Users can use workflow pages and controls to participate in business processes.

Developers can create workflows for the objects that they add. The following table describes the workflow steps that occur when a user submits an expense report to the workflow system for approval.

Expand table

Step	Runtime	Activity
1	X++ workflow runtime	A user submits an expense report by clicking the **Submit** button on one of the workflow controls. This action causes X++ code to activate a workflow instance by calling the workflow runtime API. The workflow runtime API posts a message to the message queue. The messaging batch job reads the message and sends a workflow activation request to the managed workflow runtime. > [!NOTE]

The messaging batch job processes the message queue at one-minute intervals. | | 2 | Managed workflow runtime | .NET Interop from X++ receives the message and starts a new workflow instance via Windows Workflow Foundation. This workflow instance performs a callback to the X++ workflow runtime API via .NET Interop to X++ CIL and posts a message that the workflow started.

After the message is posted, the managed workflow runtime saves the idle workflow instance to the database. The runtime then removes the workflow instance from memory. When the managed workflow runtime receives another message from the X++ workflow runtime for this workflow instance, it restores the workflow instance to memory and resumes it.

Each workflow instance is unique. If two users submit their expense reports for approval, two workflow instances start.
| | 3 | X++ workflow runtime | The messaging batch job reads the **workflow started** message from the message queue and invokes the application event handler to process a **workflow started** event. The batch job then posts an acknowledgment message that the event was processed. | | 4 | Both | This same messaging pattern repeats, as required, throughout the lifecycle of the workflow instance. |

The workflow architecture helps provide a reliable and durable messaging system, and also helps guarantee that the state of the workflow is always synchronized with the state of the application. If an unexpected hardware or software failure occurs, the workflow instance state returns to its last known saved point, and the message stays in the queue. Therefore, from an architecture perspective, the recovery model is to fix the problem and resume the workflow.

Workflow elements

This article describes the various elements that make up a workflow.

A workflow consists of elements. The sections that follow describe each type of element.

Tasks

A *task* is a unit of work that must be performed. You can add two types of tasks to a workflow: manual tasks and automated tasks.

Manual task

A *manual task* is a unit of work that a user must perform. For example, an expense report workflow can have manual tasks that require the assigned users to complete the following actions:

- Review the receipts that are submitted together with an expense report.
- Call an employee's manager.

Automated task

An *automated task* is a unit of work that the system performs. No human interaction is required. For example, a sales order workflow can have automated tasks that require the system to complete the following actions:

- Perform a credit check.
- Create a customer record for the customer, if a record doesn't already exist.

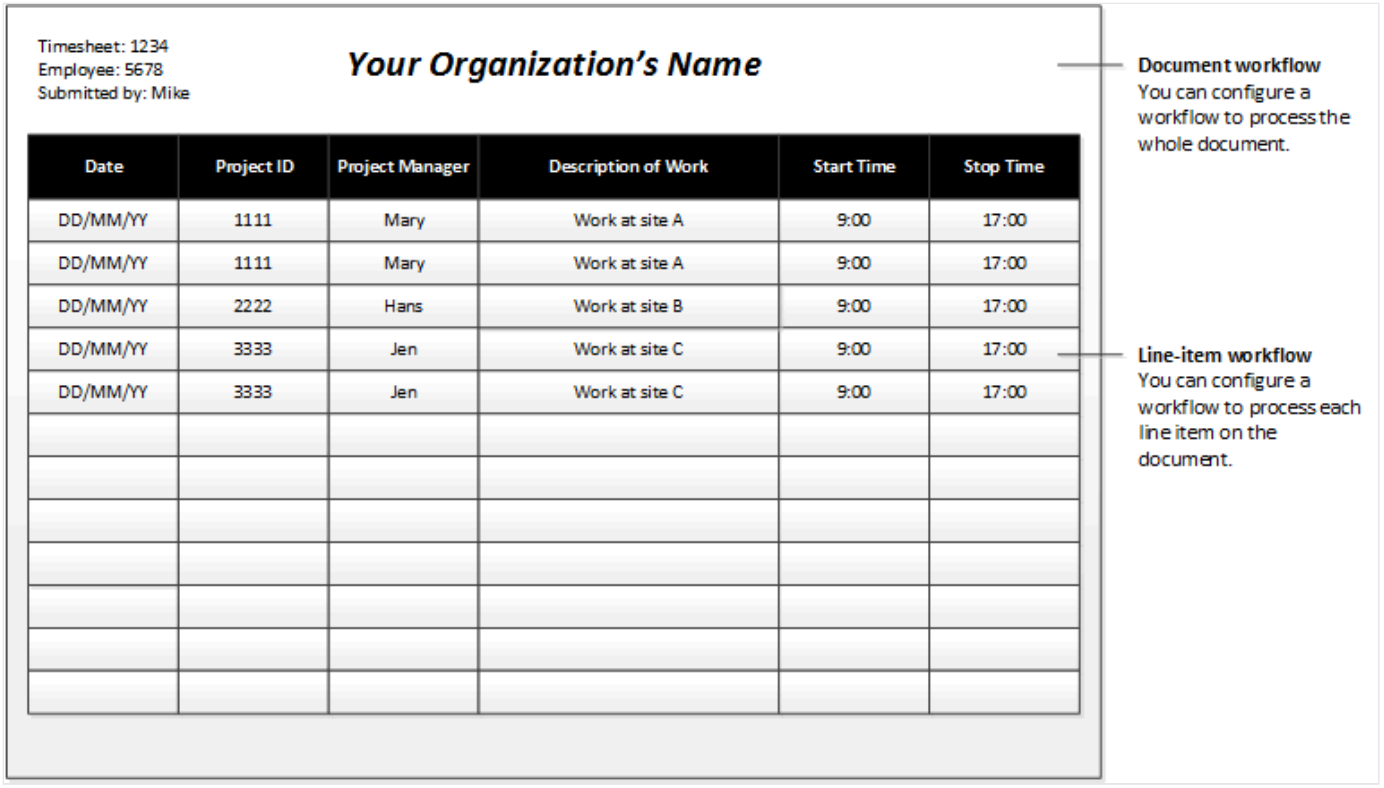
Approval processes

An *approval process* is a process that consists of separate steps. At each approval step, the user can perform the following actions:

- Approve the document.
- Reject the document.
- Request a change to the document.
- Assign the document to another user for approval.

Line-item workflow elements

You can create a workflow to process either documents or the line items on a document. For example, you create an approval workflow for timesheets. (Refer to this workflow as the *document workflow*.) You can add a *line-item workflow* element to that document workflow. When the line-item element runs, each line item on the document is submitted for processing. You might want all the line items to be processed by the same line-item workflow, or you might want each line item to be processed by a different line-item workflow. Imagine that an employee submits a timesheet that resembles the following figure.



In this scenario, you might want to create the following line-item workflows:

- **Line-item workflow 1** – Use this workflow to process line items where the project ID is 1111.
- **Line-item workflow 2** – Use this workflow to process line items where the project ID is 2222.
- **Line-item workflow 3** – Use this workflow to process line items where the project ID is 3333.

Flow-control elements

By using the following elements, you can design workflows that have alternate branches or branches that run at the same time.

Manual decision

A *manual decision* is a point where a workflow divides into two branches. A user must make a decision, and this decision determines which branch to use to process the submitted document.

Conditional decision

A *conditional decision* is a point where a workflow divides into two branches. The system decides which branch to use for processing the submitted document. To make this decision, the system evaluates the document to determine whether it meets specified conditions.

Parallel activity

A *parallel activity* is a workflow element that includes two or more workflow branches that run simultaneously.

Subworkflow

A *subworkflow* is a workflow that runs in the context of another workflow.

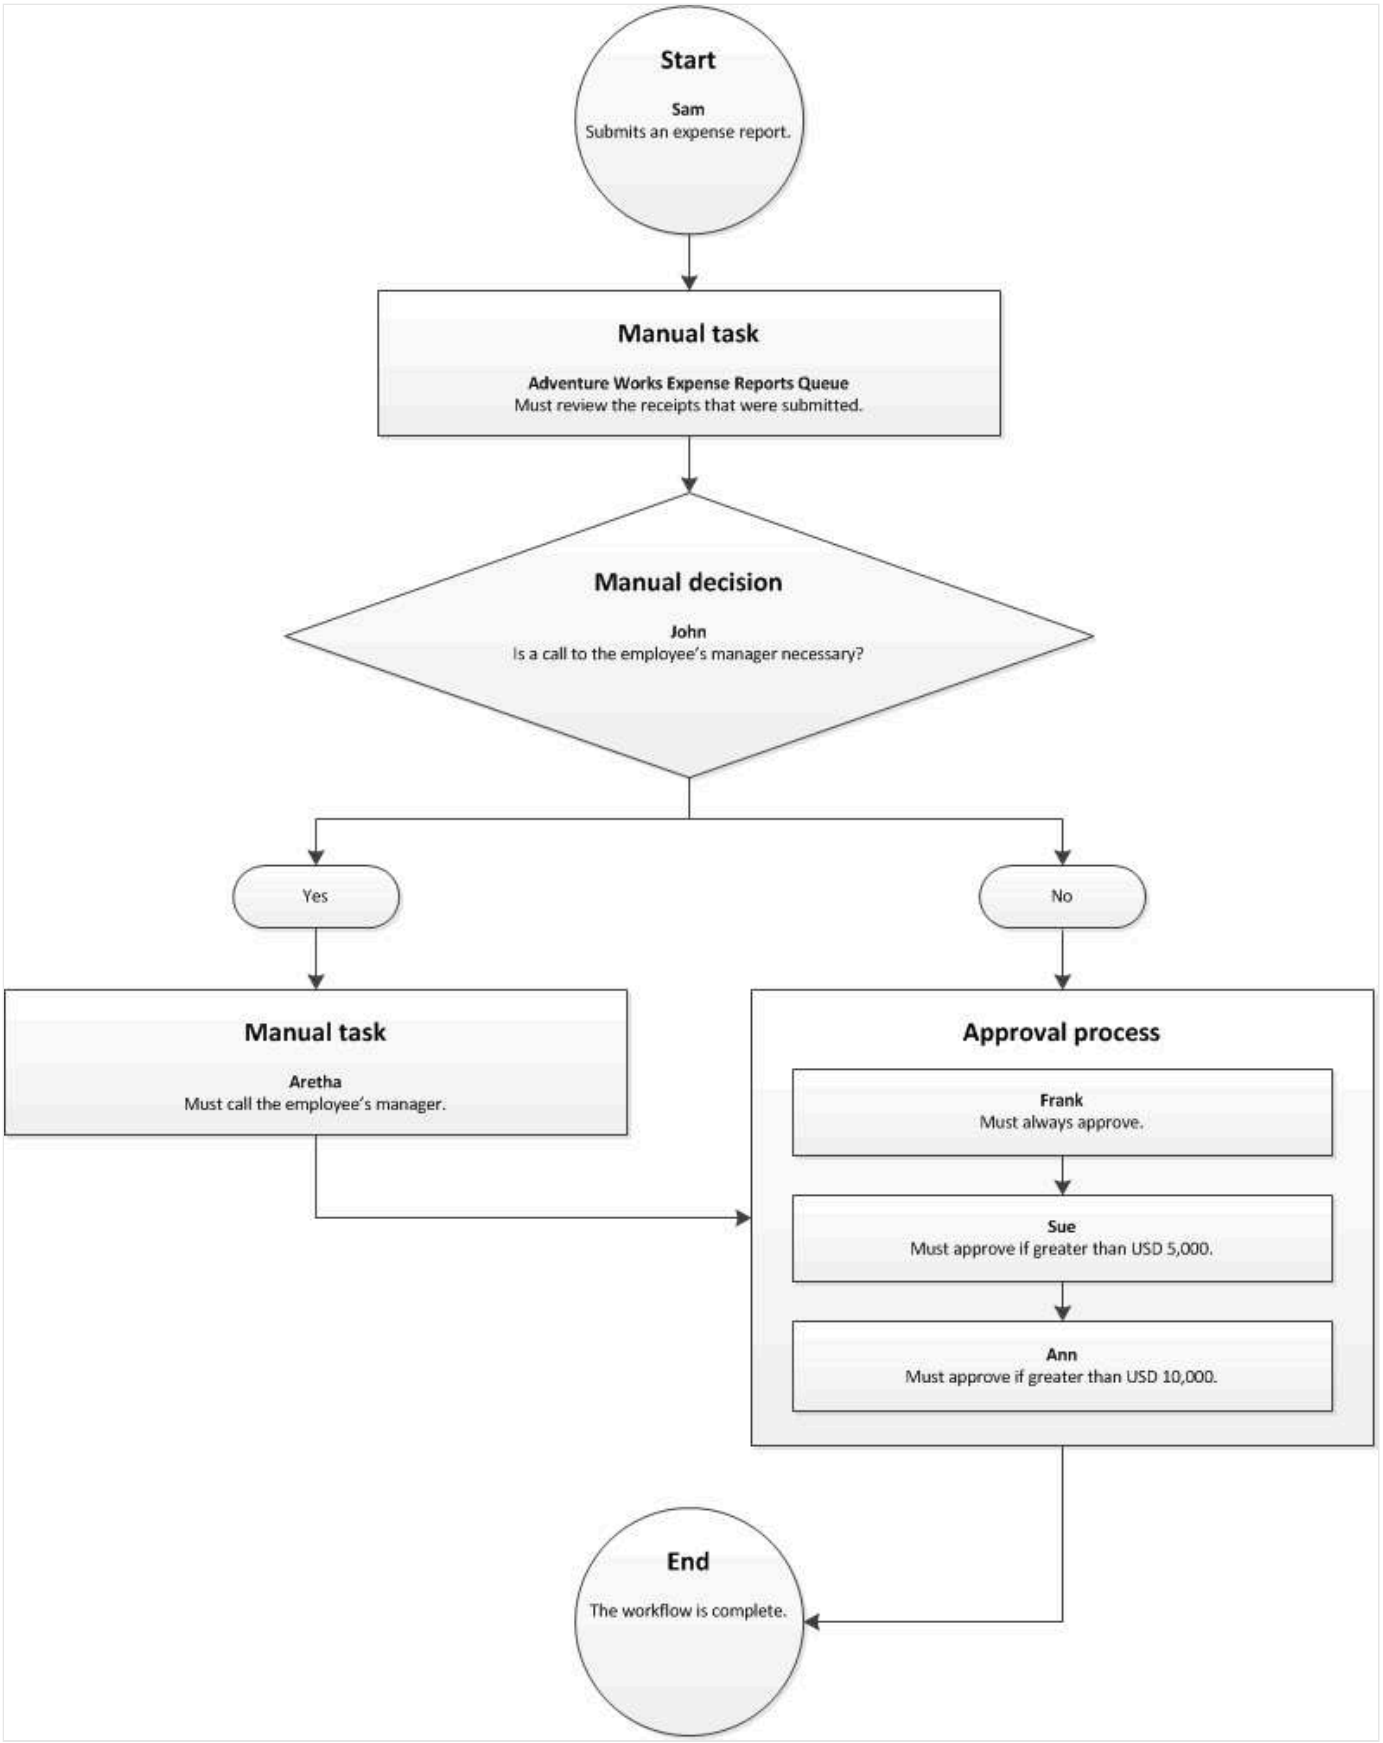
Actions in workflow approval processes

This article explains the actions that each participant in a workflow approval process can take.

A workflow can involve several groups of people: the originator, task assignees, decision makers, and approvers. For example, in the following expense report workflow, Sam is the originator, the members of the queue are task assignees, John is a decision maker, and Frank, Sue, and Ann are approvers.



The following sections explain the workflow actions that each group can perform.

Actions that an originator can perform

The originator starts a workflow instance by submitting a document for processing. For example, Sam must select the **Submit** button on the **Expense report** page to submit the expense report.

Actions that a task assignee can perform

You can assign a task to multiple people or to a work item queue that several people monitor. However, only one person can complete a task. For example, Sam submits an expense report and routes the receipts to the organization's Expense Reports department for review.

The members of the Adventure Works Expense Reports department monitor the queue. Julie, a member of that department, accepts the task of reviewing Sam's expense report and receipts. Julie can now perform one of the following actions: complete, reject, delegate, request change, reassign, or release.

> **Note**
>
> The available actions vary, depending on how the software developer designed the task.

Complete

When a user completes a task, the system assigns the document submitted for processing to the next user in the workflow, if there's a next user. If no additional processing is required, the workflow process ends.

For example, Julie, a member of the Adventure Works Expense Reports department, accepts the task of reviewing Sam's expense report and receipts. After Julie completes the review, the system assigns the document to John.

Reject

When a user rejects a document, the workflow process ends.

For example, Julie, a member of the Adventure Works Expense Reports department, accepts the task of reviewing Sam's expense report and receipts. If Julie rejects the expense report, the workflow process ends.

Sam can then resubmit the expense report. Sam can make changes first, or resubmit the original version. If Sam resubmits the expense report, the workflow process starts at the manual review task.

Delegate

When a user delegates a task, the system assigns the task to another user.

For example, Julie, a member of the Adventure Works Expense Reports department, accepts the task of reviewing Sam's expense report and receipts. Julie delegates this task to Tim, who is Julie's assistant.

Tim acts on behalf of Julie. Therefore, when Tim completes the review, the system assigns the expense report to John, just as if Julie had completed the task.

Request change

When a user requests a change to a document that was submitted, the system sends the document back to the originator.

For example, Julie, a member of the Adventure Works Expense Reports department, accepts the task of reviewing Sam's expense report and receipts. Julie notices some errors on the expense report and requests changes. The system sends the expense report back to Sam.

Sam can resubmit the expense report. Sam can make the requested changes first, or resubmit the original version. If Sam resubmits the expense report, a member of the work item queue must review the expense report and the receipts again.

Reassign

Members of a work item queue can reassign documents in that queue to another queue.

For example, Julie is a member of the Adventure Works Expense Reports department and monitors the queue. To help balance the workload, Julie can reassign the expense report and the included receipts to another queue.

Release

Occasionally, a member of a work item queue accepts a task but then decides they can't complete it. In this case, the person who accepted the task can release the document back to the work item queue.

For example, Julie is a member of the Adventure Works Expense Reports department and accepts the task of reviewing Sam's expense report and receipts. If Julie can't complete the task, she can

release the document. The expense report returns to the queue so that other members of the Adventure Works Expense Reports department can complete the task.

Actions that a decision maker can perform

Typically, you assign a document to a decision maker because there's a question that the decision maker must answer. The answer to the question is typically **Yes** or **No**, or **True** or **False**. If the decision maker doesn't select one of those choices, they can delegate the decision.

[Choice 1] or [Choice 2]

A decision maker must answer a question that's related to the document. The answer to the question is typically **Yes** or **No**, or **True** or **False**. The answer that the decision maker selects determines the workflow branch that's used to process the document.

For example, you assign Sam's expense report to John. John must decide whether the information in the document requires a call to Sam's manager. If John decides that a call is required, the expense report is assigned to Aretha, who must then call Sam's manager. If John decides that a call isn't required, the expense report is assigned to Frank for approval.

Delegate

When a decision maker delegates a decision, they assign the document to another user who must make the decision.

For example, you assign Sam's expense report to John. John delegates the decision to Maria, who is John's assistant.

Maria acts on behalf of John. If Maria decides that a call to Sam's manager is required, she assigns the expense report to Aretha, who must then call Sam's manager. If Maria decides that a call isn't required, she assigns the expense report to Frank for approval.

Actions that an approver can perform

When you assign a document to an approver, the approver can perform one of the following actions: approve, reject, delegate, or request change.

Approve

When an approver approves a document, the document is assigned to the next user in the workflow, if there's a next user. If no additional processing is required, the workflow process ends.

For example, Sam submits an expense report for USD 6,000, and you assign this document to Frank. When Frank approves the document, it's assigned to Sue for approval. When Sue approves the expense report, the workflow process ends.

Reject

When an approver rejects a document, the workflow process ends.

For example, Sam submits an expense report for USD 12,000, and you assign this document to Sue. If Sue rejects the expense report, the workflow process ends.

Sam can resubmit the expense report. Sam can make changes first, or resubmit the original version of the expense report. If Sam resubmits the expense report, the workflow process starts at the approval process.

Delegate

When an approver delegates a document, the document is assigned to another user for approval.

For example, Sam submits an expense report for USD 12,000, and you assign this document to Frank. Frank delegates the expense report to Ann.

Ann then acts on behalf of Frank. Therefore, when Ann approves the document, it's assigned to Sue for approval, just as if Frank had approved it. After Sue approves the document, it's sent to Ann for approval.

Request change

When an approver requests a change to a document, the system sends the document back to the originator.

For example, Sam submits an expense report for USD 12,000, and the system assigns the document to Sue. If Sue requests a change, the system sends the expense report back to Sam.

Sam can resubmit the expense report. Sam can make the requested changes first, or resubmit the original version of the expense report. If Sam resubmits the expense report, the system sends it to Frank for approval, because Frank is the first approver in the approval process.

Create workflows overview

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to create a workflow.

Open the workflow editor

The module that you're working in determines the types of workflows that you can create. To select the type of workflow to create a new workflow by using the workflow editor, follow these steps:

1. Open the module that you want to create a new workflow for. For example, to create a workflow for purchase requisitions, select **Procurement and sourcing**.
2. Select **Setup** > **[Module name] workflows**.
3. On the list page that appears, on the action pane, select **New**.
4. On the **Create workflow** page, select the type of workflow to create, and then select **Create workflow**. The workflow editor launches.
5. Select or sign in to the account to use with the workflow editor. If prompted to **Stay signed in to all your apps**, select **OK** to allow the account to automatically sign in to the workflow editor and other apps in the future, or select **No, sign in to this app only** if you prefer to only sign in to the workflow editor for this session.

Drag workflow elements onto the canvas

The **Workflow elements** area of the workflow editor contains the elements that you can add to your workflow. To add elements to the workflow, drag them onto the canvas.

Connect the elements

To connect one workflow element to another, hold the pointer over an element until connection points appear. Select a connection point, and then drag it to another element. Be sure to connect all the elements.

Configure the properties of the workflow

Follow these steps to configure the properties of the workflow.

1. Select the canvas to ensure that no workflow element is selected.
2. Select **Properties** to open the **Properties** page for the workflow.
3. Follow the procedures in the Configure workflow properties article.

Configure the elements of the workflow

Configure each element that you dragged onto the canvas. For information about how to configure each workflow element, see the following topics:

- Configure manual tasks in a workflow
- Configure automated tasks in a workflow
- Configure approval processes in a workflow
- Configure approval steps in a workflow
- Configure manual decisions in a workflow
- Configure conditional decisions in a workflow
- Configure parallel branches in a workflow
- Configure a parallel branch
- Configure line-item workflows.

Resolve any errors or warnings

The **Errors and warnings** pane at the bottom of the workflow editor shows messages that the workflow generates. To find the element where an error or warning occurred, double-click the error or warning message. You must resolve all errors and warnings before you can make the workflow active.

Save and activate the workflow

When you're ready to save and activate the workflow, follow these steps:

1. Select **Save and close** to close the workflow editor and open the **Save workflow** page.
2. Enter comments about the changes that you made to the workflow, and then select **OK**.
3. If you resolved all errors and warnings, the **Activate workflow** page appears. Select one of the following options:

- To activate this version of the workflow, select **Activate the new version**. When a workflow is active, users can submit documents to it for processing.
- If you don't want to activate this version, select **Do not activate the new version**. You can activate the workflow later.

Configure workflow properties

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure the various properties of a workflow.

To configure the properties of a workflow, open the workflow in the workflow editor. Select the canvas of the workflow editor, and then select **Properties** to open the **Properties** page. Use the following procedures to configure the various properties of the workflow.

Name the workflow

Follow these steps to enter a name for the workflow.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the workflow. For example, if you create a purchase requisition workflow for each country or region that you operate in, you can name the purchase requisition workflow **Purchase Requisitions Denmark** or **Purchase Requisitions Spain**.

Specify the workflow owner

The workflow owner is the person who manages and maintains the workflow. Follow these steps to specify the workflow owner.

1. In the left pane, select **Basic Settings**.
2. In the **Owner** list, select the name of the person who will manage the workflow.

Select an email template

Follow these steps to select the email template that is used to generate notification messages about the workflow.

1. In the left pane, select **Basic Settings**.

2. In the **Email template for workflow notifications** list, select the template.

Enter instructions for users

You can provide instructions to users who submit documents for processing and approval. These users are also referred to as *originators*. For example, you create a purchase requisition workflow, and you enter instructions. Users who enter purchase requisitions on the **Purchase requisitions** page can view those instructions. To view instructions, the originator selects the icon in the workflow message bar. Follow these steps to enter instructions for users.

1. In the left pane, select **Basic Settings**.
2. In the **Submission instructions** field, enter the instructions.
3. To personalize the instructions, insert placeholders. Placeholders are replaced with the appropriate data when the instructions are shown to users. To insert a placeholder, follow these steps:
   a. Select the **Submission instructions** field to specify where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.
4. To add translations of the instructions, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the text.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders. For instructions about how to enter a placeholder, see step 3.
   f. Select **Close**.

> ⓘ **Note**
>
> You can't add placeholders by using copy and paste because the target information isn't pasted in correctly. Use the interface to add placeholders.

Specify when to use this workflow through activation conditions

You can create multiple workflows that use the same workflow type. When you have multiple workflows that use the same type, you must specify when to use each workflow through activation conditions. If activation conditions aren't met, the default workflow is used. Similarly, if you define only one workflow configuration for a workflow type, the workflow configuration is used regardless of the activation conditions.

For example, you can create a purchase requisition workflow for each country or region that you operate in, such as Purchase Requisitions Denmark and Purchase Requisitions Spain, with the following conditions:

- Use Purchase Requisitions Denmark when: country/region = DK
- Use Purchase Requisitions Spain when: country/region = ES

Follow these steps to specify when to use the workflow that you're configuring.

1. In the left pane, select **Activation**.
2. Select the **Set the conditions for running this workflow** check box.
3. Select **Add condition**.
4. Enter a condition.
5. Enter any additional conditions that you need.
6. Run through the workflow with some target records to verify that the condition correctly includes and excludes records.

Specify when to send notifications

When you submit a document for processing, you create a workflow instance. You can send notifications to users when workflow instances that are based on the workflow start, complete, terminate, or stop because of an error. Follow these steps to specify when to send notifications.

1. In the left pane, select **Notifications**.

2. Select the check box for each event that should trigger notifications:

    - **Started** – Send notifications when a workflow instance starts.
    - **Stopped** – Send notifications when a workflow instance stops because of an error.
    - **Completed** – Send notifications when a workflow instance completes.
    - **Unrecoverable** – Send notifications when a workflow instance stops because of an unrecoverable error.
    - **Terminated** – Send notifications when a workflow instance terminates.

3. Select the row for an event that you selected in step 2.

4. On the **Notification text** tab, enter the text of the notification.

5. To personalize the text, insert placeholders. Placeholders are replaced with the appropriate data when the text is shown to users. To insert a placeholder, follow these steps:
   a. Select the field to specify where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.
   e. A common **Notification text** placeholder to include is "Last Notes: %Workflow.Last note%", which displays any comments from the previous step.

6. To add translations of the text, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the text.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders. For instructions about how to enter a placeholder, see step 5.
   f. Select **Close**.

7. On the **Recipient** tab, use the following options to specify who should receive the notifications.

Expand table

Option	Notifications are sent to these users	To send notifications, follow these steps
Participant	Users who are assigned to a specific group or role	1. On the **Recipient** tab, select **Participant**. 1. On the **Role based** tab, in the **Type of participant** list, select the type of group or role to send notifications to. 1. In the **Participant** list, select the group or role to send notifications to.
Workflow user	Users who are participants in this workflow	1. On the **Recipient** tab, select **Workflow user**. 1. On the **Workflow user** tab, in the **Workflow user** list, select a participant in this workflow.
User	Specific users	1. On the **Recipient** tab, select **User**. 1. On the **User** tab, the **Available users** list includes all users. Select the users to send notifications to, and move those users into the **Selected users** list.

1. Repeat steps 3 through 7 for each event that you selected in step 2.

Enter comments about the changes that you made to the workflow

To enter comments about the changes that you made to the workflow, follow these steps:

1. In the left pane, select **Notes**.
2. In the **Enter comments about the workflow** field, enter your comments.
3. Review your comments. After you add comments, you can't modify them.
4. Select **Add** to add your comments to the **Comment history** area.

Configure manual tasks in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure the properties for a manual task.

To configure a manual task in the workflow editor, right-click the task, and then select **Properties** to open the **Properties** page. Then use the following procedures to configure the properties for the manual task.

Name the task

Follow these steps to enter a name for the manual task.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the task.

Enter a subject line and instructions

You must provide a subject line and instructions for users assigned to the task. For example, if you configure a task for purchase requisitions, the user assigned to the task sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then select the icon in the message bar to view the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, select **Basic Settings**.
2. In the **Work item subject** field, enter the subject line.
3. To personalize the subject line, insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.

d. Select **Insert**.

4. To add translations of the subject line, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the translated text.
   e. To personalize the text, insert placeholders as described in step 3.
   f. Select **Close**.

5. In the **Work item instructions** field, enter the instructions.

6. To personalize the instructions, insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.

7. To add translations of the instructions, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the translated text.
   e. To personalize the text, insert placeholders as described in step 6.
   f. Select **Close**.

Assign the task

Follow these steps to specify who should receive the manual task.

1. In the left pane, click **Assignment**.

2. On the **Assignment type** tab, select one of the options in the following table. Follow the additional steps for that option before you go to step 3.

Expand table

Option	Users that the task is assigned to	Additional steps
Participant	Users who are assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to assign the task to. 1. In the **Participant** list, select the group or role to assign the task to.
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to assign the task to. 1. The system retrieves a range of user names from the hierarchy. These names represent users that the task can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition** and then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the task should be assigned to: **Assign to all users retrieved** – The task is assigned to all users in the range. **Assign only to last user retrieved** – The task is assigned to only the last user in the range. **Exclude users with the following condition** – The task isn't assigned to users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to assign the task to, and then move those users to the **Selected users** list.
Queue	A work item queue	1. After you select **Queue**, select the **Queue based** tab. 1. To assign the task to a specific queue, follow these steps: 1. In the **Queue type** list, select **Work item queues**. 1. In the **Queue name** list, select the queue. 1. If a specific condition should determine which queue the task is assigned to, follow these steps: 1. In the **Queue type** list, select **Conditional work item queues**. 1. In the **Queue name** list, select **Conditional queue**. **NOTE:** This option is used for only a few workflows, such as Case management.

3. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to complete the task. Select one of the following options:

    - **Hours** – Enter the number of hours that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.

- **Days** – Enter the number of days that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
- **Weeks** – Enter the number of weeks that the user has to complete the task.
- **Months** – Select the day and week that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of the month.
- **Years** – Select the day, week, and month that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of December.

If the user doesn't complete the task in the allotted time, the task is overdue. You can escalate an overdue task based on the options that you select in the **Escalation** area of the page.

Specify what happens when the task is overdue

If a user doesn't complete the manual task in the allotted time, the task is overdue. You can escalate an overdue task or automatically assign it to another user. Follow these steps to escalate the task if it's overdue.

1. In the left pane, select **Escalation**.
2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the task to the users who are listed in the escalation path. For example, the following table represents an escalation path.

Expand table

Sequence	Escalation path
1	Assign to: Donna
2	Assign to: Erin
3	Final action: Reject

In this example, the system assigns the overdue task to Donna. If Donna doesn't complete the task in the allotted time, the system assigns the task to Erin. If Erin doesn't complete the task in the allotted time, the system rejects the document that was submitted for processing.

3. To add a user to the escalation path, select **Add escalation**. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for

that option before you go to step 4.

Expand table

Option	Users that the task is escalated to	Additional steps
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to escalate the task to. 1. The system must retrieve a range of user names from the hierarchy. These names represent users that the task can be escalated to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition**. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the task should be escalated to: **Assign to all users retrieved** – The task is escalated to all users in the range. **Assign only to last user retrieved** – The task is escalated to only the last user in the range. **Exclude users with the following condition** – This task isn't escalated to users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to escalate the task to, and then move those users to the **Selected users** list.

4. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to complete the task. Select one of the following options:

   - **Hours** – Enter the number of hours that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Days** – Enter the number of days that the user has to complete the task. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Weeks** – Enter the number of weeks that the user has to complete the task.
   - **Months** – Select the day and week that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of the month.

- **Years** – Select the day, week, and month that the user must complete the task by. For example, you might want the user to complete the task by Friday of the third week of December.

5. Repeat steps 3 through 4 for each user that you want to add to the escalation path. You can change the order of the users.

6. If the users in the escalation path don't complete the task in the allotted time, the system takes action on the task. To specify the action that the system takes, select the **Action** row, and then, on the **End action** tab, select an action.

Specify when the system automatically acts on the task

You can configure the system to take action on the manual task if specific conditions are met. For example, a task requires that a member of the Expense reports department review the receipts that are submitted together with an expense report. According to company policy, this task must be performed if the total amount of the expense report is more than $100. In this scenario, you can configure the system to automatically mark the task as **Complete** when the total amount is less than 100. Follow these steps to specify when the system takes action on the manual task.

1. In the left pane, select **Automatic actions**.

2. Select the **Enable automatic actions** check box.

3. Select **Add condition**.

4. Enter a condition.

5. Enter any additional conditions that are required.

6. To verify that the conditions you entered are configured correctly, follow these steps:
   a. Select **Test**.
   b. On **Test workflow condition**, in **Validate condition**, select a record.
   c. Select **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
   d. Select **OK** or **Cancel** to return to **Properties**.

7. In **Auto complete action**, select the action that the system should take on the task.

Specify when to send notifications

You can send notifications to people when you delegate, escalate, complete, or reject a manual task, or when you request a change. Follow these steps to specify when to send notifications and who to send them to.

1. In the left pane, select **Notifications**.
2. Select the check box next to the events that you want to send notifications for:
   - **Delegate** – You assigned the task to another user.
   - **Escalate** – The assigned user didn't complete the task in the allotted time.
   - **Complete** – The assigned user completed the task.
   - **Reject** – The assigned user rejected the document that was submitted.
   - **Request change** – The assigned user requested a change to the document that was submitted.
3. Select the row for an event that you selected in step 2.
4. On the **Notification text** tab, enter the text of the notification.
5. To personalize the notification, insert placeholders. Placeholders are replaced with appropriate information when the notification is shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.
6. To add translations of the notification, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the translated text.
   e. To personalize the text, insert placeholders as described in step 5.
   f. Select **Close**.
7. On the **Recipient** tab, specify who to send the notifications to. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

Expand table

Option	Notification recipients	Additional steps
Participant	Users who are assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to send notifications to. 1. In the **Participant** list, select the group or role to send notifications to.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to send notifications to, and then move those users to the **Selected users** list.

8. Repeat steps 3 through 7 for each event that you selected in step 2.

Set a time limit

Follow these steps if you need to complete the manual task within a specific time.

> ⓘ **Note**
>
> The options that you select in this procedure override the options that you selected in the **Assignment** and **Escalation** areas of the page.

1. In the left pane, select **Advanced settings**.
2. Select the **Set a time limit for the workflow element** check box.
3. In the **Duration** field, specify when the task must be completed. Select one of the following options:

   - **Hours** – Enter the number of hours for task completion. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Days** – Enter the number of days for task completion. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Weeks** – Enter the number of weeks for task completion.
   - **Months** – Select the day and week for task completion. For example, you might want the task to be completed by Friday of the third week of the month.

- **Years** – Select the day, week, and month for task completion. For example, you might want the task to be completed by Friday of the third week of December.

4. If the time limit is exceeded, the system takes action on the task. In the **Action** list, select the action that the system should take.

Specify which actions are available to the user

When you assign the manual task to a user, the user must take action on the task. Follow these steps to specify which actions the user can take on the task.

> **Note**
>
> The available actions vary, depending on the design of the task.

1. In the left pane, select **Advanced settings**.
2. Select the **Complete** check box if the user should be able to mark the task as **Complete**.
3. Select the **Reject** check box if the user should be able to reject the document that was submitted.
4. Select the **Request change** check box if the user should be able to request changes to the document that was submitted.
5. Select the **Delegate** check box if the user should be able to assign the task to another user.
6. Select the **Reassign** check box if the user should be able to reassign the task to another user in the work item queue.
7. Select the **Release** check box if the user should be able to reassign the task to the work item queue. Another user can then complete the task.

Configure automated tasks in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure the properties for an automated task.

To configure an automated task in the workflow editor, right-click the task, and then select **Properties** to open the **Properties** page. Then use the following procedures to configure the properties for the automated task.

Name the task

Follow these steps to enter a name for the automated task.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the task.

Specify when to send notifications

You can send notifications to people when an automated task runs or cancels. Follow these steps to specify when to send notifications and who receives them.

1. In the left pane, select **Notifications**.
2. Select the check box next to the events to send notifications for:
   - **Execution** – Send notifications when the task runs.
   - **Canceled** – Send notifications when the task cancels.
3. Select the row for an event that you selected in step 2.
4. On the **Notification text** tab, enter the text of the notification.
5. To personalize the notification, insert placeholders. Placeholders are replaced with appropriate data when the notification appears to users. Follow these steps to insert a placeholder:

a. In the text box, select where the placeholder should appear.
b. Select **Insert placeholder**.
c. In the list that appears, select the placeholder to insert.
d. Select **Insert**.

6. To add translations of the notification, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the text.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 5.
   f. Select **Close**.

7. On the **Recipient** tab, specify who receives the notifications. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

Expand table

Option	Notification recipients	Additional steps
Participant	Users assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to send notifications to. 1. In the **Participant** list, select the group or role to send notifications to.
Workflow user	Users who participate in the current workflow	- After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to send notifications to, and then move those users to the **Selected users** list.

1. Repeat steps 3 through 7 for each event that you selected in step 2.

Configure approval processes in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the following procedure to configure the properties of the approval process.

To configure an approval process, in the workflow editor, right-click the approval element, and then select **Properties** to open the **Properties** form.

Name the approval process

Follow these steps to enter a name for the approval process.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the approval process.

Specify when the system automatically acts on the document

You can configure the system to automatically act on the document if specific conditions are met. For example, the system can approve expense reports that have total amounts that are less than USD 100. Follow these steps to specify when the system acts on the document:

1. In the left pane, select **Automatic actions**.
2. Select the **Enable automatic actions** check box.
3. Select **Add condition**.
4. Enter a condition.
5. Enter additional conditions, if necessary.
6. To verify that the conditions you entered are configured correctly, complete the following steps:

a. Select **Test** to open the **Test workflow condition** form.
b. Select a record in the **Validate condition** area of the form.
c. Select **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
d. Select **OK** or **Cancel** to return to the **Properties** form.

7. In the **Auto complete action** list, select the action that the system should take on the document.

Specify when to send notifications

You can send notifications to people when a document is approved, rejected, delegated, or escalated, or when a change is requested. Follow these steps to specify when to send notifications and who receives them.

1. In the left pane, select **Notifications**.

2. Select the check box next to the events to send notifications for:

   - **Delegate** – When a document is assigned to another user for approval.
   - **Escalate** – When the assigned user doesn't act on a document in the allotted time.
   - **Approve** – When a document is approved.
   - **Reject** – When a document is rejected.
   - **Request change** – When the assigned user requests a change to a submitted document.

3. Select the row for an event that you selected in step 2.

4. Select the **Notification text** tab.

5. In the text box, enter the text for the notification.

6. To personalize the text, insert placeholders, which are replaced with the appropriate data when they're displayed to users. To insert a placeholder, follow these steps:
   a. Select the text box at the location where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.

7. To add translations of the notification, select **Translations**. In the form that appears, follow these steps:
   a. Select **Add**.
   b. In the list that appears, select the language for the text.
   c. In the **Translated text** text box, enter the text.

d. To personalize the text, insert placeholders.
e. Select **Close**.

8. Select the **Recipient** tab.

9. Specify who receives the notifications. Select one of the options in the following table, and then follow the additional steps for the option before you go to step 10.

Expand table

Option	Notification recipients	Additional steps
Participant	Users who are assigned to a specific group or role	1. After you select **Participant**, select the **Role based** tab. 1. In the **Type of participant** list, select the type of group or role to send notifications to. 1. In the **Participant** list, select the group or role to send notifications to.
Workflow user	Users who participate in the current workflow	1. After you select **Workflow user**, select the **Workflow user** tab. 1. In the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. Select the users to send notifications to, and then move these users to the **Selected users** list.

1. Repeat steps 3 through 9 for each event that you selected in step 2.

Specify a final approver

To require extra approval when the user who submitted the document also approves it, specify a final approver for the approval step.

1. In the workflow editor, right-click the approval element, and then select **Properties** to open the **Properties** form.
2. In the left pane, select **Advanced settings**.
3. Select the **Use final approver** check box.
4. In the list, select a user to be the final approver.

Prevent the submitter from approving steps in the workflow

To prevent users who submit documents for approval from approving the documents themselves, follow these steps:

1. Go to **System administration** > **Workflow** > **Workflow parameters** > **General** > **Approver**.
2. Update the **Disallow approval by submitter** setting on the workflow to **Yes**.

By default, this setting is **No**, and users can approve the document if they're included in the approval step's assignment settings.

If you set the workflow to **Disallow approval by submitter** and include approval steps with a final approver, make sure the final approver isn't a user who typically submits documents to workflow, since they can't complete the approval.

Set a time limit

Follow these steps if you need to complete the approval process within a specific time.

> ⓘ **Note**
>
> The options that you select in these steps override the options that you selected in the **Assignment** and **Escalation** areas of each approval step.

1. In the left pane, select **Advanced settings**.
2. Select the **Set a time limit for the workflow element** check box.
3. In the **Duration** field, specify when the approval process must be completed. Select one of the following options:

    - **Hours** – Enter the number of hours in which the approval process must be completed. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Days** – Enter the number of days in which the approval process must be completed. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Weeks** – Enter the number of weeks in which the approval process must be completed.
    - **Months** – Select the day and week by which the approval process must be completed. For example, you might want the approval process to be completed by Friday of the third week of the month.
    - **Years** – Select the day, week, and month by which the approval process must be completed. For example, you might want the approval process to be completed by Friday of the third week of December.

4. If the time limit is exceeded, the system acts on the document. In the **Action** list, select the action that the system should take.

Specify which actions are available to the user

When you assign a document to a user for approval, the user must act on the document. Follow these steps to specify which actions the user can take on the submitted document.

1. In the left pane, select **Advanced settings**.
2. Select the **Approve** check box if the user can approve the document.
3. Select the **Reject** check box if the user can reject the document.
4. Select the **Request change** check box if the user can request changes to the document.
5. Select the **Delegate** check box if the user can assign the document to another user for approval.

> **Note**
>
> The **Enable actions from the work list in Enterprise Portal** check box is deprecated.

Configure the approval steps

An approval process consists of approval steps. Complete the following procedure to add steps to the approval process and configure the steps.

1. In the workflow editor, double-click the approval process. The workflow editor displays the steps of the approval process.
2. To add an approval step, drag the step from the **Workflow elements** area to the canvas.
3. To configure an approval step, see Configure approval steps in a workflow.

Configure approval steps in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure the properties of an approval step.

To configure an approval step in the workflow editor, right-click the approval step, and then select **Properties** to open the **Properties** page. Use the following procedures to configure the properties of the approval step.

Name the step

Follow these steps to enter a name for the approval step.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the approval step.

Enter a subject line and instructions

You must provide a subject line and instructions for users assigned to the approval step. For example, if you configure an approval step for purchase requisitions, the user assigned to the step sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then select the icon in the message bar to see the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, select **Basic Settings**.
2. In the **Work item subject** field, enter the subject line.
3. To personalize the subject line, insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.

d. Select **Insert**.

4. To add translations of the subject line, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 3.
   f. Select **Close**.

5. In the **Work item instructions** field, enter the instructions.

6. To personalize the instructions, insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.

7. To add translations of the instructions, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 6.
   f. Select **Close**.

Assign the approval step

Follow these steps to specify who the approval step should be assigned to.

1. In the left pane, select **Assignment**.

2. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 3.

Expand table

Option	Users that the approval step is assigned to	Additional steps
Participant	Users who are assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to assign the step to. 1. In the **Participant** list, select the group or role to assign the step to.
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to assign the step to. 1. The system must retrieve a range of user names from the hierarchy. These names represent users that the step can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition**. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the step should be assigned to: **Assign to all users retrieved** – The step is assigned to all users in the range. **Assign only to last user retrieved** – The step is assigned to only the last user in the range. **Exclude users with the following condition** – The step isn't assigned to any users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all system users. Select the users to assign the step to, and then move those users to the **Selected users** list.

3. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to take action on, or respond to, documents that reach the approval step. Select one of the following options:

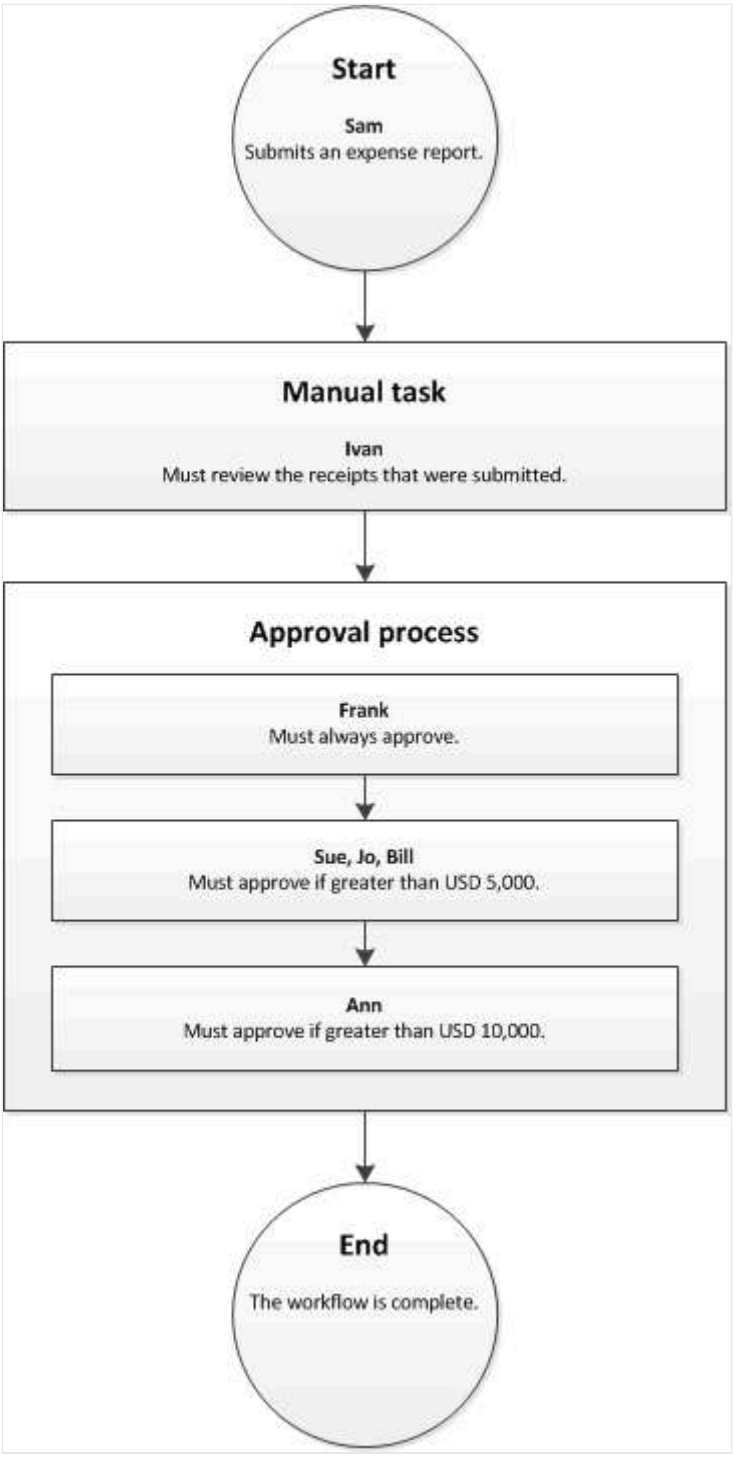
   - **Hours** – Enter the number of hours that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Days** – Enter the number of days that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Weeks** – Enter the number of weeks that the user has to respond.
   - **Months** – Select the day and week that the user must respond by. For example, you might want the user to respond by Friday of the third week of the month.

- **Years** – Select the day, week, and month that the user must respond by. For example, you might want the user to respond by Friday of the third week of December.

If the user doesn't take action on the document in the allotted time, the document is overdue. You can escalate an overdue document by selecting options in the **Escalation** area of the page.

4. If you assigned the approval step to multiple users or a group of users, on the **Completion policy** tab, select one of the following options:

    - **Single approver** – The action that is applied to the document is determined by the first person who responds. For example, Sam submits an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue is the first person who responds to the document, the action that Sue takes is applied to the document. If Sue rejects the document, it's rejected and sent back to Sam. If Sue approves the document, it's sent to Ann for approval.



- **Majority of approvers** – The action that is applied to the document is determined when most of the approvers respond. For example, Sam submits an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue and Jo are the first two approvers who respond, the action that they take is applied to the document.
  - If Sue approves the document, but Jo rejects it, the document is rejected and sent back to Sam.
  - If both Sue and Jo approve the document, it's sent to Ann for approval.

- **Percentage of approvers** – The action that is applied to the document is determined when a specific percentage of the approvers respond. For example, Sam submits an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo,

and Bill, and you entered **50** as the percentage. If Sue and Jo are the first two approvers who respond, the action that they take is applied to the document, because they meet the requirement for 50 percent of approvers.
    - If Sue approves the document, but Jo rejects it, the document is rejected and sent back to Sam.
    - If both Sue and Jo approve the document, it's sent to Ann for approval.

- **All approvers** – All the approvers must approve the document. Otherwise, the workflow can't continue. For example, Sam submits an expense report for USD 15,000. The expense report is currently assigned to Sue, Jo, and Bill. If Sue and Joe approve the document, but Bill rejects it, the document is rejected and sent back to Sam. If Sue, Jo, and Bill all approve the document, it's sent to Ann for approval.

Specify when the approval step is required

You can specify when the approval step is required. The approval step can always be required, or it can be required only if specific conditions are met.

Always require the approval step

Follow these steps if the approval step is always required.

1. In the left pane, select **Condition**.
2. Select the **Always run this step** option.

Require the approval step in specific conditions

The approval step that you're configuring might be required only if specific conditions are met. For example, if you're configuring an approval step for a purchase requisition workflow, you might want the approval step to occur only if the amount of the purchase requisition is more than USD 10,000. Follow these steps to specify when the approval step is required.

1. In the left pane, select **Condition**.
2. Select the **Run this step only when the following condition is met** option.
3. Enter a condition.
4. Enter any additional conditions that are required.
5. To verify that the conditions that you entered are configured correctly, follow these steps:
    a. Select **Test**.
    b. On the **Test workflow condition** page, in the **Validate condition** area, select a record.

c. Select **Test**. The system evaluates the record to determine whether it meets the conditions that you defined.
d. Select **OK** or **Cancel** to return to the **Properties** page.

Specify what happens when the document is overdue

If a user doesn't take action on a document in the allotted time, the document is overdue. You can escalate an overdue document or automatically assign it to another user for approval. Follow these steps to escalate the document if it's overdue.

1. In the left pane, select **Escalation**.

2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the document to the users who are listed in the escalation path. For example, the following table represents an escalation path.

   Expand table

Sequence	Escalation path
1	Assign to: Donna
2	Assign to: Erin
3	Final action: Reject

   In this example, the system assigns the overdue document to Donna. If Donna doesn't respond in the allotted time, the system assigns the document to Erin. If Erin doesn't respond in the allotted time, the system rejects the document.

3. To add a user to the escalation path, select **Add escalation**. On the **Assignment type** tab, select one of the options in the following table, and then follow the additional steps for that option before you go to step 4.

   Expand table

Option	Users that the document is escalated to	Additional steps
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to escalate the document to. 1. The system must retrieve a range of user names from the hierarchy. These names represent users that the document can be escalated to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition**. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the document should be escalated to: **Assign to all users retrieved** – The document is escalated to all users in the range. **Assign only to last user retrieved** – The document is escalated to only the last user in the range. **Exclude users with the following condition** – The document isn't escalated to any users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to escalate the document to, and then move those users to the **Selected users** list.

4. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to take action on, or respond to, documents. Select one of the following options:

   - **Hours** – Enter the number of hours that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Days** – Enter the number of days that the user has to respond. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Weeks** – Enter the number of weeks that the user has to respond.
   - **Months** – Select the day and week that the user must respond by. For example, you might want the user to respond by Friday of the third week of the month.
   - **Years** – Select the day, week, and month that the user must respond by. For example, you might want the user to respond by Friday of the third week of December.

5. Repeat steps 3 through 4 for each user that you want to add to the escalation path. You can change the order of the users.

6. If the users in the escalation path don't respond in the allotted time, the system automatically takes action on the document. To specify the action that the system takes, select the **Action** row, and then, on the **End action** tab, select an action.

Configure expenditure reviewers

Article • 06/19/2024

You can set up dynamic expenditure reviewers to route expenditures for review, based on either the user who is assigned to a project role or the financial dimension where the expenditure is being charged. The workflow process uses the specified project role or financial dimension owner to determine who the expenditure should be routed to.

You can define one or more expenditure reviewer configurations, and then select a configuration when you create a workflow. You can configure the expenditure reviewer values for each legal entity in your organization. After you define the expenditure reviewer configurations, you assign the configuration. Expenditure reviewers can be assigned to workflow tasks, approvals, and manual decisions.

> **Note**
>
> Although expenditure reviewers aren't mandatory, they can help simplify the configuration of your workflow. For example, you don't have to create one conditional decision to check for each cost center dimension, and then create another element to assign the approval or task to a specific user or groups of users. Instead, you can configure the owner of the cost center dimension and use an expenditure reviewer to dynamically select the correct user. In this way, when the ownership or assignment of cost centers changes, you just have to update the **Owner** field for the financial dimension.

Types of expenditure reviewers

Not all workflows support the concept of expenditure reviewers. By default, you can configure expenditure reviewers for purchase requisitions, purchase orders, vendor invoices, and expense reports. Each of these workflow types requires that you configure the expenditure reviewers on a separate page that is specific to the feature and module. For each supported document, expenditure reviewers can be used with either header-level workflows or line-level workflows.

The following table shows where you go to configure an expenditure reviewer for each supported document.

Expand table

Document	Navigation path
Expense reports	Expense management > Setup > Policies > Expenditure reviewers
Purchase orders	Procurement and sourcing > Setup > Policies > Purchase order expenditure reviewers
Purchase requisitions	Procurement and sourcing > Setup > Policies > Purchase requisition expenditure reviewers
Vendor invoices	Accounts payable > Policy setup > Vendor invoice expenditure reviewers

Expenditure reviewer assignments

Two types of assignment are available for each expenditure reviewer: *project distributions* and *organization distributions*. For a project distribution, you can select between project authorities and financial dimensions. For an organization distribution, you can select financial dimensions.

Project authorities include the project manager, project controller, and project sales manager. You define these authorities directly on your project, by selecting a worker in the appropriate fields.

Financial dimensions are controlled by the account structures in each legal entity. For each legal entity, you can select which financial dimensions will be used with the expenditure reviewer. The dimensions can come from either the project (in this case, you select the dimensions on the **Project distributions** tab) or the document (in this case, you select the dimensions on the **Organization distributions** tab). In the **Owner** field on the **Financial dimensions values** page, you can select the worker for each financial dimension.

Example 1: Expenditure reviewers based on organization distributions

You work for Contoso Appliances, and your organization has six departments and 10 cost centers. When a new purchase requisition is submitted, approval must come first from the department manager and then from the cost center manager.

For this example, you configure two *purchase requisition expenditure reviewers*:

- For the first reviewer, you name the department and then select the **Department** financial dimension on the **Organization distributions** tab.

- For the second reviewer, you name the cost center and then select the **Cost Center** financial dimension on the **Organization distributions** tab.

When you configure the workflow, you create two approval steps. The first is for the department, and the second is for the cost center. For each approval element, you select **Participant** in the **Assignment type** field on the **Role-based** tab, select **Expenditure participants** in the **Type of participant** field, and then select the appropriate participant in the **Participant** field.

When the purchase requisition is created, the department and cost center financial dimensions are assigned to the lines of the purchase requisition. When the workflow is submitted, the system first evaluates the department on the purchase requisition and assigns the approval element to the user who is related to the worker that you selected for the department. After the first approval step is completed, the system evaluates the second approval step and assigns the second approval element to the user who is related to the worker that you selected for the cost center.

Example 2: Expenditure reviewers based on project distributions

You work for the services division of Contoso Appliances. The organization requires that the project manager for each purchase order must approve the expense. In addition, the cost center manager for the project must approve it. The approvals can be done at the same time. In any case, both users must approve the purchase order before the workflow can proceed.

For this example, you create one *purchase order expenditure reviewer* that is named **PM And Cost Center**. You select the **Project manager** checkbox and set the **Cost center dimension** option to **Yes** on the **Project distributions** tab of the **Purchase order expenditure reviewer** page. As a part of the configuration, you must ensure that the **Project manager** field is set for all projects, and that an owner is specified for all cost centers on the **Financial dimension values** page.

When you configure the workflow, you need one approval element. You select **Participant** in the **Assignment type** field. Then, on the **Role-based** tab, you select **Expenditure participants** in the **Type of participant** field, and select the project manager and cost center in the **Participant** field. To ensure that the workflow can't proceed until both the project manager and the cost center owner approve the workflow, you set the **Completion policy** field to **All approvers**.

When the purchase order is created, the **Project** field must be specified. If you don't require a project for all your purchase orders, you should add a conditional decision to

your workflow to check for a project before the approval step is run. The system then evaluates the project that is specified for the purchase order and assigns the approval element to the user who is related to the worker in the **Project manager** field. Additionally, the system creates a task and assigns it to the user who is related to the worker that you select in the **Owner** field for the cost center from the project. Note that this example uses the cost center of the project, not the cost center of the purchase order.

Set up expenditure reviewers

This example shows how to configure a purchase requisition expenditure reviewer. To configure other types of expenditure reviewers, replace the navigation path in step 1 with the appropriate path from the table in the Types of expenditure reviewers section, earlier this article.

1. Go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchase requisition expenditure reviewers**.
2. On the **Purchase requisition expenditure reviewers** page, select **New**.
3. In the **Name** field, enter a name for the expenditure reviewer configuration, such as **cost center**.
4. On the **Expenditure reviewers by legal entity** FastTab, select the legal entity to configure.
5. For a project distribution, select the checkbox for each project authority, and select **Yes** for each financial dimension that you want to enable.
6. For an organization distribution, on the **Organization distributions** tab, select **Yes** for each financial dimension that you want to enable.
7. Repeat steps 4 through 6 for each additional legal entity.

Assign owners to financial dimensions

To assign an owner to a financial dimension, follow these steps.

1. Go to **General ledger** > **Chart of accounts** > **Dimensions** > **Financial dimensions**.
2. In the list, select the financial dimension to assign owners to.
3. Select **Dimension values**.
4. Select **Edit** to make changes to the dimension values.
5. In the list, select the dimension value to assign an owner to.
6. In the **Owner** field, select the worker to assign the dimension value to.

Configure project distributions

To assign project authorities to a project, follow these steps.

1. Go to **Project management and accounting** > **Projects** > **All projects**.
2. Select the project to assign authorities to.
3. Select **Edit** to make changes to the project.
4. On the **General** FastTab, in the **Responsible** section, select a worker for the **Sales manager**, **Project manager**, and **Project controller** fields as required.
5. On the **Financial dimensions** FastTab, select the required financial dimensions for your project.

Assign expenditure reviewers to a workflow task

This example shows how to configure a purchase requisition workflow so that it uses a purchase requisition expenditure reviewer. To configure other types of workflows, the workflow page that you must open in step 1 might be in the **Expense management** or **Accounts payable** module instead of the **Procurement and sourcing** module.

To assign purchase requisition expenditure reviewers to a workflow task, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing workflows**.
2. Double-tap (or double-click) an existing workflow, or create a new workflow.
3. In the workflow editor, in the **Workflow** pane, select the task to assign the expenditure reviewer configuration to. Then, on the **Action Pane**, in the **Show** group, select **Properties**.
4. In the left pane of the **Properties** page, select **Assignment**.
5. On the **Assignment type** tab, select **Participant**.
6. On the **Role-based** tab, in the **Type of participant** field, select **Expenditure participants**. Then, in the **Participant** field, select the expenditure reviewer configuration to use for the workflow task.

Configure manual decisions in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure the properties of a manual decision.

To configure a manual decision in the workflow editor, right-click the manual decision, and then select **Properties** to open the **Properties** page. Then use the following procedures to configure the properties of the manual decision.

Name the decision

Follow these steps to enter a name for the manual decision.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the manual decision.

Enter a subject line and instructions

You must provide a subject line and instructions for users assigned to the manual decision. For example, if you're configuring a decision for purchase requisitions, the user assigned to the decision sees the subject line and instructions on the **Purchase requisitions** page. The subject line appears in a message bar on the page. The user can then select the icon in the message bar to view the instructions. Follow these steps to enter a subject line and instructions.

1. In the left pane, select **Basic Settings**.
2. On the **Instructions** tab, in the **Work item subject** field, enter the subject line.
3. To personalize the subject line, insert placeholders. Placeholders are replaced with appropriate data when the subject line is shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.

d. Select **Insert**.

4. To add translations of the subject line, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 3.
   f. Select **Close**.

5. In the **Work item instructions** field, enter the instructions.

6. To personalize the instructions, insert placeholders. Placeholders are replaced with appropriate data when the instructions are shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.

7. To add translations of the instructions, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 6.
   f. Select **Close**.

Specify the possible outcomes of a decision

Typically, when you assign a document to a decision maker, you ask a question. The answer to this question is usually **Yes** or **No**, or **True** or **False**. Follow these steps to specify the possible outcomes of the manual decision.

1. In the left pane, select **Basic Settings**.

2. On the **Outcomes** tab, in the **Outcome 1** field, enter the name of the outcome or the option.

3. To add translations of the outcome, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.

d. In the **Translated text** field, enter the text.
e. Select **Close**.

4. In the **Outcome 2** field, enter the name of the outcome or the option.

5. To add translations of the outcome, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. Select **Close**.

Specify when to send notifications

You can send notifications to people when a decision is made, delegated, or escalated. Follow these steps to specify when to send notifications and who receives them.

1. In the left pane, select **Notifications**.

2. Select the check box next to the events that send notifications:

   - **[Choice 1]** – The assigned user selects **[Choice 1]**.
   - **[Choice 2]** – The assigned user selects **[Choice 2]**.
   - **Delegate** – The assigned user assigns the decision to another user.
   - **Escalate** – The assigned user doesn't make the decision in the allotted time.

3. Select the row for an event that you selected in step 2.

4. On the **Notification text** tab, enter the text of the notification.

5. To personalize the notification, insert placeholders. Placeholders are replaced with appropriate data when the notification is shown to users. Follow these steps to insert a placeholder:
   a. In the text box, select where the placeholder should appear.
   b. Select **Insert placeholder**.
   c. In the list that appears, select the placeholder to insert.
   d. Select **Insert**.

6. To add translations of the notification, follow these steps:
   a. Select **Translations**.
   b. On the page that appears, select **Add**.
   c. In the list that appears, select the language for the translation.
   d. In the **Translated text** field, enter the text.
   e. To personalize the text, insert placeholders as described in step 5.

f. Select **Close**.

7. On the **Recipient** tab, specify who receives the notifications. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 8.

Expand table

Option	Notification recipients	Additional steps
Participant	Users who are assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to send notifications to. 1. In the **Participant** list, select the group or to send notifications to.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to send notifications to, and then move those users to the **Selected users** list.

1. Repeat steps 3 through 7 for each event that you selected in step 2.

Assign a decision

Follow these steps to specify who should receive a manual decision.

1. In the left pane, select **Assignment**.
2. On the **Assignment type** tab, select one of the options in the following table. Follow the additional steps for that option before you go to step 3.

Expand table

Option	Users that the decision is assigned to	Additional steps
Participant	Users assigned to a specific group or role	1. After you select **Participant**, on the **Role based** tab, in the **Type of participant** list, select the type of group or role to assign the decision to. 1. In the **Participant** list, select the group or role to assign the decision to.

Option	Users that the decision is assigned to	Additional steps
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to assign the decision to. 1. The system retrieves a range of user names from the hierarchy. These names represent users that the decision can be assigned to. Follow these steps to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition**. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the decision should be assigned to: **Assign to all users retrieved** – The decision is assigned to all users in the range. **Assign only to last user retrieved** – The decision is assigned to only the last user in the range. **Exclude users with the following condition** – The decision isn't assigned to any users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to assign the decision to, and then move those users to the **Selected users** list.

1. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to make the decision. Select one of the following options:

    - **Hours** – Enter the number of hours that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Days** – Enter the number of days that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Weeks** – Enter the number of weeks that the user has to make the decision.
    - **Months** – Select the day and week that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of the month.
    - **Years** – Select the day, week, and month that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of December.

If the user doesn't make the decision in the allotted time, the decision is overdue. You can escalate an overdue decision based on the options that you select in the **Escalation** area of the page.

Specify what happens when a decision is overdue

If a user doesn't make the decision in the allotted time, the decision is overdue. You can escalate an overdue decision or automatically assign it to another user. Follow these steps to escalate the decision if it's overdue.

1. In the left pane, select **Escalation**.
2. Select the **Use escalation path** check box to create an escalation path. The system automatically assigns the decision to the users who are listed in the escalation path. For example, the following table represents an escalation path.

   Expand table

Sequence	Escalation path
1	Assign to: Donna
2	Assign to: Erin
3	Final action: [Choice 1]

   In this example, the system assigns the overdue decision to Donna. If Donna doesn't make the decision in the allotted time, the system assigns the decision to Erin. If Erin doesn't make the decision in the allotted time, the system selects **[Choice 1]** as the decision.
3. To add a user to the escalation path, select **Add escalation**. Select one of the options in the following table, and then follow the additional steps for that option before you go to step 4.

   Expand table

Option	Users that the decision escalates to	Additional steps
Hierarchy	Users in a specific organizational hierarchy	1. After you select **Hierarchy**, on the **Hierarchy selection** tab, in the **Hierarchy type** list, select the type of hierarchy to escalate the decision to. 1. The system retrieves a range of user names from the hierarchy. These names represent users that the decision can escalate to. Follow these steps

Option	Users that the decision escalates to	Additional steps
		to specify the starting point and ending point of the range of user names that the system retrieves: 1. To specify the starting point, select a person in the **Start from** list. 1. To specify the ending point, select **Add condition**. Then enter a condition that determines where in the hierarchy the system stops retrieving names. 1. On the **Hierarchy options** tab, specify which users in the range the decision should escalate to: **Assign to all users retrieved** – The decision escalates to all users in the range. **Assign only to last user retrieved** – The decision escalates to only the last user in the range. **Exclude users with the following condition:** – The decision doesn't escalate to any users in the range who meet a specific condition. Select **Add condition** to specify the condition.
Workflow user	Users in the current workflow	After you select **Workflow user**, on the **Workflow user** tab, in the **Workflow user** list, select a user who participates in the workflow.
User	Specific users	1. After you select **User**, select the **User** tab. 1. The **Available users** list includes all users. Select the users to escalate the decision to, and then move those users to the **Selected users** list.

1. On the **Time limit** tab, in the **Duration** field, specify how much time the user has to make the decision. Select one of the following options:

    - **Hours** – Enter the number of hours that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Days** – Enter the number of days that the user has to make the decision. Then select the calendar that your organization uses, and enter information about your organization's work week.
    - **Weeks** – Enter the number of weeks that the user has to make the decision.
    - **Months** – Select the day and week that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of the month.
    - **Years** – Select the day, week, and month that the user must make the decision by. For example, you might want the user to make the decision by Friday of the third week of December.

2. Repeat steps 3 through 4 for each user that you want to add to the escalation path. You can change the order of the users.

3. If the users in the escalation path don't make the decision in the allotted time, the system makes the decision. To specify the option that the system selects, select the **Action** row,

and then, on the **End action** tab, select an option.

Set a time limit

Follow these steps if you need to make the decision by a specific time.

> **Note**
>
> The options that you select in this procedure override the options that you selected in the **Assignment** and **Escalation** areas of the page.

1. In the left pane, select **Advanced settings**.
2. Select the **Set a time limit for the workflow element** check box.
3. In the **Duration** field, specify when the decision must be made. Select one of the following options:
   - **Hours** – Enter the number of hours. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Days** – Enter the number of days. Then select the calendar that your organization uses, and enter information about your organization's work week.
   - **Weeks** – Enter the number of weeks.
   - **Months** – Select the day and week that the decision must be made by. For example, you might want the decision to be made by Friday of the third week of the month.
   - **Years** – Select the day, week, and month that the decision must be made by. For example, you might want the decision to be made by Friday of the third week of December.
4. If the time limit is exceeded, the system makes the decision. In the **Action** list, select the option that the system should choose.

Configure conditional decisions in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the following procedure to configure the properties of a conditional decision.

A conditional decision is a point where a workflow divides into two branches. To configure a conditional decision, right-click the conditional decision in the workflow editor, and then select **Properties** to open the **Properties** form.

Name a decision

Follow these steps to enter a name for a conditional decision.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the conditional decision.

Set conditions

The system determines which branch to use by evaluating the submitted document to see if it meets specific conditions.

1. In the left pane, select **Basic Settings**.
2. Select **Add condition**.
3. Enter a condition.
4. Enter additional conditions, if needed.
5. To verify that the conditions you entered are configured correctly, complete the following steps:
   a. Select **Test** to open the **Test workflow condition** form.
   b. Select a record in the **Validate condition** area of the form.

c. Select **Test**. The system evaluates the record to see if it meets the conditions you defined.
d. Select **OK** or **Cancel** to return to the **Properties** form.

Configure parallel activities in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To configure a parallel activity, use the workflow editor.

A parallel activity consists of workflow branches that run at the same time.

Name a parallel activity

Follow these steps to enter a name for a parallel activity.

1. Right-click the parallel activity, and then select **Properties** to open the **Properties** form.
2. In the left pane, select **Basic Settings**.
3. In the **Name** field, enter a unique name for the parallel activity.
4. Select **Close**.

Configure the branches of a parallel activity

Follow these steps to add and configure the branches of this parallel activity.

1. Double-click the parallel activity to display the branches of the parallel activity.
2. To add a branch, drag the **Branch** element from the **Workflow elements** area to an insertion point on the canvas. The following figure shows an insertion point.

   
   > **Note**
   >
   > The order of the branches doesn't matter because all the branches of a parallel activity run at the same time.

3. To configure each branch, see Configure parallel branches in a workflow.

Configure parallel branches in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To configure a parallel branch, use the workflow editor.

A parallel branch is a workflow that runs in the context of a parent workflow.

Name a branch

Follow these steps to enter a name for a parallel branch.

1. Right-click the parallel branch, and then select **Properties**. The **Properties** form appears.
2. In the left pane, select **Basic Settings**.
3. In the **Name** field, enter a unique name for the parallel branch.
4. Select **Close**.

Design and configure the elements of a branch

Follow these steps to design and configure the elements of a parallel branch.

1. Double-click the parallel branch.
2. Drag workflow elements onto the canvas, and then configure the elements, just as you would to create any other workflow. For more information, see Create workflows overview.

Configure line item workflows

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure a line item workflow element.

To configure a line item workflow element, in the workflow editor, right-click the element, and then select **Properties** to open the **Properties** page. Then use the following procedures to configure the properties of the line item workflow element.

Name the line item workflow element

Follow these steps to enter a name for the line item workflow element.

1. In the left pane, select **Basic Settings**.
2. In the **Name** field, enter a unique name for the line item workflow element.

Specify whether the same workflow processes all line items

Follow these steps to specify whether the same workflow processes all the line items on a document.

1. In the left pane, select **Basic Settings**.
2. If the same workflow should process all the line items on a document, select **Invoke a single workflow for all line-items**. Then select the workflow to use to process the line items.
3. If a specific workflow should process line items that meet a specific set of conditions, select **Invoke a workflow for each line-item**. Then follow these steps to define the set of conditions:
   a. Select **Add**.
   b. Select the condition in the table.

c. On the **Condition name** tab, enter a name for the set of conditions that you're defining.
d. Select **Add condition** to enter a condition.
e. Enter any additional conditions that are required.
f. To verify that the set of conditions that you entered is configured correctly, select **Test**. On the **Test workflow condition** page, in the **Validate condition** area, select a record, and then select **Test**. The system evaluates the record to determine whether it meets the conditions that you defined. Select **OK** or **Cancel** to return to the **Properties** page.

On the **Workflow** tab, select the workflow to use to process line items that meet the set of conditions that you defined.

Configure the Workflow message processing batch job as critical

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The workflow system uses various batch jobs. **Workflow message processing** is an important batch job that processes workflow messages. If workflow is a key component of your organization, consider configuring the **Workflow message processing** batch job as critical.

When you configure the **Workflow message processing** batch job as critical, the system actively tracks its status. When a critical batch job fails, the support team can better monitor failures and take action to resolve any problems.

Follow these steps to configure the **Workflow message processing** batch job as critical:

1. Go to the **Batch jobs** page.
2. Search for **Workflow message processing** by using the quick filter.
3. Select the **Workflow message processing** batch job.
4. Select **Edit** in the action pane.
5. Select the **Critical Job** check box.
6. Select **Save** in the action pane.

Delegate work items in a workflow

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Manually delegate a work item

To delegate an individual work item, select the **Delegate** option in the **Workflow** menu. Enter the user to delegate to along with a comment. This action reassigns the work item to that user so they can complete it.

Manually delegate multiple work items

You can delegate multiple work items together from the **Work items assigned to me** page. The following workflow types are eligible for mass delegation: Purchase agreement approval workflow, Purchase order workflow, Purchase requisition review, and Vendor invoice workflow. The **Delegate multiple work items** feature is disabled by default. You can enable it in **Workspaces** > **Feature management**. Contact your system administrator for help with enabling this feature.

1. Go to **Common** > **Common** > **Work items** > **Work items assigned to me**.
2. Select the work items that you want to delegate.
3. Select the **Delegate work items** menu.
4. In the **User** field, select the user to delegate the work items to.
5. In the **Comment** field, enter a comment that explains why you're delegating the work items.
6. Select the **Delegate work items** button to complete the work item delegation.

Automatically delegate work items

If you plan to be out of the office or otherwise unavailable to act on work items for a period of time, you can automatically delegate new work items to other users by using the **User options** page.

Set up automatic delegation

1. Go to **Common** > **Setup** > **User options**.
2. Select the **Workflow** tab. Make sure the Delegation section is expanded. To configure the system to automatically delegate your work items to other users, create delegation rules that specify when to delegate certain types of work items. Follow these steps to create a delegation rule.
3. Select **Add**.
4. In the **Scope** field, select an option:

    - All – Delegate all work items that are assigned to you.
    - Module – Delegate only the work items that are related to a specific type of workflow. If you select this option, you must select the type of workflow in the **Name** field.
    - Workflow – Delegate only the work items that are related to a specific workflow. If you select this option, you must select the workflow in the **Name** field.

5. In the **Name** field:

    - For **Module** scope, select the target module.
    - For **Workflow** scope, select the target workflow.

6. In the **Delegate** field, select the user to delegate the work items to. Use the **Start date/time** and **End date/time** fields to specify when you want the work items to be automatically delegated.
7. In the **Start date/time** field, enter a date and time.
8. In the **End date/time** field, enter a date and time.
9. Select the **Enabled** check box to activate the delegation rule.
10. In the **Comment** field, enter a comment that explains why you're delegating the work items.

Last updated on 03/11/2026

View workflow history

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the steps to view the status of a document that you submitted to the workflow system for processing and approval. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane** > **Modules** > **Common** > **Inquiries** > **Workflow** > **Workflow history**.

    - Use this form to view the status of a document that you submitted to the workflow system for processing and approval.
    - The **Instance ID** is the identification code of the workflow instance that is processing, or has processed the document.
    - The **Status** is the workflow status of the document.
    - The **Workflow ID** is the identification code of the workflow that is processing, or has processed the document.
    - The **Document** is the identification code of the document.
    - The **Document type** is the type of document that you submitted for processing.
    - The **Workflow** is the name of the workflow that is processing, or has processed the document.
    - The **Version** is the version number of the workflow that is processing, or has processed the document.
    - The **Created date and time** is the date and time that you submitted the document.
    - The **Elapsed time** is the time that passed since you submitted the document.
    - The **Resume** button allows you to resume the workflow process for the selected document.
    - The **Recall** button allows you to recall the selected document so that it isn't processed.

2. In the list, select the link in the desired row.

    - Make sure the **Work items** section is expanded. In this section, you can view the work items that are associated with the selected document. For example, a task

might need to be completed, or the document might need to be approved.

- The **Reassign** button opens a dialog box where you can reassign a work item to another user.
- Make sure the **Tracking details** section is expanded. In this section, you can view the workflow history of the selected document.

Last updated on 03/11/2026

Workflow history summary

Summarize this article for me

This article explains how to enable the optional **Summary by Copilot** field on any **Workflow history** page in Microsoft Dynamics 365 Finance and Dynamics 365 Supply Chain Management.

Turn on Copilot support for the Workflow history page

The **Workflow history summary** feature is enabled by default in Dynamics 365 Finance version 10.0.39.

> **Note**
>
> As of version 10.0.40, and in the proactive quality updates (PQUs) for version 10.0.39, the **Workflow history summary** feature is turned on by default in Feature management.

You can use workflow history either with or without its AI-powered copilot functionality. To use the copilot functionality in workflow history, you must install the **Copilot in Microsoft Dynamics 365 Finance** app in your Dataverse environment. For more information, see Copilot prerequisites.

Use this feature to get an AI-generated summary of the workflow history that you're viewing on the **Workflow history** page. The submitter, submission date, current status, approval or rejection, request change actions, due dates, and comments are summarized for you. This feature is powered by Azure OpenAI Service's large language model. It's designed to reduce the time that you spend searching the workflow history for the most important details, so that you can approve documents quickly and efficiently.

For more information, see Workflow history summary: Transparency FAQ.

This feature has two purposes:

- Provide a concise workflow history summary.
- Help you make quicker decisions when you approve workflow documents.

Country/region and language availability

For information about the languages that Microsoft validated this Copilot feature for, see Explore Copilot features by geography and languages. Although you can use the feature in

other languages, it might not work as intended. Language quality might vary, based on the user's interactions or system settings, and might therefore affect accuracy and the user experience.

Version requirements

Workflow history summary requires the latest PQU on Dynamics 365 Finance versions 10.0.39 and 10.0.40.

Role requirements

To use this feature, you must be able to view workflow history in Dynamics 365 Finance or Dynamics 365 Supply Chain Management.

Summary by Copilot

The **Summary by Copilot** field appears at the top of any **Workflow history** page if you submit the workflow. The first line shows the submitter, submitted date, current status, and comments. The next lines show the most recent workflow actions. Workflow actions include approvals, delegations, rejections, and change requests. The workflow action dates and the user who performed each action are shown together with any comments that were entered. The comments might be summarized if they exceed the space that was allocated for comments.

Last updated on 03/11/2026

Enable users to receive workflow-related email messages

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You can configure the system to send email messages to users when workflow-related events occur. For example, you can send email messages to users when you assign documents to them for approval. The demo data company used to create this procedure is USMF.

1. Go to **Navigation pane** > **Modules** > **System administration** > **Users** > **Users**.
2. In the list, find and select the desired record.
3. On the **Action pane**, select **User options**.
4. Select the **Workflow** tab. Make sure that the **Notifications** section is expanded. In the **Notifications** section, specify how you want the user to be notified about workflow-related events.
5. In the **Line-item workflow notification type** field, select an option.
    - Grouped – Notifications for line items are grouped into a single email message.
    - Individual – An email message is sent for each line item.
    - If you want the user to receive notifications in the client, select the **Send notifications in email** check box.
6. Select **Save**.
7. Close the page.

> **Note**
>
> The workflow email templates come from either system email templates or organization email templates. The source depends on whether the workflow is a system-level (not company specific) or organization-level (company specific) workflow.

Create a workflow type

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To add workflow support for a document, you must create a workflow type. After you create a workflow type, you can use it to create workflow configurations for the document. This article provides links to the procedures for creating a workflow type.

You create workflow types to define the following elements:

- The workflow document to assign the workflow to
- A category that defines the module that the workflow type is available in
- Tasks, automated tasks, and approvals that the workflow supports
- The workflow started, completed, configuration data change, and canceled event handlers
- A **SubmitToWorkflowMenuItem** menu item

In this section

- Workflow type checklist
- Create a workflow category
- Create a query for a workflow type
- Create a new workflow type
- Create a workflow document class
- Create a SubmitToWorkflow class
- Associate a workflow document class with a workflow type

Last updated on 03/18/2026

Workflow type checklist

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the steps that are required to create a new workflow type. Use workflow types to create configurations for a workflow.

Workflow type checklist

1. If an existing category isn't appropriate, create a new workflow category to use for the workflow type. For more information, see Create a workflow category.
2. Create a query that accesses the document that the new workflow type is for. For more information, see Create a query for a workflow type.
3. Create a workflow type in Application Explorer. Typically, you complete this step by using the **Workflow** wizard. For more information, see Create a new workflow type.

Use the **Workflow** wizard to create a workflow type. The wizard performs the following tasks. In some cases, you must add more code for your workflow type. Links are provided so that you can see the details of the actions that the wizard performs and the additional steps that you must perform to complete your workflow type.

1. Create a workflow document class, and then bind the query that the workflow uses to the class. For more information, see Create a workflow document class.
2. Bind the workflow document class to the workflow type. For more information, see Associate a workflow document class with a workflow type.
3. Create workflow event handlers for started, completed, configuration change, and canceled events, and then bind event handlers to the workflow type. For more information, see Create a workflow event handler.
4. Create a class for **SubmitToWorkflowMenuItem**. Optionally create a class for **CancelMenuItem**. Bind the classes to the action menu items that you create in the next step. For more information, see Classes and methods.
5. Create an action menu item for the **SubmitToWorkflowMenuItem** workflow property. Optionally create an action menu item for the **CancelMenuItem** property. Bind the actions to the workflow type. For more information, see Create a new workflow type.

Next steps

After you create a workflow type, you can add tasks, automated tasks, and approvals.

Create a workflow category

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

When you create a workflow type, you must assign it to a workflow category. The workflow category determines whether the workflow type is available in a specific module. If an appropriate workflow category doesn't already exist, you must create it.

For example, a workflow type for a customer invoice shouldn't be available in the **Master planning** module. To make the workflow type available only in the **Customer** module, select the **Customer** module when you create a workflow category.

This article describes how to create a workflow category.

Create a workflow category

1. In Application Explorer, expand the **Business Process and Workflow** node.
2. Follow one of these steps to create the workflow category:
   - Right-click the **Workflow Categories** node, and then select **New Workflow Category**. A new workflow category group appears under the **Workflow Categories** node. Right-click the new workflow category, and then select **Properties**.
   - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Workflow category**. Enter a name for the category, and then select **Create**.
3. On the **Properties** sheet, set the following properties, as required.

Expand table

Property	Value
Name	Specify the name that you use to reference the workflow category.
Label	Specify the label for the workflow category in the user interface (UI).
Help Text	Specify the description that's shown for the workflow category in the workflow configuration UI.

Property	Value
Module	Specify the module that the workflow is available in. The default module is **Ledger**.

After you create a workflow category, you can bind a workflow type to it. Typically, the **Workflow** wizard completes this step. However, the following procedure explains how to manually bind a workflow type to a workflow category.

Bind a workflow type to a workflow category

1. In Application Explorer, expand the **Business Process and Workflow** node, and then expand the **Workflow Types** node.
2. Right-click the workflow type that you want to bind to a workflow category, and then select **Properties**.
3. On the **Properties** sheet, set the **Category** property to the workflow category that you created in the previous procedure.

Create a query for a workflow type

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Before you create a workflow type, create a query that accesses the table fields for the workflow document. This article describes how to create a query for a workflow type.

Create a query for a workflow type

1. Follow one of these steps to create a new query:
    - In Application Explorer, right-click the **Queries** node, and then select **New Query**. A query group appears under the **Queries** node. Right-click the new query, and then select **Rename**. Enter a name for the query.
    - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Query**. Enter a name for the query, and then select **Create**.
2. Expand the new query, right-click the **Data Sources** node, and then select **New Data Source**. A data source group appears under the **Data Sources** node.
3. Right-click the new data source group, and then select **Properties**.
4. On the **Properties** sheet, set the **Table** property to the main table for the document type that you're defining a workflow for.
5. In the Application Object Tree (AOT), right-click the new query, and then select **Save**.

For more information about how to create queries, see Create queries by using the AOT.

Last updated on 03/18/2026

Create a new workflow type

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To make the workflow process available for a workflow document, you must create the workflow types that are used in the workflow configuration user interface (UI). This article describes how to create a workflow type in Application Explorer.

A workflow type defines the following information:

- The document that the workflow supports
- Workflow categories, which you use to assign a workflow type to a specific module
- Tasks, automated tasks, approvals, and line item workflows that you can configure
- Menu items and event handlers

Create a new workflow type

1. Follow one of these steps to open the **Workflow** wizard. The wizard helps you create a new workflow type.

    - In **Application Explorer**, right-click the **Business Process and Workflow** node, and then select **Add-Ins** > **Workflow type wizard**.
    - On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Workflow type**. Enter a name for the query, and then select **Create**.

2. Set the following values for the wizard.

Expand table

Value	Description
Name	Specify the name for the workflow type.
Category	Select the workflow category for the workflow type. The category determines the module that the workflow type is available in. You can use an existing category or create a new category. For more information, see Create a workflow category.
Query	Select the query that accesses the table fields for the workflow document. For

Value	Description
	more information, see Create a query for a workflow type.
Document menu item	Select the menu item that points to the main page that shows the document for the workflow type.
Document web menu item	Select the web menu item that points to the Enterprise Portal page that shows the document for the workflow type.

3. Specify the types of menu items that you want to create. You can create menu items, web menu items, or both.
4. Select **Next**. A list of all the resources that the wizard creates for the workflow type is shown.
5. Select **Finish** to create the resources. The wizard creates classes, menu items, web menu items, the workflow type, and a project that contains all the items.
6. When the dialog box appears that indicates the status, select **OK**. The portal shows the project that contains the workflow type resources.

After you create a workflow type, the next step is to create a workflow document class to expose document data for conditions. For more information, see Create a workflow document class.

Create a workflow category

Last updated on 03/18/2026

Create a workflow document class

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

You define table fields in a query to create workflow conditions. In a typical scenario, you use calculated fields to determine the behavior of a workflow. For example, you can use a dynamic sales total of all records in a table as a workflow condition to determine whether the step should be used. However, a limitation of queries is that you can't define calculated fields in the queries themselves. To overcome this query limitation, you must use a workflow document class. This article describes how to create a workflow document class.

The workflow document class that you create defines table fields for conditions in two ways: the Application Explorer query and parameter methods. You must override the **getQueryName** method of the WorkflowDocument class to return the name of the query. You can optionally add calculated fields by adding parameter methods that have a specific signature on the class. For more information about workflow conditions, see Configure workflow properties and Configure conditional decisions in a workflow.

The following procedures explain how to create a workflow document class that includes a parameter method for a calculated field. Before you begin, you must create a query that specifies the data that the workflow accesses. For more information about workflow queries, see Create a query for a workflow type.

> **Note**
>
> If you use the **Workflow** wizard to create the workflow type, the wizard already creates the workflow document class.

Create a workflow document class

1. Follow one of these steps to create a new query:

    - In **Application Explorer**, expand the **Classes** node. Right-click the **Classes** node, and then select **New Class**. A class group appears under the **Classes** node. Right-click

the new class, select **Rename**, and then enter a name for the workflow document class.
- On the **Project** menu, select **Add new item**. In the **Add new item** dialog box, select **Class**. Enter a name for the class, and then select **Create**.

2. Expand the new class, select **classDeclaration**, right-click the class declaration, and then select **Edit**.

3. Enter the following code in the class declaration.

```
X++
```

```
class <MyWorkflowDocumentClassName> extends WorkflowDocument
{
}
```

4. Close the **Editor** window, and select **Yes** to save your changes.

5. Right-click the new class, point to **Override Method**, and then select **getQueryName**. A method node that is named **getQueryName** appears under the workflow document class node, and the **Editor** window appears.

> ⓘ Note
>
> Be sure to select **getQueryName** as the method to override. The WorkflowDocument.getQuery method is used only internally to retrieve the actual query, based on the string that is returned by the WorkflowDocument.getQueryName method.

6. In the **Editor** window, enter the following code for the query method.

```
X++
```

```
QueryName getQueryName()
{
    return querystr(<MyWorkflowDocumentQueryName>);
}
```

After you create the workflow document class, you can bind it to the workflow type. For more information, see Associate a workflow document class with a workflow type.

You can add a calculated field to the workflow document class only if it meets these conditions:

- You name it **parm <name>**.

- It defines the **CompanyId**, **TableId**, and **RecId** parameters.
- It returns an extended data type (EDT) that's included in the list of fields that define conditions or notification messages. The label for the EDT must uniquely identify the value.

Add a calculated field to the workflow document class

1. In the workflow document class where you want to add a calculated field, right-click the class, and then select **New Method**. A new method node appears under the **Classes** node.

2. Right-click the new method node, and then select **Edit**.

3. Enter code in the format shown in the following example. This example shows how to add a calculated field to determine the total credit amount for a journal.

```
X++
```

```
public TotalJournalCreditAmount parmTotalJournalCreditAmount(CompanyId
_companyId, TableId _tableId, RecId _recId)
{
    // The calculateAmounts method contains business and validation logic
    this.calculateAmounts(_companyId, _tableId, _recId);
    return totalJournalCreditAmount;
}
```

Create a SubmitToWorkflow class

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A workflow starts when the user selects the **Submit** button on the workflow toolbar. The **Submit** button connects to an action menu item that calls the **main** method of a class you create to activate a workflow. This article describes how to create a **SubmitToWorkflow** class and use the name of the workflow type to activate the workflow.

You can also activate a workflow by using the workflow configuration ID or the workflow sequence number. The basic procedure is the same. For more information, see Activating a workflow.

> **Note**
>
> If you use the **Workflow** wizard to create the workflow type, the wizard already creates a workflow submission manager class. You just need to add code to it.

Create a SubmitToWorkflow class

1. In Application Explorer, expand the **Classes** node.
2. Right-click the **Classes** node, and then select **New Class**. A class group appears under the **Classes** node.
3. Right-click the new class, and then select **New Method**. A new method node appears under the **Classes** node.
4. Right-click the new method, and then select **Edit**.
5. Enter the following code for the **main** method to use the name of the workflow type to activate the workflow.

   > **Note**

This example applies to workflow submissions. For an example that also works with Enterprise Portal, see Adding enterprise portal support for workflow submission.

X++

```
public static void main(Args args)
{
    // Variable declaration.
    recId _recId = args.record().RecId;
    WorkflowCorrelationId _workflowCorrelationId;
    // Hardcoded workflow type name.
    WorkflowTypeName _workflowTypeName = workflowtypestr("MyWorkflowType");
    // Initial note is the information that users enter when they
    // submit the document for workflow.
    WorkflowComment _initialNote = "";
    WorkflowSubmitDialog workflowSubmitDialog;
    // Opens the submit to workflow dialog box for user comments.
    workflowSubmitDialog =
WorkflowSubmitDialog::construct(args.caller().getActiveWorkflowConfiguration()
);
    workflowSubmitDialog.run();
    if (workflowSubmitDialog.parmIsClosedOK())
    {
        _recId = args.record().RecId;
        // Get user comments from the submit to workflow dialog box.
        _initialNote = workflowSubmitDialog.parmWorkflowComment();
        try
        {
            ttsbegin;
            // Activate the workflow from a template.
            _workflowCorrelationId =
Workflow::activateFromWorkflowType(_workflowTypeName, _recId, _initialNote,
NoYes::No);
            ttscommit;
            // Updates the workflow button to display Actions instead of
Submit.
            args.caller().updateWorkflowControls();
        }
        catch(exception::Error)
        {
            // ToDo Insert your error code here.
        }
    }
}
```

6. Close the **Editor** window, and select **Yes** to save your changes.

> ⓘ Note

When you save this code, you receive an "Empty compound statement" warning message in the **Compiler Output** window unless you add valid code in the **catch(exception::Error)** block.

Associate a workflow document class with a workflow type

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To create a workflow, you must bind a workflow document class to the workflow type. The workflow document class contains references to the table data fields that the workflow uses. This article describes how to bind a workflow document class to a workflow type.

> **Note**
>
> If you use the **Workflow** wizard to create the workflow type, the wizard already bound the workflow document class to the workflow type.

Before you begin the following procedure, create a workflow document class to expose the table fields that are used for conditions in the configuration user interface (UI). For more information, see Create a workflow document class.

Bind a workflow document class to a workflow type

1. In Application Explorer, expand the **Workflow** node.
2. In the **Workflow Types** node, right-click the workflow type that you want to bind a workflow document class to, and then select **Properties**.
3. On the **Properties** sheet, set the **Document** property to the workflow document class that defines the workflow document.

Workflow types report

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article points you to a report that lists the available workflow types.

To create a workflow, select the *type* of workflow that you want to create. For example, you might want to create a **Purchase requisition line review** workflow to define who must approve line items on purchase requisitions. For more information about creating a workflow, see Create workflows overview.

View the report

The **Workflow types report**, included with the Technical reference reports, lists each type of available workflow. The report also describes what each type of workflow is used for and indicates whether the workflows of each type are associated with a specific company in the organization or with the whole organization.

Workflow FAQ

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article answers frequently asked questions about the workflow system.

Why do I receive multiple notifications when a work item is rejected?

When you reject a work item, the system completes that work item as rejected. It also creates and assigns a new work item to the originator. The system sends a notification to the originator for the rejected work item, and it sends a separate notification to the user assigned to the new "change requested" work item.

Each notification corresponds to a different work item, but their similarity can cause confusion.

Why are my workflow exports failing?

The workflow export feature currently doesn't support workflow names longer than 48 characters. If you use a name that's longer than 48 characters, you might see a "Server failed to authenticate the request" error. You might also be unable to export a file with a file type. For more information, see Workflow export troubleshooting.

Can the submitter of a workflow approve the workflow?

Yes, a submitter of a workflow can approve the workflow unless the setting **Disallow approval by submitter** is enabled for the workflow. To enable this setting, go to **System administration** > **Workflow** > **Workflow parameters** > **General** > **Approver**.

Can I add alerts to workflows to provide notifications to users?

Here are a few key areas to note about adding alerts to workflows to provide notifications:

- Alerts versus workflow notification mechanisms
  - You can set up alerts for record changes. Workflows change records, so you can set up an alert related to a record change caused by a workflow. However, because workflows have different built-in notification options, using alerts isn't ideal.
- Standard notifications from workflows
  - Workflows have built-in email notifications. You can configure the notifications so users are sent emails. Those notifications don't result in Action Center messages for users.
  - In a future update, an Action Center message will be added so a user is assigned a workflow work item.
- Adding notifications to workflows
  - You can create Action Center messages for specific users, such as a message created from a workflow in X++.
  - Workflows have business events that you can use to trigger Flows have the notifications that they're looking for.

If a user doesn't get the proper notification from the Action Center when they're assigned a workflow work item, Workflow business events with Microsoft Power Automate can provide additional or different notifications.

There's some overlap between workflow and Microsoft Power Automate.

- Workflows that you create in Dynamics 365 Finance run inside Dynamics 365 Finance.
  - Use Dynamics 365 Finance to set up workflows that are specific to your Dynamics 365 Finance.
- Power Automate allows you to set up workflows that run outside of Dynamics 365 Finance. For more information, see Power Automate.
  - Use Power Automate to set up flows that involve information that flows through your company.

Why can't the workflow editor start under AD FS?

When running under Active Directory Federation Services (AD FS) in an upgraded environment, the workflow editor might have trouble starting. If it does, make sure that you add the URL `<https://dynamicsaxworkfloweditor/>` to the property **Microsoft Dynamics 365 for Operations On-premises - Workflow - Native application** in the ADFS settings.

Why am I getting SQL deadlocks on workflow processing?

The default field value for the **Number of workflow items per batch** on the **Workflow parameters** page is 0. A value of 0 sets the default to 20 items per batch. Be careful when adjusting this value because a high number of items per batch (> 40) can cause SQL deadlocks.

What is the Workflow Enhanced Error feature?

The Workflow Enhanced Error feature in version 10.0.13 adds error codes that differentiate various classes of workflow errors. The feature also provides error messages that are mostly similar but include minor differences to make them clearer.

What should I do if I encounter error code CAAC000E when signing in to the workflow editor?

You might encounter error code CAAC000E ("**Something went wrong. User is not eligible to enroll a device. Reason: DeviceCapReached**") when you sign in to the workflow editor if your account reaches the Microsoft Intune device registration cap that your organization configured. To ignore this error, select **Continue** to proceed with using the workflow editor to create or edit workflows.

To avoid this error in the future, select **No, sign in to this app only** the next time you sign in to the workflow editor, or contact your IT administrator to raise your device cap.

About alerts

Alerts from a notification system for critical events in the system. Use alerts to stay informed about events that you want to track during the workday. You can easily create your own set of alert rules so that you're alerted about deliveries that are overdue, orders that are deleted, prices that change, or other events that you must respond to.

In enterprise resource planning (ERP), there are several typical scenarios where you can use the alerts feature. Here are some examples.

Scenario 1: Create an alert rule for new sales orders

To create an alert rule for new sales orders, follow these steps:

1. Open the **All sales orders** page.
2. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create a custom alert**.
3. In the **Create alert rule** dialog box, on the **Alert me when** FastTab, in the **Event** field, select **Record has been created**.

Scenario 2: Create an alert rule for postponement of a delivery date

To create an alert rule for new sales orders, follow these steps:

1. Open the **All purchase orders** page.
2. Select a purchase order ID to access the purchase order details.
3. Expand the **Purchase order header** FastTab.
4. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create a custom alert**.
5. In the **Create alert rule** dialog box, on the **Alert me when** FastTab, in the **Field** field, select **Delivery date**.
6. In the **Event** field, select **has been postponed**.

After you close the **Create alert rule** dialog box, your rule appears on the **Manage alert rules** page. You can use the **Manage alert rules** page to update your existing alert rules. For example, you can modify event triggers, update event notifications, and update expiration dates. To open the **Manage alert rules** page, use the **Alert me** button on the **Options** tab of the Action Pane.

What happens when you create an alert rule?

When you create alert rules, you can associate a predefined event with a specific field. For example, the event can be the date that you specify in the field, or the contents of the field change. Alternatively, you can associate an event with the records on a specific page. For example, a record is created, or a record is deleted.

When the selected event occurs for the field or for a record on the page, an alert is sent to you. For example, you create a rule where you associate the **Delivery date** field on a specific purchase order line with the **was due this amount of time ago** event. You set the time frame to five days. In this case, an alert is sent five days after the delivery date of that purchase order line.

Additionally, you can refine alert rules by setting conditions. For example, you can be alerted about new purchase orders that are created for specific vendor accounts.

Preparing for an alert

Before you set up an alert rule, decide when or in what situations you want to receive alerts. When you know which event you want to be notified about, find the page where the data that causes that event appears. The event can be a date that arrives or a specific change that occurs. Therefore, you must find the page where the date is specified, or where the field that changes or the new record that is created appears. After you have this information, you can create the alert rule.

Components of an alert rule

An alert rule has five components:

- **Event** – The event that triggers an alert rule can be a date that arrives or a specific change that occurs. You define events on the **Send email alerts for job status changes** FastTab of the **Create alert rule** dialog box.
- **Condition** – On the **Alert me for** FastTab of the **Create alert rule** dialog box, you can select the scope of the condition, to control when you're alerted about events. You can

apply the rule either to the current record only or to all visible records on the page. If the rule applies across legal entities, you can set the **Organization-wide** option to **Yes**.

- **Expiry of rule** – On the **Alert me until** FastTab of the **Create alert rule** dialog box, you can specify how long the alert rule should be active.
- **Contents** – On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify the subject text and message text that the alert messages should use.
- **User** – On the **Alert who** FastTab of the **Create alert rule** dialog box, you can specify which user should receive the alert messages. By default, your user ID is selected.

> **Note**
>
> This option is restricted to organization administrators.

Create alert rules

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Getting started

Before you set up an alert rule, decide when or in what situations you want to receive alerts. When you know which event you want to be notified about, find the page where the data that causes that event appears. The event can be a date that arrives or a specific change that occurs. Therefore, you must find the page where the date is specified, or where the field that changes or the new record that is created appears. After you have this information, you can create the alert rule.

When you create an alert rule, you define the criteria that must be met before an alert is triggered. Criteria are basically the match between the occurrence of an event and the fulfillment of specific conditions. When an event occurs, the system starts to perform a check according to the conditions that are set up.

Ensure the alert batch jobs are running

The batch jobs for data change and due date alerts need to be running for the alert conditions to be processed and the notifications to be sent. To run batch jobs, go to **System administration** > **Periodic tasks** > **Alerts** and add a new batch job for **Change based alerts** and/or **Due date alerts**. If a long and frequently running batch job is needed, select **Recurrence** and set **No end date** with a **Recurrence pattern** of **Minutes** and a **Count** of **1**.

Events

The event that triggers an alert rule can be a date that arrives or a specific change that occurs. You define triggers for events on the **Alert me when** FastTab of the **Create alert rule** dialog box. The events that are available for a particular field depend on the trigger that you select.

For example, if you're setting up an alert rule for the **Start date** field, due date events are appropriate. Therefore, the `is due in` event type is available for that field. However, for a field

such as **Cost center**, a due date event isn't appropriate. Therefore, the `is due in` event type isn't available. Instead, the `has changed` event type is available.

Event types

Three types of events can occur:

- **Create-type and delete-type events** – These events trigger an alert when a record is created or deleted.
- **Update-type events** – These events trigger an alert when the data in a specific field changes.
- **Due date-type events** – These events trigger an alert when a date arrives.

Changes that occur can be initiated by a user. For example, a user changes the delivery date of a purchase order. Alternatively, changes can occur as part of a process. For example, the **Status** field on a page changes to reflect the life cycle of various processes in the system.

Conditions

On the **Alert me for** FastTab in the **Create alert rule** dialog box, you can use conditions to control when you're alerted about events.

For example, you can specify that the system should alert you when the status of purchase orders changes, but only if the status matches a specific set of conditions. Specifically, you want to be alerted when the status of a purchase order is set to **Received**. This change in status is the event that triggers the alert.

Next, you must decide which purchase orders you want to be alerted about. For example, you can select one of the following options. These options define the conditions for the alert rule.

- **Current selected record** – You receive an alert when the status of a specific purchase order changes to **Received**.
- **All records** – You receive an alert when the status of a purchase order is changed for an item in the active page view. You can use the advanced filtering that's available on the page to create rules for a specific set of records. For example, you can create an alert that is triggered for all purchase orders for the customers in a specific customer group.

Expiry of rule

On the **Alert me until** FastTab of the **Create alert rule** dialog box, you can specify how long the alert rule should be active.

Alert contents

On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify the subject text and message text that the alert messages should use.

User ID

On the **Alert me with** FastTab of the **Create alert rule** dialog box, you can specify which user should receive the alert messages. By default, your user ID is selected. The ability to change the user receiving the alert is restricted to organization administrators.

Alerts as business events

You can send alerts externally using the business events framework. When creating an alert, set **Organization-wide** to **No** and set **Send externally** to **Yes**. After you have the alert triggering the business event, you can trigger a flow built in Power Automate using the **When a business event occurs** trigger on the finance and operations connector, or explicitly send the event to a business events endpoint via the **Business events catalog**.

Create an alert rule

To create an alert rule, follow these steps:

1. Ensure the alert batch jobs are running (see preceding).
2. Open the page that contains the data to monitor.
3. On the Action Pane, on the **Options** tab, in the **Share** group, select **Create alert rule**.
4. In the **Create alert rule** dialog box, in the **Field** field, select the field to monitor.
5. In the **Event** field, select the type of event.
6. On the **Alert me for** FastTab, select the desired option. If you want to send the alert as a business event, set the **Organization-wide** value to **No**.
7. If the alert rule should become inactive on a specific date, on the **Alert me until** FastTab, select an end date.
8. On the **Alert me with** FastTab, in the **Subject** field, accept the default subject heading for the email message, or enter a new subject. The text becomes the subject heading for the email message that you receive when an alert is triggered. If you want to send the alert as a business event, set **Send externally** to **Yes**.
9. In the **Message** field, enter an optional message. The text becomes the message that you receive when an alert is triggered.
10. Select **OK** to save the settings and create the alert rule.

Limitations and workarounds

Workaround for creating alerts for the secondary data sources of a form

You can't create alerts for some secondary data sources on forms. For example, when creating alerts on the customer or vendor posting profiles form, only the fields on the header (CustLedger or VendLedger) are available and not the dimension accounts. The workaround for this limitation is to use **SysTableBrowser** to open that table as primary data source.

1. Open the table in the **SysTableBrowser** form.

   ```
   https://<EnvironmentURL>/?cmp=USMF&mi=SysTableBrowser&TableName=<TableName>
   ```

2. Create an alert from the SysTableBrowser form.

Change based alerts don't work for batch status changes

Change based Alerts doesn't work with batch status changes because it's turned off for performance reasons. Instead, you should set up the **Batch alerts** capability. For more information, see Set up alerts for batch enhanced forms.

Batch processing of alerts

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Batch processing functionality processes alerts. You must set up batch processing before the process and deliver alerts.

Batch processing functionality supports two types of events:

- Events triggered by change-based events. These events are also referred to as create, delete, and update events.
- Events triggered by due dates.

You can set up batch processes for each type of event.

Batch processing for change-based events

The system reads all change-based events that occur since batch processing last ran. Change-based events include updates to fields, the deletion of records, and the creation of records. The system compares these events with the conditions that you set up in alert rules. When an event matches the conditions in a rule, the batch process generates an alert.

Frequency for change-based events

For change-based events, you can set up a batch job that triggers the processing of an event soon after the system logs the event. If you set up the batch job to recur more often, users receive their alerts sooner after changes occur. However, a high frequency for batch processing might adversely affect system performance.

On the other hand, a batch job that recurs less often, and that you schedule for times when the system load is low, might help improve system performance. However, a low frequency for batch processing might not meet the users' demands for timely alerts.

Therefore, when you set up the frequency of batch processing for change-based events, consider the balance between the timeliness of alerts and the performance of the whole system. These considerations become more relevant as the number of users who create alert

rules increases. The frequency doesn't affect the number of events that the system processes. However, if more users create rules, the process runs more checks. This type of data exchange might affect system performance.

The risks of low batch frequency

If you set up a low frequency for batch processing for change-based events, data that's relevant to the conditions in alert rules might change before processing. Therefore, you might lose alerts.

For example, you create an alert to trigger when the event is **customer contact changes** and the condition is **customer = BB**. In other words, when the customer contact for customer BB changes, the process logs the event. However, the batch processing system is set up so that batch processing occurs less often than data entry. If the customer name changes from **BB** to **AA** before the event is processed, the data in the database no longer matches the condition in the rule, **customer = BB**. Therefore, when the event is finally processed, no alert is generated.

Set up processing for change-based alerts

To set up processing for change-based alerts, follow these steps:

1. Go to **System administration** > **Periodic tasks** > **Alerts** > **Change based alerts**.
2. In the **Change based alerts** dialog box, enter the appropriate information.

Batch processing for due-date events

The system detects all events that are caused by due dates, and these events are compared with the conditions that are set up in alert rules. The batch process generates an alert when an event matches the conditions in a rule.

Frequency for due-date events

For due-date events, you might want to set up batch jobs that are run during the night or at specific times of the day, to balance the system load. We recommend that you set up the batch job so that it's run at least one time per day. If alerts should be sent as early as possible, set up the batch processing to occur immediately after the system date changes. If you want to generate alerts for due-date events that occur after a batch job has already processed alerts, you can run the batch job again on the same day.

For example, a batch job has been run on a particular day. You then create a purchase order that has a due date that should trigger an alert on that same day. To receive the alert on that

day, you must run the batch job again after the purchase order is created. However, if you don't run the batch job again on that day, the next day's batch job detects any due-date events that weren't processed on previous days.

> **Note**
>
> Even when the batch process is run more than one time per day, alerts aren't duplicated for the same due-date event and conditions. Alerts are generated only for dates that have become due because of changes that occurred in the system after the last batch job was run.

Batch processing window

The processing of alert rules in a company can be stopped for several reasons. These reasons include vacations, system errors, or other issues that prevent the batch jobs from being run for some time.

To prevent due-date alerts from becoming obsolete because the batch job hasn't been run for several days, you can set up a batch processing window. A batch processing window can be used to prevent a batch job from being run for a specified number of days.

If you set up a batch processing window, an alert is sent when the alert rule is processed, even if the alert exceeds the time limit that is defined in the due-date criteria. An alert continues to be sent for as long as the period that is defined by this time limit plus the batch processing window isn't exceeded. However, when the period exceeds the value defined by the time limit plus the batch processing window, an alert is no longer sent.

Set up processing for due-date alerts

To set up processing for due-date alerts, follow these steps:

1. Go to **System administration** > **Periodic tasks** > **Alerts** > **Due date alerts**.
2. In the **Due date alerts** dialog box, enter the appropriate information.

Last updated on 11/20/2025

Client alert notifications by email

You can define custom alert rules that monitor filtered views of data and automatically send email notifications when predefined events occur. The option to send email notifications is available for all supported alert types, and you can also turn on email notifications for existing alert rules.

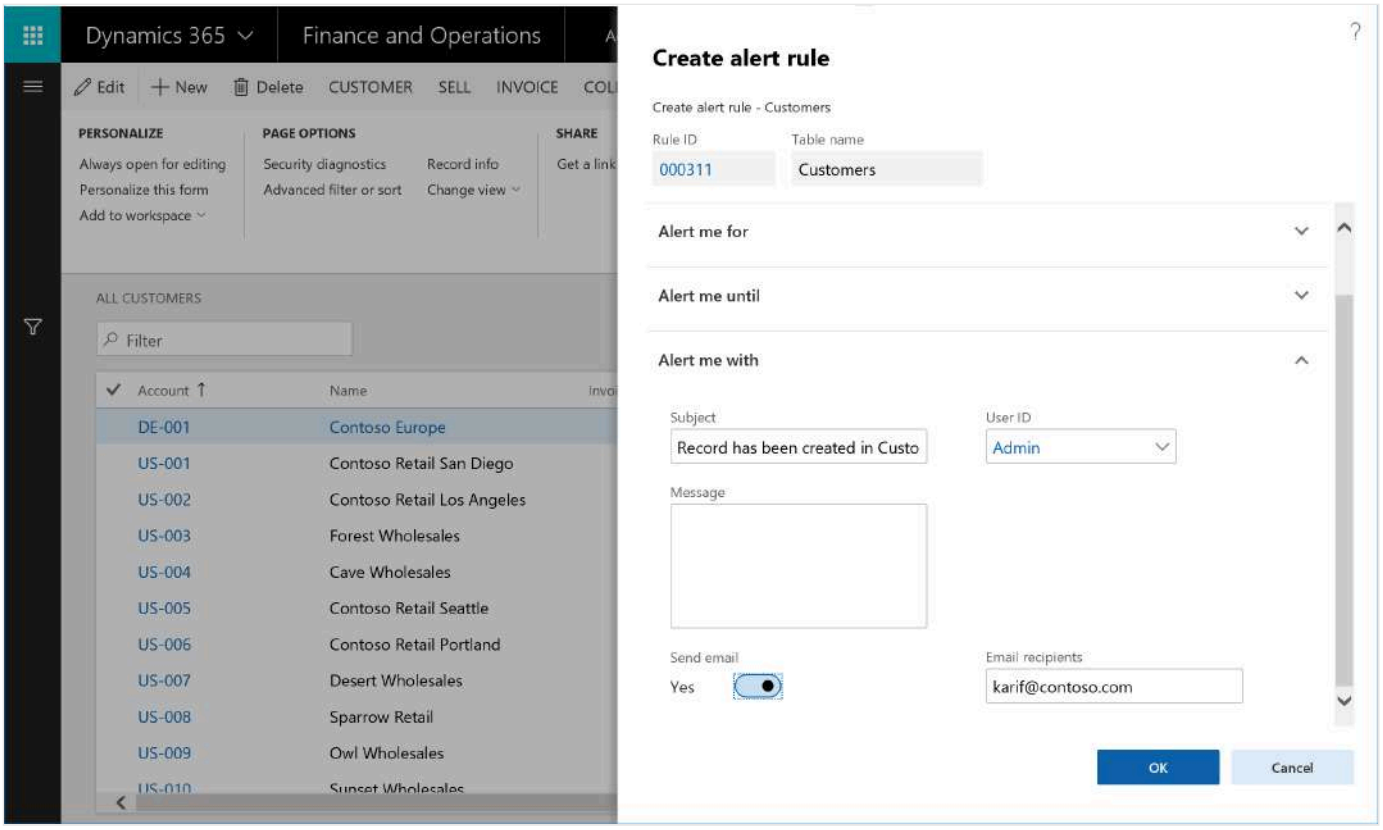
You can use built-in controls to create alert rules that monitor the filtered views of system batch jobs. By monitoring the value of the **Status** field, you can also configure alert rules that send email when a batch job fails. After you create these alert rules, you no longer have to check reports for changes to business data. Instead, you can let the intelligent change detection service do the monitoring for you.

Client alerts depend on the email subsystem that Microsoft Office integration provides. We recommend that you use the Simple Mail Transfer Protocol (SMTP) provider, so that email distribution doesn't have to rely on a local mail client.

To send notifications by email, customers must configure integrated email services. Email notifications are sent to recipients on behalf of alert owners.

For more information about how to configure email, see Configure and send email.

The following image shows the **Create alert rule** dialog box, which now includes a **Send email** option.



> **Note**
>
> When the **Send email** option is set to **Yes**, alert notifications continue to be delivered from the Action Center.

Alert notification email templates

The service sends email notifications by using predefined email templates that deliver the basic details of the alert notification.

The following image shows the structure of the alert notifications when they're received by email.

Electronic signatures overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an overview of electronic signatures and describes how you can use them.

What is an electronic signature?

An electronic signature confirms the identity of a person who starts or approves a computing process. In some industries, an electronic signature is as legally binding as a handwritten signature.

Electronic signatures are a regulations compliance requirement for several regulated industries, such as pharmaceuticals, food and beverage, and aerospace and defense. They're also required for compliance with regulations in 21 CFR Part 11 that the Food and Drug Administration (FDA) in the United States issued.

> **Note**
>
> An electronic signature by itself isn't the same as a digital signature. An electronic signature is just a substitute for a handwritten signature, whereas a digital signature provides other security measures. A digital signature can help identify whether another user or process has tampered with the data. A digital signature can also be verified, and this verification can't be refuted by the owner of the certificate that was used to sign the data. As described in the following section, electronic signatures have built-in digital signature functionality.

Electronic signatures

You can use electronic signatures for critical business processes. Some processes have built-in electronic signature capabilities. You can also create custom signature requirements for any database table and field.

Electronic signatures have built-in digital signature functionality. Every user who signs documents must obtain a valid cryptographic certificate. When a user signs a document, the private key that is associated with that certificate is validated. The system records electronic signature information in a log to provide an audit trail. To set up electronic signatures, see Set up electronic signatures.

Users who require access to electronic signatures

Three kinds of users typically require security access to electronic signatures: electronic signature administrators, signers, and electronic signature auditors.

Electronic signature administrator

The electronic signature administrator sets up signature requirements, general parameters, and approvers, and receives alerts when signatures can't be verified. By default, a user who belongs to the **Information technology manager** security role has permission to administer electronic signatures.

Signer

A signer provides electronic signatures for documents and processes that require signatures. By default, a user who belongs to the **System user** security role has permission to sign documents electronically.

> **Note**
>
> The signer might need extra permissions to access data related to the document or process that they're signing. A user who changes data and then signs for those changes must have permission to change the data. A user who signs on behalf of another user might not need access to the data. An example of this kind of user is a supervisor who signs for an employee's changes.

Electronic signature auditor

The electronic signature auditor reviews the database log and the signature review log that's available from the database log. By default, a user who belongs to the **Information technology manager** security role has permission to audit electronic signatures.

If you use a role other than **Information technology manager**, make sure that the role is assigned to the following privileges:

- View electronic signature failures
- View database log

Signing documents electronically

Get a certificate

Before you sign documents electronically, you must request a certificate.

> ⓘ **Note**
>
> Microsoft SQL Server features are used to create certificates and enable electronic signing. You don't need any other certificate or public key infrastructure (PKI).

When you request a certificate, the system creates a public key and a private key for you. You encrypt the private key by using a password that only you know. When you sign a document electronically, you verify your identity by entering the password.

To request a certificate, on the **Options** page, on the **Accounts** tab, select **Get certificate**.

You must enter and confirm the password that you use for signing. The password protects your private key and authorizes the use of your certificate. The database doesn't store this password, and no one else has access to it, not even the administrator.

If you forget the password that connects with your certificate, you must reset the certificate. Resetting the certificate doesn't affect documents that you signed by using the previous certificate. To reset the certificate, on the **Options** page, select **Reset certificate**.

Sign a document electronically

The **Sign document** page appears when you make a change that requires an electronic signature.

1. On the **Sign document** page, select the **Document** tab to review the changes to the document.
2. On the **Signature** tab, select a reason code.
3. Enter a comment, if a comment is required.
4. If your user ID doesn't appear in the **Signer** field, select it in the list.
5. Enter your location, if this information is required.
6. Select **OK**.

Sign for another user's changes

Occasionally, you might want a user to sign for another user's changes. For example, a supervisor might be required to sign for changes that an employee makes to a bill of materials (BOM). Use this procedure to designate a user as a signer for another user.

> **Note**
>
> When one user signs for another user's change, the signature must be provided at the workstation of the user who made the change. The user can't save the change until the signature is provided.

To designate approvers, follow these steps.

1. On the **Options** page, on the **Accounts** tab, select **Designate approver**.
2. In the **Approver user ID** field, select the ID of the user who must sign for another user's changes.
3. In the **Sign for user ID** field, select the ID of the user whose changes must be signed for.

Last updated on 11/26/2025

Set up electronic signatures

Summarize this article for me

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

An electronic signature confirms the identity of a person who is about to start or approve a computing process. In some industries, an electronic signature is as legally binding as a handwritten one.

Electronic signatures are a regulations compliance requirement for several regulated industries, such as pharmaceuticals, food and beverage, aerospace, and defense. They're also necessary for compliance with regulations that the United States Food and Drug Administration (FDA) issues in part 11 of Title 21 of the Code of Federal Regulations (21 CFR Part 11).

Electronic signatures aren't the same as digital signatures. An electronic signature is just a substitute for a handwritten signature, whereas a digital signature provides additional security measures. A digital signature can help identify whether another user or process tampered with the data. A digital signature can also be verified, and this verification can't be refuted by the owner of the certificate that was used to sign the data. Although electronic signatures and digital signatures differ, they can work together. For example, in finance and operations apps, electronic signatures have built-in digital signature functionality.

You can use electronic signatures for critical business processes. Some processes have built-in electronic signature capabilities. You can also create custom signature requirements for any database table and field. As was mentioned earlier, electronic signatures in finance and operations apps have built-in digital signature functionality. Each user who signs documents must obtain a valid cryptographic certificate. When a document is signed, the private key that's associated with that certificate is validated.

Enable the Electronic signature configuration key

1. Go to **System administration** > **Setup** > **License configuration**.
2. In the tree, expand **Administration**, and verify that the **Electronic signature** checkbox is selected. If the checkbox is cleared, you must enable maintenance mode before you can select it. You can enable maintenance mode in the environment by running a

maintenance job from Microsoft Dynamics 365 Lifecycle Services. Alternatively, you can use the Deployment.Setup tool locally. After you select the **Electronic signature** checkbox, turn off maintenance mode.

3. Close the page.

Set up electronic signature parameters

Prerequisites for passphrase constraints (preview)

[This section is prerelease documentation and is subject to change.]

Most electronic signature features are standard for all current versions of Microsoft Dynamics 365 Supply Chain Management. However, passphrase constraints and the ability to require comments are recent enhancements. Before you can use these features, your system must meet the following requirements:

- You're running Supply Chain Management version 10.0.44 or later.
- You turn on the **(Preview) Electronic signature improvements** feature in Feature management.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Set up the electronic signature parameters

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature parameters**.
2. Select **Edit**.
3. Set the following fields:
    - **Notice** – Enter the notice that is shown to signers on the **Sign document** page. You can enter any text. Typically, this notice informs the user what it means to sign a

document electronically, including legal implications. If you want to enter the notice text in more languages, select **Translations** on the Action Pane.

- **Require comments** – Set this option to *Yes* if all signers must enter a comment when they sign.
- **Signature timeout** – Enter a timeout period (in seconds). If np signature is provided within this period, the signing process fails.
- **Key expiry** – Enter the number of days that a digital key remains valid after it's created.
- **Signature alert recipient** – Select the user who should receive an alert email if signature validation fails. Validation fails if the system determines that the certificate and private key that a user provided show signs of tampering.
- **Minimum length** – Enter the required minimum length of the passphrase. We recommend a minimum of eight characters.
- **Minimum alpha** – Enter the required number of alphabetical characters in the passphrase.
- **Minimum numerals** – Enter the required number of numeric characters in the passphrase.
- **Minimum special** – Enter the required number of special characters in the passphrase. Special characters include the following symbols:
  - *!* (exclamation point)
  - @ (at sign)
  - # (number sign)
  - *$* (dollar sign)
  - *%* (percent sign)
  - ^ (circumflex accent)
  - *&* (ampersand)
  - * (asterisk)
  - *(* (opening parenthesis)
  - *)* (closing parenthesis)
  - *;* (semicolon)
  - *:* (colon)
  - *?* (question mark)
  - < (less than sign)
  - > (greater than sign)
  - - (hyphen)
  - + (plus sign)

- = (equal sign)
- ~ (tilde)

4. Select **Save**.
5. Close the page.

> **Note**
>
> All the parameters that are related to passphrase constraints work in conjunction with the Windows policy requirements. Although the passphrase constraints can be more complex than the Windows policy, they can't be less complex. For example, the Windows policy might require a minimum length of eight characters, including more than one numeric character and more than one special character. By contrast, the passphrase constraints might just require six characters. In this case, the password is rejected when the certificate is generated.

Set up reason codes for electronic signatures

Before electronic signatures can be used, you must set up reason codes. A valid reason code is required whenever a document is signed. The reason code indicates the purpose of the electronic signature. For example, a reason code can indicate legal approval.

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature reason codes**.
2. Select **New**.
3. In the **Reason code** field, enter a value.
4. In the **Description** field, enter a value.
5. Repeat these steps to add more reason codes as required.
6. Select **Save**.
7. Close the page.

Require electronic signatures for existing processes

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature requirements**.
2. In the list, find and select the desired record.
3. Select a process that requires electronic signatures.
4. Select or clear the **Signature required** checkbox.
5. Repeat these steps for every other process that requires electronic signatures.

6. Select **Save**.

Create a custom requirement for electronic signatures

1. Go to **Organization administration** > **Setup** > **Electronic signature** > **Electronic signature requirements**.
2. Select **New**.
3. Select or clear the **Signature required** check box.
4. In the **Name** field, enter a name for the process that requires electronic signatures.
5. In the **Table name** field, select the dropdown button to open the lookup. Find and select the table that store the data that must be signed. Then select the link in the selected row.
6. In the **Field name** field, select the dropdown button to open the lookup. Find and select the table field that you want to monitor. Then select the link in the selected row.
7. Select one of the following values to specify when a signature is required:
    - *Always* – Always require a signature when the data in the field is changed.
    - *Only* – Require a signature only under certain conditions. If you select *Only*, you must also select one of the following options: *When a record is inserted*, *When a record is updated*, or *When a record is deleted*.
8. Select **Save**.
9. Close the page.

Case management overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

By planning, tracking, and analyzing cases, you can develop efficient resolutions that can be used for similar issues. For example, when customer service representatives or Human Resources generalists create cases, they can find information in knowledge articles to help them work more efficiently. The following examples show how cases can be used for different situations in an organization.

