployment because you connect to a Finance + Operations (on-premises) environment, you connect to a cloud other than Azure Global (such as a sovereign cloud), or you have specific requirements that the global application doesn't meet. If you choose this option, you must register and maintain a custom app in Microsoft Entra ID and specify a **Microsoft Entra ID client ID** value for the connection.

- **Microsoft Entra ID client ID** – This field is available only when the **Cloud** field is set to *Manual*. Enter the client ID of your custom app registration. Learn more in User-based authentication.

- **Microsoft Entra ID tenant** – (Optional) This field is available only when the **Cloud** field is set to *Manual*. Enter the Microsoft Entra ID domain name that you're using with the Supply Chain Management server. This value has the form `https://login.windows.net/<your-Microsoft-Entra-ID-domain-name>`. Here's an example: `https://login.windows.net/contosooperations.onmicrosoft.com`. Learn more about how to find your Microsoft Entra ID domain name in Locate important IDs for a user.

  > **Important**
  >
  > Don't end this value with a slash (/).

- **Use Broker** – This option applies only when the **Authentication method** field is set to *Username and password*. It determines whether a broker is used for SSO authentication. Set this option to *Yes* for broker-based authentication and SSO. Set it to *No* to require manual input of a user name and password. Learn more about the broker that each platform requires in Device requirements.

- **Domain name** – This field applies only when the **Authentication method** field is set to *Username and password*. You can use it to make sign-in easier for workers. If you don't set this field, workers must enter their full Microsoft Entra ID user principal name to sign in. A user principal name has the form *<user name>@<domain name>*. If you specify the *<domain name>* part here, workers can sign in by entering only the *<user name>* part. (Nevertheless, workers can still enter their full user principal name.)

6. Select the **Save** button in the upper-right corner of the page.

7. The app connects to your Supply Chain Management server and shows the sign-in page.

Remove access for a lost or compromised device

If a device is lost or compromised, remove its access to Supply Chain Management. The method you use to remove access depends on how the device is configured to authenticate with Supply Chain Management. For instructions, see Remove access for a device that uses user-based authentication.

Connection settings reference for the Warehouse Management mobile app

Connection settings tell the Warehouse Management mobile app which Microsoft Dynamics 365 Supply Chain Management environment to connect to, which legal entity to use, and how to authenticate. They're expressed in JavaScript Object Notation (JSON) format.

The same JSON is used no matter how you deliver it to your devices. To choose a delivery method, see Choose how to distribute connection settings.

Create a connection settings file or QR code

The JSON must include a connection list that contains the individual connections that you need to add. After you create the JSON, you can save it as a file, deliver it through your mobile device management (MDM) provider, or generate a QR code that has the same content.

The following table summarizes the parameters that you can specify for each connection. Required parameters are listed first, followed by optional parameters.

Expand table

Parameter	Description
`"ConnectionName"`	Specify the name of the connection setting. The maximum length is 20 characters. Because this value is the unique identifier for a connection setting, ensure that it's unique in the list. If a connection that has the same name already exists on the device, the settings from the imported file override it.
`"ActiveDirectoryResource"`	Specify the root URL of Supply Chain Management.
`"Company"`	Specify the legal entity in Supply Chain Management that you want the application to connect to.
`"AuthCloud"`	Specify the type of Microsoft Entra ID app registration to authenticate with: • `"AzureGlobal"` (recommended) – Authenticate by using the global Microsoft Entra ID application that Microsoft registers and maintains. This option supports most scenarios, including Microsoft Entra Conditional Access. You don't have to register or maintain your own Microsoft Entra ID app, and you must not specify an `"ActiveDirectoryClientAppId"` value for the connection.

Parameter	Description
	• `"Manual"` – Authenticate through your own custom Microsoft Entra ID app registration. Use this option only when the global application doesn't apply to your deployment. If you choose this option, you must register and maintain a custom app in Microsoft Entra ID and specify an `"ActiveDirectoryClientAppId"` value for the connection.
`"ActiveDirectoryClientAppId"`	(Optional.) Required only when you set `"AuthCloud": "Manual"`. Specify the client ID of your custom app registration. Learn more in Create a custom application registration.
`"ConnectionType"`	(Optional.) Specify how the connection authenticates with the environment. If you don't specify a value, then `"UsernamePassword"` is assumed. Valid values are: • `"UsernamePassword"` (recommended) – Use username/password authentication. • `"DeviceCode"` (not recommended) – Use device code flow.
`"UseBroker"`	(Optional.) This parameter applies only to the `"UsernamePassword"` connection type. It determines whether a broker is used for single sign-on (SSO) authentication. The default value is `"true"`. Therefore, if you don't set this parameter, the app tries to use a broker. If no broker is available on the device, the app falls back to sign-in through the system browser or a native web view. Set it to `"false"` to always require manual input of a user name and password. Learn more about the broker that each platform requires in Device requirements.
`"DomainName"`	(Optional.) This parameter applies only to the `"UsernamePassword"` connection type. It allows you to implement a simplified sign-in process. If you don't set this field, workers must always enter their full Microsoft Entra ID user principal name (UPN) to sign in. A UPN has the form *<user name>*@*<domain name>*. If you specify the *<domain name>* part here, workers can sign in by entering only the *<user name>* part. (Even if you set the domain name here, workers can still sign in using their full UPN.)
`"ActiveDirectoryTenant"`	(Optional) Applies only when you set `"AuthCloud": "Manual"`. Specify the Microsoft Entra ID domain name that you're using with the Supply Chain Management server. This value has the form `https://login.windows.net/<your-Microsoft-Entra-ID-domain-name>`. Here's an example: `https://login.windows.net/contosooperations.onmicrosoft.com`. Learn more about how to find your Microsoft Entra ID domain name in Locate important IDs for a user.

Example connection settings file

The following example shows a valid connection settings file that contains three connections: *Connection1* uses the global application (no client ID is needed), *Connection2* uses a custom app registration with brokered authentication, and *Connection3* uses a custom app registration where workers enter a user name and password manually.

JSON

```
{
    "ConnectionList": [
        {
            "ConnectionName": "Connection1",
            "ActiveDirectoryResource":
"https://yourenvironment1.cloudax.dynamics.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "UseBroker": true,
            "AuthCloud": "AzureGlobal"
        },
        {
            "ConnectionName": "Connection2",
            "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
            "ActiveDirectoryResource":
"https://yourenvironment2.cloudax.dynamics.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "UseBroker": true,
            "AuthCloud": "Manual"
        },
        {
            "ConnectionName": "Connection3",
            "ActiveDirectoryClientAppId": "aaaaaaaa-bbbb-cccc-dddd-eeeeeeeeeeee",
            "ActiveDirectoryResource":
"https://yourenvironment3.cloudax.dynamics.com",
            "ActiveDirectoryTenant":
"https://login.windows.net/contosooperations.onmicrosoft.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "UseBroker": false,
            "DomainName": "contosooperations.onmicrosoft.com",
            "AuthCloud": "Manual"
        }
    ]
}
```

File name and location on each device

This section applies when you deliver the settings as a file. If you use MDM managed configuration or a QR code, the app stores the settings itself, and you can skip this section.

If you use the default name and location when you save the connection settings file on each device, the app automatically imports it, even during the first run after the app is installed. If you use a custom name or location for the file, the app user must specify the values during the first run. However, the app continues to use the specified name and location afterward.

The default file name is *connections.json*. The default file location depends on which type of device you're using:

- **Windows:** `C:\Users\<User>\AppData\Local\Packages\Microsoft.WarehouseManagement_8wekyb3d8bbwe\LocalState`
- **Android:** `Android\data\com.Microsoft.WarehouseManagement\files`. Because of Android scoped storage limitations, external tools can't write to this path. Use MDM managed configuration or a QR code instead.
- **iOS:** File sharing isn't supported. Use MDM managed configuration or a QR code instead.

Usually, the paths are automatically created after the first run of the app. However, you can manually create them if you must transfer the connection settings file to the device before installation.

> ⓘ **Note**
>
> If you uninstall the app, the default path and its contents are removed.

How the app applies changes

Every time that the app starts, it reimports the connection settings from their previous location to check for changes. The app updates only connections that have the same names as the connections in the connection settings file. User-created connections that use other names aren't updated.

You can't remove a connection by using the connection settings file.

Migrate the Warehouse Management mobile app from V3 to V4

Version 4 (V4) of the Warehouse Management mobile app brings significant improvements and new features that enhance the user experience and the app's performance.

For V4, Microsoft rewrote the code for the Warehouse Management mobile app to take advantage of the newest software technology. V4 offers the following benefits:

- **Enhanced performance** – Improved application responsiveness and stability.
- **Better customer support capabilities** – Faster issue resolution and customer assistance.
- **Future-ready architecture** – Streamlined development of new features and integrations.

> **Tip**
>
> - The Migration information section provides important advice that can help you avoid unexpected disruptions during the migration process.
> - The V3 support timeline provides the rollout schedule and download details.
> - If you're migrating iOS devices, read the Migrating from V3 to V4 for iOS section before you begin. Connection settings aren't preserved on iOS and Device Code authentication isn't supported.

Rollout

Microsoft has been rolling out V4 globally for several months by progressively increasing coverage of countries and regions. Each expansion wave was carefully tested to ensure stability and readiness. The rollout phase is now nearing completion.

V4 general availability schedule and sources

The general availability release of V4 is available for the following platforms on the following schedule:

- **Google Android** – Available globally starting at the end of January 2026 from Google Play and Microsoft App Center.

- **Microsoft Windows** – Available globally starting in February 2026 from Microsoft App Center.
- **Apple iOS** – The official release of WMA iOS v4 began on 23 February 2026. As of January 2026, it's available through Apple Test Flight.

Migration information

System requirements

The system requirements for V4 are the same as the system requirements for V3, except for Android devices. V3 supports Android 5 and later, but **V4 requires Android 7 or later**. Devices that run older Android versions can continue to use V3 until the May 2026 end-of-support date. However, no new releases or feature updates are available for V3, and all newly reported issues are resolved only in V4.

If you're running a newer version of Android, use V4 because it provides better compatibility than V3 on newer systems.

Compatibility between V3 and V4

V4 supports a smooth transition from V3. The following considerations summarize what stays compatible during the migration and what you should plan for when upgrading.

- **Customizations are preserved** – All customizations and configurations from V3 are fully compatible with V4 and remain functional.
- **On Android and Windows devices, connection settings can be preserved on upgrade** – When you upgrade the Warehouse Management mobile app from version 3.0.8 or higher to V4 on Android or Windows, your existing connection settings are automatically migrated. Connection settings are only preserved during an upgrade, not during a fresh installation. To preserve settings:
  - Don't uninstall V3. Instead, download the V4 installer and select the **Upgrade** option.
  - If you're running V3.0.7 or older, first upgrade to V3.0.8 or V3.0.9, then upgrade to V4.
- **On iOS devices, connection settings aren't preserved on upgrade** – You must reconfigure connections manually after installing V4. To simplify this process, prepare QR codes in advance. Learn more in Read connection settings from a QR code.
- **MDM Deployment** – If you use a mobile device management (MDM) solution to distribute the app, the connection settings are preserved when you migrate from V3.0.9 to V4, or from

V4 to any later version of V4.

- **Concurrent operation** – V3 and V4 can operate simultaneously in the same warehouse environment without conflicts provided they're installed on separate devices. You can use different authentication methods for each version without conflict. This capability allows for a phased rollout of V4 without disrupting ongoing operations. However, you can't run V3 and V4 on the same device at the same time.
- **V3 requests remain active** – Microsoft doesn't block requests coming from V3. You can continue using V3 until you're ready to migrate.

> ⓘ **Important**
>
> Microsoft doesn't force-update any device. When a new version of the Warehouse Management mobile app is released, Microsoft publishes it to the app stores (Microsoft Store, Google Play, and Apple App Store). The update is only downloaded to a device if auto-update is enabled in the device's store settings. If auto-update is disabled, the device continues to run its current version until an administrator or user manually triggers the update.
>
> To ensure a consistent and predictable migration across your device fleet, use a Mobile Device Management (MDM) solution, such as Microsoft Intune. Unlike app stores, an MDM provides a dedicated management channel that gives administrators full control over when and how updates are applied to each device.

Migrating from V3 to V4 for iOS

Microsoft started the official release of WMA iOS V4 on February 23, 2026. The rollout is phased, starting with a limited percentage of users and gradually increasing over time.

> ⓘ **Important**
>
> iOS migration has two key differences from Android and Windows:
>
> - **Connection settings aren't preserved** – When upgrading from V3 to V4 on iOS, you lose existing connection settings. You must manually reconfigure connections after the upgrade. To simplify this process, generate QR codes in advance. Learn more in Read connection settings from a QR code.

- **Device Code authentication isn't supported on iOS V4** – Before upgrading, ensure your environment is configured for username/password authentication.

Before you upgrade iOS devices

1. Verify that username/password authentication is properly configured in your environment.
2. Prepare QR codes or JSON configuration files for all connections that you need to reconfigure.
3. If you want to validate V4 behavior before the full rollout, join Apple TestFlight to test the V4 version.
4. If you want to prevent automatic updates, disable auto-update in your App Store or MDM configurations.

If you need to return to V3

If critical problems arise while you're testing V4, you can return to V3.0.9. The following conditions apply:

- **Regional rollback** – You can't downgrade a region after migrating it.
- **App downgrade** – You can downgrade individual devices from V4 to V3.0.9 without problem to ensure operational continuity.
- **Download links** – Use the following links to download V3.0.9 installers for Android and Windows devices:
  - Downgrade to V3 for Android
  - Downgrade to V3 for Windows
- **To install the Microsoft Certificate from an MSIX bundle file** – Follow these steps:

  1. Go to the folder that contains the MSIX bundle folder.
  2. Right-click the MSIX and select **Properties**.
  3. In the **Properties** window, open the **Digital Signatures** tab.
  4. From the list of signatures, select the Microsoft signature.
  5. Select **Details**, and then select **View Certificate**.
  6. Select **Install Certificate**.
  7. Choose the certificate store location.
  8. Select **Local Machine** and select **Next**.
  9. Select **Trusted Root Certification Authorities**.
  10. Select **Next**, and then **Finish** to complete the certificate installation.

Authentication

Authentication in cloud environments

App users must complete a single authentication process the first time they use the app on each device that is migrated to V4. After a device is successfully migrated, it stays authenticated. You don't need to reauthenticate the device when updating to future versions of V4.

Authentication in on-premises environments

If you use an on-premises environment of Supply Chain Management, you don't need a new Entra ID account or infrastructure configuration to support V4. Continue to use your existing configuration as established for V3. However, to support Windows and Android devices, you must add a new redirect URI to your application registration for the Supply Chain Management tenant in AD FS. For V4 of the Warehouse Management mobile app, the redirect URIs are as follows:

- **Windows** – `ms-appx-web://microsoft.aad.brokerplugin/{clientId}` (where *{clientId}* is your Microsoft Entra client ID).
- **Android** – `msauth://com.Microsoft.WarehouseManagement/hpavxC1xAIAr5u39m1waWrUbsO8=`

For more information and detailed setup instructions, go to User-based authentication for the Warehouse Management mobile app in on-premises deployments.

Supported authentication methods

The following table summarizes the supported authentication methods for each platform and type of deployment environment (cloud or on-premises).

Expand table

Platform	Cloud environment	On-premises environment
Windows	Username/password, Device code[1]	Username/password, Device code[1]
Android	Username/password, Device code[1]	Username/password only
iOS	Username/password only	Username/password only

Brokered authentication isn't a separate authentication method. It's an option of username/password authentication that enables single sign-on (SSO). Learn more in Single sign-on.

[1] For backward compatibility, these platforms still support device code flow, but Microsoft no longer recommends it because it's a frequent target of phishing attacks. It's blocked by default in *new* Microsoft Entra ID tenants and doesn't support single sign-on (SSO) or brokered authentication. Use the migration to V4 as an opportunity to move these devices to username/password authentication. Learn more in Device code flow authentication.

V3 support timeline

Use the following timeline to plan your transition from V3 and ensure devices are migrated to V4 before support ends.

- **End of support** – May 2026 (estimated).
- **Final version** – Version 3.0.9 is the final V3 release. The development team will address any reported issues in V4.
- **Feature development** – The development team won't develop new features for V3.

Last updated on 09/02/2026

User-based authentication for the Warehouse Management mobile app

The Warehouse Management mobile app supports two types of user-based authentication:

- **Username/password authentication** – The standard method for new and existing deployments. It works without any extra configuration and doesn't require a companion app.
- **Device code flow authentication** – A legacy method that remains available for deployments that still use it. Plan a move to username/password authentication, because Microsoft Entra ID security defaults block device code flow in new tenants.

To work out which combination of accounts and sign-in methods fits your warehouse, start with Choose an authentication approach.

> **Note**
>
> Give each Microsoft Entra ID account that signs in to the app only the permissions that it needs for warehousing tasks. Use accounts that are scoped to warehouse mobile device user activities, and don't sign in to devices with admin accounts.

Choose an authentication approach

Two decisions determine how you set up authentication. Answer them in order. The following sections give general guidance about what each combination supports. Your IT department makes the final decision, based on your organization's security policies.

1. **Whose identity does the app sign in with?** Use either a *worker identity*, where every warehouse worker has their own Microsoft Entra ID account, or a *device identity*, where a shared account such as `device1@contoso.com` represents the device itself.
2. **Where is the sign-in completed?** Choose either *locally* (on the warehouse device) or *remotely* (on a separate machine such as an admin's PC). Remote sign-in is typically used when devices are deployed at a site that's far from the people who hold the credentials.

The following table summarizes the four combinations.

Expand table

	Local sign-in (on the device)	Remote sign-in (on another machine)
Worker identity	Recommended for most deployments. Use username/password; QR code and PIN; multifactor authentication (MFA); or any other method that your tenant supports.	Supported. The same methods work. Device code flow is also possible, but it isn't recommended.
Device identity	Supported for shared devices. Workers identify themselves with a mobile device user account after the app is authenticated. Conditional Access signals are less meaningful, because the account represents a device instead of a person.	Use with care. Prefer username/password with MFA, so that you can revoke the session remotely if the device is lost.

In every combination, each warehouse worker still has a *warehouse worker* record with one or more *mobile device user accounts* in the Warehouse management module. The Microsoft Entra ID account authenticates the app with Supply Chain Management. The mobile device user account identifies the person who does the work. Learn more in Mobile device user accounts.

Worker identity, local sign-in

Example: At the Contoso Seattle distribution center, each of the 40 pickers has a Microsoft Entra ID account, such as `maria@contoso.com`. Handhelds are stored in a charging rack. A worker takes any device from the rack and signs in with their own credentials.

It works like this:

1. The worker signs in on the device with their Microsoft Entra ID credentials. Use whichever method suits your security requirements: username/password, QR code and PIN, or MFA.
2. If a default user ID is configured for the worker's warehouse worker record, this single sign-in authenticates the app and signs the worker in as a warehouse worker in one step.
3. Optionally, brokered authentication shares the same Microsoft Entra ID session with other apps on the device, such as Microsoft Teams or Outlook. This step is an advanced option, and it isn't required.

This combination gives you the strongest identity controls, because every action traces back to a named person, and Conditional Access policies apply to a real user.

Worker identity, remote sign-in

Example: Contoso opens a small satellite warehouse with no on-site IT staff. An administrator at headquarters completes the initial sign-in for each device before shipping the device to the site.

The same methods that are available for local sign-in also work here. You can also use device code flow. However, Microsoft no longer recommends it because it's a common target of phishing attacks. Your IT department can decide whether it's acceptable in your environment.

Because the person who enters the credentials often isn't the person who uses the device, plan for the following points:

- Prefer a method that lets the worker complete their own sign-in on the device, even when the device is configured remotely.
- Ensure that you can revoke sessions for a single account without affecting other workers.

Device identity, local sign-in

Example: Contoso mounts terminals on forklifts. Each terminal authenticates with a shared Microsoft Entra ID account, such as `device1@contoso.com`. Drivers then enter their own mobile device user account credentials to start work.

It works like this:

1. The admin configures the app with username/password authentication by using the device's Microsoft Entra ID account.
2. After the app is authenticated, workers sign in with their mobile device user account credentials (user ID and password).
3. When a worker signs out, the app stays authenticated with Supply Chain Management and shows the worker sign-in page for the next person.

This combination works best when many workers share a device, and when you don't want to create a Microsoft Entra ID account for every worker. Be aware of the following limitations:

- Conditional Access policies are harder to apply in a meaningful way. The signed-in identity is a device, not a person, so policies that evaluate user risk or per-user MFA don't produce useful results.
- Supply Chain Management attributes app authentication to the device account. Worker-level traceability comes from the mobile device user account instead.
- Give the device account only the permissions that warehouse mobile device work requires. Learn more in Mobile device user accounts.

Device identity, remote sign-in

Example: Contoso ships preconfigured terminals to a third-party logistics provider. An administrator at headquarters authenticates each device before it leaves.

This combination behaves like worker identity with remote sign-in, but the risk is higher because many people use a single shared account and the device is out of your physical control.

Take the following precautions:

- Use username/password authentication, ideally with MFA. Device code flow isn't recommended for this combination, but whether it's acceptable is a decision for your IT department to make, based on your security policies.
- Use a separate Microsoft Entra ID account for each device, rather than one account for all devices. You can then disable or revoke sessions for a single lost device without disrupting the rest of the fleet.
- Keep the device account's permissions strictly limited to warehouse mobile device work.

Licensing considerations

The Warehouse Management mobile app doesn't introduce its own identity licensing requirements. It requires only that your organization has a Microsoft Entra ID identity provider, and standard Microsoft Entra licensing terms apply.

Features that you layer on top of sign-in have their own licensing requirements. Check the requirements for each feature that you plan to use:

- **Conditional Access** – See Microsoft Entra Conditional Access.
- **QR code and PIN sign-in** – See Prerequisites to enable the QR code authentication method.
- **Microsoft Entra plans in general** – See Microsoft Entra ID licensing.

> **Important**
>
> Using a shared device identity doesn't reduce the number of licenses that you need. A device account such as `device1@contoso.com` authenticates the app, but licensing for Supply Chain Management follows the people who do the work. If you license warehouse workers as frontline workers, you still need a license for each worker who uses the app, even when many workers share one device account.

Confirm your specific entitlements with your licensing contact and the Dynamics 365 Licensing Guide. This article doesn't replace either. Learn more in Microsoft Product Terms.

Username/password authentication

When you use username/password authentication, each human worker must enter the Microsoft Entra ID username and password associated either with the device or with themselves (depending on the approach you chose). They might also need to enter a mobile device user account ID and password, depending on their warehouse worker record setup.

Microsoft recommends username/password authentication for all new and existing deployments. It works without any configuration: the app signs workers in through the system browser or a native web view, and it doesn't need Microsoft Authenticator, Intune Company Portal, or any other companion app. Most frontline deployments need nothing more than this.

If you later want single sign-on or Conditional Access policies that depend on device signals, see Advanced: brokered authentication and single sign-on.

Microsoft Entra ID also offers *QR code and PIN sign-in*, which lets workers sign in quickly on shared devices by scanning a QR code and entering a PIN, instead of typing a full username and password every time. This flow works without Microsoft Authenticator or Intune Company Portal. Licensing and tenant prerequisites are listed in Prerequisites to enable the QR code authentication method.

> **Note**
>
> QR code and PIN sign-in has the following limitations:
>
> - It's available only on Android and iOS/iPadOS devices. It isn't available on Windows devices.
> - In the current version of the Warehouse Management mobile app, it works only when the app authenticates through the browser (browser-based authentication). It isn't supported when a broker handles the sign-in natively on the device. Therefore, you can't combine it with brokered authentication yet. Broader QR code sign-in support is planned for a future version of the app.
> - A worker must complete their first sign-in by using another method before they can use QR code and PIN sign-in.
>
> This QR code is a Microsoft Entra ID sign-in credential for workers. It's not the same as the QR code that you use to distribute connection settings to devices. Learn more in Read connection settings from a QR code.

Use a custom application registration

By default, the app uses a global application that's provided and maintained by Microsoft, and no application registration is required.

You need to register your own application in Microsoft Entra ID only if you connect to an on-premises environment, connect to a cloud other than Azure Global, or have specific requirements that the global application doesn't meet. For the procedure, see Create a custom application registration for the Warehouse Management mobile app.

Set up employee, user, and warehouse worker records in Supply Chain Management

Before workers can sign in by using the mobile app, each Microsoft Entra ID account that you assign to the enterprise app in Azure must have a corresponding employee record, user record, and warehouse worker record in Supply Chain Management. For information about how to set up these records, see Mobile device user accounts.

Advanced: brokered authentication and single sign-on

Brokered authentication is an advanced capability. You don't have to use it. The app signs workers in through the system browser or a native web view, and it doesn't need Microsoft Authenticator, Intune Company Portal, or any other companion app.

Consider it only if you want one of the following things:

- **Single sign-on (SSO)** – Workers sign in to the app without entering a password, because the app reuses credentials from another app on the device.
- **Conditional Access policies that depend on device signals** – For example, a policy that requires a compliant or managed device. A broker supplies those signals.

If you don't need either, you can ignore brokered authentication entirely.

If you already use brokered authentication, keep it. Nothing about it is deprecated, and no change is required. It's described as advanced because it's optional, not because it's going away.

For the concepts, requirements, and setup steps, see Brokered authentication and Conditional Access.

> ⓘ **Note**

SSO requires **username/password** authentication. It doesn't work with **device code flow**.

Two other limitations apply when a broker handles sign-in:

- The Warehouse Management mobile app *doesn't* support **shared device mode**. To let multiple workers share a device, use the **device identity** approach instead.
- QR code and PIN sign-in isn't available. It currently requires browser-based authentication, as described in **Username/password authentication**.

Device registration requirements

The Warehouse Management mobile app works on a device in any Microsoft Entra ID registration state. You can sign in on all of the following types of devices:

- Microsoft Entra joined devices
- Microsoft Entra registered devices
- Devices that aren't joined
- Devices that aren't registered at all, including a device that's new and has never been registered

You don't have to join or register a device before workers can sign in.

Two things can still introduce a registration requirement, and neither comes from the app itself:

- **Your Conditional Access policies.** If a policy requires a specific device state or compliance status, that requirement comes from your policy. Learn more in Brokered authentication and Conditional Access.
- **Brokered authentication.** A broker passes device signals to Microsoft Entra ID by using a device-bound token, so it works with a registered device. The broker can perform the registration itself during the first sign-in, so this requirement usually isn't something that you set up in advance.

Learn more in What is device identity in Microsoft Entra ID?.

Remove access for a device that uses user-based authentication

If a device is lost or compromised, revoke its access to Supply Chain Management immediately. Disabling the associated Microsoft Entra ID user account revokes access for all devices that use that account. This limitation is why you should use a separate account for each device or each

worker, as described in Choose an authentication approach. It lets you isolate and revoke access for a single device without affecting others.

To revoke access, follow these steps:

1. Sign in to the Azure portal.
2. On the left navigation pane, select **Microsoft Entra ID**, and ensure that you're in the correct directory.
3. In the **Manage** list, select **Users**.
4. To open the user's profile, find the user account that's associated with the device or worker, and select the name.
5. On the toolbar, select **Revoke sessions** to revoke the user account's sessions.

> **Note**
>
> Depending on how you set up your authentication system, you might also want to change the user account's password or completely disable the user account.

Device code flow authentication (not recommended)

> **Note**
>
> This section describes a legacy authentication method. It's documented for deployments that already use it. For new deployments, use username/password authentication.

Device code flow is a two-step sign-in method that was originally designed for devices that don't provide a web browser. Microsoft doesn't recommend it for the Warehouse Management mobile app for the following reasons:

- **It's a frequent target of phishing attacks** – A threat actor can ask a victim to sign in with a device code that the attacker generated, and then use the resulting token to access the victim's account from the attacker's own device. Microsoft Entra ID has no reliable way to verify that the person who enters the code is signing in from the device that generated it.
- **It's blocked by default in new tenants** – Starting July 1, 2026, Microsoft Entra ID security default settings block device code flow on new tenants. This behavior commonly affects new tenants that are created for testing purposes. If you create a new tenant to test the Warehouse Management mobile app, expect device code flow to be blocked by default.

Existing tenants aren't automatically affected unless they already have security defaults enabled.

- **It isn't available everywhere** – Device code flow isn't supported on iOS, and it isn't supported for Android devices that connect to on-premises environments.
- **It doesn't support SSO** – It can't be combined with brokered authentication.

If your environment still depends on device code flow (for example, because you use test scripts or workflows that aren't updated yet), an admin can unblock it for the tenant by disabling security defaults. Because security defaults protect the whole tenant, treat this change as a temporary step while you update your setup to use username/password authentication. For more information, see Microsoft Entra security defaults.

How device code flow works

When you use device code authentication, the Warehouse Management mobile app generates and shows a unique device code. The admin who sets up the device enters this device code into an online form, along with the credentials (name and password) for a Microsoft Entra ID user account. This account can represent either the device itself or the human worker who signs in, depending on how the admin implements the system. In some cases, depending on how the Microsoft Entra ID user account is configured, the admin might also have to approve the sign-in. In addition to the unique device code, the mobile app shows the URL where the admin must enter the code and the credentials for the Microsoft Entra ID user account.

Requirements and restrictions

If you must temporarily continue to use device code authentication, be aware of the following extra requirements and restrictions:

- Create a unique Microsoft Entra ID user account for each device or human worker. In addition, *strictly limit these accounts so that they can perform only warehouse mobile device user activities*.
- While a worker is signing in by using the Warehouse Management mobile app, the app shows a generated device code. This code expires after 15 minutes and is then hidden by the app. If the code expires before sign-in is completed, the worker must generate a new code by selecting **Connect** again in the app.
- How long a device stays authenticated is controlled by your Microsoft Entra ID token lifetime and Conditional Access policies, not by the app. When the tokens for a device expire or are revoked, the device must be authenticated again. Learn more in Refresh tokens in the Microsoft identity platform.

- Single sign-on (SSO) isn't supported when you use device code flow authentication together with a mobile mass deployment (MDM) system (such as Intune) to distribute the Warehouse Management mobile app. You can still use an MDM system to deliver the app to each mobile device and deliver a `connections.json` file that sets up connections using device code. The only difference is that workers must manually sign in when they start to use the app. (This step is required only once.)

Move from device code flow to username/password authentication

To move an existing deployment away from device code flow, follow these steps:

1. Confirm that the Microsoft Entra ID accounts that the devices use can sign in with a username and password. If you use the global application that Microsoft provides, nothing else is required. If you use a custom application registration, also confirm that it allows public client flows.
2. Optional: If you want SSO, enable brokered authentication. On Android and iOS, that requires a broker app on the device.
3. Update your connection settings to specify `"ConnectionType": "UsernamePassword"` (and, when you use a broker, `"UseBroker": true`). Then redistribute them through your MDM provider, a `connections.json` file, or a QR code. Learn more in Connection settings reference and Choose how to distribute connection settings.
4. Sign in one time on each device to complete the authentication with the new method.

Last updated on 09/08/2026

Read connection settings from a QR code

The Warehouse Management mobile app supports QR code configuration to simplify the connection setup process. Instead of manually entering connection details, you can scan a QR code that contains all the required configuration information.

QR codes can contain connection configuration data in JavaScript Object Notation (JSON) format. Therefore, you can quickly deploy and set up the Warehouse Management app across multiple devices. This method is useful for IT administrators who must configure multiple devices. It's also useful when configurations must be shared with warehouse workers.

Other ways to deliver connection settings include your mobile device management (MDM) provider, a connection settings file, and manual entry on the device. To compare them, see Choose how to distribute connection settings.

Supported connection types

The feature for QR code–based connection configuration supports all connection types that the Warehouse Management mobile app supports:

- **UsernamePassword** (recommended) – Username/password authentication. The examples in this article use this connection type.
- **DeviceCode** (not recommended) – Interactive device code flow authentication.

> **Important**
>
> Specify `"UsernamePassword"` in the QR codes that you generate. A QR code can still specify `"ConnectionType": "DeviceCode"`, but that flow is blocked by default in new tenants, so the code might not work. Learn more in Device code flow authentication.

> **Note**
>
> The examples in this article omit the optional `"UseBroker"` parameter, because you don't need to set it. Learn more in Connection settings reference.

Step 1: Prepare your configuration JSON code

Create a JSON configuration that includes your connection details. Follow the instructions in Connection settings reference. The JSON code should have the following structure.

JSON

```
{
    "ConnectionList": [
        {
            "ConnectionName": "Connection1",
            "ActiveDirectoryResource":
"https://yourenvironment1.cloudax.dynamics.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "AuthCloud": "AzureGlobal"
        }
    ]
}
```

Step 2: Generate a QR code

There are several ways to generate a QR code. Use the method that best suits your needs.

Option 1: Use Copilot

Follow these steps to ask Copilot to generate a QR code for your JSON configuration.

1. Open a Copilot chat session. For example, select the **Copilot** button in Microsoft Edge, or open Microsoft Copilot from the Windows taskbar.

2. Enter a prompt that resembles the following example, but that includes your specific JSON configuration.

   text

   ```
   Please generate a QR code for the following JSON configuration:
   {
       "ConnectionList": [
           {
               "ConnectionName": "Production",
               "ActiveDirectoryResource":
   "https://yourenvironment.cloudax.dynamics.com",
               "Company": "USMF",
               "ConnectionType": "UsernamePassword",
               "AuthCloud": "AzureGlobal"
           }
       ]
   }
   ```

3. Copilot generates a QR code image based on the JSON configuration that you provided. Download the image to your device. For example, select and hold (or right-click) the image, and then select to download it. Alternatively, use a drag-and-drop operation.

Option 2: Use an online QR code generator

To generate a QR code by using an online QR code generator, follow these steps:

1. Visit any reputable QR code generator website. Bing can help you find one.
2. Select *Text* or *JSON* format.
3. Paste the complete JSON configuration that you prepared.
4. Generate and download the QR code image.

Option 3: Use PowerShell

You can use PowerShell to generate a QR code from your JSON configuration. The code resembles the following example, but it includes your specific JSON configuration.

PowerShell

```powershell
# Install and import QR code module if not already installed
Install-Module -Name QRCodeGenerator
Import-Module QRCodeGenerator

# Your JSON configuration
$jsonConfig = @"
{
    "ConnectionList": [
        {
            "ConnectionName": "Production",
            "ActiveDirectoryResource": "https://yourenvironment.cloudax.dynamics.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "AuthCloud": "AzureGlobal"
        }
    ]
}
"@

# Generate QR Code
New-QRCodeText $jsonConfig -OutPath "warehouse-config.png"
```

Step 3: Distribute the QR code

After you generate the required QR code, distribute it in any of the following ways:

- Print it for physical distribution.
- Share it digitally via email or collaboration platforms.
- Display it on-screen for easy scanning.
- Include it in documentation or setup guides.

> **Important**
>
> QR codes contain connection configuration data, which might include tenant IDs and environment URLs. Treat QR codes as sensitive information and distribute them only through secure channels. Avoid posting them in publicly accessible locations.

> **Tip**
>
> Copilot can decode a QR code if you enter a prompt such as "Please decode this QR code" and attach the image. This technique can be useful if you want to verify the contents of a QR code before you distribute it.

Step 4: Scan the QR code on each device

To use the generated QR code to configure a device, follow the steps in Import the connection settings on a device.

Mass deploy the mobile app with user-based authentication

Automated deployment and configuration of Warehouse Management can be more efficient than manual deployment when you manage many devices. One way to achieve this automation is to use a mobile device management (MDM) solution such as Microsoft Intune. For general information about how to use Intune to add apps, see Add apps to Microsoft Intune.

This article explains how to mass deploy the Warehouse Management mobile app with user-based authentication by using Microsoft Intune.

> **Important**
>
> To use MDM, configure the Warehouse Management mobile app to use username/password authentication. You can't distribute authentication tokens to mobile devices by using MDM.
>
> Single sign-on (SSO) isn't required. Without it, MDM still delivers the app and its connection settings to every device, and each worker signs in manually one time on their device. SSO only removes that one-time sign-in.

Prerequisites

To use an MDM solution to deploy the Warehouse Management mobile app and its connection settings, you must have the following resources available:

- Warehouse Management mobile app version 4.0 or later on all mobile platforms. (If you're still running version 3.x, migrate to version 4 before proceeding.)
- A valid store account for each mobile platform that you support (Microsoft account, Google Account, and/or Apple Account)
- Microsoft Entra ID. Mass deployment doesn't itself require a premium Microsoft Entra plan, but features that you choose to enable might. Learn more in Licensing considerations.
- Microsoft Endpoint Manager admin center (the Intune website)

Authentication behavior after mass deployment

After you deploy the app through MDM, the authentication experience depends on whether single sign-on (SSO) is enabled.

- **Without SSO (default)** — Each worker signs in to the app one time on their device. Deployment of the app and its connection settings is still fully automatic; only that first sign-in is manual.
- **With SSO (optional)** — If the worker is already signed in to another app on the device with the same Microsoft Entra ID account, the app reuses that token, so no separate sign-in is needed. SSO requires brokered authentication, which is an advanced option.

Depending on your user account configuration, workers might still sign in with a mobile device user account in either case.

> **Important**
>
> Don't use device code flow for MDM deployments. Configure username/password authentication instead.

Set up the source files for distribution

Each MDM solution offers several methods for sourcing the apps that it delivers to end devices. For example, a solution might use locally stored binary files or fetch binaries from an app store. Use app stores as the preferred method because it's simple and offers the most convenient way to receive updates.

The following subsections provide examples that show how to set up Intune to fetch apps from the different app stores.

Set up Intune to fetch the app from Google Play

Follow these steps to set up Intune to fetch the Warehouse Management mobile app from Google Play.

1. Sign in to the Microsoft Endpoint Manager admin center.
2. Go to **Apps** > **Android**.
3. On the **Android apps** page, on the toolbar, select **Add**.
4. In the **Select app type** dialog box, in the **App type** field, select *Managed Google Play app*. Then select **Select**.

5. On the **Managed Google Play** page, if you're setting up Google Play for the first time, you're prompted to sign in to Google Play. Sign in by using your Google account.
6. In the **Search** field, enter *Warehouse Management*. Then select **Search**.
7. On finding the Warehouse Management app, select **Approve**.
8. In the **Approve settings** dialog box, select an option to specify how updates should be handled when a new version of the app requests more permissions than the current version. We recommend that you select the **Keep approved when app requests new permissions** option. When you've finished, select **Done** to continue.
9. Select **Sync**.
10. You're returned to the **Android apps** page. On the toolbar, select **Refresh** to refresh the list of applications. Then, in the list, select *Warehouse Management*.
11. On the **Warehouse Management** page, on the **Properties** tab, select the **Edit** link next to the **Assignments** heading.
12. On the **Edit application** page, on the **Assignments** tab, add the user groups and devices that the Warehouse Management app should be available and required for. For information about how to use the settings, see Assign apps to groups with Microsoft Intune.
13. Select **Review + save**.
14. On the **Review + save** tab, review your settings. If they look correct, select **Save** to save them.

Set up Intune to fetch the app from Microsoft Store

Follow these steps to set up Intune to fetch the Warehouse Management mobile app from Microsoft Store.

1. Sign in to the Microsoft Endpoint Manager admin center.
2. Go to **Apps** > **Windows**.
3. On the toolbar, select **Add**.
4. In the **Select app type** dialog box, in the **App type** field, select *Microsoft Store app (new)*. Then select **Select**.
5. On the **Add App** page, on the **App information** tab, select the **Search the Microsoft Store app (new)** link.
6. In the **Search the Microsoft Store app (new)** dialog box, in the **Search** field, enter *Warehouse Management*.
7. When you've found the Warehouse Management app, select it, and then select **Select**.
8. The **App information** tab now shows information about the Warehouse Management app. Select **Next** to continue.

9. On the **Assignments** tab, add the user groups and devices that the Warehouse Management app should be available and required for. For information about how to use the settings, see Assign apps to groups with Microsoft Intune.
10. Select **Next** to continue.
11. On the **Review + save** tab, review your settings. If they look correct, select **Create** to save them.

Set up Intune to fetch the app from the Apple App Store

Follow these steps to set up Intune to fetch the Warehouse Management mobile app from the Apple App Store.

1. Sign in to the Microsoft Endpoint Manager admin center.
2. Go to **Devices** > **iOS/iPadOS**.
3. On the **iOS/iPad enrollment** tab, select the **Apple MDM Push certificate** tile.
4. In the **Configure MDM Push Certificate** dialog box, follow the on-screen instructions to create and upload the required Apple MDM push certificate. For more information about this step, see Get an Apple MDM push certificate.
5. Go to **Apps** > **iOS/iPadOS**.
6. On the toolbar, select **Add**.
7. In the **Select app type** dialog box, in the **App type** field, select *iOS store app*. Then select **Select**.
8. On the **Add App** page, on the **App information** tab, select the **Search the App Store** link.
9. In the **Search the App Store** dialog box, in the **Search** field, enter *Warehouse Management*. Then, in the drop-down list next to the **Search** field, select your country or region.
10. When you've found the Warehouse Management app, select it, and then select **Select**.
11. The **App information** tab now shows information about the Warehouse Management app. Select **Next** to continue.
12. On the **Assignments** tab, add the user groups and devices that the Warehouse Management app should be available and required for. For information about how to use the settings, see Assign apps to groups with Microsoft Intune.
13. Select **Next** to continue.
14. On the **Review + save** tab, review your settings. If they look correct, select **Create** to save them.

Manage connection configurations

The Warehouse Management mobile app lets you import connection settings as a managed configuration through an MDM solution. All platforms share the same **ConnectionsJson** configuration key.

> **Tip**
>
> For Android devices, MDM managed configuration is the recommended method for delivering connection settings in enterprise deployments. Due to Android's **scoped storage** restrictions (enforced starting with Android 11), external tools can no longer place a `connections.json` file in the app's private data folder. MDM managed configuration bypasses this limitation by delivering settings through app configuration policies rather than the file system.

The following subsections provide examples that show how to set up Intune to provide managed configuration for each of the supported mobile platforms. Learn more in App configuration policies for Microsoft Intune.

Create a connection JSON file

To set up managed configuration for all mobile platforms, create a connection JSON file as described in Connection settings reference. This file enables the mobile app to connect to and authenticate with your Dynamics 365 Supply Chain Management environment.

Set up Intune to support managed configuration for Android devices

Follow these steps to set up Intune to support managed configuration for Android devices.

1. Sign in to the Microsoft Endpoint Manager admin center.
2. Go to **Apps** > **App configuration policies**.
3. On the **App configuration policies** page, on the toolbar, select **Add** > **Managed devices**.
4. On the **Create app configuration policy** page, on the **Basics** tab, set the following fields:

    - **Name** – Enter a name for the policy.
    - **Platform** – Select *Android Enterprise*.
    - **Profile type** – Select the device profile types that the app configuration profile applies to.
    - **Targeted app** – Select the **Select app** link. In the **Associated app** dialog box, select the Warehouse Management app in the list, and then select **OK** to apply the setting and

close the dialog box.

5. Select **Next** to continue.
6. On the **Settings** tab, in the **Permissions** section, select **Add**.
7. In the **Add permissions** dialog box, select the checkboxes for **Camera**, **External storage (read)**, and **External storage (write)**. Then select **OK** to close the dialog box and add those permissions to the **Settings** tab.
8. In the **Permission state** field for each permission that you just added, select *Auto grant*.
9. In the **Configuration Settings** section, in the **Configuration settings format** field, select *Use configuration designer*.
10. In the **Configuration Settings** section, select **Add**.
11. In the dialog box, select the checkbox for **ConnectionsJson**. Then select **OK** to close the dialog box.
12. A new row is added to the grid in the **Configuration Settings** section of the **Settings** tab. The **Configuration key** field is set to *ConnectionsJson*. In the **Value type** field, select *String*. Then, in the **Configuration value** field, paste the entire contents of the JSON file that you created in the Create a connection JSON file section.
13. Select **Next** to continue.
14. On the **Assignments** tab, add the user groups and devices that the configuration policy should apply to. For information about how to use the settings, see Add app configuration policies for managed Android Enterprise devices.
15. Select **Next** to continue.
16. On the **Review + save** tab, review your settings. If they look correct, select **Create** to save them.

Set up Intune to support managed configuration for Windows devices

Follow these steps to set up Intune to support managed configuration for Windows devices.

1. Sign in to the Microsoft Endpoint Manager admin center.
2. Go to **Devices** > **Windows**.
3. On the **Windows devices** page, on the **Configuration profiles** tab, on the toolbar, select **Create profile**.
4. In the **Create a profile** dialog box, set the following fields:

    - **Platform** – Select *Windows 10 and later*.
    - **Profile type** – Select *Templates*.
    - **Template name** – Select *Custom*.

5. Select **Create** to apply your settings and close the dialog box.
6. On the **Custom** page, on the **Basics** tab, enter a name for the configuration profile, and then select **Next** to continue.
7. On the **Configuration settings** tab, select **Add**.
8. In the **Add Row** dialog box, set the following fields:

    - **Name** – Enter a name for the new row.
    - **Description** – Enter a short description for the new row.
    - **OMA-URI** – Enter the following value:

      ```txt
      ./User/Vendor/MSFT/EnterpriseModernAppManagement/AppManagement/AppStore/Microsoft.WarehouseManagement_8wekyb3d8bbwe/AppSettingPolicy/ConnectionsJson
      ```

    - **Data type** – Select *String*.
    - **Configuration value** – Paste the entire contents of the JSON file that you created in the Create a connection JSON file section.

9. Select **Save** to apply your settings and close the dialog box.
10. Select **Next** to continue.
11. On the **Assignments** tab, add the user groups and devices that the configuration profile should apply to.
12. Select **Next** to continue.
13. On the **Applicability rules** tab, you can limit the set of devices that the configuration profile applies to. To apply the profile to all qualifying Windows devices, leave the fields blank. For more information about how to use the settings, see Create a device profile in Microsoft Intune.
14. Select **Next** to continue.
15. On the **Review + save** tab, review your settings. If they look correct, select **Create** to save them.

Set up Intune to support managed configuration for iOS devices

Follow these steps to set up Intune to support managed configuration for iOS devices.

1. Sign in to the Microsoft Endpoint Manager admin center.

2. Go to **Apps** > **App Configuration policies**.
3. On the **App configuration policies** page, on the toolbar, select **Add** > **Managed devices**.
4. On the **Create app configuration policy** page, on the **Basics** tab, set the following fields:

    - **Name** – Enter a name for the app configuration profile.
    - **Platform** – Select *iOS/iPadOS*.
    - **Profile type** – Select the device profile types that the profile applies to.
    - **Targeted app** – Select the **Select app** link. In the **Associated app** dialog box, select the Warehouse Management app in the list, and then select **OK** to apply the setting and close the dialog box.

5. Select **Next** to continue.
6. On the **Settings** tab, in the **Configuration settings format** field, select *Use configuration designer*.
7. In the grid at the bottom of the page, set the following fields for the first row:

    - **Configuration key** – Enter *ConnectionsJson*.
    - **Value type** – Select *String*.
    - **Configuration value** – Paste the entire contents of the JSON file that you created in the Create a connection JSON file section.

8. Select **Next** to continue.
9. On the **Assignments** tab, add the user groups and devices that the configuration policy should apply to. For information about how to use the settings, see Add app configuration policies for managed iOS/iPadOS devices.
10. Select **Next** to continue.
11. On the **Review + save** tab, review your settings. If they look correct, select **Create** to save them.

Enroll devices with Intune

You must *enroll* each device that you want to manage by using Intune. Enrollment involves registering with Intune and applying organizational policies for security. Depending on the type of device and the platform, you can use the Company Portal app to enroll devices. The enrollment programs provide access to work or school resources.

Android and iOS devices

To enroll an Android or iOS device, install the Intune Company Portal app on the device. The local user must then sign in to the Company Portal app by using their company account.

Windows devices

Several methods are available to enroll a Windows device. For example, you can install the Intune Company Portal app on the device. For information about how to set up the Company Portal app and how to use the other options, see Enroll Windows 10/11 devices in Intune.

Brokered authentication and Conditional Access for the Warehouse Management mobile app

The Warehouse Management mobile app supports *brokered authentication*, a sign-in method where an OS-level identity broker, such as Microsoft Authenticator or Intune Company Portal, handles authentication and token management on behalf of the app. When you use brokered authentication, the broker provides Microsoft Entra ID with device identity, compliance status, and security signals during every authentication request.

> **Important**
>
> Brokered authentication is an advanced capability. It isn't required, and most deployments don't need it. The app signs workers in through the system browser or a native web view, without Microsoft Authenticator, Intune Company Portal, or any other companion app. Read this article only if you want single sign-on (SSO) or Conditional Access policies that depend on device signals. Otherwise, see User-based authentication for the Warehouse Management mobile app.
>
> If you already use brokered authentication, keep it. Nothing about it is deprecated, and no change is required.

Brokered authentication isn't a separate authentication method. It's an option of username/password authentication that does two things: it enables single sign-on (SSO), and it makes the app compatible with Microsoft Entra Conditional Access policies that depend on device signals. This article covers both. Use it as the single reference for brokered authentication, whether or not you use Conditional Access.

Microsoft Entra Conditional Access is an optional policy engine that controls access based on conditions such as user identity, device compliance, location, and risk level. It isn't required to run the Warehouse Management mobile app.

> **Important**

The Warehouse Management mobile app supports *connecting* through brokered authentication. It doesn't define, configure, or enforce Conditional Access policies, and it doesn't change how your policies are evaluated. Responsibilities are divided as follows:

- **The Warehouse Management mobile app (Microsoft)** – Supports brokered authentication so that the broker can pass device identity, compliance status, and security signals to Microsoft Entra ID during sign-in.
- **Your IT department** – Decides whether to use Conditional Access, and designs, configures, tests, and maintains the policies, device registration, compliance rules, and broker deployment in Microsoft Entra ID and your device management solution.

Because policy design depends on your organization's security requirements, the guidance in this article covers only the app-side setup. For policy decisions and troubleshooting of the policies themselves, work with your Microsoft Entra ID and device management administrators.

> **Note**
>
> The `"UseBroker"` connection setting defaults to `true`. Therefore, if you don't set it, the app tries to use a broker. This default doesn't create a requirement—when no broker is available on the device, the app signs workers in through the system browser or a native web view instead. Deploying a broker is a security design decision that your organization owns.

This article explains how to enable brokered authentication on the Warehouse Management mobile app so that your organization can enforce Conditional Access policies.

How brokered authentication works

When you use brokered authentication, the following flow occurs during sign-in:

1. The Warehouse Management mobile app delegates authentication to the broker app (Microsoft Authenticator or Intune Company Portal) installed on the device.
2. The broker validates the app's identity and retrieves the device's primary refresh token (PRT), which is a device-bound token that carries device identity and compliance claims.
3. The broker sends the authentication request to Microsoft Entra ID, including the device signals.
4. Microsoft Entra ID evaluates any Conditional Access policies that apply to the user, device, or app, and either grants or denies access.

5. If access is granted, the broker returns the authentication token to the Warehouse Management mobile app.

This process enables features such as single sign-on (SSO) across apps, MFA enforcement, and device-bound token protection—all without requiring the Warehouse Management mobile app to manage these security concerns directly.

Device requirements

To use brokered authentication, your device must meet the following requirements:

- You must be running Warehouse Management mobile app version 4.0.28 or later.
- Your device must be running a supported version of Windows, Android, or iOS.
- The device must be registered with Microsoft Entra ID. The broker can perform this registration (Workplace Join) as part of the first sign-in, so it isn't necessarily something that you set up in advance. The app itself doesn't require any particular registration state. Learn more in Device registration requirements.
- A broker app must be installed on the device (see the following table). If no broker is installed, the app falls back to browser-based sign-in, and device signals aren't available to Conditional Access.

Expand table

Platform	Broker app required
Windows	No separate app is required. The user must have a work account configured on the device, and the built-in Windows Web Account Manager (WAM) acts as the broker.
Android	Microsoft Authenticator or Intune Company Portal must be installed.
iOS	Microsoft Authenticator must be installed.

Set up Microsoft Authenticator (Android and iOS)

Follow these steps to set up Microsoft Authenticator. The procedure is the same for both Android and iOS.

1. Install **Microsoft Authenticator** from the device's app store (Google Play for Android, App Store for iOS).
2. Open the app and select the **Menu** button.
3. Select **Settings**.
4. Select **Device registration**.

5. Enter your email or organizational account.
6. Select **Register device**.

App registration

Brokered authentication works with the global Microsoft Entra ID application—you don't need a manual app registration. We recommend the global application because it's simpler to set up and maintain.

The global application is provided as a Microsoft first-party application (FPA) and is available on the Azure commercial cloud. If your environment is deployed on a US government cloud—such as US Government Community Cloud (GCC) or GCC High—the global application isn't available, and you must use a manual app registration instead.

If you already use a manual app registration for other reasons (such as on-premises environment requirements or a government cloud deployment), it also works with brokered authentication. Learn more in Create a custom application registration.

Configure devices to use brokered authentication

When you use the global application, the `"UseBroker"` setting defaults to `true` on all platforms, so the app tries to use a broker without extra configuration. A broker still has to be present on the device for brokered authentication to take effect. You can configure devices manually through the app UI or automatically by distributing a JSON file via QR code or MDM.

If you don't want to use brokered authentication, set the **Brokered authentication** option to *No* on the **Edit connection** page (or set `"UseBroker": false` in the JSON configuration). If the device doesn't have Microsoft Authenticator installed, the app falls back to a standard username and password connection.

Configure the connection manually

To manually set up a connection, follow these steps on each device:

1. Open the Warehouse Management mobile app and open the **Edit connection** page by doing one of the following steps:

    - If your device doesn't yet have any defined connections, select **Connect** to create a new one.

- To edit an existing connection, select **Tap to change**, choose the target connection, and then select **Edit connection settings**.
- To add a new connection, select **Set up connection** and then select **Input manually**.

2. Make the following settings on the **Edit connection** page:

   - **Authentication method** – Set to *Username and Password*.
   - **Cloud** – Set to *Azure Global* (recommended). If you use a custom app registration, set this field to *Manual* and provide the **Microsoft Entra ID client ID** value.

   Configure all the other settings as described in Manually configure the application.

3. Select **Save**.

4. Sign in with the worker's Microsoft Entra credentials.

Configure the connection by using a QR code or MDM system

To prepare for automatic connection configurations distributed by using a QR code or MDM system, create a JSON file that contains the connection details. Learn more in Connection settings reference.

For all platforms, the connection must use username/password authentication, which you specify as follows in the JSON file:

- `"ConnectionType": "UsernamePassword"`

When you use the global application (`"AuthCloud": "AzureGlobal"`), brokered authentication is enabled by default, so you don't have to set `"UseBroker"` explicitly.

The following example shows a JSON configuration that uses the global application with brokered authentication enabled:

JSON

```
{
    "ConnectionList": [
        {
            "ConnectionName": "Connection1",
            "ActiveDirectoryResource": "https://yourenvironment.cloudax.dynamics.com",
            "Company": "USMF",
            "ConnectionType": "UsernamePassword",
            "AuthCloud": "AzureGlobal"
        }
```

```
    ]
}
```

> **Note**
>
> If you use a custom app registration instead of the global application, set `"AuthCloud": "Manual"` and include a value for `"ActiveDirectoryClientAppId"`.

Learn more about distributing the JSON file to your devices in Read connection settings from a QR code and Mass deploy the mobile app with user-based authentication.

Conditional Access policy configuration

After you enable brokered authentication on your devices, your organization's IT administrators decide which Conditional Access policies to apply and configure them in the Microsoft Entra admin center. The following examples show the kinds of policies that organizations commonly apply. They're examples only, not recommendations, and the choice depends on your organization's security requirements:

- **Require MFA** – Require multifactor authentication for all users or specific groups.
- **Require compliant device** – Block access from devices that don't meet your organization's compliance requirements.
- **Location-based access** – Restrict access to specific network locations or IP ranges.
- **Risk-based access** – Block or challenge sign-ins that Microsoft Entra ID detects as risky.

The Warehouse Management mobile app doesn't need any extra configuration to work with these policies, and it has no settings that override them. When you use brokered authentication, the broker passes the required device and user signals to Microsoft Entra ID, which evaluates the policies and grants or denies access accordingly. If a sign-in is blocked, the policy evaluation occurred in Microsoft Entra ID, so your IT administrators must review the policy and the sign-in logs there.

For more information, see the Microsoft Entra Conditional Access documentation.

Last updated on 09/08/2026

Create a custom application registration for the Warehouse Management mobile app

The Warehouse Management mobile app uses a Microsoft Entra ID application registration to authenticate and connect to your Supply Chain Management environment. By default, it uses a global application that Microsoft provides and maintains, and no extra setup is required.

> **Important**
>
> Most deployments don't need this article. Use the global application if possible. It's easier to set up and maintain, and it supports most scenarios, including Microsoft Entra Conditional Access. When you use the global application, you don't have to provide a client ID or tenant in the app's connection settings.

You need your own app registration (and therefore a client ID) only in the following cases:

- You connect to a Dynamics 365 Finance + Operations (on-premises) environment.
- You connect to a cloud other than Azure Global (for example, a sovereign cloud such as Microsoft Azure operated by 21Vianet in China).
- You have specific requirements that the global application doesn't meet.

If none of these cases apply to you, use the global application instead. For more information, see Install the Warehouse Management mobile app.

When you use a custom app registration, set `"AuthCloud": "Manual"` in your connection settings, and provide your client ID in `"ActiveDirectoryClientAppId"`. Learn more in Connection settings reference.

Register the application in Microsoft Entra ID

The following procedure shows one way to register an application in Microsoft Entra ID. For detailed information and alternatives, use the links at the end of this article.

1. In a web browser, go to https://portal.azure.com.
2. Enter the name and password of the user who has access to the Azure subscription.
3. Use the search field at the top of the page to find and open the **Microsoft Entra ID** service.

4. Make sure that you're working with the instance of Microsoft Entra ID that's used by Supply Chain Management.
5. On the left navigation pane, expand **Manage** and select **App registrations**.
6. On the toolbar, select **New registration** to open the **Register an application** wizard.
7. Enter a name for the application, select the **Accounts in this organizational directory only** option, and then select **Register**.
8. Your new app registration opens. Make a note of the **Application (client) ID** value, because you need it later. This ID is referred to later in this article as the *client ID*.
9. In the **Manage** list, select **Authentication**.
10. On the **Authentication** page for the new app, open the **Settings** tab, set **Allow public client flows** to *Enabled*, and select **Save**.
11. Open the **Redirect URI configuration** tab and select **Add redirect URI**.
12. In the dialog, select **Android**. Then set the following fields:

    - **Package name** – Enter the following value (case sensitive):

      ```text
      com.Microsoft.WarehouseManagement
      ```

    - **Signature hash** – Enter the following value:

      ```text
      hpavxC1xAIAr5u39m1waWrUbsO8=
      ```

    Select **Configure** to save your settings and close the dialog to return to the **Authentication** page, which now shows your new platform configurations.
13. On the **Redirect URI configuration** tab, select **Add redirect URI**.
14. In the dialog, select **iOS / macOS**.
15. Set the **Bundle ID** field to the following value:

    ```text
    ```

```
com.microsoft.WarehouseManagement
```

16. Select **Configure** to save your settings. Close the dialog to return to the **Authentication** page, which now shows your new platform configurations.
17. On the left navigation pane, expand **Manage** and select **API permissions**.
18. Select **Add a permission**.
19. In the **Request API permissions** dialog, on the **Microsoft APIs** tab, select the **Dynamics ERP** tile and then the **Delegated permissions** tile. Under **CustomService**, select the **CustomService.FullAccess** checkbox. Finally, select **Add permissions** to save your changes.
20. Use the search field at the top of the page to find and open the **Microsoft Entra ID** service.
21. On the left navigation pane, expand **Manage** and select **Enterprise applications**. Then, in the new **Manage** list, select **All applications**.
22. In the search form, enter the name that you entered for the app earlier in this procedure. Confirm that the **Application ID** value for the app matches the client ID that you copied earlier. Then select the link in the **Name** column to open the properties for the app.
23. On the left navigation pane, expand **Manage** and select **Properties**.
24. Set the **Assignment required?** option to *Yes* and the **Visible to users?** option to *No*. Then select **Save** on the toolbar.
25. On the left navigation pane, expand **Manage** and select **Users and groups**.
26. On the toolbar, select **Add user/group**.
27. On the **Add Assignment** page, select the link under the **Users** heading.
28. In the **Users** dialog, select each user that you use to authenticate devices with Supply Chain Management.
29. Select **Select** to apply your settings and close the dialog. Then select **Assign** to apply your settings and close the **Add Assignment** page.
30. In the **Security** list, select **Permissions**.
31. Select **Grant admin consent for <*your tenant*>**, and grant admin consent on behalf of your users. If you lack the necessary permissions, return to the **Manage** list, open **Properties**, and

set the **Assignment required?** option to *False*. Each user can then provide consent individually.

More ways to register an application

For more information about how to register an application in Microsoft Entra ID, see the following resources:

- For instructions that show how to use Windows PowerShell to register an application in Microsoft Entra ID, see Use Azure PowerShell to create a service principal with a certificate.
- For complete details about how to manually register an application in Microsoft Entra ID, see the following articles:
  - Register an application in Microsoft Entra ID
  - Register a Microsoft Entra app and create a service principal

User-based authentication FAQ

This article answers frequently asked questions about user-based authentication for the Warehouse Management mobile app.

Where can I learn more about user-based authentication?

For more information about user-based authentication, read the following articles:

- User-based authentication for the Warehouse Management mobile app
- Mass deploy the mobile app with user-based authentication
- Install the Warehouse Management mobile app
- Removed or deprecated features in Dynamics 365 Supply Chain Management

Why did Microsoft deprecate service-based authentication for the Warehouse Management mobile app?

User-based authentication offers the following advantages over service-based authentication for the Warehouse Management mobile app:

- It's easier to configure and use.
- It's more secure in contexts where the Warehouse Management mobile app is used.
- It provides more robust security and more configuration options in Microsoft Entra ID.
- It enables single sign-on (SSO) authentication across apps on the same device.

Is service-based authentication deprecated everywhere?

No. Service-based authentication is deprecated only for the Warehouse Management mobile app. Other applications continue to support it.

Which authentication method should I use?

Use username/password authentication for all new and existing deployments. It works on all supported platforms, supports mass deployment, and needs no companion app on the device. If you want single sign-on (SSO) or Conditional Access policies that depend on device signals, add brokered authentication, which is an advanced option. Microsoft Entra ID QR code and PIN sign-in currently requires browser-based authentication, so it can't be combined with brokered authentication yet.

Device code flow is still accepted for backward compatibility, but it's no longer recommended. Learn more in What is device code flow, and why is it no longer recommended? later in this article.

How many Microsoft Entra ID apps do I need to register in Azure?

The Warehouse Management mobile app uses a Microsoft Entra ID application to authenticate and connect to your Supply Chain Management environment. You can use a global application that's provided and maintained by Microsoft, or you can register your own application in Microsoft Entra ID.

We recommend that you use the global application, because it's easier to set up, use, and maintain. In this case, you don't need to register any Microsoft Entra ID applications in Azure. All your devices can connect through the global application.

If you have specific requirements that the global application doesn't meet (such as the requirements for some on-premises environments), you can register your own application in Microsoft Entra ID as described in Create a custom application registration. You still need to create just one Microsoft Entra ID app registration. All your devices can then connect through it.

For information about how to configure your devices to connect through either of these methods, see Install the Warehouse Management mobile app.

How many Microsoft Entra ID users do I need?

Choose the approach that fits your warehouse. Your choice depends on how you manage identities and on your risk tolerance. Learn more in Choose an authentication approach.

Expand table

Scenario	Notes
Use the same Microsoft Entra ID account for all devices	*Not recommended.* This scenario, where you use a single Microsoft Entra ID user for all your devices, is less secure than other scenarios. It can lead to confusion in Supply Chain Management. For example, all warehouse processes are associated with a single system user, even when multiple warehouse workers use multiple warehouse devices to process work. You also can't revoke access for one device without affecting every other device.
Use a unique Microsoft Entra ID account for each device	Each worker must manually sign in to the app when they start to use the device. When you set up one Microsoft Entra ID user for each device, it's easy to block the Microsoft Entra ID user for just one device if that device is stolen or damaged. (Learn more in Remove access for a device that uses user-based authentication.)
Use a unique Microsoft Entra ID account for each worker	Single sign-on (SSO) is supported. Therefore, a worker who signs in to a device is automatically signed in to the Warehouse Management mobile app and all other apps that use the same Microsoft Entra ID account. Conditional Access policies are most effective in this scenario, because the signed-in identity represents a person.

> **Note**
>
> The number of Microsoft Entra ID accounts that you create isn't the same as the number of licenses that you need. Sharing one device account among many workers doesn't reduce your license count. Learn more in Licensing considerations.

Do I need to map users on the Microsoft Entra ID applications page in Supply Chain Management when I use user-based authentication?

No, you don't need to map users on the **Microsoft Entra ID applications** page in Supply Chain Management when you use user-based authentication.

How often do workers need to sign in to the Warehouse Management mobile app?

There's no fixed sign-in interval in the app, and the app doesn't apply a session timeout of its own. The amount of time a device or worker stays signed in is controlled entirely by your Microsoft Entra ID configuration, by configurations such as token lifetimes and Conditional

Access policies (for example, sign-in frequency). Workers must sign in again when the tokens on the device expire or are revoked. Learn more in Refresh tokens in the Microsoft identity platform and Configure adaptive session lifetime policies.

Will the current worker sign-in page change or be removed?

Although the worker sign-in page is required in some authentication scenarios, it can be skipped in others (for example, when a default user ID is set for the warehouse worker account). For more information, see Scenarios for managing devices, Microsoft Entra ID users, and mobile device users.

How can I sign out a device?

Follow these steps to sign out the Microsoft Entra ID account that's signed in on a device:

1. Open the Warehouse Management mobile app.
2. Select **Select a connection**.
3. Select **Sign out**.

What's the difference between Log off and Sign out in the Warehouse Management mobile app?

The Warehouse Management mobile app provides two similar-sounding actions that end different sessions. They aren't interchangeable.

- **Log off** is a menu item that you configure in Supply Chain Management on the **Mobile device menu items** page (with **Mode** set to *Activity code* and **Activity code** set to *Log off*). When a worker selects **Log off**, the worker's session ends on the server. The worker's stored state (such as the last screen they were viewing) is cleared, and the next worker who signs in starts from the menu that's configured for their work user.
- **Sign out** is a built-in button in the Warehouse Management mobile app. It signs the Microsoft Entra ID account out of the app on the current device, but it doesn't end the work user session in Supply Chain Management. The worker's server-side state is preserved, so the next time the same worker signs in on any device, the app returns to the screen that they last had open.

> ⓘ **Note**

If a worker uses **Sign out** while a screen other than the main menu is open, that screen reappears on the next sign-in, even if **Menu name** is set to *Main* for the work user on the **Work users** page. To always start at the configured main menu, the worker must use the **Log off** menu item before they sign out of the app. This behavior is by design.

Can I just use the Microsoft Entra ID as a worker and skip the worker sign-in page?

Yes. You can map Microsoft Entra ID users to worker IDs in Supply Chain Management. Workers can then authenticate the app with Supply Chain Management and sign in as a worker at the same time. For more information, see Scenarios for managing devices, Microsoft Entra ID users, and mobile device users.

Can I mass deploy the mobile app with user-based authentication?

Yes. For details and instructions, see Mass deploy the mobile app with user-based authentication.

What about single sign-on? Can I use the mobile app alongside Microsoft Teams to chat with my coworkers?

Yes, single sign-on (SSO) is supported. Among other capabilities, SSO lets you chat with coworkers through Microsoft Teams while you use the same account to sign in to the Warehouse Management mobile app.

If you're using SSO and sign out from one SSO app (such as Microsoft Teams), you also sign out of all other apps that use that same account (including the Warehouse Management mobile app).

Does user-based authentication work with Dynamics 365 Finance + Operations (on-premises)?

Yes. On-premises installations use Active Directory Federation Service (AD FS) instead of Microsoft Entra ID. However, the settings are similar, including the settings for user-based authentication methods such as username/password authentication. Learn more in Configure the Warehousing app for on-premises deployments.

Is it mandatory to have Microsoft Authenticator installed on the same mobile device as the Warehouse Management mobile app?

No, it's not mandatory for normal use. The app authenticates through the system browser or a native web view, without Microsoft Authenticator, Intune Company Portal, or any other companion app. Microsoft Entra ID QR code and PIN sign-in also work without these apps.

You need Microsoft Authenticator on Android and iOS devices if you want either of the following advanced capabilities:

- **Brokered authentication**, which provides single sign-on (SSO). On Android, Intune Company Portal can act as the broker instead.
- **Conditional Access policies that depend on device signals**, such as device compliance. These policies need a broker on the device to supply the signals.

Both options are advanced. Most frontline deployments don't use them. Whether you deploy a broker is a security design decision that your organization owns. Learn more in Brokered authentication and Conditional Access.

What Microsoft Entra ID device registration state does the app require?

The app doesn't require any specific device registration state. The app works on a device in any Microsoft Entra ID registration state: Microsoft Entra joined, Microsoft Entra registered, not joined, and not registered at all. You don't have to join or register a device before workers can sign in, and the app-level authentication flow works even on a device that's new and never registered.

If your organization requires a specific device state, that requirement comes from your own Conditional Access policies, not from the app. Learn more in Device registration requirements.

Can I authenticate by using Microsoft Entra Conditional Access?

Yes. Use Microsoft Entra Conditional Access to enforce policies such as multifactor authentication (MFA), device compliance, and location-based access controls. This feature requires Warehouse Management mobile app version 4.0.28 or later. Policies that depend on device signals, such as

device compliance, also require brokered authentication, because the broker passes those signals to Microsoft Entra ID. Your IT department decides which policies to apply and configures them in Microsoft Entra ID.

Here are some resources to help you work with Conditional Access:

- Learn how to set up Conditional Access in Brokered authentication and Conditional Access for the Warehouse Management mobile app.
- Find general information about Conditional Access in the Microsoft Entra Conditional Access documentation.
- For Intune-specific guidance, see Learn about Conditional Access and Intune and Common ways to use Conditional Access with Intune.

Can I authenticate using Microsoft Entra Guest User Access?

Yes. You can add an external user as a guest in the Microsoft Entra admin center. Learn how in Quickstart: Add a guest user and send an invitation.

After you send the invitation, create a warehouse worker account in Supply Chain Management and link it to the Microsoft Entra ID guest user account. If the guest user uses the Warehouse Management mobile app, you must assign appropriate roles and permissions to the warehouse worker account.

To set up the Warehouse Management mobile app to accept guest users, make the following connection settings:

- **Cloud** – Set to *Manual*.
- **Microsoft Entra ID client ID** – Enter the client ID of the Microsoft Entra ID application that you want to use.
- **Microsoft Entra ID tenant** – Enter the tenant of the host organization, in the form `https://login.windows.net/<host-organization-domain-name>`. Although this setting is optional for most connections, you must specify it for guest user access, so that workers are authenticated against the host organization instead of their home organization.

What is device code flow, and why is it no longer recommended?

Device code flow provides a two-step process that authenticates users on devices or operating systems that don't necessarily provide a web browser. For example, a media streaming app might use device code flow to allow users to sign in on smart TVs, game consoles, and other devices. For devices and operating systems that don't provide a web browser, device code flow lets you sign in by using another device (such as a computer or mobile phone).

Device code flow is a user-based authentication method that lets you enter a Microsoft Entra ID user name and password to sign in from a device. After the app is signed in, individual workers still sign in by entering their Supply Chain Management worker ID.

Microsoft no longer recommends it, mainly because it's a common target of phishing attacks. It's also blocked by default in new tenants, isn't available on iOS, and doesn't support SSO. Use username/password authentication instead.

For the full reasoning, see Device code flow authentication.

Why is device code flow blocked by default in new tenants, and how can I unblock it if I still need it?

Device code flow is vulnerable to phishing, so Microsoft Entra ID security defaults block it in *new* tenants. Existing tenants aren't affected unless they already have security defaults enabled. If you create a new tenant for testing, expect device code flow to fail there.

If a test environment or legacy workflow still depends on it, an admin can unblock it for that tenant by disabling security defaults. Because security defaults protect the whole tenant, treat this change as a temporary step while you update your setup to use username/password authentication. Learn more in Microsoft Entra security defaults.

How do I move devices that still use device code flow to a recommended method?

Follow the steps in Move from device code flow to username/password authentication. In short, verify that the Microsoft Entra ID accounts can sign in with a username and password, optionally install a broker app on Android and iOS devices if you want SSO, update your connection settings to use `"ConnectionType": "UsernamePassword"` (with `"UseBroker": true` when you use a broker), redistribute the settings, and then sign in one time on each device.

Mobile device user accounts

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Every time that a worker starts to use the warehouse app, they must sign in by using a user name and password. Any number of warehouse app users can be associated with each warehouse worker in the system, and warehouses are typically associated with each of those warehouse app users. You also configure various options for each warehouse worker record to establish default settings and other settings that are relevant to using the warehouse app.

Assign Microsoft Entra ID accounts to the mobile app in Azure

The Warehouse Management mobile app connects to Supply Chain Management through an *enterprise application* that's set up in Azure. Azure provides tools for creating Microsoft Entra ID user accounts and assigning them to the enterprise application.

Depending on the authentication scenario that you're using, you must set up a unique Microsoft Entra ID user account either for each mobile device or for each human worker that authenticates with Supply Chain Management. Make a note of the **User principal name** value of each Microsoft Entra ID account that you use for this purpose. Use these values later when you set up the Supply Chain Management user record for each account.

For more information about how to set up an enterprise application for the Warehouse Management mobile app, see User-based authentication for the Warehouse Management mobile app.

For more information about how to assign Microsoft Entra ID user accounts to enterprise applications in Azure, see Manage users and groups assignment to an application.

Set up employee records for each device or human worker

For each Microsoft Entra ID user account that you set up in the previous section, you must have a matching employee record in Supply Chain Management. Later, link each employee record to the related Supply Chain Management user record and warehouse worker record.

To create, view, and manage employee records, go to **Human resources** > **Workers** > **Employees**.

Set up Supply Chain Management user records for each device or human worker

For each employee record that you set up in the previous section, you must have a matching Supply Chain Management user record that identifies both the Microsoft Entra ID user account and the employee record. Follow these steps to set up a Supply Chain Management user record.

1. Go to **System administration** > **Users** > **Users**.

2. On the Action Pane, select **New**.

3. Set the following fields for the new user record:

    - **User ID** – Enter a unique ID for the user or device.
    - **User name** – Enter a descriptive name for the user or device.
    - **Provider** – Leave this field set to its default value.
    - **Email** – Enter the **User principal name** value of the Microsoft Entra ID account that you set up for the user or device.
    - **Telemetry ID** – Leave this field set to its default value.
    - **Company** – Select the legal entity (company) where the user works or the device is used.
    - **Person** – Select the employee record that corresponds to the user or device.
    - **Enabled** – Set this option to *Yes*.

4. On the **User's roles** FastTab, assign the *Warehouse mobile device user* role to the user account. The user must have this role to sign in to the warehouse app.

Set up mobile device user accounts

For each user record that you created in the previous section, you must create a *warehouse worker record* and assign one or more *mobile device user accounts* to it.

1. Go to **Warehouse management** > **Setup** > **Worker**.

2. To edit an existing worker, select it in the list pane. To add a new record, select **New** on the Action Pane.

3. If you're setting up a new worker, follow these steps:
   a. In the **Worker** field, select the related employee record from the **Human Resources** module. This value must match the **Person** value that's selected for the related Supply Chain Management user record.
   b. Select **Select**.
   c. On the Action Pane, select **Save**.

4. You can use a default profile to guide the warehouse worker at the packing station through the required process. Alternatively, use the default profile to save the worker's preferred profile settings. On the **Profile** FastTab, set the following fields:

   - **Container packing policy** – Select a container packing policy that defines how containers at the packing station should be processed. The container packing policy that you select here is preselected for the worker when they open the packing station. For more information, see the following blog post: Improved packing functionality.
   - **Packing profile ID** – Select a packing profile ID that defines the packing policy and container settings used. If the selected packing profile ID is associated with a container packing policy, you can't change the **Container packing policy** setting on this page.

5. On the **Default packing station** FastTab, set the following fields to define the default packing station that applies when the worker signs in. The worker can still select another packing station as required.

   - **Site** – Select the site where the default packing station is located.
   - **Warehouse** – Select the warehouse where the default packing station is located.
   - **Location** – Select the location of the default packing station.

6. The **Users** FastTab lets you create any number of mobile device user accounts for the selected worker. Each account is associated with a specific warehouse or warehouses. Use the toolbar to add or remove mobile device user accounts, reset the password for a selected account, or assign warehouses to a selected account. For each mobile device user account, set the following fields:

   - **User ID** – Enter a unique ID.
   - **User name** – Enter a name for the ID.

- **Default warehouse** – Set the default warehouse where the worker usually works. You can use the toolbar to assign additional warehouses, and the worker can switch between warehouses by using the **Change warehouse** indirect activity of the mobile device menu item.
- **Menu name** – Select the root menu that is the starting page for the worker. The ability to set up a root menu for each worker is useful because it lets you control the menu structure that each worker can use. For example, the menu for workers that are active only in the outbound area can be tailored for tasks that are related to outbound operations for that area.
- **Inactive** – A selected checkbox indicates that the mobile device user account is inactive. The mobile device user account is automatically deactivated if a worker enters the wrong password five times in a row in the warehouse app. However, you can also manually select this checkbox. Clear the checkbox to make the user active again.
- **Default user** – Select this checkbox for the mobile device user account that should be the default account for the worker, if the worker should have a default account. If you're using a sign-in scenario where you have a unique Microsoft Entra ID user account for each human warehouse worker, the Warehouse Management mobile app automatically signs in by using the default mobile device user account when the human worker signs in to the device by using their Microsoft Entra ID user account. (Learn more in Scenarios for managing devices, Microsoft Entra ID users, and mobile device users.)

7. On the **Work** FastTab, set the following fields:

- **Allow pick location override** – Set this option to *Yes* to allow the worker to override the location for picking steps. This capability can be useful if the physical inventory doesn't match the system-suggested location.
- **Allow put location override** – Set this option to *Yes* to allow the worker to override the location for put steps. This capability can be useful if the suggested put location is currently full or unavailable, or if staging locations changed.
- **Allow sales over picking** – Set this option to *Yes* to allow the worker to over-pick when sales orders are picked. Learn more in Over-picking for sales orders and transfer orders.
- **Allow transfer order over picking** – Set this option to *Yes* to allow the worker to over-pick when transfer orders are picked. Learn more in Over-picking for sales orders and transfer orders.
- **Allow movement of inventory with associated work** – Set this option to *Yes* to allow the worker to move inventory that's already reserved or already associated with other

work. Learn more in Movement of inventory with associated work in Warehouse management.

- **Allow manual item reallocation** – Set this option to *Yes* to enable manual reallocation for the worker during short picking. Item reallocation guides workers to pick inventory from another location. Although automatic reallocation is available for all workers, manual reallocation requires explicit setup for a worker. The ability to control manual reallocation for each worker can be helpful because it lets you control the visibility that each worker has when, for example, item picking from the quarantine or bulk area is limited to trusted workers. For more information, see the following blog post: Automatic and manual item reallocation during short picking.
- **Is a cycle count supervisor** – Set this option to *Yes* to make the worker a cycle count supervisor. In this case, all cycle counts that the worker performs on the warehouse app are immediately approved. The **Maximum percentage limit**, **Maximum quantity limit**, and **Maximum value limit** fields aren't considered for workers where this option is set to *Yes*.
- **Maximum percentage limit** – Enter the highest percentage limit that a cycle count can vary from the expected count without requiring approval by a cycle count supervisor.
- **Maximum quantity limit** – Enter the total quantity that the entered quantity can differ from the expected quantity (in units) without requiring approval by a cycle count supervisor.
- **Maximum value limit** – Enter the maximum amount that the cost of the inventory can differ from the expected cost without requiring approval by a cycle count supervisor.

> **Note**
>
> To skip supervisor approval, all limit checks must succeed. To let all non-supervisor users skip the approval step, set suitably high values for each of the **Maximum percentage limit**, **Maximum quantity limit**, and **Maximum value limit** fields. If all recorded values are below these limits, supervisor approval isn't required.

8. On the Action Pane, select **Save**.

9. If you added a new mobile device user account, the **Set password** dialog box appears, where you can create a simple password that the user can use to sign in to the mobile app. Enter the simple password two times, and then select **Save password** to continue.

Set the language, number formats, and time zone for each warehouse app user

When a worker signs in to the Warehouse Management mobile app, the language, number formats, and time zone change to match that worker's preferences. The account settings for the worker selected in step 3 in the Set up mobile device user accounts section determine the settings that are used. If you require separate settings for each worker, use different worker accounts. The following procedure shows how to change the language, number formats, and time zone for a warehouse app user.

1. Go to **Warehouse management** > **Setup** > **Worker**.
2. Find the worker that you want to set up, and make a note of the value in the **Worker** field.
3. Go to **System administration** > **Users** > **Users**.
4. Open the user record where the **Person** column shows the **Worker** value that you found in step 2.

   > **Important**
   >
   > The **User ID** values that are listed on the **Users** page are *not* related to the values that are shown on the **Users** FastTab of the **Worker** page that you opened in step 1.

5. On the Action Pane, select **User options**.
6. On the **Preferences** tab, set the following fields:

   - **Language** – Select the language that the worker prefers. This field also controls the number format that's shown in the warehouse app.
   - **Date, time, and number format** – Select the date and time format that the worker prefers. The warehouse app uses the number format associated with the language chosen for the **Language** field instead of this setting.
   - **Time zone** – Select the time zone where the worker works. This field affects the time stamp for all registrations that the worker makes by using the app.

> **Note**
>
> In some cases, the warehouse app might not find specific worker settings for language, number formats, and time zone. The following rules apply:

- If the app isn't connected to a Supply Chain Management environment (for example, the first time that the app is started after it's installed), the language of the local device is used. When the device language changes, the app language also changes. For more information about how to configure the language for the local device, see the documentation for your device and/or operating system.
- If the app is connected to a Supply Chain Management environment, but no preferences are set for the signed-in worker, the language, number formats, and time zone are selected based on the account that's associated with the client ID that the device uses to connect to Supply Chain Management. Learn more in **User-based authentication for the Warehouse Management mobile app**.

Tip

If you notice that incorrect time stamps are shown for registrations that are made by using the warehouse app, you might have to adjust the time zone that's set for the mobile device user account that workers use to sign in and/or authenticate with Supply Chain Management. As was previously mentioned, the time zone setting might come from the mobile device user account that's used to sign in to the warehouse app, as set up on the **Worker** page. Alternatively, if the mobile device user account isn't set on the **Worker** page, the time zone comes from the mobile device user account that's associated with the client ID that's used for authentication, as set up on the **Microsoft Entra applications** page.

Mobile bar code support

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Because Android is an open-source project, any manufacturer of hardware for warehouse bar code scanners can build a device to run the Android operating system. A device is only Android-compatible if it can run apps that are written for the Android execution environment.

However, a hardware vendor can modify and create overlays for the Android version that runs on their hardware. Microsoft can't take any responsibility to ensure that a mobile bar code scanning app for Android is compatible with a manufacturer's bar code scanning hardware and the Android version that runs on it.

The Warehouse Management mobile app has been tested with a selection of Android powered devices for bar code scanning. These tests only cover a sample of the devices that are available on the market.

We recommend that you test the Warehouse mobile scanning app on selected hardware before you decide on the hardware that you want to buy.

For information about how to solve some types of compatibility issues between the Warehouse Management mobile app and your bar code scanner, see Advanced barcode scanner configuration.

Scan bar codes using a camera in the Warehouse Management mobile app

This article explains how to set up the Warehouse Management mobile app to scan bar codes using a camera on a mobile device.

> **Note**
>
> This article applies to Warehouse Management mobile app version 4.1.5 and later. Earlier versions provide a more limited camera scanning experience, and they support fewer bar code formats.

Setup

In the display settings of the Warehouse Management mobile app, you can choose whether to use the camera for bar code scanning. If you turn on **Use the camera as scanner**, you can use the camera on every input field that has the preferred input mode set to **Scanning**.

To control whether an input field is scannable, on the **Warehouse app field names** page, set **Preferred input mode** to **Scanning**. When you select this option, a camera can be used for scanning in the Warehouse Management mobile app. Learn more in Configure fields for the Warehouse Management mobile app.

Navigation

Each page where the input field has its **Preferred input mode** set to *Scanning* includes a link to the camera page. When you're on the camera page, use the following options to navigate:

- Select the back button to go back to the **Task and details** page.
- Select the pencil on the **Task and details** page to go to a page where you can manually enter input.
- Select the camera on the **Task and details** page to go back to the camera page.

The camera scans continuously while the camera page is open. Every bar code that the camera recognizes is outlined in the preview, and the decoded value is shown under the outline. You don't have to start or restart a scan, and there's no scanning time-out.

The following controls are available on the camera page:

- **Back** – Returns to the **Task and details** page.
- **Flashlight** – Turns the device flashlight on or off. Use it in dark aisles, in freezers, or when a label is in shadow. The button isn't available on devices that don't have a flashlight.
- **Accept** – Submits the bar code. The button shows a green check mark as soon as a bar code is recognized. If more than one bar code is recognized, the app asks you to identify the correct bar code.

Customize the bar code scan marker

When you scan with the device camera, the app draws a highlight around each bar code that it recognizes, labeled with the decoded value. You can choose both the color and the thickness of that highlight.

A thin, pale marker can be hard to pick out against a busy label, a glossy surface, or in bright sunlight. Warehouse lighting and label stock vary from site to site, so a marker that works well in one facility might be hard to see in another.

To change the marker appearance:

1. Go to **Settings** > **Camera**.

2. Select **Scan marker color**, and choose one of the twelve available colors. Available options include: *Peach* (default), *White*, *Black*, *Red*, *Orange*, *Yellow*, *Lime*, *Green*, *Teal*, *Blue*, *Purple*, and *Magenta*.

   Pick a color that contrasts with the labels that you scan most often. Light colors, such as *White*, *Yellow*, and *Peach*, stand out against dark packaging and printed bar codes. *Black* and darker colors work better against pale or reflective label stock. If markers are hard to spot at a glance, increasing the thickness usually helps more than changing the color.

3. Select **Scan marker thickness**, and choose one of the five available widths. Available options include: *Thin*, *Normal* (default), *Medium*, *Thick*, and *Extra thick*.

The app shows a live preview of your settings, so you can see how the combination looks before you commit to it. Your new settings apply the next time you open the camera scanner.

Keep the following points in mind when you set the scan marker color or thickness:

- **The server saves the setting for the specific worker and device combination** – The setting follows the current worker on the current device, but it isn't shared across devices. If the

worker signs in on a different device, that device uses its own setting. Each worker and device combination is configured independently.

- **The setting persists across sessions** – After you set it, your choice is remembered when you close the scanner, sign out, or restart the app.
- **The setting only affects the display** – It doesn't change how bar codes are detected or decoded, and it has no effect on scanning accuracy or on hardware (laser) scanning.

Supported bar code formats

The following table shows the bar code formats that each platform supports.

Expand table

Bar code format	Android	iOS	Windows	Common use cases
Aztec	Yes	Yes	Yes	Transportation tickets, identification documents
Codabar	Yes	Yes	Yes	Libraries, blood banks, shipping labels
Code 39	Yes	Yes	Yes	Automotive, healthcare, government applications
Code 93	Yes	Yes	Yes	Logistics, inventory management
Code 128	Yes	Yes	Yes	Supply chain, shipping, product identification
DataBar (RSS-14)	Yes	Yes	Yes	Fresh foods, healthcare, small items
DataBar Limited	Yes	Yes	Yes	Small item identification, healthcare
DataBar Expanded	Yes	Yes	Yes	Coupons, loyalty cards, variable data
Data Matrix	Yes	Yes	Yes	Electronics, automotive parts, pharmaceuticals
DX Film Edge	No	No	Yes	Photography, film processing
EAN-8	Yes	Yes	Yes	Small retail products, magazines
EAN-13	Yes	Yes	Yes	Retail products, books, international trade
ITF (ITF-14)	Yes	Yes	Yes	Shipping cartons, distribution packaging
MaxiCode	No	No	Yes	UPS shipping, package tracking
MSI Plessey	No	Yes	No	Shelf and inventory labels in retail
PDF417	Yes	Yes	Yes	Driver's licenses, identification cards, forms
Micro PDF417	Yes	Yes	No	Small parts marking, healthcare specimens

Bar code format	Android	iOS	Windows	Common use cases
QR Code	Yes	Yes	Yes	Marketing, inventory, contact information
Micro QR Code	Yes	Yes	Yes	Small components, electronics, jewelry
rMQR Code	No	No	Yes	Rectangular applications, space-constrained items
UPC-A	Yes	Yes	Yes	Retail products, grocery items
UPC-E	Yes	Yes	Yes	Small retail products, compressed UPC

The following platform notes apply:

- On Android, the Google ML Kit bar code scanner decodes bar codes. An extra scanner decodes the DataBar formats, Micro QR Code, and Micro PDF417. The extra scanner only runs when ML Kit doesn't recognize a bar code, so it doesn't slow down everyday scanning. On iOS, the Apple Vision framework decodes bar codes. On Windows, scanning runs in the browser. Because each platform uses a different decoder, the supported formats differ, as shown in the preceding table.
- MSI Plessey is only supported on iOS 17 or later. No decoder is available for it on Android.
- On iOS, Codabar, the DataBar formats, Micro QR Code, and Micro PDF417 require iOS 15 or later.
- On iOS, UPC-A is reported as its EAN-13 equivalent, which is the same 12-digit number with a leading zero. Most hardware scanners behave the same way. If your process compares scanned values with a UPC-A item identifier, allow for the leading zero.
- The app scans all supported formats at the same time. You don't select a format in the app.

Usage tips

Here are a few tips for effective bar code scanning in the Warehouse Management mobile app:

- **Optimal scanning conditions** – For the best scanning results, ensure adequate lighting, and hold the device steady. In poor lighting, turn on the flashlight from the camera page.
- **Distance** – Hold the camera close enough that the bar code fills most of the width of the preview. Dense, one-dimensional formats, such as Code 39 and Code 128, need more detail than QR codes do. If a bar code isn't recognized, the app gradually zooms in to help, but moving closer is faster.
- **Alignment** – Keep one-dimensional bar codes roughly parallel to the focal plane of the camera. Two-dimensional formats, such as QR Code and Data Matrix, can be scanned at any angle.

- **Format selection** – The app automatically detects supported formats. Manual selection isn't required.
- **Compatibility check** – Before deployment, verify that your platform supports your specific bar code format.
- **Performance** – QR codes and standard retail formats (UPC and EAN) typically offer the fastest scanning performance.
- **Damaged or glossy labels** – Change the angle slightly to avoid glare, and clean the camera lens. Torn or wrinkled labels might have to be entered manually. Select the pencil on the **Task and details** page to enter the value.

Last updated on 08/07/2026

Advanced bar code scanner configuration

On most mobile devices, the Warehouse Management mobile app can capture scanned bar code input right out of the box. Therefore, you just have to install the app, set up the connection to Microsoft Dynamics 365 Supply Chain Management, and start scanning. However, some devices require advanced configuration before their bar code scanner hardware can interact correctly with the Warehouse Management app.

One common method for integrating scanning hardware with the Warehouse Management app is to configure your mobile device to provide *intent output* for bar code scanning. The bar code scanner can then submit scanned data directly to the Warehouse Management app. It doesn't have to send the data as simulated keystroke input instead. If you experience compatibility issues with your bar code scanner, you might be able to fix them by setting up your device to provide intent output.

This article explains how to set up a mobile device to provide intent output for bar code scanning. If your bar code scanner already works correctly with the Warehouse Management app, you don't have to read this article.

> **Note**
>
> Intent output often replaces keystroke output. Therefore, you shouldn't configure your device to use both types of output at the same time.

Prerequisites

To use intent output with the Warehouse Management mobile app, you must be running version 2.3.3.0 or later of the app.

Set up your mobile device

The Warehouse Management mobile app automatically supports intent output for bar code scanning. You don't have to configure any settings in the mobile app or Supply Chain Management to use intent output. However, you must adjust your mobile device's native settings to configure the device to use intent output. The names and locations of these settings vary, depending on the device that you're using. Therefore, see your device's documentation for specific details.

To configure your mobile device to use this feature, look for the following settings:

- **Intent output** – Enable the functionality on your device.
- **Intent action** – Set the value to *com.microsoft.warehousemanagement.BARCODE*.
- **Intent type** – Set the value to *Broadcast intent*.
- **Intent category** – Leave the default value.
- **Extra key** – The Warehouse Management mobile app requires that bar code data arrives as a string value for the `com.symbol.datawedge.data_string` key. For Zebra and ProGlove devices, you don't have to specify this value, because the devices use this key name by default. However, you might have to specify the value for other devices.

Verify your configuration

After configuring intent output, test the setup by scanning a known barcode on a field in the Warehouse Management mobile app. If the scanned value appears correctly in the field, the configuration is working. If the field remains empty or shows unexpected characters, review the intent settings on your device and ensure that keystroke output is disabled.

Customize the company logo shown in the Warehouse Management mobile app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can display your company logo in the Warehouse Management mobile app by uploading it through the legal entity settings in Supply Chain Management. The app retrieves the logo based on the legal entity the worker signs in to.

How logo priority works

The app checks for a logo in two places on the **Legal entities** page. The setting on the **Dashboard image** FastTab takes priority over the **Report company logo image** FastTab, as summarized in the following table:

Expand table

Source	When the app uses it
Dashboard image FastTab (with **Dashboard company image type** set to *Logo*)	This logo is always used when available, regardless of whether a logo is also defined on the **Report company logo image** FastTab.
Report company logo image FastTab	Used only if no logo image is defined on the **Dashboard image** FastTab. This image is also used for printed reports that include a logo.

> **Note**
>
> The **Dashboard image** FastTab setting also controls the image shown on the Supply Chain Management web client home page. If you want a different image for the web client, upload your logo for the mobile app first. Then change the **Dashboard company image**

type to a different value and upload the web client logo image. The mobile app continues to use the first logo you uploaded.

Upload company logos for the app

To upload a company logo for each legal entity, follow these steps:

1. Go to **Organization Administration** > **Organizations** > **Legal entities**.
2. Select the legal entity you want to upload a logo for.
3. Choose one of the following methods:

    - **Dashboard image method (recommended)** – Expand the **Dashboard image** FastTab, set **Dashboard company image type** to *Logo*, and select **Change** to upload the image.
    - **Report company logo image method** – Expand the **Report company logo image** FastTab and select **Change** to upload the image.

4. On the Action Pane, select **Save**.
5. Repeat from step 2 for each legal entity that needs a logo.

Last updated on 04/08/2026

Warehouse Management mobile app release schedule

Microsoft doesn't force version upgrades for the Warehouse Management mobile app. You can decide when a new version reaches each of your devices, and you can stay on your preferred version for as long as you like. However, Microsoft normally supports each release for one year. Version 4 and later releases follow a rolling 12-month support window, with each release eligible for support cases only while its publication date falls within the previous 12 months. For details, see Support policy for the Warehouse Management mobile app. Therefore, you should plan for at least one update per device per year.

For most deployments, you should install the app from an app store and let it update automatically. This approach is the simplest way to receive security fixes, platform compatibility updates, and bug fixes. It keeps devices inside the support window without extra effort. If your organization wants to validate a release before it reaches production devices, use the release schedule in this article to plan that validation.

Targeted release schedule (dates subject to change)

Each release becomes available in Microsoft App Center first. Progressive rollout to the app stores (Microsoft Store, Google Play, and the Apple App Store) starts later. Because rollout is gradual, a release might not appear on every device on the date that rollout begins. Availability in each store can take several additional days to reach all users. iOS releases can arrive later still because of Apple App Store review times.

The following table lists the current and scheduled releases of the Warehouse Management mobile app. It includes the following columns:

- The **Availability in Microsoft App Center** column indicates when you can download the release for evaluation or for manual distribution. This date is also the publication date that determines support eligibility under the 12-month support window.
- The **App store rollout begins** column indicates when progressive rollout to the app stores starts.

Expand table

Release version	Availability in Microsoft App Center	App store rollout begins	Status
4.1.6.0	September 2, 2026	September 2, 2026	Released
4.1.5.0	August 11, 2026	August 25, 2026	Released
4.1.4.0	May 28, 2026	Complete	Released
4.1.3.0	May 18, 2026	Complete	Released
4.1.2.0	May 6, 2026	Complete	Released
4.1.1.0	April 30, 2026	Complete	Released

For a list of features and fixes included in each release, see What's new or changed in the Warehouse Management mobile app. For releases before version 4.1.1.0, see Warehouse Management mobile app release notes archive.

> **Note**
>
> Microsoft App Center remains available for downloading Warehouse Management mobile app packages. If that changes, Microsoft will communicate the change and the replacement distribution method in advance through What's new or changed in the Warehouse Management mobile app.

Plan your own update process

The schedule gives you a window between App Center availability and app store rollout that you can use for validation. How you use that window is up to you. Every organization has a different device fleet, mobile device management (MDM) solution, and internal change management policy, so develop the process that fits your organization best. The following points are a starting point, not a required process.

- **Track upcoming releases** – Check this schedule and What's new or changed in the Warehouse Management mobile app so that no version reaches your devices unannounced.
- **Review the release notes** – Compare each release against the flows, device models, scanners, and authentication configuration that matter most to your operation.
- **Test on a small set of pilot devices** – Download the release from Microsoft App Center during the window before store rollout begins, and install it on devices that represent your real hardware mix. Preview builds are also available in App Center for earlier evaluation, but they're intended for evaluation only and aren't covered by the support window.

- **Use your MDM solution to control timing** – On Android, Managed Google Play in Microsoft Intune lets you set a different app update mode (*Default*, *High Priority*, or *Postponed*) for each group that the app is assigned to. For details, see Update a Managed Google Play app. On Windows, you can deploy a specific MSIX package from Microsoft App Center as a line-of-business app. For details, see Add a Windows line-of-business app to Microsoft Intune. On iOS, the app is available only through the Apple App Store, so this type of version control isn't available.
- **Report problems that you find** – If validation uncovers a regression, open a support case with a supported version so that the issue can be fixed in a current release.

Things to keep in mind

- **Stay within the support window** – Holding a version indefinitely eventually moves devices outside the rolling 12-month support window for version 4 and later releases. Learn more in Support policy for the Warehouse Management mobile app.
- **Security and platform fixes ship in current releases** – Older releases don't receive backported fixes, and operating system updates can break older builds.
- **Back-end compatibility isn't guaranteed indefinitely** – Supply Chain Management services evolve over time, so a version that you hold for a long time might eventually stop working correctly.
- **Manual distribution adds ownership** – If you take devices off the store update path, your organization becomes responsible for delivering every subsequent update, including security fixes. Make sure that you have a reliable mechanism to get the latest version onto your devices. The Warehouse Management mobile app is for your internal business use only. You may not republish or distribute it externally in any app store or similar distribution service.

Last updated on 09/02/2026

Support policy for the Warehouse Management mobile app

This article describes the support policies for the Warehouse Management mobile app. The policy that applies to you depends on the version you are running:

- **Version 3 (V3)** reaches end of support in May 2026. After that date, Microsoft no longer accepts support cases for V3. Migrate to V4 before May 2026 to keep support coverage.
- **Version 4 (V4) and all later releases** follow a rolling 12-month support window starting May 1, 2027. After that date, a release is eligible for support cases only if its publication date is within the previous 12 months. This rule applies to every V4 release. It also applies to later major, minor, and patch versions.

These policies help keep the app secure, reliable, and compatible with current platforms. By focusing on recent releases, Microsoft can:

- Deliver security fixes faster.
- Keep up with changes in Apple, Google, and Microsoft platforms.
- Provide a consistent baseline for troubleshooting.

Older releases of the app continue to function. The policies define when Microsoft accepts support cases. They don't affect service availability or sign-in.

Version 3 support policy

V3 of the Warehouse Management mobile app reaches end of support in May 2026. For details, see the Migration to V4 Guide. Migrate devices to V4 before that date to keep support coverage.

V3 runs on the *Xamarin* framework. Xamarin is no longer supported, so Microsoft can't ship new features or bug fixes for V3.

Scope of support after May 2026

Back-end APIs stay compatible with V3 during the migration period. This compatibility lets V3 clients keep running while you move to V4. The compatibility duration isn't guaranteed and may end as Supply Chain Management services change.

- **No new releases** – Microsoft can't build, patch, or ship updates for V3. The Xamarin framework is deprecated.
- **Support cases** – Microsoft no longer accepts support cases for the V3 client.

Devices that stay on V3 after May 2026 follow this V3 policy. The 12-month rolling window doesn't apply to V3.

Examples of out-of-scope scenarios

The following table lists examples of issues that Microsoft no longer investigates for V3.

- **Authentication and identity (Microsoft Entra ID)** – V3 uses legacy authentication libraries that Microsoft no longer maintains.
  - **Unsupported** – Failures with modern Microsoft Authentication Library (MSAL) flows, *Device not compliant* errors, and new conditional access policies in Microsoft Entra ID.
  - **Resolution** – Migrate to V4 to use current authentication protocols.

- **Client-side performance and connectivity** – The V3 networking stack and libraries are frozen at their current versions.
  - **Unsupported** – Local latency, connection drops, or timeouts caused by the outdated V3 libraries.
  - **Note** – If a performance issue is verified as a server-side or service-wide problem, Microsoft still investigates it as part of standard cloud service support.

- **Operating system (OS) compatibility** – Apple and Google release new OS versions often. Legacy apps often break on those new OS versions.
  - **Unsupported** – Crashes, UI glitches, or launch failures on mobile OS versions released after the final V3 release.
  - **Resolution** – Use V4 for ongoing OS compatibility. V4 is built on the latest software development kits (SDKs).

Version 4 and later support policy

Starting **May 1, 2027**, V4 and every later release follow a rolling 12-month support window. On or after that date, a release is eligible for support cases only if its publication date is within the previous 12 months. The window is evaluated on the date the support case is opened.

This rule applies to every release from V4 onward. It applies to major, minor, and patch versions equally.

How publication date is defined

The publication date of a release is the date the release first becomes available on Microsoft App Center. Releases on the Microsoft Store, Google Play, and the Apple App Store can appear later. iOS releases often arrive later because of store review times. Even so, the Microsoft App Center date is always the date that determines support eligibility.

Each V4 and later release, starting with version 4.1.1.0, lists its publication date in What's new or changed in the Warehouse Management mobile app.

Examples

- A release published on *April 30, 2026* is eligible for support cases until *April 30, 2027*. Because that date falls before May 1, 2027, the release becomes ineligible on May 1, 2027 (the date the policy takes effect).
- A release published on *June 15, 2026* is eligible for support cases until *June 15, 2027*.
- A release published on *August 1, 2027* is eligible for support cases until *August 1, 2028*.

There's no grace period after the 12-month boundary. Update the device to a supported release before you open a support case.

Why the 12-month window matters

The 12-month window is critical for keeping the app secure and reliable. It lets Microsoft:

- Ship security fixes on a current code base. Backporting across many legacy builds slows fix delivery.
- Keep up with platform changes from Apple, Google, and Microsoft. OS updates, authentication libraries, and store policies often break older releases.
- Diagnose issues against a known, well-tested baseline. This approach makes root-cause analysis faster and more accurate.
- Focus engineering work on changes that help all customers. Issues already fixed in newer releases don't need reinvestigation.

Scope of the 12-month window

- **Support cases** – Microsoft accepts and investigates support cases only when the device runs a V4 or later release with a publication date within the previous 12 months. For older releases, update to a supported version before opening a case.

- **Critical production outages** – Microsoft might still investigate severity-1 incidents that block widespread production operations. The team reviews these cases individually. The standard guidance is still to update to a supported release first. This exception isn't a substitute for staying current.
- **Preview builds** – Preview and beta builds from Microsoft App Center aren't part of the 12-month window. Use them only for evaluation. Report issues through the preview feedback channel.
- **App availability** – The app keeps running on any installed version. Microsoft doesn't block out-of-window clients, and back-end services don't reject their connections. However, Supply Chain Management services change over time. Older releases might eventually stop working with newer back-end behavior. Compatibility for out-of-window releases isn't guaranteed.
- **Security and platform fixes** – Critical fixes ship in current releases. Devices on older releases don't get those fixes.

How to identify the installed version

To check which version is installed, open the app. The version appears on the sign-in screen or in **Settings**. Compare it to the publication dates in What's new or changed in the Warehouse Management mobile app.

How to stay within the support window

- Turn on autoupdate in your app store, or push updates through Microsoft Intune or another mobile device management (MDM) solution. For details, see Mass deploy the mobile app with user-based authentication.
- Track release dates in What's new or changed in the Warehouse Management mobile app. Every V4 and later release, starting with 4.1.1.0, has a publication date.
- Update devices at least once a year. This practice keeps every device inside the 12-month support window.

User settings, color themes, and sound themes

This article explains how to use local user settings to personalize the way your Warehouse Management mobile app works, looks, and sounds.

Workers can set their own preferences locally while working on a device by following the instructions in this article.

Administrators and managers can also set default settings, device-specific settings, and user-specific settings remotely from the web client, as described in Mobile Device User Settings.

Color and sound themes

Warehouse Management mobile app version 4 introduces new color and sound themes that can help make your daily work more enjoyable and visually distinctive.

Color themes

Each worker can select their own color theme, both to match their personal preference and to make it easy to see which user is signed in. This feature is useful when several different workers use the same device throughout the day.

Many color themes are available, including:

- Blue
- Bronze
- Cyan
- Golden
- Green
- High Contrast
- Lavender
- Orange
- Pink
- Platinum
- Red

Each theme also supports several color modes, which are:

- Light – Bright background
- Dark – Dark background
- Auto – Matches your device's default setting

Sound themes

To make your workflow more fun, choose a sound theme that plays a sound after you complete a task or scan an item. For example, you might hear a bird chirp or a robot beep. You can choose from more than 20 sound themes.

Set user preferences on a mobile device

To set your user preferences on a mobile device, including the color and sound theme, follow these steps:

1. Sign in to the Warehouse Management mobile app and go to the **Main menu** page.
2. Select the **Settings** button, which is the gear icon in the top-right corner of the screen.
3. Make the following settings on the **Settings** page as needed:
    - **Product photo placement** – Select how product photos should be shown in the app (learn more about product images in Add an image to a product). Choose one of the following options:
        - *Default (show photo card)* – Display the product image as a large photo card.
        - *Only in step header* – Show the product image within the header section.
        - *Do not show* – Hide the product image in the mobile app.
    - **Color theme** – Select a color theme for the device. Choose from more than 10 color themes.
    - **Color mode** – Select a color mode for the device. The available options are *Light*, *Dark*, and *Auto*. The *Auto* option matches the device's default setting.
    - **Best button position** – Select how buttons should be positioned on the device. Elements in the app move to better fit the preference or handedness of the worker. The available options are *Bottom right (default)*, *Bottom left*, *Top right*, and *Top left*.
    - **Scan with camera** – Set this option to *Yes* to use the device camera to scan input fields where the preferred input mode is set to *Scanning*. If your device has a built-in scanner, set this option to *No* to use the scanner instead.
    - **Field filtering and sorting** – Select which fields are shown on the device and how they're ordered. You can choose to show all fields or just the promoted fields, and

you can choose to sort them or not. Learn more in Configure promoted fields for steps in the Warehouse Management mobile app.

- **Vibration level** – Select the vibration level for the device. Select a value between 0 (zero) and 5. A value of *0* represents no vibration, and a value of *5* represents maximum vibration.
- **Sound level** – Select the sound level for the device. Select a value between 0 (zero) and 10. A value of *0* represents no sound, and a value of *10* represents maximum volume.
- **Sound theme** – Select a sound theme for the device. Choose from more than 20 sound themes.
- **Text scale** – Specify the text size as a percentage of the standard size. Enter a value between 70 and 400. A value of *70* represents the smallest text scale, and a value of *400* represents the largest text scale. *100* is the standard text size.
- **Button scale** – Specify the button size as a percentage of the standard size. Enter a value between 50 and 200. A value of *50* represents the smallest button scale, and a value of *200* represents the largest button scale. *100* is the standard button size.
- **Server request timeout (minutes)** – Set how long the app should wait for a response from the server before timing out. You can select a duration from 1 to 30 minutes.
- **Button style** – Choose how certain buttons should be displayed in the app. The available options are *Buttons* and *Slider*.
- **Quantity spinner mode** – *Spinners* provide a way for workers to enter quantity values by spinning through digits using a sliding gesture, similar to using a combination lock. Use this setting to control how spinners are displayed. Choose one of the following values:
  - *Auto* – Allow the system to choose the appearance based on how much room there is on the screen.
  - *Small* – Always show the small spinner, which presents a compact control.
  - *Don't show* – Don't use spinners. Instead, allow workers to enter numerical values using an on-screen keypad.
- **Show copilot on startup** – Specify whether the Copilot workload page should be shown each time the user signs in to the app. The workload page shows work summaries and AI-generated insights to help warehouse workers better plan their shift. Learn more in Workload insights with Copilot in the Warehouse Management mobile app.
- **Show copilot data as** – Specify whether Copilot summaries should be based on work headers or work lines. The choice depends on how workers prefer to think

about their daily workload. For example, if all your orders typically contain just a few items, workers might prefer to think about their work in terms of whole orders (*Work headers*). However, if quantities vary greatly from order to order, workers might prefer to think about their work in terms of individual items (*Work lines*).

- **Play sound when rescan is required** – Choose whether to play a sound when a rescan is required. A rescan might be required, for example, when a scanned value results in an error, such as an invalid item ID.
- **Configuration mode** – Set this option to *Yes* to explore and understand the relationship between UI controls and their underlying XML. This option can be helpful when you're customizing mobile flow behavior. When this is set to *Yes*, you can press and hold on almost any button or label to drill down into the session XML. This feature isn't available for controls that aren't connected to the session XML.
- **Auto submit** – Controls whether the app or the device handles scanned data submission. Set to *No* (recommended) for new installations. Learn more in Data submission behavior in the Warehouse Management mobile app.

4. Select **Back** when you're done.

Last updated on 04/08/2026

Data submission behavior in the Warehouse Management mobile app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Warehouse Management mobile app supports two options for how it submits scanned data: *auto submit* and *manual submit*. This article explains the differences between these options and how to configure them.

How the app submits scanned data

The Warehouse Management mobile app supports two approaches for submitting scanned data:

- **Device-controlled (Auto submit = No)** – The app doesn't auto submit. Instead, the device controls submission behavior. This is the *recommended setting* because it provides consistent, predictable behavior across all devices.
- **App-controlled (Auto submit = Yes)** – The app decides how to handle scanned data. Behavior varies by device: some devices (such as Zebra) auto submit, while others (such as Honeywell) require manual confirmation. This option exists for backwards compatibility with versions before 4.0.20.0 and is *not recommended* for new installations.

Configure auto submit in the app

1. Sign in to the Warehouse Management mobile app and go to the **Main menu** page.
2. Select the **Settings** button (gear icon in the top-right corner).
3. Set **Auto submit** to *No* (recommended).

Configure auto submit on the device

When you set **Auto submit** to *No* in the app, you can still achieve auto-submit behavior by configuring your device to simulate an Enter key press after each scan. The exact steps depend on your device model. Refer to your device manufacturer's documentation for details.

> **Tip**
>
> For more granular control, you can use *intents* instead of keystroke simulation. Learn more in **Advanced bar code scanner configuration**.

Warehouse Management mobile app calculator

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Warehouse Management mobile app includes a built-in calculator that provides essential numerical entry and mathematical computation capabilities. It enables workers to perform calculations without leaving their current workflow.

The calculator supports the following features:

- Standard numerical input and real-time calculations.
- Long press the **9** key to enter negative numbers.
- Long press the decimal point (.) key to open the arithmetical operators menu.

> **Important**
>
> The long-press gestures require a press duration of at least half a second. Brief taps don't trigger the enhanced functionality.

Access the calculator

The workflow automatically shows the calculator when the worker needs it. For example, it appears when workers need to enter values for the following types of fields:

- **Quantity fields**: When entering item quantities during warehouse operations.
- **Number-type inputs**: As defined by the workflow configuration.
- **Measurement values**: When precise numerical input is required.

Basic input and calculator functionality

The calculator functions as a specialized numerical input tool with an enhanced interface. Workers can enter numbers using the numeric keypad and perform mathematical operations in real-time.

Arithmetical operators

The calculator provides access to four basic arithmetical operators. To select an operator, follow these steps:

1. Long press the decimal point (.) key on the keypad.
2. Select your desired operator (addition (+), subtraction (−), multiplication (×), or division (÷)).

Enter a negative number

To enter negative numbers in the calculator, follow these steps:

1. Enter the value using the numeric keypad.
2. Long press the **9** key on the keypad to toggle the entered value from positive to negative.
3. Continue with your calculation as normal.

> ⓘ **Note**
>
> This gesture only works with the **9** key. It provides quick access to negative values without requiring a separate negative sign button.

Usage examples

Enter a quantity value

To enter a numerical value for a quantity field, follow these steps:

1. When the app requires a quantity input, it automatically shows the calculator interface.
2. Enter your desired quantity using the numeric keypad.
3. If you need to convert the value to negative, long press the **9** key to toggle the sign.
4. Confirm the entry to proceed with your workflow.

Perform a calculation when entering a quantity value

To perform a calculation when entering a quantity, follow these steps:

1. Enter the first number by using the numeric keypad.
2. Open the operator menu by long pressing the decimal point (.) key.
3. Select your desired operator (addition (+), subtraction (−), multiplication (×), or division (÷)).
4. Enter the second number.
5. Press the equals key to view the result.
6. Confirm the entry to proceed with your workflow.

Troubleshooting

Expand table

Problem	Solution
Long press gesture doesn't activate	Hold the key for at least half a second. Brief taps enter standard input only.
Arithmetical operators menu doesn't appear	Ensure you're long pressing the decimal point (.) key specifically. Other keys don't open the menu.
Gesture activates unintentionally	Use shorter taps for standard number entry. Reserve longer presses for gesture controls.

Last updated on 04/08/2026

Haptic feedback through external wearable devices

The Warehouse Management mobile can provide haptic feedback through external wearable devices. This capability helps workers stay focused on the task at hand by providing instant, haptic responses without requiring workers to check the mobile device screen. The functionality is hardware-agnostic and supports a growing range of scanning peripherals from multiple manufacturers.

The app can communicate key system responses, such as successful scans or errors, directly through a wearable device using vibration patterns. Workers receive immediate cues while keeping their attention on picking, packing, or movement tasks. Haptic feedback provides the following key benefits:

- **Eyes-on-task productivity** – Workers receive immediate confirmation of a successful action through a tactile pulse, reducing the need to look at the mobile terminal.
- **Immediate error detection** – Distinct vibration patterns notify workers immediately when something is wrong, such as an invalid scan or blocked location.
- **Universal compatibility** – The architecture is hardware-agnostic, ensuring compatibility with a wide range of Bluetooth and tethered scanning hardware.

How it works

The integration uses the standard configuration features provided by the hardware manufacturer. After pairing a compatible wearable device with the mobile terminal (such as a tablet or handheld), the app recognizes the peripheral and routes feedback signals accordingly. You don't need to configure specific settings within the Warehouse Management mobile app or Supply Chain Management to enable feedback.

Haptic feedback signals

The app distinguishes between different operational outcomes by sending unique signals to the connected hardware, as outlined in the following table.

Expand table

Signal type	Signal description	Signal meaning
Success	A short, crisp vibration pattern with a green light.	Confirms a successful scan or task completion.

Signal type	Signal description	Signal meaning
Failure or error	A longer or double-pulse vibration pattern with a red light.	Alerts the user to an error, such as an invalid barcode or blocked location.

Hardware support

The Warehouse Management mobile app supports any human interface device (HID) or scanning peripheral compatible with the host operating system (Google Android or Microsoft Windows).

Wearable devices from ProGlove are the first to be specifically supported with haptic signaling. The Warehouse Management mobile app automatically recognizes ProGlove devices and routes feedback signals to them through their native setup utility, ProGlove Insight.

The app is built to support a growing ecosystem of smart wearables. Future updates will continue to add support for other hardware partners, freeing you to choose the devices that best fit your operational needs.

Scenario: hands-free picking

This scenario walks through a typical hands-free picking flow and shows where haptic feedback is triggered during scanning and validation so that workers can confirm success or spot errors without looking at the screen.

1. **Scan** – A worker picks an item and uses a wearable scanner to scan it.
2. **Validate** – The Warehouse Management mobile app processes the scan.
3. **Tactile response** – The app reacts in one of the following ways:

    - If the scanned item matches the expected item ID in the picking list, the wearable vibrates once, and the worker moves to the next pick immediately.
    - If the scanned item doesn't match the expected item ID in the picking list, the wearable pulses twice, notifying the worker to stop and check the screen for instructions.

Last updated on 02/05/2026

Warehouse Management mobile app accessibility features

This article describes the accessibility features of the Warehouse Management mobile app. Workers can configure these settings locally on the device through its **Settings**. Administrators can also set defaults remotely as described in Mobile device user settings.

Font and button scaling

Workers can adjust text and button sizes to match their visual needs. These settings are independent of the operating system's font and display settings.

Expand table

Feature	Range	Description
Font scaling	50% – 400%	Adjusts the text size throughout the app.
Button scaling	50% – 200%	Adjusts the size of buttons and interactive elements.

Color themes

The app supports five color themes to accommodate different visual needs and environments:

Expand table

Theme	Description
Auto	Matches the operating system's light or dark mode setting.
Light	Light background with dark text. Best for well-lit environments.
Dark	Dark background with light text. Reduces eye strain in low-light environments.
High-contrast white	White background with bold black text and high-contrast interactive elements. Designed for workers who need maximum readability.
High-contrast black	Black background with white text and high-contrast interactive elements. Designed for workers who need maximum readability in dark environments.

In addition to these accessibility-focused themes, the app offers over 10 color themes (such as Blue, Bronze, Cyan, and others) for personalization. Learn more in User settings, color themes, and sound themes.

Button positions

Workers can choose where buttons appear on the screen to match their handedness or preference:

- **Top-left** or **Top-right** — Best for workers who hold the device in one hand and interact with the other.
- **Bottom-left** or **Bottom-right** (default) — Best for thumb-based interaction.

Screen reader support

The app supports platform-specific screen readers on all three supported platforms:

Expand table

Platform	Screen reader
Android	TalkBack (preinstalled)
Windows	Narrator (built-in)
iOS	VoiceOver (built-in)

Next steps

- User settings, color themes, and sound themes
- Mobile device user settings

Workload insights with Copilot in the Warehouse Management mobile app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The Warehouse Management mobile app provides a *workload* page that shows work summaries and AI-generated insights to help warehouse workers better plan their shift. The information can include the following details:

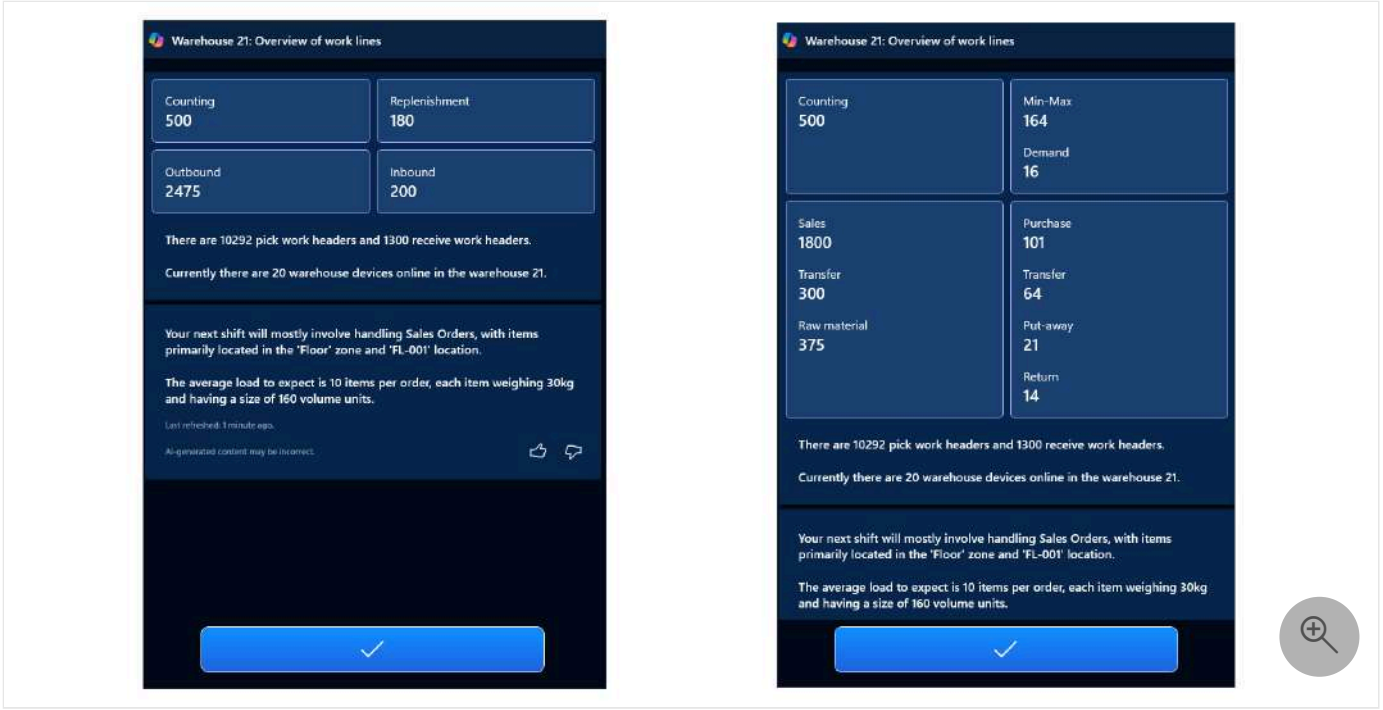
- The number of pick and receive work headers or work lines.
- The number of active warehouse mobile app sessions in the warehouse.
- Insights into the available work types.
- The current workload. This information can be shown either as work headers or work lines.
- Details of the available work per work type.
- More information about the available work. Microsoft Copilot generates this information in natural language.

Workers can use the insights on the workload page to get an overview of their workday and optimize the way that they engage with their daily tasks. Detailed information about available tasks helps enhance operational efficiency, reduce the time that is spent on information retrieval, and optimize resource allocation across the warehouse floor.

The workload page offers insights into relevant warehouse operations, such as the number of active warehouse mobile sessions that are working in the same warehouse. This information fosters a more connected and efficient workplace by promoting awareness and coordination among workers.

The following illustration shows an example of the workload page. When workers first open the page, it shows an overview of unstarted tasks that are scheduled for the current warehouse, together with a natural-language summary that Copilot generates (left). Workers can then tap any tile to view detailed information about open work by type (right). This information helps

them quickly grasp their objectives for the day. To close the workload page and open the **Main menu**, workers select the check mark button.



Prerequisites

Before you can get workload insights with Copilot in the Warehouse Management mobile app, your system must meet the following requirements:

- You must be running Dynamics 365 Supply Chain Management version 10.0.39 or later.
- You must be running Warehouse Management mobile app version 2.3.2.0 or later.
- The feature named *Context-aware worker summary screen in WMA* must be turned on in Feature management. As of Supply Chain Management version 10.0.39, the feature is turned on by default.

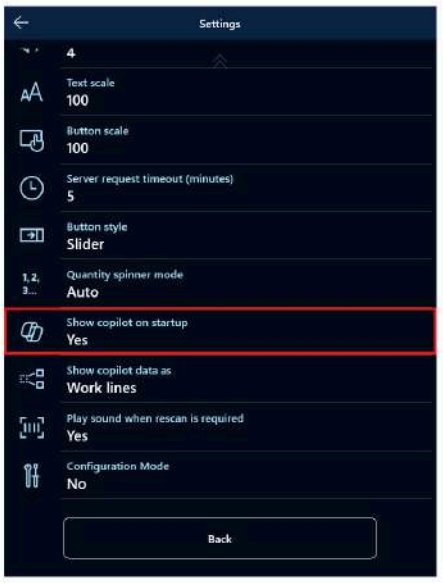
Worker preferences and options

Choose whether the workload page is shown after sign-in

Workers can specify whether they want the workload page to be shown each time they sign in to the app. To set this preference, follow these steps:

1. From the **Main menu**, open the **Settings** menu.

2. Select the **Show copilot on startup** entry.



3. Select one of the following options:

    - *Yes*: Show the workload page each time you sign in (default setting).
    - *No*: Go straight to the **Main menu** each time you sign in, without showing the workload page.

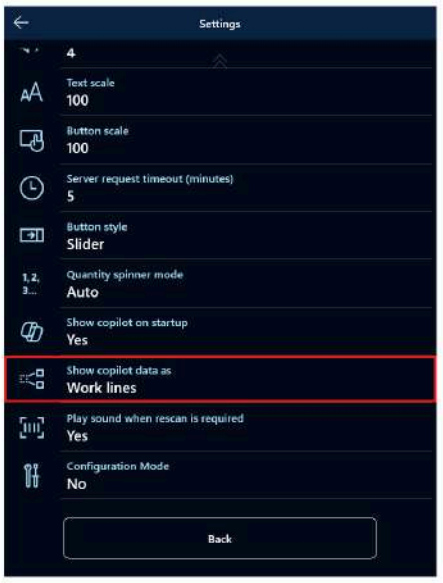
Choose whether workload data is shown as headers or lines

Workers can specify whether they want summaries to be based on work headers or work lines. The choice depends on how the workers prefer to think about their daily workload. For example, if all your orders typically contain just a few items, workers might prefer to think about their work in terms of whole orders (headers). However, if quantities vary greatly from order to order, workers might prefer to think about their work in terms of individual items (lines).

To set this preference, follow these steps:

1. From the **Main menu**, open the **Settings** menu.

2. Select the **Show copilot data as** entry.



3. Select one of the following options:

    - *Work lines*: Show the workload data as lines (default setting).
    - *Work headers*: Show the workload data as headers.

Open the workload page

Even if workers specify that the workload page should not be shown after sign-in, they can open the page at any time by following these steps.

1. On the **Main menu**.

2. Select the **Workload** button at the top of the page.

View the app log on a mobile device

The Warehouse Management mobile app maintains a local log of app operations. Use the **Local log view** page to review activity, identify errors, and export logs for troubleshooting with the Microsoft support team.

What the app log records

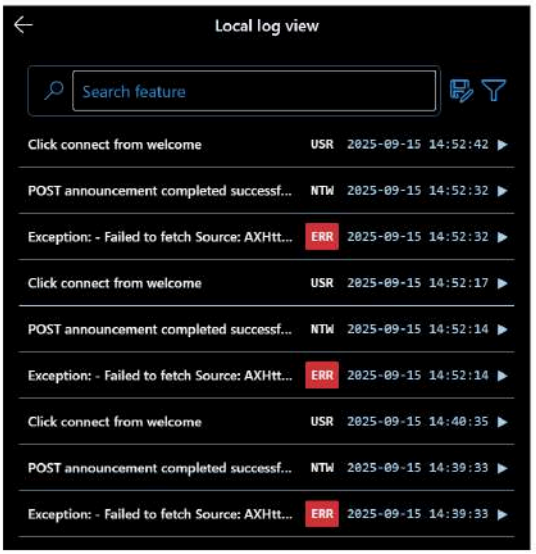
The app log captures events as they happen on the device, including:

- Sign-in attempts and authentication events
- Page navigation and workflow steps
- Connection events and network activity
- Errors and exceptions

The app stores logs locally on the device. You can export the logs as a file to share with support.

Open the Local log view page

1. Open the Warehouse Management mobile app on the affected device.
2. Open the **Diagnostics** page by using one of the following methods:
    - From the **Welcome** page, select **Set up connection** (or select **Connect** and then **Set up connection**), and then select **Diagnostics**.
    - From the **Main menu**, select **Connection settings**, then **Set up connection**, and then **Diagnostics**.
3. Select **Local log view**.



Find and filter log entries

You can find specific log entries and details using any of the following options:

- **Filter by time or type** – Select the filter button next to the **Search** field to narrow the log list by time range or issue type.
- **Search** – Enter text in the **Search** field to find specific log entries, such as an error message or connection event.
- **View details** – Select a log entry to see its full details, including timestamp, type, and message.

Export and share logs

You can export logs from the device in two ways:

- **Save to local file** – Select the **Save** button next to the **Search** field. The app saves all log entries as a text file to the device's local storage.
- **Share** – Use the device's share function to send the log file directly via email or other apps.

When you contact the Microsoft support team, export and attach the log file to your support request. This log file helps the team understand the sequence of events that led to the issue.

Check Wi-Fi connectivity and performance

The network diagnostics tool in the Warehouse Management mobile app analyzes the most critical endpoints on your network to quickly identify connectivity problems. Use it as a first step when troubleshooting connection issues. It helps detect common problems such as unreachable networks, DNS resolution failures, and slow connections.

What the network diagnostics tool does

The tool runs a series of tests against key network endpoints and displays results that help you identify where problems occur. Based on the results, it shows:

- **Wi-Fi network name** — Confirms which network the device is connected to.
- **Connection status** — Indicates whether the device has an active network connection.
- **Connection speed** — The negotiated link speed with the Wi-Fi access point.
- **Signal strength** — Helps identify if the device is too far from an access point or in an area with poor coverage.
- **IP address** — Confirms the device received a valid IP address from the network.
- **Download speed** — Measures actual data throughput, which might differ from the connection speed due to network congestion or interference.

When to use network diagnostics

Run the diagnostics tool when you encounter any of the following issues:

- The app can't connect to Supply Chain Management.
- Operations are slow or time out.
- Scanning or data submission is unreliable.
- You need to provide network information to the Microsoft support team.

Run a network diagnostic test

1. Open the Warehouse Management mobile app on the affected device.
2. Open the **Diagnostics** page by using one of the following methods:
    - From the **Welcome** page, select **Set up connection** (or select **Connect** and then **Set up connection**), and then select **Diagnostics**.

- From the **Main menu**, select **Connection settings**, then **Set up connection**, and then **Diagnostics**.

3. Select **Analyze Wi-Fi**. The **Wi-Fi diagnostics** page opens and shows details about your current Wi-Fi connection.

4. To run deeper analysis, select **Run network diagnostics**. The tool pings critical endpoints to test DNS resolution, reachability, and response times.

Interpret the results

Use the guidance provided in the following table to identify common issues:

Expand table

Result	What it means	Recommended action
No Wi-Fi network name shown	The device isn't connected to a Wi-Fi network.	Verify Wi-Fi is enabled and the device is in range of an access point.
IP address is missing or invalid	The device didn't receive an IP address (DHCP failure).	Check DHCP server availability and network configuration.
Low signal strength	The device is too far from the access point or there's interference.	Move the device closer to an access point or check for physical obstructions.
Low download speed	Network congestion, interference, or bandwidth limitations.	Check network load and consider dedicated Wi-Fi for warehouse devices.
Endpoint ping failures	DNS resolution or network routing issues.	Verify DNS settings and that required endpoints aren't blocked by a firewall.

Configure fields for the Warehouse Management mobile app

This article describes how to define and configure the names and priorities of fields shown in the Warehouse Management mobile app.

> **Note**
>
> This article applies to features in Warehouse management. It doesn't apply to features in Inventory management. The Warehouse Management mobile app is an application that you can use to perform warehouse tasks. You can define and configure the input type for the field names that the app uses, as well as configure the priority for the field names. You can't rename mobile app fields. This article explains how to define and configure Warehouse Management mobile app field names and priorities, and how they're used.

Configure warehouse app field names

When you use Warehousing on your mobile device, you can configure how metadata displays on your device on the **Warehouse app field names** page. In a new company, select **Create default setup** to generate all field names that the warehouse mobile device workflows use. Then, assign a preferred input mode and input type to them. After you generate all field names, select the following input options.

Expand table

Option	Description
Preferred input mode	This option defines whether a scanning field or a manual entry input field should show for the selected field name. This option is useful to distinguish fields depending on if bar codes are used for the field. **Note:** For field names with preferred input mode set to **Scanning**, you can enter information manually if the bar code is unreadable or damaged.
Input type	This option defines what input type should be used for the selected field name. Four options are available: **Selection** - Contains a list of options to choose from. Field names with this option aren't editable. **Date** - Field names specified as date show a date format with the label. This format helps warehouse workers see in which format to enter the date. Field names with this option aren't editable. **Alpha** - If selected, the device keyboard is used when entering information manually in the app. The keyboard experience can be changed depending on

Option	Description
	which device is used. **Numeric** - For field names that use numeric input only, select this option to display a custom numeric keypad with the input field instead of the device keyboard.

Configure warehouse app field priority

On the **Warehouse app field priority** page, you can organize field names into different priority groups. This priority system helps you decide what information appears on the main task page when warehouse workers perform tasks using the app. If you select **Create default setup**, a default set of priority groups is generated. You can create as many priority groups as you need, but the task page shows only three priority groups. When the system sends metadata to the app, it assigns each field a relative priority based on its priority group. The app displays the first three priority groups contained in the metadata on the task page. The app displays the rest of the overflowing metadata on a secondary details page. The following table shows an example of five priority groups.

Expand table

Priority group	Assigned fields
Priority 10	Item, Quantity, Unit of measure
Priority 20	Cluster position, Cluster
Priority 30	Item description
Priority 40	Configuration, Color, Size, Style
Priority 50	Location, License plate

For example, when a warehouse worker is performing a task on a mobile device, if the metadata that will be displayed in the app consists of the following fields:

- Item
- Quantity
- Unit of measure
- Item description
- Size and Location

Based on the warehouse app field priority set up in the table above, the following three rows of information will be displayed on the task page:

- Row 1: Item, Quantity, Unit of measure
- Row 2: Item description
- Row 3: Size

The remaining metadata, such as Location, doesn't appear on the task page, but it appears on a details page. To learn more and see examples of the user interface, refer to the blog post Announcing Dynamics 365 Supply Chain Management - Warehousing.

Set up mobile devices for warehouse work

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to configure the menu items that warehouse workers use to perform their work in the Warehouse management mobile app.

For example, you can use the **Mobile device menu items** page to configure menu items for the following tasks:

- Process an inquiry or perform an activity, such as printing a label, generating license plate numbers, starting a production order, or quickly looking up information about items in a location.
- Create work that another process performs. For example, receiving an item for a purchase order can create putaway work for another worker.
- Perform work that another process creates (existing work), such as putaway work that was created when an item was received for a purchase order, or picking work related to a sales order.