Example: How Fabrikam uses cases for customers in the private sector

Lisa, a customer service representative at Fabrikam, receives a telephone call from Lionel, a Fabrikam customer. Lionel is having trouble setting the correct volume level on the new sound system that Fabrikam installed in Lionel's music store. Lisa creates a case for Lionel and assigns the **Volume** category to the case. Lisa then elevates the priority and assigns a one-day service level agreement (SLA) to the case.

Lisa also enters the case details in the case log. Lisa notices that several knowledge articles are associated with the **Volume** category, and that three of them are marked as helpful for resolving cases. Lisa opens each article and discusses the resolution steps with Lionel, but none of the solutions solve the issue that Lionel is having with the new sound system. Lisa tells Lionel that an audio technician calls within 24 hours and work to solve the issue.

Lisa activates the case, and a set of activities is created. Lisa assigns the activities to Terrence, a member of the audio engineering team. Terrence sees that new activities are assigned, opens the case and reads the case log to learn more about the case. Terrence encountered the same issue the day before, and developed a solution. Terrence contacts Lionel and offers this solution for the issue. Terrence also enters it in the case details.

Because the solution is successful, Terrence decides to document it, so that other people can use it if they encounter the same issue. Terrence adds the document to the **Knowledge article** page, assigns the document to the **Volume** category, and manually elevates the ranking, so that other Fabrikam employees know that it's a successful solution. Terrence then elevates the

case to the next level. By elevating the case, Terrence creates a new activity for Marie, who is a quality assurance representative in the customer service department.

Marie sees that a new activity is assigned, and opens the case that is associated with the activity. Marie reviews the case and the case details to make sure that the correct process was followed for the case. Marie verifies that the actual case time didn't exceed the time frame that was estimated in the SLA. Marie notes that Terrence contacted the customer, and that the issue was resolved. Marie is satisfied with the treatment that the customer received and the results of the case. Marie resolves the case as closed. On closing the case, the open activity that is assigned to Marie is also closed.

Example: How City Power & Light uses cases for customers in the public sector

Annie, a customer service representative with City Power & Light, receives a telephone call from a resident of the city that City Power & Light serves. Annie records the call as an activity and takes notes of the conversation. The resident tells Annie that their house has no power. Annie informs the resident that City Power & Light will investigate, find, and resolve the issue as quickly as possible.

Annie then creates a case, associates the telephone call with the case, and creates a service order. Annie knows that other residents are likely to call to report a power outage. Therefore, to avoid overwhelming the customer service center, and to save time, Annie sends a group instant message (IM) to inform the other representatives about the issue, and to tell them that a case and service order have been created. Annie includes the case number and service order number in the IM. Then, if City Power & Light receives more telephone calls about the power outage, the customer service representatives can create an activity for each telephone call and assign it to the existing case.

Example: How Fabrikam uses cases for employees

The following scenarios show how Fabrikam Human Resources generalists in different locations can use case management when they address issues for employees.

In England

Christine, the Human Resources generalist for the English division of Fabrikam, receives a telephone call from Peter, a Fabrikam employee. Christine is informed that nine weeks ago, immediately after the birth of Peter's son, Peter changed the number of dependents on the tax withholdings. Peter wants to know why the changes haven't become effective. Christine creates

a case for Peter and reviews Peter's tax information. Christine learns that, although Peter entered new dependent information, a start date for the new tax withholdings wasn't selected. Christine informs Peter to select a start date and resubmit the changes. Peter replies to Christine's message informing that Peter has now selected a start date and resubmitted the changes. Christine attaches the email message from Peter to the case record, verifies that the correct changes were made and submitted, and closes the case.

In the United States

Luke, the Human Resources generalist for the United States division of Fabrikam, receives an email message from Shannon, a Fabrikam employee. Shannon is a machine operator who was injured on the job six months ago, and has been working with Humongous Insurance to have the medical expenses paid. Because Shannon contacted Luke about this issue four weeks ago, a case has already been created. Shannon's new email message explains that Humongous Insurance is still not returning the telephone calls. Luke opens the existing case, adds Shannon's email message as a document, and reviews the case log. When creating this case, Luke assigned the **Insurance** category to it but now sees that there's a new knowledge article that is associated with the **Insurance** category. Luke reads the knowledge article and learns that all phones at Humongous Insurance are down while the company's telephone system is being updated. The article states that the insurance company sent an email message to all its customers, but that several customers didn't receive the message because of a problem with the company's email system. All customers who have active insurance claims are asked to send their inquiries to Humongous Insurance by email or paper mail. Luke sends Shannon an email message that explains what Shannon must do to have the insurance claim settled. Luke also ranks the knowledge article as a helpful source of information. Luke creates another activity to follow up with both Shannon and Humongous Insurance in four weeks and make sure that the claim has been resolved. After four weeks, Luke contacts Shannon and learns that Humongous Insurance has paid the claims, and that Shannon is happy with the resolution. Luke changes the status of the case to **Closed**.

Plan case category security, case processes, and case categories

This article describes the considerations and decisions that you must make during the planning process, before you begin to configure cases.

You can use the case functionality to resolve both issues that are external to your organization and internal issues.

Case category security by role

Only appropriate employees in an organization should have access to cases and related information. To control which employees have access to view, create, and update different types of cases, assign security roles to case category types. Determine which security roles should have access to the various case category types.

Decision: Determine which security roles should have access to the following case category types. Your organization might not use all these category types, so make decisions only for those categories that are appropriate.

- General
- Sales
- Purchase
- Service
- Project
- Production
- Collections
- Audit
- Web
- Human Resources
- Product change
- FMLA

Case processes

Set up processes that employees must follow for the cases they open in your organization. Processes help guarantee consistency for the people involved in cases, and they help employees

resolve cases faster and more efficiently. Set up a process for each case category that you assign cases to. Although planning a separate process for each case type takes time, case resolution goes much more smoothly if you plan out the processes.

Decisions: For each case process, make the following decisions:

- What are the name and description of the process?
- Is the process active, and should employees use it when they handle a case that the process is assigned to?
- Who in the organization is responsible for applying the process to a case? For example, cost accounting or human resources might be responsible for some case processes. Multiple areas can be responsible for completing one process.

Case categories

The case category hierarchy provides a list of categories that you can assign cases to (see the "Case category security by role" section). Each top-level category includes subcategories, so that you can create more specific categories for the cases that your organization works with. Review the list of existing categories and subcategories to determine whether you need to create more. If you need to create more categories and subcategories, make the following decisions for each addition.

Decisions:

- Are you creating a new top-level category?
  - What is the name of the category?

- Are you creating a new subcategory?
  - What is the parent category of the subcategory?
  - What is the name of the subcategory?
  - Which worker owns the subcategory?
  - What department is the subcategory assigned to?
  - What case process is assigned to this subcategory?
  - What is the default service level agreement (SLA) that is assigned to this subcategory?
  - Should an activity be created when a case that this subcategory is assigned to is opened?
  - If so, what is the activity category, type, purpose, and phase?
  - Should a follow-up activity for the case be created?
  - If so, what is the follow-up activity category, type, purpose, and phase?

Record templates overview

This article introduces the concept of record templates and explains how you can use them to create records that share information.

Record templates can help you create records more quickly. However, you can only create record templates for some record types.

For example, imagine you're entering rental information for a car rental business that's located in San Francisco. Since most of the customers are likely to be from the San Francisco area, it would be helpful if you could automatically fill in the values for the **State**, **Country/Region**, and **City** fields on the rental form.

> **Note**
>
> You can apply templates only in areas that you have access to. However, you can see all template titles when you create a new record. Other users can also see all template titles if you create templates that are available to all users. Be sure to consider this visibility when naming templates. For example, avoid using names that include words such as "commission" if it's confidential that some employees in the company have commission-based salaries.

When one or more templates that you have access to exist for a specific form and you attempt to create a new record in the form, the **Select a template for** page is displayed. When you select a template from the list, the new record is created and contains default information based on the template that you selected. If you don't want to use templates when you create new records, select the **Do not ask again** check box in the **Select a template for** page. To display the template selection dialog box again, right-click any record, select **Record info**, and then select **Show template selection**.

Create a record template to facilitate data entry

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article shows how to create a record template so that you don't have to enter field values that you use often for each new record. In this procedure, you create a new record for new laptops that you add to your fixed assets. This procedure uses the USMF sample company.

To create a record template to facilitate data entry, follow these steps:

1. In the navigation pane, go to **Modules** > **Fixed assets** > **Fixed assets** > **Fixed assets**.
2. Select **New**.
3. In the **Fixed asset group** field, enter or select a value.
4. In the **Name** field, type a value. For example, enter **Corporate lead laptop**.
5. In the **Search name** field, type a value. For example, enter **laptop**.
6. Expand the **Technical information** section.
7. In the **Make**, **Model**, and **Model year** fields, type values.
8. On the Action Pane, select **Options**.
9. Select **Record info**.
10. Select **User template**.
11. In the **Name** field, type a value.
12. In the **Description** field, type a value.
13. Select **OK**.
14. Select **Close**.

Use record template to create a new record

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This procedure shows how to use a previously defined record template to create a new record. To complete this procedure, you must first complete the "Create a record template to facilitate data entry" procedure.

This procedure uses the USMF company.

1. In the **Navigation pane**, go to **Fixed assets** > **Fixed assets** > **Fixed assets**.
2. Select **New**. You're prompted to select a template. Select the one that corresponds to your business need.
3. In the list, find and select the desired record.
4. Select **OK**.

Configure document management

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure document management (document handling) so that it stores file attachments and notes for records. It includes information about the concepts and features that are involved in this functionality.

To learn more about document management, watch the short Document Management video.

Configure document types

Use document types to categorize the documents that you attach to records or the templates that you create. You can store each document type in a unique location.

The system provides a default set of document types. Use these document types to categorize an attachment as a file, image, note, or URL. The **File** and **Image** default document types are configured to use **Azure storage** as the location.

To create a new document type, follow these steps:

1. Go to the **Document types** page.
2. Select **New**.
3. In the **Type** field, enter a short name for the new document type, such as **SharePoint** or **HR Docs**.
4. In the **Name** field, enter a longer name, such as **SharePoint files** or **HR Docs**.
5. In the **Class** field, specify a class to define the behavior for the document type:
    - **Attach file** – The user is prompted for a file.
    - **Attach URL** – The user can enter a URL in the **Notes** field, such as `https://www.microsoft.com`. The **Open** button on the **Attachments** page opens the URL on a browser tab.
    - **Simple note** – The user can add a note in the **Notes** field.

6. If you specify **Attach file** in the **Class** field, use the **Location** field to specify the storage mechanism.

7. If you specify **SharePoint** in the **Location** field, select the **Edit** button (pencil symbol) and use the **Folder selection** dialog box to specify the Microsoft SharePoint address in the **SharePoint Address** field.

Configure SharePoint storage

SharePoint Online is a supported storage location for attachments.

> ⓘ **Important**
>
> - SharePoint storage is only available in Microsoft-managed environments.
> - On-premises SharePoint (a local SharePoint server) isn't currently supported.
> - SharePoint managed device policies aren't compatible with an integration to finance and operations apps.

One-time registration process

In Dynamics 365 finance and operations version 10.0.40 and later, when you enable the **SharePoint user authentication** feature, your organization needs to perform a one-time setup to use the SharePoint integration for non-interactive batch scenarios. This setup is necessary because Microsoft deprecated the Microsoft-managed high-trust connection between the finance and operations environment and SharePoint.

With this updated SharePoint authentication mechanism, batch connections use application access. As this access isn't granted by default for tenants, an Entra ID tenant administrator needs to grant access manually one time for the tenant. To provide the required application consent for finance and operations batch scenarios to connect to SharePoint, run the following PowerShell commands.

PowerShell

```
Import-Module Microsoft.Graph.Applications

# The parameter for TenantId needs to be changed
Connect-MgGraph -TenantId microsoft.onmicrosoft.com -Scopes
'Application.ReadWrite.All'

# These AppIds do not change as they are the first party application IDs
```

```
$erpServicePrincipal = Get-MgServicePrincipal -Filter "AppId eq '00000015-0000-0000-c000-000000000000'"
$sharePointServicePrincipal = Get-MgServicePrincipal -Filter "AppId eq '00000003-0000-0ff1-ce00-000000000000'"
$spAppRole = $sharePointServicePrincipal.AppRoles | where {$_.Value -eq 'Sites.ReadWrite.All'}

# Assign the SharePoint 'Sites.ReadWrite.All' permission to the Microsoft Dynamics 365 finance and operations application
New-MgServicePrincipalAppRoleAssignedTo -ServicePrincipalId $erpServicePrincipal.Id -PrincipalId $erpServicePrincipal.Id -ResourceId $sharePointServicePrincipal.Id -AppRoleId $spAppRole.Id
```

> **ⓘ Important**
>
> Interactive connections use the logged-in user's context.
>
> - As conditional access can pass through the finance and operations sign-in to SharePoint, ensure that conditional access settings for SharePoint are applied to finance and operations.
> - Calling SharePoint as a user that isn't the currently authenticated user is no longer supported.

Setting up SharePoint inside your finance and operations environment

To configure SharePoint storage, follow these steps:

1. Go to the **Document management parameters** page.
2. On the **SharePoint** tab, in the **Default SharePoint server** field, review the host name that the system automatically detects for the SharePoint site, such as contosoax7.sharepoint.com. Typically, the SharePoint host name is in the form `tenantname.sharepoint.com`, and accounts on that tenant are in the form `user1@tenantname.onmicrosoft.com`.

   Typically, if you don't specify a default SharePoint server, either there's no SharePoint site for the tenant, or a valid Microsoft 365 license isn't associated with the current user (the admin).
3. Optional: Test the SharePoint connection

   - If you disable the **SharePoint user authentication** feature, select **Test SharePoint connection** to test the specified SharePoint host name. This action verifies that the

security and license are working correctly.
    - If you enable the **SharePoint user authentication** feature, there are two SharePoint connection types to test. Use the **Test interactive SharePoint connection** action to test interactive scenarios by using the logged-in user's context. Use the **Test batch SharePoint connection** action to test batch scenarios by using the granted application access.

4. Optional: Select **Open SharePoint** to open the specified SharePoint host name in a browser. This action doesn't verify security. It just opens the SharePoint path on a browser tab for easy exploration.

5. Optional: On the **General** tab, turn on **Open attachments in new window**. For more information, see the Other configuration section later in this article.

To use SharePoint storage, set the **Location** field for a document type to **SharePoint**. Then, in the **SharePoint Address** field, enter a valid SharePoint address.

Troubleshooting SharePoint communication

SharePoint communication works for the current user only if the following conditions are met:

- A Microsoft 365 license is associated with the user's account.
- The user is a typical user on the tenant, not an external user (for example, a user from another tenant).
- There's a SharePoint site for the tenant (for example, Contoso.SharePoint.com).
- The SharePoint site is configured to **Allow this site to appear in search results**.
- The SharePoint site doesn't use managed device policies.

  If you enable managed device policies on the SharePoint instance, the finance and operations SharePoint integration stops working. Therefore, users can't download, view, or create documents that are stored in SharePoint from finance and operations apps.
- The user has access to the folder that the document is stored in.

If you can't open documents stored in SharePoint or they don't appear in preview, follow these steps to troubleshoot the issue.

1. Verify that the admin account has an associated email account. You can verify or change the associated email account on the **User** page. If you don't set up an associated email account, you must add the email account and provider via the OData Excel add-in. By

default, the email address isn't present in the Excel design. You must edit the Excel design, add all fields, apply the change, and refresh. You can then update the admin account.
2. After the admin account has an associated email account, sign in to Dynamics 365 as the admin.
3. Open an attachment that's stored in SharePoint.
4. Sign in by using a different user account that has read access to the attachments page and the configured SharePoint folder. Verify that this user account can open and preview the attachment.

Configure file types

By modifying the list of allowed file extensions, you can control the types of files that users can attach to records.

To specify file types, follow these steps:

1. Go to the **Document management parameters** page.
2. On the **File types** tab, review the default file types.
3. Remove any file types that users shouldn't attach to records. Add any file types that users should attach to records.

Configure document preview

The attachments preview uses the Web app Open Platform Interface (WOPI) that Office Online Server provides. On the **Document management parameters** page, on the **General** tab, in the **Office Web Apps Server** field, specify the Office Online Server instance to use for attachment previews. The default value is `https://onenote.officeapps.live.com`, which points to the cloud-based WOPI server.

> ⓘ **Note**
>
> For the following situations, you must adjust the **Office Web Apps Server** value:
>
> - For environments in China, use `https://onenote.partner.officewebapps.cn`.
> - For environments in the Government Community Cloud (GCC), use `https://gb4-onenote.officeapps.live.com`.

For a Dynamics 365 Finance + Operations (on-premises) environment

The default cloud-based WOPI server in Finance + Operations (on-premises) can't read the attachment file to provide a preview. If you need previews, you must install an on-premises Office Online Server instance and configure it inside the environment. Set the **Office Web Apps Server** field to the host name of the installed Office Online Server instance, and then select **Save**.

If you don't need previews, set the **Office Web Apps Server** field to `https://localhost`. The preview then shows the message "No preview available" instead of an error message.

Document preview (WOPI) doesn't work in environments where an IP allow list is enabled

Document preview (WOPI) doesn't work in environments where an IP allow list is enabled, because the WOPI service that provides the preview can't connect back to the file service to retrieve the file for rendering.

Other configuration

Consider these configuration options:

- On the **Document management parameters** page, on the **General** tab, use the **Use active document tables** option to enable the **Active document tables** allow list. If you set this option to **Yes**, you disable attachments on all other tables. Turn on this option only when it's required.
- On the **Document management parameters** page, on the **General** tab, use the **Maximum file size in megabytes** field to set the maximum file size for attachments. When you use SharePoint as a document type, users can upload only documents that have a maximum file size of 262 megabytes (MB).
- On the **Document management parameters** page, on the **General** tab, use the **Open attachments in new window** option to determine whether attachments are opened in place, or in a new window or on a new tab. Consider turning on this option especially if you use SharePoint to store attachments, because this option prevents the finance and operations user session from being reset when attachments are opened. This option is available as of version 10.0.23.
- On the **Options** page (**Settings** > **User options**), on the **Preferences** tab, use the **Enable document handling** option to disable document handling (document management).

Accessing document management attachments

Document management appears to users as the **Attach** button at the top of most pages that contain data. When you select the **Attach** button (or when you use the corresponding keyboard shortcut, **Ctrl**+**Shift**+**A**), you open the **Attachments** page in the context of the data source of the control that's currently selected on the page. This page shows all the attachments that are related to the corresponding data source.

The **Attach** button also shows a count of the attachments for the currently selected record. Therefore, you can determine whether there are attachments for the current record without having to open the **Attachments** page. The button shows exact counts for zero through nine attachments. If there are more than nine attachments, the button shows **9+** as the count. In this way, the performance impact and visual noise that exact larger counts might cause are reduced.

Document attachment history

As of version 10.0.16/Platform update 40, a history mechanism is available for record attachments. Therefore, your organization can maintain an audit of actions that are related to individual attachments. You can see when an attachment was created, marked for pending deletion, restored, deleted, or moved. You can also see who performed the action. Attachment history isn't maintained before version 10.0.16/Platform update 40. Therefore, any actions that were performed on attachments in earlier versions aren't available.

Configuration of document attachment history

To enable or disable document attachment history, go to **Document management parameters** > **General** > **History** > **Enable document history**. The default setting of the **Number of days to retain history** field is 180 days, but you can change it as you require.

Viewing an attachment's history

There are two entry points for viewing the history of a record attachment:

- When you're looking at the attachments for a specific record (see the Accessing document management attachments section), you can view the history for the current set of attachments on the **Attachments** page by selecting **Document history** on the Action Pane.
- Administrators can select the **Document history** button in the **History** section of the **Document management parameters** page. This action opens the **Document history** page, which shows a list of all attachments in the system. You can then drill into any record to view the detailed history for the selected attachment.

Attachment recovery

Platform update 29 introduced an attachment recovery feature. This feature provides a recycle bin for record attachments, so you can recover them within a configured period.

Configuration of attachment recovery

To enable attachment recovery, go to **Document management parameters** > **General** > **Deferred deletion** > **Deferred deletion enabled**. The default setting for the **Number of days to defer deletion** field is 30 days, but you can change it as you require. If you set the **Number of days to defer deletion** value to **0** (zero), deleted attachments are recoverable for an indefinite period.

After you enable attachment recovery, you create a batch job named **Scans for deleted references which have reached the end of their retention period**. This batch job uses the **Number of days to defer deletion** value to determine how long a deleted attachment should be retained, based on the **Deleted date and time** value.

Deleting attachments when attachment recovery is active

When you delete an attachment, the system adds a notification to the Message Center to confirm the deletion. The notification also provides an option that lets you undo the deletion if it was unintended.

Table extension support is built in. Therefore, the system retains any extension or custom field values on the DocuRef or DocuValue table to enable their recovery.

Recovering attachments

When you enable attachment recovery, you can recover attachments in one of three ways:

- Immediately after deletion, use the undo link in the **Attachment deleted** notification.
- On the **Attachments** page, use the **Deleted attachments** button to access the list of deleted attachments that you can recover for a particular record. You can open the deleted attachments for review, permanently delete them, or restore them.
- At **System administration** > **Inquiries**, use the **Deleted attachments** page to access the list of deleted attachments that you can recover for any record. You can open the deleted attachments for review, permanently delete them, or restore them.

Scanning attachments for viruses and malicious code

When you work with attachments, you might want to scan the files for viruses and malicious code. Therefore, in version 10.0.12 and later, extension points are available so that you can integrate with the file scanning software of your choice when you work with attachments. A similar extension point is also available for file upload. For more information, see File upload control.

> **ⓘ Important**
>
> Out of the box, finance and operations apps don't scan files for viruses and malicious code, and they don't recommend specific software for file scanning. Instead, you're responsible for choosing your own file scanning software, and for adding the appropriate code to the delegate handlers so that you can use the software or service of your choice to scan files.

The **Docu** class exposes the following two delegates. You can implement handlers for these delegates for document scanning purposes:

- **Docu.delegateScanDocument()** – This delegate applies the file scanning logic when you upload a new document attachment, or when a user tries to preview or download an existing attachment. The corresponding action fails if the scanning service determines that the file is malicious.
- **Docu.delegateScanDeletedDocument()** – This delegate applies the file scanning logic to documents in the attachment recycle bin when a user tries to preview or download a file. The corresponding action fails if the scanning service determines that the file is malicious.

Implementation details

The following example of the **ScanDocuments** class shows boilerplate code for the two handlers. For general information about how to implement handlers for delegates, see EventHandlerResult classes in request or response scenarios.

X++

```
public final class ScanDocuments
{

        If document scanning process found an issue, return false; otherwise,
return true;
        */
        return true;
    }

}
```

[Developer] Specifying valid content types when attaching documents programmatically

The following APIs from the `DocumentManagement` class let you specify the file content type (MIME type) of the file you're attaching:

- `attachFileToCommon()`
- `attachFile()`
- `attachFileToDocuRef()`

If you don't specify the file content type correctly, the attached document might not behave as expected. Therefore, if you use these APIs, consider one of the following actions:

- Pass **null** for the `_fileContentType` parameter in any of the preceding APIs. This action enables the correct content type to be inferred from the file name.
- Switch to using one of the following methods that don't include a `_fileContentType` parameter. This action helps prevent the possibility that incorrect file content types are passed.
  - **attachFileForRecord()**, which replaces **attachFileToCommon()**
  - **attachFileForReference()**, which replaces **attachFile()**
  - **attachFileForDocuRefRecord()**, which replaces **attachFileToDocuRef()**

Export attachments

In version 10.0.40 and later, Document management includes the **Export attachments** feature. Use this feature to export files and metadata that are attached to records of tables in finance and operations apps.

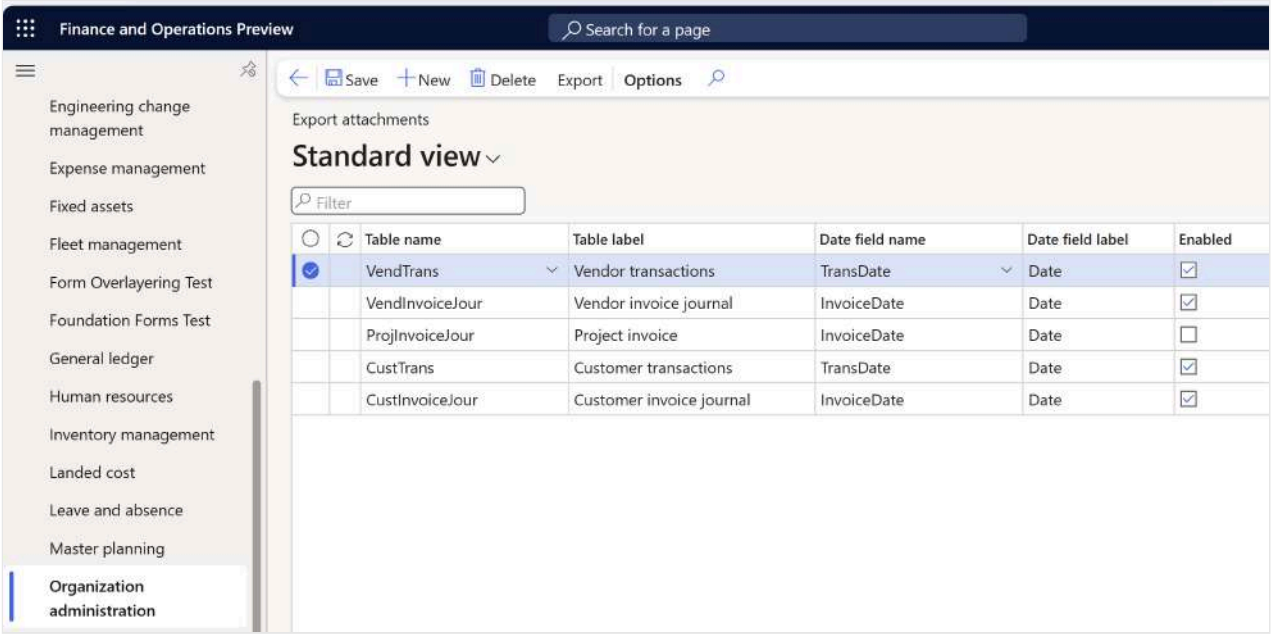
To export attachments, follow these steps:

1. Go to **Organization administration** > **Document management parameters** > **Export attachments**.
2. On the **Export attachments** page, on the Action Pane, select **New** to add a row for the first table that you want to export attachments for. Repeat this step until all the tables that you need attachments for are listed. The following table describes the fields that are available on the **Export attachments** page.

Expand table

Field name	Description	Example value
Table name	The name of the table that you want to export attachments for.	CustInvoiceJour
Table label	The label that's assigned to the selected table. Note that multiple tables can share the same label.	Customer invoice journal
Date field name	A date field of the selected table. The export job uses this field as a criterion to apply the **Date from** and **Date to** range that you specify to export attachments.	InvoiceDate

Field name	Description	Example value
Date field label	The label that's assigned to the selected date field.	Date
Enabled	When this checkbox is selected, the system includes the selected table with the next export job.	Selected



3. On the Action Pane, select **Export** to open the **Export attachments** dialog box. The following table describes the fields that are available in the **Export attachments** dialog box.

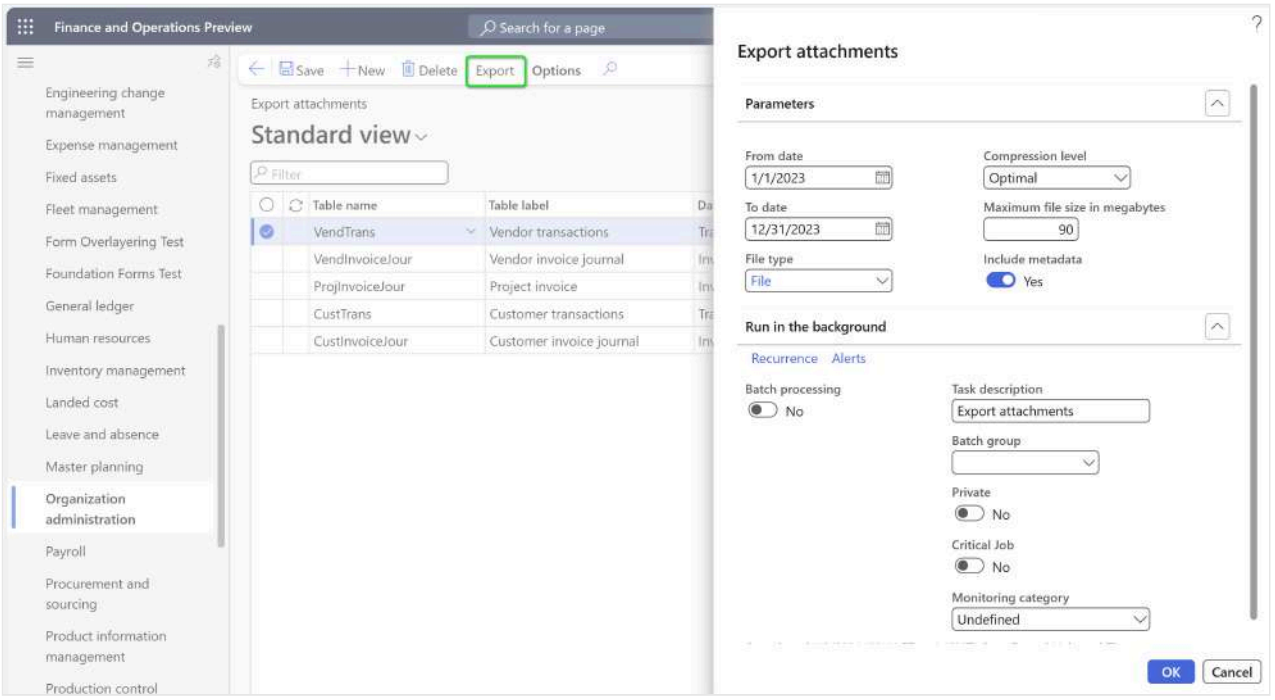
Expand table

Field name	Description	Example value
From date	Specify the first date of the period that you want to export attachments for. The export job applies this period to the **Date field name** value of the selected tables that are configured to export attachments.	1/1/2023
To date	Specify the last date of the period that you want to export attachments for. The export job applies this period to the **Date field name** value of the selected tables that are configured to export attachments.	12/31/2023
File type	Specify the file type that's used to create an archive of exported attachments. Set up this file type as described in the Configure file types section. Select **File** in the list of file types. Alternatively, use a	File

Field name	Description	Example value
	similar custom file type that you set up with an **Attach file** value in the **Class** property of the document type.	
Compression level	This parameter determines how much the data in an archive is compressed. Specifically, it defines whether a compression operation emphasizes speed or compression size. Select one of the following options: • **Fastest** – The compression operation should be completed as quickly as possible, even if the resulting file isn't optimally compressed. • **No compression** – No compression should be done on the file. • **Optimal** (default) – The compression operation should optimally balance compression speed and output size.	Optimal
Maximum file size in megabytes	Use this parameter to limit the size of the created archive. The value redefines the value that's set for the **Maximum file size in megabytes** parameter on the **Document management parameters** page for a specific execution of the **Export attachments** job. If the size of the archive file exceeds the value that you set here, the process creates and attaches multiple files. A large **Maximum file size in megabytes** value might affect the performance of job execution.	90
Include metadata	If you set this option to **Yes**, the system includes **Note** and **URL** type attachments and the metadata of **File** type attachments in the export job. Exported metadata is exported as separate JavaScript Object Notation (JSON) files. If you leave this option set to **No** (the default value), only attachments of the **File** type are exported without metadata.	Yes

4. On the **Run in the background** FastTab, set the **Batch processing** option to **Yes**, and then specify the necessary parameters to run the **Export attachments** job in the background. The job exports attachments for the legal entity where you run the job.

5. Select **OK** to start running the **Export attachments** job.



When the **Export attachments** job finishes, you can find the exported attachments in the archives that are attached for each enabled table. Depending on the volume of the exported attachments in the specified period, and the value of the **Maximum file size in megabytes** parameter in the **Export attachments** dialog box, the process might automatically split the archive into several files.

The name of each attached archive is in the format *LE_TableName_DateFieldName_Period_SeqNum.zip* and contains the following information:

- **LE** – The ID of the legal entity.
- **TableName** – The name of the referenced table.
- **DateFieldName** – The date field that's selected as a criterion.
- **Period** – The values of the **Date from** and **Date to** parameters.
- **SeqNum** – The sequential number of the archive, in case the process creates several archive files.

The name of each attachment that's included in an archive is in the format *RecID_AttachmentName_AttachmentDate_SeqNum.xxx* and contains the following information:

- **RecID** – The ID of the referenced record in the selected table.
- **AttachmentName** – The original file name of the attachment.
- **AttachmentDate** – The date when the attachment was attached to the referenced record of the table.
- **SeqNum** – The sequential number, in case there are simultaneous duplicate attachments.
- **xxx** – The attachment file extension.

Frequently asked questions

What is the difference between document handling and document management?

There's no difference between document handling and document management. Both terms refer to the same functionality. Different terms are used in different versions of the product.

What is the difference between document management and print management?

Document management lets you add notes, documents, and other files to records.

Print management lets you control print settings for selected reports. Print settings include the number of copies, the printer destination, and the multilanguage text that can be included on the report. For more information, see Document Reporting Services.

What is the difference between document types and file types?

Use document types to categorize the documents that you attach to records or the templates that you create. You can store each document type in a unique location. The table for document types is named DocuType.

File types include Word documents and images. A file type is denoted by the extension of the file, such as .txt, .png, .doc, .xlsx, or .pdf.

Does document management integrate with Microsoft 365?

Yes. The system supports SharePoint storage natively, and you can select it as the storage location for a document type. In addition, you can make any URL addressable file an attachment by using the **URL** document type.

What is the default storage location for attachments in Finance + Operations environments?

By default, the system saves attachments in Azure Blob storage automatically as part of the product cloud offering.

If I accidentally delete an attachment stored in Azure Blob Storage, can I restore it?

When you delete attachments that are stored in Azure Blob Storage, you permanently delete them. The system also deletes the references to those attachments. Therefore, if you accidentally delete an attachment, you can't restore or recover it.

Is the database information about attachments stored separately from the attachments themselves?

The system stores record attachment information in the **DocuRef** and **DocuValue** tables. The **DocuRef** table contains the record that represents the attachment. Each **DocuRef** record points to both the record it's attaching to and a **DocuValue** record. Each **DocuValue** record points to the file for the attachment. The system stores files outside the database. Therefore, database operations, such as restorations from a backup, affect only the database information about the attachment, not the attachment file itself.

Can the system store attachments in the database?

No. By default, the system stores attachments in Azure Blob storage.

What are the main differences between Azure Blob storage and database storage?

Database storage uses Azure SQL Database. File storage uses Azure Blob storage. Azure Blob storage is simpler and much less expensive.

How much storage do I get for Azure Blob storage?

See the licensing guide. Currently, you get 40 gigabytes (GB) of storage.

What is the cost for additional storage?

The cost for additional storage varies, but it's similar to the standard Azure costs for storage. In other words, the cost is about $0.05 per GB.

How do I know how much storage is already used?

The system provides proactive communication when you're approaching your database and file storage limits. However, Microsoft Dynamics Lifecycle Services provides some information, and you can log support requests for additional information.

Is there an option to export all document attachments from the system?

Although you can export attachments, this capability isn't a standard capability because the system doesn't include a standard attachment entity. You must build entities that provide attachments for a specific business document or record.

How can you extract attachments from the system?

To extract attachments, you must build an Attachments entity for a specific business document or record. There's no standard attachment entity because the identity for each record type differs. To learn how to build an Attachments entity, review the examples in Application explorer. To find these examples, search for "Attachment" under the **AOT** > **Data Model** > **Data Entities** node.

How does the document preview work for attachments stored in SharePoint?

The WOPI service retrieves the files from SharePoint by using the current user permissions. The service then renders the files in HTML to provide a document preview. The current user must have access to the files to preview or open them.

Troubleshooting problems

Problem: When users interact with Document management or Electronic reporting, they receive an error similar to "Invalid length for a Base-64 char array or string."

Explanation: Typically, this problem occurs because the token for the Office Web Apps Server is no longer valid.

Fix: The admin needs to select the **Token refresh** button to the right of the **Office Web Apps Server** field on the **Document management parameters** page under the **General** tab.

Configure and send email

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The behavior of the email subsystem is influenced by a combination of administrator configuration, user configuration, and user choices. This article is divided into sections for administrators and users to make it easy to find relevant information.

Both administrators and users set the behavior of the email subsystem.

[Administrator] Email parameters page

Email configuration for the environment

On the **Email parameters** page, administrators can configure the high-level email behavior for the environment from the **Configuration** tab.

Expand table

Field	Description
Batch email provider	Specifies which email provider will be used to send emails that are sent by processes in a batch or non-interactive manner. The Microsoft Graph and Exchange providers will use the account that's associated with the batch process. Note: Microsoft Graph is available in Dynamics 365 Finance version 10.0.38 and later.
Attachment size limit	Specifies the maximum size of a single email that can be sent via the email subsystem.
Email expiration in days	Specifies the number of days before the status of an unsent message is set to **Expired**. A value of **0** means that the default period of 30 days is in effect.

The **Email history** section serves two purposes. First, it provides an entry point to the **Email history** page, where administrators can review all sent emails and also any errors that prevented an email from being sent. Second, it lets you configure how long email history is maintained. By default, the last 30 days of email history are retained. You can adjust this period

by changing the value of the **Number of days to retain email history** field to a non-zero number. If you set the value to **0** (zero), the default number and behavior are used.

The **Email throttling** section enables non-interactive email providers (such as the batch email provider) to adhere to a per-minute sending limit. This feature can help prevent some errors if the system tries to send more emails than the provider allows. Specifically, if an email can't originally be sent because the per-minute sending limit has been reached, the send attempt for the email will be deferred for up to one minute. After ten deferrals, the system will try to send the email regardless. You can remove the per-minute sending limit from a provider by resetting the **per-minute email sending limit** field to **0**. The sending limits for the Office 365 SMTP email provider is automatically set according to the Exchange Online sending limits. Manual configuration is required for all other email providers.

> **Note**
>
> Use of the **Email throttling** feature isn't recommended for the Microsoft Graph and Exchange email providers, because they have their own throttling mechanisms. Therefore, you should ensure that the **per-minute email sending limit** field is set to **0** for both those providers.

Send email with Microsoft Graph

For customers who use Office 365, Microsoft Graph is the recommended email provider for Dynamics 365 finance and operations apps. This email provider replaces the deprecated Exchange email provider.

You must have the following permissions to set up the Microsoft Graph integration:

- You must be a system administrator in the application to link the Dynamics 365 finance and operations environment to Microsoft Graph.
- You must be an administrator for your Microsoft Entra ID account. If you aren't the administrator, an administrative user must perform the first part of the configuration for you.

One-time registration process

To create an app, follow these steps:

1. Sign in to the Azure portal by using an Azure tenant admin account.

   > **Note**

> The user who completes this procedure must have Admin rights for the tenant to register applications.

2. Go to **Microsoft Entra ID** > **App registrations** > **New application**.

3. Enter the following values:

   - **Name** – Enter the name of your app.
   - **Supported account types** – Enter only accounts that are directly in this organization (single tenant).

4. Select **Register**.

5. Make a note of the **Application (client) ID** value. You will use this value to connect to the Microsoft Graph service from your finance and operations environment.

   > ⓘ **Important**
   >
   > Be sure to capture the **Application (client) ID** value before you continue.

6. To add permissions, follow these steps:

   a. Select **Manage** > **API permissions** > **Add a permission** > **Microsoft APIs** > **Microsoft Graph**.

   b. Select **Application permissions**, and enable **Mail.Send**.

      > ⓘ **Note**
      >
      > By default, the app should include the **User.Read** delegated permission for Microsoft Graph. If that permission is missing, you must add it from the delegated permissions.

   c. Select **Add permissions**.

   d. Select **Grant admin consent for** to allow emails to be sent.

7. To create a client secret, follow these steps:
   a. Select **Manage** > **Certificates and secrets**.
   b. On the **Client secrets** tab, select **New client secret**.
   c. Enter a value in the **Description** and **Expires** fields, and then select **Add**.
   d. Make a note of the **Secret value** value. You will use this value to connect to the Microsoft Graph service from your Dynamics 365 finance and operations

environments.

> **Important**
>
> Be sure to capture the **Secret value** value before you continue.

Restrict mailboxes

Administrators can modify mailbox access. For more information, see Limiting application permissions to mailboxes.

Configure Microsoft Graph in Dynamics 365 finance and operations apps

1. In Dynamics 365 finance and operations apps, open the **Email parameters** page.
2. On the **Microsoft Graph settings** tab, in the **Application ID** field, enter the **Application ID** value that you captured when you created the new app in the previous procedure.
3. In the **Application secret** field, enter the **Secret value** value that you captured when you created a client secret in the previous procedure.
4. Select **Save**.

Exchange email provider (Deprecated)

On the **Email parameters** page, an administrator can select **Exchange** as an interactive email provider and as the Batch email provider. This mail provider will use the current user's Exchange Online account to send emails. When it's used as the Batch email provider, the batch account will be used. No additional configuration is required.

If troubleshooting is required, ensure that it's possible to sign in to the current user's account, and that emails can be sent from that account to the intended recipients.

Note that the Exchange mail provider has the following limitations:

- It isn't supported for external users, because those users won't have Exchange accounts on the system tenant.
- It's available only in Microsoft-managed environments.

Send email by using SMTP

On the **Email parameters** page, note the following settings on the **SMTP settings** tab.

Server information

Expand table

Field	Description
Outgoing mail server	The host name of the desired Simple Mail Transfer Protocol (SMTP) server. For Microsoft 365 production (including *.onmicrosoft.com accounts), use smtp.office365.com. (You can find this setting at outlook.office.com at **Settings** > **Mail** > **POP and IMAP**.) For Outlook/Hotmail, use smtp-mail.outlook.com.
SMTP port number	Typically, the port number should be set to 587 for secure transport.
SSL required	Determines whether secure transport is used. Typically, this is **Yes**, except for internal or troubleshooting scenarios.

> **Note**
>
> If you are running into issues from too many emails being sent in a short period of time, it is recommended to utilize the **Email throttling** feature mentioned in the **Configuration tab** section above. If that doesn't resolve the issue, you may consider adding the appropriate IP addresses from the outbound IP safe list to your DNS SPF record authorizing Dynamics 365 finance and operations to send emails from your domain. For more information, see Outbound IP safe list.

Authentication

Expand table

Field	Description
Authentication required	Determines whether a user name and password are needed to send emails.
User name and **Password**	If authentication is required, specify the appropriate mail account to send email from. All users need to provide the SMTP account **Send As** and **Send On Behalf Of** permissions to enable the ability to send SMTP mail. You can configure Send As permissions in the Microsoft 365 admin center (portal.office.com/Admin) at **Users** > **Active users** > **User** > **Edit mailbox permissions** > **Send email from this mailbox**. For more information, see Enable sending email from another user's mailbox in Microsoft 365.

> **Note**

Finance and operations apps don't support multifactor authentication or Modern auth (OAuth 2.0) for SMTP. The Microsoft Graph email provider can be used if a more modern integration is desired. Administrators might have to re-enable Basic authentication to allow for SMTP AUTH. For more information, see Enable or disable SMTP AUTH. Note that the deprecation of Basic authentication for Exchange online only impacts the use of Office 365 SMTP servers. Other SMTP servers that still support basic authentication won't be impacted by this Office 365 deprecation.

[Administrator] Email distributor batch process

Email that is sent directly from the server, without user interaction, via SMTP is sent by the **Email distributor batch** process. That batch process must be started to process the email queue. To start the process, open the **Email distributor batch** pane (**System administration** > **Periodic tasks** > **Email processing** > **Batch**) and turn on **Batch processing**.

If the Microsoft Graph or Exchange provider is used, then the user account associated with the batch process (usually admin) will be the sender.

[Administrator] User email

The default **send from** address for each user is pulled from the **Email** field on the **Users** page (**System administration** > **Users** > **Users**). Administrators can override this **send from** default if needed using the **Sender email** field on the **Options** page.

[User] Email provider selection section on the Options page

The **Options** page can be opened via **Settings** > **User options**. The **Email provider selection** section is on the **Account** tab.

Expand table

Field	Description
Email provider ID	Allows the user to select the email provider that should be used when sending an email. Selecting an option here is the equivalent of selecting **Do not ask again** in the **How would you like to send email** dialog box. Selecting the blank option **Prompt for which email provider to use** will cause the **How would you like to send email** dialog box to display when an email is going to be sent.

Field	Description
Sender email	Allows the administrator to provide an email address override for the user in the **From** field of the email. By default, the email alias that is associated with the user account is used as the **From** field in new emails, but this user option email address will override that. When sending email via SMTP, the user needs to have appropriate **Send As** and **Send On Behalf Of** permissions configured in Exchange or on the SMTP server. **NOTE:** You can configure **Send As** and **Send On Behalf Of** permissions in the Microsoft 365 admin center (portal.office.com/Admin) at **Users** > **Active users** > **User** > **Edit mailbox permissions** > **Send email from this mailbox**. For more information, see Enable sending email from another user's mailbox in Microsoft 365.

[User] How would you like to send email dialog box (optional)

When an email is going to be sent, the user will see the **How would you like to send email** dialog box that will list the available options for sending email.

Expand table

Field	Description
Use an email app, such as Outlook	Provides the user with a generated email (.eml) file.
Use Exchange email server	Uses the Exchange Online server associated with the tenant. The **Exchange** mail provider is currently not supported outside the public cloud, including on-premises environments.
Use the system email client	Opens the **Send email** composition dialog box and then sends the resulting email via SMTP.
Do not ask again	If this field is not selected, the next time an email is sent the most recently selected option will be used and the dialog box will not open.

[User] Send email dialog box (optional)

The **Send email** dialog box is opened to allow the user to edit the contents of the email that will be sent. Some of the following fields will be pre-populated in this window.

Expand table

Field	Description
From	Populated from the **Email** field on the **Options** page.
To, **Cc**, **Bcc**, **Subject**, and **Body**	Populated with values specified by the process that initiated the sending of the email. These fields can be edited as needed by the user.
Attachments list	May be populated with attachments specified by the process that initiated the sending of the email. This list can be edited as needed by the user.

When the email is ready to be sent, the **Send** button will cause the email to be sent via SMTP.

Usage scenarios to verify if email is configured correctly

Send mail via a local mail client

Email workflows that are enabled via the SysEmail framework can generate email messages (.eml files) that contain attachments. You can then send these messages via Microsoft Outlook or another email client.

1. In Microsoft Edge, navigate to **Accounts receivable** > **Customers** > **All customers**.
2. Select **US-008 Sparrow Retail**.
3. Click **Collect** > **Customer balances** > **Collections** to open the **Collections** page.
4. Click **Communicate** > **Email** > **Statements to contact**.
5. Click **OK** to accept the default values in the dialog box.
6. If you're prompted for the mail option to use, clear the **Do not ask again** check box (you can change this option from the **User options** page), select **Use an email app, such as Outlook**, and then click **OK**.
7. If you're using Microsoft Edge on your computer, open the email (.eml) file that is generated. If you're using Microsoft Edge on the VM, copy the file to your computer, and open it there.
8. Note the email address in the **To** field and the generated workbook attachment.

Send mail via SMTP

Email workflows that are enabled via the SysEmail framework can also be created in a simple email dialog box and then sent via Simple Mail Transfer Protocol (SMTP).

1. Go to the **Email parameters** page.
2. Click **SMTP settings**.

3. Set the **Outgoing mail server** to the desired SMTP server:

    - For Microsoft 365 production (including *.onmicrosoft.com accounts) use smtp.office365.com. (Find this setting via outlook.office.com, at **Settings** > **Mail** > **POP and IMAP**.)
    - For Outlook/Hotmail use smtp-mail.outlook.com.

4. Set the user name and password to an appropriate email account and password.
5. Leave **SSLRequired** turned on, and leave **SMTP port number** set to **587**.
6. Click **Save**.
7. In Microsoft Edge, navigate to **Accounts receivable** > **Customers** > **All customers**.
8. Select **US-008 Sparrow Retail**.
9. Click **Collect** > **Customer balances** > **Collections** to open the **Collections** page.
10. Click **Communicate** > **Email** > **Statements to contact**.
11. Click **OK** to accept the default values in the dialog box.
12. If you're prompted for the mail option to use, select **Use the Microsoft Dynamics 365 Finance email client**, and then click **OK**.
13. To receive the test message, change the **To address** to your email address.

    Ensure that the account specified in the SMTP settings is able to **Send As** and **Send On Behalf Of** your email account. The easiest way to ensure this is to use your email account in the SMTP settings.

14. Enter a subject and body for the message.
15. Click **Send**. The message should be delivered in one to five minutes.

[Administrator] Workflow email notifications

Workflow email configuration is a collection of related settings that work in conjunction.

Workflow email notification setup

1. Verify email settings:
    a. Go to **System administration** > **Setup** > **Email** > **Email parameters**.
    b. Verify that SMTP is enabled.

c. Set the SMTP mail server settings.

2. Verify that the email batch process is running:

   a. Go to **System administration** > **Periodic tasks** > **Email processing** > **Email distributor batch**.

   b. Enable the **Batch processing** option.

   c. Optionally, adjust the recurrence of the email process:
      i. Select **No end date** to adjust all recurrences of the email batch process.
      ii. Adjust the count.
      iii. Adjust to run every minute if needed.

3. Verify workflow notification system email templates:
   a. Go to **System administration** > **Setup** > **Email** > **System email templates** (for system-wide templates).
   b. Verify that the **Sender email** field is set and valid.

4. Verify workflow notification organization email templates:
   a. Go to **Organization administration** > **Setup** > **Organization email templates** (for organization-specific templates).
   b. Verify that the **Sender email** field is set and valid.

5. Verify that the user can receive email notifications:

   a. Go to **Settings** > **User options**.

   b. Go to the **Account** tab.
      i. Set the **Email provider ID** (for example, SMTP).
      ii. Optionally, set a **Sender email** override if the default **send from** address should not be used for the current user.

   c. Navigate to the **Workflow** tab. Set the option to send notifications in email to **Yes**.

6. Verify that the workflow system will send email notifications:

   For each workflow that should have a notification, open the workflow properties in the workflow editor.

   a. Click **Basic settings**. Adjust the email template for the workflow notifications.

   b. Click **Notifications**.
      i. Enable the events for which a user should be notified.
      ii. Set the recipient of the workflow notification for each event notification that is enabled.

c. On a workflow approval element for which a user should be notified:
   i. Go to **Properties**.
   ii. Enable the events for which a user should be notified.
   iii. Set the recipient of the workflow notification for each event notification that is enabled.

Workflow email notification testing

The testing for email notifications is to simply trigger the notification and then check for it.

1. Submit a workflow that has been set up for email notifications.
2. Check the workflow history to make sure that a workflow work item was assigned to the expected user.
3. Check the status of the pending email notification in **System administration** > **Periodic tasks** > **Email processing** > **Batch email sending status**.

   If the email fails to be sent, make sure that the SMTP mail account can be opened.
4. Check for the email notification in the appropriate inbox.

Troubleshooting

Common issues with sending email

There are some standard processes that can help you troubleshoot the configuration of email settings.

Expand table

Verify email settings, and send a test email.	1. Go to **System administration** > **Setup** > **Email** > **Email parameters**. 1. Verify that SMTP is enabled. 1. Verify the settings of the SMTP mail server. 1. Sign in to the SMTP account in a separate window to make sure that the account and password are correct. 1. Send a test email by going to **System administration** > **Setup** > **Email** > **Email parameters** > **Test email**.
Verify that the email batch process is running.	1. Go to **System administration** > **Periodic tasks** > **Email processing** > **Batch**. 1. Make sure that the **Batch processing** option is set to **Yes**. 1. Review the recurrence of the email process: 1. Select **No end date** to adjust all recurrences of the email batch process. 1. Adjust the count as needed.

Review the status of batch emails.	1. Go to **System administration** > **Periodic tasks** > **Email processing** > **Batch email sending status**. 1. Verify that emails are being sent from the correct account. If the account is incorrect, you must adjust settings such as user options, system templates, or organization templates, as needed. 1. Verify that all email user accounts have been granted **Send As** permission for the configured SMTP account (see Verify that all email accounts have appropriate Send As permissions later in this table).
Review any errors on the Email history page.	1. Go to **System administration** > **Setup** > **Email** > **Email history**. The **Email history** page lets administrators review all sent emails and also any errors that prevented an email from being sent. It shows both interactive and non-interactive/batch emails. 1. For any emails where the **Email status** value is **Failed**, review the error message on the **Failure details** tab, and determine whether corrective actions should be taken. Some of these errors are covered later in this article.
Verify that all email accounts have appropriate Send as permissions.	In the Microsoft 365 admin center, verify that all user mail accounts that will be used to send emails have **Send As** and **Send On Behalf Of** permissions for the configured SMTP account. For more information, see Give mailbox permissions to another user in Microsoft 365.
Verify user mailboxes.	Consider signing in to the affected (or all) user mailboxes to verify that they are valid and can be accessed by using sign-in.

Specific Microsoft Graph/Exchange email issues

- **"(401) Unauthorized" or "(403) Forbidden" error when email is sent via Exchange**

Expand table

Explanation	This issue might indicate an invalid or incorrectly set up mailbox in Office 365.
Fix	To fix this issue, make sure that the specified user exists in Office 365 and has appropriate permissions. To find the affected users, follow these steps: 1. Open the **Email history** page. 1. Add a filter for **Failed** emails to the **Email status** field. 1. Make a note of the value in the **Email sender** field. This field shows the user that Exchange is indicating isn't a valid or correctly permissioned user in Office 365.

- **"(404) Not found" error when email is sent via Exchange**

Expand table

Explanation	This issue indicates that no mailbox exists for the user account in Exchange.
Fix	To fix this issue, make sure that the specified user exists in Office 365 and has appropriate permissions, or use alternate user accounts that have valid Exchange mailboxes. To find the affected users, follow these steps: 1. Open the **Email history** page. 1. Add a filter for **Failed** emails to the **Email status** field. 1. Make a note of the value in the **Email sender** field. This field shows the user that doesn't have a mailbox in Exchange.

Specific SMTP email issues

If you continue to experience issues when email is sent via SMTP, you may be running into one of the specific errors below. If not, consider entering the SMTP account information in a tool such as SMTPer.net to verify that the SMTP server and account are valid and working correctly.

- **SMTP emails fail to be sent with "Recipient addresses in single label domains not accepted"**

Expand table

Explanation	An email failed to be sent because a recipient is using a single-label domain, but Office 365 doesn't support single-label domains. Single-label domains are Domain Name System (DNS) names that don't contain a suffix such as .com, .corp, .net, or .org. For example, contoso is a single-label domain. However, contoso.com, contoso.net, and contoso.local aren't single-label domains.
Fix	Specify alternate addresses for email recipients that aren't single-label domains.

- **SMTP emails fail to be sent with "Mailbox full"**

Expand table

Explanation	An email failed to be sent because at least one recipient's mailbox is full. For more information, see Error (554 5.2.2 mailbox full) when sending email to mail-enabled public folders in Office 365.
Fix	Use an alternate address for the recipient, or contact the recipient by using alternate means before you try again.

- **SMTP emails fail to be sent with "Authentication unsuccessful, the request did not meet the criteria to be authenticated successfully"**

Expand table

Explanation	An email failed to be sent because additional criteria are required to successfully authenticate the SMTP user account. These additional criteria might be required because multifactor authentication (MFA) is configured. However, finance and operations apps don't currently support MFA.
Fix	Adjust the user account configuration as appropriate in Office 365 before you try again. For more information, see Fix issues with printers, scanners, and LOB applications that send email using Microsoft 365 or Office 365.

- **SMTP emails fail to be sent with "Authentication unsuccessful, SmtpClientAuthentication is disabled for the Mailbox"**

Expand table

Explanation	An email failed to be sent because SMTP client authentication is disabled for the SMTP user account.
Fix	Enable SMTP client authentication for the user account in Office 365 before you try again. For more information, see Enable or disable authenticated client SMTP submission.

- **SMTP emails fail to be sent with "If your SMTP server doesn't support authentication, please clear the SMTP user name and password"**

Expand table

Explanation	This issue is related to migration from the .NET SMTP mail client (which is now obsolete) to MailKit per Microsoft recommendations. This migration causes a change in the way that SMTP user names and passwords are handled in situations where the mail server didn't support authentication. Previously, if an SMTP user name was provided, but the server didn't support authentication, the .NET SMTP mail client ignored the provided user name and password, and continued without authentication. This behavior led some customers to incorrectly believe that they were using an authenticated mail server. In MailKit, authentication is required if a user name is provided. This requirement will trigger an error for mail servers that don't support authentication, and emails will fail to be sent.

Fix	The user must go to the **Email parameters** page (**System administration** > **Setup** > **Email**) and clear the **User name** and **Password** fields on the **SMTP settings** tab.

- **SMTP emails fail to be sent with an "5.7.57 SMTP" error, or an indication that either you aren't authenticated or authentication is required**

Expand table

Explanation	The mail server is indicating that the SMTP user credentials aren't valid.
Fix	Verify that the SMTP user credentials are correct.

- **SMTP emails fail to be sent with "Microsoft.Dynamics.Ax.Xpp.Security.CryptoEncryptionException: Encryption error occurred with exception"**

Expand table

Explanation	The SMTP password is encrypted by using a key that is specific to a single environment. This error typically occurs when the password can no longer be decrypted after database migration between environments.
Fix	Clear and reenter the SMTP password on the **SMTP settings** tab of the **Email parameters** page.

- **SMTP emails fail to be sent with "Client does not have permissions to send as this sender"**

Expand table

Explanation	This issue is usually caused by incorrect setup of the **Send As** permissions for the email account.
Fix	Ensure that the email account has appropriate **Send As** permissions. For more information, see Verify that all email accounts have appropriate Send As permissions earlier in this article.

Frequently asked questions

Where do workflow email templates come from?

The email templates will be sourced from either system email templates or organization email templates depending on whether the workflow is a system-level (not company specific) or organization-level (company specific) workflow.

What email limits apply when using Microsoft Graph, Exchange, or SMTP?

The system communicates with Microsoft Graph, Exchange, or an SMTP server like a typical email client, so standard behavior and limits apply. For example, standard Exchange Online receiving and sending limits apply.

Date and time data and time zones

This article provides information about date and time fields, and time zones.

Date and time fields

Three types of date and time fields correspond to different data types in the database:

- **Combined date/time fields** – Use these fields to enter date and time data. The **utcdatetime** data type stores time and date data in a single field in Coordinated Universal Time (UTC). UTC is the primary time standard by which the world regulates clocks and time. It's, within about 1 second, mean solar time at 0° longitude. It doesn't observe daylight saving time. Time zones around the world are expressed using positive or negative offsets from UTC. For most purposes, UTC is considered interchangeable with Greenwich Mean Time (GMT). The current version of UTC is defined by International Telecommunications Union Recommendation (ITU-R TF.460-6).
- **Date fields** – Use these fields to enter dates only. The **date** data type stores a day, month, and year. However, these values aren't stored in UTC and can't be associated with a time zone.
- **Time fields** – Use these fields to display the number of seconds that have elapsed since midnight on the current date. The **timeofDay** data type stores an integer value. Time values aren't stored in UTC.

Time zones

To express UTC times in the local time, you must provide a time zone. The time zone controls the offset from UTC that is the equivalent of the local time. For example, the offset for Moscow is UTC+3. The Windows locale of your computer first sets your preferred time zone, although an administrator might change it. Use your preferred time zone only when displaying combined dates and times. To set the preferred time zone for a user, go to the **Users** page. The page shows the list of users of the system. Select the user that you want to set the preferred time zone for, and select **User options**. On the **Language and region** tab, select the preferred time zone.

Unified pricing management module overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an overview of the **Unified pricing management** module for Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management. For a video overview, see Pricing Management Overview in Dynamics 365 Supply Chain Management - TechTalk.

Increasingly, traditional business-to-business (B2B) companies are considering converting to omnichannel sales and selling directly to customers, so that they can gain more control over pricing and margins. An omnichannel conversion causes massive changes to pricing models and rules. To help B2B companies that are converting to omnichannel pricing, Unified pricing management enables attribute-based pricing rules that use attributes and data from customers, products, and order segments.

Here are some of the main challenges:

- **Pricing silos** – There's a lack of transparency across channels. There's also a lack of centralized pricing management.
- **Pricing relevancy** – All pricing factors must be considered when B2B and business-to-consumer (B2C) pricing rules are defined.
- **Pricing complexity** – There can be difficulties during the conversion to B2B and B2C pricing logic without validation.
- **Real-time execution** – The omnichannel customer experience requires a real-time pricing calculation response.

Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management use Commerce Scale Unit (CSU) Core to help traditional B2B companies embrace omnichannel pricing. The CSU Core function provides the following capabilities:

- Offer, manage, and calculate pricing, and provide transparent pricing across channels. This capability is essential for the alignment of pricing strategies across multiple channels.
- Quickly determine prices while you also consider a range of commercial aspects, such as general base prices, sales trade agreements, long-term discount agreements, short-term promotion discounts, and retrospective rebate calculations for each sales order.
- Create pricing data models that are based on price attributes. Price attributes can be based on categorized product pricing differentiators, customer groups, and order types.
- Manage complex price structures by using price component breakdowns, and define margin component price adjustments on top of item base prices. When you create an order, the pricing details can provide a list of price component breakdowns for future in-depth analysis.
- Easily manage sophisticated pricing rules when you convert from B2B pricing to B2B and B2C pricing that considers discount concurrency, bundle sales, mandatory sales items, and bonus free item pricing rules.
- Simulate prices, and show detailed price calculations.
- Use enhanced discount budget controls to help avoid margin leakage from fund consumption.
- Use the CSU-based pricing API for Dynamics 365 Commerce to enable pricing calculations to be retrieved by a native Commerce point of sale (POS) system and/or consumed by external applications to support different pricing scenarios.

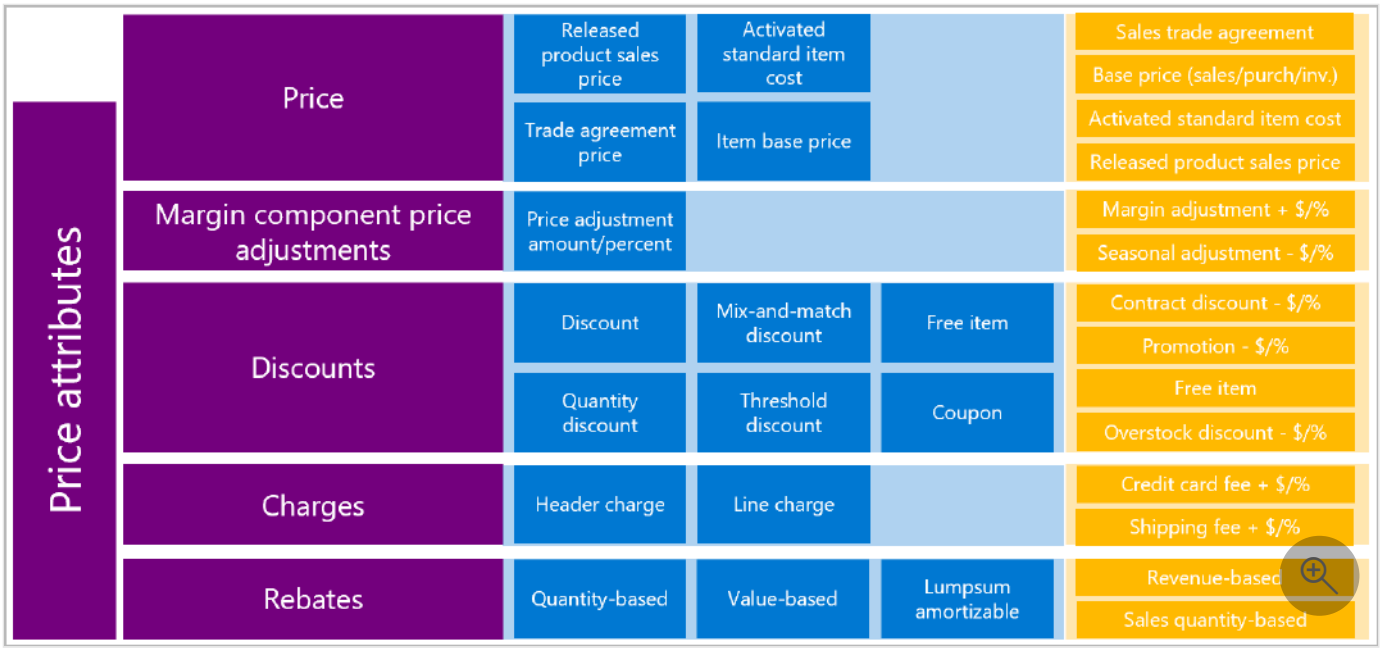
Pricing components

Unified pricing management applies the following key elements to determine pricing:

- **Price attributes** – Price attributes give you a flexible way to define your pricing factors. They use information about customers, products, sales order headers, and sales order lines. Because price attributes work with the customer and product attribute framework, they're highly configurable. You can extend them through available extension points.
- **Price component codes** – Price component codes group together price attributes. They represent the building blocks of your price structure. When you create a price and discount rule record, you also assign that record to a price component code.
- **Price structures** – Price structures help you understand the sequence of your price component codes. You can use one price structure for each company, or you can use a different price structure for each order attribute in a company. Price determination logic that's embedded in the price structure ensures that the base price can be determined. The base price is the price before any price adjustments are made (*Base price* + *Price adjustment* = *Selling price*).

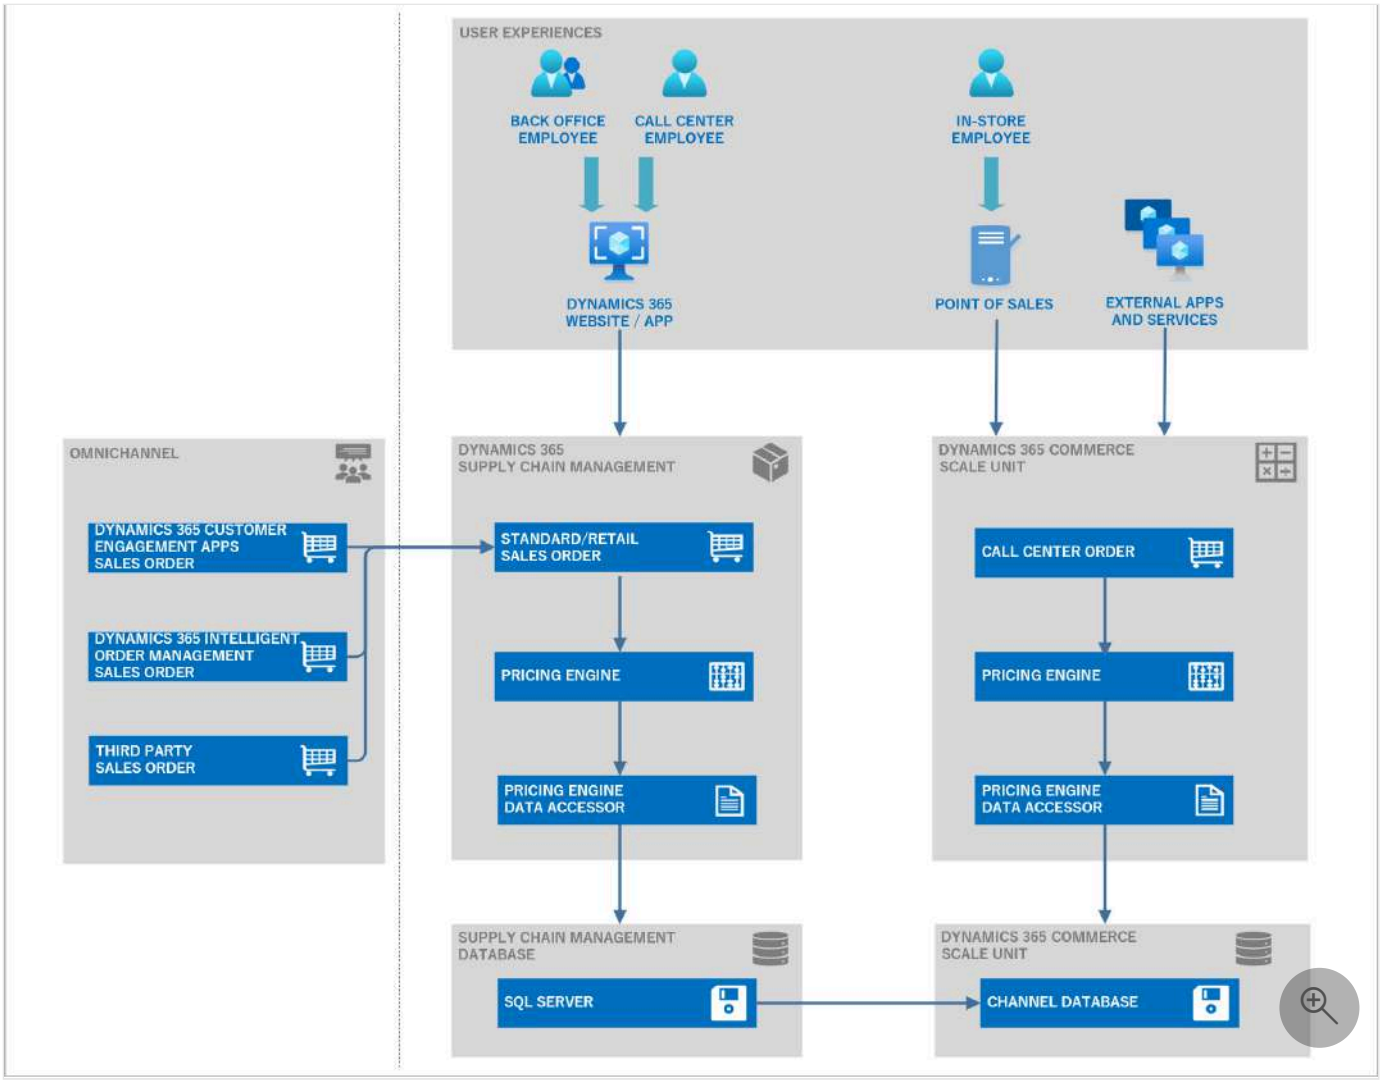
- **Concurrency modes** – Concurrency modes control how the final price is calculated in situations where multiple pricing rules are associated with the same price component code.

The following illustration shows many of the elements that affect price calculations in Unified pricing management.



Architecture overview

The following illustration shows the architecture of the **Unified pricing management** module.



> **Note**
>
> - You can create and maintain the pricing rules in Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management.
> - Omnichannel orders can come from a range of front-end ordering systems.
> - For orders that are created in Microsoft Dynamics 365 Commerce or Dynamics 365 Supply Chain Management, through integration, or through dual-write (such as orders from Dynamics 365 customer engagement apps or Dynamics 365 Intelligent Order Management), the pricing engine can provide calculated pricing and pricing details for each sales order.
> - For orders that are created in a native Commerce POS or a third-party system, calculated prices can be retrieved via the CSU-based pricing API.

Turn on the Unified pricing management module for your system

Prerequisites

To use the **Unified pricing management** module, you must be running version 10.0.41 or later of Microsoft Dynamics 365 Commerce and/or Dynamics 365 Supply Chain Management.

Turn on the Unified pricing management feature in Feature management

Before you can use the **Unified pricing management** module, you must turn it on for your system. Admins can use the Feature management settings to review the status of the feature and turn it on as required. In the **Feature management** workspace, the feature appears as follows:

- **Module:** *Sales and marketing*
- **Feature name:** *Unified pricing management*

Turn on the optional Unified pricing management pricing rule performance enhancement feature

The optional *Unified pricing management pricing rule performance enhancement* feature improves performance and provides enhanced pricing data import and export entities. To use this feature, turn on the following feature in Feature management:

- **Module:** *Sales and marketing*
- **Feature name:** *Unified pricing management pricing rule performance enhancement*

Learn more in Pricing data import and export entities.

Migrate to Unified pricing management (preview)

[This article is prerelease documentation and is subject to change.]

This article explains how to migrate to Unified pricing management in Microsoft Dynamics 365 Commerce version 10.0.46 to simplify pricing strategies with centralized control and flexible rules.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Unified pricing management migration helps Dynamics 365 Commerce customers transition from the legacy Commerce pricing engine to the Unified pricing management framework without extensive configuration or disruption.

This enhancement simplifies adoption, so you can quickly experience the benefits of centralized and flexible pricing management. It lays the groundwork for you to later extend your pricing strategies by incorporating more pricing attributes for greater precision and control.

Unified pricing management migration is structured into three incremental phases from Commerce versions 10.0.46 to 10.0.48, so you can move at your own pace and address various user scenarios and existing Commerce pricing engine configurations.

The following table describes whether various rules are supported for pricing features.

Expand table

Feature	Current nonattribute rule	New nonattribute rules	New attribute-based rules
Trade agreement price	Supported	Can also migrate	Supported
Discount	Migrate	Not supported	Supported

Feature	Current nonattribute rule	New nonattribute rules	New attribute-based rules
Shipping discount	Not supported	Not supported	Supported
Tender discount	Not supported	Not supported	Not supported
Charges	Supported	No migration (migrating existing charges rules is planned)	Supported
Rebate management	Supported	Supported	Supported
Trade agreement discount	Supported	No migration	Not supported
Price group	Migrate to attributes	Not supported	Supported
Price adjustments	Migration isn't supported.	Not supported	Supported

Prerequisites

You must be running Commerce version 10.0.46 to use Unified pricing management.

Migrate to Unified pricing management

To migrate to Unified pricing management, follow these steps:

1. In Dynamics 365 Commerce headquarters, go to the **Feature Management** workspace at **System administration** > **Workspaces** > **Feature management**.
2. Search for the **Unified pricing management pricing rule performance and enhancement** feature.
3. Select the feature, then select **Enable**.

   > ⓘ **Note**
   >
   > When you enable the feature, you unlock the migration options to migrate from the Commerce pricing engine to Unified pricing management.

4. Go to **Retail and Commerce** > **Migration** > **Set up Price group mapping for migration**. You see the following:

- The system automatically converts all existing Commerce price groups to Unified pricing management price groups.
- Each new group keeps the same price group conditions as its legacy configuration.

5. If duplicate mappings exist, the system prompts you to resolve them manually. After resolving any duplicates, select **Validate** before proceeding.

6. Go to **Retail and Commerce** > **Migration** > **Migrate Commerce Pricing Setup**. This page lets you run the migration job that transitions your current Commerce pricing engine data into the Unified pricing management framework.

   > **Note**
   >
   > In Commerce version 10.0.46, price adjustments aren't included. Price adjustments migration support is included in Commerce version 10.0.47.

7. Use the **Effective after date** field to select pricing rules that are still active and should be migrated.

8. Choose whether or not to include disabled discounts and skip trade agreements.

9. If you want to continue applying existing trade agreements without attributes, configure the corresponding parameters accordingly.

10. Select **X** to start the migration.

When the migration is complete, your data and configurations are successfully migrated to Unified pricing management, providing a foundation for future enhancements to flexible pricing strategy.

Last updated on 08/24/2026

Price attributes overview

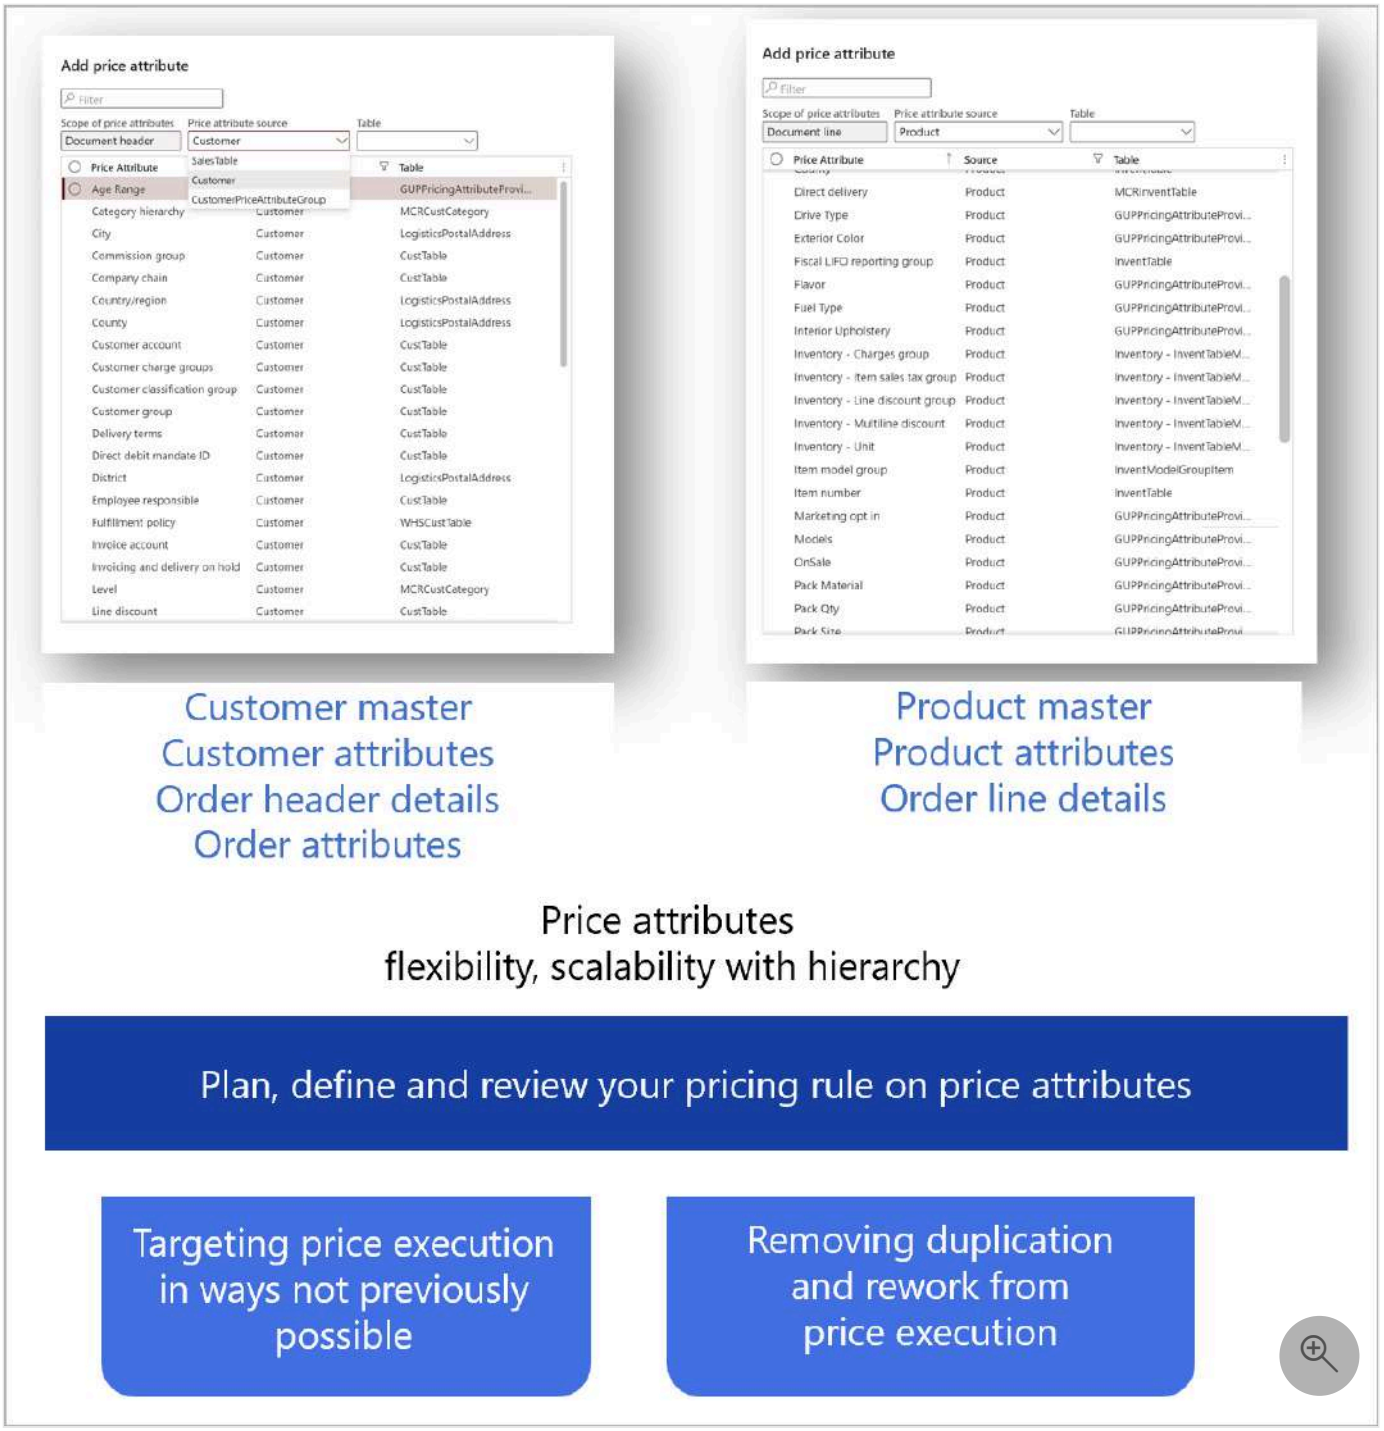
One of the key functions of a price manager is to work together with the product manager to accomplish the following tasks:

- Identify and classify products, customers, and order modes (for example, by region, pack size, brand, or age) to reflect each product's differentiating features, customer segments, and price sensitivity.
- Set up pricing rules that consider any combination of the customer, product, and order attributes to set up a flexible pricing architecture.

The Unified pricing management module provides *price attributes*. These attributes let price managers and sales promotion managers mark and group price differentiators defined for *products*, *customers*, and *sales order information*, and set up the pricing rules. Here are some examples of pricing rules:

- Sales trade agreement prices
- Margin component price adjustments
- Sales discounts
- Customer rebates on sales

Define these pricing rules by using combinations of price attributes to define the rule criteria.



Price attribute sources

Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management can maintain prices based on price groups, discount groups, product categories, product variants, storage dimensions, and tracking dimensions. These pricing factors are fixed, and can't be extended or changed to accommodate additional pricing criteria. Examples of possible product-based pricing variables include product types, brands, flavors, pack types, and pack sizes.

Customer groups don't always provide enough control over the setup of customer-based pricing. Therefore, customer-based pricing variables can also include customer area, payment method, payment terms, and loyalty program membership.

Other sales order details (such as the ordering channel, ordering site, ordering campaign, and mode of delivery) can also include pricing conditions.

Unified pricing management offers three price attribute sources that can serve as a foundation for the setup of pricing rules and conditions. For each source, it also provides out-of-box price attributes. You can build price attribute groups (header or line scope) and combine them to create price attribute combinations.

Expand table

Attribute group	Source	Source table	Price attributes
Header attribute group	Order (header)	Order table	The attributes provide out-of-box fields from the order header. You can extend them to add more fields.
Header attribute group	Order (header)	Order attributes; Attributes of the attribute group that are defined as the order attribute group in parameters	Configurable
Header attribute group	Customer	Customer master	The attributes provide out-of-box fields from customer masters. You can extend them to add more fields.
Header attribute group	Customer	Attributes of the customer attribute group that are defined as the customer attribute group in parameters	Configurable
Line attribute group	Product	Product master; Released product master	The attributes provide out-of-box fields from product masters. You can extend them to add more fields.
Line attribute group	Product	Associated product attributes that are defined as price attributes and assigned to a product	Configurable
Line attribute group	Order (line)	Order line	The attributes provide out-of-box fields from the order line. You can extend them to add more fields.

Each pricing rule allows for the combination of one header attribute group and one line attribute group.

Note

The number of attributes can affect the performance of the pricing engine. For pricing rule data entities (such as sales trade agreement prices, discounts, and rebates), up to 14 price attributes can be imported into Unified pricing management. Each pricing rule allows for the combination of one header attribute group (which can have up to seven header price attributes) and one line attribute group (which can have up to seven line price attributes).

Next steps

- Price attributes for products, customers, and orders

Last updated on 07/01/2026

Price attributes for products, customers, and orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Unified pricing management provides a set of prefilled price attributes from fields in related tables that are associated with products, customers, orders, and order lines. It also lets you create custom price attributes and associate them with orders, customers, and items. You can use those price attributes when you create pricing rules and conditions. When an order is placed, the pricing engine uses the associations to determine the appropriate price.

This article explains how to set up the configurable price attributes and associate them with products, customers, and orders.

Set up attribute types

When you create an attribute for any purpose, you must assign an *attribute type*. The attribute type defines the data type and the range of values that can be entered for attributes of that type.

To maintain your attribute types, go to **Product information management** > **Setup** > **Categories and attributes** > **Attribute types**.

Set up and assign product price attributes

You can create pricing rules that consider the attribute values assigned to each item in an order. *Attributes* provide a way to describe products and their characteristics through user-defined fields. Examples of attributes include brand, flavor, memory size, and commodity group.

When you create new attributes and assign them to a category, products in that category inherit the attributes and their default values. Attributes can be associated both with a released product

and with a product master. Default attribute values can be overridden at the level of the individual product. Only one value per attribute can be assigned to each product.

> **Note**
>
> Attributes apply to each *product*, not to each *item of inventory*. They serve as a broad classification of a product and aren't connected to inventory dimensions.

Set up product price attributes

To use attributes when you design Unified pricing management pricing rules, mark them as *price attributes* by following the procedure described in this section.

1. Go to **Product information management** > **Setup** > **Categories and attributes** > **Attributes**.
2. Select an attribute in the list pane, or create a new one.
3. Set the **Attribute type** field to the type that you identified or selected earlier.
4. Set the **Can be used as price attribute** option to *Yes*.
5. In the **Default value** field, assign a default attribute value as required.
6. On the Action Pane, select **Save**.

Assign product price attributes to products

Before attributes can have an effect, assign them to the relevant products by using one of the following methods:

- Assign product attributes to products by using the procurement category hierarchy.
- Group attributes into price attribute groups, and assign attribute groups to Commerce categories. If products are assigned to categories that are associated with attribute groups, they inherit the attributes that are included in those attribute groups.

For more information about attribute management and association, see Manage attributes and attribute groups.

Set up and assign customer price attributes

You can create Unified pricing management pricing rules that consider the attribute values assigned to the customer who places an order. To set up customer price attributes, first create an attribute group that includes the attributes that you need. Then set up that attribute group as the

customer attribute group. You can have only one customer attribute group, and it applies to all customers. However, each customer can have different values for each attribute.

Set up customer price attributes

Follow these steps to set up your customer price attributes.

1. Go to **Product information management** > **Setup** > **Categories and attributes** > **Attributes**, and set up all the customer price attributes that you need. For each attribute, make sure that the **Can be used as price attribute** option is set to *Yes*. (Learn more in the Set up product price attributes section of this article.) In the **Default value** field, assign a default attribute value as required.
2. Go to **Product information management** > **Setup** > **Categories and attributes** > **Attribute groups**, and create a customer price attribute group. Give it an appropriate name, such as *Customer price attributes*, and add each relevant attribute on the **Attributes** FastTab.
3. Go to **Pricing management** > **Setup** > **Pricing management parameters**. On the **Price attribute** tab, set the **Customer attribute group** field to the attribute group that you created to hold your customer price attributes.

Assign customer price attribute values to customers

Customer price attributes are initially assigned the default value set up for the attribute. If you need to assign a specific value for a customer, follow these steps:

1. Go to **Sales and marketing** > **Customers** > **All customers**.
2. Select a customer in the grid.
3. On the Action Pane, on the **Price** tab, select **Customer attributes**.
4. Select a customer attribute in the list pane, and then, on the **Value** FastTab, edit the attribute value for the customer as required.
5. Repeat the previous step until you assign all the attribute values that are required for the customer.

Set up and assign sales order price attributes

You can create Unified pricing management pricing rules that consider attribute values assigned to each sales order. For example, you might set up sales order price attributes for *Campaign event*, *Order type*, and *Order channel*. To set up sales order price attributes, first create an attribute group that includes the attributes that you need. Then set up that attribute group as the

sales order attribute group. You can have only one sales order attribute group, and it applies to all sales orders. However, each sales order can have different values for each attribute.

Set up sales order price attributes

Follow these steps to set up your sales order price attributes.

1. Go to **Product information management** > **Setup** > **Categories and attributes** > **Attributes**, and set up all the sales order price attributes that you need. For each attribute, make sure that the **Can be used as price attribute** option is set to *Yes*. (Learn more in the Set up product price attributes section of this article.) In the **Default value** field, assign a default value as required.
2. Go to **Product information management** > **Setup** > **Categories and attributes** > **Attribute groups**, and create a sales order price attributes group. Give it an appropriate name, such as *Order price attributes*, and add each relevant attribute on the **Attributes** FastTab.
3. Go to **Pricing management** > **Setup** > **Pricing management parameters**. On the **Price attribute** tab, set the **Sales order attribute group** field to the attribute group that you created to hold your sales order price attributes.

Assign sales order price attribute values to sales orders

Sales order price attributes are initially assigned the default value set up for the attribute. If you need to assign a specific value for an order, follow these steps:

1. Go to **Sales and marketing** > **Orders** > **All sales orders**.
2. Select an order in the grid, or create a new one.
3. On the Action Pane, on the **Price** tab, select **Sales order attributes**.
4. Select a sales order price attribute in the list pane. On the **Value** FastTab, edit the attribute value for the customer as required.
5. Repeat the previous step until you assign all the attribute values that are required for the order.

Last updated on 05/04/2026

Price attribute groups

Each *price attribute group* is a collection of price attributes. When you define a pricing rule, select a price attribute group and then specify values for each of the associated attributes. In this way, you define the match criteria used to select the sales orders and order lines that the rule applies to. This article explains how to configure price attribute groups for the Unified pricing management module.

Price attribute scopes

Price attribute groups have two scopes: *header* and *line*.

- **Header scope** – These attributes are on *sales order headers*. They describe the overall sales order. Examples include the sold-to customer and the invoice account.
- **Line scope** – These attributes are on *sales order lines*. They describe each individual order line. Examples include the product ID, the quantity, and delivery details.

When you build a pricing rule, you can combine one header price attribute group and one line price attribute group to set up your condition.

Expand table

Attribute group	Source	Source table	Price attributes
Header attribute group	Order (header)	Order table	The attributes provide out-of-box fields from the order header. You can extend them to add more fields.
Header attribute group	Order (header)	Order attributes - Attributes of the attribute group that are defined as the order attribute group in parameters	Configurable
Header attribute group	Customer	Customer master	The attributes provide out-of-box fields from customer masters. You can extend them to add more fields.
Header attribute group	Customer	Attributes of the customer attribute group that are defined as the customer attribute group in parameters	Configurable

Attribute group	Source	Source table	Price attributes
Line attribute group	Product	Product master - Released product master	The attributes provide out-of-box fields from product masters. You can extend them to add more fields.
Line attribute group	Product	Associated product attributes that are defined as price attributes and assigned to a product	Configurable
Line attribute group	Order (line)	Order line	The attributes provide out-of-box fields from the order line. You can extend them to add more fields.

Manage price attribute groups

To add, edit, or delete a price attribute group, follow these steps:

1. Go to **Pricing management** > **Setup** > **Price attribute groups** > **Price attribute groups**.
2. Follow one of these steps:
   - To create a new group, select **New** on the Action Pane.
   - To edit an existing group, select it in the list pane, and then select **Edit** on the Action Pane.
   - To delete an existing group, select it in the list pane, and then select **Delete** on the Action Pane.
3. On the header of the new or selected group, review the settings of the following fields, and edit them as required:
   - **Price attribute group** – If you're creating a new group, enter a unique name for the group. This field becomes read-only after you save the group.
   - **Validated** – This option indicates whether the group is validated. Only validated groups are active and can be used in pricing rules. You can't edit this option directly. When you create a new group or edit a previously validated group, this option is set to *No*. To validate a new or edited group, select **Validation** on the Action Pane to trigger a validation check. If the check passes, the system sets this option to *Yes*.
4. On the **General** FastTab, set the following fields:
   - **Friendly name** – Enter a descriptive or common name for the group. For new groups, the value initially matches the value that you entered in the **Price attribute group** field,

but you can change it.

- **Description** – Enter a short description of the group.
- **Help text** – Enter help text that describes the group.
- **Sales order matching scope** – If you're creating a new group, select the scope (*Header* or *Line*) where this group applies. This field becomes read-only after you save the group.

5. On the Action Pane, select **Save**.

6. On the **Attributes** FastTab, review the attributes that belong to the group, and edit them as required. Use the following toolbar buttons to work with the list:

   - **Add** – Open the **Add price attribute** dialog box, where you can add one or more attributes to the list. This dialog box shows attributes that match the selected scope and provides filtering controls to help you find the attributes that you're looking for. Select the checkbox for each attribute that you want to add, and then select **Update** to add those attributes to the group.

   - **Remove** – Remove a selected attribute from the list.

   - **Move up** and **Move down** – Move a selected attribute up or down in rank. For more information about how to use these buttons, see the next section.

> ⓘ **Note**
>
> You can define groups of products or customers, and then add attributes here that let you specify those groups by name in your pricing rules. For information about how to

create and use those groups, see Customer and product price attribute groups.

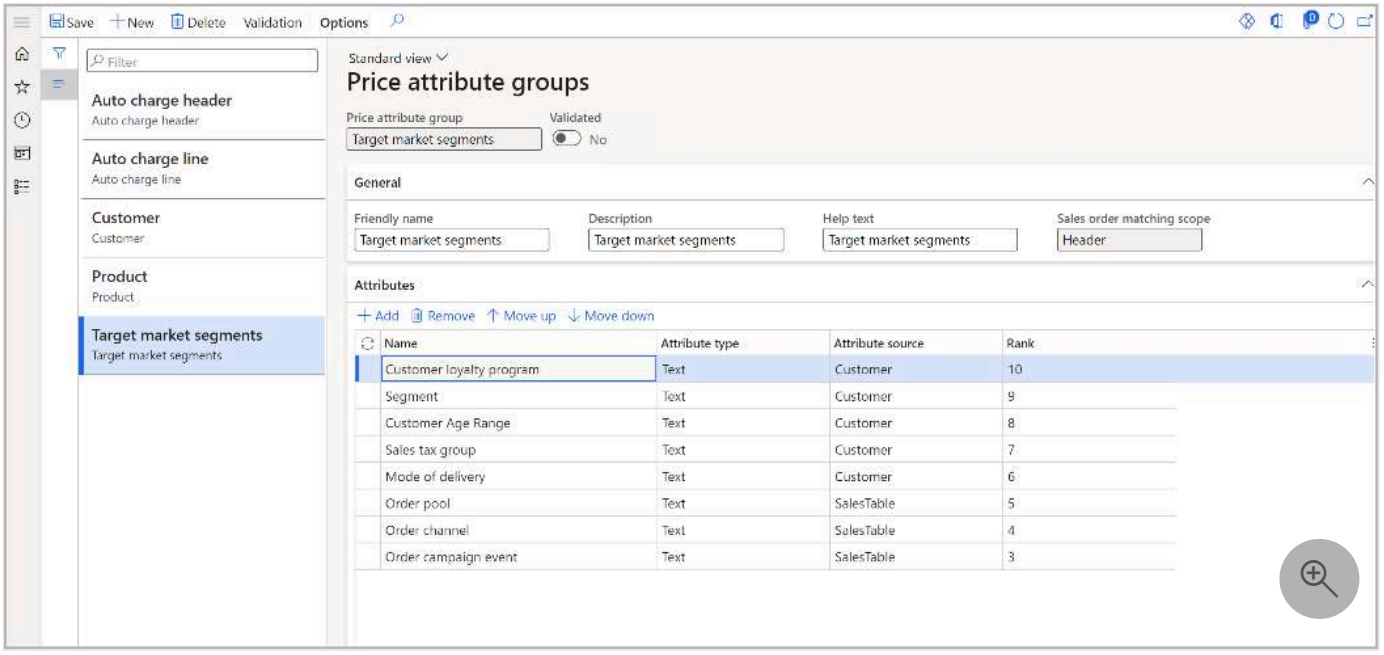
7. When you finish adding and arranging attributes, select **Validation** on the Action Pane to trigger a validation check. If the check passes, the system sets the **Validated** option to *Yes*. This setting indicates that the price attribute group is activated and can be used in pricing rules.

Price attribute ranks

A rank is assigned to each attribute in a price attribute group. The rank determines which rule applies if multiple pricing rules match for a given sales order. In this scenario, only the pricing rule that specifies a value for the highest-ranked attribute applies.

For example, a price attribute group includes the following two attributes:

- **Price attribute 1:**
  - **Name** = *Customer loyalty program*
  - **Rank** = *10*
- **Price attribute 2:**
  - **Name** = *Segment*
  - **Rank** = *9*



The following two pricing rules use this price attribute group:

- **Pricing rule 1:** If **Customer loyalty program** = *Platinum* and **Segment** = blank (any segment), **Price** = *$100*.

- **Pricing rule 2:** If **Customer loyalty program** = blank (any loyalty program) and **Segment** = *20*, **Price** = *$150*.

Provided that no other pricing rules apply, the price is $100, because that price is associated with a specific loyalty program, and the **Customer loyalty program** attribute has a higher rank than the **Segment** attribute.

Enable non-attribute based rebate management deals in Unified pricing management

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Use the Rebate management module to create contracts, deals, or agreements between a business and its customers or vendors, so that you can calculate rebates, deductions, and royalties. When you enable Unified pricing, you can determine rebates based on pricing attributes.

Starting in Microsoft Dynamics 365 Supply Chain version 10.0.48, the **Non-attribute based rebate management deals** feature can be included in Unified pricing management scenarios. When you enable this feature, the pricing evaluation process considers existing rebate agreements without requiring changes to their configuration.

This capability allows organizations to continue using existing rebate management deals while adopting Unified pricing. Customers can also create new non-attribute based rebate deals, facilitating the migration to Unified pricing for those customers who rely on the legacy behavior.

Prerequisites

To enable the features, follow these steps:

1. Go to the Feature management workspace.
2. Enable the **Unified pricing management** and **Enable non-attribute based rebate management deals for Unified pricing scenario** features.

> **Note**

There's a dependency between the listed features. You can't enable the **Enable non-attribute based rebate management deals for Unified pricing scenario** feature if the **Unified pricing management** feature is disabled. You can't disable the **Unified pricing management** feature if the **Enable non-attribute based rebate management deals for Unified pricing scenario** feature is enabled.

Enable non-attribute based rebate management deals

1. Go to **Rebate management** to see all pages related to rebate management deals. Two new pages manage non-attribute based rebate deals:

    - **Non-attribute based customer rebate deals**
    - **Non-attribute based customer royalty deals**

2. Go to the **All rebate management deals** page. On this page, you can view all rebate deals. The **Attribute-based rebate** column shows the status of each rebate deal. From this page, you can manage any existing rebate deals or create new rebate deals.

3. To create new rebate deals, in the **Type of rebate management deal** field, select attribute or non-attribute rebate deal types.

To view and manage attribute-based customer rebate deals or royalty deals, see the following pages:

- **Customer rebate deals**
- **Customer royalty deals**

To view and manage non-attribute based customer rebate deals or royalty deals, see the following pages:

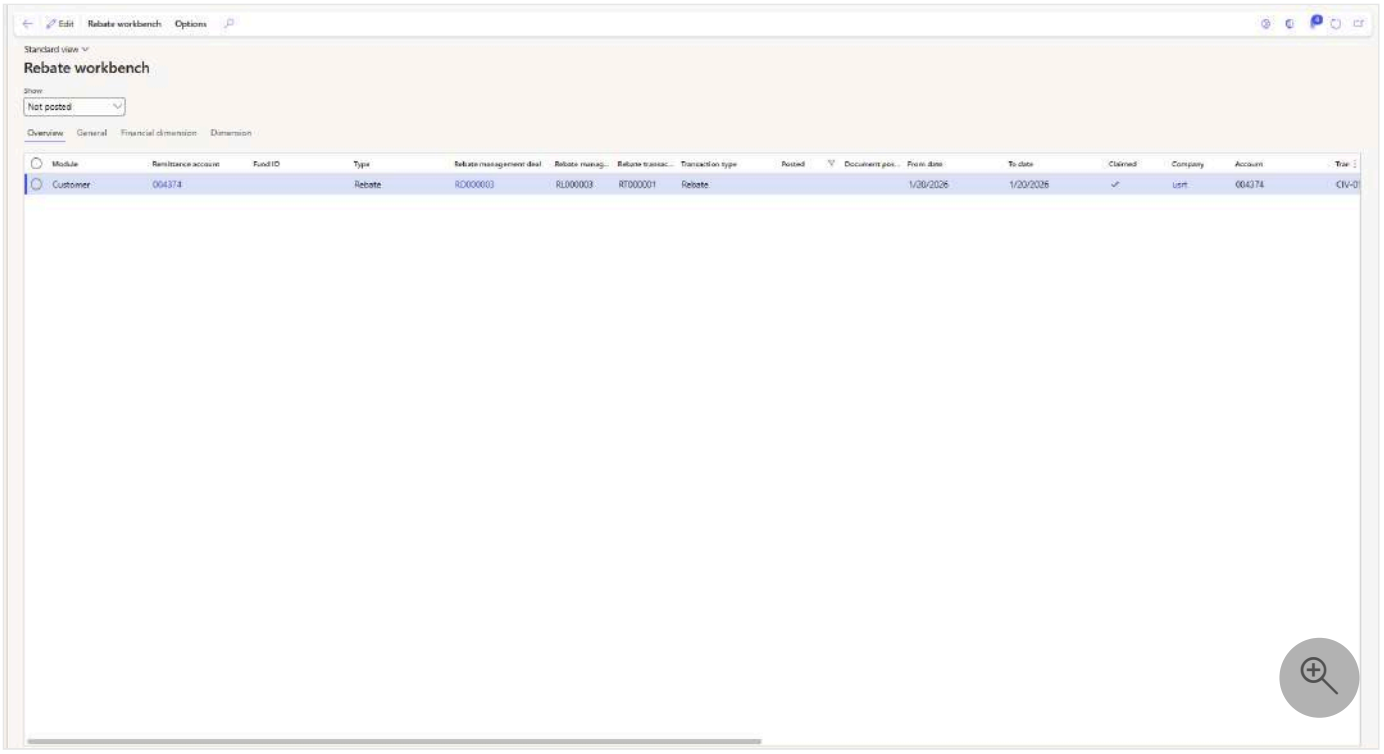
- **Non-attribute based customer rebate deals**
- **Non-attribute based customer royalty deals**

All vendor rebate deals are non-attribute based and be accessed using the **Vendor rebate deals** page.

To process, post, or cancel multiple rebate management deals, follow these steps:

1. Go to **Rebate management**.
2. Expand **Periodic tasks**. You can process, post, or cancel multiple rebate management deals by using the commands.

To view and manage all rebate management deals, see the **Rebate workbench** page.



Troubleshooting

To get more information about errors or unexpected behavior, contact Microsoft Support and open a support ticket.

Customer and product price attribute groups

Article • 03/13/2025

Customer price attribute groups and *product price attribute groups* let you create logic to define groups of customers and products, respectively. The membership of each group is based on the values of attributes that you assign to that group. These groups can make it easier to set up collections of customers and products that you can target in your pricing rules.

Usage examples

The following examples show how you can simplify your price attribute groups and pricing rules by setting up a customer price attribute group. Although these examples are focused on customer price attribute groups, product price attribute groups work in a similar way (but define groups of products instead of groups of prices).

The more often you have to use a given customer price attribute group in your price attribute groups and pricing rules, the more useful that group will be.

Customer segment for the examples

For these examples, you often target a customer segment that consists of American female wholesale and retail customers aged 20–45. The following table shows the attribute values that you can use to define this segment.

Expand table

Price attribute	Value
Gender	Woman
Customer group	30, 10
Customer age range	20-45
Country/region	USA

Example 1: Price attribute group that doesn't use a customer price attribute group

To set up price attribute groups that can target the preceding segment without using a customer price attribute group, you must ensure that each of your price attribute groups includes all four attributes. Each pricing rule that's designed to address that segment must specify all four values, plus any additional values.

Example 2: Price attribute group that uses a customer price attribute group

If you want to simplify the price attribute groups and pricing rules that you use to target the segment, you can create a customer price attribute group that has the name and attribute values that are shown in the following table.

Expand table

Customer attribute group	Attribute	Value	Rank
US-F-20-45-RE&WH	Gender	Girls, Women	4
	Customer group	10, 30	3
	Customer age range	20-45	2
	Country/region	USA	1

Each price attribute group can now include just the *Customer Price Attribute Group* attribute, plus whatever other attributes are required for each individual group. The related pricing rules can just specify that a price applies when **Customer Price Attribute Group** = *US-F-20-45-RE&WH*.

Manage customer and product price attribute groups

To add, edit, or delete a price attribute group, follow these steps.

1. Follow one of these steps, depending on the type of group that you want to create:

   - Go to **Pricing management** > **Setup** > **Price attribute groups** > **Customer price attribute groups**.
   - Go to **Pricing management** > **Setup** > **Price attribute groups** > **Product price attribute groups**.

2. Follow one of these steps:

- To create a new group, select **New** on the Action Pane.
- To edit an existing group, select it in the list pane, and then select **Edit** on the Action Pane.
- To delete an existing group, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected group, review the settings of the following fields, and edit them as required:

    - **Price attribute group** – If you're creating a new group, enter a unique name for the group. This field becomes read-only after you save the group.
    - **Validated** – This option indicates whether the group has been validated. Only validated groups are active and can be used in pricing rules. You can't edit this option directly. When you create a new group or edit a previously validated group, this option is set to *No*. To validate a new or edited group, you must select **Validation** on the Action Pane to trigger a validation check. If the check passes, the system sets this option to *Yes*.

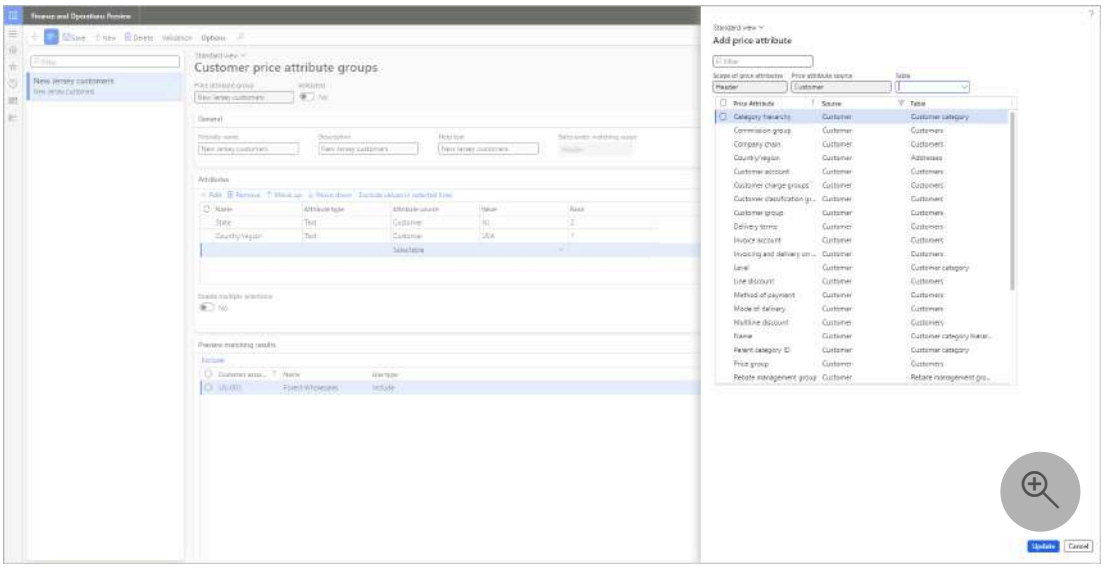
4. On the **General** FastTab, set the following fields:

    - **Friendly name** – Enter a descriptive or common name for the group. For new groups, the value initially matches the value that you entered in the **Price attribute group** field, but you can change it.
    - **Description** – Enter a short description of the group.
    - **Help text** – Enter help text that will be shown to describe the group.
    - **Sales order matching scope** – This read-only field indicates whether the group applies to the overall order header values or to individual order line values. If you're creating a customer price attribute group, the value is always *Header*. If you're creating a product price attribute group, the value is always *Line*. For more information about order matching scopes, see Price attribute groups.

5. On the Action Pane, select **Save**.

6. On the **Attributes** FastTab, review the attributes that belong to the group, and edit them as required. Use the following toolbar buttons to work with the list:

    - **Add** – Open the **Add price attribute** dialog box, where you can add one or more attributes to the list. This dialog box shows attributes that match the selected group type (product or customer) and provides filtering controls to help you find the attributes that you're looking for. Select the checkbox for each attribute that you want to add, and then select **Update** to add those attributes to the group.



- **Remove** – Remove a selected attribute from the list.
- **Move up** and **Move down** – Move a selected attribute up or down in rank.

7. For each row on the **Attributes** FastTab, enter or select one or more values in the **Value** column. All customers or products that match the specified attribute values will become a member of the current group. The following rules apply:

    - All rows are combined by using a logical AND operator. Therefore, only those companies or products that have matching values for *all* rows will be included in the group.
    - If you want to create one or more rows that include multiple values, set the **Enable multiple selections** option to *Yes*. You can then add a comma-separated list of values in the **Values** column for each row. These values are combined by using an OR operator. Therefore, the row will find products or customers that have *any* of the values in the list.
    - You can specify values to exclude by adding an exclamation mark (!) before the value. This exclamation mark is known as an exclusion prefix. For example, to find all companies that are located outside the United States, set the value of the **Country/region** attribute to *!USA*. You can automatically add the exclusion prefix to the values of any row by selecting the row and then selecting **Exclude values in selected lines** on the FastTab toolbar.

8. As you set up attributes and values on the **Attributes** FastTab, the **Preview matching results** FastTab is updated to show the resulting group members. Therefore, you can verify that your settings are giving you the result that you expect.

    - If the list includes any rows that you want to exclude, select the target rows, and select **Exclude** on the toolbar.
    - The **Line type** column indicates which rows you've selected to exclude.

- To re-include a previously excluded row, select it, and then select **Include** on the toolbar.
- If you're working with a product group, to view, exclude, and/or re-include specific item variants, select **All variants** on the toolbar. While you're viewing the variants, you can select **Product master** on the toolbar to go back to the standard item list.

9. When you've finished adding and arranging attributes, select **Validation** on the Action Pane to trigger a validation check. If the check passes, the system sets the **Validated** option to *Yes*. This setting indicates that the price attribute group is activated and can be used in pricing rules.

Use customer and product price attribute groups in price attribute groups

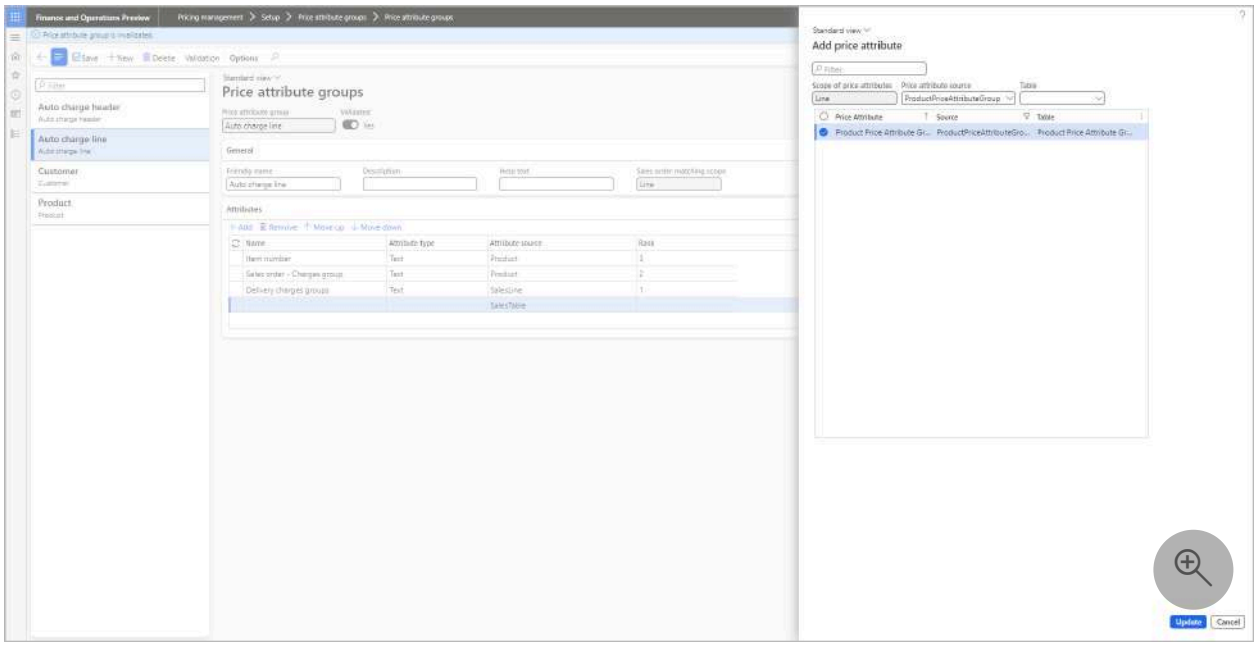
To use a customer or product price attribute group in a price attribute group, add the group as an attribute. You add these attributes just as you add other types of attributes.

Customer price attribute groups can be used only in price attribute groups where the **Sales order matching scope** field is set to *Header*. *Product* price attribute groups can be used only in price attribute groups where the **Sales order matching scope** field is set to *Line*.

You can use the **Price attribute source** filter in the **Add price attribute** dialog box to quickly find the value, as summarized in the following table.

Expand table

Price attribute group scope	Attribute name	Source	Table
Header	Customer Price Attribute Group	CustomerPriceAttributeGroup	Customer Price Attribute Group
Line	Product Price Attribute Group	ProductPriceAttributeGroup	Product Price Attribute Group



For more information about how to set up price attribute groups, see Price attribute groups.

Add custom pricing attributes for Dynamics 365 Commerce Point of Sale

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Unified pricing management lets you configure pricing rules that can also consider values of custom pricing attributes for products, customers, orders, and order lines. It provides the following two components that you can use to implement your own custom request handler and develop your logic: `GetCustomizedPricingPropertiesRequest` and `GetCustomizedPricingPropertiesResponse`.

Custom attributes are marked in the `GUPPRICINGATTRIBUTELINK` table using a specific identifier, which indicates that they require special logic in Commerce Scale Unit (CSU) to be supported in Dynamics 365 Commerce Point of Sale (POS). To mark a pricing attribute as custom, the `GUPPRICINGATTRIBUTELINK.TypeName` column must be set to `Customization`.

In CSU logic, if a custom pricing attribute is validated as `GUPPRICINGATTRIBUTELINK.TypeName = 'Customization'`, then the system calls the custom request handler.

Prerequisites

To use the features described in this article, you must be running version 10.0.46 or later of your Microsoft finance and operations apps.

First steps

Start by setting up your environment to implement custom pricing attributes, as described in the following procedure:

1. Implement a custom request handler to process custom pricing attributes. Learn more in Example custom request handler code.
2. Register the output library in the `CommerceRuntime.Ext.config` file. Here's an example of a custom request handler registration (if the output library were

`Contoso.Commerce.Runtime.Services`).

```xml
<add source="assembly" value="Contoso.Commerce.Runtime.Services" />
```

3. Build the solution and deploy it to your CSU.

Add custom pricing attributes

To implement custom pricing attributes for products, customers, orders, and order lines, follow these steps:

1. Create a class to represent each new custom pricing attribute. The class should extend `GUPAbstractPricingAttribute` and implement `GUPIPricingAttribute`. Some methods should also be overwritten, such as `getValueOfAttribute()`, `getName()`, and `getDataType()`. Describe this class with three system attributes:

   - [`GUPPricingMetadataDiscovery`] – Describe all pricing attributes.
   - [`GUPPricingAttributeSourceDiscovery(, )`] – Identify the attribute source this attribute applies to.
   - [`GUPPricingAttributeFieldsDiscovery(fieldStr(, ))`] – Identify the table and field this attribute is related to.

   You must add a new class for each custom pricing attribute you want to add.

   - Here's an example of code that creates a header-level custom pricing attribute (for `Customer` `GUPPricingAttributeSource`):

     ```x++
     /// <summary>
     /// PricingAttribute of table <c>CustTable</c> field StatisticsGroup.
     /// </summary>
     [GUPPricingMetadataDiscovery]
     [GUPPricingAttributeSourceDiscovery(GUPPricingAttributeSource::Customer,
     GUPPricingAttributeSourceLevel::Header)]
     [GUPPricingAttributeFieldsDiscovery(fieldStr(CustTable, StatisticsGroup))]
     internal class GUPPricingAttributeCustTableStatisticsGroup extends
     GUPPricingAttributeCustTable implements GUPIPricingAttribute
     {
         private Name typeName = 'Customization';

         public anytype getValueOfAttribute(Common _pricingObject)
         {
             return this.getTableRecord(_pricingObject).StatisticsGroup;
     ```

```
    }

    public str getName()
    {
        return this.getNameFromField();
    }

    public AttributeDataType getDataType()
    {
        return AttributeDataType::Text;
    }

    public Name getAttributeType()
    {
        return this.typeName;
    }

}
```

- Here's an example of code that creates a line-level custom pricing attribute (for `SalesLine` `GUPPricingAttributeSource`):

X++

```
/// <summary>
/// PricingAttribute of table <c>SalesLine</c> field LineNum.
/// </summary>
[GUPPricingMetadataDiscovery]
[GUPPricingAttributeSourceDiscovery(GUPPricingAttributeSource::SalesLine,
GUPPricingAttributeSourceLevel::Line)]
[GUPPricingAttributeFieldsDiscovery(fieldStr(SalesLine, LineNum))]
internal final class GUPPricingAttributeSalesLineLineNum extends
GUPPricingAttributeSalesLine implements GUPIPricingAttribute
{
    private Name typeName = 'Customization';

    public anytype getValueOfAttribute(Common _pricingObject)
    {
        return this.getTableRecord(_pricingObject).LineNum;
    }

    public str getName()
    {
        return this.getNameFromField();
    }

    public AttributeDataType getDataType()
    {
        return AttributeDataType::Integer;
    }

    public FieldId getField()
    {
```

```
        return fieldNum(SalesLine, LineNum);
    }

    public Name getAttributeType()
    {
        return this.typeName;
    }

}
```

2. For *new* custom pricing attributes, you must programmatically set the `TypeName` column of the `GUPPRICINGATTRIBUTELINK` table to `Customization`. Create an extension to `GUPPricingAttributeRepository` and add a statement to the `toPriceAttributeLink()` method that programmatically sets the `TypeName` column for each new custom pricing attribute. Here's an example of how to do this:

X++

```
[ExtensionOf(classStr(GUPPricingAttributeRepository))]
public static final class GUPPricingAttributeRepository_Extension
{
    public static GUPPricingAttributeLink
toPriceAttributeLink(GUPIPricingAttribute _pricingAttr)
    {
        GUPPricingAttributeLink link = next toPriceAttributeLink(_pricingAttr);

        if (link.AttributeName == "StatisticsGroup")
        {
            link.TypeName = (_pricingAttr as
GUPPricingAttributeCustTableStatisticsGroup).getAttributeType();
        }

        return link;
    }

}
```

3. Build the relevant models, Global Unified Pricing (GUP) or extension, and restart Internet Information Services (IIS). Then, clear the cache for your Microsoft finance and operations apps.

4. Open your Microsoft finance and operations app and go to **Pricing management** > **Setup** > **Price attribute groups** > **Price attribute groups**. Select the price attribute group that you want to customize and then use the **Attributes** FastTab to add your custom pricing attributes to it. Update each group as needed.

5. Go to **Retail and Commerce** > **Retail and Commerce IT** > **Distribution Schedule** and run the *1210 Pricing management* job to sync changes to the Channel database.

6. For *existing* custom pricing attributes, manually set the `TypeName` column of the `GUPPRICINGATTRIBUTELINK` table to `Customization` in SQL Server Management Studio (SSMS). Here's an example of how to set the `Customization` identifier:

```
SQL
update dbo.GUPPRICINGATTRIBUTELINK
set TYPENAME = 'Customization'
where ATTRIBUTENAME = 'Custom attribute name'
```

   The following image shows an example of how entries marked as custom are shown in the `GUPPRICINGATTRIBUTELINK` table.

	RECID	ATTRIBUTENAME	TYPENAME	PRIORITY
8	5637144583	Item number		2
9	5637145330	Delivery charges groups		1
10	5637145331	Mode of delivery		2
11	5637145332	Customer charge groups		3
12	5637145333	Customer account		4
13	5637145334	Delivery charges groups		1
14	5637145339	Sales order - Charges ...		2
15	5637145340	Item number		3
16	5637145341	Statistics group	Customization	7
17	5637145343	Line number	Customization	4

7. For `Customer` or `Product`, create a trade agreement journal that tests the new custom pricing attribute. For `SalesTable` or `SalesLine`, create an auto charge that tests the new custom pricing attribute. In both cases, make sure to set a specific value.

8. Go to **Retail and Commerce** > **Retail and Commerce IT** > **Distribution Schedule** and run the *9999 All jobs* job to sync changes to the Channel database.

9. In POS, you should see the value configured in the trade agreement journal or that an auto charge was correctly applied.

Troubleshooting

You receive a POS notification that a custom request handler isn't implemented

While creating a transaction in POS that is associated with one or more custom pricing attributes, you might receive an error message similar to the following message:

> The request GetCustomizedPricingPropertiesRequest is not implemented in customized code. Please contact your system administrator.

To address this issue, follow these steps:

1. Verify that a custom request handler is implemented and included in the build.
2. Ensure that the custom request handler is correctly registered in the `CommerceRuntime.Ext.config` file. Keep in mind that this registration can be overwritten during the build process, so it's important for you to confirm the registration after the build completes.

You receive a POS notification that custom pricing attributes are detected among out-of-box attributes

While creating a transaction in POS that is associated with one or more custom pricing attributes, you might receive one of the following error messages:

> A custom product pricing attribute has been detected. Please contact your system administrator to verify the setup of custom attributes.

Or:

> A custom customer pricing attribute has been detected. Please contact your system administrator to verify the setup of custom attributes.

To address this issue, follow these steps:

1. Verify that the CSU flight `UPSupportCustomPricingAttributesFlight` is enabled.

2. Confirm that the new custom pricing attributes are identified as custom. The `GUPPRICINGATTRIBUTELINK.TypeName` column should be set to `Customization` for all custom pricing attributes.

Further troubleshooting

To find more information about errors or exceptions, or to review CSU and POS logs, contact Microsoft Support and open a support ticket.

Example custom request handler code

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides sample code for the `GetCustomizedPricingPropertiesRequestHandler` class, which is used to implement custom pricing attributes. This handler enables you to retrieve and process custom pricing properties for products, customers, orders, and order lines.

The code demonstrates how to extend the pricing framework by defining custom attributes and linking them to specific fields in the database. It also shows how to process requests programmatically to fetch and merge these attributes into the pricing logic. For more details about adding custom pricing attributes, see Add custom pricing attributes for Dynamics 365 Commerce Point of Sale.

Price groups overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

A *price group* is a flexible tool that enables businesses to manage and adjust their pricing strategies across a wide range of attributes. These attributes include sales channels, customer groups, order types, and delivery methods. The power of a price group lies in its ability to logically bundle these attributes together. Businesses can consistently apply pricing rules and promotions across multiple entities without having to modify individual trade agreements, discount setups, or pricing components. This flexibility is valuable in both Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management, where pricing must adapt quickly to changing business conditions but also maintain consistency across various settings.

In Commerce, price groups offer a crucial level of flexibility for businesses that must run promotions or adjust pricing for specific customer segments or sales channels. For example, a retail company wants to launch a promotion that targets specific stores or e-commerce channels. By creating a price group, the retailer can easily apply the promotion across those stores and channels. In addition, the company can add stores to the promotion, or remove stores from it, without changing the underlying trade agreements or discount configurations. This ease of adjustment ensures that the company can quickly react to market trends or customer behavior, and that it can maintain the efficiency of its pricing strategy without having to do complex reconfiguration.