Configure menu items for activities and inquiries

To create a menu item for an activity or inquiry, set the **Mode** field to **Indirect**. A list of **Activity code** options then becomes available, so that you can select the type of inquiry or activity that the menu item is for. To create a menu item to generate warehouse work, set the **Mode** field to **Work**. A list of **Work creation process** options then becomes available. To create a menu item to process existing warehouse work, set the **Mode** field to **Work**, and then set the **Use existing work** option to **Yes**.

> **Note**
>
> More fields might be available for menu items, depending on the mode that you select for the menu item, and whether the menu item is used to perform existing work. Learn more about the additional field selections iin the Additional menu item options section later in this article.

If you set the **Mode** field for a menu item to **Indirect**, you can create a menu item to perform a general activity or inquiry that doesn't create work. Examples include reprinting license plate labels and an inquiry about the items in a location. The following table lists the options that are available.

Expand table

Option	Description
None	This default value doesn't enable an activity or inquiry.
About	View information about the system, such as the version number, the warehouse ID, and the worker who is currently logged on.
Change warehouse	Change the warehouse that a worker is logged on to.
Location inquiry	View information about all items and quantities for a location. For license plate controlled locations, data is sorted by license plate number in descending order. The items are usually sorted by physical quantity (for both license plate controlled and non-license plate controlled locations) but the sort order might change depending on what SQL Server finds most optimal.
License plate inquiry	View the quantity of items on a license plate and the location of the license plate.
Start production order	Start a production order.
Production scrap	Enter the quantity of scrap that was created during production for each bill of materials (BOM) line.
Production last pallet	Indicate that the last pallet of items has been produced for a production order, and that the status of the production order must be updated to **Reported as finished**. The status of the raw materials that weren't consumed during production changes back from *Picked* to *On order*, and the items can be returned to inventory.
Item inquiry	Scan an item to determine where it is in the warehouse. The inquiry returns all locations and quantities for the scanned item.
Reprint label	Reprint a license plate label.
License plate build	Create a parent license plate by combining multiple license plates in the same location. This option is useful if you move multiple license plates at the same time. After the parent license plate is moved, you must perform a license plate break before you can pick items from each license plate. **Tip:** To move a parent license plate, you must use a mobile device that is configured to create work for movements.

Option	Description
License plate break	Break up a license plate build so that you can pick items from the license plates that were in the build.
Driver check in	If you're using Transportation management, register the arrival of a driver by scanning the outbound load ID, appointment ID, or shipment ID. For this option, a load must be assigned to the appointment, and the status of the load must be **Loaded**.
Driver check out	Register that a driver has completed their appointment.
Flush number sequence cache	Delete number sequence numbers from the number sequence cache. A system administrator typically performs this activity to resolve caching issues when mobile devices are used.
Change batch disposition	Allow a worker to specify a batch disposition code for an item and batch. This selection updates the disposition code that is specified for the batch.
Display open work list	Show a list of available work to a particular user. The user can then select work to perform and is directed to it. This list is intended to be viewed on tablet devices that have a screen size of 7 inches or more. When you select this option, the **Edit query** and **Field list** menu items become available. The **Edit query** page lets you set up criteria for the work that appears in the list. The **Field list** page lets you select what fields appear in the work list. For example, you can reduce the number of fields that appear, so that the user can more quickly select the most appropriate work item. On the **General** FastTab, in the **Records per page** field, you can also select how many work records are shown per page. If you select the **Allow users to filter work by transaction type** option, the work list includes a **Filter work** control that the user can use to filter by transaction type. In the work list, users see only work that they have permission to access. You must make sure that users have permission for one or more user-directed menu items that support the specific work class types that they should be able to access. Permissions are verified when a user tries to perform work from the list.
Create transfer order from license plates	Allow warehouse workers to create and process transfer orders directly from the Warehouse Management mobile app. A worker starts by selecting the destination warehouse. The worker can then scan one or more license plates by using the app. After the warehouse worker selects **Complete order**, a batch job creates the required transfer order and order lines, based on the on-hand inventory that is registered for those license plates. Learn more in Create transfer orders from the warehouse app.
Data inquiry	Enable the creation of warehouse app menu items that can be used to look up data from the mobile device as an inquiry list. Learn more in Warehouse app data inquiry.
Pack inventory into containers	Enable support for warehouse workers as they pack inventory items into containers. A worker starts by scanning a shipment to identify the inventory items that must be packed. The worker then identifies the destination shipping container by entering its ID or scanning its bar code. Finally, when the container is fully packed, the worker registers it as closed. This step makes the container ready for further processing by Microsoft

Option	Description
	Dynamics 365 Supply Chain Management. Learn more in Packing containers with the Warehouse Management mobile app.
Container creation	Enable the container creation process. This process is typically part of the process of packing containers with the Warehouse Management mobile app.
Container closing	Enable the container closing process. This process is typically part of the process of packing containers by using the Warehouse Management mobile app.
Print container label	Enable container label printing. This process is typically part of the process of packing containers by using the Warehouse Management mobile app. Learn more in Container label layouts and printing.
Receiving completed confirmation	Enable support for receiving clerks to indicate *Receiving completed* for a load.
Complete mixed license plate	Enable support for warehouse workers to complete license plates recorded during mixed license plate receiving.

Configure menu items to create work for another worker or process

You can set up a menu item that creates work for another worker after an initial action is performed on the mobile device. For example, when one worker uses a mobile device to receive an item, the system creates putaway work for another worker. To set up a menu item that creates work, on the **Mobile device menu items** page, in the **Mode** field, select **Work**. In the following table, the options in the **Work creation process** field are arranged by work order type.

Expand table

Work order type	Option	Description
Inbound shipment order	Inbound shipment order line receiving	Register the receipt of a quantity of an item by using the inbound shipment order number and line number, and create putaway work for another worker.
	Inbound shipment order line receiving and put away	Register the receipt of a quantity of an item by using the inbound shipment order number and line number, and put away the items. The same worker performs both actions.

Work order type	Option	Description
	Inbound shipment order item receiving	Register the receipt of a quantity of an item for an inbound shipment order by registering the order number and item number, and create putaway work for another worker.
	Inbound shipment order item receiving and put away	Register the receipt of a quantity of an item for an inbound shipment order by registering the order number, and put away the item. The same worker performs both actions.
	License plate receiving	Receive an inbound advance ship notice (ASN) by using the license plate ID.
	License plate receiving and put away	Receive and put away an inbound ASN by using the license plate ID.
	Load item receiving	Register the receipt of a quantity for a load by using the load ID, and create putaway work for another worker. The item number and product dimensions match the receipt to the order lines.
	Load item receiving and put away	Register the receipt of a load by using the load ID, and put away the items. The item number and product dimensions match the receipt to the order lines. The same worker performs both actions.
	Return item receiving	Record data captured during mixed license plate receiving.
Purchase order	Purchase order line receiving	Register the receipt of a quantity of an item by using the purchase order number and purchase order line number, and create putaway work for another worker.
	Purchase order line receiving and put away	Register the receipt of a quantity of an item by using the purchase order number and purchase order line number, and put away the items. The same worker performs both actions.
	Purchase order item receiving	Register the receipt of a quantity of an item for a purchase order by registering the purchase order number and item number, and create putaway work for another worker.
	Purchase order item receiving and put away	Register the receipt of a quantity of an item for a purchase order by registering the purchase order number, and put away the item. The same worker performs both actions.
	License plate receiving	Receive an inbound ASN by using the license plate ID.
	License plate receiving and put	Receive and put away an inbound ASN by using the license plate ID.

Work order type	Option	Description
	away	
	Load item receiving	Register the receipt of a quantity for a load by using the load ID, and create putaway work for another worker. The item number and product dimensions match the receipt to the purchase order lines.
	Load item receiving and put away	Register the receipt of a load by using the load ID, and put away the items. The item number and product dimensions match the receipt to the purchase order lines. The same worker performs both actions.
Return order	Return order receiving	Register the receipt of a quantity of an item by registering the RMA number, and create putaway work for another worker.
	Return order receiving and put away	Register the receipt of a quantity of an item by registering the RMA number, and put away the items. The same worker performs both actions.
	Return item receiving	Record data captured during mixed license plate receiving.
Transfer order	Transfer order item receiving	Register the receipt of a quantity of an item, and create putaway work for another worker. **Note:** Use this option only if the items were shipped from a warehouse that isn't enabled for warehouse management processes (WMS).
	Transfer order item receiving and put away	Register the receipt of a quantity of an item, and put away the items. The same worker performs both actions. **Note:** Use this option only if the items were shipped from a warehouse that isn't enabled for WMS.
	Transfer order line receiving	Register the receipt of a quantity of an item, and create putaway work for another worker.
	Transfer order line receiving and put away	Register the receipt of a quantity of an item, and put away the items. The same worker performs both actions.
	License plate receiving	Receive an inbound ASN by using the license plate ID.
	License plate receiving and put away	Receive and put away an inbound ASN by using the license plate ID.

Work order type	Option	Description
Production	Report as finished	Register a quantity of a finished item that is finished for a production, and create putaway work for another worker. The quantity can be some or all of the quantity that was planned for production.
	Report as finished and put away	Register a quantity of a finished item that is finished for a production, and put away the items. The quantity can be some or all of the quantity that was planned for production. The same worker performs both actions.
	Kanban	Indicate that a kanban is completed, and create putaway work for another worker.
	Kanban put away	Indicate that a kanban is completed, and put away the items. The same worker performs both actions.
Inventory	Movement	Register that items are moved from one location to another. The worker specifies the location that the items are moved from and where they're moved to.
	Quarantine	Change the status of the on-hand inventory for a license plate or location to make damaged or missing inventory items unavailable.
	Movement by template	Move items from one location to another in a semi-automated manner. The worker selects the location to move items from. The system uses the location directive to determine where to move the items to.
	Warehouse transfer	Register that items are transferred from one warehouse to another. This option requires that the worker be allowed to perform work in both warehouses. **Note:** This menu item requires a default inventory transfer journal where the **Voucher draw** field is set to **Posting**.
	License plate loading	Use this option when you're setting up your warehouse for the first time. Scan all the license plates in all locations in the warehouse. The locations must be license plate–controlled. You can't use this option if **Serial number** or **Batch number** is listed above **Location** in the inventory reservation hierarchy.
Cycle count	Adjustment in	Increase the quantity of items in inventory. Specify the location, license plate, item, quantity, unit of measure, and status.
	Adjustment out	Reduce the quantity of items in inventory. Specify the location, license plate, item, quantity, unit of measure, and status of the inventory.

Work order type	Option	Description
	Spot cycle counting	Start a count for a location. The worker must count all items in the location. When the result of a count is less than the expected quantity, the missing quantity is considered a loss.

> **Note**
>
> - You can set up mobile device menu items, such as ***Mixed license plate receiving (and putaway)***, to embed some of the flows from the previous table in the process.
> - To prevent accidental selection, the **Cancel** button doesn't appear during *cycle counting* mobile workflows.

Configure menu items to process existing work

In addition to setting up menu items to create warehouse work, you can set up menu items to process existing work. Set the **Mode** field to *Work*, and select the **Use existing work** option. Some additional options then become available on the **General** tab. You can control access to the menu item by assigning one or more work classes on the **Work class** FastTab. The work classes define the work that the menu item can process. Use the work class to grant access to specific user roles or to separate processing for different types of operations. The following table describes the available options. Choose the option under the **Directed by** field in the **Mobile device menu items** page.

Expand table

Option	Description
None	This default value doesn't process work.
System directed	Supply Chain Management controls the type of work that it assigns to a worker and the order that the worker performs the work in. When you select this option, you can select **System-directed work** on the Action Pane to open the **System-directed sorting order** page, where you can set up sorting criteria for the work. The sorting criteria control the order that the worker performs the work in. You can add as many criteria as you require.
User directed	The worker selects the work to perform and the order to perform it in.
User grouping	The worker manually groups work. This option is useful when, for example, a worker can pick multiple items at the same time in a location. After the worker finishes picking all the required items, they can put away the items.

Option	Description
System grouping	Supply Chain Management groups work for the worker, based on a specified field. For example, picking work is grouped when a worker scans a shipment ID, load ID, or any value that can link each work unit. If you select this option, the following fields are required: • **System grouping field** – Select the field that the worker scans to group the work. • **System grouping label** – Enter text to instruct the worker what to scan to group the work.
Validated user directed	The worker selects the work to perform when work is associated with a larger entity, such as a load or shipment. The worker determines the order that the items are picked in. If you select this option, the following fields are required: • **Validated user directed field** – Select the field that the worker scans to group the work. • **Validated user directed label** – Enter text that instructs the worker what to scan when the system groups picking work. This option is useful when, for example, multiple pallets are staged for a load. If you select **LoadId** in the **Validated User Directed** field, the worker can pick any pallet that is associated with the load. The worker receives an error message if they scan an item that isn't associated with the load.
Cluster picking	The worker groups work into clusters. Clusters let workers pick items from a single location for multiple work orders at the same time.
Cycle count grouping	The worker selects a zone, work pool, or location, and Supply Chain Management assigns work, based on the selection. If you select this option, you can select **Cycle counting** on the Action Pane to specify additional information to display, and you can also specify the number of times that the worker must repeat the count if a difference is found.
Transport loading	This feature allows several warehouse workers to load inventory from the same or different loads onto the same truck, with loads that are fully or partially shipped.

Additional menu item options

You can find more options for menu items on the **Mobile device menu items** page. The options vary depending on the process that you're configuring the menu item for.

The following table describes these options.

Expand table

Field	Description
Allow splitting of work	Select this option to let workers put items for a work order into more than one target license plate. This option is useful when, for example, a target license plate is full, and the worker must add the remaining items to another license plate. The worker can select **Full** to indicate that the license plate is full and stop receiving picking work for it. The put location for the picked items is then displayed, and the picking work that you already completed is moved to a new work order. The remaining picking work for the target license plate stays on the original work order.
Anchoring	Select this option to let workers specify a location that overrides the suggested staging or loading location. All the remaining putaway work is directed to the new location. This option is useful when, for example, a worker who must put items for order 1 in a staging location by Dock 1 can't, because a previous load hasn't cleared the location. Instead of waiting for the Dock 1 staging location to become available, the worker can decide to use the staging location for Dock 2. In this case, the worker overrides the suggested staging location. The put location for all remaining items for the work order is then updated to the Dock 2 staging location. If you select this option, you must set the **Anchor by** field.
Anchor by	If you're using anchoring, you must specify whether to anchor by shipment or by load.
Audit template ID	Select the work audit template that interrupts the work process for this menu item so that another operation can be performed. For example, if this menu item is for inbound work, the audit template might require that the worker check the temperature in the delivery container. The point at which the process is interrupted is specified on the audit template. This point can be, for example, when work is started or completed, or when its status changes.
Cluster profile ID	Select the cluster profile to use for cluster picking. The cluster profile includes settings such as whether to create clusters automatically, the names of positions and the number of work units that they can be assigned, when to break clusters into individual units, and whether verification is required. This field is available only if **Cluster picking** is selected in the **Directed by** field.
Count total item quantity first	Select this option to require workers to count the total quantity first during a count. If a difference is found, the worker must provide additional information, such as the license plate number, batch number, and serial numbers.
Create movement	Select this option to let a worker create work for a movement, but without requiring the worker to perform the work immediately. This option is useful if, for example, a quality inspection is completed, and the inspector wants the item to be moved from the quality inspection area.
Directive code	To use a specific location directive, select the directive code that is associated with the location directive. This field is available when you create work and the work creation process is **Movement by template**.
Disable cycle count	Select this option to ignore the cycle count thresholds. If you select this option, cycle count work isn't created when threshold values are exceeded.

Field	Description
thresholds	
Display batch disposition code	Select this option to display batch disposition codes. For example, you can display batch disposition codes when you receive a returned batch. Workers can then evaluate the status or quality of a batch, and select the appropriate code. The rules on the batch disposition code determine whether the batch is available to other warehouse processes. If you don't select this option, one of the following batch disposition codes is used: • If you receive a new batch number, the default batch disposition code that is specified on the item model group. • The batch disposition code that is already assigned to the batch.
Display disposition code	Select this option to display disposition codes. For example, you can display disposition codes when you receive return items. Workers can then evaluate the status or quality of the items, and select the appropriate code. The rules on the disposition code determine whether the items are available to other warehouse processes.
Display inventory status	Select this option to display the status of items in inventory. This option is available for all menu items that use existing work, except cycle counting.
Display summary of pick screen	Select this option to display a summary of picking work for the selected work order. The summary is displayed until the first work line is processed for the work order.
Generate license plate	Select this option to generate a unique license plate number, based on the number sequence selection. For example, you can generate a license plate number for items that you receive for purchase orders.
Group put away	Select this option to group the putaway work. This option is available when the work is grouped either by the worker or by Supply Chain Management. When the worker finishes all the picking work in the group, putaway work is created for the same group.
Inventory adjustment types	Select the inventory adjustment type that determines the inventory counting journal that is used to post the adjustment, and whether to remove reservations. This field is available only for the **Adjustment in** or **Adjustment out** work creation process.
Override batch number	Select this option to let workers who report a quantity as finished for a production order enter a batch number that differs from the batch number that is assigned to the production order.
Override target license plate	Select this option to let workers specify a target license plate number that differs from the suggested target license plate. Use this option when the first pick for a work order is for the entire quantity of an item on a license plate. This option is useful when, for example, a pallet is reused.
Pick and pack	Select this option to let workers combine work for a sales order or load into a single work unit. A worker can perform work only for the sales order or load. This option is

Field	Description
	useful when, for example, you must increase a quantity for a sales order after the load, shipment, and work are created for a sales order. This option is available when the menu item uses existing work, and the work is directed by the user or system. Only work headers that contain a single initial pick work line can be combined by using this group picking concept.
Pick oldest batch	Indicate whether the worker must pick the oldest batch in a location first. The following options are available: • **None** – The worker can pick any batch in the location. The worker receives no message. • **Warn** – The worker can pick any batch in the location, but they receive a warning message if a batch isn't the oldest batch. • **Force** – The worker must pick the oldest batch in the location. The worker receives an error message if a batch isn't the oldest batch. **Note:** This option is relevant only if **Batch number** is lower than **Location** in the reservation hierarchy that is assigned to the item.
Print label	Select this option to let workers print license plate labels.
System grouping field	Select the field that determines how Supply Chain Management groups picking work for workers. For example, if you select the **ShipmentId** field, the worker scans the shipment ID to group the picking work. All work for the shipment is then assigned to the worker. This field requires that you create a menu item to use existing work that is grouped by the system. You must also enter text in the **System grouping label** field to instruct the worker what to scan.
System grouping label	Enter the text that instructs the worker what to scan when Supply Chain Management groups picking work. For example, if you're using the **ShipmentId** field to group picking work by shipment, you might enter **Shipment ID** in the field. This field requires that you create a menu item to use existing work that is grouped by the system. You must also select the field to group by in the **System grouping** field.
Use default data	Select this option to enable the **Default data** button on the Action Pane, where you can select fields to display data that a worker typically requires in their daily work. This option is useful if, for example, a worker often picks items from the same location. You can select the **From location** field to display the location by default.
Validated User Directed Field	Select the field that the worker scans to group the work. For example, if you select **LoadId**, a worker can pick any work that's associated with a selected load. You must also enter text in the **Validated User Directed Label** field to instruct the worker what to scan.
Validated User Directed Label	Enter the text that instructs the worker what to scan when picking work is grouped by a validated user-directed field. For example, if you're using the **LoadId** field to group picking work for a load, you might enter **Load ID** in the field.
Work template code	Select the work template that creates the work for a process. For example, if you receive an item for a purchase order, the putaway work is generated based on the work

Field	Description
	template. If you don't select a work template, Supply Chain Management assigns a template, based on query criteria. For more information about work templates, see Controlling warehouse work with work templates and location directives.
Show work line list	Select an option for how workers can view and interact with the lines for the currently selected picking work. For more information about this option, see Set up a mobile device menu item to provide a pick line overview.
Display tracking dimension control for last on-hand	Select one of the following options to specify how the *tracking dimension below location* control, including *batch below number* and *serial below number*, is shown for the last on-hand item. The setting of this field has no impact on the display of *tracking dimension above location*, such as *batch above number* or *serial above number*. • *Default from warehouse management parameters* – The menu item follows the configuration on the **Warehouse management parameters** page. Learn more in Global mobile device parameters. • *Display tracking dimension control* – The current menu item always shows the tracking dimension below location control (batch below number or serial below number), regardless of the settings of warehouse management parameters. • *Hide tracking dimension control* – The current menu item always hides the tracking dimension below location control (batch below number or serial below number), regardless of the setting of warehouse management parameters. **Note:** This setting affects only menu items that process a supported work order type (currently only sales orders). Unsupported work order types (such as transfer orders and purchase orders) aren't affected.

Require workers to confirm the product, location, or quantity when they pick items

You can set up work confirmations that require a worker to use a mobile device to register the location or quantity when they perform work in the warehouse. Work confirmations help ensure that the worker is at the correct location or is handling the correct quantity of items. You can also enable Supply Chain Management to automatically confirm the worker's registration. If you enable automatic confirmation, you can't also require confirmations for location or quantity. Work confirmations also include products and product variants. Additionally, you can register confirmations by scanning a bar code. To confirm products and product variants, you must enter an ID for the product or product variant. This ID can be a product ID, product search ID, external ID, GTIN, or bar code. After you enter the ID or scan the bar code, the dimensions for the product variant are displayed on the mobile device.

The following table describes the various work types that you can use work confirmations with.

Expand table

Option	Description
Pick	Require confirmation when items are picked.
Put	Require confirmation when items are put in a location.
Counting	Require confirmation during cycle counting.
Adjustments	Require confirmation when inventory quantities are adjusted.
Custom	Require confirmation for custom work.
Quarantine	Require confirmation when items are moved to quarantine.
License plate building	Require confirmation when items are consolidated to build a license plate.
Print	Require confirmation when license plate labels are printed.
Status change	Require confirmation when the status of inventory is changed.

> **Note**
>
> You can require product confirmation only for pick and put work types.

Set up mobile device menus

The menu items that you create by using the **Mobile device menu items** page become available to mobile device users after you add them to one or more menus by using the **Mobile device menu** page.

On the **Work users** page (**Warehouse management** > **Setup** > **Worker**), you can select the top-level menu that each worker can access on the mobile app. (Learn more in Mobile device user accounts.) In this way, you can set up a system that supports several different menu structures, where each worker sees only the menu items that are relevant to them.

To set up menus for mobile devices, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Do one of the following actions:
   - To add a new menu or submenu, on the Action Pane, select **New**.
   - To edit an existing menu or submenu, on the list pane, select the menu you want to edit. Then, on the Action Pane, select **Edit**.

3. In the header of the menu, make the following settings:

    - **Name**: Enter a name for the menu or submenu. This name is internal and must be unique. You can't edit this field after you save the record.
    - **Description**: Enter a short description for the menu or submenu.

4. In the **Mobile device menus** section, find and select a menu item or submenu you'd like to add in the **Available menus and menu items** column. Then select the right arrow button to move selected item to the **Menu structure** column.

5. Use the up arrow and down arrow buttons next to the **Menu structure** column to arrange the items in the menu.

    > **Tip**
    >
    > Workers can only access menu items that are included in the menu that is assigned to their mobile device user account (or a submenu of that menu). This restriction also applies to menu items that are intended for use as detours, but which you might not want workers to access directly from the menu. In this case, add the detour items to the relevant menus and then hide the items. To hide an item included in a menu, right-click on it in the **Menu structure** column and select **Hide**. To show an item that is currently hidden, right-click on it and select **Show**. (Select **Edit** from the Action Pane if you don't see the **Hide** or **Show** options.)

6. On the Action Pane, select **Save**.

Customize step titles and instructions for the Warehouse Management mobile app

> **Important**
>
> The features described in this article apply only to the new Warehouse Management mobile app. They don't affect the old warehouse app, which is now deprecated.

This article describes how to create and show custom instructions for every step of every task flow that you set up for the Warehouse Management mobile app. When warehouse workers receive well-written instructions, they can immediately start to use new flows without requiring previous training. This feature provides the following benefits:

- **Ramp up workers faster by letting them follow simple instructions for every task step.** Every step of a flow provides instructions that enable front-line workers to understand the task.
- **Provide instructions that match your own processes.** Write your own instructions to match your business and warehouse processes. For example, you can make the terminology fit your physical space and local abbreviations.

Step titles and step instructions in the app

Every step in a task flow on the Warehouse Management mobile app is identified by a step ID. Additionally, every step has a title, icon, and instruction. (Learn more in Assign step icons and titles for the Warehouse Management mobile app.)

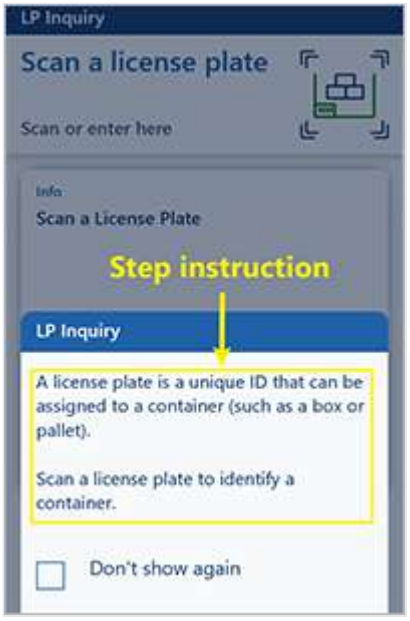
Step titles

A *step title* is a short description of what a worker should do during a step. It appears as large text at the top of the screen, as shown in the following illustration.

> **Tip**
>
> Because of the large text size, keep step titles as short as possible. Otherwise, the text might be cut off. However, for long titles, workers can still press and hold the title to open a dialog box that shows the full text.

Step instructions

A *step instruction* is a longer description that provides more information about what a worker should do during a step. It appears in a pop-up dialog box, as shown in the following illustration.



The step instruction automatically appears when a step is opened. Workers can dismiss it by tapping anywhere outside the pop-up dialog box. The dialog box includes a **Don't show again**

checkbox that workers can select to prevent the instruction from appearing the next time that they perform the same task.

Load the default setup

If your system doesn't already contain default customizable step titles or instructions, you can load a default setup. The default setup provides texts for all the available step IDs in every supported language. To load the default setup, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. On the Action Pane, select **Create default setup**. The page is filled in with the standard steps.

Customize step titles and instructions

To customize the title and/or instruction for a step in any number of languages, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.

   The **Mobile device steps** page lists every step that's available for your system. Each step ID can be shared among any number of mobile device menu items. If a step ID is shared among multiple menu items, the same title and instruction are shown for all those menu items. However, you can create overrides to customize the title and instruction for specific menu items. For more information, see the next section.

   The grid includes the following columns:

   - **Menu item name** – Rows where this column is blank use the default step title and instruction that apply to all mobile device menu items that no override is defined for. Rows where this column is set to the name of a menu item have overrides that apply only to the specified menu item.
   - **Step ID** – The unique ID of the step.
   - **Title for input** – The title that appears when the app requests new information. Typically, the fields on the page are blank (that is, they have no preset values).
   - **Title for confirmation** – The title that appears when the app requests confirmation of a value that's already stored in the system. Typically, the fields on the page have preset values.

2. Find the combination of **Step ID** and **Menu item name** values that you want to edit, and select the value in the **Step ID** column. The page that opens lists all the available translations for the title and instruction of the selected step.

3. Follow one of these steps to customize the text for any language. Both options let you edit texts for existing languages. However, only the first option lets you add texts for new languages, whereas only the second option lets you view and edit texts for all existing menu-specific overrides of the selected language.

    - On the toolbar, select **Add** to open a dialog box where you can add or edit texts for any supported language. Set the **Reference language** field to the language that you want to view values for. The values appear in the left column. Set the **Language of the translations** field to the language that you want to add or customize. In the right column, edit the values of the **Title for input**, **Instruction for input**, **Title for confirmation**, and **Instruction for confirmation** fields as you require. Then select **OK**.
    - In the grid, find and select the row where the **Language** field is set to the language that you want to edit. On the toolbar, select **View <language> translations of this step** to open a dialog box where you can edit texts for all available overrides for the selected language. The dialog box includes a grid that has rows for both the standard texts (where the **Menu item name** field is blank) and for each available override text (where the **Menu item name** field is set to the name of the menu item that the override applies to). Edit the values of the **Title for input**, **Instruction for input**, **Title for confirmation**, and **Instruction for confirmation** fields as you require. Then select **OK**.

4. Continue to work until you define every required title and instruction for every required language.

Add menu-specific overrides

As mentioned in the previous section, you can create any number of menu-specific overrides for each step ID. Use this capability to edit and change the instruction so that it better fits your local business process for a specific menu item. For example, for sales picking, if your company usually provides work IDs to workers on a printed document, you can provide a hint that workers should start by scanning a work ID.

Each override applies to a specific mobile device menu item and can contain any number of translations. If no override exists for a menu item, the menu item uses the standard texts. If no

override translation is defined for a language, the standard texts are used, even for menu items where an override is defined for other languages.

To create and configure an override, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the grid, find and select the row to create an override for.
3. On the Action Pane, select **Add step configuration**.
4. In the **Add step configuration** drop-down dialog box, set the **Menu item** field to the name of the mobile device menu item that your override applies to. Then select **OK**.
5. The page that appears shows all the texts that are available for the new override. Initially, just one language is created. All other languages continue to use the standard texts unless you add those languages here. Edit the texts and add new languages as you require, as described in the previous section.

Configure promoted fields for steps in the Warehouse Management mobile app

06/26/2025

This article describes how to promote and highlight specific information for any step in the task flows for the Warehouse Management mobile app. This capability can help focus workers' attention on the most important fields as they work through a flow. For each step in every process, admins can select which fields to promote and which fields to highlight.

Configure promoted fields from a menu-specific override

Use the following procedure to set up promoted fields.

1. Create a menu-specific override for the relevant menu and step as described in Customize step titles and instructions for the Warehouse Management mobile app.
2. Find the combination of **Step ID** and **Menu item name** values that you want to edit, and then select the value in the **Step ID** column.
3. On the page that appears, on the **Select promoted fields** FastTab, select **Select fields** on the toolbar.
4. In the **Promoted fields** dialog box, select the fields that you want to promote. You can also highlight up to two of the selected fields. Highlighted fields will be shown in bold in the Warehouse Management mobile app. As you select fields, consider the fact that some screens might be large enough to show only the top one or two promoted fields. For an example that shows how to use these settings, see the scenario later in this article.

   > ⓘ **Note**
   >
   > - The **Available fields** list includes all the fields that *could* appear for the menu item. However, other factors (such as item composition) determine which fields *actually do* appear in the Warehouse Management mobile app.
   > - You can only promote the fields that are shown in the **Available fields** list. You can't add new fields from here.
   > - For a given step, you should only promote fields that are displayed by default in the mobile app for that step. If you promote a field that isn't shown in the app, that setting has no effect.

- If you've promoted one or more fields, then only those fields will be shown on the main page of the app. However, workers can still view the remaining fields by opening the details page.
- If the promoted field has a null value, it won't be displayed.
- Non-promoted fields aren't removed from the mobile app page, just from the main card. Workers can still access them from the main card by selecting the card. This mechanism provides a way to hide less relevant fields. Non-promoted fields that are required for a workflow are always shown when relevant.

5. Select **OK** to apply your settings. Your selected fields are now listed on the **Select promoted fields** FastTab.

Example scenario

Enable sample data

To use the specified sample records and values to work through this scenario, you must be using a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

Configure sales picking with promoted steps on the license plate step

In this procedure, you'll set up promoted and highlighted fields for the **Sales picking** menu item in the license plate step.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. Find the step ID that is named *LicensePlateId*, and select it.
3. On the Action Pane, select **Add step configuration**.
4. In the drop-down dialog box, use the **Menu item** field to find and select *Sales picking*.
5. Select **OK**.
6. The details page for the override that you just created appears. On the **Select promoted fields** FastTab, select **Select fields** on the toolbar.

7. In the **Promoted fields** dialog box, you can select the fields to promote and highlight. In the **Available fields** list, find and select the following fields, and use the buttons to move them to the **Selected fields** list:

    - Location
    - Item
    - Product name
    - Inventory status

8. Use the up arrow and down arrow buttons to customize the order of the fields in the **Selected fields** list. In the Warehouse Management mobile app, the fields will appear in the order that you set here.

9. Select the **Location** field, and then select **Highlight**.

10. Select **OK** to save the configuration.

View the promoted fields in the Warehouse Management mobile app

In this procedure, you'll open the Warehouse Management mobile app and go through the steps to view the fields that you promoted and highlighted in the previous procedure.

1. In Microsoft Dynamics 365 Supply Chain Management, create a sales order that will require a pick step to pick from a location that is license plate tracked. Then release the sales order to the warehouse. Make a note of the work ID that is generated.
2. Open the Warehouse Management mobile app, and sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)
3. Select the **Outbound** menu, and then select the **Sales picking** menu item.
4. Follow the data entry instructions on the screen to enter the work ID that was generated in step 1.
5. On the step that contains the text **Scan a license plate**, you should see the changes that you made on the details page. The fields appear in the order that you set for the promoted fields, and the **Location** field is shown in bold.

Configure detours for steps in mobile device menu items

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to configure detours for menu items so that workers can "park" the current task, perform another task, and then return to the original task without losing any information.

A detour is a separate menu item that workers can open from a step in a main task. At the end of the detour, the worker returns to the place where they left the main task. During the configuration, you specify the menu item that should act as a detour. You also select which field values from the main task should automatically be forwarded (copied) to the detour and entered there. Therefore, you must understand where in the task flow you want the detour to be available to workers. You must also ensure that the information you need to copy to the detour is available for that step of the task flow.

Configure a detour from a menu-specific override

Use the following procedure to set up a detour from a menu-specific override.

1. Create a menu-specific override for the relevant menu and step as described in Customize step titles and instructions for the Warehouse Management mobile app.
2. Find the combination of **Step ID** and **Menu item name** values that you want to edit, and then select the value in the **Step ID** column.
3. On the page that appears, on the **Available detours (menu items)** FastTab, specify the menu item that should act as a detour. You can also select which field values from the main task should automatically be copied to and from the detour. For examples that show how to use these settings, see the scenarios later in this article.

> **Important**
>
> Workers can only access menu items that are included in the menu that is assigned to their mobile device user account (or a submenu of that menu). This restriction also applies to menu items that are intended for use as detours, but which you might not want workers to access directly from the menu. In this case, add the detour items to the relevant menus and then hide the items. Learn more about how to hide menu items in Mobile device menu.

Sample scenario 1: Sales picking where a location inquiry acts as a detour

This scenario shows how to configure a location inquiry as a detour in a worker-directed sales picking task flow. This detour enables workers to look up all the license plates in the location that they're picking from and pick the license plate that they want to use to complete the pick. This type of detour might be useful if the bar code is damaged and therefore unreadable by the scanner device. Alternatively, it might be useful if a worker must learn what is actually on hand in the system. This scenario works only if you're picking from license plate–controlled locations.

Enable sample data

To use the specified sample records and values to work through this scenario, you must use a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

Create a menu-specific override and configure the detour for scenario 1

In this procedure, you configure a detour for the **Sales picking** menu item in the license plate step.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. Find the step ID named *LicensePlateId*, and select it.
3. On the Action Pane, select **Add step configuration**.
4. In the drop-down dialog, use the **Menu item** field to find and select *Sales picking*.

5. Select **OK**.

6. The details page for the override that you just created appears. On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.

7. In the **Add detour** dialog, select **Location inquiry** as the detour that the Warehouse Management mobile app makes available.

8. Select **OK**.

9. On the **Available detours (menu items)** FastTab, select the detour that you just added, and then select **Select fields to send** on the toolbar.

10. In the **Select fields to send** dialog, specify the information that should be sent to and from the detour. In this scenario, you enable workers to use the location that they're supposed to pick from as input for the location inquiry detour. Therefore, in the **Send from sales picking** section, select **Add** on the toolbar to add a row to the grid. Then set the following values for the new row:

    - **Copy from Sales Picking:** *Location*
    - **Paste in Location Inquiry:** *Location*
    - **Auto submit:** *Selected* (the page refreshes with the pasted *Location* value)

11. Because the detour in this scenario is configured on the license plate step, it helps if workers can bring the license plate from the inquiry back to the main flow. Therefore, in the **Bring back from location inquiry** section, select **Add** on the toolbar to add a row to the grid. Then set the following values for the new row:

    - **Copy from Location Inquiry:** *License plate*
    - **Paste in Sales Picking:** *License plate*
    - **Auto submit:** *Cleared* (no auto update occurs when returning from the detour with a *License plate* value)

12. Select **OK**.

The detour is now fully configured. A button to start the **Location inquiry** detour appears on the license plate step for the **Sales picking** menu item.

Complete a sales pick on a mobile device and use the detour

In this procedure, you complete a sales pick by using the Warehouse Management mobile app. You use the detour that you just configured to find the license plate that you use to complete

the pick step.

1. In Microsoft Dynamics 365 Supply Chain Management, create a sales order that requires a pick step to pick from a location that is license plate tracked. Then release the sales order to the warehouse. Make a note of the work ID that is generated.
2. Open the Warehouse Management mobile app, and sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)
3. Select the **Outbound** menu, and then select the **Sales picking** menu item.
4. Follow the data entry instructions on the screen to enter the work ID that you generated in step 1.
5. On the step that contains the text **Scan a license plate**, open the actions menu. You see a new button that is labeled **Location inquiry**. An arrow in the upper-left corner indicates that the button starts a detour. Select **Location inquiry**.
6. The detour starts. On the next page, confirm the location that was copied from the main flow.
7. In the list of available license plates in the location, select the license plate that you want to copy back to the main flow. Then select the **Back** button.
8. You're returned to the sales picking main flow, and the license plate is copied back to it from the detour. Confirm the value to continue to the next step.
9. You can now complete the rest of the standard flow by entering the requested data entry instructions.

The warehouse work is now completed. The worker successfully opens a detour to perform a secondary task (location inquiry) without losing their place in the main task, and brings back the information that is required to complete the main task.

Sample scenario 2: Item inquiry with movement and adjustment detours

This scenario shows how to configure movement and adjustments as multiple detours in the location inquiry task flow. This capability can be useful in situations where a worker arrives at a location, finds that the inventory in the location differs from what is registered in the system, and must therefore adjust or move goods.

You can replace the location inquiry with a license plate inquiry or an item inquiry as you require.

Enable sample data

To use the specified sample records and values to work through this scenario, you must use a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

Create a menu-specific override and configure the detour for scenario 2

In this procedure, you configure a detour for the **Sales picking** menu item in the license plate step.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. Find and select the step ID named *LocationInquiryList*.

   > **Note**
   >
   > To use an item inquiry instead of a location inquiry, select a row where the step ID is named *ItemInquiryList*. To use a license plate inquiry, select a row where the step ID is named *LPInquiryList*.

3. On the Action Pane, select **Add step configuration**.
4. In the drop-down dialog, use the **Menu item** field to find and select *Location inquiry*.
5. Select **OK**.
6. The details page for the override that you just created appears. On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
7. In the **Add detour** dialog, select **Movement** as the detour that the Warehouse Management mobile app makes available.
8. Select **OK**.
9. On the **Available detours (menu items)** FastTab, select the detour that you just added, and then select **Select fields to send** on the toolbar.
10. In the **Select fields to send** dialog, specify the information that you send to and from the detour. In this scenario, workers look for license plate–controlled locations. Therefore, it helps to copy the license plate from the inquiry to the **Movement** detour. In the **Send**

from sales picking section, select **Add** on the toolbar to add a row to the grid. Then set the following values for the new row:

- **Copy from Location Inquiry:** *Location*
- **Paste in Movement:** *Loc / LP*
- **Auto submit:** *Cleared* (no auto update occurs)

In this detour, you don't expect any information to be copied back, because the main flow was an inquiry where no additional steps are required.

11. Select **OK**.

The detour is now fully configured. A button to start the **Movement** detour appears on the license plate step for the **Location inquiry** menu item.

Do a location inquiry on a mobile device and use the detour

In this procedure, you use the Warehouse Management mobile app to do a location inquiry. You then use the detour to complete a movement of goods.

1. Open the Warehouse Management mobile app, and sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)
2. Select the **Inventory** menu, and then select the **Location inquiry** menu item.
3. Enter a location to inquire about, such as *FL-001*.
4. When the list appears, select and hold one of the cards in it to show the available detours.
5. Select **Movement**.
6. Notice that the license plate is copied from the card that you selected. Confirm the value.
7. Follow the standard task flow to complete the movement. After the work is completed, open the actions menu, and select **Cancel**.
8. You're returned to the **Location inquiry** page. The values aren't automatically updated. Therefore, you must manually refresh the page to see the changes from the movement detour.

Sample scenario 3: Movement by template with a data inquiry detour

This scenario shows how to configure movement by template with a data inquiry detour.

Enable sample data

To use the specified sample records and values to work through this scenario, you must use a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

In this procedure, you configure a data inquiry detour for the **Movement by template** menu item in the **Scan location or license plate** step.

Configure an Item data inquire mobile device menu item for scenario 3

To create the **Item data inquire** mobile device menu item, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - In the **Menu item name** field, enter *Item data inquire*.
    - In the **Title** field, look up the inventory dimensions by items.
    - In the **Mode** field, select *Indirect*.
4. On the **General** FastTab, set the following values:
    - In the **Activity code** field, select *Data inquiry*.
    - In the **Use process guide** field, ensure that *Yes* is selected. (*Yes* is the default value.)
    - In the **Table name** field, select *InventSum*, because you want to look up inventory dimensions from this table.
5. Select the fields that appear on the cards on the **Inquiry list** page. On the Action Pane, select **Field list**.
6. On the **Field list** page, set the following values:
    - **Display field 1:** *ItemId* (This field appears as the header for each card.)
    - **Display field 2:** *InventColorId*
    - **Display field 3:** *InventSizeId*
    - **Display field 4:** *WMSLocationId*
7. On the Action Pane, select **Save**.
8. Close the page.

> ⓘ **Note**
>
> You must add the **Item data inquire** mobile device menu item to the mobile device menu before you can use it as part of a detour process.

Create a menu-specific override and configure the detour for scenario 3

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. Find and select the step ID named *LocOrLP*.
3. On the Action Pane, select **Add step configuration**.
4. In the dropdown dialog, in the **Menu item** field, select *Movement by template*.
5. Select **OK**.
6. The details page for the override that you just created appears. On the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
7. In the **Add detour** dialog, select **Item data inquiry** as the detour that the Warehouse Management mobile app will provide.
8. Select **OK**.
9. On the **Available detours (menu items)** FastTab, select the detour that you just added.
10. In the **Bring back from Items data inquiry** section, select **Add** on the toolbar to add a row to the grid. Then set the following values for the new row:
    - **Copy from Items Inquiry:** *Item number*
    - **Paste in Movement by template:** *Item*
    - **Auto submit:** *Yes*
11. Select **Add** on the toolbar to add another row to the grid. Then set the following values for the new row:
    - **Copy from Items Inquiry:** *Size*
    - **Paste in Movement by template:** *Size*
    - **Auto submit:** *Yes*

12. Select **Add** on the toolbar to add another row to the grid. Then set the following values for the new row:

    - **Copy from Items Inquiry:** *Color*
    - **Paste in Movement by template:** *Color*
    - **Auto submit:** *Yes*

13. Select **Add** on the toolbar to add another row to the grid. Then set the following values for the new row:

    - **Copy from Items Inquiry:** *Location*
    - **Paste in Movement by template:** *Loc / LP*
    - **Auto submit:** *No*

14. Select **OK**.

The detour is now fully configured. A button to start the **Item data inquiry** detour now appears in the **Scan location or license plate** step for the **Movement by template** menu item.

Create a new product master item T-Shirt and add on-hand for scenario 3

Create a new *T-shirt* product master item that has size and color variants. Add one on-hand entry for one specific size and color of this item for warehouse 24.

Do a movement by template on a mobile device and use the detour

In this procedure, use the Warehouse Management mobile app to do a movement by template. Then, complete the movement by using the detour to find the item, color, size, and location.

1. Open the Warehouse Management mobile app, and sign in to warehouse 24. (In the standard demo data, sign in by using *24* as the user ID and *1* as the password.)
2. Select the **Movement by template** menu item.
3. In the first step that contains the text **Scan location or license plate**, select **Item data inquiry**.
4. The detour starts, and the first detour step is **Item number**. Specify *T-shirt*, and then confirm the entry.

5. Select the card that contains information about the location, color, and size of the existing on-hand entry. You're returned to the movement by template flow and receive a "Work completion" message.

The detour is configured to auto-submit only the item, size, and color. The system also auto-populates the location and quantity. This behavior occurs because the system can determine the size, location, and quantity from the specified color, based on the on-hand data distribution. The detour contains three auto-submit controls that correspond to three **OK** buttons. Because a default location and a default quantity are entered after the return from the detour, they're automatically confirmed.

> **Note**
>
> Multi-level detours are detours within detours, which allow workers to jump from an existing detour to a second one and then back again. The feature supports two levels of detours out of the box and, if necessary, you can customize your system to support three or more levels of detours by creating code extensions on the `WHSWorkUserSessionState` table.
>
> Auto-submit detour steps can make it faster and easier for workers to complete detour flows in the Warehouse Management mobile app. It enables some flow steps to be skipped by letting the app populate detour data on the back end and then move automatically to the next step by auto submitting the page, as shown in Sample scenario 1: Sales picking where a location inquiry acts as a detour earlier in the article.
>
> Essentially, the number of auto-submits corresponds to the number of times that the **OK** button is selected. If a mobile app flow has defaulting mechanics, auto-submit for detours can cause variations in behavior, based on the on-hand data composition. An example is shown in Sample scenario 3: Movement by template with data inquiry detour.

Query data by using Warehouse Management mobile app detours

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Feature introduction

By providing bar code scanning capability, the Warehouse Management mobile app gives you an easy and accurate way to capture data as part of your warehouse processes. However, bar codes can sometimes get damaged and become unreadable, or the required data might not exist as a bar code in your business process flows. In these cases, manual entry of the data can take a long time and can even cause incorrect data to be captured. The results can be reduced effectiveness and a lower service level.

When you use a flexible data inquiry process, workers can easily look up the required information as part of the embedded Warehouse Management mobile app flows and apply filtering options so that only the relevant data is shown. Therefore, manual selection is faster and more accurate.

For example, in the purchase order receiving flow, a purchase order number is required to match arriving inventory. As part of this process, you can easily configure menu items to provide a card list view of the relevant purchase order numbers. In this way, you can continue the receiving flow by using a quick point-to-select approach. This article provides example scenarios, but the functionality can also be used within any or all your Warehouse Management mobile app flows.

The work user session query range utility tool

Supply Chain Management version 10.0.37 (and later) includes a *work user session query range utility tool*, which adds the following functionality for setting up queries to help workers find specific records by using the Warehouse Management mobile app:

- **Filter records by warehouse** – Set up queries that use the worker's current warehouse as a value. Use this value as a criterion for range filters (on the **Range** tab of the standard query designer). This filter is useful, for example, if you want to display a list of purchase orders expected to arrive at the warehouse where the worker is currently working. To set up a mobile device menu item to use this feature, open the query designer and, on the **Range** tab, set up a row that uses a **Criteria** of

`(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWarehouse())`. An example of how to use this functionality is provided later in this article.

- **Filter records by app user** – Set up queries that use the current worker's worker ID as a value. Use this value as a criterion for range filters (on the **Range** tab of the standard query designer). To set up a mobile device menu item to use this feature, open the query designer and, on the **Range** tab, set up a row that uses a **Criteria** of `(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWorkUserId())`.
- **Show or hide filters in the mobile app** – Choose whether to show a page with filter values during a data inquiry flow for mobile device menu items. When you're using the **Mobile device menu items** page to set up a mobile device menu item where this feature is relevant, you find a **Show filters page** setting, which lets you choose whether to show the filters *Always* or *Only when filters can be changed*.

Example scenarios

This article uses example scenarios to show how to query data by using detours to improve the purchase receipt flow. The scenarios use the standard sample data, which includes a flow named *Purchase receive*.

This flow starts by prompting workers to identify a purchase order number that they receive against. To help workers more easily identify the purchase order, enhance the first page of the flow by adding the following new query options as detours:

- **Look up POs by vendor** – Open a page that prompts workers to enter a vendor name or part of a vendor name. Use wildcard characters. For example, if a worker expects an inbound delivery today from a vendor that includes *Tailspin* in its name, they can enter **Tail*** to view a set of cards for open purchase orders that include this text. Every card has several fields that provide information about each purchase order. In addition to the vendor's name, design the cards so that they show the vendor account number, delivery date, and document status.
- **Look up POs for today** – Open a page that doesn't prompt workers to enter data, but shows a set of cards that match the "hardcoded" filter. Workers proceed by selecting a card for the purchase order that they want to register inventory items against. This process is enabled with the option **Show filter page** set to *Only when filters can be changed*. This setting means the app shows results immediately (without showing the filters page).
- **Look up POs by item** – Open a page that prompts workers to scan the bar code of any item in the arrived inventory. The flow then lists all open purchase orders that contain lines for the scanned item number. To cover situations where a bar code can't be read, add another detour lookup to this page that lets workers search for item numbers within a specific purchase order.

In each case, the worker identifies a purchase order by selecting a card and is then returned to the first page, which shows the selected purchase order number. The worker can then continue the inbound inventory item registration flow.

Enable sample data

To work through the example scenarios described in this article, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity (company) before you begin.

Configure the mobile device menu items

To create each of the new query options that you add to the first page of the flow, set up each option as a mobile device menu item. Later, make the query options available as detours to the *Purchase receive* flow.

Create the "Look up POs by vendor" menu item

Create the **Look up POs by vendor** menu item by following these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name:** *Look up POs by vendor*
    - **Title:** *Look up POs by vendor*
    - **Mode:** *Indirect*
4. On the **General** FastTab, set the following values:
    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *PurchTable* (You want to look up purchase order numbers from this table.)
    - **Show filter page:** *Only when filters can be changed* (Filters are shown due to the *Vendor name*.)
5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table (in this case, the purchase orders table).
6. In the query editor, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
Purchase orders	Purchase orders	Purchase order status	Open order
Purchase orders	Purchase orders	Delivery date	(dayRange(-10,10))
Purchase orders	Purchase orders	Vendor name	

> **Tip**
>
> In this example, the filter doesn't include any warehouse criteria and therefore returns open purchase orders for all warehouses within the current legal entity. To limit the search results to only find purchase orders for the current worker's warehouse, add a query line with **Field** set to *Warehouse* and **Criteria** set to `(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWarehouse())`. You can also use this value for fields from joined tables (such as the *Inventory dimensions* table). For more information, see **The work user session query range utility tool**.

7. Select **OK**.

   In this example, the new menu item is configured to find open purchase orders that are expected to arrive anytime between 10 days in the past and 10 days in the future.

   In the query, the **Criteria** column for *Vendor name* is left blank. Therefore, workers can specify this value while they use the Warehouse Management mobile app.

   If you want to specify how the list is sorted, set up the sorting on the **Sorting** tab.

8. In addition to defining the query, select which fields show on the cards on the inquiry list page. On the Action Pane, select **Field list**.

9. On the **Field list** page, set the following values:

   - **Display field 1:** *PurchId* (This field shows as the header for each card.)
   - **Display field 2:** *PurchStatus*
   - **Display field 3:** *PurchName*
   - **Display field 4:** *OrderAccount*
   - **Display field 5:** *DeliveryDate*
   - **Display field 6:** *displayDocumentStatus()* (This value is a display method, as the "()" at the end indicates.)

10. On the Action Pane, select **Save**. Then close the page.

Create the "Look up POs for today" menu item

Create the **Look up POs for today** menu item by following these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New** to add a mobile device menu item.

3. Set the following values for the new item:

   - **Menu item name:** *Look up POs for today*
   - **Title:** *Look up POs for today*

- **Mode:** *Indirect*

4. On the **General** FastTab, set the following values:

   - **Activity code:** *Data inquiry*
   - **Use process guide:** *Yes* (This value is automatically selected.)
   - **Table name:** *PurchTable* (You want to look up purchase order numbers from this table.)
   - **Show filter page:** *Only when filters can be changed* (Show results immediately.)

5. On the Action Pane, select **Edit query** to define a query that's based on the selected base table (in this case, the purchase orders table).

6. In the query editor, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
Purchase order	Purchase order	Purchase order status	Open order
Purchase order	Purchase order	Confirmed receipt date	(Day(0))
Purchase order	Purchase order	Warehouse	(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWareh

> **Note**
>
> In this example, the query filters search results by warehouse because it includes a line with the *Warehouse* field. If you set this line with a blank value for **Criteria**, the system shows a filter page that automatically displays the worker's current warehouse and allows the worker to update the value as needed. If you set this line to have a **Criteria** value of `(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWarehouse())`, the application automatically uses this value without showing it to the worker for confirmation. Learn more in The work user session query range utility tool.

7. Select **OK**.

   In this example, the new menu item is configured to find open purchase orders that are expected to arrive today.

   If you want to specify how the list is sorted, set up the sorting on the **Sorting** tab.

8. In addition to defining the query, select which fields show on the cards on the inquiry list page. On the Action Pane, select **Field list**.

9. On the **Field list** page, set the following values:

    - **Display field 1:** *PurchName* (This field shows as the header for each card.)
    - **Display field 2:** *PurchId*
    - **Display field 3:** *PurchStatus*
    - **Display field 4:** *DlvMode*
    - **Display field 5:** *DlvTerm*
    - **Display field 6:** *OrderAccount*
    - **Display field 7:** *VendorName()* (This value is a display method, as the "()" at the end indicates.)

10. On the Action Pane, select **Save**. Then close the page.

Create the "Look up POs by item" menu item

Create the **Look up POs by item** menu item by following these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New** to add a mobile device menu item.

3. Set the following values for the new item:

    - **Menu item name:** *Look up POs by item*
    - **Title:** *Look up POs by item*
    - **Mode:** *Indirect*

4. On the **General** FastTab, set the following values:

    - **Activity code:** *Data inquiry*
    - **Use process guide:** *Yes* (This value is automatically selected.)
    - **Table name:** *PurchLine* (You want to look up purchase order numbers based on item number via the line data.)
    - **Show filter page:** *Only when filters can be changed* (Filters will be shown due to the *Item number*.)

5. On the Action Pane, select **Edit query** to define a query that is based on the selected base table (in this case, the purchase order lines table, but you can use any of the values that are related to the header by joining to the *PurchTable*).

6. In the query editor, on the **Range** tab, add the following lines to the grid.

Expand table

Table	Derived table	Field	Criteria
Purchase order lines	Purchase order lines	Line status	Open order
Purchase order lines	Purchase order lines	Delivery date	(dayRange(-10,10))
Purchase order lines	Purchase order lines	Item number	

> **Tip**
>
> In this example, the filter doesn't include any warehouse criteria and returns open purchase orders for all warehouses within the current legal entity. To limit the search results to the current worker's warehouse, you can join to the *Inventory dimensions* table, then include the *Warehouse* field as part of the range query, and enter `(WhsWorkUserSessionSysQueryRangeUtil::whsWorkUserSessionCurrentWarehouse())` as the **Criteria** for the *Warehouse* field. For more information, see **The work user session query range utility tool**.

7. Select **OK**.

   In this example, the new menu item is configured to find open purchase order lines that are expected to arrive anytime between 10 days in the past and 10 days in the future.

   In the query, the **Criteria** column for *Item number* is left blank. Therefore, workers can specify this value while they use the Warehouse Management mobile app.

   If you want to specify how the list is sorted, set up the sorting on the **Sorting** tab.

8. In addition to defining the query, select which fields show on the cards on the inquiry list page. On the Action Pane, select **Field list**.

9. On the **Field list** page, set the following values:

   - **Display field 1:** *PurchId* (This field value will be used as the header for each card.)
   - **Display field 2:** *VendAccount*
   - **Display field 3:** *PurchQty*
   - **Display field 4:** *PurchUnit*
   - **Display field 5:** *PurchStatus*

10. On the Action Pane, select **Save**. Then close the page.

Add the new mobile device menu items to a menu

Add your three new mobile device menu items to the mobile device menu. You must complete this task before the menu items can be used as part of a detour process. In this example, you create a new submenu and add the new menu items to it.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **New**.
3. Set the following values on the header of the new record:
    - **Name:** *Inquire*
    - **Description:** *Inquire*
4. In the **Available menus and menu items** list, select the first of the mobile device menu items that you just created. Then select the right arrow button to move that item into the **Menu structure** list.
5. Repeat the previous step for the other two new menu items.
6. In the list pane on the left, select the **Main** menu.
7. In the **Available menus and menu items** list, scroll down to the **Menus** section, and select your new **Inquire** menu. Then select the right arrow button to move that item into the **Menu structure** list.

Configure detours in your mobile device steps

To complete the setup, use the detour configuration on the **Mobile device steps** page to add the three new mobile device menu items to the existing purchase order identification step in the *Purchase receive* flow.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device steps**.
2. In the **Filter** field, enter *PONum*. Then select *Step ID: "PONum"* in the drop-down list.
3. While the record that is found is selected in the grid, select **Add step configuration** on the Action Pane. In the drop-down dialog box that appears, set the **Menu item** field to *Purchase Receive*. Then select **OK** to close the dialog box.
4. On the details page for the new step configuration (**Purchase Receive : PONum**), on the **Available detours (menu items)** FastTab, select **Add** on the toolbar.
5. In the **Add detour** dialog box, find and select the **Look up POs by vendor** menu item that you previously created.
6. Select **OK** to close the dialog box and add the selected menu item to the detours list.
7. Select the new detour, and then select **Select fields to send** on the toolbar.
8. In the **Select fields to send** dialog box, don't add anything to the **Send from purchase receive** section, because you don't want to pass any values to the detour menu item. However, in the **Bring back from look up POs by vendor** section, set the following value for the empty row that is already added:

- **Copy from Look up POs by vendor:** *Purchase order*
- **Paste in Purchase Receive:** *Purchase order*

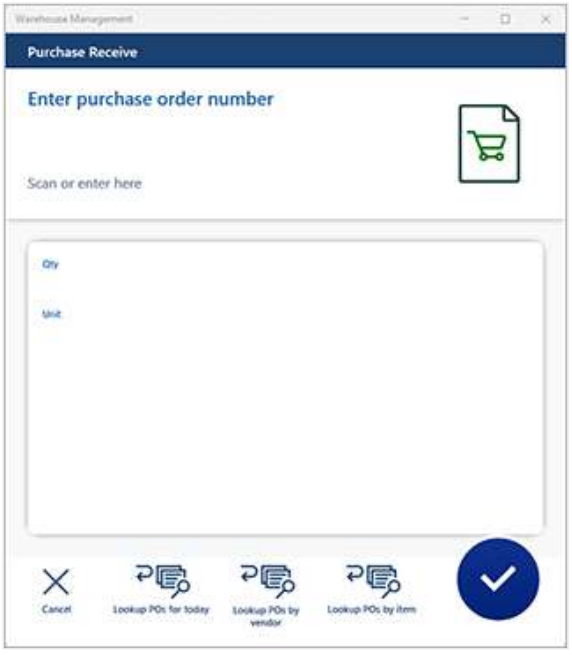
9. Select **OK** to close the dialog box.
10. Repeat steps 4 through 9 for the other two new menu items (**Look up POs for today** and **Look up POs by item**). As for the **Look up POs by vendor** menu item, you don't want to send any data to these detours, but you do want to return a purchase order number.
11. Close the page.

Try a purchase receiving flow that has a data inquiry as part of a detour

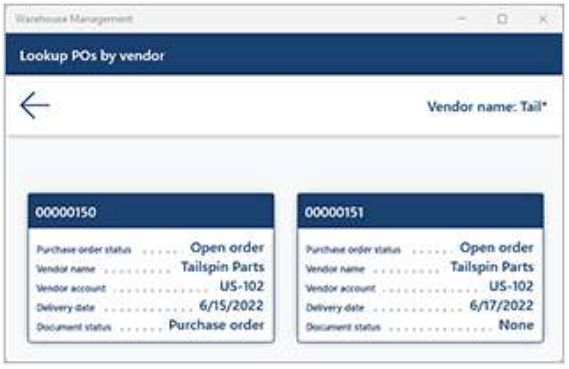
Follow these steps to test your new mobile app setup.

1. Create several purchase orders that have lines for warehouse 51.
2. Go to a mobile device or emulator that is running the Warehouse Management mobile app, and sign in to warehouse 51 by using *51* as the user ID and *1* as the password.
3. On the mobile app menu, select **Inbound** and then **Purchase receive**.

   You should see the following page, which includes the three new menu items.



4. Try out the different capabilities, and notice that you can send back a purchase order number by selecting one of the cards in the list.



> **Tip**
>
> Instead of running the receiving flow by doing a lookup from the **Purchase receive** menu item, you can start from an inquiry flow (**Main** > **Inquire** > **Look up POs by vendor**) and invoke a detour to run the desired flow by selecting one of the cards in the list. To use this approach, you can define a detour on the **Mobile device steps** page for the step that has a **Step ID** value of *GenericDataInquiryList*. Provided the ***Multi-level detours for the Warehouse Management mobile app*** feature is turned on for your system, you can also add an additional detour if needed (this feature adds support for up to two levels of detours and can be customized to support additional levels).

License plate receiving via the Warehouse Management mobile app

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up the Warehouse Management mobile app to support a license plate receiving process for physical inventory.

This functionality lets you quickly record the receipt of inbound inventory related to an advance ship notice (ASN). The system automatically creates an ASN when warehouse management processes (WMS) are used to ship a transfer order. For the purchase order and inbound shipment order processes, an ASN can be recorded manually or imported automatically by using an inbound ASN data entity process.

The ASN data is linked to loads and shipments via the *packing structures*, where pallets (parent license plates) can contain cases (nested license plates).

> **Note**
>
> To reduce the number of inventory transactions when packing structures that have nested license plates are used, the system records the physical on-hand inventory on the parent license plate. To trigger the movement of the physical on-hand inventory from the parent license plate to the nested license plates, based on the packing structure data, the mobile device must provide a menu item that is based on the *Pack to nested license plates* work creation process.

Warehousing mobile device app processing

When a worker scans an incoming license plate ID, the system initializes a license plate receiving process. Based on this information, the content of the license plate (data coming from the ASN) is

physically registered at the inbound dock location. The flows that follow depend on your business process needs.

Work policies

As with the *Report as finished* mobile device menu item process, the license plate receiving process supports several workflows based on the setup.

Work policies with work creation

When you register incoming items using a work policy that creates work, the system generates and saves put-away work records for each registration. If you use the *License plate receiving and put away* work process, then registration and put away are handled as a single operation using a single mobile device menu item. If you use the *License plate receiving* process, then the receiving and put-away processes are handled as two different warehouse operations, each with their own mobile device menu item.

Work policies without work creation

You can use the license plate receiving process without creating work. If you define work policies that have a work order type of *Transfer receipt*, *Purchase orders*, and/or *Inbound shipment order*, and you use the process for *License plate receiving (and put away)*, the following two Warehousing mobile app processes don't create work. Instead, they just register the inbound physical inventory on the license plate at the inbound receiving dock.

- *License plate receiving*
- *License plate receiving and put away*

> **Note**
>
> - You must define at least one location for a work policy in the **Inventory locations** section. You can't specify the same location for multiple work policies.
> - The **Print label** option for mobile device menu items doesn't print a license plate label without work creation. However, you can print a license plate label as part of the deferred receiving process.

Receive inventory on a location that doesn't track license plates

You can use a warehouse location assigned to a location profile even when **Use license plate tracking** isn't turned on. Therefore, when you receive inventory, you can directly register the on-hand inventory on a location without work creation.

Add mobile device menu items for each receiving location in a warehouse

The *License plate receiving enhancements* feature lets you receive at any location in a warehouse by adding location-specific license plate receiving (and put away) menu items to the Warehousing mobile app. Previously, the system supported receiving only at the default location defined for each warehouse. However, this feature lets mobile device menu items for license plate receiving (and put away) provide the **Use default data** option, which lets you select a custom "to" location for each menu item.

Show or skip the receiving summary page

You can use the *Control whether to display a receiving summary page on mobile devices* feature to take advantage of an additional detailed Warehouse Management mobile app flow as part of the license plate receiving process. With this feature, mobile device menu items for license plate receiving or license plate receiving and put-away provide a **Display receiving summary page** setting. This setting has the following options:

- **Display a detailed summary** – During license plate receiving, workers see an extra page that shows the full ASN information.
- **Skip the summary** – Workers don't see the full ASN information. Warehouse workers also can't set a disposition code or add exceptions during the receiving process.

Prevent transfer order–shipped license plates from being used at warehouses other than the destination warehouse

A license plate receiving process can't be used if an ASN contains a license plate ID that already exists and has physical on-hand data at a warehouse location other than the warehouse location where the license plate registration occurs. For transfer order scenarios where the transit warehouse doesn't track license plates (and therefore also doesn't track physical on-hand inventory per license plate), you can use the *Prevent transfer order shipped license plates from being used on other warehouses than the destination warehouse* feature to prevent physical on-

hand updates of license plates that are in transit. To manage the functionality provided by this feature, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **License plates** FastTab, set the **Transit warehouse license plate policy** field to one of the following values:
    - **Allow reuse of non-tracked license plate** – Non-tracked license plates can be reused.
    - **Prevent reuse of non-tracked license plate** – Only on-hand updates related to a shipped license plate are allowed at the destination warehouse until the transfer order has been received.

Deferred receiving processing

For businesses that use the *License plate receiving* process to inbound receive thousands of lines related to the same license plate, the Warehouse Management mobile app receiving process must wait until all lines and related work are created as part of the registration process. The exception is when the deferred receiving option is used. This option postpones registration as a background process. Therefore, warehouse workers can immediately continue other work.

More information

- For more information about mobile device menu items, see Set up mobile devices for warehouse work.
- For more information about work policies, see work policies.
- For more information about deferred receiving, see mixed license plate receiving.
- For more information about the *Report as finished* production scenario, see Warehouse work policies overview.
- For more information about inbound load management, see Warehouse handling of inbound loads for purchase orders.

Last updated on 06/22/2026

License plate build on the warehouse app

This article explains how to set up the Warehouse Management mobile app to build license plates. A license plate is a unique identifier that is assigned to a group of items. License plates help streamline the process of managing items, because items don't have to be handled individually. Instead, all the items that share a license plate can be tracked as a single unit.

This functionality lets you assign multiple child license plates to a single parent license plate. Therefore, in effect, the license plates become nested. License plate nesting is beneficial because a warehouse worker can move a larger group of inventory in one action. Therefore, the worker's processes are streamlined.

The **License plate build** menu item in the Warehouse Management mobile app helps with this process by letting users select a parent license plate and assign child license plates to it. However, license plate nesting works only if the following conditions are met:

- No on-hand inventory is assigned to the parent license plate. If the license plate that you try to use as a parent has on-hand inventory, you receive an error message.
- Any license plates that have on-hand inventory are the final members of the sequence. If you think of the whole sequence of license plates as a tree, these license plates are the leaves.

Configure the License plate build menu item

To configure the **License plate build** menu item, follow these steps:

1. In Supply Chain Management, go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New**.

3. On the header of the new record, set the following fields:

    - **Menu item name** – Enter a unique name to identify the menu item. For example, enter *License plate building*.
    - **Title** – Enter the title that should be shown on the mobile device menu. The title doesn't have to be unique.
    - **Mode** – Select *Indirect*, because this flow isn't directly related to work.

4. On the **General** FastTab, set the following fields:

    - **Use process guide** – Set this option to *No*, because process guide isn't supported for this flow.
    - **Barcode data policy** – Leave this field blank.

5. On the Action Pane, select **Save**.

To create a standalone menu item that can be used to assign license plates to a parent, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Add the new menu item to an appropriate place in your mobile device menu structure.

Example

This example shows how a parent license plate can be used to move on-hand inventory.

For this example, the following setup is in place:

- A parent license plate, *LP-PARENT*, has two nested license plates, *LP-CHILD1* and *LP-CHILD2*.
- There are two items, *item-1* and *item-2*.
- Both items have on-hand inventory in the same location, *location-1*.
- In location *location-1*, item *item-1* has on-hand inventory in license plate *LP-CHILD1*. Item *item-2* has on-hand inventory in license plate *LP-CHILD2*.

You want to move the on-hand inventory of items *item-1* and *item-2* to a new location, *new-location*. Therefore, you create an inventory movement on the parent license plate, *LP-PARENT*. By moving the parent license plate, you transfer all the nested on-hand inventory in the sequence of license plates to the new location in a single action.

To verify the on-hand movement, follow these steps:

1. In Supply Chain Management, go to **Inventory and management** > **Inquiries and reports** > **On-hand list**.
2. Filter the results by the two items, *item-1* and *item-2*.
3. For each item, select **Quantity adjustment** on the Action Pane. The page shows the on-hand inventory quantity that was put in the new location, *new-location*.

> **Important**

Parent license plates are intended to serve as links to groups of nested license plates. Therefore, for optimal performance, we recommend that you never assign on-hand inventory to parent license plates. Although some workflows might continue to work if a parent license plate has on-hand inventory, this scenario isn't fully supported.

Learn about parent license plates when advance ship notices (ASNs) are used in License plate receiving via the Warehouse Management mobile app.

Set up a mobile device menu item for moving items in the warehouse

Article • 12/20/2023

This article explains how to set up a mobile device menu item that lets workers register manual movements of items in the warehouse. The worker who uses this mobile device menu item decides what to move and where to move it.

Follow these steps to create and configure a mobile device menu item for registering movements in the warehouse.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New**.

3. On the header of the new record, set the following fields:

    - **Menu item name** – Enter a unique name to identify the menu item.
    - **Title** – The title that you enter will be shown in the user interface (UI). It doesn't have to be unique.
    - **Mode** – Select *Work*. This value is required because this mobile flow involves work.
    - **Use existing work** – Set this option to *No*, because the work is created as the movement is done.

4. On the **General** FastTab, set the following fields:

    - **Work creation process** – Select *Movement*, because this type of work is what the menu item supports. The page is updated to provide settings that are relevant to this type of work.

    - **Display inventory status** – Set this option to *Yes* to show the inventory status on the device. Set it to *No* to use the default inventory status. If the items that are moved have only one inventory status, that status is the default status. If you use only one inventory status, you typically won't have to show this information.

    - **Use default data** – Set this option to *Yes* if you want specific data fields to be shown by default to workers who use the mobile app. Default data field values can provide information that workers typically need in their daily work. After you set this option to *Yes*, select **Default data** on the Action Pane to

open a page where you can select the fields to show. For example, the *From location* field is often useful. Set this option to *No* if you don't want to select any default data for the menu item.

- **Use process guide** – Set this option to *No*, because process guide isn't currently supported for movements of items.

- **Barcode data policy** – Select the policy to use when multiple fields are filled in based on a single bar code scan. Learn more in GS1 bar codes.

- **Generate license plate** – Set this option to *Yes* to automatically create new license plates as they're needed. Set it to *No* if the worker must always select an existing license plate. A license plate is needed if part of the quantity is moved from a license plate. A license plate is also needed if the "from" location isn't license plate controlled, but the "to" location is.

- **Confirm cancel** – Select whether workers should be asked for confirmation when they cancel a movement operation that's in progress. Confirmation adds an extra step but can help prevent loss of information if a worker unintentionally cancels the operation.

- **Display container type** – Select whether to show the container type in the app. The container type must typically be shown if workers require information about the type of container that the license plate is associated with.

- **Deferred operation processing policy** – Select one of the following values to specify whether deferred processing should be used for movements that are registered by using this menu item:
  - *Respect settings* – Use deferred operation processing as defined on the work processing policy.
  - *Override settings and process operation synchronously* – Override the setting, and process the operation synchronously. This value allows for configurations where the mobile device processes the movement synchronously, regardless of the configuration for the type.

- **Full LP movement policy** – This field can help make workers more efficient when they move full license plates. The best value depends on how you manage your warehouse movements. Select one of the following options:
  - *Use specification for single item movement* – The worker is prompted to specify all relevant details (such as quantities) before they move a selected license plate.

- *Automatically move full LP for single item LP* – If a license plate contains a single item, the worker isn't prompted to scan that item before they move the license plate. However, if a license plate contains multiple items, the worker is prompted to scan each item after they identify the license plate.
- *Automatically move full LP* – The system assumes that all warehouse movements are for entire license plates, regardless of the number items that a license plate contains. The worker is never prompted to scan the items. This option works well when, for example, all warehouse movements are for entire pallets.

5. On the Action Pane, select **Save**.

6. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**, and add the new mobile device menu item to the appropriate new or existing menu.

Set up a mobile device menu item for moving items by template

07/16/2025

This article explains how to set up a mobile device menu item that lets workers register movements of items in the warehouse. The worker doesn't decide where to move the items, but instead relies on the system to determine the target location based on the work template and/or location directive configured for the menu item.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New**.

3. On the header of the new record, set the following fields:

    - **Menu item name** – Enter a unique name to identify the menu item.
    - **Title** – The title that you enter is shown in the user interface (UI). It doesn't have to be unique.
    - **Mode** – Select *Work*. This value is required because this mobile flow involves work.
    - **Use existing work** – Set this option to *No*, because the work is created as the movement is done.

4. On the **General** FastTab, set the following fields:

    - **Work creation process** – Select *Movement by template*, because this type of work is what the menu item supports. The page is updated to provide settings that are relevant to this type of work.

    - **Display inventory status** – Select one of the following options:
        - *Yes* – Show inventory status on the device. In this case, if default values are set for the **From inventory status** and/or **To inventory status** fields, then those values are used as defaults. To set these default data field values, select **Default data** on the Action Pane.
        - *No* – Use the default inventory status specified on **Warehouse management parameters** page or at the warehouse level (available at **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**). The **Default data** settings for inventory status aren't used in this case.

        > ⓘ **Note**
        >
        > If the moved items have only one inventory status, that status is the default status. If you only use one inventory status, you typically won't need to show

this information on the device.

- **Use default data** – Set this option to *Yes* if you want specific data fields to be shown by default to workers who use the mobile app. Default data field values can provide information that workers typically need in their daily work. After you set this option to *Yes*, select **Default data** on the Action Pane to open a page where you can select the fields to show. For example, the *From location* field is often useful. Set this option to *No* if you don't want to select any default data for the menu item.
- **Use process guide** – Set this option to *No*, because process guide isn't currently supported for movements of items.
- **Barcode data policy** – Select the policy to use when multiple fields are filled in based on a single bar code scan. Learn more in GS1 bar codes.
- **Generate license plate** – Set this option to *Yes* to automatically create new license plates as they're needed. Set it to *No* if the worker must always select an existing license plate. A license plate is needed if part of the quantity is moved from a license plate. A license plate is also needed if the "from" location isn't license plate controlled, but the "to" location is.
- **Create movement** – Set to *Yes* to all workers to create work for a movement without requiring that the worker do the work immediately. This option is useful, for example, after a quality inspection has been completed and the inspector wants the item to be moved from the quality inspection area.
- **Work template** – Select a work template to use when creating the movement work.
- **Directive code** – To use a specific location directive, select the directive code that is associated the location directive.
- **Override license plate during put** – Set to *Yes* to allow workers to consolidate the quantity on the license plate already at the location.
- **Group put away** – Set to *Yes* to group the putaway work. This option is available when work is grouped either by the worker or by the system. When the worker has finished all the picking work in the group, putaway work is created for the same group.
- **Audit template ID** – Select the work audit template that will interrupt the work process for this menu item so that another operation can be performed. For example, if this menu item is for inbound work, the audit template might require that the worker checks the temperature in the delivery container. The point at which

the process is interrupted is specified on the audit template and can be, for example, when work is started or completed, or when its status changes.

- **Full LP movement policy** – This field can help make workers more efficient when they move full license plates. The best value depends on how you manage your warehouse movements. Select one of the following options:
  - *Use specification for single item movement* – The worker is prompted to specify all relevant details (such as quantities) before they move a selected license plate.
  - *Automatically move full LP for single item LP* – If a license plate contains a single item, the worker isn't prompted to scan that item before they move the license plate. However, if a license plate contains multiple items, the worker is prompted to scan each item after they identify the license plate.
  - *Automatically move full LP* – The system assumes that all warehouse movements are for entire license plates, regardless of the number items that a license plate contains. The worker is never prompted to scan the items. This option works well when, for example, all warehouse movements are for entire pallets.

5. On the Action Pane, select **Save**.

6. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**, and add the new mobile device menu item to the appropriate new or existing menu.

Set up a mobile device menu item for completing work of type Purchase order

Article • 06/03/2022

This article shows how to set up a Mobile device menu item. In this example, the menu item is used for performing work of type Purchase order. The work class that's associated with the menu item determines which work is valid. You can use this guide in demo data company USMF. This procedure is typically carried out by a warehouse manager.

Create a mobile device menu item

1. Go to **Mobile device menu items** by entering it in the search bar.
2. Select **New**.
3. In the **Menu item name** field, type a value. Enter a unique value. For example, you could type `POMove`. Remember the value, you'll need it later.
4. In the **Title** field, type a value. This is the title which will be displayed on the mobile device. For example, you could type `PO Move`.
5. In the **Mode** field, select **Work**.
6. Select **Yes** in the **Use existing work** field.

    - This mobile device menu item is used to perform existing work. Therefore you must set this value to **Yes**.
    - The **Display inventory status** field determines whether the inventory status of the on-hand inventory will be displayed to the warehouse worker on the mobile device.

7. In the **Directed by** field, select **System grouping**. When you select something in the **Directed by** field, additional fields appear in the **General** section on this page. The fields that appear depend on what you selected. When you select **System grouping**, two new fields are added. These are explained below.
8. In the **System grouping** field, select **WorkPoolId**. When warehouse workers open this menu item, they'll be asked to scan a Work pool ID. All work orders with this Work pool ID and open work order lines with one of the work classes added to this menu item will be pushed to the user.
9. In the **System grouping label** field, type a value. This is the text displayed to the user on the mobile device. For example, you could type **Work pool**.
10. Select **Yes** in the **Override license plate during put** field. This option allows warehouse workers to override the target license plate when items are put down

on a license plate controlled location.

11. Select **Yes** in the **Group put away** field.

    - If all the Put lines on the work order share the same location, the user will receive one combined Put instruction for all lines.
    - Audit template ID: A work audit template allows you to specify that the work process for a menu item should be interrupted so that another operation can be performed. For example, if this menu item is for inbound work, the audit template might require that the worker checks the temperature. The point at which the process is interrupted is specified on the audit template and can be, for example, when work is started or completed, or when its status changes.

12. Expand the **Work classes** section.
13. Select **New**.
14. In the **Work class ID** field, type `Purchase`. The work pool restricts the work that the menu item can be used for. In this case it will be used for open work order lines that have the Purchase work class ID.
15. Select **Save**.

Set up work confirmation

1. Select **Work confirmation setup**.
2. In the **Work type** field, select **Pick**.
3. Select the **Auto confirm** check box. The work instruction with work type Pick will be auto-confirmed. This instruction will not be presented to the user.
4. Select **New**.
5. In the **Work type** field, select 'Put'.
6. Select the **Location confirmation** check box. The warehouse worker will be asked to perform a confirmation scan of the location, when the item is put down.
7. Select **Save**.

Add the menu item to a mobile device menu

1. Go to **Mobile device** menu by entering it in the search bar.
2. Select **Edit**.
3. Use the Quick Filter to find records. For example, filter on the **Name** field with a value of **inbound**. You want to find the menu you use for inbound menu items. In USMF this is called **Inbound**.
4. In the tree, select **a value**.
5. Select the arrow that points to the right.

6. Select **Save**.
7. Close the page.

Set up a mobile device menu item to register received items

Article • 01/31/2023

This article focuses on the setup of a mobile device menu item. This menu item is used for registration of the receipt of items ordered via purchase orders.

You can use this guide in demo data company USMF. This procedure is intended for the warehouse manager.

Create a mobile device menu item

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, type a value. This is the unique identifier for this mobile device menu item. For example, you could type `My PO registration`.
4. In the **Title** field, type a value. This is the title, which will be displayed to the user on the mobile device. For example, you could type `PO registration`.
5. In the **Mode** field, select **Work**. Registration of on-hand quantities received for a purchase order line will create work to move the items from the receiving area into the inventory. Work isn't created until the items are registered. Therefore, leave the **Use existing work** option set to **No**.
6. In the **Work creation process** field of the **General** section, select **Purchase order item receiving**.

    - A purchase order line must be uniquely identified before on-hand can be registered in the warehouse. In this scenario, the mobile device will register the purchase order number and item number, and this will allow the system to identify the PO line. Put away work will be created and can be picked up by another worker. The work creation method that you select determines which fields become available on the **General** FastTab.
    - If you select the **Use default data** option, the **Default data** button is enabled. Here you can select fields to display data that a worker typically needs in their daily work, so that these values are shown on the mobile device.
    - The **License plate grouping** parameter works in combination with the unit sequence group that's assigned to the item that's being received. You can specify whether receipts of less than or more than one pallet should be

grouped into one license plate, or divided into a separate license plate for each unit.

- If you select the **Generate license plate** option, this generates a unique license plate number based on the number sequence selection.
- You can select the template that will be used when work is created. For example, if you register an item for a purchase order, the put away work will be generated based on the work template. If you don't select a work template here, the system will assign a template based on the query criteria that are associated with the templates.
- If disposition codes are displayed on the mobile device, workers can evaluate the status or quality of the items, and select the appropriate code. The rules for the disposition code determine whether the items will be available to other warehouse processes. The rules also determine which location directive is used for the work that's created.
- If you select the **Batch disposition codes** option, workers can evaluate the status or quality of a batch, and select the appropriate disposition code. The rules that are set on the batch disposition code determine whether the batch will be available to other warehouse processes.
- If you select the **Print labels** option, a license plate label will be printed automatically when items are received.

7. Select **Save**.
8. Close the page.

Add the menu item to a mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. Use the **Quick Filter** to filter on the **Name** field with a value of `inbound`.
3. Select **Edit**.
4. In the Available menus and items tree, select the menu item that you created before.
5. Select the arrow that points to the right.
6. Select **Save**.
7. Close the page.

Set up a mobile device menu item to provide a pick line overview

This article explains how to configure options that are related to the pick line overview for mobile device menu items that are used to process picking work. The pick line overview lets warehouse workers view and select from a list of all the work lines that are related to their current task. This capability can help workers optimize their picking sequence. The feature provides options that replace the standard **Skip** button that lets workers cycle through the lines one at a time, in a fixed order. (However, the option to use that button is still available.)

Admins can configure each menu item individually to control how, when, and where the Warehouse Management mobile app presents the pick line overview.

Configure menu items to show a list of all work lines

To set up a mobile device menu item to provide a pick line overview, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Select or create a menu item that is related to picking work, and set the following values:

   - **Mode:** *Work*
   - **Use existing work:** *Yes*
   - **Directed by:** *User directed* or *System directed*

   For more information about how to create menu items and use the various settings that are available on the **Mobile device menu items** page, see Set up mobile devices for warehouse work.

3. On the **General** FastTab, configure the feature by setting the **Show work line list** field to one of the following values:

   - **Show only upon request** – Workers can choose to view the pick line list by selecting the **Skip to** button in the Warehouse Management mobile app.
   - **Show at the start of every pick** – Workers see the list every time that they start or finish a pick line. They can also view the list again by selecting the **Skip to** button in the Warehouse Management mobile app.

- **Show at the start of the first pick only** – Workers see the list every time that they start new picking work, but not after each line. They can also view the list again by selecting the **Skip to** button in the Warehouse Management mobile app.
- **Never show** – The standard **Skip** button appears in the Warehouse Management mobile app, and display of the work line list is turned off. The **Skip** button lets workers cycle through the lines one at a time, in a fixed order. They can also cycle through the list as many times as they require, until all lines have been processed.

4. On the Action Pane, select **Save**.

   If you set the **Show work line list** field to any value except *Never show*, the **Field list** button on the Action Pane becomes available.

5. On the Action Pane, select **Field list**.

6. On the **Field list** page, configure the information that the Warehouse Management mobile app shows for each line in the list.

   - The **Primary control** field is always set to *LineNum*. Therefore, each row in the list begins with a line number.
   - Use the remaining **Display field** fields to add up to seven additional display fields, as you require. In each **Display field** field, select the name of a work line field. Each line will then show a value for that field. The values will be shown in the order that you select here. You can leave some of the **Display field** fields blank if you don't require all seven values.

7. On the Action Pane, select **Save**, and then close the **Field list** page.

Create a mobile device menu item for license plate consolidation

Article • 09/29/2021

This procedure shows you how to create a mobile device menu item for license plate consolidation work. This enables warehouse workers to consolidate items on one license plate with items on another license place within the same location. For example, they might use this if subsequent staging steps were the same on both work orders, so that the work only needs to be performed once for the merged items. You can use this procedure in demo data company USMF. The task would typically be carried out by a warehouse manager. This procedure is for a feature that was added in Dynamics 365 for Operations, version 1611.

1. Go to Warehouse management > Setup > Mobile device > Mobile device menu items.
2. Click New.
3. In the Menu item name field, type a value.
4. In the Title field, type a value.
5. In the Mode field, select 'Indirect'.
6. In the Activity code field, select 'Consolidate license plates'.

Mixed license plate receiving

Mixed license plate receiving enables you to build a license plate consisting of multiple items before you register it and create putaway work.

A license plate that consists of multiple items doesn't have to be split at the receiving dock for you to register each item.

When using an item-related flow to identify the source document lines, you can scan bar codes on the item control. If the bar code has a quantity and a unit of measure (UOM) configured on it, the item and quantity are automatically added to the mixed license plate, and you're returned to the screen to scan another item. This process lets you quickly scan all the items without having to make a confirmation at each step.

In the flow for mixed license plate receiving, you can display the list of items that are already scanned to the license plate. From this list, you can modify or correct the quantity of an item.

Where it applies

Mixed license plate receiving is a mobile device receiving flow to register and create work for multiple lines or items at the same time. This process is useful if you receive inbound license plates with multiple items.

The *deferred receiving* process uses both the specific *Mixed license plate receiving* mobile device flow and the data entities that are part of the **Mixed license plate receiving** page.

How to set up mixed license plate receiving

Mixed license plate receiving is set up as a mobile device menu item.

Create a new menu item with mode **work** that doesn't use existing work. Use one of the following work creation processes:

- Mixed license plate receiving
- Mixed license plate receiving and put away

Use the following options for identifying the source document lines:

- Purchase order item receiving

- Purchase order line receiving
- Transfer order item receiving
- Transfer order line receiving
- Inbound shipment order item receiving
- Inbound shipment order line receiving
- Return order receiving
- Load item receiving

> **Note**
>
> You can add multiple items to a license plate for all the source document line identification methods. However, although you can change the receiving order on a single license plate during the receiving process for all the other methods, you can't change the selected load for the *Load item receiving* method.

Deferred receiving processing

The deferred receiving process lets you, for example, optimize the process of receiving shipments that include order lines for many items and/or serial numbers. To use this process, assign a **Deferred receiving policy ID** value to your mobile device menu item. In a scenario that involves several thousand serial numbers, the system quickly records the serial numbers and stores the information in the *mixed license plate receiving* entities. It then processes on-hand inventory updates and creates work in the background, so that warehouse workers can continue to do other work. Deferred receiving processing is useful for warehouse processes where different workers are responsible for inbound receiving and putaway.

To run a deferred receiving process that quickly records incoming inventory and group-registers on-hand inventory against license plates, configure mobile device menu items that use one of the following **Work creation process** settings:

- *Purchase order item receiving*
- *Purchase order line receiving*
- *Transfer order item receiving*
- *Transfer order line receiving*
- *Inbound shipment order item receiving*
- *Inbound shipment order line receiving*
- *Load item receiving*
- *License plate receiving*

Prerequisites

Deferred receiving processing requires Supply Chain Management 10.0.38 or higher.

Create and assign deferred receiving policies

To use deferred receiving processing, first create a deferred receiving policy and assign it to the relevant mobile device menu items.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Deferred receiving policies**.
2. Identify the policy that you want to use, or create a new one. Each policy defines when a receiving flow uses deferred receiving processing. It also sets a few other options that control how the process works. Use the tooltips that are provided on the page to learn how to use each setting.
3. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
4. In the list pane, select the menu item that you want to set up. The selected menu item must use one of the previously listed work creation policies.
5. Set the **Deferred receiving policy ID** field to the policy that you identified in step 2.

Print license plate labels as part of the receiving process

For other mobile menu item receiving processes, the system can generate and print license plate labels when you run a deferred receiving process. You can enable this capability by using the settings established by the deferred receiving policy that's selected for each menu item.

Set the system to generate up to two license plate labels by using the following options:

- **Label printing on confirming receiving** – Generate and print labels immediately (before registration and work creation).
- **Label printing on deferred receiving async processing** – Generate and print labels based on the work data.

If you set the **Label printing on confirming receiving** option so that labels are printed before work is created, the labels don't include details such as the "to" location for the license plate. This information is omitted because it isn't available until after the system finishes running the deferred receiving asynchronous process.

> ⓘ **Note**

You can use the **Reprint label** mobile device menu item as a detour process to print the label that's generated by the **Label printing on deferred receiving async processing** option as part of the putaway process.

Deferred receiving asynchronous processing

Deferred asynchronous receiving processing automatically runs immediately after a mobile device menu item completes a *Receiving completed* process, which indicates that all the required *Mixed license plate receiving* data is available. You can monitor the status of the process on the **Mixed license plate receiving** page, where the **Mixed license plate receiving status** field shows one of the following values:

- *Building license plate*
- *Processing*
- *Error*
- *Received*

If an *Execute deferred receiving* batch job fails, the related **Mixed license plate receiving status** field is set to *Error*. To view the reason for the failure, select **Mixed license plate receiving batch jobs**, and then select **Batch job log**. Take the appropriate action to address the error (for example, by updating a line quantity or deleting a line). Then manually rerun the process by selecting **Complete license plate**.

Tip

If you want the page to show the **Receiving processing ID** value that's used for each background processing task, use the personalization tools to add the column to the **Mixed license plate receiving** grid.

Last updated on 07/01/2026

Set up a mobile device menu item for completing mixed license plates

Article • 05/20/2024

This article explains how to set up the *Complete mixed license plate* mobile device flow. This flow helps streamline warehouse operations by letting workers continue to process an incoming shipment immediately after they register its arrival.

Mixed license plate receiving helps warehouse managers achieve these goals:

- **Increase efficiency and accuracy.** Workers can receive various items onto a single license plate before they register and create putaway work.
- **Handle inbound license plates.** The inbound process is simplified because multiple lines/items can be handled simultaneously.
- **Optimize workflows.** The system can be configured to create work records for each registration. Alternatively, the license plate receiving and putaway process can be used as a single operation.

You can add this capability directly to the mobile device menu, so that workers can run the flow by itself. Alternatively, you can set up a *detour* to make the flow available immediately after a related flow (such as the flow for receiving a purchase order or sales return). A detour is a menu item that can be opened from a step in a main task. Detours let workers "park" the current task, perform another task, and then return to the original task without losing any information.

Prerequisites

To use the features describe in this article, you must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.40 or later.

Create a mobile device menu item for completing mixed license plates

Follow these steps to create a mobile device menu item that runs the *Complete mixed license plate* mobile device flow.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. On the Action Pane, select **New**.

3. On the header of the new record, set the following fields:

    - **Menu item name** – Enter a unique name to identify the menu item (for example, *Complete mixed license plate*).
    - **Title** – Enter the title that should be shown on the mobile device menu. The title doesn't have to be unique.
    - **Mode** – Select *Indirect*. This value is required because this flow isn't directly related to work.
    - **Use existing work** – Set this option to *No* because this flow creates new work when the movement is done.

4. On the **General** FastTab, set the following fields:

    - **Activity Code** – Select *Complete mixed license plate*.
    - **Barcode data policy** – Leave this field blank.

5. On the Action Pane, select **Save**.

6. Follow one of these steps:

    - To create a standalone menu item that workers can use to complete any existing license plate: Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**, and add the new menu item to an appropriate place in your mobile device menu structure.
    - To add the capability to complete a license plate as part of a larger, existing flow (such as the flow for sales returns): Add the new menu item as a detour of the existing flow. For instructions, see Configure detours for steps in mobile device menu items.

Related information

- For information about how to receive shipments by using mixed license plates, see Mixed license plate receiving.
- For information about to manage return orders, see Receive unannounced sales returns.

Configure Display older batches within warehouse on a mobile device

The **Display older batches within warehouse** configuration lets you display a list of locations with batches older than the current location of the work line. The list of locations that are displayed includes information about the older batches in the location with the expiration date and the physical inventory of each batch. You can choose to pick from a new location or to continue picking from the current location.

- Pick from a new location - If you select a new location to pick from, the current work line will be updated to use the new location and work will continue as usual with the new location. For the new location to be valid, it must have enough available quantity for the whole work line. If the required quantity is not available, the work line will not be updated, and the list will display.
- Continue picking from the current location - If you continue with the current work line location, the quantities for the work line will continue to be picked from the original location.

Where it applies

Display older batches within warehouse is configured on mobile device menu items and affects the pick for batch below items.

Set up Display older batches within warehouse

The **Display older batches within warehouse** configuration is available on mobile device menu items when the **Pick oldest batch** option is set to **Warn**.

- Under **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**, set **Use existing work** to **Yes** for the menu item, and select **Warn** in the **Pick oldest batch** field.

Last updated on 07/01/2026

Pick oldest batch on a mobile device

Article • 09/24/2024

You can configure mobile device menu items to allow workers to pick any batch, or to force or warn them to pick the oldest batch in their current location. The option effects pick work for batch below items.

To set this option for a mobile device menu item, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select or create a menu item that has **Use existing work** set to *Yes*.
3. On the **General** FastTab, set **Pick oldest batch** to one of the following values:

    - *None* – Workers aren't shown any messages and can pick any batch in their location.
    - *Warn* – When picking batch-controlled items, the app shows a list of the batch(es) with the oldest expiration date. If the location is license plate controlled, the app shows a list of license plates that have the oldest batch. If a worker chooses an unlisted license plate or batch, the app shows a warning that tells the worker that an older batch is available. The worker can choose to continue with the selected batch or license plate, even though it isn't the oldest, by confirming the action.
    - *Force* – Works the same way as a *Warn*, except the worker is only allowed to continue after selecting the oldest batch or license plate.

Query item data on a mobile device

Item inquiry mobile device menu items enable warehouse workers to view key inventory details for specific items, including location, available quantity, and reserved quantity. This feature improves visibility into warehouse stock and supports efficient decision-making during daily operations.

> **Note**
>
> This functionality doesn't display batch numbers or serial IDs. If an item is a product variant, the app shows information for the captured product dimensions, such as color or size.

Key capabilities of the item inquiry feature

Item inquiry mobile device menu items provide the following key capabilities:

- **Fast access to inventory details** – Workers can view where an item is stored and see how much stock is available or reserved.
- **Support for product variants** – If an item uses product dimensions such as color or size, the app shows data for the relevant variant based on the scanned or entered information.

Example scenario

A warehouse worker wants to verify stock levels of a particular item before picking. The worker selects the **Item Inquiry** menu item on the mobile app and then scans the item barcode. In response, the app displays the following information:

- Warehouse locations where the item is stored.
- Available and reserved quantities.
- Details based on the product variant (such as color or size values).

This information allows the worker to confirm inventory without interrupting active picking or receiving workflows.

Set up the mobile device menu item

To enable this functionality, you must configure the mobile device menu item in the system. Create the **Item inquiry** menu item by following these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. Set the following values for the new menu item:
    - **Menu item name** – Enter an internal name for the menu item, such as *Item inquiry*.
    - **Title** – Enter the title for the menu item as workers should see it, such as *Item inquiry*.
    - **Mode** – Select *Indirect*.
4. On the **General** FastTab, set the following values:
    - **Activity code** – Select *Item inquiry*.
    - **Use process guide** – This setting is automatically set to *Yes* and can't be changed.
5. Go to **Warehouse management** > **Setup** > **Mobile device menu** and add the new menu item to each menu where workers should access it. Learn more in Set up mobile devices for warehouse work.

Global mobile device parameters

06/04/2025

This article explains how to set up global warehouse management parameters that affect how the system interacts with mobile devices.

For more information about how to set up warehouse workers, see Manage warehouse worker. For more information about license plate handling on mobile devices, see License plate receiving via the Warehouse Management mobile app. For more information about the cycle counting processes, see Cycle counting and Cycle counting example scenarios.

Open the Warehouse management parameters page

To open the **Warehouse management parameters** page, go to **Warehouse management** > **Setup** > **Warehouse management parameters**. You can then set the fields that are related to mobile device work.

Global mobile device settings

The global mobile device settings are found on the **Mobile device** FastTab on the **General** tab of the **Warehouse management parameters** page. The following fields are available.

Expand table

Field	Description
Mobile device note type	Select the type of information that is shown to workers during sales order picking.
Scanned quantity limit	Enter the maximum item quantity that a worker can scan during each session by using a mobile device menu item that has a **Work creation process** value of *Adjustment in*. This field doesn't affect scans that are done by using any other type of menu item.
Use mobile device session logging	Set this option to *Yes* to keep a log of worker sign-in history. To view the log, go to **Work users sessions** > **Inquiries and reports** > **Mobile device logs** > **Work user sessions**.
Number of stored errors	Enter the maximum number of error records that the system should store. To view the error log, go to **Work users sessions** > **Inquiries and reports** > **Mobile device logs** > **Work user sessions**.

Field	Description
Default warehouse transfer journal	Select the journal that is used when workers use a mobile device to move products from one warehouse to another.
Allow purchase order line registration when in external review	Set this option to *Yes* if workers should be able to use a mobile device to register order lines for purchase orders that have an **Approval status** value of *In external review*. Set this option to *No* to prevent workers from registering lines for purchase orders that are in external review.
Enable RSAT support	The field enables the Warehouse Management mobile app task validator, which logs and validates each step that the app performs. Because this process can significantly slow down system performance, you should enable the validator only during testing. You should never enable it in a production environment.

Inventory dimension display options

On the **Mobile device menu item display inventory dimensions** FastTab, you can use the **Display tracking dimension control for last on-hand** field to specify how the mobile app shows the *tracking dimension below location* control, including *batch below number* and *serial below number*. The setting has no impact on the display of *tracking dimension above location*, such as *batch above number* or *serial above number*.

This feature requires Supply Chain Management version 10.0.44 or later.

The setting of the **Display tracking dimension control for last on-hand** field applies to the entire work order type. Therefore, it affects all mobile device menu items that are used to process the work order type. Currently, this feature is supported only for sales orders. No other work order types (such as transfer orders and purchase orders) are supported.

Two options are available for this field:

- *Display tracking dimension control* – The mobile app always shows the tracking dimension below location control (batch below number or serial below number) when the work order type is processed.
- *Hide tracking dimension control* – The mobile app always hides the tracking dimension below location control (batch below number or serial below number) when the work order type is processed.

Consider the following scenario:

- You have a batch below item that is named *whsbb*.
- A sales order is placed for a quantity of two pieces of item *whsbb*.
- The available on-hand inventory for item *whsbb* is two pieces (the last batch in stock).

If the **Display tracking dimension control for last on-hand** field is set to *Hide tracking dimension control* (the default value), the following behavior occurs:

- The system automatically assigns the batch number behind the scenes and then proceeds.
- The mobile app doesn't show batch number control.
- The worker can't confirm or edit the batch number in the mobile app, even if batch number confirmation is enabled.

If the field is set to *Display tracking dimension control*, the following behavior occurs:

- The mobile app shows an *empty* batch number control.
- The user must manually enter the batch number.

You can override the default setting for any individual mobile device menu item that supports it by going to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**. Learn more in Additional menu item options.

> **Note**
>
> This setting affects only menu items that process a supported work order type (currently only sales orders). Unsupported work order types (such as transfer orders and purchase orders) aren't affected.

Warehouse mobile devices workspace

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The **Warehouse mobile devices** workspace lets you monitor the health and license status of all handheld devices that are used in your warehouses.

The first time that a user signs in to the Warehouse Management mobile app on a new device, the system collects information about that device and adds it to the **Warehouse mobile devices** workspace. The system then continuously monitors the status of each device to make sure that it's running a supported operation system and the latest version of the mobile app. Devices remain listed in the workspace until they're manually deleted.

> **Note**
>
> If the Warehouse Management mobile app is reinstalled on the same device, you might have multiple device IDs for the same physical device. In this case, you must delete the inactive device IDs.

The **Warehouse mobile devices** workspace also helps you confirm that you're in compliance with licensing requirements by showing how many devices you're running and letting you assign a device license status to each device. However, the system doesn't enforce licensing requirements. Your organization is responsible for ensuring that you've acquired the correct number of licenses for your devices.

Prerequisites

This feature requires Microsoft Dynamics 365 Supply Chain Management version 10.0.37 or later.

Open the Warehouse mobile device workspace

To open the **Warehouse mobile devices** workspace, go to **Warehouse management** > **Workspaces** > **Warehouse mobile devices**.

Summary information

The **Summary** FastTab of the **Warehouse mobile devices** workspace provides tiles that show and link to the following information:

- **Device licenses used across all companies** – This tile shows the number of device licenses that are required to cover all the devices that are currently used across all companies (legal entities). If a single device is used across multiple companies, it's counted only once here. This total includes previously used devices that are now blocked. You can delete blocked devices to stop them from being counted here. Use this information to confirm how many licenses you need. This tile doesn't provide a drill-down link.
- **Device licenses** – This tile shows the number of device licenses that are required to cover all the devices that are currently used in the current company (legal entity). The devices that are counted here have a licensing state of *License required* or *Licensed*. Select this tile to view a list that provides details about each device in this category.
- **Devices supported** – This tile shows the number of devices that are running current versions of the Warehouse Mobile app on a fully supported operating system. Select this tile to view a list that provides details about each supported device.
- **Soon out of support devices** – This tile shows the number of devices that are still healthy and compliant, but will soon become unsupported (typically because of the mobile app or operating system version that they're running). To help keep your warehouses running smoothly, be sure to upgrade or replace these devices before it's too late. Select this tile to view a list that provides details about each device that will soon become unsupported.
- **Unsupported devices** – This tile shows the number of devices that are no longer supported and might not work correctly. These devices might soon become blocked without further warning from Microsoft. To help keep your warehouses running smoothly, be sure to upgrade or replace these devices as soon as possible. Select this tile to view a list that provides details about each device that's no longer unsupported.
- **Blocked devices** – This tile shows the number of devices that are now blocked by Microsoft. Any attempt to sign in to one of these devices will be rejected by the system. Microsoft controls which devices are blocked and will use this mechanism as a last resort to help protect system integrity and compliance.

Devices needing attention

The **Devices needing attention** FastTab of the **Warehouse mobile devices** workspace provides a quick overview of devices that require attention. It provides the following two tabs:

- **Devices to update** – Select this tab to view a list of devices that are running an old version of the Warehouse Management application. You should update each of these devices to the latest version to ensure optimal compliance, performance, and user

experience. For details about the latest version of the app and a change history, see What's new or changed in the Warehouse Management mobile app. For information about how to mass deploy installations and updates for the Warehouse Management mobile app, see Mass deploy the mobile app with user-based authentication.

- **Devices to replace** – Select this tab to view a list of devices that are running an operation system that's no longer supported. These devices might pose a risk to system integrity and compliance. Therefore, you should replace them as soon as possible. If the list includes devices that you're no longer using, you can delete them.

Manage device licenses

How devices are licensed

The following concepts apply to the way that the Warehouse Management mobile app is licensed:

- **Supply Chain Management user** – This type of user has a full Supply Chain Management user license. The user can access the web client and is also automatically licensed to use the Warehouse Management mobile app. No additional user license or device license is required. This type of user is usually an administrator, office worker, or warehouse manager instead of a warehouse worker.
- **Warehouse worker (shared work user)** – This type of user can sign in only by using the Warehouse Management mobile app (not the web client). Therefore, the user doesn't require a Supply Chain Management user license. This type of user is usually a warehouse worker. In Supply Chain Management, you typically set up users of this type by using a single work user record and then assigning multiple *user* accounts to it (one for each worker). This type of user is also referred to as a *shared work user*.
- **Warehouse Management mobile app user license** – A user license allows a specific warehouse worker to use a specific device. You can't view or manage user licenses in the **Warehouse mobile devices** workspace.
- **Warehouse Management mobile app device license** – A device license allows any number of shared work users (warehouse workers) to use a specific device. You can view and manage device licenses in the **Warehouse mobile devices** workspace.

For more information about how to set up mobile device user accounts, including both Supply Chain Management users and shared work users, see Mobile device user accounts.

For complete licensing details, see the Dynamics 365 Licensing Guide.

Update licensing information for a device

The **Warehouse mobile devices** workspace lets you view information about each device that's connected to the system. It also lets you view and manage the device license status for each device. To update licensing information for a device, follow these steps:

1. Open the **Warehouse mobile devices** workspace.
2. On the **Summary** FastTab, select a tile to open the relevant device list (such as **Device licenses** or **Devices supported**).
3. Find the target device in the list, and select it.
4. On the Action Pane, select **Change device licensing**, and then select a new license state to assign to the selected device. The following license states are used:
    - *Auto* – This value is assigned to new devices and persists until the system has enough information to determine the correct license state.
    - *License required* – The device needs a license that hasn't yet been acquired. Usually, this value is automatically assigned the first time that a shared work user signs into the device.
    - *Licensed* – The device is licensed. Select this value to indicate that you've acquired the required licenses for the device.
    - *Block share usage* – The device doesn't require a device license. Devices in this license state can be used only by Supply Chain Management users (who don't require a user or device license to use the mobile app). This value prevents shared work users from signing in to the device.

Rename a device

Devices are primarily identified using a unique device ID, which is, due to privacy reasons, unrelated to any other device identifier, such as a device serial number or device name. To make it easier to identify which device ID correlates to which physical device, you can give each device a friendly name in addition to the device ID. To rename a device, follow these steps:

1. Open the **Warehouse mobile devices** workspace.
2. On the **Summary** FastTab, select a tile to open the relevant device list (such as **Devices supported**). Alternatively, go to **Warehouse management** > **Inquiries and reports** > **Mobile device logs** > **Mobile devices**.
3. Find the target device in the list, and select it.
4. On the Action Pane, select **Edit**.
5. Change the **Friendly name** field.

> ⓘ **Note**

The Warehouse Management mobile app can also provide a hardware identification of the device in some cases. If so, this information is shown in the **Hardware identification** field and a friendly name is generated using the device brand, model, and hardware identification.

Remove a device

After devices are discovered, they remain listed in the system until they're manually deleted. When you delete a device, its license is released and can be used with other devices. Follow these steps to remove a device from the system.

1. Open the **Warehouse mobile devices** workspace.
2. On the **Summary** FastTab, select a tile to open the relevant device list (such as **Blocked devices** or **Unsupported devices**).
3. Find the target device in the list, and select it.
4. On the Action Pane, select **Delete**.

Last updated on 01/09/2026

Mobile device user settings

09/17/2025

The new Warehouse Management mobile app has a set of app-specific settings that help tailor the user experience. Because the app can be used on devices of different screen sizes and configurations (such as tablet, phone, or arm-held), it can be useful to centrally manage these settings from Microsoft Dynamics 365 Supply Chain Management.

The *mobile device user settings* feature lets you define global user settings that will be used on all devices. You can also define more granular user settings for individual device brands, device models, and/or workers. When a worker signs in to the Warehouse Management mobile app, the app fetches and applies the most specific settings profile that is stored in Supply Chain Management for the matching brand, device, and/or user ID.

This feature can help workers get started more quickly whenever they begin to use a new device. Here are some examples:

- Admins can establish a standard set of preferences that work best for devices from a specific manufacturer and/or for specific device models. Therefore, workers can get started with a new device without necessarily having to change the settings.
- If your company has a pool of identical devices that are shared among workers, workers will see their preferred setup every time that they sign in, even if they have never used the specific physical device that they selected on a given day.
- In Supply Chain Management, admins can view and edit all stored settings, even for individual workers. This capability can help them troubleshoot or fine-tune new features.

Create and manage user settings

Use the **Mobile device user settings** page to create, view, and manage settings profiles at all levels of granularity. The first time that a worker edits their user settings on a new device, a new profile is automatically added on this page, if it doesn't already exist. That profile is then updated every time that the worker makes a change.

You can also define a settings profile that applies to all device brands, device models, and/or workers. You can then increase the granularity by applying more specific settings for individual brands, models, and/or workers.

Follow these steps to create and manage user settings for your mobile devices.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device user settings**.

2. Select an existing user settings profile in the list pane to open its record. Alternatively, select **New** on the Action Pane to create a new profile.

   Each profile in the list pane is labeled to indicate the brand, model, and/or user ID that the profile applies to. More general profiles have a value of *All* for some or all of these characteristics.

3. In the header section of the record for the new or selected settings profile, set the following fields:

   - **Device brand name** – Select the device brand name that the profile should apply to. If the profile should apply to all brands, leave this field blank. The list of values includes all the brands that have been defined in your system. For information about how to define the list of brands, see the next section.
   - **Device model ID** – Select the device model that the profile should apply to. If the profile should apply to all models of the selected brand, leave this field blank. The list of values includes all the models that have been defined for the brand that is selected in the **Device brand name** field. For information about how to define the list of models for each brand, see the next section.
   - **User ID** – Select the user ID of the warehouse worker that the setting profile should apply to. If the profile should apply to all workers, leave this field blank.

4. On the **General** FastTab, set the user settings values that you want to apply. These settings are the same as those offered in the app itself, but the app also provides some extra settings that aren't available here in the web client (including **Server request timeout** and **Configuration mode**). Learn more about the available settings in User settings, color themes, and sound themes.

Set local user settings in the Warehouse Management mobile app

Workers can set their own local user settings in the Warehouse Management mobile app. These settings override the default settings set by the admin. For example, a worker might prefer to use a different theme, sound level, or text scale. When a worker signs in to the Warehouse Management mobile app, the app fetches and applies the most specific settings profile that is stored in Supply Chain Management for the matching brand, device, and user ID. When a worker changes their local settings, the app updates the settings profile that is stored in Supply Chain Management for the matching brand, device, and user ID. If no matching profile exists, a new one is created.

To set local user settings in the Warehouse Management mobile app, sign in to the app and then select the **Settings** button, which is the gear icon in the top-right corner of the screen.

Learn more in User settings, color themes, and sound themes.

Create and manage mobile device brands

Use the **Mobile device brands** page to view, create, and manage the device brands and models that can be used with your settings profiles. The mobile app automatically fetches and submits the local brand name and model ID the first time that a worker edits their settings on a given device. Therefore, most of these records will usually be automatically generated. However, you can also manage all the records on this page. For example, you can give more useful descriptions to each brand and model to help distinguish similar or cryptic model IDs.

Follow these steps to create and manage your mobile device brands and models.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device brands**.
2. In the list pane, select a mobile device brand to open its record. Alternatively, select **New** on the Action Pane to create a new brand.
3. In the header section of the record for the new or selected device brand, set the following fields:
    - **Device brand name** – The brand name of the device, such as *Microsoft Corporation*.
    - **Description** – You can enter a description to help distinguish brand names.
4. The **Mobile device models** FastTab shows all the models for the selected device brand. Use the buttons on the toolbar to add rows to the grid or remove rows. For each row, you can set the following fields:
    - **Device model ID** – The device model ID, such as *Surface Book 2*.
    - **Description** – You can enter a description to help distinguish model IDs.

- Install the Warehouse Management mobile app
- Assign step icons and titles for the Warehouse Management mobile app

Warehouse app event processing

10/03/2025

Batch jobs running in Supply Chain Management can use data from a queue for processing events issued by the Warehouse Management mobile app to react as needed to the signaled events. This feature adds relevant events to the queue in response to certain types of actions taken by workers using the app. An example is when using the *Create and process transfer orders from the warehouse app* feature, the transfer order header and lines get created and updated in the back end when the system is running the **Process warehouse app events** batch job.

Set up a batch job to process warehouse app events

Process warehouse app events

Set up a scheduled batch job to process the warehouse app events for the transfer order creation and line updates.

1. Go to **Warehouse management** > **Periodic tasks** > **Process warehouse app events**.
2. The Process warehouse app events dialog box opens. Expand the **Run in background** FastTab and set **Batch processing** to **Yes**.
3. On the **Run in the background** FastTab, select **Recurrence**.
4. The **Define recurrence** dialog box opens. Set the run schedule as needed for your business.
5. Select **OK** to return to the **Process warehouse app events** dialog box.
6. Select **OK** in the **Process warehouse app events** dialog box to add the batch job to the batch queue.

Query warehouse app events

You can view the event queue and events messages generated by the Warehouse Management mobile app by going to **Warehouse management** > **Enquiries and reports** > **Mobile device logs** > **Warehouse app events**.

The standard event queue process

The warehouse app events queue will typically be used with the following described flow:

1. An event gets added to the queue with an event message. The new message initially has an Event state of **Waiting**, which means that the **Process warehouse app events** batch job will not pick up and process this message.
2. As soon as the message state is updated to **Queued**, the **Process warehouse app** events batch job will pick up and process the event.
3. The batch job updates the event states to either **Completed** or **Failed**, depending on whether the requested process was possible.
4. When all the related event messages are **Completed**, the event is deleted from the queue.

For a detailed example, see Create transfer order from warehouse app process.

Handle event errors

As part of the warehouse event processing, the requested message activity may not receive processes from the batch job. In this case, the event message will change to **Failed**. You can use the **Batch log** information to learn why and take needed action to correct any problems.

For a detailed example, see Create transfer order from warehouse app.

To reset a failed warehouse app event message:

1. Go to **Warehouse management** > **Enquiries and reports** > **Mobile device logs** > **Warehouse app events**.
2. On the **Warehouse app event messages** FastTab, find and select a relevant event that is showing **Failed** in the **Event state** column.
3. Select **Reset** from the **Warehouse app event messages** toolbar.
4. Continue working until all relevant messages are reset.

You can also remove a **Failed** event message by using the **Delete** option on the **Warehouse app event messages** toolbar.

Inspect details of active Warehouse Management mobile app sessions

>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The whole time that a warehouse worker user is using the Warehouse Management mobile app, the system maintains a *work user session* for that user. You can view the details of each active work user session by going to **Warehouse management** > **Inquiries and reports** > **Mobile device logs** > **Work user sessions**. For each session, the **Work user sessions** page shows associated **User name**, **User ID**, **Login date and time**, and **Last user action date and time** values, together with a detailed history of XML communication messages and logged errors.

> **Note**
>
> If no historical data appears on the **Work user sessions** page, a cleanup job, such as Work user session log cleanup, might be running.

The XML messages can be useful if, for example, you must look up mobile device step IDs when you're setting up a detour process. They can also be useful if you must look up field names to use in your barcode data policy definitions. Those fields name must exactly match the field names that are used in the relevant XML messages.

> **Important**
>
> To view the correct XML so that you can find information such as field names and step IDs, you must perform work by using the actual Warehouse Management mobile app, not an alternative tool such as the browser-based emulator.

The following example shows XML content that was copied from a *Mixed license plate receiving* process. Here, the Warehouse Management mobile app is currently processing a step where `Step Id="LoadId"`. This step includes a control where `DisplayArea="PrimaryInputArea"` (the display area where controls that are awaiting input or confirmation are typically found) and `name="LoadId"` (the field name that's associated with the control).

XML

```xml
<?xml version="1.0" encoding="utf-8"?>
<ParentNode>
    <Controls PagePattern="Default" PageTitle="Mixed LP receiving"
MenuItemName="Mixed LP receiving">
        <Control controlType="label" name="MixedLPReceiving" label="Mixed LP

This article provides information about the process guide framework for developers who are extending the warehouse mobile processes in X++. The warehouse mobile processes are extensible because the processes are broken into small steps. The business logic and user interface building of each step is extracted into individual classes, which allows for extensibility.

Overview of the existing design

The warehouse mobile execution flows are exposed through a single custom service endpoint. The request arrives from the mobile app in the form of an XML string, which contains the metadata of the user interface presented in the mobile app, and the values that the user enters.

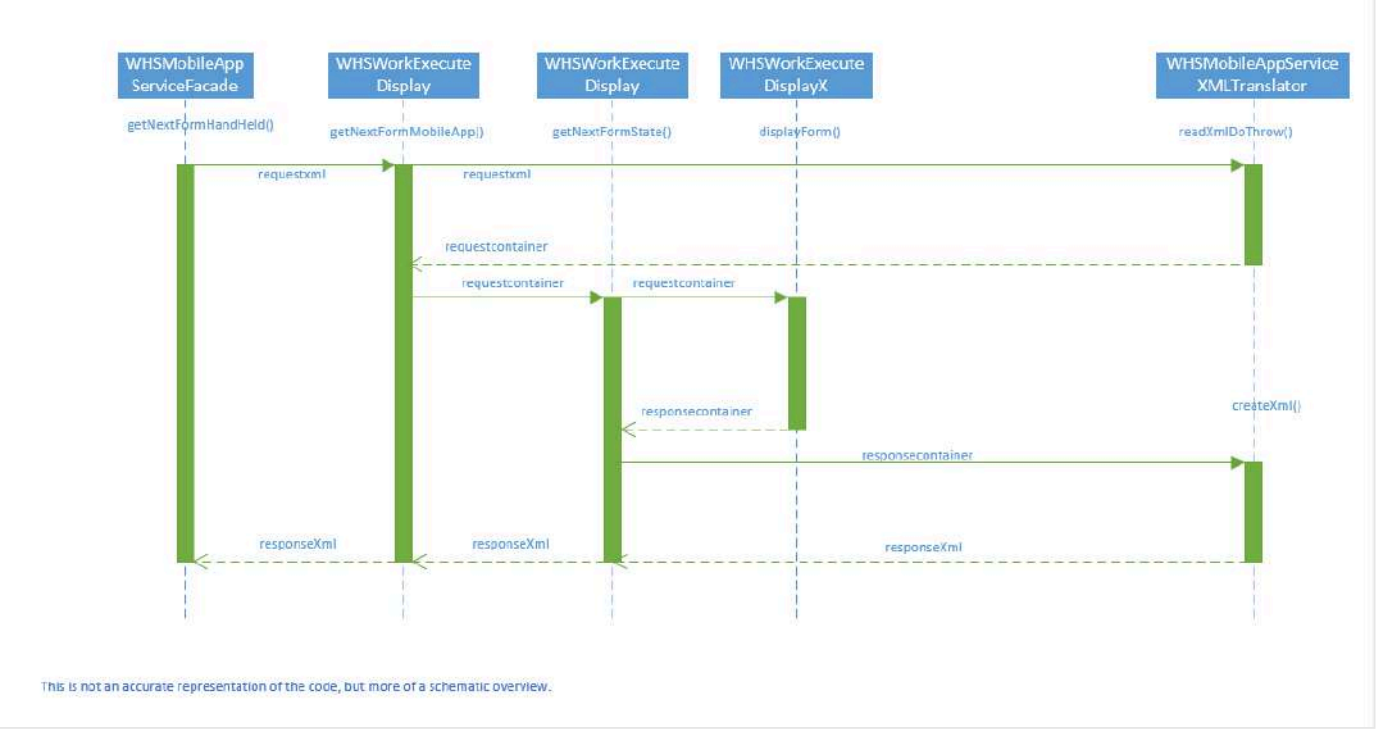
When the request is received, the first step is to deserialize the XML. The `WHSMobileAppServiceXMLTranslator` class converts the XML into a container, which holds both the control information and session information.

Next, information in the container is used to determine which warehouse process the user is working on or about to start. This process is represented by the `WHSWorkExecuteMode` enumeration. Based on this information, a derived class of `WHSWorkExecuteDisplay` is instantiated. The `displayform()` method is invoked, which performs the following actions:

- Processes the data from the user (delegated to the `WHSRFControlData` class, but some processes implement specific logic by overriding the `processControl()` method).
- Executes business logic.
- Increments the step.
- Builds the container representing the new user interface (typically in a `build…()` method).

The container is then returned to the translator, which then serializes the XML and sends it back as a response to the mobile device.

The following sequence diagram shows an overview of the execution flow. The diagram is more of a schematic overview and isn't a 1:1 representation of the actual code.



Reason for the redesign

The design offers a simple framework for building processes used in mobile flows. However, the `displayform()` methods take on multiple responsibilities. They delegate these responsibilities to other methods and classes, but without concrete class responsibilities, this delegation is inconsistent across classes. As the number of supported scenarios grows organically, some of these classes become complex. In addition, some of those classes/methods are overridden and reused in multiple modes. The result is long methods with high cyclomatic complexity. These methods have posed maintenance issues in the past. Fixing bugs in these methods is risky and regression prone. For example, the `processWorkLine()` method in the `WhsWorkExecuteDisplay` class is referred to from multiple processes (basically, anywhere where work execution is performed).

To make these methods extensible, you could split the `displayForm` methods into smaller methods and introduce extensibility points. However, because of the scenario matrix, it would be challenging for partners to write extensions and validate against regressions. Not only that, but because of the lack of structured responsibility distribution noted previously, the code would keep growing in unpredictable ways over time, posing challenges in building quality extensions.

As a result, the redesign is the sustainable option, with a goal to have clearly defined classes with independent responsibilities. A class should have one responsibility, one reason to change, and

one reason to be extended.

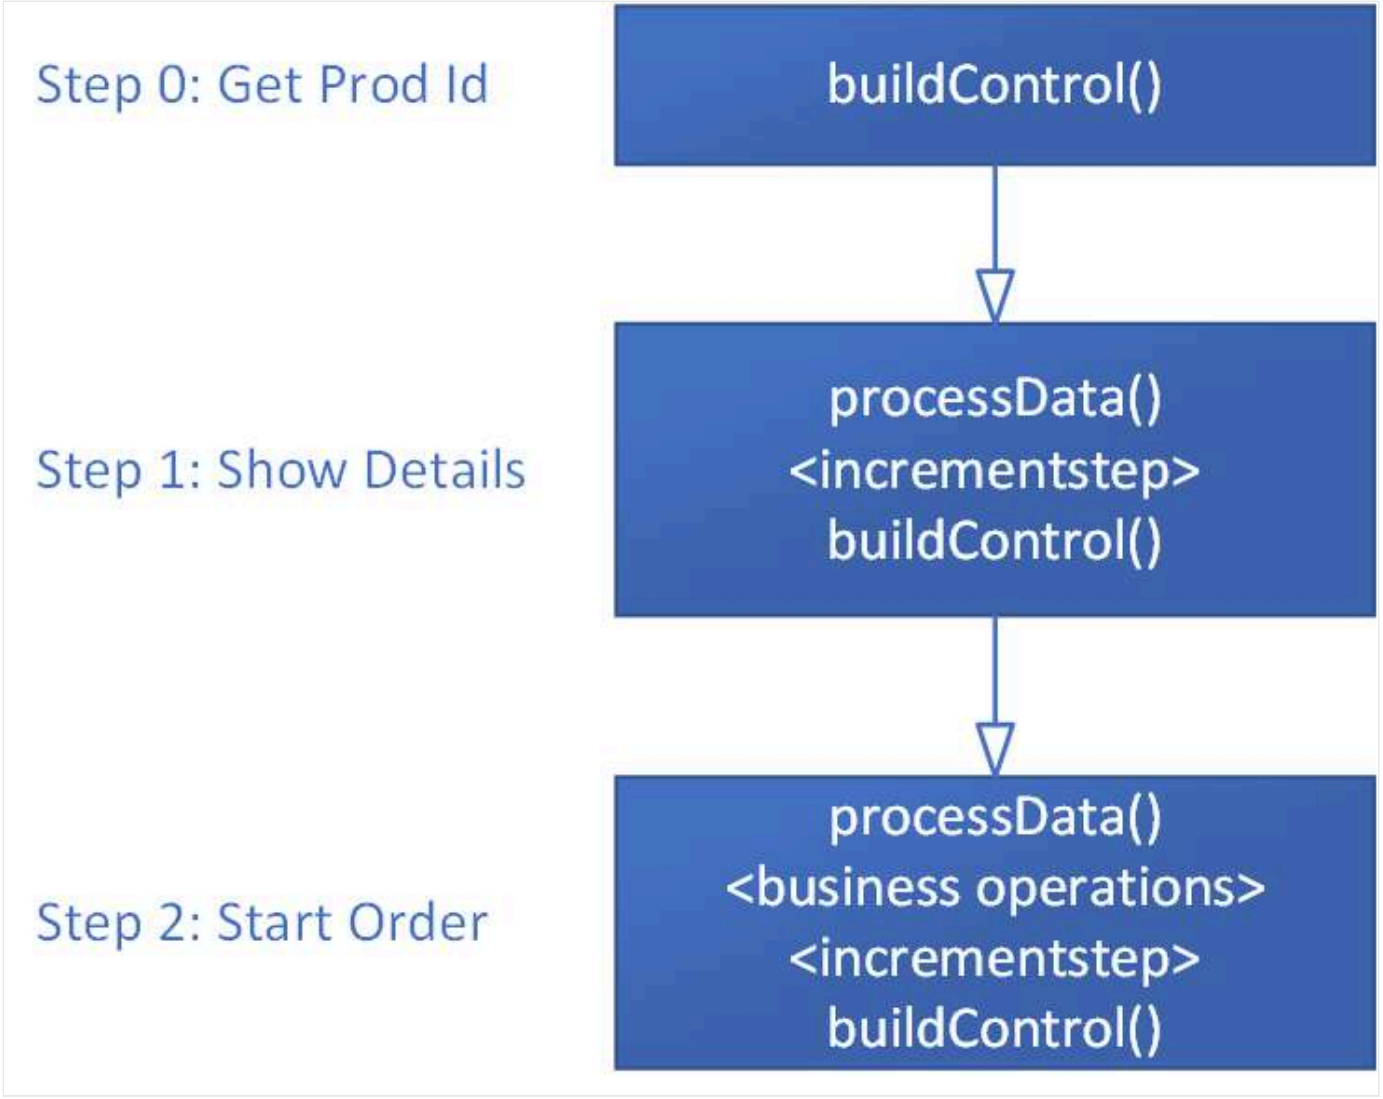
Design overview

The redesigned framework uses two core principles: divide the execution flow into individual components with well-defined responsibilities, and include well-defined extension points in each component.

The new framework is named `ProcessGuide`. The aim of these classes is to guide a user through a business process, as opposed to the rich client, which is a form-based experience where the user has more flexibility in how they interact with the data or in which order they perform tasks.

> **Note**
>
> One notable detail is the deliberate omission of the `WHS` prefix. While the mobile processes were initially introduced for warehousing, they now support various production and inventory management processes. As a result, the warehouse reference was excluded in the name of the framework.

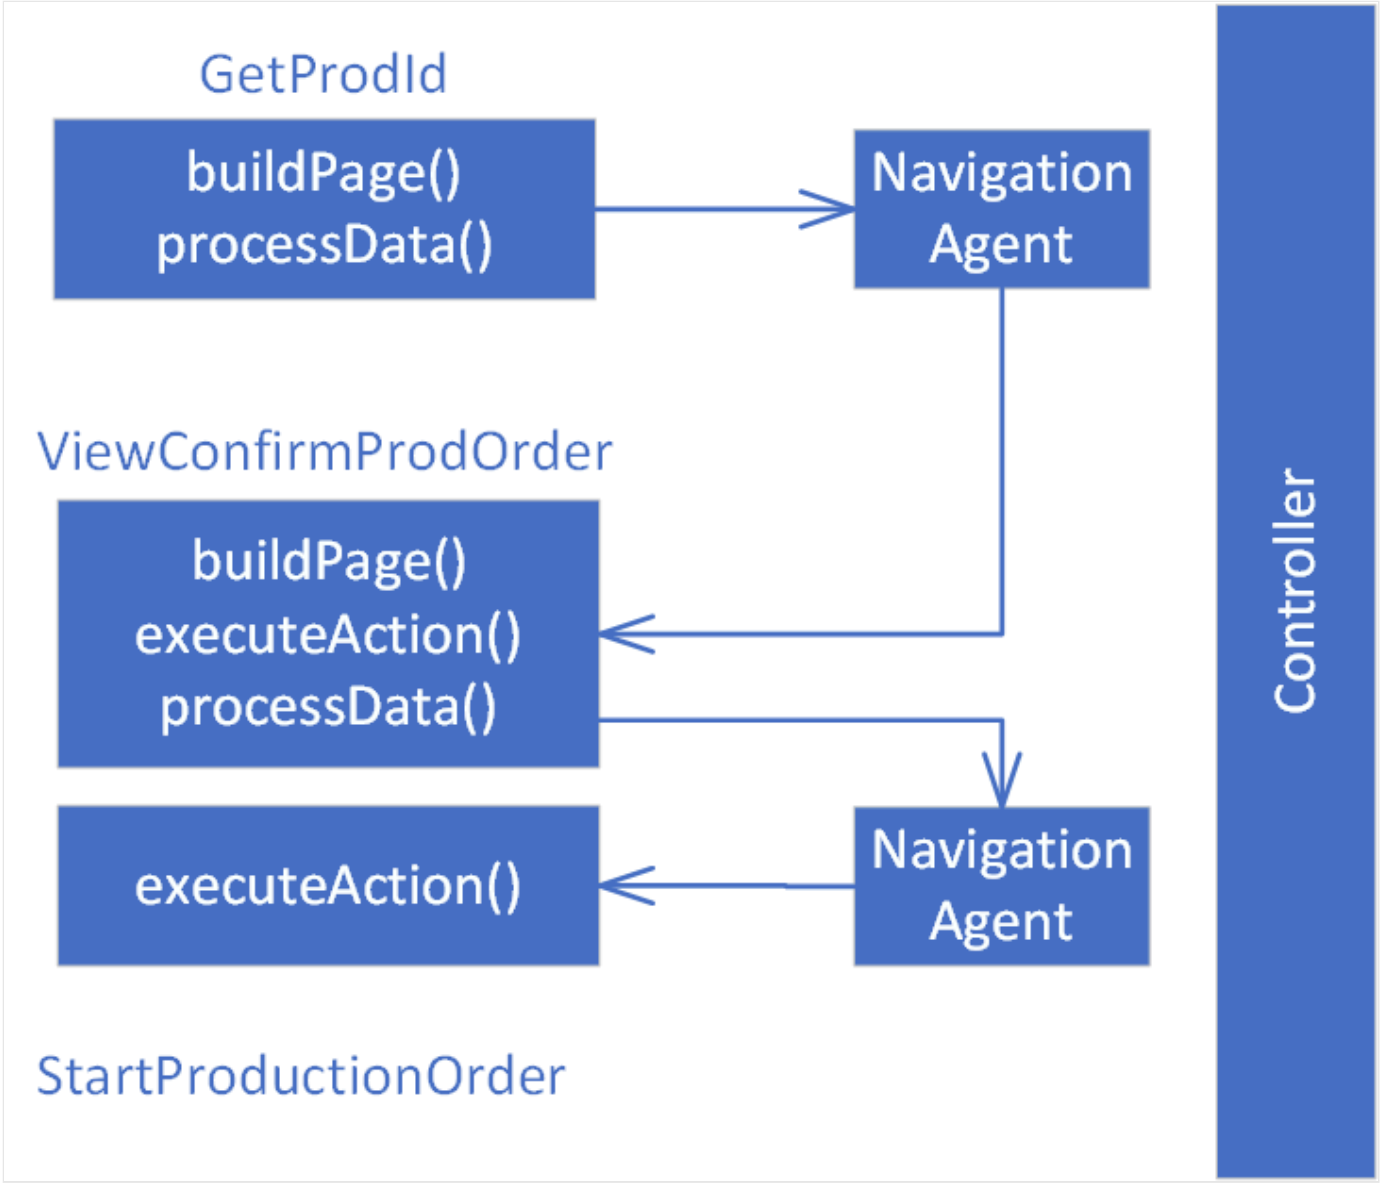
To identify the components, look at the Production Start process (`WhsWorkExecuteDisplayProdStart` class). Here's a schematic of the process.



Looking at the control flow, you need the following components:

- A controller to manage the entire business process.
- A step responsible for execution of a step in the process.
- A data processor for processing the data in a step.
- A page builder responsible for building the user interface for a step.
- A navigation agent responsible for step transition.
- A class responsible for executing the business process.

In the process flow diagram, if you begin at step 1 and start processing the data from the previous step, and then end with building a UI, data continues to be processed in the next step. This approach introduces a tight coupling between consecutive steps. As a result, the new high-level schematic looks like the following:



The key components in the redesigned process are as follows:

- `ProcessGuideController` - This class orchestrates the overall execution of the business process. It defines the factories that instantiate the step and the navigation agent, which later constitutes the process execution, and the clean-up logic for cancellation or exiting the process.
- `ProcessGuideStep` - This class represents one single step in the business process. It contains a definition of the factories that instantiate a page builder, actions, and data processors. It's responsible for invoking them in the correct sequence.
- `ProcessGuideNavigationAgent` - This class is responsible for navigation between the steps. When a step is completed, the navigation agent defines the next step and passes any parameters that the previous step might need to communicate to the next one.
- `ProcessGuidePageBuilder` - This class is responsible for instantiating the user interface.
- `ProcessGuideAction` - This class represents an action, shown as a button to the user.

- `ProcessGuideDataProcessor` - This class is responsible for processing the user entered data in a field.

Execution flow

The starting point of the execution flow remains unchanged. So, the request still arrives through the same endpoints, followed by deserializing the XML into the container. This container is then passed to `getNextFormState()`.

There are three important classes to note:

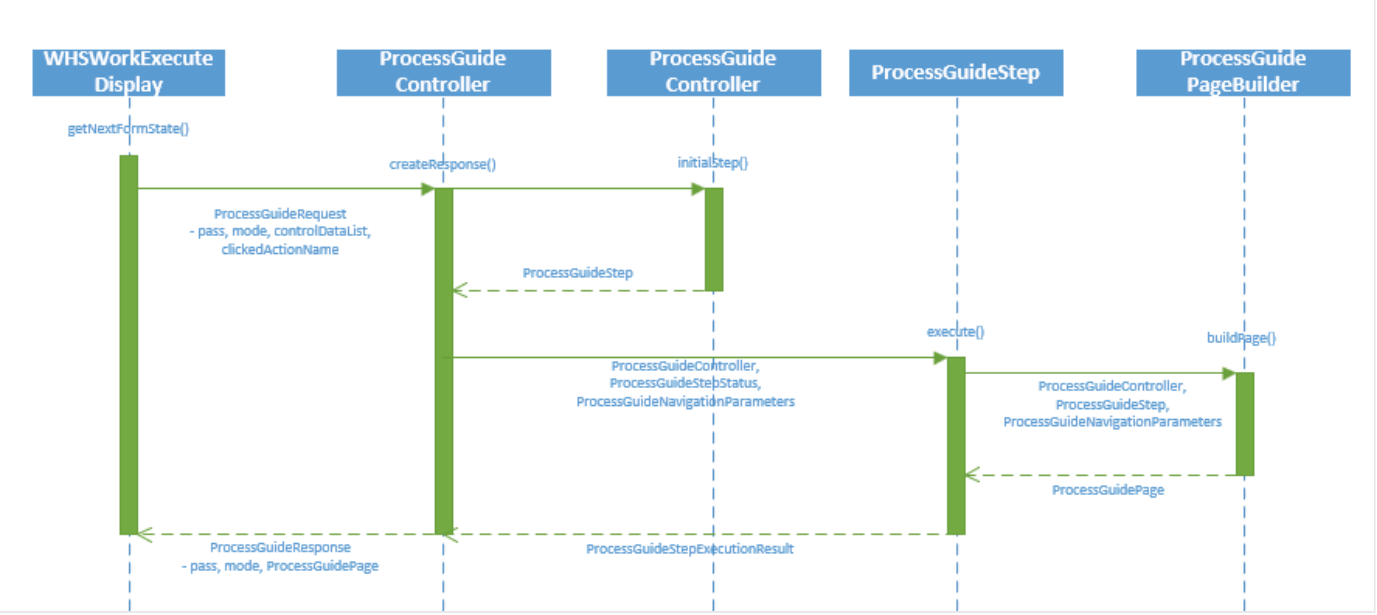
- `ProcessGuideSessionState` – This contains the session state information (such as the mode, pass, controller, and the step being executed).
- `ProcessGuidePage` – This contains a strongly typed representation of the user interface metadata.
- `ProcessGuideRequest` – This contains the above two as members and is a strongly typed representation of the request received from the mobile device.

These classes are created using the container information (both state and user entered control data). This provides a type-safe way to access and manipulate the values. Compared to repeated access of the container during the process, this provides benefit both in terms of readability and performance.

The session state information is used to instantiate the correct `ProcessGuideController` class. Once instantiated, the `createResponse()` method in the `ProcessGuideController` class is invoked. This method is the entry point to the process guide logic, and after execution, comes back with the response (represented in the `ProcessGuideResponse` class). The response is then converted back to the container and handed back to the legacy logic, which then serializes it to the XML and sends the response back to the mobile device.

Next, the controller needs to find the next step to execute. If this is the start of a new process, the controller will call `initialStep()` to get the first step in the process. After that, it would call `execute()` method in the `ProcessGuideStep`. This method would then instantiate a `ProcessGuidePageBuilder` class and call `buildPage()`, which would return with a `ProcessGuidePage` object, which is a virtual representation of the user interface to be presented to the user. The step would then send the result back to the controller, which would then save the current session state and then return the result back to `getNextFormState()` in the form of the `ProcessGuideResponse` class. Thereafter, the response is converted back to the container, and later serializes to XML and sends back the response to the mobile device.

The following sequence diagram explains this control flow. This is the most common control flow, simplified for explaining the design.



When the user takes an action on the mobile device by selecting a button (or scanning a value – which typically triggers the default action) – the request arrives at the `createResponse()` method in the `ProcessGuideController` class through the same route. This time, however, the controller knows from the session state information which step the user is in. Accordingly, it instantiates the appropriate `ProcessGuideStep` class and invokes the execute method. The `ProcessGuideStep`, in turn, reads the action name invoked by the user and then instantiates the appropriate `ProcessGuideAction` class and calls `execute()`.

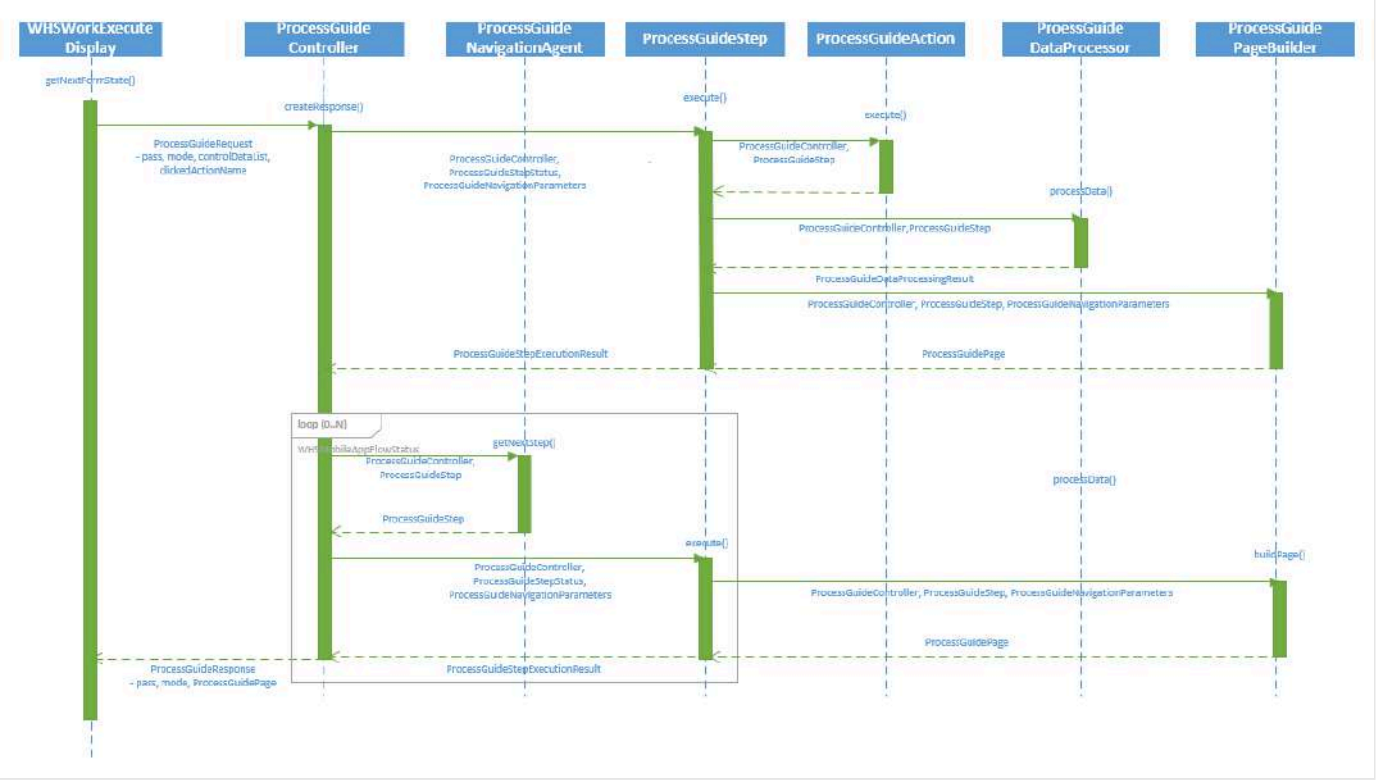
The `ProcessGuideAction` class is responsible for executing the specific action, however there are two notable exceptions.

The first one is the `ProcessGuideOKAction` class. This action implies that the user wants to confirm and move forward in the process. In accordance to that – this method actually does a callback to the ProcessGuideStep class, which means that the step invokes `processData()` in `ProcessGuideDataProcessor`. This processes the data that the user has entered, and then updates the state of the step and sends the result back to the controller. Depending on the outcome of the processor, the step invokes the page builder to build the appropriate user interface or sets the status of the step as completed. This is reflected in the top half of the following sequence diagram.

The other exception is the cancellation action, implemented in the `ProcessGuideCancelResetProcessAction` and `ProcessGuideCancelExitProcessAction` classes. These actions represent an intent to cancel the process and go back to either the start of the process or exit the process altogether. Similar to the **OK** action, these actions also perform a callback to the

step, which signals the intent to the `ProcessGuideController`. The controller then performs the necessary cleanup of state variables and either moves control to the initial step in the process or terminates the process altogether.

After the step is completed, if the status of the step is set to *Completed*, then the controller instantiates the `ProcessGuideNavigationAgent`, which returns the name of the next step. The controller then instantiates this step and invokes the `execute()` method – and the cycle continues. Most commonly, the new step invokes the corresponding `ProcessGuidePageBuilder` to build the user interface for the next screen to be presented to the user, which is then sent back. This flow is depicted in the lower half of the following sequence diagram.

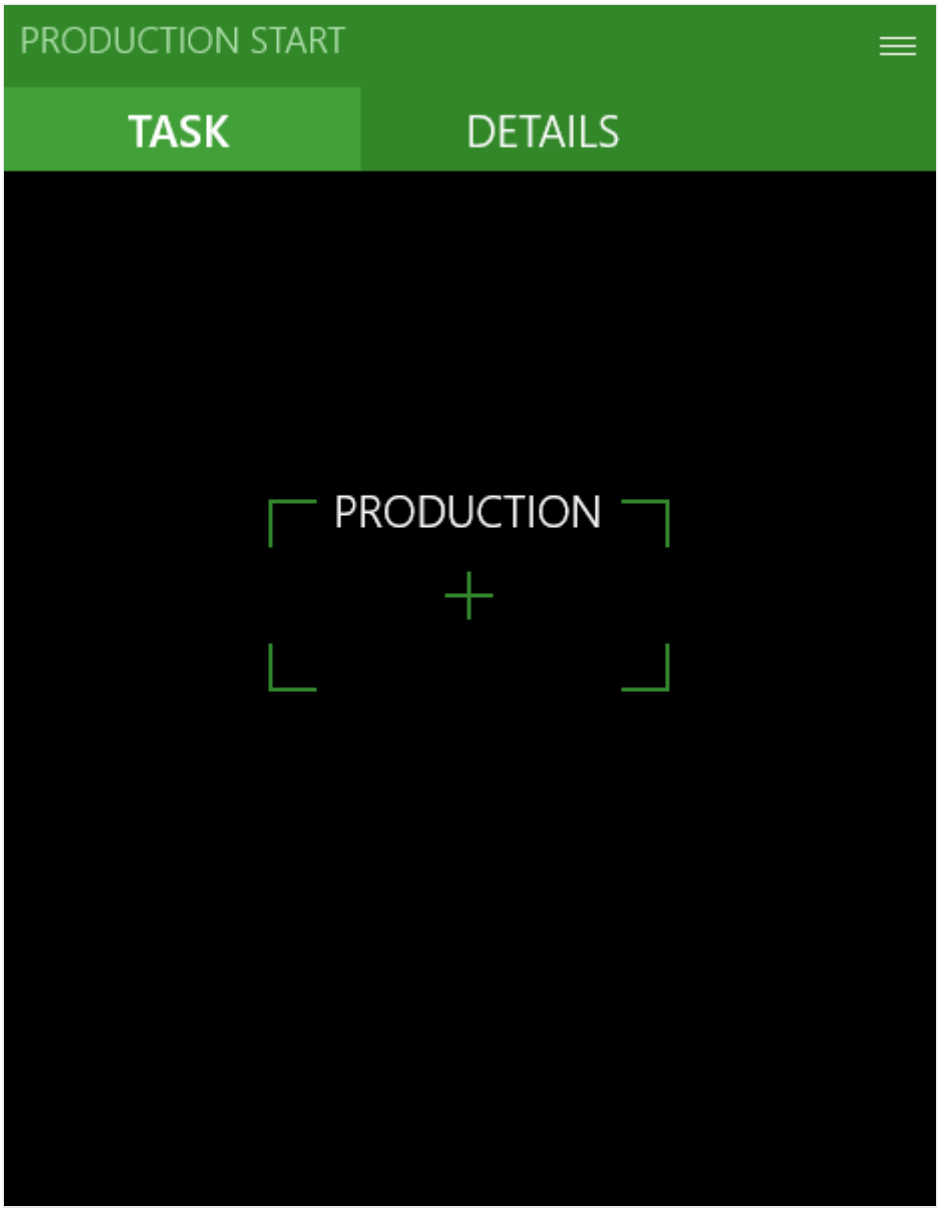


Building a new process using the ProcessGuide framework

The best way to explain the control flow is by using an example that exists in the application – the Production Start process.

Overview of the production start process

Let's start by understanding the process flow. In the first step, the user is prompted for production order ID.



When the user enters the production order ID, the order number is validated. Some of the validations that run are based on whether the order is in the same warehouse as the user is signed in to, and the status of the order. If the validation fails, the user sees an error message. If the validation succeeds, the user sees details of the production order and item.

The user can either cancel to go back to the start of the process or select **OK** to confirm. In the latter case, the production order is set to *Started* status, the corresponding journals are posted, the control moves back to the first step, and the *Work Completed* message is shown to the user.

Creating the controller

The first step in building the business process is creating the controller class, extending from the `ProcessGuideController` abstract class which implements the default behaviors of a controller. The new class name is `ProdProcessGuideProductionStartController` and decorated with the `WHSWorkExecuteMode` value of `StartProdOrder`. The same `SysExtension` based instantiation already

used in the `WHSWorkExecuteDisplay` classes is used here, which helps instantiate the controller when the user executes a menu item for this mode.

X++

```
[WHSWorkExecuteMode(WHSWorkExecuteMode::StartProdOrder)]
public class ProdProcessGuideProductionStartController extends ProcessGuideController
```

> ⓘ Note
>
> The naming pattern of the class is `\<FunctionalArea\>ProcessGuide\<Businessprocessname\>Controller`. This is the pattern used for the controller classes and to extend to other classes

Building the first step

Next, define the first step by creating the `ProdProcessGuidePromptProductionIdStep` class, which extends `ProcessGuideStep`.

A step factory instantiates the class. The `ProcessGuideController` base class invokes the factory. The default implementation of the factory instantiates the step based on name. To instantiate `ProdProcessGuidePromptProductionIdStep` as the first step in the controller, complete the following two tasks:

- Decorate the `ProdProcessGuidePromptProductionIdStep` class with a `ProcessGuideStepName` attribute.

  X++

  ```
  [ProcessGuideStepName(classStr(ProdProcessGuidePromptProductionIdStep))] public
  class ProdProcessGuidePromptProductionIdStep extends ProcessGuideStep
  ```

- In the controller class, implement the abstract method `initialStepName()` to return the step name.

  X++

  ```
  protected final ProcessGuideStepName initialStepName()
  {
      return classStr(ProdProcessGuidePromptProductionIdStep);
  }
  ```

> **Note**
>
> The value in the `ProcessGuideStepName` attribute doesn't need to exactly match the class name as shown in the preceding code. However, implementing this attribute allows for uniformity and type-safety around cross-references when using the class. Use this naming convention.
>
> The `ProcessGuideStepName` based instantiation of the step is implemented in the `ProcessGuideStepDefaultFactory` class. In the rare case that you want a different strategy for instantiating the step, complete the following tasks:
>
> - Create a new factory class that inherits from `ProcessGuidStepAbstractFactory`.
> - Optionally, create a new parameter class that implements the `ProcessGuideIStepCreationParameters` interface, containing the parameters the factory needs.
> - In your controller class, override the `stepFactory()` and `stepCreationParameters()` methods to return the preceding factory and parameters.

Next, implement the functionality of the `ProdProcessGuidePromptProductionIdStep` class. Implement the logic for building the user interface, processing the user-entered data, and determining when the step is complete.

Building the user interface for the first step

Build the user interface by creating a class that inherits from the `ProcessGuidePageBuilder` abstract class. For this step, name the class to represent what it does – `ProdProcessGuidePromptProductionIdPageBuilder`.

The instantiation mechanism of the class is similar to how the step is instantiated from the controller.

- Decorate the `ProdProcessGuidePromptProductionIdPageBuilder` class with a `ProcessGuidePageBuilderName` attribute.

```
X++
```

```
[ProcessGuidePageBuilderName(classStr(ProdProcessGuidePromptProductionIdPageBuilder))] public class ProdProcessGuidePromptProductionIdPageBuilder extends ProcessGuidePageBuilder
```

- In the `ProdProcessGuidePromptProductionIdStep` class, implement the abstract method `pageBuilderName()` to return this name.

```
X++
protected final ProcessGuidePageBuilderName pageBuilderName()
{
    return classStr(ProdProcessGuidePromptProductionIdPageBuilder);
}
```

> **Tip**
>
> Similar to the step factory, there's also an abstract factory pattern implemented for the page builder factory. So, in the rare case that you want a different strategy for instantiating the page builder, you can do the following:
>
> - Create a new factory class that inherits from `ProcessGuidePageBuilderAbstractFactory`.
> - Optionally, create a new parameter class that implements the `ProcessGuideIPageBuilderCreationParameters` interface, containing the parameters the factory needs.
> - In your step class, override the `pageBuilderFactory()` and `pageBuilderCreationParameters()` methods to return the factory and parameters.

To implement the user interface, you need a page with one text box to enter the production order ID, plus an **OK** button and a **Cancel** button. The **Cancel** button should exit the process.

To implement this UI, override two methods in the `ProdProcessGuidePromptProductionIdPageBuilder` class:

- Use the `addDataControls()` method to add the text box.

```
X++
protected final void addDataControls(ProcessGuidePage _page)
{
    _page.addTextBox(ProcessGuideDataTypeNames::ProdId, "@SYS4398",
extendedTypeNum(ProdId));
}
```

- Use the `addActionControls()` method to add the **OK** and **Cancel** buttons.

```
X++
```

```
protected final void addActionControls(ProcessGuidePage _page)
{
    #ProcessGuideActionNames
    _page.addButton(step.createAction(#ActionOK), true);
    _page.addButton(step.createAction(#ActionCancelExitProcess));
}
```

This approach adds the data controls, followed by the buttons. However, if you want to build a screen with interspersed data controls and buttons, you can override the `addControls()` method instead for flexibility.

Another scenario to consider is how to rebuild the page if validation failures occur, such as when the user enters an incorrect production order ID. The `ProcessGuidePageBuilder` base class implements the default behavior, which rebuilds the user interface, clears out the scanned value, and adds the error control with the error message. Because this is the default behavior that you want to use, you don't need to add any code for handling errors.

> **Tip**
>
> If you want to implement custom UI behavior for error situations, you can override one or more of the methods `rebuildFromRequestPage()`, `isErrorState()`, and `reuseRequestPageOnError()`.

Processing the user-entered data in the first step

The processing of the data is done in the `ProcessGuideDataProcessorDefault` class, which in turn invokes the legacy `WhsRfControlData` class. No changes are needed to this default behavior, and `WhsRfControlData` already has logic for validating the `ProdId` field, so you don't need to write any logic for handling this. If extensions are required for the validation logic, consider using the `WhsControl` based extension mechanism.

Determine if the first step is complete

When validation is successful, mark the step as completed. The base class handles this action, but you need to implement the condition that determines step completion. The following overridden method implements this condition.

X++

```
protected final boolean isComplete()
{
```

```
    WhsrfPassthrough pass = controller.parmSessionState().parmPass();
    ProdId prodId = pass.lookup(ProcessGuideDataTypeNames::ProdId);
        return (prodId != '');
}
```

View order details and confirm

In the second step in the process, the user sees a screen with details about the order. The user can either select the **OK** button to confirm the start of the production order, or select **Cancel** to go back to the start of the process. For this example, name the step `ProdProcessGuideConfirmProductionOrderStep` and the page builder class `ProdProcessGuideConfirmProductionOrderPageBuilder`.

The `ProdProcessGuideConfirmProductionOrderStep` class looks like the following.

X++

```
[ProcessGuideStepName(classStr(ProdProcessGuideConfirmProductionOrderStep))]
public class ProdProcessGuideConfirmProductionOrderStep extends ProcessGuideStep
{
    protected final ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuideConfirmProductionOrderPageBuilder);
     }
}
```

Because the user doesn't enter any values here, you don't need to override the `isComplete()` method. The step is complete when the user selects **OK**.

The page builder class overrides the `addDataControls()` method to add three labels. The first label shows the production order ID. The second label contains item information, such as item ID, dimensions, or description. The third label contains the quantity and unit of measure.

The `addActionControls()` method is overridden to add two buttons – the **OK** button, and the **Cancel** button to cancel the process and go back to the start of the process.

X++

```
/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderPageBuilder</c> builds a page that
allows the user to see details of a production order
/// and then confirm.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuideConfirmProductionOrderPageBuilde
r))]
public class ProdProcessGuideConfirmProductionOrderPageBuilder extends
```

```
ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        ProdTable prodTable =
ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        UnitOfMeasureSymbol inventUOM = InventTableModule::find(prodTable.ItemId,
ModuleInventPurchSales::Invent).UnitId;

        _page.addLabel(ProcessGuideDataTypeNames::ProdIdLabelName, strFmt("@WAX1684",
prodTable.ProdId), extendedTypeNum(ProdId));
        _page.addLabel(ProcessGuideDataTypeNames::ItemInfo,
this.generateItemInfoForProdId(pass.lookup(ProcessGuideDataTypeNames::ProdId)),
extendedTypeNum(WHSRFUndefinedDataType));
        _page.addLabel(ProcessGuideDataTypeNames::QtyLabelName, strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartUp::proposalStartUpQty(prodTable.Pro
dId)), inventUOM), extendedTypeNum(WHSRFQuantityAndUOM));

        if (PdsGlobal::pdsIsCWItem(prodTable.ItemId))
        {
            _page.addLabel(ProcessGuideDataTypeNames::InventQtyLabelName,
strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartUp::pdsCWProposalStartupQty(prodTabl
e.ProdId)), PdsCatchWeightItem::pdsCWUnitId(prodTable.ItemId)),
extendedTypeNum(WHSRFQuantityAndUOM));
        }
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelResetProcess));
    }
```

> **Note**
>
> You can find the same source code for the X++ methods in this article by using the Application Explorer. Filter on the class name, and then right-click the class name and select **View code**.

Start the production order

The third step executes the business logic for starting the production order. This step is different from the previous steps because it doesn't have a user interface. This step runs silently when the user selects **OK** in the previous step.

The `ProcessGuideStepWithoutPrompt` abstract class implements the default behavior for such steps. Therefore, the current step should extend the `ProcessGuideStepWithoutPrompt` class and override the `doExecute()` method.

The following code example shows the class and the `doExecute()` method implementation. The method retrieves the order ID and user ID from the session state and invokes the method to start this production order.

X++

```
/// <summary>
/// The <c>ProdProcessGuideStartProductionOrderStep</c> represents a step that starts
a production order.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuideStartProductionOrderStep))]
public class ProdProcessGuideStartProductionOrderStep extends
ProcessGuideStepWithoutPrompt
{
    protected final void doExecute()
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        WHSUserId userId = pass.lookup(ProcessGuideDataTypeNames::UserId);
        ProdTable prodTable =
ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        WhsWorkExecute workExecute = WhsWorkExecute::construct();
        workExecute.prodStartUp(prodTable.ProdId,
ProdUpdStartUp::proposalStartUpQty(prodTable.ProdId), userId);

        this.addProcessCompletionMessage();

        super();
    }

}
```

If an exception occurs, the framework exception handling logic rolls back the process to the previous step.

> **Note**
>
> The invocation of `addProcessCompletionMessage()` adds the *Work completed* message to the navigation parameters. The next step (assuming it has a user interface) displays this message. The base classes handle this logic, and no specific code needs to be added to the process classes to achieve this behavior.

Building the navigation through the steps

The `ProcessGuideController` base class instantiates the `ProcessGuideNavigationAgentDefault` class, which relies on a predefined navigation route. This route is a simple map of source and destination steps. For the production start scenario, because there's no conditional branching, this implementation works. Therefore, you only need to override the `initializeNavigationRoute()` method to define the navigation route.

X++

```
    protected ProcessGuideNavigationRoute initializeNavigationRoute()
    {
        ProcessGuideNavigationRoute navigationRoute = new
ProcessGuideNavigationRoute();

navigationRoute.addFollowingStep(classStr(ProdProcessGuidePromptProductionIdStep),
classStr(ProdProcessGuideConfirmProductionOrderStep));

navigationRoute.addFollowingStep(classStr(ProdProcessGuideConfirmProductionOrderStep),
classStr(ProdProcessGuideStartProductionOrderStep));

navigationRoute.addFollowingStep(classStr(ProdProcessGuideStartProductionOrderStep),
classStr(ProdProcessGuidePromptProductionIdStep));

        return navigationRoute;
    }
```

Some processes require conditional branching (based on user actions, or any other conditions). Such processes need to do the following tasks:

- Implement specific navigation agents inherited from the `ProcessGuideNavigationAgent` class.
- Implement the specific navigation agent factory inherited from the `ProcessGuideNavigationAgentAbstractFactory` class, containing logic to instantiate the correct navigation agent based on current step, session state, user action, or other logic.
- Optionally, override `navigationAgentCreationParameters()` in the controller class to pass suitable parameters.
- Override `navigationAgentFactory()` in the controller to instantiate the navigation agent factory created previously.

Action classes

Action classes represent user actions, so this example uses the **OK** action to show how the actions are created.

X++

```
[ProcessGuideActionName(#ActionOK)]
public class ProcessGuideOKAction extends ProcessGuideAction
{
    public final str label()
    {
        return "@SYS5473";
     }
     protected final void doExecute()
     {
        step.executeOKAction();
      }
}
```

The class must implement two abstract methods:

- `label()`, which returns the label to be displayed in a button control tied to this action.
- `doExecute()`, which performs the action. As mentioned earlier, the **OK** button simply performs a callback to the step. However, other actions might have more complex logic.

The actions are instantiated using `SysExtension` framework based on the `ProcessGuideActionName` attribute. Similar to the instantiation of page builders, the step class implements the default action factory, and it's possible to override that. The page builder adds a button control like this.

X++

```
_page.addButton(step.createAction(#ActionOK), true);
```

When you add the button, it asks the step to create an action class for the passed name and ties that action to the button.

Summary

To summarize everything explained in this article, here's a comprehensive summary of the code needed for the process:

1. `ProdProcessGuideProductionStartController`

    a. Override `initialStepName()` to provide the name of the first step.

    b. Override `initializeNavigationRoute()` to construct the navigation map.

    X++

    ```
    /// <summary>
    /// The <c>ProdProcessGuideProductionStartController</c> class is the
    ```

```
controller class for the production order start process guide.
/// </summary>
[WHSWorkExecuteMode(WHSWorkExecuteMode::StartProdOrder)]
public class ProdProcessGuideProductionStartController extends
ProcessGuideController
{
    protected ProcessGuideStepName initialStepName()
    {
        return classStr(ProdProcessGuidePromptProductionIdStep);
    }

    protected ProcessGuideNavigationRoute initializeNavigationRoute()
    {
        ProcessGuideNavigationRoute navigationRoute = new
ProcessGuideNavigationRoute();

navigationRoute.addFollowingStep(classStr(ProdProcessGuidePromptProductionIdSt
ep), classStr(ProdProcessGuideConfirmProductionOrderStep));

navigationRoute.addFollowingStep(classStr(ProdProcessGuideConfirmProductionOrd
erStep), classStr(ProdProcessGuideStartProductionOrderStep));

navigationRoute.addFollowingStep(classStr(ProdProcessGuideStartProductionOrder
Step), classStr(ProdProcessGuidePromptProductionIdStep));

        return navigationRoute;
    }

}
```

2. `ProdProcessGuidePromptProductionIdStep`

   a. Override `isComplete()` to specify when the step is considered complete.

   b. Override `pageBuilderName()` to specify the page builder to use.

X++

```
/// <summary>
/// The <c>ProdProcessGuidePromptProductionIdStep</c> represents a step that
/// that prompts the user for a production order id.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuidePromptProductionIdStep))]
public class ProdProcessGuidePromptProductionIdStep extends ProcessGuideStep
{
    protected boolean isComplete()
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        ProdId prodId = pass.lookup(ProcessGuideDataTypeNames::ProdId);

        return (prodId != '');
    }
```

```
    protected ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuidePromptProductionIdPageBuilder);
    }

}
```

3. `ProdProcessGuidePromptProductionIdPageBuilder`

    a. Override `addDataControls()` to add the `Prod ID` textbox.

    b. Override `addActionControls()` to add the **OK** and **Cancel** buttons.

X++

```
/// <summary>
/// The <c>ProdProcessGuidePromptProductionIdPageBuilder</c> class builds a
page
/// that prompts the user for a production order id.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuidePromptProductionIdPageBu
ilder))]
public class ProdProcessGuidePromptProductionIdPageBuilder extends
ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        _page.addTextBox(ProcessGuideDataTypeNames::ProdId, "@SYS4398",
extendedTypeNum(ProdId));
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelExitProcess));
    }

}
```

4. `ProdProcessGuideConfirmProductionOrderStep`

    a. Override `pageBuilderName()` to specify the page builder to use.

X++

```
/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderStep</c> class represents the
step for viewing production order
/// details and confirming the same.
/// </summary>
```

```
[ProcessGuideStepName(classStr(ProdProcessGuideConfirmProductionOrderStep))]
public class ProdProcessGuideConfirmProductionOrderStep extends
ProcessGuideStep
{
    protected ProcessGuidePageBuilderName pageBuilderName()
    {
        return classStr(ProdProcessGuideConfirmProductionOrderPageBuilder);
    }

}
```

5. `ProdProcessGuideConfirmProductionOrderPageBuilder`

   a. Override `addDataControls()` to add the order, item, and quantity information labels.

   b. Override `addActionControls()` to add the **OK** and **Cancel** buttons.

X++

```
/// <summary>
/// The <c>ProdProcessGuideConfirmProductionOrderPageBuilder</c> builds a page
that allows the user to see details of a production order
/// and then confirm.
/// </summary>
[ProcessGuidePageBuilderName(classStr(ProdProcessGuideConfirmProductionOrderPa
geBuilder))]
public class ProdProcessGuideConfirmProductionOrderPageBuilder extends
ProcessGuidePageBuilder
{
    protected void addDataControls(ProcessGuidePage _page)
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        ProdTable prodTable =
ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        UnitOfMeasureSymbol inventUOM =
InventTableModule::find(prodTable.ItemId,
ModuleInventPurchSales::Invent).UnitId;

        _page.addLabel(ProcessGuideDataTypeNames::ProdIdLabelName,
strFmt("@WAX1684", prodTable.ProdId), extendedTypeNum(ProdId));
        _page.addLabel(ProcessGuideDataTypeNames::ItemInfo,
this.generateItemInfoForProdId(pass.lookup(ProcessGuideDataTypeNames::ProdId))
, extendedTypeNum(WHSRFUndefinedDataType));
        _page.addLabel(ProcessGuideDataTypeNames::QtyLabelName,
strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartUp::proposalStartUpQty(prodT
able.ProdId)), inventUOM), extendedTypeNum(WHSRFQuantityAndUOM));

        if (PdsGlobal::pdsIsCWItem(prodTable.ItemId))
        {
            _page.addLabel(ProcessGuideDataTypeNames::InventQtyLabelName,
strFmt("@WAX1685",
WHSWorkExecuteDisplay::num2StrDisplay(ProdUpdStartUp::pdsCWProposalStartupQty(
```

```
prodTable.ProdId)), PdsCatchWeightItem::pdsCWUnitId(prodTable.ItemId)),
extendedTypeNum(WHSRFQuantityAndUOM));
        }
    }

    protected void addActionControls(ProcessGuidePage _page)
    {
        #ProcessGuideActionNames
        _page.addButton(step.createAction(#ActionOK), true);
        _page.addButton(step.createAction(#ActionCancelResetProcess));
    }
```

> ⓘ **Note**
>
> The `generateItemInfoForProdId()` method, which is used for generating the item information labels, is excluded from this article. This method queries a few tables to get item ID, description, and dimensions. If you want a better understanding of `generateItemInfoForProdId()`, look at the source code.

6. `ProdProcessGuideStartProductionOrderStep`

   a. Override `doExecute()` to perform the production start process and add the process completion message.

X++

```
/// <summary>
/// The <c>ProdProcessGuideStartProductionOrderStep</c> represents a step that
starts a production order.
/// </summary>
[ProcessGuideStepName(classStr(ProdProcessGuideStartProductionOrderStep))]
public class ProdProcessGuideStartProductionOrderStep extends
ProcessGuideStepWithoutPrompt
{
    protected final void doExecute()
    {
        WhsrfPassthrough pass = controller.parmSessionState().parmPass();
        WHSUserId userId = pass.lookup(ProcessGuideDataTypeNames::UserId);
        ProdTable prodTable =
ProdTable::find(pass.lookup(ProcessGuideDataTypeNames::ProdId));
        WhsWorkExecute workExecute = WhsWorkExecute::construct();
        workExecute.prodStartUp(prodTable.ProdId,
ProdUpdStartUp::proposalStartUpQty(prodTable.ProdId), userId);

        this.addProcessCompletionMessage();

        super();
    }
```

```
}
```

> ⓘ **Note**
>
> Many of the common patterns (regeneration of UI on error, setting process completion message, **OK** and **Cancel** behavior) are now part of the framework. This change saves the application developer from writing boilerplate code that is both error prone and has a risk of inconsistent behavior across processes. If the scenario needs to deviate from the common path, the application developer can override suitable methods. This deviation is intentional, explicit, and trackable.

Extending a business process

So far, this article highlights how to build a new process by using the `ProcessGuide` framework. In this final section, you find some examples of how you can extend this business process.

Add a step in a flow (using ProcessGuideNavigationAgentDefault)

Where to extend:

- Child of `ProcessGuideController` class for the process.

How to extend:

- Extend the `initializeNavigationRoute()` method in the controller class, and invoke `addFollowingStep()` in the `ProcessGuideNavigationRoute` class.

Add a step in a flow (using custom navigation agent)

Where to extend:

- Child of `ProdProcessGuideNavigationAgentFactory/ProdProcessGuideNavigationAgent`.

How to extend:

- Create a new child class of `ProcessGuideNavigationAgent` that returns the desired step name.
- Create a new class deriving from `ProcessGuideNavigationAgentFactory` that conditionally returns the navigation agent created previously.

- Extend the `navigationAgentFactory()` method in the controller class to return the factory created previously.

Add a new control in the UI of an existing step

Where to extend:

- Child of `ProdProcessGuidePageBuilder` for the step.

How to extend:

- Extend the `addDataControls()` method and add the extra control.

Complete overhaul of the user interface in an existing step

Where to extend:

- Child of `ProdProcessGuideStep`.

How to extend:

- Create a new child class of `ProdProcessGuidePageBuilder` class, and implement the desired user interface.
- Extend the `pageBuilderName()` method in the step class to return the `ProcessGuidePageBuilderNameAttribute` for the class created previously.

Alter logic when a step is considered complete

Where to extend:

- Child of `ProdProcessGuideStep`.

How to extend:

- Extend the `isComplete()` method to build the additional logic.

Assign step icons and titles for the Warehouse Management mobile app

10/03/2025

This article describes how to assign step icons and step titles for new or customized task flows for the Warehouse Management mobile app.

The following illustrations shows how step icons and titles appear in the Warehouse Management mobile app.

Standard step IDs, classes, and icons

Each step in a task flow is identified by a step ID, and each step ID has a corresponding step class. The step icon and title are specified in each step class.

Step IDs and step classes

The following table lists every step ID that is currently available, and its corresponding step class. The control name of the primary input field is used as the step ID.

For an example that shows how these step IDs and classes are used, see the implementation of the `WHSMobileAppStepInfoBuilder.stepId()` method in the Example: Assign step icons and titles for a custom flow section later in this article.

Available step icons

The system includes a collection of standard step icons that you can also use for your custom steps. You can't currently upload custom step icons. Therefore, you must always select one of the standard step icons.

The following table shows every standard step icon that is currently available, and its name.

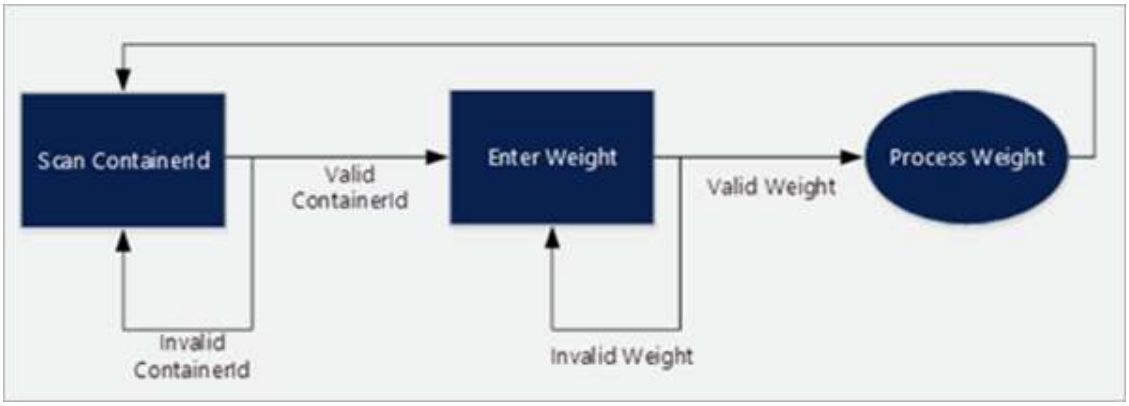
Example: Assign step icons and titles for a custom flow

This example explains how to set up step icons and titles for a custom task flow. The scenario is built on an example of a custom task flow that is presented and explored in more detail in the following blog post: Customizing the Warehousing Mobile App. The task flow works in the following way:

1. The app shows a page that prompts the worker to provide a container ID (for example, by scanning a bar code).
2. If the container ID is valid, the app opens a new page that prompts the worker for the weight. (If the container ID isn't valid, the worker is returned to the first page.)
3. When the worker enters a valid weight, the system stores the weight and returns the worker to the first page.

The following illustration shows this task flow.



Create a step class for the container input page

The container input page lets the worker scan or enter a container ID.

On the container input page, the control name of the input field is `ContainerId`. Because this control name isn't in the list of step IDs, you won't find an existing step that is based on it. Therefore, you must create a step class that represents the step. Here is an example.

X++

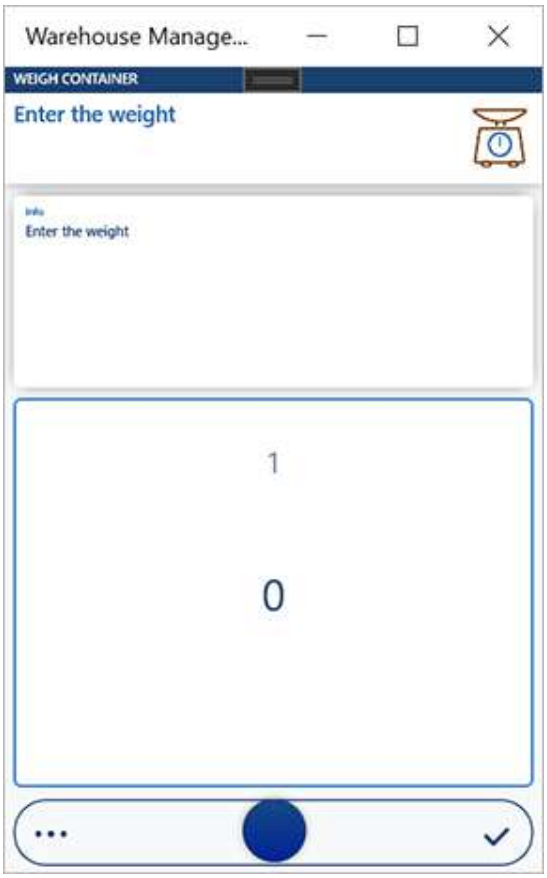
```
[WHSMobileAppStepId('ContainerId')]
final internal class WHSMobileAppStepContainerId extends WHSMobileAppStep
{
    private const WHSMobileAppStepIcon PopulationIcon = 'InventBatchID';
    private const WHSMobileAppStepTitle InputNotFilledTitle =
"@WAX:WHSMobileAppStepContainerID_InputNotFilled"; //Scan a container
    protected void initValues()
    {
        defaultStepIcon = PopulationIcon;
        defaultStepTitle = InputNotFilledTitle;
    }
}
```

The identifier of the step icon is stored in the `defaultStepIcon` class member, and the step title is stored in the `defaultStepTitle` class member.

To assign a step icon, set `defaultStepIcon` to one of the icon IDs that are listed in the Available step icons section earlier in this article.

Use a standard or custom step icon and title for the weight input

The weight input page lets the worker enter a weight.



On the weight input page, the control name of the input field is `Weight`, which is in the list of step IDs. Therefore, if the step icon and title that are defined in the `WHSMobileAppStepWeight` class are acceptable to you, you don't have to change anything for this step.

However, if you prefer to use a different icon or title for this step, you can override either the `stepId()` method or the `stepInfo()` method in the builder class. Each task flow has its own step info builder.

Override the stepId() method

The following example shows one way that you can modify a builder class by overriding the `stepId()` method.

X++

```
[WHSWorkExecuteMode(WHSWorkExecuteMode:: WeighContainer)]
public class WHSMobileAppStepInfoBuilderWeighContainer extends
WHSMobileAppStepInfoBuilder
{
    protected WHSMobileAppStepId stepId()
    {
        WHSMobileAppStepId stepIdLocal = super();
        if (stepIdLocal == 'Weight')
        {
            return 'NewWeight';
        }
        return stepIdLocal;
```

```
    }
}
```

You then create a step class for the `NewWeight` step. The code should resemble the code for the `ContainerId` example that was shown earlier in this article.

Override the stepInfo() method

The following example shows one way that you can modify a builder class by overriding the `stepInfo()` method.

```
X++

[WHSWorkExecuteMode(WHSWorkExecuteMode:: WeighContainer)]
public class WHSMobileAppStepInfoBuilderWeighContainer extends
WHSMobileAppStepInfoBuilder
{
    protected WHSMobileAppStepInfo stepInfo()
    {
        if (stepId != 'Weight')
        {
            return super();
        }
        WHSMobileAppStepInfo stepInfo = WHSMobileAppStepInfo::construct();
        stepInfo.parmStepIcon('NewIcon');
        stepInfo.parmStepTitle('NewTitle');
        return stepInfo;
    }
}
```

You then construct a `WHSMobileAppStepInfo` object, and set the icon and/or title directly.

This article explains how to configure a warehouse. It includes information about how to enable a warehouse layout and warehouse processes.

> **Note**
>
> This article applies to features in the Warehouse management module. It doesn't apply to warehouse features in the Inventory management module.

Warehouse layout

Warehouse management processes (WMS) in Supply Chain Management give you flexible ways to define your warehouse layout to meet changing needs, so that you can achieve optimal warehouse efficiency.

- You can establish high-priority and low-priority storage areas for optimum placement of goods.
- You can divide your warehouse into zones to accommodate various storage needs, such as temperature requirements, or various turnover rates for items.
- You can specify warehouse locations on any level (for example, site, warehouse, aisle, rack, shelf, and bin position).
- You can group locations by using physical capacity constraint settings.
- You can control how items are stored and picked, based on query-defined rules.

To use WMS in Supply Chain Management, you must create a warehouse and enable it for WMS. On the **Warehouses** page, select the **Use warehouse management processes** option.

Zone groups, zones, location types, and locations

As part of the process for enabling a warehouse layout, you must define warehouse zone groups, and zones, location profiles, location types, and locations.

- **Zone groups** – A logical or physical grouping of zones within a warehouse.
- **Zones** – A logical or physical grouping of locations within a warehouse.
- **Location profiles** – A logical or physical grouping of locations that have the same warehouse location process policies (for example, a mix of different item numbers can be stored there, and the same physical capacity constraints apply).
- **Locations types** – A logical or physical grouping of the warehouse locations. For example, you can create a location type for all staging locations. Mandatory settings on the **Warehouse management parameters** page drive the process of defining staging location types and the final shipping location type.
- **Locations** – The lowest level of location information. Use locations to track where the on-hand inventory is stored and picked in a warehouse.

The entities that you create to define your warehouse layout are used in the queries that you set up in work templates to drive work orders in the warehouse. Therefore, when you define the zones, location types, and so on, consider how different areas in the warehouse are used for different processes. Additionally, consider factors such as the physical characteristics of a particular area. For example, there might be areas where you can use only a certain type of forklift truck. Or, if your company has both production and finished goods within the same facility, you might want to create a single warehouse in Supply Chain Management but then separate the two operations by creating two zone groups. Give your entities descriptive names, so that it's easy to identify them when you use them in template queries.

Location stocking limits, location profiles, and fixed picking locations

You must consider the physical layout of the warehouse, both to determine storage capacities (location stocking limits and location profiles) and as part of your attempts to achieve optimal warehouse processes.

Location stocking limits help guarantee that work isn't created to request inventory to be put in a location that doesn't have the physical capacity to carry the inventory. For example, if some locations within a warehouse can hold only one pallet per location, enable location stocking limits. Set the **Quantity** value to *1*, and set the **Unit** value to *PL* within a specific location profile grouping.

If you need more advanced calculations to control the location capacity constraints, use location profiles. In this case, the weight and volume are considered when capacity calculations are done.

To achieve optimal outbound processes, evaluate whether to use fixed picking locations and fixed packing locations. Often, minimum/maximum replenishment is used for replenishment processes from a bulk area to the fixed picking locations, and multiple fixed picking locations

can be enabled within the same warehouse and for product variants. Consider the flexibility that you can achieve by enabling dedicated demand replenishment overflow locations that are used only for wave/load replenishment processing.

Location setup wizard

To quickly create the locations within a warehouse, use the **Location setup** wizard. As part of this process, you can easily maintain the format of the location names.

Warehouse processes

As part of the configuration of a warehouse, enable warehouse processes according to your business requirements. The most important components to configure are wave templates, work templates, work pools, and location directives.

Wave templates

Wave templates help enable the outbound "Release to warehouse" process. Use the wave template functionality as soon as you release order lines (either directly from source documents, via batch job processes, or via loads that you already created).

You can create three types of wave templates:

- **Shipping**
- **Production order**
- **Kanban**

Use parameters to define how far the system should automatically go in the outbound work processing. The system selects a wave template based on the wave template sequence and criteria that you specify in the template. The system checks the criteria in the template listed at the top of the sequence first. If the criteria are met, the system processes the wave template. Otherwise, the system checks the criteria in the next template, and so on. Therefore, put the template that has the most specific criteria at the top of the wave template sequence list, so that it's processed first. For example, you want to process all the work for a specific carrier today and temporarily delay processing of the work for other carriers. In this case, list the wave template that selects work for that carrier higher in the sequence than other templates. Otherwise, the work for other carriers might be processed before the work for that carrier is completed.

You must specify the wave process methods in each wave template. The available methods vary, depending on the wave template type.

Work templates

Work template definitions play an important role in the definition of warehouse management work processes. They define what work is performed, and how the work is done. Templates can also contain a directive code that links to a location directive to determine where work is performed. Work templates include a query that specifies the criteria for the work. Each template must include at least one Pick operation and one Put operation to drive the basic work operation of transferring on-hand inventory from one location to another.

If multiple workers must be able to process work for some of your warehouse operations, consider using the concept of *staging* for the inventory and separating the work execution into different work classes.

General warehouse work policies

General warehouse work policies let you influence how warehouse work is created and handled. Set up policies to control options such as default work priority values, deferred work processing, work transaction dates, and more. To view and set these policies, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **General** tab.
3. Expand the **Work** FastTab.
4. Select policies and set other work options available on this FastTab. Each field has tooltip help. To see the tooltip for a field, hover your mouse pointer over the relevant field label.

Work pools

Use work pools to organize work into groups. For example, create a work pool to classify work that occurs in a particular warehouse location. For all work types except counting, assign a work pool to a work template. For cycle counting, assign a work pool on the following pages:

- Cycle count plans
- Cycle count thresholds
- Cycle count work by location
- Cycle count work by item

When you use work templates to create work, the work pool is automatically assigned to the work.

You can also use work pool IDs to limit the type of work that is directed to a particular warehouse worker, provided that you configure this functionality on the relevant mobile device

menu item.

Location directives

As the name suggests, use location directives to direct the work transactions to the appropriate locations in the warehouse. In other words, they define where to pick and put.

To make it easier and quicker to define the actions that are associated with each location directive line, use one of the predefined strategies. For example, you can use the *Empty location with no incoming work* strategy to search for free locations in a warehouse, or you can use *FEFO batch reservation* strategy for outbound sales picking.

Next steps

- Configure locations in a WMS-enabled warehouse
- Get started with setting up the Warehouse management module

Set up a warehouse by using a warehouse configuration template

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up a warehouse by using a warehouse configuration template. There are several predefined configuration templates that you can use. For information about how to use these templates, see Configuration data templates.

Scenarios where configuration templates can be helpful

Configuration templates can be helpful in many scenarios. Here are some examples:

- You've completed and tested a configuration setup in a test environment, and you now want to copy the setup to a production environment.
- You want to roll the warehouse setup out to several legal entities or create a new warehouse in the same legal entity.
- You want to quickly prepare for a demo of the warehouse functionality.
- You want existing items and warehouses to use the functionality in Warehouse management instead of the functionality in Inventory management.

This article focuses on the first of these scenarios. It shows how you can use a configuration template to copy a configuration setup from a test environment to a production environment.

Copy a configuration setup from a test environment to a production environment

For this scenario, the configuration setup for a warehouse and some transaction processes already exist in a test environment. You now want to copy the configuration setup for the warehouse from the test environment to a production environment.

> **Note**

It's important that you include other related setup data when you copy a configuration setup. For example, you want to set up products by copying the setup from a test environment. However, you can't set up a fixed picking location for a product before that product is created. Although individual configuration templates don't support this type of dependency, there are default data templates that support it. You can easily include these default data templates in a configuration process.

Export a default warehouse template

1. Open the **Data management** workspace.

   > ⓘ **Note**
   >
   > If you're using this workspace for the first time, you must load all the data entities before you continue.

2. Select the **Templates** tile, and then select **Load default templates** to load the default templates.

   > ⓘ **Note**
   >
   > **Load default templates** is available only in the **Enhanced** view. Select **Framework parameters**, and then, in the **View defaults** field, select **Enhanced view**.

3. After the default templates are loaded, you can change them so that they meet your business requirements.

   > ⓘ **Note**
   >
   > To load default templates and import templates, you must have system administrator access. This requirement helps guarantee that all entities are correctly loaded into the template.

4. Make sure that you're in the legal entity that you want to export the company-specific data from.

5. In the workspace, select **Export**.

6. Create a new export project.

7. Select + **Add template**, and find the **400 - WMS** default warehouse template. This template adds data entities for warehouse configuration.

   > ⓘ **Note**
   >
   > If the data that you're exporting must be filtered (for example, you want to export only the data that is related to a specific warehouse), you must evaluate each data entity and add filtering via a query. Alternatively, you can export all data and then delete the records that aren't required in the destination files.

8. Select **Export**. Data that is related to all the data entities in the project is exported.

You can download a zip file for the data package. This file contains all the data in the selected format (for example, Excel format). As has been mentioned, some records in the data package files might have to be updated before you can import them into the production environment. If you update a record, make sure that you don't change the file name.

Import a warehouse configuration setup

1. In the destination environment, make sure that you're in the company that you want to import the warehouse data into.

   > ⓘ **Note**
   >
   > Before you do the import, you should identify any data dependencies. For example, the **Warehouse management** template includes a data entity that is named **Warehouse disposition codes**. This entity contains data that is related to the **Disposition codes** setup page (**Warehouse management** > **Setup** > **Mobile device** > **Disposition codes**). If an existing setup already handles the return process for sales orders, the **Return disposition code** field contains a value. The disposition code in this field is related to the **Disposition code** data entity, which is part of the **Sales and marketing** template. If the data from the **Disposition code** data entity isn't imported before the data from the **Warehouse disposition codes** field, the import will fail.

2. In the **Data management** workspace, select **Import**.

3. Create a new import project.

4. Select + **Add file**, and upload the zip file for the data package.

5. Select **Import**. In the **Enhanced** view, you can use the **Filter** option to quickly get an overview of issues that might occur during the import.

The **View execution** log provides detailed information about each data entity that is imported. You can use the staging data view to quickly get to the target data. In this way, you can see what the imported data looks like on the related pages in the application. When you use the default data templates, the import sequence for each data entity works in the predefined manner, to help guarantee that all dependent data is imported first. If custom data entities are part of the project, you must make sure that the correct sequence is defined. Learn more in Configuration data templates.

To learn more about how to use warehouse template to copy the configuration of a warehouse from one company to a new company within the same instance, see this 3-minute video on YouTube about how to use warehouse template to copy the configuration for finance and operations.

Warehouse groups

10/03/2025

Warehouse groups let you establish groups of warehouses that you can associate with various other records in Microsoft Dynamics 365 Supply Chain Management.

> ⓘ **Note**
>
> - Each warehouse can be assigned to any number of warehouse groups.
> - Only warehouses that are enabled for advanced warehouse processes (WMS) can be assigned to warehouse groups.

Create and manage warehouse groups

To create and manage your warehouse groups, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse groups**.
2. Follow one of these steps:
    - To create a new group, select **New** on the Action Pane.
    - To edit an existing group, select it in the list pane, and then select **Edit** on the Action Pane.
    - To delete an existing group, select it in the list pane, and then select **Delete** on the Action Pane.
3. If you're creating or editing a warehouse group, set the following fields on the header of the new or selected group:
    - **Warehouse group** – Enter a unique name for the group.
    - **Name** – Enter a short description of the group.
4. On the **Warehouses** FastTab, define the list of warehouses that should be members of the current group.
    - To add a warehouse to the group, select **Add** on the FastTab toolbar to add a new row to the grid. Then, in the **Warehouse** column for the new row, select a warehouse. (Only WMS-enabled warehouses are available for selection.) The other column values will be updated automatically, based on the warehouse that you selected.

- To remove a warehouse from the group, select it in the grid, and then select **Remove** on the FastTab toolbar.
- To replace one warehouse in the group with another warehouse, find the warehouse that you want to replace in the grid. Then, in the **Warehouse** column, select the warehouse that you want to use instead.

Use warehouse groups

When you're setting up some types of warehousing features (such as location directives, wave templates, outbound sorting templates, cross docking templates, slotting templates or container packing policies), you can specify whether the feature applies to a single warehouse, a group of warehouses, or all warehouses. Usually, you'll see two fields: one where you select the warehouse scope (*Warehouse*, *Group*, or *All*) and one where you make a selection, based on that scope (a single warehouse ID, a warehouse group ID, or all warehouses).

Warehouse spatial location overview (preview)

[This article is prerelease documentation and is subject to change.]

The *warehouse spatial location* feature lets you assign X, Y, and Z coordinates to warehouse locations. The system uses these coordinates to calculate optimized picking routes that minimize the travel distance required for warehouse workers to move between locations during pick work. When you use this feature, the *Sort picking work lines* wave processing step reorders the pick work lines within a work record so that workers follow an efficient route through the warehouse. The step uses the assigned coordinates, your selected distance calculation strategy, and your selected sorting algorithm to determine the optimal order.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Key concepts

The *warehouse spatial location* feature employs the following key concepts:

- **Spatial coordinates** – The X, Y, and Z values that represent a location's physical position in the warehouse. The X and Y axes represent the horizontal position, and the Z axis represents the vertical position (for example, a rack level).
- **Pick work line** – A line in a work that instructs a worker to pick items from a specific warehouse location. A work record typically contains multiple pick work lines followed by a put work line.
- **Put work line** – A line in a work record that instructs a worker to place (put) the picked items at a destination location, such as a bay door or staging area.
- **Location sorting algorithm** – The algorithm that determines the order in which pick work lines are sorted. You can choose between a fast calculation or an optimized route. Both

algorithms produce a route that starts at the farthest pick location and ends at the pick location nearest to the put location.

- **Distance calculation strategy** – The method that the system uses to calculate the distance between two locations. You can choose between a straight-line calculation or a city-block calculation. The choice affects the relative distances between locations, which in turn affects the sort order.
- **Coordinate retrieval strategy** – The method that the system uses to retrieve coordinate values for a location. Currently, the only available method retrieves the X, Y, and Z values directly from the location record.
- **Sort picking work lines** – A wave processing step that reorders pick work lines based on the spatial coordinates of the locations involved. This step only sorts pick lines that appear before the first put line in a work.

How sorting works

When the *Sort picking work lines* step runs during wave processing, the system performs the following steps for each work record:

1. *Identify the first put line in the work.* This line is the destination where the worker delivers the picked items.
2. *Collect all pick lines before the first put line.* The system sorts only these lines. Any lines after the first put line (such as additional pick and put cycles in the same work) remain in their original positions.
3. *Validate the work.* The system checks that there are at least two pick lines to sort, that the put location has valid coordinates, and that at least one pick location has valid coordinates. If validation fails, the system skips the work and keeps the pick lines in their original order.
4. *Calculate distances between locations* by using the warehouse's configured distance calculation strategy.
5. *Sort the pick lines* by using the warehouse's configured sorting algorithm so that the farthest pick location is first and the nearest pick location (closest to the put location) is last.
6. *Renumber the sorted pick lines* in the database so that the new order is preserved when the work is done.

Sorting algorithms

The *location sorting algorithm* controls how the system determines the order of pick work lines. Both algorithms produce a route where the worker starts at the farthest pick location from the

put location and finishes at the nearest pick location, so the last pick is close to the put destination.

Fast calculation algorithm

The *fast calculation algorithm* works best for warehouses that need quick route calculation with good (but not always optimal) results. It works well when pick locations are spread evenly or arranged in lines. It uses a nearest-neighbor approach:

1. Starting at the put location, the system finds the closest unvisited pick location.
2. From that location, it finds the next closest unvisited pick location.
3. This process continues until all pick locations are visited.
4. The resulting route visits locations from nearest-to-farthest (relative to the put). The system then reverses the route so that the worker starts at the farthest location and ends at the nearest.

This algorithm is fast because it makes a single pass through the pick locations. However, because it always chooses the next closest location, it can produce routes with crossing paths when locations are spread across the warehouse in complex patterns.

Optimized route algorithm

The *optimized route algorithm* works best in warehouses where minimizing total travel distance is critical. This algorithm is especially useful when pick locations are clustered in groups or scattered in patterns where the nearest-neighbor approach produces crossing paths. It starts with the same nearest-neighbor route as fast calculation, and then improves it:

1. The system builds the same initial route as fast calculation (as described in the previous section).
2. It repeatedly examines pairs of segments in the route and checks whether reversing the section between them produces a shorter total distance.
3. When it finds a shorter route, the system applies the change and continues checking.
4. The process repeats until no further improvements are found or the maximum number of improvement passes is reached.

The additional optimization step can eliminate crossing paths and produce noticeably shorter routes, especially for complex pick patterns. The trade-off is slightly longer calculation time.

When to choose each algorithm

Use the following guidelines to choose the best algorithm for your warehouse:

- *Fast calculation* is best for most scenarios. It produces near-optimal routes with minimal processing time and is suitable for high-volume wave processing.
- *Optimized route* is best when pick locations are scattered across the warehouse in patterns where the nearest-neighbor approach might create inefficient crossing paths. The optimization adds processing time but can reduce travel distance for complex pick patterns.

Example: Sorting algorithm comparison

Consider a warehouse with a put location (bay door) at coordinates (1, 1, 1) and five pick locations arranged in a pattern that challenges the nearest-neighbor approach:

Expand table

Location	X	Y	Z
PICK-A	1	50	1
PICK-B	50	1	1
PICK-C	50	50	1
PICK-D	25	25	1
PICK-E	25	50	1

- **Fast calculation result** – The nearest-neighbor approach starts at the put (1, 1, 1) and repeatedly selects the closest unvisited location. It then reverses the result. This approach can produce a route where the worker's path crosses itself, such as: *PICK-C* > *PICK-A* > *PICK-E* > *PICK-B* > *PICK-D* > *Put*.
- **Optimized route result** – The algorithm starts with the same route, then detects that reversing certain segments eliminates crossing paths. The result is a loop-free route with shorter total distance, such as: *PICK-C* > *PICK-B* > *PICK-D* > *PICK-E* > *PICK-A* > *Put*.

> **Tip**
>
> For warehouses with aisle-based layouts where pick locations fall along predictable lines (such as locations within the same aisle), *fast calculation* typically produces routes that are close to optimal. The *optimized route* algorithm provides the greatest benefit in open or irregularly laid-out warehouses where locations are scattered across multiple aisles and levels.

Distance calculation strategies

The *distance calculation strategy* controls how the system measures the distance between two locations. The sorting algorithm uses these distances to determine which pick locations are closer or farther from the put location and from each other. Choose a strategy that matches your warehouse layout so that the calculated distances reflect the actual paths that workers follow.

Straight line calculation strategy

The *straight-line calculation strategy* works best for open warehouse layouts where workers can move diagonally, such as open floor areas or wide-aisle warehouses. It calculates the direct (Euclidean) distance between two points. It assumes that workers can move freely in any direction between locations. It's calculated using the formula:

$$distance = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (|z_2| + |z_1|)^2}$$

The horizontal component uses the difference in X and Y coordinates. The vertical component uses the sum of the absolute heights of both locations (as explained in the Vertical distance calculation section).

City block calculation strategy

The *city-block calculation strategy* works best for warehouses with aisle-based layouts where workers walk along aisles and turn corners rather than cutting across open space. It calculates the distance along a grid-like path (also known as Manhattan distance). It assumes that workers must follow aisles and can't cut diagonally. It's calculated using the formula:

$$distance = |x_2 - x_1| + |y_2 - y_1| + |z_2| + |z_1|$$

The horizontal component sums the absolute differences in X and Y separately, which means the distance reflects the path a worker takes along aisles (first walking along one axis, then the other). The vertical component uses the sum of the absolute heights of both locations (as explained in the Vertical distance calculation section).

Vertical distance calculation

Both calculation strategies handle vertical movement (the Z axis) the same way: the system adds the absolute height of the starting location to the absolute height of the destination location.

For example, to move from shelf level 1 to shelf level 4, the vertical distance is *|1| + |4| = 5*, not *|4 - 1| = 3*.

This approach models the real cost of vertical movement in a warehouse. A worker can't move directly from one shelf level to another. Instead, the worker must climb down from the current level to the ground (costing the full height of that level) and then climb up to the target level (costing the full height of that level). For example, using a ladder or lift to descend from level 1 and then ascend to level 4 requires more effort than a simple height difference of 3 suggests.

> **Important**
>
> Two locations at the same shelf level (for example, both at Z = 2) still have a vertical distance of |2| + |2| = 4, not 0. This result reflects the reality that even on the same level, a worker must reach up to that shelf height at both the source and destination. If your warehouse has all locations on the ground level, set Z = 0 for all locations to eliminate the vertical component from distance calculations.

Distance calculation examples

The following examples show how the two strategies calculate distance differently for the same pair of locations.

Example 1: Two locations on the same level

You have two locations on the same shelf level (Z = 1) but different X and Y coordinates:

- Location A: (2, 3, 1)
- Location B: (8, 7, 1)

The following table shows the distance calculations for both strategies:

Expand table

Strategy	Calculation	Result
Straight line	$\sqrt{(8-2)^2+(7-3)^2+(1+1)^2} = \sqrt{36+16+4}$	**7.48**
City block	$\|8-2\|+\|7-3\|+\|1\|+\|1\| = 6+4+1+1$	**12**

The straight-line distance (7.48) is shorter because it assumes the worker walks diagonally. The city-block distance (12) is larger because the worker must follow the aisle grid: 6 units along one axis, then 4 units along the other, plus the vertical component at both locations.

Example 2: Two locations on different levels

You have two locations with the same X and Y coordinates but different shelf levels:

- Location A: (2, 3, 1)
- Location B: (2, 3, 4)

The following table shows the distance calculations for both strategies:

Expand table

Strategy	Calculation	Result
Straight line	$\sqrt{(2-2)^2 + (3-3)^2 + (4+1)^2} = \sqrt{0+0+25}$	5
City block	$\|2-2\| + \|3-3\| + \|4\| + \|1\| = 0+0+4+1$	5

When the locations differ only in shelf level, both strategies produce the same result (5 units) because vertical distance is calculated the same way in both: the worker climbs down from level 1 (1 unit) and climbs up to level 4 (4 units).

Example 3: Diagonal movement across a warehouse

You have two locations that differ significantly in X, Y, and Z coordinates:

- Location A: (1, 1, 1)
- Location B: (10, 10, 3)

The following table shows the distance calculations for both strategies:

Expand table

Strategy	Calculation	Result
Straight line	$\sqrt{(10-1)^2 + (10-1)^2 + (3+1)^2} = \sqrt{81+81+16}$	13.34
City block	$\|10-1\| + \|10-1\| + \|3\| + \|1\| = 9+9+3+1$	22

The difference between the strategies is most pronounced when the worker must cover large horizontal distances. The straight-line distance (13.34) assumes a direct diagonal path, while the city-block distance (22) reflects walking 9 units in one direction, 9 units in another direction, and then handling the vertical change at both levels.

- Wave processing

Last updated on 04/24/2026

Set up warehouse spatial locations (preview)

[This article is prerelease documentation and is subject to change.]

Warehouse spatial location sorting optimizes picking routes by assigning X, Y, and Z coordinates to warehouse locations. You can configure the sorting algorithms, add the sorting step to wave processing, and set up batch processing for large-volume warehouses.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

To use warehouse spatial locations, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.48 or later.
- The feature named *Warehouse spatial location* must be turned on in feature management.
- Warehouse locations must already be defined for your warehouse.

> **Note**
>
> After you turn on the *Warehouse spatial location* feature, you can turn it off if needed. However, all coordinate values and configurations that you entered remain in the database.

Configure warehouse-level sorting settings

Before you assign coordinates to individual locations, configure the sorting algorithms and strategies at the warehouse level.

To configure warehouse-level spatial location settings, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.

2. Select the warehouse that you want to configure.

3. On the **Warehouse** FastTab, in the **Warehouse coordinates configuration** section, make the following settings:

    - **Distance calculation strategy** – Select the method that the system uses to calculate the distance between two locations. The choice affects how distances are measured, which in turn affects the sort order of pick work lines. You can learn more about how each strategy calculates distance in Distance calculation strategies. Choose one of the following options:
        - *Straight Line* – Calculates the direct distance between two points, assuming the worker can move freely in any direction. Use this strategy for open warehouse layouts where workers can walk diagonally.
        - *City Block* – Calculates the distance along a grid-like path (walking along one axis and then another), assuming the worker must follow aisles. Use this strategy for warehouses with aisle-based layouts where workers can't cut across aisles.
    - **Coordinate retrieval strategy** – Select the method that the system uses to retrieve a location's coordinates. Currently, only one setting is available and is selected by default:
        - *Location coordinates* – Retrieves the X, Y, and Z coordinate values directly from the fields on the location record.
    - **Location sorting algorithm** – Select the algorithm that the system uses to sort pick work lines. Both algorithms sort picks so that the worker starts at the farthest location from the put (destination) location and finishes at the nearest. You can learn more about how each algorithm works in Sorting algorithms. Choose one of the following options:
        - *Fast calculation* – Builds a route by starting at the put location and repeatedly selecting the next nearest unvisited pick location, then reverses the result. Generates a route quickly and produces good results in most scenarios. Recommended for high-volume wave processing where calculation speed is the priority.
        - *Optimized route* – Starts with the same route as the fast calculation, then improves it by checking whether rearranging segments produces a shorter path. Recommended when minimizing travel distance is the priority. This option might take slightly longer to calculate but can produce noticeably shorter routes for complex pick patterns.

4. Repeat these steps for each warehouse where you want to use spatial location sorting. You can have different settings for different warehouses based on their layouts and operational priorities.

Assign coordinates to warehouse locations

After you configure the warehouse-level settings, assign X, Y, and Z coordinates to each warehouse location. The system uses these coordinates to calculate distances between locations and determine the optimal pick route.

To assign coordinates to warehouse locations, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.
2. Select a location record.
3. Make the following settings:
    - **X coordinate** – Enter the position of the location along the X axis of the warehouse. This value typically represents the aisle or horizontal position.
    - **Y coordinate** – Enter the position of the location along the Y axis of the warehouse. This value typically represents the position within an aisle (depth).
    - **Z coordinate** – Enter the position of the location along the Z axis of the warehouse. This value typically represents the vertical level (for example, the shelf or rack level). Set this value to 0 for ground-level locations to exclude vertical distance from calculations.
4. Repeat these steps for each location in each warehouse where you want to use spatial location sorting.

> **Tip**
>
> Use a consistent coordinate system across all locations in a warehouse. For example, you might use the aisle number for X, the bay number for Y, and the shelf level for Z.

Add the *Sort picking work lines* step to your wave templates

To use spatial location sorting during wave processing, add the *Sort picking work lines* step to the relevant wave templates. Learn more about wave templates in Wave templates.

To add the wave step, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select the wave template that you want to modify.
3. On the **Methods** FastTab, in the **Remaining methods** list, find and select the method with **Name** *Sort picking work lines*.
4. Select the **Add** button (right arrow) to move it to the **Selected methods** list.
5. Use the **Move up** and **Move down** arrows to position the step after the work creation step (such as *Create work*) and before the release step (if there is one). The sort must run after work is created so that there are pick lines to sort.

> **Note**
>
> The *Sort picking work lines* method only appears in the lists on the **Methods** FastTab after the *Warehouse spatial location* feature is turned on in **Feature management**. If the method still doesn't appear, go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**, and select **Regenerate methods** from the Action Pane.

Configure batch processing for *Sort picking work lines*

By default, the *Sort picking work lines* step runs synchronously during wave processing. For high-volume warehouses, you can improve performance by configuring the step to run as parallel batch tasks. When you enable batch processing, the system splits work across multiple parallel batch tasks, which can significantly reduce sorting time during wave processing.

To configure batch processing, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. Select the *sortPickingWorkLines* method in the list.
3. On the Action Pane, select **Task configuration**. The **Wave post method task configuration** page opens.
4. On the Action Pane, select **New** to add a configuration row.
5. In the **Warehouse** field, select the warehouse that you want to set up to use batch processing.
6. Make the following settings:

- **Maximum number of batch tasks** – Enter the maximum number of parallel batch tasks that the system creates to process the sort step. The actual number of tasks is the lesser of this value and the number of work records to sort. A higher value allows more parallel processing but uses more batch server capacity.
- **Wave processing batch group** – Enter the batch group to use for the sorting batch tasks. If you leave this field blank, the system uses the default wave processing batch group that you configure on the **Warehouse management parameters** page.

7. Repeat these steps for each warehouse where you want to use batch processing for the sort step.

> **Tip**
>
> Start with a small number of batch tasks (for example, 2-4) and increase the value based on your wave volume and batch server capacity. Each batch task processes one work record at a time from a shared queue, so the work is automatically distributed across available tasks.

> **Important**
>
> The system uses batch processing only when a task configuration record exists for the warehouse. If you don't set up a configuration, the sort step runs synchronously during wave execution.

Example scenario

This scenario shows how spatial location sorting reorders pick work lines to reduce travel distance, and how the distance calculation strategy affects the results.

Set up the scenario

This scenario uses a warehouse with four pick locations and one bay door (put location). The pick locations are arranged so that without sorting, the worker would zigzag across the warehouse. After sorting, the pick lines are reordered so the worker starts at the farthest location and works back toward the bay door in a more efficient path.

To set up the scenario so you can run it, follow these steps to set up the warehouse and wave template:

1. Configure a warehouse with the following settings:

    - **Distance calculation strategy** – *Straight Line*
    - **Coordinate retrieval strategy** – *Location coordinates*
    - **Location sorting algorithm** – *Fast calculation*

2. Create four pick locations with the following coordinates:

Expand table

Location	X	Y	Z	Description
PICK-001	3	2	1	Near the bay door, ground level
PICK-002	10	8	1	Far side of warehouse, ground level
PICK-003	6	5	1	Middle of warehouse, ground level
PICK-004	10	8	3	Far side of warehouse, shelf level 3

3. Create a bay door (put) location at coordinates (1, 1, 1). This location is where the worker delivers the picked items.

4. Add the *Sort picking work lines* step to the wave template, positioned after the work creation step.

Run the scenario

To run the scenario, follow these steps:

1. Create a sales order that requires items from all four pick locations.
2. Process the wave. The system creates a work record with four pick lines and one put line.
3. The *Sort picking work lines* step runs and reorders the pick lines.

Result

Before sorting, the pick work lines are in the order the system created them, which doesn't consider location proximity, as shown in the following table:

Expand table

Line	Type	Location	Coordinates
1	Pick	PICK-002	(10, 8, 1)

Line	Type	Location	Coordinates
2	Pick	PICK-001	(3, 2, 1)
3	Pick	PICK-004	(10, 8, 3)
4	Pick	PICK-003	(6, 5, 1)
5	Put	BAY-DOOR	(1, 1, 1)

With this order, the worker would zigzag across the warehouse: *far side* > *near the door* > *far side again* > *middle* > *bay door*.

During sorting, the system calculates the distance from the put location to each pick location and reorders the pick lines so the worker starts at the farthest location and works back toward the bay door. The following table shows how the distances from the put location (1, 1, 1) are calculated using the *straight-line strategy*:

Expand table

Location	Coordinates	Calculation	Distance from put
PICK-001	(3, 2, 1)	$\sqrt{(3-1)^2+(2-1)^2+(1+1)^2} = \sqrt{4+1+4}$	3.00
PICK-003	(6, 5, 1)	$\sqrt{(6-1)^2+(5-1)^2+(1+1)^2} = \sqrt{25+16+4}$	6.71
PICK-002	(10, 8, 1)	$\sqrt{(10-1)^2+(8-1)^2+(1+1)^2} = \sqrt{81+49+4}$	11.58
PICK-004	(10, 8, 3)	$\sqrt{(10-1)^2+(8-1)^2+(3+1)^2} = \sqrt{81+49+16}$	12.08

The sorted work now looks like this:

Expand table

Line	Type	Location	Distance from put
1	Pick	PICK-004	12.08 (farthest)
2	Pick	PICK-002	11.58
3	Pick	PICK-003	6.71
4	Pick	PICK-001	3.00 (nearest)
5	Put	BAY-DOOR	--

The worker now follows an efficient path: *far shelf* > *far ground* > *middle* > *near the door* > *bay door*. Each pick is closer to the destination than the previous one, eliminating the back-and-forth travel.

> **Note**
>
> The sorting step doesn't move the put line (line 5). It only reorders the pick lines before the first put. If the work contained additional pick and put cycles after the first put, those lines would also stay in their original positions.

How the distance strategy changes the result

If you change the **Distance calculation strategy** to *City Block*, the system calculates distances differently. The city-block strategy assumes workers follow aisles instead of walking diagonally:

The following table shows how the city-block strategy calculates distances from the put location (1, 1, 1):

Expand table

Location	Coordinates	Calculation	Distance from put
PICK-001	(3, 2, 1)	$\|3-1\| + \|2-1\| + \|1\| + \|1\| = 2+1+1+1$	5
PICK-003	(6, 5, 1)	$\|6-1\| + \|5-1\| + \|1\| + \|1\| = 5+4+1+1$	11
PICK-002	(10, 8, 1)	$\|10-1\| + \|8-1\| + \|1\| + \|1\| = 9+7+1+1$	18
PICK-004	(10, 8, 3)	$\|10-1\| + \|8-1\| + \|3\| + \|1\| = 9+7+3+1$	20

The sorted pick order (farthest first) is now:

Expand table

Line	Type	Location	Distance from put
1	Pick	PICK-004	20 (farthest)
2	Pick	PICK-002	18
3	Pick	PICK-003	11
4	Pick	PICK-001	5 (nearest)

Line	Type	Location	Distance from put
5	Put	BAY-DOOR	--

In this example, both strategies produce the same sorted order because the relative distances between locations are similar. However, the city-block distances are larger because they account for aisle-following movement. Notice that the gap between PICK-004 (distance 20) and PICK-002 (distance 18) is larger with city block than with straight line (12.08 vs 11.58). This difference exists because the city-block strategy adds the full shelf height at both levels (level 3 + level 1 = 4) as a separate cost, whereas the straight-line strategy combines vertical and horizontal distance into a single direct measurement.

> **Tip**
>
> The distance strategy doesn't always change the sorted order, but it can. When pick locations have similar horizontal positions but different shelf levels, the city-block strategy gives more weight to vertical distance, which can cause the sort order to differ from the straight-line strategy. Choose the strategy that best reflects how workers actually move through your warehouse.

Control warehouse work by using work templates and location directives

08/06/2025

This article describes how to use work templates and location directives to determine how and where work is carried out in the warehouse.

The instructions that warehouse workers receive on a mobile device are determined by the Dynamics 365 Supply Chain Management work templates that you set up to define the various warehouse processes and tasks. Work templates determine how the work is performed for each warehouse process. By linking a location directive to work templates, you can help guarantee that work occurs in specific physical areas of the warehouses.

Work templates

The **Work templates** page lets you define the work operations that must be performed in the warehouse. Typically, warehouse work operations consist of a pair of actions: a warehouse worker picks up on-hand inventory in one location and then puts the picked inventory down in another location.

Work templates consist of a header and associated lines. Each work template is for a specific *work order type*. Many work order types are associated with source documents, such as purchase or sales orders. However, other work order types represent separate warehouse processes, such as cycle counting. The *work pool ID* lets you organize work into groups.

Use the settings in the work header definition to determine when a new work record should be created. For example, you can set a maximum number of pick lines and a maximum expected pick time. Then, if the work for a sales order picking process exceeds either of those values, that work is split into two pieces of work. Use the **General** tab of the work template to set limits associated with each work record and set up work-split criteria such as **Estimated pick time**, **Volume**, **Weight**, **Quantity**, and **Unit**.

> **Note**
>
> Items associated with multiple units of measure (such as pieces, boxes, and pallets) should be set up with a unit sequence group and relevant conversion ratios. These settings allow you, for example, to create an order using one unit (such as boxes) and then use a different unit (such as pieces) to split the work associated with the order. Learn more in Unit of measure and stocking policies.

Use the **Work header breaks** button to define when the system should create new work headers. For example, to create a work header for each *order number*, select **Edit query** on the Action Pane, and then add the **Order number** field to the **Sorting** tab of the query editor. Fields that are added to the **Sorting** tab are available for selection as *grouping fields*. To set your grouping fields, select **Work header breaks** on the Action Pane, and then, for each field that you want to use as a grouping field, select the check box in the **Group by this field** column.

The work lines represent the physical tasks that are required to process the work. For example, for an outbound warehouse process, there might be one line for picking up the items in the warehouse and another line for putting those items into a staging area. There can then be an additional line for picking the items from staging and another line for putting the items into a truck as part of the loading process. You can set a *directive code* on work template lines. A directive code is linked to a location directive, and therefore helps ensure that the warehouse work is processed in the correct location in the warehouse.

You can set up a query to control when a particular work template is used. For example, you can set a limitation so that a particular template can be used for work only in a specific warehouse. Alternatively, you might have several templates that create work for outbound sales order processing, depending on the sales origin. The system uses the **Sequence number** field to determine the order that the available work templates are assessed in. Therefore, if you have a very specific query for a particular work template, you should give it a low sequence number. That query will then be evaluated before the other, more general queries.

> ⓘ **Note**
>
> To prevent the system from automatically overwriting work template *sequence numbers* after a template has been deleted, turn on the *Preserve work template sequence numbers on delete* feature in **Feature management**.

To stop or pause a work process, you can use the **Stop work** setting on the work line. In that case, the worker who is performing the work won't be asked to perform the next work line step. To move on to the next step, that worker or another worker must select the work again. You can also separate the tasks within a piece of work by using a different *work class ID* on the work template lines.

Location directives

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items will

be picked, and where the picked items will be put. Location directives consist of a header and associated lines, and you create them on the **Location directives** page.

On the header, each location directive must be associated with a *work order type* that specifies the type of inventory transaction that the directive will be used for, such as sales orders, replenishment, or raw material picking. The *work type* specifies whether the location directive will be used for picking or putting work, or for some other warehouse process, such as counting or inventory status changes. You must also specify a *site* and a *warehouse*. A *directive code* that you specify on the header can be used to link the location directive to one or more work templates.

As for work templates, you can set up a query to determine when a particular location directive is used. For example, you can specify that when e-commerce is the origin of a sales order, the inventory must be picked up from a dedicated area in the warehouse. The system uses the **Sequence number** field to determine the order that the available location directives are assessed in.

The location directive lines set additional restrictions on the application of the location finding rules. You can specify a minimum quantity and a maximum quantity that the directive should apply to, and you can specify that the directive should be for a specific inventory unit. For example, if the unit of measure is pallets, the items in pallets can be put in a specific location. You can also specify whether the quantity can be split across multiple locations. Like the location directive header, each location directive line has a sequence number that determines the order that the lines are assessed in.

Location directives have one additional level of detail: *location directive actions*. You can define multiple location directive actions for each line. Once again, a sequence number is used to determine the order that the actions are assessed in. On this level, you can set up a query to define how to find the best location in the warehouse. You can also use predefined **Strategy** settings to find an optimal location.

For more information about how to create and configure location directives, see Create a location directive.

How location directives work

Location directives determine *where* items should be picked and *where* they should be put. The system evaluates a location directive against each work line and then selects a location, based on the work line details. The system first finds all location directives that match a particular work line (for example, they are for the correct warehouse and match the query). It then sequentially evaluates the directives that it has found.

> **Note**
>
> There are special cases where the pick location or put location is pre-selected. For example, during *purchase registration*, the first pick is always from the location where the registration occurs. Another example is *inventory movement by template*, where the warehouse worker selects the pick location, and only the put locations are found through location directives.

Dynamic work classification

Warehouse managers often need different work pools, priorities, or bay door assignments depending on the carrier, shipping deadline, or type of items being picked. Without dynamic classification, each combination requires its own work template, which can lead to a large and complex configuration.

Dynamic work classification lets you use Power Fx formulas to determine these work parameters at runtime instead of configuring them statically on each work template. A single work template combined with a classification rule can replace many static templates, making your configuration simpler to maintain and more adaptable to changing business requirements.

Dynamic work classification provides two main capabilities:

- **Classification at work creation** – When warehouse work is created, the system evaluates a Power Fx formula to override the work pool, work priority, location directive codes, and work classes on the generated work. The formula can look up values from the work header and associated records, including the load, shipment, wave, and transportation appointment.
- **Reclassification after load changes** – If a load changes after work has been created (for example, the carrier is reassigned), the system can reevaluate the formula and update the associated work. Work can also be reevaluated on a schedule if the formula depends on the current date or time.

To start using dynamic work classification, you must configure how loads trigger reclassification, create one or more classification rules that contain your Power Fx formulas, and associate each rule with the work templates that should use it.

Prerequisites

To use the feature described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.48 or later.
- The feature named *(Production Ready Preview) Dynamic work classification* must be turned on in feature management. As of Supply Chain Management version 10.0.49, this feature is turned on by default.

Configure work reclassification on load update

To control whether dynamic work classification rules can reclassify work when loads change, configure the **Work classification on load update** option. Work is only reclassified by rules that are explicitly set to **Reclassify work on load update**, so you can choose which rules should apply when a load changes. The system always classifies work at creation if a rule is associated with the work template, regardless of this setting.

To configure this setting, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, open the **Work** FastTab.
3. Set the **Work classification on load update** field to one of the following values:

    - *Disabled* – No action is performed when a load is updated.
    - *Synchronous* – All work associated with an updated load is reclassified immediately after the load is updated.

> ⓘ **Note**
>
> When using synchronous reclassification, the user might experience a brief wait during load updates while the system processes all associated work headers.

Create dynamic work classification rules

Classification rules define the Power Fx formulas that determine how work should be classified. Each rule specifies which fields to override and the logic for calculating the new values.

To create a rule, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Work** > **Dynamic work classification rules**.

2. Select **New** to create a rule.

3. Make the following settings in the header of the new rule:

    - **Dynamic work classification rule** – Enter a name for the rule.
    - **Description** – Enter a short description for the rule.
    - **Rule scope** – Specify when the rule's formulas run during work creation and which data they can reference. The scope determines whether classification is applied only at

the work header level or also at the initial work line level. Choose one of the following values:
    - *Work* – The formula runs once, after the work header is created. Use this scope when classification depends only on header-level properties such as the carrier or shipping time.
    - *Work and initial work lines* – The formula runs twice. First, as the initial pick work line is selected, the system evaluates a separate *initial work line formula* and applies overrides to that line. Then, after all initial work lines are collected, the system runs the main formula against the work header. Use this scope when classification depends on item-level properties such as the pick zone.

4. On the **Recalculation** FastTab, make the following settings to control how and when the rule is reevaluated if a load changes after the initial work creation:

    - **Reclassification schedule ID** – This setting is reserved for future use and has no effect in the current release.
    - **Reclassify work on load update** – Set this option to *Yes* to run the classification again each time a load associated with the work header changes. This setting ensures that any updates to the load are reflected in the work classification. This setting only applies if the **Work classification on load update** parameter is set to allow reclassification (see the previous section).

5. On the **Power Fx formula** FastTab, enter a formula that returns a record with the fields you want to override. See the next sections for details on writing formulas.

6. If the **Rule scope** is set to *Work and initial work lines*, the page includes a **Initial work line formula** FastTab. This formula runs when the first work line is assigned to a new work record. See the next sections for details on writing formulas.

> **Tip**
>
> - Use the **Copy** button on the Action Pane to duplicate an existing rule as a starting point for a new one.
> - Use the **Preview** button to test a rule against an existing work header and see the results without making changes.
> - The **Work reclassification schedules** button is reserved for future use and has no effect in the current release.

Write work classification formulas

On the **Power Fx formula** FastTab of each classification rule, enter a formula that returns a record with one or more of the following fields.

The following table describes the fields that a work classification formula can return.

Expand table

Field	Type	Description
`WorkPoolId`	String	Overrides the work pool on the created work.
`DefaultWorkPriority`	Number	Overrides the priority on the created work.
`DirectiveCodeOverrides`	Record	A record where each field name is a location directive code to replace and the value is the new directive code. Applies to all pick/put pairs.
`WorkClassOverrides`	Record	A record where each field name is a work class to replace and the value is the new work class. Applies only to the second and subsequent pick/put pairs. To change the work class of the first pick/put pair, use the initial work line formula instead.

The following example shows a formula that returns all four fields.

powerfx

```
{
    WorkPoolId: "PoolA",
    DefaultWorkPriority: 100,
    DirectiveCodeOverrides: {
        BAYDOOR: "BAYDOOR-C1",
        STAGING: "STAGING-C1"
    },
    WorkClassOverrides: {
        'Standard Class': "Express Class"
    }
}
```

> **Important**
>
> Returning `Blank()` for a field (or omitting it) preserves the original value from the work template. Returning an empty string (`""`) actively clears the value. For example, returning `Blank()` for `WorkPoolId` keeps whatever work pool was set on the work template, while returning `""` removes the work pool entirely.

Available data objects for work formulas

The following table lists the objects that you can reference in a work classification formula.

Expand table

Object	Description
`workTable`	The work header that was generated.
`workTable.Load`	The load record associated with the work header.
`workTable.Shipment`	The shipment record associated with the work header.
`workTable.Wave`	The wave record associated with the work header.
`workTable.Appointment`	The first transportation management (TMS) appointment associated with the load.

Write initial work line formulas

If you set the **Rule scope** to *Work and initial work lines*, enter an additional formula on the **Initial work line formula** FastTab. This formula runs as the first pick work line is assigned to a new work record and can override the following fields.

Expand table

Field	Type	Description
`WorkPoolId`	String	Overrides the work pool on the created work header.
`WorkClassId`	String	Overrides the work class of the initial pick/put work lines.

Available data objects for initial work line formulas

The following table lists the objects that you can reference in an initial work line formula.

Expand table

Object	Description
`workLine`	The initial pick work line that was generated.
`workLine.InventTable`	The item master record for the item being picked.
`workLine.WHSInventTable`	The warehouse item settings for the item being picked.

Object	Description
`workLine.Load`	The load record associated with the work line.
`workLine.LoadLine`	The load line associated with the initial pick line.
`workLine.Shipment`	The shipment record associated with the work line.

Associate rules with work templates

After creating a classification rule, associate it with the work template that should use it. During work creation, the system evaluates the rule's formula and applies the returned overrides to the generated work.

Go to **Warehouse management** > **Setup** > **Work** > **Work templates**, select a template, and set the **Dynamic work classification rule** field to the rule you want to use for that template.

> **Note**
>
> When you use dynamic work classification with a work template, make sure the template's grouping settings align with your formula logic. For example, if your formula classifies work based on zone, the work template should group work creation by zone so that each work header contains lines from only one zone.

Examples

The following examples illustrate common scenarios where dynamic work classification can simplify your configuration.

Example 1: Set work pool and priority by carrier

A warehouse uses three carriers that pick up shipments at different times during the day. The warehouse manager wants to route each carrier's work to a separate work pool and assign higher priority to the earliest pickup.

Without dynamic classification, this setup requires three work templates. Each template filters on a different carrier code, each with its own work pool and priority settings.

With dynamic classification, a single work template and one rule handle all three carriers.

powerfx

```
Switch(workTable.Load.CarrierCode,
    "Carrier1", {WorkPoolId: "Carrier1", DefaultWorkPriority: 100},
    "Carrier2", {WorkPoolId: "Carrier2", DefaultWorkPriority: 50},
    "Carrier3", {WorkPoolId: "Carrier3", DefaultWorkPriority: 10}
)
```

If you later reassign the load to a different carrier, the system can automatically reclassify the work when reclassification on load update is turned on.

Example 2: Direct put-away to carrier-specific bay doors

Building on example 1, the warehouse manager also wants outbound put lines directed to different bay doors depending on the carrier. With static configuration, each work template needs a different location directive code.

With dynamic classification, you can add directive code overrides to the same formula.

powerfx

```
Switch(workTable.Load.CarrierCode,
    "Carrier1", {
        WorkPoolId: "Carrier1",
        DefaultWorkPriority: 100,
        DirectiveCodeOverrides: {BAYDOOR: "BAYDOOR-C1"}
    },
    "Carrier2", {
        WorkPoolId: "Carrier2",
        DefaultWorkPriority: 50,
        DirectiveCodeOverrides: {BAYDOOR: "BAYDOOR-C2"}
    },
    "Carrier3", {
        WorkPoolId: "Carrier3",
        DefaultWorkPriority: 10,
        DirectiveCodeOverrides: {BAYDOOR: "BAYDOOR-C3"}
    }
)
```

Example 3: Prioritize work by shipping deadline

Instead of classifying by carrier, this example prioritizes work based on how close the load is to its scheduled shipping time. Loads with earlier deadlines receive higher priority, ensuring workers pick the most time-sensitive orders first.

The following formula converts the scheduled shipping time into a numeric priority. A shipment scheduled for 9:00 AM becomes priority 900, while a 3:00 PM shipment becomes priority 1500.

powerfx

```
{
    DefaultWorkPriority:
        If(Not(IsBlank(workTable.Load.LoadSchedShipUTCDateTime)),
            If(IsToday(workTable.Load.LoadSchedShipUTCDateTime),
                Hour(workTable.Load.LoadSchedShipUTCDateTime) * 100
                    + Minute(workTable.Load.LoadSchedShipUTCDateTime),
                3000),
            Blank())
}
```

The formula assigns a priority of 3000 to loads scheduled for a future day (beyond the maximum time-based priority of 2359) and returns `Blank()` for loads with no scheduled date, which preserves the work template's default priority.

An alternative approach calculates priority based on the number of minutes remaining until the shipping deadline.

powerfx

```
{
    DefaultWorkPriority:
        If(Not(IsBlank(workTable.Load.LoadSchedShipUTCDateTime)),
            If(IsToday(workTable.Load.LoadSchedShipUTCDateTime),
                Max(0, DateDiff(Now(), workTable.Load.LoadSchedShipUTCDateTime,
                    TimeUnit.Minutes)),
                24 * 60),
            Blank())
}
```

> **Important**
>
> The time-remaining approach requires the reclassification batch job to run on a recurring schedule (for example, every hour) to keep priorities current. Depending on the number of open work headers, this requirement can add load to the system. The time-of-day approach (first formula) is more efficient because work only needs reclassification when the load's scheduled shipping time changes.

Example 4: Classify work by pick zone

This example assigns a different work class to the initial pick/put pair based on the zone where items are picked. For example, picks from a freezer zone can be restricted to workers with appropriate cold-weather gear.

To use this approach, set the **Rule scope** to *Work and initial work lines* and configure the work template to group work by zone. This configuration ensures each work header contains lines from only one zone.

The initial work line formula concatenates a prefix with the zone ID to create a zone-specific work class.

powerfx

```
{
    WorkClassId: Concatenate("S-", workLine.ZoneId)
}
```

Alternatively, you can set the work pool instead of the work class.

powerfx