In Supply Chain Management, price groups can be just as valuable. For example, a company offers different pricing based on *order types*. Priority orders have a higher price, because delivery is expedited. Standard orders receive discounts for longer delivery times. By grouping these order types into a price group, the company can adjust pricing for the different categories without having to rework the underlying agreements or discount structures. If the company later decides to introduce a new order type or retire an existing one, it can add the new order type to the price group, or remove the existing order type from it. Therefore, the management of pricing strategies is streamlined.

Because of the flexibility that price groups provide, companies can make quick, broad changes across a set of trade agreements or discounts without disrupting the underlying setup. This capability is especially beneficial for companies that use Commerce, because they are already accustomed to using price groups to efficiently manage promotions and customer-specific pricing.

Price groups in Microsoft finance and operations apps

Price groups classify products or services based on their price level. They give companies a flexible way to manage and adjust pricing strategies. Retailers, wholesalers, and manufacturers can segment their target markets and define different prices for different customers.

Price groups are used to calculate prices in Supply Chain Management and Commerce, and attribute-based pricing management.

The following table shows how price groups fit into the various modules and feature areas in Supply Chain Management and Commerce.

Expand table

Feature area	Association type	Context type	Description
Sales and marketing module pricing	Customer or product	• Trade agreement	Price groups that are associated with customers and products can be selected as group criteria during the maintenance of trade agreement lines.
Commerce pricing	Channel, affiliation, loyalty program, or catalog	• Trade agreement • Adjustment • Discounts	Price groups can be associated with channels, affiliations, loyalty programs, and catalogs in trade agreements, adjustments, and discounts.
Pricing management (deprecated) pricing	As an attribute	• Trade agreement • Adjustment • Discounts	Price groups can be used as an attribute in trade agreements, adjustments, and discounts.
Unified pricing management pricing	As an attribute or with attribute assignment	• Trade agreement • Adjustment • Discounts	Price groups can be used as an attribute in trade agreements, adjustments, and discounts.

You can associate price groups with attributes from customers, sales order headers, and other entities, including channels, loyalty programs, and affiliations.

Price groups are optional in Unified pricing management.

Price groups in Unified pricing management

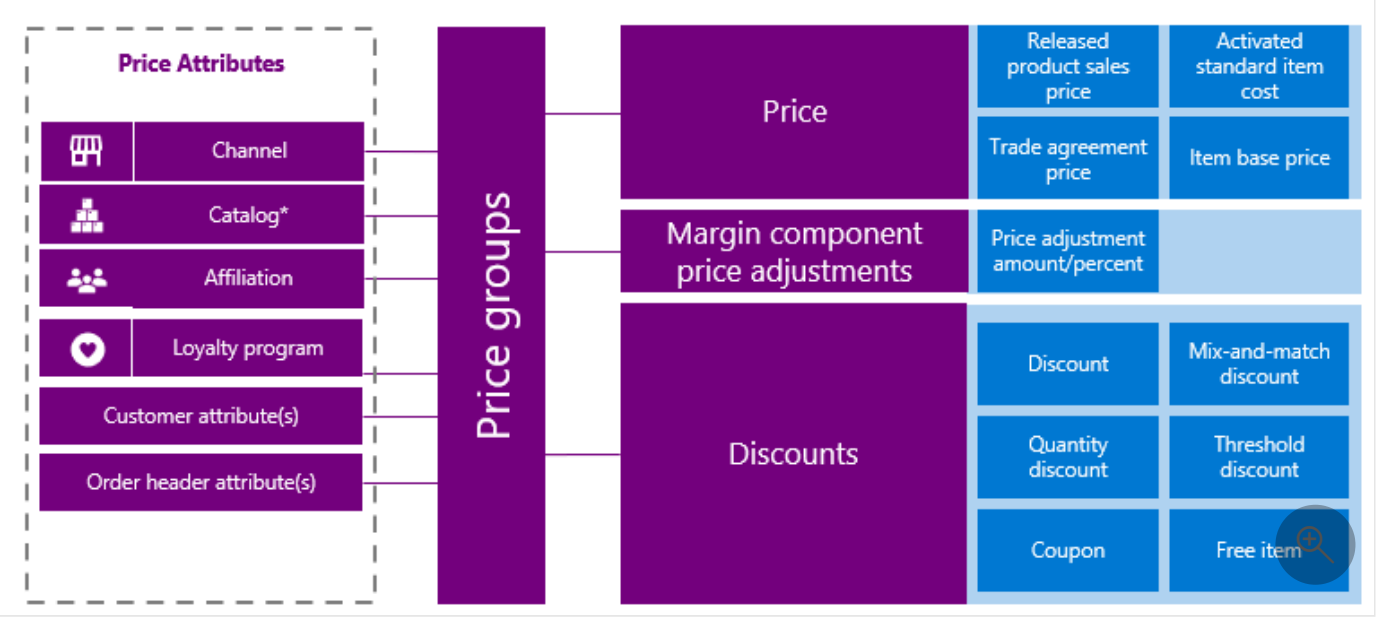
In the **Unified pricing management** module, price groups can be used to implement price discrimination strategies. For example, different prices can be charged for the same product, depending on the time of purchase, the location of the customer, or the demand conditions.

> **Note**
>
> Price groups are typically used in Commerce because they suit the way that Commerce users are accustomed to working. However, they're completely optional. Depending on the pricing scenarios that you want to implement, you might decide not to use price groups, especially if you use only Supply Chain Management.

Price groups can be defined in the following ways:

- Price groups can be used to define strategies that are associated with attributes.
- Only price groups that have no attributes associated with them can be used as attributes in header attribute groups.

The following illustration shows how price groups relate price attributes to prices, margin adjustments, and discounts. The price group is centrally positioned in pricing and discount management. The left side of the illustration shows the attributes and commerce entities that are used to manage differential prices (channels, affiliations, and loyalty programs) and discounts. The right side shows the areas where price groups can be configured in price and discount records.



In Unified pricing management, price groups provide the following functionality:

- Create logical groups of multiple pricing rules.
- Define shared context for price segmentation.
- Assign prices and discounts to Commerce entities (including channels, affiliations, and loyalty programs), and attributes from customers and sales order headers.
- Establish priorities. After price groups are configured with attribute association, ranks that are assigned to the price groups take priority over ranks that are assigned in other places.

> ⓘ Note
>
> You can't currently use price groups with Commerce catalogs.

Benefits of price groups

Price groups offer the following benefits:

- **Flexibility** – Price groups provide a flexible way to manage pricing strategies across various attributes, such as customer segments, channels, order types, and more. Therefore, businesses can quickly adapt without having to modify individual trade agreements or discount setups. Currently, only pricing header attributes are supported. However, we plan to extend support to pricing line attributes.
- **Unified nature** – Price groups offer significant value for Commerce customers. They enable efficient management of dynamic promotions, channel-specific pricing strategies, affiliations programs, and loyalty programs. In Supply Chain Management, price groups bring similar benefits by simplifying pricing strategies for key attributes, such as customer

segments, order types, and delivery methods. Therefore, they provide the flexibility to make adjustments without having to reconfigure underlying pricing structures.

- **Versatility** – Price attribute groups are linked to specific price components, and their configuration isn't easily changed after they're enabled. By contrast, price groups provide a versatile and flexible way to dynamically adjust prices on top of the established setup. Additionally, price groups aren't mandatory. Therefore, businesses can decide whether to use them, based on their specific needs and complexity.
- **Capability to make dynamic adjustments** – As business needs evolve, pricing attributes can be modified to reflect changes in strategy. For example, new channels can be introduced, or loyalty programs can be expanded. Unified pricing management simplifies the implementation of these changes without disrupting the overall pricing strategies.
- **Consistency across platforms** – The unified approach ensures that pricing strategies are consistently applied across all touch points in both Supply Chain Management and Commerce.

Examples of price group use

The following subsections provide examples that show how price groups can be used in various business-to-business (B2B) and business-to-consumer (B2C) scenarios.

Example 1: Channels

A wholesaler, retailer, or distributor wants to offer different prices for a product, depending on whether it's sold online, in a physical store, or through a mobile app. Therefore, it defines the following price groups by using the *Channels* attribute:

- Online store pricing
- Physical store pricing
- Mobile app pricing

The product is priced at £100 online, £105 in physical stores, and £98 through the mobile app. These prices are created as trade agreements and linked to channels via the price group association. The final step is to attach the relevant price groups to the appropriate stores to ensure that the correct pricing is applied across all sales channels.

Example 2: Affiliations

A company offers a special discount to all its employees. Therefore, it creates a price group that is named *Employee benefits* by using the *Affiliation* attribute. Employees receive a 15% discount on

all products. This discount is automatically applied at checkout when the system recognizes an employee's affiliation.

Example 3: Loyalty programs

The Fabrikam company wants to reward members of the *Fabrikam rewards* loyalty program by offering exclusive pricing. Therefore, it sets up a price group that is named *Fabrikam rewards pricing*. Members of this loyalty program receive a 10% discount on selected products, and this pricing is linked directly to their loyalty program membership.

Example 4: Customer

A company wants to configure a specific range of customers for some discounts. Therefore, it sets up price groups that are named *US customers*, *European customers*, and *Asian customers*. The company can then assign different discounts, based on geographic region.

Next steps

- Set up price groups for Unified pricing management
- Assign price groups
- Price group priorities

Last updated on 05/18/2026

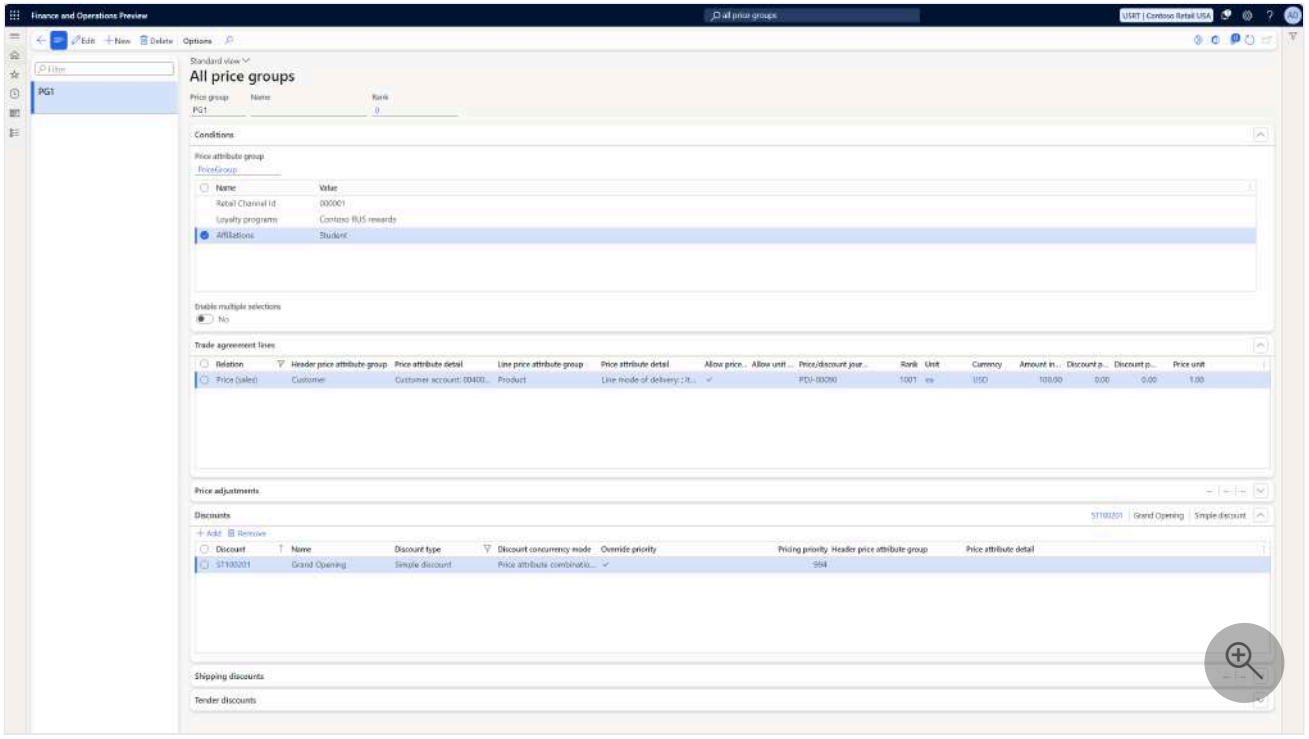
Set up price groups for Unified pricing management

To create and manage price groups that you can associate with attributes, follow these steps:

1. Go to **Pricing management** > **During-sales pricing** > **Price groups** > **All price groups**.

2. Follow one of these steps:

    - To create a new price group, select **New** on the Action Pane.
    - To view an existing price group, select it in the list pane. Then, if you want to edit the price group, select **Edit** on the Action Pane.
    - To delete an existing price group, select it in the list pane, and then select **Delete** on the Action Pane.



3. On the header of the new record, set the following fields:

    - **Price group** – Enter a unique identifier for the price group. You can edit this field only when you create a new record.
    - **Name** – Enter a descriptive name for the price group.
    - **Rank** – Select a rank for the price group. In situations where multiple price groups apply, the system uses the price group that has the highest priority. The larger the value is, the higher the priority.

4. On the **Conditions** FastTab, set the following fields to define membership rules that control which market segments are part of the price group:

    - Set the **Price attribute group** field to the price attribute group that you want to use with the price group. The grid is then updated to show the attributes that belong to the selected price attribute group.
    - For each attribute in the grid, select an appropriate value in the **Value** field.
    - Set the **Enable multiple selections** option to *Yes* to allow multiple values for each row. If you define more than one value for a row, separate the values with commas. The system combines the values by using an *OR* operator.

5. To view the list of trade agreement lines that the current price group was assigned to, select the **Trade agreement lines** FastTab.

6. To view and edit the price adjustments that apply to the current price group, select the **Price adjustments** FastTab. Then use the buttons on the toolbar to add or remove price adjustments as you require.

7. To view and edit the discounts that apply to the current price group, select the **Discounts** FastTab. Then use the buttons on the toolbar to add or remove discounts as you require.

> **Note**
>
> In the current version, the **Shipping discounts** and **Tender discounts** FastTabs on the **All price groups** page have no effect.

Last updated on 07/01/2026

Assign price groups

Assign price groups to trade agreements

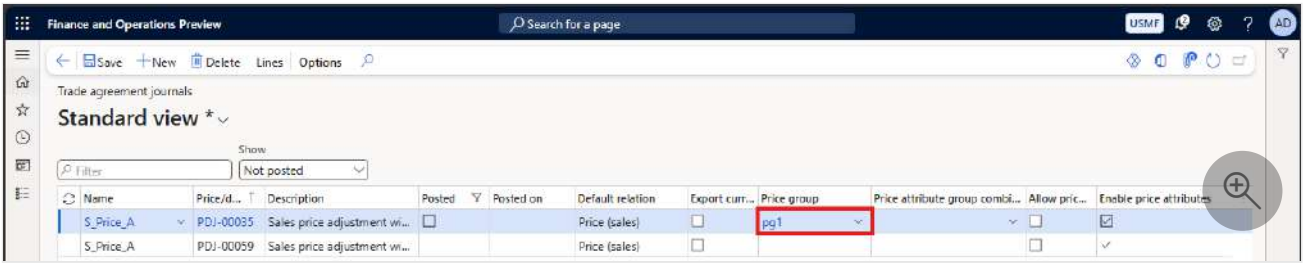
To assign a price group to a trade agreement, follow these steps:

1. Go to **Pricing management** > **During-sales pricing** > **Sales trade agreement price** > **Trade agreements journals**.

2. You can assign price groups only to journals that haven't yet been posted. Therefore, set the **Show** filter to *Not posted*.

3. Find and select the trade agreement journal that you want to assign a price group to.

4. In the **Price group** column, specify the price group that should be inherited by all lines that are added to the journal.



5. On the Action Pane, select **Lines**.

6. The **Journal lines, trade agreement** page shows the lines that belong to the selected journal. You can perform the following actions as required:

    - To add a line, select **New** on the Action Pane. Each new line inherits the price group that you assigned to the journal in step 4.
    - Edit the price group for each line.

Assign price groups to price adjustments or discounts

To assign price groups to a price adjustment or discount, follow these steps:

1. Follow one of these steps:

    - To work with a price adjustment, go to **Pricing management** > **During-sales pricing** > **Price adjustments** > **Margin component price adjustments**.

- To work with a discount, go to **Pricing management** > **During-sales pricing** > **Discounts** > **All discounts**.

2. In the list pane, select the price adjustment or discount that you want to assign a price group to. The price adjustment or discount that you select must have a status of *Disabled*. (You can view the status on the **General** FastTab.)

3. On the Action Pane, select **Price groups**.

4. On the **Price groups** page, on the Action Pane, select **New** to add a price group.

5. On the header of the new record, in the **Price group** field, specify a name for the price group.

6. On the Action Pane, select **Save**. The following fields on the page are updated:

   - **Pricing priority** – The value is updated to the **Rank** value of the selected price group.
   - **Price attribute group** – The value is updated to the **Price attribute group** value of the selected price group. The grid under this field is updated to show the conditions for the selected price group.

7. On the Action Pane, select the **Back** button to return to the price adjustment or discount. On the **General** FastTab, you can view the pricing priority that applies to that adjustment or discount. By default, the highest priority among the price groups that you assigned is shown. However, you can override the value by setting the **Override priority** option to *Yes*.

8. Repeat this procedure to add more price groups as required.

Last updated on 12/30/2025

Price group priorities

In situations where more than one price calculation can apply, the system evaluates the priority of each group to determine which one should apply. This article explains how the priority is evaluated.

Priority configuration

You can assign ranks for pricing calculations in several places. Records that you assign a higher rank to have a higher priority when the system searches for a calculation.

The following table lists the pages where you can assign ranks. It also shows how the ranks that are assigned on each page are used to calculate priorities.

Expand table

Element	Page	Field name	Calculated priority
Price attribute	Price attribute groups (**Pricing management** > **Setup** > **Price attribute groups** > **Price attribute groups**)	Rank	Same value (No conversion is done.)
Price group	All price groups (**Pricing management** > **During-sales pricing** > **Price groups** > **All price groups**)	Rank	1,000 + *Rank*
Price attribute group combination	Price component codes (**Pricing management** > **Setup** > **Price component codes** > **Price component codes**)	Combination rank	Same value (No conversion is done.)
Price component code	Price trees (**Pricing management** > **Setup** > **Price component codes** > **Price trees**)	Pricing sequence	1,000 – *Sequence*

Priority application sequence

When the system calculates prices, it checks for priorities for trade agreements, adjustments, and discounts in a specific sequence. The following table outlines the sequence that the system uses to check pricing rules during price calculations. Each sequence is numbered from 1 through 4. These numbers indicate the order of checks.

Expand table

Pricing rule	Check sequence	Field name	Visible in the pricing rule	Configured from
Trade agreement	1	Rank	No	Price group
	2	Pricing sequence	No	Price tree
	3	Combination rank	Yes	Price component code
	4	Attribute rank	No	Price attribute group
Adjustment	1	Rank	Yes	Price group
	2	Pricing sequence	Yes	Price tree
	3	Combination rank	Yes	Price component code
	4	Attribute rank	No	Price attribute group
Discount	1	Rank	Yes	Price group
	2	Pricing sequence	Yes	Price tree
	3	Combination rank	Yes	Price component code
	4	Attribute rank	No	Price attribute group

Review calculated priorities

After a calculation, the calculated priorities are shown on sales order lines for the applied pricing rules. To review the calculated priority values, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Find and open the sales order that you want to check.
3. On the **Sales order lines** FastTab, select the line that you want to check.
4. On the toolbar of the **Sales order lines** FastTab, select **Sales order line** > **View** > **Price details**.

   On the **Price details** page, each grid (**Base price**, **Margin component**, and **Discount lines**) includes a **Calculated pricing priority** column. This column shows the calculated priority of

each line in the grid.

The goal of making pricing decisions is to increase profitability. Good decision making requires a thorough understanding of the different elements that determine the price. By providing a list of pricing building blocks, Unified pricing management helps you create a price structure for pricing at the macro level. The price component code is the basic unit of the price structure. Set up your price structure by creating one or more price trees in Unified pricing management.

Expand table

Name	Description

Price components	*Price components* are the main price elements of the price structure. Here are some examples:
	• Price:
	  ◦ Base price
	  ◦ Sales trade agreement price
	  ◦ Margin component
	• Discounts
	• Rebate management
	• Auto charges

Price component codes	*Price component codes* are defined and structured based on the function and business use of your pricing elements. • Price component codes can be built according to the price sequence. • Price component codes can define default values for posting and the discount concurrency mode. • Each pricing and discount record is assigned to a specific price component code.
Price component groups	Price component codes can be grouped into *price component groups*.

Name	Description
Price attribute groups	Each *price attribute group* contains several price attributes. Each price component code can have one *header price attribute group* and one *line price attribute group*. Use these groups to define pricing rules based on attribute values that are defined in *pricing component codes*.
Combination rank	The *combination rank* for a price attribute group lets you define what occurs if multiple rules from the same price component code apply to a given order. If the concurrency mode is based on the *price attribute combination rank*, the rule that has highest rank applies.

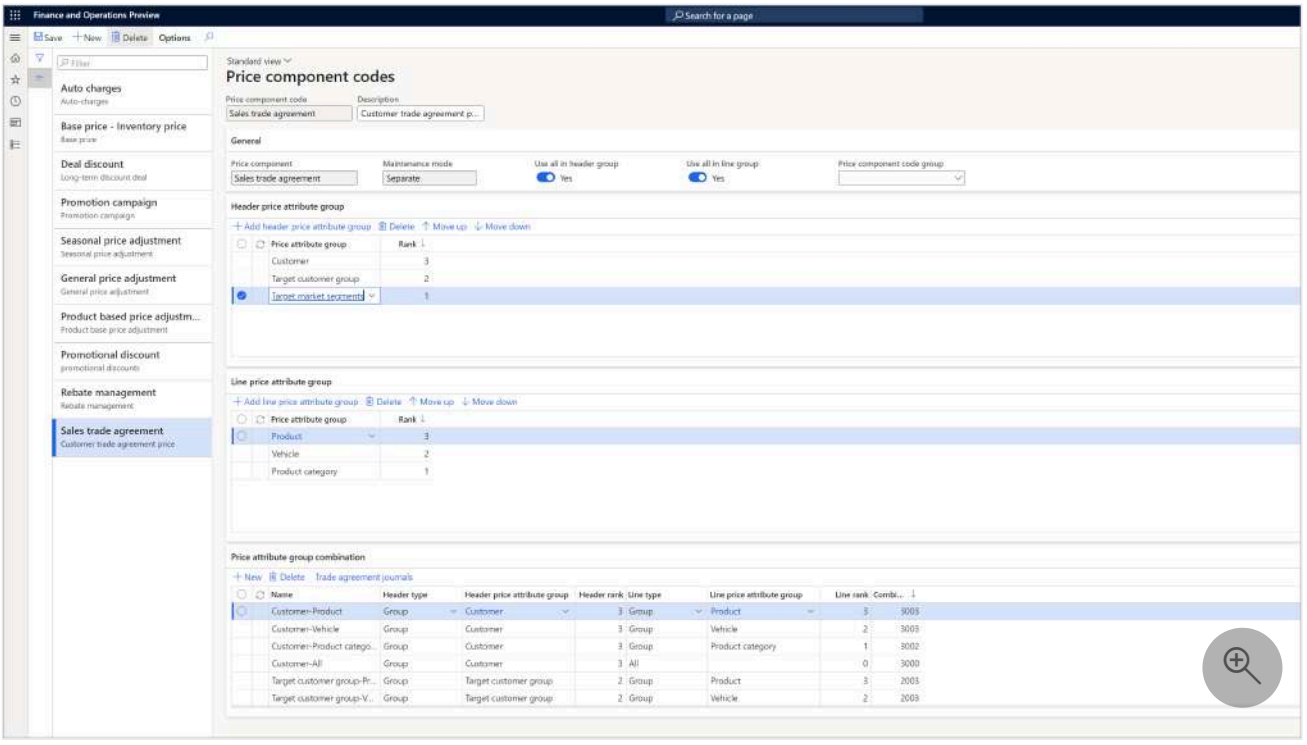
> **Note**
>
> You can have a maximum of one price component code record for each of the following price components:
>
> - Base price - inventory price
> - Base price - purchase price
> - Base price - sales price
> - Sales trade agreement
>
> You can have any number of price component code records for each of the remaining price components.

Within each price component code, you can define multiple pricing rule records that have different combinations of price attribute groups.

Set up price component codes

Follow these steps to set up your price component codes.

1. Go to **Pricing management** > **Setup** > **Price component codes** > **Price component codes**.



2. Follow one of these steps:

   - To create a new price component code, select **New** on the Action Pane.
   - To edit an existing price component code, select it in the list pane, and then select **Edit** on the Action Pane.
   - To delete an existing price component code, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected price component code, set the following fields:

   - **Price component code** – Enter a name for the code. You can edit this field only for new records. (It becomes read-only when you save the record.)
   - **Description** – Enter more details that are related to the price component code that you're creating.

4. On the **General** FastTab, set the following fields:

   - **Price component** – Select the type of price component that you're creating. You can edit this field only for new records. (It becomes read-only when you save the record.) For more information about price component types, see Price structure overview.

   - **Maintenance mode** – Select one of the following values to specify how you'll create or generate the different combinations of price attribute groups that the price component code supports when you create pricing rules for it. You can edit this field only for new records. (It becomes read-only when you save the record.)

    - *Separate* – You can assign a rank to each individual header and line attribute group. The system then automatically generates each possible combination of header and line attribute groups, and assigns a combined rank to each combination, based on your individual rankings.
    - *Combined* – You can define each relevant combination of header and line attributes, and manually assign a combination rank to each of them.

- **Use all in header group** – Set this option to *Yes* if you have the combination where header attributes have a value of *All*, so that you can create pricing rules that apply to all customers.

- **Use all in line group** – Set this option to *Yes* if you have the combination where line attributes have a value of *All*, so that you can create pricing rules that apply to all products.

- **Default auto charge concurrency mode** – Select the default concurrency rule to use for auto charges that are associated with the price component code. For information about how this type of concurrency works and the effects of each value, see Resolve concurrency within price component codes. This field is available only when the **Price component** field is set to *Auto charges*.

- **Default discount concurrency mode** – Select the default concurrency rule to use for discount pricing rules that are associated with the price component code. For information about how this type of concurrency works and the effects of each value, see Resolve concurrency within price component codes. This setting is available only when the **Price component** field is set to *Margin component* or *Discount*.

- **Price component code group** – Select a price component code group. Set up and maintain your component code groups on the **Price component groups** page (**Pricing management** > **Setup** > **Price component codes** > **Price component groups**).

5. If you set the **Maintenance mode** field to *Separate*, on the **Header price attribute group** FastTab, add each header attribute group that you want to use with the price component code. Use the buttons on the toolbar to add, remove, and rearrange header price attribute groups as required.

6. If you set the **Maintenance mode** field to *Separate*, on the **Line price attribute group** FastTab, add each line attribute group that you want to use with the price component code. Use the buttons on the toolbar to add, remove, and rearrange line price attribute groups as required.

7. If you set the **Maintenance mode** field to *Combined*, use these guidelines to set up the **Price attribute group combination** FastTab:

    - Use the buttons on the toolbar to add and remove price attribute groups as required.

    - For each attribute group, set the following fields:
        - **Name** – Enter a descriptive name for the line.
        - **Header type** – Select the type of criteria that should be available for specifying header attributes in pricing rules that use the price attribute group combination. Select *All* to create rules that apply to all customers. Select *Group* to select a group of price attributes that the pricing rules can specify values for to identify specific customers.
        - **Header price attribute group** – If you set the **Header type** field to *Group*, specify the attribute group that the price attribute group combination provides so that header attributes can be specified in pricing rules.
        - **Line type** – Select the type of criteria that should be available for specifying line attributes in pricing rules that use the price attribute group combination. Select *All* to create rules that apply to all products. Select *Group* to select a group of price attributes that the pricing rules can specify values for to identify specific products.
        - **Line price attribute group** – If you set the **Line type** field to *Group*, specify the attribute group that the price attribute group combination provides so that line attributes can be specified in pricing rules.
        - **Combination rank** – Assign a rank to the price attribute group combination. The rank is used to resolve concurrency if more than one pricing rule applies to the price component code. Learn more in the Price attribute combination rank section of this article.

    - For price component codes where **Price component** is *Sales trade agreement*, the toolbar on the **Price attribute group combination** FastTab includes a **Trade agreement journals** button. Select a row, and then select this button to create a new trade agreement journal for the selected row. The selected row is the default **Price attribute group combination** field in the trade agreement journal. Learn more in Sales trade agreement prices.

8. If you set the **Maintenance mode** field to *Separate*, use these guidelines to set up the **Price attribute group combination** FastTab:

    - The system automatically generates a row for each possible combination of header attributes (as listed on the **Header price attribute group** FastTab, plus *All* if the **Use all**

in header group option is enabled) and line attributes (as listed on the **Line price attribute group** FastTab, plus *All* if the **Use all in line group** option is enabled).

- The system automatically assigns a **Combination rank** value to each row, based on the **Rank** setting of individual header and line attribute groups.
- Use the buttons on the toolbar to add and remove price attribute groups as required.
- For each attribute group, set the following fields:
  - **Name** – For automatically generated rows, a name is generated to indicate the header and line attribute that were combined to create the row.
  - **Header type** – Select the type of criteria that should be available for specifying header attributes in pricing rules that use the price attribute group combination. Select *All* to create rules that apply to all customers. Select *Group* to select a group of price attributes that the pricing rules can specify values for to identify specific customers.
  - **Header price attribute group** – If you set the **Header type** field to *Group*, specify the attribute group that the price attribute group combination provides so that header attributes can be specified in pricing rules.
  - **Line type** – Select the type of criteria that should be available for specifying line attributes in pricing rules that use the price attribute group combination. Select *All* to create rules that apply to all products. Select *Group* to select a group of price attributes that your pricing rules can specify values for to identify specific products.
  - **Line price attribute group** – If you set the **Line type** field to *Group*, specify the attribute group that the price attribute group combination provides so that line attribute can be specified in pricing rules.
  - **Combination rank** – Assign a rank to the price attribute group combination. The rank resolves concurrency if more than one pricing rule applies to the price component code. For more information, see the Price attribute combination rank section.
- For price component codes where the **Price component** field is set to *Sales trade agreement*, the toolbar on the **Price attribute group combination** FastTab includes a **Trade agreement journals** button. Select a row, and then select this button to create a new trade agreement journal for the selected row. The selected row is the default **Price attribute group combination** field in the trade agreement journal. For more information, see Sales trade agreement prices.

9. On the Action Pane, select **Save**.

Price attribute combination rank

Rankings enable the system to determine which pricing rule to use if an order qualifies for more than one rule. In general, specific pricing rules (that is, rules that apply to a specific customer account and product number) take priority over more general rules (that is, rules that apply to a group of customers and/or a group of products). However, if two equally general rules apply (for example, a rule that targets a specific customer group and a rule that targets a specific region), it can be difficult to determine which rule should have priority. Therefore, Unified pricing management lets you specify a rank for each attribute group and each attribute group combination.

The price engine considers the **Combination rank** value if both of the following conditions are met:

- Multiple pricing rules in the same price component code apply to the same order line.
- For all the qualifying rules, the **Concurrency mode** field is set to *Price attribute combination rank*.

In this situation, the rule that matches the row with the highest **Combination rank** value applies.

For example, you have a price component code where the **Price component** field is set to *Trade agreement* and the **Maintenance mode** field is set to *Separate*. The price component code uses the attribute group settings that are shown in the following table.

Expand table

Price attribute group	Group scope	Rank
Target customer group	Header	2
Target market segment	Header	1
Product group	Line	2
Product category	Line	1

The following table shows the attribute group combinations and combination ranks that the system automatically generates based on these settings.

Expand table

Combination	Combination rank
Target customer group-Product group	2002 (highest rank)
Target customer group-Product category	2001
Target market segment-Product group	1002
Target market segment-Product category	1001

The system includes two sales trade agreements that can apply to the same sales order line, as shown in the following table.

Expand table

Rule no.	Concurrency mode	Criteria with price attributes	Price	Combination Rank
RD001	Price attribute combination rank	**Customer group** = *20* **Product group** = *Standard*	$20	2002
RD002	Price attribute combination rank	**Target market group** = *Online* **Product category** = *Electronic*	$30	1001

In this case, the pricing engine selects rule *RD001*, because that rule has the highest combination rank. Therefore, the price is $20.

Price component posting

Article • 10/28/2024

Unified pricing management lets you set up a different sales order posting ledger for each of the following types of price component codes:

- Base price
- Sales trade agreement price
- Margin component price adjustment
- Discounts

This capability enables the system to keep ledger accounts that distinguish the many layers of your pricing composition at the price component level.

For more information about how to set up your price structures, including how to assign posting profiles for each relevant price component code in a structure, see Arrange price component codes into a price structure.

Set up price component posting

Follow these steps to prepare your system to support price component posting.

1. Go to **Pricing management** > **Setup** > **Pricing management parameters**.

2. On the **Posting** tab, on the **Sales base price** FastTab, set the following fields:

    - **Post sales base price** – Set this option to *Yes* to enable *base prices* and *sales agreement prices* to be posted to a specific ledger. When you post a sales invoice, the system will use the ledger account that's specified by the posting profile that's assigned to each price component code line.
    - **Sales base price account** – Specify a fallback ledger account to use for sales base prices. This account will be used as required for price component code lines where no posting profile is specified.

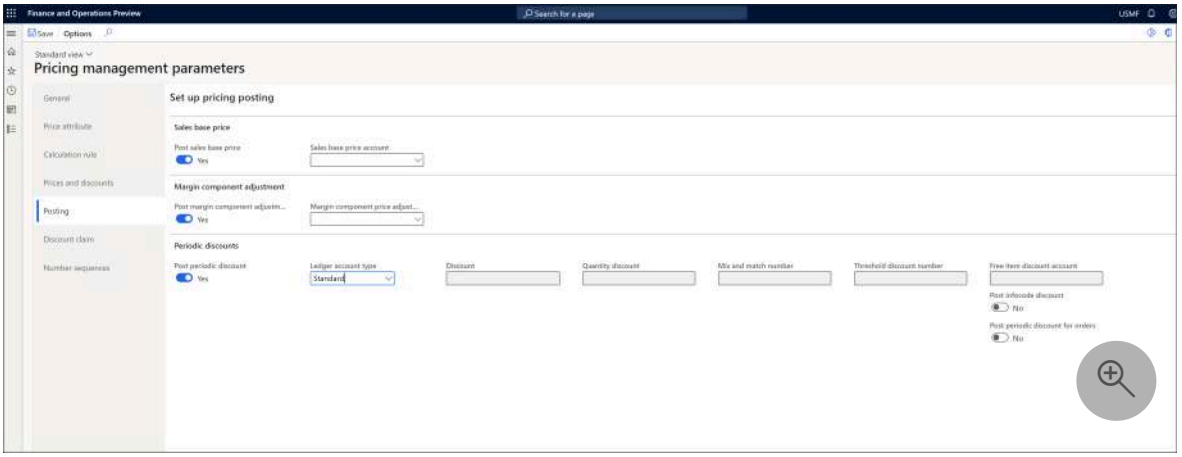
3. On the **Margin component adjustment** FastTab, set the following fields:

    - **Post margin component adjustments** – Set this option to *Yes* to enable *margin component price adjustments* to be posted a specific ledger. When you post a sales invoice, the system will use the account that's specified by the posting profile that's assigned to each price component code line.
    - **Margin component price adjustment account** – Specify a fallback ledger account to use for margin component price adjustments. This account will be

used as required for price component code lines where no posting profile is specified.

4. On the **Periodic discounts** FastTab, set the following fields:

    - **Post periodic discount** – Set this option to *Yes* to enable *periodic discounts* to be posted to a specific ledger. When you post a sales invoice, the system will first determine whether there's a specific discount account in the applied rule record. If there isn't, the system will instead use the account that's specified by the posting profile that's assigned to each price component code line. Periodic discounts include mix-and-match discounts, quantity discounts, and discount offers.
    - **Ledger account type** – Set this field to *Periodic* to set up fallback ledger accounts by using the other fields on the FastTab.



5. On the Action Pane, select **Save**.

Configure price component posting profile

Follow these steps to set up your price component posting profiles.

1. Go to **Pricing management** > **Setup** > **Posting** > **Pricing component posting**.

2. Follow one of these steps:

    - To create a new profile, select **New** on the Action Pane.
    - To edit an existing profile, select it in the list pane.
    - To delete an existing profile, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected record, set the following fields:

    - **Posting profile** – Enter a unique name.
    - **Description** – Enter a short description.

- **Price component** – Select the price component type that the posting profile applies to.

4. On the **Lines** FastTab, set up the rules that the profile will use to assign ledger accounts when price component codes of the selected price component type are posted. Use the buttons on the toolbar to add or remove lines as required. For each line, set the following fields:

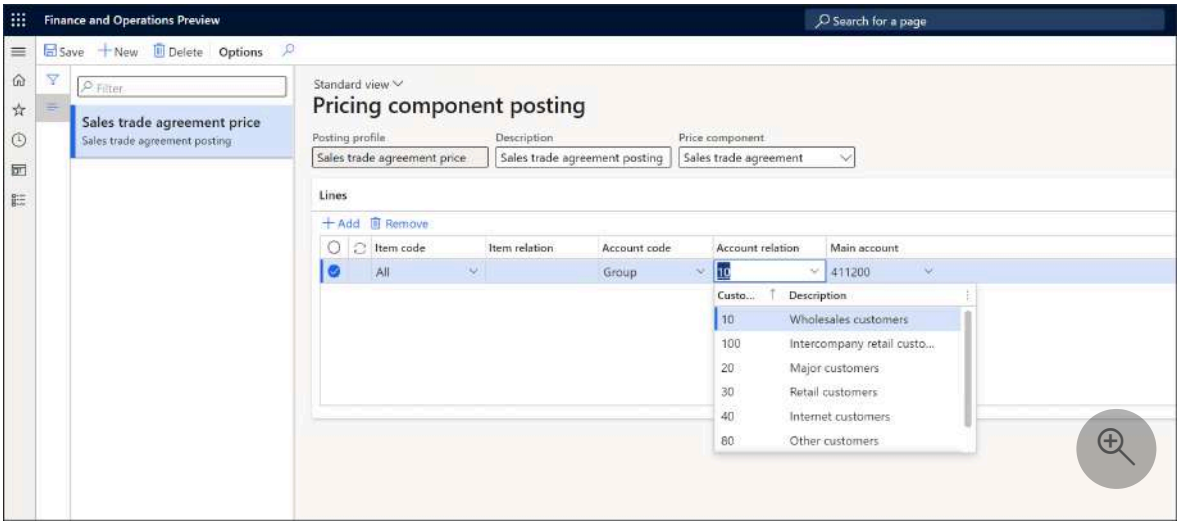
    - **Item code** – Select one of the following values to specify the scope of items where the line will apply:
        - *Table* – Assign an account for a specific item.
        - *Group* – Assign an account for an item group.
        - *All* – Assign an account for all items.

    - **Item relation** – If you set the **Item code** field to *Table*, select a specific item. If you set the **Item code** field to *Group*, select an item group.

    - **Account code** – Select one of the following values to specify the scope of customer accounts where the line will apply:
        - *Table* – Assign an account for a specific account.
        - *Group* – Assign an account for an account group.
        - *All* – Assign an account for all accounts.

    - **Account relation** – If you set the **Account code** field to *Table*, select a specific account. If you set the **Item code** field to *Group*, select an account group.

    - **Main account** – Select the account to use when the conditions that are defined by the line are met.

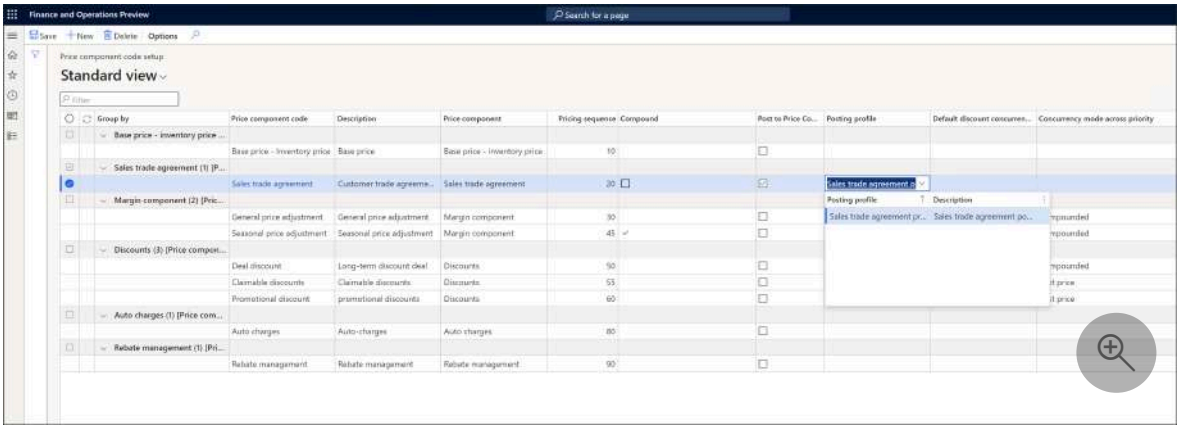


5. When you've set up all the lines that you need for the current profile, select **Save** on the Action Pane.

Associate price component posting with the price structure

Follow these steps to set up your price structures to use a specific posting profile for each relevant price component code.

1. Go to **Pricing management** > **Setup** > **Price component codes** > **Price trees**
2. Find the price component code line that you want to assign posting for, and select its **Post to price component code** checkbox. Then set the **Posting profile** field to the profile that you want to use for the line.



3. Repeat the previous step until you've assigned a posting profile to each relevant line.
4. On the Action Pane, select **Save**.
5. If you're using multiple pricing trees, repeat the previous steps until you've set up each tree.

Provide product feedback

Price structure overview

When a sales order is placed, you can review the detailed price breakdown, including the price component. The breakdown corresponds to the price structure that you configured. The price details provide an audit record that shows how the price was determined. They can serve as a starting point for future price investigation.

You can set up your system to use either a single price structure or multiple price structures.

Price component types

The following table summarizes the main types of components that can be included in a price structure.

Expand table

Price component	Price position	Details
Base price	Unit Price	The *base price* represents the common price for general use. It's at the level of the stock keeping unit (SKU).

Price component	Price position	Details
		You can have only *one* price component code of this type in each price structure. That price component code can be of any of the following base price types: • Base price - inventory price • Base price - purchase price • Base price - sales price The base price comes from the **Item base price** page. it can be either calculated or manually entered. If you set up the base price by using a price structure (price trees), and no matching record exists on the **Item base price** page, the system determines whether the item is a standard cost item. If it's a standard cost item, the system uses the active item standard cost as the source for the base price.
Sales trade agreement price	Unit Price	If the *sales trade agreement price* is available, it takes precedence over the base price, because it represents a special price arrangement with a specific group of consumers for a specific set of products. You can have only *one* price component code of this type. However, any number of sales trade agreement prices can apply to that code in different situations.
Margin component price adjustment	Unit Price	*Margin component price adjustments* move item prices up or down from the base price. Margin component price adjustments can be associated with many types of agreements, promotions, and events. They let you easily adjust prices without changing the base price. You can have *multiple* price component codes of this type, and you can associate any number of pricing rules with each one. Price adjustments are compounded across price component codes and add up to the total price adjustment.
Discounts	On-invoice discounts	*Discounts* let you adjust prices based on a wide range of calculation methods that are designed to encourage the purchase of specific products, volumes, packages, and so on. You can have *multiple* price component codes of this type, and you can associate any number of pricing rules with each one.
Rebate management	Off-invoice discounts	You can have *multiple* price component codes of this type.

Concurrency rules

If your price structure has multiple price rules that apply to the same price component code and/or to multiple price component codes of the same type, the system applies concurrency rules to resolve them.

- If more than one pricing rule applies to the same price component code in a price structure, *within-price-component-code concurrency* rules are applied to determine which rules apply and how they're combined. For more information, see Resolve concurrency within price component codes.
- If your price structure includes more than one price component code of the same type, *across-price-component-code concurrency* rules are applied to determine how they're combined. For more information, see Resolve concurrency across price component codes.

Next steps

- Set up a company to use multiple price structures
- Set up a company to use a single price structure
- Arrange price component codes into a price structure

Last updated on 07/01/2026

Set up a company to use a single price structure

This article explains how to configure a company to use a single price structure, and how to set up that structure. The purpose of a price structure is to define the order that the system calculates each type of price adjustment in, and to define other options for each price component code, such as concurrency and compounding rules.

In this scenario, companies and price structures have a one-to-one (1:1) relationship. The pricing engine matches each sales order with the price component codes, based on the pricing sequence that's defined in the single structure.

Configure a company to use a single price structure

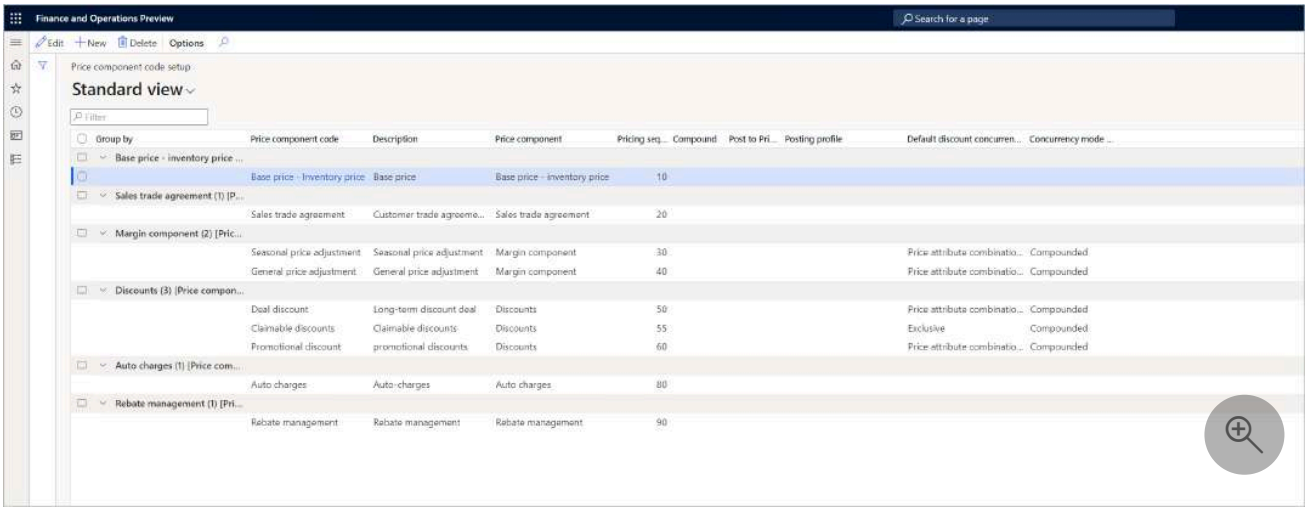
Follow these steps to use a single price structure for a company.

1. Select the company in the company picker.
2. Go to **Pricing management** > **Setup** > **Pricing management parameters**.
3. On the **Price attribute** tab, set the **Enable multiple price trees** option to *No*.
4. On the Action Pane, select **Save**.

Configure the single price structure

To set up the price structure for a company that uses a single structure, follow these steps:

1. Go to **Pricing management** > **Setup** > **Price component codes** > **Price trees**. The **Price trees** page shows your current price structure (if you have one), and lets you add or remove price component codes in the structure. The components are grouped according to the **Price component** value that's set for each price component code in the list.



2. Set up your price structure by adding and removing lines to define a price sequence. Set the fields for each price component code that you want to include. These fields work just as they do on the **Price component code list** FastTab of the **Price trees** page. For information about how to set these fields, and examples that show how they work, see Arrange price component codes into a price structure.

3. When you've set up all lines as required, select **Save** on the Action Pane.

Auto charges in single and multiple price structures

Price component codes of the *Auto charges* type are handled differently, based on whether you're using a single price structure or multiple price structures.

- *If you're using a single price structure*, you can add the price component code for auto charges in the price trees.
- *If you're using multiple price structures*, you can't add auto charges in the price tree structures. Instead, the system will apply the standard auto charge logic to determine which auto charges apply to the sales order.

Last updated on 12/30/2025

Set up a company to use multiple price structures

This article explains how to set up multiple price structures in a company. A price structure defines the order in which the system calculates each type of price adjustment. It also defines other options for each price component code, such as concurrency and compounding rules.

In this scenario, companies and price structures have a one-to-many (1:N) relationship. In addition, there are multiple price structures. The pricing engine selects a price structure based on the specified **Price tree attribute**, which is one of the order attributes. After it determines the applicable price structure, the price engine matches the sales order with the price component codes according to the pricing sequence that's defined in the applicable price tree.

Configure a company to use multiple price structures

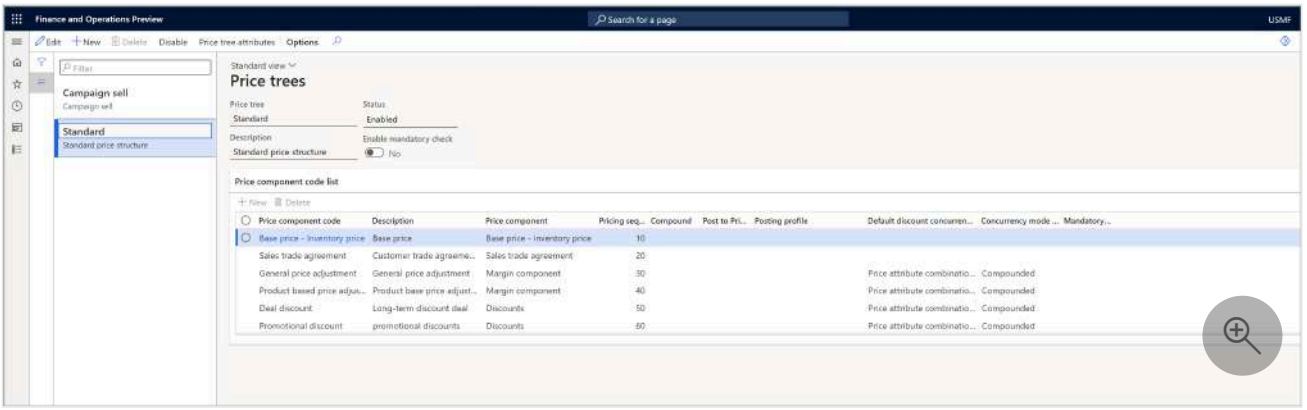
Follow these steps to use multiple price structures for a company.

1. Select the company in the company picker.
2. Go to **Pricing management** > **Setup** > **Pricing management parameters**.
3. On the **Price attribute** tab, set the **Enable multiple price trees** option to *Yes*.
4. Use the value of one of the order attributes to select which price tree to use. Set the **Price tree attribute** field to the order attribute that you want to use.

Configure the price structures

Follow these steps to create and configure a price structure.

1. Go to **Pricing management** > **Setup** > **Price component codes** > **Price trees**. The **Price trees** page shows your current price structures (if you have any), and lets you add, remove, and configure price trees.



2. Follow one of these steps:

    - To add a new price tree, select **New** on the Action Pane.
    - To edit an existing price tree, select it in the list pane, and then select **Edit** on the Action Pane.
    - To delete a price tree, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected price tree, set the following fields:

    - **Price tree** – Enter a name for the price tree.
    - **Status** – This field shows the current status of the price tree. Only price trees that have a **Status** of *Enabled* affect your price calculations. To change the status, select **Disable** or **Enable** on the Action Pane.
    - **Description** – Enter a short description of the price tree.
    - **Enable mandatory check** – If you want to mark one or more price component codes as mandatory, set this option to *Yes*.

4. On the **Price component code list** FastTab, add each price component code that should be part of the price structure for the current price tree. Use the buttons on the toolbar to add and remove lines as required. For information about how to set these fields, and examples that show how the settings work, see Arrange price component codes into a price structure.

5. When you set up all lines as required, select **Save** on the Action Pane.

6. On the Action Pane, select **Price tree attribute** to specify the value of the price tree attribute that causes this price tree to apply to a given order.

7. On the Action Pane, select **Enable** to enable the current price tree.

Auto charges in single and multiple price structures

Price component codes of the *Auto charges* type work differently depending on whether you use a single price structure or multiple price structures.

- *If you use a single price structure*, you can add the price component code for auto charges in the price tree.
- *If you use multiple price structures*, you can't add auto charges in the price tree structures. Instead, the system applies the standard auto charge logic to determine which auto charges apply to the sales order.

Arrange price component codes into a price structure

Article • 10/28/2024

Regardless of whether you're using a single price structure or multiple price structures, you use the same basic procedure to arrange your price component codes into a price structure. The only difference is that, if you use multiple price structures, you also define a condition to select the structure that's used in each situation.

- For information about how to create and manage a single or multiple price structures, see Set up a company to use multiple price structures. Then, when you're ready to add, arrange, and configure the price component codes in each structure, return to this article.

Configure a price structure

Follow these steps to create and configure a price structure.

1. Create the pricing tree or trees that you need as described in Set up a company to use multiple price structures or Set up a company to use a single price structure.

2. Go to **Pricing management** > **Setup** > **Price component codes** > **Price trees**, create or select a price tree, and expand the **Price component code list** FastTab.

3. Add each price component code that should be part of the current price structure. Use the buttons on the toolbar to add and remove lines as required. The following fields are available for each line:

    - **Group by** – In the grid, the price component codes are grouped by type. The type is shown in the **Group by** column, and the relevant price component codes are indented under their group name. When you first create a new code, a default group is selected for it. However, the default group will automatically be replaced when you select a value in the **Price component code** field. You can't edit this field directly.

    - **Price component code** – If you're adding a new line, select an existing price component code for it. (You can't edit this field for existing lines.) Each price component code can appear only once in the list. Therefore, you'll receive an error if you try to select a code that's already listed. For information about how to create and configure price component codes, see Price component codes.

- **Description** – Enter a short description.
- **Price component** – This field shows the type of the price component code that was selected for the line. The value comes from the **Price component** setting of the selected price component code and establishes the group that the line was put into.
- **Pricing sequence** – Enter an integer to define a calculation sequence for the different lines. The calculation proceeds from the lowest sequence number to the highest number. We recommend that you leave some space between numbers, so that there's room for new pricing components to be added between existing lines later. For example, use *10*, *20*, *30*, *40*, and so on, instead of *1*, *2*, *3*, *4*, and so on. The sequence can have a significant effect on the final unit price, especially if you use percentage-based calculations and compounding.
- **Compound** – This checkbox applies only to price component codes where the **Price component** field is set to *Margin component*. Select the checkbox for lines where you want to calculate the price adjustment based on the compound price (running total). Clear it for lines where you want to calculate the price adjustment based on the original base price. For discounts, the compounding behavior is controlled instead by the **Discount compound behavior** setting on the **Pricing management parameters** page. (Learn more in Resolve concurrency across price component codes.)
- **Post to price component code** and **Posting profile** – To post to a price component code, select the **Post to price component code** checkbox, and then select the posting profile that you want to use. Learn more in Price component posting.
- **Default concurrency mode** – This field shows the default concurrency mode that was set for the selected price component code. For information about how to set the default concurrency mode and interpret its value, see Price component codes.
- **Concurrency mode across priority** – This field applies only to lines where the **Price component** field is set to either *Margin component* or *Discounts*. Select one of the following values:
  - *Compounded* – The system will first compute the price adjustment or discount for each line in the structure. It will then calculate the final discount or adjustment by adding the value for every line. This value is available only for lines where the **Price component** field is set to *Discounts*

or *Margin component*. (It's the only available value for margin components.)
    - *Best price* – If the price structure includes more than one price component code that has this value, only one of those lines (the one that has the largest discount) will contribute to the final unit price. This value is available only for lines where the **Price component** field is set to *Discounts*.

  This field affects discount calculations only when the **Best price and compound concurrency control model** field on the **Pricing management parameters** page is set to *Best price and compound within priority, best price and compound across priority*. Learn more in Resolve concurrency across price component codes.

- **Mandatory** – For price trees where the **Enable mandatory check** option is set to *Yes*, use this checkbox to mark each price component code that's mandatory in the sales order. If a price component code isn't applicable, an error will be shown.

> **Note**
>
> If you use multiple price structures, they can't include price component codes where the **Price component** field is set to *Auto charge*. Instead, the system will apply the standard auto charge logic. In other words, if an auto charge rule record is applicable, the auto charge will apply to the sales order.

4. When you've set up all the lines that you need in your price structure, select **Save** on the Action Pane.

Vendor list prices and price adjustments

In some cases, Unified pricing management can derive a product's sales price from the vendor's list price or procurement price. For example, this functionality can be used for the trade of items in the retail and distribution industry, where products are procured from vendors and sold to customers.

Vendor list prices come from a vendor price catalogue and can be used as the foundation for calculating the sales price of an item.

The vendor list price features have three core elements:

- **Vendor list price** – The vendor list price lets you record the general vendor price catalog and specify a valid date period. The vendor list price is on the *item and inventory dimensions* level.
- **Vendor price term codes** – Vendor price term codes establish a list of price adjustment codes that you can use when you define vendor price term agreements. For calculations where the **Compound** option is set to *Yes*, pricing calculations apply price term codes together with the pricing sequence.
- **Vendor price term agreements** – Vendor price term agreements keep track of the contracts that you have with vendors for price adjustments for each site. The valid periods, vendors, calculation methods for price adjustments, and values are all recorded. You can use price attributes to specify the applicable items and sales order lines, because vendor price term agreements use the line price attribute group.

Unified pricing management lets you define the selling price as *Item base price ± Margin component price adjustments*.

For the items that you sell, the system can determine the item base price based on the vendor list price. The item base price is calculated as *Vendor list price + Vendor price term agreement price*. During the calculation, the system evaluates each vendor's item base price for each site. Because the item base price has just one unique active value per site, if multiple calculated prices exist, the system uses only the lowest calculated price.

Sales order base price determination rules

This article describes the price determination rules for calculating the sales order base price.

Expand table

Terms	Definition, usage, and notes	Price component type
Unit price	The price calculated for each unit in a sales order. It's calculated by using the following formula: *Unit price = Base price ± Margin component price adjustments*.	
Base price	The basis for price adjustments. It's intended for all customers and is the standard rate for general purposes. • If there's an applicable sales trade agreement price, the base price is the *sales trade agreement price*. • If there's no applicable sales trade agreement price, the base price is the *item base price*.	
Sales trade agreement price	The price that reflects a negotiated pricing strategy for a collection of customers and a group of specific products. You can configure the system so that it uses one of the following formulas to calculate the unit price based on the sales trade agreement price: • *Unit price = Sales trade agreement price* (if no margin component price adjustment applies) • *Unit price = Sales trade agreement price ± Margin component price adjustments*	Sales trade agreement
Item base price	The **Item base price** page lets you set prices for each item by using either calculated values or manually entered values. Calculated prices use the following formula: *Item base price = Vendor list price ± Vendor term agreements*.	Any of the following: • Base price - purchase price • Base price - inventory price • Base price - sales price
Standard cost	The cost version of an item that's calculated by using the standard cost model.	Base price - inventory price

Terms	Definition, usage, and notes	Price component type
Margin component price adjustments	You can set up layers of margin components to adjust the base price up (positive) or down (negative). Margin component price adjustments have a calculation sequence and can be compounded to get the total adjustment price.	Margin component
Sales agreement	Although the Unified pricing management module respects sales agreement rules, the sales agreement feature isn't otherwise integrated with the Unified pricing management module.	

The following flow chart shows the sales order base price determination rules.

- Base price versions
- Sales trade agreement prices

Last updated on 07/01/2026

Base price versions

This article describes how base price versions work in Unified pricing management. The primary purpose of a base price version is to maintain a list of *item base prices* for a specific period. The base price is a common price at the level of the stock keeping unit (SKU). Unified pricing management lets you build selling prices by using *cost-plus pricing*. When you use cost-plus pricing, you first build a price structure that starts with the base price.

The following table shows an example of a price structure that you can use to build final selling prices based on base prices.

Expand table

Pricing sequence	Price component code	Price component type	Description	Price details on the sales order
10	BAS01	Base price	Price component code *BAS01* must be associated with one of the following price component code types: • Base price – inventory price • Base price – purchase price • Base price – cost price	Base price
20	MAC01	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments
25	MAC02	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments
30	MAC03	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments

The selling price is calculated by using the following formula: *Selling price* = *Base price* ± *Margin component price adjustments*.

Determining the base price

The cost-plus pricing model works by determining the product cost and then adding a markup to determine the selling price.

- In retail and distribution industries, many products are items that are procured and then sold to customers. For these industries, the base price is typically the procurement price for a product.
- In the manufacturing industries, the base price is typically based on the calculated total cost of the bill of materials (BOM) for a product.

Unified pricing management derives base prices from one of the following two sources:

- The primary source is the item base price that's listed for each product on the **Item base price** page. To open this page, go to **Pricing management** > **Pre-sales pricing** > **Base price versions** to open the **Base price versions** page, which lists the base price versions that you created and shows the dates that each version is valid for. Select a version in the list, and then select **Price** > **Base price** on the Action Pane to view and edit the prices that apply for that version.
- If an item doesn't have an active item base price, the system determines whether it has an active cost price in a costing version. A costing version can support a standard cost inventory model for items, where the costing version contains a set of standard cost records about the items and their manufacturing processes.

The following table shows the rules for determining the base price.

Expand table

Product type	Industries	How base prices are determined
Traded items that you procure and then sell	Retail, distribution	• Unified pricing management calculates item base prices based on prices found on the **Base price versions** page. • IBase prices are calculated by using the following formula: *Base price = Vendor list price ± Vendor price term agreement*. • If several calculated prices apply to the same item, the price engine always selects the *lowest* price as the item base price. • You can activate a calculated item base price. The price engine then uses that calculated price as the base price.
Manufactured items (with BOMs) that use the standard cost model	Manufacturing	• Microsoft Dynamics 365 Commerce and Dynamics 365 Supply Chain Management can calculate and activate item cost prices based on costing versions. • You don't have to maintain item base prices on the **Base price versions** page.

Product type	Industries	How base prices are determined
		• The price engine uses the active item cost price as the base price. • Item selling prices are calculated by using the following formula: *Selling price = Active calculated item cost (base price) ± Margin component price adjustments*.
Manufactured items (with BOMs) that don't use the standard cost model	Manufacturing	• Item base prices are defined on the **Base price versions** page. • The price engine uses the active item base price as the base price.

Base price determination exception

As mentioned earlier, the base price is a common price at the SKU level. A price differentiation strategy is often applied when a price manager negotiates with a customer to set up a special price for a specific group of products for a specific date range. Record these prices as *sales trade agreement prices*. Sales trade agreement prices take priority over base prices.

The following table shows how sales trade agreements relate to selling prices.

Expand table

Do applicable margin component price adjustments exist?	Sales price calculation
No	*Selling price = Sales trade agreement price*
Yes	*Selling price = Sales trade agreement price ± Margin component price adjustments*

> **Note**
>
> To use sales trade agreement prices, your price structure must include a price component code where the **Price component** field is set to *Sales trade agreement*.

The following table shows an example of a price structure that includes a sales trade agreement.

Expand table

Pricing sequence	Price component code	Price component type	Description	Price details on the sales order
10	BAS01	Base price	Price component code *BAS01* must be associated with one of the following price component code types: • Base price – inventory price • Base price – purchase price • Base price – cost price	Base price or Sales trade agreement price
15	TAM	Sales trade agreement	Sales trade agreement	Base price or Sales trade agreement price
20	MAC01	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments
25	MAC02	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments
30	MAC03	Margin component	Adjust the price up or down based on a fixed amount or percentage.	Price adjustments

For example, when this price structure is used, the price engine might find that the following pricing rules are applicable to item *EV0001* on a sales order line:

- Activated item base price (BAS01) = $5
- Posted sales trade agreement journal price (TAM) = $8
- Margin component price adjustment (MAC01) = $3
- Margin component price adjustment (MAC02) = $2
- Margin component price adjustment (MAC03) = -$1

Therefore, the selling price for the sales order line is 8 + 3 + 2 – 1 = $12.

Next steps

- Sales trade agreement prices

Sales trade agreement prices

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Sales trade agreement prices are negotiated prices for specific products that apply to specific customers. For sales where a sales trade agreement applies, this price takes priority over the item base price.

Unified pricing management uses the standard *Trade agreement price - sales price* side, but it's enhanced with price attributes.

> **Note**
>
> Unified pricing management respects standard *sales agreements*, which differ from the *sales trade agreement prices* that are described in this article. For order lines where a *sales agreement* applies, Unified pricing management uses the sales agreement. If no sales agreement applies, Unified pricing management determines whether an applicable *sales trade agreement price* exists. The discounts that are included in sales trade agreements (line discounts, multiple discounts, and total discounts) are outside the purview of Unified pricing management. Instead, Unified pricing management provides a new approach to defining discount rules.

Net pricing

To support negotiated final prices in trade agreements, you can define sales prices directly with or without price adjustments and explicitly prevent other discount applications. This approach ensures accurate discount-exempt pricing aligned with contractual or wholesale pricing needs. This function supports sales trade agreement pricing by allowing pricing administrators to define:

- A final exclusive net price that reflects the outcome of negotiation
- Whether price adjustments (such as percentage increases or decreases) are included

- Whether promotional or system-applied discounts should be prevented from further affecting the transaction price

This capability is especially relevant in business-to-business (B2B), channel sales, or regulated pricing models, where discount logic shouldn't be allowed to alter the agreed price. It can also be important for long-term contracts that require strict adherence to fixed pricing that excludes further discounts.

To define a trade agreement sales price as a *net* (final, exclusive) price that isn't subject to further discounting, set **Allow Price Adjustment** to *No* and **Prevent Discount** to *Yes* for the relevant sales trade agreement lines. Learn more in Manage pricing rules for a sales trade agreement journal.

Configure sales trade agreements, including concurrence rules

Several configuration settings affect the way that sales trade agreements work in Unified pricing management. Before you start to create any sales trade agreement pricing rules, follow these steps to set up your system.

1. Go to **Pricing management** > **Setup** > **Pricing management parameters**.
2. On the **Price and discounts** tab, on the **Trade agreements** FastTab, set the **Enable default find next** option to one of the following values to specify how the system should resolve concurrent sales trade agreement rules:
    - *Yes* – The price engine checks all applicable trade agreement prices and applies the lowest price.
    - *No* – The price engine uses the *price attribute combination rank* to determine the price, by applying the following rules:
        a. Apply the record that has the highest *price attribute combination rank*.
        b. If two or more records have the same highest *price attribute combination rank*, check the *header price attribute*, and apply the highest-ranked record price group.
        c. If two or more records have the same highest *header price attribute*, check the *line price attribute*, and apply the highest-ranked record in the price attribute group.
        d. If multiple price records have the same rank, apply the lowest price.
3. Set the **Apply existing trade agreement** option to *Yes* if the price engine should consider posted sales trade agreement pricing rule records where the **Default relation** field is set to

Price (sales). (These records are available at **Sales and Marketing** > **Prices and discounts** > **Trade agreement journals**.) The price engine applies the following rules:

a. Apply the sales trade agreement price that meets the criteria.

b. If no sales trade agreement price applies, use the qualifying rules that are posted to the trade agreement journals.

4. On the **General** tab, set the **Date type** field to the type of date that you use when you set up criteria for matching pricing rule records. The available values are *Today*, *Requested ship date*, *Requested receipt date*, and *Created date*.

> **Note**
>
> If your organization uses only Unified pricing management and doesn't use traditional trade agreements (created via **Sales and marketing** > **Prices and discounts** > **Trade agreement journals**), the parameters on the **Activate price/discount** page (**Sales and marketing** > **Setup** > **Prices and discounts** > **Activate price/discount**) aren't required. You can safely set all toggles on this page to *No*. These parameters control which combinations of customer/item dimensions are available for traditional trade agreement journal lines, and they have no effect on UPM pricing rules, price structures, or price component codes.

Concurrency example

The following table shows an example of combinations of price component code attributes.

Expand table

Price attribute combination	Price attribute combination	Header price attribute	Rank	Line price attribute	Rank
Target customer segments + Vehicle product	2003	Customer account	4	Interior Upholstery	4
Target customer segments + Vehicle product	2003	Customer group	3	Exterior color	3
Target customer segments + Vehicle product	2003	Price group	2	Fuel type	2
Target customer segments + Vehicle product	2003	Sales group	1	Drive type	1

The following two records are posted for sales trade agreement price lines that have the same date range. Because the price attribute combinations are the same, the ranks of the price attribute combinations are also the same. Therefore, the price engine applies the RID0002 price.

Expand table

ID	Price attribute combination	Header price attribute criteria	Line price attribute criteria	Price	Applicable
RID0001	Target customer segments + Product segments	Price group = 01	Interior Upholstery = Package B	$1,500	No
RID0002	Target customer segments + Product segments	Customer account = US-003	Interior Upholstery = Package B	$1,550	Yes

Set up your price component codes and price structures

To use sales trade agreements, you must have the following configurations in your system:

- You must have exactly one price component code where the **Price component** field is set to *Sales trade agreement*. This setting lets you include sales trade agreements as part of your price structures. Learn more in Price component codes.
- Each price structure where you want to consider sales trade agreement prices must include the previously mentioned *Sales trade agreement* price component code. Learn more in Arrange price component codes into a price structure.

Manage trade agreement journal names

Follow these steps to create and manage your trade agreement journal names.

1. Go to **Pricing management** > **Setup** > **Trade agreement prices** > **Trade agreement journal names**.

2. Follow one of these steps:

    - To create a new journal name, select **New** on the Action Pane.
    - To edit an existing journal name, select it in the grid, and then select **Edit** on the Action Pane.
    - To delete an existing journal name, select it in the grid, and then select **Delete** on the Action Pane.

3. Set the following fields for the new or selected record:

    - **Name** – Enter a name for the trade agreement journal name.
    - **Description** – Enter a short description of the trade agreement journal name.
    - **Relation** – This read-only field always shows a value of *Price (sales)*.
    - **Enable price attributes** – Select this checkbox to create sales trade agreement journals that have the price attributes.

4. On the Action Pane, select **Save**.

5. To view and manage all the trade agreement journals that use a selected trade agreement journal name, select **Trade agreement journals** on the Action Pane.

Manage sales trade agreement journals

Follow these steps to create and manage your sales trade agreement journals.

1. Go to **Pricing management** > **During-sales pricing** > **Sales trade agreement price** > **Trade agreement journals**.

2. Follow one of these steps:

    - To create a new journal, make sure that the **Show** field is set to *All* or *Not posted*, and then select **New** on the Action Pane.
    - To edit an existing journal, select it in the grid.
    - To delete an existing journal, select it in the grid, and then select **Delete** on the Action Pane.

    > **Tip**
    >
    > If you're looking for an existing journal to edit or delete, use the filter and the **Show** field to find it.

3. Set the following fields for the new or selected journal:

    - **Name** – Select an existing trade agreement journal name. For the name that you select, set the **Enable price attributes** option to *Yes* and set the **Relation** field to *Price (sales)* on the **Trade agreement journal names** page.
    - **Price/discount journal number** – A value is automatically generated the first time that you save a new journal. The field then becomes read-only.

- **Description** – Enter a short description of the journal. For new journals, this field takes its default value from the selected trade agreement journal name.
- **Posted** – This read-only field shows whether the journal is posted.
- **Posted on** – If the journal is posted, this read-only field shows the date when it was posted.
- **Enable price attributes** – This read-only field takes its default value from the selected trade agreement journal name.

4. On the Action Pane, select **Save**.

Manage pricing rules for a sales trade agreement journal

Sales trade agreement journal pricing rules control which prices apply to which combinations of customers and products. Each rule exists as a *line* that belongs to the relevant sales trade agreement journal.

Follow these steps to add, view, and manage pricing rules for a sales trade agreement journal.

1. Go to **Pricing management** > **During-sales pricing** > **Sales trade agreement price** > **Trade agreement journals**.
2. Create or select the journal that you want to work with, as described in the previous section.
3. On the Action Pane, select **Lines**.
4. The **Journal lines, trade agreement** page appears. If you want to add a new pricing rule, select **New** on the Action Pane. If you want to work with existing rules only, skip ahead to step 10.
5. In the **Edit price attributes** dialog box, set up the logic for selecting the customers and products that the line applies to. On the **General** FastTab, in the **Price attribute group combination** field, select one of the price attribute combinations that's associated with your *Sales trade agreement price* price component code. The value that you select controls which attributes are available to define the customer and products that the line applies to.
6. If the selected price attribute group combination considers header values (that is, if it doesn't apply to *all* customers), the **Header price attribute group** FastTab is available. In this case, for each row on the **Header price attribute group** FastTab, enter or select one or more

values in the **Condition** column to define the rules for selecting customers. The following rules apply:

- All rows are combined by using a logical AND operator. Therefore, only those customers that have matching values for *all* rows are included.
- If you want to create one or more rows that include multiple values, set the **Enable multiple selections** option to *Yes*. You can then add a comma-separated list of values in the **Values** column for each row. These values are combined by using an OR operator. Therefore, the row finds customers that have *any* of the values in the list.
- You can specify values to exclude by adding an exclamation mark (!) before the value. This exclamation mark is known as an exclusion prefix. For example, to find all customer accounts except *DE-001*, set the **Condition** field to *!DE-001* for the attribute where the **Attribute** field is set to *Customer account*. You can automatically add the exclusion prefix to the values of any row by selecting the row and then selecting **Exclude values in selected lines**.

7. To preview the results of your settings on the **Header price attribute group** FastTab, select **Preview matching results**. A dialog box shows a preview of customers that match the conditions that you set up so far.

    - If the list includes any customers that you want to exclude, select the target rows, and then select **Exclude** on the toolbar.
    - The **Line type** column indicates which customers you selected to exclude.
    - To reinclude a previously excluded customer, select it, and then select **Include** on the toolbar.

8. If the selected price attribute group combination considers line values (that is, if it doesn't apply to *all* products), the **Line price attribute group** FastTab is available. Use this FastTab to define rules for selecting products. The fields and preview options work just as they do on the **Header price attribute group** FastTab.

9. Select **OK** to add the new line to the grid on the **Overview** FastTab of the **Journal lines, trade agreement** page.

10. On the **Overview** FastTab, for each line in the grid, set the following fields as required:

    - **Header price attribute group** – This field shows which header price attribute group was selected for the line. For lines that apply to all customers, this field is blank. To change the value, select **Edit price attribute** on the toolbar of the FastTab.

- **Price attribute detail** – This field summarizes the header attribute values that identify the customers that the line applies to. For lines that apply to all customers, this field is blank. To change the values, select **Edit price attribute** on the toolbar.
- **Line price attribute group** – This field shows which line price attribute group was selected for this line. For lines that apply to all products, this field is blank. To change the value, select **Edit price attribute** on the toolbar.
- **Price attribute detail** – This field summarizes the line attribute values that identify the products that the line applies to. For lines that apply to all products, this field is blank. To change the values, select **Edit price attribute** on the toolbar.
- **Price attribute combination rank** – This field shows the rank that's assigned to the price attribute group combination that was selected for the current line in the **Edit price attribute** dialog box. The value affects how concurrent rules are resolved when more than one rule can apply to the same order line.
- **Allow price adjustment** – Select this checkbox if your sales trade agreement price isn't your final unit price, but other margin component price adjustments are permitted. For an example that shows how this setting can affect the final unit price, see the table after this procedure.
- **Prevent Discount** – Select this checkbox to prevent any other discounts from being applied for this line. To define a trade agreement sales price as a *net* (final, exclusive) price that isn't subject to further discounting, set **Allow Price Adjustment** to *No* and **Prevent Discount** to *Yes*. Learn more in Net pricing.
- **Allow Price Adjustment** – Select this checkbox to apply adjustments (such as markup or markdown) to include in the sales price. To define a trade agreement sales price as a *net* (final, exclusive) price that isn't subject to further discounting, set **Allow Price Adjustment** to *No* and **Prevent Discount** to *Yes*. Learn more in Net pricing.
- **Allow unit conversion** – Select this checkbox to allow the price that you specified for the selected unit to be converted proportionately for sales lines that specify other units. The conversion is based on the available unit conversion factors. This feature lets you maintain a single record that can apply to sales in different units.
- **From** – Enter a minimum quantity for the line. This value defines the minimum quantity that a customer must order to qualify for the agreement price.
- **To** – Enter a maximum quantity for the line. This value defines the maximum quantity that a customer can order and still qualify for the agreement price.
- **Unit** – Select the unit that the specified price applies to.
- **Amount in currency** – Enter the price that applies to the line.
- **Currency** – Select the currency that you used to specify the price in the **Amount in currency** field.

- *Inventory dimensions* – Use columns that show inventory dimensions (such as **Color**, **Warehouse**, and **Serial number**) to further refine the conditions for a line. To select which dimensions are shown in the grid, select **Inventory** > **Dimensions** on the toolbar.

> **Tip**
>
> If you offer prices based on multiple quantity breaks, specify each quantity bracket as a row that has the relevant **From** and **To** values. For the sales trade agreement price, the tiered quantity range is per sales order line. This behavior differs from the behavior for discounts, where quantity discount tiers are per sales order line.

11. Select each line that you added, and then, on the **Details** tab, set the following fields for it:

    - **From date** – Enter the first date that the selected line will be valid.
    - **To date** – Enter the last date that the selected line is valid.

12. Continue to add lines as required. Use the following buttons on the toolbar to modify or copy existing lines:

    - **Select** – Copy existing lines from posted journals to the current journal. For information about how to use this button, see the Create a new journal based on posted journal lines section of this article.
    - **Edit price attributes** – Open the **Edit price attributes** dialog box for the selected line, so that you can edit its settings as described earlier in this procedure.
    - **Copy and revise** – Create a copy of the selected line, and open a dialog box where you can pre-edit settings for the new line.
    - **Copy line** – Create a copy of the selected line.
    - **Clear journal** – Delete *all* the lines in the journal. (To delete a single existing line, select the line, and select **Delete** on the Action Pane.)

13. On the Action Pane, select **Save**.

14. To validate all the lines, select **Validate** > **Validate all lines** on the Action Pane. To validate only the selected lines, select **Validate** > **Validate selected lines**.

15. In the **Price/discount Journal posting** dialog box, select **OK** to run the validation.

The following table shows an example of a price structure that the **Allow price adjustment** setting affects for a sales trade agreement.

Expand table

Price component code	Price component	Price sequence	Value
TAM01	Sales trade agreement price	10	$200
MAC01	Price adjustment 01	20	$10
MAC02	Price adjustment 02	30	$20

The **Allow price adjustment** setting affects the final price in the following way:

- If you select the **Allow price adjustment** checkbox, the final unit price is $230.
- If you don't select the **Allow price adjustment** checkbox, the final unit price is $200.

Post a sales trade agreement journal

Follow these steps to post a sales trade agreement journal.

1. Go to **Pricing management** > **During-sales pricing** > **Sales trade agreement price** > **Trade agreement journals**.
2. Select the journal that you want to post, and then select **Lines** on the Action Pane.
3. On the **Journal lines, trade agreement** page, on the Action Pane, select **Post**.
4. In the **Price/discount Journal posting** dialog box, select **OK** to post the journal.

Create a new journal based on posted journal lines

If you must create a new journal that includes lines that are similar to the lines in a previously posted journal, you can start by adding copies of the posted journal lines to your new journal.

1. Go to **Pricing management** > **During-sales pricing** > **Sales trade agreement price** > **Trade agreement journals**.
2. On the Action Pane, select **New**.
3. On the Action Pane, select **Lines**.
4. On the **Overview** FastTab, select **Select** on the toolbar.
5. The **Select** dialog box appears. Use the fields to build a query that finds the matching lines from posted journals that you want to copy to your new journal.
6. Set the **Match value only** option to control how the system filters the records. For example, you're looking for a journal line that matches price attribute **Customer group** = *A*, and you

have customer *US-001* that belongs to customer group A. In this case, the **Match value only** settings work in the following way:

- *Yes* – When you select customer account *US-001*, the system doesn't match the line, because there's no record that specifies the customer account, even though the rule applies to customer account US-001.
- *No* – When you select customer account *US-001*, the system matches the line, because the rule applies to customer account US-001.

7. After you set up your query, select **Select** to copy the matching posted trade agreement lines to a new journal.

8. Edit the copied lines as required.

9. Validate and post the journal.

View posted sales trade agreement prices for products and customers

Follow these steps to view posted sales trade agreement prices that apply to a selected product or customer.

1. Follow one of these steps:

   - To find trade agreement prices for products, go to **Product information management** > **Products** > **Released products**.
   - To find trade agreement prices for customers, go to **Sales and marketing** > **Customers** > **All customers**.

2. Select the product or customer that you want to inspect.

3. On the Action Pane, on the **Price** tab, select **Trade agreements**.

4. The **Trade agreements** dialog box appears. Criteria for finding lines for the selected product or customer are already included. Set the **Posted** option to *Yes* to find only posted lines.

5. Set the **Match value only** option to *No*.

6. Select **OK**. The trade agreement lines that are found are shown.

Margin price adjustments

This article describes how to set up and use margin price adjustments.

Unified pricing management lets you use *margin price adjustments* to move item prices up or down from the base price. Set up these adjustments by including one or more price component codes of the *Margin component price adjustment* type in your price structures. Price adjustments are compounded across price component codes and add up to the total price adjustment.

In scenarios where you build your selling price based on the inventory standard cost or purchase price, it represents the layers of the margin components that add up to those base prices.

You can associate margin component price adjustments with many types of agreements, promotions, and events. They let you easily adjust prices without changing the base price.

To use margin component price adjustments, complete the following configuration steps:

- Create one or more price component codes to set up the different types of margin price adjustments that you can include in your price structures.
- Create one or more price structures to define how your margin price adjustments combine with other price elements (such as base prices and discounts) to determine the final unit price.
- Set up one or more margin price adjustment pricing rules to configure the margin price adjustments that you need, and to define which customers and items they apply to, and how they're calculated. Associate each price adjustment with a specific price component code and then define the details of the calculation.

For information about how to create pricing rules for each margin price adjustment (and discount), see Pricing rules for discounts and margin price adjustments.

For example, the following illustration shows a price structure that contains two sequential margin component price adjustments (*General price adjustments* and *Seasonal price adjustments*).

This article introduces the different types of discounts that you can set up by using Unified pricing management.

To use discounts, complete the following setup steps:

- Create one or more price component codes to set up the different types of discounts that you can include in your price structures.
- Create one or more price structures to define how your discounts combine with other price elements (such as the base price and margin price adjustments) to determine the final unit price.
- Set up one or more discount pricing rules to configure each discount that you need, and define which customers and items they apply to, and how they're calculated. For each rule, select the type of discount and associate it with a specific price component code. Then, define the discount by using a combination of settings that are common to all discounts and settings that are specific to your selected discount type.

For information about how to create pricing rules for each type of discount (and for margin price adjustments), see Pricing rules for discounts and margin price adjustments.

> **Note**
>
> The *pricing sequence* of your price structure isn't associated with discount types.

Simple discounts

Simple discounts reduce the product price by a percentage or amount. Here are some examples:

- Buy items of brand A, and get 5 percent off.

- Buy items from package group B, and get $10 off.

Quantity discounts

Quantity discounts are given to customers when they purchase a specific quantity of a product. The quantity tier applies to each order, not each line. Here are some examples:

- Buy two or more items of brand A, and get 5 percent off.
- Buy five or more items of brand A, and get 7 percent off.
- Buy 10 or more items of brand A, and get 9 percent off.
- Buy 15 or more items of brand A, and get 12 percent off.

Threshold discounts

Threshold discounts are given to customers when the total for a transaction reaches one or more specified amounts. The amount threshold applies to each order, not each line. Here are some examples:

- Buy a total of $1,000 or more of items of brand A, and get $100 off.
- Buy a total of $2,000 or more of items of brand A, and get 10 percent off.

Threshold discounts are applied after other discount types, because the total order value determines their eligibility. Create a price component code for threshold discounts, and avoid mixing threshold discounts with other types in the same price component code. Set up the price component code for threshold discounts after the other discount-related price component codes that have a higher pricing sequence.

Mix-and-match discounts

Mix-and-match discounts are given to customers when they purchase a specific combination of products. Here's an example:

- Buy 10 or more items of brand A, and get 5 percent off items from package group B.

> **Note**
>
> The discount claim feature isn't available for mix-and-match discounts.
>
> For mix-and-match least-expensive discounts, the number of least-expensive products must be more than one and less than the number of products that are required to trigger the

discount.

For mix-and-match line spec discounts, the **Calculation type** and **Discount** values must be the same for all discount lines in the same line group.

Set up line groups for mix-and-match discounts

To define the different combinations of item groups and related purchase thresholds that qualify for a discount, set up *line groups* and assign them to lines in your mix-and-match pricing rules. Follow these steps to set up and apply mix-and-match line groups.

1. Go to **Pricing management** > **During-sales pricing** > **Discounts** > **Mix and match line group setup**.

2. Review the existing line groups, and create any that you need. Use the buttons on the Action Pane to add or remove line groups as required. For each row that you add to the grid, set the following fields:

    - **Line group** – Enter a unique identifier for the line group.
    - **Number of products needed** – Enter the quantity of a product that a customer must purchase to qualify for the discount. This field defines a default value that is used every time a user selects the line group for a specific discount pricing rule. However, you can override the value for each specific rule as needed.

3. Go to **Pricing management** > **During-sales pricing** > **Discounts** > **Mix and match line groups**.

4. Review the line group assignments for any or all existing mix-and-match discount rules, and create any that you need. Use the buttons on the Action Pane to add or remove line groups as required. For each row that you add to the grid, set the following fields:

    - **Discount** – Select the existing mix-and-match discount pricing rule to add a line group to.
    - **Line group** – Select the existing line group to add to the selected pricing rule.
    - **Number of products needed** – Enter the quantity of a product that a customer must purchase to qualify the discount. For new rows, this field initially shows the default value that you previously set for the selected line group on the **Mix and match line group setup** page. However, you can override the default value.
    - **Line color** – Select a color for the line group. This color appears as the background color for lines that are assigned to the group on the **Lines** FastTab when you view or

edit a mix-and-match discount pricing rule.

5. To use your line groups in a pricing rule, open the **All discounts** or **Mix and match discounts** page, and select or create your rule. Then follow these steps:

    - On the **Price/discount** FastTab, define the terms of the mix-and-match discount.
    - On the **Lines** FastTab, add a line for each item (or collection of items) that's part of the mix-and-match discount. Then use the **Line group** column to assign a line group to each line.
    - If you need to change the selection or configuration of the line groups that are available for the current pricing rule (including the number of products that are required), select **Mix and match line groups** on the Action Pane. The same fields that were available on the **Mix and match line group setup** page are available. However, only the lines for the current pricing rule are shown.

Mix-and-match example 1: Discount for bundle sales

A car dealer offers a bundle where, if a customer purchases any **Interior option** item from package *B*, they get 10% off a dashboard camera (item number *DAC0001*). The dealer sets up a mix-and-match discount pricing rule and sets the following value on the **Price/discount** FastTab:

- **Calculation type:** *Line spec*

The dealer also sets the following values on the **Lines** FastTab.

Expand table

Line no.	Price attribute	Price attribute value	Number of products needed	Unit	Discount value	Calculation type	Line group
1	Interior option	Package B	1	Ea	0.00	Percentage off	A
2	Item number	DAC0001	1	Ea	10.00	Percentage off	B

Mix-and-match example 2: Discount for any second purchase

A car dealer offers a discount where, if a customer purchases any two **Interior option** items from package *C*, they get 15 percent off the less expensive of the two items. Therefore, the dealer sets

up a mix-and-match discount pricing rule and sets the following values on the **Price/discount** FastTab:

- **Calculation type:** *Least expensive*
- **Number of least expensive lines:** *1*
- **Percentage off:** *15%*

The dealer also sets the following values on the **Lines** FastTab.

Expand table

Line no.	Price attributes	Price attribute value	Number of products needed	Unit	Line group
Line 1	Interior option	Package C	1	Ea	A
Line 2	Interior option	Package C	1	Ea	B

The following table shows the items that are available to customers.

Expand table

Item no.	Interior option	Price
EV004	Package C	$100
EV005	Package C	$120

Therefore, the customer gets 15 percent off the less expensive item (*EV004*) and gets both items for $205.

Mix-and-match example 3: Mandatory item to trigger the discount

A car dealer offers a discount where, if a customer purchases any ten **Interior option** items from package *D*, including at least one of item *EV007* (which is also an item in package *D*), they get a 12-percent discount on the whole package of interior options. Therefore, the dealer sets up a mix-and-match discount pricing rule and sets the following values on the **Price/discount** FastTab:

- **Calculation type:** *Percentage off*
- **Percentage off:** *12%*

The dealer also sets the following values on the **Lines** FastTab.

Expand table

Line No.	Price attributes	Price attribute value	Mandatory	Number of products needed	Unit	Line group
1	Interior option	Package D	No	10	Ea	A
2	Item number	EV007	Yes	1	Ea	B

The following table shows the items that are available to customers.

Expand table

Item no.	Interior option	Price
EV009	Package D	$100
EV007	Package D	$100

If a customer now orders five of item *EV009* and five of item *EV007*, they've ordered 10 items from package *D* and have also purchased the required quantity of item *EV007*. Therefore, the customer gets the 12-percent discount and pays $880 for the package.

However, if the customer orders ten of item *EV009*, they still order 10 items from package *D*, but they didn't purchase the required quantity of item *EV007*. Therefore, the customer doesn't get the discount and pays $1,000 for the package.

"Always apply" discounts

Always apply isn't a discount type. It's a concurrency mode that's available for all discount types. All discounts created by using the *Always apply* mode are applied to the appropriate items after all the existing discounts are applied. For more information, see Resolve concurrency within price component codes.

Next steps

- Create price component codes.
- Create price structures.
- Configure discount pricing rules for each discount.

Last updated on 05/29/2026

Pricing rules for discounts and margin price adjustments

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to configure pricing rules for margin component price adjustments, simple discounts, quantity discounts, mix-and-match discounts, threshold discounts, and free-item discounts.

Create and manage pricing rules

1. Depending on the type of pricing rule that you want to work with, follow one of these steps:

    - To view, edit, and create margin price adjustments, go to **Pricing management** > **During-sales pricing** > **Price adjustments** > **Margin component price adjustments**.
    - To view, edit, and create all types of discounts (including all the other discount types in this list), go to **Pricing management** > **During-sales pricing** > **Discounts** > **All discounts**.
    - To view, edit, and create simple discounts only, go to **Pricing management** > **During-sales pricing** > **Discounts** > **Discounts**.
    - To view, edit, and create quantity discounts only, go to **Pricing management** > **During-sales pricing** > **Discounts** > **Quantity discounts**.
    - To view, edit, and create mix-and-match discounts only, go to **Pricing management** > **During-sales pricing** > **Discounts** > **Mix and match discounts**.
    - To view, edit, and create threshold discounts only, go to **Pricing management** > **During-sales pricing** > **Discounts** > **Threshold discounts**.
    - To view, edit, and create free-item discounts only, go to **Pricing management** > **During-sales pricing** > **Discounts** > **Free item**.

2. Follow one of these steps:

- To add a new record, select **New** on the Action Pane, and then, on the menu, select the type of record that you want to create.
- To create a copy of an existing record, select it in the list pane, and then select **Copy** on the Action Pane.
- To edit an existing record, select it in the list pane, and then, on the **General** FastTab, set the **Status** field to *Disabled*. (All rule records are read-only while they're enabled.)
- To delete a record, select it in the list pane, and then select **Delete** on the Action Pane.

3. On the header of the new or selected rule record, set the following fields:

   - **Discount** or **Margin component adjustment** – Enter a unique identifier for the rule.
   - **Name** – Enter a common name for the rule.
   - **Discount type** – If you're working with a discount rule, this field shows the type of discount and is read-only. This field isn't shown for margin price components.
   - **Publish status** – This field is initially set to *Draft*. After you complete the record, you can activate the rule.

4. Continue to set up the pricing rule as described in the remaining sections of this article. Many settings are shared by all types of pricing rules. However, some settings are specific to margin component price adjustments, all discounts, or specific types of discounts.

Enter information on the General FastTab

The **General** FastTab provides basic settings for the pricing rule. Set the fields described in the following subsections, depending on the type of pricing rule that you're setting up.

General settings that apply to both margin price adjustments and discounts

Set the following fields on the **General** FastTab for all types of pricing rules:

- **Status** – Set this field to *Enabled* or *Disabled*. Only enabled records are available for calculations. New records are set to *Disabled* and can be enabled only after you finish setting all the required fields. All fields are read-only for enabled rules. Therefore, you must disable a rule before you can edit it.
- **Currency** – Select the currency that the rule applies to.
- **Price component** – This read-only field shows the type of pricing rule (*Discounts* or *Margin component*).

- **Price component code** – Select the price component code that the rule applies to. Only existing price component codes of the applicable type are listed.
- **Header price attribute group type** – This read-only field indicates how customers that the rule applies to are selected. It shows *All* if the rule applies to all customers. It shows *Group* if the rule applies to only a set of customers, as defined by values that are assigned to attributes that are part of an attribute group. You can set the value for the current rule by selecting **Header price attribute group** on the Action Pane. For more information, see the Set up header price attribute values section of this article.
- **Price attribute group** – If the **Header price attribute group type** field is set to *Group*, this read-only field shows the attribute group that's used to define the set of customers that the current rule applies to. For more information, see the Set up header price attribute values section.

General settings that apply only to margin price adjustments

If you're setting up a pricing rule for a margin component price adjustment, set the following fields on the **General** FastTab:

- **Concurrency model** – This read-only field indicates how the system handles situations where more than one price adjustment applies to the same price component code in a price structure. This type of situation is known as concurrency. The value *Price component code rank* means that the system selects a price adjustment based on its price attribute combination rank. If multiple price adjustments have the same highest rank, they all apply to the sales order.
- **Quantity tiers** – Set this option to *Yes* to enable the **Quantity tiers** FastTab, where you can define price adjustments that vary based on the quantity on the sales order line.

> **Note**
>
> Margin component price adjustment quantity tiers differ from quantity discounts. Quantity discounts tiers are based on the item quantity per order. Margin component price adjustment tiers are based on the item quantity per line.

General settings that apply only to discounts

If you're setting up a pricing rule for a discount, set the following fields on the **General** FastTab. Not all these fields are available for every type of discount.

- **Discount account** – If you want to post the discount amount for the discount record to a separate general ledger account, specify that account. This field overrides the similar field that's available for price structures (price trees). Learn more in Price component posting.

- **Discount concurrency mode** – Select one of the following values to specify how the system should handle situations where more than one discount rule applies to the same price component code in a price structure. (This type of situation is known as concurrency.)
  - *Exclusive* – The discount is an exclusive discount. Therefore, it can't be combined with other discounts. If there are multiple exclusive discounts, the price engine applies only the one that gives the largest discount.
  - *Best price* – Discounts of this concurrency mode compete for the largest discount (lowest price).
  - *Compounded* – The discount combines with other discounts according to the pricing sequence that's defined in the price structure. Settings on the **Pricing management parameters** page control whether the compounded discount calculation is based on the original price or the compounded amount. (Learn more in Resolve concurrency within price component codes.)
  - *Always apply* – The discount always applies. Always-apply discounts are applied last. Therefore, they represent universal discounts that apply to all sales orders.
  - *Price attribute combination rank* – Discounts of this concurrency mode don't compete based on price. Instead, they compete based on which discount has the highest price attribute combination rank. If multiple discounts have the same highest rank, they all apply to the sales order.

- **Coupon code required** – Set this option to *Yes* if a coupon code is required to qualify for the discount. The discount must be linked to the coupon. The discount triggers only if a valid coupon code is entered together with the order. When you enable this option, the **Status**, **Effective date**, and **Expiration date** fields become unavailable. The settings of those fields depend on the coupon configuration. To set up coupons, go to **Pricing management** > **During-sales pricing** > **Coupons**.

- **Claimable** – Set this option to *Yes* to make the discount claimable. (In other words, the discount is sponsored by a vendor and can therefore be charged back to that vendor.)

- **Discount claim group** – If you set the **Claimable** option to *Yes*, select the applicable claim group.

- **Claim offset posting** – If you set the **Claimable** option to *Yes*, select the offset account that you want to post the claim to.

- **Max criteria type** – If a maximum discount per order applies, select the type of limit that you want to apply:
  - *Amount*
  - *Quantity*
- **Max** – If a maximum discount per order applies, select the value of the limit.
- **Max quantity unit** – If a maximum discount per order applies, and the **Max criteria type** field is set to *Quantity*, select the unit that applies to the value that's selected in the **Max** field.

Enter information on the Details FastTab

Use the **Details** FastTab to enter more information about the pricing rule. It also provides extra information about the pricing rule. You can set and review the following fields:

- **Description** – Enter a description of the pricing rule.
- **Disclaimer** – Enter a disclaimer for the pricing rule.
- **Text for fiscal receipt** – Enter text that appears on the related fiscal receipt.
- **Header price attribute details** – This read-only field summarizes the header price attribute values for the pricing rule. (You can access the header price attribute values by selecting **Header price attribute group** on the Action Pane.) For more information, see the Set up header price attribute values section of this article.

Enter information on the Price/discount FastTab

The **Price/discount** FastTab is available only for simple, threshold, and mix-and-match discounts. The settings here combine with the settings on the **Lines** FastTab to define the discount values for different combinations of customers and items.

Price/discount settings for simple discounts

If you're setting up a simple discount, set the following fields on the **Price/discount** FastTab:

- **Percentage off** – Enter the default discount percentage for new lines added on the **Lines** FastTab. As you add each line to the **Lines** FastTab, you can change the percentage, or change the percentage off to an amount off, as described later in this article.
- **Quantity limit** – Enter the maximum order quantity that the discount applies to. This limit applies to all lines on the **Lines** FastTab. Although the value is repeated for each line on the

Lines FastTab, you can edit it only on the **Price/discount** FastTab. If you edit the value, all existing lines are updated. You can't edit the value separately for each line.

Price/discount settings for mix-and-match discounts

When you set up a mix-and-match discount, set the following fields on the **Price/discount** FastTab:

- **Percentage off** – Enter the default discount percentage for new lines added on the **Lines** FastTab. As you add each line to the **Lines** FastTab, you can change the percentage, or change the percentage off to an amount off, as described later in this article.
- **Quantity limit** – Enter the maximum order quantity that the discount applies to. This limit applies to all lines on the **Lines** FastTab. Although the value is repeated for each line on the **Lines** FastTab, you can edit it only on the **Price/discount** FastTab. If you edit the value, all existing lines are updated. You can't edit the value separately for each line.
- **Calculation type** – Select the type of calculation that the current pricing rule applies. The other fields that are available on the **Price/discount** FastTab vary based on the value that you select.
    - *Deal price* – Use a specific final price instead of a calculated discount. After you select this value, enter the price in the **Deal price** field.
    - *Percentage off* – Calculate the discount as a percentage of the item price. After you select this value, enter the percentage in the **Percentage off** field. For example, the usual price of item A is 40.00, the usual price of item B is 60.00, and a mix-and-match discount of 30 percent applies to these items. If a customer buys item A and item B together, the cost is 70.00 instead of 100.00.
    - *Amount off* – Define the discount as a fixed value. After you select this value, enter the discount in the **Amount off** field.
    - *Least expensive* – After you select this value, enter the discount price in the **Deal price**, **Percentage off**, or **Amount off** field, depending on the method that you want to use to calculate the price. Then, in the **Number of least expensive lines** field, enter the number of least-expensive items that you want to apply the discount to. Finally, set the **Multiple occurrences mode** field to one of the following values:
        - *Favor customer*
        - *Favor retailer*

- *Line spec* – Use the discount that's specified for each line on the **Lines** FastTab.

- **Count non-discountable products** – Set this option to *Yes* to count non-discountable items toward the quantity.

> ⓘ **Note**
>
> For mix-and-match and least-expensive discounts, the number of least-expensive products must be more than one and less than the number of products.

Price/discount settings for threshold discounts

When you set up a threshold discount, set the following field on the **Price/discount** FastTab:

- **Count non-discountable items toward threshold** – Set this option to *Yes* to count non-discountable items toward the quantity.

Enter information on the Quantity discount configuration FastTab

The **Quantity discount configuration** FastTab is available only for quantity discounts. Use it to set up the discounts that apply to each quantity threshold that you set up.

Quantity discount settings

On the **Quantity discount** FastTab, set the following fields, which affect how the quantity tiers work:

- **Calculation type** – Select one of the following options to specify how the discount is calculated based on the table values:
  - *Percentage off* – The discount is calculated as a percentage of the price.
  - *Amount off* – A specific value is subtracted from the price.
  - *Unit price* – A new, specific unit price is applied.

- **Interval** – This option applies only when the **Calculation type** field is set to *Amount off*. Set it to *Yes* to use a stepped calculation for each quantity tier. See the next section for an example that shows how this setting affects the discount calculation.

The grid on the **Quantity discount configuration** FastTab defines a set of quantity tiers and the discount that applies to each tier. Use the buttons on the toolbar to add and remove rows from

the grid. For each row, set the following fields:

- **Minimum quantity** – Enter the minimum quantity of an item that a customer must order to get the discount specified on the line.
- **Value** – Enter the value of the discount for the line (based on the selected calculation type).

View information on the Calculation FastTab

The **Calculation** FastTab provides information about how the price component code selected for the pricing rule is set up in your price structure.

The following information is shown:

- **Pricing sequence** – This read-only field shows the position of the selected price component code in your price structure.
- **Compound** – This read-only field is shown only for margin price adjustments, not for discounts. It indicates whether the selected price component code is set up to make compound calculations in your price structure.

Enter information on the Validation period FastTab

Use the fields on the **Validation period** FastTab to control when the pricing rule applies. The following conditions apply:

- The date range is defined at the header level.
- The date, which is used when a pricing rule is validated, is based on the value of the **Date type** field on the **General** tab of the **Pricing management parameters** page. You can set the **Date type** field to *Today*, *Requested ship date*, *Requested receipt date*, or *Created date*.

Set up the validation period by using either standard rules or advanced rules.

Set up standard date validation rules

Follow these steps to set up the validation period by using the standard validation rules.

1. Set the **Date validation type** field to *Standard* to enable the fields that are required to set up standard date validation.

2. Set the following fields:

    - **Effective date** – Select the first date that the pricing rule should apply.
    - **Expiration date** – Select the last date that the pricing rule should apply.

Set up advanced date validation rules

Advanced validation rules let you set the validation period by using a discount period record instead of entering simple start and end dates.

Discount period records let you set up detailed date and time limits that can include a start date and time, an end date and time, and specific times of day for each day of the week. Set up discount period records by going to **Retail and Commerce** > **Pricing and discounts** > **Discount periods**.

Follow these steps to set up the validation period by using the advanced validation rules.

1. Set the **Date validation type** field to *Advanced* to enable the fields that are required to set up advanced date validation.
2. In the **Discount period number** field, select the discount period record that defines the validation period that you want to use. The read-only **Description**, **Start date**, and **End date** fields are updated to show values from the selected discount period record.

Enter information on the Lines and Line details FastTabs

Use the **Lines** FastTab to control which discounts and margin price adjustments apply to each item. All the lines in a pricing rule apply to the same collection of customers. You configure this collection in the header price attribute group settings, which you can access by selecting **Header price attribute group** on the Action Pane.

Add a line and configure the set of items that it applies to

Each line assigns calculation rules that apply to a specific collection of items. When you add a line, use a dialog box to set up the items that the line affects and then add the line to the grid. Later, set up the calculation rules for the line by using the columns in the grid. Follow these steps to add a line.

1. On the **Lines** FastTab, select **New** on the toolbar.

2. The **Edit price attributes** dialog box appears. This dialog box lets you set up the logic for finding the items that the current line applies to. On the **Header price attribute group** FastTab, review the logic that's set up for selecting the customers that the current pricing rule applies to. The values apply to all lines in the current pricing rule and are read-only here. (You can change them in the header price attribute group settings.)

3. In the **Price attribute group combination** field, select the combination of price attributes that you use to define the items for the current line. The combinations that are available for selection are defined for the price component code that's selected for the current pricing rule. However, only the right side of the combination name (the line price attribute group name) is relevant, because the header attributes are common to all lines for the pricing rule, as mentioned in the previous step. Select the combination where the right side of the name matches the way that you want to define the collection of items that the line applies to.

4. If the selected price attribute group combination considers item (line) attribute values (that is, if it doesn't apply to *all* items), the **Line price attribute group** FastTab is available. In this case, for each row on the **Line price attribute group** FastTab, enter or select one or more values in the **Value** column to define the rules for selecting items. The collection of attributes that appears comes from the price attribute group combination that you selected. The following rules apply:

    - All rows are combined by using a logical AND operator. Therefore, only those items that have matching values for *all* rows are included.
    - If you want to create one or more rows that include multiple values, set the **Enable multiple selections** option to *Yes*. You can then add a comma-separated list of values in the **Value** column for each row. These values are combined by using an OR operator. Therefore, the row finds items that match *any* of the values in the list.
    - You can specify values to exclude by adding an exclamation mark (!) before the value. This exclamation mark is known as an exclusion prefix. For example, to find all items except *A0001*, set the **Value** field to *!A0001* for the attribute where the **Attribute** field is set to *Item number*. You can automatically add the exclusion prefix to the values of any row by selecting the row and then selecting **Exclude values in selected lines**.

5. On the **Preview matching results (Products)** FastTab, view the preview of items that match the conditions set up so far.

    - If the list includes any items that you want to exclude, select the target rows, and then select **Exclude** on the toolbar.
    - The **Line type** column indicates which items you selected to exclude.
    - To re-include a previously excluded item, select it, and then select **Include** on the toolbar.
    - To view, exclude, and/or re-include specific item variants, select **All variants** on the toolbar. While you're viewing the variants, you can select **Product master** on the toolbar to go back to the standard item list.

6. Select **OK** to add the new line to the grid on the **Lines** FastTab.

7. Set up the calculation rules for the new line by using the columns in the grid, as described in the next section.

If you need to return to the **Edit price attributes** dialog box to change the set of items that a line applies to, select the line, and then select **Edit line price attribute** on the toolbar.

Set line values to define calculation rules and further refine the item selection

The settings for each line on the **Lines** FastTab vary based on the type of pricing rule that you're working with. The following fields and information might be available:

- **Line group type** – This field shows whether the line applies to a specific group of items or to all items.
- **Line price attribute group** – If the **Line group type** field is set to *Group*, this field shows the name of the selected line price attribute group.
- **Price attribute detail** – This field summarizes the values set for the line in the **Edit price attributes** dialog box. To change these values, select **Edit price attribute** on the FastTab toolbar.
- **Combination rank** – This field shows the combination rank that was generated for the price attribute group combination that you selected for the line in the **Edit price attributes** dialog box. Rankings enable the system to determine which pricing rule is used if an order or order line qualifies for more than one rule. Learn more in Price component codes.
- **Required line quantity** – For free-item discounts where the **Criteria type** field is set to *Quantity*, enter the minimum quantity that must be ordered to qualify for the discount.
- **Required line amount** – For free-item discounts where the **Criteria type** field is set to *Amount*, enter the minimum amount that must be ordered to qualify for the discount.
- **Allow unit conversion** – Select this checkbox to convert the selling unit to the unit that's used for the pricing rule as required.
- **Line type** – Select one of the following values:
  - *Include*
  - *Exclude*

- **Calculation type** – Select one of the following values to specify how the discount or price adjustment for the current line should be calculated:
  - *Percentage off* or *Percent* – Calculate the discount or price adjustment value as a percentage of the price.
  - *Amount off* or *Amount* – Calculate the discount or price adjustment by using a fixed value that's added to or subtracted from the price.
  - *Unit price* – Set a new, fixed unit price.
- **Percent** or **Percentage off** – If you're using a percentage-based calculation type, enter the percentage.
- **Amount** or **Amount off** – If you're using an amount-based calculation type, enter the amount.
- **Unit price** – If you're using the *Unit price* calculation type, enter the new unit price.
- **Quantity limit** – The field shows the maximum order quantity that the discount applies to. This limit applies to all lines on the **Lines** FastTab. You can't edit this value separately for each line, but you can edit it for all lines at the same time by using the **Quantity limit** field on the **Price/discount** FastTab.
- **Number of products needed** – This field shows the number of items that the customer must buy in this line group to qualify for the discount. For mix-and-match discounts, the value is read-only and is taken from the group that's selected in the **Line group** field.
- **Line group** – If you're setting up a mix-and-match discount, select the line group that applies to the line. Before you can select a value, you must set up your line groups, add them to the current pricing rule, and configure a color and item threshold for them, as described in Mix-and-match discounts. The line is highlighted in the color that's configured for the selected line group (if any color was configured), and the **Number of products needed** value is updated to match the selected line group configuration.
- *Other dimensions* – The grid might include additional columns that show item, storage, and tracking dimensions (such as **Color**, **Warehouse**, and **Serial number**). To select which dimensions are shown, select **Display dimensions** on the toolbar. Enter values in these columns to limit the line so that it applies only to items that match the specified dimension values.

Enter information on the Lines details FastTab

To add a note that provides more information about a line on the **Lines** FastTab, select the relevant line. Enter your note in the **Description** field on the **Line details** FastTab.

Set up header price attribute values

Use header price attributes to control which customers the current pricing rule applies to. The limits apply to all lines and items that the rule applies to. (Learn more in the Enter information on the Lines and Line details FastTabs section of this article.) Follow these steps to set the header price attributes for the current pricing rule.

> ⓘ **Note**
>
> Before you can set header price attributes, you must assign a price component code on the **General** FastTab.

1. On the Action Pane, select **Header price attribute group**.
2. The **Edit price attributes** dialog box appears. This dialog box lets you set up the logic for finding the customers that the current pricing rule applies to. On the **Header price attribute group** FastTab, review and set the following fields:
    - **Scope of price attributes** – This read-only field indicates the type of attributes that your settings apply to. It always shows *Header*.
    - **Group type** – Select the type of customer selection that you want to set up. The available values depend on the price attribute combinations that are available for your selected price component code. The following values might be available:
        - *Group* – If you select this value, the dialog box provides a group of header attributes that you can assign values for, so that you can limit the set of customers that the pricing rule applies to.
        - *All* – The pricing rule applies to all customers. If you select this value, no further steps are required. Therefore, you can skip the rest of this procedure and just select **OK** to apply your settings.
    - **Price attribute group** – If you set the **Group type** field to *All*, select a price attribute group. The available values depend on the attribute groups that you enabled for the selected price component code. The value that you select affects the set of attributes that you can work with in the dialog box.

3. If you selected a price attribute group, the attributes from it appear on the **Header price attribute group** FastTab. For each row, enter or select one or more values in the **Value** column to define the rules for selecting customers. The following rules apply:

    - All rows are combined by using a logical AND operator. Therefore, only those customers that have matching values for *all* rows are included.
    - If you want to create one or more rows that include multiple values, set the **Enable multiple selections** option to *Yes*. You can then add a comma-separated list of values in the **Value** column for each row. These values are combined by using an OR operator. Therefore, the row finds customers that match *any* of the values in the list.
    - You can specify values to exclude by adding an exclamation mark (!) before the value. This exclamation mark is known as an exclusion prefix. For example, to find all customers except *US-001*, set the **Value** field to *!US-001* for the attribute where the **Attribute** field is set to *Customer account*. You can automatically add the exclusion prefix to the values of any row by selecting the row and then selecting **Exclude values in selected lines**.

4. On the **Preview matching results (Customers)** FastTab, view the preview of customers that match the conditions that you set up so far.

    - If the list includes any customers that you want to exclude, select the target rows, and then select **Exclude** on the toolbar.
    - The **Line type** column indicates which customers you selected to exclude.
    - To re-include a previously excluded customer, select it, and then select **Include** on the toolbar.

5. Select **OK** to save your settings and close the dialog box.

Set up mix-and-match line groups

If you're working with a mix-and-match discount pricing rule, select **Mix and match line groups** to select which mix-and-match line groups can be assigned on the **Lines** FastTab. Specify the number of products that must be bought from each group to qualify for the discount. For information about how to set up mix-and-match line groups, see Mix-and-match discounts.

Resolve concurrency within price component codes

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Concurrency rules let you define what happens if multiple pricing rules apply to the same order and/or order line. You can set up concurrency rules to control whether the customer receives just one of the matching rules (and if so, which one they receive), or whether the rules are combined (and if so, how they're combined). There are two types of concurrency:

- **Across-price-component-code concurrency** – This type of concurrency controls how the different price component codes that are included in a price structure combine with each other. A price structure defines a collection of different types of price component codes (including base price, sales agreement price, margin components, discounts, and/or charges), the order that the codes are calculated in, and the way that the price adjustments are calculated and combined to determine the final price.
- **Within-price-component-code concurrency** – Any number of pricing rules can be associated with each price component code that's included in a price structure. This principle is especially true of discounts. This type of concurrency occurs when an order or order line qualifies for more than one pricing rule that's associated with the same component code. For example, if you define a price component code that's named *Seasonal promotion events*, and you associate multiple discount rules with it, multiple pricing rules might apply to the same order line. Therefore, in the *Seasonal promotion events* price component code, you'll set up concurrency rules to control whether the customer receives just one of the matching discounts (and if so, which one they receive), or whether the discounts are combined (and if so, how they're combined).

This article explains how to manage *within-price-component-code concurrency*. For information about how to manage *across-price-component-code concurrency*, see Resolve concurrency across price component codes.

Types of within-price-component-code concurrency modes

The following types of within-price-component-code concurrency modes are available, depending on the type of price component code:

- **Exclusive** – The pricing rule can't be combined with other rules that are associated with the same price component code. If more than one of these rules are set up as exclusive, the price engine applies the rule that has the largest discount.
- **Best price** – Pricing rules that use this concurrency mode will compete for the largest discount (lowest price).
- **Compounded** – All applicable pricing rules are combined. On the **Pricing management parameters** page, you can configure the system so that each calculation is based on either the original price or a running total of all adjustments so far. Learn more in the System settings for resolving discount concurrency within a price component code section of this article.
- **Always apply** – The pricing rule always applies. This calculation is always applied last within a price component code.
- **Price attribute combination rank** – Pricing rules that use this concurrency mode don't compete for prices. Instead, they compete based on which rule has the highest *price attribute combination rank*. If multiple rules have the same highest rank in the same price component code, they're combined.

Configure within-price-component-code concurrency modes

You can view and/or set within-price-component-code concurrency modes in several places in the system:

- **Price component code level** – Each relevant price component code has a default within-price-component-code concurrency setting. The available modes vary, based on the type of price component code. This setting can be overwritten in any or all pricing rules as required. Learn more in Price component codes.
- **Price structure level** – Each price component code that's included in a price structure shows its default concurrency mode, but you can't edit it here. Learn more in Arrange price component codes into a price structure.
- **Pricing rule level for discounts and margin price adjustments** – The concurrency mode that's assigned to a pricing rule overrides the default mode that's assigned by its associated price component code. Learn more in Pricing rules for discounts and margin price adjustments.
- **Company level for sales trade agreements** – Sales trade agreements are set up by using trade agreement journals, where the pricing rules are defined by the related journal lines. Concurrency rules for sales trade agreements are defined on the **Pricing management**

parameters page for each company. For information about the options that are available and how to use them, see Sales trade agreement prices.

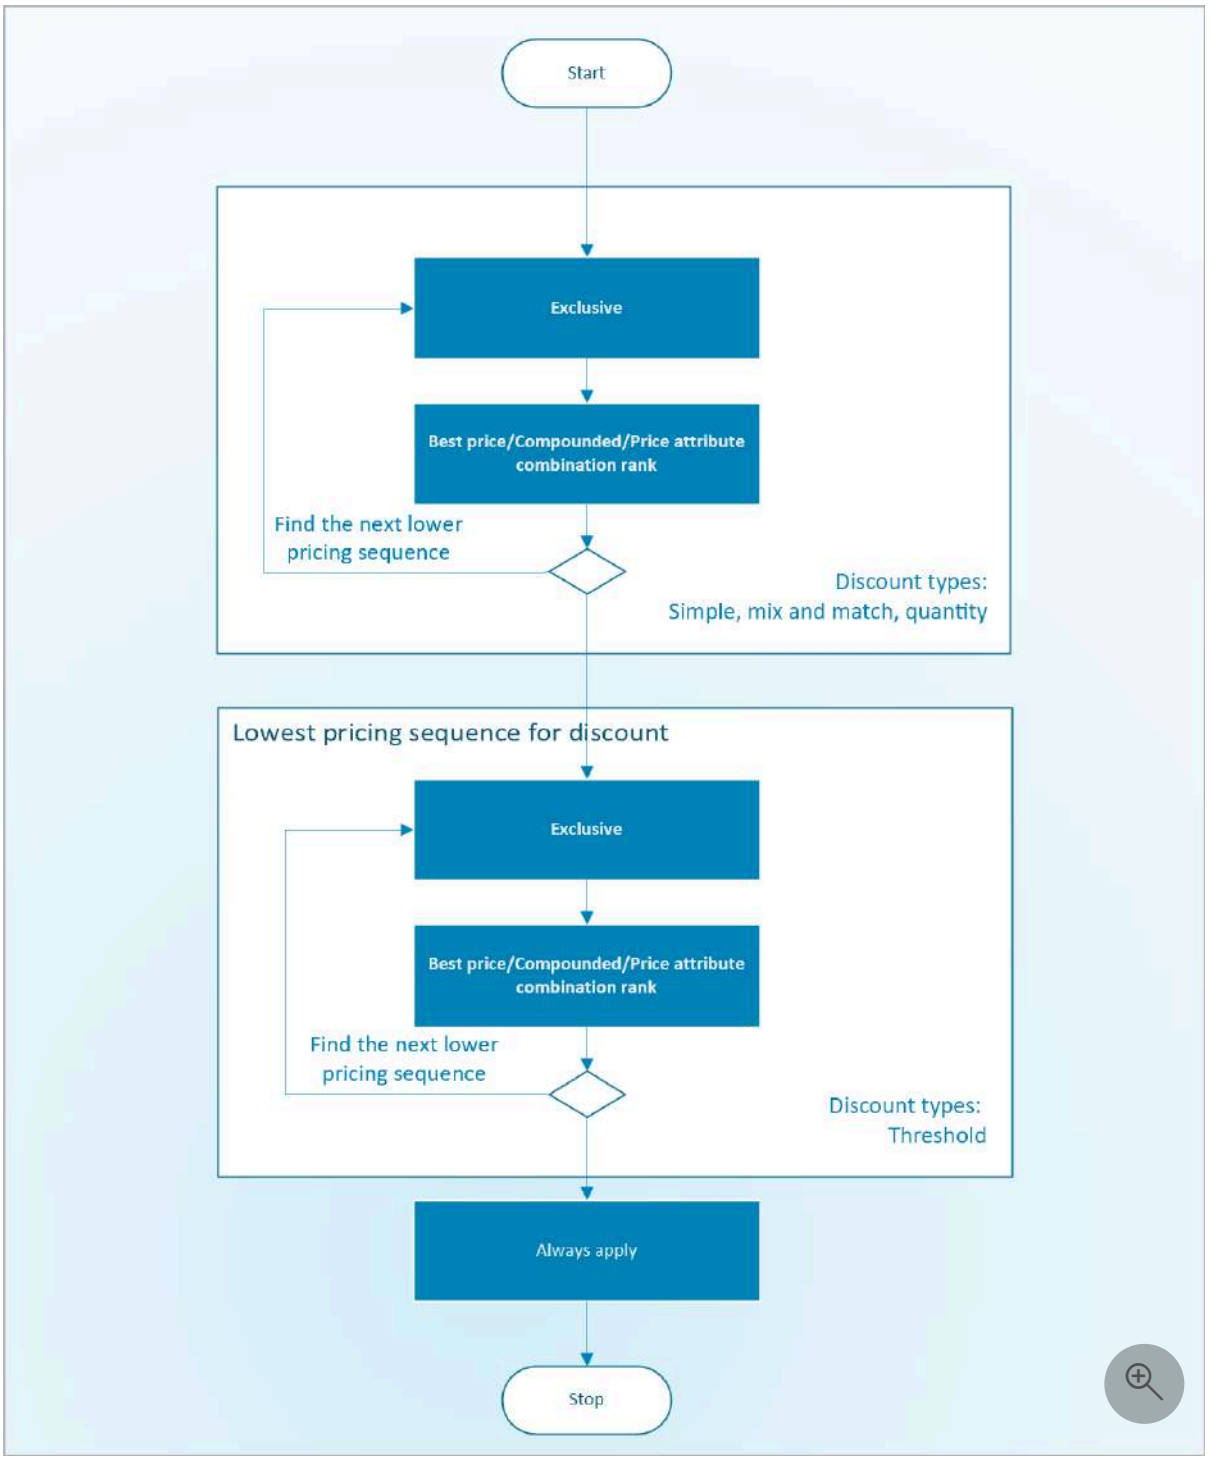
System settings for resolving discount concurrency within a price component code

A few settings on the **Pricing management parameters** page affect the way that concurrent discounts are calculated. The calculation method can, in turn, affect the way that some of your price structure settings work as they apply to discounts. Follow these steps to set up the calculation.

1. Go to **Pricing management** > **Setup** > **Pricing management parameters**.
2. On the **Prices and discounts** tab, on the **Discount concurrency control** FastTab, under **Best price and compound concurrency control model**, select one of the following options:
    - *Best price and compound within priority, never compound across priorities*
    - *Best price only within priority, always compound across priorities*
    - *Best price and compound within priority, best price and compound across priority*
3. Under **Discount compound behavior**, select one of the following options:
    - *Compound*
    - *Compound on the original price*
4. Set the **Enable competition between exclusive threshold and other periodic discounts** option to *Yes* if exclusive threshold discounts should compete with exclusive non-threshold discounts, but priority should still apply. The behavior of best-price and compounded threshold discounts will remain unchanged (that is, they won't compete with the non-threshold discounts).

Discount determination flow

The following flow chart shows how pricing rules, the price structure, and concurrency models work together to resolve within-price-component-code concurrency.



Example

Here's an example that shows how concurrency determination works.

Item *BT023* has an item price of *$1,565.00*, the concurrency mode is *Compounded*, and your system includes the discount pricing rules that are shown in the following table. The pricing sequence comes from your price structure.

Expand table

Price component code	Pricing sequence	Pricing rule ID	Concurrency mode	Calculation method	Value	Discount type
DIS 01	30	DIS01-01	Best price	Percentage	10	Simple
DIS 01	30	DIS01-02	Always apply	Percentage	5	Simple
DIS 02	40	DIS02-01	Compounded	Percentage	10	Simple
DIS 02	40	DIS02-02	Always apply	Percentage	8	Simple
DIS 03	50	DIS03-01	Compounded	Amount	20	Threshold
DIS 03	50	DIS03-02	Always apply	Amount	10	Threshold

An order is placed for a quantity of *1* of item *BT023*. Therefore, the system applies the rules in the previous table to calculate the discount that's shown in the following table. The result is a final price of $1,080.45.

Expand table

Concurrency mode	Pricing sequence	Discount price component code	Pricing rule ID	Calculation method	Value	Discount amount	New unit price
Best price	30	DIS01	DIS01-01	Percentage	10	156.50	1,408.50
Compounded	40	DIS02	DIS02-01	Percentage	10	140.85	1,267.65
Threshold	50	DIS03	DIS03-01	Percentage	20	20.00	1,247.65
Always apply	30	DIS01	DIS01-02	Percentage	5	62.38	1,185.27
Always apply	40	DIS02	DIS02-02	Amount	8	94.82	1,090.45
Always apply	50	DIS 03	DIS03-02	Amount	10	10.00	1,080.45

Resolve concurrency across price component codes

Article • 10/28/2024

Concurrency rules let you define what happens if multiple pricing rules apply to the same order and/or order line. You can set up concurrency rules to control whether the customer receives just one of the matching rules (and if so, which one they receive), or whether the rules are combined (and if so, how they're combined). There are two types of concurrency:

- **Across-price-component-code concurrency** – This type of concurrency controls how the different price component codes that are included in a price structure combine with each other. A price structure defines a collection of different types of price component codes (including base price, sales agreement price, margin components, discounts, and/or charges), the order that the codes are calculated in, and the way that the price adjustments are calculated and combined to determine the final price.
- **Within-price-component-code concurrency** – Any number of pricing rules can be associated with each price component code that's included in a price structure. This principle is especially true of discounts. This type of concurrency occurs when an order or order line qualifies for more than one pricing rule that's associated with the same component code. For example, if you define a price component code that's named *Seasonal promotion events*, and you associate multiple discount rules with it, multiple pricing rules might apply to the same order line. Therefore, in the *Seasonal promotion events* price component code, you'll set up concurrency rules to control whether the customer receives just one of the matching discounts (and if so, which one they receive), or whether the discounts are combined (and if so, how they're combined).

This article explains how to manage *across-price-component-code concurrency*. For information about how to manage *within-price-component-code concurrency*, see Resolve concurrency within price component codes.

Set across-price-component-code concurrency options for each price structure

Concurrency across price components codes affects only discounts and margin price adjustments. You configure the setting at the price structure level, by using the

Concurrency mode across priority field on the **Price trees** page. The following values are available:

- *Compounded* – The system first computes the price adjustment or discount for each line in the price structure. It then calculates the final discount or adjustment by adding the value of every line. This value is available only for lines where the **Price component** field is set to *Discounts* or *Margin component*. (For margin components, this value is the only one that's available.)
- *Best price* – If the price structure includes more than one price component code that has this value, only one of the lines (the one that has the largest discount) will contribute to the final unit price. This value is available only for lines where the **Price component** field is set to *Discounts*.

The **Concurrency mode across priority** setting affects discount calculations only when the *Best price and compound within priority, best price and compound across priority* option is selected under **Best price and compound concurrency control model** on the **Pricing management parameters** page. Learn more in the System settings for resolving discount concurrency across price component codes section of this article.

As was mentioned, margin components are always compounded across components (in other words, the **Concurrency mode across priority** field is always set to *Compounded* for margin components in your price structures). However, you must still set up each price structure to control whether each adjustment is calculated by using the base price or the compound price (that is, the running total). The option that you choose can have a significant effect on your final prices for margin price adjustments that are calculated as a percentage. For each margin component in your price structures, you can set the option by using the **Compound** checkbox. For an example that shows how the setting of this checkbox affects your final prices, see the Example price calculation using a mix of compound and non-compound margin components section of this article.

For information about how to set up price structures, see Arrange price component codes into a price structure.

System settings for resolving discount concurrency across price component codes

A setting on the **Pricing management parameters** page affects the way that concurrent discounts are calculated. The calculation method can, in turn, affect the way that some of your price structure settings work as they apply to discounts. Follow these steps to set up the calculation.

1. Go to **Pricing management** > **Setup** > **Pricing management parameters**.

2. On the **Prices and discounts** tab, on the **Discount concurrency control** FastTab, under **Best price and compound concurrency control model**, select one of the following options:

    - *Best price and compound within priority, never compound across priorities*
    - *Best price only within priority, always compound across priorities*
    - *Best price and compound within priority, best price and compound across priority*

Example: Price calculation that uses a mix of compound and non-compound margin components

If your price structure includes multiple margin and/or discount components, the order that the components are calculated in and the method that's used to combine them can significantly affect the final price.

The following table shows an example of a single price structure setup and its resulting calculations.

Expand table

Price component code	Description	Pricing sequence	Calculation method	Value	Compounded	Calculated line value	New unit price
Base	Base price - inventory Cost	10				$1,000.00	$1,000.00
MC01	Ullage	20	Percent	5	No	$50.00	$1,050.00
MC02	Freight	30	Percent	-2	Yes	-$21.00	$1,029.00
MC03	Group Margin price adjustment	40	Amount	10	No	$10.00	$1,039.00
MC04	Contract Margin price adjustment	50	Percent	5	Yes	$51.95	$1,090.95
MC05	Pickup fee	60	Amount	2	Yes	$2.00	$1,092.95

Price component code	Description	Pricing sequence	Calculation method	Value	Compounded	Calculated line value	New unit price
MC06	Other cost to sell	70	Percent	5	Yes	$54.65	$1,147.60

The system applies the following rules to calculate the final unit price:

- A new unit price is calculated for each line, according to the pricing sequence.
- For non-compounded lines, the line value is calculated based on the original base price.
- For compound lines, the line value is calculated based on the previous line's new unit price.
- Each line's new unit price is found by adding its calculated line value to the new unit price from the previous line.
- Calculation continues until all lines have been processed. The result is the final unit price.

Example: Price calculation that uses a mix of compound and best-price discount components

The following table shows an example of a price structure that uses a mix of best-price and compounded components.

Expand table

Price component code	Price sequence	Concurrency mode across priority	Price component	Computed line value
MAC01	10	Compounded	Margin component	$50
MAC02	20	Compounded	Margin component	$20
DIS 01	30	Best price	Discounts	$10
DIS 02	40	Best price	Discounts	**$20**
DIS 03	50	Compounded	Discounts	$30

In addition, on the **Pricing management parameters** page, the *Best price and compound within priority, best price and compound across priority* option under **Best price and compound concurrency control model** is selected. In the name of this option, *priority* refers to each price component code in the sequence. (This setting affects the way that the discount lines are interpreted.) Therefore, the following unit price modifications apply:

- The total price adjustment is the sum of the margin component lines: **$70**.
- The best price (largest discount) for the best-price lines is $20. The compounded discount is then added to this price. Therefore, the total discount is **$50**.

Calculate prices and discounts without creating sales orders

10/24/2025

Unified pricing management in Dynamics 365 Supply Chain Management can calculate customer and volume-specific prices and discounts without requiring you to create a sales order. This capability is useful both when creating quotes and when integrating with external selling systems where you need to calculate prices without creating a sales order. To trigger pricing and discount calculations programmatically, you just need to provide product, quantity, and customer details.

This feature exposes key calculation methods and provides sample code that you can use to implement your own custom pricing logic. If you don't have a Commerce Scale Unit (CSU) API license but still want to integrate pricing with third-party systems, use this capability to build custom services to expose pricing via APIs. You can leverage this extensibility to connect pricing seamlessly with external applications.

By carefully preparing transaction data, managing attributes consistently, and leveraging the pricing engine's capabilities, you can achieve accurate, dynamic pricing tailored to your business needs.

This article demonstrates a practical method for integrating external systems with the Unified pricing management pricing engine by using custom logic without requiring a Commerce Scale Unit. This approach enables flexible, attribute-driven pricing logic that you can embed into your applications.

Learn more about custom service development in Custom service development.

Step 1: Gather input data

The first step in the pricing workflow is to collect all relevant input data required for accurate and context-aware pricing calculations. These inputs serve as the foundation for building the transaction and determining which pricing rules apply. You might get these inputs from various sources such as user input, query strings in URLs, external APIs, or other integrated systems. Gathering input data ensures that the pricing engine receives all necessary context to evaluate and apply the correct pricing logic. Missing or incomplete inputs can lead to inaccurate pricing or skipped discount rules.

The following list outlines the most common data elements used in pricing scenarios. Use these inputs to populate transaction objects and influence pricing calculations.

- **Item numbers** – Unique identifiers for the products that customers purchase. These identifiers are mandatory.
- **Customer account numbers** *(optional)* – Identify the buyer and apply customer-specific pricing, discounts, or loyalty-based rules.
- **Quantities** *(optional)* – Specifies the number of units per item. Quantity can affect volume-based pricing or tiered discount structures.
- **Attributes** *(optional)* – Custom fields that provide additional context, such as:
  - **Site** – Indicates the location or warehouse, which might influence regional pricing.
  - **Channel ID** – Helps apply channel-specific pricing rules.
  - **Delivery mode**, **Tax group**, or **Promotion code** – Other optional fields that might trigger specific pricing logic.

X++

```
// Sample Code: Extracting Input Parameters from URL
// This X++ snippet demonstrates how to retrieve parameter values for item numbers
and Customer account numbers from the URL input. This is typically used in
runnable classes.
str itemid = urlUtil.getQueryParamValue('itemid');
str custAccount = urlUtil.getQueryParamValue('custAccount');
```

Step 2: Prepare transaction objects

After you collect the input data, construct structured transaction objects that represent the sales order and its individual lines. These objects serve as the core data model for the pricing engine. They're essential for passing all relevant information—such as item details, quantities, customer context, and unit of measure—into the pricing logic. This step transforms raw input parameters into structured Commerce Runtime (CRT) objects that the pricing engine can process. These objects encapsulate the full context of the transaction, enabling accurate and rule-based price calculations.

The pricing engine expects the transaction to be represented by two primary object types:

- **Sales transaction** – A container for the overall order. It includes customer information, currency, channel context, and a collection of sales lines.
- **Sales lines** – Each line represents a single item in the order. It includes item-specific data such as product ID, quantity, unit of measure, and line identifiers.

The following X++ code demonstrates how to initialize a sales transaction and populate it with one or more sales lines by using the input data. You need this setup before invoking the pricing engine.

X++

```
// This code initializes the transaction and populates it with sales lines using
the input data. It sets up the necessary fields for each item, preparing the data
for pricing calculations.
using Microsoft.Dynamics.Commerce.Runtime.Services.PricingEngine;
using CrtSalesTransaction =
Microsoft.Dynamics.Commerce.Runtime.DataModel.SalesTransaction;
using CrtSalesLine = Microsoft.Dynamics.Commerce.Runtime.DataModel.SalesLine;
using CrtPriceAndDiscountCalculationParameters =
Microsoft.Dynamics.Commerce.Runtime.Services.PricingEngine.PriceAndDiscountCalcula
tionParameters;
int salesLinesOrderField = 1;
str lineId = strRFix(int2str(salesLinesOrderField), 3, '0');
InventTable invTbl = InventTable::find(iItemId);
CrtSalesTransaction crtSalesTransaction = new CrtSalesTransaction();
crtSalesTransaction.set_CustomerId(custAccount);
CLRObject clrSalesLines = crtSalesTransaction.get_SalesLines();
CrtSalesLine crtSalesLine = new CrtSalesLine();
crtSalesLine.set_ItemId(itemId);
crtSalesLine.set_Quantity(qty);
crtSalesLine.set_SalesOrderUnitOfMeasure(invTbl.inventTableModuleSales().UnitId);
crtSalesLine.set_LineId(lineId);
crtSalesLine.set_LineNumber(salesLinesOrderField);
clrSalesLines.Add(crtSalesLine);
```

Step 3: Handle pricing attributes

To ensure accurate and context-aware pricing, the pricing engine relies on attribute-based logic. These attributes can exist at both the header level (order context) and the line level (item context). Calculating hash keys for these attributes is essential, as they serve as identifiers that help the pricing engine match the correct pricing rules. It prepares the pricing context by generating and storing attribute hash keys, enabling the pricing engine to match and apply the correct pricing rules based on attributes. This step enables the pricing engine to apply differentiated pricing rules based on custom attributes such as site, channel, product category, or customer type. By generating hash keys, you create a consistent and secure way to reference attribute values during pricing evaluation.

The following X++ sample code demonstrates how to process pricing attributes and generate hash keys for both the transaction header and each sales line that the pricing engine uses to evaluate applicable pricing rules.

X++

```
// Put the attribute value into the corresponding field in the temporary sales
table. The sales table record don't need to be inserted into the database
SalesTable salesTable;
salesTable.CustAccount = custTable.AccountNum; // Put the customer account to make
sure the customer attribute can be matched
```

```
SalesTable.InventSiteId = 'CENTRAL'; // Put the sales table attribute if that is
provided in parameter
RetailTempOrderItem tempOrderItem;

// Put the attribute value into the corresponding field in the temporary sales
line. The sale lines record don't need to be inserted into the database
SalesLine salesLine;
salesLine.ItemId = itemId; // Put the itemid to make sure the product attribute
can be matched
salesLine.InventTransId = lineId;
Set headerHashSet = new Set(Types::String);
Map lineHashMap = new Map(Types::String, Types::Class);
Set lineHashSet = new Set(Types::String);
Set hashKeySet = GUPHashHelper::getPropertyHashKeySetForPricingObject(salesTable,
GUPPricingAttributeSourceLevel::Header);
headerHashSet = GUPHashHelper::calculateHashValueForHashKeySet(hashKeySet);
hashKeySet = GUPHashHelper::getPropertyHashKeySetForPricingObject(salesLine,
GUPPricingAttributeSourceLevel::Line);
Set lineHashSetOneLine =
GUPHashHelper::calculateHashValueForHashKeySet(hashKeySet);
lineHashSet = Set::union(lineHashSet, lineHashSetOneLine);
lineHashMap.add(salesLine.InventTransId, lineHashSetOneLine);
ttsbegin;
tempOrderItem.itemId = itemId;
tempOrderItem.LineNum = salesLinesOrderField;
tempOrderItem.UnitOfMeasure =
UnitOfMeasure::findBySymbol(invTbl.inventTableModuleSales().UnitId).RecId;
tempOrderItem.insert();

// Create pricing manager
GUPRetailPricingDataManagerV4 gupPricingManager =
GUPRetailPricingDataManager::constructDefault(0, transId, tempOrderItem, true);
gupPricingManager.parmHeaderHashSet(headerHashSet);
gupPricingManager.parmLineHashMap(lineHashMap);

/* For version 10.0.45.
GUPPropertyHashTmp orderAttributeValueHeaderHash, orderAttributeValueLineHash;
GUPHashHelper::insertHashTempDB(orderAttributeValueHeaderHash, headerHashSet);
GUPHashHelper::insertHashTempDB(orderAttributeValueLineHash, lineHashSet);
gupPricingManager.parmOrderAttributeValueHeaderHash(orderAttributeValueHeaderHash)
;
gupPricingManager.parmOrderAttributeValueLineHash(orderAttributeValueLineHash);
*/

// For version 10.0.46.
gupPricingManager.parmLineHashSet(headerHashSet);
gupPricingManager.processHash();

ttscommit;
```

If your input attribute values include custom attributes (such as a customer's loyalty tier), use specialized helper methods to generate, hash, and register these attributes before passing them to the pricing engine. These attributes aren't part of the standard transaction schema, so

you need to explicitly handle them to ensure the pricing logic recognizes and evaluates them correctly.

To support these scenarios, you must:

- Identify the relevant attributes at either the header (order-level) or line (item-level).
- Map them to pricing attribute definitions by using `GUPPricingAttributeLink`.
- Generate hash keys by using `GUPHashHelper::getPropertyHashKeySetForPricingObject()`.

X++

```
Map salesTableAttributeValues = new Map(Types::String, Types::AnyType);
GUPPricingAttributeLink attrLink; // find the attribute that need to be specified
salesTableAttributeValues.add(attrLink.pricingAttribute().GetHashString(),
&lt;particular attribute value&gt;);
Set hashKeySet = GUPHashHelper::getPropertyHashKeySetForPricingObject(salesTable,
GUPPricingAttributeSourceLevel::Header, null, null, null,
salesTableAttributeValues);
Map salesLineAttributeValues = new Map(Types::String, Types::AnyType);
GUPPricingAttributeLink attrLink; // find the attribute that need to be specified

// Put the sale table attribute value on the map
salesLineAttributeValues.add(attrLink.pricingAttribute().GetHashString(),
&lt;particular attribute value&gt;);
Set hashKeySet = GUPHashHelper::getPropertyHashKeySetForPricingObject(salesLine,
GUPPricingAttributeSourceLevel::Line, null, salesLineAttributeValues);
```

Step 4: Specify price tree name

If your pricing logic depends on a specific pricing structure with different price components, you must define the price tree name. This configuration determines which pricing tree the engine uses to evaluate and apply pricing rules. It allows for differentiated pricing structures across scenarios. The price tree acts as a logical framework that organizes pricing rules. By specifying the correct tree, you ensure that the pricing engine applies the appropriate pricing component structure.

- **Set the Price Tree Name from input parameters** – Use a predefined value passed into your service or class to assign the price tree name directly. Use this approach when the pricing structure is known and consistent across transactions.
- **Derive the Price Tree Name dynamically based on input attributes** – In more flexible scenarios, you can compute the tree name at runtime by using product or customer attributes. For example, you might derive the tree name from an input attribute value by using code such as `unifiedPricingParameter.PriceTreeName = GUPPricingTree::getPriceTreeByEcoResValue(<EcoResValue>).Name;`.

This sample code demonstrates how to set a static tree name directly.

```
X++
```

```
Microsoft.Dynamics.Commerce.Runtime.DataModel.UnifiedPricingParameter
unifiedPricingParameter = gupPricingManager.GetGlobalUnifiedPricingParameter();
unifiedPricingParameter.PriceTreeName = 'Inheritance';
```

Step 5: Invoke pricing engine methods

With all input data, transaction objects, and pricing attributes prepared, the next step is to invoke the pricing engine to calculate prices and discounts. This step is the core execution phase of the pricing workflow. The engine applies business rules, evaluates attribute-based conditions, and returns computed pricing results. This step activates the pricing logic by passing the prepared transaction and attribute data to the pricing engine. It ensures that all relevant pricing rules—such as discounts, price groups, and attribute-based conditions—are applied consistently and accurately.

The pricing engine processes the transaction object, which includes sales lines, customer information, and pricing attributes. It evaluates applicable pricing rules based on the configured price tree, attribute hash keys, and business logic. The engine returns calculated unit prices and discount amounts for each sales line.

The following X++ code demonstrates how to invoke the pricing engine methods to calculate prices and discounts:

```
X++
```

```
RetailCurrencyOperations currencyAndRoundingHelper = new
RetailCurrencyOperations(CompanyInfoHelper::standardCurrency());
System.DateTimeOffset dateTimeOffset =
RetailPricingEngineHelper::getSessionDateTimeInChannelTimeZone(0, today());
CrtPriceAndDiscountCalculationParameters calculationParameters = new
CrtPriceAndDiscountCalculationParameters();
CurrencyCode transactionCurrency = 'USD';

// Calculate price
PricingEngine::CalculatePricesForTransaction(
    crtSalesTransaction,
    gupPricingManager,
    currencyAndRoundingHelper,
    custTable.PriceGroup,
    transactionCurrency,
    dateTimeOffset);

// Calculate discount
PricingEngine::CalculateDiscountsForLines(
```

```
    gupPricingManager,
    crtSalesTransaction,
    currencyAndRoundingHelper,
    transactionCurrency,
    custTable.LineDisc,
    custTable.MultiLineDisc,
    custTable.EndDisc,
    false, // calculateSimpleDiscountOnly
    dateTimeOffset,
    calculationParameters);
```

Step 6: Retrieve and display results

After the pricing engine completes its calculations, the final step is to extract and utilize the computed prices and discounts from the transaction object. This step transforms the pricing engine's output into actionable data that you can present to users or integrate into downstream business processes such as order creation or analytics.

The pricing engine populates each sales line in the transaction object with calculated values. These values include the final unit price, discount amount, and potentially other pricing-related metadata. You can iterate through the sales lines to extract these values and format them for display or further processing. This step is critical for ensuring that the pricing logic is correctly applied and that the results are visible and usable. The following X++ code demonstrates how to loop through each sales line in the transaction and retrieve the final price and discount amount. Typically, you place this code at the end of your pricing service or runnable class, after the pricing engine has been invoked.

X++

```
clrSalesLines = crtSalesTransaction.get_SalesLines();
CLRObject enumeratorSalesLine = clrSalesLines.GetEnumerator();
while (enumeratorSalesLine.MoveNext())
{
    crtSalesLine = enumeratorSalesLine.get_Current();
    Price price = crtSalesLine.get_Price();
    Price discount = crtSalesLine.get_DiscountAmount();
}
```

Calculate prices for external systems through the pricing calculation API

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The pricing calculation API enables external applications to retrieve accurate, real-time pricing and discount calculation results directly from Microsoft Dynamics 365 Supply Chain Management. By providing key input data, such as product and customer details, external systems can programmatically access calculated prices without creating sales orders. This approach helps ensure pricing consistency across your sales channels and simplifies quoting and integration workflows.

> **Important**
>
> This API is designed for low- to moderate-frequency pricing queries from system-to-system integrations. It isn't intended to replace the Dynamics 365 Commerce Scale Unit (CSU) pricing APIs. For high-scale, high-performance pricing scenarios—such as e-commerce storefronts, point-of-sale (POS), or product catalog browsing—Commerce Scale Unit APIs remain the recommended approach. Learn more at Commerce pricing APIs.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.47 or later.
- Unified pricing management must be enabled in your environment.

Business scenarios

This API is a good fit when external systems need to validate or retrieve prices on demand, and the request volume is low or moderate. Typical scenarios include:

- **Quoting or contract validation tools** – Retrieve calculated prices to validate quotes against Supply Chain Management pricing rules.
- **Partner or ISV integrations** – Allow third-party solutions to access pricing logic without direct access to the Supply Chain Management UI.
- **Backend workflow services** – Trigger pricing lookups from automated workflows or batch processes.
- **Internal applications** – Give internal tools pricing insight without requiring order creation.

When to use Commerce Scale Unit pricing APIs instead

For high-performance pricing workloads, use the Dynamics 365 Commerce Scale Unit (CSU) pricing APIs instead of the pricing calculation API. CSU pricing APIs are purpose-built for scenarios that include:

- E-commerce and web shopping experiences
- Product detail page (PDP) pricing
- Cart and basket pricing
- Anonymous and authenticated consumer scenarios
- High concurrency and scalability requirements

If your scenario involves online storefronts, high-traffic B2B or B2C commerce, frequent or burst pricing requests, or customer-facing digital experiences, use Commerce pricing APIs instead.

Functional scope and limitations

The following table summarizes what the pricing calculation API supports and doesn't support.

Expand table

Supported	Not supported
Single-line price calculation per product	Multiline or cart-level discounts
Simple discounts	Basket pricing or promotion concurrency
Supply Chain Management pricing rules and pricing attributes	High-frequency or high-volume pricing calls
Quantity-based pricing (default quantity is 1)	E-commerce or storefront scenarios
Variant price ranges for product masters	

Authentication

The pricing calculation API uses OAuth 2.0 with Microsoft Entra ID (formerly Azure Active Directory). To authenticate, you need the following information:

- **Directory ID** (Tenant ID) – The identifier for your Microsoft Entra tenant.
- **Client ID** – The application (client) ID of your registered app.
- **Client Secret** – A secret generated for your registered app.
- **Scope** – Set to `{D365_URL}/.default`, where `{D365_URL}` is the base URL of your Supply Chain Management environment.

Register the external application

Before you can call the API, register your external application in both Microsoft Entra ID and Supply Chain Management. The following procedure describes how to set up the registration.

1. Go to the Azure portal and sign in with an account that has permissions to manage app registrations.

2. Go to **Microsoft Entra ID** > **App registrations** and either select an existing registration or create a new one. Note the **Application (client) ID** value.

3. Under the same app registration, go to **Certificates & secrets** and select **New client secret**. Enter a description, set the expiration period, and then select **Add**.

   > **Important**
   >
   > Copy the secret value immediately after it's generated. The value is only shown once and can't be retrieved later.

4. Sign in to Supply Chain Management and go to **System administration** > **Setup** > **Microsoft Entra ID applications**.

5. Select **New** to add a record to the grid. Then set the following fields for it:

   - **Client ID** – Enter the application (client) ID that you noted earlier.
   - **Name** – Enter a descriptive name for the application.
   - **User ID** – Select a user account that has appropriate permissions.

6. Select **Save**.

The following resources provide more information about how to register an application in Microsoft Entra ID:

- For instructions that show how to use Windows PowerShell to register an application in Microsoft Entra ID, see Use Azure PowerShell to create a service principal with a certificate.
- For complete details about how to manually register an application in Microsoft Entra ID, see the following articles:
  - Register an application in Microsoft Entra ID
  - Register a Microsoft Entra app and create a service principal

API endpoint

Send pricing requests to the following endpoint by using an HTTP POST method:

HTTP

```
POST
{D365_URL}/api/services/GUPPricingServiceGroup/GUPPricingService/getActivePrices
```

Replace `{D365_URL}` with the base URL of your Supply Chain Management environment.

Request structure

Wrap all input parameters inside a single request object. Parameter names are case-sensitive.

Request parameters

The following table describes the top-level parameters that you can include in the request body.

Expand table

Name	Type	Required/Optional	Description
`dataAreaId`	string	Required if `ChannelId` isn't provided	The company identifier (for example, `"usrt"`).
`activeDate`	DateTimeOffset	Optional (defaults to the current system date and time)	The date when prices and discounts are calculated.
`productIds`	array of long	Required if `LineContexts` isn't provided	A list of product record IDs to calculate prices for.

Name	Type	Required/Optional	Description
`priceLookupContext`	object	Required if `productIds` isn't provided	An object that provides additional context for filtering prices and discounts during lookup.
`calculateSimpleDiscountOnly`	boolean	Optional (defaults to `true`)	If set to `true`, only simple discounts are calculated. If set to `false`, the input is treated as a transaction for full calculation.
`includeVariantPriceRange`	boolean	Optional (defaults to `false`)	If set to `true`, the response returns the minimum and maximum prices among all variants for a product master.

> **Note**
>
> You must provide either `productIds` or `priceLookupContext` with `LineContexts` in each request, but don't provide both in the same request.

PriceLookupContext structure

The `priceLookupContext` parameter contains a `HeaderContext` object and an optional `LineContexts` array. Together, these elements provide the pricing engine with the information it needs to calculate accurate prices.

HeaderContext

The `HeaderContext` object provides order-level details such as the customer, channel, and inventory dimensions. The following table describes the fields that make up this object.

Expand table

Name	Type	Required/Optional	Description
`CustomerAccount`	string	Optional	The customer account number.
`ChannelId`	long	Required if `dataAreaId` isn't provided	The record ID of the channel where prices and discounts are calculated.

Name	Type	Required/Optional	Description
			Either `dataAreaId` or `ChannelId` must be provided.
`InventorySiteId`	string	Optional	The inventory site. If you don't specify this value, the system takes the default from the channel. If the channel isn't provided, the system takes the default from the customer account. To override defaults and leave the value blank, specify an empty string (`""`).
`InventoryLocationId`	string	Optional	The inventory location (warehouse). The same defaulting logic applies as for `InventorySiteId`.
`AffiliationLoyaltyTierLines`	array of objects	Optional	An array of affiliation and loyalty tier IDs. Each object contains an `AffiliationId` (long) and a `LoyaltyTierId` (long).
`SalesOrderProperties`	array of objects	Optional	Key-value pairs for additional order-level attributes. Each object contains a `Name` (string), an optional `TypeName` (string), and a `Value` (string).

> **Tip**
>
> The system automatically applies affiliation and loyalty tier information if the customer account links to the affiliation or loyalty tier. You don't need to include this information explicitly in the request unless you want to specify additional affiliations.

The following example shows a `HeaderContext` object that specifies a customer, channel, inventory dimensions, affiliation and loyalty tier data, and sales order properties.

JSON

```
"HeaderContext": {
    "CustomerAccount": "2001",
    "ChannelId": 5637144592,
    "InventorySiteId": "CENTRAL",
    "InventoryLocationId": "DC-CENTRAL",
    "AffiliationLoyaltyTierLines": [
        {
            "AffiliationId": 5637144579,
            "LoyaltyTierId": 5637144578
        },
```

```
        {
            "AffiliationId": 5637144577,
            "LoyaltyTierId": 0
        }
    ],
    "SalesOrderProperties": [
        {
            "Name": "order type",
            "Value": "3"
        },
        {
            "Name": "AW Material",
            "TypeName": "AW Text Type",
            "Value": "aluminium"
        }
    ]
}
```

LineContexts

The `LineContexts` array provides line-level details for each product. Use `LineContexts` when you need to specify attributes such as quantity, unit of measure, or delivery mode for individual products.

> **Important**
>
> Don't provide both `productIds` and `LineContexts` in the same request. Doing so can lead to conflicts or unexpected results.

The following table describes the fields available for each object in the `LineContexts` array.

Expand table

Name	Type	Required/Optional	Description
`ProductRecordId`	long	Required	The unique record ID of the product.
`UnitOfMeasureSymbol`	string	Optional	The unit of measure for the product (for example, `"ea"` or `"kg"`). If omitted, the product's base unit is used.
`InventorySiteId`	string	Optional	The inventory site for this line. The same defaulting logic applies as described for `HeaderContext`.
`InventoryLocationId`	string	Optional	The inventory location for this line. The same defaulting logic applies as described for

Name	Type	Required/Optional	Description
			`HeaderContext`.
`DeliveryMode`	string	Optional	The delivery mode for the sales line (for example, `"99"` for a specific mode).
`Quantity`	real	Optional (defaults to 1)	The quantity of the product.
`SalesLineProperties`	array of objects	Optional	Key-value pairs for additional line-level attributes. Each object contains a `Name` (string), an optional `TypeName` (string), and a `Value` (string).

The following example shows a `LineContexts` array with one product line that specifies a quantity, delivery mode, and a custom line property.

JSON

```
"LineContexts": [
    {
        "ProductRecordId": 22565421974,
        "UnitOfMeasureSymbol": "ea",
        "InventorySiteId": "",
        "InventoryLocationId": "",
        "DeliveryMode": "99",
        "Quantity": 3,
        "SalesLineProperties": [
            {
                "Name": "aw Material",
                "Value": "brass"
            }
        ]
    }
]
```

Sample request

The following example shows a complete request that uses `priceLookupContext` with both a `HeaderContext` and `LineContexts` array.

JSON

```
{
    "request": {
        "dataAreaId": "usrt",
        "activeDate": "2025-11-06T14:25:26.847-08:00",
        "priceLookupContext": {
```

```
            "HeaderContext": {
                "CustomerAccount": "004009",
                "ChannelId": 5637145360,
                "InventorySiteId": "CENTRAL",
                "InventoryLocationId": "DC-CENTRAL",
                "SalesOrderProperties": [
                    {
                        "Name": "order type",
                        "Value": "3"
                    }
                ]
            },
            "LineContexts": [
                {
                    "ProductRecordId": 22565421974,
                    "UnitOfMeasureSymbol": "ea",
                    "Quantity": 3,
                    "SalesLineProperties": [
                        {
                            "Name": "aw Material",
                            "Value": "brass"
                        }
                    ]
                }
            ]
        },
        "calculateSimpleDiscountOnly": true,
        "includeVariantPriceRange": false
    }
}
```

Response structure

The API returns a JSON response that contains transaction-level information and an array of item-level pricing results. Each item result includes the calculated price, discount details, and price source information.

Key response fields

The following table describes the key fields that the API returns for each item in the `ItemResults` array.

Expand table

Field	Type	Description
`ProductId`	long	The record ID of the product.

Field	Type	Description
`ItemId`	string	The item number of the product.
`BasePrice`	decimal	The base price of the product as defined in the product master.
`TradeAgreementPrice`	decimal	The price determined by applicable trade agreements.
`AdjustedPrice`	decimal	The price after any price adjustments are applied.
`CustomerContextualPrice`	decimal	The final calculated price for the customer, including applicable discounts.
`DiscountAmount`	decimal	The total discount amount applied to the product.
`CurrencyCode`	string	The currency code for the calculated price.
`UnitOfMeasure`	string	The unit of measure for the product.
`Quantity`	decimal	The quantity used in the calculation.
`MaxVariantPrice`	decimal	The maximum price among all variants (returned when `includeVariantPriceRange` is `true`).
`MinVariantPrice`	decimal	The minimum price among all variants (returned when `includeVariantPriceRange` is `true`).
`AttainablePriceLines`	array	An array of price lines that shows how the final price was determined, including the price method and origin.
`DiscountLines`	array	An array of discount lines that shows the discounts applied, including the offer name, percentage, and effective amount.

Sample response

The following example shows a response for a single product that has a trade agreement price of 30.00 USD and a 25% simple discount applied.

JSON

```
{
    "$id": "1",
    "Transaction": {
        "$id": "2",
        "InventorySiteId": "",
        "InventoryLocationId": "",
        "LoyaltyCardId": ""
    },
    "ItemResults": [
        {
```

```
            "$id": "3",

            ]
        }
    ],
    "FreeItemLines": null
}
```

Understand the sample pricing calculation

The response provides several price-related values that help you understand how the final customer price was determined. The following walkthrough explains the relationship between these values using the sample response shown earlier.

1. **Base price** – The system starts with the product's base price of $7.99, which comes from the released product definition.
2. **Trade agreement price** – Because a trade agreement applies to this product, the system evaluates it and determines a trade agreement price of $30.00.
3. **Adjusted price** – No price adjustments apply in this case, so the adjusted price remains $30.00.
4. **Discount calculation** – The system identifies an applicable simple discount ("Grand Opening") that provides a 25% discount. The effective discount amount is $7.50.
5. **Customer contextual price** – The final price for the customer is calculated as $30.00 – $7.50 = $22.50. This value is returned in the `CustomerContextualPrice` field.

Best practices

Keep the following best practices in mind when you work with the pricing calculation API:

- **Case sensitivity** – All parameter names are case-sensitive. Make sure you use the exact casing shown in this article when you construct requests.
- **Site and location defaults** – If `InventorySiteId` or `InventoryLocationId` isn't specified, the system takes defaults from the channel configuration. If the channel isn't provided, the system takes defaults from the customer account. To override defaults and leave the values blank, specify empty strings (`""`).
- **Choosing between productIds and LineContexts** – Use `LineContexts` for detailed line-level pricing scenarios, such as when you need to specify multiple products, attributes, or specific quantities. Don't mix `LineContexts` with `productIds` in the same request.
- **Affiliation and loyalty tier** – The system automatically applies affiliation and loyalty tier information if it's linked to the customer account. You don't need to include it explicitly in the request unless you want to specify additional affiliations.
- **Multiple attribute values** – The `SalesOrderProperties` and `SalesLineProperties` fields don't support multiple values for the same attribute in a single request. If you need results for different attribute values, split them into separate requests.

Extend the API

If you need to add custom parameters to the input or output of the pricing calculation API, use the extension points available in the `GUPPricingServiceClass` class. You can extend the following methods:

- `initHeaderPricingObjectHash` – Extend to add custom logic when the header-level pricing object is initialized.
- `initLinePricingObjectHash` – Extend to add custom logic when the line-level pricing object is initialized.
- `setProductPrice` – Extend to add custom fields or logic to the product price output.

Extension example

The following example shows how to extend the `initLinePricingObjectHash` method to read a custom property from the `SalesLineProperties` array and apply custom logic.

X++

```
using CrtSalesLine = Microsoft.Dynamics.Commerce.Runtime.DataModel.SalesLine;
```

```
[ExtensionOf(classStr(GUPPricingServiceClass))]
final class GUPPricingServiceClass_Extension
{
    protected void initLinePricingObjectHash(
        CrtSalesLine _crtSalesLine,
        SalesLine _pricingObject,
        Map _salesLineAttributeValues,
        GUPAPIPriceLookupLineContextContract _lineContext)
    {
        if (_lineContext.parmSalesLineProperties())
        {
            ListEnumerator enumerator =
_lineContext.parmSalesLineProperties().getEnumerator();
            str extensionInputName, extensionInputValue;
            while (enumerator.moveNext())
            {
                Newtonsoft.Json.Linq.JObject jsonObject = enumerator.current();
                extensionInputName = jsonObject.SelectToken('ExtensionInput')
                    ? jsonObject.SelectToken('ExtensionInput').ToString()
                    : '';
                extensionInputValue = jsonObject.SelectToken('ExtensionInputValue')
                    ? jsonObject.SelectToken('ExtensionInputValue').ToString()
                    : '';
                if (extensionInputName == "Test")
                {
                    // Implement logic to assign the value to the SalesLine
                    // or set the appropriate attribute.
                }
            }
        }
        next initLinePricingObjectHash(
            _crtSalesLine,
            _pricingObject,
            _salesLineAttributeValues,
            _lineContext);
    }
}
```

> **Note**
>
> The extension class must use the `ExtensionOf` attribute and call `next` to ensure that the standard logic continues to execute after your custom logic.

Pricing data import and export entities

Microsoft Dynamics 365 Supply Chain Management and Dynamics 365 Commerce use the data management framework (DMF) for import and export. The following articles provide more information about it:

- Data management overview
- Data import and export jobs overview

Unified pricing management provides an enhanced set of data entities designed specifically for importing and exporting pricing rules. These improvements strengthen DMF mapping accuracy, data validation, and staging performance.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.46 or later.
- The feature named *Unified pricing management pricing rule performance enhancement* must be turned on in feature management.

Available entities

Unified pricing management includes an enhanced set of data entities designed for importing and exporting pricing rules. The set comprises the following entities:

- `GUPMarginComponentPriceAdjustmentLineV2Entity`
- `GUPMarginComponentPriceAdjustmentV2Entity`
- `GUPOpenTradeAgreementJournalLineV2Entity`
- `GUPPriceDiscPriceAttributeCustomerGroupV2Entity`
- `GUPPriceTermJournalTransV2Entity`
- `GUPRetailDiscountLineV2Entity`
- `GUPRetailDiscountV2Entity`
- `GUPSalesAutomaticSalesDocumentHeaderChargeTableV2Entity`
- `GUPSalesAutomaticSalesDocumentLineChargeTableV2Entity`
- `GUPSalesAutomaticSalesDocumentLineChargeV2Entity`
- `GUPTAMRebateAndDeductionsAgreementHeaderV2Entity`

Procurement and sourcing overview

07/21/2025

This article gives an overview of the functionality that's available in the Procurement and sourcing module.

Procurement and sourcing covers all the steps from identifying a need for product and services through procuring the product, receipt, invoicing, and processing of payment with vendors. Procurement processes can be configured toward specific business needs by defining purchasing policies and workflows.

Identifying a need for product and services

The need for products or services can arise from *requisitions*, for example, when an employee requires a product. *Product catalogs* can be set up to guide the selection of available products to select from, or requests can be made for products that aren't yet made available in a catalog, allowing the purchasing department to consider how the product can be supplied.

Spending limits can be used to constrain requisition spending, and the *purchasing workflow* adds the option of requiring approval before ordering happen. It's also possible to specify budget fund allocation if necessary.

The procurement department identifies suppliers for required products and services, and this can involve a *request for quotation* being sent out to multiple potential suppliers. It's possible to share the specifications of the product that's being requested and potential vendors can view these to see if they can deliver a product that conforms with them. Vendors return their bids, which the procurement department then reviews before they select the supplier that they want to procure from.

Purchase orders include an option to send out a *purchase inquiry* to the vendor as an alternative to a more comprehensive request for quotation process. The purchase inquiry can be used to help establish terms like prices, discounts, and receipt date for the order. If vendors are set up to use the **Vendor** portal, purchase inquiry functionality is disabled. Instead the order is shared on the **Vendor** portal, and when a *confirmation request* is sent, the vendor can directly confirm the order.

Vendor catalogs can be used to collect information on the product assortment that vendors can supply. Vendors can publish their own catalog, so it's easier to keep the catalog up to date. It's possible to attach an *approved vendor list* to a product, and this can help guide vendor selection when new purchase orders are opened, and prevent the use of unintended vendors.

Procurement

Purchase orders can be created in several different ways including:

- As an outcome of a master planning fun that identified a demand that requires a purchase. This process generates planned purchase orders, and when these are released, purchase orders are generated.
- Through the processing of purchase requisitions that result in procurement.
- Through the processing of purchase agreements, where purchase orders are created as released orders from the agreements. This is commonly used when purchase agreements are used to represent blanket orders.
- Manually, when the purchase order that's created isn't based on another document.

Purchase orders that are configured with *purchase approval workflows* require approval before they're recorded as approved, and this is required before the order can be processed further.

Purchase orders are *confirmed* to represent that an agreement has been established with the vendor. The purchase order will then gradually progress through different states until ultimately being invoiced or canceled.

When you create a purchase order, many of the fields are prepopulated with values that default from the information stored about the vendor in the **Vendors** page. This means that there are a limited number of fields that you need to fill in on the purchase order, although you can choose to override the default values.

Prices and discounts

Prices and discounts include information about the prices, discounts, and rebate terms that they offer. Prices and discounts can be represented as *trade agreements*. Trade agreements represent vendor price lists with prices or discounts, and have a specific set of dates for which the agreement is valid. Prices and discounts can be negotiated and represented through *purchase agreements* with conditions like commitments to buy certain volumes or monetary amounts as a precondition for the negotiated terms. *Rebate agreements* can be created with vendors where the procurement of specific products or groups of products might trigger a rebate from the vendor depending on the purchase amount or volume.

Delivery options

There are different options for the delivery process associated with a purchase order. Ordered products can be split into *delivery* schedules, where parts of the ordered quantity can be planned for delivery on different dates. Delivery can also include *direct delivery* initiated from a sales order, which automates the generation of the packing slip on the sales order at the same

time as the product receipt is recorded on the purchase order. Purchase orders can also be part an *intercompany order* chain, also referred to as intercompany purchase orders, where products are ordered from a matching intercompany sales order. In this situation, some steps are automated across the two related intercompany orders.

Supplementary items

Products can be set up to include *supplementary items*. This is to propose products that are related to the product that's being ordered. The additional products might be required, or might be optional. In some cases, supplementary items might be added as free products that accompany the purchase of other products.

Purchase order charges

Charges can be assigned to the purchase order. This can happen automatically through setup of automatic charges or by adding the charges manually. Charges can be assigned to the order at the header level, or at the order line level. Accounting of charges can be set up in different ways. For example, you can set up a charge to be accounted as a product cost. If you do this, the charges must be assigned at the order line level before the order can be confirmed. There's an option that can help allocate charges from the order header to the lines.

Product receipt and invoicing

Purchase orders that include physical products commonly require *arrival registration* to happen within a warehouse, and after this a *product receipt* is registered for the order.

Some purchase orders include products that are services or other nonphysical products where receipt in a warehouse isn't needed. Products can be created as services or *procurement categories* can be used directly on the purchase order for such orders. With these orders, accounting of product receipt is sometimes skipped and the order is invoiced directly, or alternatively product receipt registration is done on the purchase order without any prior arrival registration.

Receipt of products can result in automatic consumption for a specific purpose. This includes implied consumption with direct delivery, consumption towards a project, or accounting the product as a fixed asset.

When *vendor invoices* arrive from the vendor, they can first be recorded in the *invoice register* independent of the purchase order, and then later approved as a record against the purchase order. Recording the vendor invoice with the purchase order includes matching of the product receipt toward the invoice.

Accounting distributions can be specified on the purchase order to describe how accounting should be done within the ledger, and can also define how budget fund allocation is obtained when this is included in your configuration.

Invoiced purchase orders will record the liability into the vendor account within accounts payable, from where the *vendor payment* can be processed.

Vendor performance

Performance and review of purchasing is supported through *procurement and account payable reports*, which include spend analysis and vendor performance analysis.

Procurement and sourcing workflows

08/13/2025

Some organizations require that purchase requisitions and purchase orders are approved by a user other than the person who entered the transaction. To set up an approval process, you can create a workflow.

A workflow represents a business process. It defines how a document flows through the system and indicates who must complete a task or approve a document. There are several benefits of using the workflow system in your organization:

- **Consistent processes** – You can define the approval process for specific documents, such as purchase requisitions and expense reports. Using the workflow system helps to ensure that documents are processed and approved in a consistent and efficient manner.
- **Process visibility** – You can track the status, history, and performance metrics of a specific workflow instance. This helps you determine whether changes should be made to the workflow to improve efficiency.
- **Centralized work list** – Users can view a centralized work list to view the workflow tasks and approvals assigned to them across all workflows they participate in. This is available on the **Work items** page.

The types of workflows that you can create

The following workflow types are available for Procurement and sourcing.

Expand table

Type	Use this type to
Purchase requisition review	Create review and approval workflows for purchase requisitions.
Purchase requisition line review	Create review and approval workflows for purchase requisition lines.
Purchase order workflow	Create review and approval workflows for purchase orders.
Purchase order line workflow	Create review and approve workflows for purchase order lines.
Vendor add application workflow	Create review and approval workflows for adding new vendors via vendor requests.

> **Important**

When you're adding a new workflow, you might also see the following obsolete workflows listed in the **Create workflow** dialog box. These are related to the *confirmation of receipt* functionality that was available in Dynamics AX 2012, but which has now been deprecated. These workflows are currently unsupported.

- Delivery due date notification workflow
- Invoice received notification workflow
- Product receipt failed notification workflow
- Unconfirmed product receipt rejection notification workflow

Creating a workflow

To create a workflow, go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing workflows** and create a new workflow by selecting the type of workflow you want to create.

In the workflow canvas, you can drag workflow elements into the designer and link the elements into a flow. The workflow elements should be configured. For approval and task workflow elements, you can configure which participant should take action.

Types of participants

You can assign an approval step to the following groups of participants.

Expand table

User group	Description
Participant	Assign the approval step to members of a group or role.
Hierarchy	Assign the approval step to users in a specific organizational hierarchy.
Workflow user	Assign the approval step to users of this workflow.
Queue	Assign the approval step to a work item queue.
User	Assign the approval step to specific users.

Procurement catalogs overview

This article describes, at a high level, how purchasing professionals can set up and maintain procurement catalogs. Procurement catalogs define the items and services that company employees can order for internal use.

Purchasing professionals can create and maintain catalogs of the items and services that can be purchased for internal use in an organization. After catalogs are set up, company employees can create purchase requisitions to order from them. The catalogs can be used to enforce purchasing policies, so that employees can order only the items and services that are allowed for their buying legal entity. When you create a procurement catalog, consider the following tasks:

- Configure your procurement category hierarchy before you create the catalog.
- Determine which products you want your employees to be able to order. You can show or hide specific products in a catalog node, or you can show or hide all the products in a node.
- Determine how many procurement catalogs you require. Access to a procurement catalog is determined by the catalog policy rule that you configure for the legal entity and operating unit that an employee is assigned to.

Several factors determine the products that employees can order and the procurement categories that they can use when they create purchase requisitions:

- The category access policy rule in the purchasing policy determines which procurement categories are available in the purchase requisition. If no rule is defined, all procurement categories are available.
- Employees can order a product only if it's in the active procurement catalog for your organization, and if it's in an enabled node and not hidden. The product must also be in a category that a particular employee has access to according to the category access policy rule.
- The catalog policy rule specifies the catalog that is used. If no catalog policy rule is defined, the category access rule alone determines the products that an employee can order on the requisition.

Prerequisites

The following table describes the tasks that must be completed before a purchasing professional can create a procurement catalog.

Expand table

Task	Role	Description
Set up a procurement category hierarchy.	Purchasing manager	Procurement category hierarchies classify items or transactions for reporting and analysis. By using a procurement category hierarchy, companies can strategically manage categories, products, vendors, and other procurement factors from a central location. One procurement category hierarchy is defined for a whole organization. The catalog is based on the procurement category hierarchy: the categories in the hierarchy become nodes in the catalog. The vendors and products are included in your catalog.
Add vendors and products to procurement categories.	Purchasing manager	When the procurement category hierarchy is created for your organization, each procurement category can be associated with specific vendors, products, and so on. These associations are copied automatically to the catalog.

Set up a catalog

After meeting the prerequisites, you can set up catalogs. You can create one catalog for your whole organization or multiple catalogs for different divisions within your organization. If you create one catalog for the entire organization, your purchasing policy rules control access to the catalog.

The catalog defines which products are available when purchase requisitions are created, but you can use category access policies rules to apply additional restrictions. Because the nodes in a catalog are procurement categories, they can be suppressed by a category access policy rule. In this case, the products in that category aren't available for employees to use on requisitions. You define category access policy rules on the **Purchasing policies** page. The following table describes the tasks that must be completed to set up a catalog.

Expand table

Task	Role	Description
Create a new catalog.	Purchasing agent	When you create a catalog, specify a name and description for the catalog. Also, define whether the catalog is updated manually or automatically, and specify the catalog owner.
Control whether products are available in the catalog.	Purchasing agent	Because the products are inherited from the procurement categories, they all appear in the appropriate catalog nodes. You can control whether all products in a node are hidden or shown when the catalog is used in a purchase requisition. You can also control whether individual products in a node are hidden or shown.

Task	Role	Description
Publish the catalog.	Purchasing agent	Before employees can use a catalog in a requisition, you must define a catalog policy rule for the catalog, set the catalog's status to *Active*, and publish the catalog. You can deactivate catalogs that you no longer want to be available to your users.

Updates are published either automatically or manually, depending on the option that you select for the catalog in the **Default update type** field on the **Catalogs** page. The following default update types are available for catalogs:

- *Dynamic* – The catalog is automatically updated whenever it's changed.
- *Static* – The catalogs must be manually updated.
- *Both* – If the catalog includes product categories that have a default update type of *Static*, it must be manually updated when these categories are updated. If the catalog includes product categories that have a default update type of *Dynamic*, it's automatically updated whenever it's changed.

Create a procurement catalog

Article • 01/24/2025

This article explains how to create a procurement catalog. This task would typically be carried out by a procurement professional. You'll also learn how employees can use the catalog when they create a requisition. Before you can create a catalog, there must be a procurement category hierarchy in your system. The hierarchy is inherited by the new catalog, along with all the products that are in the hierarchy. You can use this guide in demo data company USMF where the procurement category hierarchy and other sample data are available.

Ensure that a procurement category hierarchy exists

1. Go to **Procurement and sourcing** > **Procurement categories**. A procurement category hierarchy is available in the USMF demo data company and products have been added to the **Office machines/Computers** category. If you're running this procedure as a task guide, you'll need to unlock the guide if you want to browse through the category. If a hierarchy isn't available, you can create it by selecting **New** (this action can only be done once).
2. Close the page.

Create a catalog

1. Go to **Procurement and sourcing** > **Catalogs** > **Procurement catalogs**.
2. Select **New procurement catalog** to open the drop dialog.
3. In the **Name** field, type a value.
4. Select **OK**.
5. In the tree, expand **CORP PROCUREMENT CATEGORIES**.
6. In the tree, expand **OFFICE MACHINES**.
7. In the tree, select **Computers**.
    - The products from the procurement category are displayed in the list. If you want to add a product to the category you need to do this on the **Procurement category hierarchy** page or on the **Item details** page.

- The **Default** update type determines whether new products that have been added to the procurement category hierarchy are immediately visible in the catalog. If the update type is set to *Dynamic*, changes are visible immediately. If the update type is *Static*, new products are only visible to people using the catalog after the catalog has been republished. The **Publish** action is available on the Action Pane at the top of the page. If products are removed from the procurement category hierarchy, the change is immediately visible, regardless of the value in the **Default** update type field.

8. On the Action Pane, select **Category navigation** and ensure that **Enable** is selected.
9. Select **Activate catalog**.
10. Close the page.

Make the catalog visible

1. Go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchasing policies**.
2. Select **Procurement Policy USMF**. You need to select the purchasing policy for the legal entity that the worker connected to your user profile is allowed to order products in. In the USMF demo data, the Admin user is connected to the worker called *Julia Funderburk*, and orders products in USMF by default.
3. Select the catalog that you just created.
4. Select **OK**.

Use the catalog

1. Go to **Procurement and sourcing** > **Purchase requisitions** > **All purchase requisitions**.
2. Select **New**.
3. In the **Name** field, type a value.
4. Select **OK**.
5. Select **Add products**.
6. In the list, find and select the desired record. You can use the category hierarchy on the left or the filter at the top of the list to filter the products.
7. Select **Add to lines**.
8. Select **OK**.

Set up a procurement category hierarchy

08/13/2025

This procedure shows you how to create new nodes in a procurement category hierarchy and how to configure a procurement category to be used in a procurement process. These tasks would typically be carried out by a Purchasing manager. Before you can start this procedure, there must be a category hierarchy of type *Procurement*.

Add a new procurement category

1. Go to **Procurement and sourcing** > **Procurement categories**.
2. On the Action Pane, select **Edit category hierarchy**. The current procurement category hierarchy is displayed in the left side of the page. You're about to modify the hierarchy.
3. On the Action Pane, select **New category node**. The system selects the top node by default.
4. In the **Name** field, type a value.
5. In the **Description** field, type a value.
6. In the **Friendly name** field, type a value. The friendly name is optional. It's displayed in category lookups together with the category name.
7. Select **Save**.

Add products to your new procurement category

1. Go to **Procurement and sourcing** > **Procurement categories**. Select the node you just added.
2. Toggle the expansion of the **Products** section.
3. Select **Add** to associate products with the procurement category.
4. Select the products you want to add to the procurement category.
5. Select the arrow to add the products to the **Selected** table.
6. Select **OK**.

Purchase requisition overview

This article describes the purchase requisition workflow and the different statuses that a purchase requisition can have.

Depending on the setup of your organization, you can create purchase requisitions for products that your organization uses. A purchase requisition is an internal document that authorizes the Purchasing department to buy items or services.

After a purchase requisition is approved, you can use it to generate a purchase order. Purchase orders are the external documents that the Purchasing department submits to vendors.

Creating purchase requisitions

Create a purchase requisition on the **My purchase requisitions** page, and select the items and services that you require. You can select items from a procurement catalog that your organization created, or you can request items that aren't found in a catalog by selecting a procurement category and entering the product details.

Before you can submit a purchase requisition for review, you must configure the required workflows. Use a workflow to move a purchase requisition through the review process, from an initial status of *Draft* to a final status of *Approved*.

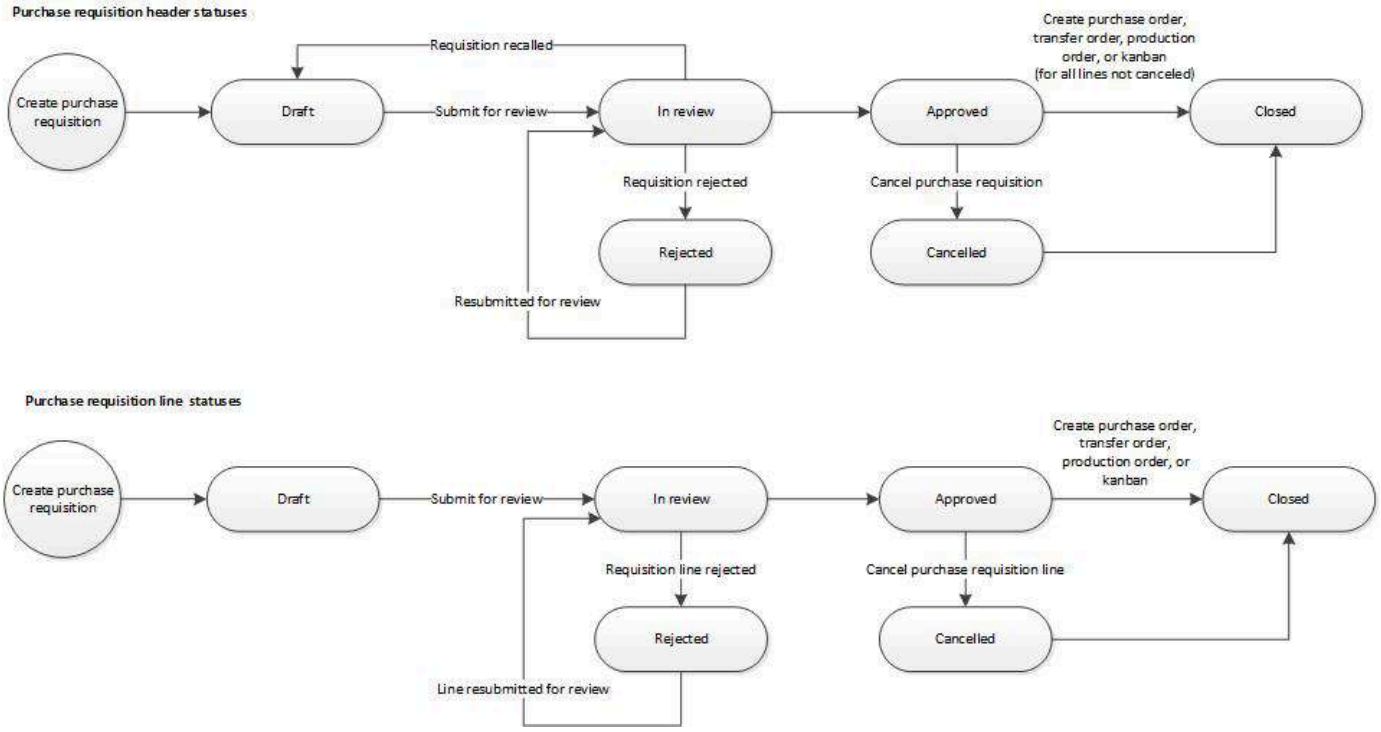
Purchase requisition statuses

When you create a purchase requisition, the system assigns a status to it. The system also assigns a status to every line that you add to a purchase requisition. When you submit a purchase requisition to a workflow for review, the system updates the status of the purchase requisition and the status of each line as the lines move through the workflow process.

You can configure the purchase requisition workflow process to route a purchase requisition through the review process as a single document. Alternatively, you can route the lines on a purchase requisition individually to the appropriate reviewers. If the purchase requisition lines are reviewed individually, the system can update the status of each purchase requisition line as the line moves through the review process. When all lines complete the review process and no review steps remain for the purchase requisition, the system updates the status of the whole purchase requisition.

Purchase requisition workflow

The following diagram shows the statuses that the system assigns to a purchase requisition and a purchase requisition line as they move through the workflow process.



Purchase requisition header and line status relationships

The overall status of a purchase requisition depends on the status of the purchase requisition lines. Therefore, you must complete the review process for all purchase requisition lines before you can complete the review process for the whole purchase requisition. The following table describes the statuses that are assigned to a purchase requisition header and lines as the purchase requisition moves through the workflow process.

Expand table

Purchase requisition status	Purchase requisition line status	Description
Draft	Draft	The purchase requisition and purchase requisition line have been created, but they haven't been submitted for review. You can modify purchase requisitions and purchase requisition lines that have a status of *Draft*. A purchase requisition or purchase requisition line also has a status of *Draft* if you recalled it but didn't resubmit it for review.

Purchase requisition status	Purchase requisition line status	Description
		Note: You can submit or recall a purchase requisition at the document level. However, you can't submit or recall a single purchase requisition line.
In review	• In review • Rejected	If the workflow is configured to route purchase requisition lines to individual reviewers, each line can have a status of *In review* or *Rejected*. The purchase requisition status updates when the review process is completed for all purchase requisition lines and no review steps remain for the purchase requisition. • *In review* – The purchase requisition lines are submitted for review. When the workflow process is completed for a purchase requisition line, the status of that line remains *In review* until all remaining purchase requisition lines are reviewed. • *Rejected* – A purchase requisition line is rejected. You can modify and resubmit purchase requisition lines that are rejected. If you resubmit a purchase requisition line that was rejected, the review process starts over for all lines in the purchase requisition that are still in review. **Note:** You can recall a purchase requisition that you already submitted. When you recall a purchase requisition, you also recall all other purchase requisition lines. You can delete purchase requisition lines that are recalled.
Rejected	Rejected	The purchase requisition and all purchase requisition lines have been rejected. You can resubmit purchase requisitions and purchase requisition lines that have been rejected.

Approved	• Approved
	• Cancelled
	• Closed
		All purchase requisition lines have completed the review process, and there are no more review steps for the purchase requisition.
		
		• *Approved* – The review process for a purchase requisition line is complete, and the line is approved.
		• *Cancelled* – The purchase requisition line was approved, but it's canceled because it's no longer required. Only purchase requisition lines that are approved can be canceled.
		• *Closed* – The purchase requisition line was approved, and documents are generated, depending on the requisition purpose.
		  ◦ If the requisition purpose is consumption, a purchase order is generated for the purchase requisition line.
		  ◦ If the requisition purpose is replenishment, one or more fulfillment documents are generated.

Cancelled	Cancelled	The purchase requisition and all purchase requisition lines have been canceled.

Purchase requisition status	Purchase requisition line status	Description
		Note: If you no longer require an item that is on a purchase requisition line, you must cancel the purchase requisition line if it's already approved. Only purchase requisition lines that are approved can be canceled. If any purchase requisition lines are in review, the purchase requisition has a status of **In review**. In this case, you can recall the purchase requisition and delete the appropriate purchase requisition line.

Closed	• Closed
	• Cancelled
		The purchase requisition is closed, and one or more fulfillment documents have been generated.
		
		• *Closed* – The purchase requisition line was approved, and documents are generated, depending on the requisition purpose.
		  ◦ If the requisition purpose is consumption, a purchase order is generated for the purchase requisition line.
		  ◦ If the requisition purpose is replenishment, one or more fulfillment documents are generated.
		• *Cancelled* – The purchase requisition line was approved, but it's canceled because it's no longer required. Only purchase requisition lines that are approved can be canceled.
		
		Note: If you no longer require an item on a purchase requisition line that is closed, you must cancel the line on the fulfillment document that was generated for the purchase requisition line.

Distributing costs to multiple financial accounts

You can distribute the cost of a product that is included in a purchase requisition to multiple financial accounts. If your organization uses dimensions, such as cost centers and departments, you can distribute the cost of a product to dimensions for financial accounts.

Requisition purposes

Requisition purposes make the process of fulfilling requisition demand more flexible. When you create a requisition, you can assign one of two purposes to it: consumption or replenishment. Depending on the requisition purpose and the setup of your organization, requisition demand can be fulfilled by a purchase order, transfer order, production order, or kanban.

In the procurement policies, you can control the requisition purposes that are available when a requisition is created for your organization.

Requisitions that have a purpose of consumption

A requisition that has a purpose of consumption represents demand for items or services that your organization uses internally. The demand that this kind of requisition creates is always fulfilled by a purchase order. If Supply Chain Management is set up to automatically generate purchase orders, purchase orders are created after the purchase requisition is approved.

Requisitions that have a purpose of replenishment

A requisition that has a purpose of replenishment represents demand to replenish inventory. For example, you create a requisition to replenish items so that you can sell them at a specific retail location at a specific time. The demand that this kind of requisition creates can be fulfilled by a purchase order, transfer order, production order, or kanban.

When the requisition purpose is replenishment, demand is expressed as a quantity instead of a monetary amount. Therefore, encumbrance accounting, budgetary control, business rules for fixed asset determination (BRAD), project accounting, and any related rules don't apply. Only products that are stocked and released to the specified legal entity can fulfill replenishment requisition demand. To define the products that are available when the requisition purpose is replenishment, use the **Replenishment category access policy rule** page.

To use purchase requisitions that have a purpose of replenishment, set up master scheduling to include requisition demand. The system automatically determines the fulfillment method for the demand that this kind of requisition creates, based on the supply policies that you set up for the items in your organization and planned by using master scheduling.

Purchase requisitions and requests for quotation

In some cases, you must start a request for quotation (RFQ) process to identify the vendor and price for products that a purchase requisition requests. You can generate an RFQ when the purchase requisition is in review. When you accept a bid, the system transfers information about the vendor, price, and other details to the requisition.

You can control whether the system should update fixed asset fields when you accept an RFQ bid for purchase requisitions that have business rules for fixed asset determination (BRAD). To set this option, follow these steps (requires Supply Chain Management version 10.0.49 or later):

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. Open the **Purchase requisition** tab.
3. Set **RFQ bid–driven fixed asset field updates** to one of the following values:

- *Yes* – Reevaluate asset classification and accounting values based on the accepted RFQ bid. This value is the default setting.
- *No* – Only transfer the RFQ price to the requisition. Preserve existing accounting values and budget control reservations.

You can put a purchase requisition on hold by selecting the **On hold** check box on the **Purchase requisition details** page. Processing of the purchase requisition can continue only after you remove the hold by clearing the check box.

> ⓘ **Note**
>
> In e-procurement, the RFQ for your purchase requisition might allow vendors to add alternate lines. In this case, your purchase requisition reflects approved alternates.

Demand consolidation

When you consolidate purchase requisition lines from multiple purchase requisitions, you increase your negotiating power with vendors. You can get better pricing, lower shipping and handling costs, and reduced overhead costs.

Purchase requisition lines are eligible for demand consolidation only if the following statements are true:

- The purchase requisition is approved.
- The purchase requisition meets the purchasing policy rule criteria for manual processing and demand consolidation.

The **Release approved purchase requisitions** page lists approved purchase requisition lines that meet the criteria for manual processing. If a purchase requisition line also meets the criteria for demand consolidation, you can add the line to a consolidation opportunity.

A consolidation opportunity is a set of purchase requisition lines that you group together so that the purchasing professional can negotiate the best deal with vendors. Purchase requisition lines that you select for a consolidation opportunity appear on the **Purchase requisition consolidation** page. You can modify the lines on this page, if changes are required. You can also add new lines to the consolidation opportunity or remove existing lines.

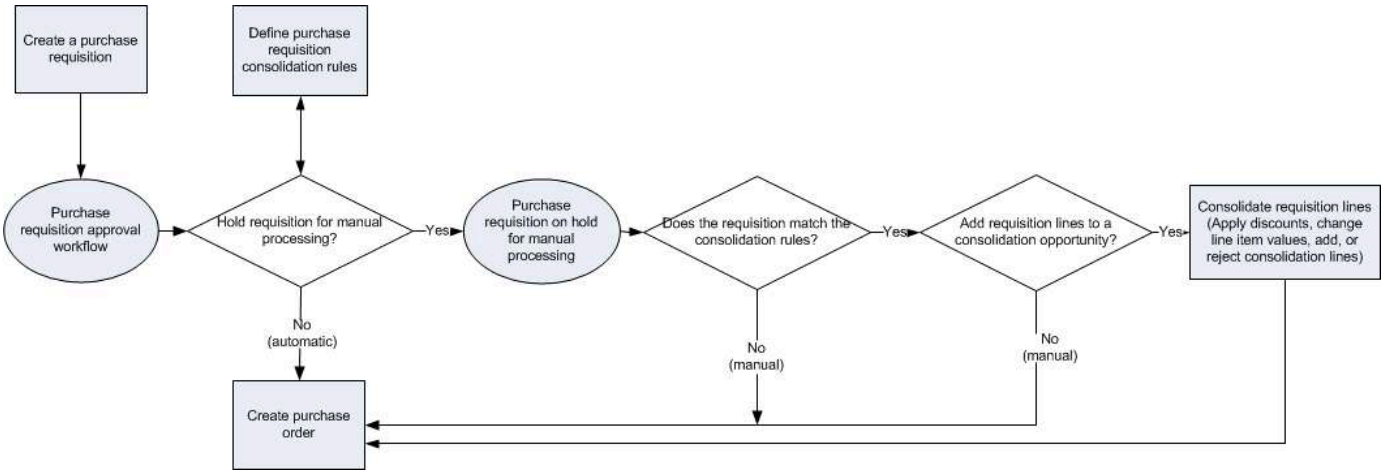
After you add requisition lines to a consolidation opportunity and make any changes that you require, you can create a purchase order for the consolidated purchase requisition lines.

> **Note**
>
> Changes that you make to a purchase requisition line on the **Purchase requisition consolidation** page are reflected on the purchase order that you create. However, the line remains unchanged in the purchase requisition, so that its history is preserved.

To create a purchase order for purchase requisition lines that aren't eligible for demand consolidation or aren't selected for a consolidation opportunity, you must process the lines manually.

Consolidating purchase requisition lines

The process for demand consolidation starts when a purchase requisition is approved in a workflow and, if budget control is configured for your organization, when the budget reservations and pre-encumbrances have been recorded. The following diagram shows the process flow for demand consolidation.



To consolidate approved purchase requisition lines, follow these steps:

1. Review approved requisition lines that have been held for manual processing, and that are eligible for demand consolidation.
2. Select lines to add to a consolidation opportunity.
3. Create a new consolidation opportunity, or add requisition lines to an existing consolidation opportunity.
4. Make any required changes to the requisition lines, and remove requisition line items that you no longer want to include in the consolidation opportunity.
5. Create purchase orders for consolidated requisition lines or for purchase requisition lines in a consolidation opportunity.

Purchase requisition workflow

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The workflow process moves purchase requisitions through the review process, from an initial status of Draft to a final status of Approved. When a purchase requisition is submitted for review, the workflow process is started. After a purchase requisition is approved, a purchase order can be generated for the purchase requisition lines and submitted to the vendor for order fulfillment.

Before a purchase requisition can be submitted for review, you must configure a workflow. The workflow process can include one or more review steps, in any order. The workflow process can also be configured to skip the review tasks and automatically approve the purchase requisition. You can configure the workflow to route the purchase requisition as a single document, or you can route individual purchase requisition lines to the appropriate reviewers. You can also create a scenario where the purchase requisition is routed as a single document to some reviewers and selected purchase requisition lines are routed to other reviewers.

If purchase requisition lines are reviewed individually, the review process must be completed for all purchase requisition lines before the workflow process can move to the next step, and before the review process for the purchase requisition as a whole can be completed. When the review process has been completed for the purchase requisition and all its lines, the overall status of the purchase requisition is updated to *Approved*.

You can configure your workflow to represent the business process for purchase requisitions in your organization. When you configure your purchase requisition workflow process, consider the following questions:

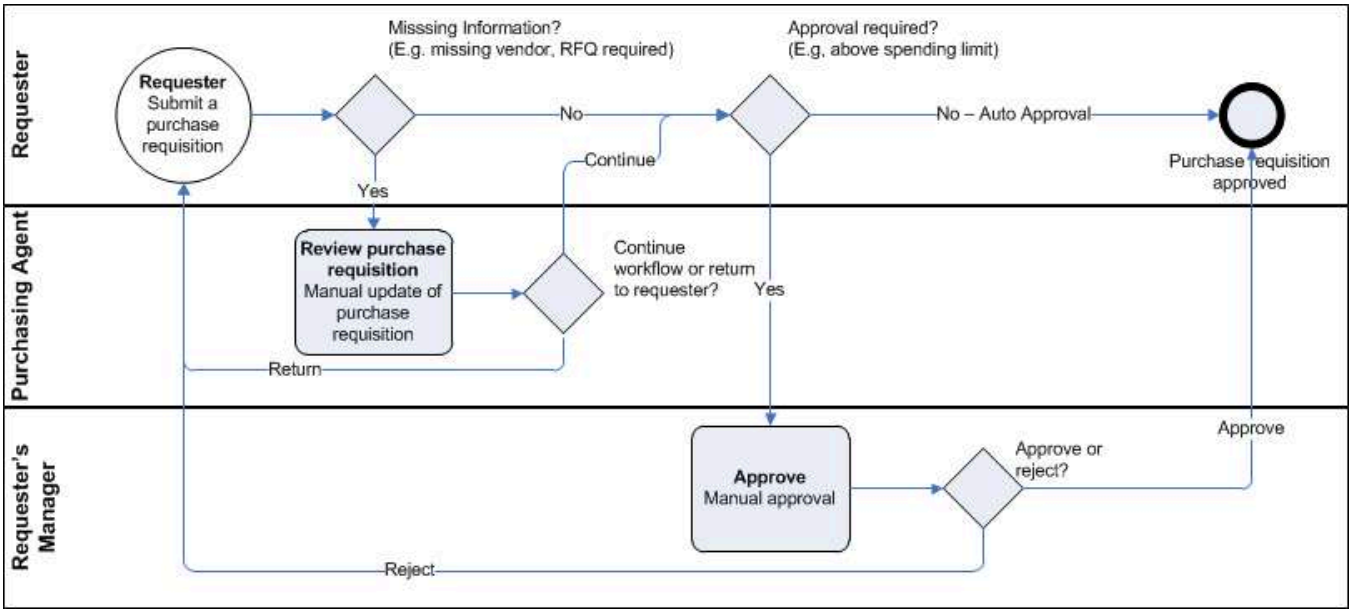
- What expenditures must be reviewed?
- What expenditures can be automatically approved?
- Who is required to review and approve expenditure requests? What role are these users assigned to?
- What process must be followed if a reviewer isn't available?

The following examples illustrate two ways that you can configure a workflow for purchase requisitions.

Example 1: Route a purchase requisition as a single document for review

The following illustration shows how a purchase requisition can flow through the workflow review process as a single document. The lines on the purchase requisition aren't routed individually. The following roles are included in the workflow process for this example:

- *Requester* – The user who requests the items or services. The requester can prepare the purchase requisition, or another worker can prepare the purchase requisition on the requester's behalf. This worker is the preparer. The preparer is responsible for managing the purchase requisition throughout the review process. Only the preparer of the purchase requisition can modify it. A worker must be granted the appropriate permissions to create a purchase requisition on behalf of someone else. Use the **Purchase requisition permission** page to set up these permissions.
- *Purchasing agent* – The user who performs a procurement review and can approve the document.
- *The requester's manager* – The user who performs a managerial review and can approve the document.



In this example, the workflow process for the purchase requisition includes the following steps:

1. The preparer submits a purchase requisition for review.
2. The purchasing agent receives a notification. The notification requests that the purchasing agent verify the information in the purchase requisition. If required information is missing, the purchasing agent can either add it or return the purchase requisition to the preparer to add it. When all the required information has been filled in, the purchase requisition can move to the next step in the review process.
3. The requester's manager reviews the purchase requisition. The purchase requisition might be routed to the requester's manager if, for example, the amount of the purchase

requisition exceeds the requester's spending limit for purchase requisitions. The requester's manager can approve or reject the purchase requisition, or return it to the preparer for changes.

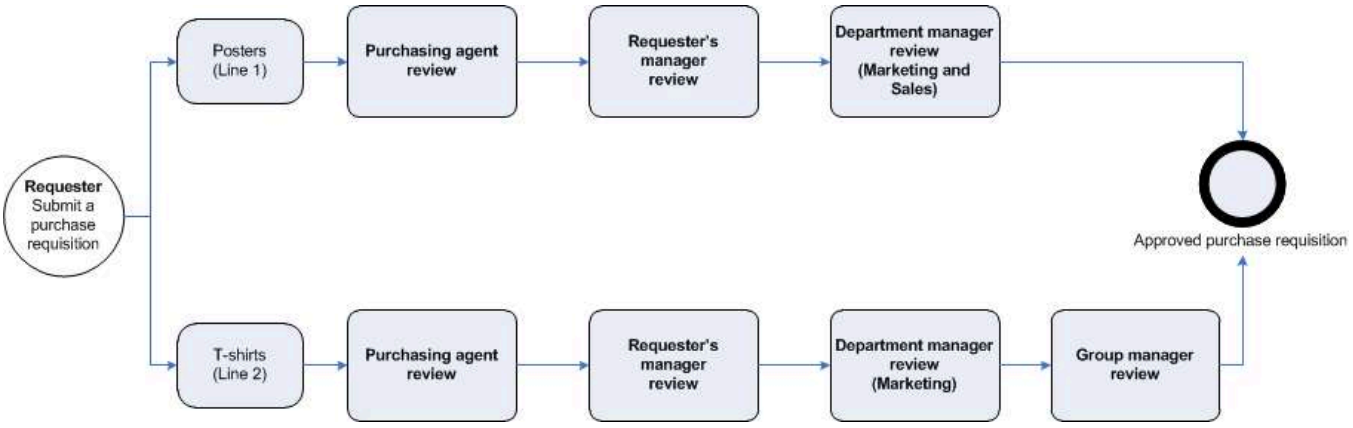
Example 2: Route the individual purchase requisition lines for review

The following illustration shows how the individual purchase requisition lines can be routed through a workflow. In general, the process for each line is the same as the process for a purchase requisition that is reviewed as a single document. However, each line must complete the workflow process individually before the workflow can be completed for the whole purchase requisition.

In this example, a worker enters a request for posters and T-shirts for a marketing campaign. The cost of the posters is split between the Marketing department and the Sales department. If the cost of the posters or T-shirts exceeds the signing limit authority for department managers, the purchase requisition must also be reviewed by the group manager.

The following roles are included in the workflow process for this example:

- *Requester* – The user who requests the items or services. The requester can prepare the purchase requisition, or another worker can prepare the purchase requisition on the requester's behalf. This worker is the preparer. The preparer is responsible for managing the purchase requisition throughout the review process. Only the preparer of the purchase requisition can modify it. A worker must be granted the appropriate permissions to create a purchase requisition on behalf of someone else. Use the **Purchase requisition permission** page to set up these permissions.
- *Purchasing agent* – The user who performs a procurement review and can approve the document.
- *The requester's manager* – The user who performs a managerial review and can approve the document.
- *Department manager* – The user who performs an expenditure review and can approve the document.
- *Group manager* – The user who performs a signature authority review and can approve the document.



In this example, the workflow process for the purchase requisition lines includes the following steps:

1. The preparer submits a purchase requisition for review. Each line is routed to the reviewer who is configured to receive it in the workflow process.
2. The purchasing agent receives a notification. The notification requests that the purchasing agent verify the information in the purchase requisition and on the purchase requisition lines. When the purchase requisition is opened by the purchasing agent all the lines are visible, but a visual indicator shows which lines have been sent to the purchasing agent for review. If required information is missing, the purchasing agent can either add it or return a purchase requisition line to the preparer to add it. When all the required information has been filled in, the purchase requisition line can move to the next step in the review process. Purchase requisition lines can continue through the review process independently of each other.
3. The requester's line manager reviews and approves the purchase requisition lines. The approval might be routed to the requester's manager if, for example, the amount on a purchase requisition line exceeds the requester's spending limit for purchase requisition lines. The manager can approve or reject one or both of the purchase requisition lines.
4. The department manager for the Marketing department reviews the purchase requisition lines for both the posters and the T-shirts. The Sales department manager reviews the purchase requisition line only for the posters, because that is the only cost that is being charged to the Sales department.
5. The group manager reviews and approves the purchase requisition line for the T-shirts only if group manager approval is required because, for example, the amount on the purchase requisition line exceeds the department manager's approval limit. The group manager doesn't have to approve the purchase requisition line for the posters.

> **Note**
>
> The system currency must be set if the header workflow for a purchase requisition requires approvals related to signing limits.

Configuring a workflow for purchase requisitions

To route a purchase requisition for review, you must configure the purchase requisition workflow processes. The workflow process that you define controls the interaction between the user who requested the items (the requester) and the reviewer and approver in the workflow. The routing of the purchase requisition depends on the conditions that are specified in the workflow configuration. For example, these conditions determine when the purchase requisition should be routed, the user or role that it should be routed to, and the actions that users can take.

The examples in this article show how a purchase requisition can be routed through a workflow as a single document or as individual purchase requisition lines. You can also configure a workflow for purchase requisitions that reflects the internal control review of purchase requisitions that is defined for your organization.

The participants or the reviewers that a task is assigned to in a workflow can be members of a particular user group, users who have a particular security role, users who are associated with the submitter in a managerial hierarchy, or named users or users who have specific expenditure responsibilities.

Purchase requisition expenditure reviewers

Expenditure reviewer configurations let you dynamically route expenditures for review, based on the user who is assigned to a project role or a financial dimension where the expenditure is being charged. The workflow process uses the specified project role or financial dimension owner to determine who the expenditure should be routed to.

You can define one or more expenditure reviewer configurations and then select a configuration when you create a workflow. You can configure the expenditure reviewer values for every legal entity in your organization. After you define the expenditure reviewer configurations, you assign a configuration to your workflow task.

You don't have to define expenditure reviewer configurations. Instead, you can assign specific users or user groups as reviewers when you define your workflow. However, if you have a complex organization, expenditure reviewers can increase the efficiency of your approval process. In addition, if you set up expenditure reviewers, you don't have to update workflow reviewer assignments every time that a reviewer changes job roles.

You can set up the expenditure reviewers on the **Purchase requisition expenditure reviewers** page. Create an expenditure reviewer configuration, and enter values for each legal entity in your organization. For requisitions that are assigned to a project, you can specify the role that is responsible for reviewing the requisitions: Project manager, Project controller, or Project

sales manager. Expenditures will be routed to the user who is assigned to the specified role. You can also route the expenditure to the financial dimension owner by selecting the appropriate financial dimension option on the **Organization distributions** tab.

To use one of the expenditure reviewers that you set up in a workflow, you must set the **Type of participant** option to **Expenditure participants** in the **Assignment** properties for the relevant workflow element.

Create a requisition for consumption

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

his article describes the process of creating a requisition. It shows you different ways to search for products in your procurement catalog and how to add a product that isn't in your catalog. Before you start this procedure, you must have a purchasing policy set up with Consumption as the default type of requisition. You can walk through this procedure in demo data company USMF, or using your own data. The procedure can only be carried out by a user profile that is set up as worker. This task is normally be carried out by an employee. The **Employee** employ security role allows you to carry out the tasks, or if you're using USMF, you can sign in as *Alicia*.

Create a new requisition

1. Go to **Procurement and sourcing** > **Purchase requisitions** > **Purchase requisitions prepared by me**.
2. Select **New**.
3. In the **Name** field, enter a name for the requisition.
4. In the **Requested date** field, enter a date. By default, the requested date and accounting date are copied to the purchase requisition lines. You can change them at the line level. The requested date is the requested receipt date.
5. In the **Accounting date** field, enter a date. The accounting date records the accounting entry in the general ledger, and validates whether budget funds are available.
6. Select **OK**.
7. In the **Reason** field, select an option from the drop-down menu. By default, the business justification reason that you select appears for the purchase requisition lines, but you can change it at the line level.
8. Select the reason.
9. In the **Details** field, enter a more descriptive justification for the requisition.

Add a line to the requisition

1. Select **Add line**. There are two ways to add lines to the purchase requisition. If you already know the product number or you already know that you're requesting a product that isn't in the product catalog, add the line directly by using **Add line**. The other way is to use **Add products** where you can use searching and filtering to find items in the product catalog.
2. Select the row you just created.

    - The requester is the worker that requests the requisition.
    - By default, the person preparing the requisition is the worker who requests it. You must be given permission to prepare a requisition line on behalf of another worker. If you have such permissions, the other workers appear in this lookup.

3. In the **Item number** field, type a value. The items that you can choose from are limited by the category access policy and the procurement catalog for the buying legal entity.
4. In the **Quantity** field, enter a number.

Add more products to the requisition

1. Select **Add products**. This option lets you search for products in the product catalog.
2. In the **Find procurement category node** field, enter the first part of the name of the category that you're looking for, and then select **Enter**. For example, enter *comput*.
3. Use the **InvokeDefaultButton** shortcut.
4. Use the **Filter** to filter the list of products in the selected category.
5. Select the product card that you want to add to the requisition.
6. Select **Add to lines**.
7. In the **Quantity** field, enter a number.
8. In the **Find procurement category node** field, type the first part of the name of the category that you're looking for, and then select **Enter**. For example, enter *High* (highlighters).
9. Use the **InvokeDefaultButton** shortcut.
10. Select **Add unlisted product to lines** to add a product that's not listed in the procurement catalog.
11. In the **Product name** field, type a value.
12. In the **Unit** field, type a value.
13. Select **OK**.
14. In the **Item description** field, add a description of the product.
15. In the **Quantity** field, enter a number.

16. In the **Unit price** field, enter a number. If you know the price for a particular vendor (that you select in the vendor account field) enter that price.
17. In the **Vendor account** field, open the drop-down list to select an option. The vendors that are available in this field depend on the purchasing policies and the status that the vendor has for the current procurement category. As an alternative to selecting a vendor here, you can select **Suggest vendor**.
18. In the list, select the vendor you want to use.
19. In the **External item number** field, type a value. This value is a reference number for the product that the vendor knows. For example, this value could be the item number of the product in the vendor's own catalog.
20. Select **OK**.

Distribute amounts

1. Select **Financials**.
2. Select **Distribute amounts**. This process shows you how to distribute the cost for the first line between two accounts. You can also distribute amounts later when the requisition is in review.
3. Select **Split** to create a new distribution line.
4. In the **Ledger account** field, select the first cost center that should take part of the cost.
5. Select the other distribution line.
6. In the **Ledger account** field, specify the other cost center.
7. Select **Distribute equally**.
8. Close the page.

View line details

1. Toggle the expansion of the **Line details** section.

Submit the requisition

1. Select **Workflow** to open the drop dialog.
2. Select **Submit**.
3. Close the page.
4. In the **Comment** field, type a note for the approver of the requisition.
5. Select **Submit**.
6. Close the page.
7. Refresh the page.

Create a requisition that uses an RFQ

06/17/2025

This article explains how to add price and vendor information to a purchase requisition from a request for quotation (RFQ) process. The example shown in this guide can be used in the USMF demo data company, and you must be logged in as an Admin to complete all the steps. The tasks in this guide would typically be done by procurement professionals.

Create a requisition

1. Go to **Procurement and sourcing** > **Purchase requisitions** > **Purchase requisitions prepared by me**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Requested date** field, enter a date.
5. In the **Accounting date** field, enter a date.
6. Select **OK**.
7. In the **Reason** field, enter or select a value.
8. Select **Add line**.
9. In the **Procurement category** field, select a category in the tree, and then select **OK**.
10. In the **Product name** field, type a value.
11. In the **Quantity** field, enter a number.
12. In the **Unit** field, enter or select a value.
13. Select **Save**.
14. Select **Workflow** to open the drop dialog.
15. Select **Submit**.
16. Close the page.
17. Select **Submit**.

Reassign a workflow task

The next task is to create an RFQ to get bids from vendors for the product. In USMF demo data, the requisition workflow is set up with a rule so that if a vendor isn't selected, or the unit price is 0 for a line, a task is assigned to a specific worker to create an RFQ. To continue with this guide, you need to reassign that task to another user (yourself). You can only do this if you're logged in as an Admin.

1. Select **Workflow** to open the drop dialog.
2. Select **View history**.
3. Refresh the page.

4. Expand the **Tracking details** section.
5. In the tree, select the line that starts with *Line workflow activated on*.
6. Select **View workflow details**.
7. Expand the **Work items** section.
8. Select **Reassign**.
9. In the **User** field, select *Admin*.
10. Select **Reassign**.
11. Close the two pages.

Create an RFQ

1. Refresh the page.
2. Select **Request for quotation**.
3. In the **Buying legal entity** field, select *USMF*. You must select the same legal entity that's on the requisition line.
4. In the list, mark the selected row. If you had multiple lines on your purchase requisition, select all the lines that you want to add to the RFQ.
5. Select **OK**.
6. Refresh the page.
7. Ensure that the FactBox is open, then expand the **Related documents** section.
8. Select the link in the **Request for quotation** field to open the RFQ that you created.
9. Select **Header**.
10. Select **Add**.
11. In the **Vendor account** field, enter or select a value.
12. Select **Add**.
13. In the **Vendor account** field, enter or select a value.
14. Select **Send**.
15. Select **OK**.
16. Select **Enter reply**.
17. On the Action Pane, select **Reply**.
18. Select **Copy data to reply**. This copies data, such as the quantity and dates, from the RFQ to the reply.
19. In the **Unit price** field, enter a number. This is the price that you've received from the vendor. You might also want to enter additional information from the vendor.
20. Select **Accept**.
21. Select **OK**.

Verify that vendor and price have been transferred to the requisition

1. Close the page.
2. Select **Lines**.
3. Select **Related information**.
4. Select **Purchase requisition**.
5. Select the line that was transferred to the RFQ. Verify that the price and vendor have been copied to the requisition.
6. Select **Workflow** to open the drop dialog.
7. Select **Complete**.
8. Select the page.
9. Select **Complete**.

Requests for quotation (RFQs) overview

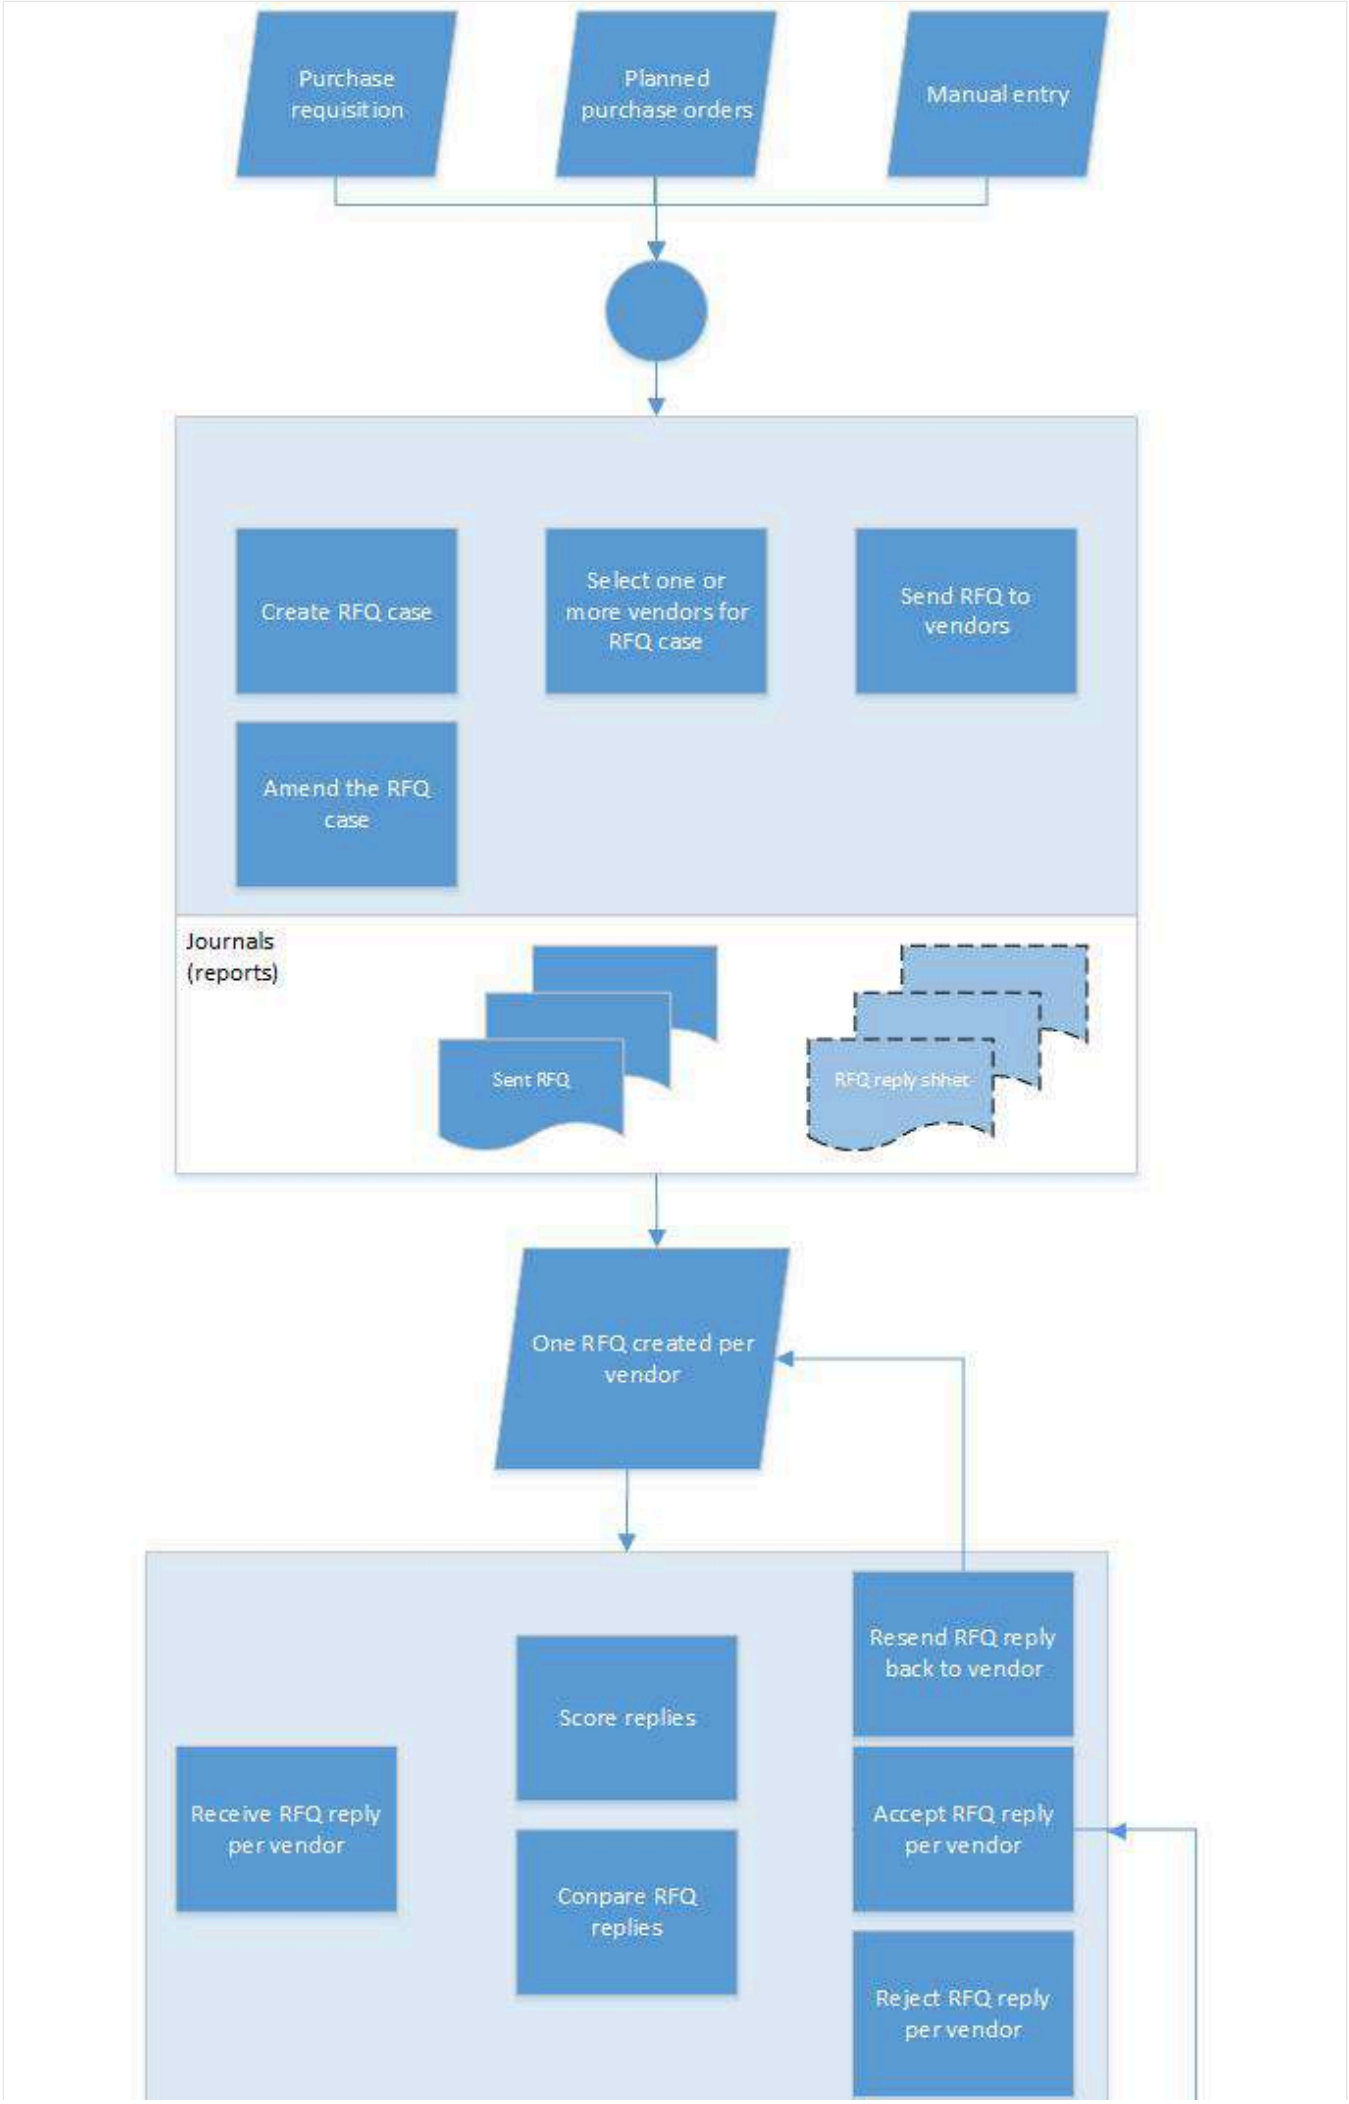
07/21/2025

This article provides an overview of requests for quotation (RFQs). Organizations issue RFQs when they want to receive competitive offers from several vendors for the items or services that they must purchase. In an RFQ, you ask vendors to provide the prices and delivery times for the item quantities that you specify. You can also ask vendors to specify whether there are any incidental charges, such as shipping costs, or any discounts for large orders or early payment of the vendor invoice.

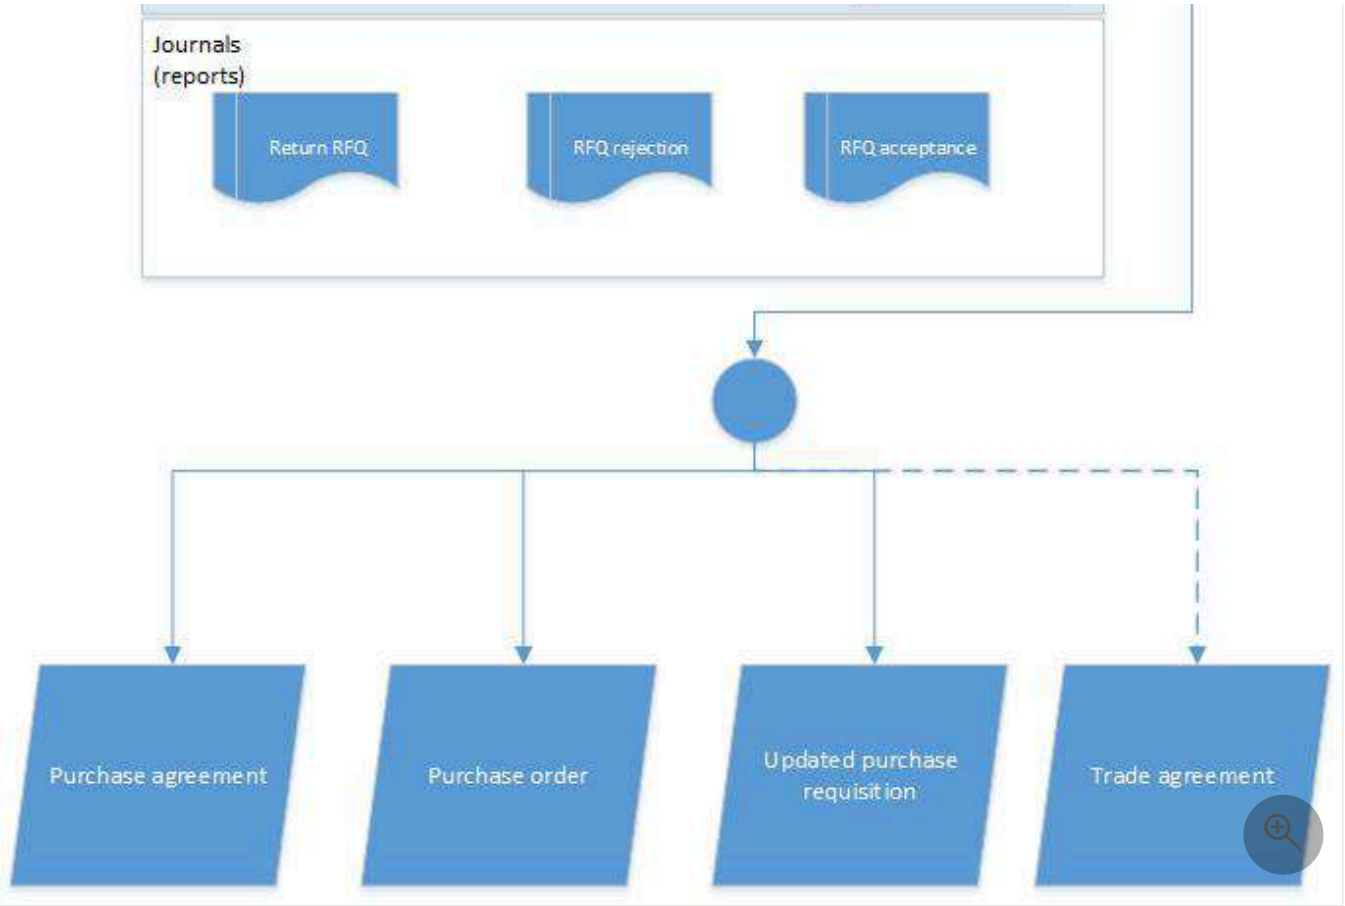
The RFQ process consists of the following tasks:

1. Create and send an RFQ to one or more vendors.
2. Receive and register bids (RFQ replies).
3. Transfer bids that you accept to a purchase order, purchase agreement, or purchase requisition.

The following illustration shows an overview of the RFQ process.



Purchase requisition
Planned purchase orders
Manual entry
Create RFQ case
Select one or more vendors for RFQ case
Send RFQ to vendors
Amend the RFQ case
Journals (reports)
Sent RFQ
RFQ reply sheet
One RFQ created per vendor
Resend RFQ reply back to vendor
Score replies
Receive RFQ reply per vendor
Accept RFQ reply per vendor
Conpare RFQ replies
Reject RFQ reply per vendor



You can create an RFQ case from planned orders, from a purchase requisition, or by manual entry. The RFQ case is the base document that you use to issue an RFQ to each vendor.

After you prepare the RFQ case and add vendors, select **Send** (**Send and publish** for public sector) on the RFQ case. An RFQ journal is generated for each vendor that you sent the RFQ to. You can configure the printing options for the **Send** action so that it either prints a report for each vendor to an archive or sends a report to each vendor's email address. In addition, you can use the RFQ journal for each vendor to generate a report that you can send or resend to the vendor later. You can also configure the **Send** action so that it generates a reply sheet that the vendor can fill in.

This article covers the process for handling RFQs when vendor collaboration isn't used. If your system is set up for vendor collaboration, vendors can enter bids directly in Supply Chain Management. Learn more in Vendor collaboration with customers and Vendor collaboration with external vendors.

If you must amend an RFQ after you send it, you can resend the RFQ to vendors when you've finished by using the two amendment actions: Create and Finalize. When you receive bids by email, you can handle these bids from the **Request for quotations** page.

If a second iteration of a reply from a vendor is required, select **Return** on the **Request for quotation** page. The Return action generates a new journal and a report that will be printed, archived, and sent according to your print settings.

If you added scoring criteria to your RFQ case, the RFQ will have a scoring panel where you can enter the scores. The total scores will appear on the RFQ and when you compare the replies on the **Compare replies** page. On the **Compare replies** page, you can also compare other reply data, such as the line price, receipt date, and total price.

After you choose a bid or bid lines, you can accept all or some lines and reject the rest. Acceptance journals, rejection journals, and corresponding reports are generated, and will be printed, archived, and sent according to your print settings. When you accept a bid or specific lines in a bid, either a purchase agreement or a purchase order is generated, or a purchase requisition is updated, depending on the purchase type of the RFQ. You can create a trade agreement that you can use later for any of the replies, regardless of whether you accepted or rejected them.

An RFQ case has two statuses: lowest and highest, you can view the status on the list page for **All request for quotations**. The lowest status is the least advanced stage of any line in the RFQ case, and the highest status is the most advanced stage of any line in the RFQ case. For example, say that an RFQ case with three lines is sent to two vendors, so there are two RFQs each with three lines. All lines are *Sent*. Now a bid is entered from one of the vendors and the RFQ lines get the status *Received*. This means that out of the three lines on the RFQ case, all of them are *Sent* for one RFQ and *Received* for another RFQ. The lowest status will then be *Sent*, and the highest status is *Received*.

These statuses will be described in more detail later in this article.

Setting up RFQ functionality

Before you can create an RFQ case, you must set up RFQ information on the **Procurement and sourcing parameters** page. When you create an RFQ case, you can specify default values that are copied to the RFQ. You can specify the following default values:

- The purchase type of new RFQs: **Purchase order** or **Purchase agreement**
- The expiration date and time offset from the day the RFQ case is created.
- Solicitation type, which might default a specific scoring method to the RFQ case.
- Delivery information and payment terms.

You can override these values for a specific RFQ case.

You should also configure the amendment process. As part of this configuration, you can turn on field locking. When field locking is turned on, a procurement professional who wants to amend an RFQ must first select **Create** in the **Amendment** section of the **Quotation** tab on the RFQ case. Then, after the RFQ case has been updated with the amendment, the procurement

professional must complete the process by selecting **Finalize**. The Finalize action generates an email that notifies the vendors about the amended RFQ.

On the **Procurement and sourcing parameters** page, you select the template to use for the email notification that is sent to vendors. When a template is created in **Email templates**, it can contain the following replacement tokens:

- %RFQ case%
- %Reason for bid return%
- %Reason for amendment%
- %Amendment prepared by%
- %Company%
- %RFQ case name%
- %Expiry Date Time%
- %Date%

The %Reason for bid return% and %Reason for amendment% tokens are replaced by text that the procurement professional can enter when they complete the amendment in the **Amendment** wizard. The values for the %Amendment prepared by% and %Company% tokens are automatically taken from the RFQ. The %Date% token is replaced by the current date.

If you want to cancel an RFQ after it's been sent, you can do that from the RFQ case. For the cancellation, an email template is required to send the cancellation notification to the vendor's contact persons. The template must be selected on the **Procurement and sourcing parameters** page. When the template is created, it can contain the following replacements tokens:

- %Reason for cancellation%
- %RFQ case%
- %RFQ canceled by%
- %Company%
- %RFQ case name%
- %Date%

The %Reason for cancellation% token is replaced by text that the procurement professional can enter in the **Cancellation** wizard. The %Date% token is replaced by the current date.

If you want to use reason codes on a bid to indicate why it was rejected or accepted, you must set up reason codes on the **Vendor reasons** page.

On the **Form setup** page in Procurement and sourcing, you can configure the appearance of your printed or stored RFQ documents.

> ⓘ **Note**

For a public-sector configuration, you must use the amendment process to change an RFQ that has already been sent. When an RFQ is sent, fields are locked. Therefore, to make changes to the RFQ, you must select **Create** to start the amendment process, as described earlier. The locking behavior is controlled by the **Lock RFQ when they are sent** option on the **Procurement and sourcing parameters** page. By default, this parameter is set to *Yes*, and for a public-sector configuration, the default setting can't be changed. Therefore, although the amendment process can be handled manually in a non-public-sector configuration, it must be used for a public-sector configuration.

When you create an RFQ case of the type Purchase order and add an inventory item to the RFQ, an inventory transaction is generated that has a receipt status of Quotation receipt. Only RFQ case lines that have this status are considered when you use a master plan to calculate supplies. If you want the master plan to include RFQ case lines as an expected receipt, you must configure this behavior in the setup of master planning.

A purchasing manager or agent can create and maintain solicitation types to suit the organization's procurement requirements. Each solicitation type can be associated with a scoring method. Scoring methods consist of a set of criteria that can be used when you score bids. You must set up solicitation types, scoring methods, and scoring criteria on the **Solicitation type** and **Scoring method** pages.

Choose default fields to include in vendor RFQ reply forms

You can specify specific types of information that you want to receive from vendors when they reply to (bid on) a request for quotation (RFQ). Fields that you mark as default are included on the online form provided for vendor collaboration. To make these settings:

1. If you haven't already done so, use the Feature management page to enable the *Select RFQ fields to include in vendor RFQ reply forms* feature.
2. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
3. Open the **Request for quotation** tab.
4. Select the **Default requests for quotation** reply fields link under the **Set up default values for requests for quotations** heading.
5. The **Default request for quotation reply fields** dialog box opens.
6. The **RFQ fields included in vendor RFQ reply forms** section includes a slider for each field that is available for use in RFQ reply forms. Fields set to *Yes* in this section will be included (together with their values) in RFQ reply forms. Set the slider to *No* for each field where you want to prevent vendors from seeing data when reviewing bids. This allows you to

enter estimated or expected values during RFQ entry for internal purposes without the vendor seeing what has been entered.

You can override these settings for individual RFQ cases as needed.

Creating and sending an RFQ

You create an RFQ case, select the vendors that you want to bid on the RFQ case, and then send RFQs to the vendors. You can use Printing settings to route the RFQ report and reply sheet reports to your preferred destination.

You can manually create an RFQ case of either the **Purchase order** purchase type or the **Purchase agreement** purchase type.

If the RFQ case is of the **Purchase order** type, the following behavior occurs that deviates from other types of RFQ cases:

- When RFQ case lines are created, inventory transactions are generated that have a receipt status of **Quotation receipt**.
- When you accept a bid, a purchase order is generated.

If the RFQ is of the **Purchase agreement** type, the following behavior occurs that deviates from other RFQ cases:

- The RFQ case is used for an agreement to purchase a specific quantity or value of product over time. You must select the date range that applies to the purchase agreement and the name of the person who manages the purchase agreement.
- When you accept a bid, a purchase agreement is generated.

If the RFQ case is generated from a purchase requisition, the **Purchase requisition** type is automatically assigned. You can't manually create an RFQ case of the **Purchase requisition** type.

You can create an RFQ case from a purchase requisition only if the status of the purchase requisition is **In review** and you're assigned to do the next workflow task. The lines in the purchase requisition are automatically updated as you accept lines from bids (RFQ replies) that you received from vendors. You can't complete, reject, approve, or perform any other actions on the purchase requisition until the requisition line is updated with an accepted RFQ line or the RFQ case is canceled.

When you create an RFQ case, you can select a solicitation type. The solicitation type determines the set of scoring criteria that is used to score RFQ replies to the RFQ case.

You can add a questionnaire to an RFQ case. This questionnaire then appears on all RFQ replies after you send the RFQ. The completion of the questionnaire is a mandatory task before the bid can be submitted.

Although defaults are provided, you can change the **RFQ fields included in vendor RFQ reply forms** settings for each individual RFQ case as needed. To do so, create or open an RFQ case. Then, on the Action Pane, open the **Quotation** tab and, from the **Replies** section, select **Set RFQ reply defaults**. The **Default request for quotation reply fields** dialog box opens, which works the same as it does when setting the defaults for vendor RFQ reply forms, except your changes here will only affect the current RFQ case. For details about how to enable this functionality and how it works, see Choose default fields to include in vendor RFQ reply forms.

There are three ways to select the vendors to add to an RFQ case:

- Add the vendors one by one.
- Search for all vendors that meet specific criteria.
- Automatically add all vendors that are approved for the procurement categories that are used on the RFQ case lines.

When the RFQ case is ready, select **Send**. The Send action generates journals and reports that will be printed, archived, and sent according to your printing settings.

If you set **Use vendor for recalculating prices** and **Use vendor specific item information** to *Yes* on the **Sending request for quotation** page when you sent the RFQ to a vendor, some vendor-specific information is automatically entered in the RFQ for that vendor.

Amending an RFQ case

Occasionally, you must change an RFQ case after you send it. You might have to change an RFQ case if, for example, the receipt dates have changed, or you want additional products or different quantities of products. You can configure the amendment process so that it's either more restrictive or less restrictive.

If you configure the amendment process so that it's more restrictive, before you can modify the fields on an RFQ case that has already been sent, you must select **Create** on the RFQ case to start an amendment. After you've completed your changes, you must select **Finalize**. You're then guided through the process of adding information for the email that is sent to notify vendors about the amendment. The updated RFQ report, which includes an amendment note, is automatically attached to the email.

If you configure the amendment process so that it's less restrictive, you don't have to select **Create** before you can modify the fields on an RFQ case that has already been sent. However, you must manually add an amendment note on the RFQ and send the case again. This

approach can be used only if none of the replies (bids) have been edited. If you've entered a reply and it's in a *Received* state, the **Send** button is unavailable. In this case, you must select **Create** and then **Finalize**, as you must do in the more restrictive process. The reply is then reset to reflect the changes to the RFQ case.

If vendors use the vendor collaboration interface to enter bids, you must always use the amendment process to notify vendors about changes to the RFQ case. This process helps prevent the situation where vendors bid on an outdated RFQ case while their bid is in progress. For more information about vendor collaboration, see Vendor collaboration with external vendors.

If you want to invite additional vendors to bid, and no changes have been made to the RFQ case, you can use the **Send** button. The vendors that you added will appear on the **Send** page and will receive the email invitation.

Receiving and registering RFQ replies

When you send an RFQ, a reply sheet is automatically generated. As you receive bids on an RFQ, you must enter them via the **Request for quotation** page by selecting the action **Edit RFQ reply.** This will allow you to enter the bid information in a dedicated bid form. Initially, the **Reply progress** is *Not started*. When you select **Edit RFQ reply,** the progress status is *Purchaser is updating* until the bid is submitted. Select **Submit** when you have entered the bid information. The **Reply progress** status changes to *Submitted by purchaser*. Similarly, with vendor collaboration enabled, the **Reply progress** will update as the vendor interacts with the bid. The status then changes from *Vendor is updating* to *Submitted by vendor*. When the bid is submitted, a journal is created as *Received*. The reply (bid) has to be submitted in order to be registered as received, and only then it can be further processed as accepted or rejected.

If you need to update the bid, you should go through the same process as above and submit again.

You can only edit the **Request for quotation** form with information that relates to processing the bid, not for entering the bid. To enter or modify the bid, select **Edit RFQ reply.**

When you enter the bid information, and if the RFQ case allows for alternate lines, you can add alternate lines for lines that only have a procurement category and no catalog item specified. Select **Add alternate** to add alternate lines.

If you've entered a reply but require a new offer from the vendor, you can return the RFQ. A new journal and a report are generated, that can be sent to the vendor.

You can see an overview of all RFQs and their statuses: *Sent*, *Received*, *Accepted*, *Rejected*, *Canceled*, *Declined* on the **Request for quotation follow-up** page.

Accepting and rejecting bids, and transferring accepted bids to downstream documents

After you've identified the best bid, such as the bid that offers the best total price, you accept the bid. You can accept some lines in a bid and reject others. You can also accept lines from different vendors. If you accept some lines, you're prompted to reject all the other lines. Therefore, if you want to accept other lines, you must select **Cancel** when you're prompted. The status of the RFQ reply for each vendor that you accept bids or lines from is updated to **Accepted**.

If you, while you prepare the purchase order or purchase agreement, need to add an additional line to the RFQ, you can do so by selecting **Add line** on the **Request for quotation** page line grid. You can only view and edit this line in **Request for quotation** page. It will be visible on the bid page when it's accepted.

When you accept a bid or one or more lines in a bid, a purchase order or a purchase agreement is automatically generated. You can then reject the bids from all the other vendors.

On the reply, you can add a reason code to explain why you accepted or rejected a bid.

When you accept a bid of the **Purchase requisition** type, the purchase requisition lines will be updated with the following information that reflects the information of the accepted bid:

- Unit price
- Discount percentage
- Discount amount
- Purchase charges
- Line charges
- Vendor
- External number
- External description

The following table shows how the RFQ status changes as you accept and reject bids from vendors.

Statuses – highest and lowest

On the Vendor tab of the RFQ case, you can see the lines with the highest and the lowest status for a particular vendor. When the vendor is added, and no lines have yet been sent, both the lowest and the highest status is *Created*. When the RFQ is sent to the vendor with all lines, the status of the two lines will be *Sent*. If some lines in a bid from a vendor are accepted and

others are rejected, the rejected lines will get the lowest status, which is *Rejected*, and the accepted lines will get the highest status, which is *Accepted*.

On the RFQ case lines, you can see the highest and the lowest status per line across all vendors. If you have sent a line to all the vendors in the RFQ case and no one have responded yet both the lowest and the highest status is *Sent*. When at least one vendor responds, the highest state will change to *Received*. If you add a new vendor to the case, the lowest status will change to *Created*

The highest and the lowest status on the RFQ case is an aggregation of the status on the **Vendor** tab and the **Lines** tab.

The statuses are ranked in the following way from lowest to highest: *Created*, *Sent*, *Received*, *Rejected*, *Accepted*, *Declined*, *Canceled*.

The following table shows how the RFQ case status changes when you create an RFQ case with lines and then send it to vendors.

Expand table

Action	Lowest RFQ case status	Highest RFQ case status	Lowest RFQ case line status	Highest RFQ case line status
Create the RFQ case header and line.	Created	Created	Created	Created
Send RFQs to all vendors in the RFQ case.	Sent	Sent	Sent	Sent
Add another vendor.	Created	Sent	Created	Sent
Send the RFQ to the second vendor.	Sent	Sent	Sent	Sent

All the lines on the RFQs that are related to the RFQ case will be in *Sent* state.

The following table shows how the RFQ status changes as you receive bids and register the information on the RFQ reply sheet.

Expand table

Action	Lowest status across all lines of all RFQs	Highest status across all lines of all RFQs	Lowest RFQ case header status	Highest RFQ case header status	Lowest RFQ case line status	Highest RFQ case line status
Register one vendor's bid to an RFQ, and save it.	Sent	Received	Sent	Received	Sent	Received
Register the second vendor's bid to an RFQ, and save it.	Received	Received	Received	Received	Received	Received

In the example below you can see the highest and lowest status on the RFQ case where one bid has been received and the other bid has been accepted. When a received bid is rejected, the lowest status will change from received to rejected on the RFQ case header and line.

Expand table

Action	Lowest status across all lines of all RFQs	Highest status across all lines of all RFQs	Lowest RFQ case header status	Highest RFQ case header status	Lowest RFQ case line status	Highest RFQ case line status
Accept one of the bids (or at least one line).	Received	Accepted	Received	Accepted	Received	Accepted
Reject all the other bids.	Rejected	Accepted	Rejected	Accepted	Rejected	Accepted

Create a request for quotation

10/17/2025

This article shows you how to create a request for quotation. A purchasing agent typically performs this task. You can use this procedure in demo data company USMF or on your own data. You need to set up solicitation types before you start. After you complete this task and create and send a request for quotation (RFQ), you can enter the replies per vendor, compare them, and award the contract.

Prepare a new RFQ

1. Go to **Procurement and sourcing** > **Requests for quotations** > **All requests for quotations**.
2. Select **New**. The following purchase types are available:

    - *Purchase order* – A document that confirms the offer to buy products, or the acceptance of an offer to sell products in exchange for payment. This type is the default.
    - *Purchase requisition* – This type is automatically selected if you create an RFQ directly from a purchase requisition. If you manually select this option, you get an error.
    - *Purchase agreement* – An agreement to purchase a specific quantity or value of product over time. If you select this option, you must select the date range that applies to the purchase agreement.

3. In the **Document title** field, type a value.
4. In the **Solicitation type** field, enter or select a value.

    - If a scoring method is associated with the solicitation type, this method is the default scoring method for the RFQ that you're creating. You can change the scoring method later.
    - In the **Receipt date** field, enter a date.
    - Select the date by which you want to receive the items.
    - In the **Expiration date and time** field, enter a date and time.
    - Specify the date and time by which vendors must respond to the RFQ.

5. In the **Warehouse field**, enter or select a value. The delivery address defaults to the warehouse address.
6. Select **OK**.

Add lines

After you specify the basic information about your RFQ, specify the goods or services that you want vendors to bid on. Item is the default line type.

1. In the **Item number** field, enter or select a value. If you're using USMF, you can select *T0020*.
2. In the **Quantity** field, enter a number.
3. Select **Add line**.
4. In the **Line type** field, select *Category*. Use the *Category* line type to create RFQs for noninventory goods or services. Then select the type of goods or services from a hierarchy of procurement categories.
5. In the **Procurement category** field, enter or select a value.
6. In the **Product name** field, type a value.
7. In the **Quantity** field, enter a number.
8. In the **Unit** field, enter or select a value.

Add vendors

1. Select **Header** to change from the lines view to the header view.
2. Expand the **Vendor** section.
3. Select **Auto-add vendors**. You can add vendors to the RFQ automatically, based on the procurement category of the items requested. If there are no vendors approved for the categories included in the lines, you can add vendors manually.
4. Select **Add**.
5. In the **Vendor account** field, enter or select a value.
6. Select **Add**.
7. In the **Vendor account** field, enter or select a value. When you select a vendor, the status is *Created*. This status means that the vendor information is saved in the RFQ, but you didn't yet send the RFQ to the vendor. You can add a vendor to an RFQ regardless of the vendor status.

Send the RFQ to vendors

1. On the Action Pane, select **Send**. On the **Sending request for quotation** page, check that the vendors in the list are the ones that you want to receive the RFQ.
2. Select **Print**. This dialog allows you to print the RFQ. If you choose to print a reply sheet, the contents of this sheet are defined in **Procurement and sourcing parameters**. To choose how to print reply sheets, select **Advanced printing options** in the **Print** dialog.

One RFQ is printed for each vendor containing the lines that have the status of *Created* or *Sent*. Canceled lines and lines with registered replies aren't printed.

3. Select **Cancel**.
4. Select **OK**.
5. Close the page.
6. Close the page.

Send several RFQs at once

To send several RFQs to vendors all at once, follow these steps:

1. Select the checkbox for each RFQ that you'd like to send.
2. On the Action Pane, open the **Quotation** tab and select **Send all lines**.
3. On the **Sending request for quotation** dialog, make sure that the vendors shown are the ones that you want to send the RFQ to.
4. Select **OK**.

You can configure the system to filter the set of vendors listed on the **Sending request for quotation** dialog based on their status. To set this option, follow these steps:

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**
2. Open the **Request for quotation** tab.
3. Set **Send all lines default status** to one of the following values:
    - *All* – List all vendors regardless of their status.
    - *Created* – Only list vendors that have **Lowest status** or **Highest status** set to *Created*.
    - *Sent* – Only list vendors that have **Lowest status** or **Highest status** set to *Sent*.
4. On the Action Pane, select **Save**.

View the RFQ journal

1. Go to **Procurement and sourcing > Requests for quotations > Request for quotations follow-up > Request for quotation journals**.
2. Select **Preview/Print**.
3. Select **Original preview**.
4. Close the page.
5. Close the page.

Sealed bidding for RFQs

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Sealed bidding keeps vendor bid replies secret until they're unsealed by purchasing personnel. All bids that are related to a request for quotation (RFQ) are first available to be unsealed upon bid expiry. Before a bid is unsealed, only users with dedicated user roles and who represent the vendor can access it.

> **Important**
>
> Modifying or extending forms, or creating new forms or business logic can defeat the protection Microsoft provides for sealed bidding. You bear the risk of using any modifications, extensions, new forms or business logic, or the inability to use the sealed bidding feature due to such modifications, extensions, new forms, or business logic. Microsoft isn't responsible for any damages arising from any modifications or extensions to forms, or any new forms or business logic that you create, or any third party creates for you. Microsoft doesn't provide technical or other support for any modifications, extensions, new forms, or business logic made by you or any third party on your behalf. You are solely responsible for complying with all applicable laws or regulations concerning sealed bidding.

How bids are kept secure

Sealed bidding uses asymmetric encryption to encrypt the bid encryption key (KEK) and symmetric encryption to encrypt the actual bid. The system integrates with Microsoft Azure Key Vault to generate and manage the encryption keys that are used to encrypt sealed bids. Each bid has its own encryption key. This encryption is kept safe in a key vault that is owned by the organization that runs Dynamics 365 Supply Chain Management. The system accesses the key vault on demand, whenever encryption and decryption are required.

Setup and configuration

This section describes the prerequisites that must be in place before you can send out RFQs that require sealed bidding.

Step 1: Set up user access to sealed bidding

When you use sealed bidding, only users who are set as the contact person for a vendor can view, edit, and submit bids for that vendor until the bidding period expires. These users must have the **Vendor (external)** role, and they must be set as a contact person for the vendor account. The contact person must also have permission to do vendor collaboration, as described in Set up and maintain vendor collaboration.

Because users who have appropriate permissions and who are set up as vendor contacts can access the sealed bids for a vendor, it's important to track who those users are. The system admin who sets up users and security roles is responsible for limiting access to sealed bids to those users who are allowed to view them.

Step 2: Set up Azure Key Vault

Supply Chain Management uses encryption keys to protect all sealed bids and keep them secret until the appropriate time. It takes advantage of the capabilities of Key Vault to generate and manage the required keys. Therefore, you must set up a connection from Supply Chain Management to a key vault to enable the system.

> **Important**
>
> The key vaults that you use for sealed bidding must meet the following requirements:
>
> - If you use a sandbox for development and testing, then you must have one dedicated key vault for the sandbox and a separate one for production.
> - Each key vault must be created in an Azure subscription that is owned by your organization (not the subscription where you're running Supply Chain Management).
> - Each key vault must be used exclusively for sealed bidding. You must not use your sealed-bidding key vaults for any other purpose.

Every bid retrieves its own secret key. This key is used every time that a user views, updates, or unseals the bid.

Key Vault generates the key that is used to retrieve the secret when the vendor selects **Bid** in the vendor collaboration interface. The key then expires after a fixed time that the procurement manager sets on the **Procurement and Sourcing Parameters** page in Supply Chain Management. After the key expires, nobody will be able to view, edit, or unseal the bid.

Therefore, it's important to configure key expiration so that there's enough time for the bidding process to be completed.

In the next three steps, you'll set up the connection to Key Vault. First, you'll set up a key vault to use with sealed bidding. Next, you'll configure Supply Chain Management to communicate with the key vault. Finally, you'll set the expiration time for the key.