```
{
    WorkPoolId: Concatenate("S-", workLine.ZoneId)
}
```

Work with location directives

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Location directives are rules that help identify pick and put locations for inventory movement. For example, in a sales order transaction, a location directive determines where the items are picked, and where the picked items are put. Location directives consist of a header and associated lines. You create them for specific *work order types*.

> **Note**
>
> This article applies to features in the **Warehouse management** module. It doesn't apply to features in the Inventory management module.

Use location directives to perform the following tasks:

- Put away incoming items.
- Pick and stage items for outbound transactions.
- Pick and put raw materials for production.
- Replenish locations.

Prerequisites

Before you create a location directive, complete the following steps to make sure that the prerequisites are in place.

1. Turn on the required license key. Go to **System administration** > **Setup** > **License configuration**, expand the **Trade** license key, and then select the **Warehouse and Transportation management** configuration key. You need admin access for this step.
2. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
3. Create a warehouse.
4. On the **Warehouse** FastTab, set the **Use warehouse management processes** option to *Yes*.
5. Create locations, location types, location profiles, and location formats. Learn more in Configure locations in a WMS-enabled warehouse.

6. Create sites, zones, and zone groups. Learn more in Warehouse set up and Configure locations in a WMS-enabled warehouse.

Work order types for location directives

Many of the fields that you can set for location directives are common to all work order types. However, other fields are specific to particular work order types.

> **Note**
>
> Two work order types, *Canceled work* and *Cycle counting*, are used only by the system. You can't create location directives for these work order types.

The tables in the following subsections list the common and work order type–specific fields that are available when you set up a location directive.

Fields common to all work order types

The following table lists the fields common to all work order types.

Expand table

FastTab	Field
Location directives	Work type
Location directives	Site
Location directives	Warehouse
Location directives	Directive code
Location directives	Scope
Lines	Sequence number
Lines	From quantity
Lines	To quantity
Lines	Unit
Lines	Locate quantity
Lines	Restrict by unit

FastTab	Field
Lines	Round up to unit
Lines	Locate packing quantity
Lines	Allow split
Location Directive Actions	Sequence number
Location Directive Actions	Name
Location Directive Actions	Fixed location usage
Location Directive Actions	Allow negative inventory
Location Directive Actions	Batch enabled
Location Directive Actions	Strategy

Fields that are specific to work order types

The following table lists the fields that are specific to particular work order types.

Expand table

FastTab	Field	Work order type
Location directives	Locate by	Purchase orders
Location directives	Locate by	Transfer receipt
Location directives	Applicable disposition code	Purchase orders

Open the Location directives page

To open the **Location directives** page, go to **Warehouse management** > **Setup** > **Location directives**.

From there, you can view, create, and edit your location directives by using the commands on the Action Pane. For information about how to use all the fields that are available on the page, see the remaining sections of this article.

Action Pane

The Action Pane on the **Location directives** page contains buttons that you can use to create, edit, and delete directives (**Edit**, **New**, and **Delete**). It also contains the following buttons that let you adjust the sequence that the location directive is processed in and configure a query that defines the criteria for applying the location directive:

- **Move up** – Move up the selected location directive in the sequence. For example, you can move it from sequence number 4 to sequence number 3.
- **Move down** – Move the selected location directive down in the sequence. For example, you can move it from sequence number 4 to sequence number 5.
- **Copy** – Open a dialog box where you can create an exact copy of the current location directive.
- **Edit query** – Open a dialog box where you can define the conditions that the selected location directive should be processed under. For example, you might want it to apply only to a specific warehouse.
- **Acceptance tests** – Open a page where you can set up automated tests to determine how your location directives behave under different starting conditions. In this way, you can quickly validate your directives as you create and maintain them. Learn more in Test location directives with acceptance tests.

Location directives header

The location directive header includes the following fields for the sequence number and descriptive name of the location directive:

- **Sequence number** – This field indicates the sequence that the system tries to apply each location directive in for the selected work order type. Low numbers are applied first. You can change the sequence by using the **Move Up** and **Move Down** buttons on the Action Pane.
- **Name** – Enter a descriptive name for the location directive. This name should help identify the general purpose of the directive. For example, enter *Sales order picking in warehouse 24*.

Location directives FastTab

The fields on the **Location directives** FastTab are specific to the work order type that you select in the **Work order type** field in the list pane.

- **Work type** – Select the type of work that must be performed. The available values depend on the type of inventory transaction that you selected in the **Work order type** field. Select one of the following values:
  - *Put* – The location directive tries to find the most ideal location to put or locate inventory that comes into the system from receiving, production, or inventory adjustments. It can also be used to define the put to the stage location or the final bay door shipping location.
  - *Pick* – The location directive tries to find the most ideal locations to physically reserve inventory from (that is, create work). The pick can be completed (that is, the pick work line can be closed) even if the work isn't completed. The user can complete physical picking. In the system, that action is a pick step. The user can then cancel from the mobile device and complete the work later. However, the work header is first closed when the final put is completed.

  > **Important**
  >
  > The other values in the **Work type** field aren't relevant for location directives. They appear only because the field isn't filtered to match the selected work order type.

- **Directive code** – Select the directive code to associate with a work template or replenishment template. On the **Directive code** page, you can create new codes for connecting work templates or replenishment templates to location directives. You can also use directive codes to establish a link between any work template line and a location directive (such as the bay door or stage location).

  > **Tip**

If you set a directive code, the system doesn't search location directives by sequence number when it needs to generate work. Instead, it searches by directive code. In this way, you can be more specific about the location directive that is used for a particular step in a work template, such as the step for staging the materials.

- **Scope** – Use this option to specify the scenarios that the location directive applies to.

Expand table

Scope setting	Single order with one item	Multiple orders with the same item	Single order with multiple items	Multiple orders with multiple items
Single item	Yes	Yes	No	No
Multiple items	No	No	Yes	Yes
Single item or order	Yes	Yes	Yes	No
All	Yes	Yes	Yes	Yes

The following table describes when the scopes are available, and whether they allow for the **Edit query** function.

Expand table

Scope	Supported work type	Supported work order types	Allow for Edit query
Single item	All	All	Yes
Multiple items	All	All	No
Single item or order	Puts	Co-product and by-product put away, finished goods put away, kanban put away, purchase orders, quality orders, replenishment, return orders, sales orders, transfer issue, and transfer receipt	Yes
All	Puts	All	No

Note

- To do puts for both multiple items and single items, you must ensure that location directives exist that cover both scenarios. For example, you might set up one or more *Single item or order* location directives to cover scenarios that require fine-tuning (such as through edits to the query), and then one or more *All* location directives to cover the remaining scenarios.
- Although *Single item* and *Multiple items* scopes can be used for puts, this approach typically leads to redundant configurations. Consider using *Single item or order* and *All* scopes instead, because this approach produces a cleaner setup.
- When you use the *Single item or order* scope, receiving flows (like purchase orders) add the order number to the location directive query during work creation. To prevent unexpected behavior, don't add query ranges for the lines in such cases.

- **Applicable disposition code** – Specify whether the disposition code of the location directive must match the disposition code that is applied when the item is received, or whether the location directive can be selected based on any disposition code. If you select *Exact match*, and the **Disposition code** field is blank, only blank disposition codes are considered for this location directive.

  > ⓘ **Note**
  >
  > This field is available only for selected work order types. For a complete list, see the Fields that are specific to work order types section earlier in this article.

- **Locate by** – Specify whether the putaway quantity should be the whole quantity on the license plate, or whether it should be item by item. Use this field to help ensure that all the contents on a license plate are put into one location, and that the system doesn't suggest that you split the contents into several locations for *ASN* (license plate receiving), *Mixed license plate* receiving, and *Cluster* receiving processes. The behavior of the location directive query, the lines, and the location directive actions vary, depending on the value that you select. The **Lines** FastTab is only used when the **Locate by** is set to *Item*.

  > ⓘ **Note**
  >
  > Depending on the order type, this field has different options and is only accessible for some work order types. You can use the *ASN* option for both transfer receipts and purchase orders.

- **Disposition code** – Use this field for location directives that have a work order type of *Purchase orders*, *Finished goods putaway*, or *Return orders*, and a work type of *Put*. Use it to guide the flow to use a specific location directive, depending on the disposition code that a worker selects in the Warehouse Management mobile app. For example, you can direct returned goods to an inspection location before they're returned to stock. A disposition code can be linked to an inventory status. In this way, it can be used to change the inventory status as part of a receiving process. For example, you have a disposition code, *QA*, that sets the inventory status to *QA*. You can then have a separate location directive to move that inventory to a quarantine location.

  > **Note**
  >
  > This field is available only for selected work order types. For a complete list, see the Fields that are specific to work order types section.

Warehouse selection FastTab

Use the **Warehouse selection** FastTab to specify the warehouse and site where the location directive applies.

- **Warehouse selection** – Select one of the following values:
  - *All* – Use the location directive for all warehouses where a more specific location directive isn't assigned.
    - *Warehouse group* – Use the location directive for all warehouses in the warehouse group selected in the **Warehouse group** field.
    - *Warehouse* – Use the location directive only for the specific warehouse selected in the **Warehouse** field.

- **Site** and **Warehouse** – If you set the **Warehouse selection** field to *Warehouse*, select the site and warehouse where the location directive applies. If you select the warehouse first, the site is filled in automatically. If you select the site first, the warehouse list is filtered so that it shows only warehouses at that site.

- **Warehouse group** – If you set the **Warehouse selection** field to *Warehouse group*, select the warehouse group where the location directive applies. For more information about how to set up warehouse groups, see Warehouse groups.

Lines FastTab

Use the **Lines** FastTab to set conditions for applying the related actions that you specify on the **Location directive actions** FastTab. For each line, you can specify the minimum quantity and maximum quantity that the actions should apply to. You can also specify that the actions should apply to a specific inventory unit.

- **Sequence number** – Enter the sequence that each location directive line should be processed in for the selected work type. You can change the sequence as you require by using the **Move up** and **Move down** buttons on the toolbar.
- **From quantity** – Specify the start of the range of quantities that the line applies to. Specify the quantity in the unit of measure selected in the **Unit** field.
- **To quantity** – Specify the end of the range of quantities that the line applies to. Specify the quantity in the unit of measure selected in the **Unit** field.
- **Unit** – Select the unit of measure for the items. You can specify a minimum quantity and a maximum quantity that the directive should apply to, and you can specify that the directive should be for a specific inventory unit. The **Unit** field is used *only* for quantity evaluation. To determine whether the location directive line is applicable at all, the system uses the quantity in the unit that is specified on that line. Every time that it reaches a location directive line, the system tries to convert the demand unit to the unit that is specified on the line. If the unit of measure conversion doesn't exist, the system moves on to the next line.
- **Locate quantity** – This field is used only during attempts to put or locate items in the warehouse. (Therefore, it applies only when the **Work type** field is set to *Put*). Select one of the following values to specify the quantity that is used to evaluate whether a quantity is within the **From quantity** to **To quantity** range:
  - *License plate quantity* – Use the quantity on the license plate that's being received.
  - *Unitized quantity* – Use the quantity that is used during the transaction. For example, you receive a quantity of 1,000 in a warehouse and break it into 10 license plates, each of which has a quantity of 100. In this case, you can use a quantity of 1,000 items instead of the license plate quantity of 100.
  - *Remaining quantity* – Use the quantity that must still be received on the purchase order line that's being processed.
  - *Expected quantity* – Use the total quantity of the purchase order line, regardless of what was already received.
- **Restrict by unit** – Select this check box to make the location directive line specific to a unit of measure or multiple units of measure. Select it to restrict the units of measure that are considered valid selection criteria for the location directive lines. This functionality works only for location directives where the **Work type** field is set to *Pick*.

For example, when you reserve quantities, you want to reserve pallets only from a specific set of locations. In this case, the lines restrict that sequence to pallets in such a way that any quantity that's less than a pallet isn't selected for the location directive.

The **Restrict by unit** check box doesn't control the unit or units that are applied on work lines. The unit restriction applies only to the units that are made available via the unit sequence group. For example, an item is associated with a unit sequence group that includes both the *pallets* unit and the *pcs* units. A unit of measure is defined, where 1 pallet = 100 pcs, and the location directive uses the **Restrict by unit** functionality only for pallets. Furthermore, a work template is defined that limits the work header creation to 50 pcs. In this case, work lines of 50 pcs are created. To specify the unit of measure for restriction, follow these steps:

1. On the **Lines** FastTab, select **Restrict by unit** on the toolbar. (This button becomes available only after you select the **Restrict by unit** check box on the line and then select **Save**.)
2. On the **Restrict by units** page, in the **Unit** field, select the unit of measure that you want to restrict by for the pick and put processes.

- **Round up to unit** – This field works together with the **Restrict by unit** check box. For example, if **Restrict by unit** and **Round up to unit** are selected on the location directive line, the work that is generated from the directive for raw material picking is rounded up to a multiple of one of the handling units specified on the **Restrict by unit** page.

  > ⓘ **Note**
  >
  > This **Round up to unit** setup works only for the *Raw material picking* work order type, and only for location directives where the **Work type** field is set to *Pick*.

- **Locate Packing Qty** – If you specify a packing quantity on a sales order, transfer order, or production order, this check box lets you restrict the system so that it can select only locations that have at least that packing quantity.

  > ⓘ **Note**
  >
  > This functionality works only with location directives of the *Pick* type.

- **Allow Split** – Specify whether the location directive can split the quantity that's being received or reserved across multiple warehouse locations, or whether the whole quantity must be located in a single location or reserved from a single location to create work.

- **Immediate replenishment template** – Use this field to create a connection to a replenishment template, so that replenishment starts immediately if items aren't allocated. If you leave this field blank, item replenishment doesn't start until all lines of the location directive are processed.

  > ⓘ **Note**
  >
  > This field is available only for selected work order types where replenishment is permitted. For a complete list, see the Fields that are specific to work order types section.

Location directive actions FastTab

You can define multiple location directive actions for each line. Use a sequence number to determine the order that the actions are assessed in. At this level, you can set up a query to define how the best location in the warehouse is found. You can also use predefined **Strategy** values to find an optimal location.

- **Sequence number** – This field shows the sequence that the actions are processed in for the selected work type. You can change the sequence by using the **Move Up** and **Move Down** buttons on the toolbar.

- **Name** – Enter the name of the location directive action. Be specific, so that the action that is performed is clear from the name.

- **Fixed location usage** – Specify which locations the location directive should consider. Select one of the following values:
  - *Fixed and non-fixed locations* – The location directive considers all locations.
  - *Only fixed locations for the product* – The location directive considers only fixed locations for products.
  - *Only fixed locations for the product variant* – The location directive considers only fixed locations for product variants.

- **Allow negative inventory** – Select this check box to allow negative inventory at the specified warehouse location in location directives.

- **Batch Enabled** – Select this check box to use batch strategies for items that are batch-enabled. Select this check box for processes that use location directives to find locations to pick batch number–tracked items from. In this way, the search for locations that hold batch number–tracked items is included. If you select this check box, and set the **Strategy** field to *None*, the system moves on to the next action line.

- **Strategy** – To more easily and quickly define the actions that are associated with each location directive line, select one of the following predefined strategies:
  - *None* – No strategy is used.
  - *Match packing quantity* – This strategy verifies whether a pick location has the specified packing quantity. This strategy is valid only when the **Work type** field is set to *Pick*.
  - *Consolidate* – This strategy consolidates items in a specific location where similar items are already available. This strategy is valid only when the **Work type** field is set to *Put*. A typical setup for put tries to consolidate on the first action line and then, on the second line, tries to put without consolidation. Consolidation of goods makes later picking more efficient.
  - *Consolidate including incoming work* – This strategy works like the **Consolidate** strategy, but it also considers locations where items on incoming put-work lines aren't already available. This consideration is beneficial when receiving multiple license plates with the same item and the items should be moved to the same location. A typical example could occur when receiving based on advance shipping notices (ASNs). This strategy also helps the system find locations when it's necessary to split work line quantities due to location stocking limits or other constraints.
  - *FEFO batch reservation* – This strategy uses first expiry, first out (FEFO) batch reservations. Use it when inventory is located by using a batch expiration date and allocated for batch reservation. You can use this strategy only for batch-enabled items. It's valid only when the **Work type** field is set to *Pick*.
  - *Round up to the full LP and FEFO batch* – This strategy combines the elements of the *FEFO batch reservation* and *Round up to a full LP* strategies. It's valid only for batch-enabled items and location directives that have a work type of *Pick*. The line must be batch-enabled to use the *FEFO batch reservation* strategy, and the *Round up to a full LP* strategy can be used only for replenishment. If you configure this strategy together with a location stocking limit, it can cause the selected put work location to be overloaded and stocking limits to be ignored.
  - *Round up to a full LP* – This strategy rounds up the inventory quantity so that it matches the license plate quantity that is assigned to the items that must be picked. You can use this strategy only for replenishment location directives of the *Pick* type. If you configure this strategy together with a location stocking limit, it can cause the selected put work location to be overloaded and stocking limits to be ignored.
  - *License plate guided* – Use this strategy when you release the order to the warehouse to create the pick-and-put work. You can use this approach for multiple license plates. This strategy tries to reserve and create picking work against the locations that hold the requested license plates that are associated with the transfer order lines. However, if these actions can't be completed, but you still want to create picking work, you should fall back to another strategy for location directive actions. Depending on your business process requirements, you might also want to search for inventory in another area of the warehouse.

- *Empty location with no incoming work* – Use this strategy to locate empty locations. A location is considered empty if it has no physical inventory and no expected incoming work. You can use this strategy only for location directives that have a work type of *Put*.
- *Location aging FIFO* – Use the first in, first out (FIFO) strategy to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where no expiration date is available to use for sorting. The FIFO strategy finds the location that contains the oldest aging date, and then allocates picking based on that aging date.
- *Location aging LIFO* – Use the last in, last out (LIFO) strategy to ship both batch-tracked items and non-batch-tracked items, based on the date when the inventory entered the warehouse. This capability can be especially useful for non-batch-tracked inventory, where no expiration date is available to use for sorting. The LIFO strategy finds the location that contains the newest aging date, and then allocates picking based on that aging date.

Example: Using location directives

For this example, consider a purchase order process where the location directive must find free capacity within a warehouse for inventory items that you just registered at the receiving dock. First, you need to find free capacity within the warehouse by consolidating with existing on-hand inventory. If consolidation isn't possible, then you need to find an empty location.

For this scenario, you must define two location directive actions. The first action in the sequence must use the *Consolidate* strategy, and the second should use the *Empty location with no incoming work* strategy. Unless you define a third action to handle an overflow scenario, two outcomes are possible when there's no more capacity in the warehouse: work can be created even though no locations are defined, or the work creation process can fail. The setup on the **Location directive failures** page determines the outcome. You can choose whether to select the **Stop work on location directive failure** option for each work order type.

Next step

After you create location directives, you can associate each directive code with a work template code for work creation. Learn more in Control warehouse work by using work templates and location directives.

Test location directives with acceptance tests

Acceptance tests let you define a set of *given-when-then* tests to verify that location directives behave as expected. In this type of test, *given* a set of conditions, *when* something happens, *then* some specified result should occur. This terminology is known from quality assurance in engineering and can be traced back to the scientific method.

Acceptance tests provide two main benefits:

- **Faster initial setup:** You can verify the outcomes of your location directives without having to go through the regular warehouse processes and inspect the work creation history log.
- **Lower maintenance:** You'll be able to have more confidence when you modify your location directives later, because you can have the impact of each change automatically validated by running your defined acceptance tests.

Acceptance tests for location directives have no operational impact on the warehouse.

> **Note**
>
> You can't create acceptance tests for location directives where the **Scope** option is set to *Multiple items* (or the **Multiple items** option is set to *Yes*). We recommend that, whenever possible, you use location directive scopes that can be tested with single items, such as *Single item or order* and *All*.

For more information about how to set up location directives, including how to use location directive scopes, see Work with location directives.

Set up an acceptance test

Follow these steps to set up an acceptance test.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. On the Action Pane, select **Acceptance tests**.
3. On the **Location directive acceptance tests** page, follow one of these steps:
    - To create a new test, select **New** on the Action Pane.

- To edit an existing test, select it in the list pane, and then select **Edit** on the Action Pane.
- To copy an existing test, select the source test in the list pane, and then select **Copy** on the Action Pane. This step can be useful when you must create a new acceptance test that is a variation of an existing test.

4. On the header of the new or selected test, set the following fields:

- **Name** – Enter a name for the test.
- **Description** – Enter a short description of the test.
- **Inactive** – Set this option to *Yes* to make the test inactive. Set it to *No* to make the test active. Inactive tests can't be run and will be skipped if you choose to run all tests.

5. On the **Given** FastTab, specify the starting conditions for the test. Set the following fields:

- **Inventory levels** – Specify whether you want to run the test based on your actual inventory or simulate empty inventory. Select one of the following values:
  - *Current on-hand inventory* – Run the test by using whatever inventory is available when the test is run. This approach can make the test result less predictable and subject to arbitrary failures (for example, if the item that is used by the test isn't available).
  - *No inventory* – Simulate an empty warehouse. The simulation will clear inventory of the item that is used in the test, and for all locations that are specified under **Additional inventory**.

- **Additional inventory** – Simulate on-hand quantities for one or more items. The test will add these quantities to the inventory that is specified by the **Inventory levels** field.
  - Select **New** on the toolbar to add a row to the grid.
  - Select **Delete** on the toolbar to remove a row from the grid.
  - Select **Display dimensions** to open a dialog box where you can add dimension columns to the grid, or remove them, as you require.
  - For each row, enter values to specify an item, dimension values, location, and quantity.

> **ⓘ Important**
>
> The settings on the **Given** FastTab don't influence the actual inventory levels in the warehouse. Instead, they simulate conditions that are in effect only temporarily, during test execution.

6. On the **When** FastTab, specify what you want to test. The values that you enter are the inputs to the location directive engine. This approach is simpler than building manual tests by creating orders. Set the following fields:

    - **Work order type** – Specify the type of order to simulate (for example, *Sales orders* or *Purchase orders*).
    - **Work type** – Specify the work type to simulate. Typically, you'll select *Pick* or *Put*.
    - **Order number** – Specify the order number to use during the test. This information can be useful if the location directive query has ranges related to the order table.
    - **Disposition code** – Specify the disposition code that is used to handle return orders.
    - **Directive code** – Specify the directive code that drives the location directives.
    - **Item number** – Specify the item to locate.
    - **Quantity** – Specify the quantity to locate.
    - **Unit** – Specify the unit of measure for the **Quantity** field.
    - **Dimensions** – Specify the storage, product, and tracking dimensions for the item to locate.

7. On the **Then** FastTab, specify the expected outcome of the acceptance test. You **must** set one (and only one) of the following fields:

    - **Exact location** – Select a precise location. The test will be marked as passed if this location is the result of the location directive.
    - **Location matching regular expression** – Enter a regular expression that will be validated against the resulting location, even if the resulting location is blank (no result). The test will be marked as passed if the regular expression matches the name of the resulting location. For more information about regular expressions, see .NET regular expressions.
    - **Location with profile** – Select a location profile. The test will be marked as passed if the resulting location has this profile.
    - **Location in zone** – Select a location zone. The test will be marked as passed if the resulting location has this zone.

8. Select **Save** to save your test. The **Results** FastTab stores a record of any test results for each test. For information about how to run tests and interpret the results, see the next section.

Run acceptance tests

After you set up your tests, you can run them, either one by one or all at once. To run one or more tests, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Location directives**.

2. On the Action Pane, select **Acceptance tests**.

3. On the **Location directive acceptance tests** page, follow one of these steps:

    - To run a single, specific test, select it in the list pane, and then select **Run** on the Action Pane.
    - To run all active tests, select **Run all** on the Action Pane.

4. After the tests have been run, the list pane is updated to indicate the most recent result of each test. To inspect the results of a test, select the test in the list pane, and then select the **Results** FastTab. The grid shows the result of each run of the test. For each result, the following information is provided:

    - **Result** – The result of the test: *Passed*, *Failed* or *Skipped*.
    - **Resulting location** – The location that was found by the test. If no location was found, this field is blank.
    - **Duration (ms)** – The duration of the test in milliseconds (ms). This field also indicates how quickly the system will be able to process your directives during daily operation. For efficient warehouse operations, you should design your location directives so that they can be processed as quickly as possible. One typical cause of a slow response is the use of location directive queries where the defined ranges or sort orders don't match an index on the table. (The system will warn you if you try to save a query that is configured in this way.)
    - **Locations evaluated** – The number of locations that were evaluated during the test. For efficient warehouse operations, you should try to have as few locations as possible evaluated. One way to minimize the number of evaluated locations is to have many location directives, the first of which are the most specific and the last of which are the most general. You can also segment your warehouse by keeping certain types of items in dedicated zones. This approach can help you avoid scanning the whole warehouse every time.
    - **Created date and time** – The date and time when the test was run.
    - **Created by** – The name of the person who ran the test.

5. To view more information about any test run, select it in the grid, and then review the **Log** field. The log includes a work creation history that will help you understand the outcome.

    > **Important**

To determine the result of the test, the system compares the **Resulting location** value with the **Then** condition. The log for a failing test might indicate that a location directive did find a location, but that location didn't match the expected location that is defined in the **Then** condition.

Troubleshoot location directives and acceptance tests

Definition of acceptance tests is typically an iterative process. If a test fails, you should find out why it failed. Perhaps the test isn't set up correctly, or perhaps a location directive must be adjusted so that it better meets your requirements.

To troubleshoot your location directives and acceptance tests, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the list pane, select a location directive that you've designed an acceptance test for.
3. Expand the FactBox pane. This pane is on the right side of the page and is labeled **Related information**.
4. In the FactBox pane, expand the **Acceptance tests** FactBox. The grid in this FactBox lists the acceptance tests that are relevant to the selected location directive. It also shows the most recent result for each of those tests. From this FactBox, you can perform the following actions:

    - Select **Run all** to run all the listed tests.
    - Select **Coverage** to switch to and from the coverage view. The coverage view uses colored highlighting to indicate which location directives, lines, and actions were used to determine the result of a selected test. Records that are marked yellow were evaluated but didn't find a location. Records that are marked green did find a location. To change the test that coverage is shown for, select the symbol in the **Result** column for the relevant test.
    - Hover over a test to view more information about it, including the log.
    - In the **Name** column, select the name of a test to open that test on the **Location directive acceptance tests** page. There, you can inspect and adjust the test as you require.
    - Select **Run tests after change** to turn on and off the setting that will automatically run all tests each time that you change a location directive. Use this functionality to provide immediate feedback about the impact of changes as you make them.

5. Based on the results indicated by the coverage view and test log, adjust your tests and/or location directives until they produce the expected results for each test.

Configure product filters for warehouse transactions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to configure product filters and filter codes to categorize inventory items in a warehouse. You can also use filters to specify which customers can order a particular item and which items can be purchased from a particular vendor.

By setting up and using product filters, you can automatically organize inventory items in a warehouse and combine filtered items into filter groups. Use filters to put items into categories for handling, purchasing, and selling processes. You might want to group items together or separate them from each other when the way that you handle them is based on weight or handling restrictions. You can also specify which customers or vendors an item can be purchased from or sold to.

Prerequisites

The following table shows the prerequisites that must be in place before you start.

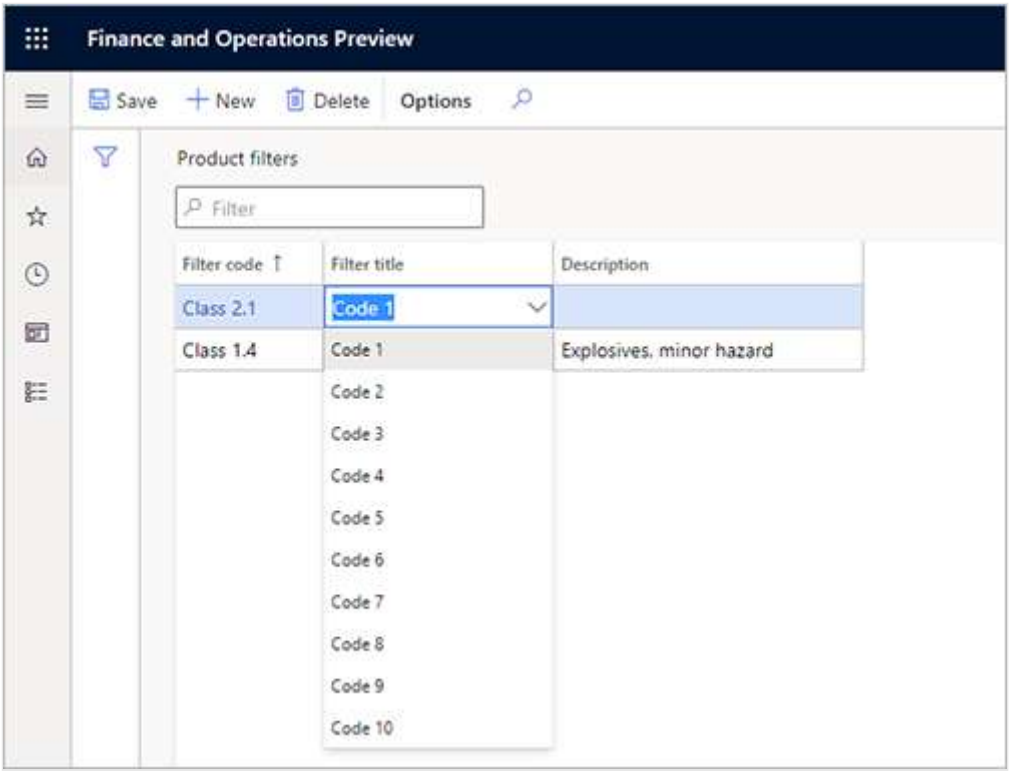
Expand table

Prerequisite	Instructions
Before you start to configure products on the **Released product details** page, turn on warehouse processing for the product's storage dimension group.	Go to **Product information management** > **Setup** > **Dimension and variant groups** > **Storage dimension groups**, and select or create a storage dimension group where the **Use warehouse management processes** option is set to *Yes*.
If you use customer filters and/or vendor filters, enable their use in Warehouse management parameters.	Go to **Warehouse management** > **Setup** > **Warehouse management parameters**. On the **Product filters** tab, set the **Enable customer filters** and/or **Enable vendor filters** options to *Yes*.

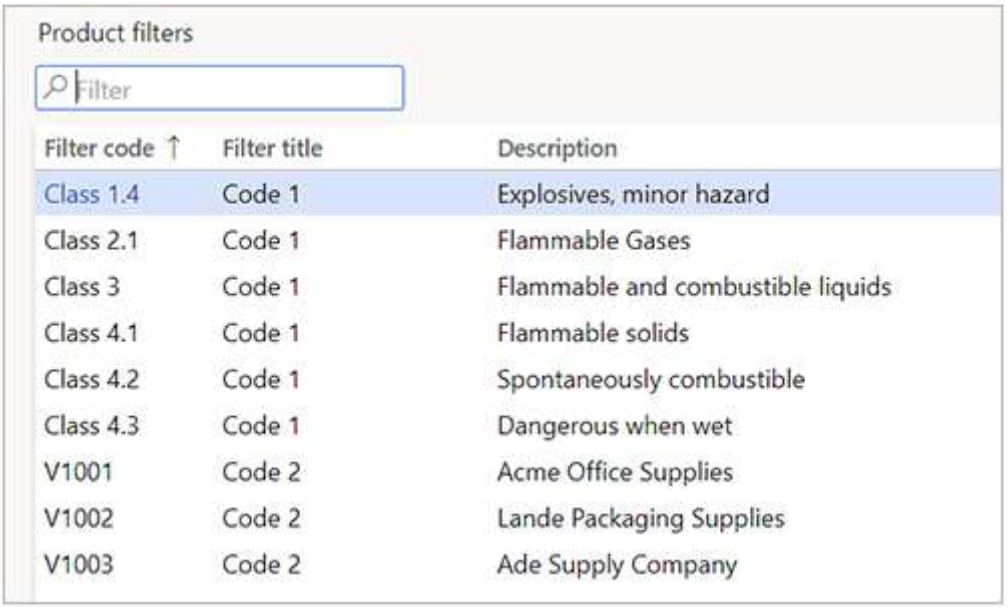
Set up product filters

Product filters provide up to 10 **Filter title** characteristics, which are enumeration (enum) values. You can select these enum values when you create a product filter. The enum values *Code 1* through *Code 10* are system-defined and represent a specific characteristic or attribute of an item. For example, *Code 1* might represent items that have a hazardous material classification. *Code 2* might represent items that only vendors can purchase. Product filters then define the specific **Filter code** value that is associated with a **Filter title** value.

1. Go to **Warehouse management** > **Setup** > **Product filters** > **Product filters**.
2. On the Action Pane, select **New** to add a product filter to the grid.
3. In the **Filter title** field, select a value.
4. In the **Filter code** field, enter a value.



5. In the **Description** field, enter a name for the code. For example, *Code 2* might represent vendors. You can then create a product filter for a specific vendor or group of vendors. To learn more, see the Setup vendor filter codes section later in this article.



Set up product filter groups

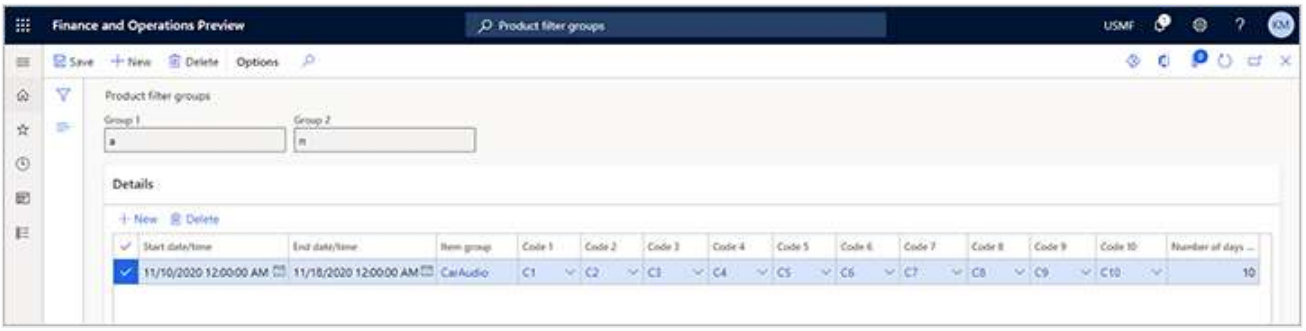
Use filter groups to organize filter codes. This capability is helpful when a group is used in a query in a location directive and you want to search for the group instead of a series of codes. Each filter group is associated with an item group.

> **Important**
>
> Not all product filter groups are available for filter codes that are higher than *Code 4* (that is, *Code 5* through *Code 10*). For example, for released products, although all the product filter codes are added, the grouping of filter codes isn't updated. This behavior might be updated in later releases.

To set up filter groups, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Product filters** > **Product filter groups**.
2. On the Action Pane, select **New**.
3. In the **Group 1** and **Group 2** fields, enter the names that you can use to categorize items.
4. On the **Details** FastTab, select **New** to add a line.
5. In the **Start date/time** and **End date/time** fields, enter start and end dates for the filter group.
6. In the **Item group** field, select the item group that the product filter should apply to.

7. In the **Code 1** through **Code 10** fields, select the filter codes to include in the group, as required.



> **Note**
>
> If you receive an error message when you close the page, a code setup might be missing. On the **Item groups** page, you can make the codes mandatory for an item group by selecting the **Assign filter code 1 for item group**, **Assign filter code 2 for item group**, and so on, check boxes.

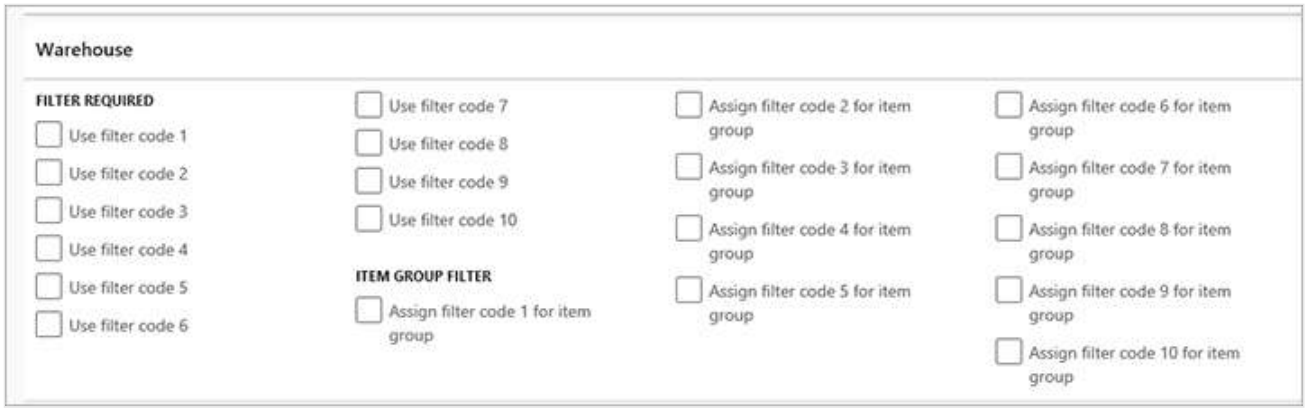
Set up filter codes on item groups

When you set up filter codes on an item group, you specify the codes required for products attached to that item group.

To set up filter codes on item groups, follow these steps:

1. Go to **Inventory management** > **Setup** > **Inventory** > **Item groups**.
2. On the Action Pane, select **New** to create an item group.
3. In the **Item group** field, enter a name.
4. In the **Name** field, enter a description.
5. On the **Warehouse** FastTab, in the **Filter required** section, select the check boxes for the filter codes that you must specify for products associated with the item group.

   To update a released product, open its **Released product details** page, and then, on the Action Pane, select **Edit**. The filters that are associated with codes then become available on the **Warehouse** FastTab.



6. In the **Item group filter** section, select the check boxes for the filters that must match for the filter group to be the default filter group for an item.

   For example, if you select the **Use filter code 1** and **Use filter code 2** check boxes, both filter code 1 and filter code 2 of the item must match the setup of the filter group for the item group before you can select the filter group. When you create a new item, the selected filter group is the default filter group in the **Group 1** and **Group 2** fields on the **Warehouse** FastTab of the **Released product details** page.

> ⓘ **Important**
>
> You can enable product filter codes only for items that use warehouse management processes (WMS).

Specify filter codes for released products

Follow these steps to specify filter codes for released products. For example, use filter codes to group hazardous products that specific vendors purchase.

1. Go to **Product information management** > **Products** > **Released products**.
2. On the Action Pane, select **New** to create a product.
3. In the **New released product** dialog box, enter the data required to create the base of a new product, and then select **OK**.

   Product filter codes aren't enabled unless the item group attached to the product is configured for filter codes.

4. On the **Warehouse** FastTab, in the **Product filter codes** section, select filter codes for the **Code 1** through **Code 10** fields, as required, to specify filter codes for the product.

Set up generally available items

You can make specific inventory items available only for customers, only for vendors, or for both customers and vendors.

> **Note**
>
> Customer and vendor filters don't apply to any item set up as generally available.

To set up generally available items, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Product filters** > **Generally available products**.
2. On the Action Pane, select **New** to create a record.
3. In the **Customer or vendor** field, select *Customer*, *Vendor*, or *All* to make the items available for customers, vendors, or both.
4. In the **Start date/time** field, enter the date and time when the item becomes available.
5. In the **Item group** field, select an item group.
6. In the **Code 1** through **Code 10** fields, select the filter codes to limit the items that are generally available.

   When you select an item group, you set that group of items as generally available. By selecting filter codes in these fields, you limit the items that are available.

Set up customer product filters

Use this optional procedure to specify items that customers can access, in addition to the items available through the filter setup on the **Generally available items** page. You can set up multiple filters for a single customer.

To set up customer filter codes, follow these steps:

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. Select a customer.
3. On the Action Pane, on the **Customer** tab, in the **Set up** group, select **Product filters**.
4. On the **Product filter codes** page, on the Action Pane, select **New**.

5. In the **Start date/time** and **End date/time** fields, enter start and end dates for the selected item group.
6. In the **Item group** field, select an item group.
7. In the **Code 1** through **Code 10** fields, select the filter codes to use as criteria to limit the items that are available for customers in the selected item group. You must make a selection for every filter code set up for the item group.

Set up vendor product filters

Use this optional procedure to specify items that a vendor can access, in addition to the items made available through the filter setup on the **Generally available items** page. You can set up multiple filters for a single vendor.

To set up vendor filter codes, follow these steps:

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Select a vendor.
3. On the Action Pane, on the **Vendor** tab, in the **Set up** group, select **Product filters**.
4. On the **Filter codes** page, on the Action Pane, select **New**.
5. In the **Start date/time** and **End date/time** fields, enter start and end dates for the selected item group.
6. In the **Item group** field, select an item group.
7. In the **Code 1** through **Code 10** fields, select the filter codes to use as criteria to limit the items that are available for vendors in the selected item group. You must make a selection for every filter code set up for the item group.

> ⓘ **Note**
>
> The setup of vendor product filters applies to released products where warehouse management processes (WMS) are enabled for the associated storage dimension group. The filter codes determine whether the system allows users to purchase a given item from a given vendor when they create purchase order lines. Microsoft Dynamics 365 Supply Chain Management has two methods for handling vendor approval. If one or more released products exist where the **Approved vendor check method** field is set to *Warning only* or *Not allowed*, both vendor approval methods can be enabled for those items. This situation might cause issues when users create purchase order lines.

Configure the transfer order receiving process

This article explains how to configure the receiving process for a warehouse. It includes information about the parameters that are available for warehouse receiving and how to configure them.

Prerequisites

Two fields are used to configure the receiving process. The **Transfer order receiving process** field is a standard part of all current versions of Microsoft Dynamics 365 Supply Chain Management. However, the **Transfer order receiving ASN cleanup** field requires Supply Chain Management version 10.0.44 or later.

Configure the receiving process for a warehouse

To configure the receiving process for a warehouse, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Receiving** FastTab, set the following fields:
    - **Transfer order receiving process** – Specify whether the registration and cost-update processes should be split for transfer orders.

      When the processes are split, receiving clerks can use the Warehouse Management mobile app to update a transfer order receipt without waiting for any financial background processing, regardless of the receiving flow. After the registration is completed, transfer order receiving can be done either manually or as part of a scheduled batch job.

      Select one of the following options:
        - *Combine the registration and receiving* – Run registration and receiving together.
        - *Split the registration and receiving for license plate receiving* – Run registration and receiving separately for license plate receiving.
        - *Split the registration and receiving for all flows* – Run registration and receiving separately for all flows.

> **Note**
>
> We recommend that you select the *Split the registration and receiving for all flows* option, because it covers all flows. By contrast, the *Split the registration and receiving for license plate receiving* option covers only license plate receiving.

- **Transfer order receiving ASN cleanup** – Specify when associated advance shipping notice (ASN) data should be deleted during transfer order receiving.

  This field covers scenarios where ASN data is required beyond the default settings of the receiving process. For example, it's applicable when you use both the Warehouse Management mobile app and the web client to partially receive a transfer order that has multiple license plates.

  Select one of the following options:

  - *Default* – ASN data is deleted when the following events occur:
    - Putaway work creation or cancellation
    - Mobile application receiving, if the work policy is set not to create work
    - Transfer order line registration from the web client
    - Transfer order receipt posting

  - *On transfer order status received* – ASN data is deleted when the following events occur:
    - Putaway work creation or cancellation
    - Mobile application receiving, if the work policy is set not to create work
    - Update of the transfer order status to *Received*

Related information

Location stocking limits

You can use the **Location stocking limits** page (**Warehouse management** > **Setup** > **Warehouse** > **Location stocking limits**) to control the load capacity at warehouse locations without having to use the more advanced processes for volumetric calculations of physical products.

The purpose of location stocking limits is to evaluate the maximum quantity that a location can contain. You can set up the feature on any of three levels, each of which has its own tab on the **Location stocking limits** page:

- Products
- Product variants
- Container types

For each level, you can define different field values. The system evaluates the capacity of a specific location, based on the **Quantity** and **Unit** values for each row. It selects the most detailed matching record first. For example, a row that has a value in the **Location profile ID** field is evaluated before a row that has a value only in the **Warehouse** field. The remaining capacity is also evaluated based on the **Quantity** value for the location stocking limit record that is used.

In the **Products** section of the page, you can define the following field values for the search for location stocking limits:

- Warehouse
- Location profile ID
- Location
- Pack size category ID
- Item number
- Unit

> ⓘ **Note**
>
> You don't have to define a **Unit** value for each location stocking limit record. The location capacity calculations are based on the inventory unit quantities. If no unit conversion is defined for a value that is used, the location stocking limit record is skipped as though another **Item number** value were defined for it.

For more information about how to set up stocking limits based on container types, see Manage inbound putaway based on container types.

> **Note**
>
> It's possible to allow stocking limits for specific locations to be exceeded for replenishment work. Learn more in Replenishment over location capacity.

Example – Purchase order receiving

This example is based on a clean *USMF* demo data set, where the following values are set on the **Product variants** tab of the **Location stocking limits** page.

Expand table

Warehouse	Location profile ID	Item number	Size	Quantity	Unit
24	FLOOR	D0013	M	300	Ea
24	FLOOR	D0013	L	240	Ea
24	FLOOR	D0013	S	360	Ea

Different unit of measure product variants are set up for the products. These variants are aligned with the location stocking limits for three pallets (PL):

- **Size M:** 1 PL = 100 each (Ea)
- **Size L:** 1 PL = 80 Ea
- **Size S:** 1 PL = 120 Ea

Therefore, each location where the **Location profile ID** value is set to *FLOOR* can carry *3 PL* of item number *D0013*.

Prepare for the example

In this example, you'll run a purchase order receiving flow for two lines. However, you must first update the demo data in the following way to ensure that the locations allow mixed items to be carried, only the empty locations *FL-002* through *FL-004* are used, and there's no open inbound work.

1. For location *FL-001*, change the value of the **Location profile** field from *FLOOR* to *FLOOR-05*.
2. For the *FLOOR* location profile, set the **Allow mixed items** option to *Yes*.
3. Create a purchase order that has the following two lines.

Expand table

Warehouse	Item number	Size	Quantity	Unit
24	D0013	S	4	PL
24	D0013	L	4	PL

Process the example

You'll first receive a quantity of *4* of unit *PL* in size *S*, and review the put line locations for the work that is created. You'll then receive a quantity of *4* of unit *PL* in size *L*, and review the put line locations for the work that is created.

1. In the Warehouse Management mobile app, sign in by using *24* as the user ID and *1* as the password.
2. Select **Inbound** > **Purchase Receive**.
3. Receive *4 PL* of item number *D0013* in size *S*.
4. Review the putaway work that was created. You should see the following result:
    - 3 PL -> FL-002
    - 1 PL -> FL-003
5. Receive *4 PL* of item number *D0013* in size *L*.
6. Review the putaway work that was created. You should see the following result:
    - 1 PL -> FL-003
    - 3 PL -> FL-004

Based on the results, you might conclude that the system failed to allocate the correct putaway locations. Otherwise, why did the system add only *1 PL* of size *L* to location *FL-003* in the last step, not *2 PL*? That is, why isn't there a total of *3 PL* for putaway to that location?

To explain this apparent failure, you must understand the selection criteria for the location stocking limits. The system selects the most detailed matching record. In this example, the most detailed matching record is the line where the **Size** value is *L*, the **Quantity** value is *240*, and the **Unit** value is *Ea*. Because you already have open work from the previous receipt of a quantity of *120 Ea* of size *S*, the remaining capacity is calculated as *240 – 120 = 120 Ea*. Therefore, the remaining capacity can carry only *1 PL* of *80 Ea*.

> **Note**
>
> You can't use location stocking limits to control, for example, the replenishment of items that have different quantities in the same location. In this case, use a *replenishment template*.

Prevent multiple owners in warehouse locations

Overview

The *prevent multiple owners* feature prevents inventory owned by different legal entities or consigned from different parties from being stored in the same warehouse location. It helps you enforce inventory owner segregation in your warehouse by making sure that all the items in a given location have the same owner. This feature is essential for warehouses that manage inventory on behalf of multiple owners, such as third-party logistics (3PL) operations, consignment warehouses, warehouses running in warehouse management only mode, or warehouses supporting multiple legal entities with distinct ownership tracking requirements.

What is inventory owner tracking?

In Dynamics 365 Supply Chain Management, the **Owner** field in the inventory dimensions tracks inventory ownership of each item. This field identifies which legal entity or external party owns a specific inventory lot, enabling proper tracking and settlement in multi-owner scenarios. Location profiles that use the **Prevent multiple owners** constraint enforce rules that make sure that all inventory items in a location share the same **Owner** value.

When to use this feature

Consider using the *prevent multiple owners* feature in any of the following scenarios:

- **Warehouse management only (WMS-only) mode** – You manage inventory for multiple legal entities or external parties and need to enforce segregation of ownership at the location level.
- **Multi-owner warehouses** – You manage physical inventory owned by multiple legal entities and need to segregate their stock.
- **Third-party logistics (3PL)** – You manage consigned inventory from multiple suppliers or customers and need to prevent cross-mingling.
- **Consignment operations** – You track and manage consigned inventory separately from owned inventory and need location-level guarantees.
- **Regulatory compliance** – Your industry or operational model requires documented segregation of ownership.

Benefits

The *prevent multiple owners* feature provides the following benefits:

- **Prevents ownership disputes** – Eliminates ambiguity about which owner inventory belongs to when stock is physically co-located.
- **Operational clarity** – Warehouse operators receive clear, immediate feedback when they attempt to violate the constraint.
- **Compliance support** – Simplifies audit trails and regulatory compliance by enforcing segregation rules consistently.
- **Automated constraints** – Reduces the need for manual workarounds or bypass procedures.

How the feature works

Core behavior

When you turn on the **Prevent multiple owners** constraint for a location profile, the system enforces the following rules for locations that use that profile:

- Each location can only store inventory for a single owner.
- An empty (undefined) owner value is treated as a distinct owner, so inventory with an empty owner value can only be mixed with other inventory that also has an empty owner value.

When the system evaluates ownership

The system evaluates the **Prevent multiple owners** constraint at three key stages:

1. **Putaway operations** – When the system selects a location for received or internal-order inventory, it confirms that the location's current inventory (if any) belongs to the same owner.
2. **Manual location changes** – When a warehouse operator manually reassigns inventory to a new location using a mobile device, the system verifies the owner compatibility before it allows the move.
3. **Replenishment operations** – When the system triggers replenishment to refill a picking location, it respects the owner constraint by selecting inventory of the same owner.

Error handling and operator feedback

If a manual location change violates the constraint, the system rejects the change with a label-driven error before any posting occurs.

If automatic location selection fails due to owner mismatches, the system triggers immediate replenishment to build new capacity for the incoming owner's inventory.

When an operator attempts to putaway inventory to a location that violates the **Prevent multiple owners** constraint, the mobile device displays a dedicated error message. The message informs the operator that the location already contains inventory owned by a different party, and suggests alternative locations.

Relationship to other mixing constraints

The **Prevent multiple owners** constraint works alongside the other mixing constraints available for location profiles:

- **Allow mixed items** – Controls whether different products can coexist in a location.
- **Allow mixed batches** – Controls whether different batch lots can coexist in a location.
- **Allow mixed status** – Controls whether inventory with different statuses (such as *Available*, *On-order*, or *Damaged*) can coexist in a location.

The system evaluates all constraints together. If any constraint is violated, the location isn't considered as a putaway candidate.

Prerequisites

To use the *prevent multiple owners* feature, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.49 or later.
- Your warehouse must be enabled for warehouse management processes (WMS) and use location-directive-driven operations.
- The tracking dimension groups that apply to the relevant items must include the **Owner** dimension.

Configure a location profile to prevent multiple owners

Enable the owner-segregation constraint as needed for each relevant location profile. After you complete this procedure, any location that uses the updated profile is subject to the owner-mixing checks described in the How the feature works section, both during putaway and during manual location changes. Repeat this procedure for each location profile that should enforce single-owner storage.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. In the list of location profiles, select the profile you want to configure. If it doesn't exist, select **New** to create one.
3. On the **Action Pane**, select **Edit**.
4. On the **General** FastTab, set **Prevent multiple owners** to *Yes* to enforce single-owner segregation for locations that use this profile.

   > ⓘ **Note**
   >
   > The **Prevent multiple owners** option is independent of the other mixing constraints (**Allow mixed items**, **Allow mixed batches**, **Allow mixed status**). You can freely combine these constraints as needed.

   > ⓘ **Important**
   >
   > When you change **Prevent multiple owners** from *No* to *Yes* for a location profile that already contains inventory, the system checks to make sure that no existing inventory violates the new constraint. If it detects violations, you see an error dialog that lists locations and their current inventory owners. Perform one or more of the following actions based on the content of the error message. Then try to enable the option again.
   >
   > - **Relocate inventory** – Move inventory with different owners to separate locations manually or according to a transfer order.
   > - **Reserve capacity** – Create new locations dedicated to specific owners.
   > - **Schedule the change** – Enable the constraint during a maintenance window when relevant locations are empty.

5. Select **Save**.

Set up the Inventory owner dimension on a tracking dimension group

Inventory ownership is tracked through the **Owner** dimension on the tracking dimension group that is assigned to your items. If this dimension isn't active, the **Owner** field stays blank on

inventory transactions, and the *prevent multiple owners* checks described in the How the feature works section have nothing to compare against. Use this procedure to enable the **Owner** dimension on each tracking dimension group that applies to items that you want to segregate by owner.

> **Important**
>
> Activating the **Owner** dimension changes the inventory tracking model for any item that uses the group. Plan the change carefully for items that already have on-hand inventory or open transactions, and follow your organization's standard process for modifying tracking dimension groups.

1. Go to **Product information management** > **Setup** > **Dimension and variant groups** > **Tracking dimension groups**.
2. Follow one of these steps:
   - On the Action Pane, select **New** to create a tracking dimension group. Enter a name and description, and then select **Save** on the Action Pane.
   - In the list pane, select the existing tracking dimension group that you want to update.
3. On the **Tracking dimension** FastTab, in the **Owner** row, select the checkboxes in the **Active** and **Physical inventory** columns.
4. Select **Save**.
5. Assign the tracking dimension group to each released product that you want to track by owner. To do this, go to **Product information management** > **Products** > **Released products**, where you can assign a **Tracking dimension group** to each new or existing released products.
   - For new products, assign a **Tracking dimension group** in the dialog when you create the released product.
   - For existing products, go to the Action Pane, open the **Product** tab and, from the **Set up** group, select **Dimension groups**. In the drop-down dialog, set the **Tracking dimension group** field.

Assign an inventory owner to inventory

After you activate the **Owner** dimension on a tracking dimension group, you must also assign an actual owner value to the inventory that flows through your warehouse. The *prevent multiple owners* feature compares these owner values when it evaluates location candidates, so any inventory that doesn't have an owner assigned is treated as belonging to a separate, *empty owner* group, as described in the How the feature works section.

Assigning an owner to inventory has two parts: registering each party that can own inventory, and then making sure that owner is set on inbound and internal transactions.

Register inventory owners

Register inventory owners before referencing them on transactions. Inventory owners are typically either vendors that consign stock to your warehouse or other legal entities for which you manage inventory.

- If you're using warehouse management only (WMS-only) mode, each source system setup must have a *Warehouse inventory owner* configuration that contains a mapping for every **Owner** value that the source system might send in an order line. The mapping ensures that the system can recognize the owner and assign it to inventory transactions. To make the configuration, open the relevant source system record and select **Warehouse inventory owner** on the Action Pane. Learn more in Configure your source systems.

- If you're not using WMS-only mode, register inventory owners on the **Inventory owners** page. Go to **Inventory management** > **Setup** > **Dimensions** > **Inventory owners** and, for each owner, make the following settings:
  - **Vendor account** – Select the vendor that owns the inventory. The **Name** and **Owner** fields are populated automatically.
  - **Owner** – Optionally, enter an owner value that's easier for external parties (such as the vendor) to recognize. You can edit this field only until you save the record.

Set the owner on inventory transactions

After you register owners, the **Owner** value flows onto inventory through the transaction that brings the stock on hand or changes who owns it. Use the appropriate method for your scenario:

- **Consignment replenishment orders** – When you create a consignment replenishment order for a vendor that's registered as an inventory owner, the vendor is set as the owner on each order line automatically. The product receipt update then registers physical on-hand inventory under that owner. For details, see Set up consignment.

- **Inventory ownership change journal** – Use a journal of type *Ownership change* to transfer existing on-hand inventory from one owner to another (for example, from a vendor to your own legal entity when you consume consignment stock). Create the journal from **Inventory management** > **Journal entries** > **Items** > **Inventory ownership change**.
- **Other inbound transactions** – For purchase orders, transfer orders, and inbound shipment orders, open the order, select a line, and on the **Line details** FastTab, open the **Product** tab and assign the **Owner**.

> ⓘ Note
>
> If you post an inventory transaction without an owner value, the resulting on-hand inventory is tracked under an empty owner. Locations that use a profile where **Prevent multiple owners** is set to *Yes* then treat that inventory as incompatible with any inventory that has a non-empty owner, and the reverse.

Example configuration

The following end-to-end example shows how the *prevent multiple owners* feature works. It illustrates one of the scenarios where the feature is most useful—a third-party logistics (3PL) warehouse—and demonstrates how location profiles, zones, and location directives work in combination with the **Prevent multiple owners** constraint to keep each owner's inventory segregated.

In this example, your 3PL warehouse stores consigned inventory from two customer partners (Partner A and Partner B). You want to prevent their stock from commingling. Therefore, you might configure your warehouse as follows:

1. Create two location profiles:
    - Name the first profile *3PL-PARTNER-A* and set **Prevent multiple owners** to *Yes*.
    - Name the second profile *3PL-PARTNER-B* and set **Prevent multiple owners** to *Yes*.
2. Assign locations in zone A to use the *3PL-PARTNER-A* profile and locations in zone B to use the *3PL-PARTNER-B* profile.
3. Configure location directives and putaway templates to route Partner A inventory to zone A and Partner B inventory to zone B.
4. When receiving Partner A inventory:

- The system automatically assigns it to a zone A location using the *3PL-PARTNER-A* profile.
- If a location is full, the system finds alternate locations within zone A with the same owner already present.
- If no available capacity exists for Partner A's owner, the system either suggests a new empty location or initiates replenishment to free capacity.

Day-to-day warehouse operations

After you configure location profiles to prevent multiple owners, day-to-day warehouse operations must align with the new constraint so that putaway, replenishment, and manual moves continue to flow smoothly. The following sections describe what warehouse managers should plan for, how operators should respond on the mobile device, and how to recover when the system can't find a compatible location.

For warehouse managers

As a warehouse manager, your role is to make sure the location-profile configuration translates into a workable physical layout and that operators have enough capacity per owner to keep putaway flowing. The following planning and monitoring activities help you avoid *owner mismatch* errors and capacity issues:

- **Monitor owner segregation** – Use the warehouse location master data to confirm that locations assigned to constrained profiles contain expected inventory owners.
- **Plan location allocation** – Allocate sufficient location capacity to each owner based on forecasted volumes.
- **Coordinate with 3PL partners** – If you manage multiple partners' inventory, agree on owner-assignment conventions to avoid empty-owner ambiguity.

For warehouse operators

Warehouse operators typically use a mobile device or terminal and barcode scanner to manage putaway, picking, and manual relocation tasks. The system handles owner segregation automatically in most cases, but operators need to know how to respond when a location is rejected so they don't bypass the **Prevent multiple owners** constraint or accidentally commingle stock.

During putaway:

1. Scan the item and owner code as directed by your receiving process.

2. The system automatically selects a location respecting the owner constraint.
3. If you see an error message that the location already has inventory from a different owner, *do not manually override it*. The constraint exists to prevent commingling. Instead, take these steps:

    - Confirm with your supervisor that the inventory owner is correct.
    - Wait for the system to suggest an alternate location (usually automatic).
    - If prompted, manually select an alternate location suggested by the system.

When manually relocating inventory:

1. Always verify the inventory owner before reassigning to a new location.
2. If the system rejects your location change due to owner mismatch, it means that the location is incompatible. Choose a location that already contains inventory of the same owner, or an empty location if available.

When putaway fails

If the system can't find an available location due to owner constraints, it performs one of the following actions:

- **Recover automatically** – The system might trigger immediate replenishment to consolidate and free capacity for the new owner.
- **Provide operator guidance** – The mobile device or work queue displays a message that explains the constraint and suggests next steps.
- **Wait for manual intervention** – In rare cases, a supervisor might need to manually relocate existing low-priority inventory to free capacity.

Interaction with location directives

Location directives control where inventory is placed during putaway and picking. When the **Prevent multiple owners** constraint is active, the system implements the following behaviors to ensure that directives respect owner segregation:

- **Strategy refinement** – The system augments location-directive logic to include owner as a grouping dimension alongside item, batch, and status.
- **Multi-step filtering** – Location selection first applies traditional directive criteria (zone, aisle, and so on), then filters by compatible owners.
- **Replenishment triggers** – If the directive is set to enable immediate replenishment, a failed putaway due to owner mismatch triggers replenishment, which is similar to item or batch

mismatches.

For example, suppose you have a directive that routes all purchase order receipts to a bulk location. The system evaluates the directive as follows depending on whether the **Prevent multiple owners** constraint is enabled:

- **Without owner constraint** – Each item is placed in any bulk location that has available capacity.
- **With owner constraint** – Items are only placed in bulk locations that exclusively contain items for the same owner. If no suitable bulk location exists, the directive might select a different location class or trigger replenishment.

Troubleshooting

Inventory owner information isn't available

Symptom

The system doesn't show inventory owner information on location or work displays.

Resolution

Confirm that the tracking dimension group for your items includes the **Owner** field. If it's missing, add it to the tracking dimension group for the items, and then perform a new receipt to generate inventory with owner tracking.

Changing Prevent multiple owners from *No* to *Yes* fails

Symptom

When you try to enable **Prevent multiple owners** on a location profile, the system displays an error dialog that lists conflicting inventory.

Resolution

To resolve the conflict, do one of the following actions:

- Relocate the conflicting inventory to other locations that don't use this profile.
- Create separate location profiles for each owner and adjust your location assignments.

When the location is empty or contains only single-owner inventory, try again to enable the constraint.

Operators frequently receive "owner mismatch" errors

Symptom

Warehouse operators report frequent constraint-violation errors during putaway.

Possible causes

This problem can occur for any of the following reasons:

- **Insufficient segregated capacity** – You allocated too few locations to each owner. Expand the location pool or reduce expected volumes.
- **Incorrect owner assignment** – Incoming inventory is being tagged with the wrong owner code. Review the receiving process and incoming document data.
- **Directive misconfiguration** – Location directives might not be routing inventory to the correct owner-dedicated locations. Review directive sequencing and query criteria.

Resolution

To resolve the issue, consider these steps:

- Work with your warehouse planner to rebalance capacity allocation per owner.
- Audit incoming data quality and owner-assignment rules.
- Review location directives to ensure they route inventory by owner correctly.

Frequently asked questions

Does the "Prevent multiple owners" constraint apply during cycle counting?

No. Cycle counting is a physical inventory verification process and doesn't enforce putaway constraints. However, if cycle counting reveals that a location contains inventory with multiple owners (from inventory that was placed before the constraint was enabled), you should relocate one owner's stock to another location to comply with the constraint going forward.

What happens if an owner code is empty or null?

The system treats empty owner values as a distinct owner and only mixes them with other inventory that also has an empty owner. This approach prevents accidentally commingling unowned inventory with owner-specific inventory.

Can I enable both "Prevent multiple owners" and "Allow mixed items" on the same location profile?

Yes. Both constraints work independently. The location allows multiple items but only from the same owner.

Does this feature support multi-owner inventory transfers?

The constraint prevents storing multi-owner inventory in the same location. To transfer inventory between owners, you must use a separate transfer order and ensure inventory passes through a quarantine or staging location configured to allow multiple owners (that is, with the constraint disabled).

If I disable "Prevent multiple owners", what happens to existing inventory?

Disabling the constraint doesn't automatically move inventory. Existing multi-owner inventory (if any) remains in place. Disabling simply stops enforcing the constraint for future putaway operations.

Configure wave processing example

This article provides an example of how to set up the criteria that determine what work is generated for a warehouse when a wave is processed, and whether waves are processed manually or automatically. You specify the criteria by setting up wave templates and queries that match a wave with released lines in sales orders, production orders, or kanban orders.

Enable sample data

To work through this scenario using the sample records and values specified here, use a system where the standard demo data is installed. You must also select the **USMF** legal entity before you begin.

Example scenario: configure wave processing

This example scenario walks through many of the diverse settings that affect how waves are created, populated, processed, and released.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select **New**.
3. In the **Wave template name** field, type a value. When you set up a wave template, specify the sequence in which the templates are matched to released lines on sales orders, production orders, or kanbans. When a line is released to the warehouse or to production, it uses the first wave template that it meets the criteria for. Put templates with the most specific criteria at the top of the list. The broader the criteria, the more likely it is for a line to meet the criteria, and this condition could lead to lines being assigned to the wrong wave.
4. In the **Wave template description** field, type a value.
5. In the **Site** field, enter or select a value. If you're using USMF, you can select site 2.
6. In the **Warehouse** field, enter or select a value. If you're using USMF, you can select warehouse 24.
7. Set the **Automate wave creation** field to **Yes**. Select this option to automatically create a wave when a sales order, production order, or kanban is released to the warehouse.

8. Set the **Process wave at release to warehouse** option to **Yes**. Select this option to automatically process the wave and create work when a line is released to the warehouse.

9. Set the **Automate wave release option** to **Yes**. Select this option to automatically release the wave. The picking work is created and made available on mobile devices.

10. Set the **Assign to open waves option** to **Yes**. Lines are assigned to waves based on the query filter for the wave template.

11. Set the **Process wave automatically at threshold option** to **Yes**. Select this option to automatically process the wave when its values reach the thresholds for weight, shipment, and lines specified in the **Wave thresholds** field group. This option is available only if **Shipping** is selected in the **Wave template type** field.

12. Set the **Automate replenishment work release option** to **Yes**. Select this option to create demand-based replenishment work and release it automatically. You must add the replenishment wave method to the wave template, and create a replenishment template using the **Wave demand** type.

13. Use settings in the **Default values** field group to assign wave attributes. Wave attributes act as filters, to restrict the kind of items that can use the wave. For example, you could specify an item group.

14. Expand the **Methods** section and set the actions taken by the wave template. Wave template methods allow you to control the sequence of activities that each wave goes through when it's processed. For example, you might have a method for wave replenishment. When you add a method, it's automatically listed in the appropriate location in the sequence of steps. If you set the **Automate replenishment work release** option to **Yes**, you need to add the replenish method here.

15. Select **Save**.

16. Close the page.

17. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.

18. Expand the **Wave processing** section.

19. In the **Wave processing batch group** field, enter or select a value.

20. Set the **Process waves in batch option** to **Yes**.

21. In the **Wait for lock (ms)** field, enter a number. Enter the time, in milliseconds, that an allocation step waits for a system resource that is locked by another allocation step. When this time is exceeded, the wave isn't processed and an error message is displayed.
22. Select **Save**.
23. Close the page.
24. Go to **Production control** > **Setup** > **Production control parameters**.
25. In the **Release to warehouse** field, select an option.

    For sales orders and kanban orders, inventory must be reserved before the order is released to the warehouse. Otherwise, items or allocation lines can't be processed. For production orders, you can also select **Allow partial reservation**. For example, this option is useful if you have the materials that you need to start production, and can wait until the additional materials become available to finish the process. If you select this option, you must manually repeat the release to warehouse process when the additional materials become available.
26. Close the page.

Warehouse parameters for wave processing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to set up warehouse parameters for wave processing. You can use wave processing to group picking work for multiple work orders into a single wave.

To use wave processing, specify the following on the **Warehouse management parameters** page:

- If you can process waves by using a batch job.
- If you collect information in a log file when waves are processed.

Set up warehouse management parameters for wave processing

To set up warehouse parameters for wave processing, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.

2. On the **Wave processing** FastTab, make the following settings:

    - **Wave processing batch group** - Select the batch group to use when you process waves by using batch jobs. The batch group specifies the server that batch jobs will run on.
    - **Process waves in batch** - Choose whether to enable waves to be automatically processed by a batch job. You must set this to *Yes* to use parallel processing. You set up the batch job on the **Process waves** page. (See also the note at the end of this list.)
    - **Create wave progress log** - Choose whether the system should generate a log record every time allocation for an item and its dimensions begins and ends. You should only enable this log when you need it, for example, during initial testing or for troubleshooting. Learn more in Wave allocation.
    - **Create wave processing history log** - Choose whether to automatically save information about a wave in a log file after the wave is processed, including during the parallel processing of pending allocations. Typically you should only enable this

during troubleshooting because it adds extra overhead. To view the log, go to **Warehouse management** > **Outbound waves** > **Wave processing history log**. Learn more in Wave creation and processing.

- **Create containerization history log** - Choose whether to automatically save information about containerization for a wave in a log file after the wave is processed. To view the log, go to **Warehouse management** > **Packing and containerization** > **Containerization history**.
- **Wait for lock (ms)** - Enter the time, in milliseconds, that an allocation step will wait for a system resource that is locked by another allocation step. When this time is exceeded, the wave is not processed and an error message is displayed.

3. On the **Release to warehouse** FastTab, make the following setting:

    - **Error on batch failure** - Choose whether to generate an error when a release to warehouse batch job fails. If this is enabled, failed jobs will end with a status of *Error*. If this is disabled, failed jobs will end with a status of *Ended*.

> ⓘ **Note**
>
> On the wave template that is used to process the wave, you can specify the settings that automate wave processing. If you set up a schedule for the batch job, you should coordinate the timing with the settings for automation in the wave template. Learn more in Create a wave template.
>
> If you are using *Transportation management* and *warehouse management processes (WMS)*, you can specify whether to consolidate loads when you process a wave. For example, this is useful when several small loads can be shipped at the same time. To consolidate loads when you process a wave, on the **Loads** tab, select the **Consolidate loads during wave processing** check box.

Set up full or partial reservation for production waves

For sales orders and kanban orders, inventory must be reserved before the order is released to the warehouse. Otherwise, the items or allocation lines cannot be processed in a wave. However, production orders are slightly more flexible. For production orders, you can specify the following:

- Allow production orders to be released to the warehouse although all materials cannot be reserved. If you select this option, you must manually repeat the release to warehouse

process when the additional materials become available. For example, this is useful if you have the materials that you need to start a production, and can wait until the additional materials become available.
- Require that all materials are reserved before an order can be released to the warehouse.

To require full reservation or allow partial reservation, follow these steps:

1. Go to **Production control** > **Setup** > **Production control parameters**.
2. On the **General** tab, in the **Release to warehouse** field, select the default setting.

Wave templates

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to set up the criteria that determine whether waves are processed manually or automatically, and the work that is generated for a warehouse when a wave is processed. You specify the criteria by setting up wave templates and queries that match a wave with released lines in sales orders, production orders, and kanbans.

Settings for wave templates

When you set up a wave template, you specify the following:

- The **Site** and **Warehouse** that the template creates work for.
- The order in which the system evaluates the templates. This order determines how the templates are matched to released lines on sales orders, production orders, and kanbans. When a line is released, the system applies the first wave template whose criteria the line meets. The broader the criteria, the more likely a line is to meet them, so put the templates with the most specific criteria at the top of the list. Use the **Move up** and **Move down** buttons on the Action Pane to arrange templates in the list.
- The actions taken by each template. The wave **Methods** perform the actions that the template creates, such as creating or distributing work for each type of wave template.
- The wave attributes (filters) that must apply to use the wave template.

> **Note**
>
> If needed, a developer can create additional methods. You can view the full list of methods on the **Wave process methods** page.

Some settings represent strategic decisions for wave processing, as follows:

- If the template is used to ship items for sales, transfer, and outbound shipment orders, or to move items to production for production orders or kanbans.

- If a wave is processed manually or automatically, as follows:
  - **Manual processing** – The line is added to a wave, and the inventory is reserved. However, you must select **Process** on the **All waves** list page to create the picking work for the order.
  - **Automatic processing** – You can fully or partially automate wave processing. If you fully automate wave processing, a wave is created that includes the line from the sales order, production order, or kanban when a sales order, production order, or kanban is created. The items are deducted from on-hand inventory, and the picking work is created. If you partially automate wave processing, you can specify values that will trigger wave processing. For example, you can specify a maximum weight for shipments. Wave processing is then triggered when the total weight of the lines in the wave reaches that value.

- If you assign shipments to an open wave. For example, if you promise customers that an order placed by 12:00 PM will ship within 24 hours, you can set up the wave template to automatically assign order lines to an open wave until 12:00 PM. At that time, the wave is automatically processed.

When a wave is processed, the system creates picking work based on the work template and location directive specified for the warehouse. The work template specifies how picking work is created, and the location directive specifies the pick and put locations.

Create a wave template

To set up a wave template, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.

2. Select **New** to create a new wave template.

3. In the **Wave template type** field, select one of the following options:

   - *Shipping* - Use the wave template for shipping items for sales orders, transfer orders, and outbound shipment orders.
   - *Production orders* - Use the wave template to move items for production orders.
   - *Kanban* - Use the wave template to move items for kanban orders.

4. In the **Wave template name** and **Wave template description** fields, enter a name and a description for the wave template.

   > **Note**
   >
   > If more than one template exists for a warehouse, the number in the **Wave template sequence** field indicates the template's position in the sequence that is applied when the template's criteria are met. You can select **Move up** or **Move down** to rearrange the sequence of templates.

5. On the **Warehouse selection** FastTab, set the following fields to specify the warehouse and site where the wave template applies:

   - **Warehouse selection** – Select one of the following values:
     - *All* – Use the wave template for all warehouses where a more specific wave template hasn't been assigned.
     - *Warehouse group* – Use the wave template for all warehouses in the warehouse group that's selected in the **Warehouse group** field.
     - *Warehouse* – Use the wave template only for the specific warehouse that's selected in the **Warehouse** field.

   - **Site** and **Warehouse** – If the **Warehouse selection** field is set to *Warehouse*, select the site and warehouse where the wave template applies. If you select the warehouse first, the site is filled in automatically. If you select the site first, the warehouse list is filtered to show only warehouses at that site.

   - **Warehouse group** – If the **Warehouse selection** field is set to *Warehouse group*, select the warehouse group where the wave template applies. For more information about how to set up warehouse groups, see Warehouse groups.

6. If you want to automate wave processing, make the following settings as needed:

   - **Automate wave creation** - Set this to *Yes* to automatically create a wave when an order or kanban is released to the warehouse.
   - **Assign to open waves** - Set this to *Yes* to automatically assign lines to an open wave when the lines are released. Lines are assigned to waves based on the query filter for the wave template.
   - **Process wave at release to warehouse** - Set this to *Yes* to automatically process the wave and create work when a line is released to the warehouse.

- **Process wave automatically at threshold** - Set this to *Yes* to automatically process the wave when its values reach the thresholds for weight, shipment, and lines specified in the **Wave thresholds** field group. This setting is only active if *Shipping* is selected in the **Wave template type** field.
- **Automate wave release** - Set this to *Yes* to automatically release the wave. The picking work is created and made available on mobile devices.
- **Automate replenishment work release** - Set this to *Yes* to create demand-based replenishment work and release it automatically. You must add the replenishment wave method to the wave template, and create a replenishment template using the *Wave demand* type. Set up a replenishment template on the **Replenishment templates** page. This requires that you add the replenish method to the wave template.
- **Continue wave processing when work creation fails** - When set to *Yes*, the system uses a blank location if it can't reserve inventory at the location proposed by the location directive (for example, because the inventory is no longer available). When set to *No*, the wave fails if the system can't reserve the inventory.

7. Set the **Wave thresholds** field group as needed:

   - **Wave weight threshold** - Enter the maximum weight a wave can contain.
   - **Shipment threshold** - Enter the maximum number of shipments that can be included in a wave.
   - **Line threshold** - Enter the maximum number of lines that can be included in a wave.

8. In the **Default values** field group, select the wave attributes to use as additional criteria for the wave template. Wave attributes are useful for assigning additional criteria, such as a specific customer name, to a wave template. You create these attributes on the **Wave attributes** page.

9. Set **Wave notification policy** to the policy you want to use for generating notifications related to waves that use this template. For an example of a wave notification policy, see Wave execution notifications.

10. On the **Methods** FastTab, the **Selected methods** pane lists the methods for the selected wave template. The wave methods perform the actions that the template creates, such as creating or distributing work. These actions are also referred to as wave steps. Wave methods are predefined for each type of wave template. You can't remove the predefined wave methods. However, you can rearrange the order of the methods and add additional methods. For example, if you're creating a wave template for shipping, you can add methods for replenishment and containerization. Wave containerization can be added to a

sequence of wave methods to define the containerization of the lines processed in a wave template. To add an additional method, do the following:

- Select a method on the **Remaining methods** pane, and then select the **Add** button (right arrow) to add it to the **Selected methods** pane.
- To change the sequence, select a method, and then select **Move up** or **Move down** arrows.

> **Note**
>
> When you add a method, it's automatically listed in the appropriate location in the sequence of steps.

11. To set up the query that will match released lines to an appropriate wave, select **Edit query** on the Action Pane.
12. To verify that the wave template settings are valid, select **Validate template**.

Wave step codes

10/03/2025

Wave step codes are codes that users can set up and use to link specific instances of wave methods to a corresponding template. The templates include templates for replenishment, containerization, label printing, load building, and sorting.

When wave step codes aren't used, users must enter free text to reference a specific template from the wave method instance. Free text is prone to errors because users must make sure that the wave step text that they add for a specific wave step method in a wave template exactly matches the wave step text in the target template.

Wave step codes for a specific wave step type are set up on a separate page. For every wave step method instance in a wave template that requires a wave step code, the wave step code must be selected in a drop-down list. Selection in a drop-down list replaces free text entry and helps reduce the risk and impact of human error. Setup codes are used to link a wave step method in a wave template to a target template for the method.

> **Note**
>
> Use of the wave step codes feature is optional. It is enabled organization-wide for all legal entities.

Setup demo

For this demo, demo data must be installed, and you must use the *USMF* demo data company.

Create new wave step codes

You can use the **Wave step codes** page to create and delete wave step codes.

Every new wave step code and its associated ID must be unique across all wave step types, and they must be defined for a specific wave step type.

Apply wave step codes

After you've defined the appropriate wave step codes, they can be applied to the wave process methods.

To apply wave step codes, go to the appropriate target template. Here are the target templates that the wave step codes are designated to point to:

- **Replenishment templates:** Warehouse management > Setup > Replenishment > Replenishment templates
- **Load build templates:** Warehouse management > Setup > Load > Load build templates
- **Sort templates:** Warehouse management > Setup > Packing > Outbound sorting templates
- **Containerization templates:** Warehouse management > Setup > Containers > Container build templates
- **Label printing templates:** Warehouse management > Setup > Document routing > Wave label templates

The templates in this list are applied when they are referenced from a wave process method that is selected in a wave template. When the wave step code on a wave process method in a wave template matches the wave step code in one of the templates types, the template is applied.

Sample scenario

The following procedure helps guarantee that the replenishment template that you created will be applied for the wave template.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave step codes**, and create a wave step code for the **Replenishment** type.
2. Go to **Warehouse management** > **Setup** > **Replenishment** > **Replenishment templates**, and create a replenishment template.
3. In the replenishment template, select the wave step code that you created for the **Replenishment** type.
4. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**, and select the wave template that you intend to use.
5. In the template, on the **Methods** FastTab, select the **Replenishment** method.
6. In the **Wave step code** field, select the wave step code that you selected in the replenishment template.

You perform these steps for each legal entity.

Wave template grouping

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Wave template grouping enables the system to use wave template setups to determine, based on criteria that you define, how it should split released lines and assign them to new or existing waves. This feature can be useful in warehouses where waves are created based on specific criteria, but where managers prefer to create waves automatically instead of manually. It enables the system to add each newly released shipment to the first wave that it finds that has matching grouping field values. If no match is found, the system creates a new wave for the new shipment.

> **Important**
>
> Wave template grouping isn't supported for the work types *production raw material picking* or *Kanban picking*. This is because wave grouping is based on shipments and these work types don't use shipments.

Set a wave template to use wave template grouping

To make wave template grouping available, follow these steps to set up your wave template.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. In the left pane, select the wave template to set up. If you're preparing to work through the scenario later in this article by using demo data, select the **62 Shipping default** template.
3. Select **Edit** to put the page into edit mode.
4. On the **General** FastTab, set the following values:
    - **Automate wave creation:** *Yes*
    - **Assign to open waves:** *Yes*

- **Process wave at release to warehouse:** *No*

5. On the Action Pane, select **Edit query** to open the query dialog box.
6. In the query dialog box, on the **Sorting** tab, review the sorting criteria, and make sure that there is a rule that includes the field that you want to use to group your waves.

   If you're preparing to work through the scenario by using demo data, add a row that has the following values:

   - **Table:** *Shipments*
   - **Derived table:** *Shipments*
   - **Field:** *Carrier service*

     > ⓘ **Note**
     >
     > After you select this value, you might receive the following message: "Field Carrier service is not an index field. Do you want to add sorting on this?" Select **Yes** to add sorting.

   - **Search direction:** *Ascending*
7. Select **OK** to save your changes and close the query dialog box.
8. On the Action Pane, select **Wave template grouping**.
9. On the **Wave template grouping** page, select the **Group by** check box for each row that you want to use to group your order lines into waves, as required. If you're preparing to work through the scenario by using demo data, select the **Group by** check box for the *Carrier service* row.
10. Select **Save**.
11. Close the **Wave template grouping** page.
12. Select **Save** to save your template.

Scenario

This section provides a script that you can work through to learn what this feature does and how to work with it.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the **USMF** legal entity before you begin.

You can also use this scenario as guidance for using the feature when you work on a production system. However, in that case, you must substitute your own values, and you might be missing some types of required records that the standard demo data provides.

Scenario: Wave template grouping

This scenario shows how to use wave template grouping to automatically create multiple waves, based on grouping criteria that are defined in a wave template. In this scenario, the wave template is set up in the system to create one wave per carrier service.

Before you begin, prepare your wave template as described in the Set a wave template to use wave template grouping section earlier in this article. If you will be working with demo data for this scenario, be sure to use the demo data values that are suggested in that procedure. This setup will group your waves according to the carrier service that is set for each sales order.

Create sales order 1

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:
    - On the **Customer** FastTab, set the **Customer account** field to *US-004*.
    - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.
7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:
    - **Shipping carrier:** *Air cargo*
    - **Carrier service:** *Air*
8. Switch back to the **Lines** view.

9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:
    - **Item number:** *A0002*
    - **Quantity:** *2*
11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers.

View the wave that was created from sales order 1

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave ID that was created from the sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab.

Create sales order 2

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:
    - On the **Customer** FastTab, set the **Customer account** field to *US-005*.
    - On the **General** FastTab, set the **Warehouse** field to *62*.
4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.
7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:

- **Shipping carrier:** *Flower moving*
- **Carrier service:** *Std*

8. Switch back to the **Lines** view.
9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *1*

11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers. Notice that the wave ID differs from the wave ID of the first sales order.

View the wave that was created from sales order 2

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave ID that was created from the second sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab.

A new wave was created for this shipment, because it uses a different carrier service than the first sales order.

Create sales order 3

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select **New** to create a sales order.
3. In the **Create sales order** dialog box, set the following values:

- On the **Customer** FastTab, set the **Customer account** field to *US-006*.
- On the **General** FastTab, set the **Warehouse** field to *62*.

4. Select **OK** to create the sales order and close the **Create sales order** dialog box.
5. The new sales order is opened in the **Lines** view. Make a note of the sales order number.
6. Switch to the **Header** view.
7. On the **Delivery** FastTab, in the **Transportation** section, set the following values:

    - **Shipping carrier:** *Air Cargo*
    - **Carrier service:** *Air*

8. Switch back to the **Lines** view.
9. In the **Sales order lines** section, select **Add line** to add a line to the grid.
10. On the new line, set the following values:

    - **Item number:** *A0001*
    - **Quantity:** *1*

11. Select the new order line, and then, on the **Inventory** menu above the grid, select **Reservation**.
12. On the **Reservation** page, on the Action Pane, select **Reserve lot** to reserve the full quantity of the selected line in the warehouse.
13. Close the **Reservation** page to return to the sales order.
14. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.
15. You receive an informational message that shows the shipment and wave for this order. Make a note of the wave ID number and the shipment ID numbers. The shipment has been assigned to the existing wave from the first sales order.

View the wave for sales orders 1 and 3

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave ID that was created from the third sales order.
3. Select the wave ID link to open the wave details page.
4. Notice that the shipment has been added to the **Wave lines** FastTab, together with the shipment for the first sales order.

Last updated on 10/03/2025

Wave allocation

Article • 01/23/2023

Wave processing can be time consuming, and most of the processing time is spent in the allocation step and in the work creation step.

It is now possible to run each of these steps in parallel, which can improve the performance of the wave processing, and allow for a larger throughput of waves in the same warehouse. This article explains how to set up the wave allocation method to run in parallel. For more information about how to set up work creation to run in parallel, see Schedule work creation during wave.

Previously it was only possible to allocate one wave at a warehouse at a time. This constraint has been removed and replaced by a new constraint that only locks the item and dimensions that are above location in the reservation hierarchy. Dimensions above the location always include product dimensions. For example, if an item is configured using *Color*, then variants for *Red*, *Blue*, and *Yellow* could each be processed in parallel.

This means that if the same item with the same dimensions above the location is being allocated by one wave, other waves will have to wait to acquire a lock on the same item and dimensions. If the lock can't be acquired in a timely manner, an error will occur and the wave processing will fail.

In order to utilize parallel processing, the wave must run in batch.

Performance improvements

Performance benefits of parallel processing fall in two categories:

- **Improved throughput** - The throughput of waves will typically improve even if parallel processing isn't configured, especially for scenarios where there is no overlap of items within the waves.
- **Improvement of the allocation for a single wave** - Testing on customer data has shown a near 50% performance improvement after switching to parallel allocation. The parallel processing is done per items and dimensions above the location, so the improvements depend on how many different items a wave contains, the infrastructure available, and the duration of the allocation versus the duration of the work creation.

Configure parallel allocation

Warehouse management parameters

To use parallel allocation processing, go to **Warehouse management** > **Setup** > **Warehouse management parameters**, open the **Wave processing** tab, and make the following settings:

- **Wave processing batch group** - Select the batch group that the initial processing of the waves should use. The subsequent processing of allocation can be done using different batch groups.
- **Process waves in batch** - Set this to *Yes* to use parallel processing.
- **Wait for lock (ms)** - Enter the time, in milliseconds, that an allocation step will wait for a system resource that is locked by another allocation step. When this time is exceeded, the wave is not processed and an error message is displayed. We recommend that you allow at least a few seconds to allow for allocation of one logical unit to finish.

For information about these and other wave processing options on the **Warehouse management parameters** page, see Warehouse parameters for wave processing.

Wave process methods

To set up parallel processing:

1. Go to **Warehouse Management** > **Setup** > **Waves** > **Wave process methods**.
2. Select the `allocateWave` method in the grid.
3. On the Action Pane, select **Task configuration**.
4. The **Wave post method task configuration** page opens. This grid lists each warehouse where you have configured the `allocateWave` method. Parallel processing will only be used for warehouses that are listed. Use the Action Pane buttons to add or remove warehouses from the grid as needed.
5. For each warehouse, make the following settings:

    - **Maximum number of batch tasks** - Specify the number of batch tasks that should be used for the allocation for the selected warehouse. The optimal number of batch tasks depends on the infrastructure available and what other batch jobs are being processed on the server. Tests done on a four core environment that was dedicated to wave processing showed that using eight tasks produced good results.
    - **Wave processing batch group** - Specific batch groups can be used for different warehouses to allow the allocation processing to scale out per warehouse.

Enable or disable parallelization across all legal entities

We recommend that you set the `allocateWave` method to run in parallel across all legal entities because this helps to improve the performance of the wave processing. Starting in Supply Chain Management version 10.0.17, the *Wave parallelization for Allocate Wave method* feature is turned on by default for all new and updated installations, and can't be turned off again. After enabling this feature, the following occurs:

- The `allocateWave` method is updated to include a task configuration setting that lets you use the **Wave process methods** page to define the number of tasks that will run simultaneously, equivalent to the number of parallel processes. As a result, the time used on the allocate-wave step (which is typically 30% to 60% of the total processing time) is reduced by a factor roughly equivalent to the number of tasks. It's also possible to select which batch will be assigned to process these tasks. It's important to note that all of your legal entities will be configured to process waves in batch. For the warehouses that are already configured to process waves in batch, and for the warehouses that are already configured to use the `allocateWave` method in parallel, the existing configuration will be kept.
- By default, all the new legal entities are configured to process waves in batch. All new warehouses with the **Warehouse management processes** option enabled will have the `allocateWave` method configured to run in parallel by default.
- On the **Warehouse management parameters** page, **Process saves in batch** is set to *Yes* and **Wait for lock (ms)** set to a default 15 seconds. This means that all waves will be executed in batch. When a wave is running, it acquires a lock on the item and dimensions above location during the allocation step. When another wave processing task tries to acquire the same lock for the identical record, it is blocked until the current process is finished. The **Wait for lock (ms)** settings establishes the maximum time the system will wait before the lock is released.

Parallel allocation processing requires wave processing to run in batch. Therefore, you will reduce your wave processing performance if you turn off the **Process saves in batch** setting, especially if wave processing is using a parallel process as defined by the task configuration for the relevant wave methods.

If necessary, you can undo each of the settings made by default when the *Wave parallelization for Allocate Wave method* feature is automatically enabled for your instance. To do this:

- Go to **Warehouse management** > **Setup** > **Warehouse management parameters**. On the **Wave processing** tab, apply your preferred values for **Process waves in**

batch and **Wait for lock (ms)**.

- Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**. Select the `allocateWave` method. On the Action Pane, select **Task configuration** to open a page that lists each warehouse where the method is set to run in parallel. Modify or delete the number of batch tasks and the assigned wave group for each listed warehouse as needed.

Troubleshooting

Troubleshoot using the Action center

Because the batch framework is used, errors that occur during wave processing will be captured in Action center messages generated by each batch job. To read the batch jobs related to a wave:

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave you want to inspect.
3. On the Action Pane, open the **Wave** tab and, from the **Wave** group, select **Batch jobs**.

Wave processing is self-correcting, so any error detected during processing should be reported using the Action center.

A typical error related to parallel processing could be that two waves try to allocate the same item at the same time and one does not complete so that the other wave is unable to acquire a lock within the specified time. If this situation occurs, the batch jobs log will contain information stating that the lock for the item could not be acquired, in which case the wave that failed must be processed again.

Because the processing is happening in parallel, data must be maintained in different tables to track the state of the processing. This means that the logs for the batch jobs might contain errors such as duplicate key errors.

The errors from the batch tasks are also part of the batch jobs log. The most important information is typically at the bottom.

In rare cases, for example if the SQL connection ended, it is possible for the wave processing to end in an inconsistent state where the batch job appears to be running but the processing is stopped. The wave can't handle errors like this, so an attempt to clean up failed waves is done when the next wave runs. Alternatively, if the current wave is in an inconsistent state, perform the following steps:

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave you need to clean up.
3. On the Action Pane, open the **Wave** tab and, in the **Wave** group, select **Cleanup wave data**.

Troubleshoot using the wave progress log

If the **Create wave progress log** option is enabled on the **Warehouse management parameters** page, then a log record is created every time allocation for an item and its dimensions begins and ends. You should only enable this log when you need it, for example, during initial testing or for troubleshooting. When this option is enabled, you can view the log by taking the following steps:

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave you want to inspect.
3. On the Action Pane, open the **Wave** tab and, in the **Wave** group, select **Progress**.

Automatic rewaving of nonallocated shipment lines

Article • 04/26/2024

Automatic rewaving of nonallocated shipment lines automatically creates work orders for failed shipment lines. Therefore, those work orders don't have to be manually monitored and created.

Use of this feature requires only that warehouse administrators schedule the *Auto add shipments to wave* job to run as often as it's required. Each time that the job runs, it checks for uncompleted work that can be automatically rewaved. This feature boosts operational efficiency by reducing downtime and initiating work that couldn't previously be completed.

This feature is especially beneficial for high-volume businesses, where it can significantly enhance operational speed and efficiency. Here are some examples:

- A retailer can support continuous packing and shipping operations, even during inventory shortages.
- In high-velocity sales and production environments, goods can be sold before they reach the storage facility from the production line.

The rewaving feature collects shipments lines for inventory that couldn't be allocated during initial wave processing. It adds a **Failed shipment lines** page, where you can review the lines that are ready to be rewaved. A scheduled batch job regularly processes these lines, tries again to allocate inventory for them, and adds the lines to a new wave if inventory is available.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- To run the *Auto add shipments to wave* batch job, you must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.37 or later.
- To monitor the status of failed shipment lines by using the **Failed shipment lines** page, you must be running Supply Chain Management version 10.0.40 or later.

Wave and rewaving workflows

The standard wave workflow

The wave management process involves three key steps:

1. **Create a wave** – Group work orders, based on criteria such as the shipment date, priority, or item type, and add the group to a wave.
2. **Process the wave** – Pick items from inventory, pack them, and prepare them for shipment.
3. **Release the wave** – Ship the packed items to customers.

The rewaving workflow

The rewaving workflow ensures continuous, uninterrupted warehouse operations, even when a shipment line fails. It ends the need for manual monitoring of failed shipment lines and enables work to be automatically created and added to each wave. It proceeds in the following way:

1. **A shipment line fails while a wave is being processed** – The system removes the failed shipment line from the wave and continues to process the rest of the wave. A failed shipment line can occur if, for example, you don't have enough inventory at a particular picking location.
2. **Create a work placeholder for the failed shipment line** – The system creates a placeholder for the work that's required to process the failed shipment. It stores this placeholder in the *Failed shipment lines* table. (If you aren't using this feature on your system, a user must manually identify failed shipments and then create new work for them.)
3. **Replenish inventory** – Inventory at the picking location is replenished according to standard warehouse operations. That inventory then becomes available for shipment in the next wave.
4. **Automatically rewave** – At the next scheduled run of the *Auto add shipments to wave* batch job, the system checks the *Failed shipment lines* table for previously failed shipments and creates work for them.
5. **Add work to the next wave** – The *Auto add shipments to wave* batch job adds the newly created work to the next wave for processing.
6. **Control and remove placeholders for completed shipment lines** – The *Auto add shipments to wave* batch job ends by checking the *Failed shipment lines* table for records that were successfully processed (that is, their status is no longer *Open*) and that the *Shipment* table includes a shipment for. These records indicate shipment lines that were successfully rewaved. The system cleans up these placeholders by removing them from the table. The system tries to rewave a

shipment line up to five times. If a line fails on the fifth attempt, the system stops trying and marks that line as *Failed*.

7. **Cleanup shipment lines that failed rewaving** - The *Wave processing removed shipments cleanup* job runs and removes *Failed* shipment lines from the *Failed shipment lines* table. These shipment lines are removed from the *Failed shipment lines* table according to the configuration of the *Wave processing removed shipments cleanup* job.

To restart the rewaving process from the beginning, you must allow the cleanup job to remove the failed shipment lines that couldn't be rewaved and then manually add them to a new wave. Then, if a shipment line fails again, the rewave process starts over with the retry count reset to zero.

Enable rewaving for your system

To enable rewaving for your system, you must set up your system to process waves in batches. You must also schedule the *Auto add shipments to wave* batch job.

Enable wave processing in batches to allow for rewaving

Before you can use rewaving, your system must be set up to process waves in batch.

1. In the system settings, go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Wave Processing** FastTab, set the **Process waves in batch** option to *Yes*.
3. On the Action Pane, select **Save** to apply the new configuration.

Schedule the Auto add shipments to wave batch job

The rewaving process runs as a batch job that you must schedule to run as often as is required for your system. Follow these steps to set up the batch job.

1. Go to **Warehouse Management** > **Outbound Waves** > **Auto add shipments to wave**.

2. On the **Run in the background** FastTab, set the following fields:

    - Set the **Batch processing** option to *Yes*.
    - Make a note of the **Task description** value. The default value is *Auto add shipments to wave*, but you can change it. You can use this value to monitor and edit the job on the **Batch jobs** page.

3. Select the **Recurrence** link.

4. Use the fields that are provided to set up a schedule that defines how often the rewaving job runs, and how long it runs for.

5. Select **OK** to save your schedule for the job.

6. Select **OK** to create the job.

7. On the **Records to include** FastTab, you can define selection criteria to limit the set of shipment lines that's processed.

    - Select the **Filter** link to open a standard query editor dialog box, where you can add or remove filter criteria.
    - The **Records to include** FastTab lists each field name and value that you added by using the query editor.
    - The **Number of retries** filter is always included, and its value (*5*) is read-only. This setting indicates that the system will try to rewave each failed shipment line up to five times. If a line fails on the fifth attempt, the system stops trying and marks that line as *failed*.

Schedule the cleanup job

The cleanup job removes failed and old shipment lines from the *Failed shipment lines* table. You must schedule it to run as often as is required for your system. To set it up, follow these steps.

1. Go to **Warehouse Management** > **Outbound Waves** > **Wave processing removed shipment cleanup**.

2. On the **Parameters** FastTab, set the following fields:

    - **Cleanup rewave threshold** – Enter the maximum number of retries that the cleanup job allows for a shipping line before it removes that line from the *Failed shipment lines* table. The *Auto add shipments to wave* batch job allows for maximum of five retries, but you can remove shipping lines sooner by entering a lower value here. Values that are more than *5* have no effect.
    - **Last update older than given number** – Enter the maximum number of days that the cleanup job should allow a shipping line to remain in the *Failed shipment lines* table. It removes all shipping lines that are older than this value.

3. On the **Run in the background** FastTab, set the following fields:

- **Batch processing** – Set this option to *Yes*.
- **Task description** – The default value is *Wave Processing Removed Shipment*, but you can change it. Make a note of the value. You can use it to monitor and edit the job on the **Batch jobs** page.

4. Select the **Recurrence** link, and use the fields that are provided to set up a schedule that defines how often the cleanup job runs, and how long it runs for.
5. Select **OK** to save your schedule for the job.
6. Select **OK** to create the job.

Monitor the rewave process

Monitor failed shipment lines

To monitor shipment lines that must be rewaved, go to **Warehouse Management** > **Shipments** > **Failed shipment lines**. For each failed shipment line, the page shows the line ID, the line's current status, the reason for the failure, and the number of times that the system tried to rewave the line.

Monitor batch job status

To monitor the status of all batch jobs, adjust their schedules, and fix any issues that arise, follow these steps.

1. Go to **System administration** > **Inquiries** > **Batch jobs**.
2. Use the **Filter** field to find the relevant jobs, based on the value that you entered in the **Task description** field when you set up the job. (On this page, the field is named **Job description**.) The default description for this type of job is *Auto add shipments to wave*.
3. View basic status information about the job in the grid.
4. Select the **Job ID** value to view more details about the job. From the details, you can edit the job's status, change its recurrence schedule, set alerts, and more.

Unsupported processes

The rewaving feature doesn't support the following processes:

- Automatic work creation for inventory that's stored in locations that aren't configured for wave processing

- Continuous checks on inventory levels

Wave execution notifications

10/03/2025

The *Wave execution notifications* feature uses business events and the Action center to deliver notifications that are related to wave execution. It lets you specify the types of events that generate notifications, the warehouses that generate them, and the users who receive them.

The **Show messages** button (bell symbol) on the right side of the navigation bar indicates when an Action center message is available for the current user. The user can select the **Show messages** button to open the Action center and review the messages.

Business events occur when business processes are run. Business processes are made up of tasks. During a business process, the users who participate in it perform business actions to complete those tasks. Business events provide a mechanism that lets external systems receive notifications from finance and operations applications. In this way, the systems can perform business actions in response to the business events. Learn more in Business events overview.

Scenario: Send wave batch execution notifications to the Action center

This scenario shows the end-to-end flow for sending notifications about wave batch execution errors to a specific role via the Action center.

Make demo data available

To follow this scenario, you must have demo data installed, and you must select the **USMF** legal entity.

Make sure that waves are run in batch mode

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Wave processing** FastTab, set the **Process waves in batch** option to *Yes*.

> **Note**
>
> If you want to disable wave batch execution notifications, set the **Disable wave processing batch notifications** option to *Yes*.

Configure a wave notification policy

Wave notification policies define the types of notifications that are sent and the users who are notified.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave notification policies**.
2. Create a record that has the following settings:
    - **Wave notification policy:** *24BatchError*
    - **Description:** *Warehouse 24 wave batch error*
    - **Send notification on:** *Error only*
    - **To role:** *System administrator*

    > **Note**
    >
    > Because this scenario uses demo data, the *System administrator* role is selected for the sake of simplicity. Therefore, because you're signed in as a system administrator user, you will receive the notifications. However, in practice, you should usually select a more specific role to notify about wave batch execution errors, such as *Warehouse manager*.

3. On the Action Pane, select **Save**.

Configure a wave template

Wave templates let you link specific instances of wave methods to corresponding wave label templates.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. In the list pane, set the **Wave template type** field to *Shipping*, and then select the *24 Shipping Default* wave template for warehouse 24.
3. On the **General** FastTab, set the **Wave notification policy** field to *24BatchError*.

Configure a work template

Work templates are used during wave execution to generate work. For this scenario, wave execution should trigger an error. By setting the work template query to use a nonexistent warehouse, you will ensure that wave execution fails and therefore sends a notification.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.

2. In the list pane, set the **Work template type** field to *Sales orders* and then select the *24 SO Stage* work template for warehouse 24.
3. On the Action Pane, select **Edit query**.
4. In the query editor dialog box, on the **Range** tab, edit the following row (or add it if it doesn't exist):
    - **Table:** *Temporary work transactions*
    - **Derived table:** *Temporary work transactions*
    - **Field:** *Warehouse*
    - **Criteria:** Change the value from *24* to *Error*.
5. Select **OK**, and confirm the change.

Create a sales order and release it to the warehouse

1. Go to **Sales and marketing** > **Sales order** > **All sales orders**.
2. Create a sales order that has the following settings:
    - **Customer account:** *US-001*
    - **Warehouse:** *24*
3. On the **Sales order lines** FastTab, add a sales order line that has the following settings:
    - **Item number:** *A0001*
    - **Quantity:** *10*

    > **Note**
    >
    > These items and quantities are only examples. The specified warehouse must contain enough stock.

4. While the new line is still selected on the **Sales order lines** FastTab, select **Inventory** > **Reservation** on the toolbar.
5. On the **Reservation** page, on the Action Pane, select **Reserve lot**. Then close the page.
6. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

Notifications from wave batch job execution

Depending on the setup of your business events, you will eventually receive a notification about wave execution failure. The Action center message will resemble the following example and will include a link to the wave that failed.

> **Error during wave execution**
> An error occurred while executing wave USMF-000000001.
> Last messages: No Work was created for Wave USMF-000000001.
>
> **STATUS**
> Active
>
> Open wave details

Wave label printing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Wave label printing offers an alternative approach to label printing by introducing a new wave step method that lets you create and print labels directly from the wave template during wave execution. Therefore, the labels are available before workers run the work order on a mobile device. Workers can then attach the required labels during picking instead of after picking.

Wave label printing uses Zebra Programming Language (ZPL) to create label layouts. A label layout is divided into three sections (header, body, and footer) to allow for labels that have repeating structure. Wave label templates tell the system which label layout to use. You can specify which printer to use. You can also print labels on several printers at the same time, as you require. The **Wave label history** page shows a record of all labels that are created by using this setup.

You can print and collate labels based on work headers, you can print break labels per work header, and you can print container content labels, case labels, and other similar labels.

> **Note**
>
> This functionality doesn't replace existing label printing functionality that is based on document routing.

Wave label printing offers the following enhancements:

- Print labels according to the number of cartons on a single work line, without using containerization. (A "carton" is a unit designated on unit sequence group lines.)
- Print several different label sequences (for example, carton and pallet labels).
- Include label enumeration (for example, 1/124, 2/124, ... 124/124), and define the range of enumeration (for example, work line, load line, or shipment).

- Create and print a bill of lading ID on labels before the bill of lading is generated.
- Create a unique serial shipping container code (SSCC) for each carton, and include it on each label.
- Create GS1-compliant number sequences for bill of lading IDs and SSCCs.
- Reprint labels from both mobile devices and the rich client.
- Void labels (for example, in short pick scenarios), and reprint them.
- Clean up the wave label history.
- Improvements to document routing layouts are shared between document routing layouts and wave label layouts. (Learn more in Document routing label layouts.)

These enhancements make it more efficient to label cartons before palletization. They especially benefit companies that ship to large retailers that automatically confirm order receipts by scanning each carton separately.

> **Note**
>
> You can implement the configuration scenarios that are described in this article either separately or in combination, depending on your business requirements. You can design several wave label templates that work in sequence (as illustrated in scenario 3). For example, you can use scenario 1 to print carton labels and scenario 2 to print pallet labels (if pallets in stock vary in size and composition).

Scenario 1: Wave label printing where a single wave label is generated

This scenario shows how a company can print shipping labels for a large retailer that automatically confirms order receipts by scanning each carton separately.

This scenario shows the end-to-end flow.

Make demo data available for scenario 1

To follow this scenario, ensure that you have the demo data installed, and select the **USMF** legal entity.

Make sure that the wave label method is available for scenario 1

You might need to regenerate the wave process methods to make the wave label printing method available.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. Confirm that **waveLabelPrinting** is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.

Set up a wave template for scenario 1

Wave templates let you link specific instances of wave methods to a corresponding wave label template.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select a template, such as **62 Shipping Default**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, select the **Wave label printing** method, and set its **Wave step code** field to *PrintLabel*. For more information about wave step codes, see Wave step codes.

Create a wave label layout for scenario 1

The label layout controls what information is printed on the label and how it's laid out. Here, you enter the ZPL code that is sent to the printer.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label layouts**.
2. Create a record with the following settings:
    - **Label layout ID:** *Carton*
    - **Description:** *Carton (SSCC)*
3. On the Action Pane, select **Save**.
4. On the Action Pane, select **Wave label row settings**.

    The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.
5. Add a row with the following settings:
    - **Row Id:** *WaveLabel*

- **Row table name:** *WHSWaveLabel*
- **Row start position:** *0*

  This field defines the vertical position where the row begins on the label.

- **Row height:** *0*

  This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there's just one row in this example, set the value to *0* (zero).

- **Rows per page:** *1*

  This field defines the number of rows that can print on each label.

  > ⓘ **Note**
  >
  > This setup prints a separate ZPL label for each record in the wave labels table.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row with the following settings:

   - **Table:** *Work lines*
   - **Derived table:** *Work lines*
   - **Field:** *Work type*
   - **Criteria:** *Pick*

   This query ensures that only pick-type work lines print on the label, not put-type work lines.

9. If you want to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
10. Close the query editor dialog box.
11. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

plaintext

```
CT~~CD,~CC^~CT~
^XA~TA000~JSN^LT0^MNW^MTT^PON^PMN^LH0,0^JMA^PR8,8~SD15^JUS^LRN^CI0^XZ

^FD>;>800$WHSWaveLabel.WaveLabelId$^FS
^FT194,439^A0N,28,28^FH\^FDof^FS
</Row>
```

13. In **Body section**, in the **Label footer** field, enter ZPL code for the required footer. Here's an example.

```
plaintext
^PQ1^XZ
```

> ⓘ Note
>
> This setup prints one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

Your label is now ready to use.

Create a wave label type

Use wave label types to link wave label templates to a unit on unit sequence group lines.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label types**.
2. Add a wave label type that has the following settings:
   - **Label type:** *Carton*
   - **Description:** *Carton*

Set up unit sequence groups for scenario 1

Next, set up the unit sequence group for the wave label type.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Unit sequence groups**.
2. Select the **Ea Box PL** group.
3. For the **Box** line, set the **Wave level type** field to *Carton*.

> ⓘ Note

If a **Wave level type** is set on a unit of measure and a wave label template references the same type, wave label records are created for the total quantity on the work line, one for each unit. For example, setting the type on unit *Box* and given a work line for five boxes, then five wave label records are created. Another example is if the work line is for a single box, and one box equals ten Ea, and the wave label type is set on the unit *Ea*, then ten wave label records are created.

Create a wave label template for scenario 1

Next, create the wave label template for the wave label type.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label templates**.
2. Add a wave level template, and set the following values in the header:
    - **Label template name:** *Carton labels*
    - **Description:** *Carton labels*
    - **Wave step code:** *PrintLabel*
    - **Warehouse:** *62*
3. On the **General** FastTab, set the **Wave label type** field to *Carton*.
4. On the **Wave label template details** FastTab, add a new row that has the following settings:
    - **Label layout ID:** *Carton*
    - **Printer name:** Select an appropriate ZPL printer.
    - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)
5. On the Action Pane, select **Save**.
6. Optional: If you're setting up a customer-specific label design, create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row with the following settings:
    - **Table:** *Shipments*
    - **Derived table:** *Shipments*
    - **Field:** *Account number*
    - **Criteria:** Enter the relevant customer account number.

    When you finish, select **OK** to close the query editor dialog box.

7. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.
8. In the query editor dialog box, on the **Sorting** tab, add a row with the following settings:
    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Reference load line id (Record-ID)*
    - **Search direction:** *Ascending*
9. Select **OK** to close the query editor dialog box.
10. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.
11. On the Action Pane, select **Wave label template group**.
12. In the **Wave label template group** dialog box, select the row where the **Reference field name** field is set to *Reference load line id*, and then select the **Label build ID** check box for this row.

    > ⓘ **Note**
    >
    > This setup creates one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. You can print this label sequence on the label layout.

Configure number sequence extensions for scenario 1

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see Configure number sequence extensions.

Create a sales order and release it to the warehouse for scenario 1

1. Go to **Sales and marketing** > **Sales order** > **All sales orders**.
2. Create a sales order with the following settings:
    - **Customer account:** *US-001*

- **Warehouse:** *62*

3. Add two sales order lines with the following settings:

    - Sales order line 1:
        - **Item number:** *A0001*
        - **Quantity:** *9024*
        - **Unit:** *ea* (9024 ea = 376 Box = 47 PL)

    - Sales order line 2:
        - **Item number:** *A0002*
        - **Quantity:** *9016*
        - **Unit:** *ea* (9016 ea = 322 Box = 46 PL)

    > ⓘ **Note**
    >
    > The items and quantities that are provided here are only examples. You must use the unit sequence group that you defined earlier, define appropriate unit conversions from *ea* to *Box* to *PL* for them, and ensure they have stock in warehouse *62*. For more information, see Unit of measure and stocking policies.

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.

5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.

6. Repeat steps 4 and 5 for sales order line 2.

7. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

    The following events occur:

    - The system processes the created shipment by using the template that includes the label printing step. The label layout defines the format of the label, and the result is a label that is printed on the printer, which is selected in the label template.
    - Wave labels are generated and printed. The number of labels equals the number of cartons (in this example, 376 Box labels for line 1 and 322 Box labels for line 2).
    - A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs follow the **SSCC-18** number format.

You can view and reprint wave labels from the following pages. On the Action Pane of each page, on the **Shipments** tab, in the **Related information** group, select **Wave labels**.

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

Scenario 2: Wave label printing for containerization (without wave label records)

This scenario shows how to print wave labels when you use containerization to automatically split items into cartons and therefore don't require a wave label record. In this case, the container ID acts as a placeholder for the SSCC.

Here are the main differences between this scenario and scenario 1:

- **Wave label templates:** You don't select a wave label type on the wave label template, and you don't require a label build grouping. Otherwise, you configure the wave label template and link to the wave template in the same way that is described in scenario 1. You must leave the wave label type blank to prevent wave labels from being generated.
- **Wave label layouts:** You configure the wave label layout row settings for work lines instead of wave label records. You must configure the row setting for the label layout by using the **WHSWorkLine** table instead of the **WHSWaveLabel** table. The **Rows per page** setting controls the number of rows that the body section has.

This configuration is also suitable for business scenarios where multiple different items are packed into one labeled box or into a pallet, and this packing process can be defined by work creation (for example, work that is grouped by shipment).

This scenario shows the end-to-end flow.

Make demo data available for scenario 2

To follow this scenario, ensure that you have the demo data installed, and select the **USMF** legal entity.

Make sure that the wave label method is available for scenario 2

You might need to regenerate the wave process methods to make the wave label printing method available.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. Confirm that **waveLabelPrinting** is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.

Set up a wave template for scenario 2

Wave templates let you link specific instances of wave methods to a corresponding wave label template.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select a template, such as **63 Containerization**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, select the **Wave label printing** method, and set its **Wave step code** field to *PrintLabel*. For more information about wave step codes, see Wave step codes.

Create a wave label layout for scenario 2

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label layouts**.
2. Create a record with the following settings:
    - **Label layout ID:** *Carton*
    - **Description:** *Carton (SSCC)*
3. On the Action Pane, select **Save**.
4. On the Action Pane, select **Wave label row settings**.

    The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.
5. Add a row with the following settings:
    - **Row Id:** *WorkLine*
    - **Row table name:** *WHSWorkLine*
    - **Row start position:** *500*

This field defines the vertical position where the row begins on the label.

- **Row height:** *-50*

  This field defines the height of each row. The row height is positive for horizontal labels and negative for vertical labels.

- **Rows per page:** *5*

  This field defines the number of rows that can print on each label.

  > ⓘ **Note**
  >
  > This setup prints several ZPL labels per work, where each page can hold up to five work lines. For example, if a label is printed for a container that has 12 lines, three labels are printed. If you want to print a separate label for each pick line, set this value to *1*.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row with the following settings:
   - **Table:** *Work lines*
   - **Derived table:** *Work lines*
   - **Field:** *Work type*
   - **Criteria:** *Pick*
9. If you want to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
10. Close the query editor dialog box.
11. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```plaintext
CT~~CD,~CC^~CT~
^XA
```

```
^LH10,10
^FO0,0 ^AT ^FD$WHSWorkTable.ContainerId$ ^FS
^FO0,75 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
^FO0,150 ^AT ^FD$WHSShipmentTable.BillOfLadingId$ ^FS
```

12. In **Body section**, in the **Label body** field, enter ZPL code for the required body. Here's an example.

    plaintext

    ```
    <Row name="WorkLine">
    <Heading>
    //Optional heading for section of rows
    </Heading>
    ^FO0,450 ^AT ^FDItem ^FS
    ^FO200,450 ^AT ^FDQuantity ^FS
    ^FO0,[[YPos]] ^AT ^FD$WHSWorkLine.ItemId$ ^FS
    ^FO200,[[YPos]] ^AT ^FD$WHSWorkLine.QtyWork$ ^FS
    </Row>
    ```

13. In **Body section**, in the **Label footer** field, enter ZPL code for the required footer. Here's an example.

    plaintext

    ```
    ^PQ1^XZ
    ```

    > ⓘ **Note**
    >
    > This setup prints one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

Your label is now ready to use.

Create a wave label template for scenario 2

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label templates**.
2. Add a wave level template, and set the following values in the header:
    - **Label template name:** *Container labels*
    - **Description:** *Container labels*

- **Wave step code:** *PrintLabel*
- **Warehouse:** *63*

3. On the **Wave label template details** FastTab, add a row with the following settings:

    - **Label layout ID:** *Container*
    - **Printer name:** Select an appropriate ZPL printer.
    - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)

4. On the Action Pane, select **Save**.

5. Optional: If you're setting up a customer-specific label design, create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row with the following settings:

    - **Table:** *Shipments*
    - **Derived table:** *Shipments*
    - **Field:** *Account number*
    - **Criteria:** Enter the relevant customer account number.

    When you finish, select **OK** to close the query editor dialog box.

Configure number sequence extensions for scenario 2

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see Configure number sequence extensions.

Create a sales order and release it to the warehouse for scenario 2

1. Go to **Sales and marketing** > **Sales order** > **All sales orders**.

2. Create a sales order with the following settings:

    - **Customer account:** *US-001*
    - **Warehouse:** *63*

3. Add five sales order lines:

    - Sales order line 1:

    - **Item number:** *A0001*
    - **Quantity:** *10*

- Sales order line 2:
    - **Item number:** *A0002*
    - **Quantity:** *20*

- Sales order line 3:
    - **Item number:** *L0006*
    - **Quantity:** *20*

- Sales order line 4:
    - **Item number:** *L0100*
    - **Quantity:** *40*

- Sales order line 5:
    - **Item number:** *L0101*
    - **Quantity:** *50*

> ⓘ **Note**
>
> The items and quantities that are provided here are only examples. They must have stock in the specified warehouse.

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.

5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.

6. Repeat steps 4 and 5 for each additional sales order line.

7. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

   The following events occur:

   - The system processes the created shipment by using the template that includes the label printing step. The label layout defines the format of the label, and the end result is a label that has five lines and that is printed on the printer, which is selected in the label template.
   - A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs follow the **SSCC-18** number format.

You can reprint these wave labels by going to **Warehouse management** > **Enquiries and reports** > **Wave label history**.

Scenario 3: Wave label printing for multilevel labels

This scenario shows how to use the wave label printing functionality when the warehousing processes require several tiers of shipping labels. For example, you might need to print separate labels for cartons and pallets, and you might need to print a break label for a whole shipment. Break labels are a separate type of label that can be used as a divider between rolls and containers, such as labels for the shipment ID and a bar code, so that the labels can easily be sorted after they're printed.

The main difference between the configuration of this scenario and the configuration of scenario 1, besides the fact that break labels are enabled, is that multiple wave label types must be associated with wave label templates and unit sequence group lines. To accomplish this configuration, you set up the following elements for this scenario:

- **Wave processing methods:** Mark the wave label method as repeatable, add it two or more times to the wave template, and set different wave step codes.
- **Wave label templates:** Configure the wave label templates and link them to the wave template. Each wave label template has its own wave label type.
- **Wave label layouts:** Create multiple wave label layouts. There is a separate label layout for each tier of labels, and there is also a break label layout.

This scenario shows the end-to-end flow.

Make demo data available for scenario 3

To follow this scenario, ensure that you have the demo data installed, and select the **USMF** legal entity.

Set up a wave process method

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. Confirm that **waveLabelPrinting** is in the list. If it isn't, select **Regenerate methods** on the Action Pane to add it.
3. For the **waveLabelPrinting** method, select the **Make method repeatable** check box.

Set up a wave template for scenario 3

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select a template, such as **62 Shipping Default**.
3. On the **Methods** FastTab, move the **Wave label printing** method to the **Selected methods** column.
4. In the **Selected methods** column, assign a **Wave step code** value, such as *Carton*, to the **Wave label printing** method. For more information about wave step codes, see Wave step codes.
5. Move the **Wave label printing** method to the **Selected methods** column a second time.
6. In the **Selected methods** column, assign a different **Wave step code** value, such as *Pallet*, to the second **Wave label printing** method. For more information about wave step codes, see Wave step codes.

Create three wave label layouts for scenario 3

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label layouts**.

2. Create a record with the following settings:

   - **Label layout ID:** *Carton*
   - **Description:** *Carton (SSCC)*

3. On the Action Pane, select **Save**.

4. On the Action Pane, select **Wave label row settings**.

   The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

5. Add a row with the following settings:

   - **Row Id:** *WaveLabel*
   - **Row table name:** *WHSWaveLabel*
   - **Row start position:** *0*

     This field defines the vertical position where the row begins on the label.

   - **Row height:** *0*

     This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there's just one row in this example, set the value to *0* (zero).

- **Rows per page:** *1*

  This field defines the number of rows that can print on each label.

  > ⓘ **Note**
  >
  > This setup prints a separate ZPL label for each record in the wave labels table.

6. Close the page.
7. On the Action Pane, select **Edit query**.
8. In the query editor dialog box, on the **Range** tab, add a row with the following settings:

   - **Table:** *Work lines*
   - **Derived table:** *Work lines*
   - **Field:** *Work type*
   - **Criteria:** *Pick*

   This query ensures that only pick-type work lines print on the label, not put-type work lines.
9. If you want to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.
10. Close the query editor dialog box.
11. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

```plaintext

```

12. In **Body section**, in the **Label body** field, enter ZPL code for the required body. Here's an example.

plaintext

```
<Row name="WaveLabel">
^FT127,439^A0N,28,28^FH\^FD$WHSWaveLabel.SeqNum$^FS
^FT256,439^A0N,28,28^FH\^FD$WHSWaveLabel.NumberOfLabels$^FS

^BY4,3,283^FT66,1115^BCN,,N,N
^FD>;>800$WHSWaveLabel.WaveLabelId$^FS
^FT194,439^A0N,28,28^FH\^FDof^FS
</Row>
```

13. In **Body section**, in the **Label footer** field, enter ZPL code for the required footer. Here's an example.

plaintext

```
^PQ1^XZ
```

> **Note**
>
> This setup prints one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

14. The first label is now ready to use.

15. Create a second layout record with the following settings:

    - **Label layout ID:** *Pallet*
    - **Description:** *Pallet*

16. On the Action Pane, select **Save**.

17. On the Action Pane, select **Wave label row settings**.

    The **Wave label row settings** page appears. Here, you can configure the dynamic part of the label.

18. Add a row with the following settings:

    - **Row Id:** *WaveLabel*
    - **Row table name:** *WHSWaveLabel*
    - **Row start position:** *0*

      This field defines the vertical position where the row begins on the label.

    - **Row height:** *0*

      This field defines the height of each row (in points), according to the ZPL standard. The row height is positive for horizontal labels and negative for vertical labels. Because there's just one row in this example, set the value to *0* (zero).

    - **Rows per page:** *1*

      This field defines the number of rows that can print on each label.

      > **Note**

This setup causes a separate ZPL label to be printed for each record in the wave labels table.

19. Close the page.

20. On the Action Pane, select **Edit query**.

21. In the query editor dialog box, on the **Range** tab, add a row with the following settings:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Work type*
    - **Criteria:** *Pick*

    This query ensures that only pick-type work lines print on the label, not put-type work lines.

22. If you want to print the bill of lading ID, on the **Joins** tab, select the **Work lines** table, and join the **Shipments** table to it.

23. Close the query editor dialog box.

24. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter code for the required header. For example, if you're using Zebra printers, you can use the following code.

    plaintext

    ```
    CT~~CD,~CC^~CT~
    ^XA
    ^LH10,10
    ^FO0,0 ^AT ^FD$WHSWaveLabel.WaveLabelId$ ^FS
    ^FO0,75 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
    ^FO0,150 ^AT ^FD$WHSShipmentTable.BillOfLadingId$ ^FS
    ```

25. In **Body section**, in the **Label body** field, enter ZPL code for the required body. Here's an example.

    plaintext

    ```
    <Row name="WaveLabel">
    ^FO0,450 ^AT ^FDItem ^FS
    ^FO200,450 ^AT ^FDQuantity ^FS
    ^FO0,[[YPos]] ^AT ^FD$WHSWaveLabel.LabelItemId$ ^FS
    ```

```
^FO200,[[YPos]] ^AT ^FD$WHSWaveLabel.QtyWork$ ^FS
</Row>
```

26. In **Body section**, in the **Label footer** field, enter ZPL code for the required footer. Here's an example.

    plaintext

    ```
    ^PQ1^XZ
    ```

    > ⓘ **Note**
    >
    > This setup prints one copy of each label. If you require more copies (for example, one copy for each side of the pallet), set the **n** value for the **^PQn** section in the footer to the required number of copies. For example, to print four copies of each label, specify **^PQ4**.

27. The second label is now ready to use.

28. Create a third layout record that has the following settings:

    - **Label layout ID:** *Break*
    - **Description:** *Break label*

29. On the Action Pane, select **Save**.

30. The **Printer text Layout** FastTab has three sections where you can write printer code: **Header section**, **Body section**, and **Footer section**. In the **Header section**, in the **Label header** field, enter ZPL code for the required header. Here's an example.

    plaintext

    ```
    CT~~CD,~CC^~CT~
    ^XA
    ^LH10,10
    ^FO0,0 ^AT ^FD$WHSWorkLine.ShipmentId$ ^FS
    ```

31. This time, no body is required. Therefore, just enter the required text in the **Footer section**. Here's an example.

    plaintext

```
^XZ
```

The third label is now ready to use.

> **Note**
>
> This third label is a break label used as a divider between label rolls.

Create two wave label types

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label types**.
2. Create a record with the following settings:
    - **Label type:** *Carton*
    - **Description:** *Carton*
3. Create a second record that has the following settings:
    - **Label type:** *Pallet*
    - **Description:** *Pallet*

Set up unit sequence groups for scenario 3

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Unit sequence groups**.
2. Select or create an **Ea Box PL** group.
3. For the **Box** line, set the **Wave level type** field to *Carton*.
4. For the **PL** line, set the **Wave level type** field to *Pallet*.

Create wave label templates

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Wave label templates**.
2. Create a label template with the following settings:
    - **Label template name:** *Carton labels*
    - **Description:** *Carton labels*
    - **Wave step code:** *Carton*
    - **Warehouse:** *62*
3. On the **General** FastTab, in the **Wave label type** field, select a value, such as *Carton*.

4. On the **Wave label template details** FastTab, add a row with the following settings:

    - **Label layout ID:** *Carton*
    - **Printer name:** Select an appropriate ZPL printer.
    - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)

5. On the Action Pane, select **Save**.

6. Optional: If you're setting up a customer-specific label design, create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row with the following settings:

    - **Table:** *Shipments*
    - **Derived table:** *Shipments*
    - **Field:** *Account number*
    - **Criteria:** Enter the relevant customer account number.

    When you finish, select **OK** to close the query editor dialog box.

7. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.

8. In the query editor dialog box, on the **Sorting** tab, add a row with the following settings:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Reference load line id (Record-ID)*
    - **Search direction:** *Ascending*

9. Add a second row with the following settings:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Shipment ID*
    - **Search direction:** *Ascending*

10. Select **OK** to close the query editor dialog box.

11. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.

12. On the Action Pane, select **Wave label template group**.

13. In the **Wave label template group** dialog box, for the row where the **Reference field name** field is set to *Shipment ID*, set the following values:

    - **Print break label:** Select this check box.
    - **Label layout ID:** Select a break label. (For example, select the *Break* label layout that you created earlier in this scenario.)
    - **Printer name:** Select the printer for the break label. (Typically, when splitting label rolls, you select the same printer that is selected on the **Wave label template details** FastTab. However, other scenarios are possible.)

14. For the row where the **Reference field name** field is set to *Reference load line id*, select the **Label build ID** check box.

    > **Note**
    >
    > This setup creates one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. You can print this label sequence on a label layout. Additionally, labels for different shipments are separated by the selected break label.

15. Select **OK** to close the **Wave label template group** dialog box.

16. Create a second label template with the following settings:

    - **Label template name:** *Pallet labels*
    - **Description:** *Pallet labels*
    - **Wave step code:** *Pallet*
    - **Warehouse:** *62*

17. On the **General** FastTab, in the **Wave label type** field, select a value, such as *Pallet*.

18. On the **Wave label template details** FastTab, add a row with the following settings:

    - **Label layout ID:** *Pallet*
    - **Printer name:** Select an appropriate ZPL printer.
    - **Run query:** *Yes* (This setting is optional, but it's recommended for optimal performance.)

19. On the Action Pane, select **Save**.

20. Optional: If you're setting up a customer-specific label design, create a query to find the customer's account. On the **Wave label template details** FastTab, select **Edit query**. Then, in the query editor dialog box, on the **Range** tab, add a row with the following settings:

    - **Table:** *Shipments*
    - **Derived table:** *Shipments*
    - **Field:** *Account number*
    - **Criteria:** Enter the relevant customer account number.

    When you finish, select **OK** to close the query editor dialog box.

21. On the Action Pane, select **Edit query** to open the query editor dialog box for the whole label template.

22. In the query editor dialog box, on the **Sorting** tab, add a row with the following settings:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Reference load line id (Record-ID)*
    - **Search direction:** *Ascending*

23. Add a second row with the following settings:

    - **Table:** *Work lines*
    - **Derived table:** *Work lines*
    - **Field:** *Shipment ID*
    - **Search direction:** *Ascending*

24. Select **OK** to close the query editor dialog box.

25. A message box prompts you to confirm the grouping reset operation. Select **Yes** to continue.

26. On the Action Pane, select **Wave label template group**.

27. In the **Wave label template group** dialog box, for the row where the **Reference field name** field is set to *Shipment ID*, set the following values:

    - **Print break label:** Select this check box.
    - **Label layout ID:** Select a break label. (For example, select the *Break* label layout that you created earlier in this scenario.)

- **Printer name:** Select the printer for the break label. (Typically, when splitting label rolls, you select the same printer that is selected on the **Wave label template details** FastTab. However, other scenarios are possible.)

28. For the row where the **Reference field name** field is set to *Reference load line id*, select the **Label build ID** check box.

> ⓘ **Note**
>
> This setup creates one label sequence ("Carton 1 of X") per load line throughout the wave, regardless of the work grouping setup. You can print this label sequence on a label layout. Additionally, labels for different shipments are separated by the selected break label.

Configure number sequence extensions for scenario 3

Number sequence extensions control the GS1 compliance of specific number sequences. This configuration is optional for the current scenario. For more information and configuration instructions, see Configure number sequence extensions.

Create a sales order and release it to the warehouse for scenario 3

1. Go to **Sales and marketing** > **Sales order** > **All sales orders**.

2. Create a sales order with the following settings:

   - **Customer account:** *US-001*
   - **Warehouse:** *62*

3. Add two sales order lines:

   - Sales order line 1:
     - **Item number:** *A0001*
     - **Quantity:** *9024*
     - **Unit:** *ea* (9024 ea = 376 Box = 47 PL)

   - Sales order line 2:
     - **Item number:** *A0002*
     - **Quantity:** *9016*

- **Unit:** *ea* (9016 ea = 322 Box = 46 PL)

> ⓘ **Note**
>
> The items and quantities that are provided here are only examples. You must use the unit sequence group that you defined earlier, define appropriate unit conversions from *ea* to *Box* to *PL* for them, and ensure they have stock in warehouse *62*. For more information, see Unit of measure and stocking policies.

4. Select sales order line 1. Then, in the **Sales order line** section, on the **Inventory** menu, select **Reservations**.

5. On the **Reservation** page, on the Action Pane, select **Reserve lot**, and then close the page.

6. Repeat steps 4 and 5 for sales order line 2.

7. On the Action Pane, on the **Warehouse** tab, select **Release to warehouse**.

   The following events occur:

   - The system processes the created shipment by using the template that includes the label printing step. The label layout defines the format of the label, and the result is a label that is printed on the printer, which is selected in the label template.
   - Wave labels are generated and printed. The number of labels equals the number of cartons (in this example, 376 Box labels for line 1, 322 Box labels for line 2, 47 PL labels for line 1, 47 PL labels for line 2, and two break labels that have the shipment ID).
   - A new bill of lading ID is generated for the shipments. If you configured the number sequence extensions, the wave label IDs follow the **SSCC-18** number format.

You can view and reprint wave labels from the following pages:

- All shipments > Shipment details
- All loads > Load details
- All waves
- Wave labels
- Wave label history

For most of these pages, you can find the relevant function by selecting **Wave labels** in the **Related information** group on the **Shipments** tab of the Action Pane.

Schedule wave label printing during wave

10/03/2025

Use the *Task based wave label printing* feature as part of your waving process to help improve efficiency, and to have the system create wave labels and work in separate tasks.

The process of configuring wave label printing is complex and relies on accurate configuration and master data. It isn't uncommon for the generation of wave label records to fail, and when it does, the whole wave processing is rolled back. The *Task based wave label printing* feature helps you avoid having to re-create work and work lines every time that a wave label is incorrectly printed.

When you use the *Task based wave label printing* feature, the system first creates work and work lines. It then creates and prints wave labels. Finally, if the wave labels are correctly created, it releases the work and wave for picking.

Manually enable the new wave step method

You must first create the new wave step method and enable it for parallel, asynchronous task processing.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave process methods**.
2. On the Action Pane, select **Regenerate method**. Notice that *waveLabelPrinting* is added to the list of wave process methods that you can use in your shipping wave templates.
3. Select the record where the **Method name** field is set to *waveLabelPrinting*, and then, on the Action Pane, select **Task configuration**.
4. On the Action Pane, select **New** to add a row to the grid. Then set the following fields for the new row:

    - **Warehouse** – Select the warehouse that you'll use to schedule work creation processing. (If you're using demo data for testing purposes, you can select warehouse *24*.)
    - **Maximum number of batch tasks** – Specify a maximum number of batch tasks. In most cases, the value should be from *8* through *16*. However, we recommend that you experiment to find the optimal setting for your scenarios.
    - **Wave processing batch group** – Select a dedicated wave processing batch group to optimize batch queue processing.

You can now update an existing wave template so that it uses the *Wave label printing* wave processing method. Alternatively, you can create a new wave template that uses it.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. On the Action Pane, select **Edit**.
3. In the list pane, select the wave template to update. (If you're using demo data for testing purposes, you can select *24 Shipping default*.)
4. On the **Methods** FastTab, in the **Remaining methods** column, select the row where the **Name** field is set to *waveLabelPrinting*.
5. Select **add** (right arrow button) to move the selected row to the **Selected methods** column.
6. In the **Wave step code** field, enter the wave step code that connects the wave template with a wave label template.

Set wave task processing threshold data

The first time that a wave process runs by using any task-based processing, the system creates default wave task processing threshold data. This data is used to control whether wave processing should run asynchronously and be task-based, so that it can process and create wave labels in parallel.

The default data initially uses a threshold value of *1* for the minimum number of work IDs (`MinimumWorkThresholdForLabelPrinting`). Therefore, when the system processes a wave that has more than one work ID, it uses task-based processing of wave labels in a separate transaction. You can manually insert or update this data in the `WHSWaveTaskProcessingThresholdParameters` table in your test environments. To update the table, create and run a custom X++ script.

Changes to the wave processing logic when task-based wave label printing is used

If the wave label processing exceeds the wave task processing threshold, task-based processing is initiated. In the next wave processing that fits the wave template, wave label printing will run in a standalone *ttsbegin/ttscommit* transaction immediately after work creation. If work release (unblocking) is configured on the wave template to run automatically, it occurs only after the wave label printing process is successfully completed.

If wave label generation fails (for example, if conversion of the work quantity to the wave label quantity fails and throws an error), only the appropriate transaction fails. The work that was previously created remains frozen. To correct errors and print the wave labels, follow these steps.

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.

2. Select the relevant wave in the grid.
3. On the Action Pane, on the **Wave** tab, in the **Print** group, select **Wave labels**.
4. Follow the on-screen instructions to send the labels for printing.
5. On the Action Pane, on the **Wave** tab, in the **Wave** group, select **Release** to manually release the work for the selected wave.

Containerization

This article describes how to automate the containerization of loads. Automated containerization creates containers and the picking work for shipments when a wave is processed.

To set up containerization, you must create the following components:

- **Container type** — Define the physical characteristics of the containers. Use container types to pack inventory items into a specific type and size of packaging, such as bins or pallets.
- **Container groups** — Create groups of container types that are similar. For example, a container group can include container types that have similar size dimensions. A container group specifies the sequence in which containers are packed, and the fill percentage of each container.
- **Container build template** — Create templates that define rules for containerization. For example, rules for mixing inventory and other packing strategies.
- **Wave templates** – Set up one or more wave templates to create the picking work for containerization.

Create wave templates for containerization

Set up one or more shipping wave templates for containerization. Wave templates include criteria that determine the following:

- How to process waves. You can choose either manual or automatic processing.
- How to create picking work. This is determined by the wave methods. The wave template must include the **containerization** method.
- How to match items or allocation lines with a wave.

For more information, see Wave templates.

Create container types

Use container types to create descriptions of containers, including maximum values for physical size dimensions and weight capacity. When a containerized wave is processed, the containers are created based on the container type information.

To set up a container type, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container type**.

2. Select **New** to create a new container type.
3. Enter a unique identifier (ID) and description for the container type.
4. In the **Tare weight** field, enter the actual or estimated weight of the container.
5. In the **Maximum weight** field, enter the maximum weight that the container can hold.
6. In the **Containerization maximum volume**, **Containerization maximum length**, **Containerization maximum width**, and **Containerization maximum height** fields, specify the physical dimensions of the container.

   > ⓘ **Note**
   >
   > The values for length and width are interchangeable. This interchangeability means that you can rotate items laterally, or on the x-axis, if needed. For example, if the length is 2 feet, and the width is 1 foot, you can change the length to 1 foot and the width to 2 feet. This interchangeability doesn't apply to the height dimension. You can't change the height value to rotate an item vertically.

7. Select custom attribute values for the container in the fields for attributes. Attributes are custom values that help to filter or sort items based on a value that isn't otherwise available. For example, if you want to pack items for a particular customer, you can create an attribute for the customer name. You create attributes on the **Container attributes** page.

Create container groups

Set up logical groups of container types. For each group, specify the sequence in which to pack the containers and the percentage of the containers to fill. The size dimensions of the item determine whether it fits in a container. The container that is closest to the size dimensions of the item is used. If you have multiple container types in a group, arrange the sequence by size, so that the largest container is first, number 1 in the sequence, and the smallest container is last.

To set up a container group, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container groups**.
2. Select **New** to create a container group.
3. Enter a unique ID and description for the container group.
4. On the **Details** FastTab, select **New** to add a container type to the group.
5. In the **Container type** field, select a container type.

6. Select **Move up** or **Move down** to specify the sequence in which the container types are packed.

Create container build templates

Set up rules for the containerization process, such as inventory mixing rules and other packing strategies. For example, set up a rule so that workers can't pack allocation lines that represent sales orders from different customers in the same container.

To set up a container build template, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container build template**.
2. Create a new container build template.
3. In the **Containerization name** and **Sequence number** fields, enter the name of the containerization template and the order that matches allocation lines.

   > ⓘ **Note**
   >
   > The system applies the first template that the allocation line meets the query criteria for. Therefore, put the template with the most specific criteria at the top of the list. The broader the criteria, the more likely that an allocation line meets the criteria. This condition could lead to lines being assigned to the wrong container. If needed, select **Move up** or **Move down** to change the sequence of templates.

4. In the **Container group ID** field, select the container group from which to create containers.
5. In the **Base query types** field, select the query type that determines what to pack and what to base the filter query on. The following options are available:

   - **Sales allocation line** — Pack allocation lines that are created for sales orders.
   - **Transfer allocation line** — Pack allocation lines that are created for transfer orders.
   - **Container** — Pack a container that the containerization process already created. For example, this option is used for nesting containers.
   - **Outbound order allocation line** — Pack allocation lines that are created for outbound shipment orders.

> **Note**
>
> To use nesting containers, you must make the containerization method repeatable. Learn more in Wave templates.

6. On the **General** FastTab, in the **Wave step code** field, enter the unique identifier of the wave process method that links the container build template to steps in a wave template.

7. Select the **Allow split picks** check box to allow workers to pack items from a work order in separate containers. This condition requires that the entire quantity fits in the container. The largest unit of measure in the allocation line is always used.

8. In the **Pack by unit** field, select the unit of measure that represents the container. For example, you can indicate that a case is a container. If you pack by the unit of measure, you can't also specify a container group because the unit of measure is the container.

9. In the **Container packing strategy** field, select the packing strategy to use. The following options are available:

   > **Note**
   >
   > The strategy applies only to sales allocation lines and transfer allocation lines.

   - **Pack into all open containers** – The system evaluates whether the allocation line fits in any container that's created during the containerization cycle.
   - **Pack into current container only** – The system only evaluates whether the allocation line fits in the most recently created container.

   For more information and examples that show how to work with container packing strategies, see Container packing strategies.

10. To set up rules for packing allocation lines in containers, select **Mixing Logic Breaks**. For example, you can create a rule that allows workers to pack allocation lines for two different items in the same container. To define a mixing rule, follow these steps:
    a. In the **Mixing Logic Breaks** page, select **New**.
    b. In the **Table** field, select the table that contains the field to use as a criterion for the mixing logic break.
    c. In the **Field Select** field, select the field to use as a criterion for the mixing logic break.
    d. Repeat these steps until you add all of the criteria for the mixing logic break.

> **Note**
>
> If you use mixing logic, sort by the same fields in the filter criteria query. This action reduces the number of containers that are created.

Last updated on 07/01/2026

Container packing strategies

10/03/2025

A *container packing strategy* is a strategy that you can use to define item allocations across containers. This article explains the differences between the *Pack into all open containers* and *Pack into current container only* strategies.

- **Pack into all open containers** – During packing, the system checks each item to determine whether it fits into any of the previously created containers. If an item doesn't fit into an existing container, the system creates a new container and continues until it finishes packing the whole order.

  For example, *n* ordered items require containerization. In the worst case, every time that the system processes an item that doesn't fit into any existing container, it does a total of ([(*n* – 1) × (*n* + 1)] ÷ 2) checks to evaluate whether the item fits into an existing container.

- **Pack into current container only** – During packing, the system checks each item to determine whether it fits into the most recently created container. If the item doesn't fit into that container, the system creates a new container and continues until it finishes packing the whole order.

  For example, *n* ordered items require containerization. In the worst case, the system does a total of (*n* – 1) checks to evaluate whether the item fits into an existing container.

Example of the flow for container packing strategies

You set up the following items for containerization.

Expand table

Item	Physical dimensions (width × depth × height)	Weight
HDMI Cable 6'	1 × 1 × 1	1
HDMI Cable 12'	2 × 1 × 1	1
HDMI Cable 18'	3 × 1 × 1	2

You also set up the following box to be used for packaging.

Expand table

Container	Physical dimensions (length × width × height)	Weight	Volume
Medium Box	6 × 3 × 2	10	100

Finally, you set up an order that has the following products and quantities.

Expand table

Sales order line	Quantity
HDMI Cable 12'	9
HDMI Cable 18'	8
HDMI Cable 6'	13

The following table summarizes how containerization works when you use the *Pack into all open containers* strategy and when you use the *Pack into current container only* strategy.

Expand table

Pack into all open containers	Pack into current container
HDMI Cable 12': 1. Create a new container, CONT0001. 2. Put 9 ea into container CONT0001.	HDMI Cable 12': 1. Create a new container, CONT0001. 2. Put 9 ea into container CONT0001.
HDMI Cable 18': 1. Check whether the item can fit into container CONT0001. 2. Create a new container, CONT0002. 3. Put 5 ea into container CONT0002. 4. Create a new container, CONT0003. 5. Put 3 ea into container CONT0003.	HDMI Cable 18': 1. Check whether the item can fit into container CONT0001. 2. Create a new container, CONT0002. 3. Put 5 ea into container CONT0002. 4. Create a new container, CONT0003. 5. Put 3 ea into container CONT0003.
HDMI Cable 6': 1. Check whether the item can fit into container CONT0001. 2. Put 1 ea into container CONT0001. 3. Check whether the item can fit into container CONT0002. 4. Check whether the item can fit into container CONT0003. 5. Put 4 ea into container CONT0003. 6. Create a new container, CONT0004.	HDMI Cable 6': 1. Check whether the item can fit into container CONT0003. 2. Put 4 ea into container CONT0003. 3. Create a new container, CONT0004. 4. Put 9 ea into container CONT0004.

Pack into all open containers	Pack into current container
7. Put 8 ea into container CONT0004.	

Example scenario: Pack single orders per container

This section presents a scenario where the system consolidates multiple orders into one shipment. Therefore, the system performs containerization from the sales order to ensure that every order that contains multiple products is packed into its own container.

This functionality lets you handle scenarios where you must pack only one sales order into each container, so that the distribution center can cross-dock full containers between retail stores. In addition to the retail scenarios (order per retail store and shipping to a distribution center for cross-docking) this technique is also commonly used in lean supply chains (sales order per just-in-time production line).

This scenario shows how you can decrease the number of containers that the system evaluates during packing by using the *Pack into current container only* strategy for containerization.

Prerequisites

This scenario references values and records that are included in the standard demo data that is provided for Microsoft Dynamics 365 Supply Chain Management. If you want to use the values that are provided here as you do the exercises, be sure to work in an environment where the demo data is installed, and set the legal entity to **USMF** before you begin.

Inspect or create container types

To inspect your container types, or to create new container types if they're required, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container types**.
2. Make sure that each of the following container types is available in your demo data. Edit or create container types as required.

    - Container type 1:
        - **Container type code:** *Box-Large*
        - **Description:** *Large Box*
        - **Maximum net weight:** *100*
        - **Volume:** *400*
        - **Length:** *4*

    - **Width:** *10*
    - **Height:** *10*

- Container type 2:
    - **Container type code:** *Box-Medium*
    - **Description:** *Medium Box*
    - **Maximum net weight:** *50*
    - **Volume:** *200*
    - **Length:** *2*
    - **Width:** *10*
    - **Height:** *10*

- Container type 3:
    - **Container type code:** *Box-Small*
    - **Description:** *Small Box*
    - **Maximum net weight:** *20*
    - **Volume:** *100*
    - **Length:** *1*
    - **Width:** *10*
    - **Height:** *10*

Inspect or create container groups

To inspect your container groups, or to create new container groups if they're required, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container groups**.

2. Make sure that the following container group is available in your demo data. If it isn't available, select **New** to create it.

    - **Container group ID:** *Boxes*
    - **Description:** *Box sizes*

3. On the **Details** FastTab for the *Boxes* container group, make sure that the following lines exist. If they don't, select **New** to add them.

    - Line 1:
        - **Sequence number:** *1*
        - **Container type:** *Box-Large*
        - **Container utilization percentage:** *100*

    - Line 2:

    - **Sequence number:** *2*
    - **Container type:** *Box-Medium*
    - **Container utilization percentage:** *100*

- Line 3:
    - **Sequence number:** *3*
    - **Container type:** *Box-Small*
    - **Container utilization percentage:** *100*

Create a new container build template

To create a new container build template, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container build template**.
2. Select **New** to create a container build template that has the following settings:

    - **Sequence number:** *1*
    - **Container template ID:** *Box*
    - **Container group ID:** *Boxes*
    - **Base query types:** *Sales allocation line*
    - **Wave step code:** *234*
    - **Allow split picks:** *Yes*
    - **Container packing strategy:** *Pack into current container only*
    - **Pack by directive unit:** *No*

3. While the row for the new template is still selected, select **Edit query** on the Action Pane.
4. A standard query editor dialog box appears. On the **Sorting** tab, select **Add** to add a row that has the following settings:

    - **Table:** *Temporary work transactions*
    - **Derived table:** *Temporary work transactions*
    - **Field:** *Order number*
    - **Search direction:** *Ascending*

    > **ⓘ Important**
    >
    > To avoid cycling over all the other open containers, and to speed up the process by checking one container at a time, use the *Pack into current container only* strategy in addition to sorting by order number. This combination works like a work break on a work template.

5. Select **OK** to close the query editor dialog box.

6. While the row for the new template is still selected, select **Container mixing constraints** on the Action Pane.

   You now add a constraint that puts items from a single order into a single container. Items from any other order go into a separate container.

7. Select **New** to create a mixing constraint that has the following settings:

   - **Table:** *Sales orders*
   - **Field select:** *SalesId* (The field appears as *Sales order* in the grid.)

8. Select **OK** to add the constraint.

9. Close the page.

Set up a wave template for containerization

To set up a wave template, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.

2. In the list pane, set the **Wave template type** field to *Shipping*.

3. Select the **63 Containerization** template in the list.

4. On the Action Pane, select **Edit**.

5. On the **Methods** FastTab, in the **Selected methods** column, find the following line:

   - **Method name:** *containerization*
   - **Name:** *Containerization*

6. Set the **Wave step code** field for the line to *234*.

Set up a work template

To set up a work template, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.

2. Set the **Work order type** field to *Sales orders*.

3. In the **Overview** grid, find and select the work template that you want to use for packing single orders per container. For this scenario, select the **63 Pick to container** template.

4. On the Action Pane, select **Edit query**.

5. A standard query editor dialog box appears. On the **Sorting** tab, add the following lines:

    - Line 1:
        - **Table:** *Temporary work transactions*
        - **Derived table:** *Temporary work transactions*
        - **Field:** *Shipment ID*
        - **Search direction:** *Ascending*

    - Line 2:
        - **Table:** *Temporary work transactions*
        - **Derived table:** *Temporary work transactions*
        - **Field:** *Order number*
        - **Search direction:** *Ascending*

    - Line 3:
        - **Table:** *Temporary work transactions*
        - **Derived table:** *Temporary work transactions*
        - **Field:** *Container ID*
        - **Search direction:** *Ascending*

6. Select **OK** to close the query editor dialog box.

7. You receive the following message: "Grouping will be reset, continue?" Select **Yes** to continue.

8. While the **63 Pick to container** template is still selected, select **Work header breaks** on the Action Pane.

    You now apply settings to break the work so that each container in the order is linked to one work order.

9. Select the **Group by this field** checkbox for each row on the **Work header breaks** page (**Shipment ID**, **Order number**, and **Container ID**).

10. Close the page.

Set up shipment consolidation policies

To set up a shipment consolidation policy, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Release to warehouse** > **Shipment consolidation policies**.
2. In the list pane, set the **Policy type** field to *Sales orders*.

3. Select the **Default** policy in the list.
4. On the Action Pane, select **Edit**.
5. On the **Consolidation fields** FastTab, in the **Selected fields** list, select the row where the **Field name** field is set to *Order number*.
6. Select the **Remove** button to move the field to the **Remaining fields** list.
7. On the Action Pane, select **Save**.

Set up physical dimensions for the product

To set up physical dimensions for the products in this scenario, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product where the **Item number** field is set to *A0001*.
3. On the Action Pane, on the **Manage inventory** tab, in the **Warehouse** group, select **Physical dimensions**.
4. On the **Physical dimensions** page, you should see the following line in the grid:
    - **Unit:** *pcs*
    - **Gross weight:** *3.00*
    - **Width:** *2.00*
    - **Depth:** *2.00*
    - **Height:** *4.00*
    - **Volume:** *16.00*
5. Close the page.
6. Select the product where the **Item number** field is set to *A0002*.
7. On the Action Pane, on the **Manage inventory** tab, in the **Warehouse** group, select **Physical dimensions**.
8. On the **Physical dimensions** page, you should see the following line in the grid:
    - **Unit:** *pcs*
    - **Gross weight:** *4.00*
    - **Width:** *3.00*
    - **Depth:** *1.00*
    - **Height:** *3.00*
    - **Volume:** *9.00*

Create sales order 1

To create a sales order, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. A dialog box for creating a new sales order appears. Set the following values:
    - **Customer account:** *US-001*
    - **Warehouse:** *63*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order opens. On the **Sales order lines** FastTab, add the following sales lines:
    - Line 1:
        - **Item number:** *A0001*
        - **Quantity:** *2*
    - Line 2:
        - **Item number:** *A0002*
        - **Quantity:** *2*
6. Select the first line, then select **Inventory** > **Reservation**.
7. On the **Reservation** page, select **Reserve lot**. Then close the page.
8. Repeat the previous two steps for the second line.
9. Close the page.

Create sales order 2

To create a second sales order, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. A dialog box for creating a new sales order appears. Set the following values:
    - **Customer account:** *US-001*
    - **Warehouse:** *63*
4. Select **OK** to create the sales order and close the dialog box.
5. The new sales order opens. On the **Sales order lines** FastTab, add the following sales lines:

- Line 1:
  - **Item number:** *A0001*
  - **Quantity:** *4*
- Line 2:
  - **Item number:** *A0002*
  - **Quantity:** *4*

6. Select the first line, then select **Inventory** > **Reservation**.
7. On the **Reservation** page, select **Reserve lot**. Then close the page.
8. Repeat the previous two steps for the second line.
9. Close the page.

Create the load

To create a load for each order that you created for this scenario and then release it to the warehouse, follow these steps.

1. Go to **Warehouse management** > **Loads** > **Outbound load planning workbench**.
2. On the **Sales lines** tab, find and select all the sales order lines from the sales orders that you created for this scenario.
3. On the Action Pane, on the **Supply and demand** tab, in the **Add** group, select **To new load**. The selected order lines are added to a new load.
4. In the **Load template assignment** dialog box, in the **Load template ID** field, select a load template, such as *40' Container*.
5. Select **OK** to close the dialog box.
6. In the **Loads** section, find and select the load that you just created.
7. Select **Release** > **Release to warehouse**.
8. In the **Release to warehouse** dialog box, select **OK** to release the selected load to the warehouse.

Verify the shipments and containers

The following procedure lets you verify the shipments that you created. Use it to review the order that you created for this scenario, to make sure that you got the expected results.

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Find and select the shipment that was created for the load that you just released.
3. On the Action Pane, on the **Transportation** tab, select **View containers**.

4. Confirm that the items from the sales orders were containerized into two different containers.

Container labels provide information about a container and the related shipment data. A typical scenario that might involve this type of label is one where a worker is creating and packing containers by using the Warehouse Management mobile app. The worker can print a container label that includes a bar code of the container ID and apply it to the physical container.

As with license plate labels, use the Zebra Programming Language (ZPL) to create label layouts for container labels.

Learn more in Packing containers with the Warehouse Management mobile app.

Example scenario: Print container labels when creating containers by using the Warehouse Management mobile app

This example scenario shows how you can set up your system to print container labels when a worker creates a container by using the web client and/or the Warehouse Management mobile app. The Warehouse Management mobile app scenario builds on the information that is provided in Packing containers with the Warehouse Management mobile app. That article provides more details about the full process of packing containers by using the Warehouse Management mobile app.

Make sample data available

To work through this scenario by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

You can also use this scenario as guidance for using the feature on a production system. However, in that case, you must substitute your own values for each setting that is described here.

Create a container label layout

The label layout controls what information is printed on the label and how it's laid out. Enter the ZPL code that is sent to the printer. Typically, you copy this code from a label designer program.

As the system generates a label, it replaces field and method names that you use in the label layout with actual values. You can easily find text that the system replaces by looking for dollar signs (`) in the code.

Create a basic label layout

Follow these steps to create a container label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
2. At the top of the list pane, set the **Label layout type** field to *Container label*.
3. On the Action Pane, select **New** to create a label.
4. Set the following values for the new label:
    - **Label layout ID** – Enter *Container*.
    - **Description** – Enter *Container ID barcode*.
    - **Definition type** – Select the method that's used to define the label layout:
        - *ZPL* – Define the label layout by using ZPL.
        - *Variables* – Define a label layout that can be used with an external service. (Learn more in Print labels using an external service.) If you select this option, the **Printer text layout** FastTab provides grids where you define system variables and data variables. Under **System variables**, set the **LabelFile** field to the path of the label design in the external system, and set the **Quantity** field to the number of labels to print. Under **Data variables**, define the values that Supply Chain Management sends by mapping them to the corresponding placeholders in the label design from the external system.

- *Variables (script)* – Use the script format to define a label layout that can be used with an external service. (Learn more in Print labels using an external service.) On the **Printer text layout** FastTab, define the label file, the quantity, and the values to send. Here's an example.

  plaintext

  ```
  "filePath": "/Instant Print/GS1-128.nlbl",
  "quantity": "1",
  "dataSources": [
  {
      "GTIN of Contained Trade Items": "06183928726611",
      "Product_name": "D365FO: $ItemName$"
  }
  ]
  ```

- **Label layout data source ID** – Leave this field blank if you use only container data. If you must include data from other tables, select a label layout data source that has the required joins. For more information about how to set up and use a label layout data source, see the next section in this article.

- **Enable label template support** – Leave this option set to *No* for now. (When it's set to *Yes*, you can add header, row, and footer elements to your layout, as described later in this article.)

- **Date, time, and number format** – Select the language to use when date, time, and number values that are shown in a label layout are formatted.

- **Printer stock type** – Select a *printer stock type*. A printer stock type typically describes the type of paper that a specific printer uses. It's also used to specify the type of paper that a specific label layout should be printed to. For information about how to set up printer stock types, see Set up printer stock types.

5. On the **Printer text Layout** FastTab, enter label code in a way that's appropriate for the selected definition type. The following example shows code that you can copy and paste for testing if the **Definition type** field is set to *ZPL*.

^PQ1,0,1,Y^XZ
```

> ⓘ **Note**
>
> While you're customizing the label code on the **Printer text layout** FastTab, you can add valid field and method names by following these steps:
>
> a. In the **Tables** list, select the table.
> b. Depending on the type of item that you want to add, select either the **Fields** tab or the **Methods** tab, and then select the name of the field or method to add.
> c. If the **Definition type** field is set to *ZPL* or *Variables (script)*, select **Insert at end of text** to add the field or method to the end of the code. As you require, move the new field or method to the place in the code where you want to use it.
> d. If the **Definition type** field is set to *Variables*, select a row in the **Data variables** table, and then select **Insert field reference** to add the field or method as a field value.

6. On the Action Pane, select **Save**.

Set up and use a label layout data source

In the label layout in the preceding example, only the container ID (`$WHSContainerTable.ContainerId$`) is used, and this value is available directly in the container table. If you want to include related information (such as the delivery name that's related to a shipment), and the required layout label data source doesn't already exist, follow these steps to create it and then select it in your label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout data source**.

2. On the Action Pane, select **New**.

3. Set the following values for the new label layout data source:

   - **Label layout data source ID** – Enter a name for the data source.
   - **Description** – Enter a short description of the data source.
   - **Label layout type** – Select *Container label*.

4. On the Action Pane, select **Save**.
5. On the Action Pane, select **Edit query**.
6. A standard query editor dialog box appears. On the **Joins** tab, add joins to the required tables. (For example, you might make a join to the shipment table if you want your label to show the delivery name that's related to a shipment.)
7. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
8. Create or select a label layout, and then, in the **Label layout data source ID** field, select the record that you just created.
9. Add the new field values to the print layout code. Reference the correct *table.field-names* values in the ZPL code. The additional tables include a number as a suffix (_#).

> ⊗ **Caution**
>
> On the **Label layout data source** page, be careful about removing a table from the query for an existing record. You might remove field and/or method names that are already used in existing label layouts.

Enable label template support

Label templates let you design labels that have more advanced layouts, which can include header, row, and footer elements. Follow these steps to format a label that includes label template elements.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
2. At the top of the list pane, set the **Label layout type** field to *Container Label*.
3. Follow one of these steps:
    - To create a new layout, select **New** on the Action Pane.
    - To edit an existing layout, select the layout in the list pane, and then select **Edit** on the Action Pane.
4. In the **Label layout data source ID** field, select a data source. You need a data source to enable label template support. However, if you need only container table data, you can select a very simple data source where no joins are defined.

5. Set the **Enable label template support** option to *Yes*.

6. Use the `{{Header ... }}`, `{{Row ... }}`, and `{{Footer ... }}` elements in your code. The following example shows a label that includes all these elements. Because it prints data about items that are packed in a container, you need to use a **Label layout data source ID** value that uses a query that joins to the container lines (container details). The data can be split among multiple pages to ensure that all data is printed if you have many container lines. In this example, a container ID bar code and six container lines are printed on the first page. Ten lines are printed per page. Each line contains information about the item, quantity, and unit. This setup is controlled by the `RowsPerLabelFirst=6` and `RowsPerLabel=10` attributes.

{{LabelEnd
^FX ... ZPL commands to end the label ...

^XZ
}}
```

Note

Because of the `RowsPerLabel=10` attribute, this setup loops over container lines and splits out a label for each set of 10 container lines. If you change the attribute to `RowsPerLabel=1`, a label is generated for each line.

This setup prints one copy of each label. If you require more copies (for example, one copy for each side of the container), set the `n` value for the `\^PQn` section in the footer to the required number of copies. For example, to print two copies of each label, specify `\^PQ2`.

Set up container label routing

To specify the container label layouts that are used and where they're printed, define a **Container label routing** record by following these steps:

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Container label routing**.
2. On the Action Pane, select **New** to create a routing record.
3. On the header of the new routing record, set the following fields:
    - **Sequence number** – Enter an integer to define the order in which to evalute the routing record. Each routing must have a unique sequence number. The system evaluates routings in order of ascending sequence numbers and uses the first routing for which the the criteria are met. If you're using demo data, enter *1*.
    - **Name** – Enter a name for the routing record. For example, enter *Container packing*.
4. On the **Overview** FastTab, use the following fields to define the criteria that select the label routing:
    - **Warehouse** – Specify the warehouse where the routing should be used. If you're using demo data, enter *62*.
    - **Location** – Specify the location where the routing should be used. If you're using demo data, select *Pack*, based on the assumption that the target printer is physically placed at the packing location.
    - **Worker** – Specify the worker that the routing should be used for. To use the routing for any worker, leave this field blank.
    - **Mobile device user ID** – Specify the user ID that the routing should be used for. To use the routing for any worker, leave this field blank.
    - **Container type** – Specify the container type that the routing should be used for.

- **Container status** - Specify the container status (*Open* or *Closed*) that the routing should be used for.
- **Account number** – Specify the customer account that the routing should be used for. To use the routing for any customer, leave this field blank.
- **Carrier** – Specify the shipping carrier that the routing should be used for. To use the routing for any carrier, leave this field blank.
- **Run query** – To add custom selection criteria to a routing record, set this option to *Yes*, and then select **Edit query** on the Action Pane. A standard query editor dialog box appears, where you can add more selection criteria.

> ⓘ Note
>
> - When you print a container label from the Warehouse Management mobile app, the current user's warehouse, location, worker ID, and user ID are passed as possible filter values for selecting the printer and layout. Other values are found based on the selected shipment.
>
> - When a worker prints a container label from the **Close container** dialog, their worker ID, packing station warehouse, and location are passed as possible filter values for selecting the printer and layout. Other values are found based on the selected shipment.

5. On the **Container label routing printer** FastTab, assign the printer and label layout to use when the criteria for the routing record are met. Select **New** on the toolbar to add a line to the grid. Then set the following fields for the new line:

   - **Name** – Select an appropriate ZPL printer. To learn more, see Install the Document Routing Agent to enable network printing. Leave this field blank if you want to use dynamic printer selection, or select *As fallback printer* in the **Use specified printer** field.
   - **Use specified printer** – If you want to use dynamic printer selection and use the configured printer as a fallback when dynamic printer selection doesn't find a more specific printer, set this field to *As fallback printer*. If this field is set to *Always* and a printer is configured, then dynamic printer selection is disabled.
   - **Label layout ID** – Select the label layout to use. The example label layout ID value that was suggested earlier in this scenario was *Container*.

   > ⓘ Note

To reduce the number of label routings, consider using dynamic printer selection with printers associated with packing station locations, mobile device users, or mobile devices. In those cases, label routings only specify the label layouts to be printed based on the properties of the container and you don't need to duplicate the setup when new packing stations and printers are added.

Set container labels to be printed automatically when new containers are created

If you want a container label to be printed automatically each time that a new container is created, configure each packing profile as described in the following procedure.

1. Go to **Warehouse management** > **Setup** > **Packing** > **Packing profiles**.
2. On the Action Pane, select **Edit**.
3. Select the profile that container labels should automatically be printed for. If you're working with sample data, select the row where the **Packing profile ID** field is set to *WHS62*.
4. Select the **Print container label at container creation** checkbox for the selected row.
5. Close the page.

> **Note**
>
> The **Container ID mode** field for packing profile *WH62* is set to *Auto*. Therefore, the number sequence defined for the *Container ID* reference is used as part of the container creation process.

Set container labels to be printed automatically when containers are closed

If you want a container label to be printed automatically each time a container is closed, configure the container packing policy as described in the following procedure.

1. Go to **Warehouse management** > **Setup** > **Containers** > **Container packing policies**.
2. On the Action Pane, select **Edit**.
3. Select the policy that container labels should automatically be printed for. If you're working with sample data, select the row where the **Packing profile ID** field is set to *WHS62Close*.
4. Set **Print container labels on container close** to *Always*.
5. Close the page.

Create a new mobile device menu item for printing container labels

To enable workers to print container labels manually, create a new mobile device menu item for the Warehouse Management mobile app.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. On the Action Pane, select **New** to add a mobile device menu item.
3. For the new menu item, set the following fields:
    - **Menu item name** – Enter an internal name for the new menu item. For example, enter *Print container label*.
    - **Title** – Enter the item name as it should appear in the Warehouse Management mobile app. For example, enter *Print container label*.
    - **Mode** – Select *Indirect*.
    - **Activity code** – Select *Print container label*.
4. Close the page.

Add the new mobile device menu item to the menu

After you create the mobile device menu item, add it to the mobile device menu. In this example, add it to the existing **Outbound** mobile device menu.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. In the list pane, select the **Outbound** menu.
4. In the **Available menus and menu items** column, select the mobile device menu item that you created (for example, *Print container label*).
5. Select the **Add** button (right arrow) to move the menu item into the **Menu structure** column.
6. Close the page.

Run a scenario to print container labels

For an example that shows how to print bar codes automatically as part of a container creation process, see Packing containers with the Warehouse Management mobile app. Follow the instructions in that article, and confirm that the scenario described in this article is also supported

when you use a packing profile where the **Print container label at container creation** checkbox is selected.

To manually print a container label, follow one of these steps:

- In the web client, go to **Warehouse management** > **Packing and containerization** > **Containers**, and select **Print** > **Container label** on the Action Pane.
- In the Warehouse Management mobile app, use the **Print container label** mobile device menu item.

To help reduce the number of steps that workers must perform when they print container labels, consider these suggestions for customizing and fine-tuning this scenario:

- Set up the mobile device menu item to query data by using Warehouse Management mobile app detours. By using this method, the menu item can look up a container ID instead of prompting the worker to enter it manually.
- When a worker selects the **Print container label** mobile device menu item on the **Outbound** menu, the app automatically submits the current **User ID** and **Warehouse** values. If workers want to specify a **Location** value, they can do so in the app.
- If you want the **Location** value to be assigned automatically when a worker selects **Print container label** from the **Pack inventory into containers** menu item, set up a detour.

License plate label layouts and printing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Label layouts control what information prints on a label and how it's arranged. You can define a license plate label layout in two ways:

- **Document routing label layouts** – These layouts provide basic layout capabilities.
- **Label layouts** – These layouts let you build more advanced layouts. Your layouts can have repeating structures and include header, body, and footer elements. You can print information from the related tables and define custom date, time, and number formats.

This article describes how to create and use *label layouts* for license plate labels. For more information about *document routing label layouts*, see Document routing label layouts.

Enable license plate label layouts

To enable license plate label layouts, set up the following elements (as described later in this article):

- **Warehouse management parameters** – Define whether to use document routing label layouts or label layouts.
- **License plate label layout** – Define the label layout to use for the license plate labels.
- **License plate label routing** – Define which Zebra Programming Language (ZPL) layouts should be printed to which network printer and under which conditions.

Set up warehouse management parameters

Follow these steps to set up warehouse parameters for license plate label printing.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **License plates** FastTab, set the **Use label layouts for license plate labels** option to *Yes* to use label layouts for your license plates (as described in this article). Set it to *No* to use document routing label layouts instead.

Create a license plate label layout

The label layout controls what information is printed on the label and how it's laid out. Enter the ZPL code that's sent to the printer. Typically, you copy this code from a label designer program.

As the system generates a label, it can replace field and method names that are used in the label layout with actual values. You can easily find text that the system replaces by looking for dollar signs (`) in the code.

Create a basic label layout

Follow these steps to create a license plate label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
2. At the top of the list pane, set the **Label layout type** field to *License Plate Label*.
3. On the Action Pane, select **New** to create a label.
4. Set the following fields for the new label:
    - **Label layout ID** – Enter a name for the layout (for example, *License plate*).
    - **Description** – Enter a short description of the layout (for example, *License plate*).
        - **Definition type** – Select the method used to define the label layout:
        - *ZPL* – Define the label layout by using ZPL.
        - *Variables* – Define a label layout that you can use with an external service. (Learn more in Print labels using an external service.) If you select this option, the **Printer text layout** FastTab provides grids where you define system variables and data variables. Under **System variables**, set the **LabelFile** field to the path of the label design in the external system, and set the **Quantity** field to the number of labels to print. Under **Data variables**, define the values that Microsoft Dynamics 365 Supply Chain Management sends by mapping them to the corresponding placeholders in the label design from the external system.
        - *Variables (script)* – Use the script format to define a label layout that you can use with an external service. (Learn more in Print labels using an external service.) On the **Printer text layout** FastTab, define the label file, the quantity, and the values to send. Here's an example.

plaintext

```
"filePath": "/Instant Print/GS1-128.nlbl",
"quantity": "1",
"dataSources": [
{
    "GTIN of Contained Trade Items": "06183928726611",
    "Product_name": "D365FO: $ItemName$"
}
]
```

- **Label layout data source ID** – Leave this field blank if you use only license plate data. If you must include data from other tables, select a label layout data source that has the required joins. For more information about how to set up and use a label layout data source, see the next section in this article.
- **Enable label template support** – Leave this option set to *No* for now. (When it's set to *Yes*, you can add header, row, and footer elements to your layout, as described later in this article.)
- **Date, time, and number format** – Select the language to use when date, time, and number values that appear in the label layout are formatted.
- **Printer stock type** – Select a *printer stock type*. A printer stock type typically describes the type of paper that a specific printer uses. It's also used to specify the type of paper that a specific label layout should be printed to. For information about how to set up printer stock types, see Set up printer stock types.

5. On the **Printer text Layout** FastTab, enter label code in a way that's appropriate for the selected definition type. The following example shows code that you can copy and paste for testing if the **Definition type** field is set to *ZPL*.

ZPL

```

^PQ1,0,1,Y^XZ
```

> **Note**
>
> While you're customizing the label code on the **Printer text layout** FastTab, you can add valid field and method names by following these steps:
>
> a. In the **Tables** list, select the table.
> b. Depending on the type of item that you want to add, select either the **Fields** tab or the **Methods** tab, then select the name of the field or method to add.
> c. If the **Definition type** field is set to *ZPL* or *Variables (script)*, select **Insert at end of text** to add the field or method to the end of the code. As you require, move the new field or method to the place in the code where you want to use it.
> d. If the **Definition type** field is set to *Variables*, select a row in the **Data variables** table, then select **Insert field reference** to add the field or method as a field value.

6. On the Action Pane, select **Save**.

Set up and use a label layout data source

In the label layout in the preceding example, only the license plate ID (`$LicensePlateId) is used, and this value is available directly in the license plate table. If you want to include related information (such as the order number that's related to a license plate), and the required layout label data source doesn't already exist, follow these steps to create it and then select it in your label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout data source**.

2. On the Action Pane, select **New**.

3. Set the following fields for the new label layout data source:

   - **Label layout data source ID** – Enter a name for the data source (for example, *LPPlusPurchOrder*).
   - **Description** – Enter a short description of the data source (for example, *License plate + Purchase order*).
   - **Label layout type** – Select *License plate label*.
   - **Join type** – Select the type of joins to use in the data source. Choose one of the following options:

- *Inner* – Use inner joins, which only return rows where there's a match in both tables. This join type creates more specialized joined tables. This option is the default behavior.
- *Outer* – Use outer joins, which return all rows from the left table and the matched rows from the right table. This join type creates larger joined tables that contain more information.

Using outer joins can sometimes help reduce the number of label layout data sources that you need to set up. For example, a license plate label with an inner join to batch requires two label layout data sources: one for items that are batch enabled and one for items that aren't. However, an outer join would let you use just one label layout data source because it returns all items, regardless of whether they're batch enabled. If you instead only want to print labels for non-batch items, then an inner join might work better.

4. On the Action Pane, select **Save**.
5. On the Action Pane, select **Edit query**.
6. A standard query editor dialog box appears. On the **Joins** tab, add joins to the required tables. (For example, if you want your label to show the order number, you might make a join to the purchase order table.)
7. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
8. Create or select a label layout, and then, in the **Label layout data source ID** field, select the record that you just created.
9. You can now add the new field values to the print layout code. Be sure to reference the correct *table.field-names* values in the ZPL code. The additional tables include a number as a suffix (_#).

> ⊗ **Caution**
>
> On the **Label layout data source** page, be careful about removing a table from the query for an existing record. You might remove field and method names that are already used in existing label layouts.

Enable label template support

Label templates let you design labels that have more advanced layouts, which can include header, row, and footer elements. Follow these steps to format a label that includes label

template elements.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
2. At the top of the list pane, set the **Label layout type** field to *License Plate Label*.
3. Follow one of these steps:
    - To create a new layout, select **New** on the Action Pane.
    - To edit an existing layout, select the layout on the list pane, then select **Edit** on the Action Pane.
4. In the **Label layout data source ID** field, select a data source. (You need a data source to enable label template support. However, if you need only license plate data, you can select a simple data source where no joins are defined.)
5. Set the **Enable label template support** option to *Yes*.
6. Use the `{{Header ... }}`, `{{Row ... }}`, and `{{Footer ... }}` elements in your code. The following example shows a label that includes all these elements. It prints data about items that are put in a license plate.

    ZPL

    ```
    {{LabelStart
    ^FX ... ZPL commands that will be printed on every label ...
    CT~~CD,~CC^~CT~
    ^XA
    ~TA000
    ~JSN
    ^LT0
    ^MNM,0
    ^MTT
    ^PON
    ^PMN
    ^LH0,0
    ^JMA
    ^PR8,8
    ~SD15
    ^JUS
    ^LRN
    ^CI27
    ^PA0,1,1,0
    ^XZ
    ^XA
    ^MMT
    ^PW831
    ^LL609
    ^LS0
    }}
    ```

```
{{Header
^FT31,59^A0N,28,28^FH\^CI28^FDLicense plate label with work lines^FS^CI27

^FH\^FD$WHSLicensePlateLabel.LicensePlateId$^FS
}}
{{Row Table=WHsWorkLine_1 StartY=400 IncY=68 RowsPerLabel=5
^FT19,$position.YPos$^A0N,42,43^FH\^CI28^FDLine:^FS^CI27
^FT128,$position.YPos$^A0N,42,43^FH\^CI28^FD$WHSWorkLine_1.ItemID$^FS^CI27
^FT250,$position.YPos$^A0N,42,43^FH\^CI28^FD$WHSWorkLine_1.QtyWork$^FS^CI27
}}
{{LabelEnd
^PQ1,0,1,Y
^XZ
}}
```

> ⓘ **Note**
>
> Because of the `RowsPerLabel=5` attribute, this example loops over license plate lines and splits out a label for each set of five license plate lines. If you change the attribute to `RowsPerLabel=1`, a label is generated for each line.
>
> This example prints one copy of each label. If you need more copies (for example, one copy for each side of the license plate), set the `n` value for the `\^PQn` section in the footer to the required number of copies. For example, to print two copies of each label, specify `\^PQ2`.

Set up license plate label routing

To specify the license plate label layouts and where they're printed, you must define a document routing record, as described in the following procedure.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Document routing**.
2. At the top of the list pane, set the **Work order type** field to *Purchase orders*.
3. On the Action Pane, select **New** to create a routing record.
4. On the header of the new routing record, set the following fields:
    - **Sequence number** – Enter an integer to define the order that the routing record is evaluated in. Each routing must have a unique sequence number. The system evaluates routings in order of ascending sequence numbers and uses the first routing that meets the criteria.
    - **Name** – Enter a name for the routing record. For example, enter *License plate*.

5. On the **Overview** FastTab, use the following fields to define the criteria that are used to select the label routing:

    - **Warehouse** – Specify the warehouse where the routing is used.
    - **Mobile device user ID** – Specify the user ID that the routing is used for. To use the routing for any worker, leave this field blank.
    - **Account number** – Specify the vendor account that the routing is used for. To use the routing for any vendor, leave this field blank.
    - **Carrier** – Specify the carrier that the routing is used for. To use the routing for any carrier, leave this field blank.
    - **Work template** – Specify the work template that the routing is used for. To use the routing for any work template, leave this field blank.
    - **From zone ID** and **To zone ID** - Specify the range of zones that the routing is used for. To use the routing for any zone, leave these fields blank.
    - **Run query** – To add custom selection criteria to a routing record, set this option to *Yes*, then select **Edit query** on the Action Pane. A standard query editor dialog box appears, where you can add more selection criteria.

6. On the **Document routing printers** FastTab, assign the printer and label layout that should be used when the criteria for the routing record are met. Select **New** on the toolbar to add a line to the grid. Then set the following fields for the new line:

    - **Name** – Select an appropriate ZPL printer. Learn more in Install the Document Routing Agent to enable network printing. Leave this field blank if you want to use dynamic printer selection.
    - **Use specified printer** – If you want to use dynamic printer selection and use the configured printer as a fallback when dynamic printer selection doesn't find a more specific printer, set this field to *As fallback printer*. If this field is set to *Always* and a printer is configured, then dynamic printer selection is disabled.
    - **Label layout ID** – Select the label layout to use. The example label layout ID value that was suggested earlier in this article was *License plate*.