Step 3: Set up a key vault to use with sealed bidding

To set up your key vault, follow these steps. The order of the steps is important.

1. If you haven't already set up an Azure subscription that is separate from the subscription where you're running Supply Chain Management, set it up.
2. Set up a key vault in your separate Azure storage. Learn more in Maintaining Azure Key Vault storage.
3. Set up your Supply Chain Management app to work as a client for your key vault. Learn more in Setting up Azure Key Vault Client.

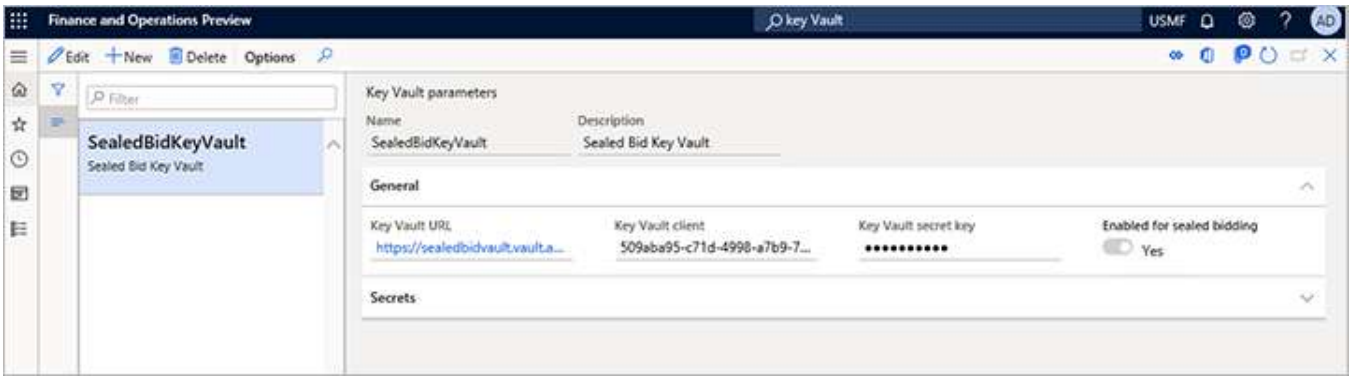
Step 4: Configure Key Vault parameters in Supply Chain Management

To configure Supply Chain Management to communicate with the key vault during sealed bidding, follow these steps.

1. Sign in to Supply Chain Management, and go to **System administration** > **Setup** > **Key Vault parameters**.

2. Select **New** to create a record, and set the following fields for it:

    - **Name** – Enter a name.
    - **Description** – Enter a description.
    - **Key Vault URL** – Enter the default URL for your key vault.
    - **Key Vault client** – Enter the interactive client ID of the Active Directory application that is associated with a key vault for authentication.
    - **Key Vault secret key** – Enter the secret reference for the certificate.
    - **Enabled for sealed bidding** – Set this option to *Yes*.



> **Note**
>
> You can enable only one key vault configuration for sealed bidding at a time. Before you disable an existing key vault configuration, you must make sure that all sealed bids that use it are unsealed. Inspect every RFQ case of the *Sealed* type, and make sure that all replies for it are unsealed.

Step 5: Set the key expiration time

To set the expiration time that is applied to the key that is generated for every new bid, follow these steps.

1. Go to **Procurement and sourcing parameters** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Request for quotation** tab, in the **Days offset** field, enter the number of days that the RFQ period should last. When an RFQ is created, the number of days that you enter here is added to the system date to define the default expiration date for the RFQ.
3. In the **Encryption key expiration day offset** field, enter the number of days that every encryption key should be valid after it's issued. After the encryption key expires, nobody will be able to view, edit, or unseal the sealed bid that uses it.

> **Tip**
>
> The value of the **Encryption key expiration day offset** field shouldn't be less than the value of the **Days offset** field.

Step 7: Set the default bid type

Every RFQ case has a bid type. The bid type defines whether that RFQ case provides open or sealed bidding.

RFQ cases that don't have a solicitation type

To set the default bid type that is assigned to new RFQ cases that aren't assigned a solicitation type when they're created, follow these steps.

1. Go to **Procurement and sourcing parameters** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Request for quotation** tab, set the **Bid type** field to *Sealed*.

RFQ cases that have a solicitation type

To set the default bid type that is assigned to new RFQ cases that are assigned a solicitation type when they're created, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Request for Quotation** > **Solicitation type**.
2. Create a new solicitation type, or select an existing solicitation type where you want to use a bid type of *Sealed*.
3. Set the **Bid type** field to *Sealed*.
4. Repeat these steps for every additional solicitation type where you want to implement sealed bidding.

> **Tip**
>
> A solicitation type doesn't have to be assigned when a new RFQ is created. If a solicitation type is assigned, the default bid type of an RFQ can retrieve it. Otherwise, the default solicitation type that is defined in Procurement and sourcing parameters can be used.

The sealed bidding process

Sealed bidding follows almost the same process that is described in Requests for quotation (RFQs) overview. The main difference is that the bid data and its attachments are kept encrypted until the bid is unsealed.

> **Important**
>
> Questionnaires aren't encrypted and shouldn't be used to collect sensitive information

Here's an outline of the process:

1. You create and send an RFQ to one or more vendors.
2. Vendors respond by submitting their sealed bid.

3. You unseal the bids after the bid entry expiration time.
4. The bids become visible, and you can evaluate and compare them.
5. After a bid is accepted, you generate a purchase order, generate a purchase agreement, or update a purchase requisition.

Create an RFQ case that uses sealed bidding

The process of creating an RFQ case for sealed bidding is almost the same as the process for non-sealed bidding. For information about how to create both types of RFQ cases, see Create a request for quotation. This section highlights a few important considerations when you create an RFQ for sealed bidding.

RFQ cases for sealed bidding must have a **Bid type** value of *Sealed*. There are three ways to assign this value to an RFQ case:

- Set the value directly on the RFQ case after you create it.
- Define sealed bidding as the default bid type for all RFQ cases in Procurement and sourcing parameters. (See the Set the default bid type section earlier in this article.)
- When you create a new RFQ case, select a solicitation type that is set up for sealed bidding. (See the Set the default bid type section.)

For sealed bidding, the RFQ case's **Expiration date and time** value establishes when the submitted bids can be unsealed. The **Expiration date and time** value on each line will match the value on the header.

You can't change the bid type after an RFQ case is sent.

Vendors respond to an RFQ

Vendors that respond to a sealed bid use the same procedure that they use to respond to open bids, as outlined in Working with RFQs in the Vendor bidding workspace. For detailed instructions about how to work with both open bids and sealed bids, see Enter and compare RFQ bids and award contracts. The only difference between processing for sealed bids and processing for open bids is that, until the bidding period has expired, procurement professionals can't open a vendor's sealed bid. Only a contact person for the vendor can open that vendor's sealed bid.

> ⓘ **Important**
>
> For sealed bidding, vendors can upload attachments only in PDF format. No other formats are accepted.

After a registered vendor user selects **Bid** on a sealed-bid RFQ, they can enter their bid data, and that data will be kept secure. Vendors can save their work as they prepare a bid, return to it as often as required, and then submit it when it's ready. Vendors can also view their bid after they submit it. If vendors must change their bid after they submit it, they can recall it, update it, and resubmit it at any time until the bidding period expires.

The following conditions apply during sealed bidding:

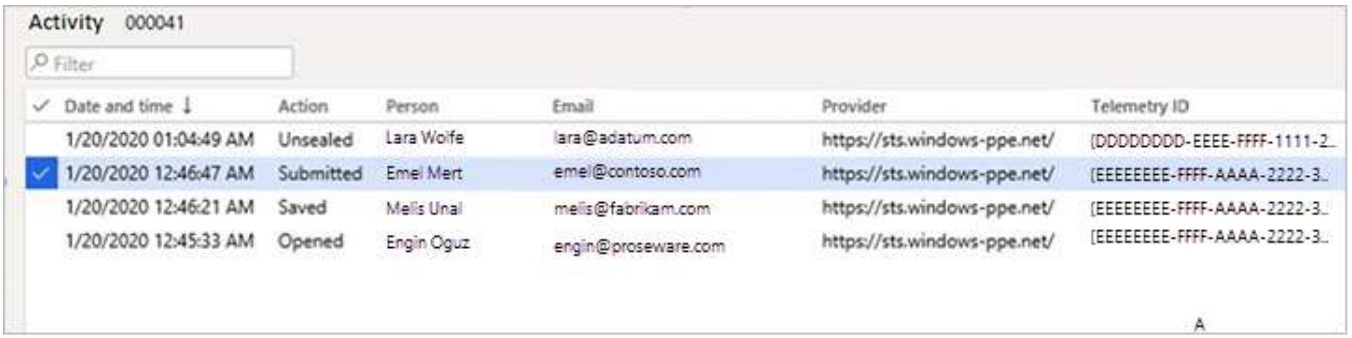
- During sealed bidding, the system creates a *Request for quotation* journal.
- When a vendor submits a bid, RFQ journals without lines are created that have a sealed price.
- After the case is unsealed, RFQ journals are created that have a price and amount. You can access this journal by selecting **Request for quotation journals** on the **All requests for quotations** page.
- The system stores a log of each action that users perform on a sealed bid. These actions include viewing, editing, and saving the bid. This log is visible both to the vendor and to procurement professionals who have access to the bid.
- As the bid progresses, procurement professionals can view its status. The status will be either *Vendor is updating* or *Submitted by vendor*.
- The status of the lines in a sealed bid remains *Sent* until the bid is unsealed.
- If the vendor chooses to decline a bid, the bid will have a **Reply Progress** status of *Declined by vendor*. This status will be visible to procurement personnel.
- Answers in questionnaires are **not** stored in encrypted form in the database. Therefore, they aren't sealed. However, they won't be visible in the RFQ user interface until the case is unsealed.

All sealed bid activities are logged

A detailed log records all user activities and actions for a bid. The activity log enables organizations to determine who updated a bid during its lifetime, and what the updates were. It also enables organizations to confirm that only authorized people accessed a sealed bid. The activity log is available on every bid's **Activity** page.

Review RFQ activity

Every interaction with the bid is logged and can be viewed on the **Activity** page. The following illustration shows an example.



Vendors can access the **Activity** page by selecting **Activity** on the **Request for Quotation Sealed bid** page. Procurement personnel can access it by selecting **Activity** on the **Request for Quotation** page. The activity log provides full visibility for vendors and for the procurement personnel who have accessed the bid. Therefore, it can reveal any unauthorized access.

Unseal sealed bids

When the **Expiration date and time** value that was configured for a sealed-bid RFQ case has passed, the **Unseal** button becomes available. Select **Unseal** to unseal all the bids for the selected RFQ case. All the bid data and attachments then become visible so that replies to the case can be managed. Additionally, journals are created that contain the submitted bid data.

The unsealing event is logged and can be viewed on the **Activity** page.

Process accepted bids

The process of comparing and approving previously sealed bids is the same as the process for open bids. For information about how to score, compare, reject, and accept unsealed bids, see Enter and compare RFQ bids and award contracts.

The RFQ activity log can never be deleted

Nobody, not even administrators and Microsoft Support, can edit or delete the RFQ activity log. This restriction helps ensure the fairness of the sealed bidding process. It also helps ensure that an accurate audit trail is maintained.

Last updated on 10/03/2025

Create a requisition that uses an RFQ

06/17/2025

This article explains how to add price and vendor information to a purchase requisition from a request for quotation (RFQ) process. The example shown in this guide can be used in the USMF demo data company, and you must be logged in as an Admin to complete all the steps. The tasks in this guide would typically be done by procurement professionals.

Create a requisition

1. Go to **Procurement and sourcing** > **Purchase requisitions** > **Purchase requisitions prepared by me**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Requested date** field, enter a date.
5. In the **Accounting date** field, enter a date.
6. Select **OK**.
7. In the **Reason** field, enter or select a value.
8. Select **Add line**.
9. In the **Procurement category** field, select a category in the tree, and then select **OK**.
10. In the **Product name** field, type a value.
11. In the **Quantity** field, enter a number.
12. In the **Unit** field, enter or select a value.
13. Select **Save**.
14. Select **Workflow** to open the drop dialog.
15. Select **Submit**.
16. Close the page.
17. Select **Submit**.

Reassign a workflow task

The next task is to create an RFQ to get bids from vendors for the product. In USMF demo data, the requisition workflow is set up with a rule so that if a vendor isn't selected, or the unit price is 0 for a line, a task is assigned to a specific worker to create an RFQ. To continue with this guide, you need to reassign that task to another user (yourself). You can only do this if you're logged in as an Admin.

1. Select **Workflow** to open the drop dialog.
2. Select **View history**.
3. Refresh the page.

4. Expand the **Tracking details** section.
5. In the tree, select the line that starts with *Line workflow activated on*.
6. Select **View workflow details**.
7. Expand the **Work items** section.
8. Select **Reassign**.
9. In the **User** field, select *Admin*.
10. Select **Reassign**.
11. Close the two pages.

Create an RFQ

1. Refresh the page.
2. Select **Request for quotation**.
3. In the **Buying legal entity** field, select *USMF*. You must select the same legal entity that's on the requisition line.
4. In the list, mark the selected row. If you had multiple lines on your purchase requisition, select all the lines that you want to add to the RFQ.
5. Select **OK**.
6. Refresh the page.
7. Ensure that the FactBox is open, then expand the **Related documents** section.
8. Select the link in the **Request for quotation** field to open the RFQ that you created.
9. Select **Header**.
10. Select **Add**.
11. In the **Vendor account** field, enter or select a value.
12. Select **Add**.
13. In the **Vendor account** field, enter or select a value.
14. Select **Send**.
15. Select **OK**.
16. Select **Enter reply**.
17. On the Action Pane, select **Reply**.
18. Select **Copy data to reply**. This copies data, such as the quantity and dates, from the RFQ to the reply.
19. In the **Unit price** field, enter a number. This is the price that you've received from the vendor. You might also want to enter additional information from the vendor.
20. Select **Accept**.
21. Select **OK**.

Verify that vendor and price have been transferred to the requisition

1. Close the page.
2. Select **Lines**.
3. Select **Related information**.
4. Select **Purchase requisition**.
5. Select the line that was transferred to the RFQ. Verify that the price and vendor have been copied to the requisition.
6. Select **Workflow** to open the drop dialog.
7. Select **Complete**.
8. Select the page.
9. Select **Complete**.

Create a scoring method for RFQs

Article • 05/02/2022

This procedure shows you how to create a scoring method. A scoring method is a set of criteria that can be used to compare bids that are sent in reply to a request for quotation (RFQ). For example, you might want to rate a vendor on past performance, or rate whether the company is environmentally friendly or a good collaborator, or you might want to compare bids based on price. The scoring method can be associated with a solicitation type as the default scoring method for RFQs of that type. These tasks would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data.

1. Go to Procurement and sourcing > Setup > Request for quotation > Scoring method.
2. Click New.
3. In the Name field, type a value.
4. In the Description field, type a value.
5. Click Save.
6. Click New.
7. In the Name field, type a value.
8. In the Description field, type a value.

    - This description is shown along with the scoring method name when a scoring method is selected for an RFQ.

9. In the Range from field, enter a number.

    - The range limits what the procurement professional can enter as a score. When there are multiple scoring criteria on an RFQ, the scores that have been entered are added to each other and the sum is made available to allow the bids to be compared.

10. In the Range to field, enter a number.
11. Click New.
12. In the Name field, type a value.
13. In the Description field, type a value.
14. In the Range from field, enter a number.
15. In the Range to field, enter a number.

Create solicitation types and scoring criteria for RFQs

06/17/2025

This guide shows you how to create a solicitation type and associate this with a scoring method. It also shows how to use the solicitation type on a request for quotation (RFQ) which then sets the default scoring method. These tasks would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data. You need to have a scoring method available before you start.

Create a solicitation type

1. Go to **Procurement and sourcing** > **Setup** > **Request for quotation** > **Solicitation type**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, type a value.
5. In the **Scoring method** field, select the scoring method that you want to use for this solicitation type.
6. Select **Save**.
7. Close the page.

Use the solicitation type

1. Go to **Procurement and sourcing** > **Requests for quotations** > **All requests for quotations**.
2. Select **New**.
3. In the **Solicitation type** field, select the solicitation type that you created.
4. Select **OK**.
5. Select **Scoring criteria**. The scoring criteria that are shown are the ones from the scoring method that you associated with the solicitation type. You can choose to add or delete criteria on this page. It's also possible to add new criteria by copying them from other scoring methods.
6. Select **Copy criteria**.
7. In the **Scoring method** field, enter or select a value.
8. Select **OK**.
9. Close the page.

Responding to vendor questions on Request for quotations

10/03/2025

When your agency has sent a request for quotation (RFQ), vendors sometimes have questions that pertain to the request. Vendors that have questions related to an RFP can submit their questions and read the answers on **Vendor collaboration** page, when you make that page available to them. When vendor questions are accepted, **Questions and answers** is available on the **Request for quotation bid** page on **Vendor collaboration**, and for your agency through the **Request for quotation** page, **Questions and answers**.

Users can publish answers to vendor questions more than once. Vendors can't no longer post questions after a vendor is selected and the RFQ is awarded, or after the cutoff date for questions is reached.

Allow questions and answers to be used in RFQs

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. Open the **Request for quotation** tab.
3. Set the following options as needed:

    - **Allow vendor questions**: Enables or disables vendor questions for RFQ cases. You must set this to *Yes* to use the features described in this article.
    - **Default direct response**: When you reply to a question, you can choose to reply to all vendors who received the RFQ or to reply only to the specific vendor who submitted the question. You can make choose this option each time you reply, but this setting controls the default. If you usually reply to all vendors, set this to *No*. If you usually reply to individual vendors, set this to *Yes*.

Setting up for vendor questions

When creating a request for quotation, you determine whether vendors can ask questions about the RFQ.

1. Navigate to **Procurement and sourcing** > **Requests for quotations** then click **New** > **Request for quotation**
2. In the **New request for quotation** page, **Header** to set the **Vendor question options** fields to allow questions before a certain date.
3. Set the **Allow vendor question** option to **Yes** so the vendors can enter questions. Users can enter and answer questions and designate commonly asked questions to publish for

vendors when the RFQ is sent to vendors.
4. Optional: In the **Cutoff date** field, define the final date by which questions must be submitted. If no cutoff date is entered, questions are accepted as long as the RFQ is open and accepting bids.
5. Click **Save** to save the RFQ.
6. Click **Send** to send the RFQ to the vendors for bidding.

Entering and replying to vendor questions

Vendors enter questions in the **Vendor Collaboration** > **Request for quotations bid** page, **Vendor questions** FastTab. The question is visible only to the vendor and users.

Entering a vendor question

1. In Vendor collaboration, in the **Request for quotation bid** page, click **Questions and answers**, and then click + **Ask a question**.

   > ⓘ **Note**
   >
   > Alternately, a user can enter questions for a vendor on the **Request for quotation** page, by clicking **Manage replies**, **Edit RFQ reply** then clicking **Questions and asnwers**.

2. On the **Question** field, enter the question text.

3. Click the **Submit**. Repeat steps 1-3 to add a question.

4. When done, click **Save** to save your questions.

Replying to a single vendor

The question and answer are visible only to the vendor and users.

1. On the **Request for quotations** page, click the **Questions and answers** to display the **Questions and answers** page.
2. Click **Edit**.
3. Enter text in the **Answer** field to respond to the vendor's question.
4. Check the **Direct response** box.
5. Click **Save** to save your replies.
6. Click **Send answers** to send the answers to the vendor.

Replying to all vendors

If you receive the same question from multiple vendors, you can group the questions and respond with one answer. All vendors receive notification when the commonly asked questions and answers are published. The vendors and anyone with access to the request for quotation can view the summary of questions and answers.

1. On the **Request for quotations** page, click the **Questions and answers** to display the **Questions and answers** page.
2. Click **Edit**.
3. Choose a code for the common question, such as the letter 'a.'
4. For each line that asks a similar question, enter the code in the **Group code** field. For example, for each line asking about item color, enter 'a.'
5. Choose one of the lines with the code value, and enter the question and answer the way you want them to read in the summary that will be available when the questions and answers are published (**Group question, Group answer** fields).
6. Optional: You can mark the **Direct response** check box to send the answers only to the selected vendors.
7. Click **Save** to save your answers.
8. Optional: You can revert the questions and answers to the previously published values if you want to undo your changes.
9. Click **Send answers** to send your answers to the vendors.

Changing RFQ to allow or disallow questions

You can make changes to allow or disallow questions to RFQs until the RFQ is awarded. You can also extend or shorten the time frame in which vendors can submit questions. For published RFQs, you must modify a request for quotation to allow or disallow vendor questions or adjust the time frame for questions.

> ⓘ **Important**
>
> If you amend an existing RFQ for the purpose of allowing vendor questions, the system will clear all existing responses when you resend the RFQ.

Enter and compare RFQ bids and award contracts

06/17/2025

This article explains how to enter replies to a request for quotation (RFQ), score and compare bids, and then award the contract to one of the vendors. You can use this procedure in the **USMF** demo data company.

Before you start this procedure, you must have an RFQ that has two lines, and that has been sent to at least two vendors. To create this RFQ, complete the Create a request for quotation procedure. Scoring criteria must also be set up before you can complete this procedure.

You can enter the bid as either a vendor or a procurement professional. Learn more in Set up and maintain vendor collaboration.

Enter a reply as a vendor

1. Go to **Vendor collaboration** > **Workspaces** > **Vendor bidding**.
2. In the **New bid invitations** list, find an RFQ that was recently sent. Select the RFQ to review what was requested.
3. Select **RFQ attachments** to review any attachments that have been added.
4. Select **Bid** to make the fields editable. Notice that the **Bid progress** field is set to **Vendor is updating**.
5. On the header and lines, enter the values from the bid reply.
6. If any attachments should be added to the bid, select **Bid attachments**.
7. Select the **Bidding guiding items** FastTab to view whether any documents are required.
8. Select the **Amendments** FastTab to view whether the RFQ has been amended.
9. Select the **Questionnaire** FastTab. Any questionnaires that appear here must be answered.
10. Select the **Line details** FastTab to view extended information about the line.
11. Select **Reset from RFQ** only if you must reset the values that have been entered to the original RFQ values.
12. You can save the bid at any time and do additional processing later, provided that the expiration date and time haven't passed. In this case, you can find the bid in the **Bids in progress** list in the **Vendor bidding** workspace.
13. When the bid is ready to be sent, select **Submit**. If you don't want to bid, select **Decline**. Submitted bids are available in the **Submitted bids** list in the **Vendor bidding** workspace.
14. After the bid is submitted, you can recall it at any time before the expiration date and time. When a bid is recalled, it isn't treated as submitted. When the bid is accepted or rejected by the procurement department, it appears in either the **Awarded bids** or **Lost bids** list in the **Vendor bidding** workspace.

Enter a reply from a vendor as a procurement professional

1. Make sure that the permission to edit vendor bids is set up. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**. On the **Request for quotations** tab, set the **Purchaser can edit vendors bid** option to **Yes**.
2. Go to **Procurement and sourcing** > **Requests for quotations** > **All requests for quotations**.
3. Select an RFQ that has a status of **Sent**, and then select the link in the **Request for quotation case** field.
4. Select **Manage replies**. The page that appears shows an RFQ for each vendor that was invited to bid.
5. Select an RFQ that hasn't been replied to. (The **Reply progress** field should be set to **Not started**.)
6. Select **Edit** > **Edit RFQ reply**. The **RFQ reply** page appears. As a procurement professional, you can now enter the reply on behalf of the vendor. Notice that the **Bid progress** field is set to **Purchaser is updating**.
7. Enter the bid data. When you've finished, select **Submit**.

Score the bids

1. On the **All requests for quotations** page, select the RFQ case that you want to score replies for.
2. Select **Manage replies**.
3. Select the reply to score.
4. Select **Header** so that you can view the scoring for the bid.
5. On the **Bid scoring** FastTab, enter a number in the **Score** field for one of the scoring criteria. If you hover over a scoring criterion, a tooltip shows the range that the score must be within. In this demo, you can enter a number between 1 and 5 for any of the scoring criteria.
6. Repeat step 5 for another scoring criterion.
7. If the RFQ case has a questionnaire that was sent to the vendors, you can enter the vendor responses on the **Questionnaires** FastTab.
8. Close the page.
9. Repeat steps 1 through 8 for all the other bids.

Compare the replies

1. On the Action Pane, on the **General** tab, select **Compare replies**.

2. In the **Rank** field, enter a number.

    - This page shows the bids, together with the header and line information, and also the total score at the header level. You can compare the lines by sorting the grid so that comparable lines are next to each other. The following information is also included:
    - **Quantity** – The quantity that the vendor quoted. This quantity might not equal the quantity that is specified in the RFQ.
    - **Net amount** – The price that the vendor quoted for the items on the line, minus any discounts.
    - **Deviation** – The number of days by which the receipt date on the bid header or line differs from the requested receipt date on the RFQ header or line. You can enter a rank for each bid.

3. Select the header line for the other bid that you want to rank.
4. In the **Rank** field, enter a number.
5. Select **Save**.

Reject a bid

1. Select the header line for the bid that you want to reject. You can accept, reject, or return only one bid or the lines on only one bid at a time.
2. Select the **Mark** check box.

    - If you select the **Mark** check box on the header of the bid, all the lines are also marked. To reject or accept only some of the lines on the bid, you can mark just those lines. Additionally, you can accept one vendor's bid for some lines of an RFQ and then award other RFQ lines to a different vendor. However, you must do one bid at a time.
    - If alternate lines are present, you can accept either the original bid line or its alternate, but not both.

3. Select **Reject**.
4. Select **Parameters**, and then, in the **Reason reject** field, enter or select your reason for rejecting the bid. The reason is stored in the reply.
5. Select **OK**.
6. Select **OK**.

Accept a bid

1. Select the bid to accept, and then select the link in the **Request for quotation** field. If you're on the **Compare request for quotation replies** page, the highlighted bid that has focus is the bid that the system will consider during the Accept action. You can accept lines from only one bid at a time.
2. On the Action Pane, select **Reply**.
3. Select **Accept**. If you marked only specific lines, the Accept action will include only those lines. If you want to accept all the lines on the bid, you don't have to mark the lines.
4. Select **Parameters**, and then, in the **Reason accept** field, enter or select your reason for accepting the bid. The reason is stored in the bid.
5. Select **OK**.
6. Select **OK**. When you select **OK**, a purchase order is generated based on the lines that are included in the RFQ acceptance. If there are other bids that haven't been processed (accepted, rejected, or returned), the system prompts you to reject them.

View the purchase order that is generated

On the Action Pane, on the **General** tab, select **Purchase order**. The page that appears shows the purchase order that was generated when you accepted the bid.

Purchase order overview

This article provides general information about purchase orders (POs) and links to other articles that are related to the various stages that a PO goes through.

A purchase order (PO) is a document that represents an agreement with a vendor to buy goods or services. The document also helps keep track of product receipts that are made toward the order and, later, the accounting of vendor invoices that the vendor bills toward the order.

The **Purchase orders** page contains an overview of the available orders and lets you modify those orders. When you open a PO, you can select the **Header** view, which contains information that is specified only one time for each PO, such as the vendor details. Alternatively, you can select the **Lines** view, where you can modify order lines. Typically, you'll switch between these two views as you modify POs. Charges aren't listed directly on the **Purchase orders** page, but are accessed via menus on the order header and lines.

There are many reports where you can view information about POs, product receipts, and vendor invoices. These reports are found in the **Procurement and sourcing** and **Accounts payable** modules.

The **Purchase order preparation** and **Purchase order receipt and follow-up** workspaces let you view lists of POs in the various states that they've progressed to. They also provide a summary of the actions that must be taken. The **Purchase order preparation** workspace is focused on PO creation and review, processing of the order through approval, and confirmation with the vendor. The **Purchase order receipt and follow-up** workspace is focused on processing the receipt of goods or services against POs. It includes lists that give insight into receipts that are overdue, or that will soon be due for delivery by the supplier. These workspaces aren't used to perform the related receipt activities that are done in the warehouse. Those activities are performed by using pages in the **Inventory management** and **Warehouse management** modules. Processing of vendor invoices should be done by using the **Vendor invoice entry** workspace, and payments should be done by using the **Vendor payments** workspace.

The following articles provide an overview of the various stages that a PO goes through:

- Create purchase orders
- Approve and confirm purchase orders
- Product receipt against purchase orders
- Overview of vendor invoices

Types of purchase orders

There are three types of purchase orders. When you create a purchase order, you must specify the type. Set up a default order type for new orders on the **Procurement and sourcing parameters** page.

Expand table

PO type	Description
Journal	Use this type to create a draft order. This type doesn't affect stock quantities or generate inventory transactions. The PO journal lines aren't included in master scheduling.
Purchase order	Use this type to create purchase orders when you confirm orders with a vendor, and as the orders are processed through receipt and invoicing before payment is made to the vendor. This type of purchase order is the most common.
Returned order	Use this type when you return goods to the vendor. This type of order requires that you specify the return material authorization (RMA) number that the vendor gives you. Specify the RMA number on the **General** tab of the purchase order. The order lines must have negative quantities.

Purchase order data entities

If you integrate purchase orders with external systems through OData or the Data management framework, be aware of which purchase order types each standard data entity covers.

The *Purchase order headers V2* (`PurchPurchaseOrderHeaderV2Entity`) and *Purchase order lines V2* (`PurchPurchaseOrderLineV2Entity`) data entities include only records where the purchase order type is *Purchase order*. By design, they don't return *Returned order* records. Therefore, queries against these entities don't include purchase return orders, and you can't create or update purchase return orders through them.

There's currently no separate standard public data entity for purchase return order headers and lines.

If your integration must read or write purchase return orders, use the extensibility model to create a custom data entity that exposes the header and line data that you require. Before you use a custom entity in production, test its validations, table relations, cross-company behavior, and create and update operations.

> **Important**

Don't modify the generated SQL view behind a standard data entity, and don't change the application database directly. These approaches bypass supported application validation, and your changes can be overwritten when the database is synchronized.

Purchase order statuses

POs include several status fields that indicate the progress of the order. You can see all these fields in the **Header** view of the order. You can also see some of these fields in the grid overview of all orders. The **Purchase order status** field shows the status for quantities on the order. The following values are available:

- *Open order* – Orders are created, and quantities are on order.
- *Received* – You received the full quantity on the order, but you didn't invoice it yet.
- *Invoiced* – You invoiced the full quantity on the order. If an order is partially received or invoiced, *Received* status and *Invoiced* status aren't appropriate. Therefore, the order still has a status of *Open order*.
- *Canceled* – You confirmed an order but later canceled it. Therefore, this status indicates that there are no longer any open quantities on order.

The **Document status** field helps you quickly review the order's progress in terms of documents that are processed. It shows the status of the most recent document that is completed for the order. The following values are available:

- *None* – No document is processed for the order yet.
- *Purchase inquiry* – The system generated a purchase inquiry, and the order is awaiting feedback from the vendor.
- *Purchase order* – The system processed confirmation of the order.
- *Product receipt* – The system processed product receipt on the order.
- *Invoice* – The system accounted an invoice with the order.

Use the **Approval status** field when a PO goes through a review process or workflow. The following values are available:

- *Draft*, *In review*, and *Rejected* – These statuses are used only when an approval workflow is used for the PO.
- *Approved* – This status is assigned to orders that have completed workflow approval. Orders that are created without using an approval workflow receive a status of *Approved* immediately.

- *In external review* – This status is used in scenarios where a purchase inquiry is sent to the vendor, so that the vendor can confirm terms of the PO. This status is also used in the process that is initiated by the **Confirmation request** action. For this process, the vendor is asked to confirm terms of the PO by connecting to your system and registering whether it confirms or rejects the order.
- *Confirmed* – This status is assigned after the order has been confirmed. Typically, this status is the last approval status that is assigned to an order.

Approve and confirm purchase orders

This article describes the statuses that a purchase order (PO) goes through after you create it, and the effect of enabling change management on POs.

After you create a PO, it might need to go through an approval process. After the vendor agrees to the order, set the PO to a status of *Confirmed*.

Approval of purchase orders

POs that don't use change management have a status of *Approved* as soon as you create them, whereas POs that use change management have a status of *Draft* when you first create them. A PO that you create by firming a planned order from master planning is always set to a status of *Approved*, regardless of the change management settings. A PO creates inventory transactions only when it reaches the *Approved* status. Therefore, that inventory doesn't appear as available for reservation or marking until the order is accepted.

Enable change management for POs by setting the **Activate change management** option on the **Procurement and sourcing parameters** page. When you enable change management, POs must go through an approval workflow after you complete them. Supply Chain Management has a workflow process editor where you can define a workflow to represent your approval process. This workflow can include rules for automatic approval, rules that determine who will be assigned to approve particular POs, and rules for escalating a workflow that has been waiting for approval for a long time. You can enable the change management process for all vendors or for specific vendors. You can also set up the process so that it can be overridden for individual POs.

When you enable change management, POs move through six approval statuses, from *Draft* to *Finalized*. After an order is approved, users who want to modify it must use the **Request change** action.

Expand table

Approval status	Description	Request change is enabled
Draft	The PO is a draft and hasn't been submitted for approval in the PO workflow.	No
In review	The PO was submitted for approval in the PO workflow.	No

Approval status	Description	Request change is enabled
	Approval is pending.	
Rejected	The PO was rejected during the approval process.	No
Approved	The PO was approved.	Yes
Confirmed	The PO was confirmed. A PO can't be confirmed until it has been approved.	Yes
Finalized	The PO was made final. It's now financially closed and can no longer be changed.	No

Confirming purchase orders

POs that have an approval status of *Approved* can go through additional steps before they're confirmed. For example, you might have to send a purchase inquiry to the vendor to inquire about prices, discounts, or receipt dates. In this case, you can set the PO to the *In external review* status by using the **Purchase inquiry** action.

Vendors that are set up to use the vendor collaboration interface can review orders on the portal, and approve or reject them. During this review process, the PO has a status of *In external review*. The vendor collaboration interface can be configured so that a confirmation from the vendor automatically confirms the order in Supply Chain Management. In this scenario, you must schedule the **Confirm accepted purchase orders from vendor collaboration** batch job, which is responsible for processing and confirming your POs. Alternatively, you can manually confirm a PO after you receive confirmation from the vendor. If a vendor rejects a PO, the rejection is received together with the reason for the rejection and suggestions for changes. In this case, the status of the PO remains *In external review*.

There's also an option to generate a pro-forma confirmation for an order before the actual confirmation has been processed. This option just creates a report that you can share with the vendor. It doesn't create any journal information.

After the vendor has agreed to the order, the next step is to record the PO as committed. You can complete this step by using either the **Confirmation** action or the **Confirm** action. Both these actions set the approval status of the order to *Confirmed*. Confirmation of an order initiates two additional processes:

- A journal is created to store an exact copy of what was confirmed in the system. Sometimes, orders require changes, and additional journals are created after the updated order is

confirmed. These journals let you view the history of the various versions of the order that were confirmed.

- Accounting distributions are created, and order checks and budget checks occur if this functionality has been enabled. If either check fails, you receive an error message that states that changes must be made to the PO before it can be confirmed again.

> **Note**
>
> The purchase order confirmation report includes price and amount information—the **Unit price**, **Discount**, **Discount percent**, and **Amount** columns, together with the totals table—only when the vendor is set up to include that information. This behavior is controlled by the **Purchase order prices/amount** option on the vendor record. The system applies this option when it creates the purchase order confirmation. Therefore, if you change the option on the vendor after an order was already confirmed, the confirmation that was already generated isn't affected. If you change the setting, confirm the purchase order again to generate a new confirmation report. (You don't have to delete the earlier confirmation.) The **Purchase order prices/amount** field on the **General** tab of the **Procurement and sourcing parameters** page sets the default value for newly created vendors only. It doesn't change existing vendors or existing confirmations.

A vendor might request some type of assurance that payment will be provided for a purchase. There are various methods for providing this guarantee within accounts payable processes. For example, the **Prepayment** action reserves funds for the PO, and this prepayment is recorded on the PO.

Changing purchase orders

In some situations, you might have to change a PO after it has reached an approval status of *Approved* or *Confirmed*.

If the PO was created by using a change management process, you can make changes by recalling the order or, if the order has already been approved, by using the **Request change** action. In this case, the approval status is changed back to *Draft*, and you can then modify the order. After you've finished making changes, you might have to submit the PO for reapproval. You can configure the types of changes that require reapproval by using a **Re-approval rule for purchase orders** policy rule on the **Purchasing policies** page.

If part of the ordered quantity for a PO line has been delivered, you can't change the ordered quantity when the purchase order is in *Draft*. However, you can change the **Deliver remainder** quantity on the line for the purchase order that is in *Draft* status.

After an order has been confirmed, you can no longer delete it. However, you can cancel the total quantity or any remaining quantity on an order, provided that the quantity hasn't been received or invoiced. You can then use the **Finalize** action to prevent further processing.

Canceling purchase orders

Use the **Cancel** action on the header to cancel a purchase order (PO).

If the quantity is partially registered, received, or invoiced, you can cancel only the remaining quantity that isn't registered, received, or invoiced. The order quantity is reduced accordingly. When you update the quantity on the line, you also update the line status. For example, the original quantity on the line is 5, and you receive a quantity of three. In this case, you can cancel only two. The line updates to *Received* status.

If you add a delivery remainder to the order line and it exceeds the quantity on the order line, the **Cancel** action doesn't cancel the excess quantity. Instead, the line remains in *Open order* status because it has a remaining quantity. For example, the original quantity on the line is 5, and the delivery remainder is 7. If you cancel the order, you cancel five, and a quantity of two remains, as you can see in the inventory transactions.

To cancel the whole quantity on a PO line, cancel the delivery remainder quantity on the line. The line updates to *Canceled* status.

If a PO is under change management, you must submit any change, such as cancellation of the order or the delivery remainder, to the workflow system for approval before the process can be completed and the inventory transactions can be updated as canceled.

Configure purchase order confirmation batch jobs

Use the *Confirm purchase orders* batch job to confirm multiple purchase orders at the same time. For example, you can schedule the job to confirm all approved purchase orders at the end of each day, confirm drop-shipment purchase orders that are generated from sales orders, or confirm time-sensitive purchase orders before supplier cutoff times.

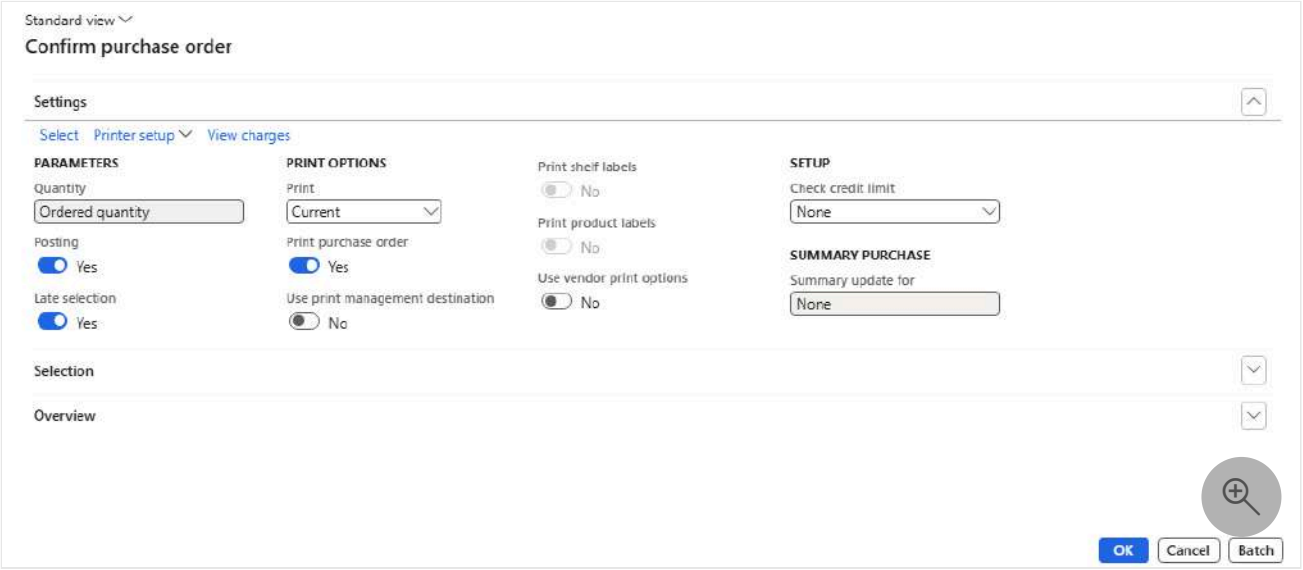
This article describes how to schedule the job, prevent failures when a vendor is on hold, and configure options for printing or emailing purchase order confirmation journals.

Schedule the auto-confirmation batch job

The *Confirm purchase orders* batch job processes purchase orders in bulk. Follow these steps to schedule and configure the batch job:

1. Go to **Procurement and sourcing** > **Purchase orders** > **Purchase order confirmation** > **Confirm purchase orders**.

2. The **Confirm purchase order** dialog opens.



3. On the **Settings** FastTab, set **Print** to one of the following values.

   - *Current* – The system generates and sends a purchase order confirmation journal for each purchase order it confirms while it works. Use this option when each confirmation must be sent even if another purchase order in the same batch fails.

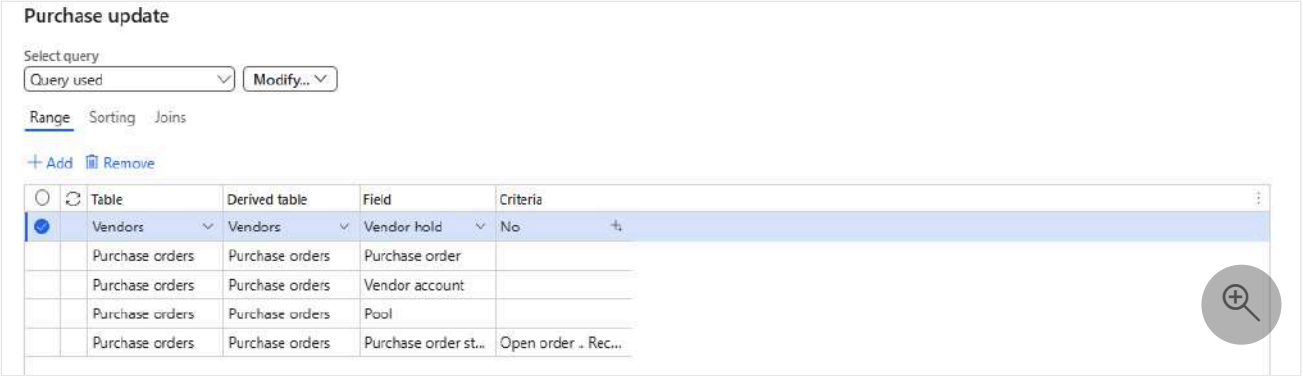
- *After* – The system confirms all purchase orders before it generates and sends any purchase order confirmation journals. With this option, if one purchase order in a batch fails validation (for example, because of a credit management check or because change management is enabled), the system might not send confirmations for any of the purchase orders in the batch, including those that were confirmed successfully. Use this option if your organization needs to use the standard (global) print management destination set on the **Print management setup** page.

4. Set other options on the **Settings** FastTab as needed. Use tooltips to learn more about each setting. The following settings are recommended for most organizations:

    - **Print purchase order** – Set to *Yes* to print or send purchase order confirmation journal after the system confirms a purchase order.
    - **Use print management destination** – Choose how the system decides where to send purchase order confirmation journals. Set to *No* to use the destination specified in the local **Printer setup** dialog (as set on this page). Set to *Yes* to use the standard (global) print management destination set on the **Print management setup** page (available from **Accounts payable** > **Setup** > **Forms**). If you want to deliver confirmations by email, set this option to *No* so you can use the local printer setup to configure the email. See the next section for details. When this option is set to *Yes*, the system always uses the *After* print behavior in batch processing, even if *Current* is selected in the **Print** field.
    - **Late selection** – Set to *Yes* to select the most recent purchase orders for confirmation each time the batch job runs.

5. The batch job fails if it tries to confirm an order or generate a document for a vendor that's on hold, so you should exclude these vendors. To exclude purchase orders for vendors that are on hold, select **Select** on the **Settings** FastTab toolbar and then make the following settings in the **Purchase update** dialog:

    - Go to the **Joins** tab. Expand the **Tables** node and select **Purchase orders** in the tree. On the toolbar, select **Add table join**. Set **Show details** to *Yes* and select the row where **Relation** is *Vendors (Vendor account)* and **Relation source** is *VendTable : InvoiceVendor*. On the toolbar, select **Select**.
    - Go to the **Range** tab. On the toolbar, select **Add**. Add a row where **Table** = *Vendors*, **Field** = *Vendor hold*, and **Criteria** = *No*.
    - Select **OK**.



6. Select the **Batch** button to open the batch job scheduler. Make the following settings on the **Parameters** FastTab:

    - On the toolbar, select **Recurrence**. Set up the run schedule for the batch job, and then select **OK**. Choose a recurrence interval that reflects your order volume, other batch workloads, and vendor lead times. In environments that process large volumes of data or run many batch jobs, don't run this job more often than every 10 minutes.
    - Set **Batch processing** to *Yes*.
    - Set other batch options as needed.
    - Select **OK**.

7. Select **OK** to save the batch job configuration.

> ⓘ **Note**
>
> When **Print management destination** is set to *Yes*, the system always uses the *After* print behavior in batch processing, even if you set **Print** to *Current* (the batch job always saves and runs with **Print** set to *After*). With *After*, if one purchase order in a batch fails validation (for example, because of a credit management check or because change management is enabled), the document sending step might not run for any purchase orders in the same batch, even those that were confirmed successfully.

Where to find confirmation history after a recurring batch runs

The **Confirmations** page that you open from a purchase order shows *posting-parameter* records. These records are staging data for the current batch operation, not the permanent confirmation history. On every recurrence, the *Confirm purchase orders* batch job clears the existing records in its posting-parameter set before it selects the purchase orders for the next run. As a result, purchase orders from a previous run no longer appear on that page. This behavior is by design, and the **Late selection** setting isn't the reason that the previous staging records are cleared.

The permanent confirmation history isn't affected. To review confirmations for audit or historical purposes, go to **Accounts payable** > **Purchase orders** > **Purchase order confirmations**, and then filter by purchase order, vendor, confirmation number, or date. Build reports and integrations from the purchase order confirmation journals rather than from the posting-parameter staging tables.

Configure email delivery of purchase order confirmation documents

To set your system to deliver purchase order confirmation journals by email after auto-confirmation, follow the procedure in the previous section, but be sure to use the following settings in the **Confirm purchase order** dialog:

- Set **Print purchase order** to *Yes*.
- Set **Use print management destination** to *No*.
- Set **Print** to *Current*.
- Set **Late selection** to *Yes*.
- On the toolbar, select **Printer setup** > **Purchase order**. Select **Email** and then set up your email options for delivering purchase order confirmation journals.
- If you want to send or print a copy of the purchase order confirmation journals, select **Printer setup** > **Purchase order (copy)**. Then set up the destination options for the copy.

Calculate requested ship dates for purchase orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Purchase orders in Microsoft Dynamics 365 Supply Chain Management can include both a *requested receipt date*, which specifies when the order should be received at your company's location, and a *requested ship date*, which specifies when the vendor should ship from their location. The system calculates requested ship dates based on the requested receipt date, lead time, the transport days setup, the vendor ship calendar, and other settings. The transport days setup lets you define the number of days that are required to transport items between pairs of addresses. Vendor ship calendars define the days when each vendor can ship.

If any of your vendors don't have specific delivery terms (such as delivery duty paid, delivery at place, or delivery at place unloaded), you must tell them when they should ship.

When master planning suggests a date for placing a planned order, it also considers the transport days setup. This approach helps ensure that the goods arrive on time.

Prerequisites

To calculate requested shipment dates for purchase orders, your system must meet the following requirements:

- You must be running Dynamics 365 Supply Chain Management version 10.0.40 or later.
- You must be using Planning Optimization, not the deprecated master planning engine.

Enable supplier requested and confirmed shipment dates for a company

To enable supplier requested and confirmed shipment dates for a legal entity (company), follow these steps:

1. Use the company picker to select the legal entity where you want to calculate requested shipment dates for purchase orders.
2. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
3. Open the **Delivery** tab.
4. Set **Supplier requested and confirmed shipment dates** to *Yes* to make the feature available to the current legal entity. Set to *No* to hide the feature for the current legal entity.
5. Repeat this procedure for each legal entity where you want to turn on (or turn off) the option.

> ⓘ **Note**
>
> If you use intercompany trade, then each of the legal entities involved must have this option turned on to allow requested shipment dates to be calculated for intercompany purchase orders.

Specify whether requested ship dates can be in the past

Sometimes, because of your requested receipt date, plus the lead time, transport days, vendor ship calendar, and other settings, the system might calculate a requested ship date that's in the past. To specify how the system handles this situation, follow these steps:

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Delivery** tab, in the **Requested ship date in the past** field, select one of the following values:
    - *None* – Always allow requested ship dates to be in the past, without showing a warning.
    - *Allow with warning* – Allow requested ship dates to be in the past, but show a warning message to users when this situation occurs.
    - *Disallow with warning* – Always find the next earliest ship date that's after the current date, and show a warning message to users when this situation occurs.

Set up purchase transport days

To define the number of days that are required to transfer goods between addresses, follow these steps:

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.

2. Follow one of these steps:

    - To use an existing record, use the filters at the top of the grid to find it. To edit the record that you find, select the link in the **Shipping country/region** column. To delete the record, select it, and then select **Delete** on the Action Pane.
    - To create a new record, on the Action Pane, select **New**.

3. On the details page for the new or selected record, on the **General** tab, use the fields to define the shipping address, the receiving address, and the number of days that are required to transport goods between them. For more information about each field, hover over its label to open a tooltip.

    > **Tip**
    >
    > - When you must enter an address, first enter a value in the **Shipping ZIP/postal code** field. Often, the system can automatically fill in the rest of the address fields for you, based on the postal code.
    > - To calculate the ship date, the system uses the most specific purchase transport days record that it can find. For example, you have two purchase transport days records: one that specifies 30 days from Spain to the United States and another that specifies 20 days from Madrid to New York. In this case, a purchase order that's shipped from Madrid to New York uses 20 days, whereas an order from Valencia to New York uses 30 days.
    > - If the shipping address and receiving address have equal priority, the shipping address takes precedence.

4. On the **Transport days per mode of delivery** FastTab, you can set specific transport days for any number of delivery modes (such as road, rail, and air). Use the buttons on the toolbar to add and remove rows in the grid as you require.

    - For each row, select a mode of delivery, and then specify the number of transport days for that mode.
    - If you want one of the modes of delivery to define the default transport days that apply to any modes that aren't specified in the grid, select the **Default** checkbox for

that mode's row.
    - If the **Default** checkbox isn't selected for any row, the **Transport in days** value that's specified on the **General** FastTab is used as the default travel time.

5. On the Action Pane, select **Save**.

Vendor settings for calculating requested ship dates

To calculate requested ship dates, you must set up an address for each vendor. To help make the calculation more accurate, you can also set up vendor ship calendars that define specific days when each vendor can ship.

Set up vendor addresses

To set up addresses for a vendor, follow these steps:

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Open the vendor record that you want to work with.
3. On the **Addresses** FastTab, add and remove addresses as you require. If more than one address is specified on the **Addresses** FastTab, when the system uses the purchase transport days setup to calculate the shipping date, it uses the address where the **Primary** option is set to *Yes* as the shipping point.

> **Tip**
>
> - The vendor address is applied to the purchase order and used as the shipping point for purchase transport days.
> - The receiving point for purchase transport days is the second factor that's used to calculate the shipping date. The delivery address depends on the setup, and a default value can be taken from the company, site, or warehouse. Any update to the site or warehouse for a purchase order header or line triggers a recalculation of the shipping date, because the new site or warehouse might have a different delivery address.

How calendars affect ship and receipt date calculations

The following calendars are relevant for ship and receipt date calculations:

- **Purchase calendar** – This calendar defines when a vendor is open. For example, a vendor might accept orders on workdays but not weekends.

- **Vendor ship calendar** – This calendar defines when purchase orders can be shipped from the vendor.
- **Warehouse calendar** – This calendar defines when purchase orders can be received at the site or warehouse.

The purchase and vendor ship calendars are considered when the ship date is calculated. The warehouse (item coverage group) calendar is used when the receipt date is calculated.

> **Note**
>
> If no coverage group is assigned to an item on the **Released product details**, **Item coverage**, or **Master planning parameters** page, then master planning uses the *general coverage group* (which is set in the **General coverage group** field on the **Master planning parameters** page) and calculates the working days based on the calendar assigned to that group.

Learn more in Calendars and master planning.

The following examples show how calendars affect the calculation of requested ship and receipt dates for purchase orders.

Calculation example 1

This example shows how requested ship and receipt dates are calculated for a product that has five days of lead time and two purchase transport days.

The following table shows the calendars that apply.

Expand table

Calendar	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue
Purchase calendar	Open	Open	Open	Open	Open	Open	Open	Open	Open
Vendor ship calendar	Open	Closed	Closed	Closed	Open	Open	Open	Open	Open
Warehouse calendar	Open	Open	Open	Open	Closed	Closed	Closed	Closed	Open

The following table shows the calculated dates.

Expand table

Date type	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue
Order date	X								
Ship date						X			
Receipt date									X

The calculation results are based on the following information:

- The ship date is Saturday, which is the first open day that's available in the vendor ship calendar after the five days of lead time.
- The receipt date is Tuesday, which is the first open day that's available in the warehouse calendar after the two transport days.

Calculation example 2

This example shows how requested ship and receipt dates are calculated for a product that has three days of lead time and two purchase transport days.

The following table shows the calendars that apply.

Expand table

Calendar	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue
Purchase calendar	Open	Open	Open	Open	Open	Open	Open	Open	Open
Vendor ship calendar	Open	Closed	Closed	Closed	Open	Open	Open	Open	Open
Warehouse calendar	Open	Open	Open	Open	Closed	Closed	Closed	Closed	Open

The following table shows the calculated dates.

Expand table

Calendar	Mon	Tue	Wed	Thu	Fri	Sat	Sun	Mon	Tue
Order date	X								
Ship date					X				
Receipt date									X

Compared to the previous example, the results are calculated in the following way:

- The ship date is moved one day, because the vendor ship calendar shows that the vendor is closed on Thursday.
- The receipt date is moved two days, because the warehouse calendar shows that the warehouse is closed on Sunday and Monday.

Assign vendor ship calendars

For each vendor, you can specify a ship calendar that indicates the dates when the vendor can ship. For example, some vendors might be able to ship during all opening hours, whereas others can ship only on Mondays. You can define as many specific ship calendars as you require and then apply them to each vendor as appropriate.

If you have goods that must be expedited, and the relevant vendor makes an exception on their vendor ship calendar, you can change or remove the vendor ship calendar for the relevant purchase order lines.

For information about how to set up a ship calendar and define the available ship dates and times for it, see Calendars and master planning.

To assign a ship calendar to a vendor, follow these steps:

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Open the vendor record that you want to assign a ship calendar to.
3. On the **Invoice and delivery** FastTab, in the **Ship calendar** field, select the ship calendar that applies to the vendor.

Date calculations and recalculations

This section describes how and when the system calculates and recalculates requested ship dates.

Requested ship date

The requested ship date calculation considers lead time (lead time per vendor if it's set up on trade agreements), the mode of delivery, and the vendor ship calendar. The lead time is the time that the vendor takes to produce the item. It doesn't include transport days (from vendor to company).

You can configure how the system handles requested ship dates that are in the past. Learn more in the Specify whether requested ship dates can be in the past section.

Order date of planned purchase orders

When a master planning run indicates that a planned order is needed, the order date is calculated backward from the requirement date. The calculation considers margins, lead time, and the purchase transport days setup. The requested ship date is calculated according to the same rules that are used for purchase orders. However, for planned orders, the requested ship date isn't saved as a field value or shown on the **Planned purchase order** details page.

The requested ship date is also calculated for manually created planned purchase orders.

Recalculations for updated orders

When you edit a purchase order where the requested and/or confirmed ship date has already been calculated, the system does the following recalculations:

- If the **Requested ship date** value is changed, the **Requested receipt date** value is recalculated.
- If the **Requested receipt date** value is changed, the **Requested ship date** value is recalculated.
- If the **Confirmed ship date** value is changed, the **Confirmed receipt date** value is recalculated.
- If the **Confirmed receipt date** value is changed, the **Confirmed ship date** value is recalculated.
- If any of the following information is changed, the relevant ship and receipt dates are recalculated:
  - Address on the header
  - Mode of delivery (on the header or on a line)
  - Warehouse on a line

If you change the **Requested ship date** or **Confirmed ship date** value on the header of a purchase order, the system asks you whether the relevant ship and receipt dates should also be updated for each line.

> ⓘ **Note**
>
> If any subsequent changes are made at the line level (such as modifying the unit, warehouse quantity, or site), the line **Requested ship date** and **Requested receipt date** are recalculated based on the current date rather than the header date. To ensure accurate date calculations,

we recommend that you complete all necessary updates at the line level before updating the header **Requested ship date** or **Confirmed ship date**.

Purchase order ship and receipt date calculation logic

This section explains how the **Requested ship date** and **Requested receipt date** are calculated for purchase orders. These dates are influenced by lead times, transport days, vendor calendars, and other settings.

Key terms and concepts

The following table describes key terms and concepts related to purchase order ship and receipt date calculations.

Expand table

Term	Description
Requested ship date	The date on which you want the vendor to ship the goods.
Requested receipt date	The date on which you want to receive the goods.
Confirmed ship date	The date on which the vendor ships the goods, as confirmed by the vendor.
Confirmed receipt date	The date on which you receive the goods, as confirmed by the vendor.
Lead time	The number of days the vendor requires to prepare an item.
Transport days	The number of days needed to ship goods from vendor to warehouse.
Purchase calendar	The calendar that defines when a vendor is open for business.
Vendor ship calendar	The calendar that defines when purchase orders can be shipped from the vendor.
Warehouse calendar	The calendar that defines when purchase orders can be received at the site or warehouse
Item coverage calendar	An optional calendar used to adjust receipt dates.

Calculation logic

The following table summarizes the logic used to calculate purchase order ship and receipt dates.

Expand table

Calculation	Description
Requested ship date	Calculated as today's date plus lead time. Adjusted to the next working day if the assigned calendar is *Active*.
Requested receipt date	Calculated as the requested ship date plus transport days. Adjusted to the next working day if the assigned calendar is *Active*.
Lead time (on the **Line details** tab)	Populated only if **Calculate PO delivery date** is set to *Yes* and the purchase order originates from a purchase requisition, purchase agreement, or request for quotation.
Transport days	Applied based either on the selected mode of delivery at the purchase order line level or the default mode of delivery configured for the warehouse master.
Confirmed dates	Manually entered by the vendor and not adjusted by any calendar.
Trade agreement working days	When enabled, lead time is calculated using only open working days.

For details about how to update the **Requested ship date** and **Requested receipt date** in the header, see Recalculations for updated orders.

Example date calculation scenarios

This section provides examples that show how requested ship and receipt dates for purchase orders are calculated in various scenarios.

Example scenario prerequisites

These scenarios have the following prerequisites:

- Your system must meet all the feature prerequisites that are listed in the Prerequisites section of this article.
- The **Purchase transport days** page must be configured with at least one receiving address, shipping address, and number of transport days. The addresses must match the vendors and receiving warehouses that you use for these scenarios.
- Unless otherwise specified, all calendars must have all days open.
- On the **Procurement and sourcing parameters** page, on the **Delivery** tab, the **Requested ship date in the past** field must be set to *None*.

Example scenario 1: Standard purchase order

In this scenario, there are two purchase transport days from the vendor shipping address to the site/warehouse receiving address. Dates are calculated forward, and the purchase transport days are added to the requested ship date to determine the requested receipt date.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
2. Make sure that you have a record for delivery from the vendor shipping address that you plan to order from to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
3. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
4. On the Action Pane, select **New** to create a purchase order.
5. On the **Vendor** FastTab, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page. Then select **OK** to create and open the purchase order.
6. On the **Purchase order lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
7. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:

    - **Requested ship date** – The value is the current date (unless you specified another date for the order header).
    - **Requested receipt date** – The value is a date that's two days later than the **Requested ship date** value for the purchase order. The system calculates this date based on your setup on the **Purchase transport days** page. The following settings can also affect the calculation:
        - If the product that's ordered has lead time, the system adds that lead time to the transport time when it calculates the receipt date. (Therefore, the formula is *Requested ship date = Requested ship date + Product lead time*.)
        - The vendor ship calendar and warehouse calendar can also affect the date calculation by allowing for closing times at one or both locations. (Learn more in the How calendars affect ship and receipt date calculations section.)

    Any update to the **Requested ship date** or **Requested receipt date** value causes the system to recalculate the dates. An update to the **Requested ship date** value triggers a forward

calculation of the **Requested receipt date** value, and an update to the **Requested receipt date** value triggers a backward calculation of the **Requested ship date** value.

Example scenario 2: Purchase order with dates in the past

This scenario shows how the system handles requested ship dates that are in the past, based on the **Requested ship date in the past** setting. (Learn more in the Specify whether requested ship dates can be in the past section.)

The default value of the **Requested ship date in the past** field is *None*. In this case, requested ship dates in the past are always allowed, and no warning is shown. This scenario shows what happens if you change the value to *Disallow with warning*. In this case, a warning message is always shown if requested ship dates are in the past. The system then finds the next earliest ship date that's after the current date.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Delivery** tab, set the **Requested ship date in the past** field to *Disallow with warning*. Then select **Save**.
3. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
4. Make sure that you have a record for delivery from the vendor shipping address that you plan to order from to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
5. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
6. On the Action Pane, select **New** to create a purchase order.
7. On the **Vendor** FastTab, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page. Then select **OK** to create and open the purchase order.
8. On the **Purchase order lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
9. On the **Line details** FastTab, on the **Delivery** tab, set the **Requested receipt date** field to a date that doesn't allow for enough time for transport. (For example, select today's date.)

The system shows a warning message such as "The requested ship date 1/18/2024 is not valid because it is before today. Earliest possible requested ship date is 1/22/2024 with requested receipt date 1/26/2024." The requested date fields are updated to match the warning message.

If you try to directly enter a requested ship or receipt date that's in the past, you receive a warning that doesn't include any suggested dates (for example, "The requested ship date 1/8/2024 is not valid because it is before today"). In this case, you can't save the order until you select a valid date.

Example scenario 3: Purchase order created from a sales order

In this scenario, you create a purchase order from a related sales order and observe how the requested ship and receipt dates are calculated for both orders.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
2. Make sure that you have a record for delivery from the vendor shipping address that you plan to order from to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
3. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
4. On the Action Pane, select **New** to create a sales order.
5. On the **Customer** FastTab, set the **Customer account** field to any customer account (it doesn't matter which one). Then select **OK** to create and open the sales order.
6. On the **Sales order lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
7. On the **Line details** FastTab, on the **Delivery** tab, set the **Delivery date control** field to *None*.
8. Set both the **Requested ship date** field and the **Requested receipt date** field to a date that's one week from now.
9. On the Action Pane, on the **Sales order** tab, in the **New** group, select **Purchase order**.
10. On the **Lines** FastTab, you see a line that matches the line from your sales order. For this line, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page.

11. Select the **Include** checkbox for the line.
12. Select **OK** to create the purchase order and return to your sales order.
13. On the Action Pane, on the **General** tab, in the **Related information** group, select **Purchase order**.
14. The related purchase order opens. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:
    - **Requested receipt date** – The value matches the sales order's requested ship date.
    - **Requested ship date** – The value is calculated backward from the receipt date, based on the number of purchase transport days, to the first available open date.

Example scenario 4: Direct delivery created from a sales order

This scenario is similar to the previous one, but you create a direct delivery order from a sales order. Because you're using direct delivery for this scenario, the shipment never arrives at your warehouse. Therefore, transport time is calculated based only on the *vendor's shipping address* and the *customer's receiving address*.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
2. Make sure that you have a record for delivery from the vendor shipping address that you plan to order from to the receiving address of the *customer* that you plan to ship to. Set the **Transport days** field to *2* for this record.
3. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
4. On the Action Pane, select **New** to create a sales order.
5. On the **Customer** FastTab, set the **Customer account** field to the customer whose receiving address you set up on the **Purchase transport days** page. Then select **OK** to create and open the sales order.
6. On the **Sales order lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields if they're required. However, these fields don't affect the delivery time calculation, because you're using direct delivery.
7. On the **Line details** FastTab, on the **Delivery** tab, set the **Delivery date control** field to *None*.
8. Set both the **Requested ship date** field and the **Requested receipt date** field to a date that's one week from now.

9. On the Action Pane, on the **Sales order** tab, in the **New** group, select **Direct delivery**.
10. On the **Lines** FastTab, you see a line that matches the line from your sales order. For this line, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page.
11. Select the **Include** checkbox for the line.
12. Select **OK** to create the purchase order and return to your sales order.
13. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:
    - **Requested receipt date** – The value is the requested ship date that you entered earlier.
    - **Requested ship date** – The value is calculated backward from the receipt date, based on the number of purchase transport days, to the first available open date.
14. On the Action Pane, on the **General** tab, in the **Related information** group, select **Purchase order**.
15. The related purchase order is opened. On the **Line details** FastTab, on the **Delivery** tab, notice that the **Requested receipt date** and **Requested ship date** values match the values of the sales order. These dates are synced because this order is a direct delivery order.

Example scenario 5: Intercompany order

For intercompany orders, the requested ship and receipt dates must be synced for both sales orders and purchase orders. The purchase transport days, lead time, delivery date control, and calendar availability must also be considered.

To complete this scenario, first set up an intercompany relationship between the customer and vendor that you use.

1. Use the company picker to select the company that's purchasing an item. This company is the one where you must set up the purchase transport days and create the purchase order.
2. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
3. Make sure that you have a record for delivery from the vendor warehouse to the customer warehouse that you're using for this scenario. Set the **Transport days** field to *2* for this record.
4. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.

5. On the Action Pane, select **New** to create a purchase order.

6. On the **Vendor** FastTab, set the **Vendor account** field to the intercompany vendor whose shipping address you set up on the **Purchase transport days** page. Then select **OK** to create and open the purchase order.

7. On the **Purchase order lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.

8. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:

    - **Requested ship date** – The value is the current date (unless you specified another date for the order header).
    - **Requested receipt date** – The value is a date that's five days later than the **Requested ship date** value of the purchase order. The system calculated this date based on your purchase transport days setup.

9. On the Action Pane, on the **Manage** tab, in the **Intercompany tracing** group, select **Intercompany sales order**. The requested dates on the sales order line should match the dates that you saw on the purchase order line.

> **Tip**
>
> The sourcing order determines whether and how the purchase order transport days are calculated.
>
> - If dates are updated on the sales order, lead time and customer transport days take precedence, and purchase order transport days are calculated. These dates are editable only when you source from the sales order.
> - If dates are updated on the purchase order, purchase transport days and lead time are calculated, and requested and confirmed dates are synced back to the sales order.

Example scenario 6: Purchase agreement

This scenario shows how requested ship and receipt dates are calculated when you create a purchase order from a purchase agreement.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.

2. Make sure that you have a record for delivery from the vendor shipping address that you plan to create a purchase agreement for to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
3. Go to **Procurement and sourcing** > **Purchase agreements** > **Purchase agreements**.
4. On the Action Pane, select **New** to create a purchase agreement.
5. On the **Vendor** FastTab, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page. Then select **OK** to create and open the purchase agreement.
6. On the **Purchase agreement lines** FastTab, select **Add line**.
7. In the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
8. On the Action Pane, on the **Purchase agreement** tab, in the **Generate** group, select **Confirmation**.
9. In the **Confirm purchase agreement** dialog box, select **OK**.
10. On the Action Pane, on the **Purchase agreement** tab, in the **New** group, select **Release order**.
11. In the **Create release order** dialog box, in the **Purchase quantity** field for the line, enter a value. Then set the **Requested receipt date** field to one week from today.
12. Select **Create** to create the purchase order.
13. Make a note of the purchase order number that's shown in the message at the top of the page.
14. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
15. Open the purchase order that you just created. Use the purchase order number that you made a note of to find it.
16. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:
    - **Requested receipt date** – The value is the date that you entered when you released the purchase order.

- **Requested ship date** – The value is calculated backward from the receipt date, based on the number of purchase transport days, to the first available open date.

Example scenario 7: Purchase requisition

This scenario shows how requested ship and receipt dates are calculated when you create a purchase order from a purchase requisition.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
2. Make sure that you have a record for delivery from the vendor shipping address that you plan to create a purchase requisition for to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
3. Go to **Procurement and sourcing** > **Purchase requisitions** > **All purchase requisitions**.
4. On the Action Pane, select **New** to create a purchase requisition.
5. In the **Name** field, enter a name for the requisition. Then select **OK** to create and open the purchase requisition.
6. On the **Purchase requisition lines** FastTab, on the toolbar, select **Add line**.
7. In the **Item number** field, enter a value. Then, in the **Quantity** field, specify a quantity.
8. On the **Line details** FastTab, on the **Inventory dimensions** tab, set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
9. On the Action Pane, select **Workflow** to open a dropdown dialog box. Select **Submit** to open a dialog box where you can enter a comment. Then select **Submit** in this dialog box to submit the requisition for approval.
10. Generate a purchase order for the purchase requisition through the **Submit requisition for approval** workflow. The resulting purchase order should have the following requested dates:

    - **Requested receipt date** – The value is the **Requested date** value from the purchase requisition.
    - **Requested ship date** – The value is calculated backward two purchase transport days from the requested receipt date of the purchase order.

Example scenario 8: Purchase request for quotation

This scenario shows how requested ship and receipt dates are calculated when you create a purchase order from a request for quotation (RFQ) reply.

1. Go to **Procurement and sourcing** > **Setup** > **Distribution** > **Purchase transport days**.
2. Make sure that you have a record for delivery from the vendor shipping address that you plan to create a purchase requisition for to the warehouse receiving address where you plan to receive the order. Set the **Transport days** field to *2* for this record.
3. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
4. On the **Request for quotation** tab, set the **Purchaser can edit vendors bid** option to *Yes*.
5. Go to **Procurement and sourcing** > **Requests for quotations** > **All requests for quotations**.
6. On the Action Pane, select **New** to create an RFQ.
7. Set the **Requested receipt date** field to one week from today. Then enter values in any other required fields, and select **OK** to create the RFQ.
8. On the **Request for quotation lines** FastTab, in the **Item number** field, select an item. Then set the **Site** and **Warehouse** fields to the warehouse that you set up a receiving address for on the **Purchase transport days** page.
9. On the **Header** tab, on the **Vendor** FastTab, set the **Vendor account** field to the vendor whose shipping address you set up on the **Purchase transport days** page.
10. On the Action Pane, select **Save**.
11. On the Action Pane, on the **Quotation** tab, in the **Process** group, select **Send**.
12. In the **Sending request for quotation** dialog box, select **OK**.
13. On the Action Pane, on the **Quotation** tab, in the **Replies** group, select **Manage replies**.
14. On the Action Pane, select **Edit** > **Edit RFQ reply**.
15. On the Action Pane, select **Submit**.
16. In the **Submit** dialog box, select **OK**.
17. On the Action Pane, on the **Reply** tab, in the **Process** group, select **Accept**.

18. In the **Accepting request for quotation** dialog box, select **OK** to create the purchase order.
19. On the Action Pane, on the **General** tab, in the **Other information** group, select **Purchase order**.
20. Open the new purchase order.
21. On the **Line details** FastTab, on the **Delivery** tab, you see the following values:
    - **Requested receipt date** – The value matches the **Requested receipt date** value from the RFQ.
    - **Requested ship date** – The value is calculated backward from the requested receipt date, based on the purchase transport days setup.

Review and accept changes to confirmed purchase orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

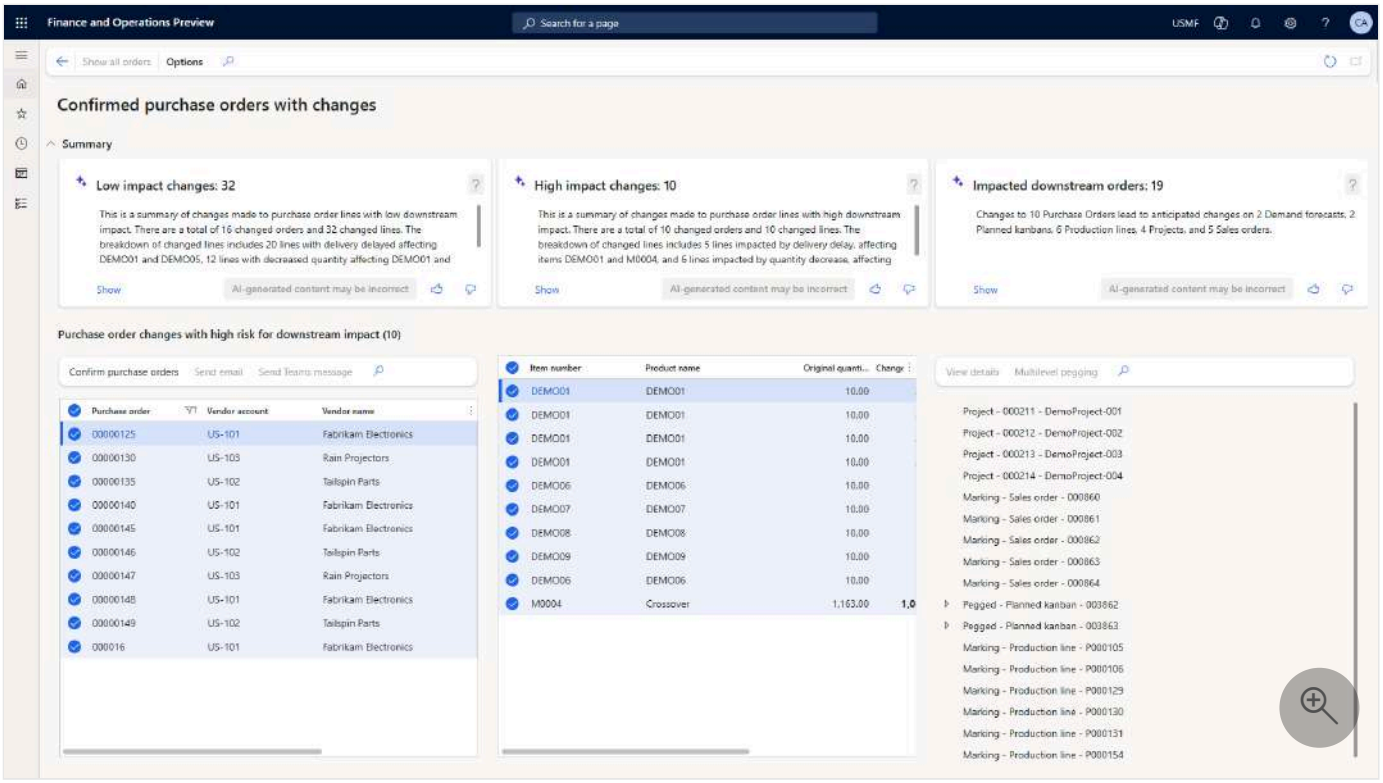
During procurement planning, changes to confirmed purchase orders can significantly affect downstream processes such as planned production, service work, or sales orders. The new **Confirmed purchase orders with changes** workspace makes it fast and easy to identify and reconfirm changes that have only a low risk of downstream impact. Procurement managers can focus on high-impact changes to assess downstream order impacts and communicate directly with vendors.

Prerequisites

The **Confirmed purchase orders with changes** workspace is enabled by default. However, its AI-powered and Copilot functionality must be enabled separately. To take advantage of the Copilot features, see Enable Copilot support for managing changes to confirmed purchase orders for the system requirements and information about how to set them up.

The Confirmed purchase orders with changes workspace

To open the workspace, go to **Procurement and sourcing** > **Workspaces** > **Confirmed purchase orders with changes**.



The workspace lists all previously confirmed supplying purchase orders that are changed since confirmation. It helps during the review process by identifying potential impacts on demand such as production work, service work orders, and sales orders.

The relations between supplying purchase orders and demand can originate from different sources, such as pegging from master panning, inventory markings, and purchase orders created for demand in projects.

At the top of the workspace, three tiles summarize groups of changes to confirmed purchase orders and the related impact on downstream demand:

- **Low impact changes** – This tile highlights changes to purchase orders that have no known impact on downstream demand. No known impact is assumed if changes to the quantity or delivery dates don't affect those requirements from demand. Examples of these changes include an increased quantity or an earlier date. A summary of changes is generated to help you review and validate the purchase orders.
- **High impact changes** – This tile highlights purchase orders that have known downstream impacts on demand. These changes are summarized together with the detected demand impacts, to help you investigate further and decide what action to take.
- **Impacted downstream orders** – This tile summarizes impacts on different kinds of downstream demand orders by total per type of order. This information helps you review potential impacts on demand and identify each originating change.

Each tile provides a **Show** link. When you select this link, the view beneath shows the changes to supplying purchase orders and the affected demand according to the tile's classification and filter.

Review changes to confirmed purchase orders

Purchasers use the workspace to review and accept changes to confirmed purchase orders. They typically follow these steps:

1. Study all changes to confirmed purchase orders and their downstream impact.
2. Focus on changes that have a low risk of downstream impact.
3. Review changes that have a high risk of downstream impact.
4. Review the remaining impact on downstream demand orders.

The following subsections describe these steps in more detail.

Step 1: Study all changes to confirmed purchase orders and their downstream impact

The purchaser first opens the **Confirmed purchase orders with changes** workspace and studies all the changes that vendors submit through the purchase order change management process. Vendors can submit these changes through several channels.

When a purchase order that was previously confirmed is changed, it's moved back to the *Approved* state. The workspace shows all purchase orders changed after confirmation.

The workspace shows two lists: one for the purchase orders and one for the purchase order lines.

The purchase order list shows the purchase order number, the vendor, and the requested receipt date from the purchase order header. To view the related records, select the purchase order or vendor link in the list.

The purchase order lines list shows information about each line that has proposed changes. This information includes the item number, product name, original quantity, new quantity, original confirmed receipt date, and new confirmed receipt date. The workspace also provides a hierarchical view of any downstream impact. The **Reference** field indicates the type of downstream impact, such as a planned kanban for a production order, a sales order, or a maintenance work order.

Step 2: Focus on changes that have a low risk of downstream impact

To take action effectively and efficiently, start by focusing on low-impact changes. These changes have no known downstream impact according to the current plan.

The **Low impact changes** tile at the top of the workspace provides an AI-generated, natural-language summary of the changes that have a low risk of impact. Select the **Show** link to open the corresponding filtered view.

The purchaser reviews the changes and can then accept them by selecting individual or multiple purchase orders and then selecting **Confirm purchase orders** on the toolbar above the list. The procedure for confirming the changes is the same as the procedure for confirming a purchase order for the first time, and it supports batch processing. Any extension that's registered for purchase order confirmation also runs.

After the selected purchase orders are reconfirmed, they're moved back to the *Confirmed* state.

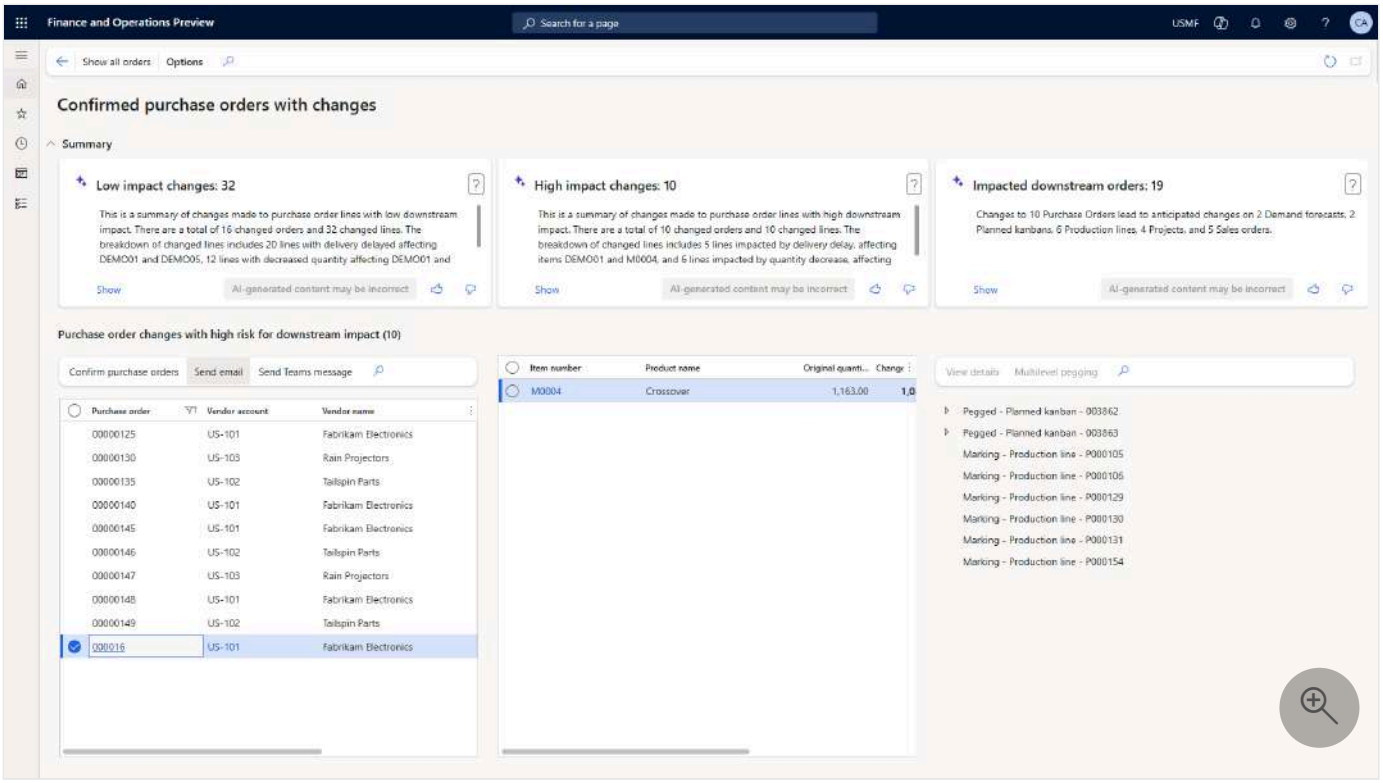
Step 3: Review changes that have a high risk of downstream impact

The purchaser spends more time on changes that have a high risk of downstream impact. These changes have downstream orders allocated to them, and the downstream impact is identified.

The **High impact changes** tile provides an AI-generated, natural-language summary of the changes that have a high risk of impact. Select the **Show** link to open a filtered view where you can focus on those impacts and take action.

> **Note**
>
> Only direct downstream impacts are considered. Indirect downstream impacts, such as product work that depends on other production work, aren't yet considered.

From this view, you can reach out to a vendor by using email or Microsoft Teams. By using the contact details of the vendor contact person, the system generates a proposed message text and adds it to a new email message or Microsoft Teams chat. You can then review, update, and send the message.



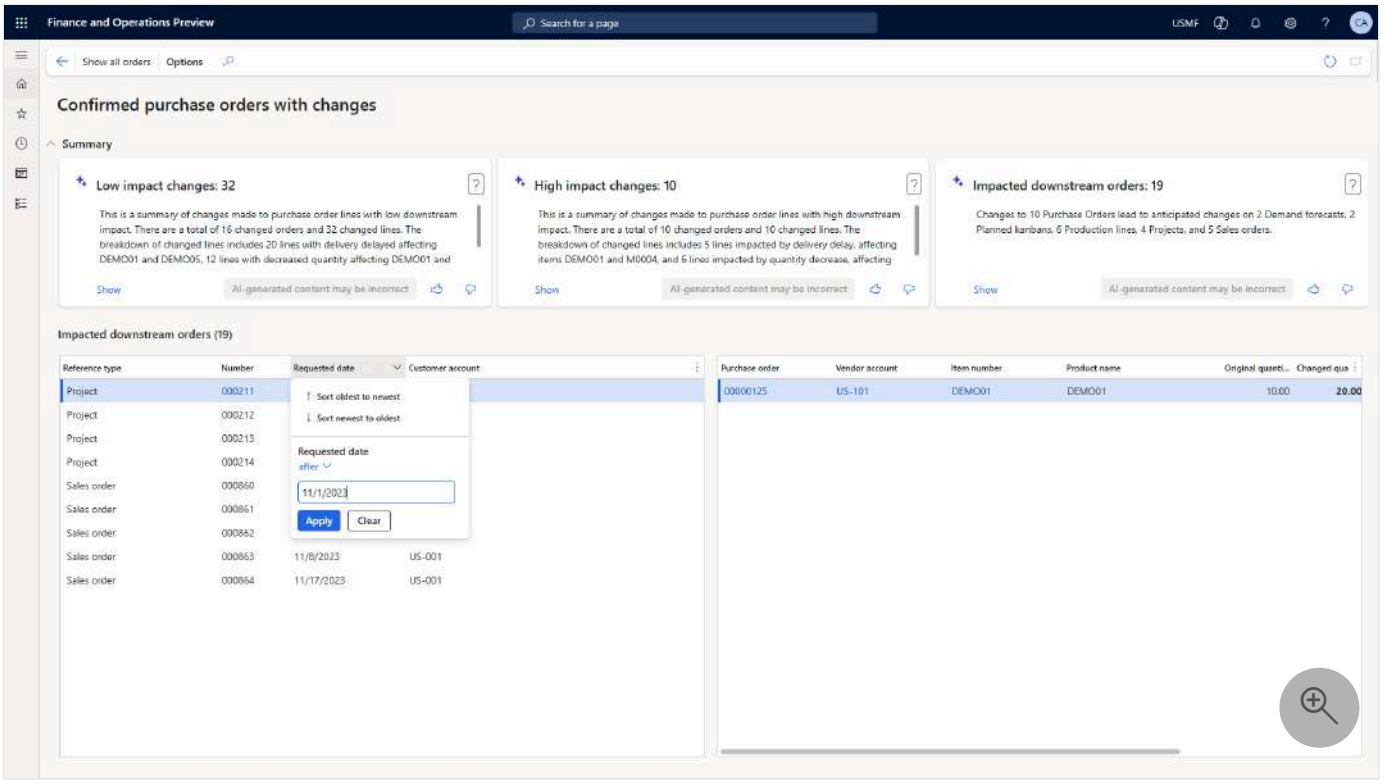
After you communicate with the vendor, you can update the order further and then send it back to the vendor for confirmation. Alternatively, you might cancel the order and plan for alternative supply.

Step 4: Review the remaining impact on downstream demand orders

After addressing most of the order changes, the purchaser can review the overall downstream impact of the remaining open order changes.

The **Impacted downstream orders** tile provides a summary of the downstream impact. Select the **Show** link to open a filtered view where you can focus on those impacts and take action.

In this view, you can analyze the changes from the perspective of downstream impact and identify the purchase order changes that cause the impact. You can then take action on those purchase orders.



A good way to focus on the most pressing downstream impact is to sort and filter the list by the date of impact (the requested date in the downstream order). You can then take action by communicating with downstream stakeholders. Those stakeholders might, in turn, contact affected customers and replan the downstream orders.

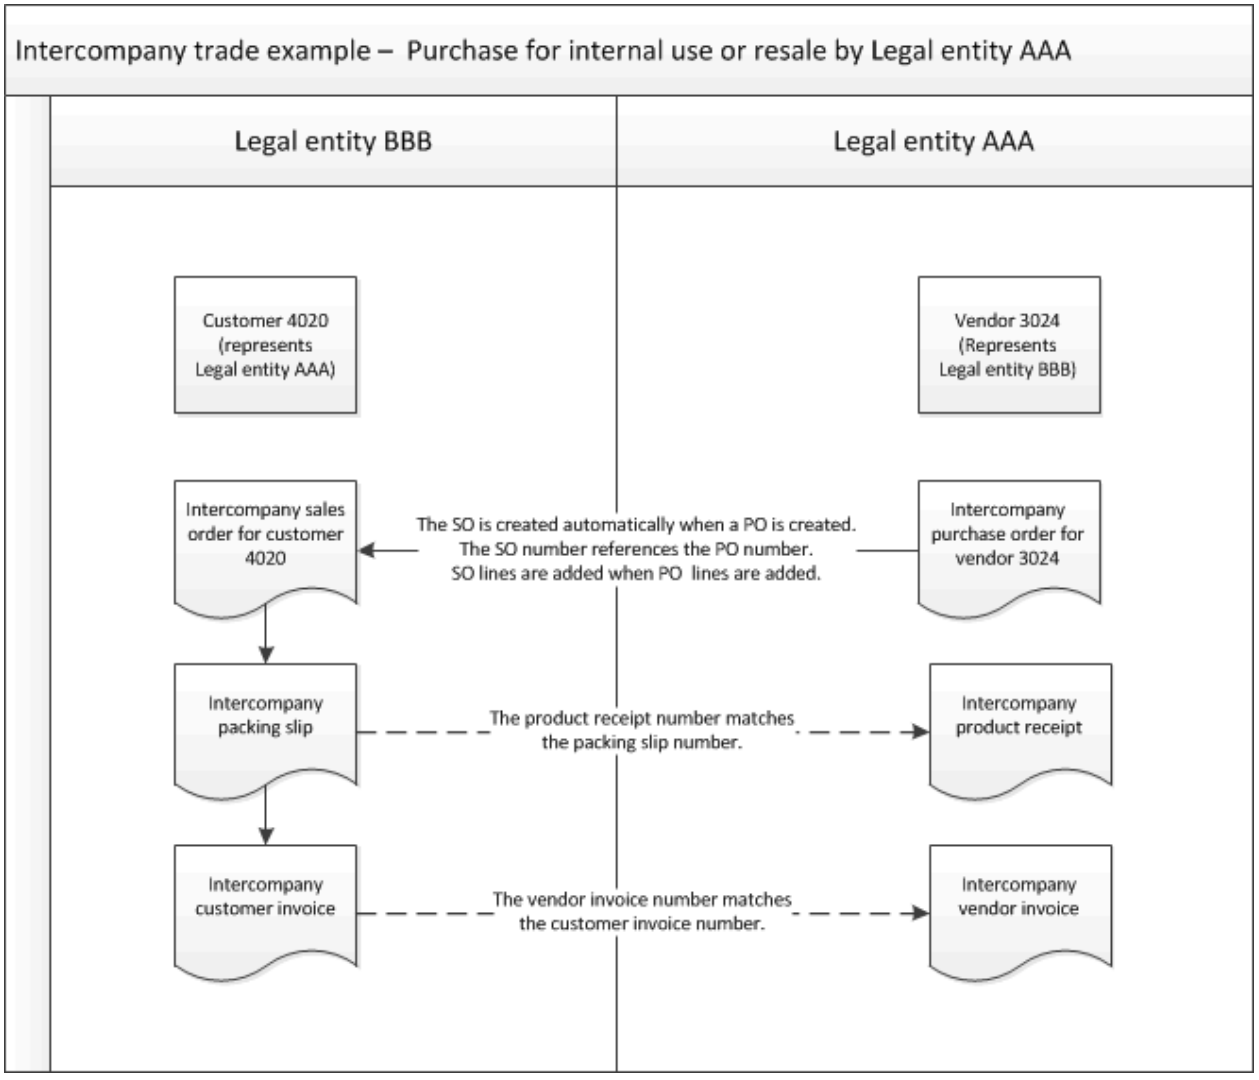
Create and invoice an intercompany purchase order for internal use

Article • 01/07/2025

You can create an intercompany purchase order for an intercompany vendor. This automatically creates an intercompany sales order at the intercompany vendor.



Create an intercompany purchase order and a corresponding intercompany sales order

Do these steps in legal entity AAA, as shown in the illustration.

1. Select **Accounts payable** > **Purchase orders** > **All purchase orders**.
2. On the **All purchase orders** list page, create a purchase order for an intercompany vendor. The field values are copied from the vendor account to the purchase order.

Because you're working with an intercompany vendor, an intercompany sales order is created in the legal entity that corresponds to the vendor. The number of the intercompany sales order can be the same as the number of the intercompany purchase order, and it can include the ID of the legal entity. The number structure that is used depends on the selection in the **Sales order numbering** field in the **Intercompany** page. For example, if you create purchase order 00029_064 in legal entity AAA, the sales order number in legal entity BBB is AAA00029_64.

An informational message tells you that an intercompany purchase order and intercompany sales order have been created. The message includes the intercompany sales order number, for your information.

3. Add line items to the purchase order. The corresponding line items are added automatically to the intercompany sales order. If an item doesn't exist in the other legal entity, a message is displayed and you can't add the item to the purchase order. To fix this problem, switch to the other legal entity and release the product to that legal entity. The item will be available to be added to sales orders in that legal entity. Then, switch back to the legal entity of the purchase order and continue adding line items.

4. When you have finished entering information for the purchase order, confirm it.

Process the intercompany packing slip and customer invoice

Do these steps in legal entity BBB, as shown in the illustration.

1. Go to **Accounts receivable** > **Sales orders** > **All sales orders**.

2. On the **All sales orders** list page, select the intercompany sales order.

3. On the Action Pane, select the **Pick and pack** tab, and then select **Packing slip**.

4. Select the **Posting** check box.

5. Select **OK**. The packing slip is posted in legal entity BBB.

6. On the **All sales orders** list page, select the intercompany sales order.

7. On the Action Pane, select the **Invoice** tab, and then select **Invoice**.

8. Select the **Posting** check box.

9. Select **OK**.

The customer invoice for the intercompany sales order is posted in legal entity BBB.

Process the intercompany product receipt and vendor invoice

Do these steps in legal entity AAA, as shown in the illustration.

1. Go to **Accounts payable** > **Purchase orders** > **All purchase orders**.
2. On the **All purchase orders** list page, select the intercompany purchase order.
3. On the Action Pane, select **Receive**, and then select **Product receipt**. The product receipt is created. The product receipt number is the same as the intercompany packing slip number.
4. Select the **Posting** check box.
5. Select **OK**.
6. On the **All purchase orders** list page, select the intercompany purchase order.
7. On the Action Pane, select **Invoice**, and then select **Invoice**. The vendor invoice is created. The vendor invoice number is the same as the intercompany customer invoice number.
8. Finish entering the vendor invoice, and then post it.

Check intercompany order price discrepancies

Article • 02/09/2024

You can use this procedure to check for price discrepancies on intercompany orders.

1. Go to **Procurement and sourcing** > **Purchase orders** > **Intercompany** > **Check intercompany order price discrepancies**.

2. Set up a batch job, if you need to, and then select **OK** to check the prices and discounts for intercompany sales orders and purchase orders. Otherwise, select **Cancel** to close the page without performing the check.

   > **Tip**
   >
   > If there are any synchronization issues or issues with the prices, these will be listed in an informational message that will be displayed. You can print the informational message for reference.

3. On the informational message, select the relevant line to open the order in the current legal entity. Open the order in the related legal entity by selecting **Intercompany**, and then **Intercompany purchase order** or **Intercompany sales order**.

   > **Note**
   >
   > To allow an update of the intercompany order:
   >
   > a. Go to **Accounts receivable** > **Customers** > **All customers**.
   > b. On the Action Pane, select the **General** tab, and then select **Intercompany**.
   > c. On the **Intercompany** page, select **Purchase order policies** or **Sales order policies**.
   > d. Select **Allow price edit** and **Allow discount edit** in both areas.

4. Open the relevant intercompany order where you want to keep the price.

5. For each order line, change the **Unit price** field for the line, and then change it back to the original value. Change the **Discount** field for the line back and forth, and change the relevant **Charges on purchases** or **Sales charges** fields back and forth. Changing the values back and forth will trigger a synchronization of the

prices, discounts, and charges from this intercompany order line to the referenced intercompany order line, so they will be automatically aligned.

> **Note**
>
> This synchronization is valid only if the intercompany sales order has not been invoiced. If the intercompany sales order has been invoice-posted and a customer invoice journal has been created, changes must be performed directly on the intercompany purchase order lines by setting the prices, discounts, and charges equal to those on the intercompany customer invoice journal. If this is not done, the intercompany purchase order cannot be invoice-posted, because there will be a mismatch in the order totals.

6. Repeat the procedure until all intercompany purchase and sales orders are synchronized.

Record the receipt of goods on the purchase order

This article explains how to record receipt of goods directly on a purchase order. You can also register product receipt in the warehouse, and then later record it on the purchase order. A purchasing agent or an accounts payable coordinator typically performs this task. The example shown in this guide uses values from the USMF demo data company and has you prepare an example purchase order to receive against. If you use the procedure on your own data, start at the *Record receipt of goods* section.

Prepare a new purchase order for receipt of goods

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. In the **Vendor account** field, enter *US-101*.
4. Select **OK**.
5. In the **Item number** field, enter *M0001*.
6. In the **Quantity** field, enter *5*.
7. On the Action Pane, select **Purchase**.
8. Select **Confirm**.

Record receipt of goods

1. On the Action Pane, select **Receive**.
2. Select **Product receipt**. The **Quantity** field allows you to select different options for the quantity that you want to receive. For example, if a quantity is previously registered in the warehouse, you can select *Registered quantity*. For this example, use the value *Ordered quantity*.
3. Expand the **Overview** section.
4. In the **Product receipt** field, type any value. Enter a reference used as voucher for the product receipt journal.
5. Expand the **Lines** section.
6. Set **Quantity** to *4*. Manually specify the quantity that you're receiving for each line on the order.

7. Select **OK**. The goods are now recorded as received on the purchase order, and a product receipt journal is created as document to reflect this. Use the **Product receipt** action to review the journals created with the purchase order, and see what was received, and when.

Create purchase orders

08/13/2025

This article describes the process and options when you manually create a purchase order.

When you create a purchase order (PO), general information about the whole order is specified in the PO header, and you then add one or more PO lines. This article describes some of the most frequently used options that are available.

You can also create POs by copying lines from another PO document or a sales order. In this case, you can reverse the sign on the inventory, as you would reverse the sign on an invoice to indicate credit.

Although you can manually create POs, they're more typically generated from other processes. Orders can be automatically created based on other documents, such as requisitions. Alternatively, they can be created as part of the master planning process through planned POs. If you use purchase agreements, POs can be created by the **Release order** action. There are also more advanced methods for automatically creating a PO. For example, orders can be created when you use direct delivery or intercompany order chains.

Creating a purchase order header

When you create a new PO, a dialog box appears, where you can enter the most common information for the PO header. When you select **OK** to close the dialog box, the order is created, and you can then specify additional information in the header.

The first detail that you must consider when you create a PO is the type of order. The **Purchase order** type is used most often. However, if a credit invoice is required, you can use the **Returned order** type.

You must specify the supplier in the **Vendor account** field. For this field, you can search on either the account or the vendor name. If a vendor delivers from multiple locations but uses a single invoice account, you can select that invoice account in the **Invoice account** field and then use it with different vendor accounts. If you must create a PO for products that won't be ordered repeatedly, you can use the **One-time supplier** option. This option automatically creates a new vendor account that is marked as a one-time account, to support a later clean-up process for one-time accounts in the **Accounts payable** module. When you select a vendor account, many fields in the PO header inherit default values from the information that is associated with the vendor account. For example, the default delivery site and warehouse are copied from the vendor information. However, you can override these default values if the purchase is intended for another location.

If the supplier has provided a reference number for the order, you can record this information in the **Vendor reference** field. For returned orders, you must specify a value in the **RMA** field to reference the supplier's authorization for processing the return.

If a purchase agreement is associated with the order, you must specify this information in the **Purchase agreement** field.

The PO header also contains information about charges that apply to the whole order instead of individual lines. Charges can be automatically added to the order if automatic charges have been set up for the vendor or the vendor's charge group. You can also manually add charges to the order header by selecting **Maintain charges** on the Action Pane.

Adding purchase order lines

POs can be for physical products or for services. A setting on the inventory model group determines whether a particular item number applies to a product or a service. Usually, the item that is purchased is specified by an item number. However, if the order is for products or services that are directly consumed, you can also specify the item by using a procurement category.

PO lines contain lots of fields, but many of these fields have a default value or a value that is inherited from the order header. Additional fields are set when you select a product or service. The fields that are most often set manually include the fields for the item number, quantity, and requested receipt date. Information about unit price and discounts is also important, but the values of those fields are often determined by trade agreements or purchase agreements.

When you select a product, you can search on all or part of the product name instead of using the item number. If the product has several variants, such as different sizes, you can see an overview of the available variants by using the **Add lines** function or by using the lookup that is available in the **Variant number** field.

Often, you'll have to specify several dimensions for the item that is selected on each PO line. The dimensions that must be specified depend on the dimension groups that have been assigned to the product master definition. For example, you'll often have to specify a site and warehouse to indicate the location that the product should be delivered to. You identify product variants by specifying a variant number, or by entering values for one or more product dimensions, such as color, size, configuration, or style. Tracking dimensions, such as batch and serial number, let you uniquely identify each inventory lot. After you've created an order, you can capture dimension values on the order by using the **Registration** action. For example, you've ordered a quantity of five pieces of an item. Later, you register that three of those pieces will be black, and two of them will be blue. This approach is an alternative to capturing the dimension information during arrival registration.

You can check the details of the inventory transaction status for stocked products. For example, you might want to check the on-hand inventory to help you decide how much to order. Alternatively, you might want to review the inventory status of an ordered quantity to see whether inbound arrival registration has occurred.

A PO line that is being used to return a product to the vendor will have a negative quantity. You can select a specific lot to return by using the **Reservation** action.

Sometimes, you might want to divide the quantity that you've ordered, so that different parts of it are delivered on different dates. You can set up these deliveries by using the **Delivery schedule** action, which is available on the **Purchase order line** menu in the **Lines** view.

Charges can be automatically added to PO lines, if automatic charges have been set up for the vendor or vendor charge group, and for the item or item charge group. However, more typically, charges are added manually at the order line level. To add a charge, open the **Maintain charges** page by using the **Maintain charges** action on the **Financials** menu in the **Lines** view. The advantage of adding charges directly at the order line level is that the charge can be allocated as an inventory cost. To set up charge codes to account product cost, use the **Item** debit option. These types of charges must be allocated from the PO header to the lines before the order can be confirmed. For example, you might want to allocate charges based on the quantity on each line. The charge category also affects how charges are accounted. For example, fixed charges specify a fixed amount, and percent charges are calculated as a percentage of the net amount for the order line. POs can be assigned to a load, and the load might include an estimate of the expected expense for the transportation cost. You can allocate this expense from the load back to the PO lines.

Purchase order actions

After you've added the header and lines to the PO, you must often complete additional steps before the order is ready to be sent to the vendor. Because so many options are available, you might find it helpful to use Action search to find the relevant menu item.

You can configure products on the order so that they have supplementary items. Supplementary items are products that must or can be bought together with other products. Supplementary products might be added free of charge as accompanying products, or you might be able to decide whether to add them to the order or not. You can review the supplementary items after each order line that is added. However, you'll probably find it more convenient to review and add relevant supplementary items for all the order lines by using the **Supplementary items** page, which you can open from the Action Pane.

Discounts are usually added to lines as they're created. However, a few discounts apply to the whole order:

- The **Total discount** action calculates a total discount percentage that is applied to the full order. Don't confuse this discount with the cash discount percentage. Cash discounts are applied when the invoice is paid, and they depend on payment settlement by a specific date.
- If a multi-line discount applies, you must use the **Multiline discount** action to calculate and assign it to the order. Multi-line discounts are discounts that can be offered if a mix of products on the order exceeds a joint threshold. Only a few companies use this type of discount.

Charges that have a charge code that uses the **Item** debit type must be assigned to the line level before the order can be sent to the vendor. You might find it convenient to assign these charges at the order header level, so that you can specify the total amount of the charge. However, in this case, the charge must then be allocated down to each line before the order can be confirmed. You can use the **Allocate charges** action to split amounts from charges that are assigned at the header level down to the order lines. Charges can be split according to the net amount of each line, according to the quantity that has been ordered, or evenly across the order lines. After you've allocated charges to the lines, the charge is removed from the order header.

POs can be configured to require that budget funds be allocated to the order before it can be processed. In this case, you can use the **Budget checking** action to allocate the budget.

You might have to delay the completion of a PO. For example, you might require additional information about products or services, or you might have to get authorization for the spend. There are several ways to hold back an order. For example, you can wait to send the order. Alternatively, if a change management workflow is being used, don't submit the order for approval. If you must block all orders for a particular vendor, you can also mark the vendor as *On hold* for processing on the vendor master. There are also circumstances that might prevent the order from being processed. For example, processing might be prevented if credit limits have been exceeded, or if the required budget funds aren't available.

Create a purchase order

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article shows you how to create a purchase order manually. The system often creates purchase orders automatically as a result of master planning, direct delivery, and other processes. A purchasing agents also create purchase orders. This procedure includes sample values based on the USMF demo data company.

Create the purchase order header

The purchase order header captures information that applies to the entire order, such as the vendor, delivery location, receipt date, and the person placing the order. Follow these steps to start a new purchase order and set the header values that will act as defaults for the order lines you add later.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. Select vendor account *US-101*. When you select a vendor, the system copies details from the vendor record, such as address, invoice account, delivery terms, and delivery mode, as default values into the order header. You can change these values at any time.
4. Expand the **General** section.
    - The **Site** field together with the **Warehouse** field specifies where the procured goods or services must be delivered. The default delivery address is the site. You can populate both fields with values set up for the selected vendor, or you can specify them manually.
    - Use the **Receipt date** field to specify when procured goods and services need to be delivered. You can specify a single receipt date for the order, or you can give the individual order lines unique receipt dates. If the receipt date you specify here can't be

met for specific products or services because they have longer lead times, the system creates those lines with a later receipt date to accommodate for this.

5. Expand the **Administration** section. Use the **Orderer** field to specify who is placing the order. This information might be convenient to share with the vendor in case they need to contact that person. The system might automatically assign the field a value if the current user account is associated with a name on the **Users** page.

6. Select **OK**. The order header is created. When you work with purchase order lines, you see only a summary of the header information. If you need to view the rest of the information, select **Header**.

Add a purchase order line

Purchase order lines specify the individual products, services, or expense categories that you are buying, along with quantities, prices, discounts, and delivery details. Follow these steps to add a line to the order, choose the product dimensions that you want to track, and enter the pricing and quantity information that will be sent to the vendor.

1. Select **Purchase order line**.

2. Select **Dimensions**. Products can be in variants that are differentiated by dimensions, such as color, size, or style. You can also set up products to use storage dimensions, such as site and warehouse. There are also optional tracking dimensions, such as batch and serial numbers. To improve the efficiency of order entry, add the dimension fields that you commonly use directly to the order grid.

3. Select the **Color** check box. If you select the **Save setup** option, the selected dimensions appear by default the next time you open the purchase order page.

4. Select **OK**.

5. In the **Item number** field, select *T0004*.

    - Create order lines for products and services by specifying an item number. Create order lines for expenses by specifying a procurement category.
    - Use the **Procurement** category field for adding lines where procured items are expensed directly, rather than going into inventory. This means that if you need to expense a purchase, you can create a purchase order line that specifies a procurement category, rather than creating a line with an item number. You can also associate items

with a procurement category. In this case, the procurement category is shown as informational only.

6. In the **Color** field, enter or select a value. The **Site** and **Warehouse** fields typically populate with values from the order header, but you can override the fields if some lines need to be delivered to different locations.

7. In the **Quantity** field, enter a number.

    - Select the quantity that you want to purchase. The **Quantity** field automatically populates with the minimum order quantity for the product if this is set up, or with the value of 1.
    - The **Unit** field indicates the unit of measure for the ordered quantity. Typically, the unit is automatically provided from the purchasing unit on the product master data, but you can change this.
    - The **Unit price** field typically contains a value from either a purchase agreement or a trade agreement. You can change the unit price on individual order lines, for example if a unique price is negotiated with the vendor.
    - The **Discount** field represents a discount amount per unit. This discount therefore reduces the unit price by the discount. This discount is commonly supplied automatically from purchase agreements or trade agreements, but you can override on individual lines if unique discounts are negotiated with the vendor.
    - Enter a discount percentage that reduces the net amount for the line accordingly. The discount percent is often supplied automatically from purchase agreements or trade agreements, but you can override on individual lines if a unique discount percentage is negotiated with the vendor.
    - The value in the **Net Amount** field is calculated from other fields on the line including quantity, unit price, discount, and discount percent. You can change the net amount, but then the **Unit Price**, **Discount**, and **Discount percent** fields are blank. When you post toward the line, the amount posted is proportional to the net amount. Typically the **Net Amount** field is only used for displaying the net amount of the line.

8. Expand the **Line details** section.

9. Select the **Delivery** tab. You can assign a unique receipt date to each order line. The date is inherited from the field on the purchase order header, but you can change this.

Review order totals

Before you submit a purchase order, it's a good idea to verify the totals so that you can confirm the overall cost, taxes, charges, and discounts that apply to the order. Follow these steps to open the totals dialog box and review the calculated amounts for the whole order.

1. Select **Totals**.

    - If you don't see the **Totals** action, select the **Purchase Order** tab on the Action Pane.
    - This dialog box shows totals for the whole order.
    - The **Selection** field allows you to change the basis of how totals are calculated. For example, you could choose **Product receipt quantity** to show totals that relate to the amount of the products that are received, or **Ordered quantity** to show the amount of product that you ordered.

2. Select **OK**.

Default financial dimensions for purchase orders created from purchase requisitions

When you create a purchase order from a purchase requisition, the system initializes financial dimensions on the purchase order based on the following rules:

- **Purchase order header dimensions** – The system always initializes the financial dimensions on the purchase order header based on the vendor setup. This setup includes dimensions such as *Business unit*, *Cost center*, and any other mandatory financial dimensions configured on the vendor.
- **Purchase order line dimensions** – If you create the purchase order from a purchase requisition, the system copies line-level financial dimensions from the corresponding purchase requisition lines.

Create a purchase order governed by budget

06/17/2025

Use this procedure to create a purchase order that is checked for available budget.

Review the budget control configuration

1. Go to **Budgeting** > **Setup** > **Budget control** > **Budget control configuration**.
2. Select the **Budget funds available** tab.
3. Select the **Documents and journals** tab.
4. Select the **Define budget control rules** tab.
5. Select the **Define budget groups** tab.
6. Close the page.

Create a purchase order

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. In the **Vendor account** field, enter or select a value.
4. Expand the **General** FastTab.
5. In the **Accounting date** field, set the date.
6. Select **OK** to close the dialog and open your new purchase order.
7. On the **Purchase order lines** FastTab, select **Add line** from the toolbar to add a new line and then fill out the line as needed to add an item to the order.
8. On the **Purchase order lines** FastTab toolbar, select **Financials** > **Distribute amounts**.
9. In the **Ledger account** field, specify an account.
10. Close the page.

Perform budget checking

1. Continue working with the purchase order you just added a line to.
2. On the **Purchase order lines** FastTab toolbar, select **Financials** > **Perform budget checking**.
3. On the **Purchase order lines** FastTab toolbar, select **Financials** > **Budget check errors or warnings**.
4. The **Budget check errors or warnings** dialog opens. Check the results of the check and then select **Close** to close the dialog.

Create a purchase order with a delivery schedule

Article • 01/24/2025

This article demonstrates how to create a delivery schedule for a purchase order. A delivery schedule is used when a quantity on an order or a journal is requested to be delivered in multiple shipments. The example shown in this guide can be used in the USMF demo data company. This procedure would typically be done by a purchasing agent.

Create a delivery schedule

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. On the Action Pane, select **New**.
3. In the **Vendor account** field, enter *US-101*.
4. Select **OK**.
5. In the **Item number** field, enter *M0001*.
6. In the **Quantity** field, enter *10*.
7. Select **Purchase order line**.
8. Select **Delivery schedule**.
    - The **Delivery schedule** page allows you to specify the number of shipments in which the total quantity of the order line will be delivered from the vendor.
    - By default, the system copies the total quantity and other delivery details of the original purchase line into the first delivery schedule line. In this example, we'll create a schedule for two shipments, with the second shipment's date offset by a week from the first shipment.
9. In the **Quantity** field, change the quantity to *4*.
10. Select **New**.
11. In the **Quantity** field, enter *6* as the remaining quantity.
    - In the receipt date field, select a date that's one week after the date on the first delivery line.

- You can keep track of the total quantity that's allocated to the delivery schedule lines by looking at the **Total** and **Remaining** fields. When the remaining quantity is zero, the full quantity from the original line has been allocated to the schedule.

12. Expand the **Charges conversion** section.

    - The options here allow you to control how you want charges to be distributed across the delivery schedule lines. If you select *Copy gross amounts*, the charge amount on the original order line is copied to each delivery line. The *Allocate to delivery lines* option divides the original line charge according to the quantity on each delivery line.

13. Collapse the **Charges conversion** section.

14. Select **OK**.

    - The delivery schedule has now been applied to the order.
    - The original order line, now referred to as a Commercial line, has been converted to an Order line with multiple deliveries. It's marked with a distinct icon and acts as a header for the delivery lines.

15. Select the second order line, which is the first of the two delivery lines.

    - The two new lines, referred to as Delivery lines, make up one delivery schedule. The order will be processed against these lines and not the original line. If documents such as confirmations, product receipt journals, or invoices are printed, only the delivery lines are shown.

Change the delivery schedule

You can change the quantity on delivery lines. If you do this, the commercial line is automatically updated to the total quantity in the delivery lines.

1. In the **Quantity** field of the first delivery line, change the quantity from *4* to *5*.

2. Select the first order line (the commercial line).

    - The quantity on the commercial line has been changed to 11.

Process product receipt using delivery schedules

The purchase order must be confirmed before the product receipt can be processed. In this example, receipt is recorded directly on the purchase order. The receipt could also have been recorded when the goods arrived in the warehouse.

1. On the Action Pane, select **Purchase**.
2. Select **Confirm**.
3. On the Action Pane, select **Receive**.
4. Select **Product receipt**. In the **Product receipt** field, type any value.
    - This field is used to enter a reference that will be used as voucher for the product receipt journal.
    - In the **Quantity** field, select *Ordered quantity*. This option means that the receipt will process for the quantity that the order lines were created with.
    - Make sure that the **Print product receipt** field is set to *No*. Printing isn't needed in this example.
5. Expand the **Lines** section.
    - Notice how the product receipt is created for the two delivery lines and not the original order line. If the receipt had been recorded in the warehouse, it would also have been recorded on the delivery schedule lines.
6. Collapse the **Lines** section.
7. Select **OK** to post the receipt.

Create a purchase order for a one-time supplier

06/17/2025

This procedure shows you how to create a purchase order for a one-time supplier. The supplier is created automatically with the purchase order, rather than having to create the vendor account manually. Purchase orders are typically created by a purchasing agent. A one-time vendor account must already be set up in the **Account payable parameters** page.

To create a purchase order for a one-time supplier, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Select **New**.
3. Select *Yes* in the **One-time supplier** field. A vendor account is automatically created and assigned to the purchase order. The vendor account is created based on the template that is specified on the **General** tab in the **Accounts payable parameters** page.
4. In the **Name** field, type a name for the supplier.
5. Select **OK**. The purchase order can now be completed and processed like any other order. There are no special characteristics related to how this is done. The invoice will account a due transaction on the vendor account that was created with the order, and payment will then be processed.

Apply a purchase agreement when creating a purchase order

Article • 01/24/2025

This procedure shows how to use a purchase agreement when you create a purchase order. The purchase agreement must be applied when you create the purchase order because there are general terms that should be copied to the purchase order header. Typically this task would be carried out by a purchasing agent. As a prerequisite for this guide, you must have an effective purchase agreement with a product quantity commitment for a vendor and items. The same procedure can be used if you have a purchase agreement with other types of commitments.

Create a purchase order

1. Go to **Procurement and sourcing** > **Workspaces** > **Purchase order preparation**.
2. On the Action Pane, select **New purchase order**.
3. The **Create purchase order** dialog opens. Select a **Vendor account**. Inspect and adjust the other address fields as needed.
4. Expand the **General** FastTab.
5. In the **Purchase agreement** field, find and select the effective agreement that you want to use. All available agreements for the vendor are listed here.
6. Select **Yes**.
7. Select **OK**.

Add a line

1. In the **Item number** field, type a value. If there are specific inventory or location dimensions on the commitment, you must enter the same values on the purchase order line to make use of the agreement.
2. In the **Site** field, select the drop-down button to open the lookup. The site may already be populated with the default value from the order, or from the vendor. If so, skip this step.
3. In the list, find and select the desired record.
4. In the list, select the link in the selected row.
5. In the **Quantity** field, enter a number. Validate that the price is copied from the commitment.

Look up the commitment

1. Select **Update line**.
2. Select **Attached**. Here you can get details for the purchase agreement. For example, you can see the price and whether the price and discount are fixed, which means that if you change price or discount on the purchase order to a different value than on the commitment, the system will remove the link so the purchase order line doesn't fulfill the commitment. You can also see if the Max is enforced option is selected, which means that the quantity on the commitment can't be exceeded by summing all of the purchases that fulfill the commitment.
3. Close the page.

Look up the purchase agreement

1. On the Action Pane, select **General**.
2. Select **Purchase agreement**.
3. Close the page.
4. Close the page.

Create a purchase return order

09/03/2025

Use purchase return orders (return POs) when you need to send goods back to a vendor. Here are a few common scenarios where you might create a return PO:

- You received goods that need to be returned
- You created an invoice but didn't receive the goods
- You need to return some of the goods that you received (partial return of goods)
- You received items that weren't ordered (unplanned receipt)
- Vendor buyback or consignment return

This article explains how to create a return PO by using the **Credit note** action to copy lines from a vendor invoice document to a new purchase order. It also shows you how to confirm the order and process shipment of the goods back to the vendor. A purchasing agent typically carries out this task.

Create a new return PO

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**. The first step is to create a new purchase order to use as the return PO.
2. Select **New**.
3. In the **Vendor account** field, specify the vendor you're returning to.
4. Select **OK**.
5. On the Action Pane, select **Purchase**.
6. Select **Credit note**. This page lets you copy from an existing vendor invoice to your return order. This page is the same page that's used for other copy actions. But because you opened it from the **Credit note** action, the page is configured to support the creation of a return order that offsets vendor invoices.
7. Expand the **Parameters** section.

    - The **Invert sign** option is automatically selected, and you can't change it. This option ensures that the sign is changed for the quantities, and that order lines that you add offset the vendor invoice.
    - The **Copy charges** option is automatically selected, and you can't change it. This option means that charges from the vendor invoice are added to the return PO to offset the original charge. You can modify the changes on the order header and lines later.
    - The **Copy precisely** option is automatically selected, and you can't change it. This option ensures that an exact copy is made of the values in all the fields on the

vendor invoice header and lines. This option means that a return PO is created with values that match all terms used with the vendor invoice document.
    - The **Delete purchase lines** option deletes any purchase order lines that already exist on the purchase order before adding the new lines. In this example, you didn't yet add any lines to the return PO, so this option has no effect. Use this option with caution, as it deletes all existing lines without further warning.
    - The **Copy order header** option is automatically selected, and you can't change it. This option ensures that information is copied from the vendor invoice and applied to the return PO header. This option is useful because it helps to ensure that the return PO offsets the invoice by using similar terms.
8. Collapse the **Parameters** section.
9. Expand the **Invoices** section. You opened the page from the **Credit note** action, so the only option available is to copy information from vendor invoices. This tab shows all the available invoices for the vendor account that you specified on the return PO. The invoices are identified by the invoice voucher or the purchase order IDs.
10. Find the vendor invoice that includes the items you want to return and highlight it by selecting any field in that line.
11. Select the check box for the line. The lines available on the vendor invoice are automatically selected together with the order.
12. Highlight the line for the item you want to return by selecting any field in that line. In the **Quantity** field, enter the quantity that you want to return to the vendor.
13. Clear the check box for each line that you don't want to return items for. Only the lines that you select are copied to your order.
14. Collapse the **Invoices** section.
15. Expand the **Selected lines or header to be copied** section. This view shows a summary of all the documents and lines that you selected to copy to your order.
16. Collapse the **Selected lines or header to be copied section**.
17. Select **OK**. The line that you selected is now copied to your return PO. The **Quantity** field shows a negative value for each item you're returning.
18. In the **Purchase order line** section, select **Inventory**.
19. Select **Marking**. The order line that you created is marked against the inventory transaction from the vendor invoice. This marking ensures that the inventory that's returned to the vendor is the same as the inventory that was received from them earlier. There are some situations where marking doesn't occur, for example, if the inventory is already marked as *Consumed*, or if the product is one that doesn't use marking.
20. Select **OK**.

Confirm and record the shipment of goods

1. Select **Actions** > **Confirm**.

2. On the Action Pane, select **Receive**.
3. Select **Product receipt**.

    - Use this page to record product receipt for purchase orders and to process the return of goods back to the vendor. Order lines with a negative quantity mean that goods are to be returned to the vendor, and the document that you can generate from this page can be used as packing slip for this use.
    - In the **Quantity** field, select *Ordered quantity*. This step ensures that the shipment processes the full ordered quantity that the order lines include.

4. In the **Product receipt** field, type a value. Use this field to enter a reference that acts as a voucher for the product receipt journal.
5. Select **OK**. The goods are now recorded as shipped on the return PO, and a product receipt journal is created. Use the Product receipt action to review the journals created with the purchase order, and see what was received or returned, and when.

Create project purchase order

Article • 05/02/2022

This procedure shows you how to create a project purchase order. This task uses the USSI data set.

1. Go to Project management and accounting > Projects > All projects.
2. In the list, click the link in the selected row.
3. On the Action Pane, click Manage.
4. Click Item task.
5. Click Purchase order.
6. In the Vendor account field, enter or select a value.
7. In the Site field, enter or select a value.

    - These steps aren't required, but they do simplify the purchase order by setting up a default site and warehouse for the purchase order lines.

8. In the Warehouse field, enter or select a value.
9. Click OK.
10. In the list, mark the selected row.
11. In the Item number field, enter or select a value.

    - This can be the item number or a procurement category.

12. Expand the Line details section.
13. Click the Project tab.

    - Verify that the sales and cost prices are available. If they are not available but needed, enter the information.

14. Click Save.

Create a repeat purchase order

This article shows you how to create a repeat purchase order (PO) by copying lines from an earlier purchase order document to a new PO or to an existing PO. You can create repeat orders by using two methods. Use the actions available at the document level from the Action Pane, or use the line detail actions. The document level actions are intended for creating a new purchase order by adding lines and header information from another order, while the line details action is mainly for adding lines to an existing order. You can use the example shown in this guide in the USMF demo data company. A purchasing agent typically carries out this task.

Create a new repeat purchase order

1. In the navigation pane, go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**. First, try the option for copying information to a new order.
2. Select **New**.
3. In the **Vendor account** field, enter *US-101*.
4. Select **OK**.
5. On the Action Pane, open the **Purchase order** tab and, from the **Copy** group, select **From all**. The **Copy from other documents** dialog opens. From here, you can copy from existing orders to your order. There are different options for how the lines are copied, and different kinds of documents that you can copy from. See the options for how lines are copied first.
6. Expand the **Parameters** FastTab.
    - The **Quantity factor** field is useful if you need to use a quantity that is different from the one on the order that you're copying from. For example, if you want to order twice the quantity that's in the lines that you're copying from, type `2` in this field and then the system adds lines where the original quantity is doubled.
    - The **Invert sign** field also supports changing the ordered quantity by changing the sign of the quantity for order lines that are added. This change might be useful if you need to reverse a transaction, by creating order lines that negate the transaction. This option is automatically selected when the page is opened from the **Create credit note** action.

- The **Copy charges** option allows you to copy charges to your new order from the document that you're copying the order lines from.
- The **Recalculate prices** option uses the current prices and discounts rather than copying these values from the document that you're copying other information from.
- The **Copy precisely** option copies the values of several fields on the order header and lines. If you don't select this option, default values are used for many of the fields relating to the vendor and products, just like when you create a new order manually. For example, if you set **Copy precisely** to *Yes* and copy an order that overrides the default invoice account for the vendor, then that same invoice account is copied to your new order. If you set **Copy precisely** to *No*, the default invoice account for the vendor is used on your new order instead. Values for the following fields are copied when **Copy precisely** is set to *Yes*:
  - **Language**
  - **Terms of payment**
  - **Method of payment**
  - **Payment specification**
  - **Number sequence group**
  - **Cash discount**
  - **Discount percentage**
  - **Currency**
  - **Delivery terms**
  - **Mode of delivery**
  - **Dimension**
  - **Sales tax group**
  - **Override sales tax**
  - **Prices include sales tax**
  - **Transport**
  - **Port**
  - **Statistics procedure**
  - **Template ID**
  - **Delivery name**
  - **Postal address**
  - **Reference**
  - **Reference Table ID**
- The **Delete purchase lines** option deletes all purchase order lines that already exist on the purchase order that you're copying to, before applying the new lines. Use this option with caution, as it deletes all existing lines without further warning.

- If you use the **Copy order header** option, you don't need to manually create the header information on your new order. This option results in default values being used for the fields associated with the vendor. If the document that you're copying from has non-default values that you want to copy, use the **Copy precisely** option as well.
- There are different document sources that you can copy from, and each has a separate section on this page. For example, the **Purchase orders** section allows you to copy from existing purchase orders.

7. In the **Purchase orders** section, select the lines you want to copy to your clipboard. You can select additional purchase order lines from other purchase orders and copy them to your order as well. You can also add lines from other kinds of purchase documents. The next few steps review the different options.

8. Expand the **Confirmation** section. Here you can select purchase order confirmations to copy from. The purchase order confirmations are identified by the associated purchase journal ID or the purchase order ID.

9. Expand the **Product receipts** section. Here you can select product receipt journals to copy from. The product receipt journals are identified by the product receipt voucher or the purchase order ID.

10. Expand the **Invoices** section. Here you can select vendor invoices to copy from. The invoices are identified by the invoice voucher or the purchase order ID.

11. Expand the **Selected lines or header to be copied** section. This view shows a summary of all documents and lines that you selected to copy to your order.

12. Select **OK**. The lines that you selected are copied to your new purchase order.

Copy lines to an existing purchase order

Instead of copying an entire order, it's more common to create a new PO and complete the information on the PO header. Then, copy individual lines from existing orders.

1. Select **Purchase order** line.

2. Select **From all**. The page that opens is identical to the one shown earlier, but different options are selected when you open it from the order lines view. Review the parameters.

3. Expand the **Parameters** section.

- The **Delete purchase lines** option isn't selected. This setting means that you can copy new lines to your order without removing existing lines.
- The **Copy order header** option isn't selected, as you're only adding extra lines to the order.
- For this example, copy lines from an existing purchase order.

4. Select the line for the desired purchase order. Notice that the single order line on this PO is also selected.

5. Select **OK**. The extra order line is added to your purchase order.

Procurement Agent overview (production-ready preview)

[This article is prerelease documentation and is subject to change.]

The Procurement Agent in Dynamics 365 Supply Chain Management works with procurement teams to manage supplier changes that affect purchase orders and supply commitments. By streamlining routine supplier communication and automating impact evaluation, the Procurement Agent enables purchasers to spend less time on manual updates and analysis, and more time on informed decision-making and exception handling.

> **Important**
>
> - This is a production-ready preview feature.
> - Production-ready previews are subject to supplemental terms of use.

The Procurement Agent includes the following capabilities that work together in the procurement workflow:

- Supplier communications
- Impact analysis

You can choose to enable and use both capabilities together or just one of them.

Supplier communications

Supplier communications features of the Procurement Agent manage inbound and outbound updates tied to purchase orders. With it, teams can quickly coordinate with vendors and keep purchase records aligned with supplier commitments.

The inbound functionality monitors and classifies emails from vendors. For those related to purchase orders, it identifies which messages are confirmations and which are change requests. For change requests, it identifies the changed fields. Purchasers can confirm and apply changes without having to find and open the purchase orders, ensuring purchase orders are up-to-date.

Supplier communications also supports outbound communication, enabling teams to automate outgoing or follow-up communication.

Learn more about supplier communications in Supplier communications features of the Procurement Agent.

Impact analysis

The *Impact analysis* features of the Procurement Agent evaluate how supplier changes affect inventory, production schedules, and customer deliveries. When you receive a supplier change through configured sources, impact analysis automatically assesses the downstream effects on orders and inventory. This process helps procurement teams understand the consequences of a change before deciding whether to accept it or take further action.

Vendors might send change requests through various channels. Impact analysis supports change requests arriving through emails processed by supplier communications and changes submitted through the vendor collaboration interface. It classifies each change as either *Has impact* or *No impact*. Learn more in Review the impact of purchase order changes from vendors.

You can also manually initiate impact analysis for a selected purchase order. Learn more in Impact simulation.

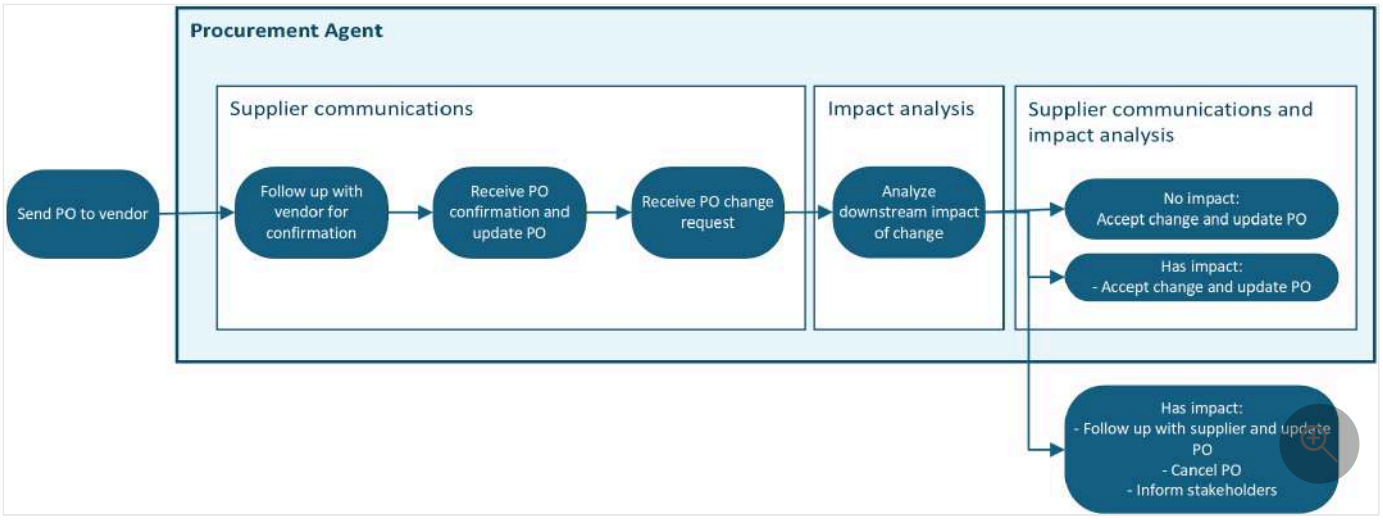
Learn more about impact analysis in Impact analysis overview.

How the Procurement Agent capabilities work together

Procurement Agent capabilities fit into the procurement workflow differently based on whether supplier communications or the vendor collaboration interface is used to communicate with suppliers.

When you process emails through supplier communications together with impact analysis

The following diagram illustrates how the supplier communications and impact analysis capabilities of the Procurement Agent work together when you receive change requests through emails processed by supplier communications. The Procurement Agent detects changes in supplier emails, runs impact analysis for relevant changes, and surfaces the impact analysis result back in the **Emails from vendors** workspace to help purchasers make informed decisions.

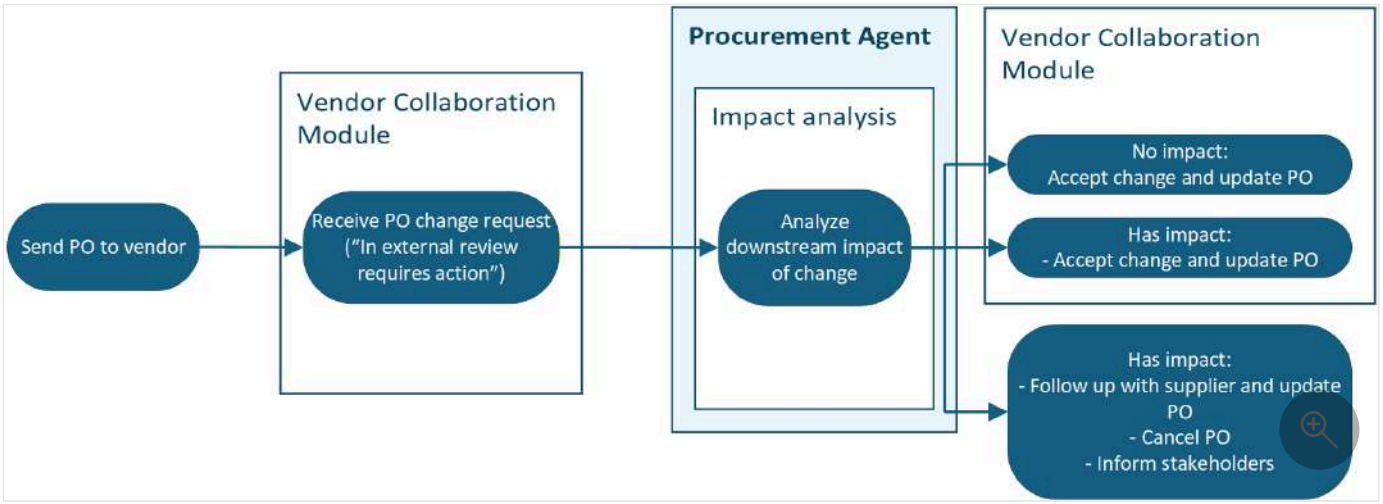


1. Send purchase order to vendor
2. Follow up with vendor for confirmation (supplier communications)
3. Receive purchase order confirmation and update purchase order (supplier communications)
4. Receive purchase order change request and view changed fields in the **Emails from vendors** workspace (supplier communications)
5. Analyze downstream impact of the change and view result in the **Emails from vendors** workspace (impact analysis)
6. Make a decision based on the impact analysis result (supplier communications + impact analysis)

    - *No impact* – The purchaser can accept the change and update the purchase order (supplier communications)
    - *Has impact* – The purchaser can view more details about the impact (impact analysis) and determine how to proceed. This action can be to follow up with the supplier, accept the change and update the purchase order if nothing can be done (supplier communications), cancel the purchase order, and inform stakeholders.

When you use the vendor collaboration interface together with impact analysis

The following diagram shows how the supplier communications and impact analysis capabilities of the Procurement Agent work together when you receive change requests through the vendor collaboration interface. The Procurement Agent runs impact analysis for changes received through the vendor collaboration interface and surfaces the impact analysis result in the **Purchase order preparation** workspace to help purchasers make informed decisions.



1. Send purchase order to vendor.
2. Receive purchase order change request via the vendor collaboration interface's *In external review requires action* tab in the **Purchase order preparation** workspace.
3. Analyze downstream impact of the change (impact analysis).
4. Make a decision based on the impact analysis result (impact analysis).

    - *No impact* – The purchaser can accept the change and update the purchase order.
    - *Has impact* – The purchaser can view more details about the impact (impact analysis) and determine how to proceed. This action can be to follow up with the supplier, accept the change and update the purchase order if nothing can be done, cancel the purchase order, as well as informing stakeholders.

Cost

The Procurement Agent incurs charges based on the number of Microsoft Copilot Studio credits you use when running it. The agent has a fixed cost per run and a variable cost that depends on the resources it consumes. The agent management configurations control this cost.

For information about how charges apply to each capability, see Cost for supplier communications and Cost for impact analysis.

Learn about the billing rates and management for Copilot Studio in Billing rates and management.

Impact analysis overview (production-ready preview)

[This article is prerelease documentation and is subject to change.]

The Procurement Agent in Dynamics 365 Supply Chain Management works with procurement teams to manage supplier changes that affect purchase orders and supply commitments. Impact analysis evaluates whether and how supplier changes affect inventory levels, production schedules, and customer deliveries. It helps teams react faster and with higher confidence by clearly indicating when purchase order changes proposed by suppliers have downstream impact.

> **Important**
>
> - This is a production-ready preview feature.
> - Production-ready previews are subject to supplemental terms of use.

Instead of spending a lot of time manually tracing pegging, reservations, or planning dependencies across the system for each change communicated by suppliers, teams can quickly determine which changes they can safely accept and which require further action. This process helps prioritize time spent on changes with impact, ultimately protecting service levels and production continuity.

When a supplier proposes a change to a purchase order through a configured source, or when it's manually initiated, impact analysis looks for downstream impact on sales orders, production orders, transfer orders, and inventory levels. It does this by tracing the changed supply across the system to identify orders that are linked to the purchase order through markings and peggings (if available), and checking this tracing against confirmed incoming supply and projected on-hand inventory.

Review the impact of purchase order changes from vendors

Purchasing teams regularly receive change requests from suppliers, including delivery delays, quantity reductions, and cancellations. Each change to a purchase order can potentially affect safety stock, production schedules, internal transfers, and customer commitments. In most cases, purchasers don't want to spend time on changes to purchase orders with no downstream impact.

Impact analysis gives purchasers the confidence, visibility, and ability to quickly identify those changes that can be safely accepted, apply them right away, and move on.

For changes with downstream impact on orders, or changes that cause inventory levels to go below certain thresholds, purchasers need to quickly understand the details and consequences, and decide how to respond. Purchasers often follow up with a supplier to request alternatives, such as expediting production or transportation, resulting in an earlier delivery date, increased quantity delivered, or a split delivery, while also looking for other alternatives such as alternative vendors.

If purchasers must accept a change with impact, they now know straight away which internal stakeholders to inform.

Impact analysis automatically analyzes the downstream impact of changes that arrive through emails (if you're using the supplier communication feature of the Procurement Agent) and through the vendor collaboration interface of Supply Chain Management.

Learn more in Review impact of purchase order changes from vendors.

Simulate whether purchase order changes have impact

The impact simulation capability allows purchasers and planners to test the impact of proposed changes that aren't directly communicated through emails or the vendor collaboration interface. Some key use cases for this simulation include:

- Testing and getting a feel for the impact analysis feature before using it on live supplier change requests.
- Proactively testing potential scenarios for at-risk or high-priority purchase orders. This scenario could be purchase orders for which you didn't receive a reply yet.
- Evaluating whether supplier proposals for expediting or setting new dates or quantities solve the impact. These proposals can be alternatives that result from follow-up conversations with the supplier for changes with impact.
- Evaluating changes received and reviewed in channels that don't automatically trigger an impact analysis.

Learn more in Simulate whether purchase order changes have impact.

Cost

Impact analysis incurs charges based on the number of Microsoft Copilot Studio credits you use when running it. It has a fixed cost per run and a variable cost that depends on the resources it consumes. The agent management configurations control this cost.

Impact analysis runs on changes that vendors communicate through the configured sources. If you set up and configure impact analysis to run for changes coming through emails via supplier communications, you pay credits when the conditions in the configuration of supplier communications are met. For example, if you configure supplier communications to run on incoming emails from all vendors in a shared mailbox, and you configure impact analysis to run on vendor emails, impact analysis consumes credits when any vendor sends an email about purchase order changes.

The fixed cost applies each time the agent runs, and the variable cost depends on the number of line changes communicated.

Learn about the billing rates and management for Copilot Studio in Billing rates and management.

Last updated on 08/10/2026

How impact analysis works (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This article explains how impact analysis determines whether a purchase order line change has downstream impact. It runs automatically based on configured sources, but you can also run it manually.

Impact analysis considers the following purchase order line changes:

- Delayed delivery dates (changes to the *Confirmed delivery date*)
- Quantity decreases
- Cancellations (where quantity is changed to 0)

Supplier communications features of the Procurement Agent detect the following kinds of changes in supplier emails, but these changes don't trigger an impact analysis:

- Unit of measure
- Price
- Quantity increases
- Earlier delivery dates

Planning data used for the impact analysis

Impact analysis uses planning data available in Dynamics 365 Supply Chain Management. It uses any available markings and peggings between supply and demand orders present in the last-run dynamic plan to trace downstream orders impacted by a purchase order line change.

If you use the master planning features of Supply Chain Management, impact analysis follows the supply and demand chain through pegging relationships in the active dynamic plan to find which planned and confirmed orders depend on changed supply. The dynamic plan used for impact analysis is the one set in the **Current dynamic master plan** field on the **Master planning parameters** page (**Master planning** > **Setup** > **Master planning parameters**).

When pegging data is available, impact analysis can trace dependency chains to identify indirectly affected orders, such as those listed on the following pages:

- **Purchase order** > **Production order** > **Production order** > **Sales order**

- **Purchase order** > **Transfer order** > **Sales order**

Pegging enables broader, multilevel impact tracing. When you use the master planning features of Supply Chain Management, the available planning data is richer, which enables deeper and broader impact visibility.

How impact analysis determines impact

Impact analysis evaluates planning and inventory data to place changes into one of the following categories:

- **Has impact** – The change delays downstream orders or causes inventory levels to fall below zero or the minimum level configured for that item.
- **No impact** – The change doesn't delay downstream orders or cause inventory to drop below minimum levels.

Impact analysis considers the following types of downstream orders when determining impact:

- **Sales orders** – Customer orders that might be delayed or can't be fulfilled.
- **Production orders** – Manufacturing orders that depend on the supply.
- **Transfer orders** – Transfers that rely on the item.
- **Forecast orders** – Demand forecast requirements used by the planning system to anticipate and prepare for expected future demand.
- **Safety stock requirements** – Planned requirements generated by the planning system to maintain minimum inventory levels. These requirements appear when the planning system creates planned orders to replenish safety stock, and the purchase order change affects the ability to fulfill those planned requirements.

Has impact scenarios

Impact analysis flags impact when:

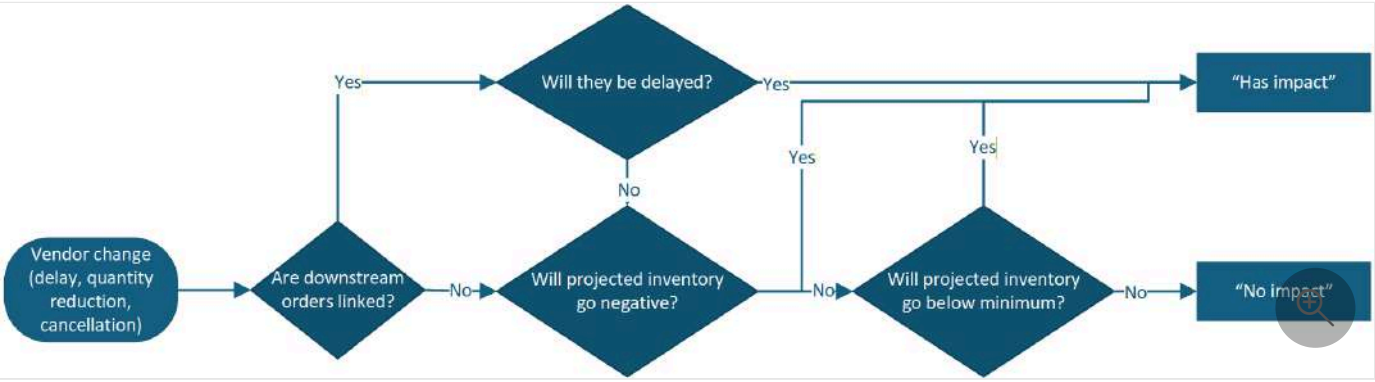
- **Downstream orders are delayed** – The supply date moves after the delivery date required by connected demand.
- **Inventory threshold breaches** – The change is projected to cause inventory levels to drop below one of the following critical thresholds:
  - **Below minimum** – On-hand inventory falls below the configured safety stock level (but remains positive).
  - **Negative** – On-hand inventory goes below zero, resulting in a complete stock-out.

No impact scenarios

A change has no impact when it meets one of the following conditions:

- **No downstream orders found** – The purchase order isn't linked to any dependent demand.
- **Sufficient buffer exists** – Inventory levels stay above the minimum level you set for that item.
- **Change is an improvement** – The purchase order date moves earlier or quantity increases (positive changes don't flag impact).

The following diagram illustrates how impact analysis evaluates whether a change has impact or not based on the downstream orders and inventory levels.



Last updated on 08/24/2026

Set up and configure impact analysis features of the Procurement Agent (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This article explains how system administrators can use the agent deployment wizard from Copilot Hub to set up and configure the impact analysis features of the Procurement Agent, regardless of whether you're also using the supplier communications features of the agent.

If you're already using supplier communications, you can choose to keep the same Entra ID and connections you created in the supplier communications set-up, or you can create new ones.

Prerequisites

To use the impact analysis features of the Procurement Agent, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.48 build 10.39.2117 or later. If you're running 10.0.48, ensure you're running the newest available build.
- The following features must be turned on in feature management. Select **Check for updates** if the features don't appear on your system.
  - *Immersive Home*
  - *Agent management*
  - *(Production-ready preview) Procurement Agent - Impact analysis*

  > **Tip**
  > - If you don't see all of the features you're looking for in the **Feature management** workspace, select **Check for updates** to refresh the list of features.
  > - If you can't enable the *Agent management* feature, ensure that your environment fulfills all of the **prerequisites**, including version requirements and Copilot Studio billing.

- In the Power Platform admin center, ensure you're running the following versions of the following Dynamics 365 Apps in your Supply Chain Management environment. It's important that you install or update them in the following order:
  - First, install *Copilot for finance and operations apps* version 1.0.03048.2 or later. If it's already installed, update it to the latest version.
  - Then, install *Copilot in Microsoft Dynamics 365 Supply Chain Management* version 1.1.03510.1 or later. If it's already installed, update it to the latest version.

- Normally, the Microsoft Copilot Studio agent needed for impact analysis to run is published automatically. But there might be data loss prevention (DLP) policies on your environment that prevent the publishing of this agent. To check if the agents are successfully published, go to Copilot Studio and find your environment. Ensure that the following Microsoft Copilot Studio agent is published in that environment: *Procurement Agent - Impact Analysis*. If the agent isn't published, you can find help in Troubleshoot data policy enforcement for Copilot Studio.

Understand the agent identity user

An *agent identity user* is a dedicated Microsoft Entra ID user account that the Procurement Agent uses to sign in to the systems it connects to. This account isn't a person account for day-to-day business use. Instead, it's a service-style identity that gives the agent the permissions it needs to access Dataverse, Microsoft Copilot Studio, and Supply Chain Management while it performs its work.

You create or select this user during setup because the agent must authenticate to several services and components before it can run impact analysis. The identity user is what allows the agent to read incoming vendor change requests, review the related purchase orders and downstream data, and trigger the processes that evaluate the impact of those changes. The agent deployment wizard uses this identity user as the foundation for the connection and authorization steps you complete to enable impact analysis.

Run the agent deployment wizard

To use the agent deployment wizard to set up the impact analysis features, follow these steps:

1. Open Copilot Hub in Power Platform admin center and select **Dynamics 365 agents** in the **Manage** section.

2. Select **Select environment** and choose your target environment.

3. In the **All agents** section, find the **Procurement agent - Impact analysis (Preview)** tile and select the **Add** button in that tile to launch the agent deployment wizard.

4. The **Overview** page opens, which provides a summary of the agent deployment wizard and its capabilities. Select **Next** to continue.

5. The **Check prerequisites** page opens. This step makes sure your environment meets all of the prerequisites for the agent.

    - The deployment wizard automatically checks most of these prerequisites for you. It shows a green check mark for each fulfilled prerequisite. If any of the features or settings aren't enabled, enable them before you continue. Each section provides links to the Power Platform admin center to help you enable the relevant features or settings. Learn more in Enable or disable Copilot features.
    - In the **Make sure the following apps are up to date with at least the versions noted** section, review this list of required apps and versions. Make sure that the apps listed are installed in your environment and that their versions are equal to or greater than the ones listed. For more information about the required apps and versions, see the prerequisites section.
    - Each time you make changes to meet the prerequisites, go back to the agent deployment wizard and select the **Reload** button at the right side of each section to let the wizard check the status of that section again. When all prerequisites are met, green check marks are shown for all sections.
    - Your environment might include data loss prevention (DLP) policies that prevent it from creating connections for the Procurement Agent. Ensure that the required connections are allowed in your organization. Learn more in Advanced connector policies and Data Loss Prevention Policies.

    When all prerequisites are met, select **Next** to continue.

6. The **Set up agent identity** page opens. Use this page to set up the *agent identity user* account that the agent uses to interact with Dataverse and Microsoft Copilot Studio. To set up your agent identity user, follow links and make settings in the following sections on this page:

    - **Create your agent's Entra user ID** – For security and ease of maintenance, use a dedicated identity for the agent. If you don't already have an eligible user available, select the link provided to open the Microsoft 365 admin center and create a new user that will be the agent identity user. Then select that user in the drop-down list

provided. Select **Set up**. This action triggers the wizard to check the required roles in the next section, **Set up identity in environment**.

- **Set up identity in environment** – This section shows the steps required to configure the agent identity user in your Power Platform environment. Green check marks indicate which steps are completed successfully. A link to the Power Platform admin center environment user settings is provided so that you can complete the required actions manually if needed.
- **Assign required product licenses** – The Procurement Agent uses premium tier connectors, so the agent identity user you selected must have a license that permits those connectors. You must check this license manually in the Power Platform admin center. Learn more in Power Platform licensing FAQs or download the Licensing Guide. Examples of sufficient licenses are listed in this section. Select the link provided to open the Microsoft 365 admin center, where you can review and assign licenses for the agent identity user. Once you verify that the licenses are in place, check **Complete**.
- **Set up identity in Finance and Operations** – Add the agent identity user as a user in Supply Chain Management and assign the security roles listed in this section. You must check this setting manually in Supply Chain Management. Make a note of the roles listed and then select the link provided to open the **User settings** page of Supply Chain Management, where you can review and assign security roles for the agent identity user. Ensure that each of the required roles is assigned to the agent identity user, and then go back and continue to complete wizard. Once you verify that the roles are in place, check **Complete**.

After you confirm all the required settings, select **Next** to continue.

7. The **Connect agent** page opens. The agent identity user you specified on the previous page is used to set up these connections.

   - **Connect the agent** – The agent uses the types of connections listed here. For each type, select an existing connection from the menu if one is available. If no connections are available, select the + button to create a new connection. Select **Connect agent** to use the connections you selected, and wait until the agent is connected.
   - **Activate data flows and processes** – Select **Activate flows** and wait for all of the flows listed to switch to the *Activated* state.

   When all connections and data flows are shown as successful, select **Next** to continue.

8. The **Set up user permissions** page opens. Add users who can interact with the agent and specify if they can configure it or only view results.

    - In the **Add a user** search field, search for a user. In the **Select a role** dropdown, assign the *Agent manager* or *Agent user* role. The *Agent manager* role grants the user permission to enable and edit configurations of the agent, while the *Agent user* role only grants the user permission to view impact analysis results. Users assigned the *Agent manager* role can also view results of the agent.
    - If you need to create new users in your environment to manage the agent configuration or review agent results, see Create users.

    After you assign permissions to users, select **Next** to continue.

9. The **Enable agent** page opens.

    - **Publish Copilot Studio agents** – The wizard automatically publishes the Microsoft Copilot Studio agents needed for the Procurement Agent to run. If this action succeeds, the **Deploy** button is greyed out and shows the help text *All agents are already published*. If the agent isn't automatically published, it might be because data loss prevention (DLP) policies in your environment prevent this action. Learn more in Troubleshoot data policy enforcement for Copilot Studio. Select the **Microsoft Copilot Studio: Agents** link provided here to go to Copilot Studio, where you can check whether these agents are published and publish them if necessary. Learn more in Key concepts - Publish and deploy your agent.
    - **Enable Immersive Home and agent features in Finance and Operations** – This section lists the features that you must turn on in Supply Chain Management. Make a note of the features listed here and then select the link provided to open the **Feature management** workspace, where you can enable each of the features.

    > **Tip**
    >
    > - If you don't see all of the features you're looking for in the **Feature management** workspace, select **Check for updates** to refresh the list of features.
    > - If you can't enable the *Agent management* feature, ensure that your environment fulfills all of the **prerequisites**, including version requirements and Copilot Studio billing.

    Select **Next** to continue.

10. The final page of the wizard opens. Select **Finish** to complete the setup.

Configure sources that automatically trigger impact analysis

To use impact analysis on incoming change requests received through emails or the vendor collaboration interface, first enable the relevant sources. Learn more in Supplier communications features of the Procurement Agent and Vendor collaboration with external vendors.

To enable impact analysis to run based on change requests coming through one or both sources, follow these steps:

1. Sign in to the Supply Chain Management environment as a user who has permissions to manage the agent configuration.
2. Go to **Agents** > **Agents**.
3. Open the **Library** tab.
4. Find the *Show impact of changes in purchase orders - Impact analysis - Procurement Agent* tile and select **Select** for that tile.
5. Open the **Source** dropdown list and select one or both of the following options:

    - *Vendor emails* – Select this option if you're using supplier communications features of the Procurement Agent to receive and classify emails from vendors.
    - *Vendor collaboration module* – Select this option if you're using the vendor collaboration interface to receive and manage vendor responses.

6. Select **Activate**.

If you're using impact analysis with supplier communications, impact analysis only runs on configurations set for the *Updates from vendors (reading vendor emails)* feature (see Configure the agent to track your email). If you set up a configuration for the Procurement Agent to read and review emails from all vendors, impact analysis runs on all change requests received from all vendors. If you set up a configuration for the Procurement Agent to read and review only emails from certain vendors, impact analysis only runs on change requests received from those specific vendors. If your organization sets up multiple configurations, for example to accommodate different purchasers responsible for their own vendors, the impact analysis configuration applies to all of them. Impact analysis runs for all change requests received from all specified vendors in all configurations.

Review impact of purchase order changes from vendors (production-ready preview)

[This article is prerelease documentation and is subject to change.]

Impact analysis can automatically run based on supplier changes received through emails or the vendor collaboration interface. Whichever options you configure also show the results of the impact analysis for review directly in Dynamics 365 Supply Chain Management, so purchasers can decide how to respond in their existing workflow.

Review changes received via email (supplier communications)

The supplier communications features of the Procurement Agent classify whether emails from vendors are confirmations, change requests, or related to something else (indicated as *Other*). If you enable impact analysis, it runs automatically for all the change requests you receive. If an email that the system classifies as a *Change request* in the list pane is shown as *Has impact*, it means that it includes either a purchase order header or line change that *Has impact*.

Vendors can communicate changes to both purchase order headers and lines. For example, the whole purchase order can be delayed, specific lines can have delays or quantity changes, or a combination of these changes can occur. For this reason, there's an **Impact** column on both the **Purchase order header** and **Purchase order lines** grids.

The system runs the impact analysis for purchase order line changes only. If a delay to an entire purchase order is communicated, that delay applies to the purchase order header, the Procurement Agent propagates this delay to all of the lines in that purchase order, and runs an impact analysis on all lines individually. Any line-level changes always take precedence, so if a delay to the purchase order header is communicated, but one line is even more delayed, the Procurement Agent runs the impact analysis on the line-level delay.

To review if changes have downstream impact, follow these steps:

1. Open the **(Preview) Emails from vendors** page by doing one of the following steps:

    - Go to **Procurement and sourcing** > **Purchase order receipt and follow-up** to open the **Purchase order receipt and follow-up** workspace. Then select the **(Preview)**

Emails from vendors tile.

- Go to **Procurement and sourcing** > **(Preview) Procurement Agent - Supplier communications** > **(Preview) Emails from vendors**.

2. Select an email classified as a *Change request* in the list pane, and then look at the grids on the **Summary** FastTab, where changed field values are highlighted in bold. These changes can be on the purchase order header and/or lines.

3. Check the **Impact** column on both the **Purchase order header** and **Purchase order line** grids. It shows one of the following values based on the impact analysis results: *Has impact* or *No impact*.
   a. If a change to a **Purchase order header** *Has impact*, this condition means that a purchase order header delay causes at least one line to have downstream impact. If there isn't a header change, but instead line-level changes, check the **Impact** column on the **Purchase order lines** grid.
   b. Purchase order line changes can show the following results:

      - *Has impact* - Change affects downstream orders and/or inventory levels.
      - *No impact* - Change can be safely accepted.

4. Expand the **Impact of purchase order line** FastTab to see a brief summary of each line change that *Has impact*.

5. To view the full impact analysis of a change that *Has impact*, select the **View details** button. The **Impact analysis** page opens. Learn more about this page in the Impact analysis details page section later in this article.

Review changes received via vendor collaboration interface

When vendors respond to purchase orders through the vendor collaboration interface, you can review proposed changes and their downstream effects directly from the purchase order preparation workspace. If you enabled impact analysis for the vendor collaboration source, the impact results are available alongside the vendor's response so you can decide how to proceed. To review the impact of changes received through the vendor collaboration interface, follow these steps:

1. Go to **Procurement and sourcing** > **Workspaces** > **Purchase order preparation**.
2. On the **Orders** FastTab, open the **In external review requires action** tab.
3. Find and select a purchase order with a **Vendor response status** of *Accepted with changes*.

4. To view more details about the impact of the proposed change on the selected purchase order, do one of the following steps:

    - On the toolbar, select **View impact analysis** to open the **Impact analysis** page, which is described in the next section.
    - On the toolbar, select **View responses to latest sent order** to open the vendor's proposed changes. In the **Purchase order line impact** section, review the impact summary and select **View details** to see the full impact analysis on the **Impact analysis** page, which is described in the next section.

Impact analysis details page

The **Impact analysis** page opens when you select **View details** from either the email-based workflow or the vendor collaboration workflow. This page shows all the downstream effects of the proposed change in one place. The **Impact analysis** page includes a summary of the impact, a detailed list of impacted orders, and a detailed list of inventory impacts, including a graph that shows projected inventory levels over time. The following subsections describe the various parts of the **Impact analysis** page.

Filter and item information

The **Filter by** section shows key information about the purchase order and item affected by the proposed change, along with a selector to switch between different lines if the purchase order has multiple lines. The information in this section helps you understand which item and purchase order line you're analyzing, and gives you quick access to related information and planning details.

This section provides the following information and features:

- The **Purchase order line** being shown, which provides a drop-down list that lets you select a line for multi-line purchase orders.
- The **Item number** and **Item name** being analyzed.
- An **Open net requirements** link, which opens the detailed planning logic used for the impact calculation if you're using master planning.

Purchase order line impact

The **Purchase order line impact** FastTab provides an AI-generated summary of the downstream impact, including specific mentions of affected orders and inventory problems. The agent

analyzes the full impact details and provides a concise natural language explanation to give you a quick overview before you dive into detailed tables and graphs.

Impacted orders

The **Impacted orders** FastTab shows a detailed table of all downstream orders affected by the purchase order change. It includes sales orders, production orders, transfer orders, safety stock orders, and forecasts that the proposed change impacts. This detailed view helps you understand exactly which orders are affected and how, so you can make informed decisions about accepting the change and communicating with relevant stakeholders.

Each row in the grid on the **Impacted orders** FastTab provides the following information about the impacted order:

Expand table

Column	Description
Order type	Sales order, Production order, Transfer order, Safety stock order, or Forecast
Order number	Specific order ID
Customer/reference	Customer name for sales orders, or production/transfer number
Tracing method	How the order is linked: *Pegging* (from planning) or *Marking* (explicit reservation)

Use the **View order**, **View item**, and **View customer** buttons to open related pages in Supply Chain Management.

If this table is empty, the change has no direct impact on specific orders.

Impacted inventory

The **Impacted inventory** FastTab shows whether the purchase order change causes inventory to drop below safety stock or go negative. The following table summarizes the columns shown on the **Impacted inventory** FastTab:

Expand table

Column	Description
Site	The site where inventory is affected.
Warehouse	The warehouse where inventory is affected.

Column	Description
Expected inventory level	Shows one of the following values to indicate how the change impacts inventory levels: • *Below minimum* – Inventory drops below configured safety stock level but remains positive. You still have inventory, but your safety buffer is consumed. • *Negative* – Inventory goes below zero (complete stockout). You can't fulfill orders from on-hand inventory.
Expected impact date	The date when the inventory breach occurs.

The inventory projection graph on the **Impacted inventory** FastTab visualizes inventory levels over time, showing how the purchase order change affects your projected inventory. The graph includes a legend with two lines:

- **Projected inventory before change** – Shows expected inventory levels based on the original purchase order and plan (displayed as a stepped line).
- **Projected inventory after change** – Shows projected inventory levels if you accept the vendor's proposed change (displayed as a stepped line). If the after-change line drops below the safety stock reference line, this condition is highlighted as a **Below minimum** impact. If it goes below zero, it is highlighted as a **Negative** impact.

The two lines might diverge without resulting in an impact, which means that projected inventory levels after the vendor change might be lower, but still above minimum level.

Additional visual elements:

- **X-axis** – Timeline showing dates
- **Y-axis** – Inventory quantity
- **Horizontal reference lines** – Show the safety stock threshold if available

> **Important**
>
> This projection is based on current planning data. It shows what *would happen* if you accept the change, but the plan isn't updated yet. Once you accept the change and update the purchase order, planning needs to run to create the new official plan.

Accept a change and apply it to the purchase order

Purchasers can accept changes that:

- Have no or low downstream impact.
- Have an impact, but the purchaser decides to accept the change anyway. This decision might be because there's no other option but to accept.

To accept changes without going back to the purchase order, see one of the following articles based on how you receive changes from vendors:

- To accept changes processed by the supplier communications features of the Procurement Agent, see Review and apply purchase order changes received in vendor emails.
- To accept changes when received through the vendor collaboration interface, see Updating a PO when a vendor suggests changes.

When purchasers choose to accept a change that has a downstream impact, they now have a clear understanding of that impact and can communicate it directly to the relevant stakeholders.

Last updated on 08/24/2026

Simulate whether purchase order changes have impact (production-ready preview)

[This article is prerelease documentation and is subject to change.]

The impact simulation capability enables purchasers and planners to test the impact of changes that aren't directly or explicitly communicated through emails or the vendor collaboration interface. This functionality is useful when proactively testing potential changes to critical or at-risk purchase orders, seeing whether changes received through external channels have an impact, or evaluating whether supplier follow-up proposals to increase quantities or deliver earlier solves the impact.

To run an impact simulation, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase orders** > **All Purchase orders** and select a purchase order.
2. On the Action Pane, open the **Purchase Order** tab and, from the **Impact simulation** group, select **Simulate purchase order changes**.
3. Modify the purchase order details for the simulation by completing any or all of the following steps:

    - In the **Purchase order heading** section, select a new **Confirmed receipt date** to change the date for all purchase order lines.
    - In the **Purchase order lines** section, select a new **Confirmed receipt date** to change the date for one or more specific purchase order lines.
    - In the **Purchase order lines** section, select a new **Quantity** to change the quantity for one or more specific purchase order lines.

4. Select **Simulate impact**.
5. The result is displayed as described in Review impact of purchase order changes from vendors.

> **Important**
>
> Impact simulations *don't* change the actual purchase order or affect planning calculations. Simulations use the current planning data at the time of simulation and are for analysis only.

Last updated on 08/10/2026

Test impact analysis features (production-ready preview)

[This article is prerelease documentation and is subject to change.]

Impact analysis helps you understand how vendor change requests affect downstream orders, such as production, sales, and transfer orders, before you take action. This article describes four ways to test impact analysis, depending on whether you want to test with or without supplier communications, and whether you're using a sandbox or production environment:

- **Forward actual vendor emails** to a testing email address in your sandbox environment.
- **Use actual vendor emails** in your production environment.
- **Use the Add vendor messages functionality** in your sandbox or production environment to test without setting up a complete email pipeline.
- **Simulate a purchase order change** in your sandbox or production environment without using supplier communications.

Choose the approach that best matches your current setup and testing goals.

Test impact analysis with supplier communications

Test with supplier communications by forwarding actual vendor emails to a testing email address in your sandbox environment

If you're testing supplier communications in your sandbox environment, you can enable impact analysis to see the impact of forwarded change requests. This testing approach corresponds to the supplier communications testing phases *Phase 1* and *Phase 2* outlined in Test the "Updates from vendors" (reading emails) feature.

Test with supplier communications on actual vendor emails in your production environment

If you're already using supplier communications in production, you can see impact analysis running on live change requests that you receive and use up-to-date planning data. This testing approach corresponds to the supplier communications testing phase *Phase 3* outlined in Test the "Updates from vendors" (reading emails) feature, and is the optimal way to test impact analysis with supplier communications.

Test with supplier communications using the *Add vendor messages* functionality in your sandbox or production environment without a complete email setup

Instead of testing impact analysis on actual change request emails you receive from vendors, use the *Add vendor messages* functionality as described in Try out the *updates from vendors* feature without a complete email setup (production-ready preview). You can write a sample email from one of your vendors or you can copy and paste a real email you received from a vendor. Ensure the message communicates a change request to at least one purchase order line.

When you select **Save**, it takes a few minutes for supplier communications and impact analysis to review the message. Select **Refresh** to update the page, after which the email queue in the left-hand navigation pane of the **(Preview) Emails from vendors** workspace updates to show the new message. The message is labeled a *Change request* and shows a status of *Analyzing impact*. Select **Refresh** again to see the result of the impact analysis, which is shown as *Has impact* or *No impact*. Learn more about navigating and interpreting the impact analysis results in Review impact of purchase order changes from vendors.

Testing impact analysis with supplier communications in sandbox vs production

Impact analysis can only find the affected downstream orders when planning data is current. This requirement can cause problems when you test impact analysis with supplier communications in a sandbox environment. If planning data is outdated, you might not find downstream orders such as production, sales, and transfer orders for the purchase order referenced in the incoming email.

You can avoid the risk of a blank result by testing impact analysis with supplier communications in a production environment. In this case, you can use actual vendor emails and up-to-date planning data to see the impact of incoming change requests. Impact analysis doesn't take any action on your behalf—it only runs on incoming change requests that you configure to trigger it. Learn more in Configure sources that automatically trigger impact analysis.

If you want to test in a sandbox environment, consider refreshing data immediately before testing and verify that the items on the test purchase order are linked to demand orders such as sales, production, or transfer orders. Check this condition on the **Net requirements** page. If you don't want to refresh data, you can create test demand orders and link them to the purchase order you want to test before you run impact analysis. If you use this approach, remember to rerun planning before trying out impact analysis for the test order.

Test impact analysis without supplier communications using the simulation capability in your sandbox or production environment

You can test impact analysis without supplier communications by simulating a date and quantity change to a purchase order. Learn more in Simulate whether purchase order changes have impact.

Ensure that the item on the purchase order for which you're simulating a change is linked to downstream demand in **Net requirements**. If you manually add linked orders such as sales orders, remember to rerun planning before running the simulation.

Supplier communications features of the Procurement Agent (production-ready preview)

[This article is prerelease documentation and is subject to change.]

Purchasing personnel spend a large part of their day on manual tasks that are related to communicating with vendors, following up with them, and maintaining changes that are related to purchase orders. Often, these tasks have low complexity, but they're manual and repetitive. Therefore, procurement personnel are eager to automate them. They can then spend the time that they save on more complex and meaningful tasks. Automating these tasks can also help companies save on procurement costs.

> **Important**
>
> - This is a production-ready preview feature.
> - Production-ready previews are subject to supplemental terms of use.

Communication between procurement departments and vendors is often unstructured and conducted via email, even for companies that implement electronic data interchange (EDI) and companies that work with recurrent vendors.

The Procurement Agent uses AI to automate many communications with vendors. Therefore, purchasers can focus on tasks that add more value and can be more productive.

Follow up on purchase orders

The Procurement Agent can automatically generate emails that remind vendors to confirm a purchase order or ask why a delivery is late. Therefore, purchasers don't have to spend time finding the orders that require attention and then writing emails for them. The agent can automatically send the emails right away, or it can save them as drafts that require human review before they can be sent.

Learn more in Follow up on purchase orders using the Procurement Agent.

Speed up purchase order communications

The Procurement Agent helps purchasers speed up communications with vendors by enabling Copilot to read emails from some or all vendors.

The agent can determine what each email is about (for example, whether it's a purchase order confirmation or a purchase order change request) and which purchase order numbers it applies to. The agent then matches information that it extracts from the email to fields in the system and indicates any changes. In this way, purchasers can review just that information and update the fields in the system as required. They don't have to manually open the purchase order and do all the work. They can then spend the time that they save on other tasks that add more value.

Learn more in Review and apply purchase order changes received in vendor emails.

Specifically, the agent helps with the following scenarios:

- **Increase or decrease order quantity** – The agent detects a supplier's request to increase or decrease the ordered quantity by reading the email body and any attachments (PDF). It summarizes the requested change, identifies the impacted purchase order and purchase order line, and flags it for approval when needed.
- **Cancel quantity or line** – The agent recognizes that the supplier is asking to cancel (for one line or multiple lines) and matches the message to the correct purchase order and lines. It provides a short summary of what is being reduced.
- **Price increase or decrease** – The agent detects a requested unit price increase or decrease (including supporting rationale if provided) by reading the supplier's email and any attached documentation. It summarizes the old versus new price (where available) and flags it as a commercial change requiring buyer decision or approval.
- **Cancel balance** – When a supplier indicates they won't fulfill the remaining (open) balance of a purchase order, the agent detects this intent and identifies the affected purchase orders and lines. It summarizes what portion is being canceled (if stated) and flags it as an exception that typically needs buyer intervention (alternate sourcing, renegotiation, and so on).
- **Updating confirmed delivery date** – If the supplier confirms or revises the order confirmation date, the agent extracts the date change from the email or attachment and links it to the correct purchase order. It summarizes what changed (previous versus updated date if present) and surfaces it so the buyer can quickly validate and accept.
- **Updating confirmed shipping date (ETA based on ETD)** – When the supplier provides only an estimated time of departure (ETD) or ship date (not an *into warehouse* date), the agent detects which date is provided and indicates the estimated time of arrival (ETA) date. The agent can learn to infer or derive the receiving ETA using agreed transit-time assumptions.

- **Match unit of measure** – If the supplier uses a different unit representation (for example, *packs* versus *each*), the agent identifies the unit mismatch and still extracts the intent of the change. The agent can learn or standardize unit patterns over time and presents a clear summary for the buyer rather than failing the match.
- **Follow up for not confirmed purchase order** – For purchase orders that remain unconfirmed after a defined threshold (such as seven days), the agent identifies the gap and prompts follow-up with the vendor.
- **Follow up on delayed purchase order** – For purchase orders that are delayed beyond a defined threshold, the agent identifies the gap and prompts follow-up with the vendor.

The agent doesn't currently support the following scenarios:

- **Splitting a line into multiple deliveries** – When a supplier proposes splitting delivery (for example, *ship 30 now, 70 later*), the agent should extract the proposed delivery breakdown from the email or attachment and summarize it. It should clearly call out new delivery dates and quantities, associate them to the correct purchase order lines, and split them into multiple deliveries. This scenario isn't yet supported.
- **Changing site for delivery receipt for specific line** – If the supplier requests shipping to a different site or warehouse for a particular line, the agent should extract the new delivery location from the message or attachment and match it to the purchase order line. It should summarize the requested site change and highlight it as a logistics-impacting update requiring review before acceptance. This scenario isn't yet supported.
- **Changing vendor for a specific line** – When a supplier asks to ship from a different operating entity (same supplier, different state or account), the agent should detect that the request implies a vendor account change for processing. It should summarize the reason and proposed vendor ID (if provided) and flag it as an exception scenario for procurement to validate and approve. This scenario isn't yet supported.
- **Changing vendor for the purchase order** – When a supplier asks to ship from a different operating entity (same supplier, different state or account) for the entire purchase order, the agent should detect that the request implies a vendor account change for processing. It should summarize the reason and proposed vendor ID (if provided) and flag it as an exception scenario for procurement to validate and approve. This scenario isn't yet supported.

Cost

The supplier communications features of the Procurement Agent incur charges based on the number of Microsoft Copilot Studio credits you use when running it. The agent has a fixed cost

per run and a variable cost that depends on the resources it consumes.

- For the *follow up on purchase orders* feature, the fixed cost applies each time the agent runs. The variable cost depends on the number of emails the agent writes.
- For the *review and apply purchase order changes* feature, the fixed cost applies each time the agent runs. The variable cost depends on the number of emails the agent reads and the number of attachments those emails have.

Learn about the billing rates and management for Copilot Studio in Billing rates and management.

Try out the *updates from vendors* feature without a complete email setup (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This article explains how to try out the *updates from vendors* (reading vendor emails) functionality of the Procurement Agent without having to do a complete email setup first.

The Procurement Agent has two independent supplier communication features:

- *Follow-up with vendors* (writing reminders)
- *Updates from vendors* (reading vendor emails)

The *follow-up with vendors* feature is straightforward to set up and try out, but the *updates from vendors* feature requires a more complex email setup. If you want to try the *updates from vendors* feature without doing a complete email setup, use the approach described in this article. This approach lets you try the feature by creating a few test emails so you can see how the agent works and how it handles the kinds of messages that you receive.

To try out this feature, follow these steps:

1. Enable the *(Production Ready Preview) Procurement Agent - Supplier communications* feature in Feature management.

2. Go to **Procurement and sourcing** > **(Preview) Procurement Agent - Supplier Communications** > **(Preview) Emails from vendors**.

3. When the feature is fully configured, the **Emails from vendors** workspace lists the emails that the agent identified as coming from vendors. However, you can also add messages manually to try out the feature without needing to set up email integration. To do that, select **Add vendor messages** from the Action Pane.

4. Enter the following information into the dialog:

    - **Title** – Enter a title for your test message.
    - **Message** – Enter or paste the body of the email. You could copy this content from the body of an existing email that you want to try or just enter a fictional message.

- **Attachment** – If you'd like to add an attachment, select the **Browse** button here and then select an image or PDF file. You can add up to 10 attachments.

5. Select **Save**.

6. Wait for a few minutes and refresh the page, which then shows your message. Select the email to see how the agent processed it, what information it extracted, and how it classified the email.

Set up and configure supplier communications features of the Procurement Agent (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This article explains how system administrators can use the agent deployment wizard from Copilot Hub to set up and configure the supplier communications features of the Procurement Agent.

Prerequisites

Before you can use the supplier communications features of the Procurement Agent, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.44 or later, with all available quality updates.
- The following features must be turned on in feature management. Select **Check for updates** if the features don't appear on your system.
  - *(Production ready Preview) Immersive Home*
  - *(Production ready preview) Agent management*
  - *(Production ready preview) Procurement Agent - Supplier Communications*
  - Optional: To have the agent send emails automatically, turn on the feature *(Production ready preview) Procurement Agent - Supplier Communications - automatically sending follow-up emails*. We recommend that you turn off this feature for sandbox environments because data (such as purchase orders) might not be up to date, or vendor email addresses might be missing.

> **Tip**
> - If you don't see all of the features you're looking for in the **Feature management** workspace, select **Check for updates** to refresh the list of features.
> - If you can't enable the *Agent management* feature, ensure that your environment fulfills all of the **prerequisites**, including version requirements and Copilot Studio

billing.

- In the Power Platform admin center, ensure you're running the following versions of the following Dynamics 365 Apps in your Supply Chain Management environment. Install or update them in the following order:
  - First, install *Copilot for finance and operations apps* version 1.0.03048.2 or later. If it's already installed, update it to the latest version.
  - Then, install *Copilot in Microsoft Dynamics 365 Supply Chain Management* version 1.1.03510.1 or later. If it's already installed, update it to the latest version.

- Normally, the Microsoft Copilot Studio agents needed by supplier communications features are published automatically. However, data loss prevention (DLP) policies on your environment might prevent publishing these agents. To check if the agents are successfully published, go to Copilot Studio and find your environment. Ensure that the following Microsoft Copilot Studio agents are published in that environment:
  - *Supplier communications Agent - inbound*
  - *Supplier Communications Agent - outbound*.

  If the two agents aren't published, see Troubleshoot data policy enforcement for Copilot Studio.

Video instructions

For video instructions on how to set up supplier communications, watch Supplier Communications: Setup and configure via agent deployment wizard.

The remaining sections in this article provide the same instructions in a text-based format.

Understand the agent identity user

An *agent identity user* is a dedicated Microsoft Entra ID user account that the Procurement Agent uses to sign in to the systems it connects to. This account is distinct from a person who uses the mailbox day to day. Instead, it's a service-style identity that gives the agent the permissions it needs to access Dataverse, Microsoft Copilot Studio, Exchange, and Supply Chain Management while it reads and responds to supplier emails.

You create or select this user during setup because the agent must authenticate to multiple services before it can monitor mailboxes, classify incoming emails, and send follow-up messages. In the context of supplier communications, the identity user is the account that the wizard uses to

connect the agent to the relevant mailboxes and background services. That connection lets the agent process incoming vendor emails and manage related actions in Supply Chain Management without requiring a human to sign in for each step.

Run the agent deployment wizard

To set up the supplier communications features, follow these steps:

1. Open Copilot Hub in Power Platform admin center and select **Dynamics 365**.
2. Select **Select environment** and choose your target environment.
3. In the **All agents** section, find the **Supplier Communications Agent** tile and select the **Add** button in that tile to launch the agent deployment wizard.
4. The **Overview** page opens, which provides a summary of the agent deployment wizard and its capabilities. Select **Next** to continue.
5. The **Check prerequisites** page opens. Make sure your environment meets all of the prerequisites for the agent. The prerequisites are organized into sections on this page, and you must meet all of the prerequisites in each section to continue. Here's how to review the prerequisites:

    - In the **Make sure the following apps are up to date with at least the versions noted** section, review this list of required apps and versions. Make sure that the apps listed are installed in your environment and that their versions are equal to or greater than the ones listed. For more information about the required apps and versions, see the prerequisites section.
    - If any of the apps aren't installed or updated to the required version, install or update them before you continue. A link to the Power Platform admin center is provided to help you check the app versions and do the installations or updates if needed. Mark the **Complete** check after you've confirmed that all of the apps meet the requirements.
    - The remaining sections on this page automatically check whether all other required features and settings are enabled in your environment. If they are, green check marks are shown. If any of the features or settings aren't enabled, enable them before you continue. Links to the Power Platform admin center are provided in each section to help you enable the relevant features or settings if needed. Learn more in Enable or disable Copilot features.
    - Each time you make changes to meet the prerequisites, go back to the agent deployment wizard and select the reload button at the right side of each section to let

the wizard check the status of that section again. When all prerequisites are met, green check marks are shown for all sections.
- Your environment might include data loss prevention (DLP) policies that prevent creating connections for the Procurement Agent. Ensure that your organization allows the required connections. For more information, see Advanced connector policies and Data Loss Prevention Policies.

When all prerequisites are met, select **Next** to continue.

6. The **Set up agent identity** page opens. Use this page to set up the *agent identity user* account that the agent uses to interact with Dataverse and Microsoft Copilot Studio. To set up your agent identity user, follow links and make settings in the following sections on this page:

   - **Create your agent's Entra user ID** – For security and ease of maintenance, use a dedicated identity for the agent. If you don't already have an eligible user available, select the link provided to open the Microsoft 365 admin center and create a new user that will be the agent identity user. Then select that user in the drop-down list provided.
   - **Set up identity in environment** - This section shows the required steps to configure the agent identity user in your Power Platform environment. Green check marks indicate which steps have been completed successfully. A link to the Power Platform admin center environment user settings is provided so that you can complete the required actions manually if needed.
   - **Assign required product licenses** – The Procurement Agent uses premium tier connectors, so the agent identity user you selected must have a license that permits those connectors. Learn more in Power Platform licensing FAQs or download the Licensing Guide. Examples of sufficient licenses are listed in this section. Select the link provided to open the Microsoft 365 admin center, where you can review and assign licenses for the agent identity user.
   - **Set up identity in Finance and Operations** – The agent identity user must be added as a user in Supply Chain Management and assigned the security roles listed in this section. Make a note of the roles listed and then select the link provided to open the **Users** page of Supply Chain Management, where you can review and assign security roles for the agent identity user. Ensure that each of the required roles is assigned to the agent identity user, and then go back and continue to complete wizard.

   After you confirm all the required settings, select **Next** to continue.

7. The **Connect agent** page opens. To set up each of the required connections, make settings in the following sections on this page. The agent identity user you specified on the previous page is used to set up these connections.

   - **Connect the agent** – The agent uses the types of connections listed here. For each type, select an existing connection from the menu if one is available. If no connections are available, select the + button to create a new connection. Select **Connect the agent** to use the connections you selected, and wait until the agent is connected.
   - **Activate data flows and processes** – Select **Activate data flows** and wait for all of the flows listed to switch to the *Activated* state.

   When all connections and data flows are shown as successful, select **Next** to continue.

8. The **Configure mailboxes** page opens – To enable the email analysis and delivery features of the Procurement Agent, you must configure one or more mailboxes and synchronize them with Dataverse using server-side synchronization. You can choose to use shared mailboxes, private mailboxes, or both. At a minimum, you must configure at least one mailbox.

   - To use a shared mailbox, follow these steps:
     a. Select **Set up shared mailbox**.
     b. Enter the shared mailbox email address. Ensure the shared mailbox already exists in Exchange Server. Learn more in Create a shared mailbox.
     c. Select **Search** and then select **Set up**.
     d. Follow the on-screen instructions to approve and enable the configuration for the shared mailbox.

     This process associates the shared mailbox with a team in the Power Platform environment.

     > **Important**
     >
     > Add all users who create agent configurations or review agent results related to this mailbox as members of the associated team.

   - To set up a private mailbox, follow these steps:
     a. Select **Set up private mailbox**.
     b. Search for a user. If the user doesn't appear, see Add users to environment.
     c. Select the mailbox associated with the selected user.
     d. Select **Set up**.

e. Follow the on-screen instructions to approve and enable the configuration. This process enables synchronization between the email server and Dataverse for the selected mailbox.

> **Important**
>
> Only the owner of a private mailbox can create agent configurations and review agent results related to that mailbox. The owner must have **permissions** to manage the agent configuration and review agent results.

Learn more in Set up server-side synchronization of email.

9. The **Enable agent** page opens. To enable the agent, follow links and make settings in the following sections on this page:

   - **Publish Copilot Studio agents** – Normally, the Microsoft Copilot Studio agents needed for the Procurement Agent to run are published automatically. But there might be data loss prevention (DLP) policies in your environment that prevent the publishing of these agents (learn more in Troubleshoot data policy enforcement for Copilot Studio). This section lists the agents that must be published. Select the link provided here to go to Copilot Studio, where you can check whether these agents are published and publish them if necessary. Learn more in Key concepts - Publish and deploy your agent.
   - **Enable agent related features** – This section lists the features that must be turned on in Supply Chain Management. Make a note of the features listed here and then select the link provided to open the Feature feature management workspace, where you can enable each of the features.

> **Tip**
>
> - The *(Production ready preview) Procurement Agent - Supplier communications - automatically sending follow-up emails* feature is optional. It allows the agent to send emails automatically. Turn off this feature for sandbox environments because data there (such as purchase orders) might not be be current, or vendor email addresses might be missing.
> - If you don't see all of the features listed on this page, select **Check for updates** to refresh the list of features.
> - If you can't enable the *Agent management* feature, ensure that your environment fulfills all of the **prerequisites**, including version requirements and Copilot Studio

billing.

After you complete all of the settings on this page, select **Next** to continue.

10. The final page of the wizard opens. Select **Finish** to complete the setup.

Assign user permissions

After you run the setup wizard, set up user permissions for the users who manage the agent configuration and review agent results. The permissions differ for users who manage the agent configuration and users who review agent results. The following sections describe these differences.

If you need to create new users in your environment to manage the agent configuration or review agent results, learn how to Create users.

Required permissions for users who manage the agent configuration

The following permissions are required for users who create and manage the agent configuration:

- Required Dataverse user roles:
  - *Basic User*
  - *Finance and Operations Agent Configuration Manager*
  - *Finance and Operations Basic User*
- Required Supply Chain Management user roles:
  - *System user*
  - *Purchasing manager* and/or *Purchasing agent*

Required permissions for users who review agent results

Users who review the agent results need the following permissions:

- Required Dataverse user roles:
  - *Basic User*
  - *Finance and Operations Basic User*
- Required Supply Chain Management user roles:
  - *System user*

- *Purchasing agent*

Troubleshooting

Issues with setting up supplier communications features of the Procurement Agent

For help with problems that might occur when setting up supplier communications features of the Procurement Agent, go to Solve common problems when setting up supplier communications features.

Issues with server-side synchronization

Learn how to fix common issues that are related to server-side synchronization in Troubleshooting and monitoring.

Last updated on 08/26/2026

Solve common problems when setting up supplier communications features (production-ready preview)

[This article is prerelease documentation and is subject to change.]

This article helps system administrators to solve typical issues when configuring supplier communications features of the Procurement Agent.

The *Dynamics 365 apps* link isn't shown for my environment in the Power Platform admin center

Symptoms

In the Power Platform admin center, the environment is deployed for finance and operations apps, but it doesn't show **Dynamics 365 apps** under **Resources** on the environment details page.

Solution

Open your project in Microsoft Dynamics Lifecycle Services and then open the **Full details** for your finance and operations apps environment. Under **Power Platform Integration**, check whether any errors are reported (such as "LCS Power Platform Integration provisioning fails with timeout"). Then attempt a retry to complete the deployment.

> **Note**
>
> Dual write isn't required for agent deployment.

It isn't possible to install the Copilot apps on my environment in the Power Platform admin center

Symptoms

In the Power Platform admin center, you go to **Manage** > **Dynamics 365 Apps** and try to install the applications *Copilot for finance and operations apps* and *Copilot in Microsoft Dynamics 365*

Supply Chain Management, but your finance and operations apps environment isn't shown in the **Select an environment** drop-down list in the install dialog.

Solution

Open your project in Lifecycle Services and then open the **Full details** for your finance and operations apps environment. Under **Power Platform Integration**, check whether any errors are reported (such as "LCS Power Platform Integration provisioning fails with timeout"). Then attempt a retry to complete the deployment.

I can't enable the *Agent management* feature in feature management

Symptoms

In the **Feature management** workspace for your finance and operations apps environment, when you try to enable the *Agent management* feature, you receive the following error message:

> You cannot enable this Feature. Environment must be linked to Dataverse for agents to function

The error appears even though a Dataverse environment was successfully created in Lifecycle Services.

Solution

If you're running version 10.0.44 of finance and operations apps, then install the latest quality update for that version. This is required because the initial preview release of version 10.0.44 didn't include important changes to the Copilot message capacity, and these changes are required to enable the agent management feature.

The Procurement Agent shows error "Exception has been thrown by target of invocation"

Symptoms

When you're configuring the supplier communications features of the Procurement Agent, and specifying the conditions in which the agent should operate, the following error is shown when you press the **Activate** button:

> Exception has been thrown by target of invocation

Solution 1

It could be that, when you installed or updated the *Copilot for finance and operations app* Dynamics 365 app in the Power Platform admin center, the included cloud flows weren't turned on automatically. To resolve the issue, open your Power App maker environment, select the Dataverse environment associated with your finance and operations app, and select **Solutions**. Under **Managed**, find *Copilot for finance and operations apps*, open the ellipsis (...) menu and select **Edit**. Select the object category **Cloud flows** and make sure that each of the two cloud flows is turned on.

Solution 2

Make sure that the mailbox email address is always identified using lower case only.

1. In Power Platform admin center, open your environment details and then select **Settings** from the top navigation bar.
2. Expand the **Email** heading and select **Mailboxes**. Identify the mailbox that you configured in Dataverse for the Supplier Communication Agent and open the details. In the field **Email Address**, make sure that the email is written in lower case.
3. Back on the **Settings** page, expand the **Business** heading and select **Queues**. Identify the queue you created for your team and open it. In the field **Incoming Email**, make sure that the email is written in lower caps.

Test supplier communications features (production-ready preview)

[This article is prerelease documentation and is subject to change.]

Learn how to test the supplier communications features of the Procurement Agent in Microsoft Dynamics 365 Supply Chain Management.

The agent has two independent supplier communications features:

- *Follow-up with vendors* (writing reminders)
- *Updates from vendors* (reading vendor emails).

Test the feature you need first. If you plan to use both supplier communications features, start with *Follow-up with vendors* because it's easier to set up, configure, and test.

Test the "Follow-up with vendors" (writing reminders) feature

Use the user interface to set up the feature to fit your needs. Then test to make sure that the emails work as expected.

Test the "Updates from vendors" (reading emails) feature

The agent works by matching incoming vendor emails to existing purchase orders. To try this feature, your sandbox environment must have both of the following items:

- **Purchase orders** – Synchronize recent purchase orders from production to your sandbox environment.
- **Vendor emails** – Forward or send test emails that reference those purchase orders.

To ensure that you can continuously test in sandbox by using your latest purchase orders and emails, update the sandbox by using the following process.

Synchronize data between production and sandbox environments for vendor email matching

When you test in a sandbox environment (Phase 1 or Phase 2 in the following section), the agent needs purchase order data to match against vendor emails. Prepare your sandbox environment by following these steps:

1. Run a full data refresh.

2. Synchronize just the purchase orders to ensure that your sandbox environment reflects any new delta purchase orders as you progress in your testing. Follow the instructions in the following subsections to export purchase orders from your production environment and import them into your sandbox environment by using the Data management framework.

Export purchase orders from the production environment

Follow these steps in the production environment.

1. Open **Data management**.
2. Create a new export project.
3. Select the **Purchase orders composite V3** entity.
4. Select the **XML-Element** format.
5. Create a filter by selecting the filter icon in the **Filter** column.
6. Add a range for the **Created date and time** field.
7. Set the filter value to `(DayRange(-14, 0))`. Modify the first argument (`-14`) to control how many days back to export. A higher value exports more data, which could exceed the import capacity of the sandbox environment.
8. Run the export in batch mode.

Prepare the sandbox environment (one-time setup)

To avoid number sequence conflicts when importing purchase orders, enable manual numbering for purchase orders in the sandbox environment.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. Select the **Number sequences** tab.
3. Find the number sequence that's used for purchase orders and navigate to it.
4. On the **General** FastTab, set **Manual** to *Yes*.

Import purchase orders into the sandbox environment

Repeat these steps regularly (for example, weekly) to keep the sandbox environment up to date.

1. Go to **Data management**.

2. Create a new import project.
3. Select the **Purchase orders composite V3** entity.
4. Start the import in batch mode.

Forward emails

This feature requires more setup permissions, test email addresses, and multiple scenarios. Start small and then expand, as described in the following subsections.

Phase 1: Forward some emails from a vendor email address to a testing email address in a sandbox environment

This phase lets you test the smallest possible scope. Start with a test email address so you can test without risk. It doesn't matter if you plan to use the purchaser's email in production or a common mailbox for the purchasing department.

- The agent only reads emails from vendor domains. If you want to send or forward vendor emails from your own email account, you must add your email address as a vendor contact. To add your email address, follow these steps:

    1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
    2. Create or select a vendor.
    3. On the **Contact information** FastTab, add a row with your own email address (the one you send or forward test messages from).

- Ask your Microsoft Exchange admin to create a test email address and send the messages to that address.

- Connect that email address to the sandbox environment where you do the testing.

- Refresh your data (copy production data to the sandbox) or forward older emails so the system can match them.

- Forward emails in batches—for example, five emails at a time. Check results and note if there's anything unexpected, and continue until you have a good idea of how it performs.

Phase 2: Forward emails from selected vendors

Now that you have a few emails available on your system, start working with messages from those vendors that you communicate with the most or that have the most confirmations that you want the agent to handle.

- Use the same setup as before, but this time autoforward a set of emails from real vendor email addresses to the test address.
- Refresh data or import purchase orders and products before you do the test, especially if your testing should last for a few weeks. The agent can't match an email to a purchase order if the purchase order isn't in the system. Collaborate with one or more of your purchasers if you haven't already.

For this phase, you might want to involve one or more of your purchasers.

Phase 3: Use real email addresses in production

Now you're ready for the final test: testing in production. Set up the agent in production using real email addresses. Stop the agent from working in your sandbox.

Testing in production is safe. The feature doesn't interfere with standard business processes. At best, the agent does the work automatically. At worst, if the agent doesn't understand something correctly, the purchaser still needs to do it manually.

The supplier communications features of the Procurement Agent are production-ready preview features. They have the quality of generally available (GA) features and you can go live with them. The reason They aren't fully GA is that the Procurement Agent is under continuous development. By designating these features as production-ready previews, Microsoft can continue improving them.

For this test, use the following recommendations:

- Have purchasers work with the agent to do their daily tasks.
- Start with just one or a few purchasers.
- Optionally filter messages from a few vendors to start small.

Phase 4: Expand the number of vendors in production

Keep adding more vendors to the configuration so you can gradually increase the value provided by the agent.

Last updated on 08/26/2026

Follow up on purchase orders by using the Procurement Agent (production-ready preview)

[This article is prerelease documentation and is subject to change.]

The Procurement Agent helps you identify and follow up on purchase orders that vendors didn't yet confirm or that delivery is late for. For each order that it finds, the agent automatically generates a draft email that is addressed to the relevant vendor.

The Procurement Agent helps you perform the following actions:

- Create agent tasks to find purchase orders that require follow-up. Each user has unique tasks, so you can create and adjust them to meet your specific business needs. Two default tasks are provided. One task follows up on unconfirmed purchase orders, and the other task follows up on late deliveries. You can modify or delete the default tasks as required to meet your business needs.
- Configure how emails are generated for each task.
- Review the draft emails that the agent generates. After you review each message, you can modify it, and send it. To generate the emails, the agent uses data from the purchase order lines and related tables.

By default, the system provides two tasks that help you find purchase orders that require action:

- *Unconfirmed purchase orders* – This task finds purchase orders assigned to you with a delivery date within the next 60 days that the vendor didn't yet confirm (that is, the confirmed delivery date is blank). The task uses the following criteria:
  - The **Deliver remainder (line)** field is set to a value other than *0* (zero).
  - The **Confirmed receipt date (line)** field is blank.
  - The **Requested receipt date (line)** field is set to a date that is before the current date.
  - The **Orderer (header)** field is set to your user account (the current user).
  - The **Document status (header)** field isn't *None*.

- *Delayed purchase orders* – This task finds purchase orders assigned to you that are delayed (that is, the confirmed delivery date is one or more days ago). The task uses the following criteria:
  - The **Deliver remainder (line)** field is set to a value other than *0* (zero).

- The **Confirmed receipt date** field is set to a date that is before the current date.
- The **Orderer (header)** field is set to your user account (the current user).

Configure task criteria and email settings

The following procedure explains how to set up agent tasks to find purchase orders that require follow-up. It also explains how to configure the way that Copilot generates vendor email content for each task.

1. Open the **(Preview) Follow-up emails** page by following one of these steps:

   - Go to **Procurement and Sourcing** > **(Preview) Procurement Agent - Supplier communications** > **(Preview) Follow-up emails**.
   - Go to **Procurement and sourcing** > **Purchase order receipt and follow-up** to open the **Purchase order receipt and follow-up** workspace. A tile named **(Preview) Follow-up emails** indicates the number of emails that require review. Select the tile.

2. Follow one of these steps:

   - To edit an existing task, select it in the list, and then select **Edit**.
   - To delete an existing task, select it in the list, and then select **Delete**.
   - To create a new task, select **Configure agents**. Then, under **Library**, select **Send follow-up emails to vendors with Supplier Communications Agent**.

3. Edit the name of the task as required. (The default name is *Send follow-up emails to vendors with Supplier Communications Agent*.)

4. Select whether you want the task to find unconfirmed purchase orders or delayed purchase orders.

5. Modify the criteria to define which purchase orders require follow-up. For example, you might want the task to find: unconfirmed orders for the next two months, or orders created more than three days ago, or orders sent but not confirmed.

6. Select the fields that you want to include in the email, such as delivery dates or the address.

7. To add a signature, select **Signature**, and enter the desired text. You can also add an email footer that has text such as "This email was written with the help of AI."

   > **Important**

If your system is set up to send emails automatically, the email footer is mandatory.

8. Select the tone of the emails (*Casual* or *Formal*, *Urgent*, or *Non-urgent*).

Examples

Here are some examples of other tasks that you might set up:

- To generate emails for orders that you created less than three days ago, and that the vendor didn't yet confirm, specify the following criteria:
  - The **Deliver remainder (line)** field on the line is set to a value other than *0* (zero).
  - The **Confirmed receipt date (line)** field on the line is blank.
  - The **Created date** field is set to a date that's between three days before the current date and current date.
  - The **Orderer (header)** field on the header is set to your user account (the current user).
- To generate emails for orders that you created for vendor group A less than three days ago, and that the vendor didn't yet confirm, specify the following criteria:
  - The **Deliver remainder (line)** field on the line is set to a value other than *0* (zero).
  - The **Confirmed receipt date (line)** field on the line is blank.
  - The **Created date** field is set to a date that's between three days before the current date and current date.
  - The **Orderer (header)** field on the header is set to your user account (the current user).
  - The **Vendor (group)** field is set to *A*.
- You might want to send a second follow-up email if a vendor doesn't reply to the first one you sent. However, agent tasks are designed to generate just one email per purchase order unless the purchase order changes. Therefore, to continue following up when no vendor reply is received, create two agent tasks that use the same core criteria but different date ranges that don't overlap. You can use any suitable date field to define the ranges. For example, you can use the delivery date, as illustrated in the following table:

Expand table

Agent task	Example criteria
Recent overdue purchase orders	The delivery date is between seven days ago and the current date.
Extended overdue purchase orders	The delivery date is earlier than eight days ago.

This setup lets the first task generate draft emails for recently overdue purchase orders while a second task generate draft emails for purchase orders that are still overdue after that. Even though no purchase order changes are made, a second draft email is generated when the order moves into the second date range.

> **Important**
>
> Make sure that the date ranges don't overlap. Otherwise, the same purchase order might get evaluated by multiple tasks at the same time.

Configure automatic sending of follow-up emails

To configure automatic sending of follow-up emails without requiring user review, follow these steps:

1. Sign in to Supply Chain Management as an administrator.
2. Go to **System administration** > **Workspaces** > **Feature management**.
3. Make sure the *(Production ready preview) Procurement Agent – Supplier communications - automatically sending follow-up emails* feature is turned on. This feature is optional and is turned off by default. Learn more in Set up and configure supplier communications features of the Procurement Agent.
4. Go to **System administration** > **Setup** > **Email** > **Email parameters**.
5. Open the **Configuration** tab.
6. On the **General** FastTab, set **Batch email provider** to *Graph*. This setting turns on the batch email provider.
7. On the **Enabled interactive email providers** FastTab, make sure that *Graph* is listed in the **Enabled** column.
8. On the **Microsoft Graph settings** tab, make sure that the **Application ID** and **Application secret** fields are filled in. If they aren't, you might need to contact your organization's Azure tenant admin for help. Learn more in Configure Microsoft Graph in Dynamics 365 finance and operations apps.
9. To test whether the email is working, open the **Test email** tab. Set **Email provider** to *Graph* and enter the email address for an account that you can read in the **Send to** field. Then select **Send test email** and check your inbox for the test email.

Configure the email sender

When a user reviews and sends an email that the agent drafts, the email comes from that user's email address.

When the system automatically sends an email without user review, the email comes from the agent identity user email address.

To configure the email address of any user (including the agent identity user):

1. Sign in to Supply Chain Management as an administrator.
2. Go to **System administration** > **Users**.
3. Select the user you want to configure (for example, the agent identity user).
4. On the Action Pane, select **User options**.
5. Open the **Account** tab.
6. On the **Email provider selection** FastTab, make the following settings:
    - **Email provider ID** – Set to *Graph*.
    - **Sender email** – Enter the email address that should appear in the **From** field of the follow-up emails sent by the selected user.
7. On the **Account** FastTab, enter the **Name** that you want to show in the signature of the email body. The emails conclude with a "Best regards" signature that includes the name configured in this field.

> **Tip**
>
> If you're a user without administrator rights in Supply Chain Management, you can configure your own email parameters, but not other users'. To configure your own email parameters, select the settings gear icon at the upper right side of the screen, and choose **User Options** from the menu. Then continue from step 5 in the previous procedure.

Configure the email receiver for each vendor

To choose the recipient of the follow-up emails for a vendor, follow these steps:

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Find and open the target vendor from the list.

3. The **Contact information** FastTab lists various ways that you can contact the selected vendor and lets you edit the list. Use the settings here to configure the email address the agent should use when sending follow-up emails to this vendor. The agent chooses which contact line to use as follows:

    - If a contact line is set up as the priority email address for purchase order communications, the agent always uses that email address for this vendor, regardless of whether the agent task is set up to send emails per purchase order or grouped per vendor. For details about how to set up this address, see Set up the priority purchase order communications email address for a vendor.
    - If no contact line is set up as the priority email address for purchase order communications, the agent applies the following logic to find the email address to use:
        - If the agent task is configured to send emails grouped per vendor, the agent uses the contact line of **Type** *Email address* that has the **Primary** checkbox selected. If no email address is set as **Primary**, then the agent arbitrarily chooses one of the lines of **Type** *Email address*.
        - If the agent task is configured to send emails per purchase order, the agent prioritizes the **Email** field of the purchase order if there is one. If the purchase order doesn't have an email address, the agent uses the vendor's contact information as described in the previous bullet point.

> **Tip**
>
> To see whether an email address listed on the **Contact information** FastTab is set up as the priority email address for purchase order communications, select the row and then select **Edit contact information** from the FastTab toolbar. In the **Edit contact information** dialog, check the value of the **Purpose** field. If it's set to *Purchase Order Communications* (or to another name that was created for this purpose), the email address is set up as the priority email address for purchase order communications. Learn more in **Set up the priority purchase order communications email address for a vendor**.

Set up the priority purchase order communications email address for a vendor

As described in the previous section, the agent always uses the contact line that is set up as the priority email address for purchase order communications if such a line exists for the vendor,

regardless of whether the agent task is set up to group emails per vendor or per purchase order. To set up this priority address, follow these steps:

1. Go to **Organization administration** > **Global address book** > **Address and contact information purpose**.
2. At the top-right corner of the grid, open the **Grid options** menu (ellipsis button) and select **Insert columns**.
3. In the **Insert columns** dialog, select the check box for the row with a **Field value** of *Type*. Then select **Update**. The grid now shows a **Type** column.
4. If a row already exists with a **Type** of *Purchase Order Communications*, note its **Purpose** name and skip this step. Otherwise, add it by selecting **New** on the Action Pane and make the following settings for the new row:
    - **Purpose** – Enter a short name, such as *My Purchase Order Agent Communications*.
    - **Description** – Enter a short description, such as *Priority purchase order communications email address for a vendor*.
    - **Postal address** – Don't select this check box because this purpose is for email addresses, not postal addresses.
    - **Contact information** – Select this check box. This option makes the row available for use with contact information lines, including email addresses.
    - **Type** – Select *Purchase Order Communications*.
5. On the Action Pane, select **Save**.
6. Go to **Accounts payable** > **Vendors** > **All vendors**.
7. Find and open the vendor you want to set up from the list.
8. On the **Contact information** FastTab, select the row with the email address you want to send follow-up messages to. Then select **Edit contact information** from the FastTab toolbar.
9. In the **Edit contact information** dialog, set **Purpose** to the purpose name you found or created earlier in this procedure.
10. Select **OK**.

Review and send drafted emails

To review the emails that were previously created for the various configurations, go to **Procurement and Sourcing** > **(Preview) Procurement Agent - Supplier communications** > **(Preview) Follow-up emails**. The configurations appear on the left, and the emails for each configuration appear on the right.

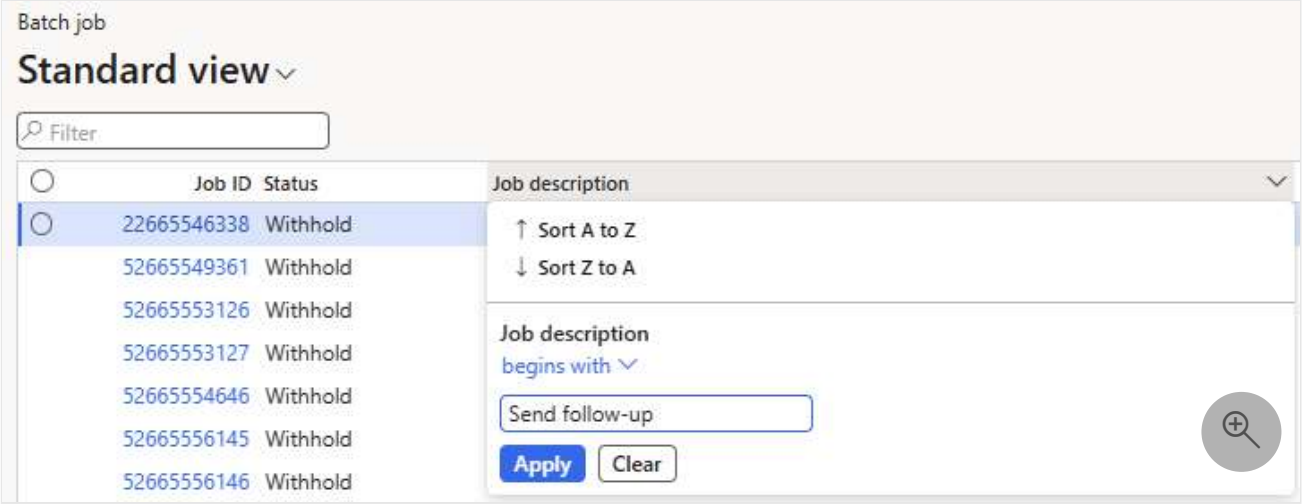
Edit each message as required, and then select **Send** to send it to the vendor.

Set up the periodic agent run schedule and batch job options

The Procurement Agent includes a batch job that runs the agent automatically. To change the default configuration of the job, follow these steps:

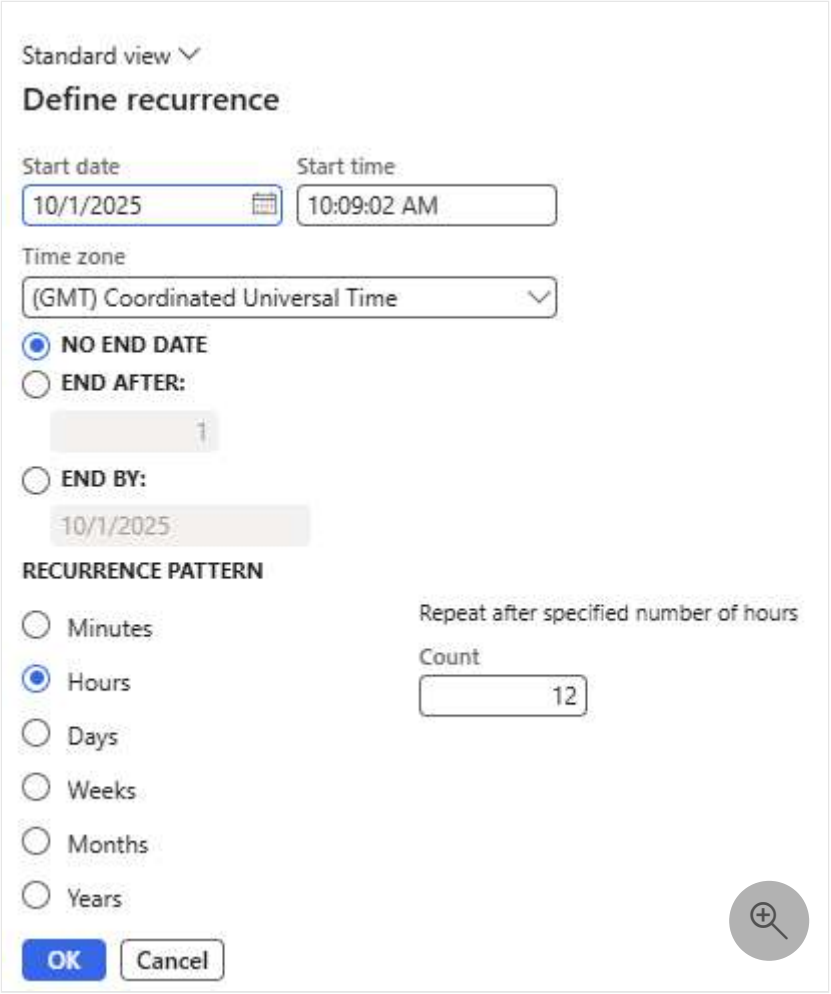
1. Go to **System Administration** > **Inquiries** > **Batch jobs**.

2. Find and select the job that has a **Job description** that matches the name of the agent configuration, which is described in Configure task criteria and email settings. For example, if the agent name is *Send follow-up emails to vendors with Supplier Communications Agent*, you can locate its batch job quickly by using this text in the **Job description** column header filter. The agent name might be different on your system, so check the name before proceeding.



3. Select the job, and then select **Recurrence** from the Action Pane.

4. In the **Define recurrence** dialog, set up the run schedule as desired, and then select **OK**.



5. To get more information about the batch job and adjust other settings, return to the **Batch jobs** page and select the link in the **Job ID** column.

Review and apply purchase order changes received in vendor emails (production-ready preview)

[This article is prerelease documentation and is subject to change.]

The Procurement Agent helps speed up communications with vendors about purchase orders by enabling Copilot to read emails from some or all vendors.

When Copilot analyzes a vendor email, it determines what the message is about. For example, the agent recognizes whether it's a purchase order confirmation or a purchase order change request. It also identifies which purchase order it applies to. Copilot then matches the information that it extracts from the email to fields in the system and indicates whether there are any changes. Therefore, you just need to review the information that Copilot provides, review the proposed changes, and decide whether to accept those changes. Copilot saves you time, because you don't have to manually find, open, and edit the purchase order in the system.

Copilot classifies each vendor email that it reads into one of the following categories, based on the intent that it detects in the message:

- *Purchase order confirmation* – Copilot detected that the intent of the message is to confirm one or more purchase orders (all the purchase orders that the email mentions).
- *Purchase order change request* – Copilot detected that the message contains at least one requested change to a purchase order. For example, the vendor wrote to tell you that they can't deliver the full quantity that was requested for one or more lines, to tell you that they can't deliver on time, or to reject the entire order.
- *Rejected* – Copilot detected that the vendor can't supply the requested purchase order.
- *Other* – Copilot couldn't identify any of the previous intents.

For the first two categories, Copilot identifies which purchase orders the email is related to and matches the information in the email to information in the system.

> **ⓘ Important**
>
> The agent can read incoming PDF attachments but not Microsoft Word or Excel documents.

When you review incoming changes that are based on an email, the system shows the original email, the current information in the system, and the changes proposed. Therefore, you can more easily understand each change. After you finish reviewing the proposal and making any corrections that are required, you can apply the changes directly to the relevant purchase order.

Configure the agent to track your email

You need to configure the Procurement Agent to monitor a specific email address for incoming messages from vendors. Follow these steps to complete the configuration.

> **Important**
>
> Before you begin, complete the steps in Set up and configure supplier communications features of the Procurement Agent. If you want to send or forward email communications from your own email address for testing, you must also set up your email address as a vendor contact as described in Forward emails.

1. Sign in to the Microsoft Dynamics 365 Supply Chain Management environment as a user who has permissions to manage the agent configuration.
2. Go to **Agents** > **Agents**.
3. On the **Library** tab, for **Speed up updates in purchase orders with Supplier communications agent**, select **Select**.
4. On the **Agent configuration** page, use the dropdown menu to specify which vendors the agent should analyze emails for. Select **Any vendor** to track all vendors or **Specific vendors** to track a list of specific vendors that you provide.
5. Select the mailbox that the agent should monitor. The dropdown menu shows all mailboxes that the sign-in user has access to. If the mailbox that you're looking for isn't in the list, you might need to share and synchronize it with Dataverse. Learn more in Set up and configure supplier communications features of the Procurement Agent.
6. Select **Activate**.

Review and accept changes suggested by the agent

The agent detects changes in the following fields:

- Quantity
- Unit of measure
- Price

- Confirmation
- Delivery date
- Cancellation

To review and accept changes that the agent suggests based on the emails that it reads, follow these steps:

> **ⓘ Important**
>
> Before you begin, confirm that the signed-in user has access to the mailboxes. Learn more in Set up and configure supplier communications features of the Procurement Agent.

1. Go to **Procurement and sourcing** > **Purchase order receipt and follow-up** to open the **Purchase order receipt and follow-up** workspace.

2. The **(Preview) Emails from vendors** tile indicates the number of emails that require review. Select the tile.

   The left side of the **(Preview) Emails from vendors** page lists all the emails that the agent reads. The right side shows summaries that Copilot generates.

3. Follow one of these steps:

   - To apply all the changes that the agent suggests, select **Apply all suggestions**. This action affects all purchase orders that the message mentions.
   - To apply all suggestions to a single selected purchase header and all its lines, select **Apply suggestions** in the **Purchase order header** section.
   - To apply suggestions to specific purchase order lines, select the relevant lines, and then select **Apply suggestions** in the **Purchaser order lines** section.

Teach the agent how to better interpret incoming email content

If a vendor uses acronyms or other language that the system doesn't recognize, the Procurement Agent might not have enough data to interpret it. However, you can teach the agent to better process incoming email content. By teaching the agent, you help improve its accuracy.

Two types of teaching are available:

1. Column mapping teaching (improves recognition of field names)

2. Value teaching (improves recognition of field values)

Teach the agent about column mappings

Agent teaching applies when any of the following situations occur:

- The incoming email from the vendor contains a term or acronym that the agent can't interpret.
- The email contains multiple possible matches for a single field in Supply Chain Management. For example, various vendors might use many different names to refer to the field named **Confirmed receipt date** in Supply Chain Management. Examples include:
  - **Estimated delivery date**
  - **Confirmed delivery date**
  - **Transportation load date**
  - **Ship date**
  - **Ship by**
  - **Approx. delivery date**
  - And more.

If the agent detects ambiguity when trying to identify a field, it shows that "Some columns are mapped with low confidence." In this case, select **Review** to manually choose which of the fields from the vendor's email you want the agent to use. This action opens a dialog that lists possible mappings for the field. After you choose the correct mapping, choose how broadly to apply it: to all vendors from now on, to the current vendor from now on, or just for this one time.

To map more fields, select **Show more**. This action expands the list of fields that are available for mapping. Agent teaching for field mappings is currently supported for the **Confirmed receipt date**, **Unit**, **Quantity**, and **Unit price** fields.

Teach the agent about value mappings

For some fields, a vendor might use values that are synonyms or industry equivalences that aren't saved in your system. You can train the agent to recognize these equivalences. For example, as a value for the **Unit** field, you might use *cartons* while one of your vendors always uses the name *cassettes* for the same unit. When the agent detects the different value as a change, you can clarify the equivalence. When you edit the field, the teaching pane appears. You can then save the equivalence for all vendors, for the current vendor, or not at all.

Locate existing teaching items

If any teaching is previously saved for all vendors or a specific vendor, you can always find it later, review it, or delete it by following these steps:

1. Go to **Procurement and sourcing** > **(Preview) Procurement Agent - Supplier communications** > **(Preview) Emails from vendors**.
2. On the Action Pane, select **Taught items** to view everything that the agent was taught.
3. If you see any lessons that you want to delete, select them, and then select **Delete** on the Action Pane.

Last updated on 08/26/2026

Purchase agreements

This article provides information about purchase agreements. A purchase agreement is a contract that commits an organization to buy a specified quantity or amount by using multiple purchase orders over time. In exchange for this commitment, the buyer receives special prices and discounts.

Purchase agreements can apply to a specific quantity of a product, a specific currency amount of a product, or a specific currency amount of the products in a procurement category. The prices and discounts of the purchase agreement override the prices and discounts that are specified in any trade agreements that exist.

On the **Purchase agreements** page, you can create, apply, and follow up on purchase agreements that exist between your organization and your vendors. For example, after you create a purchase agreement, you can order directly from it. Each purchase agreement has a validity period that is defined by the person who creates the purchase agreement. The receipt date of a purchase must be within the effective dates of this validity period.

After you create a purchase agreement, you must activate it before it becomes effective. To activate a purchase agreement, set the **Mark agreement as effective** option to *Yes*.

To prevent your purchase agreement from being used and confirmed, mark the agreement status as *Closed*. You can still update the status to *Effective** at any time after making this change.

Responsible workers on purchase agreements

You can identify a primary responsible worker and secondary responsible worker on the purchase agreement classification. The resulting purchase agreement inherits these values. You're not required to add responsible workers to the purchase agreement, and you can modify them directly on a case-by-case basis on the purchase agreement itself. You can't specify a secondary responsible worker without a primary responsible worker, although you don't have to have a secondary responsible worker. You can't specify the same worker as both the primary and secondary responsible worker.

Commitment types

Each line in a purchase agreement is a commitment to buy something. You can use lines from multiple purchase orders (POs) to fulfill the commitment. There are four types of commitments:

- **Product quantity commitment** – You purchase a specific quantity of a product.
- **Product value commitment** – You purchase a specific currency amount of a product.
- **Product category value commitment** – You purchase a specific currency amount in a procurement category. The amount can be for a catalog item or a noncatalog item.
- **Value commitment** – You purchase a specific currency amount of any product or products in any procurement category.

Pricing terms for purchase agreements

Pricing terms can vary, depending on the type of commitment. The pricing terms from purchase agreements override any other pricing terms that are set up for trade agreements. The following table describes the price-related fields that are affected by each commitment type. You can update fields that contain *Yes* on an order line.

Expand table

Commitment type	Unit price	Price unit	Discount percent	Cash discount amount
Product quantity commitment	Yes	Yes	Yes	Yes
Product value commitment			Yes	
Product category value commitment			Yes	
Value commitment			Yes	

Policies for purchase agreements

The following policies affect the way that the link between a purchase agreement commitment and the corresponding PO lines works:

- **Max is enforced** – The total quantity or amount for all order lines can't exceed the quantity or amount that is specified on the related commitment.
- **Price and discount is fixed** – The price on an order line and the price on the related commitment must be the same. If the price is changed on the order line, the link to the commitment is broken. If the link is broken, the order line doesn't contribute to the fulfillment of the commitment.
- **Minimum release amount and Maximum release amount** – If an amount is specified, you receive a message if you make any change to an order line that causes the order line to

differ from the related commitment.

Fulfillment calculations for purchase agreements

Fulfillment quantities and amounts are shown on the **Fulfillment** tab on the **Line details** FastTab of the **Purchase agreements** page.

The **Fulfillment** area shows the remaining amount or quantity that is required to fulfill the commitment.

The **Agreement** area shows the total quantity or the total amount that the sales agreement line is valid for.

You can access the PO lines and the invoice lines that contribute to the fulfillment calculation by selecting the **Related information** action on the lines or on the header of a purchase agreement.

Confirmations and version history for purchase agreements

When you confirm a purchase agreement, the current version of the purchase agreement is stored in a history table. If you change the purchase agreement, you can confirm it again to store another version of the purchase agreement in the history. If you don't confirm a purchase agreement, you can still use it to create POs. However, the history information for the purchase agreement isn't stored. You can preview or print all versions of the agreement. You can then share the revisions with your vendor to obtain approval.

Applying purchase agreements in the ordering process

When you create a PO, you can apply a purchase agreement to it. Information from the terms for the agreement, such as the payment terms, delivery terms, and delivery address, is then copied to the header of the PO. If the PO contains one or more lines for products or categories that are covered by the agreement, the prices and discounts from the purchase agreement are used for those lines. The amount or quantity on the order line contributes to the fulfillment of the commitment in the purchase agreement. The same PO can include both lines that aren't related to a purchase agreement and lines that have a commitment for a purchase agreement.

You can select a purchase agreement only when you're creating a PO. You can't select a purchase agreement after the PO has been created.
In some situations where POs are created indirectly, you can control whetherSupply Chain

Management automatically searches for applicable purchase agreements. For example, you might do this when you're automatically firming planned POs or creating POs that are based on sales orders.

Delivery address defaults from a purchase agreement

When you apply a purchase agreement to a PO, you're prompted to transfer the currency and delivery address from the agreement. If you select **Yes**, the agreement values replace the values that are already on the PO. Select **No** if you want to keep the existing PO delivery address.

The transfer uses the default values that are saved on the purchase agreement header. If the agreement doesn't yet have a saved set of header defaults, there's no address for the transfer to apply, so it clears the delivery address on the PO instead of replacing it. This behavior is by design.

To make sure that the agreement address is transferred, follow these steps:

1. Open the purchase agreement and confirm that it's marked as effective and remains valid through the required delivery date.
2. On the agreement header, update at least one field. For example, reselect the **Delivery name** or **Delivery address** value.
3. Save the agreement. Saving the header creates the default values, including the delivery address, that the transfer uses.
4. Return to the PO, select the purchase agreement again, and select **Yes** at the transfer prompt. Verify that the expected delivery address remains on the PO.

Matching policy on purchase agreements

You can define a line matching policy on the header of the purchase agreement. This line matching policy will respect the accounts payable parameters line matching policy when the **Allow matching policy override** field on the **Accounts payable parameters** page (on the **Price and quantity matching** FastTab) is set to *Higher than company policy*. Documents that reference the purchase agreement will use the line matching policy that's defined on the purchase agreement header unless otherwise defined on the corresponding item, item and vendor, or category purchasing policy.

Purchase agreements and intercompany trade

Intercompany trading relationships can be created between vendor accounts and customer accounts that are in different legal entities. When a sales order or PO is created for one of the parties, an intercompany order chain is created. In the order chain, the sales order and PO are created in the appropriate legal entities.

You can create a purchase agreement or sales agreement for one of the intercompany trading parties. You can then generate the corresponding sales agreement or purchase agreement for the other intercompany trading party in the other legal entity.

If you create an intercompany PO that uses the intercompany purchase agreement in one legal entity, the corresponding intercompany sales order uses the corresponding intercompany sales agreement in the other legal entity. The fulfillment of the sales agreement commitments and the fulfillment of the purchase agreements are synchronized, just as the intercompany sales order and the intercompany PO are synchronized.

Financial dimensions on purchase agreements

You can copy financial dimensions to document headers or to individual lines of a purchase agreement. If you change the dimensions in the agreement header or on the agreement line, the change doesn't affect any released orders, but it will be reflected on any new orders.

Related information

- Create a purchase agreement
- Apply a purchase agreement when creating a purchase order

Create a purchase agreement

This article shows you how to create a purchase agreement. Typically, a purchasing manager completes this procedure. Set up purchase agreement classifications before you start. After you create an agreement, use it when you create a purchase order. This action copies the purchase agreement conditions to the header and to any lines in the order that the agreement affects.

Create a new purchase agreement

1. Go to **Procurement and sourcing** > **Purchase agreements** > **Purchase agreements**.
2. Select **New**.
3. In the **Vendor account** field, select the drop-down menu and select the row of the desired record.
4. In the **Purchase agreement classification** field, select the drop-down menu and select the row of the desired record.
5. Expand the **General** FastTab.
6. In the **Expiration date** field, enter a date. This expiration date is the default for all commitment lines and determines how long each specific commitment is valid.
7. In the **Document title** field, type a name for your purchase agreement.

    - Leave the **Default commitment** field set to **Product quantity commitment** (or change it if it's not set to this).
    - The default commitment value determines your options on the agreement lines. If you need a new commitment type when you're creating the agreement lines, change the default commitment on the header. There are four types of commitments:
        - *Product quantity commitment* – for a specific quantity of a product.
        - *Product value commitment* – for a specific currency amount of a product.
        - *Product category value commitment* – for a specific currency amount in a procurement category where the amount can be for a catalog item or a non-catalog item.
        - *Value commitment* – for a specific currency amount which any product or any procurement category can fulfill.

8. Select **OK**.

Add a commitment

1. Select **Add line**.
2. In the **Item number** field, select the desired record from the drop-down menu.
3. In the **Quantity** field, enter a number. This number is the total quantity that you agree to buy from your vendor.
4. In the **Unit price** field, enter a number.
5. Expand the **Line details** section.
6. Set the **Max is enforced** option to *Yes*. The **Max is enforced** option limits the use of the commitment. You can only purchase up to the quantity specified in the **Quantity** field for the line.

Add header conditions

1. On the Action Pane, select **Options**.
2. Select **Change view**.
3. Select **Header view**.
4. Expand the **Terms** section.
5. In the **Method of payment** field, select the desired record in the drop-down menu. The payment terms from the vendor account appear here by default.
6. In the **Mode of delivery** field, select the desired record in the drop-down menu.
7. In the **Delivery terms** field, select the drop-down button to open the lookup.

Confirm and activate the agreement

1. On the Action Pane, select **Purchase agreement**.
2. Select **Confirmation**. Set the **Mark agreement as effective** option to **Yes**.
3. Select **OK**.
4. On the Action Pane, select **Purchase agreement**.
5. Select **Purchase agreement confirmations**. The **Preview/Print** option generates a document for the purchase agreement that you can print or send to the vendor. If you update the agreement later and reconfirm it, both versions appear here.
6. Close the page.

Automatic application of charges

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Based on the customer or vendor that you're working with or the item that you're selling, you might want to apply specific additional charges. The *charges* feature in Microsoft Dynamics 365 Supply Chain Management helps you automatically apply charges to purchase orders or sales orders.

Automatic charges (auto charges) are automatically applied when you create a sales order or a purchase order. You can define auto charges for specific vendors, customers, groups of vendors, groups of customers, items, or groups of items. You can also define auto charges that apply to all vendors, customers, or items.

Set up parameters

The **Procurement and sourcing parameters** page has a few settings that are especially relevant when you want to apply charges automatically in the purchase order. To complete this setup, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing parameters**.
2. On the **Prices** tab, on the **Prices** FastTab, set the following fields:
    - **Find auto charges for header** – Set this option to *Yes* if charges should automatically be applied to purchase order headers.
    - **Find auto charges for line** – Set this option to *Yes* if charges should automatically be applied to purchase order lines.

The **Accounts receivable parameters** page also has a few settings that are especially relevant when you want to apply charges automatically in the sales order. To complete this setup, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Accounts receivable parameters**.
2. On the **Prices** tab, on the **Prices** FastTab, set the following fields:

- **Find auto charges for header** – Set this option to *Yes* if charges should automatically be applied to sales quotation and sales order headers.
- **Find auto charges for line** – Set this option to *Yes* if charges should automatically be applied to sales quotation and sales order lines.

Set up charges codes

To apply charges, you must first define charges codes.

1. Follow one of these steps:

   - For purchase orders: Go to **Procurement and sourcing** > **Setup** > **Charges** > **Charges code**.
   - For sales orders: Go to **Accounts receivable** > **Setup** > **Charges** > **Charges code**.

2. On the Action Pane, select **New** to create a charges code.

3. In the header of the new record, set the following fields:

   - **Charges code** – Enter a code for the charges.
   - **Description** – Enter a description of the charges.
   - **Item sales tax group** – Select an item sales tax group, if applicable.
   - **Prorate** – Set this option to *Yes* if you want to prorate your charges. This option is available only for sales orders.
   - **Maximum amount** – Enter the maximum amount that's allowed for the charges code. This field is used to validate charges for vendor invoices. It's available only for purchase orders.

     > ⓘ **Note**
     >
     > To turn on the functionality for validating charges for purchase orders, go to **Accounts payable** > **Setup** > **Accounts payable parameters**. On the **Invoice validation** FastTab, in the **Invoice validation** section, set the **Enable invoice matching validation** option to *Yes*.

4. The **Posting** FastTab includes **Debit** and **Credit** sections. Set the following fields, depending on the ledger that you want to post the charges to:

   - **Type** – Select the type of account that you're posting to (*Ledger*, *Customer*, or *Item*). If you select *Ledger account* as the debit type or credit type, specify a posting type in

the **Posting** field, and specify the main account in the **Account** field.
- **Posting** – Select the type of postings to create (such as *Broker fee* or *Customer settlement*).
- **Account** – Select the account to post the charge for.

5. On the Action Pane, select **Save**.

Create charge groups

Charge groups automatically apply specific charges to a group of customers or vendors. The following subsections describe how to create and assign these charge groups.

Charge groups for purchase orders

To create charge groups for purchase orders, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Charges** > **Vendor charges group**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
    - **Charges group** – Enter the name of the charge group.
    - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.
4. Go to **Procurement and sourcing** > **Vendors** > **All vendors**, and either open an existing vendor or create a new vendor.
5. On the **Purchase order defaults** FastTab, in the **Purchase order** section, set the **Charges group** field to the charge group that you created.

Charge groups for sales orders

To create charge groups for sales orders, follow these steps.

1. Go to **Accounts receivable** > **Setup** > **Charges** > **Customer charge groups**.
2. On the Action Pane, select **New** to add a row to the grid, and then set the following fields:
    - **Charges group** – Enter the name of the charge group.
    - **Description** – Enter a description of the charge group.
3. On the Action Pane, select **Save**.

4. Go to **Accounts receivable** > **Customers** > **All customers**, and either open an existing customer or create a new customer.

5. On the **Sales order defaults** FastTab, in the **Sales order** section, set the **Charges group** field to the charge group that you created.

Define auto charges

After you set up your charge codes, follow these steps to define the auto charges.

1. Follow one of these steps:

    - For purchase orders: Go to **Procurement and sourcing** > **Setup** > **Charges** > **Automatic charges**.
    - For sales orders: Go to **Accounts receivable** > **Setup** > **Charges setup** > **Auto charges**.

2. In the list pane, in the **Level** field, select the level where your auto charge applies:

    - *Header* – Apply charges to the order header.
    - *Line* – Apply charges to the order lines.

3. Select an existing auto charge to edit it, or select **New** to define a new auto charge.

4. In the **Account code** list, select one of the following values to specify the scope of accounts that the auto charge affects:

    - *Table* – Assign charges to a specific customer or vendor.
    - *Group* – Assign charges to a miscellaneous charges group.
    - *All* – Assign charges to all customers or vendors.

5. In the **Customer relation** or **Vendor relation** field, select a specific customer or vendor if you set the **Account code** field to *Table*. If you set the **Account code** field to *Group*, select a customer or vendor charges group.

6. In the **Item code** field, select one of the following values to specify the scope of items that the auto charge affects. You can select an item code only when you define auto charges at the line level.

    - *Table* – Assign charges to a specific item.
    - *Group* – Assign charges to an item charges group.
    - *All* – Assign charges to all items.

7. In the **Item relation** field, select a specific item if you set the **Item code** field to *Table*. If you set the **Item code** field to *Group*, select an item charges group.

8. *For sales orders only:* In the **Mode of delivery code** field, select one of the following values to specify the scope of delivery modes that the auto charge affects:

    - *Table* – Assign charges to a specific mode of delivery.
    - *Group* – Assign charges to a mode of delivery group.
    - *All* – Assign charges to all modes of delivery.

9. *For sales orders only:* In the **Mode of delivery relation** field, select a specific mode of delivery if you set the **Mode of delivery code** field to *Table*. If you set the **Mode of delivery code** field to *Group*, select a mode of delivery group.

10. On the **Lines** FastTab, define the charges and the charge rates that the current auto charge uses. You can use the toolbar on this FastTab to add as many lines as you require. For each line, set the following fields:

    - **Currency** – Select the currency that you want to use to calculate the charge. This field applies to the *Header* and *Line* levels for sales quotation and sales order charges.

    - **Charges code** – Select the code for the charge.

    - **Category** – Select one of the following values:
        - *Fixed* – Enter the charge as a fixed amount on the line. You can use fixed charges on charges both in the order header and on the order lines.
        - *Pcs* – Base the charge on unit with no unit of measure conversion. *Pcs* in this case represents any unit of measure and not the specific *Pcs* unit of measure. You can use these charges only on order lines. They appear when you calculate the order total.
        - *Percent* – Enter the charge as a percentage on the line. You can use percentage charges on charges both in the order header and on the order lines.
        - *Intercompany percent* – Enter the charge as a percentage on the line for intercompany orders. You can use intercompany percentage charges only on order lines.
        - *External* – A third-party service that's associated with one or more shipping carriers calculates the charge.
        - *Specific unit* – Express the charge value in the unit of measure on the charge line. Unit of measure conversion is used to apply it proportionally to the unit of measure on the sales line. This category applies only to the *Line* level.
        - *Specific unit match* – Express the charge value in the unit of measure on the charge line. The unit of measure on the sales line must match this unit of measure for the charge line to be applied. No unit of measure conversion is applied. This category applies only to the *Line* level.

- **Unit** – Enter the unit that applies when the **Category** field is set to *Specific unit* or *Specific unit match*.
- **Charges value** – Enter the charge value, based on the category that you selected.
- **Charges currency code** – Specify a currency for the charge if you want to use a currency other than the currency that you specified in the **Currency** field. You can use a different currency only if the **Debit type** or **Credit type** field is set to either *Ledger account* or *Item* for the selected charges code.
- **From amount** – Specify a starting amount to apply the auto charge to. In this context, the amount refers to the order total.
- **To amount** – Specify the ending amount to apply the auto charge to. In this context, the amount refers to the order total.
- **Sales tax group** – Specify a sales tax group.
- **Site** and **Warehouse** – Specify a site and warehouse if charges should be applied only for a specific site and warehouse.
- **Keep** – Select this checkbox to keep the charges transactions after invoicing is completed, so that the charge is applied every time that you create a new invoice for the selected customer account.

For sales orders only: If you want to calculate tiered charges, see Tiered charges on sales orders for information.

Supply Chain Management provides the following optional functionality for calculating auto charges. You might need to enable and configure these features before you can use them. For more information, follow the links.

- Auto charge compounding and sequencing
- Units of measure for line-level charges

> **Tip**
>
> When configuring auto charges for accounts payable in Dynamics 365 Finance, you might see duplicate charge calculations if you set up auto charges for both specific vendors (*Table*) and all vendors (*All*). This situation occurs because the system applies all relevant auto charge configurations, regardless of hierarchy, whenever you create a new purchase order. For example, if you set up a charge code with account code *All*, the system applies that charge code to every purchase order, even if you also set up other specific vendor or group configurations.

Allocate charges from the header to a line

The following procedure shows how to allocate header-level charges to a line. Before you start this procedure, you should already have a header-level charge of the *fixed amount* type and an order where you apply that charge. Additionally, the order should already include at least one line item.

1. Open the purchase order or charge order.

2. On the Action Pane, follow one of these steps:

    - For purchase orders: On the **Purchase** tab, in the **Charges** group, select **Allocate charges**.
    - For sales orders: On the **Sell** tab, in the **Charges** group, select **Allocate charges**.

3. In the **Allocate charges to order lines** dialog box, set the following fields:

    - **Charges allocation** – Select one of the following values to specify how the charges should be allocated:
        - *Net amount* – Allocate charges according to each line amount relative to the total net amount.
        - *Quantity* – Allocate charges according to the number of units for each line relative to the total number of units.
        - *Per line* – Allocate charges equally among the total number of lines.

    - **Allocate charges to lines** – Select a value to specify whether charges should be allocated to all lines, to positive lines only, or to negative lines only.

    - **Allocate all** – Select this checkbox to allocate charges to order lines even if the charges code has a debit type other than *Item*.

    - **Received** – Select this checkbox to allocate charges only to received order lines.

    - **Stocked** – Select this checkbox to allocate charges to only inventoried order lines.

    - **Show selections and clear specific lines** – Select this checkbox to exclude specific lines from this allocation. When you select this checkbox, the **Choose lines to exclude from allocation** grid opens. This grid includes only lines that match the criteria that are defined by the **Allocate charges to lines** and **Stocked** settings. For example, if you set the **Allocate charges to lines** field to *Positive lines* and select the **Stocked** checkbox, the grid shows only lines that are both positive and inventoried. In addition, the grid automatically filters out any lines that the full quantity is already received for. While the grid is open, clear the **Include** checkbox for each line that you want to exclude from allocation.

> **Important**
>
> When you work with the **Choose lines to exclude from allocation** grid, be sure to leave the grid open until you select **Allocate**. If you close the grid before you select **Allocate**, your settings in the grid are lost. Therefore, charges are allocated based on the criteria that you previously defined.

4. Select **Allocate** to apply your settings and close the dialog box.

Reapply header auto charges

In some cases, the system reapplies header auto charges by deleting and inserting them after you update a header field.

You can set up auto charges to consider vendor charge groups or modes of delivery. Therefore, when you update the **Charges group** or **Mode of delivery** on a purchase order header, the charge might change based on the auto charge setup. When the charge needs to be recalculated, the system deletes the existing auto charge and inserts a new auto charge. The recalculation doesn't affect charges you add manually to the purchase order.

After the system allocates an auto charge from the header to a line, it doesn't track its origin (there's no reference from the line to the auto charge setup), so the charge becomes a line charge. If you then update the **Charges group** or **Mode of delivery** on a purchase order header, the system reapplies the new, recalculated header charge, but it doesn't affect the line charges. This pattern applies to both purchase order headers and sales order headers.

The following examples show how to update header-level charges and select a new **Mode of delivery** on the purchase order header. Each example assumes that you already have a header-level charge of type *fixed amount* and an order where that charge is applied. The order must already include at least one line item.

Example 1: Header auto charge value resets after changing the mode of delivery

This example shows that if you customize the value of a header auto charge and then update the mode of delivery for the purchase order, the system resets the header auto charge to its original value.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders** and open a purchase order that includes a header auto charge of type *fixed amount*.

2. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.
3. For the existing header auto charge, enter a new value in the **Charges value** field.
4. On the Action Pane, select the **Back** button to return to the purchase order.
5. Open the **Header** tab of the purchase order.
6. Expand the **Delivery** FastTab and select a new value for the **Mode of delivery** field.
7. On the Action Pane, select **Save**.
8. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note that the **Charges value** is now reset to its original auto charge value.

Example 2: Header auto charge is reapplied after allocating it to a line and then changing the mode of delivery

This example shows that if you allocate a header auto charge to a line and then update the mode of delivery for the order, the system reapplies the original header auto charge while leaving the allocated charge applied to the line.

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders** and open a purchase order that includes a header auto charge of type *fixed amount*.
2. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note the header auto charges listed here.
3. On the Action Pane, select the **Back** button to return to the purchase order.
4. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Allocate charges**.
5. On the **Allocate charges to order lines** dialog, select the **Allocate all** check box. Then select **Allocate** to allocate the header auto charge to the order lines.
6. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

   Note that the header auto charges are no longer listed because you allocated them to the line level.

7. On the Action Pane, select the **Back** button to return to the purchase order.
8. On the **Purchase order lines** FastTab, select a purchase order line.
9. On the **Purchase order lines** FastTab toolbar, select **Financials** > **Maintain charges**.

   Note that the previous header auto charge is now shown here, at the line level.
10. On the Action Pane, select the **Back** button to return to the purchase order.
11. Open the **Header** tab of the purchase order.
12. Expand the **Delivery** FastTab and select a new value for the **Mode of delivery** field.
13. On the Action Pane, select **Save**.
14. On the Action Pane, open the **Purchase** tab and, in the **Charges** group, select **Maintain charges**.

    Note that the original header auto charge is now reapplied to the order, even though the charge is also listed at the line level.

Units of measure for line-level charges

All line-level auto charges and line charges include a category that controls how and where the charge applies. The available categories include *Specific unit* and *Specific unit match*. These categories let you set up and apply line charges that are specific to the unit of measure for a line item that's either sold or purchased. They work in the following way:

- *Specific unit* – The auto charge is defined by using a specific unit (such as *ea*). The system then converts proportionally from other units if a conversion factor is available. For example, a sales line is for 2 boxes of an item where a box is defined as containing 10 ea. There's a charge of 2 USD per ea. In this case, the sales line produces a charge of 40 USD (= 2 boxes × 10 ea/box × 2 USD/ea). If no conversion factor is available, the charge isn't applied.
- *Specific unit match* – The auto charge is defined by using a specific unit (such as *ea*). However, the system applies that charge only to lines that use the same unit. For example, you set up a charge so that a line charge is added when the item is sold in smaller units (such as *ea*). However, there's no line charge for orders that are specified in larger units (such as cases).

The *Specific unit* and *Specific unit match* categories are supported for sales quotation lines, sales order lines, purchase requisition lines, request for quotation lines, and purchase order lines. Because both categories apply to both sales orders and purchase orders, they're also supported for intercompany trade.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.38 or later.
- The feature named *Unit of measure for line level charges* must be turned on in feature management. As of Supply Chain Management version 10.0.45, it's mandatory and can't be turned off.

Example scenario: Set up line-level auto charges for specific units and unit matching

This example scenario shows how to set up line-level auto charges that apply to a specific unit, or that are calculated based on unit matching.

Enable demo data

To work through this scenario by using the demo records and values that are specified here, you must be on a system where the standard demo data is installed. Additionally, you must select the *USMF* legal entity before you begin.

Set up the auto charges

Follow these steps to set up a line charge in auto charges.

1. Go to **Accounts receivable** > **Setup** > **Charges** > **Auto charges**. (Similar steps can be completed at **Accounts payable** > **Setup** > **Charges** > **Automatic charges** and **Procurement and sourcing** > **Setup** > **Charges** > **Automatic charges**.)

2. In the list pane, set the **Level** field to *Link*.

3. On the Action Pane, select **New** to create an auto charges record.

4. On the header of the new record, set the following values:

    - **Account code** – Select *All*.
    - **Item code** – Select *All*.
    - **Mode of delivery code** – Select *All*.
    - **Charge description** – Enter a short description.

5. On the Action Pane, select **Save**.

6. The **Lines** FastTab should now include a blank line. If it doesn't, select **Add** on the toolbar to add one. Set the following values for this line:

    - **Currency** – Select *USD*.
    - **Charges code** – Select *Freight*.
    - **Category** – Select *Specific unit*.
    - **Unit** - Select *ea*.
    - **Charges value** – Enter *2*.
    - **Sales tax group** – Leave this field blank.
    - **Site** – Leave this field blank.
    - **Warehouse** – Leave this field blank.

- **Keep** – Leave this checkbox cleared.

7. On the **Lines** FastTab, select **Add** on the toolbar to add a second charge line. Set the following values for it:

    - **Currency** – Select *USD*.
    - **Charges code** – Select *Install*.
    - **Category** – Select *Specific unit match*.
    - **Unit** - Select *dz* (dozen).
    - **Charges value** – Enter *5*.
    - **Sales tax group** – Leave this field blank.
    - **Site** – Leave this field blank.
    - **Warehouse** – Leave this field blank.
    - **Keep** – Leave this checkbox cleared.

8. On the Action Pane, select **Save**.

Use the auto charges on a sales order

The charges can now be automatically applied to a sales quotation line or a sales order line. To apply the charges to a sales order line, follow these steps:

1. Go to **Sales and Marketing** > **Sales orders** > **All sales orders**.

2. On the Action Pane, select **New** to create a sales order.

3. In the **Create sales order** dialog box, set the **Customer account** field to *US-004*. Then select **OK** to create the order. The selected customer must use the same currency as the auto charges that you set up (*USD*).

4. The new sales order is opened. On the Action Pane, on the **Sell** tab, in the **Charges** group, select **Maintain charges**.

5. If any charges are listed on the **Maintain charges** page, select them, and then select **Delete** on the Action Pane.

6. Close the **Maintain charges** page by selecting the back button on the Action Pane.

7. You're returned to the order. On the **Sales order lines** FastTab, add an order line, and set the following values for it:

    - **Item number** – Select *A0002*.

- **Quantity** – Enter *2*.
- **Unit** – Select *ea*.
- **Site** – Select *6*.
- **Unit price** – Enter *50*.

The **Net amount** field should show a calculated value of *100*.

8. While the new order line is still selected on the **Sales order lines** FastTab, select **Financials** > **Maintain charges** on the toolbar.

9. Confirm that the **Maintain charges** page shows the two auto charges that you set up earlier. Then close the page by selecting the back button on the Action Pane.

10. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

11. The **Totals** dialog box shows the different calculation results that apply to the current order. Notice that the value that's shown for **Total Charges** is 4 USD. This value is calculated in the following way:

    - There's a *Specific unit* charge of 2 USD per ea. Because the line is for the equivalent of 2 ea, this charge is 2 ea × 2 USD/ea = 4 USD.
    - There's also a *Specific unit match* charge of 5 USD per dz. However, because the unit that you're ordering in is ea, not dz, this charge doesn't apply.
    - The total charge for the line combines both charges. Therefore, the total charge is 4 USD.

12. Select **OK** to return to the sales order.

13. On the sales line, change the **Unit** value to *dz*. When you're prompted to overwrite prices and discounts, select *No*, and then select **OK**. (The system is configured to convert 1 dz to 12 ea.)

14. On Action Pane, on the **Sales order** tab, in the **View** group, select **Totals**.

15. In the **Totals** dialog box, notice that the value that's shown for **Total Charges** is now 58 USD. This value is calculated in the following way:

    - The unit is now *dz*, and there's a *Specific unit match* charge of 5 USD per dz. Because you're now ordering two dozens, this charge is 2 dz × 5 USD/dz = 10 USD.
    - There's also a *Specific unit* charge of 2 USD per ea. Because the system is configured to convert 1 dz to 12 ea, and you're now ordering a total of two dozen items, it can

determine that the order line is for 24 ea. Therefore, this charge is 24 ea × 2 USD/ea = 48 USD.

- The total charge for the line combines both charges. Therefore, the total charge is 10 USD + 48 USD = 58 USD.

Pricing management

The features that are described in this article work together with the Unified pricing management module. Pricing management introduces changes to the setup and search of auto charges. Therefore, it also changes some of the behavior that's described in this article. When the Unified pricing management module is enabled, charges that are set up at **Accounts receivable** > **Charges setup** don't apply. Instead, only charges that are set up on the auto charges page that's specific to the **Pricing management** module apply to sales orders and sales quotations. To set up auto charges in Pricing management, go to **Pricing management** > **During-sales pricing** > **Charges setup** > **Auto charges**.

Vendor rebates

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Vendor rebates help companies better manage their supplier rebate programs by automating tasks required to administer, track, and claim earned rebates.

This article provides an overview of the most common tasks that you might want to perform when you work with vendor rebates. The overview covers the following tasks:

- Review details of a rebate agreement.
- Identify orders that qualify for rebates, and generate rebate claims.
- Review and approve claims.

Audience and purpose

The information in this article is intended for business decision makers in enterprise companies, in positions such as purchase manager, chief financial officer (CFO), and accounting manager, who have the following responsibilities:

- Negotiate vendor price, discount, and rebate agreements.
- Manage staff that processes rebate claims and collects payments.
- Order inventory at the best possible prices.

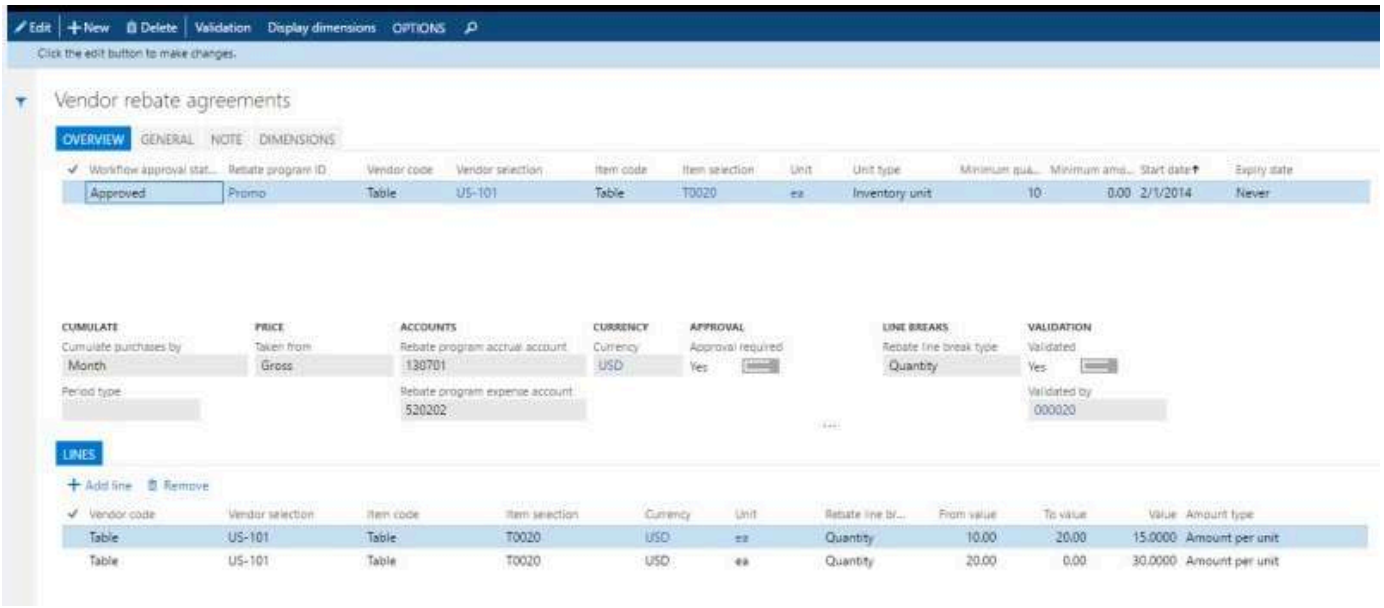
People in these positions are looking for ways to achieve various goals. Here are some examples:

- Flexibly accommodate different types of vendor promotion programs and rebate conditions.
- Reduce the administrative burden and errors associated with monitoring promotion performance and processing claims.
- Improve cash flow forecasts by accruing for future receivables.
- Have a quantified basis for ongoing and future negotiations with vendors about rebates.