Automatically print labels when purchase orders are received by using the mobile app

If you want a license plate label to be printed automatically each time that a new purchase order is received, configure mobile device menu items as described in the following procedure.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.

2. Follow one of these steps:

- To create a new menu item, select **New** on the Action Pane.
- To edit an existing menu item, select it in the list pane, then select **Edit** on the Action Pane.

3. Set the following fields for the new or selected menu item:

    - **Menu item name** – Enter an internal name for the new menu item. For example, enter *Mixed*.
    - **Title** – Enter the item name as it should appear in the Warehouse Management mobile app. For example, enter *Mixed LP Receiving*.
    - **Mode** – Select *Work*.
    - **Work creation process** – Select *Mixed license plate receiving*.
    - **Print label** – Set this option to *Yes*.

4. Close the page.

If you create a new mobile device menu item, you must add it to the mobile device menu, as shown in the following example. In this example, you add it to the existing **Inbound** mobile device menu.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
2. On the Action Pane, select **Edit**.
3. In the list pane, select the **Inbound** menu.
4. In the **Available menus and menu items** column, select the mobile device menu item that you created (for example, *Mixed*).
5. Select the **Add** button (right arrow) to move the menu item into the **Menu structure** column.
6. Close the page.

Run a scenario to print license plate labels

To experiment with printing license plate labels, set up a scenario for mixed license plate receiving through the Warehouse Management mobile app. Learn more in Mixed license plate receiving. Follow the instructions in that article, and confirm that the scenario described in this article is supported.

Enable license plate label printing

Article • 01/31/2023

This article shows how to enable the automatic printing of a Serial shipping container code (SSCC) label after the last item is picked from inventory in a sales picking work process. You can run this procedure in demo data company USMF. If you're run it using your own data, you need to have a number sequence set up for license plates. You need to set up a label printer before you begin this task. Go to Organization administration > Setup > Network printers. On the Action Pane, click Options, and then click the Download document routing agent installer button. Run the installer and make sure that you have a working network printer set to Active before you continue with the procedure.

Set up the GS1 company prefix

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. In the **GS1 company prefix** field, enter the 7 numbers for your GS1 company number.
3. Select **Save**.
4. Close the page.

Setup the SSCC license plate number sequence

1. Go to **Organization administration** > **Number sequences** > **Number sequences**.
2. In the **Area** field, select an option.
3. In the **Reference** field, select an option.
4. In the **Company** field, type a value.
5. Expand the **Segments** section.
6. Select **Edit**.
7. In the **Segments** table, select the first row
8. Select **Remove**.
9. Select **Remove**.
10. Select **Save**.
11. Close the page.

Create the document route layout

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Document routing layouts**. Enable the SSCC layout.

2. Select **New**.
3. In the **Layout ID** field, type a value.
4. In the **Description** field, type a value.
5. Select **Insert at end of text**.
6. Select **Save**.
7. Close the page.

Set up the document routing

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Document routing**.
2. In the **Work order type** field, select an option.
3. Select **New**.
4. In the **Warehouse** field, type a value.
5. In the **Name** field, type a value.
6. Select **New**.
7. In the **Layout ID** field, enter or select a value.
8. In the **Name** field, enter the printer name that you want to use.
9. Select **Save**.
10. Close the page.

Create mobile device menu

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Select **New**.
3. In the **Menu item name** field, type a value.
4. In the **Title** field, type a value.
5. In the **Mode** field, select an option.
6. Select **Yes** in the **Use existing work** field.
7. Select **Yes** in the **Generate license plate** field.
8. Expand the **Work classes** section.
9. Select **New**.
10. In the **Work class ID** field, type a value.
11. Select **Save**.
12. Close the page.
13. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu**.
14. In the tree, select the menu item that you created before.
15. Select **Edit**.
16. Select the arrow to add the menu item to the menu.

17. Select **Save**.
18. Close the page.

Update a work template

1. Go to **Warehouse management** > **Setup** > **Work** > **Work templates**.
2. Select **Edit**.
3. Select **New**.
4. In the **Work type** field, select **Print**.
5. In the **Work class ID** field, enter or select a value.
6. Select **Move up**.
7. Select **Save**.
8. Close the page.

Custom label layouts and printing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to create and use *custom labels*. With custom labels, you can print labels for any type of data that you set up. For example, you can print product labels, location labels, customer labels, and more. When you define one or more custom label layouts, the system automatically shows a **Print** button on the relevant pages.

Set up your system to show a Print button for custom labels

Follow these steps to set up your system to automatically show a **Print** button on pages that handle data for which a custom label is available.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **Reports** tab, on the **Custom labels** FastTab, set the **Display custom label print buttons** option to *On all forms*.

Set up the data source for a custom label

Follow these steps to define the data source for a custom label and then select it in your label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout data source**.

2. Follow one of these steps:

   - To create a new record, select **New** on the Action Pane to add a row to the grid.
   - To edit an existing record, select **Edit** on the Action Pane, then select the row for the label that you want to edit.
   - To remove a record, select it in the grid, then select **Delete** on the Action Pane.

3. If you're creating or editing a record, set the following fields for the new or selected label:

- **Label layout data source ID** – Enter a name for the data source (for example, *Locations*).
- **Description** – Enter a short description of the data source (for example, *Locations*).
- **Label layout type** – Select *Custom label*.
- **Custom label root table** – Select the table that should be used as the main data source for the label (for example, *WMSLocation* to print labels for locations, *InventTable* to print labels for products, or *CustTable* to print labels for customers).
- **Join type** – Select the type of joins used when adding related tables. Selecting *Inner join* retrieves data only if data exists in both joined tables, while selecting *Outer join* retrieves data from the root table even if there's no data in the related table.

> ⓘ **Note**
>
> Forms that don't have a data source or that use a temporary table as a data source can't use custom labels (for example, the **Registration** page for purchase orders uses `TmpInventTransWMS` as a data source, so custom labels can't be printed for that table). Instead, you must use a standard table.

4. On the Action Pane, select **Save**.

5. If you want the custom label to include information from related tables, follow these steps to set up the required joins:
   a. On the Action Pane, select **Edit query**.
   b. A standard query editor dialog box appears. On the **Joins** tab, add the required joins to the required tables.
   c. Select **OK** to apply your settings and close the dialog box.

6. If you want to use parameters specified at printing time, follow these steps to set up the parameters:

   a. On the Action Pane, select **Parameters**.

   b. The **Label layout data source parameters** page opens. Use the Action Pane buttons to add or delete rows as needed. For each parameter, specify the following fields:

      - **Name** – Enter the name of the parameter. This name is used in the label layout to refer to the parameter (for example, *label_quantity*). It can only include letters A-Z (upper and lower case), numbers, and the underscore (_) character.
      - **Data types** – Specify the type of data the parameter can hold. Currently, only *String* is supported, which means that no special number or date formatting is available in label layouts when replacing the placeholder with the value. Using

the *String* value shouldn't pose any issues with whole numbers, such as quantity of labels printed.
- **Display name** – Enter the name that will be shown to the user on the custom label printing dialog (for example, *Quantity of labels*).
- **Mandatory** – Specify whether a value must be given for the parameter on the custom label printing dialog.
- **Default value** – Enter the value that will be initially presented to the user on the custom label printing dialog (for example, *1*).

c. Close the page.

Create and manage custom label layouts

Follow these steps to create a custom label layout that uses data from a label layout data source that you set up.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.

2. At the top of the list pane, set the **Label layout type** field to *Custom Label*.

3. Follow one of these steps:

   - To create a new record, select **New** on the Action Pane.
   - To edit an existing record, select **Edit** on the Action Pane, then select the record that you want to edit in the list pane.
   - To remove a record, select it in the list pane, then select **Delete** on the Action Pane.

4. If you're creating or editing a record, set the following fields on the header:

   - **Label layout ID** – Enter a name for the layout (for example, *Locations*).
   - **Description** – Enter a short description of the layout (for example, *Locations*).
   - **Label layout data source ID** – Select the data source for the custom label (for example, *Locations*).
   - **Enable label template support** – Set this option to *No* if you're creating a simple label layout. Set it to *Yes* to create more advanced layouts that include `{{Header ... }}`, `{{Row ... }}`, and `{{Footer ... }}` elements. For more information about how to use these elements, see Enable label template support.
   - **Date, time, and number format** – Select the language to use when date, time, and number values that are shown in the label layout are formatted.

5. On the **Printer text Layout** FastTab, enter your label content code. Here's an example of code for printing a location label. You can copy and paste it for testing.

ZPL

```
CT~~CD,~CC^~CT~
^XA~TA000~JSN^LT0^MNM,0^MTT^PON^PMN^LH0,0^JMA^PR8,8~SD15^JUS^LRN^CI27^PA0,1,1,0

^FT19,148^A0N,42,43^FH\^CI28^FDLocationID: ^FS^CI27
^FT230,148^A0N,42,43^FH\^CI28^FD$WMSLocation_1.wMSLocationId$ ^FS^CI27
^BY3,3,180^FT116,525^BCN,,Y,N
^FH\^FD^FS
^PQ$dsparams.label_quantity$^XZ
```

> ⓘ **Note**
>
> Use `dsparams.parameter-name` to refer to label layout data source parameters.
>
> In this example, the print dialog provides a **Quantity of labels** field, which lets the user specify the number of labels to print.

6. On the Action Pane, select **Save**.

Print a custom label

Follow these steps to print a custom label.

1. In Supply Chain Management, open the page that's associated with the data source that's used for your custom label. Here are some examples:

   - To print a location label (which uses the *WMSLocation* table), go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.
   - To print a product label (which uses the *InventTable* table), go to **Product information management** > **Products** > **Released products**.
   - To print a customer label (which uses the *CustTable* table), go to **Sales and marketing** > **Customers** > **All customers**.

2. Select one or more records that you want to print a label for.

3. On the Action pane, on the **Options** tab, in the **Custom labels** group, select the print option for the type of label that you're printing (for example, **Print locations**).

4. In the **Print custom labels** dialog box, set the following fields:

- **Label layout ID** – Select the layout that you want to use (for example, *Locations*).
- **Printer name** – Select the printer that you want to print from.
- **Label layout data source parameters** - Specify any parameters defined on the label layout data source (for example, *Quantity of labels*).

5. Select **OK**.

Print Arabic language labels

To print Arabic language descriptions on a Zebra Programming Language (ZPL) printer, set up the electronic reporting (ER) framework to generate ZPL labels. Follow these steps:

1. Set up the electronic reporting (ER) Framework.

   Configure the ER parameters in Supply Chain Management to enable label printing. Learn more in Design a new ER solution to print ZPL labels.

2. Design a data model.

   Create an ER configuration that includes a warehouse management domain for label printing.

3. Use Unicode-compatible fonts.

   Make sure that your ZPL printer supports Arabic fonts such as *TT0003M_.TTF* or *ZEBRA Swiss Unicode*.

4. Generate ZPL code.

   Use ER to format the label in ZPL II and include Arabic text by using the `^CI28` command for character encoding.

5. Print the labels.

Document routing label layouts

This article describes how to create layouts for license plate, container, custom, and wave labels. It also provides guidelines for using the Zebra Programming Language (ZPL) used to create the layouts.

Document routing label layouts define the way that labels are laid out and the data that is printed on them. You configure the printing trigger points when you set up mobile device menu items and work templates.

The information in this article applies to all document routing label layouts, including the layouts for license plate labels, container labels, custom labels, and wave labels.

You can print highly complex labels, provided that the printing device can interpret the text that is sent to it. For example, a ZPL layout that includes a bar code might resemble the following example.

ZPL

```
^XA~TA000~JSN^LT0^MNW^MTD^PON^PMN^LH0,0^JMA^PR2,2~SD15^JUS^LRN^CI0^XZ
^XA
^MMT
^PW320
^LL0160
^LS0
^FT20,58^A0N,28,28^FH\^FDLabel:^FS
^FT20,81^AAN,18,10^FH\^FD$LicensePlateId$^FS
^BY1,3,17^FT20,106^BCN,,Y,N,N,A
^FD$LicensePlateId$^FS
^PQ1,,,Y^XZ
```

As part of the label printing process, the text `$LicensePlateId$` in this example is replaced with a data value. Several widely available label generation tools can help you format the text for the label layout. Many of these tools support the `$FieldName$` format. In addition, Microsoft Dynamics 365 Supply Chain Management uses special formatting logic as part of the field mapping for the document routing layout.

To see the values that are printed, go to **Warehouse management** > **Enquiries and reports** > **License plate labels**.

Custom number formats

You can customize the formatting of numerical field values that are printed by using codes that have the following format.

ZPL

```
$FieldName:FormatString$
```

Here is an explanation of this format:

- `FieldName` is the name of the data field (such as **Qty**).
- `FormatString` defines how the data must be printed.

The following examples show how you can customize the work quantity (**Qty**) field:

- To always show four digits (by using zeros as placeholders), use `$Qty:0000$`. For example, if the quantity is 10, the label will show "0010."
- To always show two decimal places, use `$Qty:0.00$`. For example, if the quantity is 10, the label will show "10.00."

For a complete list of the available number format strings, see Custom numeric format strings.

Custom string formats

You can remove the first characters of a string by using the following field and format code.

ZPL

```
$FieldName:#..$
```

Here, `#` specifies the number of characters to skip. For example, to print a Serial Shipping Container Code (SSCC) license plate number that doesn't include the first two characters, use `$LicensePlateId:2..$`. In this case, the license plate number 00111111111111222221 will be printed as "11111111111222221."

Custom date/time formats

The following example shows how you can control the format used to print dates.

ZPL

```
$PrintedDate:dd-MM-yyyy$
```

In this example, the date April 30, 2020, is printed as "30-04-2020."

For a complete list of the available date/time formats, see Custom date and time format strings.

Print individual lines from multiline data

If a data field contains multiple lines (that is, lines that are separated by line breaks), you can print an individual line by using the following format.

ZPL

```
$FieldName[#]$
```

Here, `#` is the line number that you want to print. Use 1 for the first line.

For example, your system has an `AdditionalAddress` field that stores the following multiline address:

Contoso Inc.
123 Street Name
Some City, Some State

You can print this address, one line at a time, by using the following codes.

Expand table

Code	Text that is printed
`$AdditionalAddress[1]$`	Contoso Inc.
`$AdditionalAddress[2]$`	123 Street Name
`$AdditionalAddress[3]$`	Some City, Some State

Print and format from a display method

You can print from a display method by using the following format.

ZPL

```
$DisplayMethod()$
```

You can combine this format with other types that were described earlier in this article. For example, you have a display method that is named `DisplayListOfItemsNumbers()`, and you want to print the first item number of this method. In this case, you can use the following code.

ZPL

```
$DisplayListOfItemsNumbers()[1]$
```

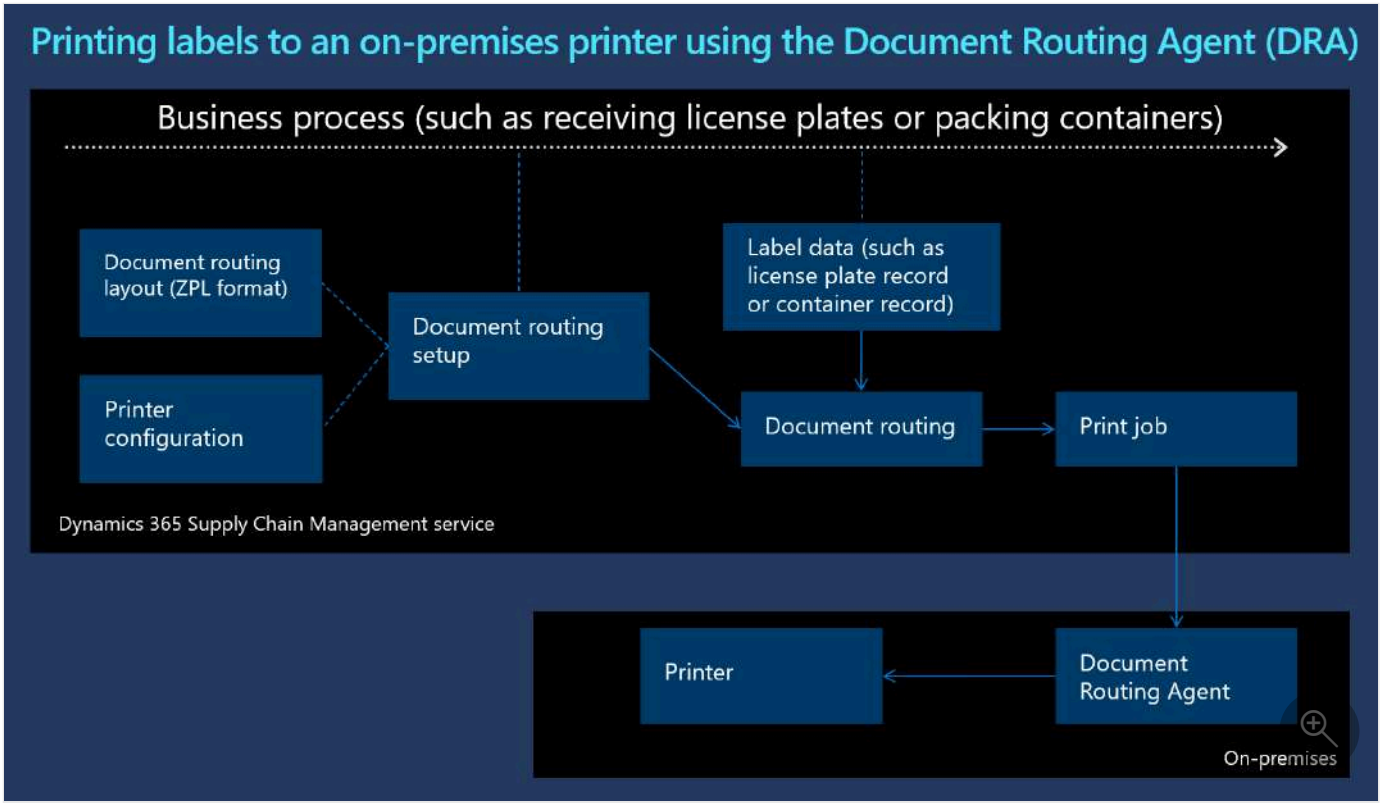
Print labels by using an external service

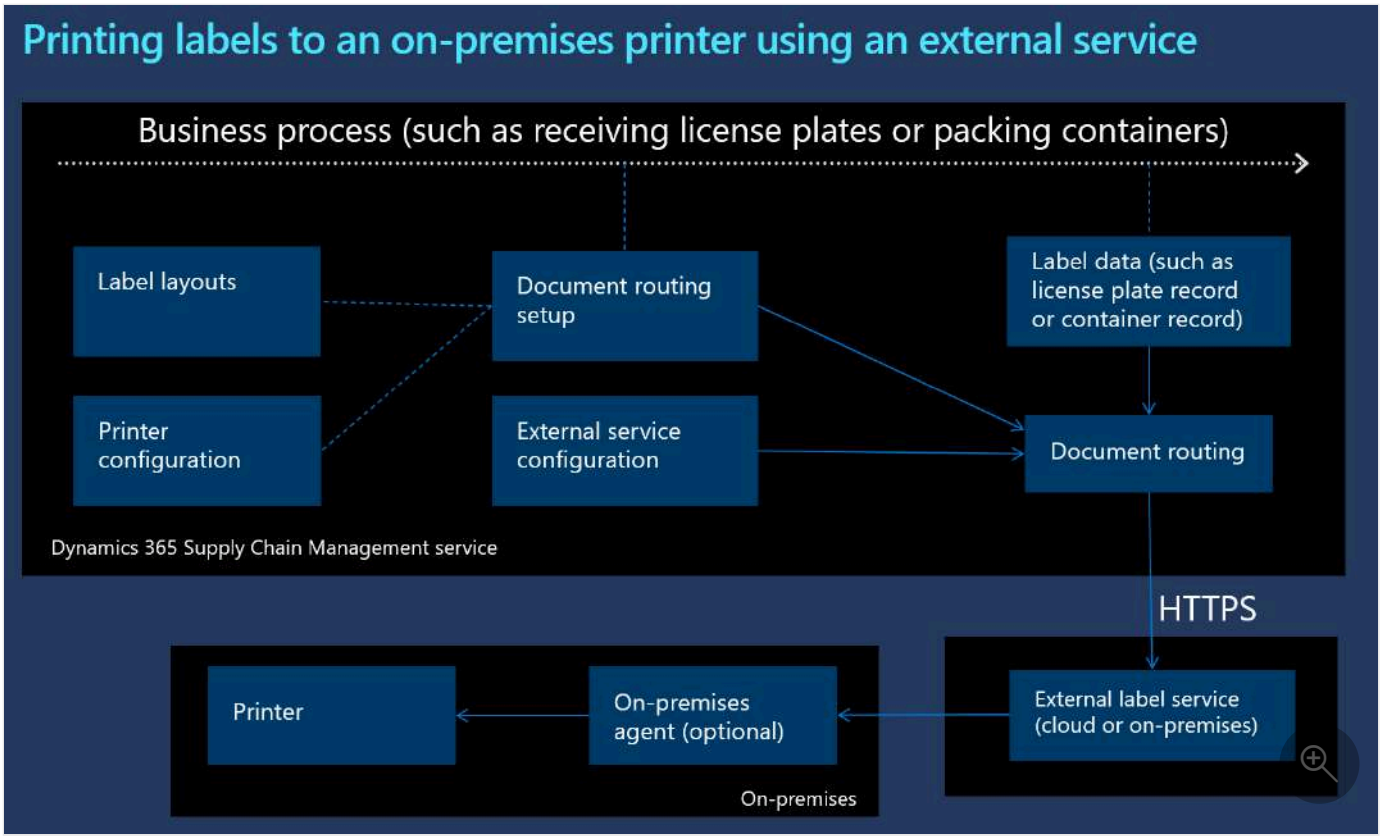
This article describes how to set up and print labels by using an external service. This feature enables direct interaction between Microsoft Dynamics 365 Supply Chain Management and third-party solutions by providing a framework for communicating via HTTP APIs, without requiring the Document Routing Agent (DRA). You can design and print different types of labels by using third-party labeling products, such as Seagull Scientific BarTender® and the Loftware label service solution.

The following illustrations show how printing through the DRA compares to printing through an external service. They highlight the benefits and drawbacks of each method, and can help you decide which printing solution best fits your business needs.

Printing labels by using the DRA



Printing labels by using an external service



For more information about the document routing framework, see Install the Document Routing Agent to enable network printing.

For an example that shows how to set up this feature for the Loftware third-party label printing service, see Print labels using the Loftware label service solution.

For an example that shows how to set up this feature for the Seagull Scientific BarTender third-party label printing service, see Print labels using the Seagull Scientific BarTender label service solution.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.34 or later.
- You must design your labels using the newer *label layouts* feature instead of the older *document routing label layouts* feature. See the next section for guidelines.

Use label layouts instead of document routing label layouts

Classic *document routing label layouts* treat the layout body as plain text and apply string escaping, which can produce malformed JSON or XML payloads. Therefore, you must use the newer *label layouts* when you print labels through an external service.

- To view and create layouts that use the new *label layouts* feature, go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**. Use these layouts when you print labels through an external service.
- To see the older *document routing label layouts*, go to **Warehouse management** > **Setup** > **Document routing** > **Document routing layout**. Don't use these layouts to print labels through an external service.

Learn more about how to work with label layouts in Container label layouts and printing, License plate label layouts and printing, and Custom label layouts and printing.

To enable label layouts for license plate labels, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **General** tab.
3. On the **License plates** FastTab, set **Use label layouts for license plate labels** to *Yes*.

If you need to migrate existing document routing label layouts, use the Data entities framework to export and then import them by using the following entities:

- **Document routing printer layouts** — to export your existing document routing layout definitions, including the template body content.
- **Label layouts with active versions** — to import and export label layout definitions.
- **Label layout data sources** — to import and export custom data source configurations used by label layouts.

Overview of required configurations

To enable label printing through an external service, set up the following elements:

- **External service definition** – Defines how to call the external API. The definition consists of one or more operations.
- **External service instance** – Represents a specific deployment of the service described by the external service definition. Specifies the URL of the service and the authentication secret to use. For each external service definition, you can use one or more instances. For example, you can set up multiple warehouses, each of which has its own on-premises installation of labeling software.

- **Label printers** – Defines the label printers that the labeling service manages.
- **Document routing setup** – Defines which printer is used for which layout in a specific business process.
- **Label layout** – Defines a label layout.

The remaining sections of this article describe how to configure each of these elements.

Set up an external service definition

An external service definition specifies how to call a specific service. This configuration depends on the API definitions that the external service supports. Typically, the external service provider supplies these API definitions.

Follow these steps to set up an external service definition.

1. Go to **Warehouse management** > **Setup** > **External services** > **External service definitions**.
2. On the Action Pane, select **New** to create an external service definition.
3. Set the following fields for the new service definition:
    - **External service definition** – Enter a name for the definition, such as *External*.
    - **Description** – Enter a short description of the definition, such as *External*.
4. On the Action Pane, select **Save**.
5. On the **External service operations** FastTab, select **Edit operations** on the toolbar.
6. The **External service operations** page appears. External service operations define how the system formats its HTTP requests to the external service. You must add at least one operation, which the system uses to print labels. On the Action Pane, select **New** to add a new operation, and then follow these steps:
    - On the header of the new record, set the following fields:
        - **External service definition** – This read-only field shows a value of *External*.
        - **External service operation** – Enter a name for the operation.
        - **Description** – Enter a short description of the operation.
    - On the **General** FastTab, set the following fields:
        - **HTTP method** – Select the HTTP method to use (*GET*, *POST*, or *PUT*).

    - **Operation timeout** – Select the timeout period for the operation, in milliseconds (for example, *500*).
    - **Request body type** – Select the type of body that the service expects:
        - *Raw* – The service expects an XML or JSON message.
        - *form-data* – The service expects data that's formatted as an HTTP form.
    - **Relative URL** – Enter the relative part of the URL for calling the service. Your external service provider must provide this value.
- If you want to express a request entirely in a URL, use the **Request query string** FastTab to define query parameters for authenticating requests.
- Use the **HTTP request headers** FastTab to define the HTTP authorization header, which is the most common method for providing authentication information.
- The **Request body (form data)** FastTab appears when the **Request body type** field is set to *Form-data*. Use it to provide the names of the form data fields and their values. Use the toolbar to add or remove rows in the grid as required. For each row, set the following fields:
    - **Key** – Enter the name of the form data field.
    - **Value** – Enter the value of the form data field.
    - **File name** – This field is required only in special cases where the service expects that the value resembles an uploaded file. For example, it's required by Zebra's `SendFileToPrinter` service.
- The **Request body (raw)** FastTab appears when the **Request body type** field is set to *Raw*. Use it to specify the body content and the content type. Set the following fields:
    - **Content type** – Specify the MIME content type identification (for example *application/xml*, *application/json*, or *text/plain*).
    - **Request body** – Enter the body content.

You can use the following substitution placeholders in the header values, the form data values, or the request body:

- `$auth.secret` – This placeholder is replaced by the authentication secret configured on the external service instance. Use it to store a shared key, token, or password that's required to authenticate with the external service instance.
- `$label.printer` – This placeholder is replaced by the name of the printer that you configure later. Use it to signal to the external service where the label should be

printed.
- `$label.body` or `$label.body:base64` – This placeholder is replaced by the label generated from a label layout or document routing layout. Use the base64 formatting version (`$label.body:base64`) if the externals service expects a base64-encoded Zebra Programming Language (ZPL) script.

7. If you require additional service operations (for example, one for ZPL-based layouts and one for variable-based layouts), repeat the previous step to add them.

8. On the Action Pane, select **Save**. Then select the **Close** button to return to the **External service definitions** page.

9. On the **Label print service** tab, set the following fields:

    - **Print operation** – If you created an operation for printing ZPL-based layouts, select the name of that operation. The operation must already be defined for the current service definition, as described earlier in this procedure.
    - **Variables print operation** – If you created an operation for printing variable-based layouts, select the name of that operation. This operation must already be defined for the current service definition, as described earlier in this procedure.
    - **Variable label layout template** – If you're using a variable-based layout, enter the content for the variable-based layout template.

10. On the Action Pane, select **Save**.

Set up an external service instance

Each external service instance defines a specific instance of an external service.

1. Go to **Warehouse Management** > **Setup** > **External services** > **External service instances**.

2. On the Action Pane, select **New** to create an external service instance.

3. Set the following fields for the new service instance:

    - **External service instance** – Enter a name for the instance, such as *External*.
    - **Description** – Enter a short description of the definition, such as *External*.
    - **External service definition** – Select the service definition to use with the instance. The example service definition value that was suggested earlier in this article was *External*.

4. On the **General** tab, set the following fields:

- **Base URL** – Enter the host name of the external service.
- **Authentication secret** – Enter the authentication secret (password or shared key) used to authenticate with the service.
- **Logging level** – Select the level of log entries to generate:
  - *Errors only* – Log only errors.
  - *Successes and errors* – Log both successes and errors (recommended).
  - *None* – Don't generate any log entries.
- **Log request bodies** – Select how much extra detail to include in log entries:
  - *Errors only* – Include details about errors.
  - *Successes and errors* – Include details about both successes and errors (recommended).
  - *None* – Don't include any details. Show only log headers.
- **Service offline** – If you know that the service will be offline for some time, set this option to *Yes* to prevent the system from trying to connect to it. This setting can help save system resources, because it prevents the system from waiting for the service to respond to requests. Set this option back to *No* when the service is back online.

5. On the Action Pane, select **Save**.

For information about how to read the log entries, see the Review the external service request log section later in this article.

Set up a printer

Use the following procedure to link a printer with the external print service.

1. Go to **Warehouse Management** > **Setup** > **Document routing** > **Label printers**.
2. On the Action Pane, select **New** to add a printer to the grid.
3. Set the following fields for the new printer:
   - **Connection type** – Select the type of connection that's used to communicate with the printer:
     - *External label service* – Connect to a cloud printer through an external service. Cloud printers include printers that are accessible only through the external label service.
     - *Document routing agent/Hybrid* – Connect to a DRA printer, or use the DRA as a fallback for the external service if the service can't print the label.

- **Printer name** – Enter or select the printer name. This value represents an internal Supply Chain Management printer name. If the printer is already configured as a DRA printer, you can select its name in the lookup dialog box. To set up an external service, you must specify the printer name. That name must not already be used for a DRA printer. When you enter a name for an external service printer, use a prefix or another method to keep the names of external service printers separate from printers that you might register through the DRA in the future.

- **Printer stock type** – Select a *printer stock type*. A printer stock type typically describes the type of paper that a specific printer uses. It's also used to specify the type of paper that a specific label layout should be printed to. For information about how to set up printer stock types, see Set up printer stock types.

- **Batch print** – Select this checkbox to enable the system to send multiple labels to the selected printer as a single batch job. Clear this checkbox to send one label at a time. Batch jobs print labels all at once, without being interrupted by other print jobs.

- **Maximum file size** – If you enabled batch printing for the printer, enter the maximum size, in megabytes, for batch files that are sent to it. The value must be more than 0 (zero). Batches that exceed the maximum size are split into smaller batches before they're sent. A large file size lets you include more labels in each batch. However, large batches might take a long time to print and therefore delay other jobs. Alternatively, they might fail if they exceed the memory capacity of your printer. To find the maximum supported value, see your printer's specifications.

- **Label print service instance** – Select the service instance to use. The example service instance value that was suggested earlier in this article was *External*.

- **Label print service printer name** – Enter the printer name as it's defined in the external service. This value represents an external printer name that's used in the external service.

- **Label print service execution policy** – If the **Connection type** field is set to *Document routing agent/Hybrid*, select one of the following values to specify what the system should do if a request to the external service fails:
  - *Only use the label print service* – The system won't try to print the label by using the DRA, even for printers where using the DRA would otherwise be an option.
  - *Fallback to the Document Routing Agent* – The system tries to print the label by using the DRA.

Configure a label layout

You can configure a label layout in either of the following ways:

- Use ZPL or another printer command language directly.
- Specify XML, JSON, or a similar data format that the external service uses to generate and print label layouts.

For more information about how to set up label layouts, see License plate label layouts and printing.

The rest of this section provides an example that shows how to use a JSON request body for an external label service. For this example, the external service has an operation that requires the following JSON body (including several variables) to print a label to a specific printer.

JSON

```
{
    "printer": "LABELPRINTER",
    "labelfile": "/Labels/SimpleLicensePlateLabel1",
    "variables": {
        "Item": "ITEM1",
        "Container": "CONTAINER1"
    }
}
```

Part of this JSON request body is generated by the label layout and includes data for a specific label. It's embedded in the external service operation's request body definition, which specifies a printer and other data that isn't specific to the label. Because the printer is provided by the `$label.printer` substitution, this part of the request goes into the external service operation. Because the label file and the variables are specific to each label, this part of the request goes into the label layout.

The following example shows what the external service operation's request body might look like.

JSON

```
{
    "printer": "$label.printer$",
    $label.body$
}
```

The following example shows what the label layout (in this case, the layout for a license plate label) might look like.

JSON

```
"labelfile": "/Labels/SimpleLicensePlateLabel1",
"variables": {
    "Item": "$ItemId$",
    "Container": "$LicensePlateId$"
}
```

Set up document routing

For information about how to set up document routing, see License plate label layouts and printing.

Run a scenario to print custom labels

If you want to experiment with printing labels, you can set up a scenario for printing location labels. For more information, see Custom label layouts printing. Follow the instructions in this article, and confirm that the scenario is supported.

Review the external service request log

The external service request log contains information about each request that the system sends to an external service. It can help you troubleshoot problems.

The amount of detail that the log records depends on the **Log level** and **Log request bodies** settings that you specify for each external service instance. Learn more in the External service instance configuration section earlier in this article.

For each request, the system checks if the external service returns the HTTP success code (200). If the external service returns a different HTTP code, such as 4xx or 5xx, the system reports an error, provided that you enable the relevant logging options.

To review the request log that's generated while labels are printed to the external service, follow these steps:

1. Go to **Warehouse management** > **Enquiries and reports** > **External service request log**. Alternatively, to review the log for a specific instance, go to **Warehouse Management** > **Setup** > **External service instances** > **Request log**.
2. In the grid, select the request log to review.
3. On the Action Pane, select **Request details**.
4. Review the log.

Print labels by using the Loftware label service solution

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to set up and print labels in Microsoft Dynamics 365 Supply Chain Management by using the Loftware solution. It's one example that shows how to use the Supply Chain Management external service label printing feature. For general information about how this feature works, see Print labels using an external service.

Loftware lets you create, manage, and print standardized, compliant bar code labels. It also lets you print labels to supported cloud-connected printers or a wide variety of classic on-premises printers. Loftware has several products that can be used together with the external label printing service, including a cloud solution (Loftware Cloud) and several versions of their on-premises products. This article focuses on how to integrate Supply Chain Management with the Loftware Cloud solution.

For more information about Loftware Cloud, see Loftware Cloud & Label Management System.

> **Important**
>
> By enabling the external service integration, you affirm that you understand that the data handling, privacy, and compliance standards of the external service might not be the same as the standards that Dynamics 365 Supply Chain Management provides. To learn whether the external service meets your organization's security and privacy requirements, including requirements for the handling of personal data and geo-residency, consult the external service's documentation and terms. Your privacy is important to us. To learn more, read the Microsoft Privacy Statement.

Loftware Cloud supports two integration approaches for other cloud applications:

- **Cloud Print API** – Loftware Cloud generates the labels and sends print jobs to the printer. This printer can be either a so-called *cloud printer* (a printer that's connected directly to the Loftware Cloud instance, without using any locally installed software or printer driver) or any printer that's connected to a workstation where a print gateway component is installed. For the current list of supported cloud printers, see the Loftware website.
- **Cloud Trigger API** – Loftware Cloud sends messages to an on-premises Loftware Automation Service instance, which generates the labels and sends them to the printer. You must install a Windows printer driver for each of your printers.

If you don't want any local software footprint, the preferred option is to use the Cloud Print API together with supported printers. Otherwise, use the Cloud Trigger API. Nevertheless, both options are available.

Here are some of the pros and cons of each integration option:

- The Cloud Trigger API lets you use an out-of-box cloud integration pack or completely customize the processing of print requests.
- The Cloud Print API is synchronous. In other words, the server waits for the print engine to print the label. Although the Cloud Print API reports the outcome of the print job, Supply Chain Management doesn't use that result. Therefore, you must wait a little longer when you print labels, or you must set a time-out on the external service operation. If a time-out occurs, the Cloud Print API continues to print, but the request is logged as a time-out.
- On-premises printer naming is simpler in the Cloud Trigger API, because you can use the names of the printers as they're configured on the servers that run the Loftware Automation Service. To use the Cloud Print API, you must specify a workstation ID to indicate which workstation you want to print to.
- For the Cloud Trigger API, you can install multiple instances of the Loftware Automation Service on the local network to achieve load balancing and high availability. As was noted in the previous point, you must specify which workstation the printing request should be routed to. If that workstation isn't available, the label isn't printed. Conversely, multiple Loftware Automation Service instances can handle requests to the same cloud trigger.
- The Cloud Print API has a smaller installation footprint.

> **Important**
>
> The information in this article is for general information purposes only. Although we try to keep the information up to date and correct, Microsoft makes no representation or warranties of any kind, express or implied, about accuracy, reliability, or completeness with the respect to the Loftware product. Loftware might change the functionality of the Loftware

product at any time without notice. If you experience any issues or have any additional questions about the Loftware product, contact Loftware directly.

Prerequisites

To use the features that this article describes, you must be running Supply Chain Management version 10.0.34 or later.

Prepare for Loftware Cloud integration

Before you can access Loftware Cloud by using either the Cloud Print API or the Cloud Trigger API, you must register in the Loftware Developer Portal and then link your Developer Portal subscription with your Loftware Cloud instance. For instructions, see the Loftware Help Center.

> **Important**
>
> When you register in the Loftware Developer Portal, be sure to make a copy of your primary or secondary subscription key. (Use the primary key by default.) You need this key to configure the external service definition later.

If you want to use printers that are enabled for the Internet of Things (IoT), you must connect them to your Loftware Cloud instance. For instructions, see the Loftware Help Center.

Configure Supply Chain Management to print to cloud printers by using the Cloud Print API

By using the Cloud Print API, you can print labels that Loftware Cloud generates based on variables that are sent from Supply Chain Management. You can also send a Zebra Programming Language (ZPL) label, such as an existing label layout or a shipping label that's provided by a shipping carrier for small parcel shipping (SPS) integration.

This section describes how to set up an external service definition that has two operations: one for printing variable-based layouts and one for printing ZPL-based label layouts. If you don't need to use both types of layout, you can set up just one of the two operations that are described here.

Set up an external service definition for printing through the Cloud Print API

Follow these steps to set up an external service definition.

1. Go to **Warehouse management** > **Setup** > **External services** > **External service definitions**.
2. On the Action Pane, select **New** to create an external service definition.
3. Set the following fields for the new service definition:
    - **External service definition** – Enter a name for the service definition, such as *NLPrint*.
    - **Description** – Enter a short description of the service definition, such as *Loftware Cloud Print API*.
4. On the Action Pane, select **Save**.
5. On the **External service operations** FastTab, select **Edit operations** on the toolbar.
6. On the **External service operations** page, on the Action Pane, select **New** to add an operation for printing variable-based layouts. Then follow these steps for the new record. If you don't use variable-based layouts, you can skip ahead to step 8.
    - On the header, set the following fields:
        - **External service operation** – Enter a name for the operation, such as *Print*.
        - **Description** – Enter a short description of the operation, such as *Print to cloud printer*.
    - On the **General** FastTab, set the following fields:
        - **HTTP method** – Select *POST*.
        - **Operation timeout** – Enter a timeout period for the operation, in milliseconds, such as *500*.
        - **Request body type** – Select *Raw*.
        - **Relative URL** – Enter */Print/v2/Print*.

        > ⓘ **Note**
        >
        > Cloud Print is a synchronous API. Therefore, it waits until the label is printed and then provides immediate feedback about whether printing was successful. However, because this process can take several seconds, the system might provide a bad user experience for mobile device users. Additionally, the result isn't currently used. Therefore, set a timeout period of 500 milliseconds. Even though Supply Chain Management stops waiting after this timeout expires, printing continues in the background.

- On the **Request HTTP headers** FastTab, add a row, and set the following fields for it:
  - **Key** – Enter *Ocp-Apim-Subscription-Key*.
  - **Value** – Enter *$auth.secret$*. Be sure to enter the value exactly as it appears here.

- On the **Request body** FastTab, set the following fields:

  - **Content type** – Enter *application/json*.

  - **Body** – Enter the content of the request body. Here's an example.

    JSON

    ```
    {
        "deviceType": "CloudPrinter",
        "deviceId": {
            "printerName": "$label.printer$",
            "workstation": null
        },
        $label.body$
    }
    ```

7. On the Action Pane, select **Save**.

8. On the Action Pane, select **New** to add an operation for printing ZPL-based layouts. Then follow these steps for the new record. If you don't use ZPL-based layouts, you can skip ahead to step 10.

   - On the header, set the following fields:
     - **External service operation** – Enter a name for the operation (for example, *SendData*).
     - **Description** – Enter a short description of the operation (for example, *Send ZPL to cloud printer*).

   - On the **General** FastTab, set the following fields:
     - **HTTP method** – Select *POST*.
     - **Operation timeout** – Enter a timeout period for the operation, in milliseconds, such as *500*.
     - **Request body type** – Select *Raw*.
     - **Relative URL** – Enter */Print/v2/SendData*.

   - On the **HTTP request headers** FastTab, add a row, and set the following fields for it:
     - **Key** – Enter *Ocp-Apim-Subscription-Key*.
     - **Value** – Enter *$auth.secret$*. Be sure to enter the value exactly as it appears here.

- On the **Request body** FastTab, set the following fields:
  - **Content type** – Enter *application/json*.
  - **Body** – Enter the content of the request body. Here's an example.

```
JSON
{
    "deviceType": "CloudPrinter",
    "deviceId": {
        "printerName": "$label.printer$",
        "workstation": null
    },
    "data": "$label.body:base64$"
}
```

9. On the Action Pane, select **Save**.
10. Select the **Close** button to return to the **External service definition** page.
11. In the list pane, select the record that you were working on at the beginning of this procedure.
12. On the **Label print service** FastTab, set the following fields:
    - **Print operation** – If you created an operation for printing ZPL-based layouts, select the name of that operation (for example, *SendData*).
    - **Variables print operation** – If you created an operation for printing variable-based layouts, select the name of that operation (for example, *Print*).
    - **Variable label layout template** – If you're using a variable-based layout, enter the content for your variable-based layout template. Here's an example.

```
JSON
"filePath": "$SystemVariables.LabelFile$",
"quantity": "$SystemVariables.Quantity$",
"dataSources": [
    {
        {{Row Table=LabelLayoutVariable
            "$LabelLayoutVariable.Variable$": "$LabelLayoutVariable.Value$",
        }}
    }
]
```

Set up an external service instance for printing through the Cloud Print API

Follow these steps to set up an external service instance for printing through the Cloud Print API.

1. Go to **Warehouse Management** > **Setup** > **External services** > **External service instances**.
2. On the Action Pane, select **New** to create an external service instance.
3. Set the following fields for the new service instance:
    - **External service instance** – Enter a name for the instance, such as *NLPrintProd*.
    - **Description** – Enter a short description of the instance, such as *Loftware Cloud Print API Production*.
    - **External service definition** – Select the service definition to use with the instance. The example service definition value suggested earlier in this article is *NLPrint*.
4. On the **General** tab, set the following fields:
    - **Base URL** – Enter `https://labelcloudapi.onnicelabel.com`.
    - **Authentication secret** – Enter your primary or secondary subscription key from the Loftware Developer Portal. You should have made a note of this key earlier, when you were preparing for Loftware integration.
    - **Logging level** – Select *Successes and errors*.
    - **Log request bodies** – Select *Successes and errors*.

You can now create label printers and label layouts by using either variables or ZPL.

> ⓘ **Note**
>
> - When you create label printers on the **Label printers** page in Supply Chain Management, in the **Label print service printer name** field, enter the name of the printer from the **Cloud printers** tab in Loftware Cloud Control Center.
> - When you create a variable-based label layout on the **Label layout** page of Supply Chain Management, in the **System Variables** grid, include a row where the **Variable name** field is set to *LabelFile* and the **Value** field is set to the full path and file name of the label. To find the full path and file name, sign in to Loftware Control Center, and then, on the **Documents** tab, select the label file, and copy the full value of the **Path** field (under **File properties**).

Configure Supply Chain Management to print to local network printers by using the Cloud Trigger API

By using the Cloud Trigger API, you can call an on-premises installation of the Loftware Automation Service, which then processes the request and performs preprogrammed actions. Before you move on to the next steps, install Loftware on the computers that run the Loftware Automation Service, and set up the required printers for those computers. For guidance that helps you install and set up printers, see the Loftware documentation.

To simplify the configuration of the Loftware Automation Service, use the Loftware Cloud Data Integration pack, and follow the instructions provided in the Loftware Help Center. The following procedure summarizes the required steps. More details are provided in the Loftware Help Center.

1. Download the integration pack by using the link that's provided.
2. Sign in to Loftware Control Center.
3. On the **Documents** tab, create the following folder: `/Demo/LabelCloudDataIntegration`.
4. Open the zip file that you downloaded, and extract the files.
5. Upload the contents of your document storage folder into the `LabelCloudDataIntegration` folder in Loftware Control Center.
6. On the computer where the Loftware Automation Service is installed, open Loftware Automation Manager.
7. If you didn't already, connect the Loftware Automation Service to your Loftware Cloud instance.
8. In Loftware Automation Manager, select **Add**, and browse to the `LabelCloudDataIntegration` folder in Loftware Cloud.
9. Open the `CloudIntegration-CloudTrigger.misx` file.
10. Verify that the print trigger uses the unique identifier *Api-CloudIntegrationDemo-Print*. Then start only this trigger. Supply Chain Management doesn't currently support other triggers.

After you install and start the print trigger, you're ready to configure the external service definition and external service instance that are required to access the Loftware Automation Service by using the Cloud Trigger API. Unless you customize the demo automation configuration, you can print only variable-based layouts, not ZPL-based layouts. In this case, you configure only one operation on the external service definition.

Set up an external service definition for printing through the Cloud Trigger API

Follow these steps to set up an external service definition for printing through the Cloud Trigger API.

1. Go to **Warehouse management** > **Setup** > **External services** > **External service definitions**.
2. On the Action Pane, select **New** to create an external service definition.
3. Set the following fields for the new service definition:
    - **External service definition** – Enter *NLTrigger*.
    - **Description** – Enter *Loftware Label Cloud Trigger API*.
4. On the Action Pane, select **Save**.
5. On the **External service operations** FastTab, select **Edit operations** on the toolbar.
6. On the **External service operations** page, on the Action Pane, select **New** to add an operation for the *Print* service operation. Then follow these steps for the new record:
    - On the header, set the following fields:
        - **External service operation** – Enter a name for the operation, such as *Print*.
        - **Description** – Enter a short description of the operation (for example, *Print to local printer*).
    - On the **General** FastTab, set the following fields:
        - **HTTP method** – Select *POST*.
        - **Operation timeout** – Enter a timeout period for the operation, in milliseconds, such as *500*.
        - **Request body type** – Select *Raw*.
        - **Relative URL** – Enter */Trigger/v1/CloudTrigger/Api-CloudIntegrationDemo-Print*.
    - On the **HTTP request headers** FastTab, add a row, and set the following fields for it:
        - **Key** – Enter *Ocp-Apim-Subscription-Key*.
        - **Value** – Enter *$auth.secret$*. Be sure to enter the value exactly as it appears here.
    - On the **Request body** FastTab, set the following fields:
        - **Content type** – Enter *application/json*.
        - **Body** – Enter the content of the request body. Here's an example.

            JSON

```
{
    "Printer": "$label.printer$",
    $label.body$
}
```

7. On the Action Pane, select **Save**.

8. Select the **Close** button to return to the **External service definition** page.

9. On the **Label print service** FastTab, set the following fields:

    - **Print operation** – Leave this field blank.

    - **Variables print operation** – Select the print operation that you created earlier in this procedure (for example, *Print*).

    - **Variable label layout template** – Enter the content for your variable-based layout template. Here's an example.

      JSON

      ```
      "FilePath": "$SystemVariables.LabelFile$",
      "Quantity": "$SystemVariables.Quantity$",
      "Variables": [
          {{Row Table=LabelLayoutVariable
              {
                  "Name": "$LabelLayoutVariable.Variable$",
                  "Value": "$LabelLayoutVariable.Value$"
              },
          }}
      ]
      ```

Set up an external service instance for printing through the Cloud Trigger API

Follow these steps to set up an external service instance for printing through the Cloud Trigger API.

1. Go to **Warehouse Management** > **Setup** > **External services** > **External service instances**.

2. On the Action Pane, select **New** to create an external service instance.

3. Set the following fields for the new service instance:

    - **External service instance** – Enter a name for the instance, such as *NLTriggerProd*.

- **Description** – Enter a short description of the instance, such as *Loftware Cloud Trigger API Production*.
- **External service definition** – Select the service definition to use. The example service definition value suggested earlier in this article is *NLTrigger*.

4. On the **General** tab, set the following fields:

   - **Base URL** – Enter `https://labelcloudapi.onnicelabel.com`.
   - **Authentication secret** – Enter your primary or secondary subscription key from the Loftware Developer Portal. You should have made a note of this key earlier, when you were preparing for Loftware integration.
   - **Logging level** – Select *Successes and errors*.
   - **Log request bodies** – Select *Successes and errors*.

You can now create label printers and label layouts by using variables.

> **Note**
>
> - When you create label printers on the **Label printers** page in Supply Chain Management, in the **Label print service printer name** field, enter the name of the printer from the **Cloud printers** tab in Loftware Cloud Control Center.
> - When you create a variable-based label layout on the **Label layout** page of Supply Chain Management, in the **System Variables** grid, include a row where the **Variable name** field is set to *LabelFile* and the **Value** field is set to the full path and file name of the label. To find the full path and file name, sign in to Loftware Control Center, and then, on the **Documents** tab, select the label file, and copy the full value of the **Path** field (under **File properties**).
> - When you create a variable-based label layout, **Variable name** in the **Data variables** grid can't be the same as **Variable name** in the **System variables** grid.

Print labels by using the Seagull Scientific BarTender® label service solution

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to set up and print labels in Microsoft Dynamics 365 Supply Chain Management by using the BarTender® labeling solution by Seagull Scientific. It's one example that shows how to use the Supply Chain Management external service label printing feature. For general information about how this feature works, see Print labels using an external service.

The BarTender labeling solution is available both as on-premises software and as a cloud-based software-as-a-service (SaaS) offering that's named BarTender Cloud™. Currently, only BarTender Cloud can be used together with the external label printing service for Supply Chain Management.

This article describes how to integrate Supply Chain Management with BarTender Cloud. It includes information about how to communicate with BarTender Cloud by exchanging documents in YAML format through the BarTender Cloud REST API. For more information about BarTender Cloud, see BarTender Cloud.

> **Important**
>
> By enabling the external service integration, you affirm that you understand that the data handling, privacy, and compliance standards of the external service might not be the same as the standards that Dynamics 365 Supply Chain Management provides. To learn whether the external service meets your organization's security and privacy requirements, including requirements for the handling of personal data and geo-residency, consult the external service's documentation and terms. Your privacy is important to us. To learn more, read the Microsoft Privacy Statement.

The information in this article is for general informational purposes only. Although Microsoft tries to keep the information up to date and correct, Microsoft makes no representation or warranties of any kind, express or implied, about accuracy, reliability, or completeness with respect to the BarTender product. Seagull Scientific might change the functionality of the BarTender product at any time without notice. If you have any additional questions about the BarTender product, contact Seagull Scientific.

Prerequisites

To use the features that this article describes, you must be running Supply Chain Management version 10.0.34 or later.

Get a copy of your personal access token from BarTender Cloud

Before you can access BarTender Cloud through its REST API, you must get a copy of your personal access token from BarTender Cloud. Supply Chain Management uses this token to authenticate with BarTender Cloud. For more information about how to get this token, see BarTender Cloud REST API in the BarTender help center. Be sure to make a note of the token, because you need to enter it later.

> **Note**
>
> Personal access tokens expire after a fixed number of days. You need to enter a new token before the old one expires. You can manually refresh the token to obtain a new one.

Configure Supply Chain Management to print to printers managed by BarTender Cloud

For the scripts that the BarTender Cloud service must run, the BarTender Cloud Actions REST API accepts several formats, including YAML-based and JSON-based action scripts and scripts that use the older BarTender XML (BTXML) format. In this article, the label that's printed is based on a design that's saved in your BarTender Cloud account. The article describes how to use the `PrintBTWAction` action to print the label to a printer that's accessed through a BarTender Cloud Print Gateway that's installed on your local network.

Set up an external service definition for printing through the Actions API

Follow these steps to set up an external service definition.

1. Go to **Warehouse management** > **Setup** > **External services** > **External service definitions**.
2. On the Action Pane, select **New** to create an external service definition.
3. Set the following fields for the new service definition:
    - **External service definition** – Enter a name for the service definition, such as *BTCloud*.
    - **Description** – Enter a short description of the service definition, such as *BarTender Cloud*.
4. On the Action Pane, select **Save**.
5. On the **External service operations** FastTab, select **Edit operations** on the toolbar.
6. On the **External service operations** page, on the Action Pane, select **New** to add an operation for printing variable-based layouts. Then follow these steps for the new record:
    - On the header, set the following fields:
        - **External service operation** – Enter a name for the operation, such as *Actions*.
        - **Description** – Enter a short description of the operation, such as *Actions API*.
    - On the **General** FastTab, set the following fields:
        - **HTTP method** – Select *POST*.
        - **Operation timeout** – Enter a timeout period for the operation, in milliseconds, such as *500*.
        - **Request body type** – Select *Raw*.
        - **Relative URL** – Enter */api/actions*.

        > ⓘ **Note**
        >
        > Cloud Print is a synchronous API. Therefore, it waits until the label is printed and then provides immediate feedback about whether printing was successful. However, because this process can take several seconds, the system might provide a bad user experience for mobile device users. Additionally, the result isn't currently used. Therefore, set a timeout period of 500 milliseconds. Even

though Supply Chain Management stops waiting after this timeout expires, printing continues in the background.

- On the **Request HTTP headers** FastTab, add a row, and set the following fields for it:
  - **Key** – Enter *Authorization*.
  - **Value** – Enter *Bearer $auth.secret$*. Be sure to enter the value exactly as it appears here.
- On the **Request body** FastTab, set the following fields:
  - **Content type** – Enter *text/yaml*.
  - **Body** – Enter the content of the request body. Here's an example.

```
YAML
- SetVariableAction:
    VariableName: D365PrinterName
    VariableValue: $label.printer$
$label.body$
```

> **ⓘ Important**
>
> Paste the body text exactly as it appears here. Indentation is important. Be sure to use four spaces to indent. Don't use tabs.

7. On the Action Pane, select **Save**.
8. Select the **Close** button to return to the **External service definition** page.
9. In the list pane, select the record that you were working on at the beginning of this procedure.
10. On the **Label print service** FastTab, set the following fields:
    - **Print operation** – Leave this field blank.
    - **Variables print operation** – Select the name of the operation that you created for printing variable-based layouts, such as *Actions*.
    - **Variable label layout template** – Enter the content for your variable-based layout template. Here's an example.

YAML

```
- PrintBTWAction:
    DocumentFile: librarian://Main/$SystemVariables.LabelFile$
    Printer: "%D365PrinterName%"
    Copies: $SystemVariables.Quantity$
    NamedDataSources:
{{Row Table=LabelLayoutVariable
      $LabelLayoutVariable.Variable$: $LabelLayoutVariable.Value$
}}
```

> **Important**
>
> Paste the body text exactly as it appears here. Indentation is important. Be sure to use four spaces to indent. For the `NamedDataSources` variables, be sure to use six spaces to indent. Don't use tabs.

Set up an external service instance for printing through the Actions API

For this procedure, you need the personal access token that you previously obtained from BarTender Cloud.

Follow these steps to set up an external service instance for printing through the Actions API.

1. Go to **Warehouse Management** > **Setup** > **External services** > **External service instances**.
2. On the Action Pane, select **New** to create an external service instance.
3. Set the following fields for the new service instance:
   - **External service instance** – Enter a name for the instance, such as *BTCloud*.
   - **Description** – Enter a short description of the instance, such as *BTCloud*.
   - **External service definition** – Select the service definition to use with the instance. The example service definition value that was suggested earlier in this article is *BTCloud*.
4. On the **General** tab, set the following fields:
   - **Base URL** – Enter one of the following instance URLs, depending on the region:
     - **For the AMER region:** `https://am1.bartendercloud.com`
     - **For the EMEA region:** `https://eu1.bartendercloud.com`
     - **For the APAC region:** `https://ap1.bartendercloud.com`

- **Authentication secret** – Enter the personal access token that you obtained from BarTender Cloud. You should have made a note of this token earlier, when you were preparing for BarTender integration.
- **Logging level** – Select *Successes and errors*.
- **Log request bodies** – Select *Successes and errors*.

You can now create label printers and label layouts.

> **Note**
>
> - When you create label printers on the **Label printers** page in Supply Chain Management, in the **Label print service printer name** field, enter the name of the printer as it appears in the **Print** dialog box in BarTender Cloud, or as it's retrieved from the Printer API. Use the following format: *printer:workstation/printer*.
> - When you create a variable-based label layout on the **Label layout** page of Supply Chain Management, in the **System Variables** grid, include a row where the **Variable name** field is set to *LabelFile* and the **Value** field is set to the full path and file name of the label (including any folders, if the label file is stored in a folder). The BarTender Cloud REST API uses a Librarian path, but the beginning of the full Librarian name is already coded in the variable label template.
> - When you create a variable-based label layout, **Variable name** in the **Data variables** grid can't be the same as **Variable name** in the **System variables** grid.

Dynamic printer selection

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up your system to dynamically select a printer when printing license plate labels and container labels.

When dynamic printer selection is used, and a worker requests printing, the system selects a printer based on the current work user, warehouse, location, and/or zone. The warehouse manager can set up default printers for each work user, warehouse, location, and/or zone.

> **Important**
>
> The location is only considered when printing container labels.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- Dynamic printer selection requires Microsoft Dynamics 365 Supply Chain Management version 10.0.36 or later.
- The added ability to set up default printers for specific mobile devices (on the **Devices** tab of the **Default label printers** page) requires Supply Chain Management version 10.0.41.

Basic printing and label layout setup

Before you can set up dynamic printer selection, you must configure your printers and labels in the system, as summarized in the following subsections.

Set up printer stock types

A *printer stock type* typically describes the type of paper, such as the size, that a specific printer uses. Use it to specify the type of paper that a specific label layout should print to.

> **Important**
>
> To use dynamic printer selection, you *must* set up a printer stock type for each relevant printer. You must also set up a printer stock type for each label layout that you want to use for dynamic printer selection.

Follow these steps to set up printer stock types.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Printer stock types**.
2. Create or select a stock type.
3. For the new or selected stock type, set the following fields:
    - **Printer stock type** – Enter a name for the printer stock type, such as *A1*.
    - **Description** – Enter a short description of the printer stock type.
4. Repeat steps 2 and 3 until you set up all the stock types that you need.
5. On the Action Pane, select **Save**.

Set the printer stock type for a label printer

Follow these steps to set the printer stock type for a label printer.

1. Go to **Warehouse management*** > **Setup** > **Document routing** > **Label printers**.
2. Create or select a printer.
3. For the new or selected printer, set the **Printer stock type** field to the relevant printer stock type. For example, select one of the stock types that you set up in the previous section. For information about the other settings that are available for a label printer, see Set up a printer.
4. Repeat steps 2 and 3 until you set up all the stock types that you need.
5. On the Action Pane, select **Save**.

Set up a label layout, including the printer stock type

Follow these steps to set the printer stock type for a label layout.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Label layout**.
2. At the top of the list pane, set the **Label layout type** field to *License Plate Label*.
3. Create or select a label layout.
4. For the new or selected label layout, set the **Printer stock type** field to a printer stock type that you set up earlier in this article. For information about the other settings that are available for a label layout, see License plate label layouts and printing.
5. On the Action Pane, select **Save**.

Configure the license plate label routing

Follow these steps to configure the license plate label routing.

1. Go to **Warehouse management** > **Setup** > **Document routing** > **Document routing**.

2. Set up license plate label routing as described in Set up license plate label routing. However, on the **Document routing printers** FastTab, include only one row, and configure it in the following way:

   - **Name** – Leave this field blank.
   - **Label layout ID** – Select the label layout that you set up in the previous section.

   > ⓘ Note
   >
   > If the **Document routing printers** FastTab includes a row where the printer name is specified (that is, the **Name** field isn't blank), dynamic printer selection isn't used. Instead, the specified printer is used.

3. On the Action Pane, select **Save**.

Set up default label printers for specific workers and locations

After your printers and label layouts are set up, you can set up default label printers for specific workers and locations. The settings define the printer that the system selects for the current worker and/or location when you use dynamic printer selection. Learn more in the How the system selects a printer section later in this article.

Follow these steps to set up default label printers for each worker and/or location.

1. Go to **Warehouse management** > **Document routing** > **Default label printers**.

2. On the **Locations** tab, the grid shows the default label printers assigned to each location. For flows where the system can determine the location of a worker who requests printing, the printers that you set in this grid have priority (provided that the worker didn't manually override the default printer selection). Use the toolbar buttons to add or remove rows as required. For each row, set the following fields:

    - **Printer stock type** – Select the printer stock type that the row applies to.
    - **Warehouse** – Select the warehouse that includes the location.
    - **Location scope type** – Select *Location* if the row applies to one specific location. Select *Zone* if the row applies to a zone that includes multiple locations.
    - **Location scope** – Depending on the **Location scope type** value, select either the location or the zone that the row applies to.
    - **Printer name** – Select the default printer to use for the location or zone that the row applies to.

3. On the **Users** tab, the grid shows the default label printers that assigned to each worker in each warehouse. Use the toolbar buttons to add or remove rows as required. For each row, set the following fields:

    - **Printer stock type** – Select the printer stock type that the row applies to.
    - **User ID** – Select the user ID of the worker that the row applies to.
    - **Warehouse** – Select the warehouse that the row applies to. You can set up multiple rows for workers who work in more than one warehouse. Leave this field blank to set the default printer that's used for a worker if no other, more specific row applies. When the worker requests printing, the system selects the printer that's most specific to the warehouse where the worker is signed in.
    - **Printer name** – Select the default printer to use for the combination of a worker, warehouse, and stock type on the row.

4. On the **Devices** tab, the grid shows the default label printers assigned to mobile devices. Use the toolbar buttons to add or remove rows as required. For each row, set the following fields:

    - **Printer stock type** – Select the printer stock type that the row applies to.
    - **Mobile device** – Select the ID or friendly name of the device that the row applies to.
    - **Printer name** – Select the default printer to use for the device that the row applies to.

5. On the Action Pane, select **Save**.

Create a menu item that lets workers override their default printer

Set up the Warehouse Management mobile app to let workers override the default printer that's assigned to them. Workers can use their mobile device to scan a new printer name.

Create a new mobile device menu item, set the **Mode** field to *Indirect*, and set the **Activity code** field to *Override label printer*.

How the system selects a printer

When a print job is run, the system uses the following sequence to identify which printer to use:

1. If the current worker manually overrides the printer, and the selected printer uses the printer stock type of the layout that's currently being printed, the system uses that printer (and then skips the remaining steps in this sequence).

2. If no printer override exists, the system checks the default printer setup.
   a. If a default label printer that uses the required stock type is set up for the location or zone that's specified in the current flow (for example, when a container label is printed from the packing station), the system uses that printer.
   b. If a default label printer that uses the required stock type is set up for the mobile device the current flow is executing on (for example, forklift mounted mobile device and printer), the system uses that printer.
   c. Otherwise, the system uses the default label printer that uses the required stock type and that's set up for the current user and warehouse.

3. If no printer is found, a fallback printer, if provided, is used. Fallback printers are configured for specific label printing scenarios, such as license plate label printing or container label printing. For more information, see Related information.

4. If no override or default printer is found, no label is printed.

Advanced scenarios

You can also use the functionality described in this article for more advanced scenarios, such as reprinting a license plate label created in one warehouse on a printer located in another warehouse.

Reprint a label in a different warehouse

One way to reprint a label in a different warehouse is to use the **Default label printers** page to set up a default label printer for a user, location, or device in another warehouse. For example, for a given **Printer stock type**, **User ID** *25* has **Printer name** set to *Printer25*. This means that when user *25* is reprinting labels that were originally created in warehouse *24*, they will now be sent to printer *Printer25* instead of the printer defined on the **Document routing** page for warehouse *24*.

> **Important**
>
> A valid document routing setup must exist based on the field values on the license plate label (for example, *Warehouse*), even when when a different printer is used later. For example, if the label was originally created in warehouse *24*, then there must be a document routing record for warehouse *24* with the same **Layout ID** and **Printer stock type** as the default printer for the other user, location, or device.

Shipment auto-updates

Article • 06/28/2022

The auto-update shipment functionality automatically updates quantities (both increases and decreases) on a load line that is associated with a shipment, after the load has been released to a warehouse. This functionality remains turned on until the load line on the shipment or load is processed on a wave. When it's used, order updates can automatically flow through to the warehouse, without requiring manual intervention, until warehouse work is created.

When the auto-update shipment functionality isn't used, only quantity decreases automatically flow until warehouse work is created. Users must manually update or delete lines, and they must then re-release lines if order quantities are increased or new order lines are added. By using the auto-update shipment functionality, businesses can seamlessly provide updates to the warehouse without having to worry that related shipments and loads won't reflect order line updates.

The auto-update shipment functionality applies to both sales order lines and transfer order lines, and it's turned on for a specific warehouse. Therefore, companies can apply different auto-update shipment policies across warehouses, as they require. By default, the auto-update shipment policy for quantity decreases is applied for all warehouses that use warehouse management processes (WMS). When this default policy setting is used, only quantity decreases automatically flow through to a shipment and load until warehouse work is created. This behavior resembles the behavior that was used before the auto-update shipment functionality was introduced.

Main elements of the functionality

The auto-update shipment functionality relies primarily on the shipment status to determine whether the quantity on a load line should be changed when a change is made on a sales order line or transfer order line. It also relies primarily on the shipment status to determine when a new load line should automatically be added to an existing load. When the shipment status is **Waved** or higher, no automatic update occurs.

Wave status is also considered for automatic updates. When the wave that is related to the load line has a status of **Held**, **Executing**, **Released**, **Picked**, or **Shipped**, if a user tries to reduce the quantity on a load line (via a quantity decrease on the sales order line or transfer order line), the following error message is shown: "Reservations cannot be removed because there is work created which relies on the reservations." Additionally, when the wave has one of the previously mentioned wave statuses, if a user tries to

indirectly increase the load line quantity by increasing the quantity on the sales order line or transfer order line, the quantity on the load line isn't automatically increased. In this case, the load line must be manually updated.

Scenarios

The auto-update shipment functionality supports four scenarios: adding a new order line, increasing the quantity on an order line, decreasing the quantity on an order line, and removing an order line.

- **Add a new order line** – When the **Auto update shipment** field on the **Warehouse** FastTab of the **Warehouses** page (**Warehouse management** > **Setup** > **Warehouse** > **Warehouses**) is set to **Always**, if a shipment exists for the order, and a new order line is added to a sales order or transfer order after a load has already been created for the sales order, the existing load isn't updated. A new load line that has no reference to the existing load is created and associated with the existing shipment. The new line is added to the load and released.
- **Increase the quantity on an order line** – When the **Auto update shipment** field is set to **Always**, if a shipment exists for the order, and the quantity on an existing sales order line or transfer order line is increased after a load has already been created for the sales order, the load line is increased by the same quantity as the order line. If the load was released, but no work was created, the load line is increased by the same quantity as the order line.
- **Decrease the quantity on an order line** – When the **Auto update shipment** field is set to **Always** or **On quantity decrease**, if a shipment exists for the order, and the quantity on an existing sales order line or transfer order line is decreased after a load has already been created for the sales order, the quantity on the associated load line is updated to match, unless the quantity on that load line already equals or is less than the new quantity on the order line. In that case, the load line isn't affected. If the load was released, but no work was created, the quantity on the associated load line is updated to match, unless the quantity on the load line already equals or is less than the new quantity on the order line. In that case, the load line is affected.
- **Remove an order line** – When the **Auto update shipment** field is set to **Always** or **On quantity decrease**, if the user tries to remove an order line that a load line exists for, an error message is shown.

Example scenario

For this scenario, you must have demo data installed, and you must use the **USMF** demo data company.

Turn on the auto-update shipment functionality

To turn on the auto-update shipment functionality, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses**.
2. Select warehouse **24**.
3. On the **Warehouse** FastTab, in the **Auto update shipment** field, change the value from **On quantity decrease** to **Always**.

After you change the value to **Always**, any increases or decreases in the quantities on sales order lines and transfer order lines, and any additions of new lines, are reflected on shipments and loads for the selected warehouse, given the previously mentioned update constraints.

Change the wave template so that load lines aren't automatically processed

To configure the wave template so that it doesn't automatically process load lines, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Waves** > **Wave templates**.
2. Select wave template **24 Shipping default**.
3. Select **Edit**.
4. On the **General** FastTab, set the **Automate wave creation** option to **Yes**, and make sure that all other options are set to **No**.

It's important that no work be automatically created and released as part of the wave creation process. After work is created that is related to the load line that was created for the sales order line, the load line is no longer automatically updated if the quantity on the sales order line is changed.

Create a sales order

To create a sales order, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select customer **US-003**.
3. Create a line for item number **A0001**.
4. Enter a quantity of **10**. (Make sure that you're using warehouse **24**.)

5. Select **Save**.
6. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**. A shipment and a wave are created.

Because you changed the wave template in the previous procedure, no load or work is created. The shipment status is **Open**, and the wave status is **Created**.

Decrease the quantity on a sales order line

To decrease the quantity on a sales order line, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select the sales order that you just released to the warehouse.
3. Select the sales order line. In the **Quantity** field, change the value from **10** to **8**.
4. From the sales order line, select **Warehouse** > **Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, the quantity reflects the change on the sales order line.

Increase the quantity on a sales order line

To increase the quantity on a sales order line, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select the sales order that you previously released to the warehouse.
3. Change the line quantity from **8** to **12**.
4. Select **Save**.
5. Go back to the **All sales orders** page, and select the sales order again.
6. On the Action Pane, on the **Warehouse** tab, in the **Related information** group, select **Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, the quantity reflects the change on the sales order line.

Although the quantity on the load line was increased from 8 to 12, only eight items remain reserved, unless automatic reservation is turned on. Because the quantity that was added to the existing shipment hasn't been reserved, if the wave is processed at this point, without reservation, work is created only for the quantity that has already been reserved.

> **Note**
>
> When the quantity on an order line is decreased, the quantity on the load line isn't affected if it already equals or is less than the new quantity on the order line. When the quantity on an order line is increased, the load line is increased by the same

quantity as the order line. If the quantity on the order line differs from the quantity on the load line, the difference remains.

Add a sales order line

To add a sales order line, follow these steps.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Select the sales order that you previously released to the warehouse.
3. Create a line for item number **A0002**.
4. In the **Quantity** field, enter **10**. (Make sure that you're using warehouse **24**.) The new line is automatically added to the existing shipment.
5. Select **Save**.
6. Go back to the **All sales orders** page, and select the sales order again.
7. On the Action Pane, on the **Warehouse** tab, in the **Related information** group, select **Shipment details**. On the **Shipment details** page, on the **Load lines** FastTab, notice the second load line.

Because the sales order line that you just added to the existing shipment hasn't been reserved, if the wave is processed at this point, work is created only for the quantity on the first sales order line and the first load line.

Process a wave

To process the wave, follow these steps.

1. Go to **Warehouse management** > **Outbound waves** > **Shipment waves** > **All waves**.
2. Select the wave that you previously created.
3. On the Action Pane, on the **Wave** tab, in the **Wave** group, select **Process**.

The wave is processed and creates work for the reserved quantities on the load lines. The shipment status is updated from **Open** to **Waved**. As the shipment status is updated to **Waved**, any changes that occur, such as decreases or increases in line quantities, or the addition of new lines to the sales order, don't affect the existing load lines that are associated with the waved shipment.

If a shipment has a status of **Waved** or higher, updates to the quantity on a sales order line aren't reflected on or validated against a load line that is associated with the shipment. Changes to the quantity on a load line must be made directly on the load line.

Validation is done after work has been created for the load line and a reservation has been made. A decrease in the quantity on the sales order line is then validated against the work line reservation.

Create a location profile

Article • 01/31/2023

This article explains how to create a location profile in Dynamics 365 Supply Chain Management. Every location in the warehouse needs to have a location profile associated with it that describes the properties of the location, for example, whether the location allows mixed items. In this procedure we'll create a profile for a location that doesn't require license plate control. We'll enable mixed items, and mixed inventory statuses, and allow cycle counting. You can use this procedure in the USMF demo data company.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. Select **New**.
3. In the **Location profile ID** field, type a value.
4. In the **Name** field, type a value.
5. In the **Location format** field, enter or select a value.
6. In the **Location type** field, enter or select a value.
7. In the **Dock management profile ID** field, enter or select a value.
8. Select **Yes** in the **Allow mixed items** field.
9. Select **Yes** in the **Allow mixed inventory statuses** field.
10. Select **Yes** in the **Allow cycle counting** field.
11. Select **Save**.

Configure locations in a WMS-enabled warehouse

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This guide shows you how to configure the location setup for a new WMS-enabled warehouse (a warehouse that uses warehouse management processes (WMS)). A warehouse manager typically performs this process. You can run this guide in demo data company USMF or on your own data. Ensure that you have at least one configured site.

> **Note**
>
> For a full guide on how to set up the Warehouse management module, see Get started with setting up the Warehouse management module.

Create a new warehouse

1. Go to **Inventory management** > **Setup** > **Inventory breakdown** > **Warehouses**.
2. Select **New**.
3. In the **Warehouse** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **Site** field, select or enter an existing site value.
6. Expand the **Warehouse** section.
7. Set the **Use warehouse management processes** option to *Yes*. This setting enables you to run warehouse management processes (WMS) by using warehouse work and mobile devices.
8. Close the page.

Define a location format

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location formats**. Location formats are a naming system that you use to create unique and consistent names for the different location bin positions within a warehouse. Use separators as part of the location format to make it easier to identify components of the location, such as the aisle number. In this example, you create a name with four components. For example, these components could be *aisle*, *rack*, *shelf*, and *bin*.
2. Select **New**.
3. In the **Location format** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **Segment description** field, enter a value. This field describes what the first component of the location name represents. For example, it could be *Aisle*.
6. In the **Length** field, enter a number. This field determines how many characters this part of the location name must have. The total of all components in the name, including the separators, can't exceed 10 characters.
7. In the **Separator** field, enter a value. This field determines which character or symbol is used between the first and second component of the name.
8. In the **Details** section, select **New**.
9. In the **Segment description** field, enter a value.
10. In the **Length** field, enter a number.
11. In the **Separator** field, enter a value.
12. In the **Details** section, select **New**.
13. In the **Segment description** field, enter a value.
14. In the **Length** field, enter a number.
15. In the **Separator** field, enter a value.
16. In the **Details** section, select **New**.
17. In the **Segment description** field, enter a value.
18. In the **Length** field, enter a number.
19. Select **Save**.
20. Close the page.

Define location types

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location types**. Use location types as filtering options to control different warehouse management processes. At a minimum, create staging and final shipping location types to define the outbound warehouse management process.
2. Select **New**.

3. In the **Location** type field, enter a value.
4. In the **Description** field, enter a value.
5. Close the page.

Define location profile

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**. The definition of location profiles is very important. You can control grouped locations capacity and the policies related to what inventory gets stored and how it's stored. Use location profiles as filtering options to control different warehouse management processes. At a minimum, create a user location profile to enable WMS.
2. Select **New**.
3. In the **Location profile ID** field, enter a value.
4. In the **Name** field, enter a value.
5. In the **Location format** field, select the dropdown to open the lookup.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row.
8. In the **Location type** field, select the dropdown to open the lookup.
9. In the list, find and select the desired record.
10. In the list, select the link in the selected row.
11. Select or clear the **Allow mixed inventory statuses** check box. Enable this option if you want to allow mixed inventory status values in the locations grouped by this location profile.
12. Select or clear the **Override rules for batch days** check box. Enable this option to override the rule for how many days the inventory batch expiration dates can differ and to allow mixing of inventory batches that don't obey this rule.
13. Select or clear the **Allow cycle counting** check box. Enable this option to allow cycle counting processing in all the locations grouped by this location profile.
14. Expand or collapse the **Dimensions** section. The **Dimensions** tab allows you to define parameters and methods to enable precise calculations of the load capacity within each of the locations.
15. Close the page.

Enable warehouse management parameters

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**. To process warehouse work, set parameters for the user location profile, the staging location type, and the final shipping location type. When the outbound process ends at the final

shipping location type that you define, the related outbound transactions update to "Picked".

2. Expand the **Location profiles** section.
3. In the **User location** field, select the dropdown to open the lookup.
4. In the list, select the link in the selected row.
5. Expand the **Location types** section.
6. In the **Staging location type** field, select the dropdown to open the lookup.
7. In the list, select the link in the selected row.
8. In the **Final shipping location type** field, select the dropdown to open the lookup.
9. In the list, select the link in the selected row.
10. Close the page.

Define warehouse zone groups

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouse zone groups**. Warehouse zones can be filters for options to control the different warehouse management processes. You need to create a zone group before you can define a zone.
2. Select **New**.
3. In the **Zone group ID** field, type a value.
4. In the **Zone group name** field, type a value.
5. Close the page.

Define warehouse zones

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Zones**.
2. Select **New**.
3. In the **Zone ID** field, enter a value.
4. In the **Zone name** field, enter a value.
5. In the **Zone group ID** field, select the dropdown to open the lookup.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row.
8. Close the page.

Create locations using the Location setup wizard

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location setup wizard**.
2. In the **Warehouse** field, select the dropdown to open the lookup.
3. In the list, find and select the desired record.

4. In the list, select the link in the selected row.
5. In the **Zone ID** field, select the dropdown to open the lookup.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row.
8. In the **Location profile ID** field, select the dropdown to open the lookup.
9. In the list, find and select the desired record.
10. In the list, select the link in the selected row.
11. In the list, mark the selected row.
12. In the **From number** field, enter a number. The From number and To number fields define how many locations will be created. For example, if you set From number to 1 and To number to 3 for all four lines in the location format, 81 locations will be created (3x3x3x3).
13. In the **To number** field, enter a number.
14. In the list, find and select the desired record.
15. In the **From number** field, enter a number.
16. In the **To number** field, enter a number.
17. In the list, find and select the desired record.
18. In the **From number** field, enter a number.
19. In the **To number** field, enter a number.
20. In the list, find and select the desired record.
21. In the **From number** field, enter a number.
22. In the **To number** field, enter a number.
23. Select Create.

Create locations manually

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**. You can easily create locations within a warehouse. You must enter the location name and the location profile ID.
2. Select **New**.
3. In the **Warehouse** field, enter a value.
4. In the **Location** field, enter a value. You're creating a new location, so enter a new unique name instead of selecting an existing one.
5. In the **Location profile ID** field, enter a value.
6. Close the page.

Define pack size categories

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Pack size categories**. Use pack size categories to group items that have similar physical packing sizes. In this example, the

pack size category controls the capacity at the picking locations within a specific zone of the warehouse. Assign the pack size category ID to the released product entity to use it as part of the stocking limits processing.

2. Select **New**.
3. In the **Pack size category ID** field, enter a value.
4. In the **Pack size category name** field, enter a value.
5. Close the page.

Define location stocking limits

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location stocking limits**. Location stocking limits help ensure that work isn't created that requests inventory to be put in a location that doesn't have the physical capacity to carry the inventory.
2. Select **New**.
3. In the **Warehouse** field, enter a value.
4. In the **Location profile ID** field, enter a value.
5. In the **Pack size category ID** field, enter a value.
6. In the **Quantity** field, enter a number.
7. Select **Save**.
8. Close the page.

> **Note**
>
> You can allow stocking limits to be exceeded for specific locations for replenishment work. For more information, see Location stocking limits and Replenishment over location capacity.

Define fixed picking locations

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Fixed locations**. You can define the locations to use for each product or each product variant. You can create multiple fixed locations for the same product within the same warehouse.
2. Select **New**.
3. In the **Item number** field, enter a value.
4. In the **Warehouse** field, enter a value.
5. In the **Location** field, select the dropdown to open the lookup.
6. In the list, select the link in the selected row.

7. Close the page.

Define location blocking causes

Assign each location **Input blocked** and **Output blocked** causes. These causes affect warehouse management business processes and determine whether you can use that location for input and/or output. One reason to block a location is that it requires maintenance. To set up the blocking causes that you can use for locations, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Inventory** > **Blocking causes**.
2. Select **New**.
3. In the **Cause of blocking** field, enter a short name that identifies the cause. This value appears when setting up the location.
4. In the **Description** field, enter a short description.
5. In the **Policy** field, select one of the following values:

    - *Do not use for warehouse work* – Locations blocked for this cause aren't blocked when processing warehouse work.
    - *Also use for warehouse work* – Locations blocked for this cause are also blocked when processing warehouse work.

6. Close the page.

Warehouse location status

Microsoft Dynamics 365 Supply Chain Management includes several location fields that give you flexibility when you work with and maintain locations. You can include location statuses in the location directive query to provide better control over warehouse flow.

The following four fields on the **Locations** page track information about the current status of a location. These fields let warehouse managers get an overview of the status of the warehouse locations. They also allow for advanced reporting and filtering.

- **Item number** – The item that is currently in the location. If the location contains multiple items, this field is blank.
- **Last activity date and time** – The timestamp of the last warehouse transaction that was performed against the location.
- **Aging date** – The date when the inventory in the location was brought into the warehouse. This value is calculated based on the aging date of the license plate. It's accurate for locations that are license plate–tracked, but it might not be accurate for locations that aren't license plate–tracked.
- **Location status** – The status of the location. There are four possible values:
  - **Undetermined** – The location profile can't track status. Therefore, the current status is unknown.
  - **Empty** – There's currently no inventory in the location.
  - **Picking** – Outbound transactions have been performed against the location since it was last empty.
  - **Storage** – Only inbound transactions have been performed against the location since the location was last empty.

Set up warehouse location status

Prepare the sample data required for the example scenario

Before you start working through the scenario, activate sample data and set up the feature as described in this section. To complete the example scenario, use either the Warehouse Management mobile app or the browser-based emulator. The steps that are provided here use the Warehouse Management mobile app. The steps for the browser-based emulator are similar.

Use the USMF legal entity

To work through the example scenario by using the sample records and values that are specified here, use a system where the standard demo data is installed. Additionally, select the *USMF* legal entity before you begin.

Set up location profiles

The example scenario requires that you prepare two location profiles.

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location profiles**.
2. Select **Edit** to put the page into edit mode.
3. Select the *BULK-06* profile.
4. On the **General** FastTab, set the following values:
    - **Enable item in location:** Set this option to *Yes*.
    - **Enable location activity date and time:** Set this option to *Yes*.
    - **Enable location status:** Set this option to *Yes*.

    These options control whether the reference fields on the location are active.
5. Repeat steps 3 through 4 for the *PICK-06* profile.

> **Note**
>
> When the parameters on the location profile (**Enable item in location**, **Enable location activity**, **Enable location status**) are set to *Yes*, the system immediately updates the relevant locations by executing the *warehouse location status consistency check* job.

Scenario

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. In **Create purchase order**, on the **Vendor** FastTab, in the **Vendor account** field, select *104*.
4. On the **General** FastTab, in the **Warehouse** field, select *61*.
5. Select **OK**.

6. Your new purchase order (PO) opens. It includes an empty line in the **Purchase order lines** grid. On this line, set the following values:

    - **Item number:** *A0002*
    - **Quantity:** *5*

7. On the Action Pane, on the **Purchase** tab, in the **Actions** group, select **Confirm** to confirm the purchase order.

8. On the mobile device, go to **Inbound** > **Purchase Receive**.

9. Select the **PONUM** field, enter the PO number, and confirm.

10. Select the **ITEM** field, enter *A0002* as the item number, and confirm.

11. On the **QTY** page, enter *5* as the quantity, and confirm.

    You can enter the quantity in either of the following ways:

    - Select the plus sign (+) or minus sign (–) button to add or subtract a numerical value.
    - Select the blank field between the plus sign (+) and minus sign (–) buttons to open the number pad.

12. Confirm your selection of item number *A0002* and a quantity of *5*. A "Work Completed" message appears at the bottom of the page.

13. Select the Menu button (sometimes referred to as the hamburger or the hamburger button) in the upper-right corner, and then select **Cancel** to exit **Purchase Receive** and return to the **Inbound** menu.

14. On the purchase order page, select **Work details** above the **Purchase order lines** grid.

15. On the **General** tab, notice the **Work ID** and **Target license plate ID** values that were created.

16. In the **Lines** section, notice the **Location** values for the *Pick* and *Put* work types.

17. On the mobile device, go to **Inbound** > **Purchase Put-away**.

18. Select the **ID** field, enter the work ID, and confirm.

19. Confirm once more to complete the *Pick* entry.

20. Select the Menu button in the upper-right corner, and then select **Done** to complete the *Pick* work.

21. Make a note of the Putaway location, and confirm. A "Work Completed" message appears at the bottom of the page.

22. Select the Menu button in the upper-right corner, and then select **Cancel** to exit **Purchase Put-away** and return to the **Inbound** menu.

23. Select **Back** to return to the main menu.

24. In Dynamics 365 Supply Chain Management, go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.

25. Filter on **Location**, and enter the putaway location from the purchase order work. You see the following results:

    - The **Location status** column shows a value of *Storage*, because the last transaction against this location was a put.
    - The **Item number** column shows a value of *A0002*, because that item was received and put to the location.
    - The **Last activity date and time** column shows the timestamp for the date and time when the work was completed at the location.

26. On the mobile device, go to **Quality** > **Movement**.

27. Select the **LOC/LP** field, and enter the location you made note of in the previous steps.

28. Confirm the information that is shown. Make a note of the license plate number that is generated.

29. On the **To Information** screen, select the **LOC/LP** field, and enter *06A07R2S1B* as the location to move the item to.

30. On the **To Information** screen, confirm the **LP** value (the target license plate ID), which is automatically generated. A "Work Completed" message appears at the bottom of the page.

31. Select the Menu button in the upper-right corner, and then select **Cancel** to exit **Movement** and return to the **Quality Management** menu.

32. Select **Back** to return to the main menu.

33. In Dynamics 365 Supply Chain Management, go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.

34. Refresh the **Locations** page, and view the original putaway location again. Notice that the **Location status** field is now set to *Empty*, and the **Item number** column is blank.

35. View the record for location *06A07R2S1B*, and notice that the **Status** value has changed to *Storage*, and the **Item number** and **Last activity date and time** fields are updated.

36. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.

37. Select **New**.

38. In **Create sales order**, in the **Customer account** field, select *US-002*.

39. In the **Warehouse** field, select *61*.

40. Select **OK**.

41. Your new sales order opens. It includes an empty line in the **Sales order lines** grid. On this line, set the following values:

    - **Item number:** *A0002*
    - **Quantity:** *1*

42. On the **Sales order lines** FastTab, on the **Inventory** menu, select **Reservation**.

43. On the **Reservation** page, select **Reserve lot** to reserve the order line. Then select the **Close** button (**X**) in the upper-right corner to close the page.

44. On the Action Pane, on the **Warehouse** tab, in the **Actions** group, select **Release to warehouse**.

45. In the **Sales order lines** section, on the **Warehouse** menu, select **Work details**.

46. Copy the **Work ID** value that was created.

47. On the mobile device, go to **Outbound** > **Sales picking**.

48. Select the **ID** field, enter the work ID that you copied earlier, and confirm.

49. On the **Sales orders: Pick** page, the **LOC** field suggests the picking location as the putaway location that was created earlier. Make a note of the location.

50. Select the **LOC** field, enter the location, and confirm.

51. Select the **LP** field, enter the license plate number that you made a note of during the Movement activity, and confirm.

52. Select the **Item** field, enter the *A0002* as the item number, and confirm.

53. On the **QTY** page, enter *1* as the quantity, and confirm.

    You can enter the quantity in either of the following ways:

    - Select the plus sign (+) or minus sign (–) button to add or subtract a numerical value.
    - Select the blank field between the plus sign (+) and minus sign (–) buttons to open the number pad.

54. Select the **TARGET LP** field, enter a user-defined target license plate ID, and confirm.

55. Confirm once more to complete the picking work. A "Work Completed" message appears at the bottom of the page.

56. Select the Menu button in the upper-right corner, and then select **Cancel** to complete the picking activity and return to the **Outbound** menu.

57. In Dynamics 365 Supply Chain Management, go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**.

58. Filter on **Location**, and enter the pick location from the sales order work.

59. Notice that the **Location status** field for the location that the sales order work picked from is now set to *Picking*, and the **Last activity date and time** field is updated.

> ⓘ **Note**
>
> You can update the location fields only through warehouse transactions. If you move inventory by using a journal or other non-WMS processes, the fields aren't updated.

Last updated on 07/01/2026

Additional location zones

Three new zone fields are available in Microsoft Dynamics 365 Supply Chain Management. Warehouse managers can use them to define additional warehouse organizations or layouts. The new zone fields can be set either manually or by using the **Location setup** wizard. They can be used in any query or filtering that uses the Locations table.

No additional setup is required to use the zone fields.

Use location zones

1. Go to **Warehouse management** > **Setup** > **Warehouse** > **Location setup wizard**.
2. Set the following values:
    - In the **Warehouse** field, select *62*.
    - In the **Zone ID** field, select *FLOOR*.
    - In the **Additional Zone 1** field, select *PICKZONE1*.
    - In the **Additional Zone 2** field, select *WEBSHOP1*.
    - In the **Location profile ID** field, select *FLOOR*.
3. Select the **Floor** line.
4. In the **From number** field, enter *1*. In the **To number** field, enter *3*.
5. Select the **Aisle** line.
6. In the **From number** field, enter *1*. In the **To number** field, enter *5*.
7. Select **Create**.
8. You receive messages that state that new locations have been added. Select the **Show messages** button to view the messages.
9. Go to **Warehouse management** > **Setup** > **Warehouse** > **Locations**. The new locations appear in the list, and all zone fields are available (that is, the existing zone field and the new additional zone fields).

Schedule load utilization

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can schedule load utilization for selected location types, and you can also project the current and future load utilization. You can project the load for one or more sites, for the load units (zone or warehouse), or for a combination of a zone and a warehouse.

Schedule and view the load for a warehouse or site

To schedule the load for sites, warehouses, or zones, you create a space utilization setup and associate it with a master plan.

In the space utilization setup, you use location types, such as **Bulk location** and **Picking location**, to specify how space utilization should be projected. You also specify a storage load mode, such as **Zone**.

The projection of future space utilization is based on information that is calculated on the associated master plan. Master plans forecast the resource planning for incoming and outgoing orders for production and operations. The projection of available space is based on the relation between the space utilization setup and the selected master plan.

By using the storage load mode that you selected in the space utilization setup, you can specify whether the load should be projected for each warehouse or zone, or whether the projections should include information about both warehouses and zones. You also specify whether blocked locations should be excluded from the calculation of load utilization.

You can project the space utilization by generating the **Warehouse load utilization** report. When you generate this report, you can specify whether the load utilization should be projected for each site, across sites, or for the selected load unit, such as zone or warehouse.

Create a space utilization setup for a warehouse

1. Select **Inventory management** > **Setup** > **Warehouse monitoring** > **Space utilization**.
2. Select **New** to create a space utilization setup. Specify an ID and a name for the new setup.

3. In the **Storage load mode** field, select whether the overview of space utilization should show information by warehouse, zone, or warehouse and zone.
4. Set the **Exclude blocked locations** option to **Yes** to exclude blocked inventory locations from the calculation of available space. You can block an inventory location for input and output by specifying a blocking cause for the location in the **Input blocked** or **Output blocked** field on the **Other** FastTab on the **Inventory locations** page.
5. On the **Location type** FastTab, select the location types to include in the space utilization calculation. You must select at least one location type for the projection.

Associate a space utilization setup with a master plan

1. Select **Inventory management** > **Periodic tasks** > **Schedule load utilization**.
2. In the **Master plan** field, select a master plan.
3. In the **Number of days** field, specify the number of days to include in the projection of current and future workloads.
4. In the **Space utilization** field, select the space utilization setup to use for the projection of current and future workloads.

Specify the load utilization projection and view information

1. Select **Inventory management** > **Inquiries and reports** > **Physical inventory reports** > **Warehouse load utilization**.

2. In the **Show by** field, select the level of the space utilization projection:

    - **Site** – Project the space utilization for each site. This projection is useful if, for example, you want to view all the warehouses for a site so that you can balance the space utilization between the warehouses.
    - **Load unit** – Project the space utilization for zones or warehouses. The available space is then projected according to the value that you selected in the **Storage load mode** field on the **Space utilization** page when you created the space utilization setup.

3. Follow one of these steps, depending on the value that you selected in the previous step:

    - If you selected **Site** in the **Show by** field, the **Site** field is available. Select one or more sites to include in the projection.
    - If you selected **Load unit** in the **Show by** field, the **Load unit** field is available. Select the load unit.

4. In the **Load type** field, select **Volume** or **Weight** to specify the warehouse operating unit to project space for.

5. In the **Space utilization setup** field, select the space utilization setup that the projection should be based on.

Schedule workload capacity

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can schedule workload capacity for warehouses, and you can also project the current and future workloads for the workers in individual warehouses. You can project the workload for the whole warehouse, or you can project the workload separately for incoming and outgoing workloads.

To project workload output for selected warehouses, master scheduling data must be available for those warehouses. Learn more in Master plans overview.

Schedule and view workloads for a warehouse

To schedule workload capacity for a warehouse, you create a workload setup for one or more warehouses, and then associate the workload setup with a master plan. In the workload capacity setup, you can define limits for the weight or volume for incoming and outgoing transactions. You can also create more than one setup for each warehouse and then associate the setup with individual master plans. For example, you might use this approach to accommodate seasonal changes in the workforce.

If the workers for a warehouse work with transactions for both incoming and outgoing workloads, you can configure the warehouse capacity setup so that the workload is projected in a combined view.

To schedule and view workloads for warehouses, you must complete the following tasks:

1. Create a workload capacity setup and define workload capacity limits for one or more warehouses.
2. Associate the workload capacity setup with a master plan to create workload projections and specify how long those projections will apply.

Create a workload capacity setup for a warehouse

1. Select **Inventory management** > **Setup** > **Warehouse monitoring** > **Workload capacity**.

2. On the Action Pane, select **New** to create a workload capacity setup.
3. On the **Warehouses** FastTab, select **New**, and then enter values on the line to associate a warehouse with the workload capacity setup.
4. Select the **Combined inbound and outbound workload** check box if the **Workload capacity** report should show the total workload for incoming and outgoing transactions in one view.
5. On the **Transaction types** FastTab, select the types of incoming and outgoing transactions that the workload limits will apply to.

> ⓘ **Note**
>
> You must select at least one transaction type for both the incoming workload and the outgoing workload.

Define limits for volume or weight

You can set up limits for volume or weight, depending on the limitation that is relevant for the warehouse workforce. The limits that you specify are included in the workload capacity projection that you can view on the **Workload capacity** report.

To project information about volume and weight for items, the standard volume of one inventory item and the weight of one inventory item must be specified for all products. The fields that are required are available in the following field groups on the **Manage inventory** FastTab of the **Released product details** page:

- Handling
- Physical dimensions
- Weight measurements

If this information isn't specified correctly, you receive a message when you generate the **Workload capacity** report. From the report, you can then drill down to identify the missing information that is required in order to project the future workload.

Associate a workload capacity setup with a master plan

1. Select **Inventory management** > **Periodic** > **Schedule workload**.
2. In the **Master plan** field, select the master plan to use for workload projections.
3. In the **Number of days** field, specify the number of days that the workload projection covers.

4. In the **Workload** field, select the workload setup to associate with the master plan.

View workload capacity

1. Select **Inventory management** > **Inquiries and reports** > **Physical inventory reports** > **Workload capacity**.
2. In the **Number of columns** field, specify the number of columns to show on the report.
3. In the **Order type** field, select **Planned and confirmed**, **Planned**, or **Confirmed** to indicate the type of orders to project on the report.
4. In the **Load type** field, select a load type to specify whether the workload capacity should be projected for volume or weight.
5. In the **Workload capacity** field, select a workload capacity setup.

Set up dispositions codes

Article • 09/29/2021

This procedure focuses on the setup of a disposition code that can be used on a mobile device for the return order receiving process. Disposition codes are a collection of rules that can be used when items are received. For example, when a work user uses a mobile device to receive items that were damaged, the user must scan a disposition code for damaged items. The inventory status of the goods received, the work template, and the location directive can be determined from the scanned disposition code. For the purchase order receiving process and the production order report as finished process, the use of a disposition code is optional. For the sales order return receiving process, if the items are registered using a mobile device, the use of disposition code is mandatory. This guide was created using the demo data company USMF. This procedure is intended for the warehouse manager.

1. Go to Warehouse management > Setup > Mobile device > Disposition codes.
2. Click New.
    - Create a new disposition code to use for customer returns.
3. In the Disposition code field, type a value.
4. In the Inventory status field, select an inventory status where there is inventory blocking.
    - If you're using USMF, select 'Blocking'. You can add an inventory status to the disposition code to override the default status that's on the order lines.
5. In the Work template field, type a value.
    - Optional: Select a work template code that is associated with a return order. If no value is provided, the work template will be resolved using the standard rules configured in your system. Selecting a work template will limit the processes this disposition code can be used with. For example, if a disposition code has a work template with a work order of type purchase order, it can't be used to register items that are returned by customers.
6. In the Return disposition code field, type a value.
    - The return disposition code determines the remainder of the return order process for the items registered. In this example, the customer should receive a credit note. Add a returns disposition code that contains an action Credit.

Unit of measure and stocking policies

This article describes how default units, unit sequences, and unit conversions are used in warehouse processes.

Unit sequence groups define the sequence of units that can be used in warehouse operations. You create them on the **Unit sequence groups** page. The sequence shows the relationship of the various units. For example, you store pallets that contain boxes that contain individual pieces of items. In this case, you must provide the three different units and the logical order of the layers. Unit sequence groups let you define the policies for the grouping of license plates, and the default units that should be used for various warehouse processes. This article applies to both the warehouse management processes (WMS) available in the Warehouse management module and the more basic warehousing solution that is available in the Inventory management module.

Unit sequence groups for released products

To use released products in warehouse work processes, assign a unit sequence group to them. If you validate a product that is associated with a Storage dimension group, and the **Use warehouse management processes** option for the Storage dimension group is set to **Yes**, you receive an error message if a unit sequence group ID isn't defined for the product. If the unit sequence group that you use contains multiple lines (and therefore multiple units), you must set up a unit conversion between the units. You complete this setup on the **Unit conversions** page. The smallest unit in a sequence group that you associate with a released product must match the inventory unit that is defined for the corresponding product. The inventory unit is the unit that is used for base calculations of the on-hand inventory. You can also set up unit of measure conversions for product variants of product masters by using the **Enable unit of measure conversions** option.

License plate grouping

You can specify whether receipts of less than or more than a specific unit should be grouped into one license plate or divided into a license plate for each unit. To set up this behavior, use the **License plate grouping** option on the **Line details** tab of the **Unit sequence groups** page. If you want to use the license plate grouping when you process work by using a mobile device, select the **License plate grouping** option on the **Mobile device** menu item. For example, you're using a mobile device to register an item that is associated with a unit sequence group that has two lines.

The first line is for Pieces, and the **License plate grouping** option is set to **Yes**. The second line is for the Pallet unit, and the **License plate grouping** option is set to **No**. In this case, the system can automatically guide the split and creation of license plates per 100 pieces.

Units for cycle counting

To define which units should be used as part of the cycle counting processes, select the **Use unit for cycle counting** option on the **Unit sequence groups** page. You can select up to four units in the sequence group. If you select more than four units, the additional units don't appear on the mobile device.

Default units for mobile device receiving processes

To set the default units that should be used for receiving processes on mobile devices, enable the **Default unit for purchase and transfer** and **Default unit for production** options on the **Unit sequence groups** page. For example, you can specify that, by default, the system should use Pallet quantities when purchase order on-hand inventory is received by using a mobile device, but that the stock-keeping unit should be Pieces. To get the conversion for the number of pieces that each pallet contains, you must define a unit conversion, such as 100 Pcs = 1 PL.

Default order settings

As part of the creation of released products, select default units for purchases, sales, and inventory to process the various orders. Set the default units and quantities for the various source documents by using the **Default order settings** and **Site specific order settings** pages. You can access these pages from the **Released products** page.

Last updated on 07/01/2026

System grouping on an open work list

By using a system grouping field, you can filter an open work list without having to edit the mobile device menu item. Where it applies, system grouping works for filtering a work list on a single work header field. You cannot use system grouping to filter on line level fields.

Set up system grouping on an open work list

Use these steps to set up system grouping on an open work list.

- From a mobile device menu item, select **Mode: Indirect** and **Activity Code: Display open work list**. The following options become available. These options are required for system grouping on an open work list.

Expand table

Option	Description
Allow system grouping	Enables system groping for a selected work list menu item.
System grouping field	Available only if **Allow system work** is set to **Yes**. Select the field that determines how picking work will be grouped for workers. For example, if you select the **ShipmentId** field, the worker will scan the shipment ID to group the picking work. All work for the shipment is then assigned to the worker. This field requires that you create a menu item to use existing work that is grouped by the system. Use the **System grouping label** field to inform the worker what to scan.
System grouping label	Available only if **Allow system work** is set to **Yes**. Enter information for the worker about what to scan when picking work is grouped. For example, if you use the **ShipmentId** field to group picking work by shipment, you might enter Shipment ID in the field. This field requires that you create a menu item to use existing work that is grouped by the system. You must also select the field to group by in the **System grouping** field.

GS1 bar codes and QR codes

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the **Request access to Finance and Operations Viva Engage Community** form and choose the community you want to join.

Warehouse workers often complete several tasks when they use a mobile device scanner to register movements of an item, pallet, or container. These tasks can include both scanning bar codes and manually entering information on the mobile device. The bar codes use a company-specific format that are defined and managed by using Microsoft Dynamics 365 Supply Chain Management.

GS1 bar codes for shipping labels provide a global standard for the exchange of data between companies. They're available in both linear (1D) symbologies (bar code formats), such as GS1-128, and 2D symbologies, such as GS1 DataMatrix and GS1 QR codes. GS1 bar codes not only encode data but also let you use a predefined list of *application identifiers* to define the meaning of that data. The GS1 standard defines the data format and the various kinds of data that it can encode. Unlike older bar code standards, GS1 bar codes can have multiple data elements. Therefore, a single bar code scan can capture several types of product information, such as the batch and the expiration date.

GS1 support in Supply Chain Management dramatically simplifies the scanning process in warehouses where pallets and containers are labeled by using bar codes in GS1 format. Warehouse workers can extract all the required information through a single scan of a GS1 bar code. By eliminating the need to do multiple scans and/or manually enter information, GS1 bar codes help reduce the time that is associated with tasks. At the same time, they also help improve accuracy.

Logistics managers must set up the required list of application identifiers and associate each of them with the appropriate mobile device menu items. The application identifiers can then be used across warehouses as a global setting for moving and packing purposes. Therefore, all shipping labels take a unified form.

Unless otherwise stated, this article uses the term *bar code* to refer to both linear (1D) bar codes and 2D bar codes.

The GS1 bar code format

The GS1 General Specifications specify which symbologies can be used for GS1 bar codes and how to encode the data in the bar code. This section provides a short introduction to the article. For full details, see the GS1 General Specifications published by GS1. The GS1 specifications document is regularly updated, and the information that it provides is up to date with GS1 General Specifications release 22.0.

GS1 bar codes use the following symbologies:

- **Linear or 1D bar codes** – GS1-128 and GS1 DataBar
- **2D bar codes** – GS1 DataMatrix, GS1 QR Code, and GS1 Dotcode

GS1 is mentioned in GS1-128, which is a special case of the ordinary Code-128 linear bar code, GS1 DataMatrix, and GS1 QR Code. The difference between the GS1 version and the non-GS1 version is the presence of a special character (FNC1) as the first character in the bar code data. The presence of an FNC1 character indicates that the data in the bar code should be interpreted according to the GS1 specification.

The data in the bar code itself consists of multiple data elements, each of which is identified by an application identifier at the start of the field. Usually, the data is also presented under the bar code in a human-readable format, where the application identifier is shown in parenthesis. Here's an example: `(01) 09521101530001 (17) 210119 (10) AB-123`. This bar code contains three elements:

- **Application identifier 01** – The GS1 global trade item number (GTIN) of the item.
- **Application identifier 17** – The expiration date.
- **Application identifier 10** – The batch number.

For each element, the data might have either a predefined length or a variable length. There's a fixed list of application identifiers that have predefined lengths. All other application identifiers have variable length, and the GS1 application identifier list specifies the maximum length and format of data. For example, application identifier 01 has a predefined length of 16 characters (two for the application identifier itself and then 14 for the GTIN), and application identifier 17 has a predefined length of eight characters (two for the application identifier itself and then six for the date). However, application identifier 10 has two numbers for the application identifier itself and then up to 20 alphanumeric characters.

When elements are put together, if an element follows a variable length element, a separator character must be used. This separator can be either the special FNC1 character or the group separator character (a nonprintable character that has ASCII code 29 and hexadecimal code 1D). The separator shouldn't be used after the last element. Although the separator also shouldn't be used after elements that have predefined length, its presence isn't a critical error.

In the bar code data from the previous example of a bar code that contains application identifiers 01, 17, and 10, the data in a Code-128, QR Code, or DataMatrix symbol is encoded as `<FNC1>` **`01`** `09521101530001` **`17`** `210119` **`10`** `AB-123` (application identifiers are shown in bold). As a best practice, put any element that has variable length at the end, to eliminate the need for an extra group separator character. However, the bar code can also have a different order of elements, where the separator is mandatory. Here's an example: `<FNC1>` **`01`** `09521101530001` **`10`** `AB-123<GS>` **`17`** `210119`.

Dates and decimal numbers

You must always represent dates in *YYMMDD* format, where GS1 specifications determine the century of the year. You can represent only dates from 49 years in the past to 50 years in the future (relative to the current year).

Some data elements contain decimal numbers. For example, application identifiers 3100, 3101, ... 3105 represent a net weight in kilograms. Because these application identifiers have a predefined length of 10, six numbers are available for the quantity. The position of the decimal point is specified by the last number of the application identifier. Therefore, this family of application identifiers can also be represented as *310n*. Because the GS1 standard specifies that there must always be at least one number to the left of the decimal point, a maximum of five decimal places is allowed.

The following examples show how different application identifiers (shown in bold) interpret the number *123456*:

- **`3100`** `123456` → 123456 (integer)
- **`3101`** `123456` → 12345.6 (one decimal place)
- **`3102`** `123456` → 1234.56 (two decimal places)
- **`3103`** `123456` → 123.456 (three decimal places)
- **`3104`** `123456` → 12.3456 (four decimal places)
- **`3105`** `123456` → 1.23456 (five decimal places)

Scanning GS1 bar codes in Supply Chain Management

To scan GS1 bar codes, warehouse workers use a scanner that's built into or connected to a mobile device. The scanner then transmits the scanned bar code to the Warehouse Management mobile app as a series of keyboard events. This mode of operation is also known as a *keyboard wedge* or *wedge*. The mobile app then sends the received text as-is to Supply Chain Management. When the system receives input data, it first determines whether the data begins with one of the configured prefixes that indicate that the data is actually a GS1 bar code (see the Set up global GS1 options section). If the scanned data does begin with one of those prefixes, the system uses a GS1 parser to parse the data and extract individual data elements according to their application identifiers. After the data is parsed, either the current input field or multiple fields are filled in with the scanned data.

Configuration of bar code scanner hardware and software

For Supply Chain Management to correctly recognize and decode GS1 bar codes, the hardware scanner or supporting software must be configured to perform the following actions:

- Add a prefix to the scanned bar codes, so that the system can recognize a GS1 bar code.
- Convert the nonprintable ASCII group separator character (ASCII code 29 or hexadecimal code 1D) to a printable character, such as a tilde (~).

Although you can add any prefix to the scanned bar code, one option is to add an ISO/IEC 15424 symbology identifier, also known as an *AIM identifier*. This three-character identifier starts with `]`, then has one character that identifies the symbology that is used, and then has a number that is used as a further modifier. For example, the AIM identifier `]C1` specifies a Code 128 bar code (because of the character `C`), and the modifier `1` specifies that there's an FNC1 character in the first position of the data. On the other hand, `]C0` is a Code 128 bar code that has any other character as the first character of the data.

The following five symbology identifiers correspond to GS1 bar codes that have application identifier elements:

- `]C1` – Code 128 (`C`) with FNC1 character in first position (`1`), also known as GS1-128.
- `]e0` – GS1 DataBar.
- `]d2` – DataMatrix (`d`) with ECC 200 and FNC1 in first position (`2`), also known as GS1 DataMatrix.
- `]Q3` – QR Code (`Q`) Model 2 symbol with FNC1 in first position (`3`), also known as GS1 QR Code.
- `]J1` – GS1 DotCode.

If you use these identifiers, compatibility with non-GS1 bar codes requires that the scanners or scanning software b econfigured to remove any identifiers that don't correspond to the GS1 identifiers. For example, if you scan a "normal" Code 39 bar code, the prefix `]A0` is added. Because the system doesn't understand this prefix as one of the GS1 prefixes, it interprets it as data and produces unexpected results.

> ⓘ **Note**
>
> For convenience, version 2.0.17.0 and later of the Warehouse Management mobile app removes any AIM prefixes that aren't included in the previous list. This behavior supports cases where you can configure the scanner to add the AIM prefix but not to remove the unwanted prefixes.

Single and multiple field scanning

After the data is parsed from the bar code, it's fed into the mobile device flow controls. Two methods are processed:

- **Single field scanning** – This method fills in only the field where you scanned the bar code. For example, if you scan the bar code `<FNC1>` **`01`** `09521101530001` **`17`** `210119` **`10`** `AB-123` while the cursor is in the **Item** field, the GTIN `09521101530001` from the bar code is entered in that field. If you scan the same bar code while the cursor is in the **Batch ID** field, the batch number `AB-123` from the bar code is entered. This mode works for all fields in all flows and requires only that the generic bar code data setup be configured. If a bar code contains multiple elements, you must still scan it multiple times, because only one piece of the bar code at a time is entered into the mobile device flow. The generic bar code data setup controls this behavior, as described in the Establish the generic bar code data setup section.
- **Multiple field scanning** – This method fills in multiple fields when you scan one bar code, by pushing extra data into the mobile device flow state. For example, the policy is configured to push application identifier 01 into the `ItemId` control and application identifier 10 into the `InventBatchId` field. In this case, if you scan the bar code `<FNC1>` **`01`** `09521101530001` **`17`** `210119` **`10`** `AB-123`, data for both variables is pushed at the same time. Therefore, the system doesn't prompt you for the item and batch number in the flow. Bar code data policies that link to menu items control this behavior, as described in the Set up bar code data policies for mobile device menu items section.

> ⚠ **Warning**

The default bar code data policies work without unexpected behavior. However, customization of bar code data policies linked to menu items can cause unexpected behavior, because the flow might not expect some data to be available at a particular time.

Set up global GS1 options

The **Warehouse management parameters** page provides a few settings that establish global GS1 options.

To set up global GS1 options, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Bar codes** FastTab, set the following fields:
    - **FNC1 Character**, **Datamatrix character**, and **QR code character** – Specify characters that should be interpreted as a prefix for each type of GS1 bar code.
    - **Group separator** – Specify the character that replaces the ASCII group separator character.
    - **Maximum length of identifier** – Specify the maximum number of characters that is permitted for the application identifier. This field isn't required if the *Enhanced GS1 Parser* feature is turned on for your system.
    - **Unknown application identifier policy** – Select one of the following values to specify what the system should do if it encounters an unknown application identifier when it parses a GS1 bar code:
        - *Error* – The system reports an error and doesn't scan any part of the bar code. To scan this type of bar code, you must add a matching entry in the GS1 application identifier table.
        - *Skip the data element* – The system continues to parse the bar code without reporting an error or a warning. The data from the unknown application identifier isn't available to the application for further processing.

Note

Prefixes tell the system that a bar code is encoded according to the GS1 standard. Up to three prefixes (**FNC1 Character**, **Datamatrix character**, and **QR code character**) can be used simultaneously and for various purposes.

Bar code data application identifiers

GS1 formats not only encode the data but also let you use a predefined list of application identifiers to define the meaning of the data. Logistics managers must set up the required list of application identifiers and associate each of them with the appropriate mobile device menu items. Use the identifiers across warehouses as a global setting for moving and packing purposes. Therefore, all shipping labels take a unified form.

The system uses the data, especially the predefined application identifiers, to establish the rules that apply to the relevant piece of scanned information.

Each application identifier signals to the system that subsequent characters in the scanned bar code should be considered a block of encrypted information. The setup of the application identifiers defines how the system interprets a bar code and saves it as a value in the system.

Logistics managers can use standard international application identifiers and/or create their own.

Load the standard application identifiers

To get started quickly, load a list of common international application identifiers. You can then extend or edit the list later, as needed.

To load the standard application identifiers, follow these steps:

1. Go to **Warehouse management** > **Setup** > **GS1** > **Barcode data application identifiers**.
2. On the Action Pane, select **Create default setup**.

> ⚠ **Warning**
>
> The **Create default setup** command deletes all currently defined application identifiers and replaces them with the standard list. However, after you load the default setup, you can customize the list as needed.

Set up custom application identifiers

If some or all application identifiers that your company uses differ from the standard set, you can create your own codes from scratch or customize the standard set as you require.

To set up and customize your GS1 own application identifiers, follow these steps:

1. Go to **Warehouse management** > **Setup** > **GS1** > **Barcode data application identifiers**.

2. Follow one of these steps:

    - To create a new identifier: On the Action Pane, select **New**.
    - To edit an existing identifier: Select the identifier, and then, on the Action Pane, select **Edit**.

3. Set the following fields for the new or selected identifier:

    - **Application identifier** – Enter the identification code for the application identifier. Typically, this code is a two-digit integer, but it can be longer. For decimal values, the last digit indicates the number of decimal places. For more information, see the description of the **Decimal** checkbox later in this list. You can create a single application identifier for all decimal place variants by using the letter *n* as the last character in the application identifier. For example, you can configure just one application identifier (*310n*) instead of a separate application identifier for each number of decimal places (*3101*, *3102*, *3103*, and so on).
    - **Description** – Enter a short description of the identifier.
    - **Fixed length** – Select this checkbox if values that are scanned by using this application identifier have a fixed number of characters. Clear this checkbox if the length of values is variable. In this case, you must indicate the end of the value by using the group separator character that you specified on the **Warehouse management parameters** page.
    - **Length** – Enter the maximum number of characters that can appear in the values that are scanned by using this application identifier. If the **Fixed length** checkbox is selected, exactly this number of characters is expected.
    - **Type** – Select the type of value that is scanned by using this application identifier (*Numeric*, *Alphanumeric*, or *Date*). For more information about how dates and numbers are represented in bar code data, see the Dates and decimal numbers section.
    - **Decimal** – Select this checkbox if the value includes an implied decimal point. If this box is selected, the system uses the last digit of the application identifier to determine the number of decimal places. For more information about how dates and numbers are represented in bar code data, see the Dates and decimal numbers section.

> ⚠ **Warning**
>
> Although the system allows you to set the **Fixed length** checkbox for any application identifier, use it only for the subset of application identifiers that have a predefined length per the GS1 General Specifications. The enhanced GS1 parser already contains the list of all application identifiers that have predefined lengths.

> ⓘ **Note**
>
> The **Group separator** value specified on the **Warehouse management parameters** page is optional if a value that is followed by an application identifier has a fixed length.

Establish the generic bar code data setup

The generic bar code data setup establishes a collection of common mappings. These mappings match each relevant input field in the mobile app to the application identifier that controls how values from scanned bar codes are interpreted and stored in that field. By default, these settings apply to all scans for all mobile device menu items. However, a bar code data policy assigned to a specific menu item can overwrite these settings for one or more specific fields.

The generic bar code data setup supports scanning only one value at a time. Therefore, if you want to load multiple field values from a single scan, you must set up a bar code data policy for the relevant menu items.

For more information about bar code data policies, see the next section.

Load the standard generic bar code data setup

The **Barcode data generic setup** page lets you load a standard set of mappings between mobile device fields and standard application identifiers that the default setup creates.

To establish the generic bar code data setup, go to **Warehouse management** > **Setup** > **GS1** > **Barcode data generic setup**. Then select **Create default setup** to automatically assign a suitable application identifier to each field that mobile device menu items typically use.

> ⚠ **Warning**

If a generic bar code data setup already exists, the **Create default setup** command deletes it and loads the standard setup.

Customize the standard generic bar code data setup

To customize the generic bar code data setup, follow these steps:

1. Go to **Warehouse management** > **Setup** > **GS1** > **Barcode data generic setup**.

2. Follow one of these steps:

    - To create a new mapping, on the Action Pane, select **New**.
    - To edit an existing mapping, select the mapping, and then, on the Action Pane, select **Edit**.

3. Set the following fields for the new or selected mapping:

    - **Field** – Select or enter the mobile app input field that the incoming value should be assigned to. The value isn't the display name that workers see. Instead, it's the key name that is assigned to the field in the underlying code. The default setup provides a collection of fields that are likely to be useful, and includes intuitive key names for each field and matching programmed functionality. However, you might need to talk to your development partners to find the correct selections for your implementation.
    - **Application identifier** – Select the applicable application identifier, as defined on the **Barcode data application identifiers** page. The identifier establishes how the bar code is interpreted and stored as a value for the named field. After you select an application identifier, the **Description** field shows the description of it.

Set up bar code data policies for mobile device menu items

The purpose of the GS1 standard is to enable workers to load several values when they scan a single bar code one time. To achieve this purpose, logistics managers must set up bar code data policies that tell the system how to interpret multivalue bar codes. Later, you can assign policies to mobile device menu items to control how a bar code is interpreted when workers scan it while they're using a specific menu item.

If no bar code data policy is assigned to a menu item, the system can capture only a single value. This value is applied to the mobile app input that is selected when the worker takes the scan, as

specified by the generic bar code data setup. If a bar code data policy is assigned to the menu item, the system still uses the generic bar code data setup to map the first bar code value to the selected field. However, it can then capture additional field values, as specified by the applicable policy.

Load the standard specific bar code data policies

To get started quickly, load a set of standard bar code data policies. You can later extend or edit the policies as needed.

To load the standard application identifiers, follow these steps:

1. Go to **Warehouse management** > **Setup** > **GS1** > **Barcode data policy**.
2. On the Action Pane, select **Create default setup**.

> ⚠ **Warning**
>
> The **Create default setup** command deletes all currently defined policies and replaces them with the standard set of policies. However, after the default setup is loaded, you can customize the policies as needed.

Set up custom specific bar code data policies

> ⚠ **Warning**
>
> Some bar code data policies might not work with every mobile flow that you use. When you configure custom bar code data policies, test the mobile device flow by using different pieces of information that are scanned at different points in the flow. In this way, you can determine whether the flow behaves as you expect.

To set up and customize your bar code data policies, follow these steps:

1. Go to **Warehouse management** > **Setup** > **GS1** > **Barcode data policy**.
2. Follow one of these steps:
   - To create a new policy: On the Action Pane, select **New**.
   - To edit an existing policy: Select the policy in the list pane.
3. On the header of the new or selected policy, set the following fields:

- **Policy name** – Enter a name for the policy.
- **Description** – Enter a short description of the policy.
- **Field value capturing method** – Select one of the following values to specify how the individual bar code values should be handled as part of the mobile device flow:
  - *Process immediately* – The application identifier values are immediately passed to the next mobile device step, even though the recorded values aren't required for capture as part of a later mobile device step. Depending on the recorded values, this value can cause unexpected mobile device flow processing.
  - *Save as default* – The application identifier values are stored throughout the whole mobile device menu item flow and are used only in mobile device steps that require the defined fields. Therefore, the exact mobile device step field control names must be specified as part of the bar code data policy setup, to link the application identifier values from the bar codes to the Warehouse Management mobile app fields. For more information about how to find the correct field names, see Inspect details of active Warehouse Management mobile app sessions.
- **Auto submit** – This option is available only when the **Field value capturing method** field is set to *Save as default*. Set it to *Yes* to automatically submit the mobile device step if all the fields are set.

4. On the **Policy lines** FastTab, map field names to application identifiers as required for the current policy. Use the buttons on the toolbar to add or remove rows as you require. For each row, set the following fields:
   - **Field** – Select or enter the mobile app input field that the incoming value should be assigned to. The value isn't the display name that workers see. Instead, it's the key name that is assigned to the field in the underlying code. The default setup provides a collection of fields that are likely to be useful, and includes intuitive key names for each field and matching programmed functionality. However, you might have to talk to your development partners to find the correct selections for your implementation. For more information about how to look up field names, see Inspect details of active Warehouse Management mobile app sessions.
   - **Application identifier** – Select the applicable application identifier, as defined on the **Barcode data application identifiers** page. The identifier establishes how the bar code is interpreted and stored as a value for the named field. After you select an application identifier, the **Description** field shows the description of it.

- **Sorting** – This column is available only when the **Field value capturing method** field is set to *Process immediately*. Every multivalue bar code includes a series of application identifiers, each of which is followed by a value. The applicable bar code data policy identifies which application identifier is mapped to each database field. However, if a bar code uses the same application identifier more than once, the system uses the order in which application identifiers appear in the code to map them to fields. For rows that share an application identifier with one or more other rows, use this field to establish the order that the matching rows should be processed in. The row that has the lowest sorting value is processed first.
- **Allow overwriting** – This column is available only on the **Policy lines** grid when **Field value capturing method** in the policy details header is set to *Save as default*. Select the checkbox in the **Policy lines** grid for rows where scanned data should replace the default data related to the specified **Application identifier** in the system. Only field values that are enabled for editing in the mobile application step are overwritten when this option is selected.

> ⓘ **Note**
>
> - For bar codes that include more than one identical application identifier, you *must* use the **Sorting** field to establish the order of the fields.
> - When **Auto Submit** is set to *Yes*, the mobile device immediately sends scanned information to the system. After the information is received, the mobile device displays a new screen, ready for the next input. This feature allows for a quick and efficient scanning process. The device only displays data after scanning when user interaction is required.
> - Select the **Allow overwriting** checkbox for rows where scanned information should replace the default data in the system. For example, if there's a purchase order for 10 pieces, but you only need to scan 5 pieces, this option allows the scanned data to override the default quantity.

Assign bar code data policies to mobile device menu items

By default, all mobile device menu items provide input fields where workers can scan a single value, according to the generic bar code data setup. If you want workers to be able to scan more

than one field value in a single scan for any mobile device menu item, assign a bar code data policy by following these steps.

1. Go to **Warehouse management** > **Setup** > **Mobile device** > **Mobile device menu items**.
2. Create or open a menu item.
3. On the **General** FastTab, set the **Barcode data policy** field to the policy that applies to the menu item.

GS1 setup example

This example applies to a system where the GS1 options are set up in the following way:

- On the **Warehouse management parameters** page, the following global settings are available:
  - **FNC1 character:** *]C1*
  - **Group separator:** ~
- On the **Barcode data application identifiers** page, the following application identifiers are relevant to this example.

Expand table

Application identifier	Description	Fixed length	Length	Type	Decimal
01	GTIN	Selected	14	Numeric	Cleared
10	Batch number	Cleared	20	Alphanumeric	Cleared
17	Expiry date	Selected	6	Date	Cleared
30	Receiving quantity	Cleared	8	Numeric	Cleared

- On the **Barcode data generic setup** page, the following settings for the generic bar code data policy are relevant to this example.

Expand table

Field	Application identifier	Description
ItemId	01	GTIN

- On the **Barcode data policy** page, there's a policy where the **Policy name** field is set to *Purchase receiving*. This policy includes the following lines.

Expand table

Field	Application identifier	Description	Sorting
ExpDate	17	Expiry date	0
InventBatchId	10	Batch number	0
Qty	30	Receiving quantity	0

- On the **Mobile device menu items** page, there's a menu item that is named *Purchase receiving*. Its **Barcode data policy** field is set to *Purchase receiving*.

After goods for a purchase order arrive at the warehouse, the worker follows these steps.

1. On the mobile device, select the **Purchase receiving** menu item.
2. Enter the purchase order number.
3. Select the **Item** field, and scan the following bar code: `]C10100000012345678~3030~10b1~17220215`.

Because of the settings that are established for this example, the system parses the scanned bar code in the following way.

Expand table

Field key	Application ID	Value	Note
ItemId	01	00000012345678	Because the worker scanned to the **Item** field, the first value in the bar code is mapped to that field. The mapping is taken from the generic bar code data setup.
Qty	30	30	Because several field values are being captured in a single scan, this mapping and all remaining mappings are taken from the bar code data policy that is assigned to the **Purchase receiving** menu item. This value is the quantity that was received.
InventBatchId	10	b1	This value is the batch ID.
ExpDate	17	220215	The date format is YYMMDD. Therefore, the expiry date is February 15, 2022.

The receipt is then registered, and the relevant database values are entered after the single scan.

> **Tip**

If GS1 bar codes that contain multiple values don't work as part of a Warehouse management mobile app flow, check the following settings:

- On the **Barcode data generic setup** and **Barcode data application identifiers** pages, make sure that the settings are aligned with the bar codes that you're using and with the bar code data policy that's assigned on the **Mobile device menu item** page.
- On the **Barcode data policy** page, select the policy that you're having trouble with, and check the following settings:
  - Set the **Field value capturing method** field to *Save as default*.
  - In the grid, make sure that all the field names are aligned with the step ID input control names for the actual mobile device. For more information about how to look up field names, see **Inspect details of active Warehouse Management mobile app sessions**. For some typical examples, see the table after this list.
- On **Warehouse management parameters**, on the **General** tab, on the **Bar codes** FastTab, set the **Unknown application identifier policy** field to *Skip the data element*.

The following table shows some typical examples where the step ID field mapping fails, so that a scanned GS1 bar code can't be processed.

Expand table

Used field name	Correct field name	Process
ItemId	ProductConfirmation	Item confirmation step
CatchWeight	OutboundWeight	Catch weight picking step

Last updated on 06/12/2026

Set up warehouses for transfer orders

Use warehouse levels to create a hierarchy that supports transfer orders between warehouses. With this setup, master scheduling calculates item requirements at the individual warehouse level and generates planned transfer orders from an assigned source warehouse to fulfill them.

1. Select **Inventory management** > **Setup** > **Inventory breakdown** > **Warehouses**.
2. Select the warehouse that you want to refill.
3. On the **Master planning** FastTab, select the **Refilling** check box.
4. In the **Main warehouse** field, select the warehouse that you want to assign as the refilling warehouse. Master scheduling calculates a transfer requirement for the selected warehouse and generates a planned transfer order from the assigned **Main warehouse**.

   > **Note**
   >
   > If you clear the **Refilling** check box, the selected warehouse is assigned a warehouse level in regard to the **Main warehouse**, but the **Main warehouse** isn't set up as a refilling warehouse.

5. Close the page to apply the new setup.

> **Tip**
>
> To assign a warehouse for refilling, first set up the warehouse as a storage dimension on the **Storage dimension groups** page. On this page, select the **Active** field and the **Coverage plan by dimension** field for the warehouse.

Set up transport lead time

Set up the transport lead time between the warehouses on the **Transport days** page.

1. Go to **Inventory management** > **Setup** > **Distribution** > **Transport days**.
2. In the **Receiving point** field, select **Warehouse**.
3. Select the **Shipping warehouse**, **Receiving warehouse**, and **Transport days**.

4. (Optional) Under the **Transport days per mode of delivery** tab, set the transport time depending on the mode of delivery.

Last updated on 07/01/2026

View and manage the work exceptions log

Work exceptions are work-related errors that can occur during warehouse operations (such as discrepancies in inventory or missing goods at a given location). The system registers these exceptions in the work exceptions log, which lets managers track and diagnose issues related to warehouse workflows such as pick or pack procedures.

Example of how a worker can create a work exception

The Warehouse Management mobile app automatically creates exceptions during some types some workflows in response to certain events. For example, one possible way that a worker can trigger a work exception is by completing the following procedure to perform a short pick (assuming the required work record already exists):

1. Open the Warehouse Management mobile app.
2. Go to **Outbound** > **Sales Picking**.
3. Enter the **Work ID** and select **OK**.
4. Enter the **Location** and select **OK**.
5. Select **Short Pick**.
6. Specify the following values:

    - The target license plate.
    - The quantity picked.
    - The reason for the short pick (for example, the item wasn't available at the expected location).

7. Select **OK** and complete the work.

The short pick event generates a work exception for the specified **Location**.

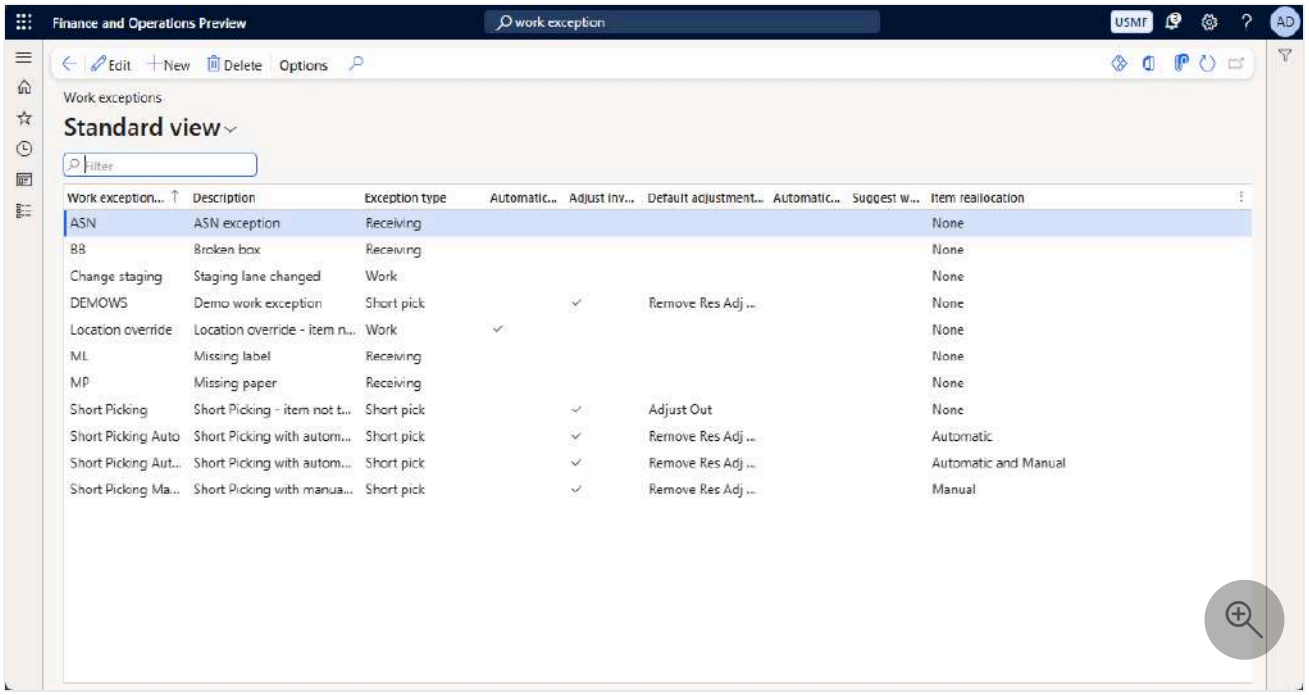
Configure behaviors for handling each type of work exception

You can configure the way the system should handle each relevant type of work exception. For example, you could set the system to adjust inventory at an affected license plate or allow automatic item reallocation.

To configure system behaviors, follow these steps:

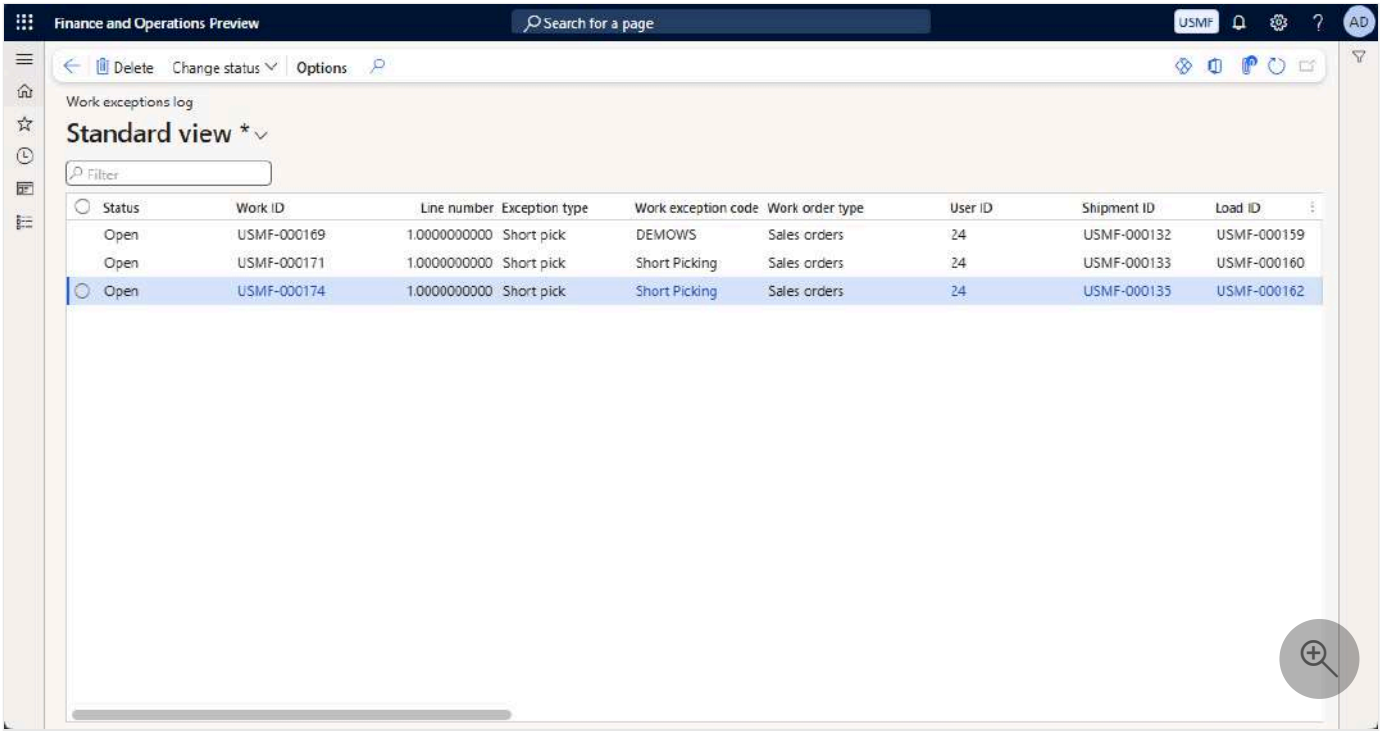
1. Go to **Warehouse management** > **Setup** > **Work** > **Work exceptions**.