Review details of a vendor rebate agreement

A vendor rebate agreement is a record of a contract with a vendor that specifies the negotiated terms and conditions under which the company qualifies for a monetary reward in return for achieving preset purchase targets. Vendor rebate agreements are recorded on the **Rebate agreements** page.

To open the **Vendor rebate agreements** page, select **Procurement and sourcing** > **Vendor rebates** > **Rebate agreements**.



On the **Vendor rebate agreements** page, you can view details about the negotiated conditions of a vendor agreement.

The agreement's header specifies the general conditions that qualify a company for rebates. In effect, the header information specifies that a vendor grants a rebate when a specific product is bought in a specific quantity. On the header, you also specify the unit of measure rebate option and the calculation date type.

- On the **Overview** tab, if you have lines with **Item code** set to *table* to specify the item, then the agreement is for that specific item. If you have lines with **Item code** set to *Group* or *All* to specify the items, then the vendor rebate agreement is individually processed per item qualifying for the item code, not across all items qualifying for the item code.

- On the **General** tab, in the **Unit of measure rebate option** field, you can define whether a unit of measure is a condition for the purchase order line to qualify for a rebate claim.
    - *Convert* – A purchase order line qualifies for a vendor rebate per the rebate agreement. You receive a rebate regardless of the unit of measure applied on the line.

    - *Exact match* – To qualify for a rebate, a purchase line must have the same unit of measure that is specified on the agreement.

- On the **General** tab, in the **Calculation date type** field, select the date used to determine whether the purchase occurs in the validity period of the rebate agreement.
    - *Created* – Use the creation date of the purchase order.
    - *Requested delivery* – Use the requested receipt date.

On the agreement lines, you can specify the vendor rebate agreement in more detail.

- In the **Cumulate purchase by** field, you can set the calculation of the rebate claim. The amount can depend on a period (week, month, year, lifetime, or a customized period). The **Invoice** value indicates that a rebate claim is determined every time that a purchase order line is invoiced.

- In the **Taken from** field, you can specify the basis for the rebate calculation.
    - *Gross* – The rebate is calculated based on the gross price of the item.
    - *Net* – The rebate is calculated based on the net price of the item (that is, the price after other discounts have been applied).

- The **Rebate program accrual account** and **Rebate program expense account** fields specify account numbers that receive accrued rebate amounts during the intermediate stage between approval and processing.

- When the **Approval required** option is set to *Yes*, the rebate claim must be approved before it can be accrued or paid out.

- The **Rebate line break type** field specifies the basis for the rebates.
    - *Quantity* – The rebates are volume-based.
    - *Amount* – The rebates are amount-based.

- On the **Lines** FastTab, you can see how different quantity tiers can be set up to grant different rebates. For example, in the previous illustration, the **From value** and **To value** fields indicate that a product quantity between 10 and 19 units will qualify for a rebate of USD 15 per unit.

    > ⓘ **Note**
    >
    > The **From value** value is inclusive, whereas the **To value** value is exclusive. For example, the **Rebate line break type** field is set to *Quantity*, and you enter *1* in the **From value**

field and *3* in the **To value** field. In this case, the rebate amount applies when you purchase one or two items, but not when you purchase three items.

- In the **Workflow approval status** field, the *Approved* value indicates that the agreement applies to purchase orders that meet the agreement's conditions.

Identify orders that qualify for rebates, and generate rebate claims

When purchase orders are placed with a vendor that the company has a rebate agreement with, the program identifies any future vendor credit payments. If the purchase orders qualify for a rebate, a rebate claim is generated for every order line as soon as a purchase invoice has been posted. This process is automatic. Later, you can review the expected rebates and see the impact of those rebates on the product's cost and profit margin.

View details of rebates applied to a purchase order line per the vendor rebate agreement

1. On the **Purchase order** page, select an order line, and then select **Purchase order line** > **View** > **Price details**.
2. On the **Price details** page, select the **Rebates** FastTab.

The **Vendor rebate** field in the **Margin estimation** section of the **Price details** page also shows the rebate information.

> ⓘ **Note**
>
> On the **Procurement and sourcing parameters** page, on the **Prices** tab, verify that the **Enable price details** option is set to *Yes*. If the option is set to *No*, you can't view the rebates.

Review and approve claims

Generated rebate claims represent the future payments that can be expected from the vendor. Before a credit note is issued to the vendor, the agreement owner typically wants to review and approve the claims. However, the status of a claim determines whether it's ready for the approval process.

The status of claims and the effect on the approval process

When a claim is generated, its status is set to *To be calculated* if the rebate is granted on a cumulative basis or *Calculated* if the rebate is granted per invoice. If the status of a claim is *To be calculated*, the claim must go through a calculation process that the Cumulate function handles. Only claims that have a status of *Calculated* can be included in the approval process.

> ⓘ **Note**
>
> If the **Approval required** option on a vendor rebate agreement is set to *No*, any claims that are generated have a status of *Approved*. Approval is mandatory for claims that are granted on a cumulative basis.

Approve claims, and view postings and invoice details

After claims are approved, Accounts payable (A/P) can process them. A credit memo (vendor invoice) for the rebate claim amount is automatically generated. The credit is then added to the vendor balance, and the A/P team can include it in the regular settlement process.

1. Select **Procurement and sourcing** > **Vendor Rebates** > **Rebate claims** to open a rebate claim.
2. Close the rebate claim.
3. Mark the claim, and then, on the Action Pane, select **Approve**.
4. On the request page, in the **Vendor** field, select the vendor that you're authorized to receive a rebate from, and then select **OK**.

   A Rebate accrual journal is posted for the claim amount. This posting debits the Accrued Vendor Rebates Receivable account for the expected vendor credit and credits the interim Accrued Vendor Rebates Received account for the expected gain.

5. In the rebate list, select the line, and then, on the Action Pane, select **Rebate transactions** to see and navigate to the journal batch number for this rebate accrual posting.

   To move the claims to the regular A/P process, the A/P clerk must now complete the rebate claim handling by running the Process function.

6. On the Action Pane, select **Process**, and then select **Filter**. In the **Criteria** field for the **Vendor account** field, select the vendor to process rebate claims for, select other relevant filters, and then select **OK**.

   The message bars and the status change to *Completed* indicating that the following events have occurred:

   - A Rebate accrual journal posting has reversed the previous interim amounts on the accrual receivable and expense accounts.
   - A vendor invoice (credit note) for the rebate amount has been created.

     > ⓘ **Note**
     >
     > The setting of the **Manual invoice posting** option on the **Rebate program** tab of the **Procurement and sourcing parameters** page determines whether a vendor invoice is posted manually or automatically as part of claim processing.

   - When the vendor invoice is posted, either automatically or manually, the vendor's Payable account has been debited, and the Discounts and Allowances Received account has been credited.

     > ⓘ **Note**
     >
     > The Discounts and Allowances Received account number is specified for the procurement category that is used on the purchase invoice line for the rebate. The procurement category, in turn, is set on the **Rebate program** tab of the **Procurement and sourcing parameters** page.

7. In the rebate list, select the line, and then, on the Action Pane, select **Rebate transactions** to see and navigate to the journal batch number for this rebate accrual posting and also the vendor invoice number.

8. Select the line for the vendor invoice transaction, and then, on the Action Pane, select **Vendor invoice**. If the vendor invoice has been posted, you see the Invoice journal. Otherwise, you see the vendor invoice as a pending vendor invoice that requires manual posting.

   The invoice line specifies the details of the vendor invoice for the **Commissions and Rebates** procurement category.

9. On the **All vendors** page, select the vendor that you receive a rebate from, and then, on the Action Pane, select **Transactions**. Find the line for the invoice. The rebate amount has now been added to the vendor balance.

Summary

The process for handling vendor rebates involves multiple manual tracking tasks that are often tedious. By automating these tasks, the vendor rebate management feature helps you move through the following processes:

- Generating accurate rebate claims
- Accruing the expected receivable and interim gain in the general ledger
- Updating the vendor balance and the income statement with the allowance that is due

Purchasing policies overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about purchasing policies. A purchasing policy is a collection of rules that control the requisition process. Purchasing policies help procurement administrators implement their procurement strategy by creating a policy structure that aligns with the organization's strategic purchasing requirements.

A purchasing policy consists of a set of policy rules. When you define a policy rule, you first select a rule type. You then create a rule for the rule type by defining the settings, the start date, and the end date for the rule.

For example, an administrator creates a policy, selects the *Catalog policy* rule type, and then adds a catalog policy rule to the policy. This catalog policy rule specifies that the Adventure catalog must be used for internal procurement. After you associate the purchasing policy with a particular organization, employees of that organization see the Adventure catalog when they create requisitions.

Manage purchasing policies

To manage your purchasing policies, go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchasing policies**. From there, you can create, edit, and delete purchasing policies as needed.

Assigning policies to organizations

Before a policy can take effect, you must associate it with an organization. When you create or edit a policy, use the **Policy organization** FastTab of the **Purchase policy** page to associate it with an organization.

Purchasing policies are associated with the *Procurement internal control* hierarchy purpose. Therefore, purchasing policies apply only to organizations in hierarchies that have a hierarchy

purpose of *Procurement internal control*. You can also select organizations from the flat list of legal entities in the CompanyInfo table. These legal entities are designated in the policy framework as *Companies*.

Determine which rule to apply

Depending on how you configure your purchasing policies, multiple rules can affect the users in an organization. The following examples illustrate different ways that you can configure purchasing policies and specify how policies are applied when a transaction occurs.

Example 1: Simple purchasing policy configuration

Small and less complex organizations can set up purchasing policies by legal entity and use only the *Companies* organization hierarchy.

For Fabrikam, a small business, purchasing requirements vary little across the organization. Purchasing rules vary only among the organization's legal entities. For example, employees of Fabrikam Canada and employees of Fabrikam U.S. purchase goods and services from different catalogs and different vendors. Therefore, Fabrikam sets up its purchasing policies at the legal-entity level.

Fabrikam creates two purchasing policies. *Policy A* applies to its U.S. legal entity, *1111*. *Policy B* applies to its Canadian legal entity, *2222*. When an employee in legal entity *1111* creates a purchase requisition, the policy rules come from *policy A*. For example, the product catalog that the employee sees is specified in the catalog policy rule for *policy A*.

When an employee in legal entity *2222* creates a purchase requisition, the policy rules come from *policy B*.

> **Note**
>
> If an employee of legal entity *1111* purchases an item on behalf of an employee of legal entity *2222*, the policy rules that are specified for legal entity *2222* (that is, the policy rules from *policy B*) are applied.

Example 2: Complex purchasing policy configuration

In the previous example, all purchasing rules were defined in a single organization hierarchy, the *Companies* organization hierarchy. However, a complex organization might define policies for

multiple organization hierarchies.

Contoso is a large company that requires complex purchasing rules to control the requisition process. Contoso has defined rules for two different organization hierarchies: *Department* and *Global purchasing control*.

Policy 123 is defined for the *Department* organization hierarchy for the *Sales UK – Sales* department. In *policy 123*, the purchase requisition control rule specifies that restrictions must be enforced for minimum order quantities. In this rule, the **Enforce minimum order quantity restrictions** option is selected.

Policy 456 is defined for the *Global purchasing control* organization hierarchy for the *Sales and Marketing* department. In *policy 456*, the purchase requisition control rule doesn't specify that restrictions must be enforced for minimum order quantities. In this rule, the **Enforce minimum order quantity restrictions** option is deselected.

Sam works in the *Sales UK – Sales* department in Contoso's United Kingdom office. The policies for both the *Department* and *Global purchasing control* organization hierarchies apply to Sam's department. When Sam creates a purchase requisition, the system must determine which policy to apply. The system administrator set up the purchasing policy parameters to specify that purchasing policies must be applied in the following order of precedence:

1. *Global purchasing control*
2. *Department*
3. *Companies*

Therefore, *policy 456* is applied to the purchase requisition that Sam creates, and no minimum order quantity is required for the purchase requisition.

Policy rules

When you create or edit a policy, add and configure its policy rules by using the **Policy rules** FastTab of the **Purchase policy** page. Each type of rule has its own set of conditions and actions, as described in the following subsections.

Catalog policy rule

The catalog policy rule determines which procurement catalog users see when they create purchase requisitions. If a user has been granted permission to order products on behalf of another user, the requisition uses the catalog policy rule that is defined for the requester's legal

entity and operating unit to determine which catalog to display. Before you can define a catalog policy rule, you must create and publish a procurement catalog.

Category access policy rule

The category access policy rule determines which categories users can access when they create purchase requisitions. If you don't specify a rule, users can add all the procurement categories to the purchase requisition.

1. Select the **Include parent rule** option to apply the category access policy rule of the parent organization to the category.
2. In the **Available categories** pane, select the categories that the rule applies to. When you select a category, all categories that are higher in the hierarchy are also added to the **Selected categories** list.
3. Select the **Include subcategories** option to apply the rule to all subcategories of the selected category.

Category policy rule

The category policy rule defines how users can select vendors for each category. It also defines requirements for the receiving and invoicing processes.

Reapproval rule for purchase orders

The reapproval rule is an optional rule that defines the criteria for requiring reapproval when a purchase order is changed. The selected fields are evaluated in the purchase order workflow when the *Requires purchase order reapproval* condition is set up in the workflow.

> ⓘ **Note**
>
> Accounting distribution is always reset when you change an approved purchase order with change management enabled. To avoid reapproval of a purchase order when certain fields are changed, don't include the field Accounting distribution.changed as a selected field for reapproval.

Purchase requisition RFQ rule

The purchase requisition RFQ rule defines criteria for requiring a request for quotation (RFQ) for a purchase requisition line. If a line meets the conditions, the *informal RFQ* or *formal RFQ* stamp

appears on the requisition line.

Purchase requisition control rule

The purchase requisition control rule for requisitions of type *Consumption* is an optional rule. When you create rules of this type, you can set options on various tabs:

- On the **Workflow submission** tab, configure the fields that must be entered on the requisition line for the requisition to be submitted for approval.
- On the **Order quantities** tab, configure the fields that are required on the purchase requisition under certain conditions. You can also enforce order quantities.
- On the **Dates** tab, configure whether the accounting date is the same as the requested date.
- On the **Address** tab, define whether the user is allowed to create new addresses in the system to apply to the purchase requisition.

Requisition purpose rule

The requisition purpose rule is an optional rule that determines the type of requisition purpose that is allowed for a specific legal entity. Unless another purpose is indicated in this rule, requisitions automatically have a purpose of **Consumption** when they're created.

Replenishment category access policy rule

The replenishment category access policy rule is an optional rule that determines the products that are available to fulfill requisition demand for a specific legal entity when the requisition purpose is *Replenishment*.

Replenishment control rule

The replenishment control rule is an optional rule that defines the fields that must be entered on the requisition line for the requisition to be submitted for approval when the requisition purpose is *Replenishment*.

Purchase order creation and demand consolidation rule

The purchase order creation and demand consolidation rule defines the policy rules to use when generating a purchase order from an approved purchase requisition. When you create rules of this type, set options on various tabs:

- On the **Purchase order split** tab, define criteria for splitting purchase requisition lines onto separate purchase orders.

- On the **Price/discount transfer** tab, define when to recalculate the price agreement when creating a purchase order:
  - **Only if no trade agreement** – Transfer prices and discounts from the purchase requisition only if there's no applicable trade agreement or base price. If a trade agreement or base price exists for the item or vendor, recalculate prices and discounts based on the trade agreement or the base price, and apply them to the purchase order. Unless otherwise specified, this is the default behavior.
  - **Always** – Always transfer prices and discounts from the purchase requisition.

  You can also allow the requester to change the method of price and discount transfer for individual purchase requisition lines, regardless of the price and discount transfer rule that you define. Select the **Allow manual override per purchase requisition line** option to enable this capability.

- On the **Item description transfer** tab, transfer the item description from the requisition when it originates from an RFQ.

- On the **Price Tolerance** tab, define rules to route approved purchase requisitions back through the review process when the price of a procurement catalog item increases. Set the maximum amount that the net amount on a line item on a purchase requisition can increase between the time when the purchase requisition is approved and the time when the purchase order is created. The net amount is calculated by using the following formula: ([Quantity × (Unit price – Discount) ÷ Price unit] + Purchase miscellaneous charges) × (100 – Discount percent) ÷ 100 Purchase requisition lines that exceed the price tolerance that you set are held for manual processing. The rules that you configure on the **Error processing** tab determine how the purchase requisition lines are processed.

- On the **Error processing** tab, configure the processing rule that is applied to a purchase requisition if it fails validation during purchase order creation because of a vendor error or a price tolerance error. Select one of the following options:
  - **No action** – The purchase requisition lines remain on the **Release approved purchase requisitions** page. The status of the purchase requisition lines remains *Approved*. However, you must resolve the errors before a purchase order can be generated for the purchase requisition lines.
  - **Cancel the purchase requisition line** – The purchase requisition lines are canceled. The requester can create a new purchase requisition for the canceled lines if they still want to

request the line items.
    - **Create a new purchase requisition line** – The purchase requisition lines are canceled. New purchase requisitions are then generated that contain only the purchase requisition lines that failed validation. The new purchase requisitions that are generated have a status of *Draft*. These purchase requisitions can be resubmitted for review after the validation errors are resolved. The preparer of the purchase requisition lines is notified that the lines were canceled, and that new purchase requisitions were generated for the purchase requisition lines that failed.

- On the **Manual purchase order creation** tab, define the parameters that determine whether a purchase requisition must be manually processed, or whether it can be automatically converted to a purchase order. The parameters can apply to internal catalog items, external catalog items, or non-catalog items. Select one of the following options:
    - **Manually create purchase orders** – Manually create purchase orders for all purchase requisitions.
    - **Automatically create purchase orders** – Automatically create purchase orders for all approved purchase requisitions. No purchase requisitions are held for manual purchase order creation.
    - **Automatically create purchase orders except under these conditions** – Manually create purchase orders for purchase requisitions that match the criteria that you define. All other purchase requisitions that are approved are automatically converted to purchase orders. If you select **Automatically create purchase orders except under these conditions**, you can add procurement categories and vendors to specify which approved purchase requisition lines are held for manual processing. This option can apply to internal catalog items, external catalog items, and non-catalog items. When you select a procurement category, any subcategories for that procurement category are also selected. Select the **All** option for a specific type of purchase requisition line to hold all lines of that line type for manual processing.

  If you want purchase orders to be generated automatically from approved purchase requisitions when the batch job for purchase order generation runs, select the **Run automatic purchase order creation as a batch job** option. This option applies only to purchase requisitions that don't require manual processing. By running automatic purchase order generation as a batch job, you can schedule this activity at a time when resources are less constrained. If the **Prepayment required** option is selected on the purchase requisition lines, select the **When the requisition is set up for prepayment** option to hold approved purchase requisitions for manual processing. You can filter purchase requisitions that are

held for manual processing so that you can view only those purchase requisition lines that require prepayment.

- On the **Demand consolidation** tab, define the parameters that determine whether purchase requisitions that are manually processed can be considered for purchase requisition consolidation. The parameters can apply to internal catalog items, external catalog items, or non-catalog items. Select one of the following options:
  - **Do not allow demand consolidation** – No approved purchase requisition lines are eligible for demand consolidation. This option is selected by default and applies only to purchase requisition lines that require manual processing for purchase order creation.
  - **Always allow demand consolidation** – All approved purchase requisition lines are eligible for demand consolidation. **Note:** If you select the **Always allow demand consolidation** option on the **Demand consolidation** tab, but you select the **Automatically create purchase orders** option on the **Manual purchase order creation** tab, all purchase requisitions are held for manual processing.
  - **Allow demand consolidation under these conditions** – Define the criteria that determine whether approved purchase requisition lines are eligible for demand consolidation. For each type of purchase requisition line, you can set the criteria by procurement category and vendor. If you select **Allow demand consolidation under these conditions**, you can set the criteria by procurement category and vendor for each type of purchase requisition line. When you select a procurement category, any subcategories for that procurement category are also selected. If you select the **All** option for a specific line type, all purchase requisition lines of that line type are eligible for demand consolidation.

> **ⓘ Important**
>
> If you enable budget control and set purchase requisitions to **Automatically create purchase orders** on approval, also turn on **Run automatic purchase order creation as a batch job** on the **Purchase order creation and demand consolidation** policy rule (**Procurement and sourcing** > **Setup** > **Policies** > **Purchasing policies**). Otherwise, the budget check that runs during requisition release can repeatedly re-trigger the release process, trapping requisition processing in a never-ending loop that degrades performance and can make the system unresponsive. Running automatic purchase order creation as a batch job processes approved requisitions asynchronously and prevents the loop.

Create purchasing policies

Article • 01/24/2025

This article shows you how to create purchasing policies to align with your business processes for purchasing. Before you can create purchasing policies, you must set up the purchasing policy parameters. It's possible to create, modify, and retire a purchasing policy, but you can't delete a purchasing policy. This procedure would typically be carried out by a purchasing manager. You can use this procedure in demo data company USMF or on your own data.

Set up policy parameters

1. Go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchasing policies**.
2. On the Action Pane, select **Parameters**.

    - Policy precedence rules apply to different levels in your organization. The organizational units that are shown depend on your organizational hierarchy, and on which levels in the hierarchy have been assigned the purpose of Procurement internal control. For example, your organization might have legal entities, cost centers, regions, and departments, but it might be that only some of these have a hierarchy purpose of Procurement internal control. As a default, the organization of type Company is available.

3. Select the **Policy rule type parameters** tab.
4. In the tree, go to **Purchasing policy** > **Purchase requisition control rule**.

    - You define the order of precedence for policy resolution at the policy level. However, for some policy types, you can override the order of precedence for individual policy rule types. For example, you might define the order of precedence for purchasing policies to be: cost center, department, company. For the catalog policy rule, you might want the order of precedence to be: department, cost center, company. You can change the order of precedence for the Catalog policy rule. When a worker creates a requisition, the catalog that is displayed is determined by the policies that are associated with the worker's department, then their cost center, and then their company.
    - If there's more than one organizational level listed, you can use the Up/Down arrows to set the order of precedence for the Purchase requisition control rule.

5. Close the page.

Create a new policy

1. Select **New**.
2. In the **Name** field, type a value.
3. In the **Description** field, type a value.

    - A single purchasing policy can only apply to one organization hierarchy. For example, you could have one hierarchy called *Geographic* and one called *Department*, and have a different purchasing policy for each.
    - Select an organization that the policy should apply to.

4. Select the arrow to add the selected organization.

You can repeat this process to add more organizations.

Add a policy rule

1. In the **Policy rule type** list, select **Requisition purpose rule**.

    - You'll create a rule that sets the default requisition purpose to type Consumption but allows the Replenishment type to be selected instead.

2. Select **Create policy rule**.
3. Select **Yes** in the **Allow manual override** field.
4. Select **Close**.

Now you can set up other policy rules for the purchasing policy. Note that a Policy rule type cannot have overlapping rules that are active at the same time within a single procurement policy.

Set up policies for procurement category hierarchies

Use this procedure to set up rules for ordering products in a category. The rules are defined for a specific purchasing policy. The category access rule controls which procurement categories employees can access when they create a requisition. When an employee creates a requisition, the legal entity and the operational unit that the employee belongs to determine the purchasing policy and category access rule that apply. A purchasing manager typically carries out this task.

Find the procurement policy

1. Go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchasing policies**.
2. Open the policy that you want to add a rule to. It must be an active policy.

Create a category access rule

1. Expand the **Policy rules** FastTab.
2. In the **Policy rule type** list, select the *Category access policy rule*. If the **Create policy rule** button is dimmed, it's because there's already an active policy rule for category access. Check the **Effective** and **Expiration** fields to determine which rule is active. Then select the rule, and select **Retire policy rule**. If the **Create policy rule** button is available, you don't need to do anything.
3. Select **Create policy rule**.
4. In the **Effective date** field, enter a date and time. The time must not overlap with another rule that's already active.
5. Select a category that the rule applies to. Make a note of which category this is – you need it later. When you select a category, its parent category or categories are also added to the **Selected categories** list. If you want the rule to apply to all subcategories of the selected category, select the **Include subcategories** check box.
6. Select the right arrow to add to the **Selected categories** list.
7. Select **OK**. If you set the **Include parent rule** option to *Yes*, the policy rule that you define for a parent category is also assigned to its child categories, if no policy rule exists for the child categories.

Create a category policy rule

1. In the **Policy rule type** list, select **Category policy rule**. If the **Create policy rule** button is dimmed, select the active policy rule, and then select **Retire policy rule**.
2. Select **Create policy rule**.
3. In the **Effective date** field, enter a date and time.
4. Select **Add**.
5. In the **Category** field, select the same category that you used for the **Category access rule**.
6. In the **Vendor selection** field, select an option. Select a rule to control which kind of vendors can be selected for the category when requisitions are created.
7. Select **Close**. The policy rules that you defined apply to requisitions of type Consumption. To define policies for requisitions of type *Replenishment*, create a rule for the **Policy rule type** called *Replenishment category access policy rule*.

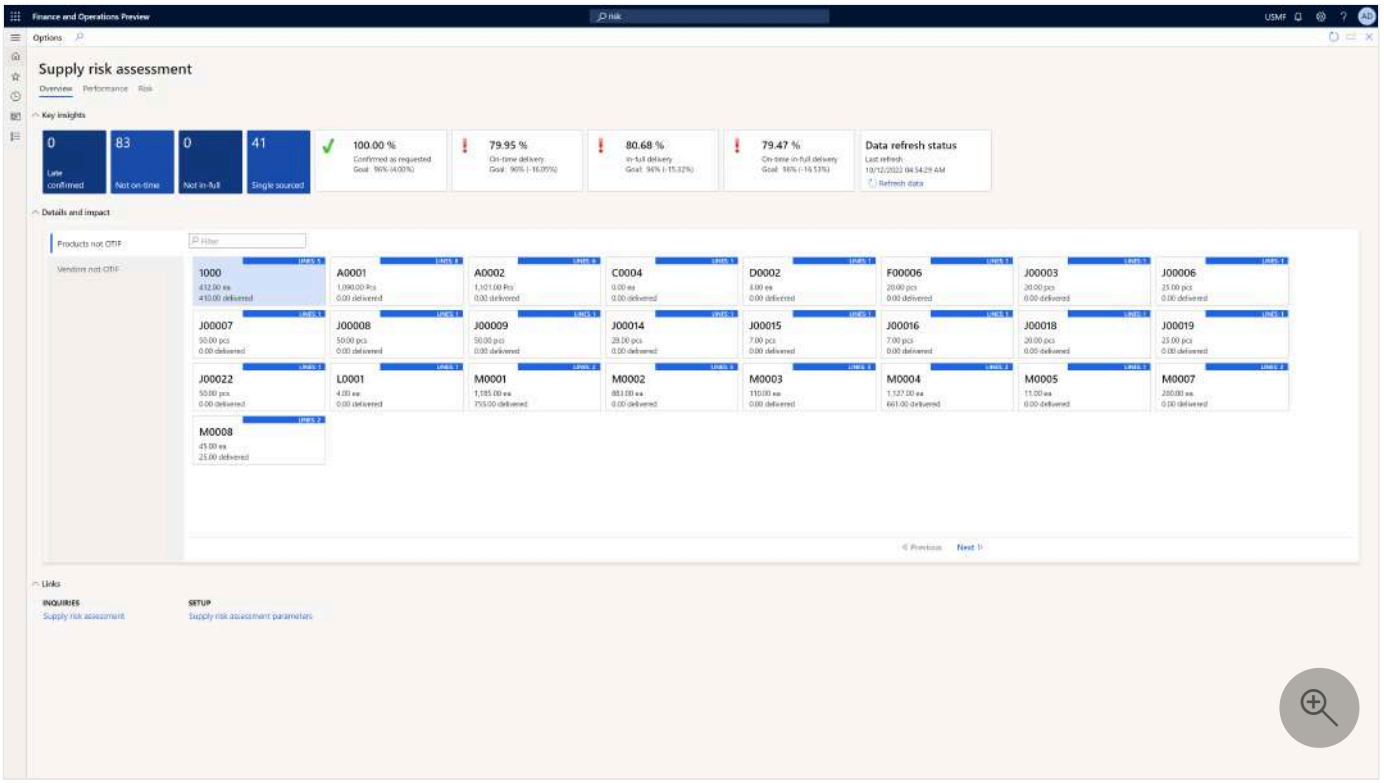
Supply risk assessment overview

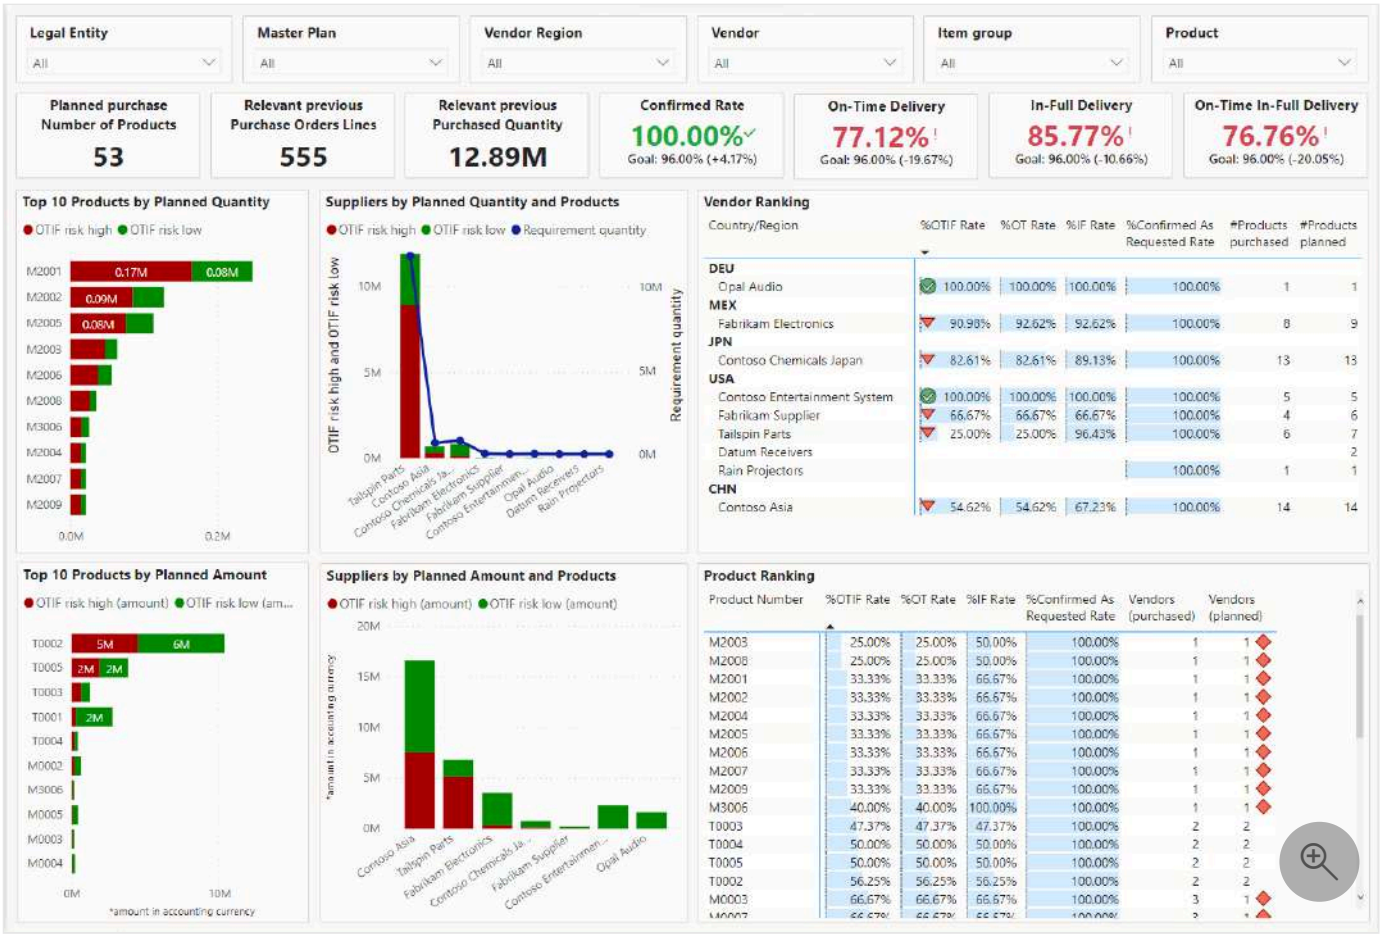
Supply risk assessment for Microsoft Dynamics 365 Supply Chain Management helps you identify supply risks, so you can take action to prevent supply chain disruptions.

The Supply risk assessment workspace, together with the supplier performance and risk analysis reports, helps supply managers understand the risk of encountering sourcing shortages and delays. It enables businesses to take proactive actions to balance cost and resilience when they optimize their supply chains.

The following illustration shows an example of the **Supply risk assessment** workspace.



The following illustration shows an example of the **Risk assessment** report for planned purchases. This report is one of the supplier performance and risk analysis reports.



The first release of this set of capabilities is available in release version 10.0.31. This release focuses on delivery performance by suppliers. It enables ranking and risk assessment based on planned orders.

The capabilities let you perform the following tasks:

- Measure the supply delivery performance of suppliers and products along several dimensions.
- Derive a risk assessment for future planned supply.

This release doesn't include the following capabilities:

- Holistic assessment of vendors along other aspects, such as financial ratings, compliance, security, and other risks
- Risks from other types of supply, such as production

The Supply risk assessment workspace as your point of entry

The **Supply risk assessment** workspace consists of lists of actionable items and embedded Power BI reports. It shows metrics such as on-time in-full (OTIF) ratings for vendors and product

rankings. It also represents the past performance as a risk for future supply. Planned purchase orders can quantify risk in terms of the quantity and amount that are at risk if the same performance and trend continue into the future.

To help mitigate the risks that you discover, you can take different approaches. For example, diversify vendors, or use different shipping methods or sourcing locations for planning. After you update the plan, reassess the supply risks and validate the improvements.

Next steps

- Turn on and set up the feature as described in Configure Supply risk assessment.
- Open the **Supply risk assessment** workspace to start discovering products and vendors that had low ratings in the past, and to access the Power BI reports for performance and supply risk analysis, as described in Actionable workspace for discovering and handling supplier risks.
- Open the Power BI reports for detailed performance and risk analysis.

Last updated on 07/01/2026

Configure supply risk assessment

This article describes how to enable and set up supply risk assessment.

Configure thresholds

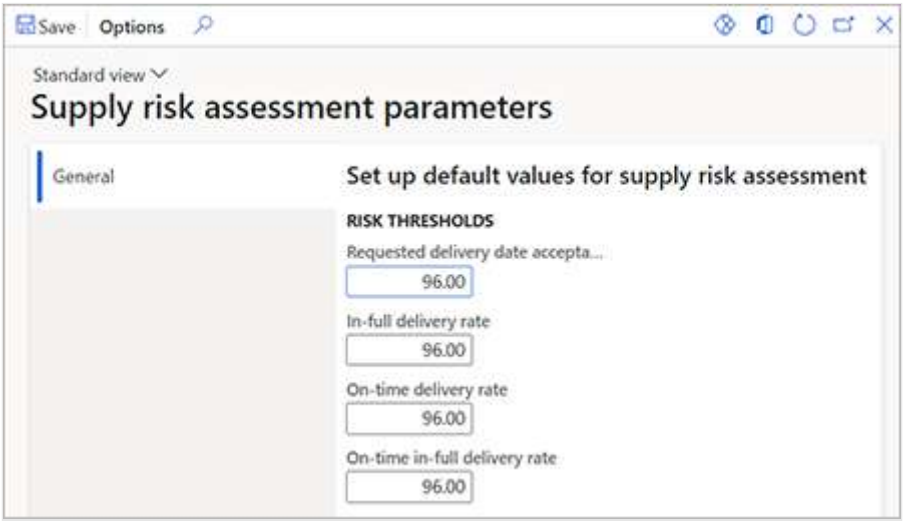
Use the following procedure to configure the feature by selecting the minimum rates that you want the system to apply when it calculates your supply risks.

1. Go to **Procurement and sourcing** > **Setup** > **Supply risk assessment parameters**.

2. On the **General** tab, set the following fields:

    - **Requested receipt date acceptance rate** – Enter the minimum percentage of orders where vendors are expected to return a confirmed receipt date (CRD) that meets your requested receipt date (RRD).
    - **In-full delivery rate** – Enter the minimum percentage of deliveries that are expected to arrive in full (IF).
    - **On-Time delivery rate** – Enter the minimum percentage of deliveries that are expected to arrive on time (OT).
    - **On-time in-full delivery rate** – Enter the minimum percentage of deliveries that are expected to arrive on time and in full (OTIF).

    Each of these metrics is calculated as a rate within the relevant scope of analysis. Set the rates that you consider a risk for your business. By default, each rate threshold is set to 96 percent.



3. On the Action Pane, select **Save**.

Initialize workspace data and configure refresh options

When you first turn on and set up the feature, the **Supply risk assessment** workspace doesn't show any data. However, because the system periodically updates the data, the workspace eventually shows data. Alternatively, you can manually initialize or refresh the data as described in the following procedure.

1. Go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**.

   > ⓘ **Note**
   >
   > You don't have to do anything in the **Supply risk assessment** workspace right now. However, you must visit it at least once after you enable the feature, to make the required data cache configuration available.

2. Go to **System administration** > **Setup** > **Data cache** > **Data set cache configuration**.

3. On the Action Pane, select **Edit**.

4. In the grid, select the row where the **Consumer** field is set to *VendSupplyRiskCacheDataSet*, and set the following fields for it:

   - **Enabled** – Select this checkbox to enable the system to keep the data in the **Supply risk assessment** workspace up to date. If you clear this checkbox, the data isn't updated.
   - **Refresh frequency (seconds)** – Specify how often (in seconds) the system should refresh the data in the **Supply risk assessment** workspace.
   - **Manual refresh** – Select this checkbox to enable the **Refresh data** button on the **Data refresh status** tile on the **Supply risk assessment** page. If you clear this checkbox, the button is still shown, but it doesn't do anything.

5. On the Action Pane, select **Save**.

6. If you selected the **Manual refresh** checkbox and want to initialize or refresh the data in the **Supply risk assessment** workspace now, follow these steps:
   a. Go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**.
   b. On the **Overview** tab, on the **Data refresh status** tile, select **Refresh data**.

Refresh the analytics entity store data used by Power BI reports

If you didn't use purchase data for Power BI until now, you might need to refresh this data and and/or set it up so that it's automatically updated from now on. If this data isn't refreshed, your Power BI reports for supply risk assessment show errors.

1. Go to **System administration** > **Setup** > **Entity store**.
2. In the list pane, find and select the record named *Purchase cube*.
3. On the Action Pane, select **Edit**.
4. Select **Refresh** to start the refresh process. This process takes about 15 minutes.
5. To set up a scheduled refresh (recommended), set **Automatic refresh enabled** to *Yes*, and then set the **Recurrence** field to the desired refresh interval.

Last updated on 07/01/2026

Actionable workspace for discovering and handling supplier risks

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The **Supply risk assessment** workspace provides a direct view of the top key insights that are related to supplier performance and related risks. It also provides embedded reports that you can use for detailed performance and risk analysis.

Open the Supply risk assessment workspace

To open the workspace, go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**.

The workspace provides three tabs for direct actionable navigation and embedded analytic reporting that uses Microsoft Power BI:

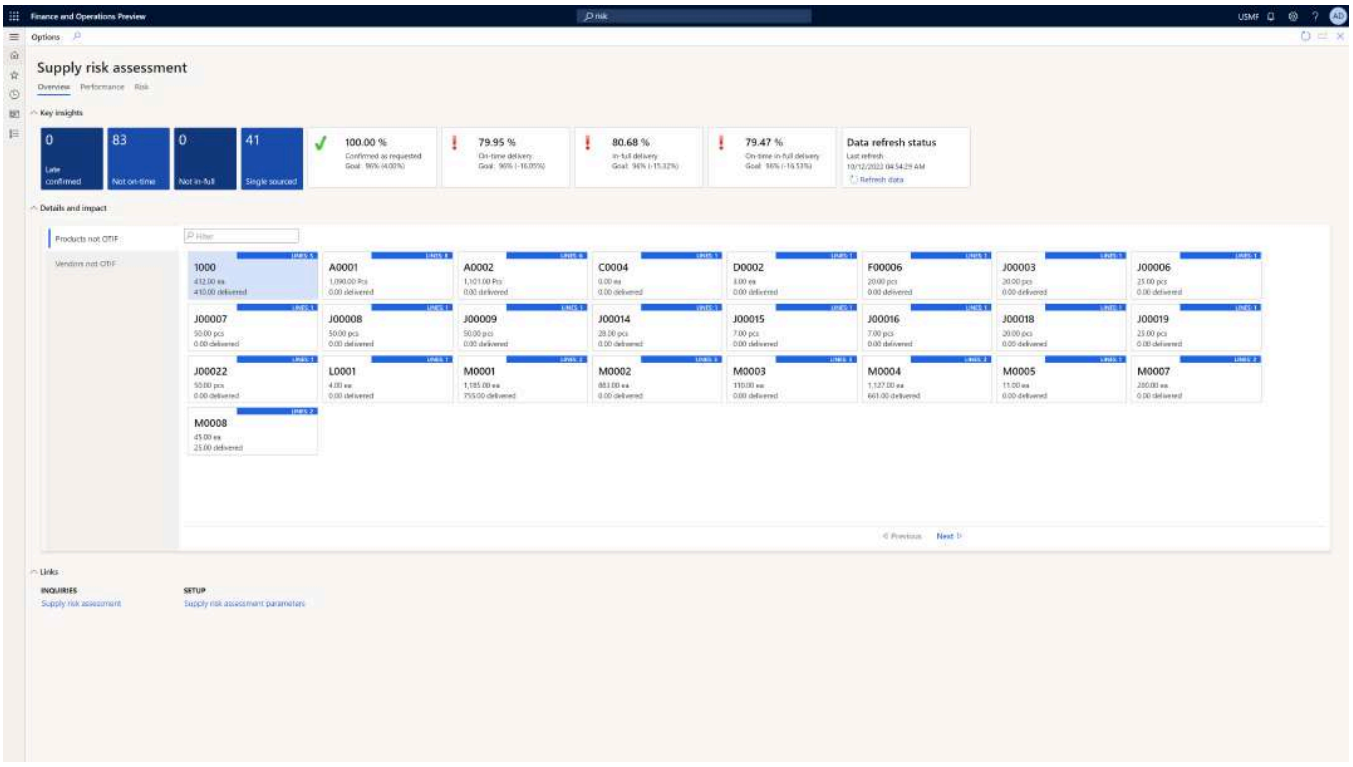
- Overview
- Performance
- Risk

Each tab is described in detail later in this article.

> **Note**
>
> If the workspace is blank or doesn't show the latest data that you expect to see, you might have to initialize or refresh the data. For instructions, see Configure supply risk assessment.

Overview tab

The **Overview** tab shows metrics and actionable content that let you navigate to relevant views and records in Dynamics 365 Supply Chain Management, such as planned orders, products, and vendors. The data on the **Overview** tab is filtered by the currently selected legal entity.

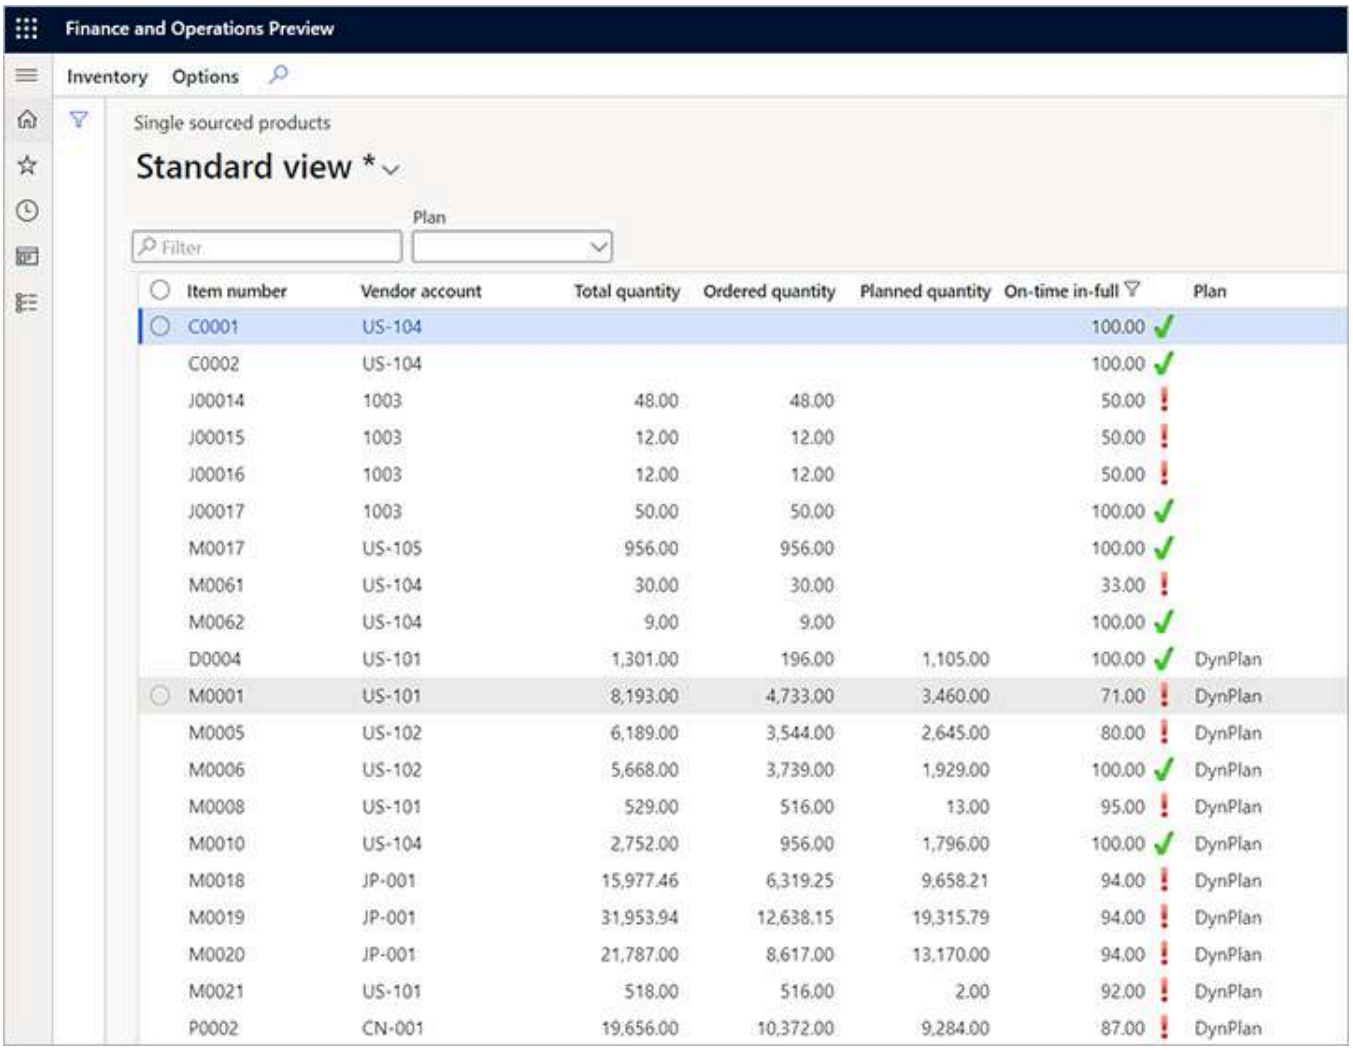


Key insights FastTab

The **Key insights** FastTab of the **Overview** tab shows the following tiles. Each tile reports a metric that is calculated for the scope of the workspace.

- **Late confirmed** – The number of purchase order lines where vendors returned a confirmed receipt date (CRD) that was later than your requested receipt date (RRD).
- **Not on time** – The number of purchase order lines that weren't delivered on time (OT).
- **Not in full** – The number of purchase order lines that weren't delivered in full (IF).
- **Single sourced** – The number of planned order items that only one vendor is assigned to. These items might indicate increased risk.

Each tile summarizes a details view, which you can open by selecting the tile. The following illustration shows the details view that is available from the **Single sourced** tile. It shows on-time in-full (OTIF) ratings and highlights whether your configured threshold was met for each item.



Item number	Vendor account	Total quantity	Ordered quantity	Planned quantity	On-time in-full	Plan
C0001	US-104				100.00	
C0002	US-104				100.00	
J00014	1003	48.00	48.00		50.00	
J00015	1003	12.00	12.00		50.00	
J00016	1003	12.00	12.00		50.00	
J00017	1003	50.00	50.00		100.00	
M0017	US-105	956.00	956.00		100.00	
M0061	US-104	30.00	30.00		33.00	
M0062	US-104	9.00	9.00		100.00	
D0004	US-101	1,301.00	196.00	1,105.00	100.00	DynPlan
M0001	US-101	8,193.00	4,733.00	3,460.00	71.00	DynPlan
M0005	US-102	6,189.00	3,544.00	2,645.00	80.00	DynPlan
M0006	US-102	5,668.00	3,739.00	1,929.00	100.00	DynPlan
M0008	US-101	529.00	516.00	13.00	95.00	DynPlan
M0010	US-104	2,752.00	956.00	1,796.00	100.00	DynPlan
M0018	JP-001	15,977.46	6,319.25	9,658.21	94.00	DynPlan
M0019	JP-001	31,953.94	12,638.15	19,315.79	94.00	DynPlan
M0020	JP-001	21,787.00	8,617.00	13,170.00	94.00	DynPlan
M0021	US-101	518.00	516.00	2.00	92.00	DynPlan
P0002	CN-001	19,656.00	10,372.00	9,284.00	87.00	DynPlan

Details and impact FastTab

The **Details and impact** FastTab has two tabs. The **Products not OTIF** tab shows a tile for each product that didn't meet the OTIF rate expectations, based on past purchase orders, whereas the **Vendors not OTIF** tab shows a tile for each vendor that didn't meet the OTIF rate expectations.

Each tile shows the number of items that were ordered and the number of items that were delivered in the relevant unit of measure. The header of each tile shows the number of relevant order lines for this calculation. The following illustration shows an example of tiles on the **Vendors not OTIF** tab.

Select a tile to view the list of order lines that were counted by that tile.

Links FastTab

The **Links** FastTab provides convenient links to the **Supply risk assessment parameters** page (see Configure supply risk assessment) and to the integrated supply risk assessment report (see Power BI reports for risks analysis and performance ranking).

Performance and Risk tabs

The **Performance** and **Risk** tabs provide in-depth analytics reports of your vendor and supply performance, and the calculated risks for your planned supply orders. For more information about how to work with these reports, see Power BI reports for risks analysis and performance ranking.

Last updated on 07/10/2025

Power BI reports for risks analysis and performance ranking

08/13/2025

Microsoft Dynamics 365 Supply Chain Management provides an integrated risk and performance report, and also two reports that are embedded into the **Supply risk assessment** workspace (supplier performance analysis and risk assessment analysis). All three reports use Power BI and are based on the same metrics as the workspace. Each report offers rich filtering and data slicing options to help you identify the most pressing supplier performance issues and potential risks for planned supply.

The tiles for metrics and key performance indicators (KPIs) at the top of each report page show relevant key figures that summarize the performance in each currently selected filter scope (including the total number of purchase orders and order lines). Some risk assessment reports show information about the planned order volume. Typically, you'll also find performance rates for the percentage of order lines that have delivery data on or before the requested date, based on order line receipts and the rates of order lines that were delivered on time (OT), in full (IF), and on time and in full (OTIF).

The metrics and KPI tiles are updated when you filter or select different vendors, products, regions, or delivery methods. This changing information can help you identify correlations with different factors that affect supply performance.

Integrated risk and performance report

The integrated risk and performance report shows information only about planned orders and is therefore most relevant for risk assessment. It combines elements of the two embedded reports. For information about how to use and interpret the various views of this report, see the later sections of this article.

You can open the integrated risk and performance report in two ways:

- Go to **Procurement and sourcing** > **Inquiries and reports** > **Supply risk assessment** > **Supply risk assessment**.
- Go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**, and then, on the **Links** FastTab, select the **Supply risk assessment** link.

Embedded supplier performance analysis

The workspace-embedded supplier performance report shows a holistic performance assessment, not only for planned orders but also for all products that have previously been purchased.

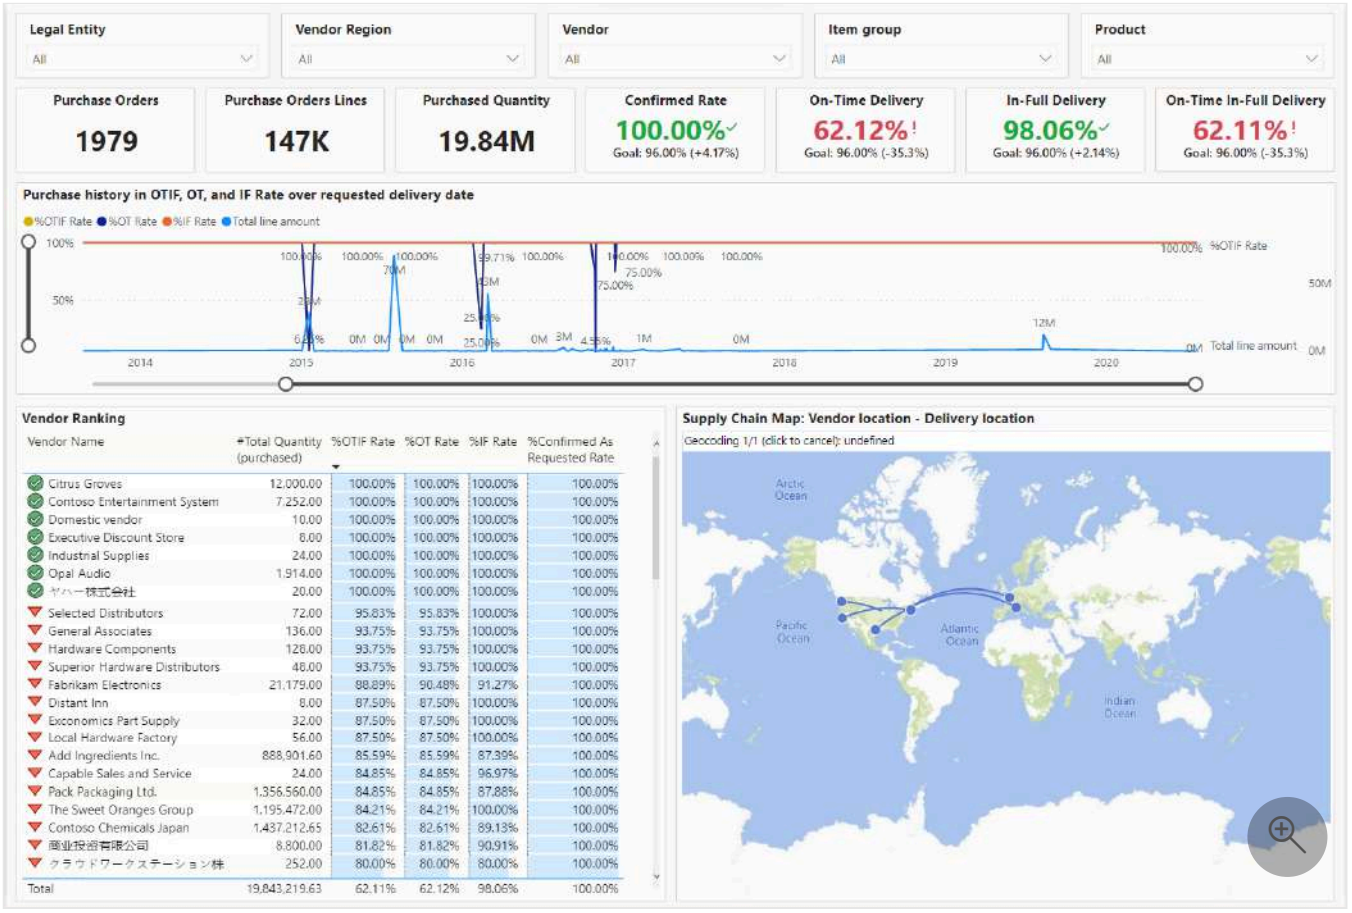
To open the embedded supplier performance analysis report, go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**, and then select the **Performance** tab.

All supply performance analysis reports provide a header that includes slicers and filters. To limit your analysis, select products, and then use the slicers and filters to select the relevant legal entities (companies), regions, vendors, and item groups. The filters are carried through the different report pages. Therefore, you don't have to repeatedly reapply the filter settings.

Vendor and product ranking report

Use the two similar reports for product and vendor ranking to study the historic order performance in terms of OTIF deliveries. You can find OTIF trends and outliers in the timeline of deliveries, and see them in relation to the total line amounts.

You can zoom in on the timeline and select individual data points to see the related vendors or products. Alternatively, you can select one or more vendors, based on their ranking, and see the appropriate performance timeline.



Multi perspective OTIF ranking

On this report, the worst OTIF rankings are calculated from various perspectives and shown side-by-side for products, vendors, delivery methods, and sites. You can use individual or combined dimensions to identify bottlenecks that might cause a drop in supply performance.

Embedded supply risk assessment analysis

The workspace-embedded supply risk assessment report shows a holistic performance assessment, not only for planned orders but also for all products that have previously been purchased.

To open the embedded supplier performance analysis report, go to **Procurement and sourcing** > **Workspaces** > **Supply risk assessment**, and then select the **Risk** tab.

The risk assessment report turns the performance observations into a risk calculation for planned orders, based on purchase order receipts.

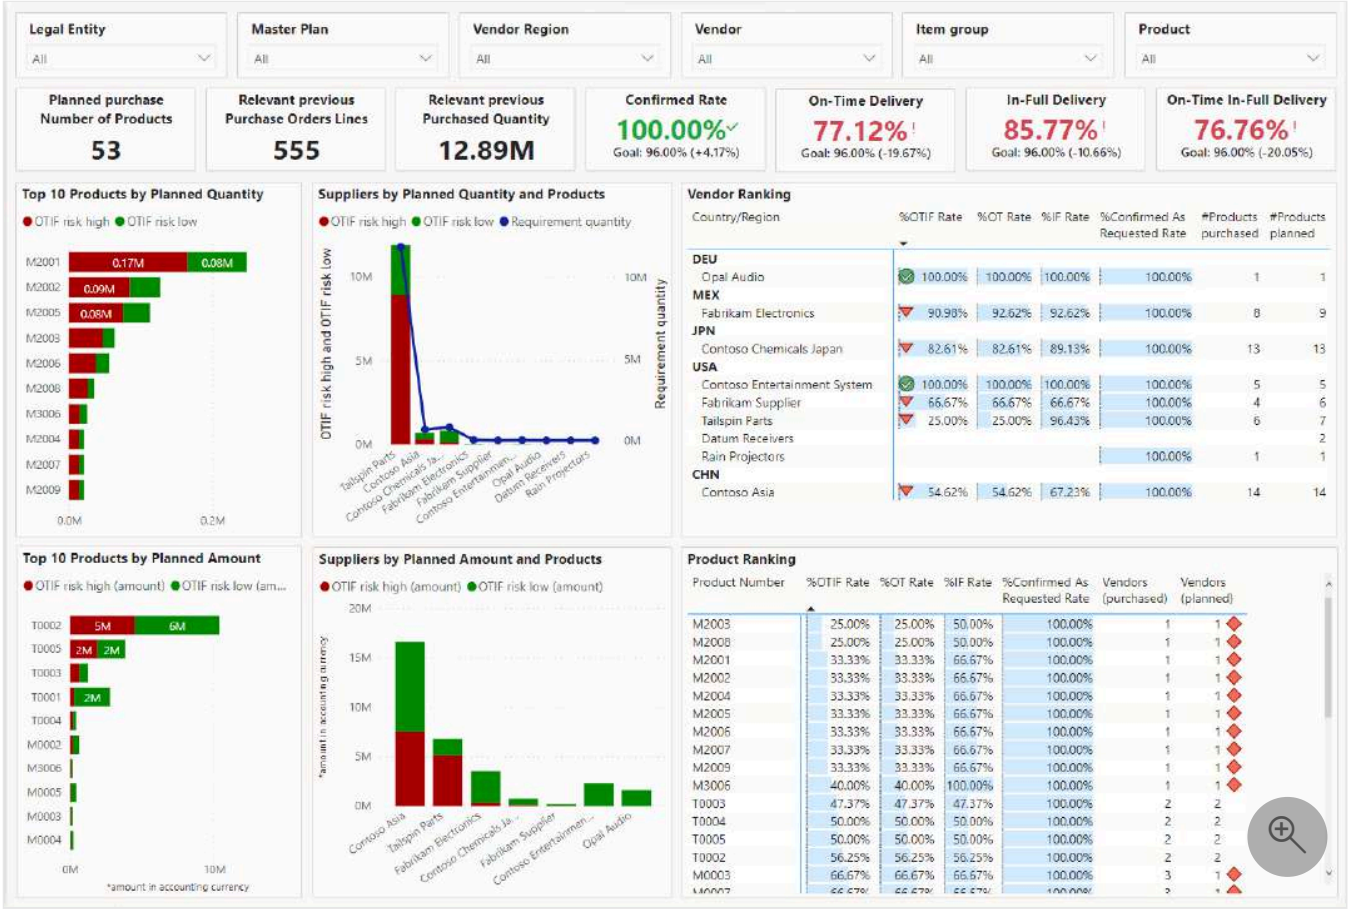
All supply risk analysis reports provide a slicer and filter header that includes a master plan selector. You can use this filter to select a single master plan. In this way, you can help prevent the unwanted double accounting of planned orders from multiple plans.

Risk assessment overview report

This report helps you analyze the calculated risks for your planned purchases. After you filter to the desired scope, you'll see the top-10 products ranked by risk in their aggregated quantity and amount. The high-risk classification is derived from the planned product quantity and amount multiplied by the observed OTIF rate of past orders. The low OTIF risk is the remaining total quantity or amount.

> **Note**
>
> The risk assessment is most statically significant when most of the order lines in the observed time frame are for products where few fundamental changes are expected to surrounding factors.

After you zoom in on a group of planned product supplies, you can study additional performance statistics for the products and vendors that are assigned to the planned orders.

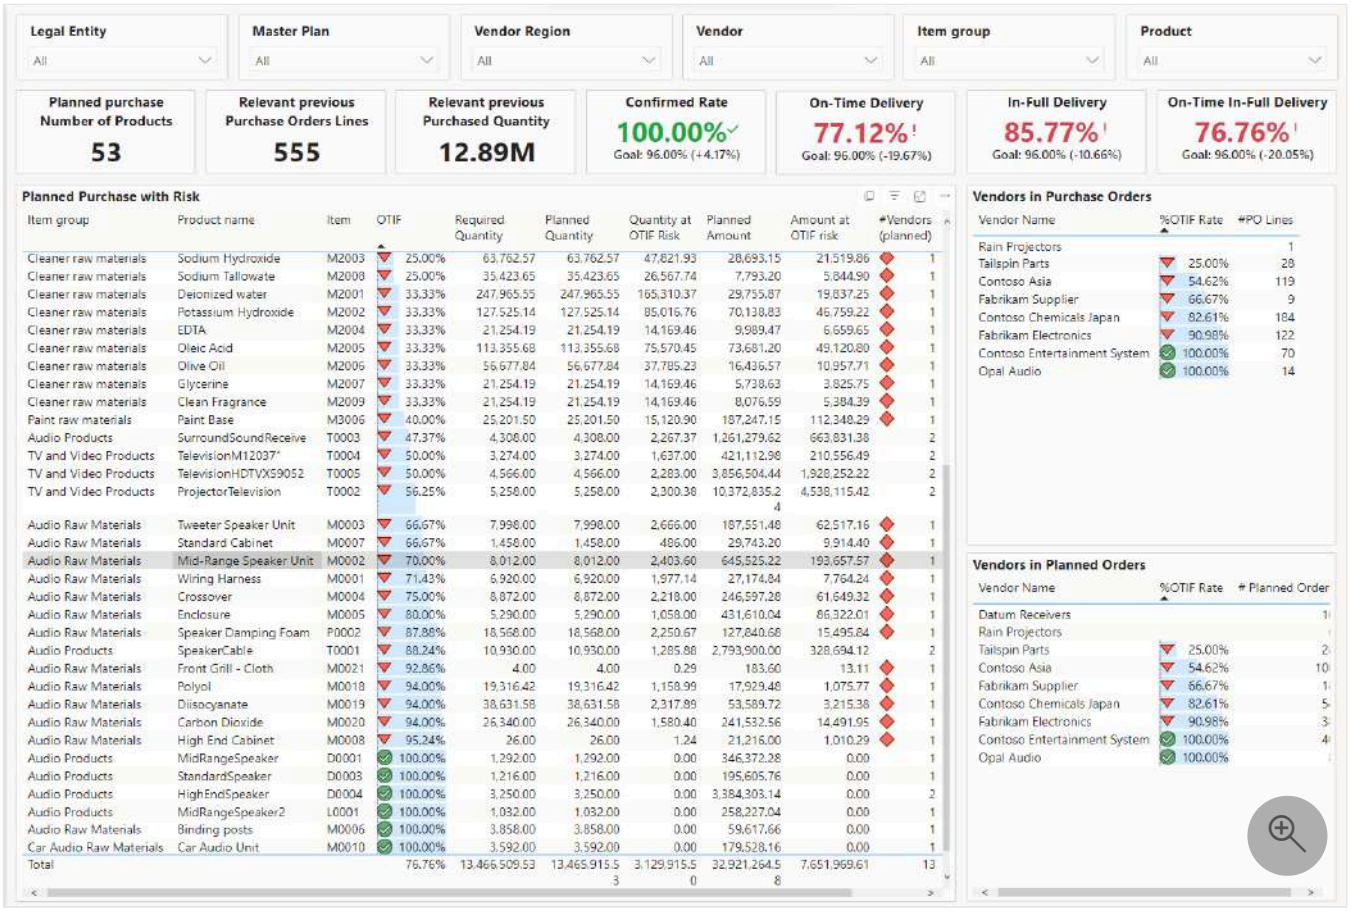


Detailed sourcing risk breakdown

The detailed planned purchase risk breakdown lists show all at-risk products within their item groups, together with the planned quantity and amount, and the corresponding risk amounts.

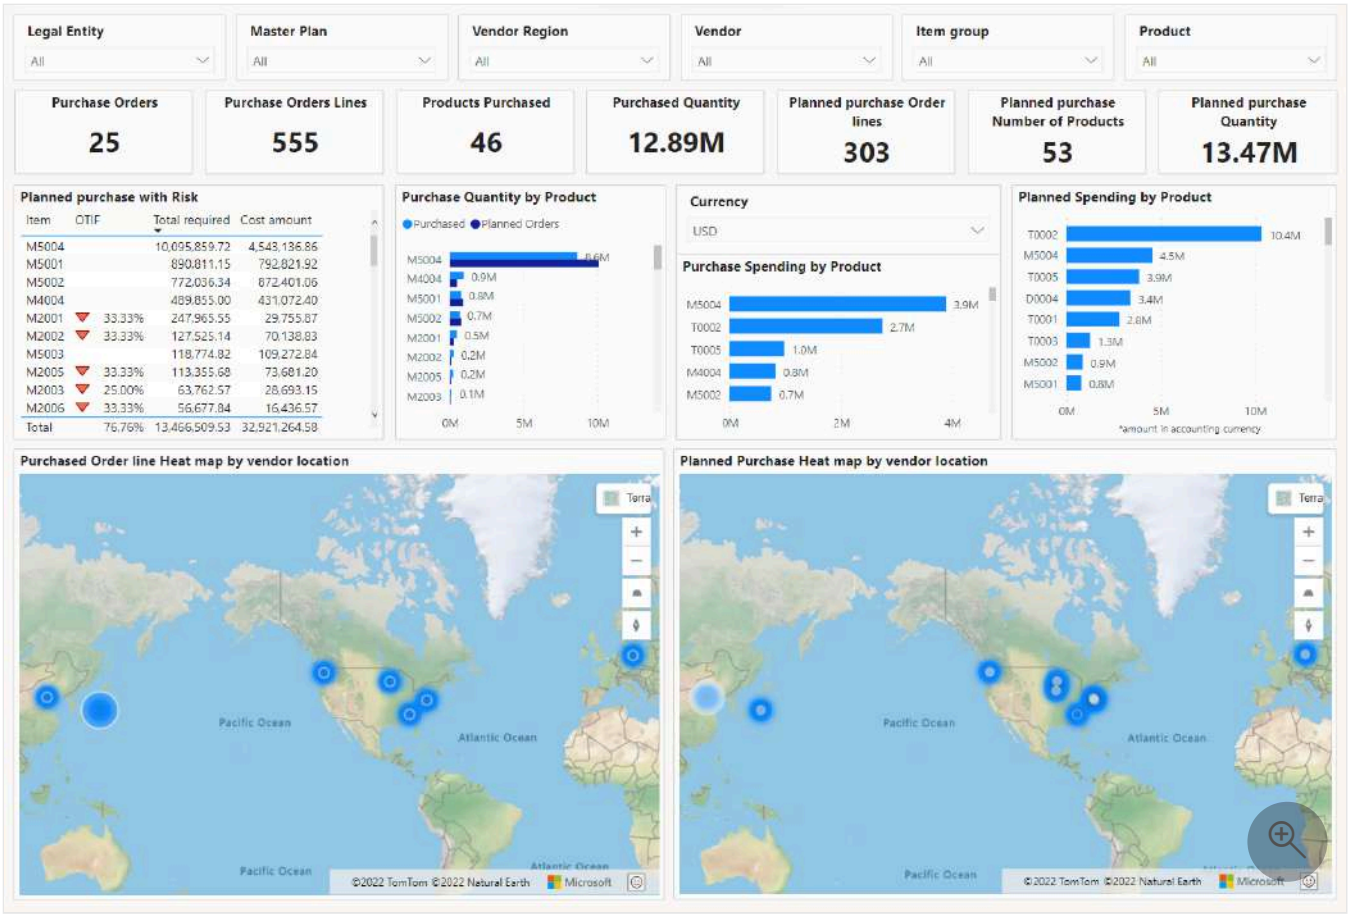
This view can help you study vendors that were used for past orders that led to bad performance. Consider using other or additional vendors to help reduce the risk for future

planned purchases.



Compare vendor locations between past order and planned orders

To better compare the overall supply-originating location (vendor location), you can study the side-by-side geographic maps. These maps are heat maps that highlight where supply was coming from for purchase orders versus planned supply orders.



Supply flow comparison from the past against planned supply

You can dive deeper into the supply from source to delivery location in comparison to past purchase and planned supply. You can filter by items that have been identified as at risk and by delivery methods. In this way, you can identify potential risks that are imposed by the route and method of delivery.

Product receipt against purchase orders

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the various options for registering products as received.

Product receipt is the process of recording that products you ordered are received so that the purchase order (PO) lines can be processed for invoicing. In some cases, products go through preregistration, where you record additional information from the supplier before receiving the products. When products arrive, you first mark them as *Registered*. You might then send the products through other processes, such as quality management, before you finally mark them as *Received*.

Preregistration (ASN)

Suppliers might share information about products that they'll ship. In this case, you can preregister the products to record this information before receiving the products. By preregistering products, you reduce the amount of work that is required during item registration and receipt. Suppliers can provide product information electronically through an Advance Shipment Notice (ASN) that the system automatically records. The information in the ASN includes the quantity of products that will be shipped and the date when they'll be shipped. The ASN might also include information such as batch or serial numbers. The **Transportation management** module registers the ASN.

Registration

You often register product receipt at the inbound docks in a warehouse. Workers register receipts using a hand-held device or through arrival journals. Alternatively, you can manually register product receipt by using the **Registration** action on the **Purchase order** page. In both cases, you mark the products as *Registered*. You don't yet mark the products as *Received*.

Products that you receive in a warehouse might go through quality inspection before workers put them away into inventory. Either quality orders or quarantine orders can be used to perform quality inspection. If you use quality orders, you can configure the process to temporarily block products through a reservation while they're inspected. If you use quarantine

orders, workers move products to another warehouse for inspection. This warehouse is known as the quarantine warehouse. In both quality inspection processes, workers might scrap some of the goods, either because they don't conform to the quality expectations or because the quality inspection involves destructive testing of a sample of the product.

Product receipt

Use the **Product receipt** action on the **Purchase orders** page to mark products as *Received* on the purchase order. The **Posting product receipt** page has various options for the quantity that you account as received. For example, you can set the **Quantity** field to *Ordered quantity* or *Receive now quantity*. Alternatively, if a warehouse arrival process is used, set this field to *Registered quantity*. You can modify the quantities on each order line that you mark as *Received*, to account for any discrepancies, such as under-delivery and over-delivery. During product receipt, specify a product receipt identifier, which is typically a reference to the packing slip from the supplier. This identifier is required for accounting, because it enables checks or audits of supplier packing slips against what is received, and the accounted inventory or expense.

Create purchase orders for products that aren't intended as inventory but are considered an expense. This category includes order lines where the products are marked as *Not stocked* by their inventory model group, and also lines that use procurement categories. In this case, the items might not go through arrival registration and receipt in the warehouse. Instead, use the **Product receipt** action to record the receipt directly on the purchase order, and the receipt is based on the ordered quantity, not a registered quantity.

Use the **New fixed asset** option for purchase order lines to indicate that the purchase is a fixed asset instead of inventory. In this case, the fixed asset determination rules that you configure determine whether the purchase of the product or category exceeds specific thresholds, and must therefore be accounted for as an asset and go through fixed asset management. You can also make purchases toward an existing fixed asset. In this case, adjust the amount as appropriate.

You can select multiple orders and process receipt on all those orders together. This approach isn't used often, but you might want to use it if a supplier consolidates shipments for you into a single load. During product receipt on the purchase, there's a function for doing summary updates. Summary updates let you post a single packing slip from the supplier for more than one purchase order.

You might create purchase orders from a sales order where the **Direct delivery** option was selected. When you use direct delivery, the products never arrive in your warehouse but are shipped directly from the supplier to the customer. In this case, you usually record the receipt directly on the purchase order. The receipt can be done automatically, such as through electronic data interchange (EDI) integration with the supplier. Alternatively, if the purchase

order is an intercompany order, Supply Chain Management automates the receipt on the intercompany sales order when shipment occurs. When you use direct delivery, you still account products as inventory, even though they don't physically arrive at the warehouse. Therefore, when you register product receipt on the purchase order, the sales order is automatically updated with a packing slip, so that the overall change to inventory is 0 (zero). In direct delivery scenarios, you shouldn't require preregistration. If you're using warehouses that are enabled for warehouse management, you can get around the requirement for license plate registration by specifying a virtual warehouse instead. You specify this warehouse in the **Direct delivery warehouse** field on the product.

After you process the product receipt on the purchase order, the system sets the purchase order status to *Received* to indicate that the invoice can be processed for the order. You can review details about products that are already received by using the **Product receipt journals** page.

You can access this page from the **Receipt** action group on the **Purchase order** page. The information in the journals includes details about the quantities, dates, and dimensions.

Auto posting product receipts

To automatically post product receipts for multiple purchase orders, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase orders** > **Receiving products** > **Post Product receipt**.
2. In the **Posting product receipt** dialog, on the **Settings** FastTab toolbar, select **Select**.
3. In the **Purchase update** dialog, use the **Range** tab to specify selection criteria for finding the purchase orders you want to post.
4. Select **OK** to return to the **Posting product receipt** dialog. The purchase orders that match the criteria you specified are displayed on the **Overview** FastTab.
5. On the **Overview** FastTab, enter the product receipt identifier in the **Product receipt** column for each purchase order in the grid. This information enables the system to post the product receipt.

   You must specify a product receipt identifier when each product is received. It's typically a reference to the packing slip from the supplier. This identifier is required for accounting because it enables supplier packing slips to be checked against what was received and against the accounted inventory or expense.
6. Select **Batch** to open the **Batch processing** dialog, where you can set up the batch job that posts the product receipt.

7. Select **OK** to return to the **Posting product receipt** dialog.
8. Select **OK** to close the **Posting product receipt** dialog.

After the system finishes processing product receipts for all lines in the purchase order, it sets the purchase order status to *Received* to indicate that the invoice can now be processed for the order.

To correct or cancel a product receipt, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase orders** > **Receiving Products** > **Product receipt**. The **Product receipt journal** page opens.
2. On the **Overview** tab, select the product receipt that you want to correct or cancel.
3. On the **Overview** tab toolbar, select **Correct** to make corrections or **Cancel** to cancel the product receipt.

> **Note**
>
> - When correcting a product receipt, you can only reduce the received quantity. To raise the quantity, you must post a new product receipt journal.
> - Late selection isn't supported for product receipt posting. A product receipt number is required when you post a packing slip, but when you use late selection, this number isn't available because no parameter table exists and the system doesn't create an interaction during batch recurrence processing. Therefore, late selection is disabled for packing slip posting to ensure successful batch processing.

Auto post product receipts when using WMS

Auto posting works differently if you're using warehouse management processes (WMS). Learn more in Warehouse handling of inbound loads for purchase and inbound shipment orders.

Vendor invoices overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides general information about vendor invoices. Vendor invoices are requests for payment for products and services. Vendor invoices might represent a bill for ongoing services, or they can be based on purchase orders for specific items and services.

Vendor invoices

A vendor invoice from a purchase order is produced when products or services are received according to a purchase order placed with a vendor. The vendor invoice contains a header, and one or more lines for items or services. A vendor invoice completes the cycle from purchase order to product receipt to vendor invoice.

Although some vendor invoices connect to a purchase order, vendor invoices can also contain lines that don't correspond to purchase order lines. You can also create vendor invoices that aren't associated with any purchase order. These vendor invoices might represent ongoing services, such as a utility bill. You don't have to reference a purchase order when you add an ongoing service.

There are several ways to enter a vendor invoice:

- Use the vendor invoice register to quickly enter invoices that don't reference a purchase order, so that you can accrue the expense. By using the vendor invoice approval journal, you can select those invoices and post them to the vendor balance to reverse the accrual.
- Use the vendor invoice journal to quickly enter invoices that don't reference a purchase order, in a single step.
- Together with the vendor invoice pool, use the vendor invoice register to quickly enter invoices to accrue the expense. You can open the associated purchase orders later to post the invoice against the expense account.

- Use the **Open vendor invoices** and **Pending vendor invoices** pages to create vendor invoices from confirmed purchase orders.
- The **Invoice capture solution** automatically creates vendor invoices from digital invoice images. For more information, see Invoice capture.

The following discussion provides more information about how to use the **Open vendor invoices** or **Pending vendor invoices** page to create a vendor invoice from a purchase order.

Understanding invoice line quantities

When you open a vendor invoice from a related purchase order, the system creates invoice lines from the purchase order. By default, the system takes the quantities from the product receipt. However, you can use any of the following default behaviors:

- **Receive now quantity** – Use this option for partial shipments. The default value in the **Quantity** field is set to the quantity specified in the **Receive now** field on the purchase order.
- **Ordered quantity** – Use this option for complete shipments. The default value in the **Quantity** field is set to the quantity specified in the **Ordered** field on the purchase order.
- **Registered quantity** – Use this option if the item requires registration, as specified on the **Item model groups** page. The default value in the **Quantity** field is the physical update quantity that has been registered.
- **Product receipt quantity** – Use this option if a product receipt has already been received for the order. The default value in the **Quantity** field is the total quantity of available product receipts.
- **Registered quantity and services** – Use this option if quantities are registered in arrival journals for stocked items or items that aren't stocked. This option also includes services, regardless of whether they're registered.

If your legal entity uses invoice matching, you can view the results of the quantity matching in the **Product receipt quantity match** column. You can also use the **Matching details** button on the **Review** tab of the Action Pane to view the results of the quantity matching.

Adding a line that wasn't on the purchase order

You can add a line that wasn't on the purchase order to the vendor invoice. You must select an item number or procurement category. You can then add quantities, prices, and amounts to the line. The line is included only in matching policies for invoice totals.

Submitting a vendor invoice for review

Your organization might use workflows to manage the review process for vendor invoices. Workflow review can be required for the invoice header, the invoice line, or both. The workflow controls apply to the header or the line, depending on where the focus is when you select the control. Instead of the **Post** button, a **Submit** button sends the vendor invoice through the review process.

Preventing invoice submission to workflow

To prevent an invoice from being submitted to a workflow, use the following options.

- **Invoice total and the registered total aren't equal.** The user who submitted the invoice receives an alert that the totals aren't equal. This alert gives the user an opportunity to correct the balances before they resubmit the invoice to the workflow system. This feature is available if the **Prohibit submission to workflow when the invoice total and registered invoice total aren't equal** parameter on the **Feature management** page and the **Workflow option when invoice total and registered total aren't equal** parameter on the **Accounts payable parameters** page are turned on.
- **Invoice contains unallocated charges.** The user who submitted the invoice receives an alert that the invoice has unallocated charges. In this way, the user can correct the invoice before they resubmit it to the workflow system. This feature is available if the **Prohibit submission to workflow when there are unallocated charges on a vendor invoice** parameter on the **Feature management** page and the **Workflow option when unallocated charges exist** parameter on the **Accounts payable parameters** page are turned on.
- **Invoice contains the same invoice number as another posted invoice.** The user who submitted the invoice receives an alert that an invoice was found that has a duplicate number. The user can correct the duplicate number before they resubmit the invoice to the workflow system. The alert is shown if the **Check the invoice number used** parameter in Accounts payable is set to **Reject duplicate**. This feature is available if the **Prohibit submission to workflow when the invoice number already exists on a posted invoice, and your system isn't set up to accept duplicate invoice numbers** parameter on the **Feature management** page is turned on.
- **Invoice contains a line where the invoice quantity is less than the matched product receipt quantity.** The user who submits the invoice or tries to post it receives a message that the quantities aren't equal. This message gives the user an opportunity to correct the values before they resubmit the invoice to the workflow system. This feature is available if the **Block posting and submission of vendor invoices to workflow** parameter on the

Feature management page and the **Block posting and submission to workflow** parameter on the **Accounts payable parameters** page are turned on.

Matching vendor invoices to product receipts

Enter and save information for vendor invoices, and match invoice lines to product receipt lines. You can also match partial quantities for a line.

Create a vendor invoice based on the product receipt line items that you received through the current date, even if you didn't receive all the items for a particular purchase order. For example, use this option if a vendor sends one invoice per month to cover all the deliveries that it shipped during that month. Each product receipt represents a partial or complete delivery of the items on the purchase order.

When an invoice is in workflow, the approver can update invoice quantities so that they match the value in the **Product-receipt-quantity-to-match** field. To do so, select the **Update the invoice quantities to match product receipt quantities in workflow** feature in the **Feature management** workspace and select **Enable**. If an approver in the workflow process removes all the matches from all the product receipts from the invoice line, the invoice line is deleted. When this feature isn't enabled, invoice quantities aren't updated for invoices in workflow.

When you post the invoice, the **Invoice remainder** quantity for each item is updated with the total of the received quantities from the selected product receipts. If both the **Invoice remainder** quantity and the **Deliver remainder** quantity for all items on the purchase order are 0, the status of the purchase order changes to **Invoiced**. If the **Invoice remainder** quantity isn't 0, the status of the purchase order remains unchanged, and you can enter additional invoices for it.

This option assumes that you posted at least one product receipt for the purchase order. The vendor invoice is based on these product receipts and reflects the quantities from them. The financial information for the invoice is based on the information that you enter when you post the invoice.

For more information, see Record vendor invoice and match against received quantity.

Configure an automated task for vendor invoice workflow to post the vendor invoice using a batch job

Add an automated posting task to the Vendor invoice workflow so that invoices are processed in a batch. Posting invoices in a batch lets the workflow process continue without having to wait for

the posting to finish, which improves the overall performance of all the tasks submitted to the workflow.

To post a vendor invoice in a batch, on the **Feature management** page, turn on the **Vendor invoice batch posting** parameter. Configure vendor invoice workflows by going to **Accounts payable** > **Setup** > **Accounts payable workflows**.

You can see the **Post the vendor invoice using a batch** task in the workflow editor, regardless of whether the feature parameter, **Vendor invoice batch posting**, is enabled. When the feature parameter isn't enabled, an invoice that contains the **Post the vendor invoice using a batch task** isn't processed in workflow until the parameter is enabled. The **Post the vendor invoice using a batch** task must not be used in the same workflow as the **Post vendor invoices** automated task. Also, the **Post the vendor invoice using a batch** task should be the last element in the workflow configuration.

You can specify the number of invoices to include in the batch, and the number of hours to wait before rescheduling a batch, by going to **Accounts payable** > **Setup** > **Accounts payable parameters** > **Invoice** > **Invoice workflow**.

Working with multiple invoices

You can work with multiple invoices at the same time and post all of them at the same time. If you need to create multiple invoices, use the **Pending vendor invoices** page. If you must post and print multiple vendor invoices, use the **Invoice approval journal**. If you're using the **Invoice approval journal**, you must post at least one product receipt for the purchase order, and you must post an invoice for the purchase order in an invoice register. The financial information for the invoice comes from the invoice that you posted in the register.

Recovering vendor invoices that are in use

While a user is using a vendor invoice, other users can't edit it. However, the state of an invoice might sometimes indicate that the invoice is in use, even though no user is actively editing it. For example, the application might stop responding while the invoice is being edited, or a user might inadvertently leave the invoice open in the application.

Use the **Recover vendor invoices** page to recover or release vendor invoices that are in use for more than four hours, so that you can edit them. You can open this page from the **Periodic task** navigation or a tile on the **Vendor invoice entry** workspace. After you recover an invoice, it's available for editing on the **Vendor invoice** page.

You can access the **Recover vendor invoices** page only if you're assigned the **Recover vendor invoices in use** security duty and privilege. Additionally, the **Allow vendor invoice recovery** parameter on the **Accounts payable parameters** page must be turned on.

Default financial dimension in vendor invoice lines

For vendor invoices that are associated with a purchase order, the default financial dimension comes from the corresponding purchase order lines.

For vendor invoices that aren't associated with any purchase order, the default financial dimension merges the dimensions from the dimension link, invoice header, and item. If the same dimension is defined on the dimension link, invoice header, and item, the dimension on the invoice line follows this priority sequence: dimension link > invoice header > item

Resetting the workflow status for vendor invoices from Unrecoverable to Draft

A workflow instance that stops because of an unrecoverable error has a workflow status of **Unrecoverable**. When the status of a vendor invoice workflow is **Unrecoverable**, you can reset it to **Draft** by selecting **Recall**. You can then edit the vendor invoice. This feature is available if the **Resetting the workflow status for vendor invoices from Unrecoverable to Draft** parameter on the **Feature management** page is turned on.

Use the **Workflow history** page to reset the workflow status to **Draft**. You can open this page from **Vendor invoice** or from the **Common** > **Inquires** > **Workflow** navigation. To reset the workflow status to **Draft**, select **Recall**. You can also reset the workflow status to **Draft** by selecting the **Recall** action on the **Vendor invoice** or **Pending vendor invoices** page. After you reset the workflow status to **Draft**, you can edit the vendor invoice on the **Vendor invoice** page.

Viewing the invoice total on the Pending vendor invoices page

You can view the invoice total on the **Pending vendor invoices** page by enabling the **Display invoice total on pending vendor invoices list** parameter on the **Accounts payable parameters** page.

Vendor open transactions report

The **Vendor open transactions** report provides detailed information about the open transactions for each vendor as of the date that you specify. Use this report during the audit procedure to verify balances between vendor book transactions and ledger account transactions.

For each transaction, the report includes the following details:

- Invoice number
- Transaction date
- Voucher number
- Transaction amount in the transaction currency and accounting currency
- Credit balance in the transaction currency and accounting currency
- Debit balance in the transaction currency and accounting currency
- Subtotal amount in the accounting currency
- Payment due date

Filter the data on the report

When you generate the **Vendor open transactions** report, the following default parameters are available. Use them to filter the data that the report includes.

- **Exclude future settlement** – Select this checkbox to exclude transactions that are settled after the date that you enter in the **Open transactions per** field.
- **Open transactions per** – Enter a date to include transactions that are open as of that date. If you don't enter a date, this field is set to the maximum date. (The maximum date is the latest date that the system accepts, December 31, 2154.) By default, the next time that you run the report, this field is set to the last date that you entered in it.

Use the filters under the **Record to include** field to further limit the transaction data that the report includes.

Extend invoice number length

Starting in Dynamics 365 Finance version 10.0.40, you can enable the **Extend the length of invoice number for vendor invoice** feature to increase the invoice number from 20 characters to 50 characters in the vendor invoice and invoice journal. Before enabling the feature, create a ticket in Lifecycle services to open the **EnableEdtStringDatabaseStringLengthAttributeInComputation** flight.

Additional resources

- Set up vendor invoice policies

Set up and maintain vendor collaboration

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The vendor collaboration interface exposes a limited set of information about purchase orders, invoices, and consignment stock to external vendor users. From this interface, a vendor can also reply to requests for quotation (RFQs), and view and edit basic company information.

This article explains how to set up vendor collaboration in Dynamics 365 Supply Chain Management. It also explains how to set up a workflow to provision new vendor collaboration users, and how to manage the security roles for those users.

Set up vendor collaboration security roles

A procurement professional or a vendor that has enough permissions can request that a contact person be provisioned as a user by enabling **Provision vendor user** on the contact person record. During the provisioning process, user permissions are selected for the new external user, and the new vendor user request is submitted. It's important that you correctly set up the user permissions that are available for selection in the vendor user request. Otherwise, vendors might be granted access to information that they shouldn't have access to in Supply Chain Management.

Set up the security roles that are available for selection when a new user request is used for a contact person

1. Select **System administration** > **Security** > **External roles**.
2. Select **New**, and then select a security role and the *Vendor* party role.

You might want to add the *Vendor admin (external)* and *Vendor (external)* roles that are provided in Supply Chain Management. Alternatively, you can use security roles that your company has created.

You should make the *Vendor admin (external)* role available only if vendors should be able to create new contacts, submit vendor collaboration user requests for new users and changes to user information, and handle those requests via a workflow.

If you plan to manually set up vendor contacts and users, you can make just the *Vendor (external) role* available. This role will then be the only role that can be requested through a vendor user request.

> **Note**
>
> The *SystemUser* role is automatically granted when you manually create a new user account. Therefore, you must remove that role and assign the *SystemExternalUser* role. If new user accounts are created via the workflow that is initiated by a vendor user request to provision a new user, one or more of the roles that you've set up for vendor collaboration and the *SystemExternalUser* role will be assigned.

Vendor admin (external) security role

The *Vendor admin (external)* role can be used for external vendors that maintain vendor contact information and make requests to provision new vendor collaboration users. External users who have this security role can perform the following tasks:

- View and modify contact person information, such as the person's title, email address, and telephone number.
- Add a new or existing contact person to the vendor accounts that they're a contact for.
- Delete any contact person that they have created.
- Activate or deactivate the association between a contact person and a vendor account. After the association between a contact person and a vendor account is deactivated, the contact person can't be referred to on new purchase orders or other documents.
- Deny or allow a contact person's access to documents on the vendor collaboration interface that are specific to the vendor account. After the association between a contact person and a vendor account is deactivated, access to documents that are specific to the vendor account is always denied.
- Request a new user account for a contact person by using the **Provision user** action.
- Request that a contact person's user account be deactivated.
- Request that a contact person's user account be modified to add or remove security roles.
- View RFQs.

Vendor (external) security role

The *Vendor (external) role* can be used for external vendors that will work with purchase orders. External users who have this security role can perform the following tasks:

- Respond to and view information about purchase orders.
- Maintain vendor collaboration invoices.

- View consignment inventory.
- View and respond to RFQs.
- View vendor information.

Set up security roles that are used when prospective vendors are onboarded

To onboard vendors that are initiated via a prospective vendor registration request, you must set up an external security role. This role will be assigned to new users during the provisioning process that is controlled by the workflow of the *User request workflow (platform)* type. Learn more in the Set up workflows to process vendor collaboration user requests section later in this article.

For information about how to onboard prospective vendors, see Onboard vendors.

Set up a security role that is used when a new prospective vendor user request is submitted

1. Select **System administration** > **Security** > **External roles**.
2. Select **New**, and then select a security role and the *Prospective vendor* party role.

You should add the *Vendor prospect (external)* role that is provided in Supply Chain Management.

The security role will grant access only to the new vendor registration wizard.

Set up workflows to process vendor collaboration user requests

To help guarantee that all the relevant tasks are completed, and that the appropriate approvals are given, you must set up workflows to handle vendor collaboration user requests.

Vendor collaboration user requests are submitted either by external vendors that have the *Vendor admin (external)* security role or similar permissions, or by procurement professionals in your company. They can also be generated from prospective vendor registration requests during the vendor onboarding process.

There are three types of requests:

- Requests to provision a new user
- Requests to deactivate an existing user

- Requests to modify the security roles of an existing user

For more information about vendor collaboration user requests, see Manage vendor collaboration users.

You must create two or more workflows to process all three types of vendor collaboration user requests. New workflows are created on the **User workflows** page.

Example of a workflow for provisioning new users and modifying security roles

To handle vendor user requests to create new users and modify security roles, you can put a branching condition at the beginning of the workflow. In this way, a different branch of the workflow is used, depending on whether the request is to create a new user or modify an existing user.

To set up this branching, create a new workflow of the *User Request Workflow (Platform)* type. The branches of this workflow might contain the following elements.

Branch to provision new users

1. Assign an approval task to the person who is responsible for approving that new users should be granted access to vendor collaboration information.

2. Assign a task to the person who is responsible for requesting new Microsoft Microsoft Entra user accounts in Azure portal. Use the predefined *Send Azure B2B user invitation* task for this step. B2B users can be automatically exported to Microsoft Entra ID. Use the predefined *Provision Microsoft Entra B2B user*. Learn more in Export B2B users to Microsoft Entra ID.

3. Assign an approval task to the person who uploads to Azure. If an account isn't successfully created, this person rejects the task and ends the workflow. This approval task can be skipped if you've included the step that automatically exports new user accounts to Azure via the B2B application programming interface (API).

4. Add an automated task that provisions a new user. Use the predefined *Automated provision user* task for this step.

5. Add a task that notifies the new user. You might want to send the new user a welcome email that includes a URL for Supply Chain Management. This email can use a template that you create on the **Email messages** page and then select on the **User workflow parameters** page. The template can include the *%portalURL%* tag. When the welcome

email is generated, this tag will be replaced by the URL of the Supply Chain Management tenant.

> **Note**
>
> This workflow can be used in multiple scenarios that involve user onboarding. For example, it can be used when prospective vendors or contact persons require a vendor collaboration account. Therefore, you should phrase the email as a general statement that can be used for multiple purposes.

Branch to modify security roles

1. Assign an approval task to the person who is responsible for approving changes to security roles.
2. Add an automated task that adds or removes the relevant security roles. Use the *Automated provision user* task for this step.

Example of a workflow for inactivating a user

Create a workflow of the *Inactivate user request workflow platform* type, and then add the following tasks.

1. Assign an approval task to the person who is responsible for accepting requests to deactivate users. You can add conditions to automate this approval step.
2. Add an automated task that deactivates the user. Use the *Automated user inactivation* task for this step.
3. Add any clean-up tasks that are required. For example, you can add a task that removes the account from your directory in Azure portal.

Enable vendor collaboration for a specific vendor

Before you create a user account for someone who will use vendor collaboration, you must set up the vendor so that it can use vendor collaboration. For details about how to do this, see Vendor collaboration with external vendors.

Troubleshoot the provisioning of new vendor collaboration users

New vendor collaboration users are provisioned via the workflow that you set up to process vendor collaboration user requests of the **Provision vendor user** type.

If the email address of a new vendor collaboration user belongs to a domain that is registered with Azure as a tenant (that is, if it's a managed domain account), the email address must be an existing Microsoft Entra account. Otherwise, the provisioning process can't be completed.

For more information about the process that is used in the *Send Azure B2B user invitation* task in the workflow for Microsoft Entra account management, see Microsoft Entra B2B collaboration.

Manage vendor collaboration users

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to request the provisioning of new vendor collaboration users and how to add new vendor collaboration contacts.

The vendor collaboration interface in Dynamics 365 Supply Chain Management exposes information about purchase orders, invoices, and consignment stock to external vendors. You can create new vendor collaboration contacts and request new user provisioning if you're working as an external vendor with the *Vendor admin (external)* security role or similar permissions. You can also perform these tasks if you're working as a procurement professional. In this article, this role refers to a procurement professional who is working within the company that owns the instance of Supply Chain Management. For more information about how to use vendor collaboration if you're an external vendor, see Vendor collaboration with customers.

For more information about how to use vendor collaboration if you're a procurement professional, see Vendor collaboration with external vendors.

Add new vendor collaboration contacts

To access vendor collaboration, you first need to be added as a vendor collaboration contact. You might also want to add contacts for employees in your company who don't use vendor collaboration. For example, they could be the point of contact for other kinds of procurement information. Add new contacts on the **All contacts** page, which you access from the **Vendor collaboration** > **Contacts** menu. To add a new contact:

1. Select **New.**
2. Enter the contact person details.
3. Choose which legal entity they're representing in your company, and which legal entity they'll work with in the company that they'll collaborate with. Select a **Legal entity in my company/Legal entity in customer company** pair.

4. Select **Create.**

If you want to delete a contact, you can only delete the contacts that you created.

Vendor collaboration user requests

Only procurement professionals or external vendor administrators can raise vendor collaboration user requests.

- If you're an external vendor, submit requests from the **All contacts** page within the **Vendor collaboration** module.
- If you're a procurement professional, submit requests from the **View contacts** page. To do this, on the vendor record, in the **Setup** section on the Action Pane, select **Contacts** > **View contacts**.

You can request to provision a user, deactivate a user, or modify security roles. If you're an external vendor administrator, you must be registered as a contact person for the vendor accounts that you want to make user requests for, and you must have access to the vendor collaboration interface for those vendor accounts.

When a request is submitted, it's added to the **Vendor collaboration user requests** list in the **Vendor collaboration** module, and to the **Vendor collaboration user request** list in the **Procurement and sourcing** module (the Procurement and sourcing module isn't accessible to external users).

Provision a user

Before you can request to provision a new user, you need to set up that person as a contact for one or more vendor accounts. To create a request for a new vendor collaboration user:

1. On the **All contacts** page, select **Provision vendor user**.
2. Enter an email address for the user. The user uses this address to sign in to Supply Chain Management. If the email address belongs to a domain registered as a tenant with Microsoft Azure, the email address must be an existing Microsoft Entra ID account for the provisioning process to complete successfully. If the email address doesn't belong to a domain registered with Microsoft Azure, a Microsoft Entra account is created as part of the provisioning process and the new user receives an invitation email. Consumer email addresses with domains such as @hotmail.com, @gmail.com, or @comcast.net can't be used to register a user.

3. Set the **Vendor collaboration access allowed** option to *Yes* for all the legal entities that the user needs access to.
4. In the **Assign user roles** section, select the **Assign** check box for the security roles that the new user should have.
5. Select **Submit**.

When you submit the vendor user request, the **Vendor collaboration access allowed** field is set to *Yes* for the selected vendor account and a user request workflow starts. As part of the workflow, a new user is created and security roles are assigned. In addition, an Azure B2B service is activated which initiates interaction with Azure portal and associates a new or existing Microsoft Entra account with the Supply Chain Management user account. Learn more in What is Microsoft Entra B2B collaboration?.

Inactivate a user

To remove access to vendor collaboration for a user, use one of the following methods:

- On the **Contacts** page for the vendor, set the **Vendor collaboration access allowed** option to *No* for the contact. Set this option individually for each legal entity that the person is a contact for. Only procurement professionals can use this option.
- Inactivate the entire user account by submitting an **Inactivate vendor user** request.

To request that a user is deactivated:

1. On the **All contacts** page, select **Inactivate vendor user**.
2. Enter a comment in the **Business justification** field.
3. Select **Submit**.

Modify security roles

The **Maintain vendor user roles** page is the same as the **Provision vendor user** page except that you can edit the list of security roles.

To request that the security roles are modified for a user:

1. On the **All contacts** page, select **Maintain vendor user roles**.
2. Enter a comment in the **Business justification** field.
3. In the **Maintain user roles** section, select the security roles that you want to assign, or clear the ones that you want to remove.
4. Select **Submit**.

Set up vendor accounts

07/21/2025

This article describes the types of information that you must specify when you create a new vendor account.

When you create a vendor account, you enter information about the vendor. This information is used to automatically enter data in documents and to track activity that involves the vendor. For example, you can configure the following information for a vendor:

- Assign a vendor group. Every vendor must be assigned to a vendor group. The vendors in a vendor group have parameters that they share. For example, they might have the same terms of payment.
- Configure the vendor for catalog import. Vendors can provide a file that contains the catalog of their items and services. This file can be uploaded so that your workers can order from the vendor.
- Assign the vendor to procurement categories.
- Allow an existing vendor to do business with another legal entity in your organization.
- Put a vendor on hold for specific types of transactions.
- Set up banking information for the vendor, so that you can send payments electronically.
- Set up tax, delivery, invoice, and payment information for the vendor. By default, these settings are copied to new documents that you create for the vendor.
- Set up default financial dimensions that are used to automatically post transactions with the vendor to financial accounts.

To speed up the process of creating vendor accounts, you can create templates. To create a template, on the **Vendor** page, on the Action Pane, select **Options** > **Record info**. Then select **Company accounts template**. Company account templates are shared with other users.

You can also create a user template for your own use. You can't delete a vendor that is associated with other records, such as contacts or products.

Create, edit, and manage vendor accounts

To create, edit, and manage vendor accounts, go to **Procurement and sourcing** > **Vendors** > **All vendors**. Learn more in Set up vendor accounts.

Vendor account numbers

The account number is a unique identifier for a vendor. You can set up account numbers so that they're generated automatically when you create a vendor. You can also configure the

number sequence so that account numbers are entered manually. For example, you might want to use the vendor's telephone number as the identifier.

Vendor organizations and individual vendors

When you create a new vendor account, you must select whether the vendor is an organization or a person. Your selection affects the information that you must fill in for the vendor. For a person, this information includes the first name, family name, and title. For an organization, this information includes the organization number and the number of employees.

Addresses

For each vendor, you can define multiple addresses, each of which is used for a different purpose. For example, you can create an address that has a purpose of *Invoice*. Or, if you'll pay the vendor by using checks, you can set up an address that has a purpose of *Remit-to*. If you must specify an address to use for money transfers to foreign banks, the purpose will be *SWIFT*.

Vendor contacts

You can store contacts for a vendor. These contacts can then be used on documents such as purchase orders or requests for quotation (RFQs).

To add contacts for a vendor, on the **All vendors** page, on the **Vendor** tab, in the **Set up** group, select **Contacts** > **Add contacts**.

You can create vendor contacts from scratch. Alternatively, you can copy details from another person who is already registered in Supply Chain Management, and edit the information as you require.

> **Note**
>
> Adding a contact for a vendor isn't the same as adding contact information for that vendor. Although you might add general contact information for a vendor, you might also have several specific people who are contacts at that company, and who all have their own contact information.

You can't delete a contact person record if the contact is referenced on a document. Instead, you can deactivate the contact.

Vendors in different legal entities

If a vendor is registered for only one legal entity in your organization, and other legal entities must register the same vendor, you can use the **Add vendor to another legal entity** page to configure the vendor to do business with another legal entity. You must select a vendor group, currency, and hold status for the vendor in the selected legal entity.

If multiple legal entities in your organization do business with the same vendor, and each legal entity maintains a separate vendor account for that vendor, you can merge the party IDs for the vendor accounts. In this way, information such as the address and the number of employees can be shared, so that you must update it in only one place.

To merge party IDs, follow these steps.

1. On the **Global address book** page, select the address book records that represent the vendor in each legal entity that should be included in the mapping.
2. On the Action Pane, select **Merge records**.

Agreements

When you set up a vendor account, you might also want to register the agreements that you have with the vendor. You can set up price and discount agreements by using the actions on the vendor record. You can also set up a purchase agreement on the **Purchase agreements** page.

Putting a vendor on hold

You can put a vendor on hold for various transaction types. The following options are available:

- *No* – No holds have been put on the vendor.
- *Invoice* – No invoices can be posted for the vendor.
- *All* – The vendor is on hold for all transaction types. These transaction types include purchase requisitions, invoices, and payments.
- *Payment* – No payments can be generated for the vendor.
- *Requisition* – Purchase requisitions can't be created for the vendor, and requisition lines already created before the vendor was set on hold can't be converted to a purchase order. Requisition lines for the vendor will be canceled if your policy is set to create purchase orders automatically.
- *Never* – The vendor is never put on hold for inactivity.
- *Purchase order* – Purchase orders can't be created for the vendor, but you can still proceed with any open invoices or payments to the vendor.

When you put a vendor on hold, you can also specify a reason and a date when the on-hold status will end. If you don't enter an end date, the vendor's on-hold status lasts indefinitely.

You can bulk update the on-hold status to *All* for vendors based on the selected criteria on the **Vendor inactivation** page, and assign a reason for why the vendor is on-hold.

The following criteria are used to include vendors that have been inactive in a period, include or exclude vendors that are employees, and exclude vendors that are under a grace time before the next hold.

- Based on the number of days that you enter in the **In activity period** field on the **Vendor inactivation** page, the application calculates the latest date where the vendor can have any activity to be considered inactive. That is, the current date minus the number of days that you enter. If one or more invoices exist for the vendor where the date is later than the calculated latest date, the vendor will be excluded from the inactivation. This is also validated if the vendor has payments after that date, open purchase requisitions, open purchase orders, requests for quotations, or replies.
- The number of days in the **Grace time before next hold** field is used to calculate the latest grace date. That is, the current date minus the days that you enter. This only applies to vendors who have previously been deactivated. The application verifies the history of other occurrences of inactivation for the vendor and checks if the latest inactivation occurred before the latest grace date. If so, the vendor will be included in the inactivation process.
- The parameter **Include employees** refers to vendors that are linked to an employee. You can set if you want to include those employees.

This process will always exclude vendors where the value in the **Vendor hold** field is *Never*.

Vendors that pass the validations are put on-hold, which sets the **Vendor hold** field value to *All* and the **Reason** to what has been selected. A record in the on-hold history is created for the vendor.

Vendor invoice account

If more than one vendor has the same billing address, or if a vendor is invoiced through a third party, you can specify an invoice account on the vendor record. The invoice account is the account that the invoice amount is credited to when you create a vendor invoice from a purchase order. If you don't enter an invoice account on the vendor record, the vendor account is used as the invoice account.

Vendor bank accounts

If you must make payments to a vendor bank account, you can enter information about the vendor’s bank and bank accounts on the **Vendor bank accounts** page. You can also enter information about validation and payments for the bank account. For example, you can add prenotes to vendor bank accounts. These prenotes can be used to verify the accuracy of account data, such as routing numbers and account numbers. You must specify a default account for payments to the vendor. However, when you make an actual payment, you can change this account to one of the vendor's other accounts.

Ledger accounts

You can specify the default accounts that automatically appear in vendor invoice journals for the specified vendor. This functionality can be useful if you typically pay for the same types of items or services from the same vendors over time. When you specify a default account, you can quickly and efficiently enter journal entries in the invoice journal. The default accounts that you specify aren't used for purchase orders, or for vendor invoices that are entered on the **Vendor invoice** page.

You select default accounts on the **Default account setup** page, which you can open from the **Invoice** tab on the vendor record. The accounts that you select here appear in the filtered list of accounts for the vendor account when you enter a journal entry. You can set one of the accounts as a default account.

Create a vendor account

This procedure shows how to create a vendor account, and add an address and contact information. The procedure doesn't show how to populate all fields for purchasing and financial purposes. To learn more about those fields, read the field descriptions. You can use this procedure in demo data company USMF or on your own data. Procurement professionals or accounts receivable personnel typically create vendor accounts.

Create a new vendor account

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. On the Action Pane, select **New**.
3. In the **Vendor account** field, enter a value that uniquely identifies the vendor.

    - The value might be populated automatically. If so, you can skip this step.
    - You can create vendor accounts for a person or organization. This choice affects which fields are available. In this example, create a vendor account for an organization.

4. In the **Name** field, enter or select a vendor name. If your vendor is already registered in your system, select it in the dropdown list. The new vendor account inherits the address and contact information that's already registered.
5. In the **Group** field, select a vendor group. Use the vendor group to group vendors that have any of the following parameters in common: terms of payment, settle period, inventory posting ledger accounts - including the sales tax group, default ledger accounts, product filter codes, or supply forecast configuration.
6. In the **Number of employees** field, enter the number of employees.
7. In the **Organization number** field, enter the legal organization number of the vendor.

Add an address

1. Expand the **Addresses** section.
2. Select **Add**.
3. In the **Purpose** field, select a purpose of the address. You can select one or more purposes. These purposes help you select the correct address for a given purpose. For example, if the purpose is *Invoice*, use that address when you send invoices.
4. In the **Name or description** field, enter a name of the address.

5. In the **Country/region** field, select a country/region. Enter the address details. The country/region that you select determines the fields you're presented with, corresponding to the address format for the country/region.
6. Select **OK**.

Add contact information

1. Expand the **Contact information** section.
2. Select **Add**.
3. In the **Description** field, enter a contact name.
4. In the **Type** field, select a contact type. For example, if the contact details include the phone number, select *Phone* option in the **Type** field.
5. In the **Contact number/address** field, type a contact information. You can select the Primary check box if this is the primary contact.
6. Select **Save**.
7. Close the page.
8. Close the page.

Last updated on 07/01/2026

Create a vendor bank account

This procedure shows you how to create a bank account for a vendor. You can use this procedure in demo data company USMF.

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Select the vendor that you want to create a bank account for, and then select the link on the **Vendor account ID** field.
3. On the Action Pane, select **Vendor**.
4. Select **Bank accounts**.
5. On the Action Pane, select **New**.
6. In the **Bank account** field, type a value. This ID identifies the bank account on the vendor record.
7. In the **Name** field, type a value.
8. In the **Bank groups** field, enter or select a value.
9. In the **Routing number type** field, select an option. This type of routing number is used for international payments.
10. In the **Bank account number** field, type a value.
11. In the **SWIFT code** field, type a value.
12. In the **IBAN** field, type a value.

    - The IBAN number must be in the correct format. For example, you could use *DE89370400440532013000*.
    - The status of the bank account is *Active* if the **Active date** is reached, and the **Expiration date** isn't exceeded. It's also active if both the **Active date** and **Expiration date** fields are blank. If the dates in both the **Active date** and **Expiration date** fields are in the future, electronic payments aren't available. Other payment types are available and the bank account is active.

13. Expand the **Setup** section.
14. In the **Text code** field, type a value. This field specifies a code that appears on the bank statement of the recipient.
15. In the **Message to bank** field, type a value.
16. In the **Exchange reference** field, type a value. This is the reference number for any forward-term or fixed-term rate of exchange.
17. In the **Currency** field, enter or select a value. When prenotes are issued, this section provides an overview of their status (pending or approved).

18. Expand the **Address** section.
19. Expand the **Prenotes** section.
20. Expand the **Contact information** section.
21. In the **Telephone** field, type a value.
22. Close the page.
23. Select **Edit**.
24. Expand the **Payment** section.
25. In the **Bank account** field, select the account that you just created.
26. Select **Save**. The address might be inherited from the bank group, if one is specified, or you can add it here.

Vendor posting profiles

Vendor posting profiles control the posting of vendor transactions to the general ledger.

Vendor posting profiles

Vendor posting profiles enable you to assign general ledger accounts and document settings to all vendors, a group of vendors, or a single vendor. These settings apply when you create purchase orders, vendor invoices, and cash payments. For some transactions, you can select a posting profile that differs from and takes precedence over the posting profiles that you set up on this page. You define the default posting profile on the **Ledger and Sales Tax** FastTab on the **Accounts payable parameters** page. The default posting profile automatically appears on the header of new documents, where you can change it to a different posting profile if needed.

You can also associate posting definitions with transaction posting types on the **Transaction posting definitions** page. Posting definitions control the posting of vendor transactions to the general ledger instead of posting profiles.

Creating a posting profile

Setup

Specify the ledger accounts that are used in the posting of transactions that use the selected posting profile. Select an account code and, whenever possible, an account or group number for the selected posting profile. In the posting process, the system locates the most appropriate posting profile for each transaction by searching for the most specific account code, account number, or group and number combination in the following priority.

Expand table

Account code **field value**	Account/Group number **field value**	**Search priority**
Table	Specific vendor account	1
Group	Vendor group that is assigned to the vendor	2
All	Blank	3

If you want all vendor transactions to use the same posting profile, set up only one posting profile with **All** in the **Account code** field. Specify the following values to set up your posting profile.

Expand table

Field	Description
Posting profile	Enter a code for the posting profile. For example, you could create two posting profiles to obtain one account for vendor balances in the national currency and another for vendor balances in a foreign currency. You could call one account National and the other Foreign.
Description	Enter a description of the posting profile.
Account code	Specify whether the posting profile applies to a specific vendor, a group of vendors, or all vendors: • **Table** – The posting profile applies to a single vendor. Select the vendor account in the **Account/Group number** field. • **Group** – The posting profile applies to a vendor group. Select the vendor group in the **Account/Group number** field. • **All** – The posting profile applies to all vendors. Leave the **Account/Group number** field blank.
Account/Group number	If you select **Table** in the **Account code** field, select the account number of the vendor that is associated with the posting profile. If you select **Group**, select a vendor group. If you select **All**, leave this field blank.
Summary account	Select the ledger account that the system uses as the summary account for the vendors that the posting profile relates to. The **Do not allow manual entry** parameter for this main account is marked. If you subsequently remove this account from the posting profile, validate the **Do not allow manual entry** setting on the **Main accounts** page. **Note:** If you select the **Use posting definitions** option on the **General ledger parameters** page, the transaction posting definition for vendor invoices is used instead of the summary account.
Settle account	Select the liquidity ledger account that is used for cash flow forecasts. This field is only available when cash flow forecasting is enabled.
Sales tax prepayments	Select the account for sales tax payments that are received in advance. **Note:** The posting profile that the system uses when the payment is marked as a prepayment is selected in the **Posting** profile with **Prepayment journal voucher** field in the **Ledger and sales tax** area on the **Accounts payable parameters** page.
Arrival	Select the ledger account that the system posts information about unapproved vendor invoices to. The user enters the information in the **Invoice register journal**. For example, a user enters very basic information about vendor invoices when they are received in the

Field	Description
	invoice register. When the invoice register is posted, the system posts the transactions to the account that is entered here and in the **Offset account** field. When the invoices are approved, the system transfers the debt from the arrival account to the vendor summary account.
Offset account	Select the ledger account that you use to offset unapproved vendor invoices when you update them by using the invoice register. The offset account works as the offset account for transactions that you post to arrival accounts. Therefore, the account contains vendor purchases that aren't yet approved.

Table restrictions

For transactions that have the selected posting profile, specify whether to settle transactions automatically, calculate interest, and send collection letters. You can also select the account to use when closing transactions that have the selected posting profile.

Specify the following values to set up your posting profile

Expand table

Field	Description
Settlement	Select this option to enable automatic settlement of transactions that have this posting profile. If you clear this option, you must manually settle transactions by using the **Settle open transactions** page.
Cancel	Select this option if you want to be able to cancel transactions that have this posting profile.
Close	Select a posting profile to change to when closing transactions that have this posting profile. A transaction is closed when it's fully settled.

Last updated on 08/04/2026

Vendor request configurations

06/17/2025

To complete a vendor request, a vendor contact person must complete the prospective vendor registration wizard.

On the **Vendor request configurations** page, you can create profiles that specify required fields and visible fields in the prospective vendor registration wizard.

The vendor registration wizard starts by asking the prospective vendor user which country/region the vendor is doing business in. This information determines the applicable configuration. If no specific configuration is defined for a country/region, a default configuration is used.

Set up a vendor request configuration

By default, there's a vendor configuration available on the **Vendor request configurations** page.

It isn't possible to select country/regions for the default configuration, so the **Countries/regions** section can't be changed.

1. Go to **Procurement and sourcing** > **Setup** > **Vendors** and then select **Vendor request configurations**.
2. Select the **Fields** tab to set the status of the listed fields.

    - *Hidden* (Not visible)
    - *Displayed* (Visible but not mandatory)
    - *Required* (Visible and mandatory)

3. Select the **Content** tab to specify if text is going to be shown on the wizard and if there should be an acknowledgment that the prospective vendor user must accept this before moving to the next step in the wizard. The acknowledgment is requested for any terms and conditions that the user must accept to continue.

You can also enter a confirmation message that is displayed when the wizard is finalized, and you can add one or more questionnaires.

Create a vendor configuration for a specific country/region

1. Go to **Procurement and sourcing** > **Setup** > **Vendors** and then select **Vendor request configurations**.
2. Select **New** to create a new configuration, and provide a name for the configuration.
3. Select **Save**.
4. Open the **Country/regions** tab to select the country/region that the configuration should be used for.
5. Complete the configuration by following the guidelines for the default configuration.

Onboard vendors

08/13/2025

> **Note**
>
> Azure Active Directory is now Microsoft Entra ID. Learn more

New vendors can be onboarded and registered as vendors in Microsoft Dynamics 365 Supply Chain Management, based on information that is collected from a person who represents the vendor.

The process consists of the following steps, where various roles perform actions in the system.

1. **Data management OData** – Entity import. The initial request is the prospective vendor registration request. Typically, this request comes from a source such as a customer-hosted website that allows anonymous access. Vendors can sign up by providing basic information, such as the vendor name, justification, organization number, and name and email address of the contact person. The requests are imported via the Data management interface.
2. **Prospective vendor registration request list page** – Based on the information that is provided in the prospective vendor registration request, a procurement professional decides whether the vendor should be onboarded. The procurement professional views the incoming request on the **Prospective vendor registration requests** list page.
3. **User provisioning workflow** – When a procurement professional has verified the information in the incoming request and has decided to continue with the onboarding process, the user request workflow provisions the new user and sends an invitation email to accept the contact person as an authenticated user of Microsoft Dynamics 365.
4. **Vendor registration wizard** – The vendor's contact person signs in by using the new user account. They complete a vendor registration wizard to provide information such as addresses, business information, procurement categories, and questionnaire responses.
5. **Approval workflow** – A vendor request that includes the registration information is created. This vendor request is submitted to a workflow, and is routed for review and approval.
6. **Creation of a vendor master and user role modification** – When the vendor request is approved, a vendor record is created. The user account of the vendor's contact person is either granted permission to vendor collaboration or deactivated.

The following table shows the steps and roles that are involved in the process.

Expand table

Role and "process"	Data management OData – Entity import	Prospective vendor registration request list page	User provisioning workflow	Vendor registration wizard	Approval workflow	Creation of a vendor master and user role modification
System	The request for a new vendor is imported.					After the vendor request is accepted, the vendor record is created.
Procurement professional		Start the onboarding process.			Review and either accept or reject the vendor request.	
Administrator			Create a user in Supply Chain Management and Microsoft Azure.			
Vendor contact person			Send email to the contact person.	Register vendor information.		

For a quick demonstration of the vendor onboarding process, watch this short YouTube video about How to onboard a new vendor in finance and operations.

Importing the prospective vendor registration request

The prospective vendor registration request is an entity in Supply Chain Management. You can set up the system to import data via this entity.

The following table shows the information that this entity contains, and that can be imported.

Expand table

Field	Description
Vendor name	The name of the vendor.
Business justification	The reason or reasons for the vendor request.
Organization number	An officially known registration number.
Line of business	The line of business that the vendor is in.
Contact person's first name	The first name of the person who will be invited to register vendor information.
Contact person's middle name	The middle name of the person who will be invited to register vendor information.
Contact person's last name	The last name of the person who will be invited to register vendor information.
Contact person's email	The email address that will be used to create a new user in Supply Chain Management, and that will be registered in the tenant's Microsoft Entra account.
Submitted date	The date when the request was created in an external system.
Legal entity	The legal entity where the vendor is requesting to become a vendor. This value must be a legal entity code that has been registered in Supply Chain Management. If no value is received though the import process, a value from the Procurement and sourcing parameters is applied.
Vendor type	The vendor can be either an organization or a person. The vendor type determines how the vendor is finally created.

After the prospective vendor registration request is imported, it appears on the **Prospective vendor registration request** list page. From this list page, a procurement professional can invite the user. A user request for provisioning the user is sent to a workflow.

Submitting a prospective vendor user request

The purpose of a prospective vendor user request is to provision the person who submitted the initial request, so that they can sign in to Supply Chain Management by using the email account that is provided in the prospective vendor registration request.

The prospective vendor user request is processed by the user request workflow. This workflow communicates through Microsoft Entra B2B collaboration. It creates a user in Supply Chain Management that has the appropriate security settings.

New users that are set up have the following security roles:

- System external user
- Vendor prospective (external)

The new user will receive an email that is generated by the user request workflow. This email invites the user to sign in to the system.

For information about the configuration of the email and the workflow in general, see the description of a user request workflow in Set up and maintain vendor collaboration.

Vendor registration

A prospective vendor user who signs in to Supply Chain Management will see the first page of a vendor registration wizard, where they can enter vendor information.

The wizard reflects the configuration of the vendor request. The country or region where the vendor does business determines what information is requested in the wizard and what information is mandatory.

For more information about the vendor request configuration, see Set up and maintain vendor collaboration. The following table gives an overview of the pages in the wizard and the purpose of each page.

Expand table

Page	Description
Country/region	The country or region determines the vendor request configuration that is applied on the remaining wizard pages. It also determines values in the **Tax state** lookup.
Terms and conditions	This page might be available, depending on the vendor request configuration. If it's available, the user must acknowledge the terms and conditions to continue.
Vendor information	This page contains the vendor name, which is automatically entered from the original prospective vendor registration request. It also contains the organization number, the vendor's telephone number, fax number, and email address, and the vendor's addresses for various purposes.
Contact person information	This page contains the contact person's name, which is automatically entered from the original prospect vendor registration request. It also contains the contact person's telephone number and email address, and the contact person's addresses for various purposes.
Business information	This page contains tax registration numbers (for various countries or regions) and the numbers of employees. It also indicates whether the business is minority owned.

Page	Description
Procurement categories	This page contains the procurement categories that the vendor is requesting approval for. The user can select categories in the procurement category hierarchy. You can configure the number of levels that are shown in the hierarchy at **Procurement and sourcing parameters** > **Vendor collaboration**, under **Procurement and sourcing** > **Setup**.
Questionnaires	The wizard might include a set of questionnaires for the vendor. Questionnaires that appear in the wizard are configured either on the vendor request or per procurement category. If questionnaires are configured per procurement category, the procurement categories that the vendor requests approval for determine the questionnaires that appear in the wizard. On the **Procurement categories** page, you can add a questionnaire under the relevant category and set the activity type to *Vendor onboarding*.

When the prospective vendor user completes the vendor registration wizard, a vendor request is created.

Manually or automatically submit a vendor request

A vendor request can be created as a draft and manually submitted to a workflow. Alternatively, the vendor request can be automatically submitted to a workflow when the vendor registration wizard is completed. A request can be submitted manually if, for example, a procurement professional wants to assess whether the request should be routed through an approval process before it's submitted to the workflow.

To configure the vendor request so that it's submitted automatically to a workflow when the vendor registration wizard is completed, select **Procurement and sourcing parameters** > **Vendor collaboration** and then select **Auto submit prospective vendor registration to workflow**.

Vendor requests

Vendor requests are available on the **Vendor collaboration user requests** page.

A vendor request contains the information that the prospective vendor user entered in the vendor registration wizard.

The request lets you review the vendor information and decide whether the vendor should become a registered vendor.

The vendor request should be submitted to a workflow, and it should be routed to the relevant reviewers and approvers. For basic information about how to set up workflows, see

Procurement and sourcing workflows.