2. Use the buttons on the Action Pane to add, edit, and delete rows as needed. To learn how to use the settings in each column, hover your mouse pointer over the column header to see a tooltip.

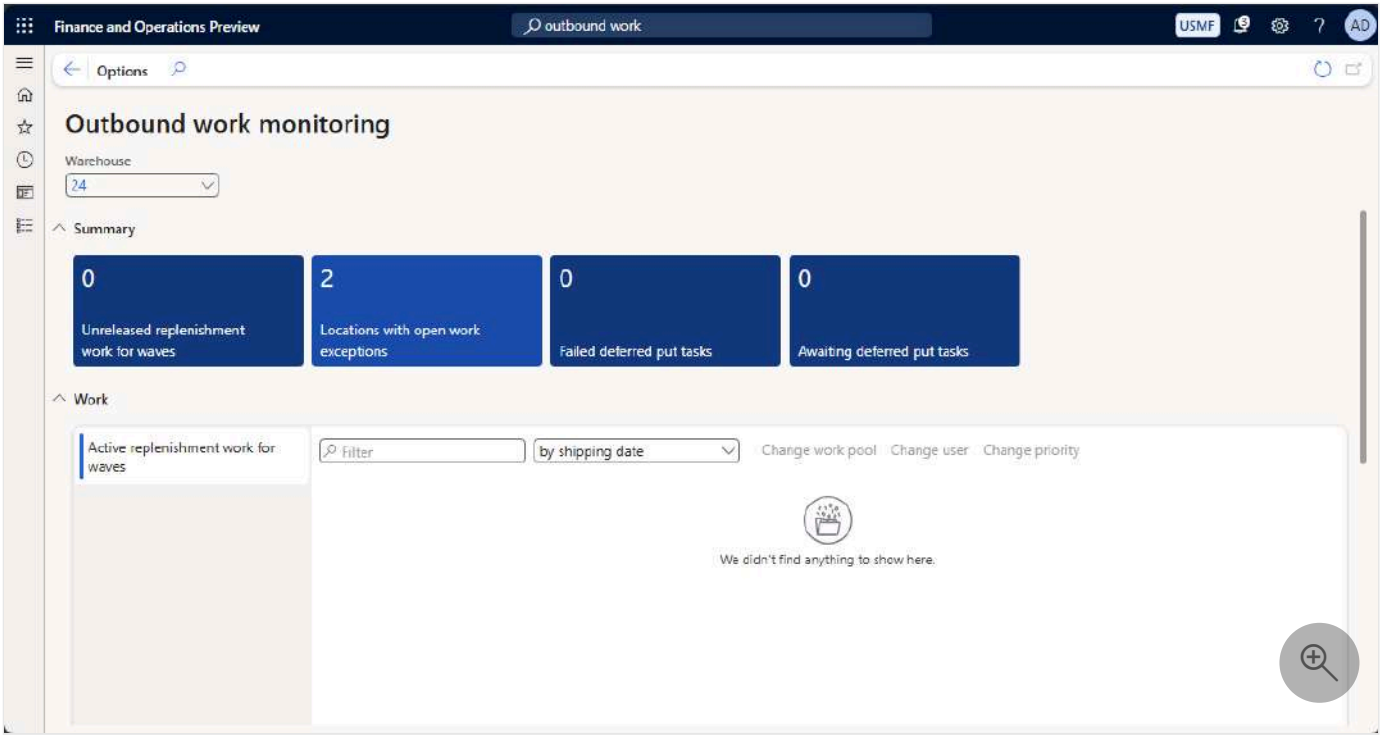


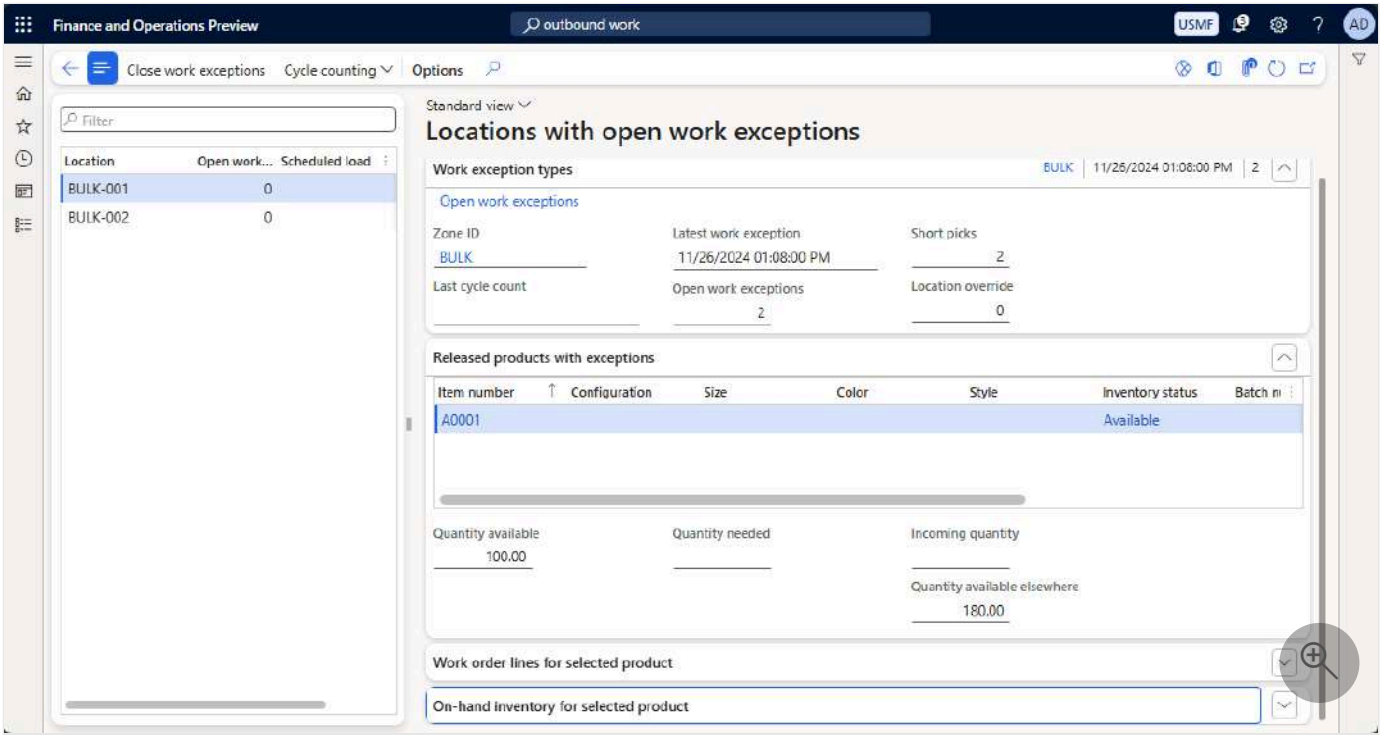
View the work exceptions log

To view the work exceptions log, go to **Warehouse management** > **Work** > **Work exceptions log**. You can sort and filter the list using the column headers or by entering a value in the **Filter** field and selecting where to search for it (for example by **Status**).



Work exceptions can also be shown on other pages, such as the **Outbound work monitoring** workspace (available at **Warehouse management** > **Workspaces** > **Outbound work monitoring**), which provides a tile that shows the number of **Locations with open work exceptions**. Select that tile to view and explore full details about the exceptions at each location.





Clean up the work exceptions log

Even after they're resolved, the system keeps all log entries until they're explicitly removed. Cleaning out old work exceptions helps make it easier for users to search for locations with open

work exceptions and improves the performance of pages that show work exceptions.

The system provides a clean-up batch job to help you delete multiple entries in the work exceptions log once they're resolved or no longer necessary. When you set up the job, you set the criteria for selecting which entries should be deleted (for example, according to the status and/or age of each entry). When the job runs, it removes all work exceptions that match the criteria.

This feature requires Supply Chain Management version 10.0.43 or later.

To clean up the work exceptions log, follow these steps:

1. Go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Clean up work exceptions logs**.
2. In the dialog, expand the **Parameters** FastTab and make the following settings:

    - **The number of days to keep** – Specify the age (in days) of the oldest entries to keep. Entries older than this are removed.
    - **Status** – Select the status of the exception logs to delete (*Open* or *Closed*).
    - **Maximum cleanup records count** – Specify the maximum number of records to delete. Setting a limit here can improve system performance by preventing too many records from being deleted in a single operation. (Default is 100,000.)

3. On the **Run in the background** FastTab, set up batch, batch group, scheduling, and alert options as you require, just as you might do for other batch jobs in Supply Chain Management.

When the job finishes execution, the system shows a notification of how many records were removed.

User-configurable queries in warehouse management

Article • 03/10/2025

The purpose of user-configurable queries is to limit the data that is processed. You might want to limit this data either because of business requirements or for performance reasons. The exact behavior of a query and the way that the results are used depend on the functional areas where that query is used. However, most user-configurable queries have the same basic structure and behavior. The logic resembles the logic of regular SQL queries.

Many places in the **Warehouse management** module must be set up for user-configurable queries. Here are some typical examples:

- The **Edit query** button on the **Work templates** page
- The **Location directives** page
- The **Select products** button on the **Replenishment templates** page

Here are some more examples of pages:

- SysQueryForm
- Wave template
- Work templates
- Location directives
- Labor standards
- Document routing
- Wave label templates
- Wave label layouts
- Label layout data source
- Container label routing
- Wave filters
- Mobile device menu items
- Cluster profiles
- Wave load building templates
- Cross docking templates
- Container build templates
- Replenishment templates
- Slotting templates
- Outbound sorting template
- Cycle count plans

- Cycle counting threshold
- Shipment consolidation policies
- Shipment consolidation templates

Here are some more examples of buttons:

- Edit query
- Select items
- Select locations
- Select products
- Select product variants
- Select locations to replenish
- Select zones to replenish
- Define product query
- Define product variant query

> **ⓘ Important**
>
> The most common mistake that users make in queries is to add table joins and expect the functionality to apply only to the added records. For example, the user adds a join to a sales table in the *Location directive action* query. The *Location directive action* query applies only when sales orders that meet the user-defined criteria are processed.
>
> Filters are added only to the tables that are in the default query. If the user adds a join to sales orders, the record doesn't add a filter to the sales order that is being released.

Basic query structure

Ranges

Ranges are filters that are used to limit which records are returned from the query. They are explicitly applied to individual table fields. In addition, they are implicitly applied when join relations are used.

Joins

Joins are applied between two tables to define how the data between them is filtered and potentially combined. There can be multiple joins to the same table.

The queries in X++ support several types of joins: *InnerJoin*, *OuterJoin*, *ExistsJoin*, and *NoExistsJoin* (*NotExist*). However, only *ExistsJoin* and *NoExistsJoin* are available in user-configurable queries. *ExistsJoin* is the default join type, regardless of the join mode (for example, *1:n* or *n:1*).

> **Note**
>
> In some special cases (for example, on the **Label layout data source** page), dedicated functionality was developed to support inner or outer joins in user-configurable queries, but those joins aren't available. If the default query has those types of joins, the user can add ranges to them. New table joins that are added through the user interface (UI) can be joins of the *ExistsJoin* or *NoExistsJoin* type only. Users can't view which type of join is used in the default query.

- *InnerJoin* returns the combined records from both joined tables. Therefore, it's a subset of the two table records. The join is made based on the specified relations between the two tables.
- *OuterJoin* returns the records from the first table, but any records that have a match in the other table will have those fields populated. The join is made based on the specified relations between the two tables.
- *ExistsJoin* resembles *InnerJoin*, but no record information from the second table is returned in the result.
- *NoExistsJoin* resembles *ExistsJoin* in that only record information from the first table is returned. However, the filtering is the opposite. Therefore, the record is returned if the match does **not** exist.

Sorting

Sorting is applied after the results are returned from the ranges and joins. It's applicable only to the returned records and fields. Sorting can't be applied to the second table in a join of the *ExistsJoin* type.

> **Important**
>
> The addition of further ranges, sorting, and especially table joins negatively affects performance. In some cases, ranges and joins must be added to meet business requirements. However, users should not create queries that are too complex.

Examples

Work templates page

On the **Work templates** page, each work order type has a slightly different default query. The purpose of the query is to select the work template that is used to create warehouse work and remaining work lines from the initial temporary work transactions during wave processing. The temporary work transactions are initialized from the order lines and headers.

In the case of sales orders, for example, the top table is `Temporary work transactions`. Two tables are joined to it, `Order lines` and `Locations`. You can't view the join type from the UI. You can view it only from the development environment. In this case, both joins are inner joins. The `Locations` table has no further joins. However, the `Order lines` table has one inner join to the `Sales orders` table and another inner join to the `Items` table. The `Sales orders` table has no further joins. However, the `Items` table has an inner join to the `Warehouse item number` table. The `Warehouse item number` table has no further joins. No default ranges are added to the query.

Users can add ranges to any of the previously mentioned tables. Only records that meet all the conditions can use this work template during wave processing.

For example, the user selects the `Warehouse item number` table and sets the **Field** field to *Code 1* and the **Criteria** field to *A*. In this case, only items where product filter code *Code 1* is set to *A* can use this work template.

Next, the user adds a relation to the `Carrier (Shipping carrier)` table to the `Temporary work transactions` table. The join is an *ExistsJoin* join. The user can now add a range on that table. For example, the user adds a range on the `Carrier` table and the **Shipping carrier** field, and specifies the name of some carrier in the **Criteria** field. In this case, the work template applies only to temporary work transactions where the specified carrier name is set.

> **Note**
>
> Although many tables are listed as available for joins, the related fields aren't populated in all cases. This behavior might lead to unexpected results.

Location directives page

On the **Location directives** page, there are two different user-configurable queries. One is related to the location directive (header), and the other is related to the location directive actions. The action-related query has different default values, depending on

the work type or the setting of the **Batch enabled** checkbox. The purpose of this query is to find a suitable warehouse location for the work line to pick from or put to.

If you use a sales order pick action where the **Batch enabled** checkbox is cleared, the top table is `Locations`. One table is joined to it, `On-hand inventory`. The join is an inner join. Ranges are predefined. The **Warehouse**, **Physical inventory**, and **No open quantities** fields have values set in the **Criteria** field and aren't editable. The **Location** and **Item number** fields are present, but they have no value in the **Criteria** field and are editable.

> **Note**
>
> In older versions, there might be a third table (`Inventory dimensions`) between `Locations` and `On-hand inventory`.

The user can specify the desired **Location profile ID** ranges on the `Locations` table. In this case, only locations that match the criteria are evaluated when the query tries to find a valid location to pick the item from.

The user might also add sorting, such a sort on the **Location** field of the `Locations` table in the *Ascending* search direction. In this case, the locations are evaluated based on the order of their location IDs. For example, the location that has the ID *Location123* is evaluated before the location that has the ID *Location321*.

> **Note**
>
> In some cases, additional ranges or tables are applied during processing but aren't visible to the user. In the preceding example, the item is always applied for the pick location directive action, because on-hand inventory is picked for a specific item.

Next, the user adds a relation to the `Order lines (Item number)` table to the `On-hand inventory` table. The join is an *ExistsJoin* join. The user can now add a range on that table. For example, the user adds a range on the `Order lines` table and the **Customer** field, and specifies some customer account in the **Criteria** field.

> **Important**
>
> You might think that the preceding query applies only when sales orders are processed for the specified customer account. However, the query actually has the following meaning: *find a location that has an item for which there is a sales line for*

the specified customer account. If the item was ever added to a sales line for that customer account, the additional table join and range have no functional effect. However, they add performance overhead.

Data entity support for user-configurable queries in warehouse management

Article • 03/07/2025

One challenge of user-configurable queries is the interaction with data entities. Because the queries are packed in a way that isn't readable by users, it's difficult to make changes to them through the data entities. To address this issue, special JavaScript Object Notation (JSON) fields are added to the warehouse data entities that have user-configurable queries. All relevant warehouse entities are updated with support for these JSON fields.

Example

This article uses the example of a newly created *Location directive actions* query.

Set up a location directive action

To set up a location directive action, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Location directives**.
2. In the **Work order type** field, select *Sales orders*.
3. On the Action Pane, select **New** to create a location directive.
4. In the **Name** field, enter *JSON test*.
5. In the **Work type** field, select *Pick*.
6. Select **Save**.
7. On the **Lines** FastTab, select **New**.
8. In the **To quantity** field, enter *999*.
9. Select **Save**.
10. On the **Location Directive Actions** FastTab, select **New**.
11. In the **Name** field, enter *JSON test action*.
12. Select **Save**.
13. Set up the data entities. Learn more in Data entities overview.
14. Export the new location directive action with the *Warehouse location directive line actions V3* data entity, for example, in the *XML-Element* format.

Review the exported file

If you open the exported XML file, its content should resemble the following example.

XML

```
<?xml version="1.0" encoding="utf-8"?>
<Document>
    <WHSWAREHOUSELOCATIONDIRECTIVELINEACTIONV3ENTITY>

Message processor messages for warehouse management processes

07/29/2025

Message processor messages are used for processes that run asynchronously. For example, you can use a message processor message to post a sales packing slip when the last shipment container is closed as part of a manual packing process or by Warehouse management only mode to create *inbound shipment orders* and *outbound shipment orders*.

Example message type: Run packing slip for container

For example, the *Run packing slip for container* message type is used to create and post a sales packing slip when a warehouse worker closes the last container in a shipment. The message that's inserted will be in a *Queued* message state. This state indicates that the message is waiting to be picked up by the **Message processor** batch job.

View the message log, message content, and details

To view the messages that are processed by the message processor, go to **System administration** > **Message processor** > **Message processor messages**. For information about how to use the **Message processor messages** page to review messages, find and fix failed messages, and more, see Message processor messages page.

Message processor batch job

You should schedule a periodic batch job to process the messages, by going to **System administration** > **Message processor** > **Message processor**. In the dialog box that appears, you must select a value in the **Message queue** field (for example, *Warehouse*), and you must specify a processing interval. Learn more in Schedule message processing by using the message processor batch job.

Set up business events to deliver alerts for failed processing results

On the **Message processor messages** page, you can filter on the *Failed* value of the **Message state** field to inquire about failed messages. In addition, you can set up business events to alert you about failed processing results. Learn more in Set up business events to deliver alerts for failed processing results.

Clean up processed and canceled message processor messages

Over time, processed and canceled messages, which are no longer needed, can accumulate in the system, potentially affecting performance and data management. Therefore, you should periodically clean up these messages to maintain system efficiency. Learn more in Clean up processed and canceled message processor messages.

Warehouse-specific inventory transactions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Warehouse-specific inventory transactions (referred to as *warehouse transactions* in this article) are database records that store information about how inventory is stored and moved around in the warehouse. Warehouse transaction records are highly optimized for warehouse operations.

In versions of Microsoft Dynamics 365 Supply Chain Management before 10.0.32, the system used a single type of standard inventory transactions (referred to as *inventory transactions* in this article) for both warehouse operations and other types of inventory transactions. However, in newer systems, use warehouse transactions where they apply (though inventory transactions still support other functionality). For warehouse operations, warehouse transactions provide many benefits in comparison to inventory transactions. Here are some examples:

- Significantly improved warehouse operation performance, especially for scenarios that include large numbers of serial or batch numbers (tracking dimensions).
- Improved scalability that's made possible by a reduction in the number of inventory transaction records that are required to support warehouse operations. Standard inventory transactions generate many more records and can therefore cause a heavy load on the database.

How warehouse transactions compare to inventory transactions

Warehouse transactions differ from inventory transactions in several ways. Here are the key differences:

- Warehouse transactions can operate on items in bulk. In other words, a single warehouse transaction can reserve, issue, or receive a set of items that have different serial or batch numbers. This capability enables the system to avoid repeated validations and use efficient set-based operations. It also reduces the amount of data that the system generates. Because the item sets can be reused, the same information doesn't have to be recorded multiple times.

- Warehouse transactions don't hold any financial or cost information. They're used only in warehouse operations, which don't have any financial impact. This change significantly reduces the number of fields, indexes, and validations that are required in the database. For warehouse operations that have a financial impact (such as counting, adjust-in, or adjust-out), the system still relies on inventory transactions.
- Warehouse transactions are immutable. Therefore, except in a few system processes, they're never updated or deleted. This property allows for more predictable system performance, because it avoids splitting the transactions. It also allows for a more detailed audit log of what occurred in the system. The extra details can be useful during investigations.
- Warehouse transactions are frequently archived. This feature helps keep the size of the warehouse transactions table small. It also enables the system to implement different data models for active and completed transactions. The data model for active transaction is optimized for inserts. (This optimization is critical for fast mobile device operations.) By contrast, the data model for completed transactions is optimized for queries.

Prerequisites

Before you can use this feature, the following prerequisites must be in place:

- You must update any customizations that rely on inventory transactions that will be replaced by warehouse transactions. Learn more in the Audit and update your customizations to support warehouse transactions section of this article.
- You must be running Dynamics 365 Supply Chain Management version 10.0.32 or later.
- If you're running Supply Chain Management version 10.0.35 or earlier, the feature that's named *Warehouse-specific inventory transactions* must be turned on in Feature management. In newer versions, this feature is fully integrated into the product, so it's either mandatory or no longer listed in Feature management.

Audit and update your customizations to support warehouse transactions

When you enable the *Warehouse-specific inventory transactions* feature, your system changes as follows:

- The system stops generating inventory transactions for warehouse operations. Instead, it uses warehouse transactions. Therefore, you must update any customizations and extensions that rely on the relevant inventory transactions for warehouse operations. This change affects only those warehouse scenarios that you configure to use warehouse

transactions. Learn more in the Choose which scenarios should use warehouse transactions section of this article.
- The system stops calling several existing methods when it processes warehouse operations.

When you try to enable the feature, the system checks for extensions that might break because of these changes. If it finds any issues, it sends you an error message that identifies the extension and explains how you must update it. If you receive such a message when you try to enable the feature, follow these steps.

1. Contact your developer or Microsoft partner, and ask them to review the relevant extensions and make the required fixes.
2. Declare the module that contains the problematic extension as *validated*. You can make this change by extending the `buildValidatedModuleSet()` method in the `WHSWarehouseInventoryTransactionFeatureExtensionValidator` class and adding the name of the module that contains a flagged extension into the set.
3. Deploy the updated module. The feature validator should now allow you to activate the feature.

> **⊗ Caution**
>
> The feature validator can't detect all possible issues. For example, it can't detect whether an extension is reading inventory transactions that are related to warehouse work. (Those inventory transactions will no longer exist after you enable the feature.)

Choose which scenarios should use warehouse transactions

The system lets you choose which scenarios use warehouse transactions. For example, you can use the new warehouse transactions for warehouse movements, but continue to use inventory transactions for all other operations. Therefore, organizations that use a system that was customized before enabling the *Warehouse-specific inventory transactions* feature can gradually move toward using warehouse transactions. They can start with the least customized scenarios or the scenarios where performance improvements are most required.

To choose which scenarios use warehouse transactions, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. On the **General** tab, on the **Warehouse inventory transaction mechanism** FastTab, select the **Use warehouse inventory transactions** checkbox for each scenario where you want to

use warehouse transactions. Scenarios that you leave this checkbox cleared for will continue to use inventory transactions.
3. On the Action Pane, select **Save**.

Some warehouse work types are just wrappers around other system processes (such as adjust-in/adjust-out and counting operations) and continue to use inventory transactions. Those operations change the on-hand inventory on all the inventory dimensions and therefore have a financial impact.

Source document transactions still use inventory transactions (records in the `InventTrans` table) and continue to use the inventory stack. For example, in the sales picking scenario, the reservation that's related to the sales line is still represented by an inventory transaction. However, when you release a sales order to the warehouse, the work that's created uses warehouse transactions. When you complete the work, the sales line's inventory transaction is updated to *Picked* status, and all specific dimension values are assigned, just as if the work had used inventory transactions.

Review warehouse transactions

The **Warehouse transactions** page shows both warehouse transactions and inventory transactions. By contrast, the **Inventory transactions** page shows only inventory transactions. Therefore, only the **Warehouse transactions** page shows all the transactions that are related to your warehouse operations. For example, in a sales picking scenario, if you want to view all transactions that are related to the sales order, you must open the **Warehouse transactions** page. It shows both the sales order inventory transactions and work-related warehouse transactions. The **Inventory transactions** page shows only the sales order transactions.

The purpose of the **Warehouse transactions** page is to show all the transactions that are relevant to managing the warehouse. It doesn't show inventory transactions that are in *Ordered* or *On order* status. You can open it from several places in the system, including the **On-hand** pages and the **Warehouse inventory transactions** page.

For example, to open the **Warehouse transactions** page from the **On-hand** page for a selected product, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select a released product.
3. On the Action Pane, on the **Manage inventory** tab, in the **View** group, select **On-hand inventory**.

> **Note**
>
> To view *all* transactions for the selected product, you can select **Warehouse transactions** instead.

4. On the **On-hand** page, select the row for the on-hand inventory that you want to inspect.
5. On the Action Pane, select **Warehouse transactions**.

The **Warehouse transactions** and **Inventory transactions** pages provide similar functionality. However, the **Warehouse transactions** page is limited to functionality that applies to warehouse operations. It lets you perform the following actions:

- To choose which inventory dimensions to show, select **Display dimensions** on the Action Pane.
- To view all transactions that have the same inventory dimensions as a selected row, select **Warehouse transactions for dimensions** on the **Inventory** tab of the Action Pane.
- To trace inventory dimensions for a selected row, select **Trace** on the **Inventory** tab of the Action Pane to open the **Trace inventory dimensions** page.
- To view batch attribute details for a selected row, select **Inventory batch attributes** on the **Inventory** tab of the Action Pane.

Archive warehouse transactions

Because warehouse transactions and inventory transactions differ slightly in nature, the system can archive warehouse transactions more often than inventory transactions. Whenever warehouse work is completed (closed or canceled), the system archives all the related warehouse transactions. The archived warehouse transactions are still available through the user interface (UI), just as nonarchived transactions are. However, they're moved from the storage that's optimized for fast inserts (active transactions) to the storage that's optimized for queries (archived transactions). The system can detect this distinction, and it takes the archived warehouse transactions into account when, for example, on-hand recalculation consistency checks are done or the **Trace inventory dimensions** page is used.

The archival procedure is implemented by the *Archive warehouse inventory transactions* process automation background process. This process is automatically registered when you enable the *Warehouse-specific inventory transactions* feature. By default, it runs every 10 minutes. However, system administrators can change the recurrence properties, based on the actual system use.

To change the recurrence properties of the *Archive warehouse inventory transactions* process, follow these steps.

1. Go to **System Administration** > **Setup** > **Process Automations**.
2. On the **Background Processes** tab, in the grid, select the row where the **Name** field is set to *Archive warehouse inventory transactions*.
3. Select **Edit** on the toolbar.
4. The **Edit background process** dialog opens. Review and edit the configuration as needed and select **OK**.

To review the execution history of the *Archive warehouse inventory transactions* process, follow these steps.

1. Go to **System Administration** > **Setup** > **Process Automations**.
2. On the **Background Processes** tab, in the grid, select the row where the **Name** field is set to *Archive warehouse inventory transactions*.
3. Select **View most recent results** on the toolbar.
4. The **Execution results** dialog box that appears shows a list of each process execution. Here, you can see whether each process succeeded and view its execution log.

Frequently asked questions

This section provides answers to a few frequently asked questions about warehouse-specific inventory transactions.

Is Microsoft planning to decouple on-hand inventory from the InventTrans and WHSInventReserve tables?

There are no current plans to decouple on-hand inventory from these tables.

What do the new transaction types represent and how are they used in the WHSInventoryTransactionTable table?

The `WHSInventoryTransactionTable` table includes the following four types of transactions (as defined by `WHSInventoryTransactionTypeEnum`).

- **Registered issue** – Represents an item being physically issued.
- **Registered receipt** – Represents an item being physically received.
- **Physical reservation** – Represents item reservations.
- **Removed physical reservation** – Represents an explicit, separate transaction type for removing a reservation. All reservation-related transactions can be dropped during the

archival process to save space, depending on your settings.

How does ItemSetId differ from a license plate, and is there any guidance on how to proceed with both going forward?

`InventTrans`-based inventory wasn't designed to represent inventory operations (such as *issue*, *receipt*, and *reservation*) over a set of items. License plates (such as target license plates in warehouse work) are one example of such a *set of items*. From the perspective of the `InventTrans`-based inventory stack, a license plate is just a dimension similar to other storage dimensions in `InventDim`. The concept of item sets in the new inventory stack aims to address this gap. During initial picks, an item set is constructed, and subsequent operations (such as *put to stage*, *pick from stage*, and *put-away to bay door*) reuse that item set. This approach avoids recording redundant information about items being moved. However, license plates are still used in the new system.

Related information

- For more information about this feature, consider joining the Warehouse Inventory Transactions community on Microsoft Viva Engage, where you can find useful guides, get our latest updates, and post any questions you have about using warehouse transactions.

Last updated on 11/19/2025

Optimize location directive queries

Article • 05/26/2023

Because of recent improvements to the on-hand inventory data model, location directive queries can now run much faster than before. However, if you've been running Microsoft Dynamics 365 Supply Chain Management for a while, you might have many older location directives that still use queries that were designed for the old data model. The *Optimize location directive queries* tool identifies location directive queries that use a suboptimal query pattern and transforms them so that they use the optimal querying approach that the new data model enables.

The optimization advisor now includes a rule that periodically checks whether your queries can be optimized. If it identifies the potential for improvement, it generates an optimization advisor opportunity that highlights the changes and suggests that you to run the tool as described in this article.

> **Important**
>
> - We recommend that you first run the tool on a user acceptance testing (UAT) environment. You should run it on your production environment only after you're sure that all location directives still behave as expected in the UAT environment, and that all **location directive acceptance tests** still pass.
> - Avoid running the tool during peak hours. It will lock your location directives and flush them from all application object servers. Therefore, waving and work creation will run slower for the duration of the job.

Prerequisites

To use the *Optimize location directive queries* tool, you must be running Supply Chain Management 10.0.35 or later.

Run the tool

Follow these steps to run the *Optimize location directive queries* tool.

1. Go to **Warehouse management** > **Periodic tasks** > **Clean up** > **Optimize location directive queries**.

2. The **Optimize location directive queries** dialog box appears. If you want to limit the scope of the optimization, on the **Records to include** FastTab, select **Filter** to open a standard query editor dialog box, where you can define selection criteria. The fields work just as they do for other types of queries in Supply Chain Management.

3. On the **Run in the background** FastTab, specify how, when, and how often the tool should run. The fields work just as they do for other types of background jobs in Supply Chain Management.

    - We recommend that you run the tool only as it's needed instead of setting up a recurring schedule.
    - As was mentioned, we also recommend that you run the tool only during off-peak hours. Therefore, instead of running it immediately, consider setting it up as a batch job that's scheduled to run just once at an appropriate time (such as Sunday at 8 PM).

4. Select **OK** to run the tool by using the options that you selected.

How it works

Location directives for picks typically rely on on-hand inventory information that's available in the `InventSum` table to determine where items should be picked from. Because location directive queries usually include inventory dimensions to ensure that product variants are considered when this determination is made, these queries previously required a join between the `InventSum` and `InventDim` tables. However, the data model has now been denormalized to optimize this common query pattern. All the required information is now available directly in the `InventSum` table. The elimination of a join operation typically boosts the performance of location directive queries by 30 to 50 percent.

The *Optimize location directive queries* tool transfers all ranges from `InventDim` to `InventSum` and removes the join to `InventDim`.

Analyze warehouse material movement through process mining

> **Note**

The Microsoft Power Automate Process Mining feature offers *task mining* and *process mining* capabilities to help you better understand your business processes, so that you can optimize them. Dynamics 365 Supply Chain Management offers a *Warehouse material movement analysis* template for the Power Automate Process Mining. Use this template to create processes that help warehouse and operations managers gain insights into the material flow in the warehouse. It helps find inefficiencies that you can remove to improve the performance of the warehouse.

The *Warehouse material movement analysis* template uses warehousing, product, and transactional data that's stored in your system. It lets you visualize and analyze material movements on the warehouse floor, based on closed warehouse work records. In process mining terminology, each warehouse work record corresponds to a *case*, and each pick or put work line corresponds to an *event*. Depending on your configuration, an *activity* can be any one of the following items:

- Warehouse location
- Warehouse location profile
- Warehouse zone

For more information about Power Automate Process Mining, see Overview of Power Automate Process Mining.

This article describes what's included in the *Warehouse material movement analysis* template, and explains how to deploy and access Power Automate Process Mining processes.

Prerequisites

The *Warehouse material movement analysis* template for Power Automate Process Mining has the following prerequisites:

- You're running Supply Chain Management version 10.0.35 or later.
- Your Supply Chain Management environment must be linked to a Dataverse environment.
- The user who deploys the process in Power Automate Process Mining must have the *Warehouse manager*, *Warehouse planner*, and/or *System administrator* role.
- The Supply Chain Manager user who deploys the process in Power Automate Process Mining must also be configured as a user in the linked Dataverse environment. To deploy the process, a user must have the *Environment maker* and/or *System administrator* role. After the process is deployed, it can be shared with other users. Those users automatically get the permissions required to use the process.

Deploy a new Power Automate Process Mining process based on the template

Set up as many processes as you need, each with a different name and filters. Follow these steps to deploy a *Warehouse material movement analysis* process.

1. Go to **Warehouse management** > **Setup** > **Process mining** > **Warehouse material movement process configuration**.

2. On the Action Pane, select **Deploy process** to open the deployment wizard.

3. Follow the on-screen instructions. Provide the following information:

    - **Process name** – Enter a name for the process. Include the legal entity (company) and other filter information in the name, so you can easily identify the process later.
    - **Company** – Select the legal entity that you want to use this process to analyze. Only warehouse work records in the selected legal entity are included in Power Automate Process Mining process.
    - **Number of months to load** – Specify the number of months to load at a time. This filter helps prevent excessive or irrelevant data from being loaded into Power Automate Process Mining. Only warehouse work records that were closed after the specified time threshold are included in Power Automate Process Mining process.
    - **Activity** – Specify which column Power Automate Process Mining should treat as an *activity*. To learn more about process mining terminology, see Glossary in Power Automate Process Mining.

> **Note**
>
> Try to limit the data by optimizing the **Number of months to load** filter value. Power Query Online includes several threshold checks. Therefore, if you try to load too much data, time-out or quota violation exceptions might occur, and the system might fail. Load less than 25 months of data into the *Warehouse material movement analysis* process and ensure that the total number of events in the process is less than 4 million.

When you complete the deployment wizard, the following actions occur:

- **Initial data is loaded.** The system loads 200 *cases* into the staging table. In the context of the *Warehouse material movement analysis* process template, each case corresponds to a single closed warehouse work record. Most likely, many more than 200 records meet the filtering criteria set in the deployment wizard. By loading only 200 cases, the system enhances performance and the user experience, so that you can access the visualization more quickly.
- **You're prompted to complete the deployment process.** Power Automate Process Mining user interface (UI) opens on a new tab in your browser. You might be asked to sign in. Power Automate Process Mining uses your credentials to read data from Supply Chain Management. Don't close the page right away. Otherwise, you interrupt the deployment. You don't have to do anything else on the page. Power Automate Process Mining lets you know when deployment is completed.

Refresh data in the staging table and Power Automate Process Mining

As mentioned earlier, after you deploy a new process, the system loads an initial set of 200 cases into the staging table and loads that data into Power Automate Process Mining. This behavior lets you get started quickly. However, to work with your full data set, you must refresh the staging table and Power Automate Process Mining. This section describes how to manually trigger this process.

> **Tip**
>
> Although it can be useful to refresh the data on demand from time to time, you probably want to set up each process so that it automatically refreshes its data on a regular basis. For

instructions, see the Configure the warehouse material movement process section of this article.

Follow these steps to manually refresh data in the staging table and Power Automate Process Mining.

1. Go to **Warehouse management** > **Setup** > **Process mining** > **Warehouse material movement process configuration**.
2. In the list pane, select the process to refresh the data for.
3. On the Action Pane, select **Refresh staging table**. The batch job that's responsible for refreshing the staging table runs every five minutes. The next time that it runs, it picks up the request to refresh the table. It then loads all the data that matches the filters specified during deployment.
4. On the **General** FastTab, the **Last staging table refresh** field is updated to indicate that the table is refreshed. However, the new data isn't available in Power Automate Process Mining until you refresh it there. Select **View process details** on the Action Pane, and then select **Refresh data** in Power Automate Process Mining.

A staging table cleanup batch job runs daily and removes any records from the staging table that no longer satisfy the filter criteria. For example, it removes any records that are now too old.

Configure warehouse material movement processes

After you deploy a process, you can configure it at any time by following these steps.

1. Go to **Warehouse management** > **Setup** > **Process mining** > **Warehouse material movement process configuration**.

2. In the list pane, select the process to refresh the data for.

3. On the **General** FastTab, set the following fields:

    - **Automatic refresh recurrence** – Select how often the system should update the data table (*None*, *Once per day*, or *Once per week*). Although this update refreshes data in the staging table, it doesn't automatically load that data into Power Automate Process Mining. To set Power Automate Process Mining to periodically load this data from the staging table, select **View process details** on the Action Pane. Then, in Power Automate Process Mining, select **Schedule refresh**, and select a refresh schedule. You can also manually refresh the data in Power Automate Process Mining by selecting **Refresh data** in Power Automate Process Mining.

- **Last staging table refresh** – This read-only field shows the date and time when the staging table was last refreshed.
- **Enforce offline hours** – Set this option to *Yes* to prevent the system from refreshing the staging table during the specified hours. This option can be useful if you want to avoid refreshing the table during peak hours.

4. On the **Process parameters** FastTab, review the following fields:

    - **Legal entity** – This read-only field shows the legal entity specified during deployment.
    - **Number of months to load** – This read-only field shows the number of months to load, as specified during deployment.
    - **Activity** – This read-only field shows the activity specified during deployment.

    The **Processing log** FastTab shows a history of data refresh and cleanup operations. This information can be useful during troubleshooting.

Access the warehouse material movement analysis process

You can access the warehouse material movement analysis process from both Supply Chain Management and Power Automate Process Mining UI.

To access the process from Supply Chain Management, follow these steps:

1. Go to **Warehouse management** > **Enquiries and reports** > **Warehouse performance analysis** > **Warehouse material movement analysis**.

2. In the **Process name** field, select the name of the process to view. The list includes only processes that meet both the following conditions:

    - The process is ready for analysis. (In other words, it has been deployed and analyzed in Power Automate Process Mining.)
    - The current user can access the process. (In other words, the current user created or shared the process.)

3. The Power BI report for your selected process opens. You can interact with the report to view the process and analyze it in various ways.

4. To view the selected process in Power Automate Process Mining, select **View process report** on the Action Pane. Power Automate Process Mining UI opens on a new tab in your browser.

5. To perform advanced process analysis, assess process behavior with business rules, detect rework, and build your own business metrics, select **Open Power Automate Process Mining** to open process in Power Automate Process Mining desktop app. For more information about its capabilities, see Power Automate Process Mining overview.

FAQ

Why don't I see all the events (work lines) and cases (work headers) that I expect in Power Automate Process Mining process?

Several reasons might prevent you from seeing all the events and cases that you expect. Check the following items:

- Confirm that the staging table is recently refreshed. Go to **Warehouse management** > **Setup** > **Process mining** > **Warehouse material movement process configuration**, and review the **Last staging table refresh** field on the **General** tab and the information on the **Processing log** FastTab.
- Confirm that the warehouse work that you expect to see in the process is closed. The warehouse work closed date and legal entity (company) should meet the process filtering criteria that are specified during process deployment. You can check these details on the **Warehouse material movement process configuration** page.
- Confirm that Power Automate Process Mining process is recently refreshed. For information about how to view refresh information, and how to set up schedules to automatically refresh the staging table and Power Automate Process Mining process, see the Configure the warehouse material movement process section of this article.

Why don't I see the process that I'm looking for on the Warehouse material movement analysis page?

Several reasons might prevent you from seeing a process on the **Warehouse material movement analysis** page. Check the following items:

- Confirm that you have access to the process. Usually, to view a process, you must have created it yourself, or the creator must share it with you. To confirm that you have access, sign in to Power Automate Process Mining in Power Automate by using the same user account, and determine whether you can access the process.
- Confirm that the process is deployed and ready for analysis. The **Warehouse material movement analysis** page shows only processes that are ready for analysis. If the process is

still being deployed, it might not yet appear on the page. To confirm that the process is ready for analysis, try to open the Power BI report for the process in Power Automate Process Mining UI.

Why do I receive an error during process deployment?

The system performs several checks while it's provisioning a process. Most failures occur either because the Supply Chain Management user account that's used isn't registered in Dataverse or because the account doesn't have the required privileges. If deployment takes a long time (about four hours), you're probably exceeding the threshold limits for Power Automate Process Mining integration. Consider changing the filters to reduce the number of events that are loaded into Power Automate Process Mining. You can typically lower the **Number of months to load** filter value.

Enable warehousing telemetry with Application Insights

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article describes how to set up Microsoft Dynamics 365 Supply Chain Management to send warehousing telemetry data to Application Insights.

Turn the telemetry feature on or off for your system

To use this feature, it must be turned on for your system. As of Supply Chain Management version 10.0.43, it's turned on by default. Admins can turn this functionality on or off by searching for the *Monitoring and telemetry* feature in the **Feature management** workspace.

Set up Application Insights

Start by setting up Application Insights on your Azure subscription.

1. If you don't already have a subscription to Azure, get one.

   > **Note**

You can set up the Application Insights resource on any Azure tenant that can be accessed by your system. For example, you might set up Application Insights on a tenant that belongs to your Microsoft partner. In this case, your Microsoft partner will be able to analyze your telemetry data even if they don't have access to your Azure tenant.

2. Sign in to the Azure portal for the account where you want to install Application Insights.
3. Create an Application Insights resource by following the instructions in Create an Application Insights resource.
4. Keep a copy of the **Instrumentation key** or **Connection string** value for your Application Insights resource. (For more information, see Create an Application Insights resource.) You'll need this value later, when you set up Supply Chain Management to submit the data.

Set up your apps to send telemetry data to Application Insights

After you've set up Application Insights and have a copy of its instrumentation key, you're ready to enable Supply Chain Management to send telemetry data.

1. Sign in to Supply Chain Management as a user who has system admin privileges.
2. Go to **System administration** > **Setup** > **Monitoring and telemetry parameters**.
3. On the Configure tab, choose which types of telemetry you'd like to capture. Only the selected types are sent to Application Insights. Of the options listed, only the following are relevant for warehousing telemetry:

    - **User sessions (custom events)** – This must be enabled to capture warehouse events. You should set this option to *Yes*.
    - **Warehouse events** – Specify whether you want to send warehousing telemetry data to Application Insights. You should set this option to *Yes*.

4. On the **Environments** tab, identify the environment mode (*Development*, *Test*, and *Production*) of each environment that you want to send telemetry from. Use the **New** and **Delete** buttons to add and remove rows as needed. You can create as many rows as you want, but we recommend that you create no more than one for each **Environment mode** value (if more than one environment ID is mapped to the same mode, the system selects an ID at random). Make the following settings for each row:

- **LCS Environment ID** – Enter the ID of the Microsoft Dynamics Lifecycle Services environment that you want to send telemetry data from. To find this ID, sign in to Lifecycle Services, and open the environment details page for your environment. In the **Environment Details** section, look for the **Environment ID** field.
- **Environment mode** – Select the mode of your selected environment.

5. On the **Application Insights registry** tab, map each environment mode that you use to a target Application Insights connection string or instrumentation key. If a database is copied from one environment to another, the mode will be auto-detected and fail over to the new target endpoint. Environments that aren't mapped default to the *Development* mode. Use the **New** and **Delete** buttons to add and remove rows as needed. You can create up to three rows here (one for each **Environment mode** value). Make the following settings for each row:

   - **Environment mode** – Specify the mode you want to map.
   - **Connection string** or **Instrumentation key** – Enter the value that you copied when you set up Application Insights in Azure.

   > **Note**
   >
   > You can use the same instrumentation key for different environment modes.

6. On the Action Pane, select **Save** to save your settings.

Pricing

Application Insights is billed based on the volume of telemetry data that your application sends (data ingestion) and the length of time that you want data to be available (data retention). For up-to-date information about pricing, see Azure Monitor pricing.

Next steps

- Monitor Warehouse Management usage and performance

Last updated on 03/10/2026

Monitor Warehouse Management usage and performance

Microsoft Dynamics 365 Supply Chain Management emits telemetry data for various Warehouse Management activities and operations, including both the Supply Chain Management tenant and the Warehouse Management mobile app. Telemetry data helps provide insight into the activities and general health of your tenants and devices, so that you can diagnose problems and analyze operations that affect performance. Use Application Insights, an Azure service that's optimized for this purpose, to collect and process telemetry data.

Prerequisites

Before you can collect and analyze Warehouse Management telemetry data, ensure that your system meets the following prerequisites:

- **Supply Chain Management version** – Telemetry with Application Insights requires Supply Chain Management version 10.0.29 or later. Additional telemetry features require later versions. See the tables later in this article for details about which features require which versions of Supply Chain Management.
- **Warehouse Management mobile app version** – Telemetry with Application Insights requires Warehouse Management mobile app version 2.0.28 or later. Additional telemetry features require later versions of the app. See the tables later in this article for details about which features require which versions of Supply Chain Management and the Warehouse Management mobile app.
- **Application Insights** – You must have an Application Insights resource in Azure, and you must configure your Supply Chain Management environment to send telemetry data to it. For instructions, see Enable warehousing telemetry with Application Insights.

View telemetry data in Power BI

The fastest and easiest way to get started viewing your warehousing telemetry is to download and set up the Power BI reports provided by Microsoft. The downloadable reports and instructions for how to set them up are available in the Supply Chain Management telemetry repository on GitHub.

Technical details of all available telemetry data

In Application Insights, telemetry data from Supply Chain Management tenants and the Warehouse Management mobile app are logged as custom events. Technical details of all custom events and all data that could be logged for each event are available in the Supply Chain Management telemetry repository on GitHub. This information can help you design your own custom Power BI reports and explore the data directly in Application Insights. The following sample query files list all of the available event IDs, field names, and version requirements:

- For Supply Chain Management tenant telemetry details, see the WarehouseManagement.kql example query on GitHub.
- For Warehouse Management mobile app telemetry details, see the WarehouseMobileApp.kql example query on GitHub.

Analyze how long work takes in the mobile app (preview)

[This section is prerelease documentation and is subject to change.]

Warehouse Management mobile app version 4.1.5.0 and later emits telemetry that describes how long work takes in the app, rather than only how long the server takes to answer. Use this telemetry to find the steps where workers lose the most time, and to tell a slow server apart from a page that's simply hard to complete.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Time spent on each page

Every request that the app sends to the server reports how long the worker spent on the page that the request replaces. The app splits this time into two separate measurements:

- **Active time** – Time when the app is in the foreground and the worker can act on the page.
- **Idle time** – Time when the app is in the background, or the device is locked or asleep.

The app reports these measurements separately because a page that's left open on a locked device during a break otherwise looks the same as a page that a worker struggles to complete. Only the active time indicates that a page is hard to fill in.

A page is new when its structure changes. The structure refers to the page layout and the set of fields and buttons on it. Retyping a value or correcting an entry doesn't start a new measurement because the worker is still completing the same step.

Completed operations

The app reports a summary for each unit of work that a worker completes, such as a full putaway or a picking run, instead of a single page or request. Each summary covers the whole flow, from the moment the worker starts the operation until the server confirms it. The summary describes the following aspects of the flow:

- How many pages the worker moved through and how many requests the app sent.
- How many buttons the worker pressed and how often the worker had to open a dialog box to enter or edit a value.
- How many error messages the server returned during the flow.
- How the worker entered data, including how much of the flow the worker spent scanning with the camera compared to a dedicated scanner such as a ring scanner.
- How the elapsed time divided between waiting for the server, filling in pages, and idle time.

The app also reports operations that a worker abandons. These operations indicate how the flow ended, such as whether the worker canceled it or signed out. The app includes abandoned operations so that the data doesn't reflect only the flows that succeeded, which are the flows that are least likely to need attention.

Because each summary covers a complete flow, you can compare the same operation across sites, shifts, and devices. You can see the effect of a configuration change on the time that the operation takes end to end.

Correlate app telemetry with server telemetry

Mobile app events include the identifier of the server session that the worker signed in to. Because Supply Chain Management also records the identifier, you can join the events that the app emits to the corresponding server-side activity. You can follow a single worker's session across both.

Use this identifier when the app reports a slow step, so you can determine whether the worker spent the time on the device or in Supply Chain Management. Keep the detailed diagnostic information in the server-side telemetry, and use the session identifier to find it, instead of increasing the volume of data that each device sends.

For the field names that carry this data, and the app and Supply Chain Management versions that are required for each field, see the WarehouseMobileApp.kql example query on GitHub.

View telemetry data in Application Insights

As an alternative to Power BI, you can view your telemetry data directly in Application Insights. Telemetry is stored in Azure Monitor Logs in the `customEvents` table. You can view the collected data by writing log queries in the Kusto Query Language (KQL). For more information, see Azure Monitor Logs overview and Log queries in Azure Monitor.

As a simple example, follow these steps:

1. In the Azure portal, open your Application Insights resource.
2. On the **Monitoring** menu, select **Logs**.
3. On the **New Query** tab, enter the following code to view the last 100 custom events.

```plaintext
kql
customEvents
| take 100
| sort by timestamp desc
```

Review sample code, FAQs, and more in the Supply Chain Management telemetry GitHub repository

For more examples of how to work with KQL, plus answers to frequently asked questions, and tips about using Supply Chain Management telemetry with Excel, Power Automate, Power BI, PowerShell, and more, see the Supply Chain Management telemetry repository on GitHub.

Set up alerts on telemetry events

You can configure the system to send you an alert message if something occurs in your environment or app that requires immediate action. Application Insights makes it easy to define

these alerts. For more information and instructions, see What are Azure Monitor Alerts.

Pricing

Application Insights is billed based on the volume of telemetry data that your application sends (data ingestion) and the length of time that you want data to be available (data retention). For up-to-date information about pricing, see Azure Monitor pricing.

Upgrade warehouse management from Microsoft Dynamics AX 2012 to Supply Chain Management

Article • 02/07/2024

This article provides an overview of the process of upgrading from Microsoft Dynamics AX 2012 R3, running the *WMSII* module, to Dynamics 365 Supply Chain Management.

Supply Chain Management no longer supports the legacy *WMSII* module from Dynamics AX 2012. Instead, you can use the *Warehouse management* module. In the *WMSII* module, the Location and Pallet ID inventory dimensions can be selected for financial inventory. However, the Pallet ID inventory dimension can't be used for financial inventory in Supply Chain Management.

During an upgrade, all products that are associated with a storage dimension group that uses the Pallet ID inventory dimension are identified, marked as blocked, and not processed for upgrade.

Upgrading to Supply Chain Management when AX 2012 R3 WMSII is used

After the upgrade, you can use a set of options on the **Change storage dimension group for items** page to unblock products that were blocked during upgrade, and then process transactions for those products.

Enabling items in Supply Chain Management

This change is required because in Supply Chain Management, item tracking is part of the warehouse management processes (WMS). For these processes, all warehouses and their locations must be associated with a location profile. If you want to use WMS, the following configuration must be done:

- Existing warehouses must be enabled to use WMS.
- Existing released products must be associated with a storage dimension group that uses WMS.

If the source storage dimension groups use the Pallet ID inventory dimension, the locations of existing on-hand inventory that used the Pallet ID inventory dimension must be associated with a location profile where the **Use license plate tracking** parameter is

selected. If the existing warehouses should not be enabled to use WMS, you can change the storage dimension groups of the existing on-hand inventory to groups that handle only the Site, Warehouse, and Location inventory dimensions.

> ⓘ **Note**
>
> You can change the storage dimension group for items even if open inventory transactions exist.

Find products that were blocked because of the pallet ID

To view the list of released products that were blocked during upgrade and can't be processed, go to **Inventory management** > **Setup** > **Inventory** > **Items blocked for inventory updates**.

Change the storage dimension group for blocked products

To be used as part of a warehouse management process, an item must be associated with a storage dimension group in which the Location inventory dimension is active, and the **Use warehouse management processes** parameter is selected. When this setting is selected, the Site, Warehouse, Inventory status, Location, and License plate inventory dimensions become active.

To unblock products that were blocked during upgrade, you must select a new storage dimension group for the products. Note that you can change the storage dimension group even if open inventory transactions exist. To use items that were blocked during upgrade, you have two options:

- Change the storage dimension group for the item to a storage dimension group that uses only the Site, Warehouse, and Location inventory dimensions. As a result of this change, the Pallet ID inventory dimension is no longer used.
- Change the storage dimension group for the item to a storage dimension group that uses WMS. As a result of this change, the License plate inventory dimension is used.

Enable warehouses to use WMS

Follow these steps to enable a warehouse to use WMS.

1. Create at least one new location profile.
2. Go to **Warehouse management** > **Setup** > **Enable warehouse management processes** > **Enable warehouse setup**.
3. On the **Enable warehouse setup** page, add the warehouses that should be enabled to use WMS. You can complete this step either directly on the page or by using the Microsoft Office integration.
4. Assign a location profile to all the locations. You can easily complete this step directly from the page by using the Microsoft Office integration. You can either export and import the data, or use the data entity processing in Data management.
5. Validate the changes. As part of the validation process, various validations of data integrity occur. As part of a larger upgrade process, issues that occur might have to be adjusted on the source implementation. In this case, an additional data upgrade will be required.
6. Process the changes.

Change the storage dimension group for items to use WMS

This section describes how to change product storage dimension groups for items as part of the process of upgrading warehouse management from AX 2012 to Supply Chain Management.

Purpose of changing storage dimension groups for items

By changing storage dimension groups for items, you can migrate existing items that have open inventory transactions so that they use the new storage dimension that's required to use WMS in Supply Chain Management.

In a typical migration scenario, you have existing items where the location dimension is enabled. The migration process enables those items to fulfill the WMS item requirements and ensures that all the related data matches the new settings. In this way, business processes can proceed after the migration.

To use WMS, your items must meet the following requirements:

- The storage dimension group for each item must have the **Use warehouse management processes** parameter set to *Yes*. The storage dimension represents how you store or retrieve items in your inventory.
- An inventory reservation hierarchy must be assigned.

- A unit sequence group must be assigned. The unit sequence group defines the sequence of units that can be used in warehouse operations.

Prerequisite settings

You must configure the following settings before you start to migrate items:

1. Create a new **Inventory status** value, and assign it as the **Default inventory status ID** value in the **Warehouse management parameters** settings.
2. Create a new storage dimension group where the **Use warehouse management processes** parameter is set to *Yes*.
3. On the **Reservation hierarchy** page, define a new reservation hierarchy to accommodate each item's storage and tracking dimension groups.
4. Create one or more unit sequence groups that include the units that are used for each item's inventory units.

Change storage dimension groups for items

Supply Chain Management provides a migration tool to help you change the storage dimension group for items. Follow these steps to migrate an item.

1. Go to one of the following locations:

    - **Inventory Management** > **Setup** > **Inventory** > **Change storage dimension group for items**
    - **Warehouse management** > **Setup** > **Enable warehouse management processes** > **Change storage dimension group for items**

2. On the Action Pane, select **New** to add a row to the grid. Set the following fields for the new row:

    - **Item number** – Select the item number to migrate.
    - **Storage dimension group** – Select the storage dimension group that you plan to migrate the item to.
    - **Reservation hierarchy** – Select the reservation hierarchy that applies to the migrated item.
    - **Unit sequence groups** – Select the unit sequence group that applies to the migrated item.

3. Repeat step 2 until you've added all the rows that you need.

    Tip

Instead of adding one row one at a time, as described here, you can import many rows at the same time by using either Microsoft Office integration or the data entity process that's described in **Data management**.

4. On the Action Pane, select **Validate changes**. The system validates all the rows on the page to ensure that data integrity will be maintained. As part of a large migration process, you might have to adjust data on the source implementation to fix issues. Therefore, several additional rounds of data migration might be required. The validation checks for the following conditions, among others:

    - A default inventory status must be defined.
    - On-hand inventory with pallets must exist only on license-plate-tracked locations.
    - On-hand inventory without pallets must not exist on license-plate-tracked locations.
    - All combinations of storage dimension groups and reservation hierarchies must be valid.
    - Items that are migrated to use WMS must not be enabled to use catch weight.

5. On the Action Pane, select **Process changes**. The update of all the inventory dimensions can take a while. You can monitor the progress by checking the batch job tasks. The process uses both parallel processing and the batch framework, and the difference is handled by different batch tasks.

    > ⓘ **Note**
    >
    > If you upgrade from a version that supports pallets, the upgrade process identifies any items where the pallet dimension is active. Because these items use unsupported settings, the upgrade process creates a record for each of them on the **Items blocked for inventory updates** page. In this way, the items are blocked from all inventory processes. Blocked items must be migrated.

Unsupported scenarios

The following scenarios aren't supported:

- **Catch-weight-enabled items:** Because the pallet dimension is active for catch-weight–enabled items, those items must be downgraded to a dimensions group where only the location dimension is active.

- **Reserve ordered transactions:** Because of the way that reservations work for WMS-enabled items, there are specific constraints on the state of the inventory transactions. If any reserved ordered transactions have a "hole" in the dimensions, the item can't be converted. A hole can occur for items where the batch dimension is active and is below the location dimension in the reservation hierarchy. If a reservation exists on the site, warehouse, or batch, the location is missing. We refer to this situation as a hole. Holes aren't supported. To fix the issue, remove the hole by either assigning the missing dimensions or clearing the dimensions.

Warehouse management only mode overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Warehouse management only mode lets you set up a legal entity in Microsoft Dynamics 365 Supply Chain Management that's dedicated to warehouse management processes. This legal entity can then provide warehousing services to other legal entities in Supply Chain Management. Alternatively, it can provide warehousing services to external enterprise resource planning (ERP) systems or order management systems. There are two basic scenarios:

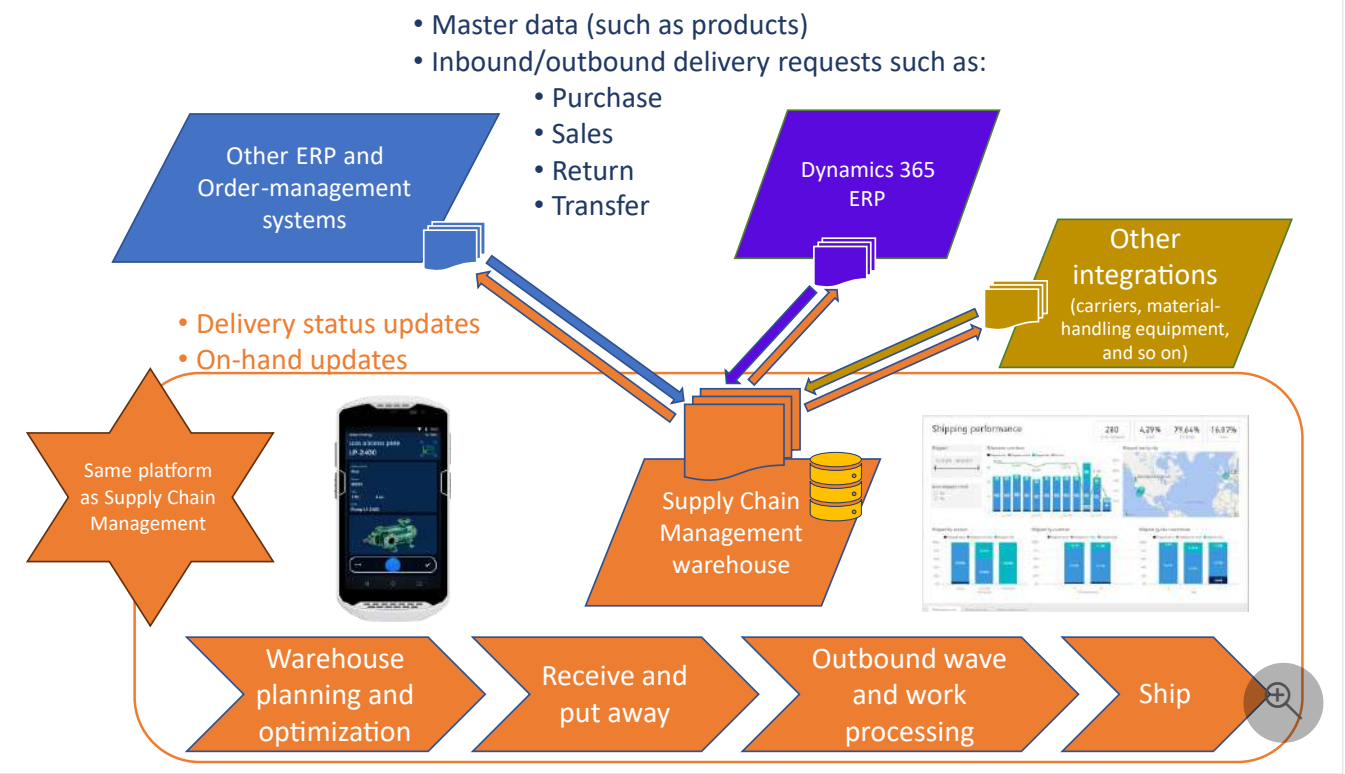
- **Integrate Warehouse management only mode with an external ERP system** – Take advantage of the core warehouse management (WMS) functionality that Supply Chain Management offers while you also continue to take advantage of your existing investments in third-party ERP and order management systems. Regardless of the ERP or ordering systems that you have in place, you can now quickly deploy our advanced WMS functionality without having to set up or maintain areas of Supply Chain Management that you don't need. You're then ready to benefit from advanced WMS features such as automation integration, carrier integration, and the Warehouse Management mobile app.
- **Set up an external shared warehouse for other legal entities in Supply Chain Management** – If you use an external shared warehouse, logistic operations run in a separate legal entity. This legal entity shares warehousing services with other legal entities that manage all the order and financial processing.

Warehouse management only mode uses lightweight source documents that are dedicated to inbound and outbound shipment orders. Because these documents focus exclusively on warehouse management, they can replace multiple types of more general-purpose documents (such as sales orders, purchase orders, and transfer orders) from a pure warehouse management perspective.

Deployment options

Warehouse management only mode provides several deployment options to support the business needs of running your warehouse management processes.

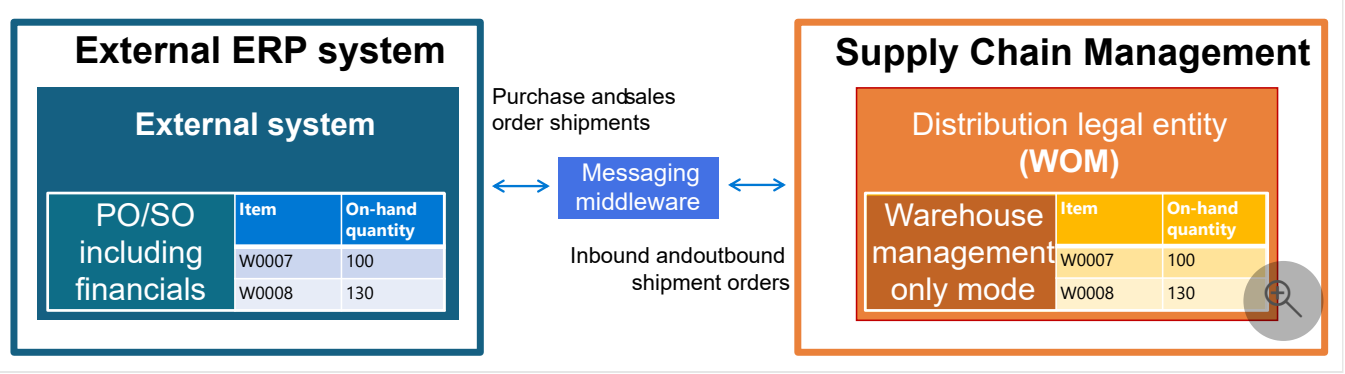
You can start a free trial of Dynamics 365 Supply Chain Management via the unified admin experience for finance and operations apps. You can then try out an implementation as shown in the following high-level diagram of the elements and processes of an integrated system. Learn more in this example that shows how to use inbound and outbound shipment orders.



The solution is very flexible. Therefore, you can choose the configuration of features and systems that best fits your business needs. The following subsections provide a few examples that show how you can integrate Supply Chain Management warehouse management mode.

Handle all orders and financial processing in an external system

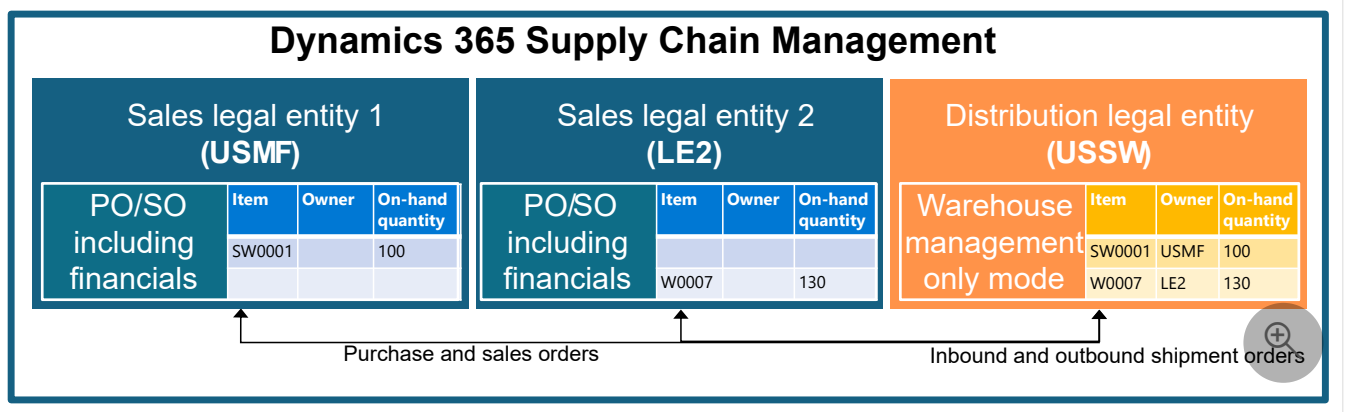
The following high-level diagram shows an example where Supply Chain Management is used to handle warehouse operations only. An external system is used to handle all orders and financial processing.



For this type of implementation, you must configure the warehouse management processes as part of Supply Chain Management. For a more detailed description of this process and the related processes, see Warehouse management only mode with external ERP system.

Use a separate legal entity to manage warehouse management processes for other legal entities in Supply Chain Management

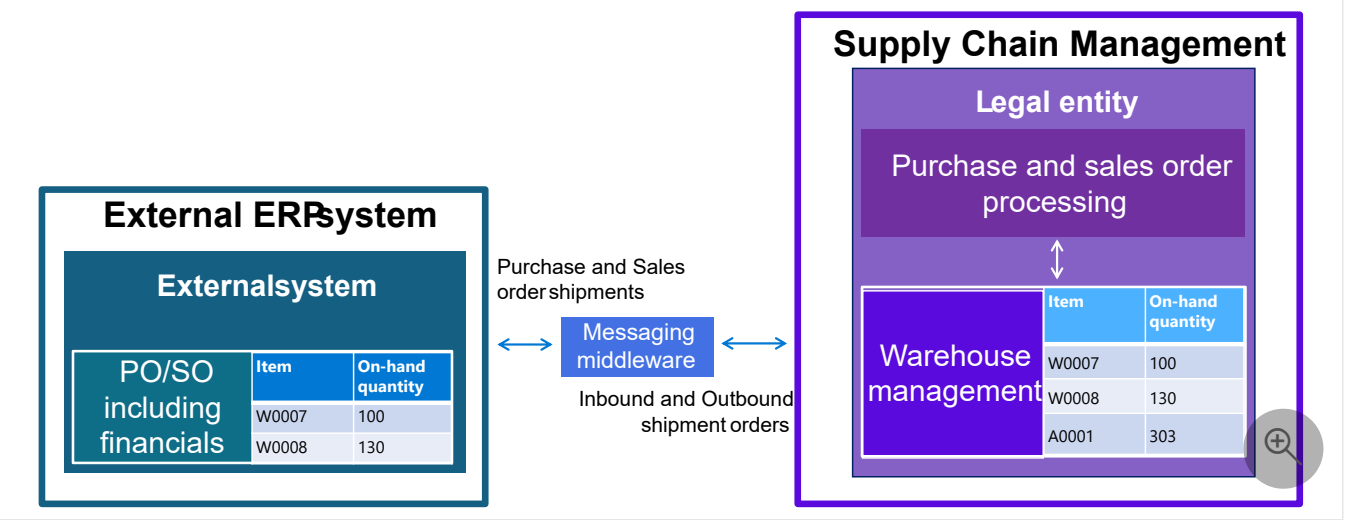
The following high-level diagram shows an example where a system uses a separate Supply Chain Management legal entity to manage warehouse management processes for other legal entities. As part of this management, it tracks the ownership of shared items by using an owner inventory dimension.



For a more detailed description of this process and the related processes, see Warehouse management only mode with external shared warehouse.

Handle logistic warehouse processes for both internal and external integrations

The following high-level diagram shows an example where a system uses Supply Chain Management to handle warehousing, plus a wider range of processes (such as sales, purchase, and production orders). At the same time, it also uses Supply Chain Management to handle warehouse operations for other ERP and order processing systems.



For this type of implementation, the same warehouse instance can handle all the logistic warehouse processes for both internal and external integrations.

Unsupported processes

The following high-level processes aren't supported out of the box when Warehouse management only mode is processed. The list is most relevant to existing customers who already run warehouse management processes and are considering adopting the *Warehouse management only mode* functionality.

Expand table

Process	Description
Inbound Warehouse Management mobile app flows	The Warehouse Management mobile app flows for inbound shipment orders don't support: • Goods in transit where the receiving process is handled against a container. • Sales return orders that support return reason codes and disposition codes as part of the flow for the **Return order receiving (and put away)** mobile device menu item. Instead, you must use the blind return process.
Production flows	Inbound and outbound shipment orders don't support production order, batch order, or kanban processing, including material consumption and reporting as finished via the Warehouse Management mobile app. In addition, you can't use cross-docking from production orders to outbound docks in combination with inbound and outbound shipment orders.
Transportation management processes	The transportation management engines that are currently supported for purchase order loads aren't supported for the inbound shipment order processes. Note that charges can't be assigned, and direct invoicing can't be processed, for either inbound shipment orders or outbound shipment orders. Therefore, the apportionment weight engine can't be used to generate freight bills.

Process	Description
Creation of orders from the warehouse app	The process of creating outbound shipment orders from the Warehouse Management mobile app isn't supported. (That process resembles the *Create transfer order from license plates* process for mobile devices.)
Internal order processing information that's provided to external systems	When you're using the supported orders in Supply Chain Management (such as transfer, sales, purchase, and production orders), all the related business process data is automatically maintained in Supply Chain Management. However, no business events or related inbound and outbound on-hand information is provided to external systems for these types of processes. For example, if you create a transfer order, ship inventory out of one warehouse, and receive it in another warehouse in Supply Chain Management, you can't use the method that's described for inbound and outbound shipment orders to inform the external systems about the operations. You must instead use a different method, such as Warehouse inventory update logs.
Order-committed reservations as part of the *allow reservation on demand order* capability	• In Supply Chain Management version 10.0.46 and later, *order-committed reservations* are fully supported as part of the *allow reservation on demand order* capability. • In Supply Chain Management version 10.0.45 and earlier, *outbound shipment order line* transaction reservations don't support reservations on inventory dimensions below the location in the reservation hierarchy. However, these reservations are supported for *sales order line* transactions.
Items enabled for catch weight processing	Items that are enabled for catch weight processing aren't supported for inbound or outbound shipping orders.
Policies and processes around vendor or customer accounts	Representations of vendors and customers aren't used for inbound or outbound shipping orders. Therefore, you can't use related order processing policies with this type of setup. For example, you can't use customer-specific or vendor-specific product filters or nonconformance management.
Order line registration and pick update processing	Inbound and outbound shipment order lines don't support the manual registration and un-registration processes that are supported by other types of order lines (such as purchase, sales, and transfer order lines).

Warehouse management only mode with external ERP systems

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

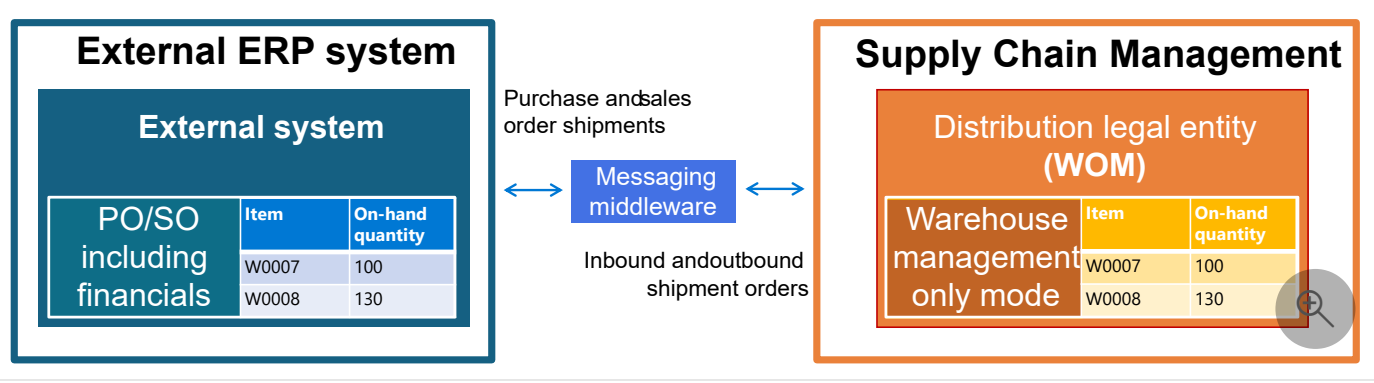
This article explains how to perform day-to-day warehousing tasks when you use Warehouse only mode to integrate with an external enterprise resource planning (ERP) system.

There are numerous ways to use Warehouse management only mode. For example, you can enable Microsoft Dynamics 365 Supply Chain Management to handle logistics operations, and then connect warehouses to external ERP systems that do all the order and financial processing.

In addition, the warehouse management processes can use an owner inventory dimension to track the ownership of inventory for items that are shared across source systems.

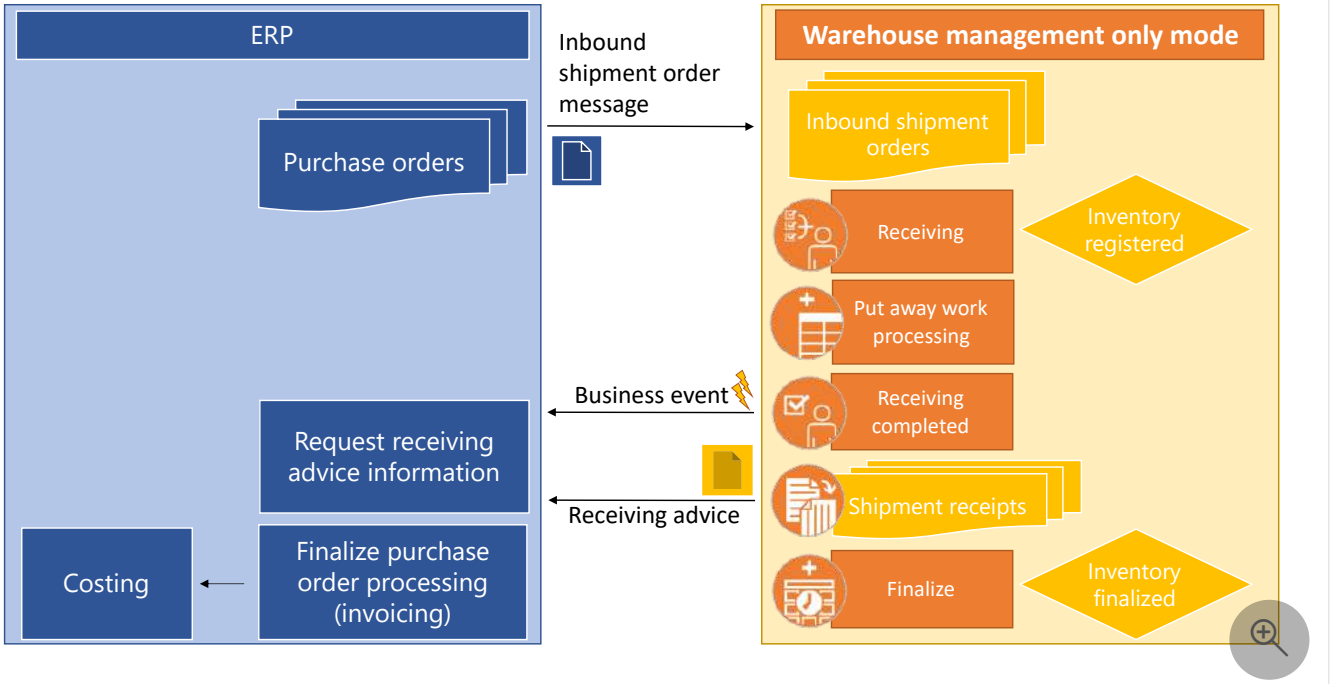
High-level implementation example

The following illustration shows an example where Warehouse management only mode (WOM) is running in the *WOM* Supply Chain Management legal entity. This legal entity handles logistics warehouse operations for an external ERP system that manages order and financial processing.



Inbound process example (external ERP system integration)

The following illustration highlights the elements of the inbound process.



Here's a high-level description of the inbound process. Steps that start with *ERP* are done by the ERP system. Steps that start with *WOM* are done by Supply Chain Management in Warehouse management only mode.

1. *ERP:* An external system submits an inbound shipment order message to Supply Chain Management.

2. *WOM:* Supply Chain Management processes the message in Warehouse management only mode and creates orders.

3. *WOM:* Inbound loads are created in one of four ways, as established by the Source systems settings in Supply Chain Management:

    - Manually, by using the Inbound load planning workbench
    - By importing advanced shipping notices (ASNs)
    - Automatically during message processing
    - Automatically during the Warehouse Management mobile app receiving process

4. *WOM:* Warehouse workers use the Warehouse Management mobile app to *register* the inbound shipment transactions.

5. *WOM:* Supply Chain Management runs receiving completed processes that are related to each relevant load. These processes update the load status to *Received*, generate shipment

receipts, and trigger *business events* for the external systems.

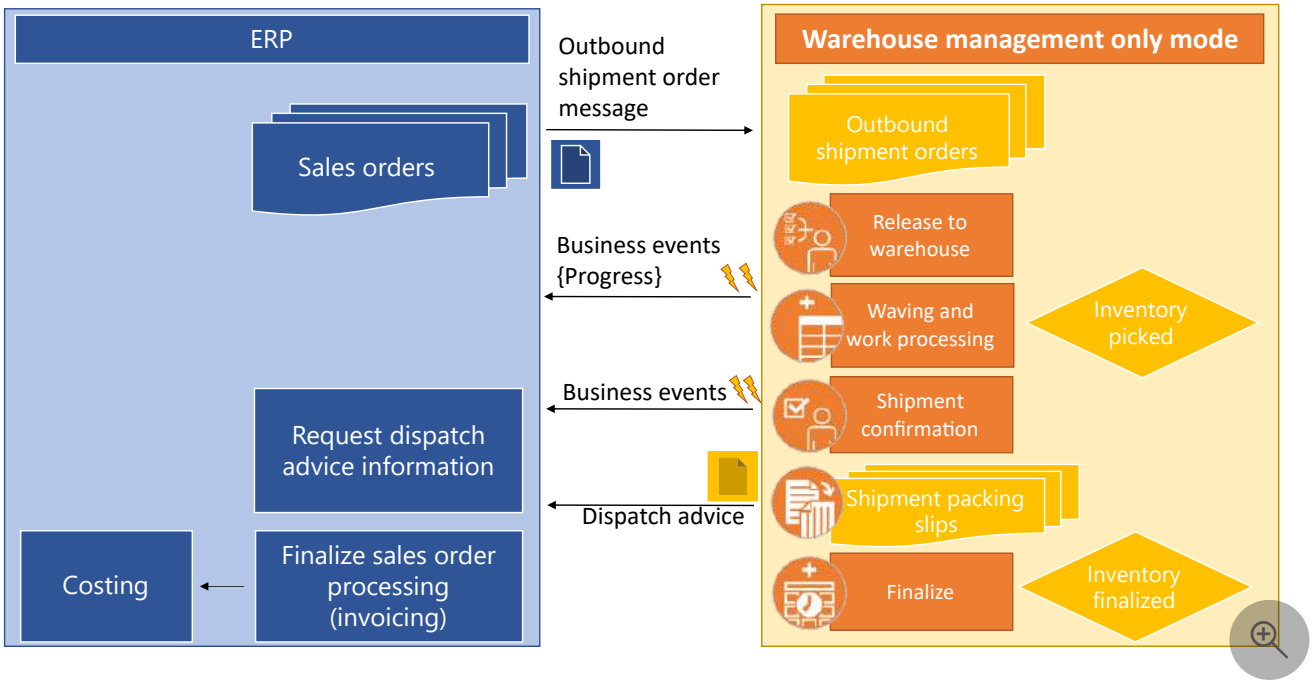
6. *ERP:* The external system reads and uses the shipment receipt data for further processing. For example, if purchase orders are associated with the inbound shipment orders in the external system, this processing involves purchase order invoicing.

7. *WOM:* Supply Chain Management finalizes the inbound shipment orders by running the *Post shipment receipts* batch job.

For a more detailed description of this process and the related processes, see Work with warehouse management only mode in Supply Chain Management.

Outbound process example (external ERP system integration)

The following illustration highlights the elements of the outbound process.



Here's a high-level description of the outbound process. Steps that start with *ERP* are done by the ERP system. Steps that start with *WOM* are done by Supply Chain Management in Warehouse management only mode.

1. *ERP:* An external system submits an outbound shipment order message.

2. *WOM:* Supply Chain Management processes the message in Warehouse management only mode and creates orders.

3. *WOM:* Inventory reservations are created in one of two ways, as established by the Source systems settings in Supply Chain Management:

    - Automatically by the message processor
    - Manually, as part of the release process

4. *WOM:* The orders are released for further warehouse processing, either manually or automatically (via the *Automatic release of outbound shipment orders* batch job).

5. *WOM:* Depending on the setup of your wave template definitions, warehouse work might be created and released immediately.

6. *WOM:* The outbound warehouse work is processed, and the status of the related outbound shipment order line transactions is updated to *Picked*.

7. *WOM:* The loads are outbound ship confirmed. As a result, *business events* and a *shipment packing slip* are created for the external system.

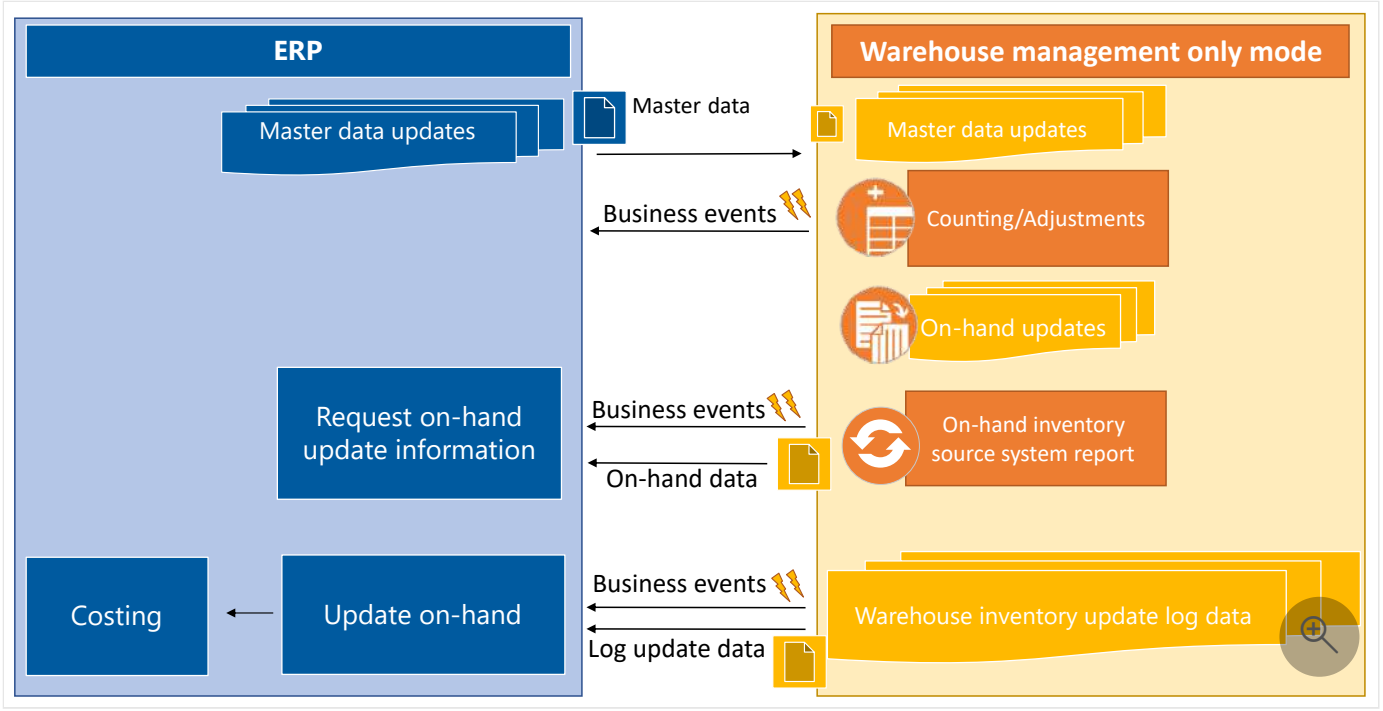
8. *ERP:* The external system reads the shipment packing slip and uses its data for further processing (such as sales order invoicing for sales orders that are associated with outbound shipment orders).

9. *WOM:* Supply Chain Management finalizes the outbound shipment order by running the *Post shipment packing slips* batch job.

For a more detailed description of this process and the related processes, see Work with warehouse management only mode in Supply Chain Management.

On-hand inventory updates between systems

The following illustration shows the internal processes that are used for Warehouse management only mode.



The Warehouse management module uses the counting journal to support multiple on-hand inventory update processes. For more information about the counting process, see Cycle counting.

As part of the journal posting process, Supply Chain Management triggers a business event. External systems can read about the updates through the counting journal entities. It's important to act only on the updated quantities. Otherwise, the systems can go out of sync because of the updates. The following scenario provides an example.

Example scenario: Updating on-hand inventory between systems

At the start of this scenario, on-hand information about item number A0001 is in sync between the external ERP system (ERP) and the Supply Chain Management warehouse management system (WMS), as the following table shows.

Expand table

Item number	ERP on-hand	WMS on-hand
A0001	0 pcs	0 pcs

The following subsections show how different events cause these values to change.

On-hand update 1

Supply Chain Management receives 10 pcs of item number A0001 against an inbound shipment order without running *receiving completed* processing. Therefore, the external system isn't yet informed about this update. As a result, the external system and Supply Chain Management are now out of sync, as the following table shows.

Expand table

Item number	ERP on-hand	WMS on-hand
A0001	0 pcs	10 pcs

On-hand update 2

In Supply Chain Management, an on-hand adjustment (counting journal) that's posted for item A0001 adds 1 pcs of on-hand inventory. The following table shows the result.

Expand table

Item number	ERP on-hand	WMS on-hand
A0001	0 pcs	11 pcs

A business event informs the external system about the on-hand adjustment. As part of this process, the journal posting changes from 10 pcs to 11 pcs in Supply Chain Management. The external system considers only the updated quantity of 1 pcs. The following table shows the result.

Expand table

Item number	ERP on-hand	WMS on-hand
A0001	1 pcs	11 pcs

On-hand update 3

Supply Chain Management runs a *receiving completed* process that's related to the received 10 pcs of item number A0001. Therefore, the external system is informed via a business event. It then reads the shipment receipt information and updates its on-hand quantity with an additional 10 pcs. The following table shows the result.

Expand table

Item number	ERP on-hand	WMS on-hand
A0001	11 pcs	11 pcs

> **Note**
>
> Make sure that each of your items is assigned to an item model group that's configured as described in Master and reference data. In this way, you don't have to configure inventory postings and fiscal calendars when you make adjustments by using the counting journal.

On-hand inventory reconciliation

Warehouse management only mode generates data for an on-hand inventory reconciliation process when you generate a **Create source system on-hand inventory** report (**Warehouse management** > **Inquiries and reports** > **Physical inventory reconciliation** > **Create source system on-hand inventory report**).

To create the header and line data, specify **Source system** and **As of date** values. You must also select the level of inventory dimensions that the report should be generated for.

When inventory that's related to inbound shipment orders is received, on-hand inventory is physically updated based on the status of the registered inventory transactions. When inventory is shipped via outbound shipment orders, the physical on-hand inventory is reduced based on the *Picked* inventory transactions. This physical inventory on-hand representation of the registered and picked items remains until the related *Shipment receipt* and *Shipment packing slip* journals are posted as part of the background finalization processes. To include this part of the physical on-hand inventory in the export, be sure to enable the **Include Registered and Picked inventory quantities** parameter.

The external system is informed about the available data via the `WHSSourceSystemInventoryOnhandReportBusinessEvent` business event. It can read the data via the `WarehouseInventoryOnhandReports` and `WarehouseInventoryOnhandReportLines` data entities.

> **Note**
>
> If you run the **Create source system on-hand inventory** report as a recurring batch job, the **As of date** value is ignored, and data is generated based on the current processing date. For example, you set up the recurrence so that it has a **Start date** value of yesterday, and you set

the job to run once per day. In this case, every day, the batch job automatically generates on-hand inventory data for the previous day.

Warehouse inventory update logs

For integrations that require very quick on-hand inventory synchronization processes, use the Warehouse inventory update log (**Warehouse management** > **Inquiries and reports** > **Physical inventory reconciliation** > **Warehouse inventory update log**). This log can collect all the inventory transaction updates that lead to on-hand updates that are of interest for the external systems. For example, you might have an external system that handles information about inventory status changes.

To keep the external systems updated about inventory transaction updates that are related to inbound and outbound shipment orders, set the **Enable warehouse inventory update logs** option to *Yes* for the relevant source systems, for both inbound and outbound shipment orders.

To view the update log, go to **Warehouse management** > **Inquiries and reports** > **Physical inventory reconciliation** > **Warehouse inventory update log**.

> **Important**
>
> When the **Enable warehouse inventory update logs** option is enabled, be sure to uptake the updates in the external systems in such a way that they don't cause double updates in combination with the data that's used as part of the ***Shipment receipts*** and ***Shipment packing slips*** messages.

By default, the *Publish warehouse inventory update log updates* background process runs every 10 minutes. It creates data that external systems can consume by using the `WarehouseInventoryUpdateLogs` entity. The `WHSInventoryUpdateLogBusinessEvent` business event can be used as part of this process.

Warehouse inventory owner

Warehouse management processes can use an owner inventory dimension to track the ownership of inventory for items shared across multiple source systems.

To use the owner inventory dimension, products must have a tracking dimension group where the *Owner* dimension is enabled. You must also create a record on the **Warehouse inventory**

owner page (**Warehouse management** > **Setup** > **Warehouse management integration** > **Warehouse inventory owner**).

> **Important**
>
> The *Warehouse inventory owner* configuration must contain a mapping for every *Owner* value that a source system sends in the order line. If a mapping is missing, the order message fails to process. This requirement also applies when the source system sends an empty owner value. In such cases, the configuration must map the empty value from the source system to the appropriate value in the *WOM* Supply Chain Management legal entity system.

Last updated on 05/22/2026

Warehouse management only mode with external shared warehouses

09/17/2025

This article explains how to use Warehouse management only mode to support external shared warehouse processing. This approach allows warehouse management functionality to be consolidated into a separate legal entity that handles requests from multiple sales subsidiaries (legal entities) in Microsoft Dynamics 365 Supply Chain Management.

You can use Warehouse management only mode to handle logistics operations in a legal entity solely dedicated to warehousing operations. You can then connect warehouses between that legal entity and other legal entities that do all the order and financial processing. In addition, warehouse management processes can use an *owner* inventory dimension to track which legal entity owns the inventory for items that are shared across legal entities.

This feature works without modifications in a single-instance deployment model. If you want to link between multiple instances, one of which handles logistics and warehouse processes, you must set up an integration process like the one described in Warehouse management only mode with external ERP system.

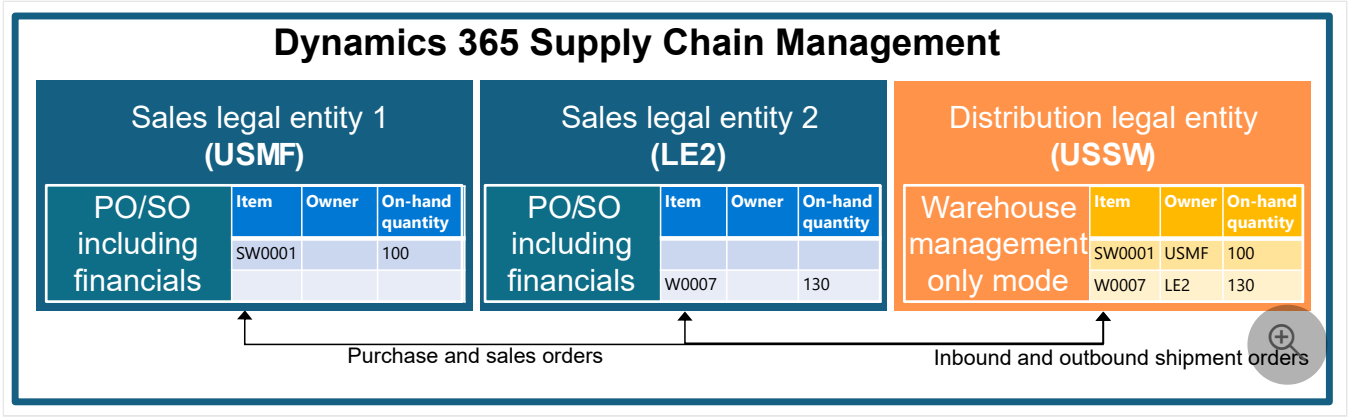
To use *Warehouse management only mode* in a multi-instance deployment, you must use the standard integration process.

The following articles provide detailed information about how *Warehouse management only mode* works:

- Warehouse management only mode with external ERP system
- Exchange data between systems
- Monitor and control message processor messages

High-level implementation example

The following illustration shows an example system where Warehouse management only mode is active with an external shared warehouse in the *USSW* legal entity. The *USSW* legal entity handles logistics warehouse operations for two sales subsidiaries that manage order and financial processing in the *USMF* and *LE2* legal entities.



The *USMF* and *USSW* legal entities are included in the standard demo data. The *LE2* legal entity shown in the illustration is just an example.

The scenarios described in this article use sample records and values from the demo data. To follow along, ensure your system has the standard demo data installed. Otherwise, substitute the sample values with your own configuration settings.

Warehouse management only mode demo data

The standard demo data includes the following data to support scenarios involving *Warehouse management only mode with external shared warehouses*:

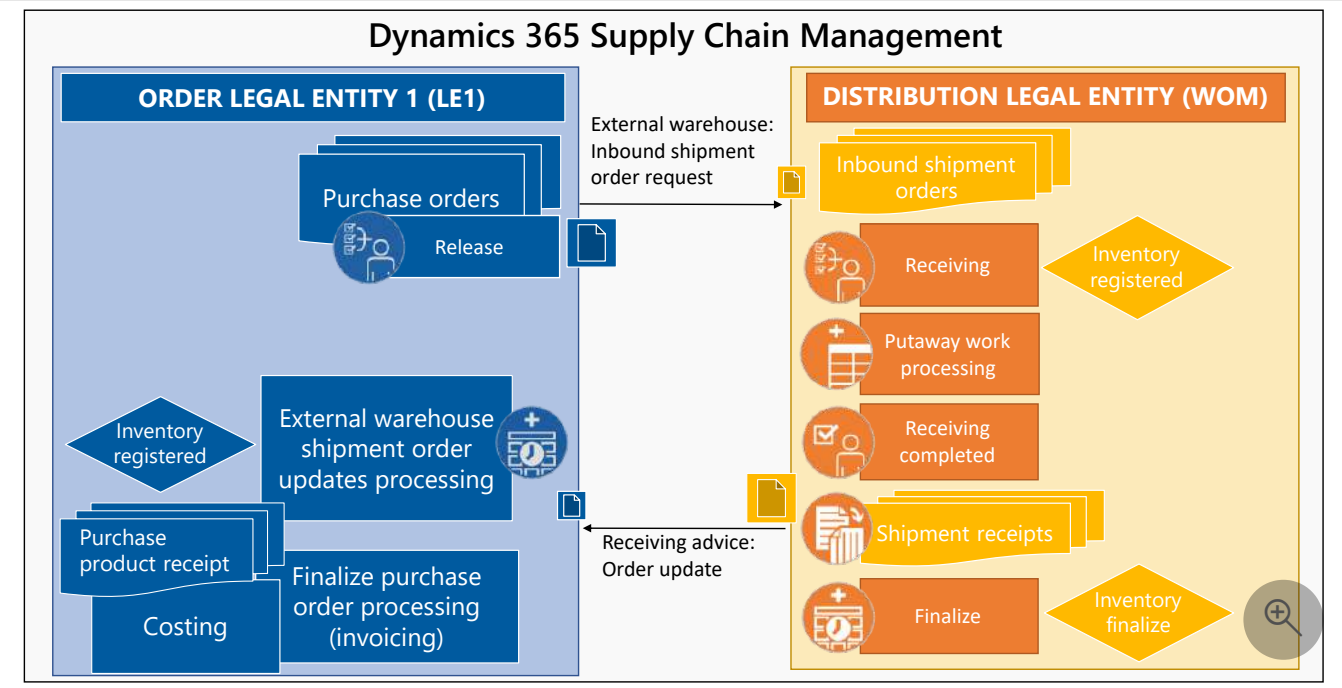
- The legal entity *USSW*, which is set up with a site *1* and warehouse *SW-11*.
- Work templates and location directives for inbound and outbound shipment orders.
- The source system *Product Information Management (PIM)*
- The source system *Contoso Entertainment System USA (USMF)*
- The item *SW0001*, which is released to both the *USMF* and the *USSW* legal entities.
  - In the *USSW* legal entity, the *SW0001* item uses the *Non-valuated* item model group and has the *Owner* tracking dimension enabled.
- Warehouse *2-EXT* in the *USMF* legal entity is marked as an external warehouse that is mapped to warehouse *SW-11* in the *USSW* legal entity.

Other demo data is also included to support the scenarios. The previous list just highlights the most important elements.

> **Important**
>
> The demo data for these scenarios is only available in Supply Chain Management version 10.0.45 and later.

Inbound process example (shared warehouse)

The following illustration highlights the elements of the inbound process when you use a shared warehouse.



Here's a high-level description of the inbound process. Steps that start with *USMF* are done by a sales subsidiary. Steps that start with *USSW* are done by the warehousing entity.

1. *USMF:* Purchase orders are created and released to the warehouse. The system then creates *external warehouse inbound shipment order requests*. As a result, inbound shipment order messages are delivered to the *USSW* legal entity. Purchase orders that are released to the externally managed warehouse can be processed via a periodic background process. (This background process is set up at **Warehouse management** > **Periodic tasks** > **Create external warehouse inbound shipment order requests**.) Alternatively, they can be manually processed by using the **Release to warehouse** option on the purchase orders page.
2. *USSW:* The warehousing entity processes the inbound shipment order messages. As a result of this processing, *inbound shipment orders* are created.
3. *USSW:* Inbound loads are created manually, automatically, or through import (depending on your configuration).
4. *USSW:* Warehouse workers use the Warehouse Management mobile app to register the inbound shipment order transactions.
5. *USSW:* The warehousing entity processes receiving completed operations for the related loads. These operations update the load status to *Received* and generate *external warehouse inbound shipment order updates* for *USMF*. You can turn on automatic message processing for the *External warehouse shipment order updates* message queue.
6. *USMF:* During the processing of the external warehouse inbound shipment order updates, inbound loads and shipments are created, and the related purchase order line

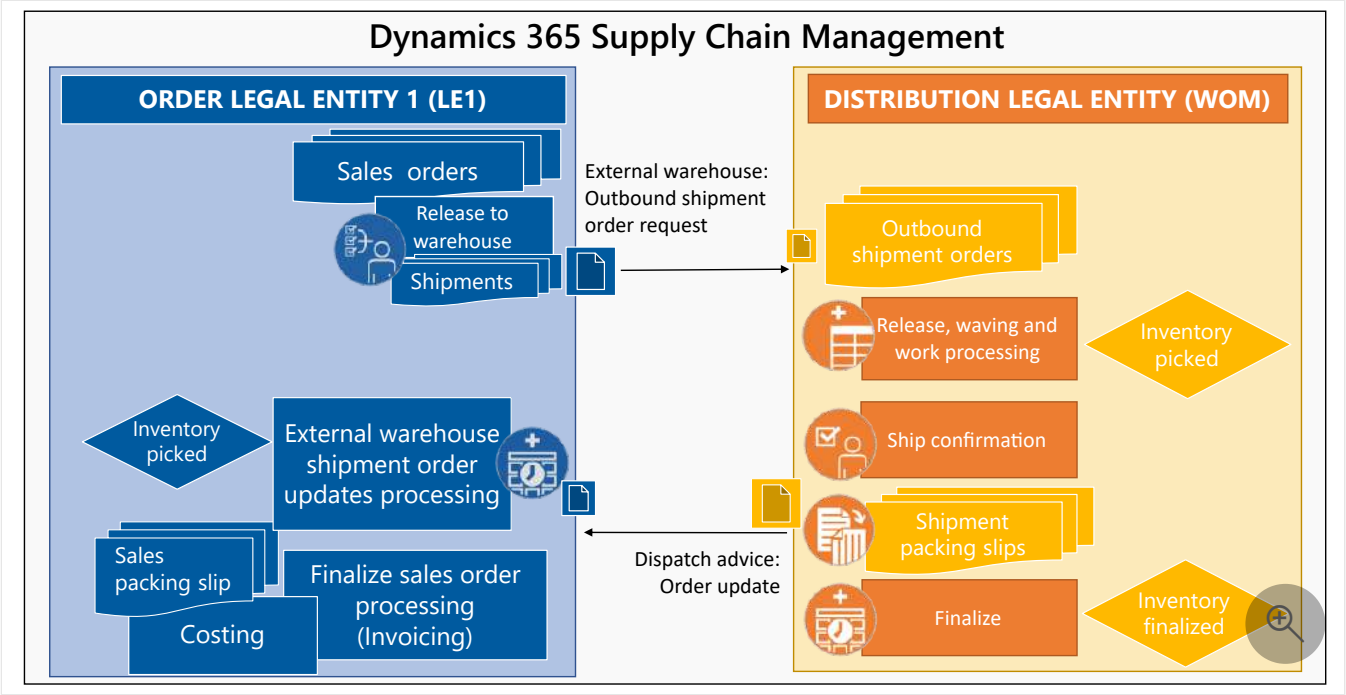
transactions are updated to *Registered*. This status update allows further processing of product receipts and invoices.

7. *USSW:* The warehousing entity finalizes the inbound shipment order line transactions by running the *Post shipment receipts* batch job.

For a more detailed description of this process and the related processes, go to Work with warehouse management only mode in Supply Chain Management.

Outbound example process (shared warehouse)

The following illustration highlights the elements of the outbound process when you use a shared warehouse.



Here's a high-level description of the outbound process. Steps that start with *USMF* are done by a sales subsidiary. Steps that start with *USSW* are done by the warehousing entity.

1. *USMF:* Sales orders are created and released to the warehouse. The system then creates *external warehouse outbound shipment order requests*. As a result, outbound shipment order messages are delivered to the *USSW* legal entity.
2. *USSW:* The *Outbound shipment order messages* are processed. As a result of this processing, *outbound shipment orders* are created.
3. *USSW:* Inventory reservations are created either manually or automatically (depending on your configuration).
4. *USSW:* The orders are released for further warehouse processing, either manually or automatically. If you use outbound load planning processes, you can create loads by using the Outbound load planning workbench before you release the orders.

5. *USSW:* Depending on the setup of your wave template definitions, warehouse work might be created and released immediately.
6. *USSW:* Outbound warehouse work is processed, and the status of the related outbound shipment order line transactions is updated to *Picked*.
7. *USSW:* The loads are outbound ship confirmed. As a result, external warehouse outbound shipment order updates are generated for *USMF*.
8. *USMF:* During the processing of the external warehouse outbound shipment order updates, outbound shipment data and the related sales order line transactions are updated. The transactions become *Picked*. This update allows further processing of the packing slip and invoice. You can turn on automatic message processing for the *External warehouse shipment order updates* message queue.
9. *USSW:* The warehousing entity finalizes the outbound shipment order line transactions by running the *Post shipment packing slips* batch job.

For a more detailed description of this process and the related processes, go to Work with warehouse management only mode in Supply Chain Management.

> **Important**
>
> For the preceding flow, the **Allow load split during ship confirm** option for outbound loads isn't supported in the *USSW* legal entity. Likewise, planned cross-docking information isn't automatically transferred from the sales subsidiary legal entities to the *Warehouse management only mode* process.

> **Note**
>
> When you release orders or loads to the warehouse in the *USMF* legal entity, the shipments that are created are locked with **Outbound shipment processing ownership** set to *External* until order data from the *USSW* legal entity is returned. If order data isn't returned, or if other issues occur, you can get update rights for the shipments by selecting the **Claim processing ownership** action on the shipments. Only admin roles should be granted permission to use this action.

Transfer orders (shared warehouse)

Transfer orders with external shared warehousing mean that either the source, destination, or both warehouses in a transfer order are external. Most aspects of the transfer order processing work in the same way, regardless of whether you use external shared warehouses.

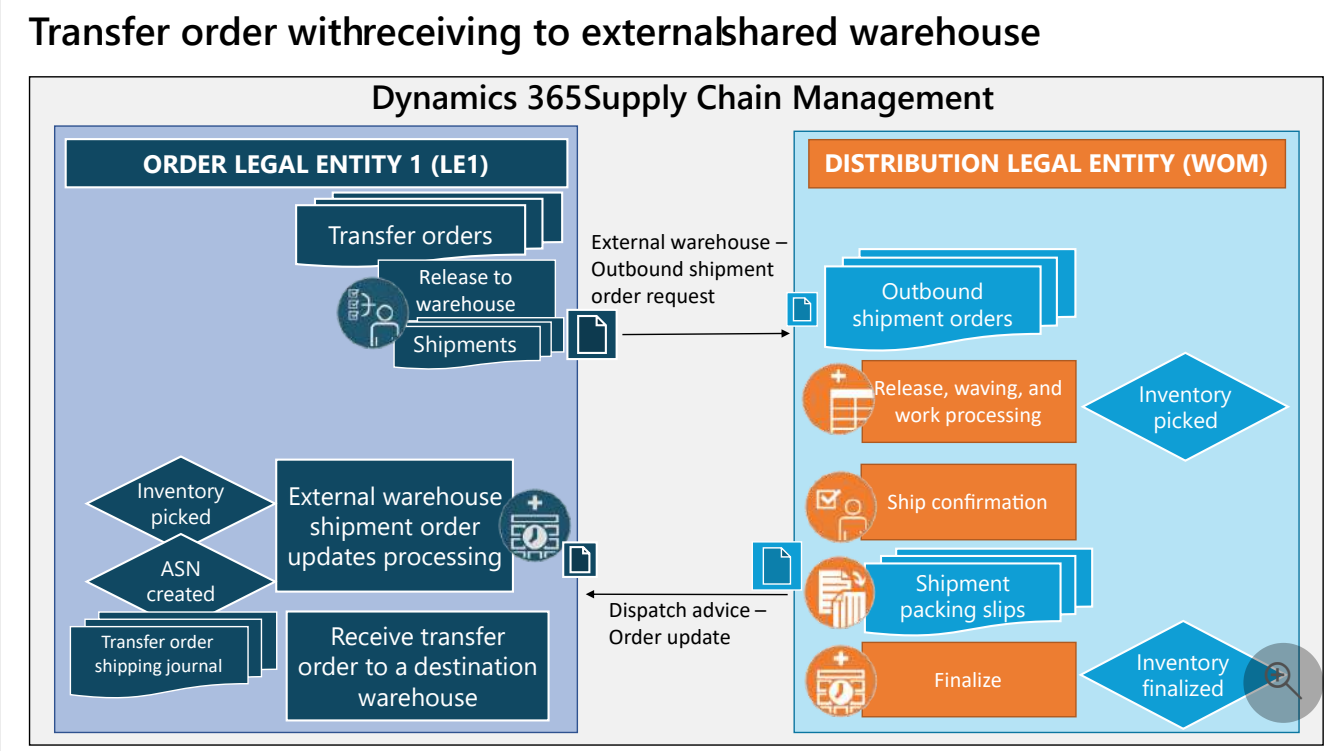
Prerequisites

Before you can use this feature, your system must meet the following requirements:

- You must be running Supply Chain Management version 10.0.44 or later.
- In the warehouse configuration of the externally managed warehouse, you must set both a *default location* and a *default license plate location*. This location is used as a temporary location when processing a transfer order. When shipping from an external warehouse, the system sends an update to communicate what was shipped and what license plate was used. Inventory is then moved from a *default location* to a *default license plate location* and the transfer order is processed against that location.

Transfer order shipped from an external warehouse

The following illustration highlights the elements of the transfer order process when shipping from an external warehouse.



Here's a high-level description of the process. Steps that start with *USMF* are done by a sales subsidiary. Steps that start with *USSW* are done by the warehousing entity.

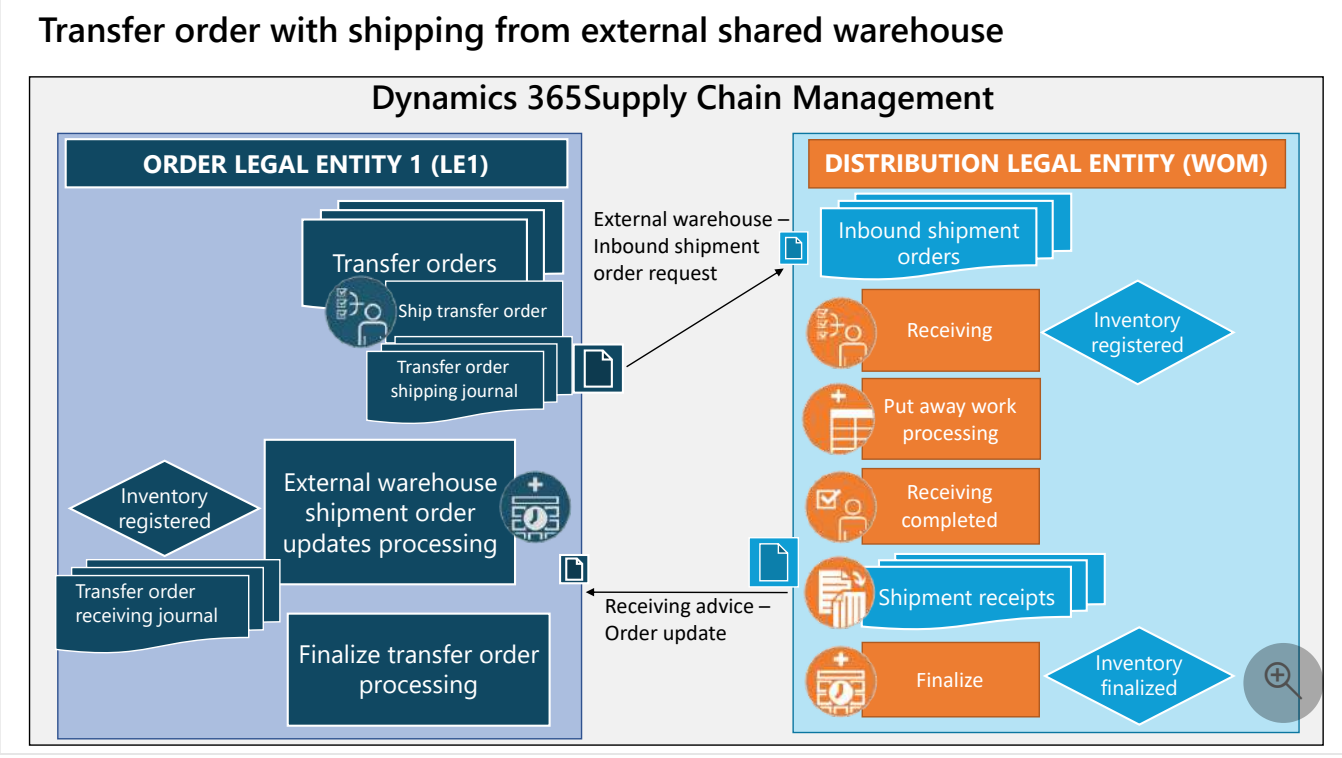
1. *USMF:* The transfer order is created and released to the warehouse. The system then creates *external warehouse outbound shipment order requests*. As a result, outbound shipment order messages are delivered to the *USSW* legal entity.
2. *USSW:* The *Outbound shipment order messages* are processed. As a result of this processing, *outbound shipment orders* are created.

3. *USSW:* The orders are released for further warehouse processing, either manually or automatically. The rest of the process proceeds as described in Outbound example process (shared warehouse).
4. *USSW:* The loads are outbound ship confirmed. As a result, external warehouse outbound shipment order updates are generated for *USMF*.
5. *USMF:* As the external warehouse outbound shipment order updates are processed, the system updates outbound shipment data and the related transfer order transactions. The transfer order becomes *Shipped* if everything from the order is shipped. This update allows further processing of the transfer order when received at the destination warehouse.

> **Note**
>
> When the outbound shipment order update is processed in *USMF*, an inbound advance shipment notice (ASN) is created for every license plate that was shipped from the external warehouse. This allows for license plate receiving in the destination warehouse.

Transfer order received at an external warehouse

The following illustration highlights the elements of the transfer order process when receiving at an external warehouse.



Here's a high-level description of the process. Steps that start with *USMF* are done by a sales subsidiary. Steps that start with *USSW* are done by the warehousing entity.

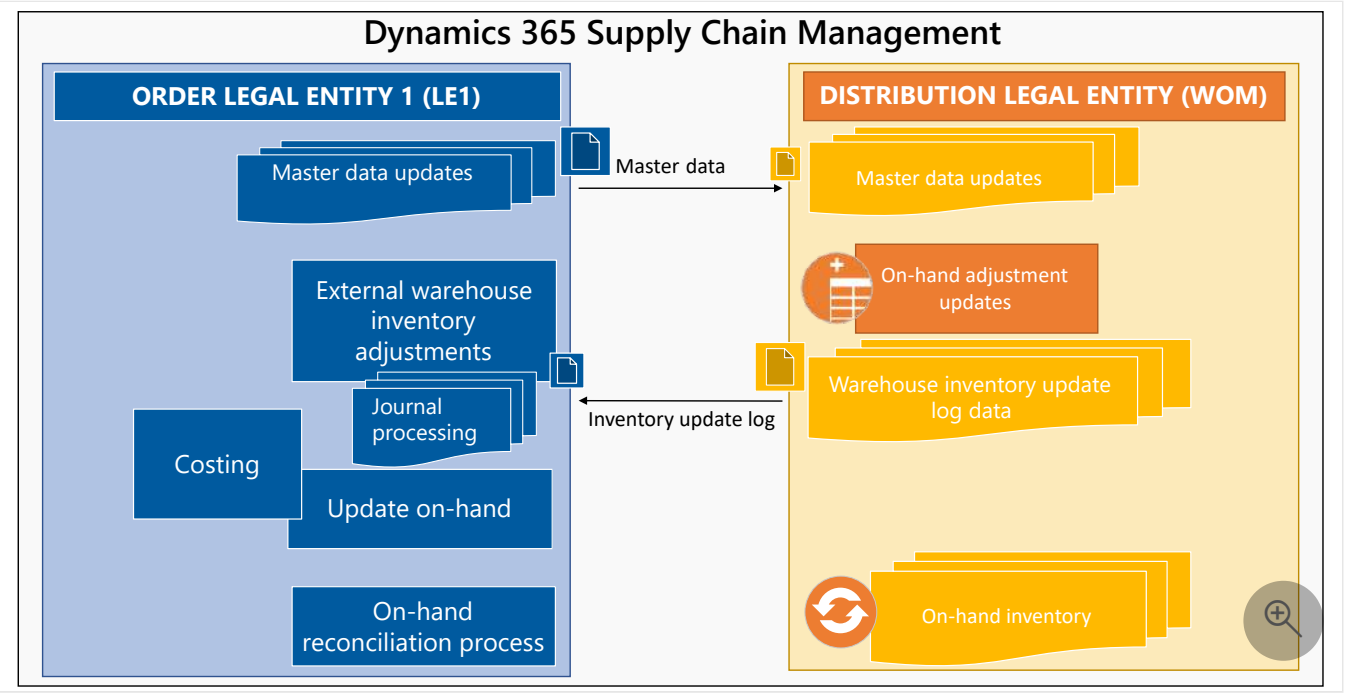
1. *USMF:* The transfer order is created and released to the warehouse. The transfer order is shipped and the system creates a *transfer order shipping journal*. The system then creates *external warehouse inbound shipment order requests* from the shipping journal. As a result, inbound shipment order messages are delivered to the *USSW* legal entity.
2. *USSW:* The warehousing entity processes the inbound shipment order messages. As a result of this processing, *inbound shipment orders* are created.
3. *USSW:* Inbound loads are created manually, automatically, or through import (depending on your configuration). The rest of the processing in the *USSW* proceeds as described in Inbound example process (shared warehouse).
4. *USSW:* The warehousing entity processes receiving completed operations for the related loads. These operations update the load status to *Received* and generate *external warehouse inbound shipment order updates* for *USMF*.
5. *USMF:* As the external warehouse inbound shipment order updates are processed, the system creates inbound loads and shipments, and updates the related transfer order line transactions. If everything from the transfer order is received, the transfer order moves to the *Received* status.

Transfer order with shipping from and receiving to an external warehouse

It's possible to have both source and destination warehouses set as external. This scenario works the same as the previous two scenarios combined.

On-hand adjustments

The following illustration shows how on-hand inventory adjustments are handled when Warehouse management only mode is run.



Changes in on-hand inventory that are the result of inbound and outbound shipment orders are handled when *Receive external warehouse inbound shipment order update* and *Receive external warehouse outbound shipment order update* operations are processed through the message processor in the *USMF* legal entity. However, other warehouse movements, such as warehouse counting operations, must also ensure that on-hand inventory is the same between the *USSW* legal entity and any related order processing legal entities, such as *USMF*. Therefore, Warehouse management only mode can record the changes in warehouse inventory in the warehouse inventory update log (**Warehouse management** > **Inquiries and reports** > **Physical inventory reconciliation** > **Warehouse inventory update log**). This data is used to automatically create external inventory adjustments for the relevant legal entities via the *Publish warehouse inventory update log updates* process automation background process. (By default, this background process runs every 10 minutes.)

You can use the *Create external inventory adjustment journals* process (**Warehouse management** > **Periodic tasks** > **Create external inventory adjustment journals**) to generate the inventory adjustment journals that are used to update the on-hand inventory. In this way, you can keep inventory information synced between the two legal entities.

To automatically post the inventory adjustment journals, go to **Warehouse management** > **Periodic tasks** > **Post external inventory adjustment journals**. This process posts the journals that the *Create external inventory adjustment journals* process creates.

Warehouse inventory update logs

The Warehouse inventory update log (**Warehouse management** > **Inquiries and reports** > **Physical inventory reconciliation** > **Warehouse inventory update log**) collects all the inventory

transaction updates that lead to on-hand updates that are of interest for the related legal entities. For example, you might want to handle information about inventory status changes.

> **Tip**
>
> For example, if you want to adjust the inventory in the warehouse only mode legal entity without affecting the order legal entity or causing duplicate adjustments through the warehouse inventory log update process, you can use an Inventory journal name with the *Exclude from warehouse inventory update logs* setting turned on. This prevents the journal posting from being logged.

> **Important**
>
> For source systems that are related to external warehouse management systems, keep the **Enable warehouse inventory update logs** option turned off for inbound and outbound shipment orders. In this way, you prevent inventory adjustment journal processing from updating your on-hand inventory in the sales subsidiary legal entities.

Example setup that uses external shared warehouse processing in Supply Chain Management

This section provides an example that shows how to set up and use Warehouse management only mode with external shared warehouse processing in Supply Chain Management.

Legal entities and source systems

To use Warehouse management only mode as described in this article, you must have at least two legal entities. For this example, the two legal entities are named as *USMF* and *USSW*.

In the *USSW* legal entity, you must create a source system to handle shipment orders and the inventory on-hand update processes. For this example, this source system is named *SS-USMF*.

> **Important**
>
> When you use Warehouse management only mode with external shared warehouses, your source system must be set up to use an outbound shipment processing policy that has

its **Enforce shipment to order matching** option set to *Yes*. The behavior of this setting varies slightly based on the version of Supply Chain Management you're using.

- Supply Chain Management version 10.0.46 and later – When you confirm a shipment, the policy instructs the system to update the delivery remainder on the source order line to reflect the quantity that was actually shipped. If you later reverse the shipment the shipment, the delivery remainder is restored to the original ordered quantity.
- Supply Chain Management version 10.0.45 and earlier – If the shipped quantity differs from the ordered quantity, you must manually update the delivery remainder to match the shipped quantity before you confirm the shipment. Otherwise, the update fails on the *USMF* legal entity.

In the *USMF* legal entity, you must set up an external warehouse management system of the *Legal entity* type and link it to the *SS-USMF* source system in the *USSW* legal entity. You can complete this setup by going to **Warehouse management** > **Setup** > **Warehouse management integration** > **External warehouse management systems**.

In the *USMF* legal entity, you can now go to **Warehouse management** > **Setup** > **Warehouse** > **Warehouses** and select the warehouses that you want to handle externally. Specify the external warehouse management system and the external warehouse name from the *USSW* legal entity. You should select a default location that doesn't use license plates. This location is used for all inventory changes from the external warehouses in the *USMF* legal entity.

> **Note**
>
> The **Use warehouse management processes** option must be turned on for the warehouses in both legal entities.

Product master and reference data

Warehouse management must be fully set up in all legal entities that run warehouse management processes (such as *USSW*). This setup includes product master data. The same products and product variants can be used for the released products in all legal entities. In this case, you must use a separate source system as the source for managing product master data. If you share products among multiple sales subsidiaries or legal entities, you must create the necessary source system item data. For example, you might create a source system named *PIM-D365* and assign it as the *product master source system* for the *SS-USMF* source system.

You must also ensure that the products have a tracking dimension group where the *Owner* dimension is enabled. In this way, the ownership of the inventory can be tracked for each of the related legal entities. For this example setup, you don't have to enable the *Owner* tracking dimension for the released product in the *USMF* legal entity. However, if you enable it, the legal entity owner dimension value is automatically assigned to the purchase and sales order lines, and you can't change it.

You can find more details about the product master data in Master and reference data. However, be sure to use the *Non-valuated* inventory model for the products in the *USSW* legal entity. In addition, be sure to enable the *Owner* inventory tracking dimension.

> **Note**
>
> The products must be linked to a storage dimension group where the **Use warehouse management processes** option is turned on.

To use the *Owner* dimension, you must create a record on the **Warehouse inventory owner** page (**Warehouse management** > **Setup** > **Warehouse management integration** > **Warehouse inventory owner**). Learn more in Warehouse inventory owner.

If you use this example setup in an environment where you already have some released products, ensure that you create the data for the released products and variants on the **Source system items** page.

> **Tip**
>
> Set the **Product maintenance rule** value to *Maintain source system items* on the *PIM-D365* source system in the *USSW* legal entity. In this way, the source system item data is automatically created for you when you release products to the *USSW* legal entity.

Exchange data between systems

Warehouse management only mode requires that you set up integration between external systems and the Microsoft Dynamics 365 Supply Chain Management system. The following categories of interactions are required:

- Master data (such as product information)
- Document data (such as purchase orders and sales orders)
- Progress data (such as receiving, dispatch, and on-hand inventory information)

You can use many different integration methodologies for these three categories. This article describes the recommended integration process.

Master and reference data

To keep communication consistent, both systems need to sync and have access to several types of master and reference data. One example is the product master data. You can import this type of data into Supply Chain Management by using the following messages that relate to product master data:

- `WHSSourceSystemProductMessageEntity` – Create products and released products, including product masters for variants.
- `WHSSourceSystemProductVariantMessageEntity` – Create variants for product masters where **ProductSubtype** = *ProductMaster*.
- `WHSSourceSystemProductSpecificUnitOfMeasureConversionMessageEntity` – Create product-specific unit-of-measure conversions.
- `WHSSourceSystemProductBarcodeMessageEntity` – Create the product bar code setup.
- `WHSSourceSystemProductGlobalTradeItemNumberMessageEntity` – Create the Global Trade Item Number (GTIN) for the products.
- `WHSSourceSystemProductDocumentAttachmentMessageEntity` – Attach product documents, product images, and so on.

> **Tip**
>
> When you import products, use **record templates** to include the **TemplateName** value in your messages. You can also make sure that the required reference fields for the released products are assigned.

Like shipment orders, the system validates these messages during message processing. The process automatically links the product information to a source system record through the *Source system items* entity. The external system can use business events to monitor how the status of messages changes during message processing.

You can mark only one source system record as the external system that maintains the product master data related to the unique reference for a released product or item number. Use the **Source system items** page to view and maintain this data.

> **Note**
>
> The message processor handles each message related to creating product master data separately, based on its `MessageId`. Some messages have dependencies, such as the requirement to create the released product before giving it a barcode. If you use number sequences instead of external item numbers for products, then `SourceSystemProductMessages` processes create new products when no released product or source system item data exists.

> **Tip**
>
> Use the **Source system item number** field during communication between the systems. It's useful when, for example, an external system uses a European Article Number (EAN) bar code as the unique identification number that's linked to an **Item/variant number** field that has a different value. The *Source system item number* data is automatically created when you use the previously listed messages.
>
> When you use the Warehouse Management mobile app, you can use the **Source system item number** value to look up the **Item/variant number** value that's used internally.

You can import the required master data into Supply Chain Management by using data entities. The following types of master and reference data are required to create the **Release product/Item number** value that's used in warehouse management processes:

- **Item model groups** – Each released product must be assigned to an item model group in Supply Chain Management. Therefore, at least one group must be available. The group can control business processes for batch-tracked items. The following settings are recommended for every item model group that's used with Warehouse management only mode. These settings eliminate the need to set up any costing data for the products.
  - **Inventory model** – Set this field to *Non-valuated*.
  - **Post physical inventory** – Turn off this option. You can select this option only if you've already set up at least one source system record.
  - **Post financial inventory** – Turn off this option. You can select this option only if you've already set up at least one source system record.
- **Item groups** – Use these groups to organize business processes, especially when you use product filter codes. No account setup is required when you use *Non-valuated* inventory model groups.
- **Storage dimension groups** – Enable the use of storage inventory dimensions such as sites, warehouses, locations, and license plates. Be sure to enable the **Use warehouse management processes** parameter.
- **Tracking dimension groups** – Enable the use of tracking inventory dimensions such as owner, batch, and serial numbers. Note that the *Owner* dimension value must equal the company that a warehouse is associated with. Learn more in Unsupported processes.
- **Reservation hierarchy** – Defines which dimensions are reserved during the outbound shipment order reservation process. Dimensions that are put below the *Location* dimension are controlled by the warehouse management processes.

- **Units** – Each quantity that a warehouse process handles must be associated with a unit. When multiple units (such as each, box, and pallet) are used for an item, define the *inventory unit* as the smallest unit for the item.
- **Unit sequence groups** – Define the sequence of units that can be used in warehouse operations. For more information about the required setup, see Unit of measure and stocking policies.

> **Note**
>
> The messages that create product master data use the ***product data entities***. You can use these entities by themselves, or you can use them to maintain product master data.

View and maintain source system product messages

In Warehouse management only mode, you can view, update, and create product messages. This capability lets you quickly test integrations during the implementation process. When an externally created message is in a *Failed* message state, you can update field values and assign the updated message back into the message queue. The original message is versioned and non-editable. To view and maintain the messages, go to one of the following pages:

- **Warehouse management** > **Source system products** > **Source system product messages**
- **Warehouse management** > **Source system products** > **Source system product variant messages**
- **Warehouse management** > **Source system products** > **Source system product barcode messages**
- **Warehouse management** > **Source system products** > **Source system product document attachment messages**
- **Warehouse management** > **Source system products** > **Source system product global trade item number messages**
- **Warehouse management** > **Source system products** > **Source system product specific unit of measure conversion messages**

The **Warehouse integration monitoring** workspace lets you track the number of source system product messages that are *Queued* and *Failed*.

> **Note**
>
> You can set each source system to either allow or prevent users from manually creating messages on the listed pages. Open the relevant source system record, and set the **Enable manual source system product message creation** option to *Yes* to allow manual messages or *No* to prevent them. Unlike messages that are imported via integration, manually created messages aren't versioned.

Source system inventory status mapping

When you use Warehouse management only mode with external shared warehouses, inventory statuses in your external source system might have different identifiers than the inventory

statuses that you set up in Supply Chain Management. The *source system inventory status mapping* feature lets you create a mapping between your internal inventory status values and the values that your source systems use. The system then automatically translates inventory status values during inbound and outbound shipment order processing, including when inventory status is applied during order registration.

This mapping works in a similar way to source system items. While source system items map item numbers between systems, inventory status mapping maps inventory status identifiers between systems.

Prerequisites

To use source system inventory status mapping, you must be running Supply Chain Management version 10.0.49 or later.

Set up inventory status mapping

To set up the mapping between source system inventory statuses and Supply Chain Management inventory statuses, follow these steps:

1. Do one of the following:
    - Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source system inventory statuses**.
    - Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**. Select the source system that you want to set up inventory status mapping for, and then select **Source system inventory statuses** on the Action Pane.
2. On the Action Pane, select **New** to create a new mapping record.
3. Set the following fields:
    - **Source system** – Select the source system that the mapping applies to.
    - **Inventory status** – Select the Supply Chain Management inventory status that this record maps to.
    - **Source system inventory status** – Enter the inventory status identifier that the external source system uses.
4. Repeat the previous steps for each inventory status that you need to map for each source system.

> **Note**
>
> Each combination of source system and inventory status must be unique. Likewise, each combination of source system and source system inventory status must be unique. This uniqueness ensures that the mapping can reliably convert values in both directions.

Import inventory status mapping by using data entities

You can import the inventory status mapping data by using the `WHSSourceSystemInventoryStatusEntity` data entity. Use the Data management framework to

import records in bulk. The entity exposes the following fields:

Expand table

Field	Description
`SourceSystemId`	The source system identifier.
`InventStatusId`	The Supply Chain Management inventory status ID.
`SourceSystemInventoryStatusId`	The inventory status identifier used by the external source system.

How the mapping is applied

The system applies inventory status mapping in the following scenarios:

- **Inbound shipment order updates** – When an external warehouse sends an update that includes an inventory status (for example, as part of a receiving completed operation), the system uses the mapping to convert the source system inventory status to the corresponding Supply Chain Management inventory status. The mapped value is then used to register the purchase order or transfer order line transaction. Learn more in Inventory status in inbound shipment order update registration.
- **Outbound shipment order updates** – When an external warehouse ships inventory and generates a packing slip, the transaction data that's sent to the source system includes inventory status information. The system converts the Supply Chain Management inventory status to the corresponding source system value in the update message.
- **Inbound and outbound shipment order requests** – When shipment order request data includes inventory status dimensions, the system converts between source system and Supply Chain Management values, depending on the direction of the message.

If the system doesn't find a mapping for a given inventory status value, it processes the message without applying an inventory status conversion.

Inventory status in inbound shipment order update registration

In Supply Chain Management version 10.0.49 and later, when an external warehouse sends an inbound shipment order update that includes inventory status information, the system applies that status during registration processing in the source system legal entity. This process means that the registered purchase order or transfer order line transaction uses the inventory status from the external warehouse update, rather than the inventory status that was originally specified on the order line.

This behavior is important in scenarios where the external warehouse assigns a different inventory status during receiving. For example, if a purchase order line has an inventory status of *Available*, but the external warehouse determines during inspection that the goods should be marked as *QualityInspection*, the inbound shipment order update from the external warehouse includes the *QualityInspection* status. When the update is processed, the system registers the purchase order line with the *QualityInspection* status (after applying source system inventory status mapping, if configured).

> **Important**

When using this feature with source system inventory status mapping, ensure that you configure all inventory statuses that the external warehouse might send back in updates in the mapping table. If the external warehouse sends an inventory status that isn't mapped, the system uses the value as-is without conversion.

The following example shows the end-to-end flow:

1. A purchase order line in the *USMF* legal entity has inventory status *Available*.
2. The order is released to the external warehouse (*USSW*) via an inbound shipment order request.
3. In *USSW*, warehouse workers receive the goods and assign inventory status *QualityInspection* during the receiving process.
4. Receiving is completed and an inbound shipment order update is sent back to *USMF*. The update includes inventory status *QualityInspection* (or its source system equivalent, if mapping is configured).
5. *USMF* processes the update. If source system inventory status mapping is configured, the system maps the source system status to the Supply Chain Management status. The purchase order line transaction is registered with the mapped inventory status.

> **Note**
>
> The inventory status field is visible on the **External warehouse inbound shipment order request** and **External warehouse outbound shipment order request** pages when the source system inventory status mapping feature is enabled. The `WHSShipmentReceiptTransactionInventoryDimensionV2Entity` and `WHSShipmentPackingSlipTransactionInventoryDimensionV2Entity` entities also expose the **SourceSystemInventoryStatus** field, which shows the mapped source system inventory status value.

Consigner and consignee information

To make it easier to set up your warehouse operation, create and use data for *consigners* and *consignees* and their related group definitions. For example, use this approach for a process that's related to setting up a quality order creation process for a specific consigner or consigner group.

Neither the *Inbound shipment order policies* (which are part of the **Source systems** setup) nor inbound shipment order message processing requires that the fields for the **Consigner's account number** value exist in the entity for the **Consigners** page (**Warehouse management** > **Setup** > **Warehouse management integration** > **Consigners**). The same "free text" concept exists for the outbound shipment order process that's related to the **Consigner's account number** value.

Country/region

To create a new legal entity for your warehouses and import outbound shipment orders, you must define **country/region** values in Supply Chain Management. Use these records in outbound shipment orders to create addresses. Depending on your address setup and the way that you use address fields in order messages, you might have to create additional data before you can import order messages (for example, to support state/province and county combinations).

Inbound and outbound shipment order messages

Use inbound and outbound shipment order messages to inform Supply Chain Management about which physical inventory to receive and ship. These messages include both header data and lines data.

- `WHSInboundShipmentOrderMessageEntity` – Create inbound shipment order header.
- `WHSInboundShipmentOrderLineMessageEntity` – Create inbound shipment order lines.
- `WHSOutboundShipmentOrderMessageEntity` – Create outbound shipment order header.
- `WHSOutboundShipmentOrderLineMessageEntity` – Create outbound shipment order lines.

> **Note**
>
> - You can update an inbound or outbound shipment order by submitting a message that includes a matching order number and source system in the header data.
> - You can delete an inbound or outbound shipment order by submitting a message that includes a matching order number and source system in the header data and omits all line data.

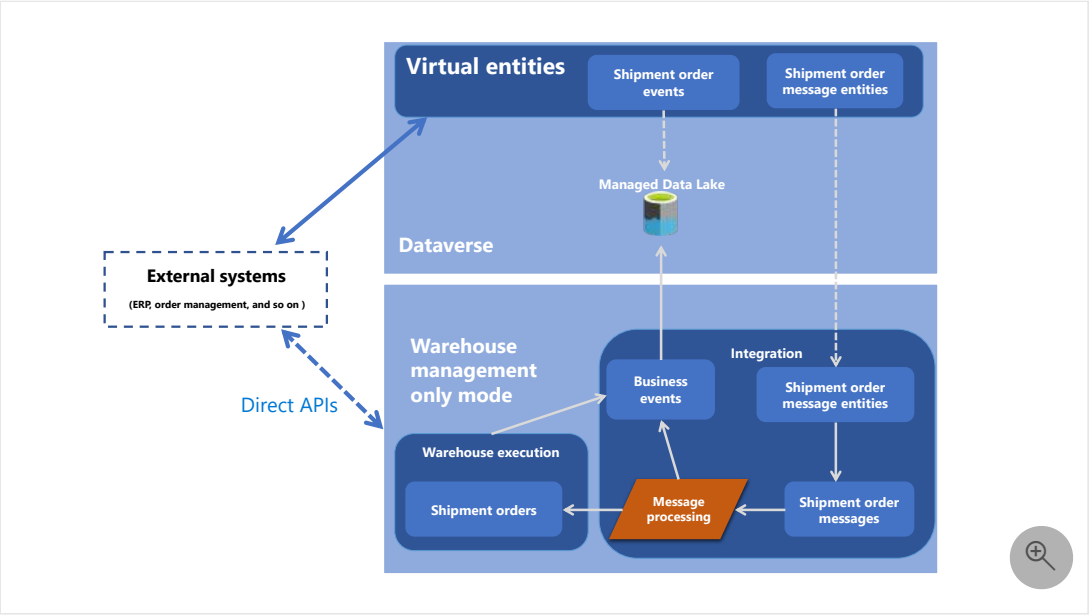
Messages between systems are exchanged by using lightweight *inbound shipment order* and *outbound shipment order* documents. These documents eliminate the need to use several other types of documents that Supply Chain Management typically uses (such as sales orders, purchase orders, and transfer orders). Therefore, they have several benefits. For example, they simplify integration with enterprise resource planning (ERP) and order management systems. They also make Supply Chain Management warehouse management functionality available to a wide range of external ERP and order management systems.

You can exchange inbound and outbound shipment order messages by using Dataverse. Alternatively, you can exchange these messages through Open Data Protocol (OData) by using shipment order message entities. You can also use the Data management import process. For example, you can use the *Inbound shipment order messages composite entity* (`WHSInboundShipmentOrderMessageCompositeEntity`) and *Outbound shipment order messages composite entity* (`WHSOutboundShipmentOrderMessageCompositeEntity`).

You can attach documents to inbound and outbound shipment order messages by using the *Inbound shipment order message document attachment entity* (`WHSInboundShipmentOrderMessageDocumentAttachmentEntity`) and *Outbound shipment order message document attachment entity* (`WHSOutboundShipmentOrderMessageDocumentAttachmentEntity`).

Supply Chain Management queues the incoming documents and then processes them by using the message processor. This approach ensures consistent data between the systems, both for master data (such as products) and order progress status. Therefore, Supply Chain Management inbound and outbound shipment orders are prevented from creating or updating nonvalid or unsupported order data. Process the messages as part of a periodic batch job that the message processor triggers by using the *Shipment orders* message queue.

The following illustration shows how the message processor fits into an integrated system.



Progress data and business events

External systems can send many different business process requests to the warehouse management system. For example, each external system can continuously check for the progress of a sales order. To support this process, you can set up Supply Chain Management to deliver business events as required. Business events keep external systems informed about the progress and actions that are occurring in Supply Chain Management. When you set up this process, the external systems don't have to continue to check for information that might not have changed since the last request. Instead, they can react only when they're informed.

Warehouse integrations support several out-of-the-box business events. The following table lists some of them.

Some business events don't include all journal details directly. In these cases, the event contains only the journal ID. You can use this ID to retrieve the full information through related data entities listed in the following table.

Expand table

Business event ID	Description	Data entities
`WHSSourceSystemProductMessageChangedStatusBusinessEvent`	Source system product message changed status	
`InventCountingJournalPostedBusinessEvent`	Counting journal posted	`InventInventoryCountingJournalHeaderEntity` `InventInventoryCountingJournalHeaderLineEnti` `InventInventoryCountingJournalNameEntity`
`WHSSourceSystemInventoryOnhandReportBusinessEvent`	Source system on-hand inventory report created	`WHSInventoryOnhandReportEntity` `WHSSourceSystemInventoryOnhandReportLineEnti`

Business event ID	Description	Data entities
`WHSInventoryUpdateLogBusinessEvent`	Warehouse inventory update log updated	`WHSSourceSystemItemInventoryUpdateLogEntity`
`WHSOutboundNotificationCreatedBusinessEvent`	Outbound warehouse notification created	`WHSOutboundNotificationEntity` `WHSOutboundShipmentNotificationEntity` `WHSOutboundShipmentLineNotificationEntity`
`WHSShipmentOrderMessageChangedStatusBusinessEvent`	Shipment order message status updated	
`WHSShipmentPackingSlipJournalModifiedBusinessEvent`	Shipment packing slip updated	`WHSShipmentPackingSlipJournalHeaderEntity` `WHSShipmentPackingSlipJournalLineEntity` `WHSShipmentPackingSlipTransactionInventoryDi`
`WHSShipmentPackingSlipJournalFailedBusinessEvent`	Shipment packing slips update failed	
`WHSShipmentReceivingJournalModifiedBusinessEvent`	Shipment receipts updated	`WHSShipmentReceiptJournalHeaderEntity` `WHSShipmentReceiptJournalLineEntity` `WHSShipmentReceiptTransactionInventoryDimens` (Supply Chain Management version 10.0.45 and `WHSShipmentReceiptTransactionInventoryDimens` (Supply Chain Management version 10.0.46 and
`WHSShipmentReceivingJournalFailedBusinessEvent`	Shipment receipts update failed	
`SysMessageProcessorMessageProcessedBusinessEvent`	Message processor message failed	
`WhsWaveExecutedBusinessEvent`	Wave executed	
`WHSQualityOrderValidatedBusinessEvent`	Quality order validated	
`WHSEWInboundShipmentOrderRequestCreatedBusinessEvent`	Inbound shipment order request created (can be used to integrate Supply Chain Management with another warehouse management system)	`WHSEWInboundShipmentOrderRequestEntity`, `WHSEWInboundShipmentOrderLineRequestEntity` `WHSEWInboundShipmentOrderRequestStatusEntity`
`WHSEWOutboundShipmentOrderRequestCreatedBusinessEvent`	Outbound shipment	`WHSEWOutboundShipmentOrderRequestEntity` `WHSEWOutboundShipmentOrderLineRequestEntity`

Business event ID	Description	Data entities
	order request created (can be used to integrate Supply Chain Management with another warehouse management system)	`WHSEWOutboundShipmentOrderRequestStatusEntit`
`WHSEWInboundShipmentOrderUpdateChangedStatusBusinessEvent`	Inbound shipment order update is being processed and has therefore changed status (can be used to integrate Supply Chain Management with another warehouse management system)	
`WHSEWOutboundShipmentOrderUpdateChangedStatusBusinessEvent`	Outbound shipment order update is being processed and has therefore changed status (can be used to integrate Supply Chain Management with another warehouse management system)	

At a minimum, use the following business events for integration with an external ERP system:

- `InventCountingJournalPostedBusinessEvent` – Announces that an on-hand inventory adjustment occurred and indicates where detailed information about the update can be found.
- `WHSSourceSystemInventoryOnhandReportBusinessEvent` – Announces that an on-hand inventory report was generated and indicates where detailed information about the update can be found.
- `WHSShipmentPackingSlipJournalModifiedBusinessEvent` – Announces that an outbound shipment confirmation process occurred and indicates where the detailed dispatch advice

data can be found. This data can be used for a sales invoicing process, for example.

- `WHSShipmentReceivingJournalModifiedBusinessEvent` – Announces that an inbound receiving completion process occurred and indicates where the detailed receiving advice data can be found. This data can be used for a purchase order invoicing process, for example.

On-hand adjustments

When you integrate an ERP system and a warehouse management system, keep on-hand inventory data aligned. Several processes can help maintain this alignment as part of the Warehouse management only mode implementation approach. For more information about how the inventory on-hand update process works, see On-hand inventory updates between systems.

Warehouse management only mode with external shared warehouses

You can set up an integration between Supply Chain Management and an external warehouse management system. To enable this integration, use external warehouse shipment order requests and updates for communication between the systems. Learn more in Warehouse management only mode with external shared warehouses.

Inbound and outbound shipment order requests

Use external warehouse inbound and outbound shipment order requests to import orders from Supply Chain Management into your warehouse management system. When you release an order to the warehouse, the system creates a business event with a request ID. Use this ID to retrieve full details through related data entities.

Expand table

Business event ID	Description	Data entities

`WHSEWInboundShipmentOrderRequestCreatedBusinessEvent`	Inbound shipment order request created	`WHSEWInboundShipmentOrderRequestEntity`
		`WHSEWInboundShipmentOrderLineRequestEntity`
		`WHSEWInboundShipmentOrderRequestStatusEntity`

`WHSEWOutboundShipmentOrderRequestCreatedBusinessEvent`	Outbound shipment order request created	`WHSEWOutboundShipmentOrderRequestEntity`
		`WHSEWOutboundShipmentOrderLineRequestEntity`
		`WHSEWOutboundShipmentOrderRequestStatusEntity`

Inbound and outbound shipment order updates

Use external warehouse inbound and outbound shipment order updates to send shipment updates from your warehouse management system to Supply Chain Management. The message processor handles these updates in the same way as inbound and outbound shipment order messages.

- `WHSEWInboundShipmentOrderUpdateEntity`
- `WHSEWInboundShipmentOrderLineUpdateEntity`

- `WHSEWInboundShipmentOrderLineInventDimUpdateEntity`
- `WHSEWOutboundShipmentOrderUpdateEntity`
- `WHSEWOutboundShipmentOrderLineUpdateEntity`
- `WHSEWOutboundShipmentOrderLineInventDimUpdateEntity`

Unannounced sales returns from another warehouse management system

If your warehouse management system receives an unannounced sales return, it must update the Supply Chain Management system accordingly. To achieve this goal, send an external warehouse inbound shipment order update message to the Supply Chain Management system. Ensure that you include all required details and entities so the return update can be processed correctly.

- `WHSEWInboundShipmentOrderUpdateEntity`
  - Set the value of the `InboundShipmentOrderOriginLinkType` field to *1*, which represents the `ExternalOrigin` enum value of the `WHSInboundShipmentOrderOriginLinkType` enum.
- `WHSEWInboundShipmentOrderLineUpdateEntity`
- `WHSEWInboundShipmentOrderLineInventDimUpdateEntity`
- `WHSEWInboundShipmentOrderExternalOriginEntity`
  - This entity provides additional required information.
  - The value of the `InboundShipmentOrderExternalOriginId` field must match the `InboundShipmentOrderOriginId` field on the `WHSEWInboundShipmentOrderUpdateEntity` entity. You can choose and maintain this ID.
  - Set the `ExternalWarehouseManagementSystemId` field to the external warehouse management system ID configured in your Supply Chain Management system.

Last updated on 07/23/2026

Enable and configure Warehouse management only mode

This article explains how to configure Warehouse management only mode by setting up source systems, master data, and business events.

Turn on Warehouse management only mode

To use the Warehouse management only mode capability, your system must meet the following requirements:

- You're running Microsoft Dynamics 365 Supply Chain Management version 10.0.36 or later.
- The feature named *Warehouse management only mode* is turned on in feature management. As of Supply Chain Management version 10.0.47, this feature is mandatory and can't be turned off.

Configure your source systems

Use the **Source systems** page to set up each external system that you want to use Warehouse management only mode to integrate with. To use Warehouse management only mode, you must have at least one record on this page. To set up a source system, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**.

2. Follow one of these steps:

    - To create a new record, select **New** on the Action Pane.
    - To edit an existing record, select it in the list pane, and then select **Edit** on the Action Pane.
    - To delete an existing record, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected record, enter a name for the source system. The source system must include this name in each message that it sends to Supply Chain Management, and the name in the message must exactly match the value that you specify here.

4. Configure other settings as required to control the shipment order import processes. Tooltip help is provided for each field. Hover your mouse pointer over a field's label to view the tooltip.

5. If you use Warehouse management only mode with external shared warehouses, then on the **Outbound shipment orders** FastTab, you must select an **Outbound shipment processing policy** that has its **Enforce shipment to order matching** option set to *Yes*. Learn more in Outbound shipment processing policies.

6. (Optional) If your external source system uses different inventory statuses than Supply Chain Management, select **Source system inventory statuses** on the Action Pane to set up the mapping. Learn more in Source system inventory status mapping.

7. (Optional) Warehouse management processes (WMS) can use an *Owner* inventory dimension to track the ownership of inventory for items shared across multiple source systems. To use the owner inventory dimension, products must have a tracking dimension group where the *Owner* dimension is enabled, and you must also create a *Warehouse inventory owner* configuration that contains a mapping for every *Owner* value that a source system sends in an order line. If a mapping is missing, the order message fails to process. This requirement also applies when the source system sends an empty owner value. In such cases, the configuration must map the empty value from the source system to the appropriate value in the *WOM* Supply Chain Management legal entity system. To create a warehouse inventory owner configuration, select **Warehouse inventory owners** on the Action Pane. Learn more in Product master and reference data.

8. If another source system maintains the product master data, specify that source system in the **Product master source system** field. To view and manually maintain the product master data mapping integration, select **Source system items** on the Action Pane.

9. Use the **Source system items** FastTab to define how the product creation message processing must create the internal item numbers.

10. On the Action Pane, select **Save**.

> **Note**
>
> You can't find or search for the menu items that are related to Warehouse management only mode until you create at least one record on the **Source systems** page. In addition,

searching for pages requires that the current user's default company has a **Source system** record.

Background processes

As part of the Source system creation process, the system automatically creates the following automated background processes:

- **Process source system product messages** – Processes product master data messages. By default, the repeat interval is one minute.
- **Process shipment order messages** – Processes inbound and outbound shipment order messages. By default, the repeat interval is one minute.
- **Publish warehouse inventory update log updates** – Makes inventory update log data available to external systems via the `WarehouseInventoryUpdateLogs` entity. By default, the repeat interval is 10 minutes.
- **Post shipment packing slips** – Finalizes outbound shipment orders. By default, the repeat interval is 10 minutes if the **Shipment packing slips posting delay** value is set to one day.
- **Post shipment receipts** – Finalizes inbound shipment orders. By default, the repeat interval is 10 minutes if the **Shipment receipts posting delay** value is set to one day.

Prevent multiple owners in warehouse locations

If you're running warehouses that contain inventory from multiple owners, use the *prevent multiple owners* feature to ensure that all the items stored in a given warehouse location have the same owner. The feature prevents cross-mingling of inventory and allows each owner to have its own segregated storage space. Learn more in Prevent multiple owners in warehouse locations.

Set up automatic release of outbound shipment orders

Release to warehouse is the process of making inventory ready for dispatch processing. When you release an order to the warehouse, the system creates load lines and shipments. If automatic wave processing is set up, loads and required work are also created.

To automatically release outbound shipment orders to the warehouse, set up a batch job to process the orders on a regular basis. Go to **Warehouse management** > **Release to warehouse** > **Automatic release of outbound shipment orders** to set up and schedule the job.

For more information about the *release to warehouse* process, see Release to warehouse.

Set up number sequences

If the order numbers that the external system provides don't match the order numbers used in Supply Chain Management, set up number sequences for outbound shipment orders and inbound shipment orders. Define all the number sequences that are associated with the **Number sequences** page (**Warehouse management** > **Setup** > **Warehouse management parameters** > **Number sequences**). These number sequences include the following extra number sequences that are added for Warehouse Management only mode:

- *Outbound shipment order*
- *Inbound shipment order*
- *Shipment packing slip*
- *Shipment receipt*
- *Warehouse outbound notification ID*
- *Load line inventory pick*
- *Internal consigner's account number*
- *Internal consignee's account number*
- *External warehouse outbound shipment order origin ID*
- *External warehouse inbound shipment order origin*
- *External warehouse outbound shipment order update ID*
- *External warehouse inbound shipment order update*

> **Tip**
>
> You can quickly enable all number sequences by using the **Generate** option on the **Number sequences** page.

Set up mobile device menu items

To enable warehouse workers to use the Warehouse Management mobile app to register inbound shipment transactions, set up one or more mobile device menu items that use one of the following processes. Each of these processes requires an inbound load.

- *License plate receiving (and put away)*
- *Load item receiving (and put away)*
- *Mixed license plate receiving (and put away)*
- *Inbound shipment order line receiving*
- *Inbound shipment item receiving*

- *Inbound shipment order line receiving (and put away)*
- *Inbound shipment order item receiving (and put away)*

For more information, see Set up mobile devices for warehouse work.

Set up master data and business events

To enable Supply Chain Management to exchange meaningful information with an external system, sync some master and reference data between the two systems. This data includes released products, item model groups, and countries/regions. You must also set up business events to manage the exchange of information between the two systems. For more information, see Exchange data between systems.

Enable and configure unannounced returns in Warehouse management only mode

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set up Microsoft Dynamics 365 Supply Chain Management to handle unannounced returns when you use Warehouse management only mode. Most aspects of the unannounced returns process work in the same way, regardless of whether you use Warehouse management only mode. This article highlights the differences. Learn more about the unannounced returns process and how to set it up in Receive unannounced sales returns.

Prerequisites

Before you can use the features that are described in this article, your system must meet the following requirements:

- You must be running Supply Chain Management version 10.0.41 or later.

Set up source systems

To use Warehouse management only mode, you must have at least one *source system*. Each source system record configures the way that a specific external system integrates with Supply Chain Management in Warehouse management only mode.

In Configure your source systems, you can find general information about how to set up source systems so that they can be used with Warehouse management only mode. The following procedure highlights the settings that are important for unannounced returns.

1. Go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**.
2. In the list pane, select the source system that you want to set up. Alternatively, create a new source system

3. On the **Inbound shipment orders** FastTab, set the following fields to configure the options for unannounced returns:

    - **Enable returns process** – Set this option to *Yes*.
    - **Number sequence code** – Select the number sequence that should be used to generate order numbers for inbound shipment orders that are created during the returns process.
    - **Return order type** – Enter the name that identifies the document type for return orders in the source system. To find the value, consult your external system's documentation.

    > **Important**
    >
    > If your source system is Dynamics 365 Supply Chain Management (as is the case when you run an external shared warehouse scenario), you must set the **Return order type** field to *Return*, which is the return order type that is used in Supply Chain Management.

4. On the **Outbound shipment orders** FastTab, set the following fields to configure the options for unannounced returns:

    - **Outbound shipment processing policy** – Select a policy where the **Enforce shipment to order matching** option is set to *Yes*. Learn more in Outbound shipment processing policies.
    - **Enable return details creation** – If you use return details receiving, set this option to *Yes*. If you use only blind returns, you can save system resources by setting this option to *No*.

Set up return item receiving policies and mobile device menu items

To enable workers to process unannounced returns in the warehouse, you must set up mobile device menu items and return item receiving policies. The required settings are almost the same as the settings for receiving unannounced returns without Warehouse management only mode. This section points out the differences.

Return item receiving policies

Return item receiving policies enable each menu item to process the return correctly. You set them up by going to **Warehouse management** > **Setup** > **Mobile device** > **Return item**

receiving policies. Policies that are used with Warehouse management only mode must have the following settings:

- **Return process** – Select either *Blind return* or *Return details*, depending on the type of return that your menu item should process.
- **Create return order** – Select *Inbound shipment order*.
- **Return order identification** – This field is available only when the **Return process** field is set to *Blind return*. Select the type of extra identifying information that the system should return when it registers a return order with your external system:
  - *None* – The system doesn't return any extra identifying information, and the app doesn't prompt the worker to enter any additional information during receiving.
  - *Account number* – When Supply Chain Management registers a return with your external system, it returns an account number to help identify the return order. The way that you use this value depends on the needs of your external system. (See the documentation for your external system.) It's typically the ID of the customer who is returning the items (their customer account number). The mobile app prompts the worker to scan or enter this number during receiving.
- **Return order type** – This field is available only when the **Return order identification** field is set to *Account number*. Like the account number, the value in this field is returned to the source system when a return is registered with your external system. It's intended to hold the name that identifies the document type for return orders in the source system. The way that you use it depends on the needs of your external system. (See the documentation for your external system.) If you leave this field blank, the value is inherited from the relevant source system configuration.

> **ⓘ Important**
>
> If your source system is Dynamics 365 Supply Chain Management (as is the case when you run an external shared warehouse scenario), you must set the following values for your blind return policies:
>
> - **Return order identification** – Select *Account number*, and instruct workers to enter the customer ID (account number) when the mobile app prompts them during receiving.
> - **Return order type** – Enter *Return*, which is the return order type that is used in Supply Chain Management. (Alternatively, if *Return* is already specified as the default return order type for the source system, leave this field blank.)

Learn more in Create return item receiving policies.

Mobile device menu items

To create the mobile device menu items that you need, follow the instructions in Set up mobile device menu items to process unannounced returns. Be sure to configure each menu item so that it uses a return item receiving policy that was set up as described in the previous section.

Last updated on 09/10/2025

Work with Warehouse management only mode in Supply Chain Management

Article • 04/30/2024

This article explains how to use Warehouse only mode to perform day-to-day warehousing tasks.

Monitor the integration

To monitor the integration between the external systems or legal entities with Microsoft Dynamics 365 Supply Chain Management, go to **Warehouse management** > **Workspaces** > **Warehouse integration monitoring**. From the **Warehouse integration monitoring** page, you can perform the following tasks:

- Get an overview of integration messages.
- Go to pages that have related information and functionality, such as the **Message processor messages** page.

Maintain inbound shipment orders

To review and maintain your inbound shipment orders, go to **Warehouse management** > **Inbound shipment orders** > **Inbound shipment orders**. The documents that are listed on the **Inbound shipment orders** page provide information about the expected product receipts. The page provides a **Header** view and a **Lines** view of the available shipment orders as seen from Supply Chain Management. For each line, you can view detailed information about the receiving status, inventory transactions, and associated warehouse work. You can also view the receiving status on the order header and lines, and use it to follow the inbound progress of the orders.

The following **Receiving status** values are available:

- *Open* – No quantities have been fully received.
- *Partially received* – Some, but not all, quantities have been fully received.
- *Received* – All quantities have been fully received.

If you're already familiar with Supply Chain Management, you might recognize that this document resembles a simplified purchase order. However, inbound shipment orders don't make any financial postings for the general ledger.

> ⚠ **Warning**
>
> For inbound shipment order lines, you can select **Update line** > **Delivery remainder** to update expected order line transaction quantities. Make sure that you have the correct user role security privilege for this process, because this update (like message editing) allows for potential inconsistencies between the external systems and Supply Chain Management.

> ⓘ **Note**
>
> The internal inbound shipment order number must be unique. You can configure the system to use the external order numbers as internal numbers. In this way, you don't have to use a number sequence for the order. To ensure unique numbers across external systems, consider using the **Order number prefix/suffix** options.

Enable manual inbound shipment order creation

In addition to using entity messages to create inbound shipment orders, you can enable manual inbound shipment order creation for one or more source systems. Users can then create inbound shipment orders directly on the **Inbound shipment orders** page. To enable manual inbound shipment order creation, go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**, and set the **Enable manual inbound shipment order creation** option to *Yes* for the relevant source system. This setting activates the **New** button on the **Inbound shipment orders** page. For shipment orders that are created without message processing, the **Order type** field has the value *Manual order* instead of *Inbound shipment order*.

Maintain outbound shipment orders

To review and maintain documents that contain information about products that have been requested for dispatch, go to **Warehouse management** > **Outbound shipment orders** > **Outbound shipment orders**. The **Outbound shipment orders** page provides a **Header** view and a **Lines** view of the available shipment orders as seen from Supply Chain Management. For each line, you can view detailed information about the release status, shipment status, inventory transactions, and associated warehouse work. You can also view and edit the release status and shipment status on the order header, and use them to follow the outbound progress of the orders.

The following **Release status** values are available:

- *Open* – No quantities have been released to the warehouse.
- *Partially released* – Some, but not all, quantities have been released to the warehouse.
- *Released* – All quantities have been released to the warehouse.

The following **Shipment status** values are available:

- *Open* – No quantities have been shipped confirmed.
- *Partially shipped* – Some, but not all, quantities have been shipped confirmed.
- *Shipped* – All quantities have been shipped confirmed.

If you're already familiar with Supply Chain Management, you might recognize that this document resembles a simplified sales order that uses some of the same reservation and release to warehouse processes. Use the Source systems settings to control whether you want to automatically trigger reservations when documents are imported, and/or automatically reject shipment orders that can't be partly or fully reserved.

> ⚠ **Warning**
>
> For outbound shipment order lines, you can select **Update line** > **Delivery remainder** to update expected order line transaction quantities. Make sure that you have the correct user role security privilege for this process, because this update (like message editing) allows for potential inconsistencies between the external systems and Supply Chain Management.

> ⓘ **Note**
>
> The internal outbound shipment order number must be unique. You can configure the system to use the external order numbers as internal numbers. In this way, you don't have to use a **number sequence** for the order. To ensure unique numbers across external systems, consider using the **Order number prefix/suffix** options.

Enable manual outbound shipment order creation

In addition to using entity messages to create outbound shipment orders, you can enable manual outbound shipment order creation for one or more source systems. Users can then create inbound shipment orders directly on the **Outbound shipment orders** page. To enable manual outbound shipment order creation, go to **Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**, and

set the **Enable manual outbound shipment order creation** option to *Yes* for the relevant source system. This setting activates the **New** button on the **Inbound shipment orders** page. For shipment orders that are created without message processing, the **External order type** field has the value *Manual order* instead of *Outbound shipment order*.

Receiving completed process

The *receiving completed* process updates the load status to *Received* and generates shipment receipts. The shipment receipts then trigger a business event for the external systems.

Workers can manually trigger the *receiving completed* process from the load by using either the web client or the Warehouse Management mobile app. To enable workers to use the Warehouse Management mobile app, set up a **Receiving completed confirmation** mobile device menu item. You can add this menu item as part of a detour in the inbound receiving flows.

You can specify whether workers should capture a packing slip ID and date for each shipment that's associated with an inbound load. On the **Warehouse management parameters** page, on the **Loads** tab, in the **Capture receiving completed packing slip** field, select one of the following values to specify the system behavior:

- *Never* – Don't prompt for the packing slip ID and date.
- *Always* – Prompt for the packing slip ID and date, and allow the worker to proceed only after values they're specified.
- *Optional* – Prompt for the packing slip ID and date, but allow the worker to proceed without specifying them.

> **Note**
>
> Depending on your setup on the **Inbound shipment order policies** FastTab of the **Source systems** page (**Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**), inbound loads might be created in any of the following ways:
>
> - Automatically, when an inbound shipment order is imported
> - Automatically, when an ASN is imported
> - Via a manual process
> - As part of the Warehouse Management mobile app receiving process
> - As part of an *Order receiving completed* process, which creates loads for registered inventory transactions that aren't associated with a load. This

process is useful when the item arrival journal process is used. It can be triggered directly from an inbound shipment order or via the **Inbound shipment order receiving completed** background process.

When the system creates load data as a result of processing an inbound shipment order message, the delivery policy controls whether load quantities are adjusted to the received quantities, or whether the received quantities must match the load line quantities, as part of the *Receiving completed* process.

Shipment receipts

Go to **Warehouse management** > **Inbound shipment orders** > **Shipment receipts** to view the detailed line transactions that are related to received inventory. The data is version controlled, and you can follow the posting status on the header.

The header status is changed from *Ready for posting* to *Posted* as part of the *Post shipment receipts* process automation job. This job is automatically initialized as part of the Source systems setup. The Source systems setup also lets you schedule the batch job to ensure that the related inbound shipment order line transactions are moved to a finalized transaction state for the **Warehouse management** module.

To view all the background processes that you have running, go to **System administration** > **Setup** > **Process automations**.

> ⓘ **Note**
>
> You can reverse receiving confirmations only if the related inbound shipment order line transactions haven't yet been finalized.

> ⚠ **Warning**
>
> If you enable Warehouse management only mode and are already running a periodic *Update product receipts* batch job for loads that are associated with purchase orders, you probably have to update the query for the batch job to exclude inventory transaction updates for inbound shipment orders. To update the query, add the *Load details* entity, and specify a *NotExist* join to the *Loads* entity. Then add a range definition for the **Reference** field, where **Criteria** = *Inbound shipment order*.

External systems can be informed via business events when new data is available. They can read the data via the following data entities:

- `ShipmentReceiptJournalHeaders` – The shipment receipt header data.
- `ShipmentReceiptJournalLines` – The shipment receipt line data.
- `ShipmentReceiptTransactionDimensions` – The detailed shipment receipt line data.

Shipment packing slips

To view detailed line transactions that are related to shipped inventory, and to print a report, go to **Warehouse management** > **Outbound shipment orders** > **Shipment packing slips**, and select **Preview/Print**. To control the printed inventory dimension values, go to **Warehouse management** > **Setup** > **Warehouse management parameters**, and then, on the **Reports** tab, select an option for **Shipment packing slip**.

Shipment packing slip data is version controlled, and you can follow the posting status on the header. The **Posting status** value is changed from *Ready for posting* to *Posted* as part of the *Post shipment packing slips* process automation job. This job is automatically initialized as part of the Source systems setup. The Source systems setup also lets you schedule the batch job to ensure that related outbound shipment order line transactions are moved to a finalized transaction state for the **Warehouse management** module.

To view all the background processes that you have running, go to **System administration** > **Setup** > **Process automations**.

> **Note**
>
> If no language is defined for an order, the report uses the company-specific language settings.

External systems can be informed via business events when new data is available. They can read the data via the following data entities:

- `ShipmentPackingSlipJournalHeaders` – The shipment packing slip header data.
- `ShipmentPackingSlipJournalLines` – The shipment packing slip line data.
- `ShipmentPackingSlipTransactionDimensions` – The detailed shipment packing slip line data.

> **Note**

You can reverse the shipment confirmation only if the related outbound shipment order line transactions haven't yet been finalized.

View and maintain shipment order messages

In Warehouse management only mode, you can view, update, and create shipment order messages. Therefore, you can quickly test integrations during the implementation process. When an externally created message is in a *Failed* message state, you can update all field values except the order header and line numbers. Go to one of the following pages to view and maintain the messages:

- **Warehouse management** > **Inbound shipment orders** > **Inbound shipment order messages**
- **Warehouse management** > **Outbound shipment orders** > **Outbound shipment order messages**

To try out the process of creating inbound and outbound shipment orders via messages, set the **Enable manual outbound shipment order message creation** and **Enable manual inbound shipment order message creation** options to *Yes* for the relevant **Source system** record. You can then create shipment order messages directly on the **Outbound shipment order messages** and **Inbound shipment order messages** pages. In addition, you can follow the **Message origin** value, which can be *Manual entry* or *Integration*.

Use the **Processing status** field to monitor the progress of each shipment order message. The following **Processing status** values are available:

- *Receiving* – The message is in the process of being imported.
- *Received* – The message has been received and is in a *Queued* state in the message processor. It's now ready to be picked up for processing.
- *Accepted* – The message processor state is *Processed*. Therefore, a shipment order has been created.
- *Failed* – The message processor processed the message, but one or more errors occurred. You can create a copy of the message when you save it after you edit it.
- *Draft* – The message is a manually copied or created message that can be updated. To reprocess the message, move it into the *Queued* message state by selecting **Queue** on the Action Pane.
- *Canceled* – The message has been manually canceled.

Tip

Select **Show old versions** to follow manual message updates based on the value of the **Replaced by message** field.

> ⚠ **Warning**
>
> In a production environment, manually entered messages and field updates can cause data inconsistencies between the external source system and Supply Chain Management. For example, you might change an item number to a value that isn't known to the external system. This type of update will probably cause issues in progress information flows. The issues might even be impossible to correct in the external system. We recommend that you use user roles and security privileges to restrict access to this functionality to as few people as possible.

Example of using inbound and outbound shipment orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an example scenario that shows how to create inbound and outbound shipment orders via message processing. It uses the standard sample data that's associated with the *USMF* example legal entity (company).

How to test the creation process

To try out the creation process for inbound and outbound shipment orders via messages, set the **Enable manual outbound shipment order message creation** and **Enable manual inbound shipment order message creation** options to *Yes* for a **Source system** record. You can then create shipment order messages directly on the **Outbound shipment order messages** and **Inbound shipment order messages** pages.

Another quick way to post example messages is to use Open Data Protocol (OData) requests.

In both example cases, the message processor in Microsoft Dynamics 365 Supply Chain Management processes the messages and creates the orders in the warehouse system.

> **Tip**
>
> To completely skip the shipment order creation processes via messages, you can create the inbound shipment orders and outbound shipment orders directly on the order pages by allowing the *Enable manual inbound shipment order creation* and *Enable manual outbound shipment order creation* settings for a source system.

The same message structure logic applies to both the inbound and outbound shipment order messages:

- Order header
    - Order line 1

    - Order line 2

      ...

    - Order line *n*

- Complete

> **Tip**
>
> For more examples of HTTP requests for creating messages and integrating inventory and product master data, go to the **dynamics365scm-warehouse repository on GitHub**.

Prerequisites

Before you can work through this example by using a Supply Chain Management environment, you must prepare your system in the following way:

- Check the version requirements, and enable the feature as described in Enable and configure warehouse management only mode.
- Work in a system where the standard demo data is installed, and select the *USMF* legal entity.
- Set up at least one record on the **Source systems** page. This example scenario assumes that you've set up a source system where the **Source system** field is set to *ERP*. Learn more in Configure your source systems.
- Set up the required number sequences as described in Set up number sequences.

Set up authentication for the example

On the **Microsoft Entra ID applications** page, assign the *Admin* user to the client that's used for authentication during interaction with the Supply Chain Management environment from an external source. Alternatively, assign another user who has authentication access to the integration messages, such as the default *Warehouse System Integration Operator* role. If you use the same user as part of the product master data import, more privileges that are related to product master data entities must be added to the *Warehouse System Integration Operator* role.

When you post entities via OData, you must ensure either that the user's default company matches the company that the entity will be posted to, or that the company (`dataAreaId` value) is specified in the request payload messages. Either way, shipment order messages can be completed only if the company (`dataAreaId` value) is specified.

Create shipment order messages

Example of a simple inbound shipment order message

For the `InboundShipmentOrderMessages` inbound shipment order header message, you must provide the following data at a minimum:

- `MessageId`: *M1*
- `dataAreaId`: *USMF* (Optional, depending on the default authorization user company)
- `SourceSystemId`: *ERP*
- `OrderNumber`: *IO1*
- `ReceivingWarehouseId`: *51*

When you use variables, the `InboundShipmentOrderMessages` message looks like the following example.

JSON

```
POST {{resource}}/data/InboundShipmentOrderMessages
{
"MessageId": "{{MessageId}}",
"dataAreaId": "{{dataAreaId}}",
"SourceSystemId": "{{SourceSystem}}",
"OrderNumber": "{{OrderNumber}}",
"ReceivingWarehouseId": "{{Warehouse}}"
}
```

The `InboundShipmentOrderLineMessages` message looks like the following example.

JSON

```
POST {{resource}}/data/InboundShipmentOrderLineMessages
{
"MessageId": "{{MessageId}}",
"dataAreaId": "{{dataAreaId}}",
"SourceSystemId": "{{SourceSystem}}",
"OrderNumber": "{{OrderNumber}}",
"OrderLineNumber": 1,
"ItemNumber": "A0001",
"ExpectedQuantity": 10,
"ExpectedUnitSymbol": "Pcs"
}
```

To commit the messages, post a *complete* message for the header and lines. The complete message looks something like the following example.

JSON

```
POST {{resource}}/data/InboundShipmentOrderMessages(MessageId='{{MessageId}}',
dataAreaId='{{dataAreaId}}',SourceSystemId='{{SourceSystem}}',
OrderNumber='{{OrderNumber}}')/Microsoft.Dynamics.DataEntities.Complete?cross-
company=true
```

> **Note**
>
> The `dataAreaId` value is used as part of the key to match against the released header and line messages. Therefore, the `dataAreaId` value must be specified. The suffix `?cross-company=true` is required only for messages where the company differs from the user's default company that's set up on the **Microsoft Entra ID applications** page.

Example of a simple outbound shipment order message

For the `OutboundShipmentOrderMessages` outbound shipment order header message, you must provide the following data at a minimum:

- `MessageId`: *M2*
- `dataAreaId`: *USMF* (Optional, depending on the default authorization user company)
- `SourceSystemId`: *ERP*
- `OrderNumber`: *OO1*
- `ShipFromWarehouseId`: *51*
- `ConsigneeName` or `ReceiverName`: *Microsoft*
- `ConsigneeCountryRegionId` or `ReceiverCountryRegionId`: *USA*

When you use variables, the `OutboundShipmentOrderMessages` message looks like the following example.

JSON

```
POST {{resource}}/data/OutboundShipmentOrderMessages
{
"MessageId": "{{MessageId}}",
"dataAreaId": "{{dataAreaId}}",
"SourceSystemId": "{{SourceSystem}}",
"OrderNumber": "{{OrderNumber}}",
"ShipFromWarehouseId": "{{Warehouse}}",
"ConsigneeName": "{{ConsigneeName}}",
"ConsigneeCountryRegionId": "{{ConsigneeCountryRegionId}}"
}
```

The `OutboundShipmentOrderLineMessages` message looks like the following example.

JSON

```
POST {{resource}}/data/OutboundShipmentOrderLineMessages
{
"MessageId": "{{MessageId}}",
"dataAreaId": "{{dataAreaId}}",
"SourceSystemId": "{{SourceSystem}}",
"OrderNumber": "{{OrderNumber}}",
"OrderLineNumber": 1,
"ItemNumber": "A0001",
"OrderedQuantity": 10,
"OrderedUnitSymbol": "Pcs"
}
```

To commit the messages, post a *complete* message for the header. The complete message looks something like the following example.

JSON

```
POST {{resource}}/data/OutboundShipmentOrderMessages(MessageId='{{MessageId}}',
dataAreaId='{{dataAreaId}}',SourceSystemId='{{SourceSystem}}',
OrderNumber='{{OrderNumber}}')/Microsoft.Dynamics.DataEntities.Complete?cross-
company=true
```

> **Note**
>
> The `dataAreaId` value is used as part of the key to match against the released header and line messages. Therefore, the `dataAreaId` value must be specified. The suffix `?cross-company=true` is required only for messages where the company differs from the user's default company that's set up on the **Microsoft Entra ID applications** page.

Message processor messages for shipment orders

After the two documents are imported into the message queue, you must use the message processor to process them and create the actual inbound and outbound shipment orders.

Last updated on 09/26/2025

Warehouse management only mode FAQ

Article • 04/30/2024

This article provides answers to frequently asked questions about Warehouse management only mode.

What should I do when a message is shown as Failed in the message processor?

The message processor retries three times before it fails. You can use business events to be notified about this failure. Follow the view log information for the **Message processor messages** page, and use that information to take the next appropriate action: queue the message (that is, move it back into the processing queue), cancel it, or manually update it.

> **Note**
>
> Usually, you must correct errors in the data before it makes sense to try to reprocess a failed message.

Why does my message stay in the Queued state instead of being processed?

If multiple messages that have dependencies are in the *Failed* state (for example, for the same order number), you must either correct the data and move the message back to the *Queued* state, or cancel the dependent messages.

Why do I have to provide a Country/Region field value for my outbound shipment order?

Outbound shipment orders must be able to create a shipping address. Therefore, you must specify at least two field values: **Country/Region** and **Name**. The **Country/Region** value must match existing data in the address setup. You can use the following message fields to provide the data:

- `ConsigneeName`
- `ConsigneeCountryRegionId`
- `ReceiverName`
- `ReceiverCountryRegionId`

Learn more in Master and reference data.

Why does Supply Chain Management show all the modules instead of just those that are related to warehouse management?

Warehouse management only mode is part of a larger deployment of Microsoft Dynamics 365 Supply Chain Management. Therefore, it lets you use all the integration points. To limit a user's access to other modules, assign only those security roles that are related to warehouse management processes:

- *Warehouse manager* – Enable and review processes, maintain master data, and respond to inquiries.
- *Warehouse mobile device user* – Access the *Warehouse Mobile Devices Portal* service.
- *Warehouse planner* – Work with setup and planning processes.
- *Warehouse system integration operator* – Set up integration processes that are related to inbound/outbound shipment orders and on-hand inventory synchronization.
- *Receiving clerk* – Work with inbound processes.
- *Shipping clerk* – Work with outbound processes.
- *Warehouse worker* – Work with daily warehouse processes.

Why do I receive the following error when I post a counting journal: "No fiscal calendar has been defined for the ledger. In general ledger setup, select a fiscal calendar for the ledger"?

Usually, Supply Chain Management requires that you configure several costing and general ledger settings, including fiscal calendars. However, you can remove this requirement by setting up item model groups that don't use these features and associating those item model groups with the relevant released products. Learn more in Master and reference data.

Why do I receive the following error when I process warehouse operations: "The accounting currency hasn't been defined for the ledger. You must define the currency in the Ledger form"?

Usually, Supply Chain Management requires that you configure several costing and general ledger settings, including a ledger currency. However, you can remove this requirement by setting up item model groups that don't use these features and associating those item model groups with the relevant released products. Learn more in Master and reference data.

Why do I receive the following error when I process different order types: "The accounting currency hasn't been defined for the ledger. You must define the currency in the Ledger form"?

Warehouse management only mode uses just two types of documents: *inbound shipment orders* and *outbound shipment orders*. All other types of documents (such as *sales orders* or *purchase orders*) can be processed only if you've configured the required costing and general ledger options, regardless of your item model group setup.

Why can't I just Receive complete what I have partly inbound registered?

Depending on your setup on the **Inbound shipment order policies** FastTab of the **Source systems** page (**Warehouse management** > **Setup** > **Warehouse management integration** > **Source systems**), inbound loads might be created in any of the following ways:

- Automatically, when an inbound shipment order is imported
- Automatically, when an advanced shipping notice (ASN) is imported
- Via a manual process
- As part of the Warehouse Management mobile app receiving process
- As part of an *Order receiving completed* process

When the system creates load data as a result of processing an inbound shipment order message, the delivery policy controls whether load quantities are adjusted to the received quantities, or whether the received quantities must match the load line quantities, as part of the *Receiving completed* process.

Why do I receive the following error for my existing Update product receipts process: "Unable to update product receipt for a load with inbound shipment order lines"?

If you enable Warehouse management only mode and are already running a periodic *Update product receipts* batch job for loads that are associated with purchase orders, you must update the query for the batch job to exclude inventory transaction updates for inbound shipment orders. To update the query, add the *Load details* entity, and specify a *NotExist* join to the *Loads* entity. Then add a range definition for the **Reference** field, where **Criteria** = *Inbound shipment order*.

Why do I receive the following error when I process a transfer order: "The accounting currency has not been defined for the ledger. You must define the currency in the Ledger form"?

In addition to setting up item model groups that don't use costing and general ledger settings (see Master and reference data), you must enable Warehouse-specific inventory transactions for the *Transfer issue* and *Transfer receipt* warehouse scenarios.

Can I attach documents and notes to inbound and outbound shipment orders?

Yes. Both inbound and outbound shipment order messages support document attachments. For more information, see the descriptions of *Inbound shipment order messages composite entity* and *Outbound shipment order messages composite entity* in Data management. These entities contain the child entities *Inbound shipment order document attachment messages* and *Outbound shipment order document attachment messages*.

Why can't I see and search for page names that are related to Warehouse management only mode?

Even if the *Warehouse management only mode* feature is enabled, you must create a record on the **Source systems** page before the system can look up the related pages. In addition, the current user's default company must have a source system set up to search for the page names. Learn more in Enable and configure Warehouse management only mode.

Why doesn't my registered inventory transaction have a load ID?

If you use the item arrival journal process to receive updated inbound shipment order line quantities, inventory transactions won't be associated with a load. To achieve this result, you must use the *Order receiving completed* process, which creates loads for registered inventory transactions that aren't associated with a load. This process can be triggered directly from an inbound shipment order or via the **Inbound shipment order receiving completed** background process (available at **Warehouse management** > **Periodic tasks** > **Inbound shipment order receiving completed**).

Why do I receive the following error when processing shipment orders: "Not able to resolve released item/variant for external item ID [ItemId]"?

When processing shipment orders, you may receive the following error, even though a related item or variant exists:

> Not able to resolve released item/variant for external item ID [ItemId].

This error occurs because released products and variants must be linked to a source system through the Source system items data entity. This is crucial for recording how item and variant numbers must be handled for each external source system.

Why aren't any external inventory updates recorded after I run external shared warehouse processing?

In one typical case, you create a counting journal for an item, which adjusts the on-hand inventory for the selected warehouse. Before you proceed, make sure that the **Warehouse inventory update log** page shows the information that you need for this adjustment. If it doesn't, you must verify that all the required **Source system** and **Source system item** settings are in place.

Even if the warehouse inventory update log has the correct information, it sends the data to the **External inventory updates** page only for the warehouse inventory dimensions that are connected through the external warehouse management system and the relevant warehouses. For more information about how to configure this process, see Warehouse management only mode with external shared warehouses.

Monitor and control message processor messages

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The message processor is a framework for processing messages that represent events. It has the following properties:

- It processes messages in the correct order. (Dependent messages are processed in sequence.)
- It's scalable. (Independent messages can be processed in parallel.)
- It uses the required system resources.
- It avoids exhaustion of system resources if a spike in messages occurs.
- It's reliable.
- It's traceable.

You might use this framework, for example, to develop and manage custom integration with external systems, and to process other custom functionality. Microsoft Dynamics 365 Supply Chain Management includes, for example, several out-of-box features that use predefined message types and message queues. These features include third-party manufacturing execution system (MES) integration, deferred posting, and packing slip posting during container close. Warehouse management only mode uses the message processor framework to manage *inbound and outbound shipment orders*.

This article describes how to monitor and control the processing of all message types by using the **Message processor messages** page.

Message processor messages page

Use the **Message processor messages** page to view the list of incoming messages, view the message log, manually process messages, and troubleshoot issues.

Open the Message processor messages page

To view the list of messages processed by the message processor, go to **System administration** > **Message processor** > **Message processor messages**.

Grid columns and filters on the Message processor messages page

Use the fields at the top of the **Message processor messages** page to find specific messages. Most of these filters match the column headings in the message grid. The following filters and column headings are available:

- **Message type** – The type of message.
- **Message queue** – The name of the queue that the message is processed in. The following queues are available:
  - *Manufacturing Execution 3rd Party* – This queue holds messages that are created as part of the *Manufacturing execution system integration* feature. These messages also appear on the **Manufacturing execution systems integration** page, which is like the **Message processor messages** page but is focused exclusively on that feature. For more information, see Integrate with third-party manufacturing execution systems.
  - *Production* – This queue holds messages that are created as part of the *Make finished goods physically available before posting to journals* feature. These messages also appear on the **Deferred production order posting** page, which is like the **Message processor messages** page but is focused exclusively on that feature. For more information, see Make finished goods physically available before posting to journals.
  - *Warehouse* – This queue holds messages that are created for warehouse management, such as to post a sales packing slip when the last shipment container is closed as part of a manual packing process. (This message has a message type of *Run packing slip for container*.)
  - *Shipment Orders* – This queue holds messages that support Warehouse management only mode.
  - *Source System Products* – This queue holds messages that support source product master data.
  - *External warehouse shipment order updates* – This queue holds messages that support external shared warehouse processing.
  - *Dynamics 365 Sales Integration* – This queue holds messages that integrate with Dynamics 365 Sales. For more information about this feature and the messages that it

might add to this queue, see Work with added efficiency in quote-to-cash with Dynamics 365 Sales.
    - *<Custom queues>* – If your system is customzied to support additional types of queues, they appear here. For more information about how to add custom queues, see Implement a new queue.

- **Message state** – The state of the message. The following states exist:
    - *Queued* – The message is ready to be processed by the message processor.
    - *Processed* – The message was successfully processed by the message processor.
    - *Canceled* – The message is canceled by a user.
    - *Failed* – The message failed to be processed.

- **Message content** – This filter does a full-text search of message content. (The grid doesn't show message content.) The filter treats most special symbols, such as hyphens, as spaces, and it treats all space characters as Boolean OR operators. For example, if you search for a specific `journalid` value that equals *USMF-123456*, the system finds all messages that contain either "USMF" or "123456," and the list is likely to be long. Therefore, it's better to enter just *123456* in this case, because more specific results are returned.

View the message log, message content, and details

To view detailed information about a message, select it in the grid. Then, select the **Log** or **Message content** tab under the message grid, where each processing event is shown.

The text on the **Message content** tab depends on the **Message type** value. Therefore, the text length varies. A typical message content text starts with an opening brace ({) and ends with a closing brace (}). In between are field names (for example, `journalId`), each followed by a colon and a value (for example, *USMF-123456*).

The toolbar on the **Log** tab includes the following buttons:

- **Log** – Select this button to show the processing results. This function is especially helpful when messages have a **Processing result** value of *Failed*, and you want to understand the reasons for the processing failure.
- **Bundle** – Multiple message processing operations can run as part of the same batch process. Select this button to view the detailed data. For example, you can see whether dependencies exist that require the system to process some messages in a specific sequence.

Manually process, cancel, or requeue a message

Depending on the current state of a message, you can manually process or cancel it. Select the message in the grid, and then select **Process** or **Cancel** on the Action Pane.

If you want to requeue a previously canceled message, select it in the grid. Then, select **queue** on the Action Pane. The system processes the message as usual.

Schedule message processing by using the message processor batch job

To process a message queue, set up a batch job to run it. Usually, you set up a fixed, regular schedule for processing each queue. However, you can also run any queue on demand. To create and schedule the required batch jobs, follow these steps:

1. Go to **System administration** > **Message processor** > **Message processor**.
2. In the **Message processor** dialog box, in the **Message queue** field, select the message queue that's associated with the messages that you want to process. The queue that you select depends on the feature or system that generated the messages.
3. On the **Run in the background** FastTab, set up batch and scheduling options as you require, just as you would do for other types of jobs in Supply Chain Management.
4. Select **OK** to run or schedule the job based on your settings.

Message processor queue setup

You can configure the number of processor tasks dedicated to each message processor queue and set rules for how often the queue cleans processed and canceled messages. Unconfigured queues use a default value that you can override as needed. Follow these steps to customize one or more queues.

1. Go to **System administration** > **Message processor** > **Message queue setup**.

2. Follow one of these steps:

    - To edit an existing queue, select **Edit** on the Action Pane, and then select the target queue in the grid.
    - To add a new configuration, select **Add** on the Action Pane to add a new row to the grid. Then, in the **Message queue** field for the new row, select the name of the queue that you want to configure.

3. For the new or selected row, make the following settings:

- **Number of processor tasks** – Specify the number of processor tasks dedicated to the specified queue. The maximum value is *8*. The minimum value depends on the minimum number of batch threads that are configured for your system (typically *2*).
- **Days before processed message deletion** – Specify the number of days before processed messages are cleaned up (deleted). Set this field to zero (0) to turn off processed message cleanup. For more information, see Clean up processed and canceled message processor messages.
- **Days before canceled message deletion** – Specify the number of days before canceled messages are cleaned up (deleted). Set this field to zero (0) to turn off canceled message cleanup. For more information, see Clean up processed and canceled message processor messages.

4. On the Action Pane, select **Save**.

Clean up processed and canceled message processor messages

The message processor is a framework that processes messages in the system, such as those related to inventory transactions, sales orders, and more. Over time, processed and canceled messages, that are no longer needed, can accumulate in the system, potentially affecting performance and data management. Therefore, you should periodically clean up these messages to maintain system efficiency.

Prerequisites

To use the cleanup functionality described in this article, you must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.45 or later. No feature management settings are required.

Set up message cleanup for each message processor queue

You set up message cleanup using the **Message queue setup** page, which allows you to specify how long processed and canceled messages should be retained for each queue before they're deleted.

To configure message cleanup, follow these steps:

1. Go to **System administration** > **Message processor** > **Message queue setup**.

2. Follow one of these steps:

    - To edit an existing queue, select **Edit** on the Action Pane, and then select the target queue in the grid.
    - To add a new configuration, select **Add** on the Action Pane to add a new row to the grid. Then, in the **Message queue** field for the new row, select the name of the queue that you want to configure.

3. For the new or selected row, make the following settings:

    - **Number of processor tasks** – Specify the number of processor tasks that should be dedicated to the specified queue. The maximum value is *8*. The minimum value

depends on the minimum number of batch threads that are configured for your system (typically *2*). This setting isn't related to the cleanup job, but ensures that the queue can process messages efficiently.

- **Days before processed message deletion** – Specify the number of days to retain processed messages before deletion. To turn off processed message cleanup, set this field to 0.
- **Days before canceled message deletion** – Specify the number of days to retain cancelled messages before deletion. To turn off cleanup, set this field to 0.

4. On the Action Pane, select **Save**. The system automatically creates a background process to run the cleanup job. By default, the process runs daily, but you can modify this schedule in the Process automation workspace, as described in the next section.

Review and manage cleanup jobs

Whenever you have at least one message queue set to be cleaned up, the system automatically creates a background process to run the cleanup operation regularly. Follow these steps to review, schedule, and manage this process in the Process automation workspace:

1. Go to **System administration** > **Setup** > **Process automation**.
2. Open the **Background processes** tab to view the list of background processes.
3. Use the **Filter** field to search for the process that has a **Name** of *Cleanup job for the message processor*.
4. Select the process in the grid and then select **Edit** from the toolbar.
5. The **Edit background process** dialog opens. Use the settings here to view and modify the schedule and other settings for the cleanup job.
6. Select **OK** when you're done.

Optimization advisor

The Optimization advisor can remind you to manage outdated messages when they exist in the message processor. It includes a diagnostic rule called *Check for aged processed or canceled messages*, which identifies messages older than 30 days and creates an optimisation opportunity for them. You can take action directly from the **Optimization advisor** workspace. By default, this rule runs monthly.

To turn the rule on or off, or to change the frequency of the rule, follow these steps:

1. Go to **System administration** > **Periodic tasks** > **Maintain diagnostic validation rules**.

2. Find the row where **Rule name** is *Check for aged processed or canceled messages*.
3. Make the following settings for the rule as needed:

    - **Status** – Set to *Active* or *Inactive*.
    - **Run frequency** – Choose how often to run the check (*Daily*, *Weekly*, *Monthly*, or *Unscheduled*).

To view and act on your optimization opportunities, including those related to cleaning up aged messages, follow these steps:

1. Go to **System administration** > **Workspaces** > **Optimization advisor**. Here, you can see a list of optimization opportunities that the system has identified, including those related to message processor cleanup.
2. Select the row where **Area** is *SCM* and **Optimization opportunity** is *Cleanup job for message processor*.
3. From the toolbar, select **More information** to learn more about the opportunity and recommended actions.
4. If you want to act on the opportunity, select **Take action** from the toolbar to open the **Message queue setup** page, and configure the cleanup settings as described previously in this article.

Business events, custom message queues, and custom message types

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to design your own custom message queues and message types for the message processor by using Visual Studio. It also describes how to set up business events to deliver alerts for failed processing results.

Set up business events to deliver alerts for failed processing results

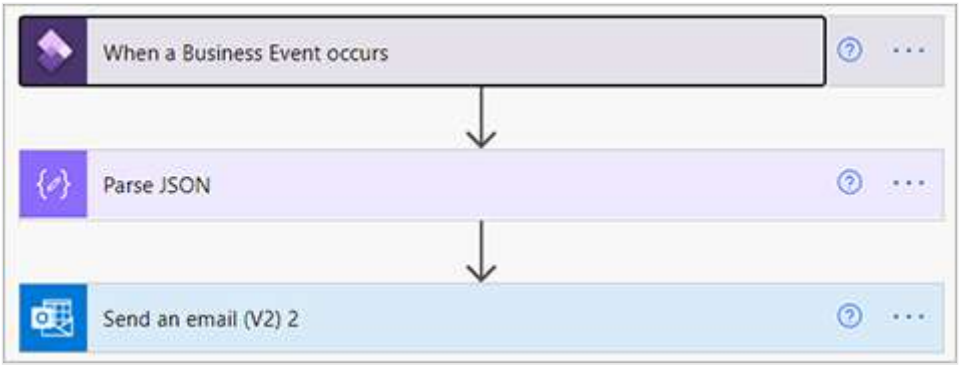
You can set up business events to alert you about failed processing results. To complete this setup, activate the *Message processor message processed* business event on the **Business events catalog** page (**System administration** > **Setup** > **Business events** > **Business events catalog**). As part of the activation process, you'll be directed to specify whether the event is specific to one legal entity or all legal entities. You'll also be directed to provide an endpoint name, which must be defined in advance.

> **Note**
>
> If **When a Business Event occurs** is set to *Microsoft Power Automate* (instead of *HTTPS*, for example), the endpoint name will automatically be created in Supply Chain Management, based on the *Microsoft Power Automate* setup.

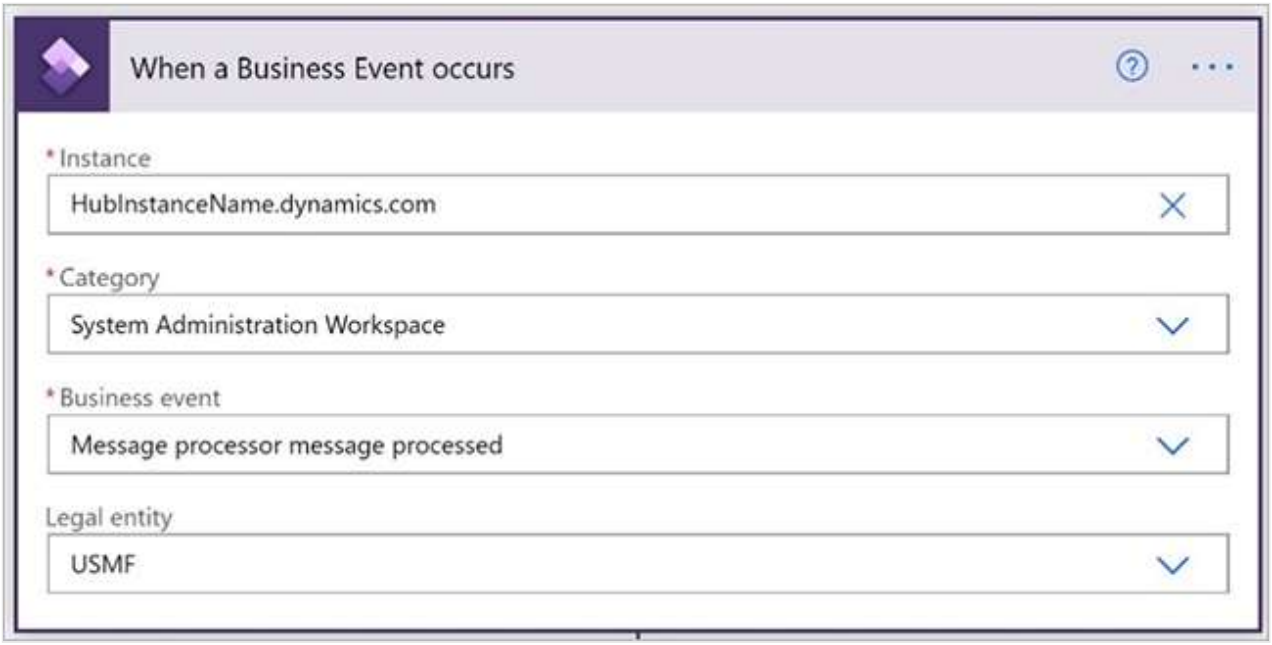
Business events Power Automate example

In this example, **When a Business Event occurs** is set to *Microsoft Power Automate* to send email notifications that containing Action center (formerly Infolog) messages and hyperlinks that open the **Message processor messages** page for a specific failed message. As you require, you can add extra logic to send the notifications in parallel via different channels and control the recipients based on the event data.

1. In Power Automate, create an automated cloud flow for the **When a Business Event occurs - Fin & Ops App (Dynamics 365)** flow trigger, followed by the **Parse JSON** and **Send an email** steps.



2. In the **When a Business Event occurs** step, you can look up or enter values in the **Instance** and **Category** fields, and then set the **Business event** field to *Message processor message processed*.



3. In the **Parse JSON** step, in the **Schema** field, enter a schema that defines the extended fields. You can use the **Download schema** option on the **Business events catalog** page in Supply Chain Management, or you can start by pasting in the following example schema text.

JSON

```
{
    "properties": {
        "BusinessEventId": {
            "type": "string"
        },
        "ControlNumber": {
            "type": "integer"
```

```
        },
        "EventId": {
            "type": "string"
        },
        "EventTime": {
            "type": "string"
        },
        "MajorVersion": {
            "type": "integer"
        },
        "MessageContent": {
            "type": "string"
        },
        "MessageDestinationCompanyId": {
            "type": "string"
        },
        "MessageDestinationOperationalSiteId": {
            "type": "string"
        },
        "MessageDestinationWarehouseId": {
            "type": "string"
        },
        "MessageDestinationWorkloadName": {
            "type": "string"
        },
        "MessageInfolog": {
            "type": "string"
        },
        "MessageProcessingResult": {
            "type": "string"
        },
        "MessageProcessingResultLabel": {
            "type": "string"
        },
        "MessageProcessorMessagePageUrl": {
            "type": "string"
        },
        "MessageQueue": {
            "type": "string"
        },
        "MessageQueueLabel": {
            "type": "string"
        },
        "MessageSourceCompanyId": {
            "type": "string"
        },
        "MessageSourceOperationalSiteId": {
            "type": "string"
        },
        "MessageSourceWarehouseId": {
            "type": "string"
        },
        "MessageSourceWorkloadName": {
            "type": "string"
        },
```

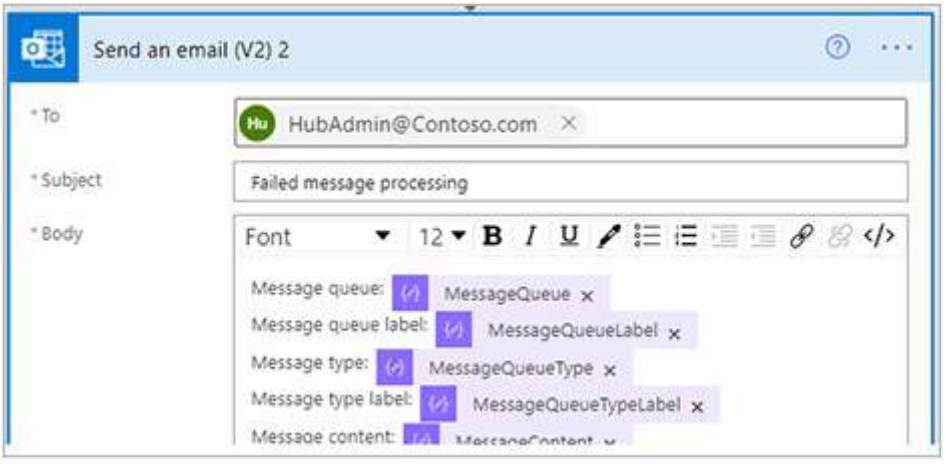
```
        "MessageState": {
            "type": "string"
        },
        "MessageStateLabel": {
            "type": "string"
        },
        "MessageType": {
            "type": "string"
        },
        "MessageTypeLabel": {
            "type": "string"
        },
        "MinorVersion": {
            "type": "integer"
        }
    },
    "type": "object"
}
```

4. In the **Send an email** step, you can select the individual fields, or you can start by pasting the following example email body into the **Body** field.

plaintext

```
Message queue: @{body('Parse_JSON')?['MessageQueue']}
Message queue label: @{body('Parse_JSON')?['MessageQueueLabel']}
Message type: @{body('Parse_JSON')?['MessageQueueType']}
Message type label: @{body('Parse_JSON')?['MessageQueueTypeLabel']}
Message content: @{body('Parse_JSON')?['MessageContent']}
Message state: @{body('Parse_JSON')?['MessageState']}
Message state label: @{body('Parse_JSON')?['MessageStateLabel']}
Message processing result: @{body('Parse_JSON')?['MessageProcessingResult']}
Message processing result label: @{body('Parse_JSON')?
['MessageProcessingResultLabel']}
Message infolog: @{body('Parse_JSON')?['MessageInfolog']}
Message source company ID: @{body('Parse_JSON')?['MessageSourceCompanyId']}
Message source workload name: @{body('Parse_JSON')?
```

```
['MessageSourceWorkloadName']}
Message source site ID: @{body('Parse_JSON')?
['MessageSourceOperationalSiteId']}
Message source warehouse ID: @{body('Parse_JSON')?['MessageSourceWarehouseId']}
Message destination company ID: @{body('Parse_JSON')?
['MessageDestinationCompanyId']}
Message destination workload name: @{body('Parse_JSON')?
['MessageDestinationWorkloadName']}
Message destination site ID: @{body('Parse_JSON')?
['MessageDestinationOperationalSiteId']}
Message destination warehouse ID: @{body('Parse_JSON')?
['MessageDestinationWarehouseId']}
Message processor message page URL: @{body('Parse_JSON')?
['MessageProcessorMessagePageUrl']}
```



When you save the business event, it's automatically activated and is ready to be used as part of Supply Chain Management.

Message processor scheduler

The message processor has one scheduler. The `SysMessageKeyDateTimeSequenceProcessorScheduler` class schedules messages that have dependencies that are based on a key, date, and time, so that the messages are processed in the correct order. Messages that must be processed are stored in the `SysMessageProcessorTaskBundle` and `SysMessageProcessorTaskBundleMessage` tables. Dependent messages must be in the same bundle.

The `SysMessageKeyDateTimeSequenceProcessorScheduler` class is used by the third-party MES integration feature to secure messages that are related to a production order, and that are processed in the order that they're received or created in. The dependencies are defined by a key (production order number) and the time.

For example, the system receives or creates the following messages:

- Production order 1 – Start message

- Production order 2 – Start message
- Production order 2 – Report as finished message
- Production order 1 – Report as finished message

In this case, the `SysMessageKeyDateTimeSequenceProcessorScheduler` class will schedule the processing of messages in the following order:

1. Production order 1 – Start message
2. Production order 1 – Report as finished message
3. Production order 2 – Start message
4. Production order 2 – Report as finished message

Each report-as-finished message depends on the successful processing of the related start message.

Because a bottleneck can occur when records are picked up for processing for multiple tasks, and because there might be dependencies between the messages, the system bundles the messages. For example, if the bundle size is 2, the system will create the following bundles:

- Bundle 1 - Production order 1 – Start message
- Bundle 1 - Production order 1 – Report as finished message
- Bundle 2 - Production order 2 – Start message
- Bundle 2 - Production order 2 – Report as finished message

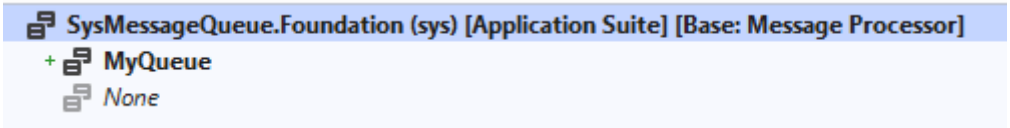
For scalability, when you develop a new queue, you can configure the number of tasks that should process the bundles. (Learn more in Implement a new queue.) If the configuration uses two message processor tasks, the two bundles can be processed in parallel.

Development example: Implement a custom message queue

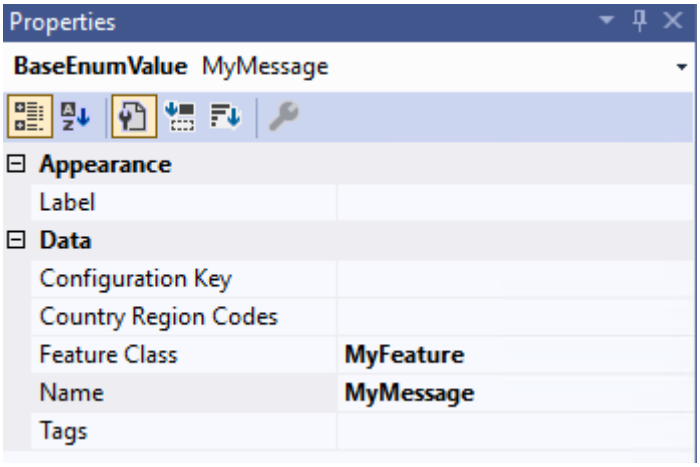
This example shows how to add a new queue. After the queue is created, you'll be able to submit messages to it. Those messages will then be processed by the message processor according to the settings that were described earlier.

1. In Visual Studio, create an extension for the `SysMessageQueue` enum.

2. Add a new enum value for the new queue.



3. Set a feature class on the enum value.



4. Create a class that extends `SysMessageQueueMetadata`, as shown in the following example.

X++

```
[SysMessageQueueFactoryAttribute(SysMessageQueue::MyQueue)]
public final class MyQueue extends SysMessageQueueMetadata
{

    /// <summary>
    /// Gets the default number of message processor tasks.
    /// </summary>
    /// <returns>The default number of message processor tasks.</returns>
    public SysMessageProcessorsTasks getDefaultMessageProcessorsTasks()
    {
        return 1;
    }

    /// <summary>
    /// Get the maximum number of messages in a bundle.
    /// </summary>
    /// <returns>The maximum number of messages in a bundle.</returns>
    public SysMessageProcessorMaxBundleSize getMaxBundleSize()
    {
        return 10;
    }

    /// <summary>
    /// Determines if messages should be queued when sending or processing
messages.
    /// </summary>
    /// <returns>true if messages should be queued when sending a message;
otherwise false.</returns>
    public boolean queueMessageOnSend()
    {
        return true;
    }

    /// <summary>
```

```
    /// Determines if dependent messages should be committed per created
transaction ID.
    /// </summary>
    /// <returns>true if dependent messages should be committed per created
transaction ID.; otherwise false.</returns>
    public boolean commitPerCreatedTransactionID()
    {
        return false;
    }

}
```

5. Create an extension for the `SysMessageProcessorToggle` class to enable the message processor in the user interface (UI).

X++

```
[ExtensionOf(classStr(SysMessageProcessorToggle))]
final class MySysMessageProcessorToggle_Extension
{
    /// <summary>
    /// Determines if the toggle is enabled.
    /// </summary>
    /// <returns>
    /// true if the toggle is enabled; otherwise, false.
    /// </returns>
    internal boolean isEnabled()
    {
        return next isEnabled() || MyFeature::instance().isEnabled();
    }

}
```

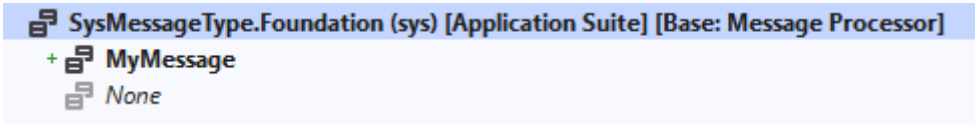
Development example: Implement a custom message type

This example shows how to create a message type for each type of process that you want to make available to the message processor. The message type establishes which processes can be run by messages of that type. The name of the message type will be shown on the **Message processor messages** page to identify the purpose of each message in the queue.

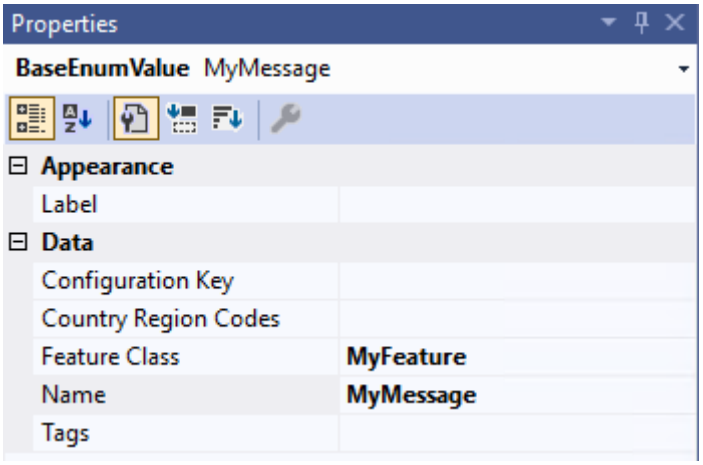
Follow these steps to create a new message type.

1. In Visual Studio, create an extension for the `SysMessageType` enum.

2. Add a new enum value for the new message type.



3. Set a feature class on the enum value.



4. Create a class that extends `SysMessageTypeMetadata`, as shown in the following example.

X++

```
[SysMessageTypeFactoryAttribute(SysMessageType::MyMessage)]
public final class MyMessage extends SysMessageTypeMetadata
{
    /// <summary>
    /// Validates if it is allowed to send a message on a given queue.
    /// </summary>
    /// <param name = "_messageQueue">A queue to send message to.</param>
    /// <param name = "_messageTarget">A message target.</param>
    /// <param name = "_sourceMessageTarget">A message source.</param>
    /// <returns>true if it is allowed to send a message; false, otherwise.
</returns>
    public boolean canSendMessage(SysMessageQueue _messageQueue,
SysMessageTargetRecId _messageTarget, SysMessageTargetRecId
_sourceMessageTarget)
    {
        if (_messageQueue == SysMessageQueue::MyQueue)
        {
            return true;
        }

        return false;
    }

    /// <summary>
    /// Returns a list of allowed message state transitions.
    /// </summary>
    /// <returns>A list of allowed message state transitions.</returns>
    public Enumerator getAllowedMessageStateTransitions()
    {
        // Allow the following state transitions:
```

```
        // SysMessageState::None -> SysMessageState::Queued
        // SysMessageState::None -> SysMessageState::Processed

        // SysMessageState::Queued -> SysMessageState::Processed

        // SysMessageState::Failed -> SysMessageState::Queued
        // SysMessageState::Failed -> SysMessageState::Cancelled
        // SysMessageState::Failed -> SysMessageState::Processed

        return
SysMessageStateTransition::getProcessedCancelledStateTransitions();
    }

    /// <summary>
    /// Returns dependencies related to a message.
    /// </summary>
    /// <param name = "_message">The message to add dependencies to.</param>
    /// <returns>A list of dependencies related to a message.</returns>
    public List getDependencies(SysMessage _message)
    {
        List dependencies = new List(Types::Record);

        // Add a dependency to the message if you need to process messages in
order.
        // For example, process a start message before an end message.
        // The message will not be processed before the dependent message is
processed or cancelled.

        // The default scheduler,
SysMessageKeyDateTimeSequenceProcessorScheduler only supports one dependency
per message.
        // Messages with different keys may be processed in parallel.

        SysMessageDependencyKey dependencyKey = strFmt('Mykey:%1',
this.getContract(_message).parmMyKey());

dependencies.addEnd(SysMessageKeyDateTimeSequenceDependency::create(dependencyK
ey));

        return dependencies;
    }

    /// <summary>
    /// Execute the logic associated with the given message state transition.
    /// </summary>
    /// <param name = "_message">The message.</param>
    /// <param name = "_messageStateTransition">The state transition to
execute.</param>
    public void processMessageStateTransition(SysMessage _message,
SysMessageStateTransition _messageStateTransition)
    {
        if
(_messageStateTransition.isEqual(SysMessageStateTransition::newFromStates(SysMe
ssageState::Queued, SysMessageState::Processed)))
```

```
        {
            this.processMessage(_message);
        }
        else if
(_messageStateTransition.isEqual(SysMessageStateTransition::newFromStates(SysMe
ssageState::Failed, SysMessageState::Processed)))
        {
            this.cancelMessage(_message);
        }
    }

    private void processMessage(SysMessage _message)
    {
        // Add logic to process the message.
    }

    private void cancelMessage(SysMessage _message)
    {
        // Add logic to cancel the message if needed.
    }

    private ClassId contractClass()
    {
        return classNum(MyContract);
    }

    protected MyContract getContract(SysMessage _message, ClassId _objectTypeId
= this.contractClass())
    {
        var contract = FormJsonSerializer::deserializeObject(_objectTypeId,
_message.Content) as MyContract;

        return contract;
    }

}
```

Gantt control development guide

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

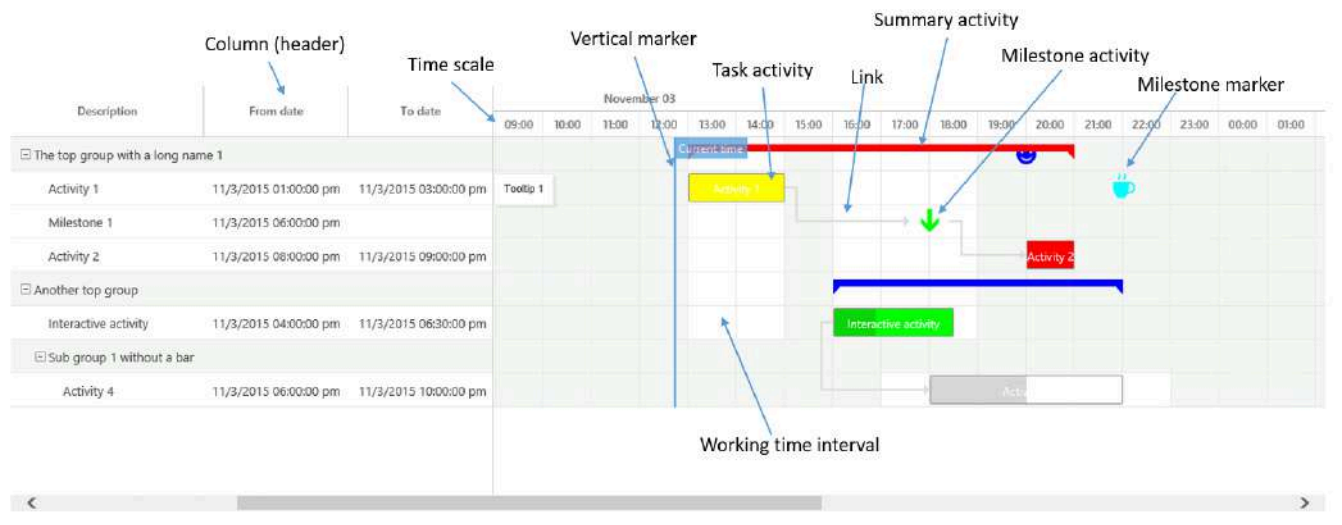
This article describes how to create new forms by using the Gantt control. Review the code in the Tutorial_Gantt form. This code demonstrates the full capabilities of the Gantt control, and shows how to load data and work with the application programming interface (API).

What's new for Gantt

In Microsoft Dynamics AX 2012, the client was a Win32 application, and extensions used Microsoft ActiveX, WinForm, or Microsoft Windows Presentation Foundation (WPF) controls. ActiveX and ManagedHost controls are incompatible with the HTML-based platform, so you can't use them to add custom controls. Instead, use the new extensible control framework to add controls by using HTML and JavaScript. This framework implements the new Gantt control. Unlike earlier versions, you don't have to pay an extra license fee to use the control in your own forms or to extend the control.

High-level overview of the control

The following illustration shows the visual elements of the Gantt control.



To add the control to a new form, right-click the top node in the form design, and then select **Add new** > **Gantt**. After you set the **Height** and **Width** properties to **SizeToAvailable**, you don't need to set any other properties in the designer. Unlike many other controls, Gantt controls can't be bound to data sources. Instead, you must add all data to the control from code.

Adding activities, links, and milestone markers

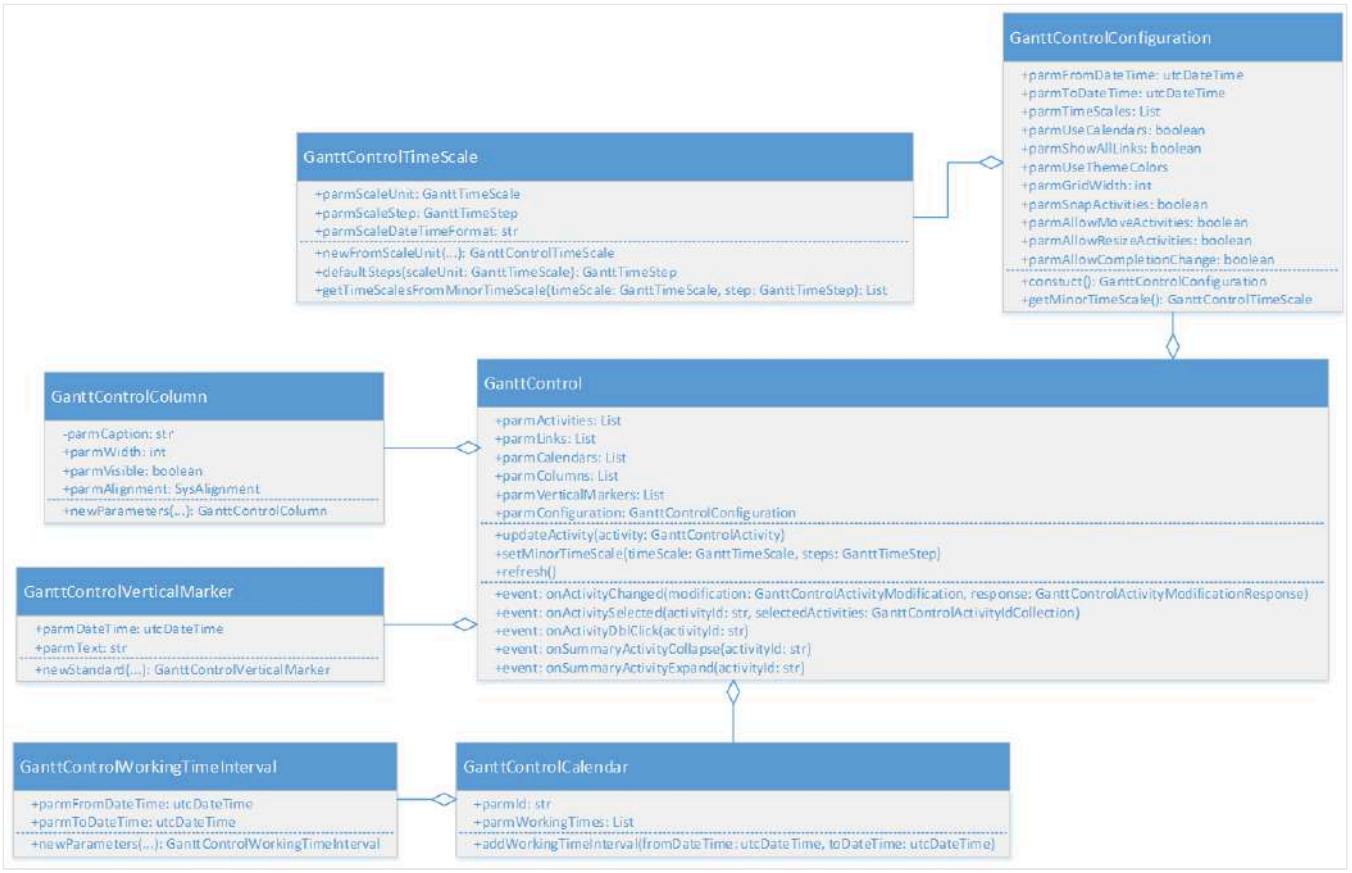
The most basic element of a Gantt chart is the task activity. Each activity gets its own row in the chart. Activities can form a hierarchy, like a tree, by referencing a parent activity. Additionally, you can connect any two activities to each other through links (across hierarchies). To add data to the control, build up a list that contains the instances of the element that you want to add. Then assign the list to the control by using a **parm** method. When you modify data, don't just modify the content of the list. To notify the client that data changed and to trigger a refresh, you must reassign the list to the control by using the **parm** method.

Each activity must have a unique ID across all activity types. This ID is required to build the hierarchy and the links. The ID also identifies the activity when the server is notified after a user interaction. There are two types of milestones: The milestone activity is a stand-alone activity that gets its own row in the chart and can be referenced from the links. The milestone markers appear on the same row as the related activity. Both types of markers use symbols from the Dynamics Symbol font.

Column headers and content

In the grid on the left side of the control, you can arrange the data into columns. Provide the column definitions through the **GanttControl.parmColumns** property, which is a list of **GanttControlColumn** objects. Give the content of the columns as a simple **List** object that

contains the text strings for an activity through the **GanttControlActivity.parmColumnTexts** property. The values in the column list must be strings. Therefore, format any numbers, enumerations, dates, and so on on the server. When formatting **utcdatetime**, take into account the user's preferred time zone because the Gantt chart uses that time zone when rendering.



Working times

An activity can reference a calendar. A calendar is basically a list of working time intervals. Use a calendar to visually separate working time from non-working time by giving the cells (intersections of a row and a time scale interval) a different background color. These working time intervals don't have to come from the standard calendar tables. The intervals are just data that you can load from anywhere. Although calendars are a nice feature that can give you a good overview, you must consider some performance issues. When you turn calendars on (by setting **GanttControlConfiguration.parmUseCalendars** to **true**), the control renders each cell in HTML by using a DIV element. If a calendar shows many activities for a long period at a very granular minor timescale, many DIV elements exist. Depending on the browser and hardware, the large number of DIV elements can cause performance problems for the user. In this case, you might need to turn calendars off. By using this approach, you significantly reduce the number of DIV elements that the control must render. The control can't turn off calendars by itself to improve performance. Based on your specific scenario, determine what works best for your users.

Color use

Elements such as the activities and milestone markers have a color property. Typically, you calculate the int value for a specific color by using the **WinAPI::RGB2int** method, or the user sets the value by using the color picker (which you open by calling **ColorSelection::selectColor**). Instead of controlling the colors yourself, you can specify that the colors adhere to the current theme. When you set the **GanttControlConfiguration.parmUseThemeColors** option to **true**, the control overrides any color values you set that aren't part of the current theme. You don't need to specify colors manually. When you use theme colors, the **parmIsActive** flag on an activity determines whether the activity appears in a dark color or a light color.

Interactions

Whenever the user interacts with the Gantt, the control raises an event to notify the server-side code. The following events are currently available:

- onActivitySelected(str _activityId, GanttControlActivityIdCollection _allSelectedActivityIds)
- onActivityDblClick(str _activityId)
- onSummaryActivityExpand(str _activityId)
- onSummaryActivityCollapse(str _activityId)
- onActivityChanged(GanttControlActivityModification _modification, GanttControlActivityModificationResponse _response)

All these events are one-way notifications from the client. However, the **onActivityChanged** event is somewhat special, because you can set a response. Typically, when a user makes a modification (for example, dragging an activity to a new time), you must either update other activities or make some adjustments to the activity itself (for example, change the column texts). In the **GanttControlActivityModificationResponse** response, you can provide a list of activities that must be updated. If the change that the user makes is just accepted as is, don't set a response. However, at the very least, you must update the column texts of the current activity to guarantee that the new from and to dates appear. On an activity, the **parmAllowMove** flag determines whether the activity can be moved. However, higher-level flags on **GanttControlConfiguration** determine whether you can move any activity (**parmAllowMoveActivities**), resize any activity (**parmAllowResizeActivities**), or change the completion percentage for the activity (**parmAllowCompletionChange**).

Create a new transportation management engine

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article describes how to create a new transportation management engine in Dynamics 365 Supply Chain Management.

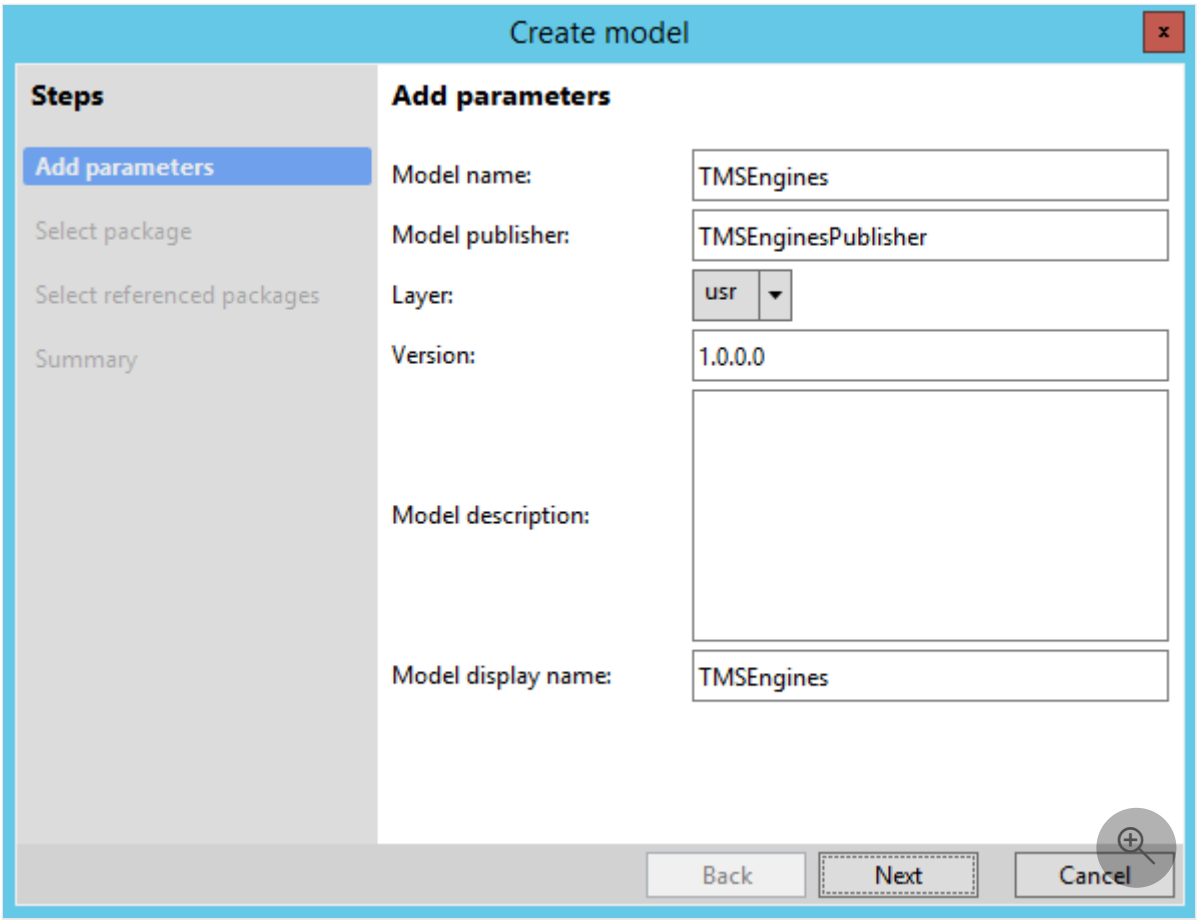
Transportation management (TMS) engines define the logic that generates and processes transportation rates in Transportation management. Supply Chain Management provides several different engine types that calculate different parameters, such as rates, transit times, and the number of zones crossed during transit. This article explains how to use the Microsoft Visual Studio development environment together with Supply Chain Management development tools to create and deploy a new TMS engine, and then how to set up the engine in Operations. For more information about the engines, see Transportation management engines.

Create a new TMS engine

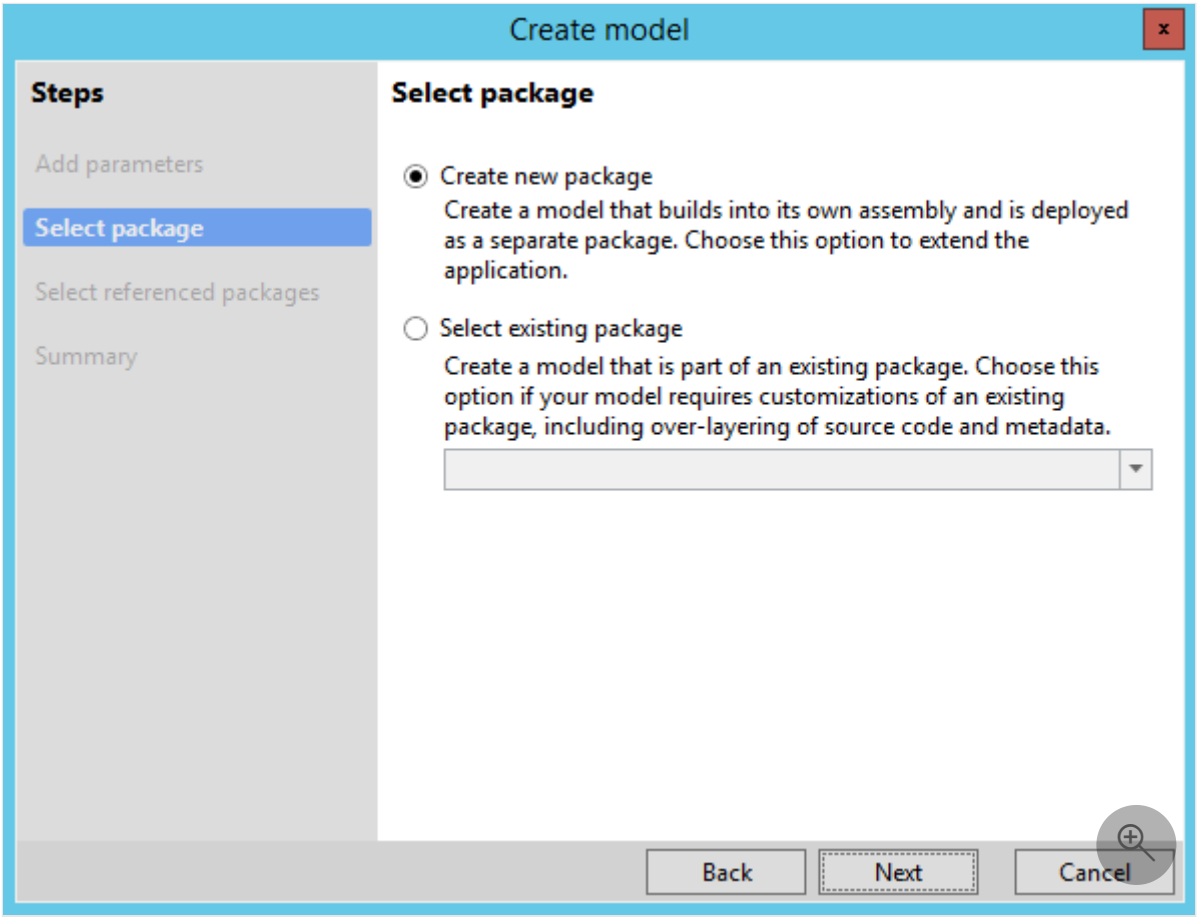
This section explains how to create a class library that has a TMS engine implementation, and how to reference it from a Supply Chain Management model.

1. To deploy your new engines, you must have a model that contains the engines. On the **Dynamics 365** > **Model Management** menu, select **Create model** to create a new model.

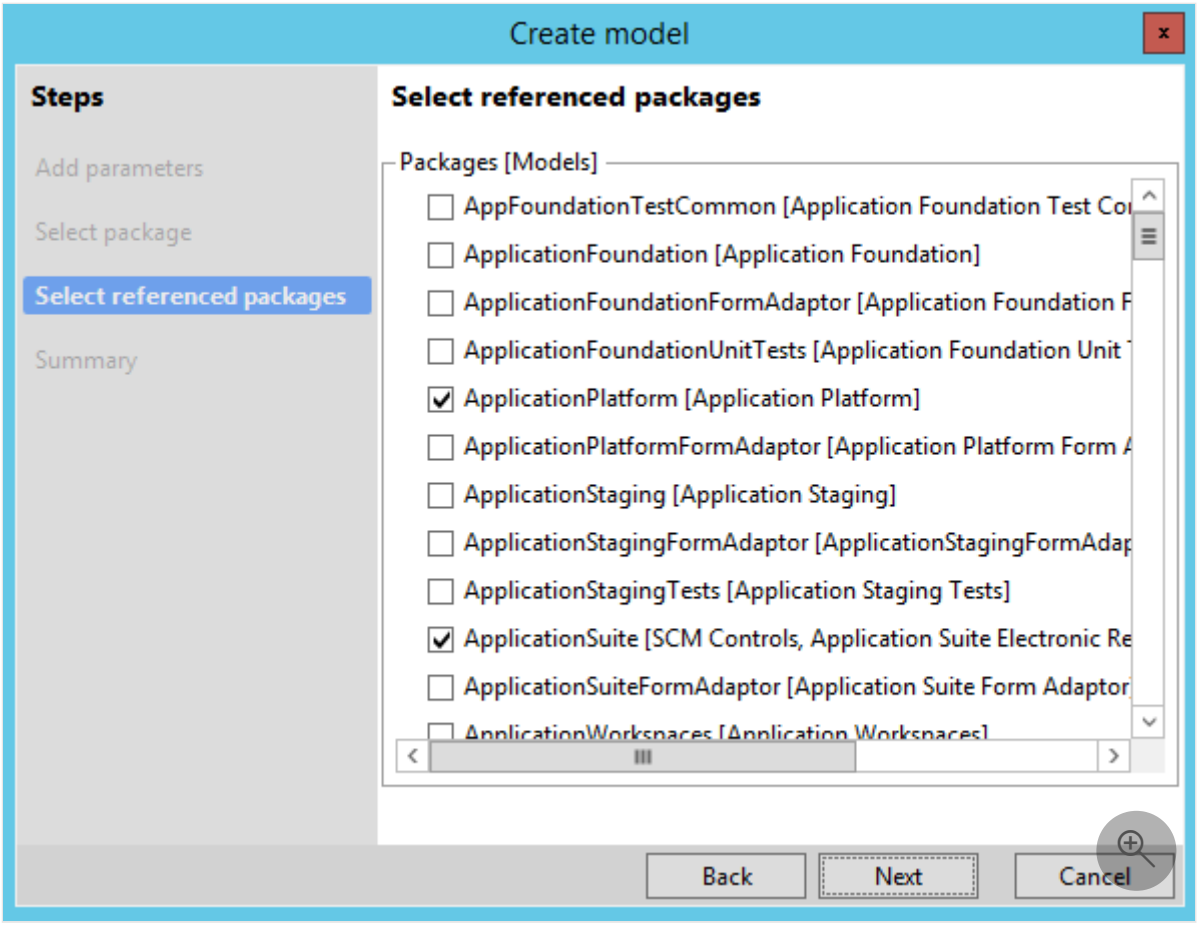
On the first page of the **Create model** wizard, name the model *TMSEngines*.



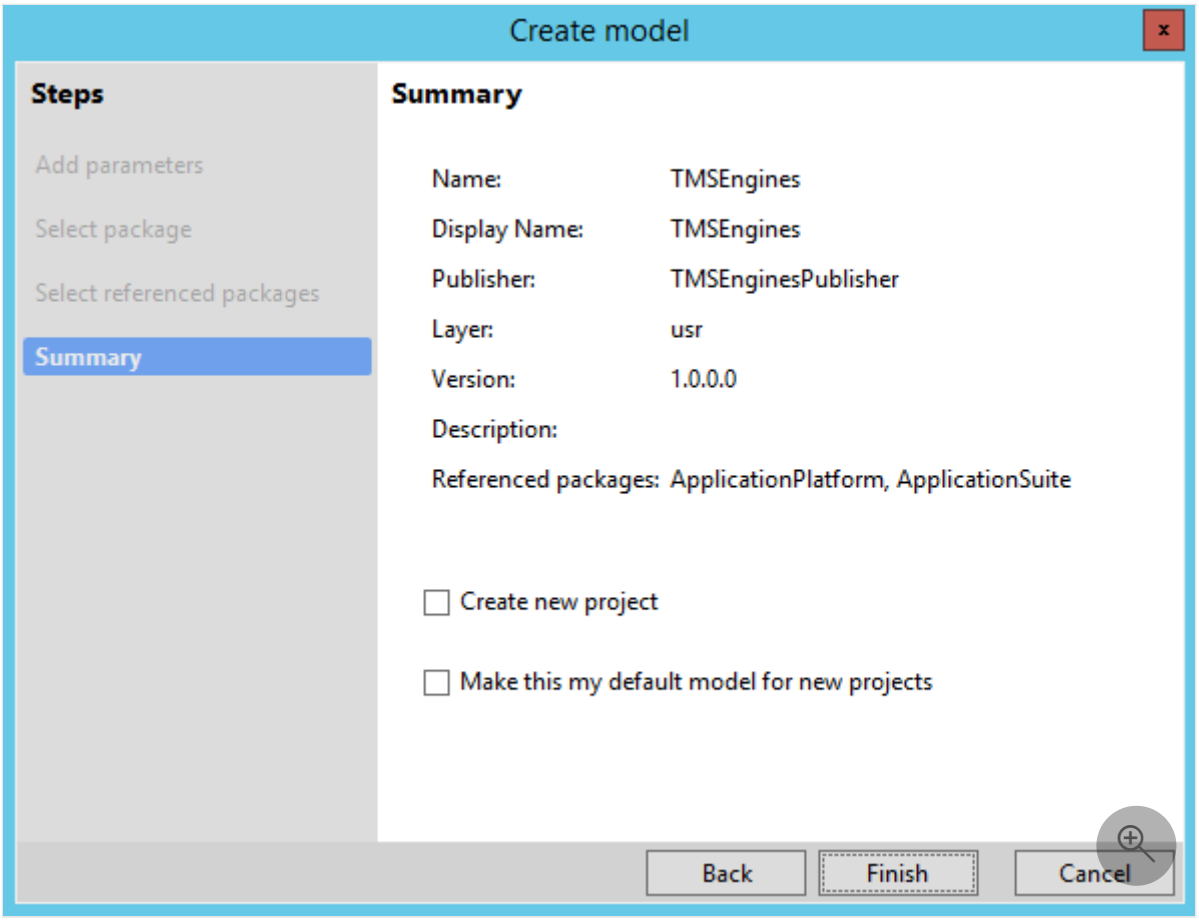
2. On the next page, select **Create new package**.



3. On the next page, select the **ApplicationSuite** model to reference. (The *ApplicationPlatform* model is preselected.)



4. On the next page, select **Finish** to confirm the creation of a new model.



5. In a new solution, create a new Supply Chain Management project, and name it *TMSThirdParty*. The framework must be set to *.NET Framework 4.8* or newer. Double check that the project's file (`TMSThirdParty.rnrproj`) specifies the correct .NET Framework version. If it doesn't, update it directly in the file to `<TargetFrameworkVersion>v4.8</TargetFrameworkVersion>`. In the project properties, set the project's model to *TMSEngines*.

6. Add a new C# *Class Library (.NET Framework)* to your solution, and name it *ThirdPartyTMSEngines*. The framework must be set to *.NET Framework 4.8* or newer and must match the settings on the *TMSThirdParty* project.

7. In the *ThirdPartyTMSEngines* project, add references to Supply Chain Management–specific assemblies specified in the following list.

   > **ⓘ Important**
   >
   > The **Copy Local** property for all the references in this list must be set to *False*. Otherwise, you risk producing runtime issues where the engine class might not be found or the assembly might not load correctly.

   - Application assemblies that enable X++ types to be referenced. These assemblies can be found in the following locations. [Packages root] is the path of the location

where all the deployed assemblies are placed, such as `C:\Packages`.

```text
[Packages
root]\ApplicationPlatform\bin\Dynamics.AX.ApplicationPlatform.dll
[Packages
root]\ApplicationFoundation\bin\Dynamics.AX.ApplicationFoundation.dll
[Packages root]\ApplicationSuite\bin\Dynamics.AX.ApplicationSuite.dll
```

- Framework assemblies that enable access to data, LINQ, and auxiliary functions. All these assemblies can be found in [Packages root]\bin.

```text
Microsoft.Dynamics.ApplicationPlatform.Environment.dll
Microsoft.Dynamics.AX.Data.Core.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.AdoNet.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Interface.dll
Microsoft.Dynamics.AX.Framework.Linq.Data.Msil.dll
Microsoft.Dynamics.AX.Server.Core.dll
Microsoft.Dynamics.AX.Xpp.AxShared.dll
Microsoft.Dynamics.AX.Xpp.Support.dll
```

- The core TMS assembly (which contains engines) and the TMS base assembly (which contains helpers, constants, data transfer class definitions, and so on). These assemblies can be found in the following locations.

```text
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.dll
[Packages root]\ApplicationSuite\bin\Microsoft.Dynamics.AX.Tms.Base.dll
```

8. Rename the C# class that is automatically generated in the *ThirdPartyTMSEngines* project to `SampleRatingEngine`.

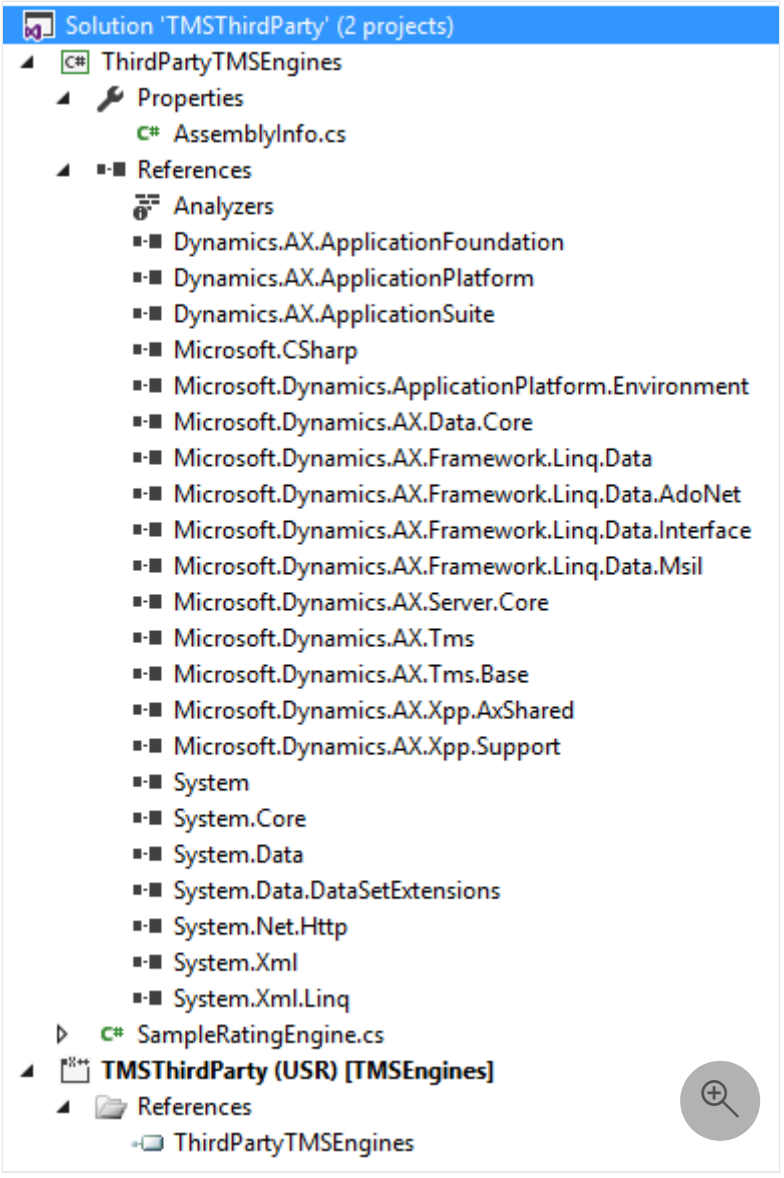
9. Implement the engine. Because you're creating a rate engine in this example, inherit from the base class for rate engines. The base class implements most of the rate engine interface (`TMSFwkIRateEngine`). You just have to implement the rate method. To keep this example simple, make this method register a hard-coded rate of 100. You can create engines that implement any of the engine interfaces, such as `TMSFwkIAccessorialEngine`. All the engine interfaces are defined in X++.

```C#
```

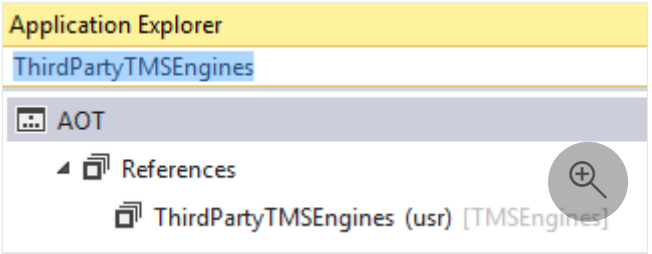
```
namespace ThirdPartyTMSEngines
{
    using Dynamics.AX.Application;
    using Microsoft.Dynamics.Ax.Tms.Base.Data;
    using Microsoft.Dynamics.Ax.Tms.Base.Utility;
    using Microsoft.Dynamics.Ax.Tms.Bll;
    using System.Xml.Linq;
    public class SampleRatingEngine : BaseRateEngine
    {
        public override RatingDto rate(TmsTransactionFacade
_transactionFacade, XElement _shipment, string _rateMasterCode)
        {
           XElement re =
shipment.RetrieveOrCreateRatingEntity(this.RatingDto);
           re.AddRate(TmsRateType.Rate, 100);
           return this.RatingDto;
        }
    }
}
```

10. Build the solution.

11. Add a new reference to the *TMSThirdParty* project. The reference should point to the *ThirdPartyTMSEngines* project. When you finish, your solution should look like this.



12. Build the solution. Verify that the new library appears in the **References** node in Application Explorer.



> **Note**
>
> If you're testing the new engine directly in the development environment, you might also need to build the entire *TMSEngines* model from **Extensions** > **Dynamics 365** > **Build models**. This might resolve the issue if the engine assembly couldn't be found.

Deploy the TMS engine as a package

One way to deploy third-party TMS engines is through a deployment package. To deploy the engine as a package, follow these steps:

1. In Visual Studio, go to **Extensions** > **Dynamics 365** > **Deploy** > **Create Deployment Package** and create a deployment package for the new model you created as described in Create a new TMS engine.

2. In Microsoft Dynamics Lifecycle Services, go to **Asset Library** > **Software deployable package**. Select **Add** to add the deployment package you created to Lifecycle Services.

3. After the validation completes, go to **Environments** > **{Your Environment ID}** > **Maintain** > **Apply updates**, select the deployable package, and apply it.

> **Note**
>
> If the system warns you that you don't have permission to deploy packages on Lifecycle Services, contact your Lifecycle Services administrator for support.

Set up the TMS engine in Supply Chain Management

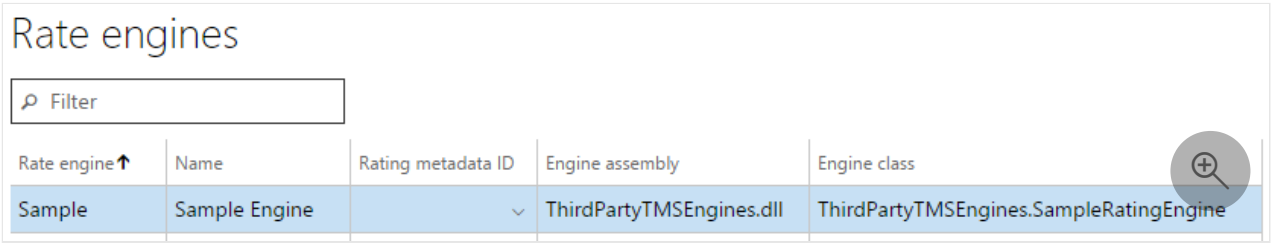
This section explains how to set up Supply Chain Management to use a TMS engine, and shows how the new engine that you created is used in rate shopping. The example in this section uses the USMF demo data company.

1. Create a new engine as described in Create a new TMS engine.

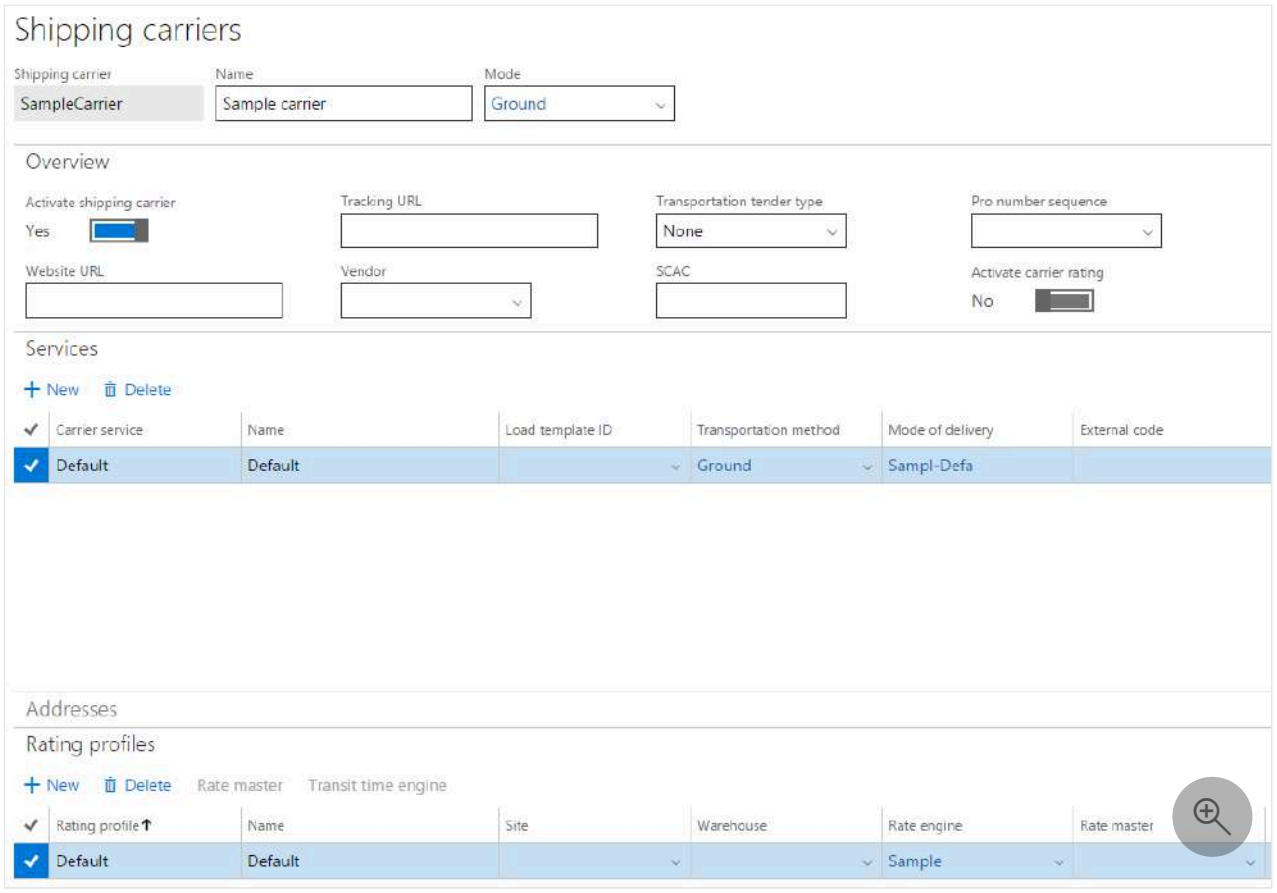
2. Build your solution.

3. Deploy the TMS engine DLL file through a deployment package, as described in Deploy the TMS engine as a package.

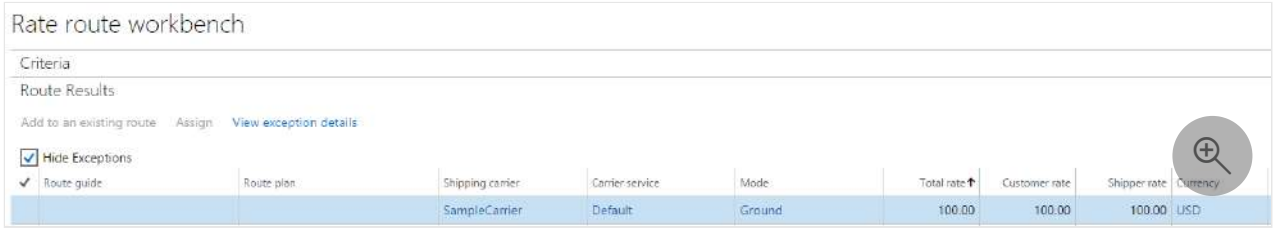
4. In Supply Chain Management, on the **Rate engines** page, create a new rating engine. The engine should point to the engine assembly produced by building the engine class library and the engine class that you implemented.



5. Create a shipping carrier that uses the Sample rate engine. Because our engine doesn't use any data, you don't have to assign a rate master.



6. On the **Rate route workbench** page, select **Rate shop**. You should see a rate of 100.00 from SampleCarrier, as shown in the following screenshot. In this example, you're rate shopping for a route from warehouse 24 to customer US-004. However, but because the rate is hard-coded, you always see a rate of 100.00.



Tips and tricks

- If you're using development tools for Supply Chain Management, it's useful to add a new project to your solution. If you set this project as your startup project and start a debugging session, you can debug both X++ and C# code in the same debugging session.
- Every time that you change and recompile your *ThirdPartyTMSEngines* project, you must deploy through a deployment package. Otherwise, you might run using a stale assembly.

- After you execute TMS-specific operations in Supply Chain Management, the Internet Information Services (IIS) worker process might lock the *ThirdPartyTMSEngines* assembly so that the assembly can't be updated. In this case, restart the w3svc process.

Whitepaper

For more information, download the following white paper (written to support AX2012, but still partially applies for Dynamics 365 Supply Chain Management):

- Implementing and deploying Transportation management engines

Extend inventory on-hand data entities

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Microsoft Dynamics 365 Supply Chain Management provides extensibility features that let you add fields to tables through extension. This article provides an example that shows how to add extended fields to the `INVENTORSITEONHANDENTITY` and `INVENTWAREHOUSEONHANDENTITY` views, so that the capabilities of the inventory on-hand data entities can work with the extensions. For more information about data entities, see Data management overview.

> **Note**
>
> Here's a list of some of the inventory on-hand data entities:
>
> - Inventory on-hand by site
> - Inventory on-hand by site V2
> - Inventory on-hand by warehouse
> - Inventory on-hand by warehouse v2

After you add fields to tables that are used by the `inventSiteOnHandView` view, you must sync the engine so that the extensions are correctly recognized.

1. Extend the `InventSiteOnHandView` view by adding the extension field.
2. Extend the `InventSiteOnHandAggregatedView` view with the extension fields.
3. Extend the `InventSiteOnHandAggregatedViewBuilder` viewBuilder class by modifying the `getExtensionFields()` method. In this way, you map old view fields to new view fields when viewBuilder synchronization is run.

For example, you added the following four fields to the `InventTable` table through extension:

- Custom field 1
- Custom field 2
- Custom field 3
- Custom field 4

In this case, you must modify the `getExtensionFields()` method in the following way.

X++

```
[ExtensionOf(classStr(InventSiteOnHandAggregatedViewBuilder))]
public final class InventOnHandAggregatedViewBuilder\_Extension
{
    protected Map getExtensionFields()
    {
        next getExtensionFields();
        Map extensionFields = new Map(Types::Int64, Types::Int64);
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 1),
fieldNum(InventSiteOnHandAggregatedView, Custom field 1));
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 2),
fieldNum(InventSiteOnHandAggregatedView, Custom field 2));
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 3),
fieldNum(InventSiteOnHandAggregatedView, Custom field 3));
        extensionFields.insert(fieldNum(InventSiteOnHandView, Custom field 4),
fieldNum(InventSiteOnHandAggregatedView, Custom field 4));
        return extensionFields;
    }
}
```

After you complete these steps, you can extend the inventory on-hand by site and inventory on-hand by warehouse data entities by adding the new fields. In this way, you ensure that the extended fields are recognized and included during data migration that uses those data entities.

Global Inventory Accounting home page

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

International organizations are under increasing pressure from authorities to comply with local and global accounting standards. The valuation of inventory plays a significant role in ensuring compliance. The Global Inventory Accounting Add-in for Microsoft Dynamics 365 Supply Chain Management provides a comprehensive solution that enables organizations (especially international organizations) to use multiple costing ledgers to do inventory accounting. Therefore, those organizations can comply with multiple accounting standards and internal management accounting at the same time.

Global Inventory Accounting lets you account inventory in multiple representations by applying the appropriate valuation method (standard cost, average, or specific identification) and the selected accounting currency per instance. Global Inventory Accounting enables organizations to report inventory statements and subledger accounting values (also known as the inventory

balance and the cost of goods sold) in what is often referred to as dual valuation and/or dual currency.

Inventory accounting is done in individual ledgers. Several Global Inventory Accounting ledgers can be created for each legal entity in an organization, as required. Therefore, multiple inventory representations can be obtained. All documents that are posted in a legal entity (such as purchase orders, sales orders, and transfer orders) will be accounted in all the costing ledgers that are associated with that legal entity.

A Global Inventory Accounting ledger is defined by a combination of the following elements:

- Calendar
- Currency
- Exchange rate table
- Convention

A convention is a collection of inventory accounting policies that can be associated with one or more ledgers. Conventions let you share a common set of policies within your organization.

Availability

Global Inventory Accounting is currently available in the following Azure geographic regions:

- Australia
- Canada
- China
- Europe
- France
- Norway
- South Africa
- Switzerland
- UAE
- United Kingdom
- United States

If you try to install the add-in from another geographic region, Microsoft Dynamics Lifecycle Services will show a message that your geographic region isn't supported. Global Inventory Accounting doesn't support on-premises deployments of Supply Chain Management.

If you have any issues enabling Global Inventory Accounting in one of the supported geographic regions listed here, log the issuee through Microsoft Customer Service and Support channels including your environment ID, tenant ID, and error details in the request.

Licensing

Global Inventory Accounting is licensed together with the standard cost management features available for Supply Chain Management. You don't have to purchase an additional license to use Global Inventory Accounting.

Last updated on 06/24/2026

Get started with Global Inventory Accounting

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

Global Inventory Accounting lets you do multiple inventory accountings in the Global Inventory Accounting ledgers that you've set up. You must associate each Global Inventory Accounting ledger with a *convention*. A convention is a collection of the following types of accounting policies:

- Cost object
- Input measurement basis
- Cost flow assumption
- Cost element

> **Note**
>
> Even after you turn on Global Inventory Accounting, you can still do inventory accounting in Microsoft Dynamics 365 Supply Chain Management in the usual way.

Global Inventory Accounting is an add-in. To make its features available, you must install it from Microsoft Dynamics Lifecycle Services. You can choose to evaluate it in a test environment before you turn it on for production environments.

Global Inventory Accounting doesn't currently support all the cost management features that are built into Supply Chain Management. Therefore, it's important that you evaluate whether the set of features that is currently available will meet your requirements.

How to get the Global Inventory Accounting add-in

> **Important**
>
> To use Global Inventory Accounting, you must have a Lifecycle Services–enabled high-availability environment (not a OneBox environment). Additionally, you must be running Supply Chain Management version 10.0.19 or later.

To install Global Inventory Accounting, install the add-in. The Global Inventory Accounting service endpoints are automatically set up, so you don't need to find them manually. If you have any issues enabling Global Inventory Accounting, log the issue through Microsoft customer service and support channels including your environment ID, tenant ID, and error details in the request.

Licensing

Global Inventory Accounting is licensed together with the standard features of inventory accounting that are available for Supply Chain Management. You don't have to purchase an additional license to use Global Inventory Accounting.

Prerequisites

Set up Microsoft Power Platform integration

Before you can enable add-in functionality, you must integrate with Microsoft Power Platform by following these steps.

1. Open the Lifecycle Services environment where you want to add the service.
2. Go to **Full details**.
3. In the **Power Platform Integration** section, select **Setup**.
4. In the **Power platform environment setup** dialog box, select the checkbox, and then select **Setup**. Typically, setup takes between 60 and 90 minutes.
5. After setup of the Microsoft Power Platform environment is completed, the page shows the name of your environment. Additionally, the **Power Platform Integration** section shows the statement, "Power Platform environment setup is complete." Global Inventory Accounting doesn't require a dual-write application.

Learn more in Enable Power Platform Integration, and follow the steps to connect either to a new Power Platform environment or to an existing Dataverse instance that you already manage.

Install or update the add-in and solution

Use the following procedure to install or update the Global Inventory Accounting add-in and solution. The part of the procedure you should follow depends on whether you're installing for the first time or just need to update the solution for an existing installation.

- If you have never installed the add-in before, follow the full procedure to install both the add-in and the solution.
- If you're already using Global Inventory Accounting but need to update the solution in the Power Platform admin center, then do step 6 only and skip all of the other steps.

To install or update the add-in and solution:

1. Sign in to Lifecycle Services.
2. Open the Lifecycle Services environment where you want to add the service.
3. Go to **Full details**.
4. Go to **Power Platform Integration** and select **Setup**.
5. In the **Power platform environment setup** dialog box, select the checkbox, and then select **Setup**. Typically, setup takes between 60 and 90 minutes.
6. After the Microsoft Power Platform environment setup is complete, sign in to the Power Platform admin center and then install or update the Global Inventory Accounting solution by doing the following steps:
   a. Select the environment where you want to install or update the solution.
   b. Select **Dynamics 365 apps**.
   c. Select **Install App**.
   d. Select **Dynamics 365 Global Inventory Accounting**.

e. Select **Next** to install.

7. After the solution is completely installed, go back to the Lifecycle Services environment. On the **Environment add-ins** FastTab, you should see that Global Inventory Accounting is being installed. After a few minutes, the status should change from *Installing* to *Installed*. (You might have to refresh the page to see this change.) At that point, Global Inventory Accounting is ready to use.

If the default language of your Dataverse installation isn't English, follow these steps:

1. Go to **Advanced Setting** > **Administration** > **Languages**.
2. Select *English* (*LanguageCode=1033*), and then select **Apply**.

Set up the integration

Follow these steps to set up the integration between Global Inventory Accounting and Supply Chain Management.

1. Sign in to Supply Chain Management.
2. Go to **System administration** > **Feature Management**.
3. Select **Check for updates**.
4. On the **All** tab, search for the feature named *Global inventory accounting*.
5. Select **Enable now**.
6. Go to **Global inventory accounting** > **Setup** > **Global inventory accounting parameters** > **Integrations parameters**.
7. Depending on which version of Supply Chain Management you're running, follow one of these steps:

    - **Supply Chain Management version 10.0.19 to 10.0.26**: In the **Data service endpoint** and **Global inventory accounting endpoint** fields, enter the URLs that the Global Inventory Accounting team sent to you by email. (Learn more in the How to get the Global Inventory Accounting add-in section.)
    - **Supply Chain Management version 10.0.27 and newer**: You don't need to enter the endpoints, so you can skip this step.

Global Inventory Accounting is now ready to use.

Last updated on 06/24/2026

Business documents supported by Global Inventory Accounting

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

After the Global Inventory Accounting Add-in is fully set up, it's ready to process inventory-related documents that are entered in Microsoft Dynamics 365 Supply Chain Management.

Supported business documents

There are two types of business documents:

- **Documents that have a journal** – These documents include product receipt, purchase invoice, packing slip, and sales invoice documents.
- **Documents that don't have a journal** – These documents include counting, movement, and inventory adjustment documents.

Later in this article, purchase orders are used as an example to illustrate the process.

The following table lists the documents that the current release supports.

Expand table

Document type	Document
Purchase Order	Product Receipt

Document type	Document
Purchase Order	Invoice
Sales Order	Packing slip
Sales Order	Invoice
Inventory Journals	Movement
Inventory Journals	Adjustment
Inventory Journals	Counting
Inventory Journals	Transfer
Transfer Order	Shipment
Transfer Order	Receive

> ⓘ **Important**
>
> Global Inventory Accounting asynchronously processes the documents that are entered in Supply Chain Management. No error messages are shown for problematic documents.

Example: Purchase order

Product receipt

Post product receipts in the usual way. On the **All purchase orders** page, select a purchase order, and then, on the Action Pane, on the **Receive** tab, select **Product receipt** to open the **Product receipt journal** page. An operation event and a Global Inventory Accounting event are generated for each line. Therefore, select the **Lines** tab, and then select **Inventory** > **Events and measurements** to open the **Events and measurements** page.

Global Inventory Accounting is an accounting system that is based on events and measurements. The measurement line grid on the **Events and measurements** page shows a list of measurements. Each measurement has a list of dimensions.

For each operation event, there are two types of measurement:

- **Operations measurements** – These measurements describe business documents in generic terms. One measurement is the product quantity using the unit of measure that is used in

the document. There are also measurements that affect the inventory value, such as extended price, discount, discount percent, and line charge.
- **Resource accounting measurements** – These measurements are from the inventory register perspective. They describe the document's impact on the inventory in the inventory unit of measure. If there are multiple inventory registrations, there are multiple lines of resource accounting measurements.

The dimensions are organized in the following way:

- **Duality** – Duality describes the agents who participate in the economic events. For external business documents, the primal dimensions describe the legal entity where the document is entered, whereas the dual dimensions describe the vendor, customer, and so on. For internal business documents (for example, transfer orders), the dual dimensions describe the counterpart warehouse.
- **Dimension type** – Dimension types categorize the dimensions.
- **Dimension** – The name of the dimension.
- **Dimension value** – The value of the dimension.

Global Inventory Accounting event

Global Inventory Accounting takes the operational events and measurements as input. It then does the appropriate accounting for each related ledger, based on the attached currency and convention. You can select **Global inventory accounting events and measurements** to view the Global Inventory Accounting event. The Global Inventory Accounting event follows the same methodology as operation events, but it uses different measurements. There are three major measurement types: product cost quantity, product cost, and variance.

Subledger accounts are used to further classify the measurements. There might be multiple ledgers. These ledgers are linked to the legal entity where the document is entered. You can view the events and measurements for each ledger by changing the value of the **Ledger** field.

Cost element

Based on the cost element policy that is attached to the ledger, the system assigns a cost element to each accounted operation event measurement that affects the inventory cost. These measurements include extended price, discount, discount percent, and line charge.

Measurement line details

The **Overview** tab shows the details of the attached policies. The cost object dimensions show the cost object, based on the cost object policy. Specific identification dimensions show the batch number if the cost flow assumption is *Specific – Batch*.

Purchase invoice

Post the invoice in the usual way. Then, on the Action Pane, on the **Invoice** tab, in the **Journals** group, select **Invoice** to open the invoice journal. An operation event and a Global Inventory Accounting event are generated for each line. Therefore, select the **Lines** tab, and then select **Inventory** > **Events and measurements** to open the **Events and measurements** page. The **Events and measurements** page shows the same measure type. However, because the page shows a different measure role and measure modifier, the impact on the agent (legal entity) differs.

Select **Global inventory accounting events and measurements** to view the Global Inventory Accounting event. The inventory quantity and cost now flow out from the *Goods received not invoiced inventory* subledger account and into the *Cost of goods purchased* subledger account.

Enable Power BI for Global Inventory Accounting

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

You can pin tiles, dashboards, and reports from your PowerBI.com account to your Microsoft Dynamics 365 application workspace.

Prerequisites

The following prerequisites must be in place before you can enable Power BI reporting:

- You must be a system administrator in the Dynamics 365 application.
- You must have a PowerBI.com account.
- You must have at least one dashboard and one report in your Power BI account.
- You must be an administrator for your Microsoft Entra account.

- The Microsoft Entra domain must be the same domain that you used for your PowerBI.com account.

Setup

To set up the Power BI integration, follow these steps:

1. Go to the *Global Inventory Accounting Add-in Templates* repo on GitHub and download the latest *Global inventory accounting- production costing* file (for example, `Global.inventory.accounting-.production.costing.Preview.-.v2.1.pbix`).
2. Sign in to PowerBI.com, upload and configure the **Global Inventory Accounting** Power BI report file by following these steps:
   a. Upload **Global Inventory Accounting** Power BI file by following these steps:
      i. Select **New**.
      ii. Select **Upload a file**.
      iii. Select the **Global Inventory Accounting** Power BI report file.
   b. Configure the **Global Inventory Accounting** Power BI report by following these steps:
      i. Go to **My workspace**, find the data set for Global Inventory Accounting, and then, from the **Options** menu, select **Settings**.
      ii. In **Settings for Global Inventory Accounting**, expand **Parameters**, and update all parameters as required. These settings let Power BI report use the data in your Dataverse. In particular, be sure to check the following settings:

          - Overwrite the default **Dataverse URL** values using the values found under **Power platform environment information** in Microsoft Dynamics Lifecycle Services (in the **Power platform integration** section).
          - Overwrite the default **Environment ID** values using the values found under **Environment details** in Lifecycle Services (in the **Manage environment** section).
          - Select the **Edit credentials** link next to the **CDS** label in the **Data source credentials** section. Then sign in to your Dataverse account using the **OAuth2** authentication method.

      iii. Verify that the Power BI reports found at **My workspace** > **Reports** > **Global Inventory Accounting** are now working correctly and display content from your system. If after completing this procedure, you're still having trouble enabling Power BI for Global Inventory Accounting, please submit a support request to Microsoft Customer Service and Support. Include your environment ID, tenant ID, and error details in the request.
3. Register the application as described in Configure PowerBI.com integration. By completing this step, you'll get the **application ID** and **application key** that is required for the next step.

4. Integrate the **Global Inventory Accounting** Power BI report file into Dynamics 365 Supply Chain Management by following these steps:
    a. Go to **System administration** > **Setup** > **PowerBI.com configuration**.
    b. Select **Edit**.
    c. Select **Enable PowerBI.Com integration**.
    d. In the **Application ID** field, enter the application ID that you found in step 4.
    e. In the **Application key** field, enter the application key that you found in step 4.
    f. Select **Save**.
    g. Refresh the page so that the Power BI sign-in dialog box appears.
    h. On the **Options** tab, select **Open report catalog**, and then select the **Global Inventory Accounting** Power BI report file that you uploaded earlier.
    i. Refresh the page. You should see that your report has been added.
    j. Under **Power BI reports**, select the **Global Inventory Accounting** link.

Learn more in Configure PowerBI.com integration.

Conventions

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A convention is a container for a set of policies that affect system behavior. Based on your business requirements, you must define conventions by using a combination of the various policies that establish how costs should be accounted in Global Inventory Accounting. You can associate each convention with one or more ledgers to ensure consistency in accounting policies that are applied across ledgers.

To set up your conventions, go to **Global inventory accounting** > **Setup** > **Conventions**. For each convention, set the following fields:

- **Name** – Enter the name of the convention.
- **Description** – Enter a description of the convention.
- **Cost Object policy** – Select a cost object policy. These policies determine the level of granularity that the system applies to calculate and maintain the inventory value. The following predefined options are available:
  - Product – Site
  - Product – Site – Warehouse

  For example, if you select *Product – Site*, for every inventory movement (inflow or outflow), the system calculates and maintains the inventory cost of each product at the site level. Therefore, inventory movements at lower levels, such as the warehouse level, don't affect

the inventory value. (An example of a warehouse-level transfer is an item transfer between two warehouses in one site.) Likewise, you can't view the inventory cost at a lower level, such as the warehouse level.

- **Input measurement basis policy** – Select an input measurement basis policy. These policies determine the costs that should flow into the inventory account and the costs that should be charged. The following options are relevant for trading companies:
  - **Normal historical** – All the cost components flow into the inventory account.
  - **Standard** – Standard cost flows into the inventory accounts, and the difference between the applied cost and the actual costs is charged to variance accounts. If you want to create a *Standard* input measurement basis policy, you must first create a price list where the policy can look up the item's standard cost.
  - **Price lists** – Global Inventory Accounting supports fetching item prices from multiple legal entities. You can define a price list that the input measurement basis policy uses. In this way, the system knows where to look up the item price. Follow these steps to set up price lists:
    1. In the **Name** field, enter a name.
    2. In the **Description** field, enter a description.
    3. In the **Costing type** field, select a costing type (*Standard cost* or *Planned cost*).
    4. In the **Price type** field, select a price type (*Cost*, *Purchase*, or *Sales price*).
    5. Add a costing version.
    6. On the Action Pane, select **Price** to validate the item prices on the price list.
- **Cost flow assumption policy** – Select a cost flow assumption policy. These policies determine how costs are removed from inventory and reported as the cost of goods sold. The following predefined options are available:
  - Average
  - Specific – Batch

  > **Note**
  >
  > Global Inventory Accounting is a perpetual inventory system. Therefore, the system tracks the inventory value on a transaction-by-transaction basis.

- **Cost element policy** – You can define cost element policies and link them to this field. A *cost element* is the cost of a resource consumed by an event. You can use cost elements to track

and categorize costs. To create cost element policies, enter information in the following places:

- **Name** field
- **Description** field
- **Cost element** list
- **Rules** grid

If you don't want to break down the inventory value further, you must still create a cost element list that has a single cost element. You must then create a cost element policy to map all the relevant measurement types (cost components) to that cost element.

Global Inventory Accounting ledger

> **Important**
>
> Global Inventory Accounting for Dynamics 365 Supply Chain Management is currently deprecated and will reach end of support on July 1, 2027. Learn more in Removed or deprecated features in Dynamics 365 Supply Chain Management.

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Global Inventory Accounting has its own set of ledgers. Each time an inventory-related transaction is processed for a relevant legal entity, the system can account for that transaction in any number of Global Inventory Accounting ledgers, as required.

A ledger is a register of debit and credit measures. These measures are classified by using cost elements and subledger accounts. A Global Inventory Accounting ledger is defined by its combination of a currency, a calendar, a convention, and an association with a legal entity.

To set up your Global Inventory Accounting ledgers, go to **Global inventory accounting** > **Setup** > **Global inventory accounting ledgers**. For each ledger, set the following fields:

- **Name** – Enter the name of the ledger.
- **Description** – Enter a description of the ledger.
- **Fiscal calendar** – Specify the fiscal calendar for the ledger.
- **Currency and exchange rate type** – Use the fields on this FastTab to select the accounting currency that the ledger uses, and the exchange rate type. The currency that you select can differ from the currency that the legal entity uses. In Global Inventory Accounting, users can define as many costing ledgers as they require. Global Inventory Accounting supports

inventory accounting in multiple currencies and in multiple valuations. Set the following fields:

- **Currency** – Select the costing currency that inventory-related values are maintained in. These values include the inventory value, cost of goods sold, inventory in transit, and all kinds of variance.
- **Exchange rate type** – Select the exchange rate that the system should use to convert the transaction amount in the transaction currency and the standard cost of the items into the costing currency.

- **Convention name** – Specify a convention. A convention is a collection of policies that establish how costs are accounted in this ledger.

- **Legal entity** – The ledger accounts the documents that are posted to the selected legal entity.

- **Priming** – Select whether inventory transactions that were created before the ledger was created should be processed according to the currency and convention in the ledger. Select one of the following values:
  - **Activated** – The ledger should process transactions that were created before the ledger was created.
  - **Deactivated** – The ledger should process only transactions that are created after the ledger was created.

  > ⓘ **Important**
  >
  > You will **not** be able to come back and set this field after you enter new documents.

- **Status** – The system automatically sets the status of newly created ledgers to *Prepare*.

Scale unit capability for Supply Chain Management is deprecated and no longer available to new customers

Article • 05/20/2024

Important

The scale unit capability for Microsoft Dynamics 365 Supply Chain Management has been paused for new customers since July 2022 and is now deprecated. Warehouse management only mode replaces some of the functionality planned for scale units and adds many new architectural and integration possibilities. For more information about this and other feature deprecations, see Removed or deprecated features in Dynamics 365 Supply Chain Management.

The Commerce Scale Unit (CSU) Core platform for Microsoft Dynamics 365 Commerce isn't related to the scale unit capability for Dynamics 365 Supply Chain Management in any way. CSU Core is not affected by this announcement and is still fully supported for the Dynamics 365 Commerce application. For more information about that functionality, see Introduction to Commerce Scale Unit (CSU) Core.

The Pricing management module is deprecated and no longer available to new customers

Important

The Pricing management module (previously in preview) is deprecated and will be removed in a future release. It's replaced by the Unified pricing management module, which offers nearly all of the same functionality as the deprecated Pricing management module, plus several important enhancements. Both the deprecated pricing management module and the Unified pricing management module use similar or identical navigation paths in the Supply Chain Management user interface, so only one of these modules can be active at a time. As of Supply Chain Management version 10.0.41, if you never enabled the deprecated pricing management module in your environment, you can only use the Unified pricing management module. If you enabled the deprecated pricing management module, you can continue to use it until its removal, but transition to the Unified pricing management module as soon as possible to take advantage of the new features and enhancements that it offers. For help with transitioning from the deprecated pricing management module to the Unified pricing management module, contact Microsoft Support.

Mobile app home page

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article describes the **Finance and operations (Dynamics 365)** mobile app and provides links to resources that can help you implement it in your organization.

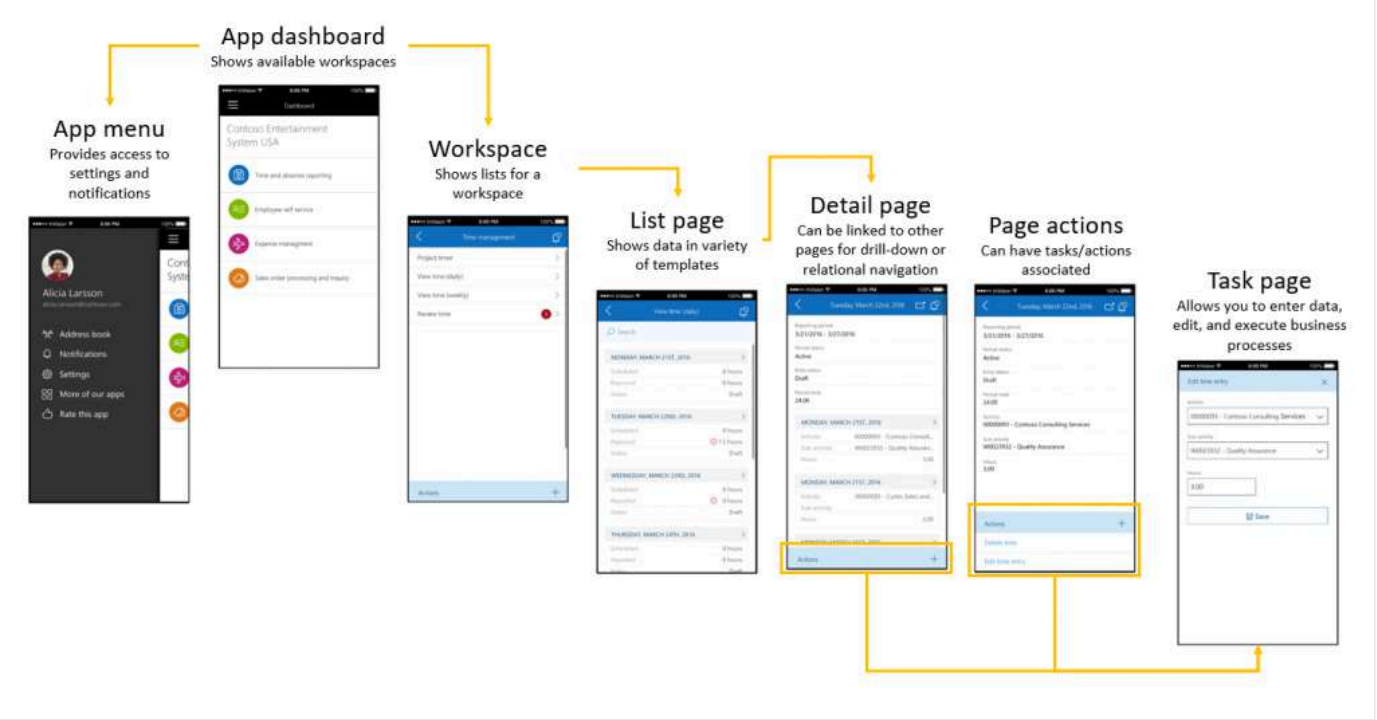
Overview

The mobile app enables your organization to make its business processes available on mobile devices. After your IT admin enables the mobile workspaces for your organization, users can sign in to the app and immediately begin to run business processes from their mobile devices. The mobile app includes the following features that can help increase productivity:

- Users can view, edit, and act on business data, even if they have intermittent network connectivity or their mobile devices are offline. When a device reestablishes a network connection, offline data operations are automatically synchronized.
- IT admins or developers can build and publish mobile workspaces that are tailored to their organization. The app uses your existing code assets. Therefore, you don't have to reimplement your validation procedures, business logic, or security configuration.
- IT admins or developers can easily design mobile workspaces by using the point-and-click workspace designer that's included with the web client.
- IT admins or developers can optionally optimize the offline capabilities of workspaces by using the Business logic extensibility framework. Because data continues to be processed while a device is offline, your mobile scenarios remain rich and fluid, even if devices don't have constant network connectivity.

Elements of the mobile app

Navigation in the mobile app consists of four basic concepts: the dashboard, workspaces, pages, and actions.



1. When you start the app, you go to the **dashboard**.

2. On the dashboard, you can see a list of **workspaces** that are published.

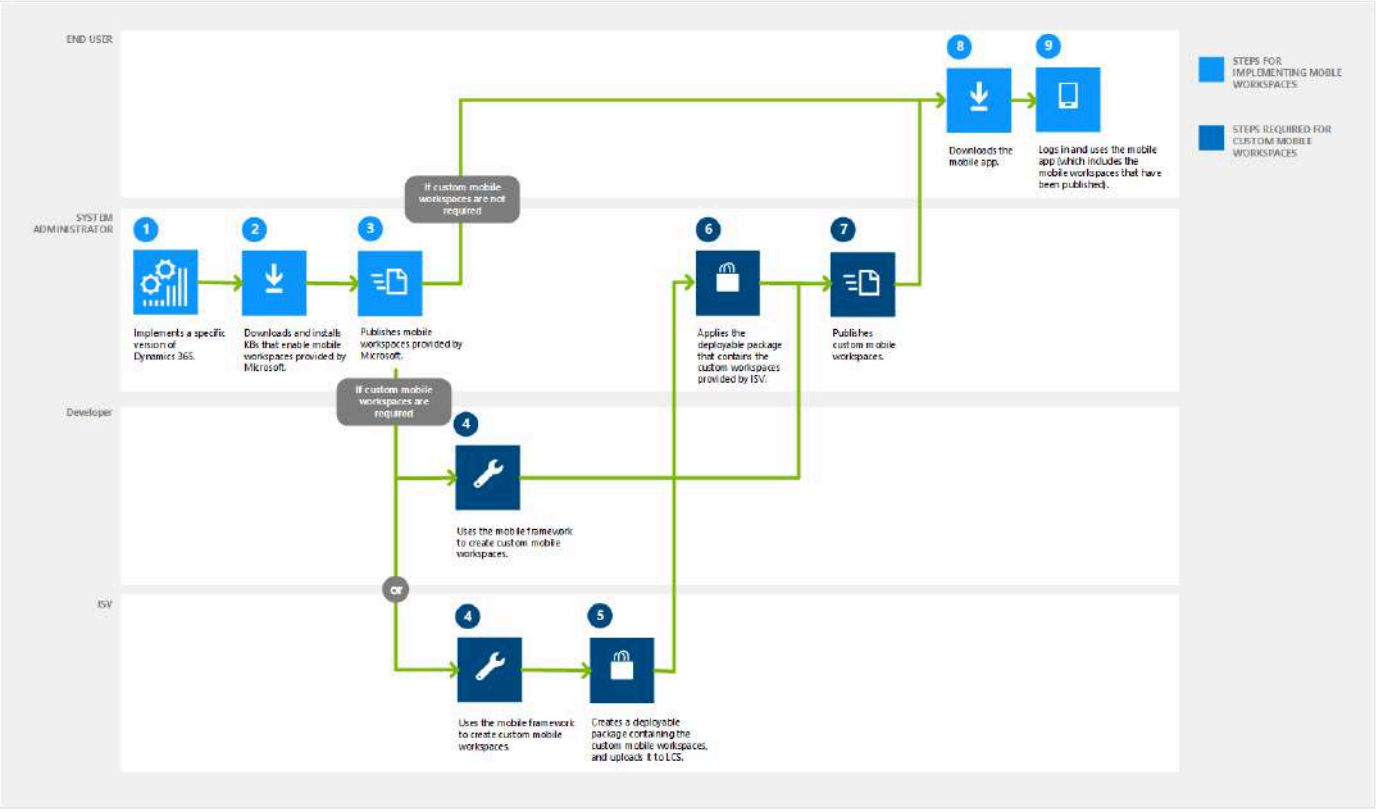
3. In each workspace, you can see a list of **pages** that are available for that workspace.

4. After you're on a page, you can perform several actions. Here are some examples:

    - View detailed data.
    - Navigate to other pages for related data, such as entity details or lines.
    - See a list of **actions** that are available for that page. Actions let you create or edit existing data.

Implementation process

The following illustration shows the process for implementing both mobile workspaces that are provided by Microsoft and custom mobile workspaces.



The following table includes links to resources that can help you implement both mobile workspaces that are provided by Microsoft and custom mobile workspaces. The numbers in the first column correspond to the numbered steps in the previous illustration.

Expand table

Step	Role	Action	Resources to help you complete the action
1	System administrator	Implement the finance and operations app in your organization.	• If you haven't yet deployed a version of Microsoft Dynamics 365, see Deploy a demo environment. • To see a list of mobile workspaces that can be used, see Mobile workspaces recently released.
2	System administrator	**If you're using Microsoft Dynamics 365 for Operations version 1611:** Download and install KBs that enable the mobile workspaces that are provided by Microsoft.	See the following articles for more information: • Cost controlling mobile workspaces • Inventory on-hand mobile workspace • Sales orders mobile workspaces

Step	Role	Action	Resources to help you complete the action
			• Vendor collaboration mobile workspace • Project time entry mobile workspace • Expense management mobile workspace
3	System administrator	Publish the mobile workspaces that are provided by Microsoft.	Publish a mobile workspace
4	Developer or independent software vendor (ISV)	Use the mobile platform to create custom mobile workspaces.	Mobile platform
5	ISV	Create a deployable package that contains custom mobile workspaces, and upload the package to Microsoft Dynamics Lifecycle Services.	Create a deployable package
6	System administrator	Apply the deployable package that contains the custom workspaces that are provided by the independent software vendor (ISV).	Apply a deployable package
7	System administrator	Publish the custom mobile workspaces that are provided by the ISV.	Publish a mobile workspace
9	User	Sign in, and use the mobile app. The app includes the mobile workspaces that have been published by the system administrator.	To see a list of mobile workspaces that are provided by Microsoft, see Mobile workspaces recently released.

Set up the Asset management mobile workspace

Article • 08/06/2024

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article describes how to set up Microsoft Dynamics 365 Supply Chain Management and the finance and operations (Dynamics 365) mobile app to run an **Asset management** mobile workspace that workers can use to perform asset management tasks.

Set up maintenance worker users in Supply Chain Management

For each user that requires access to the **Asset management** mobile workspace, follow these steps.

1. In Supply Chain Management, go to **Human resources** > **Workers**, and make sure that a worker record exists for the user that you want to set up. Create a new worker record as required.
2. Go to **Asset management** > **Setup** > **Workers** > **Workers**, and make sure that the worker record that you identified (or created) in the previous step is mapped to a maintenance worker record. Create a new maintenance worker record as required, and set the **Worker** field to the worker record from the previous step.
3. Go to **Asset management** > **Setup** > **Workers** > **Maintenance worker groups**, and make sure that the maintenance worker record that you identified (or created) in the previous step belongs to a maintenance worker group.
4. Go to **System administration** > **Users**.
5. Select the relevant user in the grid.
6. On the **User Details** FastTab, set the **Person** field to the worker account that you want to associate with the current user account. This worker account should be the

worker record that you identified (or created) in step 1 and mapped to a maintenance worker record in step 2.

> ⓘ **Note**
>
> User permissions and security roles apply to the features of the **Asset management** mobile workspace just as they apply to the features of the Supply Chain Management user interface. Therefore, every user that you set up to access the **Asset management** mobile workspace must have the security roles that are required to perform similar operations directly in Supply Chain Management.

Publish the Asset management mobile workspace

To make asset management features available in the finance and operations (Dynamics 365) mobile app, you must publish the **Asset management** mobile workspace.

1. In Supply Chain Management, select the **Settings** button (the gear symbol in upper-right corner), and then select **Mobile app** on the menu.
2. In the **Manage mobile app** dialog box, find the **Asset Management** tile. If it contains the text "In metadata - not published," the workspace hasn't yet been published. If it contains the text "In metadata - published," the workspace has already been published, and you can skip the rest of this procedure.

3. Select the **Asset Management** tile, and then select **Publish** on the toolbar. After a few seconds, you should receive a notification that states that the workspace has been successfully published. Additionally, the text on the tile should change to "In metadata - published."

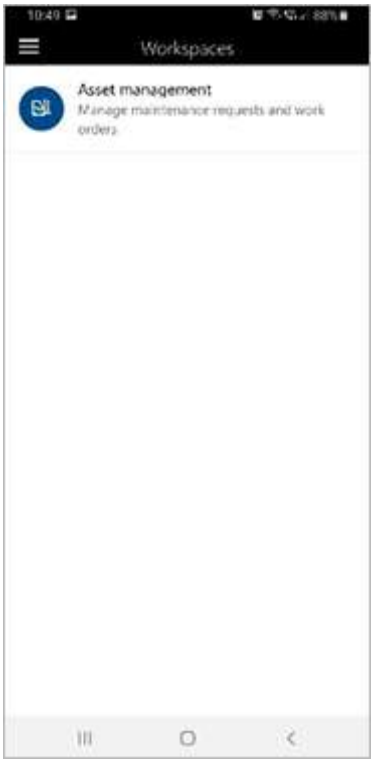
Set up the finance and operations (Dynamics 365) mobile app

1. Open the finance and operations (Dynamics 365) app. The sign-in page should appear. In the **Sign in** field, enter your Supply Chain Management URL, or select a recent URL in the **Recent environments** list, and then tap **Connect**.

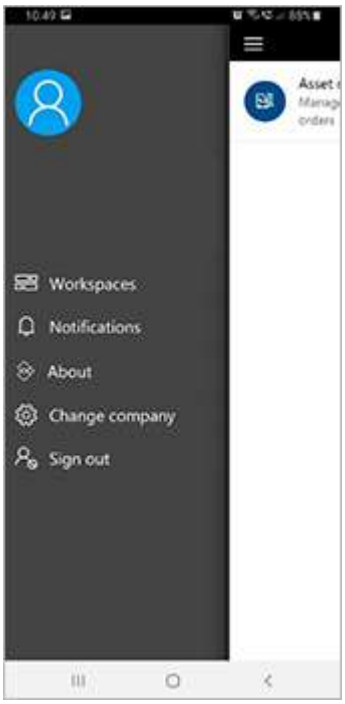
2. If you're prompted to confirm the connection, select the **I understand** check box, and then tap **Connect**.

3. On the **Pick an account** page, use your Microsoft account to sign in to the mobile application.

   The **Workspaces** page appears. It lists every mobile workspace that has been published by your Supply Chain Management instance.



4. If you must change the legal entity (company), tap the Menu button (sometimes referred to as the hamburger or the hamburger button) in the upper-left corner, and then tap **Change company**.



5. On the **Workspaces** page, select the workspace that you want to work with to open it.

Work with the Asset management mobile workspace

For more information about how to work with the **Asset management** mobile workspace, see Use the Asset management mobile workspace.

For more information about the finance and operations (Dynamics 365) mobile app, see the Mobile app home page.

Use the Asset management mobile workspace

Article • 06/29/2022

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article provides information about the **Asset management** mobile workspace. This workspace lets users view and create maintenance requests and work orders. Users can also view the assigned work order jobs in a calendar or list view. Assets and functional locations can also be viewed and searched for.

Overview

Asset Management is an advanced module for managing assets and work order jobs in Dynamics 365 Supply Chain Management. The **Asset management** mobile workspace lets users quickly view assigned work order jobs on the mobile device of their choice. Users can also create and manage maintenance requests, update lifecycle state, and view asset and functional location details by using their mobile device.

Specifically, the **Asset management** mobile workspace lets users perform these tasks:

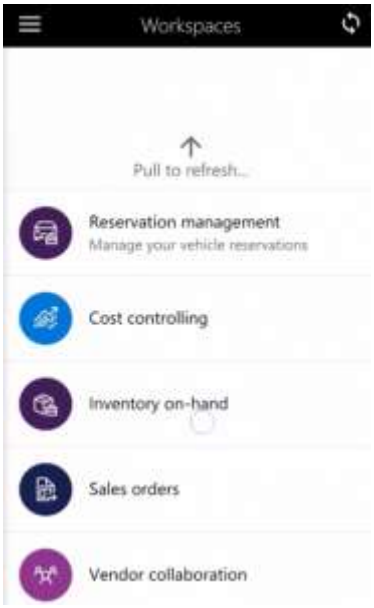
- Create, view, and edit maintenance requests, take a photo or attach an existing image to the maintenance request, change the maintenance request lifecycle state.
- Create, view, and edit work orders, take a photo or attach an existing image to the work order, change the work order lifecycle state, view work order jobs.
- View assigned work order jobs in a calendar view.
- Create, view, and edit work order job, update asset counters, view maintenance checklist, view and edit work order job notes, view the tools required for the work order job.
- View or search for a specific asset or functional location.

Prerequisites

Before you can use the **Asset management** mobile workspace, your admin must set up the required user and worker accounts, and publish the workspace. Learn more in Set up the Asset management mobile workspace.

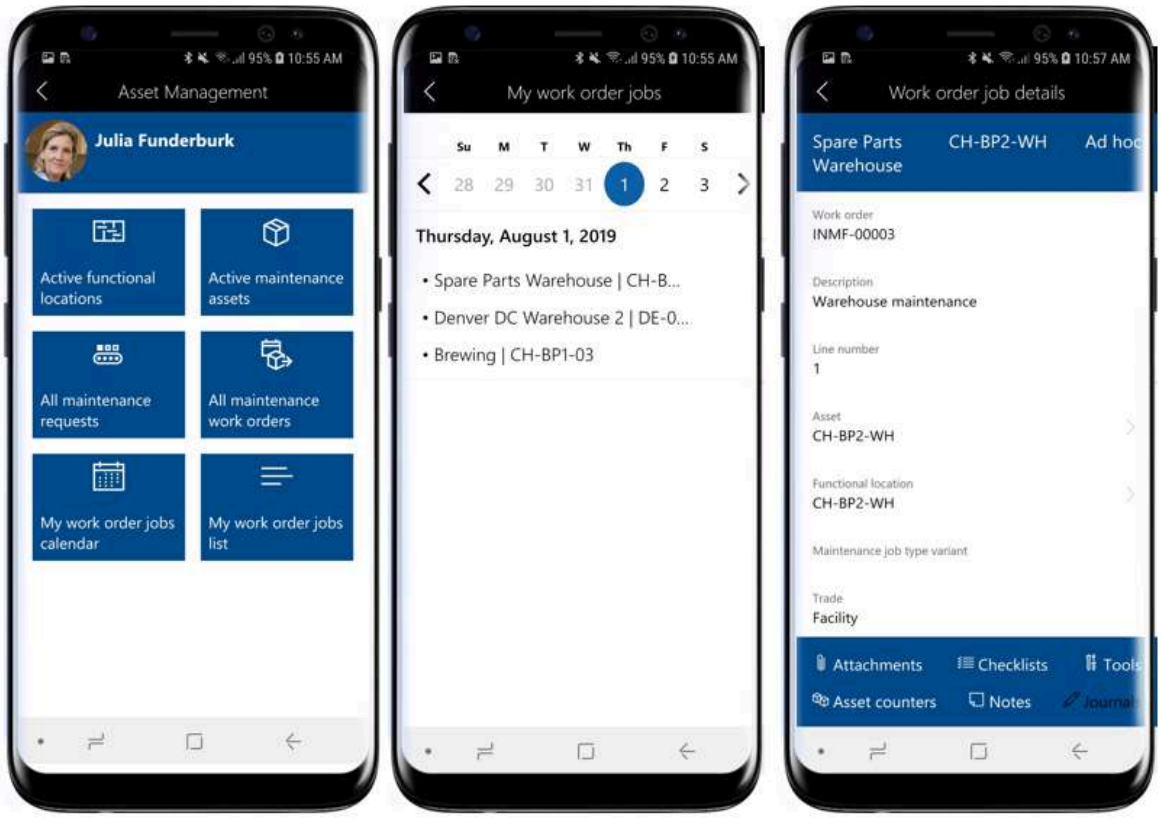
Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you'll have to refresh the list of mobile workspaces.



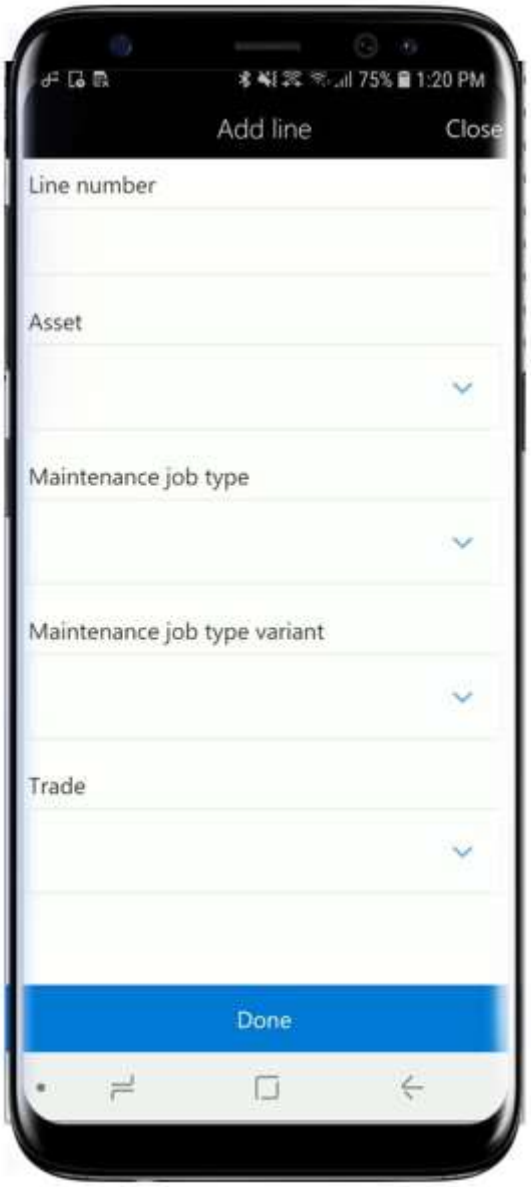
View assigned work order jobs in calendar view

1. On your mobile device, open the **Asset management** workspace.
2. Select **My work order jobs calendar**.
3. Select the date you want to view work order jobs for. In the list, you'll see the asset ID and functional location ID for each work order job.
4. Select a work order job in the list to see job details: Asset and functional location details as well as other navigation links to view **Attachments**, **Checklists**, **Tools**, **Asset counters**, **Notes**, **Journals**.



Create a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to create a new work order job for.
4. Select the **Add line** button.
5. Select the **Asset** you want to create a work order job for.
6. Select **Maintenance job type**, **Maintenance job type variant** and **Trade**.
7. Select **Done**.

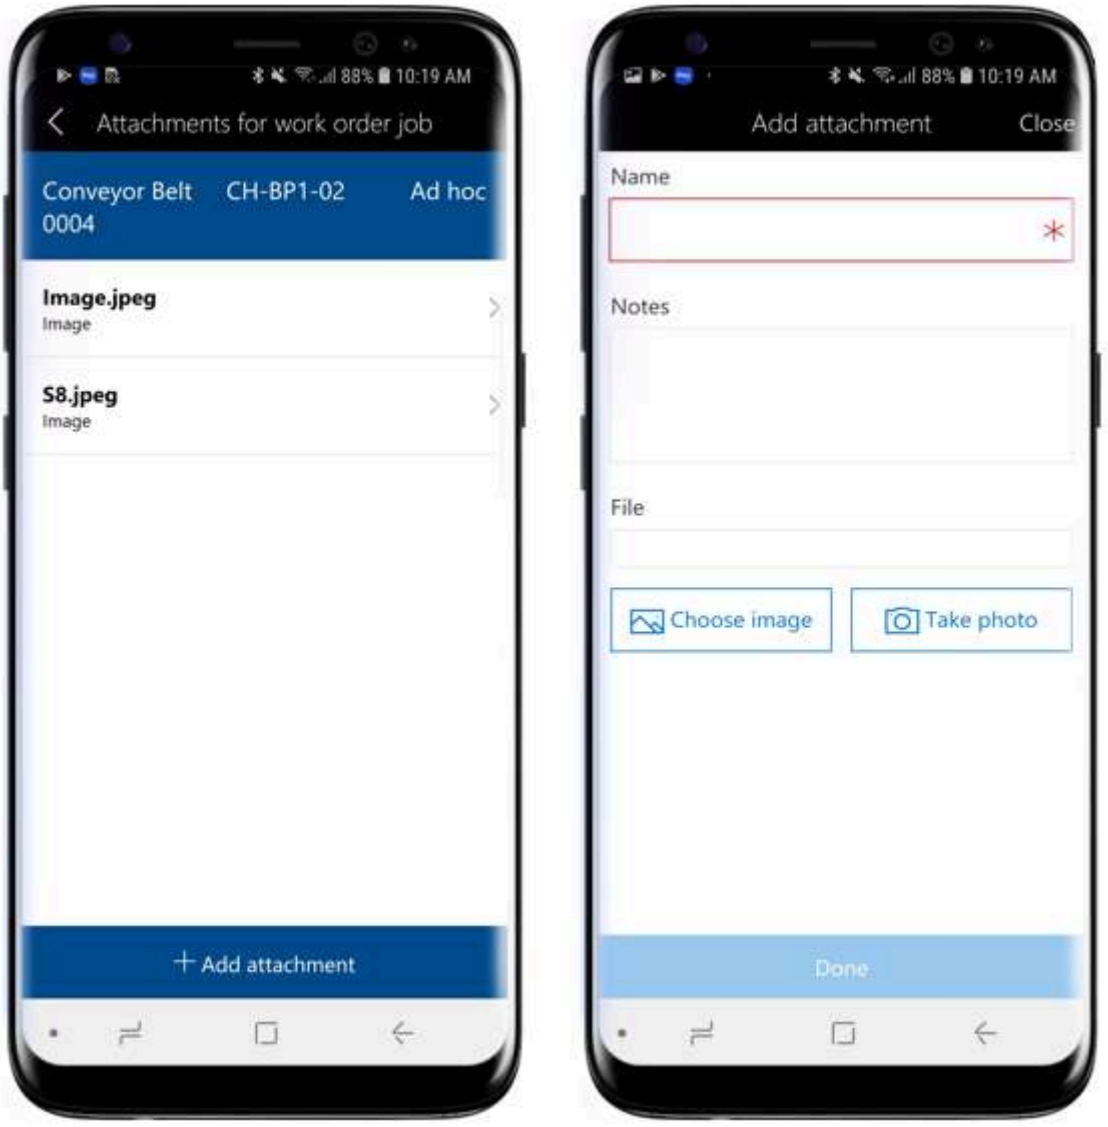


Add attachment to a work order job

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order > work order job you want to add an attachment to.
    - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **Work order job details** page.
4. Select **Attachments** on the **Work order job details** page.
5. You'll see existing attachments on the work order job. Select **Add attachment**.
6. Enter **Name** and **Notes** for the attachment.

7. Select **Choose image** to select a photo from the mobile gallery, or **Take photo** to take a photo.

8. Select **Done**.



View maintenance checklist on a work order job

1. On your mobile device, open the **Asset management** workspace.

2. Select **All maintenance work orders**.

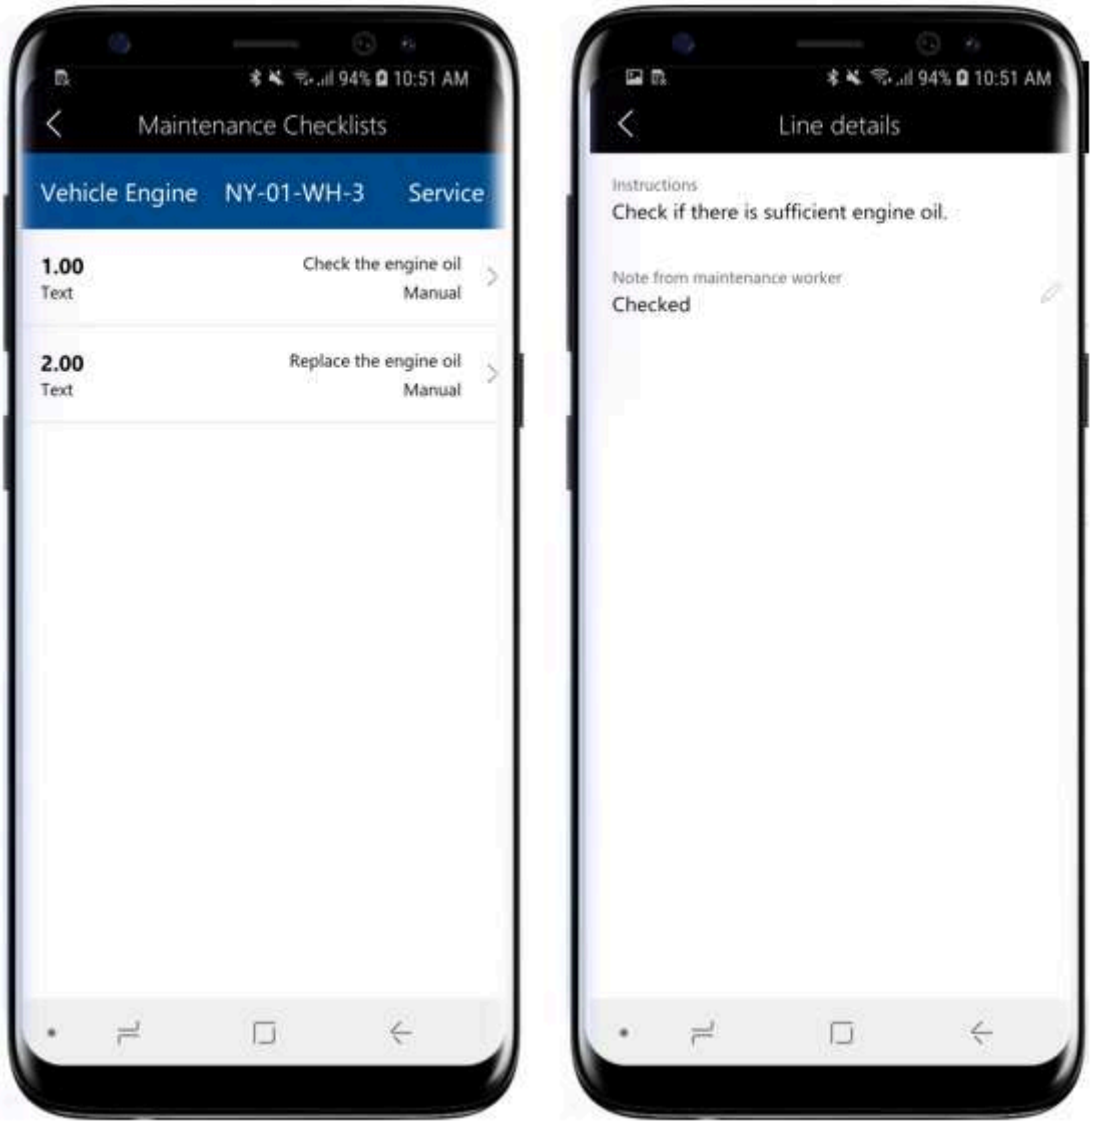
3. Select the work order > work order job you want to view checklists for.

    - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.

4. Select **Checklists** on the **Work order job details** page.

5. You'll see a list of checklist lines related to the work order job. Select a checklist line to view **Instructions** and add **Notes**.

6. Select the back button (<) to return to the previous page.



View and update asset counters on a work order job

1. On your mobile device, open the **Asset management** workspace.

2. Select **All maintenance work orders**.

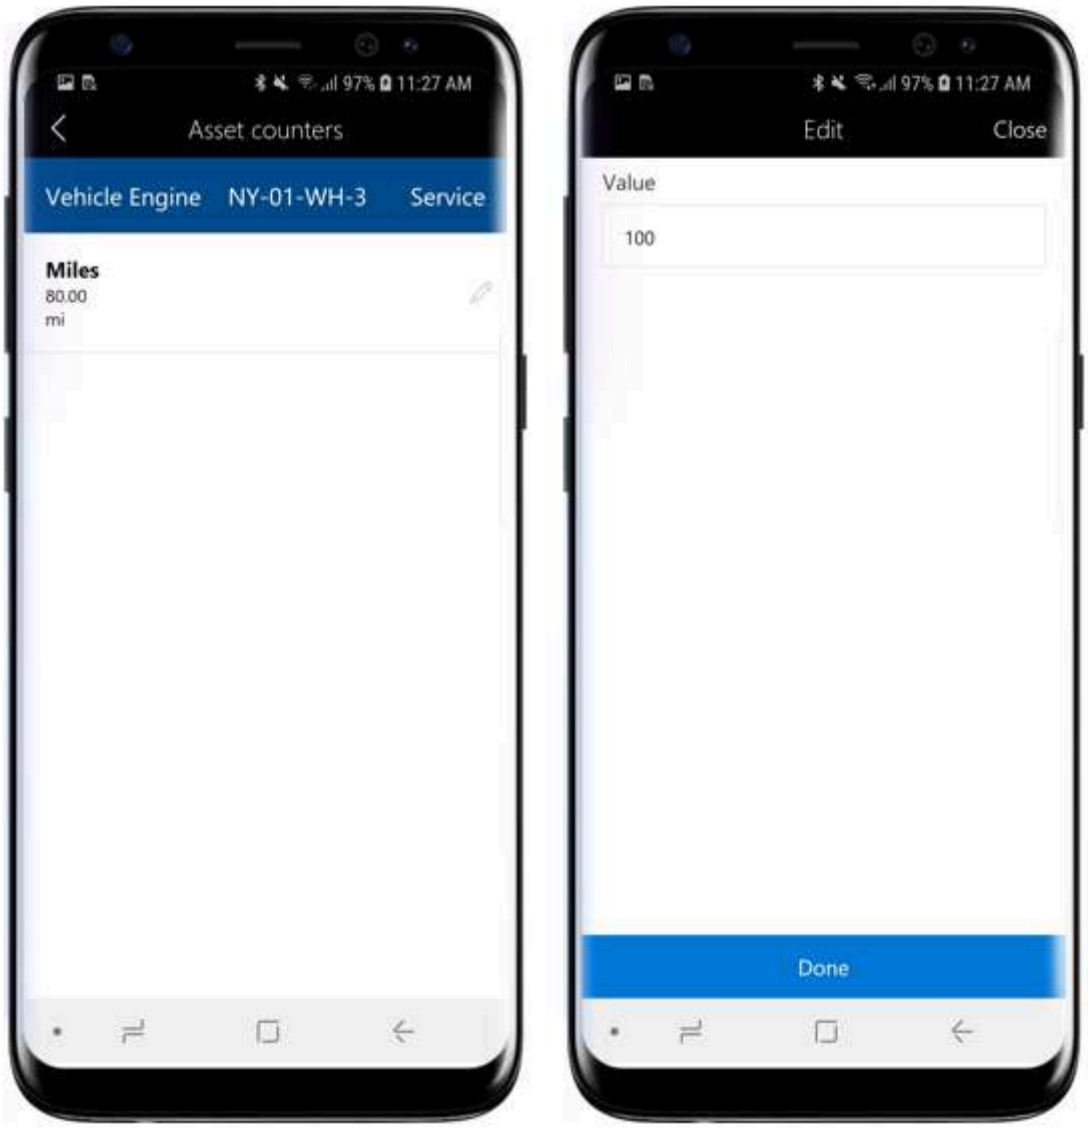
3. Select the work order > work order job you want to view asset counters for.

    - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.

4. Select **Asset counters** on the **Work order job details** page.

5. You see a list of asset counters related to the work order job. Select the pencil icon on an asset counter line to update the counter value.

6. Enter a new counter value, and select **Done**.



Register consumption on a work order job

1. On your mobile device, open the **Asset management** workspace.

2. Select **All maintenance work orders**.

3. Select the work order > work order job you want to add consumption registrations for.

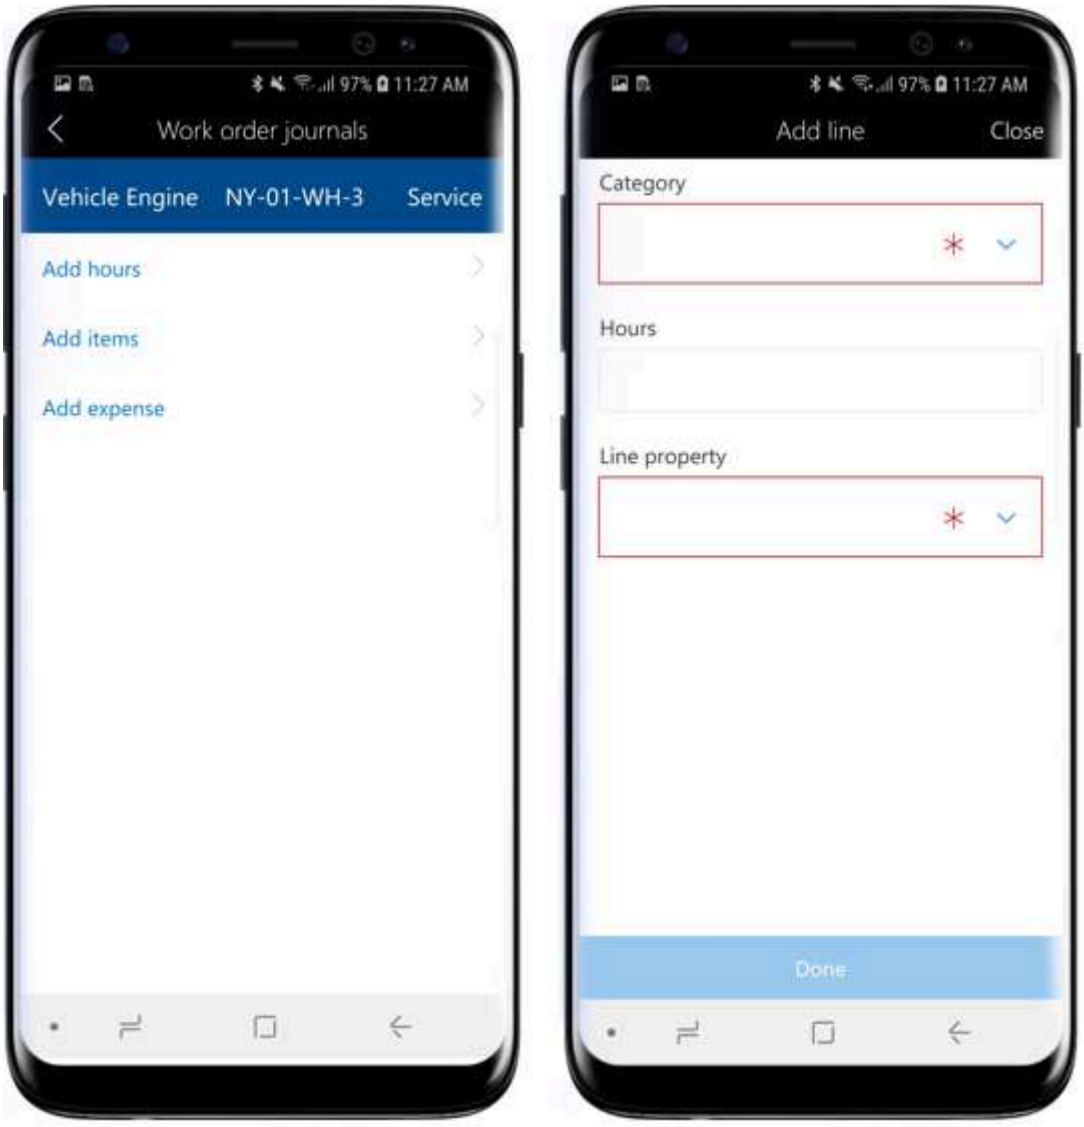
    - Alternatively, you can also select **My work order jobs calendar** or **My work order jobs list** on the home page to navigate to the **work order job details** page.

4. Select **Journals** on the **Work order job details** page.

5. Select **Add hours** to create work hour registrations.
    a. Select the **Category** from the lookup.
    b. In the **Hours** field, enter the number of work hours spent on the work order job.
    c. Select the appropriate **Line property**.
    d. Select **Done**.

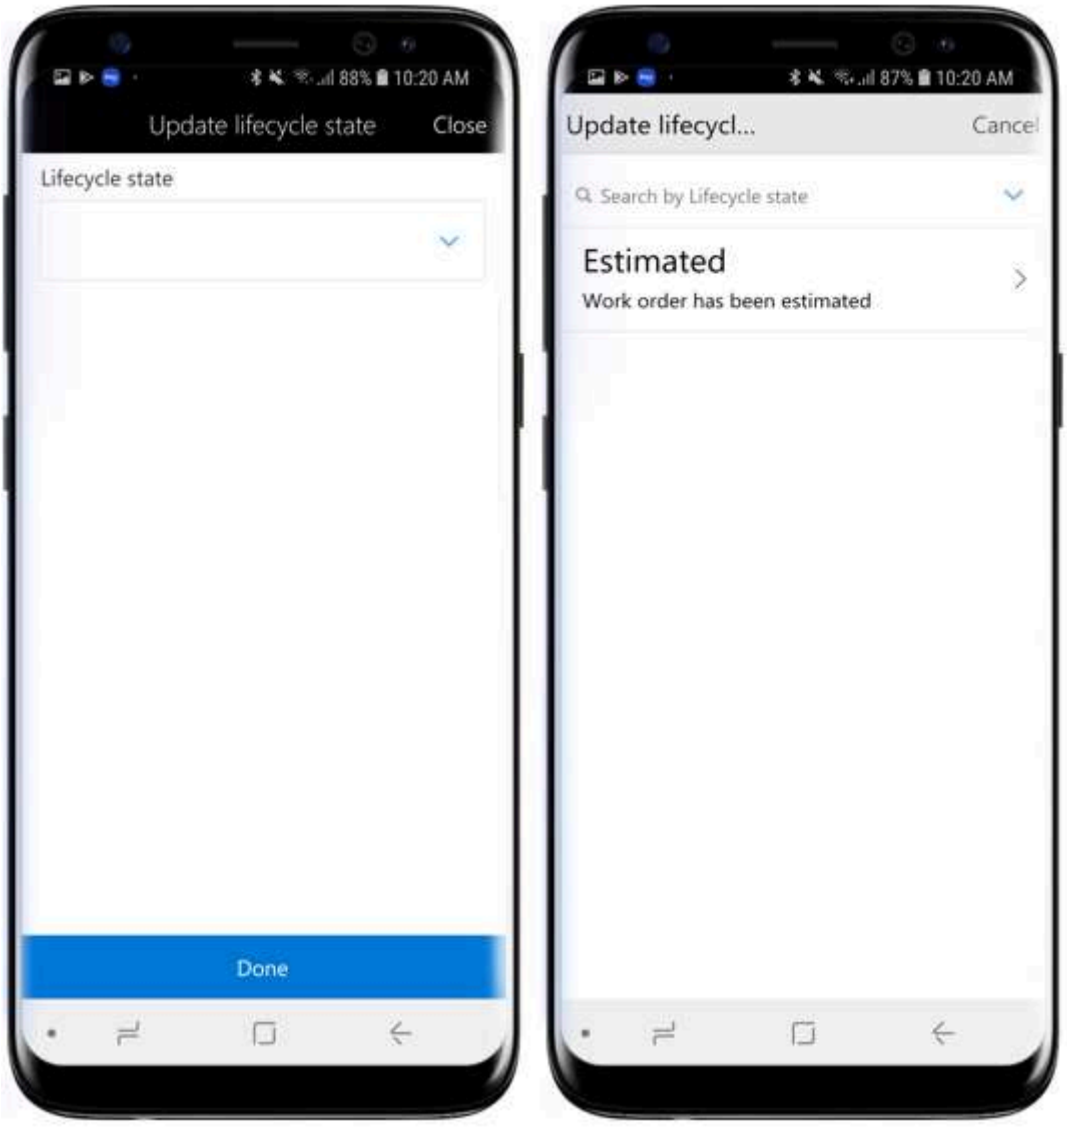
6. Select **Add items** to create item registrations.
    a. Select the **Item number** from the lookup.
    b. Select the **Site** from the lookup.
    c. Enter the **Quantity** of items consumed.
    d. Select **Done**.

7. Select **Add expense** to create expense registrations.
    a. Select the **Category** from the lookup.
    b. Enter the quantity for the expense registration.
    c. Select the **Sales currency** from the lookup.
    d. Enter the **Cost price** for the expense registration.
    e. Select **Done**.



Update lifecycle state on a work order

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance work orders**.
3. Select the work order you want to update lifecycle state for.
4. Select the **Update state** button at the bottom of the screen.
5. Select a new lifecycle state from the list.
6. Select **Done**.

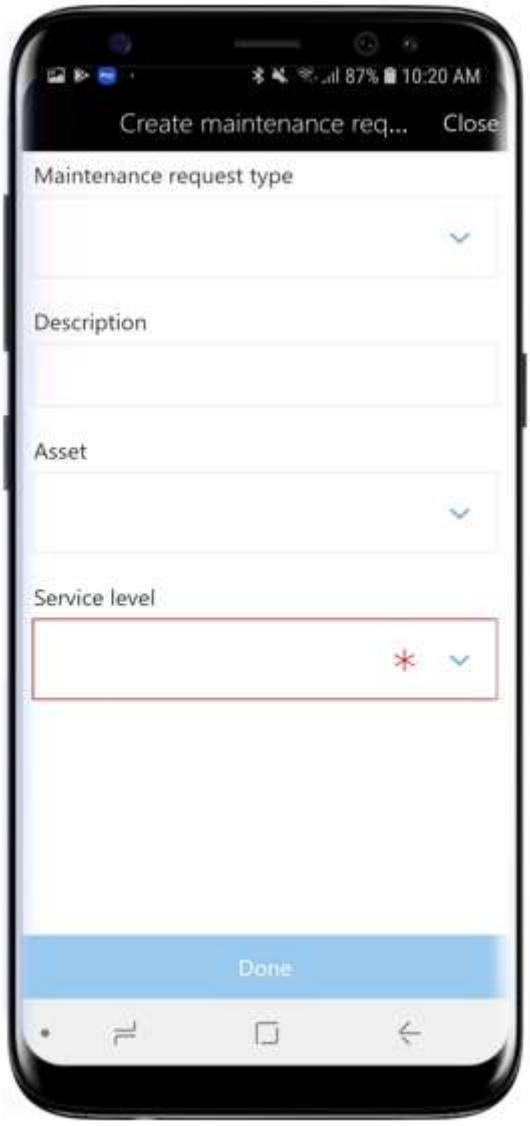


Create a maintenance request

1. On your mobile device, open the **Asset management** workspace.
2. Select **All maintenance requests**.
3. Select **Actions** at the bottom of the screen, and select **Create maintenance request**.
4. If number sequence is enabled for maintenance requests in **Asset management**, the **Maintenance request** field is hidden because it is automatically filled out. If the **Maintenance request** field is visible, enter a maintenance request ID.
5. Select a **Maintenance request type**.
6. Enter a **Description** for the maintenance request.
7. Select the **Asset** you want to create the request for.

8. Select the **Service level** for the maintenance request.

9. Select **Done**.



Add attachment to a maintenance request

1. On your mobile device, open the **Asset management** workspace.

2. Select **All maintenance requests**.

3. Select the maintenance request you want to add an attachment to.

4. Select **Attachments** at the bottom of the screen.

5. Select **Add attachments**.

6. Enter **Name** and **Notes** for the attachment.

7. Select **Choose image** to select a photo from the mobile gallery or **Take photo** to take a photo.

8. Select **Done**.

This article provides information about the **Company directory** mobile workspace. This workspace lets users view and contact other employees in their organization.

This mobile workspace can be used with the finance and operations mobile app.

Overview

The **Company directory** mobile workspace lets users perform these tasks:

- View a list of employees in the organization.
- Search for employees in the organization.
- View contact information for employees.
- Contact employees from the profile information.

Prerequisites

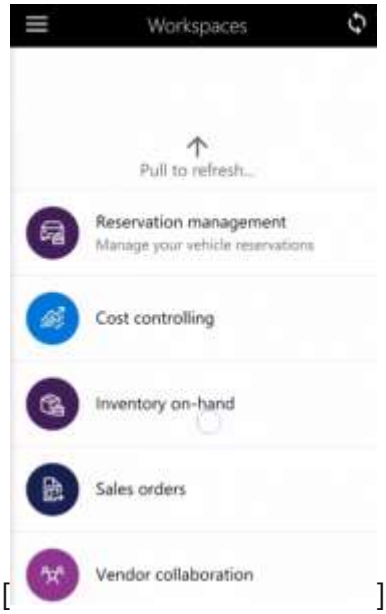
Before you can use this mobile workspace, the following prerequisites must be met.

Expand table

Prerequisite	Role	Description
One of the following products must be deployed in your organization: • A finance and operations app • Microsoft Dynamics 365 Human Resources	System administrator	If you don't already have a finance and operations app deployed in your organization, see Deploy a demo environment. If you don't already have Human Resources deployed in your organization, the system administrator can access a trial version from the Human Resources webpage.
The **Company directory** mobile workspace must be published.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.



View the company directory by using the mobile workspace

1. In the mobile app, select the **Company directory** workspace. A list of employees is shown.
2. Select an employee. The **Employee profile** page appears. The information on this page includes the employee's first name, last name, title, and department.

Search the company directory by using the mobile workspace

1. In the mobile app, select the **Company directory** workspace.
2. In the **Search** field, enter an employee's first name, last name, title, or department to start the search.
3. Select an employee. The **Employee profile** page appears. The information on this page includes the employee's first name, last name, title, and department.

Cost controlling mobile workspace

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Human Resources, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article provides information about the **Cost controlling** mobile workspace. Cost center managers use this workspace to view information about cost center performance anytime and anywhere.

Use this mobile workspace with the finance and operations (Dynamics 365) mobile app.

Overview

The **Cost controlling** mobile workspace provides an instant view of the current performance of cost centers by comparing actual costs against the budgeted costs. You can drill down to the

status of individual cost elements.

For example, an employee receives an invitation to an international conference, but the organization must cover all the travel expenses. The employee asks their manager whether they can attend the conference. The manager opens the **Cost controlling** mobile workspace on their mobile device to see whether there's budget for the employee to attend the conference.

Data security

The data in the **Cost controlling** mobile workspace is secured through user credentials. Cost center managers are allowed to see data only for their own cost center. The access-level security is managed in the **Cost accounting** module.

Cost accountants define the configuration of the **Cost controlling** mobile workspace in the **Cost accounting** module. After the workspace is published to the mobile app, it's available in the app. Therefore, all cost center managers in the organization can view data in the same format.

Actions, views, and links

The **Cost controlling** mobile workspace provides the following actions, views, and links:

- **Actions:**
  - Use **Select configuration** to select a layout.
  - Use **Select cost object** to select the cost centers to filter data on.

    ```
    > [!NOTE]
    > The cost centers that appear in the list depend on the access that you grant in the **Cost accounting** module.
    ```

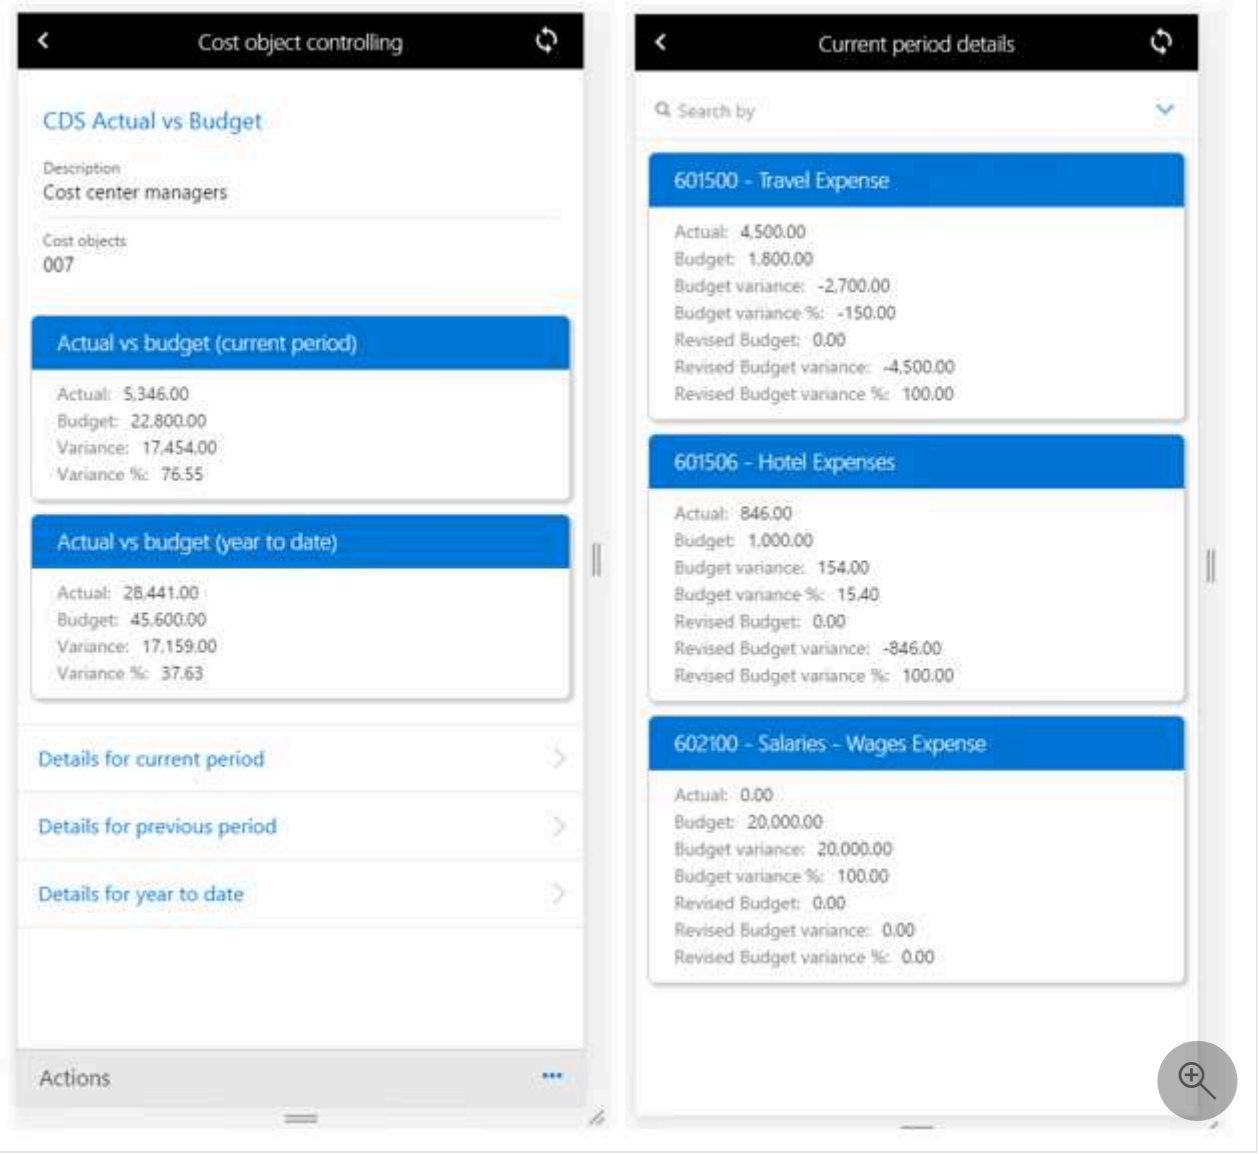
- **Views:** Based on the actions that you select and the configuration in the **Cost accounting** module, you can view the following information on the cards:
  - Actual vs budget (current period)
  - Actual vs revised budget (current period)
  - Actual vs budget (previous period)
  - Actual vs revised budget (previous period)

- Actual vs budget (year to date)
- Actual vs revised budget (year to date)

  The following amounts show on every card: Actual, Budget, Variance, and Variance %.

- **Links:**
  - Details for current period
  - Details for previous period
  - Details for year to date

  When you select a link, a card shows for each cost element. The following amounts show on every card: Actual, Budget, Budget variance, Budget variance %, Revised budget, Revised budget variance, and Revised budget variance %.



Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that you deploy for your organization.

Prerequisites if you use Microsoft Dynamics 365 Finance

If you deploy Finance for your organization, the system administrator must publish the **Cost controlling** mobile workspace. For instructions, see Publish a mobile workspace.

Prerequisites if you use version 1611 with Platform update 3 or later

If your organization uses version 1611 with Platform update 3 or later, the system administrator must complete the following prerequisites.

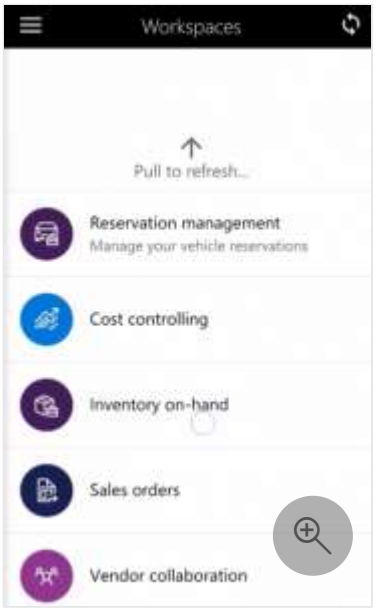
Expand table

Prerequisite	Role	Description
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the **Cost controlling** mobile workspace. To implement KB 4013633, your system administrator must follow these steps: 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services (LCS). 2. Install the metadata hotfix. 3. Create a deployable package that contains the **SCMMobile** model, and then upload the deployable package to LCS. 4. Apply the deployable package.
Publish the **Cost controlling** mobile workspace.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. If your system administrator publishes a new workspace later, you need to refresh the list of mobile

workspaces.



View the performance of your cost center by using the Cost controlling mobile workspace

1. On your mobile device, select the **Cost controlling** workspace.
2. Select **Cost object controlling**.
3. Select **Actions**.
4. Select **Select configuration** to select a cost controlling layout.
5. Select **Done**.
6. Select **Actions**.
7. Select **Select cost object** to select the cost centers that you have access to.
8. Select **Done**.
9. View the overall performance of your cost center.
10. Select the **Details for current period** link.
11. View the performance of individual cost elements.
12. You can also search for specific cost elements.

This article provides information about the **Inventory on-hand** mobile workspace. This workspace helps you gain insights into reserved and available inventory anytime and anywhere.

Use this mobile workspace with the finance and operations (Dynamics 365) mobile app.

Overview

Typically, companies ship and receive inventory multiple times each day. These movements constantly change the on-hand inventory status. The **Inventory on-hand** mobile workspace lets you see the cross-company on-hand inventory status, so that you can gain the latest insights into inventory data on the mobile device of your choice. Regardless of whether you work in the

warehouse, purchasing, sales, manufacturing, or management, or have other roles, you can access on-hand inventory data anytime and anywhere.

The mobile workspace provides an instant view of the on-hand status across facilities. It lets you view on-hand inventory across facilities, current material reservations, and unreserved on-hand inventory. You can also enter item numbers to query on-hand inventory, and can do a filtered search for on-hand products or variants.

Specifically, the mobile workspace provides these features:

- You can search by product number or product name to find products to view the on-hand inventory status for.
- For the selected products, you can view the following information:
  - On-hand inventory per site
  - On-hand inventory per warehouse
  - On-hand inventory per location
  - On-hand inventory per batch (for batch-controlled products)
  - On-hand inventory per inventory status
- Product on-hand inventory is shown in the following ways:
  - By physical inventory (This view represents the total amount.)
  - By physical reserved (This view represents the reserved amount.)
  - By available physical (This view represents available amount that has no reservations.)

Prerequisites

The prerequisites differ, based on the version of Supply Chain Management that you deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management is deployed for your organization, the system administrator must publish the **Inventory on-hand** mobile workspace. Learn more in Publish a mobile workspace.

Prerequisites if you use Platform update 3 or later

If you deploy platform update 3 or later for your organization, the system administrator must complete the following prerequisites.

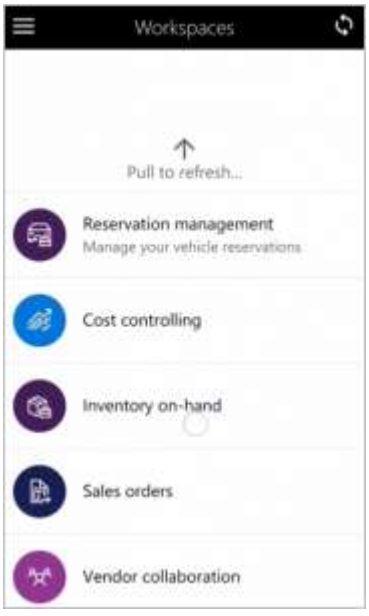
Create a deployable package that contains the **SCMMobile** model, and then upload the deployable package to Lifecycle Services. 4. Apply the deployable package.
Publish the **Inventory on-hand** mobile workspace.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Supply Chain Management URL.
3. When you sign in for the first time, enter your user name and password.
4. After you sign in, the app shows the available workspaces for your company. If your system administrator publishes a new workspace later, you need to refresh the list of mobile workspaces.



View the on-hand inventory for a product by using the Inventory on-hand mobile workspace

1. On your mobile device, select the **Inventory on-hand** workspace.
2. Select **Check on-hand for an item**. You see a list of the products that are loaded into your app for offline use. By default, 50 items are loaded, but a developer can change this number. For more information, developers should see Mobile platform.
3. If your item isn't in the list, select **Search more**. Search by product number, or switch to a search by product name.
4. Select a product. If the item has an image, the image is shown.
5. Select one of the following options to view the status of on-hand inventory:

   - View on-hand per site
   - View on-hand per warehouse
   - View on-hand per location
   - View on-hand per batch (for batch-controlled products)
   - View on-hand per inventory status

Invoice approvals mobile workspace

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article provides information about the **Invoice approvals** mobile workspace. This workspace provides a list of invoices that you receive through the vendor invoice header workflow process.

Use this mobile workspace with the finance and operations mobile app.

Overview

The **Invoice approvals** mobile workspace lets Accounts payable clerks and managers view invoices that the vendor invoice header workflow process assigns to them. You can view the invoice information, and even the line and distribution details, to help you make informed approval decisions. From the workspace, you can take action to move the invoice through the workflow process.

Prerequisites

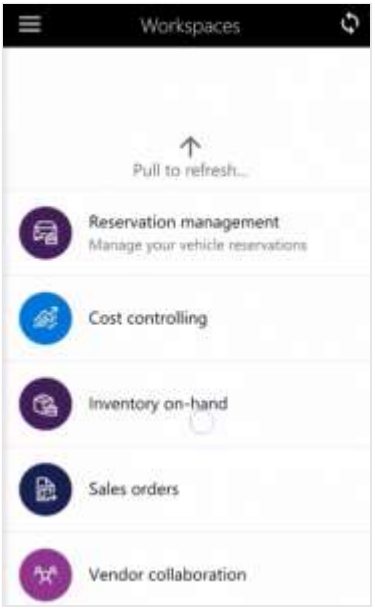
Before you can use this mobile workspace, the following prerequisites must be met.

Expand table

Prerequisite	Role	Description
Microsoft Dynamics 365 Finance must be deployed in your organization.	System administrator	See Deploy a demo environment.
The **Invoice approvals** mobile workspace must be published.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the app shows the available workspaces for your company. If your system administrator publishes a new workspace later, you need to refresh the list of mobile workspaces.



Approve invoices by using the Invoice approvals mobile workspace

1. On your mobile device, select the **Invoice approvals** workspace.
2. Select the invoice that the vendor invoice header workflow process assigned to you.
3. On the **Invoice details** page, review the invoice header information, such as the vendor and date information.

4. Select a line on the invoice to view more detailed information about it in the **Invoice line details** view.
5. In the **Invoice line details** view, select **Distributions** to show the line distributions. Here, you can view the accounting for the invoice line. The information that is shown includes the financial dimensions and the main account.
6. On the **Invoice details** page, select **Distributions** to show all distributions. Here, you can view the accounting for the whole invoice. The information that is shown includes the financial dimensions and the main accounts.
7. Select **Attachments** to view any notes or files that are attached to the invoice.
8. On the **Invoice details** page, select the appropriate workflow action to complete your review process.
9. Select **Done**.

My team mobile workspace

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article provides information about the **My team** mobile workspace. This workspace lets managers view their direct reports and extended staff. They can also send praise to individuals in their reporting chain.

Use this mobile workspace with the finance and operations mobile app.

Overview

The **My team** mobile workspace lets managers perform these tasks:

- View a list of the manager's direct reports.
- View a list of the manager's extended reporting team.
- View detailed information for each team member, such as birth date, seniority date, years of service, and compensation and performance information.
- Send praise to any individual in the manager's extended reporting team.

Prerequisites

Before you can use this mobile workspace, the following prerequisites must be met.

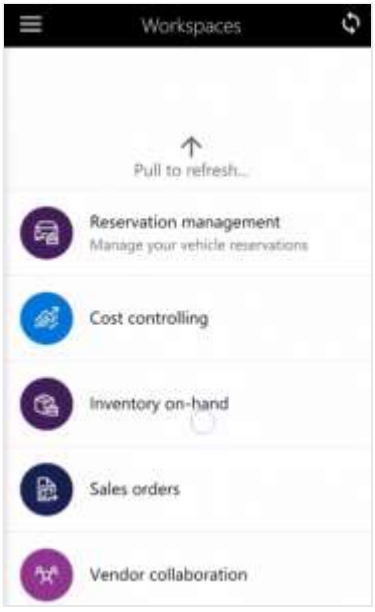
Expand table

Prerequisite	Role	Description
One of the following products must be deployed in your organization:	System administrator	If you don't already have a finance and operations app deployed in your organization, see Deploy a demo environment. If you don't already have Human Resources deployed in your organization, the system administrator can access a trial version from the Human Resources webpage.

Prerequisite	Role	Description
• A finance and operations app • Microsoft Dynamics 365 Human Resources		
The **My team** mobile workspace must be published.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.



View team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.

2. Select a team member. The **Team member summary** page appears. The information on this page includes the team member's birth date, seniority date, years of service, years in the current position, and compensation information.

View extended team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.
2. Select the **Direct reports** link. A list of your extended team is shown.
3. Select a team member. The **Team member summary** page appears. The information on this page includes the team member's birth date, seniority date, years of service, years in the current position, and compensation information.

Send praise about team members by using the My team mobile workspace

1. In the mobile app, select the **My team** workspace. A list of team members is shown. The list also shows each team member's title, and any direct reports that the member has.
2. Select a team member. The **Team member summary** page appears.
3. Select **Send praise**.
4. Enter the text of the praise that you want to send.
5. Select **Done**.

Project mobile applications overview

Three mobile applications related to project time are available for Microsoft Dynamics 365: Project Timesheet, Project Time Entry, and My timesheets/Timesheets for my review (Optimized for mobile).

Project Timesheet mobile app

The Dynamics 365 Project Timesheet mobile app lets users submit and approve timesheets for projects on their mobile device. This mobile app surfaces the timesheet functionality in the Project management and accounting area of Dynamics 365 Finance. It helps improve user productivity and efficiency, and also helps with the timely entry and approval of project timesheets.

Project Time Entry workspace

The Project Time Entry workspace lets users enter and save time against a project. However, it doesn't let users submit or approve project timesheets. It can be used only for time entry. This mobile workspace is intended to be used together with the finance and operations mobile application.

My timesheets/Timesheets for my review

My timesheets (Optimized for mobile) and Timesheets for my review (Optimized for mobile) make up a solution that lets employees create, submit, and approve project timesheets on a mobile device. Workers can access the Finance functionality through the URL for the application. This solution doesn't require the finance and operations mobile application.

For more information

- Project timesheet mobile application
- Project time entry
- Project timesheets on a mobile device
- Implement custom fields for the Microsoft Dynamics 365 Project Timesheet mobile app on iOS and Android

Project timesheet mobile application

Article • 03/19/2025

Overview

The Microsoft Dynamics 365 Project Timesheet mobile app lets users submit and approve timesheets for projects on their mobile device (iPhone or Android). This mobile app surfaces the timesheet functionality that resides in the Project management and accounting area of Dynamics 365 Finance. It helps improve user productivity and efficiency, and also enables timely entry and approval of project timesheets.

Deprecation of mobile app (Dec 2025)

Microsoft ended support for Xamarin on **May 1, 2024**. As a result, the Dynamics 365 Project Timesheet mobile app (which is based on Xamarin) will be **deprecated by Dec 31, 2025**.

You can use Timesheets optimized for mobile as an alternative mobile experience that supports creation, submission, and reviewing of timesheets.

> **Important**
>
> Learn about the end of Microsoft Xamarin support in the Xamarin Support Policy. Microsoft recommends that customers switch to Timesheets optimized for mobile to avoid potential disruptions caused by security issues that result from ending Xamarin support.

Download and install the mobile app

Download and install the Microsoft Dynamics 365 Project Timesheet mobile app for Android or iPhone from the mobile store for your device.

Enable the app

In Finance, the Project Timesheet mobile app must be enabled. To enable the functionality, go to **Project management and accounting parameters** > **Timesheet** and select the **Enable Microsoft Dynamics 365 Project Timesheet** parameter.

Resolve sign-in issues

Issue: During sign-in to the Project Timesheet Mobile app, users receive an error message that states that they "can't access the application '2bc50526-cdc3-4e36-a970-c284c34cbd6e' in that tenant."

Issue: During sign-in to the Project Timesheet Mobile app, users receive an error that resembles one of the following examples:

- "AADSTS50020: User account '[user name]' from identity provider 'https://sts.windows.net/[app ID]' doesn't exist in tenant '[tenant ID]' and can't access the application '[app ID]' in that tenant."
- "Selected user account doesn't exist in tenant '[tenant ID]' and can't access the application '[app ID]' in that tenant."

Explanation: These issues are caused by a change that was made to Microsoft Entra ID in May 2022 and that is related to external users. Because this change wasn't made to finance and operations apps, it can affect customers on any version of the platform or application.

Fix: All external users must be invited to the tenant through Microsoft Entra ID. For more information, see Invite users with Microsoft Entra B2B collaboration.

Sign in to the app

1. Start the app on your mobile device.
2. Enter your Finance URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. You'll be signed into your default company.

Submit a project timesheet

You can create and submit a project timesheet in the app. You can base a new timesheet on information from a previous timesheet, saved lines, or project assignments. If you're designated as a delegate, you can also enter a timesheet for another worker. To create a timesheet as a delegate, select the **Menu** button and then select a resource name.

The timesheet page creates a new timesheet for the timesheet period, based on the current date. The work week is displayed. If the timesheet period covers multiple weeks,

you can select another work week from the work week tabs. If a timesheet exists for the current date, it's displayed. If you need to create a new timesheet in a different timesheet period, select the **Menu** button and then select **New timesheet**.

You can enter project information by clicking the **Add time** action or the **Copy time from** action. The **Copy time from** action copies project line information, but not the hours. The **Copy time from** menu includes the following options:

- **Copy from existing timesheet** - Copy timesheet lines from an existing timesheet.
- **Copy from favorite** - Create new timesheet lines by using the timesheet settings that you selected as favorites.
- **Copy from assignment** - Create new timesheet lines from assigned projects.

The project information that is displayed is dependent on the mobile parameters that you defined on the **Project management and accounting parameters** page.

In the **Legal entity** field, select the legal entity for which you performed project work. The **Legal entity** field is available only if intercompany timesheet support has been enabled for your legal entity.

Select the customer who is associated with the project for the timesheet. For the initial release on the Android, entry by customer isn't supported, as you must select the project first. If you selected the project first, the **Customer** field is filled in automatically.

In the **Project** field, select the project that you're entering time for. The **Customer** field is filled in automatically.

The customer and project lookups enable searching across both customers and projects.

Select information in the **Category**, **Activity**, **Line property**, **Sales tax group**, and **Item sales tax group** fields as required. These fields can be overridden.

The **Line property** field is set to a default value, based on project management and accounting parameters. When the project/category and category/resource parameters are enabled, the **Line property** value is set to the default value you have defined for this validation. When the project/category and category/resource parameters aren't enabled, the **Line property** value defaults according to the **Enable default line property** field on the **Project management and accounting parameters** page. The **Line property** value can be overridden.

Select a day to add time. Enter the number of hours that you worked each day.

To add comments about the hours you're entering, click **Add comments**, and then enter comments for an internal audience, customer audience, or both. Internal comments can be viewed by project managers. Customer comments are included on invoices.

To save the line as a favorite, select the check box, and then click **Save as favorite**.

Financial dimension and attachment support aren't provided in the mobile application.

Continue adding project lines as needed to complete your timesheet.

Click **Submit** to send the timesheet to the approval workflow.

Review timesheets

A list of the timesheets that need to be reviewed is available on the menu. This option is only available if you've been designated as a workflow approver. Both header and line approval are supported. Line level approval offers the ability to mark one or more lines for approval. After reviewing the timesheet information, click **Approve**, **Delegate**, or **Return** to continue the workflow.

> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article provides information about the **Purchase order approval** mobile workspace. This workspace lets you view purchase orders and respond to them through actions. For example, you can approve or reject a purchase order.

Overview

Purchase orders that require approval go through an approval workflow. The workflow can include various steps that require that one or more people take action. For example, a person might have to complete a task or approve the purchase order.

The **Purchase order approval** mobile workspace lets you easily view and respond to purchase orders from your mobile device. This workspace also lets you take the same workflow actions

that you can take from the web client.

Prerequisites

The prerequisites vary, depending on the version of Supply Chain Management that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Purchase order approval** mobile workspace. For instructions, see Publish a mobile workspace.

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

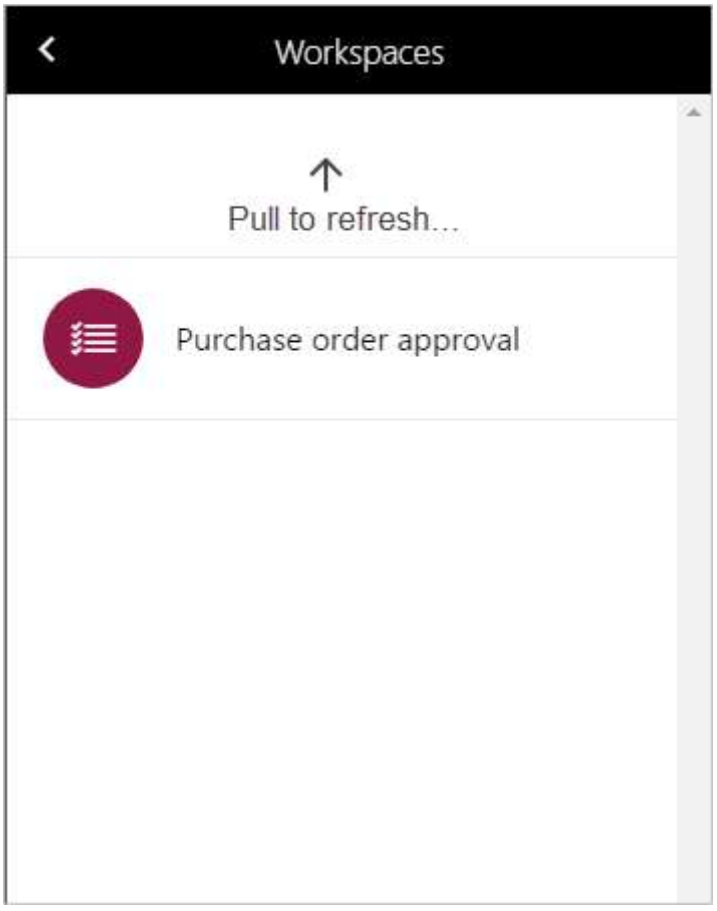
If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

Expand table

Prerequisite	Role	Description
Implement KB 4017918.	System administrator	KB 4017918 is an X++ update or metadata hotfix that contains the **Purchase order approval** mobile workspace. To implement KB 4017918, your system administrator must follow these steps: 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services. 2. Install the metadata hotfix. 3. Create a deployable package that contains the **SCMMobile** model, and then upload the deployable package to Lifecycle Services. 4. Apply the deployable package.
Publish the **Purchase order approval** mobile workspace.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. If your system administrator publishes a new workspace later, you'll have to refresh the list of mobile workspaces.



View orders that are assigned to you

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take action in the purchase order approval workflow.
3. Select an order. On the **Order details** page, you'll see the order header information and lines. You can also find guidelines from the workflow task.
4. Select **Accounting distributions** to open the **Header accounting distributions** page.
5. Return to the **Order details** page, and select a line. From the order line details, you can also explore the line-specific accounting distributions.

Complete an action on the purchase order

After you've viewed the purchase order that is assigned to you and read the workflow instructions, you should be ready to take action.

1. On your mobile device, select the **Purchase order approval** workspace.
2. Select **Orders assigned to me** to view all the purchase orders for which you've been asked to take action in the purchase order approval workflow.
3. Select an order, and view the details page.
4. Select **Actions** to show the available actions. The actions that are available depend on the task that has been assigned to you.

Expand table

Task action	Approval action
Complete	Approve
Return	Reject
Request change	Request change
Delegate	Delegate

5. Select the appropriate action.
6. On the **Complete task** page, enter a comment. If you select the **Delegate** action, you must select a user to delegate the task to.
7. Select **Done**. After you refresh your workspace, the purchase order will no longer be in your list.

This article provides information about the **Sales orders** mobile workspace. This workspace helps you stay up to date about your sales orders anywhere and anytime.

This mobile workspace is intended to be used with the finance and operations (Dynamics 365) mobile app.

Overview

The **Sales orders** mobile workspace lets you view detailed information about each sales order. This information includes the status of the order, contact information for the customer, and contact information for the order taker. The **Sales orders** mobile workspace provides an instant

view of sales orders. You can view all sales orders, view sales orders by customer, or view information about a specific sales order.

The mobile workspace provides two views to help you analyze sale orders in depth.

View all sales orders

This view lists all sales orders.

- Use one of the following filters to select the sales orders to view:
  - Search by sales order
  - Search by customer account
  - Search by customer name
  - Search by status
  - Search by release status
  - Search by created date and time

- After you select sales orders, you can view the details of specific orders. Specifically, you can view the following information:
  - Customer name and address information
  - Various dates for the sales order, such as the requested ship date and the confirmed ship date
  - Contact information for the order taker
  - Customer contact information
  - Order lines
  - Shipments that show how and when a sales order was shipped

View orders for a customer

This view lists sales orders by customer.

- Use one of the following filters to view orders for a customer:
  - Search by name
  - Search by account

- After you select a customer, you can view the following information:

  - Customer name and group

  - Customer contact information

  - Customer sales orders and details about those sales orders:
    - Customer name and address information

- Various sales order dates
- Contact information for the order taker
- Customer contact information
- Order lines
- Shipments that show how and when a sales order was shipped

Prerequisites

The prerequisites differ, based on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Sales orders** mobile workspace. For instructions, see Publish a mobile workspace.

Prerequisites if you use Dynamics 365 for Operations version 1611 with platform update 3 or later

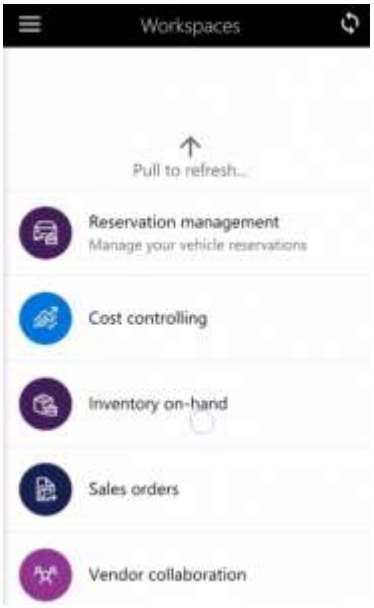
If Dynamics 365 for Operations version 1611 with platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

Expand table

Prerequisite	Role	Description
Implement KB 4013633.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the **Sales orders** mobile workspace. To implement KB 4013633, your system administrator must follow these steps: 1. Download the metadata hotfix from Microsoft Dynamics Lifecycle Services. 2. Install the metadata hotfix. 3. Create a deployable package that contains the **SCMMobile** model, and then upload the deployable package to Lifecycle Services. 4. Apply the deployable package.
Publish the **Sales orders** mobile workspace.	System administrator	See Publish a mobile workspace.

Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company is shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.



View information about sales orders for a customer by using the Sales order mobile workspace

1. On your mobile device, select the **Sales orders** workspace.
2. Select **View orders for a customer**.
3. Use account or customer name information to find the customer.
4. Select the customer.
5. Select **Contact information** or **Sales orders**. If you select **Sales orders**, a list of sales orders for the customer is shown.
6. Select **Sales order**. You can now view information about sales order lines, information about shipments, customer contact information, and contact information for the order taker.

Vendor collaboration mobile workspace

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

> **Important**
>
> Starting February 2026, new customers can't create projects in Microsoft Dynamics Lifecycle Services for Microsoft Dynamics 365 Finance, Microsoft Dynamics 365 Supply Chain Management, and Microsoft Dynamics 365 Project Operations. New customers should use the Power Platform admin center instead. For more information, see Lifecycle Services project creation freeze.

This article provides information about the **Vendor collaboration** mobile workspace. This workspace helps your vendors stay up to date about the purchase orders that have been sent to them for approval. They can also view information about new and updated purchase orders and contacts.

This mobile workspace is intended to be used with the finance and operations (Dynamics 365) mobile app.

Overview

The **Vendor collaboration** mobile workspace keeps vendors informed about new purchase orders, so that they can view purchase orders and then respond to them in the web client.

> ⓘ **Note**
>
> The mobile workspace should be used as a supplement to the vendor collaboration web interface, not a replacement for it.

Your vendors can use the **Vendor collaboration** mobile workspace to view new purchase orders that are sent to them for approval. It shows purchase order information, such as products, quantities, and requested receipt dates. Price information is also available, depending on the configuration of each vendor.

A user who signs in as a vendor will see which purchase orders have been responded to, and which purchase orders are still awaiting customer action. For example, a purchase order might be awaiting customer action because the vendor suggested another receipt date, but the customer hasn't yet agreed to that date. The vendor will also see a list of purchase orders that have been confirmed but haven't yet been delivered.

To respond to a purchase order, the vendor must use the vendor collaboration web interface that is available in the web client. There, the vendor can also get more information about the order, such as document attachments, the delivery address per line, and charges that are associated with the vendor.

Vendors that have a special security role can see which contact persons are registered for a vendor account. The same security role lets a vendor view the status of any user request that has been submitted.

The vendor collaboration web interface in the web client must be used to create new contacts and submit new user requests.

The **Vendor collaboration** mobile workspace lets a vendor perform these tasks:

- View new purchase orders that are sent to the vendor.
- View purchase orders that the vendor has responded to, and that are awaiting customer action.
- View purchase orders that have been confirmed but haven't yet been fully received.
- View contact person information that is registered for the vendor account. (This task requires an additional security role.)
- View information about a user request that was submitted by the vendor, and follow the status of the request. (This task requires an additional security role.)

Prerequisites

The prerequisites vary, depending on the version of Microsoft Dynamics 365 that has been deployed for your organization.

Prerequisites if you use Supply Chain Management

If Supply Chain Management has been deployed for your organization, the system administrator must publish the **Vendor collaboration** mobile workspace. For instructions, see Publish a mobile workspace.

Prerequisites if you use Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later

If Microsoft Dynamics 365 for Operations version 1611 with Platform update 3 or later has been deployed for your organization, the system administrator must complete the following prerequisites.

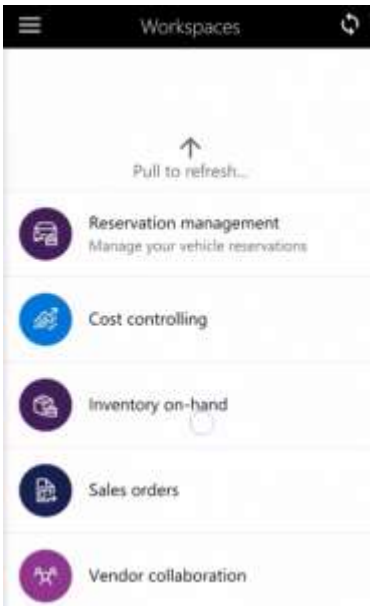
Expand table

Prerequisite	Role	Description
KB 3216943 must be implemented if you're using Platform update 3.	System administrator	KB 3216943 is a binary update that is required if you're using Platform update 3. To implement this KB, the system administrator must follow these steps: 1. Download KB 3216943 from Microsoft Dynamics Lifecycle Services. 2. Install the binary update, which is delivered as a deployable package. For information about how to apply a deployable package, see Apply a deployable package.
KB 4013633 must be implemented.	System administrator	KB 4013633 is an X++ update or metadata hotfix that contains the **Inventory on-hand** mobile workspace. To implement KB 4013633, your system administrator must follow these steps: 1. Download the metadata hotfix from Lifecycle Services. 2. Install the metadata hotfix. 3. Create a deployable package that contains the **SCMMobile** model, and

Prerequisite	Role	Description
		then upload the deployable package to Lifecycle Services. 4. Apply the deployable package.
The **Vendor collaboration** mobile workspace must be published.	System administrator	See Publish a mobile workspace.
The vendor user must have access to the vendor collaboration web interface in the web client and must set up a vendor collaboration user.	Purchasing professionals and the system administrator	Follow the steps in the following articles to set up and work with the vendor collaboration web interface. • Use vendor collaboration to work with external vendors • Manage vendor collaboration users • Set up and maintain vendor collaboration • Use vendor collaboration to work with customers in Supply Chain Managements

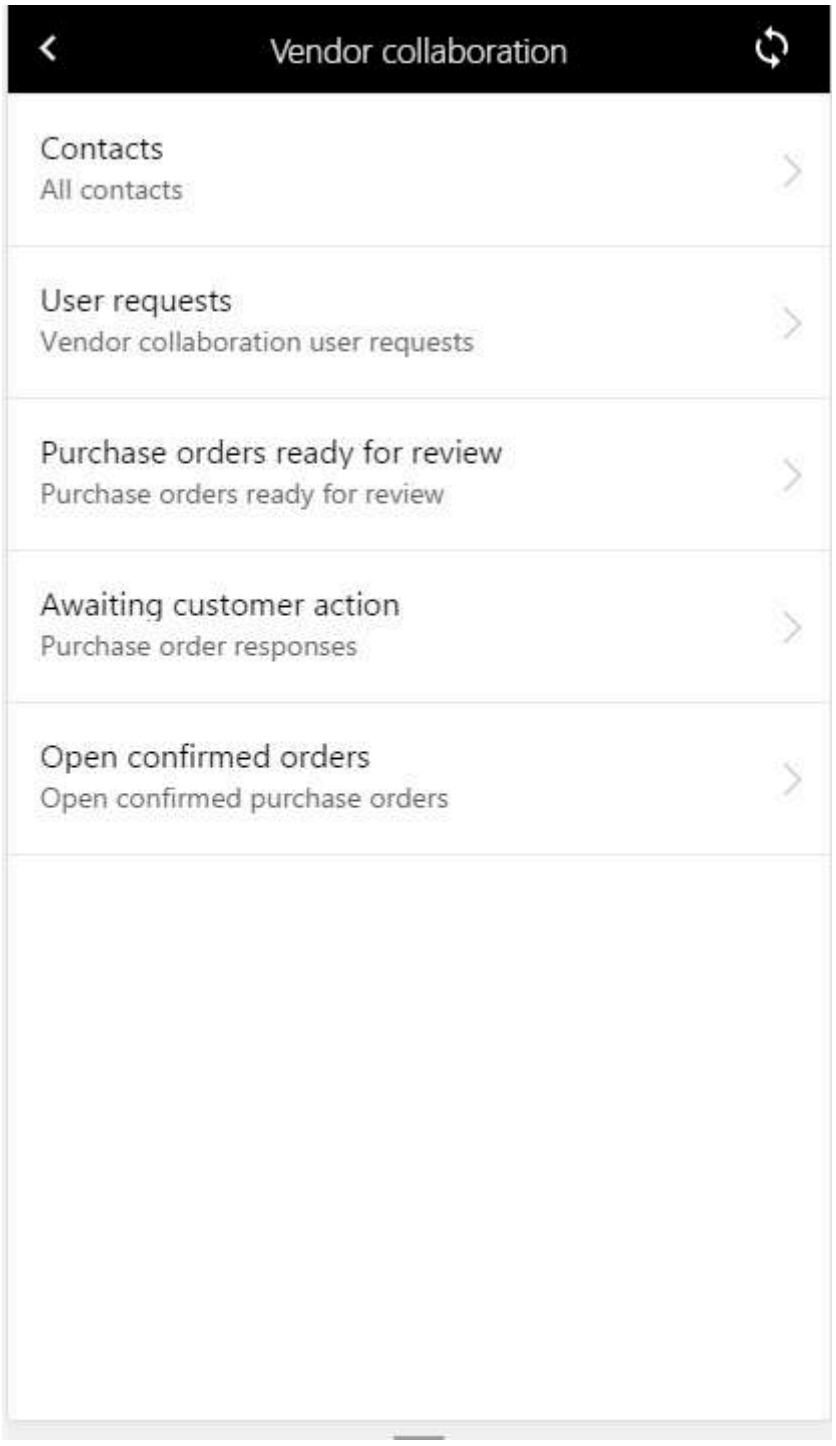
Sign in to the mobile app

1. Start the app on your mobile device.
2. Enter your Microsoft Dynamics 365 URL.
3. The first time that you sign in, you're prompted for your user name and password. Enter your credentials.
4. After you sign in, the available workspaces for your company are shown. Note that if your system administrator publishes a new workspace later, you will have to refresh the list of mobile workspaces.



Use the Vendor collaboration mobile workspace

When you select the **Vendor collaboration** workspace, you'll see the following options.



The **Vendor collaboration** workspace includes the following pages.

Contacts

The **Contacts** page lets you see all the contacts that have been set up for the vendor account. It shows the contact person's name, primary email address, and user alias, if the contact person has an alias. This page also shows whether the contact person's user account is active. When you select a contact, you see contact details, such as the legal entities that the person is a contact for. You also see contact information, such as a telephone number or an alternative email address.

User requests

The **User requests** page lets you see all the user requests that you've submitted via the vendor collaboration web interface. You can also follow the status of those requests. When you select a user request, you can see what was requested, add or deactivate a user, change security, and see which security roles were requested for the user.

Purchase orders ready for review

The **Purchase orders ready for review** page lets you see all the purchase orders that the customer has sent, but that haven't yet been responded to. You can view selected information about the order, such as which products were requested and when those products should be delivered. Price information is also available, depending on the configuration of the vendor.

You can also see whether the purchase order has notes or attachments. However, to open notes and attachments, you must use vendor collaboration web interface in the web client. Select **Purchase order line** to see all the lines together with their details. For each line, an indicator will show whether there are notes or attachments, or whether the delivery address differs from the delivery address that is shown on the header.

To respond to the purchase order, you must use the vendor collaboration web interface in the web client.

Awaiting customer action

The **Awaiting customer action** page lets you find purchase orders that you or another person in your company who has access to vendor collaboration has responded to. The purchase orders are visible in this list only if the customer must take one of the following actions on the purchase order:

- If the purchase order was rejected, the customer must either update or cancel the original order, and then send it again. When the purchase order is sent again, it no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted with changes, the customer must either update the original order and then send it again for review, or update the order per the requested changes and then confirm it immediately. In both cases, the purchase order no longer appears on the **Awaiting customer action** page.
- If the purchase order was accepted but still appears on the **Awaiting customer action** page, the purchase order wasn't automatically confirmed when it was accepted. It's now waiting for a purchasing agent to change the order status to **Confirmed**. Typically, a purchase order is considered an agreement between the customer and the vendor as

soon as the vendor accepts the order. Therefore, the update to **Confirmed** status is usually just a formality.

When you select a purchase order, additional details appear about the response. You can see the line details and response for every line. The line status shows which of the following responses has been given:

- Accepted
- Rejected
- Accepted with changes
- Substituted/Substitute
- Split into schedule/Schedule line

Note that the **Delivering** field is set to either **Yes** or **No** to indicate whether the lines will be delivered. A line might not be delivered because for the following reasons:

- The line was rejected.
- A substitution was made, and the original line isn't expected to be delivered as requested in the received order.
- The line was split into multiple schedule lines, and the original line isn't expected to be delivered as requested in the received order.

Any changes that have been made to the order line response are shown. However, uploaded notes and attachments aren't shown. To view notes and attachments, you must use the vendor collaboration web interface in the web client.

Open confirmed orders

When the purchase order is confirmed by the customer (that is, the status of the purchase order is changed to **Confirmed**), it appears in the open confirmed order. It will remain in the list until it's registered as received by the customer.

Publish mobile workspaces

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

> **Important**
>
> The finance and operations (Dynamics 365) mobile app and platform are no longer supported. The platform components supporting the mobile app will be removed in a future update. The mobile app has also been removed from app stores. Previously installed instances of the app will continue to work. For more information, see Removed or deprecated platform features.

This article describes the steps that system administrators must follow to publish a mobile workspace. You must publish a mobile workspace so that users can access it in the mobile app.

Publish a mobile workspace

To publish a mobile workspace, follow these steps:

1. In your browser, start your web client.
2. Select **Settings** > **Mobile app**.
3. Select the mobile workspace to publish.
4. Select **Publish**.

After you publish a new workspace, users must pull to refresh the list of mobile workspaces.

Responsible AI FAQs for Dynamics 365 Supply Chain Management

An AI system includes not only the technology, but also the people who use it, the people affected by it, and the environment in which it's deployed. Microsoft's Responsible AI FAQs are intended to help you understand how AI technology works, the choices system owners and users can make that influence system performance and behavior, and the importance of thinking about the whole system, including the technology, the people, and the environment. You can use Responsible AI FAQs to better understand specific AI systems and features that Microsoft develops.

Responsible AI FAQs are part of a broader effort to put Microsoft's AI principles into practice. To find out more, see Microsoft AI principles.

AI-driven features in this app

This app contains a growing list of AI-driven features. To learn about the capabilities and impact of specific features, select a feature name from the list.

- Responsible AI FAQ for AI summaries with Copilot
- Responsible AI FAQ for Analyze demand plans with Copilot
- Responsible AI FAQ for the Confirmed purchase orders with changes workspace
- Responsible AI FAQ for Workload insights with Copilot
- Responsible AI FAQ for the Procurement Agent (production-ready preview)
- Responsible AI FAQ for Generative insights for Demand planning (production-ready preview)

Responsible AI FAQ for AI summaries with Copilot

This FAQ provides answers to frequently asked questions about the AI technology that's used in AI summaries with Microsoft Copilot in Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

What are AI summaries with Copilot?

AI summaries with Copilot are available on many of the most-used pages in Supply Chain Management. These summaries provide a quick overview of the most important information that's related to the page, personalized for the current user. Summaries can include information such as the number of lines on a purchase order, the number of items in a warehouse, or the number of overdue invoices for a vendor.

The information that Copilot provides depends on the current page and user context. For example, the information can vary based on the other pages that the user works with the most, and it's limited based on the user's security roles and permissions.

What are the capabilities of AI summaries with Copilot?

AI summaries with Copilot use Copilot to generate natural-language summaries of information that's available on the pages where they appear and other related pages. Copilot uses the *gpt-3.5-turbo* generative AI model to generate the natural-language content. Summaries and content are generated from data records that are stored in the system, including products, purchase orders, and vendors.

You can share your feedback directly with Microsoft if an administrator enables user feedback for Copilot and related experiences. Learn more about how Microsoft's in-product feedback system works in Learn about Microsoft feedback for your organization. Learn more about how to enable user feedback for Copilot and related experiences in finance and operations apps in Enable enhanced user feedback for Copilot and related experiences.

What is the intended use of AI summaries with Copilot?

This section describes the intended use for each of the available summaries.

Product hover and released product summaries

Many different people need product information, including sellers, planners, and purchasers. Unlike product information managers, people who work in these roles often lack deep knowledge of each product and where all its information can be found in the system. Product summaries provide high-level information about what each product is, its availability, and its purchase and sale information.

Purchase order summaries

Each purchase order summary shows an overview of a selected purchase order's status. For example, it can show the number of partially or fully confirmed, received, and invoiced lines. It can also show other selected insights, such as a summary of lines that are overdue or nearly overdue. Each summary helps focus users' attention on the most important or unusual things about an order.

Sales order summaries

Sales order summaries are similar to purchase order summaries, but for sales orders.

Vendor summaries

Intelligent vendor summaries include information about vendor on-hold status, active contracts, rebates, open purchase orders, outliers, and risks. Each summary indicates the vendor's account number, vendor currency, and accounting currency. Purchase orders, posted vendor invoices, and payment status information are provided. Overdue vendor invoices, purchasing agreements, and active rebates are also shown. Risks arise from overdue purchase lines, delivery trends, vendor history, and potential foreign exchange losses from outstanding invoices.

Traceability activity summaries

The Traceability Add-in for Dynamics 365 Supply Chain Management collects activity events across the supply chain and product lifecycle, but it isn't always easy for users to get a quick picture of a tracked object's history. Copilot analyzes the many activity events associated with a selected tracked object and then provides a natural-language summary that helps you quickly understand the object's history. This summary is shown at the top of the full list of activity events.

Traceability where-used summaries

Traceability provides a comprehensive where-used insight report, which lets you track the usage of items across various processes. Copilot offers detailed where-used summaries at both the item-number and quantity levels, allowing for precise analysis.

How were AI summaries with Copilot evaluated? What metrics are used to measure performance?

AI summaries with Copilot underwent substantial testing before they were released. They rely on user feedback to report inappropriate content.

If you encounter inappropriate generated content, report it to Microsoft by using this feedback form: Report abuse. Your feedback helps improve the functionality.

Microsoft might disable Copilot-driven features for selected customers if abuse of the functionality is detected.

What are the limitations of AI summaries with Copilot? How can users minimize the impact of these limitations?

AI summaries with Copilot use Copilot to generate summaries of information on the page where they appear and other related pages. Not all pages are used.

The generated content should never be used without manual review or supervision.

What operational factors and settings allow for effective and responsible use of AI summaries with Copilot?

When you use the feature, follow these recommendations:

- Make sure that your company has enough control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- Always review the generated summaries before you make decisions based on the information that's provided.

Responsible AI FAQ for Analyze demand plans with Copilot

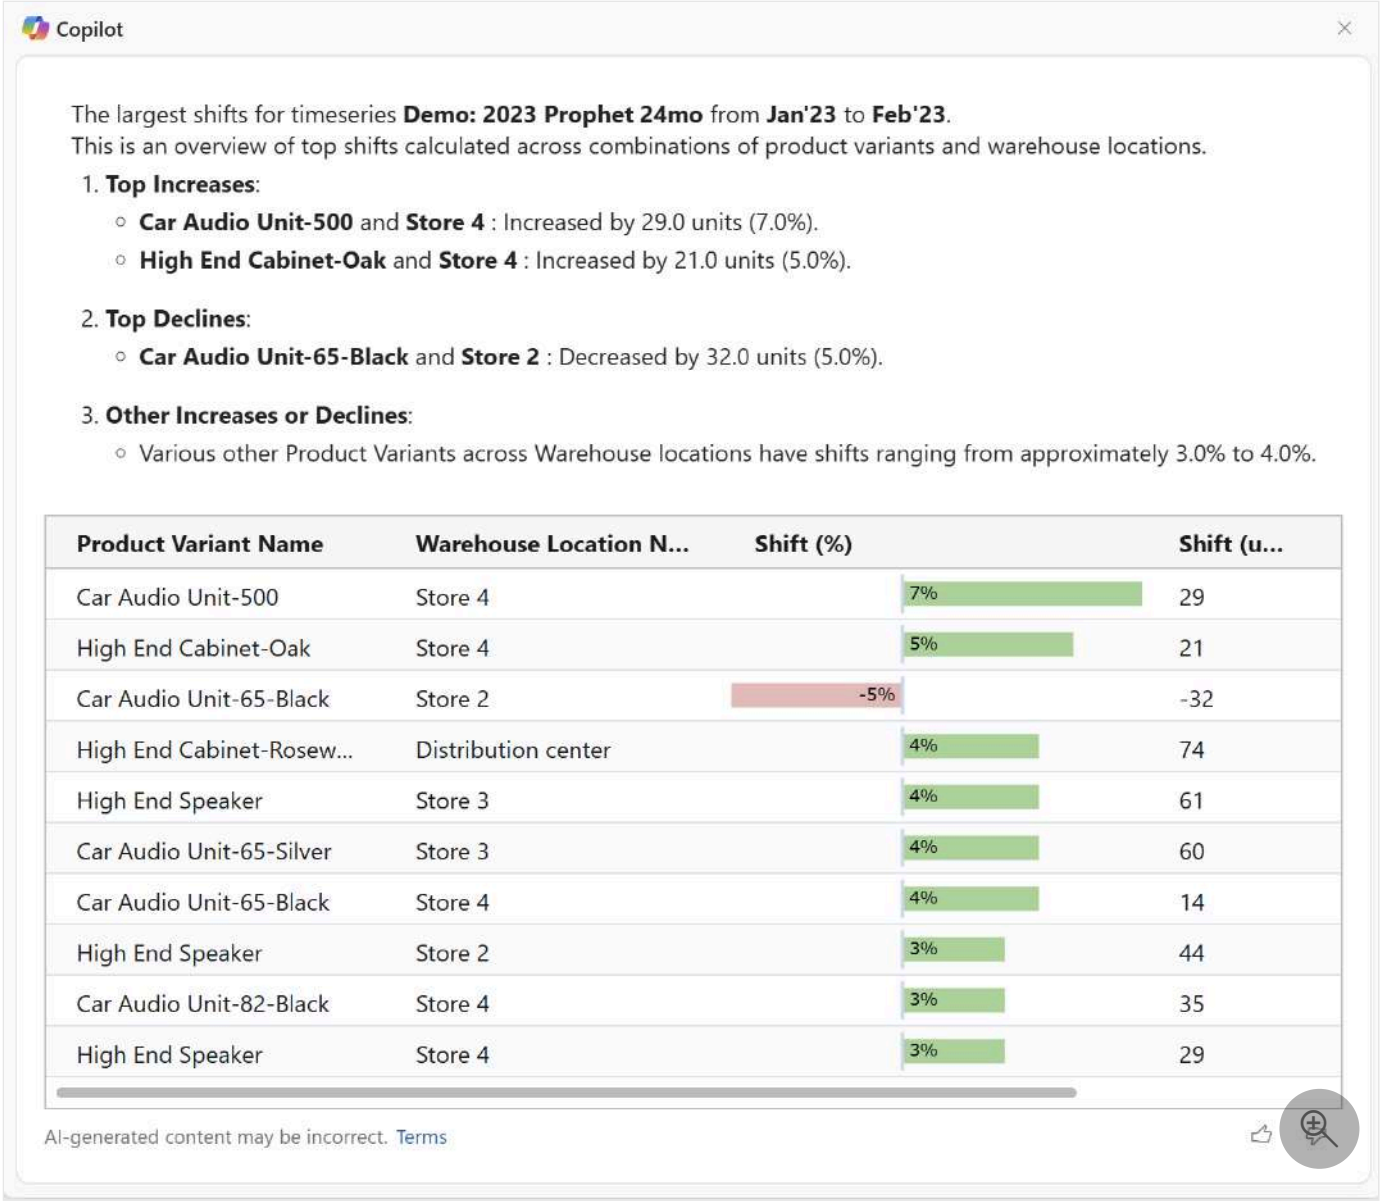
This FAQ provides answers to frequently asked questions about the AI technology that's used in the *Analyze demand plans with Copilot* feature for Demand planning in Microsoft Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

What is Analyze demand plans with Copilot?

Demand planning in Supply Chain Management lets you use Copilot to analyze your demand plans. You can select from a set of predefined questions to analyze data for shifts, trends, anomalies, and accuracy. The results are delivered as a summary using natural language and visualizations.

By using Copilot, you can quickly gain valuable insights across multiple dimensions. You can use these insights to improve operational efficiency, increase profitability, and improve customer satisfaction.

For example, a demand planner is interested in learning the most significant factors that contributed to a notable shift between two consecutive periods. The planner opens the relevant worksheet, selects a point of interest on the chart, and then selects a predefined question to ask Copilot. Copilot's response might resemble the following example.



What are the capabilities of Analyze demand plans with Copilot?

This feature lets users select from a set of predefined questions to analyze their multidimensional demand plans. The system queries the data in each dimension and for all dimensions. The results are delivered as a summary using natural language and visualizations.

Copilot respects all of the filters applied to the data set, so only the filtered data is analyzed. Increasing and decreasing results are highlighted when found.

Copilot allows you to analyze data for the following metrics:

- Shifts *(Compares two consecutive periods of days, weeks, or months)*
- Trends *(Compares six consecutive periods of days, weeks, or months)*
- Deviations *(Compares two time series)*
- Anomalies

What is the intended use of Analyze demand plans with Copilot?

Demand planners spend considerable time analyzing demand plans. This feature helps these users gain valuable insights into demand plans. It helps them make informed decisions by providing a single result that summarizes the most significant shifts, trends, anomalies, or accuracies that occurred across several dimensions. Planners can then adjust their plans based on the detected results.

How was Analyze demand plans with Copilot evaluated? What metrics are used to measure performance?

The system underwent substantial testing before it was released. It relies on user feedback to report inappropriate content.

If you encounter inappropriate generated content, report it to Microsoft by using this feedback form: Report abuse. Your feedback helps improve the functionality.

Microsoft might disable Copilot-driven features for selected customers if abuse of the functionality is detected.

What are the limitations of Analyze demand plans with Copilot? How can users minimize the impact of these limitations when they use the system?

Copilot shows a maximum of ten results. These results are ordered by significance. Results of equal significance are ordered arbitrarily. Although there might be additional results that have the same significance as the tenth result, Copilot doesn't indicate that those results exist.

As of January 2025, AI-generated results are available in all languages supported by Demand planning.

AI-generated content should not be used without manual review or supervision.

Summaries and terminology provided by Copilot in languages other than English may be less accurate than their English language versions.

What operational factors and settings allow for effective and responsible use of Analyze demand plans with Copilot?

When you use this feature, follow these recommendations:

- Make sure that your company has enough control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- Before you make decisions about modifications to the demand plan, always review and study the generated response, and compare it with actual demand plan data.

Responsible AI FAQ for the Confirmed purchase orders with changes workspace

09/11/2025

This Responsible AI FAQ provides answers to frequently asked questions about the AI technology that's used in the **Confirmed purchase orders with changes** workspace in Microsoft Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

What is the Confirmed purchase orders with changes workspace?

The **Confirmed purchase orders with changes** workspace helps procurement professional quickly and easily assess, manage, and follow up on changes that are made to purchase orders after they're confirmed. It uses Copilot to generate natural-language change summaries and draft communications for vendors.

What are capabilities of the Confirmed purchase orders with changes workspace?

The feature takes changes to confirmed purchase orders as input and then identifies the downstream orders that are related to those purchase orders. The feature uses Copilot to generate natural-language summaries and draft communications for vendors. Copilot uses the *gpt-3.5-turbo* generative AI model to generate the natural-language content. Summaries and content are generated from data records stored in the system, including products, purchase orders, and vendors.

What is the intended use of the Confirmed purchase orders with changes workspace?

The **Confirmed purchase orders with changes** workspace is intended to help procurement professional review changes to confirmed purchase orders and mitigate the downstream impacts. It supports a workflow where the purchaser first reviews and reconfirms changed purchase orders that have little or no downstream impact. It then provides tools to help the purchaser assess and mitigate the impact of changes that have significant downstream impact.

Messaging text that Copilot generates isn't intended to be used without manual review or supervision.

How was the Confirmed purchase orders with changes workspace evaluated? What metrics are used to measure performance?

The **Confirmed purchase orders with changes** workspace underwent substantial testing before it was released. It relies on user feedback to report inappropriate content.

If you encounter inappropriate generated content, report it to Microsoft by using this feedback form: Report abuse. Your feedback helps improve the functionality.

Microsoft might disable the Copilot-driven features for selected customers if abuse of the functionality is detected.

What are the limitations of the Confirmed purchase orders with changes workspace? How can users minimize the impact of its limitations when they use it?

The **Confirmed purchase orders with changes** workspace uses Copilot to generate a summary of impact and proposed communication content.

The generated content should never be used without manual review or supervision.

What operational factors and settings allow for effective and responsible use of the Confirmed purchase orders with changes workspace?

When you use the feature, follow these recommendations:

- Make sure that your company has sufficient control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- Always review generated summaries, and study the detailed lists of changes and impacts, before you make decisions about reconfirming purchase orders.
- Always review generated communication drafts before you send them by email or post them to a Teams message.

Related information

- Review and accept changes to confirmed purchase orders
- Transparency note for Copilot data security and privacy in Microsoft Power Platform

Responsible AI FAQ for Workload insights with Copilot

This FAQ provides answers to frequently asked questions about the AI technology that is used in the *Workload insights with Copilot in the Warehouse Management mobile app* feature in Microsoft Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

What is the Workload insights with Copilot feature?

The *Workload insights with Copilot* feature provides visibility into the warehouse workload when workers start their shifts. It uses Copilot to generate natural-language work insights.

What are the capabilities of Workload insights with Copilot?

The *Workload insights with Copilot* feature provides insights into available work headers, pick lines, and receiving lines. It also provides information about available workforce and Copilot-generated insights into pending warehouse work.

What is the intended use of Workload insights with Copilot?

The *Workload insights with Copilot* feature is intended to help workers understand the current warehouse workload through Copilot-generated analyses and summaries of warehouse trends. It helps workers plan their day, so that they can be as effective as possible during their shift.

How was the Workload insights with Copilot feature evaluated? What metrics are used to measure performance?

The *Workload insights with Copilot* feature underwent substantial testing before it was released. It relies on user feedback to report inappropriate content.

If you encounter inappropriate generated content, report it to Microsoft by using this feedback form: Report abuse. Your feedback helps improve the functionality.

Microsoft might disable the Copilot-driven features for selected customers if abuse of the functionality is detected.

What are the limitations of Workload insights with Copilot? How can users minimize the impact of those limitations when they use the feature?

The *Workload insights with Copilot* feature uses Copilot to generate a summary of warehouse insights into the workload.

The generated content should never be used without manual review or supervision.

What operational factors and settings allow for effective and responsible use of Workload insights with Copilot?

When you use the *Workload insights with Copilot* feature, follow these recommendations:

- Make sure that your company has sufficient control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- Always review generated summaries, and study the detailed information before you make decisions about workload actions.

Related information

Responsible AI FAQ for the Procurement Agent (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This FAQ provides answers to frequently asked questions about the AI technology that is used in the Procurement Agent that is available with Copilot in Microsoft Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

> **Important**
>
> - This is a production-ready preview feature.
> - Production-ready previews are subject to supplemental terms of use.

What is the Procurement Agent?

The Procurement Agent provides the following capabilities that help purchasers communicate with vendors and handle change requests as part of their daily work:

- *Send follow-up emails to vendors on purchase orders*
- *Speed up updates in purchase orders based on incoming vendor emails*
- *Review the impact of purchase order changes from vendors* - automatically triggering the impact analysis for incoming change requests
- *Simulate if purchase order changes have a downstream impact* - manually triggering the impact analysis

Send follow-up emails to vendors on purchase orders overview

It can be tedious to follow up on purchase orders that are sent to vendors if the vendors haven't yet confirmed or delivery is late. It can take significant time to find the correct orders in the system and then write a specific email for each order.

To streamline this process, the system helps you perform the following actions:

- Create a query to find the purchase orders to follow up on. Configuration is user specific.

- Configure the email generation process for each group of purchase orders that the query finds. The system provides two default queries. One query is used to follow up on unconfirmed purchase orders, and the other query is used to follow up on late deliveries. Queries are unique for each user. Therefore, you can create and adjust them to meet your specific business needs.
- Review and modify drafted emails, copy them to your email client, and/or send them. The data that is used to generate the emails comes from the purchase order lines and/or related tables.

Speed up updates in purchase orders based on incoming vendor emails overview

This capability helps speed up communications with vendors about purchase orders. It enables Copilot to read emails from all or specific vendors.

The Procurement Agent can determine what each email is about (for example, whether it's a purchase order confirmation or a purchase order change request) and which purchase order numbers it applies to. Copilot then matches the information that it extracts from the email to fields in the system and indicates whether there are any changes. Therefore, the purchaser can review just the information that Copilot provides and update the fields in the system as required. They don't have to manually open the purchase order and do all the work themselves. They can then spend the time that they save on other tasks that add more value.

Review the impact of purchase order changes from vendors overview

Impact analysis automatically analyzes the downstream impact of change requests that arrive through e-mails (Procurement Agent - Supplier communications) and through the vendor collaboration interface if configured and enabled.

Purchasing teams regularly receive change requests from suppliers, including delivery delays, quantity reductions, and purchase order cancellations. Each change request can potentially affect safety stock, production schedules, internal transfers, and customer commitments.

In most cases, purchasers don't want to spend time on changes to purchase orders with no downstream impact. Impact analysis gives purchasers the confidence, visibility, and ability to quickly identify these changes that can be safely accepted, apply them right away, and move on.

For changes with downstream impact on orders, or ones that cause inventory levels to go below certain thresholds, purchasers need to quickly understand the details, consequences, and decide how to respond. Purchasers often follow up with the supplier. If purchasers must accept a change with impact, they now know straight away which internal stakeholders to be informed.

Simulate whether purchase order changes have impact overview

The impact simulation capability allows purchasers and planners to test the impact of purchase orders changes that weren't directly communicated through supported channels. This capability could be used to proactively test changes on high-priority or at-risk purchase orders, or to analyze the impact of changes communicated through non-supported channels such as telephone.

What are the capabilities of the Procurement Agent?

Send follow-up emails to vendors on purchase orders

The *Send follow-up emails to vendors on purchase orders* capability uses Copilot to generate natural language email texts and subjects, based on information from purchase orders that are found through user-specified queries. User-defined settings such as language tone, length, and urgency are used to adjust the resulting text. Copilot uses the gpt-4o generative AI model to generate the natural language content.

Speed up updates in purchase orders based on incoming vendor emails

The *Speed up updates in purchase orders based on incoming vendor emails* capability must be set up to access the relevant users' email and analyze emails from either all or specifically selected vendor email addresses. Each relevant vendor record must include an email address to enable Copilot to recognize it.

You must also set the frequency of the email analysis.

Copilot classifies each vendor email that it reads into one of the following categories, based on the intent that it detects:

- *Purchase order confirmation* – Copilot detected that the purpose of the email is to confirm one or more purchase orders (all the purchase orders that are mentioned in the email).

- *Requested changes* – Copilot detected that the email contains at least one requested change to a purchase order. For example, the vendor can't deliver the full quantity that was requested, or they can't meet the requested delivery date.
- *Rejection* – Copilot detected that the vendor can't deliver the purchase order as a whole.
- *Other* – Copilot couldn't identify any of the previous intents.

For the first two categories, the system identifies which purchase orders the email is related to and matches the information in the email to information in the system.

For messages where the vendor requested a change, the system indicates the current information plus the new information in the purchase order. Therefore, the changes are easier to understand.

A review page lists the emails that were identified and classified, and summarizes the information in each message. From this page, you can apply the changes directly to the purchase order that is stored in the system.

Review the impact of purchase order changes from vendors

The *Review the impact of purchase order changes from vendors* capability only runs automatically on change requests, and only on sources selected during setup.

If you choose to enable impact analysis based on changes received in email, the analysis only runs on emails classified as *Requested changes*, and during the specific conditions set up for the *Speed up updates in purchase orders based on incoming vendor emails* capability. In other words, the analysis only runs for specified mailboxes and vendors.

If you enable the vendor collaboration interface, this capability runs on *In external review requires action* messages only.

Simulate whether purchase order changes have impact

To use the *Simulate whether purchase order changes have impact* capability, enable the *Procurement agent - Impact analysis* feature in feature management. This capability runs only when you change a date or quantity of a purchase order and select *Simulate impact*.

What is the intended use of the Procurement Agent?

The Procurement Agent has the following intended uses:

- The *Send follow-up emails to vendors on purchase orders* capability streamlines the process of following up on purchase orders. By default, it identifies orders that are delayed or

unconfirmed. It presents a draft message to purchasers, who can review and modify it, copy it to their email client, and send it.

- The *Speed up updates in purchase orders based on incoming vendor emails* capability saves purchasers time by automatically reading emails, extracting information from them, and mapping that information to information in the system.
- The *Review the impact of purchase order changes from vendors* capability saves purchasers time in manually analyzing planning data to understand if a change request has downstream impact.
- The *Simulate whether purchase order changes have impact* capability enables purchasers and planners to stay on top of potential purchase order changes and to test different scenarios.

How was the Procurement Agent evaluated? What metrics are used to measure performance?

The Procurement Agent underwent substantial testing with demo data examples before it was released.

Microsoft relies on users to report inappropriate generated content. If you encounter inappropriate content, report it to Microsoft by using the following feedback form: Report abuse. Your feedback helps improve the functionality.

Microsoft might disable Copilot-driven features for selected customers if it detects abuse of the functionality.

What are the limitations of the Procurement Agent? How can users minimize the impact of these limitations?

The *Send follow-up emails to vendors on purchase orders* capability uses Copilot to generate an email based on information that it retrieves through user-specified queries. You can select which fields to include in the email text. The information in the email is limited to data that comes from purchase orders, purchase order lines, and related information (such as vendor records). Primary contacts that are linked to emails and vendors are used to identify the recipient's name and company. User data is used to identify the sender's name and company.

The generated content should never be used without manual review or supervision.

The system doesn't send emails automatically, unless you explicitly configure it to do so. You're responsible for reviewing and sending each email.

To configure the system to send emails automatically, an admin must turn on the *(Production ready preview) Procurement Agent – Supplier communications - automatically sending follow-up emails* feature in Feature management. Use this capability only after you test and review drafted emails over a long period.

The *Speed up updates in purchase orders based on incoming vendor emails* capability is intended only for vendor collaboration (classification of emails that are related to purchase orders). Therefore, during setup, you must specify which vendors' email addresses (either all or only specific ones) the system can read emails from.

What operational factors and settings allow for effective and responsible use of the Procurement Agent?

When you use the feature, follow these recommendations:

- Make sure that your company has enough control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- When you use the *Send follow-up emails to vendors on purchase orders* capability, always review each email and subject before you use the information that is provided or make decisions based on it.
- When you use the *Speed up updates in purchase orders based on incoming vendor emails* capability, always review each email, intent extraction, and data before you use the information that is provided or make decisions based on it.
- When you use the *Review the impact of purchase order changes from vendors* capability, review the detailed impact before determining if a change is safe to accept and apply to the purchase order.

Responsible AI FAQ for Generative insights for Demand planning (production ready preview)

08/18/2025

[This article is prerelease documentation and is subject to change.]

This FAQ provides answers to frequently asked questions about the AI technology that's used in Generative insights for Demand planning in Microsoft Dynamics 365 Supply Chain Management. It includes key considerations and details about how the AI is used, how it was tested and evaluated, and any specific limitations.

> **Important**
>
> - This is a production-ready preview feature.
> - Production-ready previews are subject to supplemental terms of use.

What are Generative insights for Demand planning?

Generative insights for Demand planning analyzes your demand plans to detect patterns (such as seasonality and signal correlations) across products and locations. The feature provides answers using natural language and visualizations.

By using Generative insights, you can quickly gain valuable insights across multiple dimensions. You can use these insights to improve operational efficiency, increase profitability, and improve customer satisfaction.

Learn more about this feature in Generative insights for Demand planning (preview).

What are the capabilities of Generative insights?

This feature lets you analyze your multidimensional demand plans for patterns such as seasonality and signal correlations. The system queries the data for all dimensions, and returns natural-language summaries, graphs, and other visualizations.

What is the intended use of Generative insights?

Demand planners spend considerable time analyzing demand plans. This feature helps them gain valuable insights into the patterns that can be found in their data. These insights help planners make informed decisions about when to initiate promotions and also help them to predict the potential impact of those promotions.

How was Generative insights evaluated? What metrics are used to measure performance?

The system underwent substantial testing before it was released. It relies on user feedback to report inappropriate content.

If you encounter inappropriate generated content, report it to Microsoft by using this feedback form: <Report abuse. Your feedback helps improve the functionality.

Microsoft might disable Copilot-driven features for selected customers if the abuse of the functionality is detected.

What are the limitations of Generative insights? How can users minimize the impact of these limitations when they use the system?

A maximum of fifteen seasonal patterns can be detected. Generative insights calculates a confidence score for each seasonal pattern and sorts them according to that score. Results of equal confidence are ordered arbitrarily.

Products with insufficient data are grouped into a system-generated seasonal pattern named *Insufficient data*. This approach ensures that all data is analyzed and assigned a classification.

The AI-generated results are always presented in US English.

AI-generated content should not be used without manual review or supervision.

What operational factors and settings allow for effective and responsible use of Generative insights?

When you use this feature, follow these recommendations:

- Make sure that your company has enough control over data permissions to ensure that business data can't be manipulated to influence AI data processing in an undesirable way.
- Before you make decisions about modifying a demand plan, always review and study the generated response, and compare it with actual demand plan data.

Development and administration for finance and operations apps

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Development and administration for finance and operations apps includes:

- Administrator experience and Lifecycle Services
- Developer experience
- Intelligence
- Mobile apps
- Data management and data entities
- Office integration

Developer experience

The developer experience is based on modern tooling that uses Visual Studio and .NET components.

- The development tools are decoupled from any running environment. You develop against local, XML-based files, not the online database.
- Microsoft Visual Studio is the development environment. Finance and operations customizes the Visual Studio environment to provide you with a smooth and familiar experience.
- The X++ compiler generates Common Intermediate Language (CIL) for all features. CIL is the same intermediate language used by other .NET-based (managed) languages, such as the C# programming language.
- You can leverage the browser-based client and design patterns for forms to provide an improved end-user experience.
- The Application Lifecycle Management (ALM) system supports build automation, test automation, and deployment of models to the cloud.

For more information, see Develop and customize home page.

Administrator experience and Lifecycle Services

Finance, Supply Chain Management, and Commerce are cloud-hosted. As an IT professional, use Microsoft Dynamics 365 Lifecycle Services to monitor and tune your environments, deploy features, and stay up to date with recent hotfixes. Within your deployment, you can configure security, and manage when processes run. You can also use Lifecycle Services when you're called on to support business intelligence and reporting, mobile apps, Office, and other integrations.

BI and reporting

Finance and operations provides five distinct reporting experiences. It offers specialized tools to meet the complex and diverse reporting needs of various functions throughout the organization.

- Operational views – Designed to address the specific needs of a given business persona.
- Business documents – Static documents used to capture and exchange processed business data.
- Analytical tools and visualizations – Personalized presentations of logical calculations that allow the user to explore their data.
- Electronic reporting – Tool used to configure formats for electronic documents.
- Financial reporting – Designed to provide in-depth accounting management tools based on standard views of financial activities across legal entities.

Mobile apps

The finance and operations mobile app empowers your organization to mobilize its business processes. After your IT admin enables the mobile workspaces feature for your organization, users can sign in to the app and immediately begin to run business processes from their mobile devices. The Dynamics 365 for finance and operations mobile app includes the following features that can help increase productivity:

- Users can view, edit, and act on business data, even if they have intermittent network connectivity or their mobile devices are offline. When a device reestablishes a network connection, offline data operations automatically synchronize with finance and operations.

- IT admins or developers can build and publish mobile workspaces that are tailored to their organization. The app uses your existing code assets, so you don't have to re-implement your validation procedures, business logic, or security configuration.
- IT admins or developers can easily design mobile workspaces by using the point-and-click workspace designer that's included with the finance and operations web client.
- IT admins or developers can optionally optimize the offline capabilities of workspaces by using the Business logic extensibility framework. Because data continues to be processed while a device is offline, your mobile scenarios remain rich and fluid, even if devices don't have constant network connectivity.

Data management and data entities

You can easily integrate data from finance and operations with Microsoft and non-Microsoft data sources by using Dataverse, Power Apps, and Power BI. For more information, see Data entities overview.

Office integration

The Microsoft Office integration capabilities provide users with a productive environment that helps them get the job done by using Office products. For more information, see Office integration overview.

Welcome to Dynamics 365 Commerce

This article provides an overview of Microsoft Dynamics 365 Commerce.

Dynamics 365 Commerce, built on the proven Dynamics 365 Retail capabilities, delivers a comprehensive omnichannel solution that unifies back office, in-store, call center, and digital experiences. Dynamics 365 Commerce enables you to build brand loyalty through personalized customer engagements, increase revenue with improved employee productivity, optimize operations to reduce costs and drive supply chain efficiencies, and ultimately deliver better business outcomes.

This release enables the creation of digital experiences by using built-in web authoring and development tools to produce engaging and intelligent digital storefronts. A connected marketing and headless commerce platform further enable the seamless management of content, assets, promotions, inventory, and pricing across all channels.

- **Everything to build and run digital commerce:** Streamline your business with an end-to-end commerce solution that scales to your needs across traditional and emerging channels. Built-in web authoring and development tools enable you to create engaging intelligent digital storefronts, while a connected marketing and headless commerce platform enables seamless management of content, assets, promotions, inventory, and pricing across channels.

- **Build loyalty and exceed customer expectations:** Use clienteling tools to gain a comprehensive view of your customer and respond to their needs at every level of engagement, based on customer profile, history, and preferences that flow across physical and digital channels. Empower your employees to foster lasting relationships through AI-driven recommendations, customer insights, and loyalty programs that elevate brand appeal.

- **Flexible and intelligent omnichannel experience:** Unify physical and digital commerce by providing consistent experiences to customers across cloud search and discovery, product reviews, wish lists, inventory, gift cards, and loyalty. Allow customers to purchase when, how, and where they want, on any device, while providing choice around modern payment methods and product collection or delivery.

- **Streamline operations using AI in the cloud:** Drive omnichannel commerce experiences and integrated, optimized back-office operations through ingrained, pervasive, and context-

aware cloud intelligence. Use advanced merchandising, inventory management, distributed order management, and pricing and promotion to innovate and stay ahead of competition. Derive insights by visualizing and analyzing comprehensive and consistent data across all aspects of your business. Use AI-driven technologies to provide accessible websites, protect your business against payment fraud, and efficiently moderate user-generated content like ratings and reviews.

Core concepts and tasks