The following table shows the statuses that vendor requests can have.

Expand table

Status	Description
Draft	The vendor request hasn't yet been submitted.
Request submitted	The vendor request has been submitted, and the first step in the workflow is being processed.
Pending review	If there are multiple reviewers in a workflow task, a reviewer can accept the task of reviewing the vendor request and then complete the review. If there's only one reviewer, that participant can complete the review by selecting *Completed* in the workflow action. They don't have to accept the work item first.
Request pending approval	The vendor request has been routed to the participants for approval, and there's an option to request additional information. A request for additional information causes the work item to be routed back to the submitter. The vendor request can also be approved or rejected while it's in this status.
Application change request	Additional information has been requested by the approver, and the vendor request has been routed to the person who submitted the vendor request. The submitter can add required information and then resubmit the vendor request. If a vendor request is resubmitted, the status is changed back to *Request pending approval* status.
Request approved	This status is a final state.
Request rejected	This status is a final state.

Approving a vendor request

When a vendor request is approved, a vendor account is created, and the status *Approved* appears on both the initial prospective vendor registration request and the vendor request.

Before you approve a vendor request, on the **New vendor** page, on the **General** FastTab, select **Vendor group** to select a vendor group.

If the prospective vendor user should have access to Supply Chain Management as a vendor collaboration user who represents the vendor, set the vendor collaboration access permission to *Yes*. To deactivate the user account that the prospective vendor used to register, set this permission to *No*.

If the vendor collaboration access permission is set to *Yes*, when the vendor request is approved, a request is submitted to modify the user's roles so that the user has the roles that are defined for the **Vendor** type in **External roles**. If this permission is set to *No*, when the vendor request is approved, a request is submitted to deactivate the user. In this case, the workflow to deactivate a user request must be set up.

For a vendor account to be created when the vendor request is approved, the number sequence for creating vendors from vendor requests must be set to *Auto*.

For an overview of the access permissions of a vendor collaboration user, see Set up and maintain vendor collaboration.

Rejecting a vendor request

If a vendor request is rejected, a reason for rejection must be selected in the vendor request.

When a vendor request is rejected, a request is submitted to deactivate the user. In this case, the workflow to deactivate a user request must be set up. Learn more in Set up and maintain vendor collaboration.

When a vendor request is rejected, the status *Rejected* appears on both the initial prospective vendor registration request and the vendor request.

Deleting a prospective vendor registration request in various statuses

The various statuses of a prospective vendor registration request give an overview of the request's progress.

By using the **Delete** action on the prospective vendor registration request, you can clean up and remove the chain of records that has been created, and you can deactivate the user account. The result of the **Delete** action varies, depending on the status of the prospective vendor registration request, as shown in the following table.

Expand table

Status	Status description	Result of the Delete action
New	No actions have been taken on the request.	The prospective vendor registration request is deleted.
User requested	When you select **Invite user**, the status is changed to *User requested*, and a	You can't delete a prospective vendor registration request that has this status,

Status	Status description	Result of the Delete action
	prospective user request is created and submitted to a user request workflow.	because the user request workflow hasn't ended.
User invited	The user request workflow is approved, and the user is created.	A request to deactivate the user is created, and the prospective vendor registration request is deleted.
Registration in progress	The new user has signed in and has started the vendor registration wizard.	A request to deactivate the user is created, and the prospective vendor registration request and the data that was entered in the vendor registration wizard are deleted.
Vendor request created	The vendor registration wizard has been completed.	A request to deactivate the user is created, and the prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted. **NOTE:** You can't use the **Delete** action when the vendor request is in a review process in the workflow.
Approved	The vendor request is approved.	The prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted.
Rejected	The vendor request is rejected.	The prospective vendor registration request, the data that was entered in the vendor registration wizard, and the vendor request are deleted.

Vendor collaboration with external vendors

07/21/2025

The **Vendor collaboration** module is targeted at vendors who don't have electronic data interchange (EDI) integration with Microsoft Dynamics 365 Supply Chain Management. It lets vendors work with purchase orders (POs), invoices, consignment inventory information, and requests for quotation (RFQs), and also lets them access parts of their vendor master data. This article explains how you can collaborate with external vendors who use the vendor collaboration interface to work with POs, RFQs, and consignment inventory. It also explains how to enable a specific vendor to use vendor collaboration, and how to define the information that all vendors see when they respond to a PO.

For more information about what external vendors can do in the vendor collaboration interface, see Vendor collaboration with customers.

For more information about how vendors can use vendor collaboration in invoicing processes, see Vendor collaboration invoicing workspace. For information about how to provision new vendor collaboration users, see Manage vendor collaboration users.

Defining the information that is shown to vendors when they respond to POs

When vendors respond to a PO that you send them, they see one of three message boxes, where they must confirm that they want to accept the PO, reject it, or accept it with changes. Because the information that must be shown to the vendor at that point might be specific to your business, you can specify the text that appears in each confirmation message. For example, the text can inform the vendor about the next steps in the process, or about terms and conditions.

To define the text that's shown in the PO response, follow these steps

1. On the **Information for vendors responding to POs** page, select the response type, and then select **Edit**.
2. In the **Information message** box, enter the information that should be shown to vendors in the message box.

If you must add messages in more than one language, create separate messages, and specify the appropriate language code for each. The message that is shown to each vendor will be in the language that the vendor uses.

Setting the vendor collaboration options for a specific vendor

An administrator configures the general settings for vendor collaboration, such as the security roles that are available for all vendors that you collaborate with. However, there are also settings that can differ for each vendor account. You should configure these settings.

- Enable vendor collaboration.
- Specify whether the vendor should see price information.

Enabling vendor collaboration

Before user accounts can be created for an external vendor, you must configure the vendor account so that vendor can use vendor collaboration. On the **Vendors** page, on the **General** tab, set the **Collaboration activation** field. The following options are available:

- *Active (PO is auto-confirmed)* – POs are automatically confirmed if the vendor accepts them without changes. If you use this option, be sure to schedule the *Confirm accepted purchase orders from vendor collaboration* batch job, which is responsible for processing the confirmations. For instructions, see the next section.
- *Active (PO is not auto-confirmed)* – Your organization must manually confirm POs after the vendor has accepted them.

Scheduling the auto-confirmation batch job

If you use the *Active (PO is auto-confirmed)* option for one or more of your vendors (as described in the previous section), you must schedule the *Confirm accepted purchase orders from vendor collaboration* batch job, which is responsible for processing and confirming your POs. Otherwise, auto-confirmations will never occur. Use the following procedure to schedule this job.

1. Go to **Procurement and sourcing** > **Purchase orders** > **Purchase order confirmation** > **Confirm accepted purchase orders from vendor collaboration**.

2. In the **Confirm accepted purchase orders from vendor collaboration** dialog box, on the **Run in the background** FastTab, select **Recurrence**.

3. In the **Define recurrence** dialog box, define the schedule that the job should run on. When you're choosing your schedule, consider the following issues:

    - If your system processes a large volume of data and runs many batch jobs, performance might be an issue. In this case, you probably shouldn't run this job

more often than every 10 minutes (depending on your other requirements). If performance isn't an issue for you, you can run it as often as every 1 to 2 minutes if necessary.
    - If your vendors tend to deliver goods quickly (within the day that they agreed to), the recurrence should be frequent (every 10 to 30 minutes or so). In this way, warehouse workers will be able to receive the goods against the confirmed PO after confirmation is done.
    - If your vendors tend to have a long lead time (more than 24 hours), you can set this task to run just once a day or so.

4. Select **OK** to apply your schedule and return to the **Confirm accepted purchase orders from vendor collaboration** dialog box.

5. Set additional background options as needed. The dialog box provides the usual options for setting up batch jobs in Supply Chain Management.

For more information about batch jobs, see Batch processing overview.

Specifying whether the vendor should see price information

To share price information for POs via the vendor collaboration interface, you must set the **Purchase order prices/amount** option on the **Purchase order defaults** tab for the vendor account to *Yes*. This price information includes the unit price, discounts, and charges.

Working with POs when vendor collaboration is used

Sending a PO to a vendor

POs are prepared in Supply Chain Management. When a PO has a status of *Approved*, you send it to the vendor by selecting **Send for confirmation** on the **Purchase order** page. The PO status is then changed to *In external review*. After the PO has been sent, the vendor can see it on the **Purchase orders for review** page in the vendor collaboration interface. The vendor can then accept the PO, reject it, or suggest changes to it. The vendor can also add comments to communicate information such as changes to the PO. If you want to draw the vendor's attention to a new PO, you can also use the Print management system to send the PO by email.

Confirmation and acceptance of a PO by a vendor

After a vendor accepts a PO, the PO can be automatically confirmed, or it might have to be manually confirmed. The behavior depends on whether the **Collaboration activation** field is set to *Active (PO is auto-confirmed)* or *Active (PO is not auto-confirmed)* for the vendor.

The following table shows the typical exchange of information, depending on the vendor's response when you send a PO for confirmation.

Expand table

Vendor response	Result
The vendor accepts the order, and Supply Chain Management is configured to automatically confirm POs that the vendor accepts.	The status of the order is updated to *Confirmed*. If the order can't be updated for some reason, the vendor response is still recorded as *Accepted*, but the status of the PO remains *In External Review*. The PO that was sent to the vendor and that has a status of *In external review* is updated with confirmed receipt dates on the lines. This update initiates a new version that is automatically set to *Confirmed* status. When the PO is confirmed, it appears in the vendor collaboration interface.
The vendor accepts the order, but Supply Chain Management isn't configured to automatically confirm POs that the vendor accepts.	The vendor response is recorded as *Accepted*, but the status of the PO remains *In external review*. The PO that was sent to the vendor and that has a status of *In external review* is updated with confirmed receipt dates on the lines. This update initiates a new version that is automatically set to *In external review* status. You can then manually confirm the PO.
The vendor rejects the order.	The vendor response is recorded as *Rejected*, and the status of the PO remains *In external review*. The rejection is received together with the vendor's note.
The vendor accepts the order with changes. Changes are suggested at the line level. The vendor can accept or reject individual lines. Here are some other changes that the vendor can suggest: • Change dates or quantities. • Split lines for different receipt dates or quantities. • Substitute an item. The vendor can't change price information and charges. However, the vendor can suggest these changes by using notes.	The vendor response is recorded as *Accepted with changes*, and the status of the PO remains *In external review*. The statuses show the types of changes that the vendor has suggested. For information about the automatic consumption of changes, see the "Update the PO when a vendor suggests changes" section later in this article.

You can use the **Purchase order preparation** workspace to monitor which POs the vendor has responded to. This workspace contains two lists that contain POs that have a status of *In external review*:

- In external review requires action
- In external review awaiting vendor response

Changing a PO

To change a PO that a vendor has already responded to, you must send the vendor a new version of the PO. The new PO will have a version suffix to indicate that it's a modified version of a PO that was previously sent. The **Purchase order vendor confirmation history** page lets you and your vendors track the history of each order. The previously confirmed version of a PO remains in the list of confirmed POs until the new PO has been confirmed.

Canceling a PO

When you cancel a PO, the status is changed to *Approved*. You must send the PO back to the vendor, so that the vendor can confirm or reject the cancellation. After the cancellation is confirmed, the PO appears in the vendor's list of confirmed POs as *Canceled*.

Adding attachments to a PO

You can add attachments such as files, images, and notes to the PO by using the document management system. Attachments of the *External* type will be visible to the vendor when you send the PO.

Updating a PO when a vendor suggests changes

If a vendor has responded to a PO and suggested changes, the next step is to process the response.

In the **Purchase order preparation** workspace, in the **In external review requires action** list, you can identify POs that a vendor has accepted with changes. From this list, you can also navigate to the vendor's response.

On a response, a vendor can change the following information on the header:

- Vendor document reference
- Mode of delivery
- Delivery terms

- Confirmed receipt date

The vendor can also add a note or attachment.

On the lines, the vendor can change the quantity and the receipt dates, add notes and attachments, reject a line, substitute a line with another product that is entered as text, and split a line into multiple deliveries. The status of a line varies, depending on the changes that the vendor has suggested:

- *Accepted with changes*
- *Rejected*
- *Substituted* – In this case, an extra line is added that has a status of *Rejected*.
- *Confirmed*
- *Split into schedule* – In this case, extra lines are added that have a status of *Schedule lines*.

If a line has no changes, the line status is *Accepted*.

On the response, the line statuses tell you the types of changes that the vendor made. Additionally, all fields that were changed appear bold to help you identify the changes.

You can update a PO by selecting **Process PO update** on the response or on one line at a time. An **Is PO update processed?** field on the header and the lines indicates whether the system has processed the header or lines to update the PO with changes that originate from the response. You can run the **Process PO update** action only one time per header or line.

Not all suggested changes can be updated on a PO. Only updates on the header, and updates of dates and quantities on lines, can be automatically updated on the PO. For other changes, you must manually update the PO. In this case, the value of the **Is PO update processed?** field is *Manual update*. For example, if a vendor suggests that a line be split into a schedule, this change must be made manually.

Every line that has a status of *Accepted* will have a confirmed receipt date. When you run the **Process PO update** action, this date is updated on the PO. Notes and attachments aren't automatically transferred to the current PO. Additionally, trade agreements aren't reassessed on the PO lines when you update the current PO via the **Process PO update** action.

PO statuses and versions

This section describes the various statuses that a PO can have up to the time when it's confirmed. It also describes when new versions of a PO are made available to the vendor. The behavior varies, depending on whether you use change management for POs.

Versions and statuses if you don't use change management

The following table shows an example of the changes in status and version that a PO might go through.

Expand table

Action	Status and version
The initial version of the PO is created in Supply Chain Management.	The status is *Approved*.
The PO is sent to the vendor.	A version is registered in the vendor collaboration interface, and the status is changed to *In external review*.
The vendor sends an *Accepted with changes* response.	The status is still *In external review*.
You make some changes that the vendor requested.	The state is changed to *Approved*.
You send the new version of the PO to the vendor.	A new version is registered in the vendor collaboration interface, and the status is changed to *In external review*.
The vendor accepts the new version of the PO.	The status is still *In external review*, unless the vendor account is configured to automatically set POs to *Confirmed* status when the vendor accepts them.

Vendors don't have to confirm a PO by using the vendor collaboration interface. They can also send an email or communicate their acceptance of a PO via other channels. You can then manually confirm the order. In this case, you receive a warning that states that the order is being confirmed even though there's no response from the vendor. The PO then appears in the confirmation history as an open confirmed order that doesn't have any responses. At this point, the vendor no longer has the option to confirm or reject the PO.

> **Note**
>
> The version of the PO that is available to other processes in Supply Chain Management is always the latest version, even if that version hasn't yet been registered in the vendor collaboration interface.

Versions and statuses if you use change management

If change management is enabled for POs, POs go through an approval workflow to reach the *Approved* status. This process isn't visible to the vendor.

The following table shows an example of the changes in status and version that a PO might go through when change management is turned on. A version is registered when the PO is approved, not when the PO is sent to the vendor or confirmed.

Expand table

Action	Status and version
The initial version of the PO is created in Supply Chain Management.	The status is *Draft*.
The PO is submitted to the approval process. (The approval process is an internal process that the vendor isn't involved in.)	The status is changed from *Draft* to *In review* to *Approval* if the PO isn't rejected during the approval process. The approved PO is registered as a version.
The PO is sent to the vendor.	The version is registered in the vendor collaboration interface, and the status is changed to *In external review*.
You make some changes that the vendor requested, either manually or by using the **Process PO update** action on the response to update the PO.	The status is changed back to *Draft*.
The PO is submitted to the approval process again.	The status is changed from *Draft* to *In review* to *Approval* if the PO isn't rejected during the approval process. Alternatively, the system can be configured so that specific field changes don't require re-approval. In this case, the status is first changed to *Draft* and is then automatically updated to *Approved*. The approved PO is registered as a new version.
You send the new version of the PO to the vendor.	The new version is registered in the vendor collaboration interface, and the status is changed to *In external review*.
The vendor approves the new version of the PO.	The status is changed to *Confirmed*, either automatically, or when you receive the response from the vendor and then confirm the PO.

Sharing information about consignment inventory

If you're using consignment inventory, vendors can use the vendor collaboration interface to view information on the following pages:

- **Purchase orders consuming consignment inventory** – POs for consignment inventory are generated when the ownership of the inventory is changed from the vendor to your company. A product receipt is posted at the same time. These consignment POs are

shown only on the **Purchase orders consuming consignment inventory** page. They aren't included on the **All confirmed purchase orders** page in the **Vendor collaboration** module.

- **Products received from consignment inventory** – This page lists all the transactions where the ownership of products has been transferred from the vendor to your company. Vendors can use this information to invoice the customer.
- **On-hand consignment inventory** – This page shows the vendor-owned on-hand consignment inventory that has been received at your warehouse.

Working with RFQs when you use vendor collaboration

This section describes the interactions between customers and vendors during the RFQ process. It also explains how information is communicated to the vendors.

For a basic overview of support for the RFQ process, see Requests for quotation (RFQs) overview.

Alternates, attachments, amendments, and returns

- **Alternates** – On the header of an RFQ case, you can specify that alternates are allowed for non-catalog item lines. When alternates are enabled, vendors can add an alternate line for each requested line.

- **Attachments** – Attachments can be added at both the header level and the line level of an RFQ case. Attachments can be classified as either internal or external. Internal attachments can be viewed only on the customer side, whereas vendors can view external attachments after they're sent.

  Vendors can also add attachments on their bid reply. These attachments can be viewed on the customer side after a vendor submits the bid reply. Attachments that vendors add are always classified as external. To access an attachment that a vendor has submitted together with a bid, select **Bid attachments** or **Bid line attachments**.

  To open attachments that were sent together with the RFQ case, use the document handling paper clip symbol on the reply.

- **Amendments** – When an amendment is finalized, the existing bid replies are removed so that they can be replaced by updated values. Information such as the line price and quantity from previous bid replies can be viewed via the journals on the RFQ case.

To enforce amendment processing, on the **Procurement and sourcing parameters** page, on the **Request for quotations** FastTab, set the **Lock RFQs when they are sent** option to **Yes**. (This option is set and required for Public sector.)

- **Returns** – If a vendor has submitted a bid, but more or modified information is required for the RFQ case, the customer can return the bid to the vendor. The data from the bid that was previously submitted is retained, and the vendor can make the requested modifications without having to restart the bid process.

Public sector extensions

For Public sector, the extended functionality enables an RFQ case to be sent to vendors and published. When you publish an RFQ, anyone who requests the information can view the work that complies with most public-sector regulations. All available work is reflected on the **Open published requests for quotations** list page, and the canceled, pending, or awarded RFQs can be viewed on the **Closed published requests for quotations** list page. These documents can also be viewed on a site outside Supply Chain Management through integrations with the following data entities:

- Published requests for quotations
- Published requests for quotations line
- Published requests for quotations header attachments

These entities let people who aren't provisioned users in Supply Chain Management, but who have anonymous access to the external site, view the available and closed work. Additionally, extended functionality in **Send and publish** lets the user who sets up parameters for the RFQ process define an email template. Then, when the procurement professional creates the RFQ case, they must select the email template to send the required information to the vendors on the RFQ case.

The user who sets up parameters for the RFQ process can create multiple email templates. These email templates can contain both static text and the following replacement tokens. The tokens will be replaced with contextual values when an email is created.

- %RFQCase%
- %RFQCaseName%
- %bidType%
- %inviteOnly%
- %expiryDateTime%
- %requester%
- %requestingDepartment%
- %accountnum%

- %todaysdate%
- %createddate%

If an amendment is required and is sent after the RFQ is sent, the RFQ will be resent to all invited vendors. The published document will also be updated on the **Open published requests for quotations** page.

Maintain vendor certification

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes the steps that your vendors can use to maintain their certifications using the **Vendor collaboration workspace**. Examples of certifications might include a Woman Business Enterprise (WBE) or a Leadership in Energy and Environment Design (LEED) company. Vendors need to enter certification information in the **Vendor information** workspace. From there, vendors select **More details**, and then select **Certifications**.

Turn on the vendor certification feature

Before you can use this feature, it must be turned on in your system. Administrators can use the Feature management page to check the feature status and enable it if needed. In the **Feature management** workspace, the feature is listed in the following way:

- **Module** - *Accounts payable*
- **Feature name** - *Enable vendor collaboration certification management*

Add a new certification

To add a new certification, select the **Add** button located above the **Certification** grid in the **Vendor information** workspace. Enter the following information:

- Certification number
- Certification type
- Certifying organization
- Certification date
- Liability amount, if applicable
- Effective date
- Expiration date
- Comments, optional

If there are documents related to the specific certification, you can attach them by selecting the **Document** button.

Certifications that are entered by your vendors on this page will be assigned a source of “Vendor”. You can enter certificate information on your vendor's behalf under vendor bank accounts. The information displays here and the source will display as **Customer**.

Vendors can edit or delete their certifications as needed.

Vendor collaboration generated certification records

After certification information has been added by a vendor, the information will be visible on the **Vendor collaboration generated certifications** page. To open the page, go to **Accounts payable** > **Inquiries** > **Vendor reports** > **Vendor collaboration generated certifications**. By default, all new or modified certification records are visible. An Accounts payable clerk can view the changes and validate the information through their confirmation process to validate. When the information has been confirmed, the certification record listed on the page can be selected and marked as reviewed. Marking the record as reviewed will remove it from the default list.

All certification changes are visible on the **Vendor collaboration generated certifications** page. If a change isn't displayed on the page, you can view it by adjusting the filters for the vendor account, effective date range, or choosing whether to include information for certification changes that have been reviewed.

Last updated on 06/15/2026

Category requests from vendors

10/03/2025

The category request process lets vendors request that new procurement categories be associated with their account. Those procurement categories can then be used by the related procurement and sourcing processes. (Learn more in Procurement catalogs overview.)

Category requests are initiated by vendors in the **Vendor information** workspace. They are then submitted to your agency for review and approval. Approved categories are added to the list of procurement categories for the vendor's account.

You can also manually add procurement categories to vendor accounts. Learn more in Approve vendors for specific procurement categories.

Vendor collaboration requirements

Before a vendor can interact with category requests, it must be set up for vendor collaboration.

The vendor must have at least one vendor collaboration user. Only vendor users with the *Vendor admin (external)* security role can create and submit category requests.

Learn more in Set up and maintain vendor collaboration.

Set up the Vendor category request workflow

The *Vendor category request* workflow must be set up in the procurement and sourcing workflows. Vendors will submit new category requests that you can review and approve. Requested procurement categories are added to a vendor account after a category request is approved.

The following example shows how to set up a simple *Vendor category request* workflow that has a single approver. You must review your internal processes to determine the appropriate workflow setup for your agency.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing workflows**.
2. On the Action Pane, select **New**.
3. In the dialog box, select **Vendor category request workflow** to open the workflow editor.
4. Sign in to the workflow editor.
5. On the Action Pane, select **Properties**.
6. On the **Properties** page for the workflow, in the **Submission instructions** field, enter instruction text. The instructions will be visible to vendors when they submit a category

request.
7. Close the **Properties** page.
8. Drag the **Approve new category request** workflow element onto the canvas.
9. Drag a link from the **Start** workflow element to the **Approve new category request** workflow element.
10. Drag a link from the **Approve new category request** workflow element to the **End** workflow element.
11. Double-tap (or double-click) the **Approve new category request** workflow element.
12. Select and hold (or right-click) the **Step 1** workflow element, and then select **Properties**.
13. On the **Properties** page for the workflow element, in the **Work item subject** field, enter subject text. This text will be shown as the value of the **Subject** field on the **Work items assigned to me** page.
14. In the **Work item instructions** field, enter instruction text. The instructions will be visible to approvers when they select **Workflow** on the Action Pane of a category request.
15. In the left pane, select **Assignment**.
16. On the **Assignment type** tab, set **Assign users to this workflow element** to *User*.
17. On the **User** tab, in the **Available users** list, select an approver. For example, select a user in the Procurement department.
18. Select the right arrow button (>) to move the approver to the **Selected users** list.
19. Close the **Properties** page.
20. Select **Save and close**.
21. In the **Version notes** field, enter notes about the workflow.
22. Select **OK** to save the workflow.
23. If you're ready to start to test the workflow, select **Activate the new version**. Otherwise, select **Do not activate the new version**.
24. Select **OK** to complete the workflow setup.

> **Tip**
>
> If your agency doesn't require approval of category requests, you should configure the workflow for automatic approval.

For more information about how to set up workflows, see Workflow system overview.

Create and submit a category request

This section describes how vendors can use the **Vendor information** workspace to create, edit, view, and submit category requests.

Start a new request

To start a new category request, follow these steps.

1. In the **Vendor information** workspace, select the **Category requests** tile.
2. On the **Category requests** page, on the Action Pane, select **New category request**.
3. In the **New category request** dialog box, find the category that you want to apply for by navigating the tree and/or using the filter at the top of the list. Select the checkbox for each relevant category.

   Note the following points:

   - Categories that are currently active on your vendor account are shown as selected and can't be removed.
   - You can request multiple procurement categories in a single category request.
4. Select **OK** to create the draft request.

   The new draft request now appears on the **Category requests** page.
5. Open the new draft request to review and edit it as required.

   - To view the list of categories that are currently included in the request, select the **Requested categories** FastTab.
   - To view your active categories, open the **Active categories** FactBox on the right side of the page.
   - To add a category to the request, select **Add** on the toolbar on the **Requested categories** FastTab.
   - To remove a category from the request, select the category on the **Requested categories** FastTab, and then select **Remove** on the toolbar.
   - To attach a document to the request, select **Attachments** on the Action Pane. Attached documents will be available to approvers when they review the category request.
   - To remove an attached document from the request, select **Attachments** on the Action Pane. Select the document to remove, and then select **Delete** on the Action Pane.
6. If you're ready to submit the request, select **Submit** on the Action Pane. Otherwise, just close the page and skip the remaining steps of this procedure. You can then return to the request later.
7. Read any submission instructions that appear, and then select **Submit**.
8. In the **Comment** box, enter any additional information that is required. Then select **Submit** to complete the request.

Edit a draft or recalled request

To edit a draft or recalled category request, follow these steps.

1. In the **Vendor information** workspace, select the **Category requests** tile.
2. Select the draft or recalled request to open it.
3. Edit the request as required, and then either close it or submit it as described in the previous procedure.

Submit a draft or recalled request

To submit a draft or recalled category request, follow these steps.

1. In the **Vendor information** workspace, select the **Category requests** tile.
2. Select the draft or recalled request that you want to submit.
3. On the Action Pane, select **Submit**.
4. Read any submission instructions that appear, and then select **Submit**.
5. In the **Comment** box, enter any additional information that is required. Then select **Submit** to complete the request.

   The status of the category request is changed to one of the following values:

   - *Pending review* – The request is in the workflow.
   - *Pending approval* – Approval is required.

Recall a submitted request that hasn't yet been approved

To recall a category request that has been submitted but hasn't yet been approved, follow these steps.

1. In the **Vendor information** workspace, select the **Category requests** tile.
2. Select the pending request that you want to recall.
3. On the Action Pane, select **Recall**.
4. In the **Enter a comment** box, enter any additional information that is required. Then select **Submit** to complete the request.

   The status of the category request is changed to *Canceled*. The request will remain in this status until you delete or resubmit it.

Delete a draft or recalled request

To delete a draft or recalled category request, follow these steps.

1. In the **Vendor information** workspace, select the **Category requests** tile.
2. Select the draft or recalled request that you want to delete.
3. On the Action Pane, select **Delete**.
4. Select **Yes** to confirm the deletion.

View completed requests

To view completed requests, open the **Vendor information** workspace and select the **Category requests** tile. Category requests that have been completed will have one of the following statuses:

- *Approved* – The request was approved. To view the newly added categories, go back to the **Vendor information** workspace, open the **More details** drop-down list in the left pane, and then select **Categories**.
- *Rejected* – The request was rejected. You can create a new category request as required.

Review category requests

This section explains how to approve, reject, and delegate category requests that vendors submitted, and how to view completed requests. These workflow actions are for the whole category request.

View category requests

To view category requests, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **Vendor collaboration requests** > **Category requests**.

   The **Category requests** page appears. The default page view shows category requests that have a status of *Pending action*.

2. To view all requests, select *All* in the **Show requests** field.

3. Open a request to review and edit it as required.

   - To view the list of categories that are currently included in the request, select the **Requested categories** FastTab.

- To view the active categories, open the **Active categories** FactBox on the right side of the page.
- If documents were submitted, the **Attachments** (paper clip) button on the Action Pane shows a count of the attached documents. To view attached documents, select the **Attachments** button. Then select the document to view and select **Open** to view it.
- To attach a document to the request, select **Attachments** on the Action Pane. Attached documents will be available to approvers when they review the category request.
- To remove an attached document from the request, select **Attachments** on the Action Pane. Select the document to remove, and then select **Delete** on the Action Pane.
- To view the workflow history, select **Workflow** on the Action Pane. In the workflow options, select **More** and then **Workflow history**. The **Workflow history** page appears.

Approve a pending category request

To approve a pending category request, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **Vendor collaboration requests** > **Category requests**.
2. Select the pending request to approve.
3. Review the category request.
4. Optional: On the **General** FastTab, in the **Reason code** field, select a reason code. Then, in the **Reason comment** field, enter a comment about the reason code.
5. On the Action Pane, select **Workflow**.
6. In the workflow options, select **Approve**.
7. In the **Comment** field, enter any additional information that is required. Then select **Approve** to complete the request.

   The status of the category request is changed to *Approved*, and the procurement categories are added to the vendor account.

Reject a pending category request

To reject a pending category request, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **Vendor collaboration requests** > **Category requests**.
2. Select the pending request to reject.
3. Review the category request.
4. On the Action Pane, select **Edit**.
5. On the **General** FastTab, in the **Reason code** field, select a reason code. Then, in the **Reason comment** field, enter a comment about the reason code.
6. On the Action Pane, select **Save**.
7. On the Action Pane, select **Workflow**.
8. In the workflow options, select **More** and then **Reject**.
9. In the **Comment** field, enter any additional information that is required. Then select **Reject** to complete the request.

   The status of the category request is changed to *Rejected*. At this point, the vendor can create a new category request as required.

Delegate a pending category request

To delegate a pending category request to another user, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **Vendor collaboration requests** > **Category requests**.
2. Select the pending request that you want to approve.
3. On the Action Pane, select **Workflow**.
4. In the workflow options, select **More** and then **Delegate**.
5. In the **User** field, select the user to assign the category request to for review.
6. In the **Comment** field, enter any additional information that is required.
7. Select **Delegate** to complete the delegation. The selected user can now review the category request.

View procurement categories for a vendor

To view procurement categories for a vendor after a category request is approved, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.

2. On the **All vendors** page, select the vendor that you want to view procurement categories for.

3. On the Action Pane, open the **General** tab and, from the **Set up** group, select **Categories**.

   The **Categories** page appears. The **Procurement** FastTab shows procurement categories that were added through the category request.

4. On the **Procurement** FastTab, you can make changes if needed. For example, you can set the **Vendor category status** field to *Preferred*.

Vendor collaboration with customers

06/17/2025

This article describes how you can use vendor collaboration to work with customers in Microsoft Dynamics 365 Supply Chain Management. Vendors can complete a series of business processes from the following workspaces:

- **Purchase order confirmation** – Monitor and respond to purchase orders (POs).
- **Vendor bidding** – View requests for quotation (RFQs), and respond to them by entering bids.
- **Vendor information** – View and update vendor master data.
- **Invoicing** – Work with invoices. This article doesn't cover the **Invoicing** workspace. For more information about this workspace, see Vendor collaboration invoicing workspace.

Vendors can also monitor information about consignment inventory.

Working with POs in the Purchase order confirmation workspace

The **Purchase order confirmation** workspace lets you respond to the purchase orders (POs) that have been sent to you for review. It also lets you view information about POs that are awaiting action from the customer, and POs that have been confirmed but are still open.

There are three lists in the **Purchase order confirmation** workspace:

- **Purchase orders for review** – This list shows POs that have been sent to you and are awaiting a response from you. After you respond, the PO disappears from the list. If the customer sends you a new version of the PO before you've responded to the previous version, only the latest version is shown.
- **Awaiting customer action** – This list shows all the POs that you've responded to but that the customer hasn't yet confirmed. If you accept a PO, you can monitor it in this list until the status is changed to **Confirmed**. If you reject a PO or accept it with changes, you can monitor it here until the customer sends a new version.
- **Open confirmed purchase orders** – This list shows all the POs for your account that have a status of **Confirmed**. When products or services are fully received against the PO, the PO disappears from the list.

You can use the following pages to work with POs:

- **Purchase orders for review** – This page contains the same information as the **Purchase orders for review** list in the workspace. See the description earlier in this article.

- **Purchase order vendor confirmation history** – This page contains all POs and all versions of POs that have been sent to the vendor. It also contains all the responses that have been returned from the vendor.
- **Open confirmed purchase orders** This page contains the same information as the **Open confirmed purchase order** list in the workspace. See the description earlier in this article.
- **All confirmed purchase orders** – This page contains all the POs that have been confirmed. The POs that are shown on this page include POs where products or services have been received. You can use this list to monitor POs that you can send invoices for.

Responding to POs

The POs that the customer sends you to review appear in the **Purchase order confirmation** workspace and on the **Purchase orders for review** page. After you open a PO, you can accept it, reject it, or accept it with changes. There might be attachments on the PO header or on individual lines. Additionally, you can attach information to your response on the PO header or individual lines. For example, you might suggest a substitute item for one of the lines.

You can preview and print the PO as a PDF file by using the **Preview/Print** option. You can also use the **Display dimensions** action to hide or show the following dimension columns: **Site**, **Warehouse**, **Color**, **Size**, **Style**, and **Configuration**.

If you use the **Accept with changes** option, you can accept or reject individual lines. You can also make the following changes to lines:

- Change dates or quantities. To update the confirmed receipt date on all lines, use the **Update receipt date** option on the PO header.
- Split lines for different receipt dates or quantities.
- Substitute an item. In the **Line details** section, enter an item description and the item number in the **External** field.

You can't change pricing information or charges, but you can use notes to make suggestions for these changes.

If the customer sends you a new version of a PO, it will have a version suffix to indicate that it's a modified version of a PO that was previously sent. The **Purchase order vendor confirmation history** page lets you track the history of each order.

Monitoring consignment inventory

If you're using consignment inventory, you can use the vendor collaboration interface to view information on the following pages:

- **Purchase orders consuming consignment inventory** – POs for consignment inventory are generated when the customer takes ownership of the inventory. These consignment POs are shown only on this page. They aren't included on the **All confirmed purchase orders** page.
- **Products received from consignment inventory** – This page lists all the transactions where the ownership of products has been transferred to the company that is consuming the inventory. You can use this information to invoice the customer.
- **On-hand consignment inventory** – This page shows the on-hand consignment inventory that is owned by your company, but that is on hand at the customer's warehouse.

Working with RFQs in the Vendor bidding workspace

The **Vendor bidding** workspace lets you view the requests for quotation (RFQs) that your company has been invited to respond to. You can also respond to the RFQs.

The workspace also shows all the RFQs that you've lost or won. Additionally, if the system is configured for the public sector, the workspace shows the RFQs that are publicly available.

Viewing RFQs

Open the **Vendor bidding** workspace to access the following information:

- Select **New bid invitations** to see the RFQs that your company has been invited to respond to. From here, you can view an RFQ and start the bidding process. You can also see amended RFQs that a new bid must be submitted for.
- Select **Returned bids** to see the RFQs that the customer has returned to you so that you can provide more information or update the bid.
- Select **Bids in progress** to see the RFQs that you or a contact person who represents your company has been working on but hasn't yet submitted.
- Select **Awarded bids** to see when the customer has awarded at least one line item in your bid.
- Select **Lost bids** to see bids where all lines have been rejected.
- Select the **Request for quotations** link to see a list of all the vendor's RFQ invitations and any bids that have been submitted. The **Request for quotations** page lists all the RFQs that a vendor has been involved in. You can search by status.
- Select the **Declined bids** link to see a list of all the RFQs where a vendor's contact person has declined to bid.

Working with RFQs that are publicly available

People who work in the public sector can see open and expired RFQs that have been made available to the public.

- Select the **Open published requests for quotations** link to see a list of open RFQs that are available to the public. An open RFQ is an RFQ that hasn't yet expired. You can find the expiration date and time on the header of the RFQ.

  If you've been invited to bid, you can find the same RFQ on the **New bid invitations** page. Sometimes, you might want to bid on an open RFQ, but you haven't been invited to bid. In this case, you might be able to invite yourself, provided that the customer has enabled self-invitation for the RFQ case.

  The **New bid invitations** page provides a filter that lets you view the open RFQs and identify those that contain lines that match your approved procurement categories.

- Select the **Closed published requests for quotations** link to see a list of closed RFQs that are available to the public. A closed RFQ is an RFQ that has expired. You can find the expiration date and time on the header of the RFQ.

  A closed RFQ shows all vendor bids down to the line level. As bids are awarded or rejected, this information is reflected in the closed RFQ. Any attachments that are included in the bid are also available.

> **Note**
>
> This functionality is available only if the public sector configuration is turned on.

Bidding

- Select **Bid** to start to bid on an RFQ.

  When the editing is enabled for bid fields on the headers and lines of an RFQ, you can enter your bid directly in the line grid. You must also consider any additional bid information that should be added in the line details.

  When you start to work on a bid, it appears in the **Bids in progress** section.

  At any time before the expiration date, you can save a bid. You can then return later to finish and submit the bid. After you submit a bid, you can recall and update it up until the expiration date.

- Select **Reset from RFQ** to reset the data that you entered for a bid and revert to the original RFQ. You can reset the header or the line.

- Select **Add alternate** or **Remove alternate** in the line grid to work with alternates.

  Some RFQs allow for alternate bids. You can specify alternate bids only for lines of the **Category** type, because specific items can't be added as alternates.

- Select **RFQ attachment** or **RFQ lines attachment** to open any attachment that the customer has added to an RFQ. Select **Bid attachments** or **Bid line attachments** to upload attachments together with the bid.

  There might be questionnaires that you must answer before you're allowed to submit a bid.

- Select **Decline** if you don't want to bid. After you select **Decline**, you can't recall the action and enter a bid.

If an RFQ is amended, you must enter a new bid. You can find information about the amendment on the **Amendments** tab of the RFQ page. Amended RFQs appear on the **New bid invitations** page.

Accessing vendor master data in the Vendor information workspace

As a vendor, you can access part of the information that the customer maintains in the vendor master record. Therefore, you can keep the information up to date. To update the information, you must have a vendor admin (external) role.

The accessible information is the vendor name, addresses, contact information, contact persons and their contact information, identification numbers, tax registration numbers, procurement categories that the vendor is approved to sell to the customer in, and information about certifications.

Related information

- Manage vendor collaboration users

Maintain vendor bank account information

Vendors can use the Vendor collaboration functionality to maintain their bank account information. This article explains how to add and maintain bank information for vendors that you do business with.

After you give access to vendors, they can add information for new bank accounts. You can then review that information and complete the pre-note process, so that the new accounts are used for payments to those vendors.

You can maintain your vendor account in the **Vendor information** workspace. There, vendors select **More details** and then **Bank accounts** from the drop-down list. To add a new bank account, select **Add** above the bank account grid. In the **New** dialog box that appears, enter the following information:

- Bank account
- Bank name
- Bank account number
- Bank routing number
- Effective date
- Expiration date
- Comments (optional)

SWIFT and the International Bank Account Number (IBAN) codes are required for all non-US based companies. You can update the SWIFT and IBAN requirements parameter on the **Accounts payable parameters** page after the feature is enabled.

If there are any documents that are related to the specific certification, you can attach them by selecting **Document**.

Bank information that vendors enter on the page shows **Vendor** as the source. You can also enter bank account information on a vendor's behalf. That information appears here, and **Customer** is shown as the source. For more information, see Create a vendor bank account.

After an account is added, vendors can edit their bank's effective and expiration dates as required.

Vendor collaboration-generated bank changes page

After vendors update their bank information, you can see that information on the new **Vendor collaboration-generated bank changes** page, available under **Accounts payable** > **Inquiries** > **Vendor reports**. By default, the page shows all newly entered or modified bank records. The accounts payable clerk can view the changes and run the account information through the pre-note process to validate it. When this process is complete and the primary payment method is manually updated, you can select and mark the bank account as reviewed on the **Vendor collaboration-generated bank changes** page. This action removes the account from the default list.

To view all changes to a vendor's bank information, change the filters to view the page by vendor account, effective date range, and whether the changes are reviewed.

Import vendor catalogs

Article • 11/18/2024

Vendor catalogs import

In Dynamics 365 Supply Chain Management, purchasing professionals can create and maintain catalogs for company employees to use when they order items and services for internal use. To create a procurement catalog, you can add the items and services that you want to make available to employees, either by importing the product catalog data or by manually adding the product catalog data to the product master.

You can upload catalog data submitted by a vendor from the Microsoft Dynamics 365 client.

The product data that a vendor submits to you, in the form of a catalog maintenance request (CMR) file, must be in XML file format. The CMR file should contain the details for the products that the vendor supplies to your company.

Import vendor catalog data

To import vendor catalog data, you must complete the following tasks:

1. Set up a project in the Data management workspace where you have defined your data mapping rules. Select **Data management** and then select **Set up roles for data projects**.

2. Set up a procurement category hierarchy, and assign your vendors to procurement categories. If you use commodity codes, add the commodity codes to the procurement categories. Learn more about setting up a procurement category hierarchy in Set up a procurement category hierarchy.

3. Configure the vendor for catalog import. Select a vendor, and then select **Procurement** > **Set up** > **Configure vendor for catalog import**.

4. Configure workflow for catalog import. Create a CMR file template and share this with your vendor.

5. Select **Procurement and sourcing** > **Catalogs** > **Vendor catalogs** to create a vendor catalog. The catalog maintenance request (CMR) files that you receive from your vendor are grouped in this catalog.

6. Upload the CMR file.

7. Review, approve, or reject the products in the vendor catalog. The products are automatically mapped to the procurement categories.

Approved products are added to the product master and are released to the selected legal entities. Only approved products can be added to the procurement catalog.

Generate a catalog import file template

The catalog import file template is an XSD file that you use to create a CMR file for a vendor's products. You can use the CMR file to create a new catalog, replace an existing catalog, or modify an existing catalog.

1. Go to **Procurement and sourcing** > **Catalogs** > **Vendor catalogs** and open the catalog that you want to work with.

2. Download a current catalog import template (XSD file). On the **Update catalog** page, on the Action Pane, on the **Catalogs** tab, in the **Related information** group, select **Generate catalog template** and select **Procurement category**.

    - With the **Procurement category** option, you can generate a catalog template that includes the procurement categories in which the vendor is authorized to provide products.

3. In the **Save as** dialog box, select the location where you want to store the catalog file template and save the file.

For more information and for examples, refer to this blog post: Vendor catalogs in Dynamics AX.

Set up an external catalog for PunchOut e-procurement

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

By using the external catalog, you can ensure that the product and price information that you subsequently process in Supply Chain Management is accurate and up to date.

The requisition can then be approved and converted to a purchase order and an order can be placed at the vendor.

When the external catalog is set up and an employee prepares a requisition, an option is available to redirect to an external site, the external catalog, and return the shopping basket that was created at the external site.

This communication is based on the cXML protocol and it needs to be set up between the systems of the buying and the selling organization.

To set up the communication, your vendor needs to provide information for you to use in the configuration of the external catalog, such as identity, domain of the buyer's company (for example, "DUNS" and "DUNS number"), credentials, and the URL to reach the vendor's catalog.

Set up an external catalog

Set up the external catalog so that when an employee enters a purchase requisition, they're redirected to an external site to select products.

The products that the employee selects from the external catalog are returned with up-to-date price information and from here, they can be added to the purchase requisition.

The intention isn't to enable employees to place an order on the external site.

When setting up the external catalog, make sure that the purpose of the site that the external catalog accesses is to collect quote information and not to place a real order.

To set up an external vendor catalog, complete the following tasks:

1. Set up a procurement category hierarchy. Learn more in Set up policies for procurement category hierarchies.
2. Register the vendor in Supply Chain Management. Before you can set up configurations to access an external vendor's catalog, set up the vendor and the vendor contact in Microsoft Dynamics 365. Add the external catalog's vendor to the selected procurement category. For more information about registering vendors, see Manage vendor collaboration users. Learn more about how to assign vendors to a procurement category in Approve vendors for specific procurement categories.
3. Make sure that the units of measure and the currency that the vendor uses are set up. Learn more about how to create a unit of measure in Manage units of measure.
4. Configure the external vendor catalog by using the requirements for your vendor's external catalog site. Learn more about this task in Configure the external vendor catalog.
5. Test the vendor's external catalog configurations to verify that the settings are valid and that you can access the vendor's external catalog. Use the **Validate settings** action to validate the request setup message that you've defined. This message should cause the vendors external catalog site to be opened in a browser window. During validation, you can't order items and services from the vendor. To order items and services, you must access the vendor's catalog from a purchase requisition.
6. Activate the external catalog by using the **Activate catalog** button on the **External catalogs** page. Activate the external catalog before employees can use it. You can deactivate the external catalog at any time.

Configure the external vendor catalog

This section gives more details about task 4 in the preceding section.

1. Enter a name and description for the vendor's external catalog. The name that you enter will appear on the cart that represents the external catalog that is shown to employees who creates a requisition. Employees can select on the cart to open the catalog on the vendor's external catalog site.

2. Add an image by using the **External catalog image** action. The image appears on the cart that represents the external catalog. Employees who create a requisition can see the cart. The image's width and height must be equal. Otherwise, the image doesn't display correctly.

3. Select whether the vendor's external catalog website should appear in the same browser window as the one where the employee created the requisition, or if it should open in a new window.

4. Select the vendor for the catalog. In the **Legal entities** list, there's a row for each legal entity where the vendor is set up. To allow users to request products directly from the vendor's catalog in some legal entities but not others, use the **Prevent access** or **Allow access** button for each legal entity where you want the catalog to be or not to be available.

5. In the **Default expiration (Days)** field, enter the number of days that a quotation received from the external catalog is valid and can be used to purchase from the external vendor. When a quotation is created and retrieved from the vendor's external catalog site, the quotation is valid as of the current system date and remains valid for the number of days that you enter in this field.

6. Select the **Add** button to start mapping the procurement categories to the external catalog. Then, in the Category name list, select a category. The list of categories is a superset of procurement categories that the vendor is mapped to in all the legal entities set up for the vendor.

   > ⓘ **Note**
   >
   > Procurement policies are used to allow or restrict access to categories for the buying legal entity or receiving operating unit. Punchout to an external catalog requires that you allow access to at least one of the procurement categories mapped to the catalog.

7. Set up the cXML setup request message that is sent to the vendor. The automatically generated message format is the minimal template that is required in order to start a session. Fill in values for the tags.

At any time, you can reload the system-generated message template by selecting **Restore message format**.

If you restore the message format, the current message is replaced by the automatically generated message format, which has empty tags.

cXML setup message

The following table describes the tags included in the template:

Expand table

Field	Description
< Header >< From >< Credential domain="" >	The domain of the buyer's company.
< Header >< From >< Credential>< Identity >< /Identity >	The identity of the buyer's company.
< Header >< To >< Credential domain="" >	The domain of the vendor's company.
< Header >< To >< Credential>< Identity >< /Identity>	The identity of the vendor's company.
< Header >< Sender >< Credential domain="" >	The domain of the buyer's company.
< Header >< Sender >< Credential >< Identity >< /Identity>	The identity of the buyer's company.
< Header >< Sender >< Credential >< SharedSecret >< /SharedSecret >	The shared secret for the buyer's company.
< Request deploymentMode="" >	The test or production deployment.
< Request >< PunchOutSetupRequest >< SupplierSetup >< URL >< /URL>	The URL of the vendor's PunchOut endpoint.

Extrinsic elements

An extrinsic element is additional information, such as a user name that is based on a user that punches out. The extrinsic element is set when the PunchOut occurs and it can be sent in the request setup message.

Your vendor might require an extrinsic element in the setup request. In that case, add the extrinsic element to the list of extrinsic elements in the **Message format** section of the **External catalog** page.

Specify a name for the extrinsic element that the vendor can recognize and map it to a value. The options for values are: User name, User email, or Random value. For more information about the cXML protocol, see the cXML.org website.

Post back message

The post back message is the message that is received from the vendor when the user checks out from the external site and returns to Supply Chain Management. Post back messages can't be configured. The messages are based on the cXML protocol definition. Here's the information that can be part of the post back message that is received on a requisition line.

Expand table

Message received from vendor	Copied to requisition line
< ItemIn quantity="" >	Quantity
< ItemIn>< ItemID >< SupplierPartID >< /SupplierPartID >	External item ID
< ItemDetail>< UnitPrice >< Money currency="" >	Currency
< ItemDetail >< UnitPrice >< Money >< /Money >	Unit price
< ItemDetail >< Description ShortName="" >	Product name
< ItemDetail >< Description >< /Description >	Included in item description; Product name if ShortName isn't specified.
< ItemDetail >< UnitOfMeasure >< /UnitOfMeasure >	Unit
< ItemDetail >< Classification >< /Classification >	Included in item description
< ItemDetail >< Classification domain="" >	Included in item description

Delete an external catalog

Delete an external catalog by using the **Delete** action on the page.

If a product is requested from the external vendor catalog, the external vendor catalog can't be deleted. Instead, the status of the external vendor catalog is set to inactive. If you want to remove access to the external vendor's catalog site, but not delete it, change the external catalog status to **Inactive**.

Purchasing cXML Enhancements

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

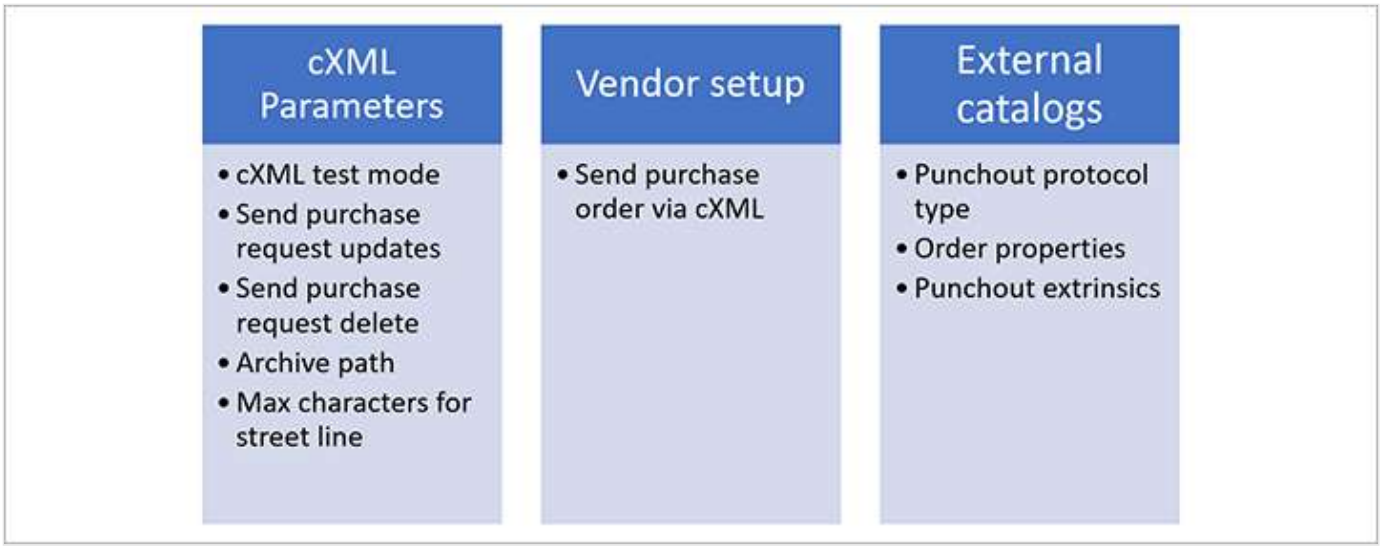
The *Purchasing cXML Enhancements* feature builds on the external catalog functionality used for purchase requisitions. The external catalog functionality is known as *PunchOut*. Although a purchase order doesn't have to originate from a purchase requisition, there must be a connection between the vendor on a purchase order and the parameters that are used to send the purchase order document.

Prepare to use the Purchasing cXML Enhancements feature

Before using this feature for the first time, configure settings in the following three areas:

- **cXML parameters** – Set up global parameters for the functionality for sending purchase orders.
- **Vendor setup** – If you want to use commerce eXtensible Markup Language (cXML) by default for all new purchase orders created for any vendor, set the **Send purchase order via cXML** option to *Yes* for that vendor.
- **External catalogs** – Use the new **Order properties** settings to define the format of the purchase order document and how it's sent.

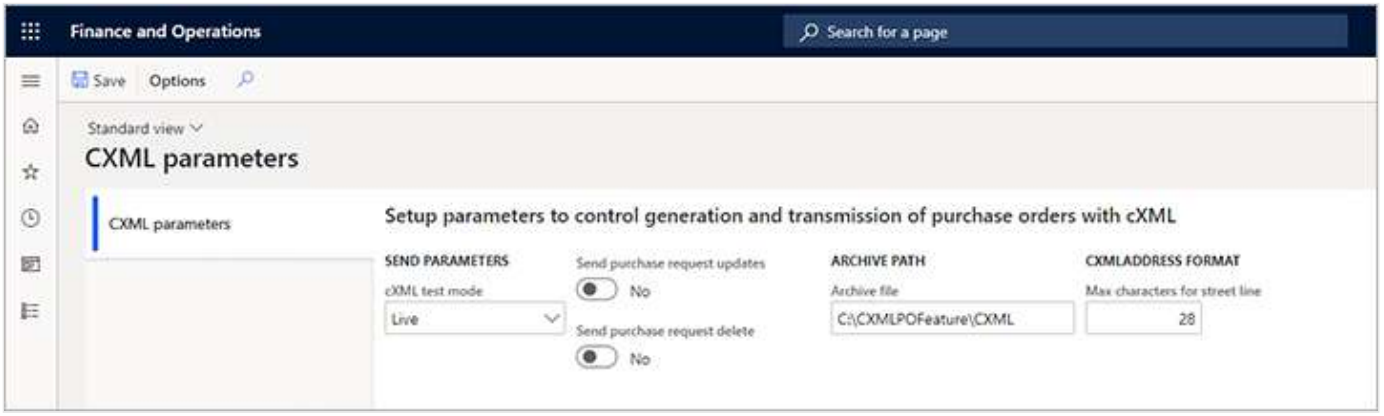
The following illustration summarizes this configuration.



In addition, set up the Purchase order request batch job. This batch job sends the confirmed purchase orders.

Set up global cXML parameters

Use the **cXML parameters** page to make a few global settings that apply to the functionality for sending purchase orders.



Go to **Procurement and sourcing** > **Setup** > **cXML management** > **cXML parameters**, and set the following parameters:

- **cXML test mode** – This global parameter affects the way that purchase orders are physically sent from the batch job. Select one of the following values:
  - **Test** – In this mode, the batch job can be running, and the XML document for the message is generated, but it isn't sent. Instead, it's saved on the purchase order request for review purposes. This mode is helpful when you're in an initial implementation, and you want to see how data is entered in the cXML message. You might also want to generate sample messages that you can send to vendors for initial validation.

    - **Live** – In this mode, the feature uses the external catalog settings to physically transmit each document to the vendor.

- **Send purchase request updates** – Set this option to *Yes* to send an update message for purchase orders. Set it to *No* to prevent the message from being sent. Most vendors prefer not to receive update messages. Instead, they require that customers contact them by phone or email if a purchase order should be changed. This parameter is a global parameter, and no override can be specified on the external catalog for each vendor. A purchase order is marked as updated if you post a second confirmation on a purchase order, but the first confirmation is already sent and acknowledged by the vendor. If there's a second confirmation, but the first confirmation isn't sent, the second confirmation is treated as a new document. You can confirm a purchase order as many times as you want until one confirmation is sent. The next confirmation is then treated as an update message.

- **Send purchase request delete** – Set this option to *Yes* to send a delete message for purchase orders. Set it to *No* to prevent the message from being sent. Most vendors prefer not to receive delete messages. Instead, they require that customers contact them by phone or email if a purchase order was sent by mistake. This parameter is a global parameter, and no override can be specified on the external catalog for each vendor. A purchase order is marked as deleted if you cancel the purchase order in Supply Chain Management.

- **Archive file** – Specify the file path where you want to export and save archived cXML documents. The path is used when you run the purge function from the **Purchase order request** page.

- **Max characters for street line** – Enter the maximum number of characters that can be used in the street field for addresses in the cXML document. This global parameter affects all vendors unless an override is specified on the external catalog properties.

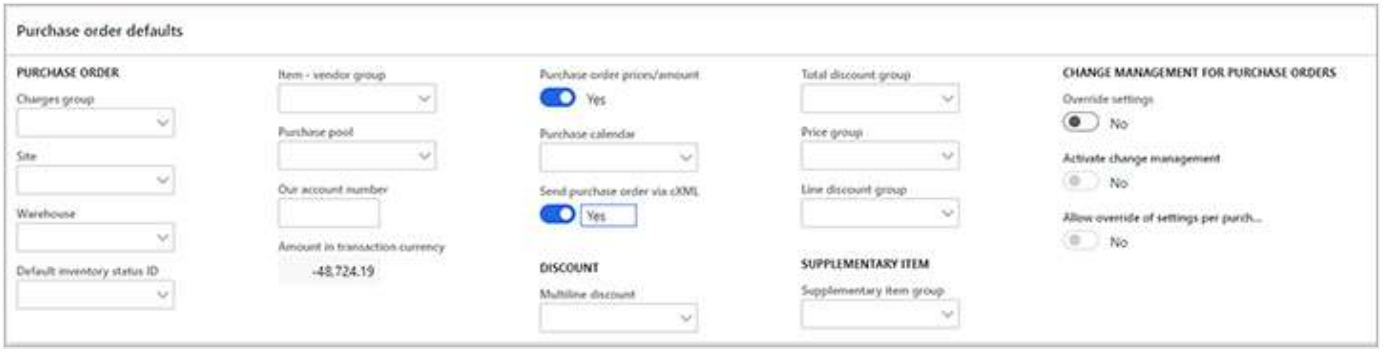
Set up vendor purchase orders to use cXML

Every time that you confirm a purchase order where the **Send purchase order via cXML** option is set to *Yes*, the system automatically generates the cXML message and delivers it to the vendor that is associated with that purchase order. There are two ways to control this option for your purchase orders:

- To set up a vendor so that it automatically uses cXML for all new purchase orders that are created from a requisition, go to **Procurement and sourcing** > **Vendors** > **All vendors**, and select or create a vendor to open its details page. Then, on the **Purchase order defaults**

FastTab, set the **Send purchase order via cXML** option to *Yes*. If cXML should also automatically be used for new purchase orders that are **not** created from a requisition, you must also set the **ENABLEMANUALPO** order property to *True* for the related external catalog, as described in the Set the order properties section later in this article.

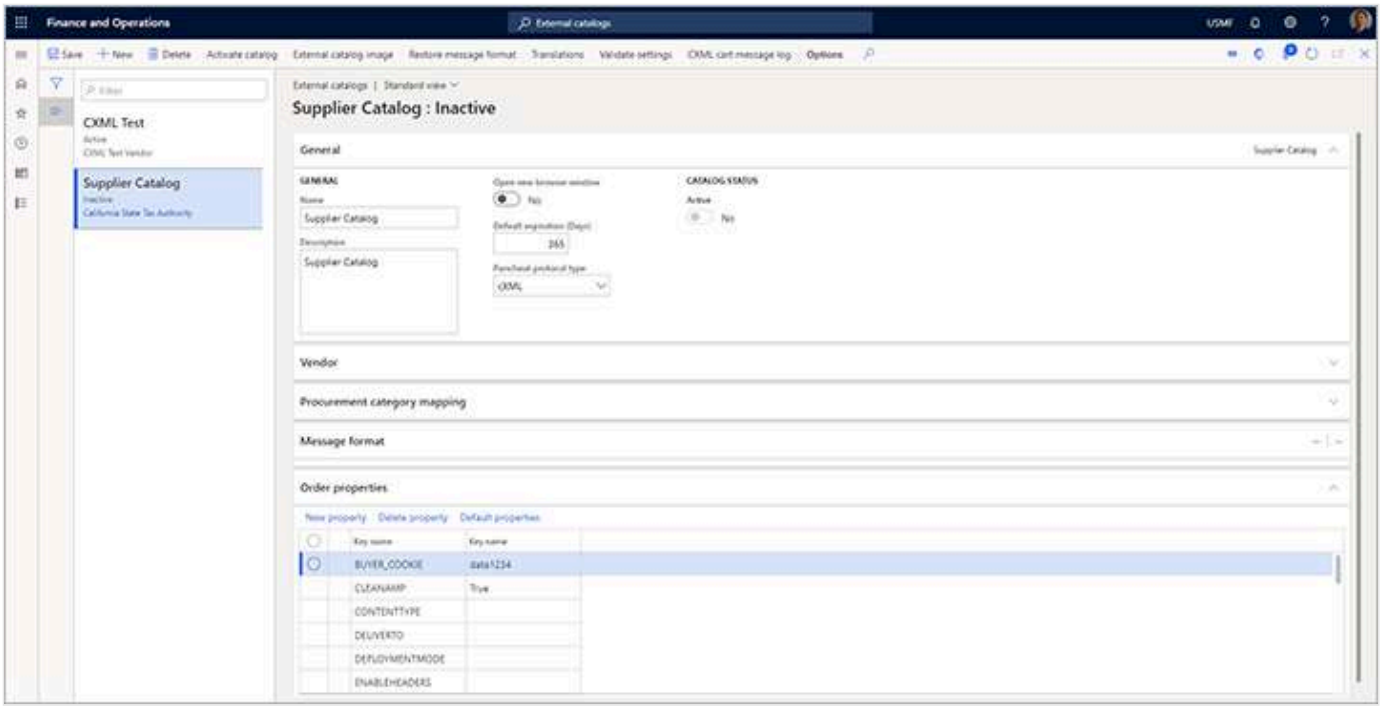
- For individual purchase orders, go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**, and select or create a purchase order to open its details page. Switch to the **Header** view, and then, on the **Setup** FastTab, set the **Send purchase order via cXML** option as required.



Set up an external catalog to use cXML

On the **External catalogs** page, for each of your catalogs, you can set up the PunchOut functionality and the functionality for sending purchase orders. To find the relevant settings, go to **Procurement and sourcing** > **Catalogs** > **External catalogs**. Start by setting up each catalog as usual. This process includes assigning a vendor, selecting the categories that the vendor is allowed to supply, and activating the catalog. Then configure the additional settings that are described in this section.

> **Note**
>
> When you confirm a purchase order that can be sent via cXML, the system looks up the vendor that is associated with the purchase order and then finds the first active external catalog that is associated with that vendor. The system then uses the settings from that external catalog to send the purchase order. If multiple external catalogs are set up, the system uses only the first external catalog that it finds, based on the vendor on the purchase order. Therefore, create just one external catalog for each vendor.



Set the PunchOut protocol type

On the **General** FastTab of the **External catalogs** page, set the **Punchout protocol type** field to *cXML*. This option will be the only available option, unless a partner has extended the functionality and provides an additional option in the extension.

If you use the catalog for PunchOut, set up the message format. The message format establishes the connection to the vendor in the PunchOut transaction from the requisition. When a purchase order is sent, the order properties establish the connection with a vendor.

Set the order properties

The **Order properties** FastTab for external catalogs provides a grid where you can define the order properties. It also provides a toolbar. This toolbar contains the following three buttons that you can use to manage the order properties:

- **Default properties** – When you're setting up a new catalog, select this button to add a predefined collection of commonly used properties to the grid.
- **New** – Add a new property to the grid.
- **Delete** – Delete the currently selected property from the grid. If you accidentally delete a default property, select **Default properties** to restore all the missing properties.

Every time that you add one or more properties to the grid, use the right column to specify a value for each.

Use the default properties in the following way:

- **BUYER_COOKIE** – This tracking field can be used to indicate specific information for your company. Unless you have an agreement with the vendor about how this property is used, it doesn't have very much meaning when sending a purchase order. Therefore, you should set it to a simple value.

- **DELIVERTO** – When the shipping address is entered in the document from the purchase order, the **Attention information** field is used to set the **DeliverTo** field in the XML message. If you require that this value be a requester name, and you'll set the requester field on the purchase order header, enter the value *REQUESTER* for this property, so that the requester name will be entered in the **DeliverTo** field in the XML. In this case, the primary email address and phone number that are used will be from the requester instead of the orderer.

- **DEPLOYMENTMODE** – Set this property as required by the vendor. The values are usually *PRODUCTION* or *TEST*. Set the value based on your communication with the vendor. Usually, it must match the intended system behind the **ORDERCHECKURL** value that the vendor indicates as a test or production system.

- **FIXEDBILLADDRESSID** – When the **addressID** field in the XML message is set, it picks up the location that is specified on the address. If the ID value that you've communicated to the vendor differs from the value on the address location for some reason, you can force an override by specifying the value here. The assumption is that you'll use only one address with the vendor, and that the address is set up in the vendor's system. The billing address is the primary invoice address that is specified for the legal entity in Supply Chain Management.

- **FIXEDSHIPADDRESSID** – When the **addressID** field in the XML message is set, it picks up the location that is specified on the address. If the ID value that you've communicated to the vendor differs from the value on the address location for some reason, you can force an override by specifying the value here. The assumption is that you'll use only one address with the vendor, and that the address is set up in the vendor's system. The shipping address is the address that is specified on the header of the purchase order. Most vendors accept only header addresses, not line addresses. Although there are fields for line addresses in the XML, they'll be set to the header address.

- **FROM_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.

- **FROM_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.

- **ORDERCHECKURL** – Enter the URL to transmit the purchase order documents to. This URL starts with `https://` and is supplied by your vendor.
- **PAYLOAD_ID** – Enter a prefix value for the payload ID, as required for the business processes that are in place for the current vendor.
- **SENDER_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **SENDER_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **SHARED_SECRET** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **STREETLENGTH** – Enter a number that represents the maximum number of characters that the vendor will accept as a street name. If a value is entered here, it overrides the value that is specified on the **cXML parameters** page. The system removes line breaks and spaces to try to fit the standard address in Supply Chain Management into the number of characters that is specified here. Any additional characters are truncated.
- **TO_DOMAIN** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **TO_IDENTITY** – Enter the value that is used to send purchase order documents. This value is supplied by your vendor.
- **USERAGENT** – Enter a value to identify the system that you're using. For example, enter *Dynamics 365 Supply Chain Management*.
- **VERSION** – Enter a cXML version number, if the vendor requests this information. The default version is *1.2.008*. This version is stable and is accepted by most vendors.
- **RESPONSETEXT** – Enter any custom text that you expect the vendor to return in the cXML response message after the order is sent. In this way, the system can mark the message as *Acknowledged*. If the response doesn't match standard text or the customer text that you enter here, the request is marked as *Error*.
- **RESPONSETEXTSUB** – Set this property to *TRUE* if you want to search the vendor response text for the values that are specified in the **RESPONSETEXT** field. For example, the vendor might return a long string that includes "OK" in the response. In this case, you can enter *OK*

in the **RESPONSETEXT** field and set **RESPONSETESTSUB** to *TRUE* to search for "OK" anywhere in the response. The order can then be set to *Acknowledged*.

- **CONTENTTYPE** – In a typical catalog setup, you don't have to set this property. If you receive a server 500 error from a vendor's system when you send a purchase order, you can do testing by setting this property to *FALSE*. That value changes a setting in the web request and might enable the message to be sent for some platforms.

- **ENABLEHEADERS** – Set this property to *TRUE* to send headers together with the purchase order. You must set this property only if the vendor requires it. If you set this property to *TRUE*, add extra custom properties that are based on the names that the vendor provides, and prefix them with *H_*. Typical examples include **H_USERID**, **H_PASSWORD**, **H_RECEIVERID**, and **H_ACTIONREQUEST**. The following custom properties are included in the default properties:
  - **H_USERID** – If the trading partner requires that you send a user ID as part of the URL to submit a purchase order, enter the value here.
  - **H_PASSWORD** – If the trading partner requires that you send a password as part of the URL to submit a purchase order, enter the value here.

- **ENABLEMANUALPO** – If this property is set to *TRUE*, when users manually create purchase orders (that is, when they don't start from a requisition), those purchase orders inherit the setting of the **Send purchase order via cXML** option from the vendor. If this property isn't set, or if it's set to *FALSE*, the **Send purchase order via cXML** option isn't set on the purchase order header for manually created purchase orders. For purchase orders that are created from a requisition, the setting of the **Send purchase order via cXML** option is always inherited from the vendor, regardless of the setting of this property. Learn more in the Set up vendor purchase orders to use cXML section earlier in this article.

- **PUNCHOUTPOONLY** – If this property is set to *TRUE*, only purchase requisition lines that are created from the PunchOut process set the **Send purchase order via cXML** option on the purchase order header. In addition, the purchase requisition line type of all lines on the purchase order must be *External catalog item*. Otherwise, the cXML purchase order can't be created.

- **PUNCHOUTSHIPTO** – If this property is set to *TRUE*, the default address of the legal entity is added to the PunchOut setup request message when the user opens an external catalog. This address is added as the **ShipTo** address. Vendors use the **ShipTo** address to show pricing based on the company location.

- **TRACEPUNCHOUT** – Set this property to *TRUE* if you receive an error message when you try to browse to an external catalog from the requisition. Trace information is then filled in for the **PunchOutSetupRequest** and **PunchOutResponse** messages that are sent between Supply Chain Management and the vendor site. You can view this information on the **cXML cart message log** page, which you can open from the **External catalog setup** page for the vendor catalog that you're having issues with. Set this property to *TRUE* only if you're troubleshooting, because it creates a large performance overhead on the database for each PunchOut. Learn more in the View the cXML cart message log for external catalog PunchOut section later in this article.

- **TRACESEND** – Set this property to *TRUE* to collect more information about purchase orders sent using cXML. To view the collected information, go to the **Purchase order request** page. Set this property to *TRUE* only while troubleshooting cXML functionality because it generates a large performance overhead on the database for each purchase order that you send.

- **REPLACENEWLINE** – Set this property to *TRUE* if you're having an issue because a vendor's system is sending a **PunchOutResponse** message that includes newline characters (\n). This issue might occur if the vendor's messages are parsed through middleware or a procurement hub. If you're having an issue with a new vendor setup, set the **TRACEPUNCHOUT** property to *TRUE* to view the **PunchOutResponse** message and determine whether the XML tags are broken up by newline characters.

- **POCOMMENTS** – Set this property to *TRUE* if you want the cXML document to include notes that are attached to the purchase order in Supply Chain Management. The attachment text is included in the header comments in the purchase order message. For more information about how the system selects and processes these attachments, see the Attach notes to a purchase order section later in this article.

- **VENDCOMMENTS** – Set this property to *TRUE* if you want the cXML document to include notes that are attached to the purchase order in Supply Chain Management. The attachment text is included in the header comments in the purchase order message. For more information about how the system selects and processes these attachments, see the Attach notes to a purchase order section.

- **CLEANAMP** – Set this property to *TRUE* if you receive an error message when you try to do a PunchOut to a vendor, and the vendor's return URL includes incorrectly encoded ampersands (&).

- **PUNCHOUTTZ** – Set this property to *TRUE* if the vendor that you're working with uses the International Organization for Standardization (ISO) 8601 standard to do a specific validation of the date/time of PunchOut request message. Supply Chain Management uses the Coordinated Universal Time (UTC) date in the **PunchOutSetupRequest** message. Therefore, when you set this property to *TRUE*, *+00:00* is added to the date/time format.

- **WMSADDRESSID** – Set this property to *TRUE* to use the warehouse number on the purchase order header as the **addressID** value in the **ShipTo** address for the purchase order request that is sent to the vendor. If you set a value for the **FIXEDSHIPADDRESSID** property, that value takes precedence over this value. Therefore, use one property or the other to set the **addressID** value in the **ShipTo** address for the document.

- **PUNCHOUTSHIPTOUSER** – This property works together with the **PUNCHOUTSHIPTO** property. If **PUNCHOUTSHIPTO** is set to *TRUE*, the address for the legal entity is picked up. If **PUNCHOUTSHIPTOUSER** is set to *TRUE*, the primary address from the PunchOut user is used instead of the legal entity address.

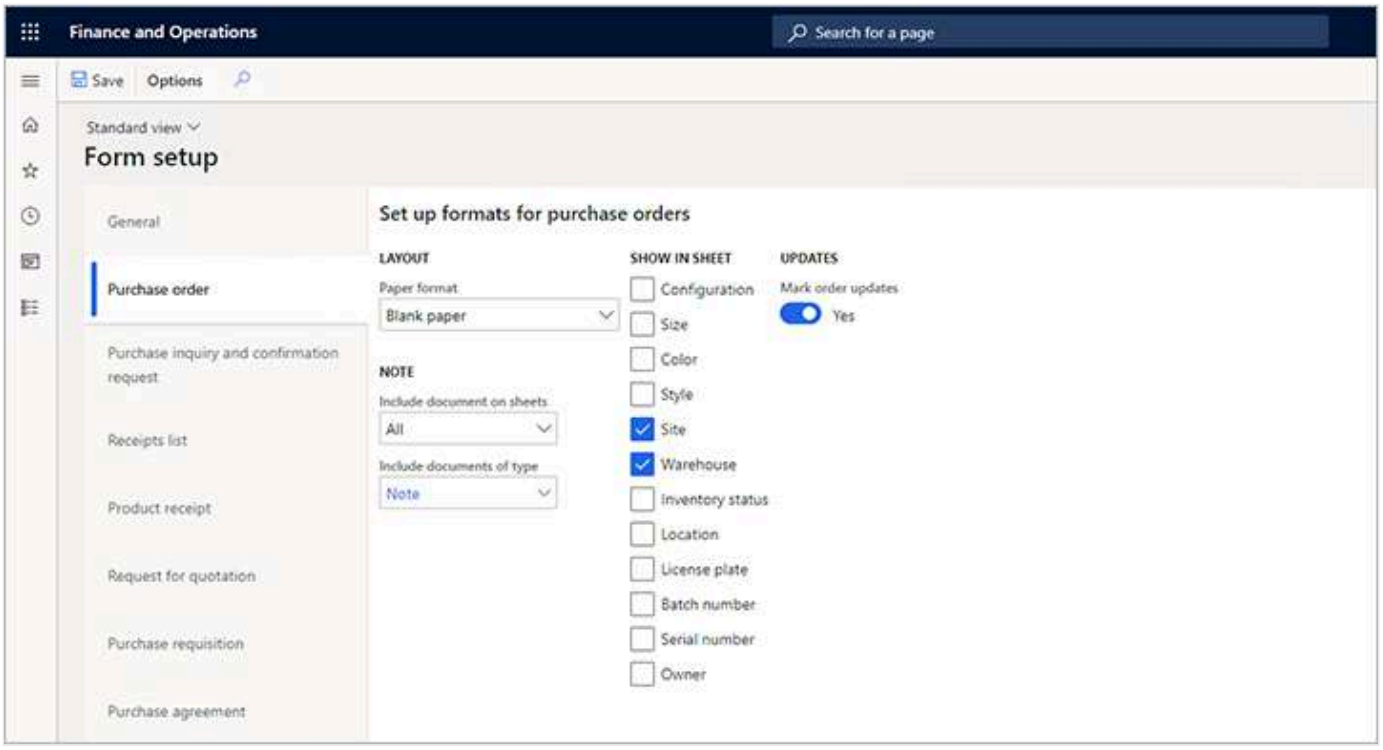
Activate the external catalog

After you set up all the properties and configure other settings for your external catalog, return to the **General** FastTab of the **External catalogs** page, and set the **Active** option to *Yes*.

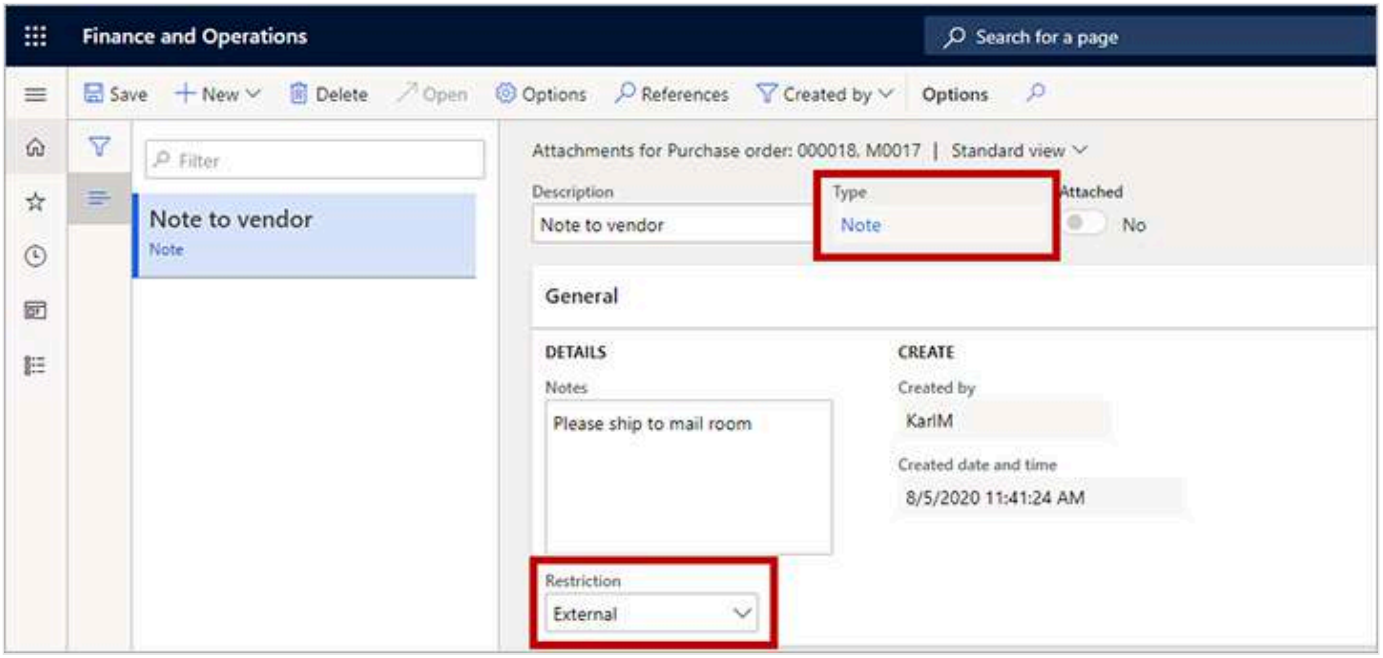
Attach notes to a purchase order

As mentioned in the Set the order properties section, if you want your delivered cXML to include text from notes attached to the relevant purchase order and/or vendor records, set the **POCOMMENTS** and **VENDCOMMENTS** properties to *TRUE* in the external catalog setup. This section provides more detail about how the system selects and processes these attachments.

To set the types of notes that the system looks for, go to **Procurement and sourcing** > **Setup** > **Forms** > **Form setup**. Then, on the **Purchase order** tab, set the **Include documents of type** field to the type of note that you want to include. Only text notes are included, not document attachments.



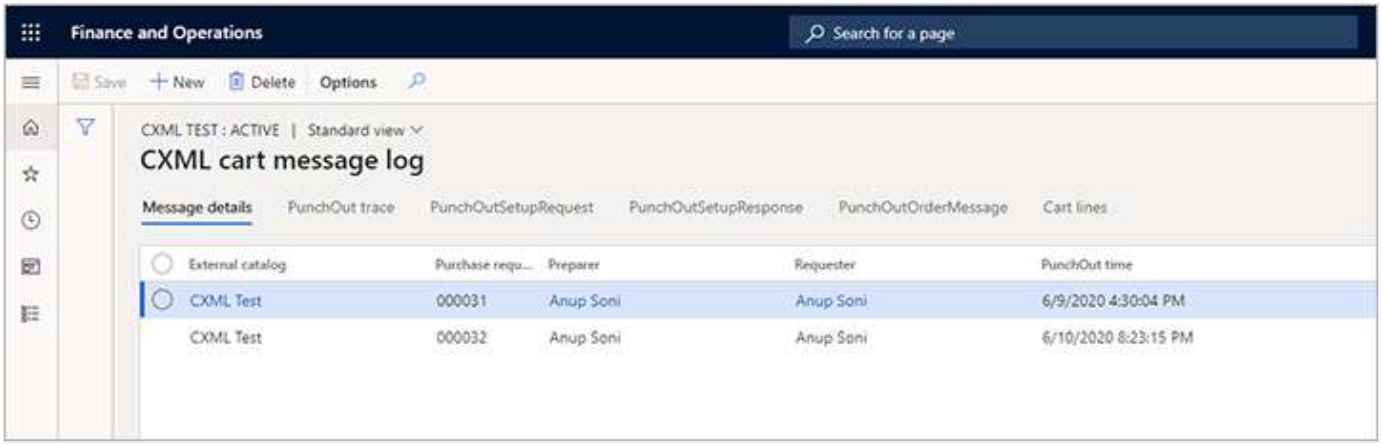
Attachments are included with a purchase order only if their **Type** field matches the value that you select in the **Include documents of type** field, and if their **Restriction** field is set to *External*. To create, view, or edit the attachments for a purchase order, go to **Procurement and sourcing** > **All purchase orders**, select or create a purchase order, and then select the **Attachments** button (paperclip symbol) in the upper-right corner.



View the cXML cart message log for external catalog PunchOut

When you set the **Punchout protocol type** field to *cXML* for an external catalog, the system will capture a message log of the carts that come back from vendors. This log can be used for troubleshooting and other data purposes.

To open the log for an external catalog, select the relevant catalog, and then, on the Action Pane, select **cXML cart message log**. The **cXML cart message log** page shows a list of the carts that are returned, the XML that is related to those carts, and the lines that are created on the related purchase requisition.



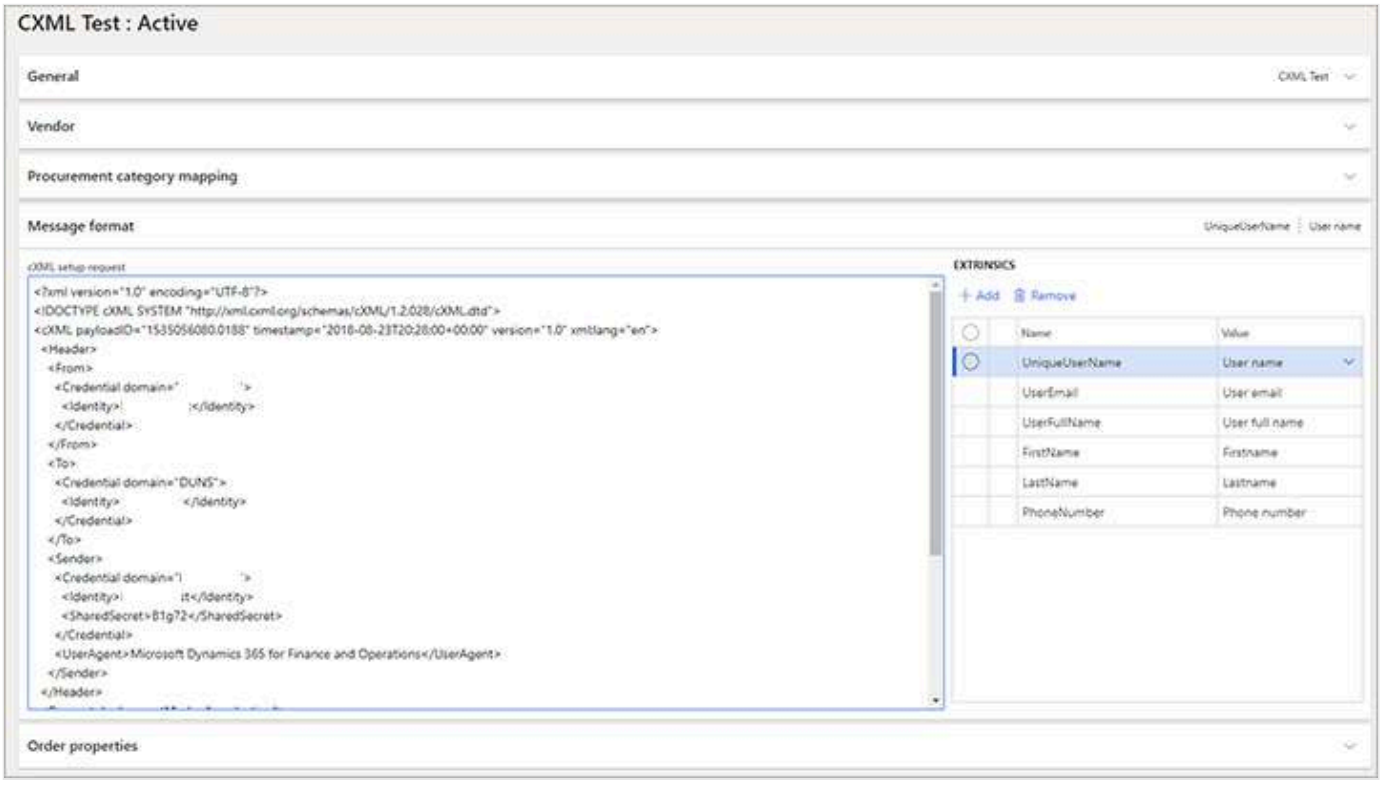
Set the extrinsic elements for external catalog PunchOut

When you set the **Punchout protocol type** field to *cXML* for an external catalog, you can add custom extrinsic elements that are inserted at the correct place in the request XML message.

To add extrinsic elements to an external catalog, follow these steps:

1. Go to **Procurement and sourcing** > **Catalogs** > **External catalogs**.
2. Select the relevant catalog.
3. On the **Message format** FastTab, in the **Extrinsics** section, select **Add** to add a row to the grid for each extrinsic element that you want to include. On each row, set the following fields:
    - **Name** – Enter a name for the element. This value becomes the value of the **name** attribute for the **Extrinsic** XML element that each row creates. Usually, you work with your vendor to agree on the name for each extrinsic element.
    - **Value** – Select a value for the element. This value becomes the value of the XML element that each row creates. The following values are available:

- **User name** – Use the name of the user who is doing the PunchOut. This name is the sign-in name for Supply Chain Management.
- **User email** – Use the email address of the user who is doing the PunchOut. This address is the address that the user sets up on the **Account** tab of the **User options** page.
- **Random value** – Use a unique random value.
- **User full name** – Use the full name of the contact person who is associated with the user who is accessing the external catalog.
- **Firstname** – Use the given name of the contact person who is associated with the user who is accessing the external catalog.
- **Lastname** – Use the family name of the contact person who is associated with the user who is accessing the external catalog.
- **Phone number** – Use the primary phone number of the contact person who is associated with the user who is accessing the external catalog.



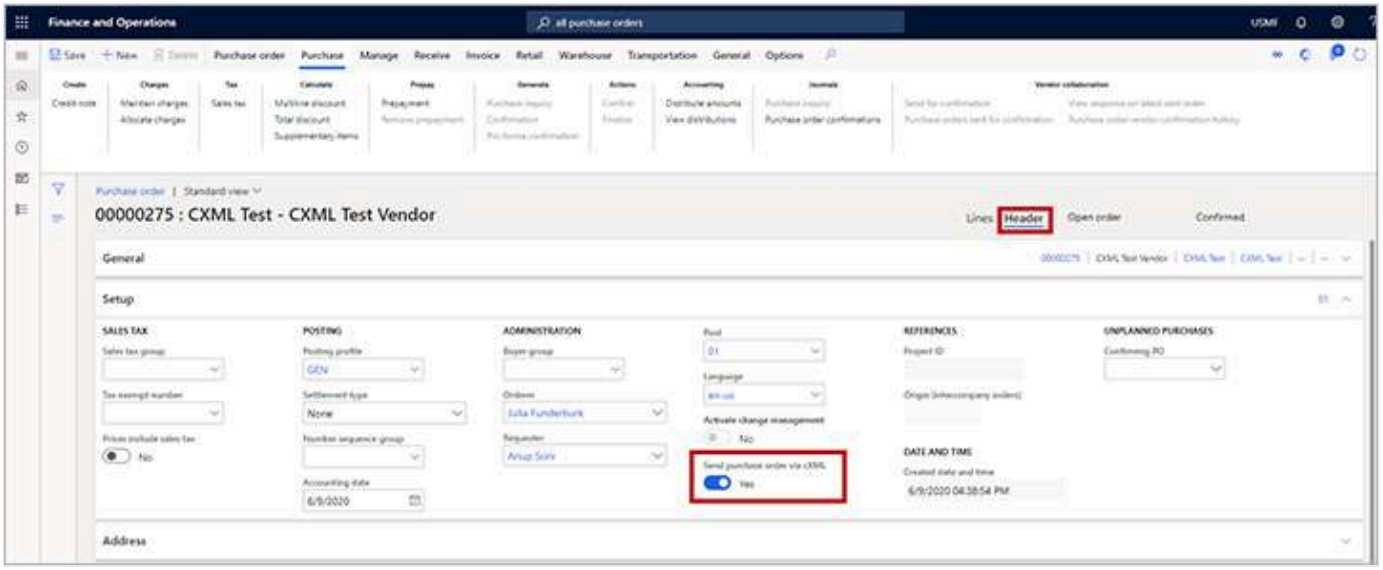
The user or admin doesn't see the extrinsic elements, because they aren't added until the user does a PunchOut. They're automatically inserted between the **BuyerCookie** and **BrowserFromPost** elements in the cXML setup request message. Therefore, you don't have to set them manually in the XML when you set up the external catalog.

```
<Request deploymentMode="production">
  <PunchOutSetupRequest operation="create">
    <BuyerCookie></BuyerCookie>
    <BrowserFormPost>
      <URL></URL>
    </BrowserFormPost>
```

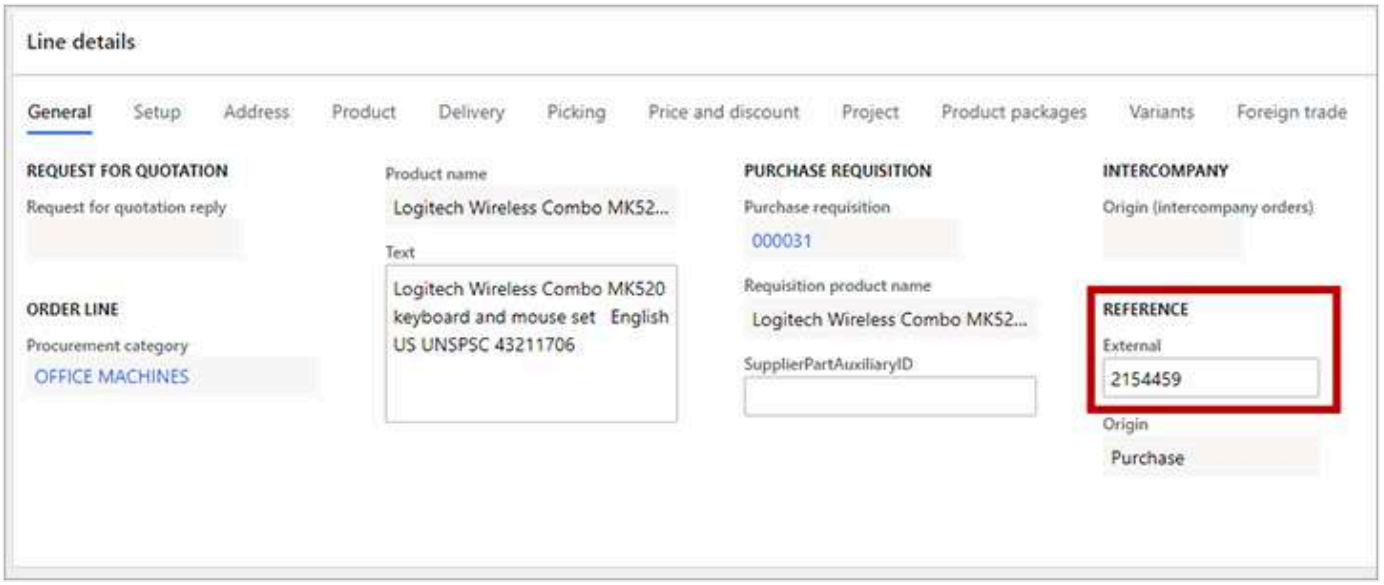
```
<Request deploymentMode="production">
  <PunchOutSetupRequest operation="create">
    <BuyerCookie></BuyerCookie>
    <Extrinsic name="UniqueName"></Extrinsic>
    <Extrinsic name="UserEmail"></Extrinsic>
    <BrowserFormPost>
      <URL></URL>
    </BrowserFormPost>
```

Create and process a purchase order

When you create a purchase order for a vendor, the purchase order inherits the setting for the **Send purchase order via cXML** option from that vendor. However, the setting remains available on the **Setup** FastTab in the **Header** view of the purchase order, so that you can change it later as required.



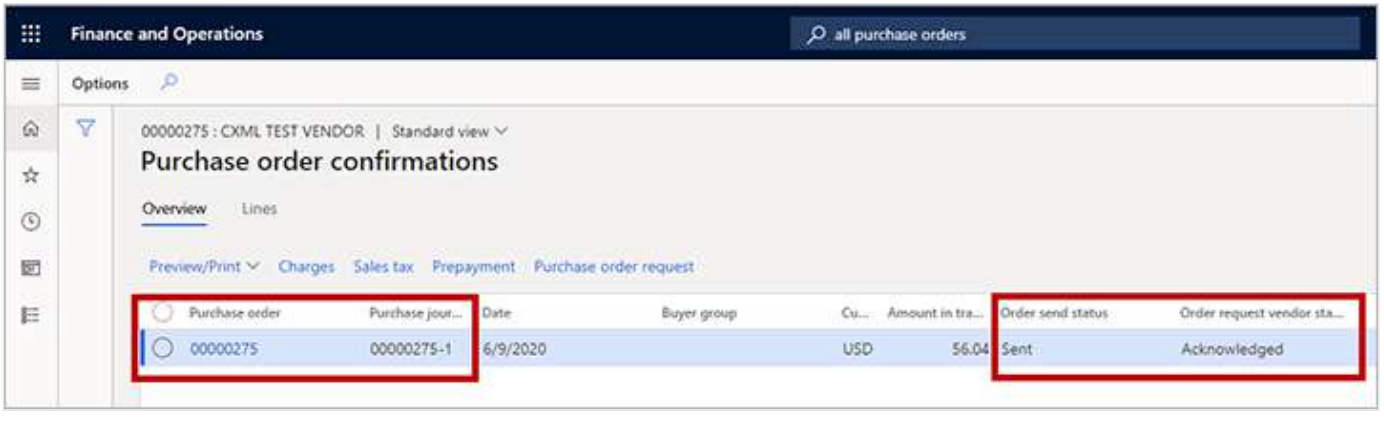
When you create a purchase order from a purchase requisition that came from a PunchOut flow, all the required line details are filled in. You can then manually add purchase order lines or copy them from other purchase orders. Be sure to set all required fields. These required fields include the external reference number, which is the vendor number that used in the cXML message.



When you finish filling in all the details for the purchase order, confirm it. The system doesn't send a message unless you confirm the purchase order. To confirm a purchase order, on the Action Pane, on the **Purchase** tab, in the **Actions** group, select **Confirm**.

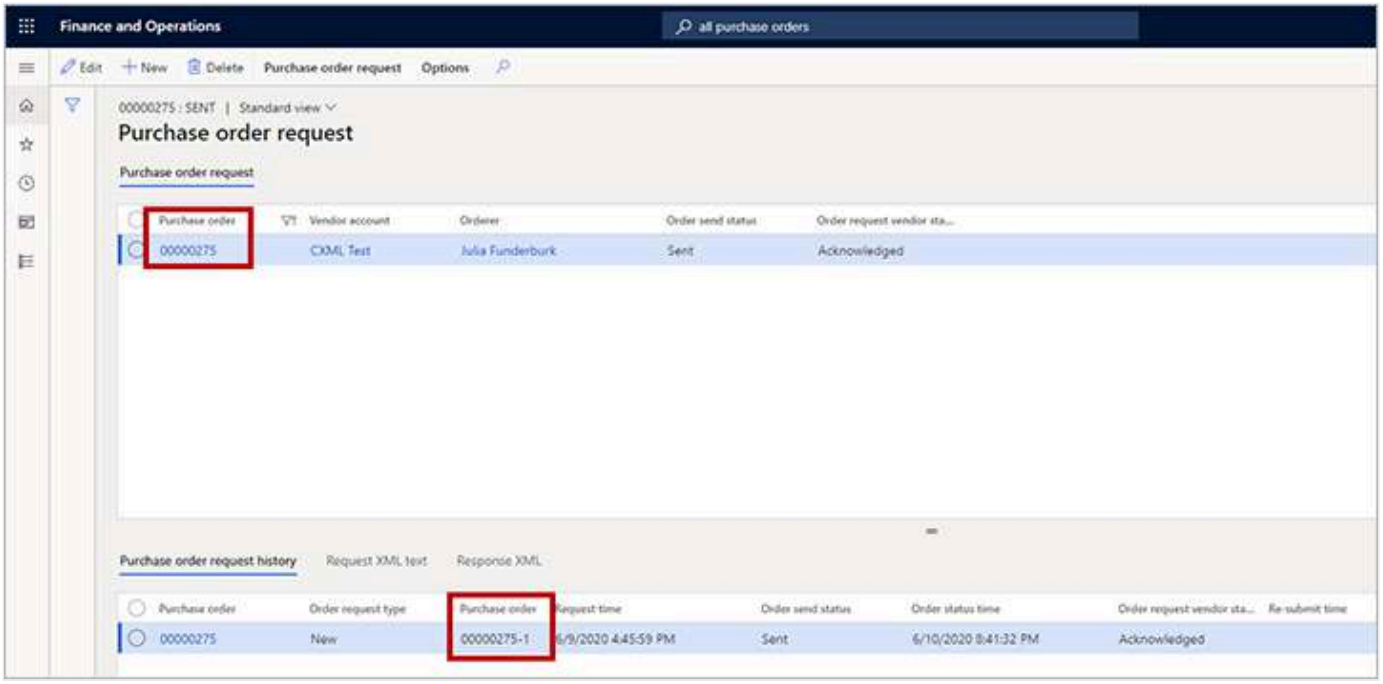
After you confirm the purchase order, you can view the status of the confirmation through the **Purchase order confirmations** journals. On the Action Pane, on the **Purchase** tab, in the **Journals** group, select **Purchase order confirmations**.

Each purchase order can have many confirmations. Each confirmation has an incremental number. In the following illustration, the purchase order is *00000275*, and the confirmation is *00000275-1*. This numbering reflects standard Supply Chain Management functionality, where changes in a purchase order, and therefore the type of cXML message that should be sent to the vendor, are identified based on the confirmation. As the illustration shows, the **Purchase order confirmations** page also includes **Order send status** and **Order request vendor status** fields. For more information about the various status values that you might see on this page, see the Monitor purchase order requests section later in this article.

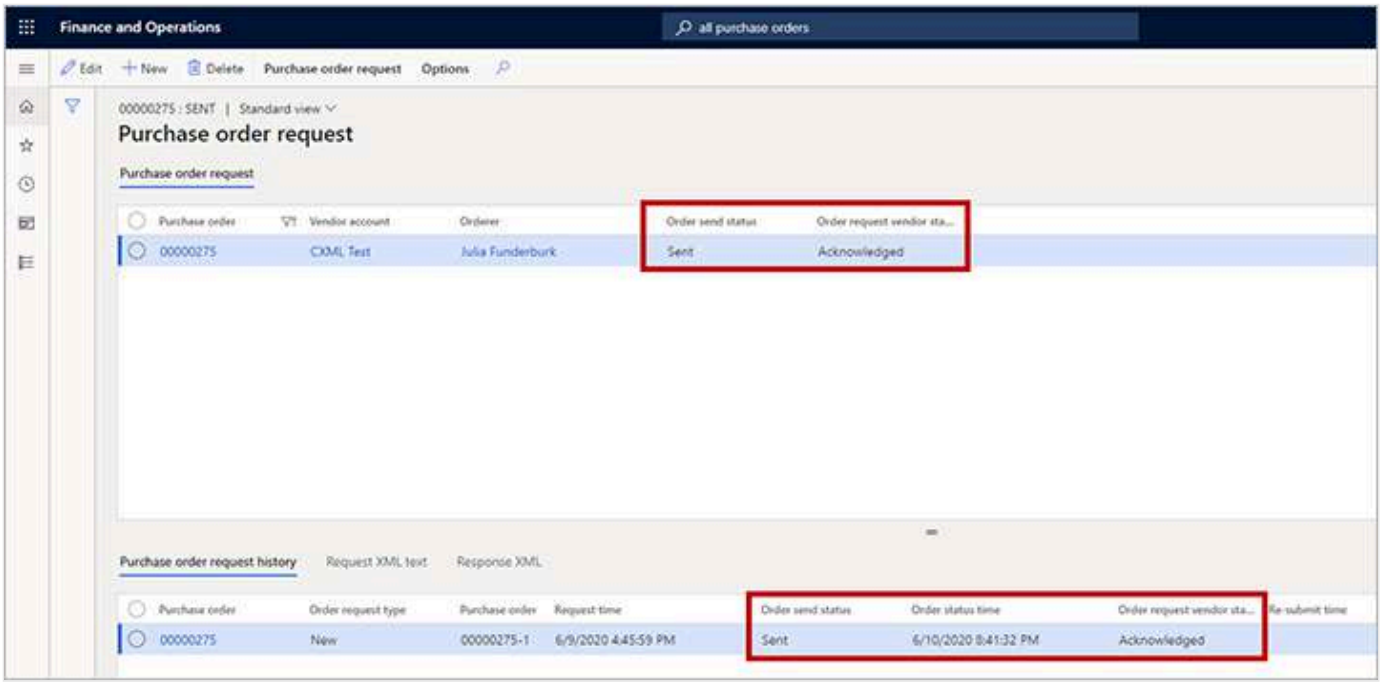


To view more information about the document, select **Purchase order request** above the grid.

The **Purchase order request** page includes two grids. The grid in the upper part of the page has one record for each purchase order that is marked for sending. The grid on the **Purchase order request history** tab in the lower part of the page might have several records for the selected purchase order, to indicate the status of each confirmation. The following illustration shows purchase order 00000275 in the upper grid and document 00000275-1 in the grid on the **Purchase order request history** tab.



If the batch job is set up and running, the document will be sent. You can view the status change after the document is sent. In the following illustration, the **Order send status** field is set to *Sent*. The **Order request vendor status** field is set to *Acknowledged* to indicate that the vendor received the document, and was able to read it and store it in its system. The grid on the **Purchase order request history** tab shows the time when the document was sent. For more information about the various status values that you might see on this page, see the Monitor purchase order requests section.



Schedule the purchase order request batch job

To activate the batch job for sending purchase order requests, go to **Procurement and sourcing** > **Setup** > **cXML Management** > **Purchase order request**. On the Action Pane, on the **Purchase order request** tab, in the **Batch** group, select **Submit job** to open the **Purchase request prepare and send** dialog box. Use this dialog box to set up the recurrence, just as you usually do for batch jobs in Supply Chain Management. Select an interval based on your order volume. Although you can run the batch job every minute, it's probably best to send batches throughout the business day, based on order receipt windows that match your vendors' schedules.

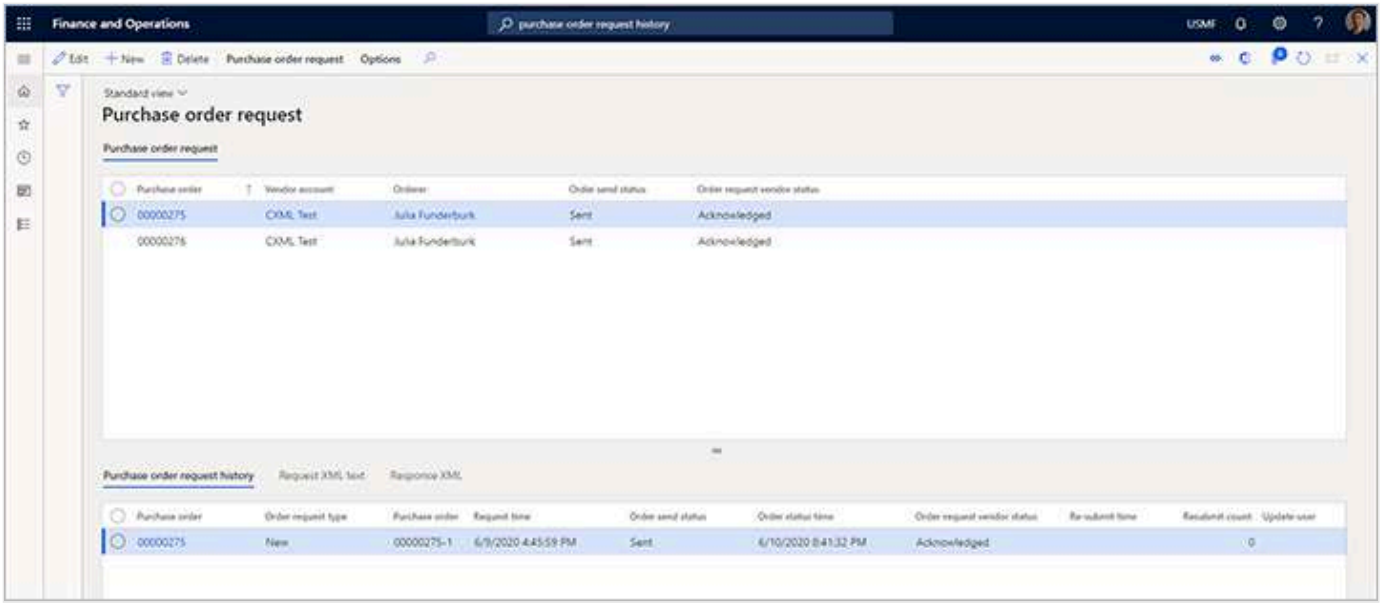
For example, your vendor has a policy that states that all orders that are received by 1 PM are shipped on the same day. In this case, you might run the batch only a few times during the morning to communicate any orders that you have. The remaining orders are sent the next day. This decision is purely a business decision. You can review it and set the parameters for it accordingly.

The process looks for purchase order request documents that have a status of *Waiting*. If you have an order that you must send to a vendor immediately, you can select **Submit job** and set the **Batch processing** option to *No*.

Monitor purchase order requests

View the status of a purchase order

When orders that can be sent via cXML are confirmed, they go into *Waiting* status. As described in the Create and process a purchase order section, you can view the purchase order status on the **Purchase order request** page. Each purchase order request can have one of several statuses, depending on its parameters and data. This section describes the various status types and the values that they can have. This information can help you manage issues and understand the status of your purchase orders.



The grid in the upper part of the **Purchase order request** page might show the following status values:

- **Order send status** – This field can have one of the following values:
  - **Waiting** – The document is waiting to be sent.
  - **Sent** – The document is sent.
  - **Stopped** – The document is marked as *Stopped* before it's sent. To mark a document as *Stopped*, select **Stop** on the Action Pane of the **Purchase request** page.
  - **Archive** – The document is purged. To purge a document, select **Purge** on the Action Pane of the **Purchase request** page.

- **Order request vendor status** – This field can have one of the following values:
  - **Waiting** – The document is waiting to be sent.
  - **Acknowledged** – The vendor acknowledges to have received the document. You can review the detailed XML message returned from the vendor by selecting the **Response XML** tab in the lower part of the page.
  - **Error** – The document is sent to the vendor, but an error occurs. You can review the error message by selecting the **Response XML** tab in the lower part of the page.

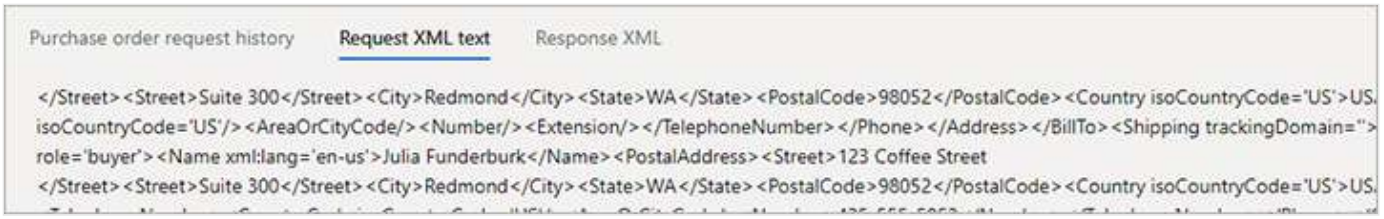
The grid on the **Purchase order request history** tab in the lower part of the **Purchase order request** page might show the following values:

- **Order request type** – This field can have one of the following values:
  - **New** – The line is marked as new immediately after the purchase order is confirmed.
  - **Update** – If a confirmation has is already sent and acknowledged by the vendor, the next confirmation is marked as *Update*. Updates are sent only if the **Send purchase request updates** option is set to *Yes* in the global cXML parameters.
  - **Delete** – If a confirmation is already sent and acknowledged by the vendor, but the purchase order is canceled, the confirmation that's waiting is marked as *Delete*. Deletions are sent only if the **Send purchase request delete** option is set to *Yes* in the global cXML parameters.
- **Request time** – The time of creation of the order confirmation. You can compare the request time with the order status time to determine the time between confirmation and vendor acknowledgment.
- **Order send status** – This field is the same as the **Order send status** field in the upper part of the page. It's repeated here to make it easier to view the status at the confirmation level. If the **Order request type** field is set to *New*, and the purchase order is reconfirmed before a confirmation is sent, the **Order send status** field is set to *Archive*.
- **Order status time** – The time when the purchase order request history record was last updated. (The updates include status changes.)
- **Order request vendor status** – This field is the same as the **Order request vendor status** field in the upper part of the page. It's repeated here to make it easier to view the status at the confirmation level.
- **Re-submit time** – The time when the record was resubmitted.
- **Re-submit count** – The number of times that the record is resubmitted. A high number indicates multiple failures, and therefore might indicate an issue with either your data setup or your vendor's data setup.

View the XML for a purchase order request message

To view the XML for the purchase order request message, select the **Request XML text** tab at the bottom of the **Purchase order request** page. The information on this tab can help during testing

or error validation. To make the information easier to read, you can view it as a formatted message. Copy the contents of the tab to a text file, and then view it in an XML editor.



View the details of the vendor response

To view the content of a vendor acknowledgment or error response, select the **Response XML** tab at the bottom of the **Purchase order request** page.

Use external catalogs for PunchOut e-procurement

06/17/2025

By using external catalogs for PunchOut e-procurement, you don't have to maintain information about your vendors' products in your own master data. Instead, the shopping cart on a vendor's website is converted to requisition lines that have the correct product information.

You should avoid maintaining the descriptions and prices of your vendors' products in your own product master data. Instead, use external catalogs for PunchOut e-procurement. Then, when employees create requisitions, they can *punch out* to a vendor's external catalog site (in other words, they leave your system and go to the vendor's site). The products that are added to the shopping cart on the vendor's website can then be converted to requisition lines. Therefore, you get the correct product information: product ID, name, price, and so on.

To use external catalogs, an employee must create a requisition on the **My purchase requisitions** page.

The employee who creates a requisition is referred to as the preparer of the requisition. As a preparer, you can complete the following tasks.

Use the **External catalogs** line action to open a page that includes all external catalogs that are available for the specified requester, buying legal entity, and receiving operating unit.

Depending on your permissions, change the requester, buying legal entity, and receiving operating unit. A change in those values might change the list of external catalogs that are available to a requester. The external catalogs that are available depend on the current active purchasing policies for the buying legal entity or the receiving operating unit. These policies can allow or prevent access to specific procurement categories. Therefore, the list of external catalogs that are mapped to these procurement categories can be affected.

For more information about policies, see Purchasing policies overview.

- To find external catalogs for specific procurement categories, enter text in the catalog search field.
- To add products from a vendor's external catalog on the vendor's website, select the external catalog. Then add products to the shopping cart, and check out. The shopping cart lines will be transferred to Microsoft Dynamics 365.

If there are multiple options for procurement categories, select the correct procurement category before you add the lines to the requisition. After lines have been added to a

requisition, you can add more lines without using external catalogs. Alternatively, you can continue to use external catalogs to add lines.

When the requisition is ready, use the **Workflow** > **Submit** action to submit it for approval.

Approve vendors for specific procurement categories

Article • 01/24/2025

This article explains how to approve vendors for specific procurement categories in Dynamics 365 Supply Chain Management. When a purchase requisition is created, there may be a requirement to select an approved or preferred vendor, depending on how the purchasing policies are set up. This procedure shows you how to specify that a vendor is approved or preferred for a specific procurement category. This task would usually be carried out by a procurement professional. You can use this procedure in demo data company USMF.

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Select the vendor that you want to set as an approved or preferred vendor for a category.
3. On the Action Pane, select **General**.
4. Select **Categories**.
5. Select **Add category**.
6. In the **Category** field, select *OFFICE AND DESK ACCESSORIES (OFFICE AND DESK ACCESSORIES)*.
7. In the **Vendor category status** field, select *Preferred*. It's possible to specify more than one preferred vendor for a category.
8. Select **Save**.
9. Go to **Procurement and sourcing** > **Procurement categories**.
10. In the tree, select *CORP PROCUREMENT CATEGORIES\OFFICE AND DESK ACCESSORIES*.
11. Expand the **Vendors** section. Check if the vendor that you selected appears as a preferred vendor for the Office and desk accessories category. If you're running this procedure as a task guide, you may have to select the **Unlock** button to be able to scroll down to the list of vendors. It's also possible to add preferred and approved vendors on this page.
12. In the tree, expand *OFFICE AND DESK ACCESSORIES* and select *Scissors*.
13. Select *No* in the **Inherit vendors from parent category** field.
14. Select *Yes* in the **Inherit vendors from parent category** field.

Approve vendors for specific products

This procedure shows you how to approve vendors for specific products. When you approve vendors, you control which vendors can be used when adding the product to a purchase order. A purchasing manager typically carries out this task.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the desired record.
3. In the list, select the link in the selected row.
4. Expand the **Purchase** FastTab. If there's a primary vendor shown in the **Vendor** field, add this vendor as an approved vendor in the following steps. Make a note of the vendor number, if one is shown.
5. On the Action Pane, select **Purchase**.
6. Select **Setup**.
7. Select **Add**.
8. In the **Vendor** field, enter or select a value. Select the approved vendor. At least one of the lines has to be the primary vendor if there was one in the product record. If you made a note of the vendor number earlier, select it here.
9. In the **Expiration** field, enter a date. Choose a date that is a few months ahead.
10. Select **Add**.
11. In the **Vendor** field, enter or select a value.
12. In the **Expiration** field, enter a date. Choose a date that is different from the previous expiration date.
13. Close the page.
14. On the Action Pane, select **Approved vendors**.
15. In the **Expiration** field, enter a date. This date acts as a filter so you can see who the approved vendors are, up to a certain date.
16. Close the page.
17. On the Action Pane, select **Effective period**.
18. In the **Show vendors expired by** field, enter a date. Use this page to identify vendors where the approval status expires after a certain date.
19. Close the page.
20. Select **Edit**.
21. In the **Approved vendor check method** field, select an option. This field allows you to select the policy for what should happen if the product is added to a purchase order line where the vendor isn't an approved vendor.

22. Select **Save**.
23. Close the page.
24. Close the page.
25. Go to **Procurement and sourcing** > **Vendors** > **Vendor/item relations** > **Approved vendor list by item**. This page gives you an overview of all products and the approved vendors.
26. Close the page.
27. Go to **Procurement and sourcing** > **Vendors** > **All vendors**. You can also start from a vendor and then go to the list of approved products for that vendor account.
28. In the list, find and select the desired record.
29. On the Action Pane, select **Procurement**.
30. Select **Approved vendor list by vendor**.
31. Close the page.
32. Close the page.

Search for vendors

06/17/2025

Learn how to search for vendors based on specific criteria. This example shows you how to search for vendors that are approved for a particular procurement category and have their primary address in a specific country/region. You can run this procedure in demo data company USMF, or on your own data. This task would usually be carried out by a procurement professional.

1. Go to **Procurement and sourcing** > **Vendors** > **Vendor search**.
2. Select the plus icon to open the **Procurement category selection** page.
3. In the tree, select *CORP PROCUREMENT CATEGORIES\OFFICE MACHINES*. If you're running this procedure as a task guide, you might need to select the **Unlock** button before you can select the correct node. If you're not using USMF, select one of the categories that you have.
4. Select **Add**. It's possible to select more than one category here. If you do so, the search finds all the vendors that are approved for at least one of the categories.
5. Select **OK**.
6. In the **Country/region** field, type a value.
7. Select **OK**.

Set up permissions for ordering products on behalf of someone else

Article • 01/24/2025

This article explains how to grant workers permission to prepare purchase requisitions on behalf of other workers. In other words, a purchase requisition "preparer" can create a requisition for another "requester." The procedure also shows how to grant a worker permission to order items and services in different legal entities or operating units. Typically, these tasks are performed by a purchasing manager. You can use this procedure either on data for the USMF demo company or on your own data.

Grant permission to enter purchase requisitions on behalf of another worker

1. Go to **Procurement and sourcing** > **Setup** > **Policies** > **Purchase requisition permissions**. Make sure that the **Current view** field is set to *By preparer*. The list in the left pane shows the people who can be granted permission to prepare requisitions on behalf of other people.
2. Select the person to grant permission to (the preparer).
3. Select **Add**.
4. Find and select the person to add as a requester.

    - The requester is the person that the preparer can create requisitions on behalf of.
    - In the **Authorization** field, select *Specific* if the preparer should be able to create purchase requisitions on behalf of the selected worker. Select *Reporting* if the preparer should also be able to create purchase requisitions on behalf of all workers who report to that worker.

5. In the **Effective** field, enter a date.
6. In the **Expiration** field, enter a date.

View preparers who have permission to create purchase requisitions for a selected worker

1. In the **Current view** field, select *By requester*. This view shows a list of preparers who have been granted permission to create purchase requisitions on behalf of a selected worker.

2. Use the Quick Filter to find the worker that you just added as the requester.
3. Select the requester. The Preparer list shows the people who have permission to order items on behalf of the requester who is selected in the left pane. You can add additional preparers here. This view also lets you grant the requester permission to create requisitions in legal entities and operating units that aren't that person's primary legal entity or operating unit.

Supplier Engagement overview (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement solution provides a unified framework for managing interactions between your organization and its suppliers. It covers the full supplier lifecycle—from registration and onboarding to managing requests for quotation (RFQs), purchase orders, invoices, and consignment inventory. Suppliers enter and maintain their own data directly in the system, which reduces manual entry and helps keep information consistent across procurement, finance, and supply chain processes.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Supplier Engagement replaces the older vendor collaboration interface with broader capabilities, including global vendor data management, a dedicated Power Pages portal, and lifecycle processes such as qualification and termination. You can use both solutions in parallel during the transition. Learn more in How Supplier Engagement compares to the vendor collaboration interface.

Solution components

Supplier Engagement consists of three components that work together: the Supplier Engagement app, the supplier portal, and Supply Chain Management.

Supplier Engagement app

The Supplier Engagement app is a Microsoft Power Platform model-driven app for internal users such as procurement staff and supplier managers. It provides an overview of all suppliers across legal entities and supports the following activities:

- Registering new suppliers and managing the new-supplier lifecycle from qualification to approval
- Recording supplier capabilities and maintaining certificates
- Reviewing risks and tracking corrective actions
- Managing user accounts that grant access to the supplier portal

The app is connected to Supply Chain Management, which makes supplier information available in related business processes.

Supplier portal

The supplier portal is a Microsoft Power Pages site for external supplier representatives. Through the portal, suppliers can:

- View and respond to requests for quotation
- Review purchase orders
- Submit invoices
- Manage consignment inventory
- Update organization details and maintain certificates
- Provide compliance information when required

The portal serves as the primary channel of communication between suppliers and your organization. Information entered by suppliers is available in Supply Chain Management for procurement, finance, and inventory processes.

Supply Chain Management

Supply Chain Management stores and processes the data that is exchanged with suppliers through the Supplier Engagement app and the supplier portal. Information such as purchase orders, requests for quotation, invoices, and consignment inventory is recorded and maintained in Supply Chain Management.

Global vendors, local vendors, and vendor contacts

Global vendor concept

The Supplier Engagement solution introduces the concept of a *global vendor* in Supply Chain Management. A global vendor represents a single party that can act as a vendor across multiple legal entities. This design differs from vendor collaboration, where you create and manage vendor records separately for each legal entity.

Global vendors help organizations maintain consistent supplier information across legal entities:

- Certifications, contacts, and addresses are entered once and shared.
- Redundant data entry and maintenance are reduced.
- Supplier information can be viewed and managed consistently across all entities.

Learn more in Global vendor management overview and Work with Supplier Engagement data in Supply Chain Management.

Global vendors can be created in three ways:

- Through self-registration from the supplier portal
- By creating the vendor manually in the Supplier Engagement app
- By creating from Supply Chain Management using an existing vendor party

Initially, a new global vendor is considered a *prospect*. After review, it becomes *qualified*. Once qualified, a global vendor can be *released* to a legal entity in Supply Chain Management. Releasing a global vendor creates a *local vendor* account in the selected legal entity. The local vendor is linked to the same party record as the global vendor, so core information such as name, addresses, and contact details is shared.

> **Note**
>
> In Supply Chain Management, a *party* is a shared record that represents a person or an organization. A party can hold multiple roles, such as vendor, customer, or worker. With Supplier Engagement, a global vendor is linked to a party of type *organization*. The same party can hold a vendor role in each company that it supplies.

For example, you might set up a global vendor and its related party and local vendors as follows:

- **Global vendor** – Contoso Office Supplies (Global vendor number: GV-01001-P0H3N7)
- **Party** – Contoso Office Supplies (Party number: 000001745)
- **Local vendors**:
  - Contoso Office Supplies – Vendor number: 1001 – Company: USMF
  - Contoso Office Supplies – Vendor number: 2001 – Company: DEMF

At the global vendor level, you can manage the information shared by the party, including:

- Name
- Addresses
- Contact information (phone, email, website)

- Number of employees
- Organization number
- DUNS number
- Known as
- Phonetic name
- Language

Besides the information shared by the party, the local vendors also share certifications added to the global vendor. Certifications maintained at the global vendor level are marked as global.

You can put a global vendor on hold, and this action propagates to the local vendor accounts. When you set a global vendor on hold, you set all local vendor accounts on hold as well. However, you can manage the hold independently for each local vendor account.

> **Important**
>
> For data to synchronize to Supplier Engagement, a global vendor must exist in Supply Chain Management. The global vendor concept is only available when the Supplier Engagement feature is turned on.

Local vendors

In Supply Chain Management, a local vendor represents a supplier relationship that exists within a specific legal entity (company). In environments where Supplier Engagement isn't turned on, you create and manage all vendor records only at this local level. Each legal entity maintains its own vendor accounts, even if the same supplier works with multiple legal entities.

The global vendor feature, introduced with Supplier Engagement, builds on top of local vendor management. A global vendor represents the supplier as a single party across all legal entities. Use the Supplier Engagement app to release a global vendor to one or more legal entities. Releasing creates a local vendor record in the selected legal entity that's linked to the same party as the global vendor.

You can also create local vendors directly in Supply Chain Management by using the standard vendor creation process from an existing party record. This process creates a vendor that's valid only for the selected legal entity, without the global vendor context.

Global vendor contacts and local vendor contacts

A global vendor contact represents a person who acts on behalf of a supplier at the global level. It's stored as a party of type person and linked to the global vendor's party through a relationship of type global vendor contact. This record is the master reference for the contact across the organization.

A local vendor contact is a representation of a global vendor contact in the context of a specific legal entity. It allows the same person to be recognized as a contact for one or more local vendor accounts under the same global vendor. The global vendor contact is the central record, while each local vendor contact reflects that person's role as a vendor contact for a specific legal entity.

Internal buyers can use the Supplier Engagement app to create and maintain global vendor contacts for any supplier company. External vendor users use the supplier portal to create global vendor contacts for their own companies. You must use the Supplier Engagement app or supplier portal to make updates and deletions.

In Supply Chain Management, you create and manage local vendor contacts by using the **Vendor contacts** page. When you associate a local vendor with a global vendor, creating a local vendor contact automatically establishes the link to the corresponding global vendor contact.

> ⓘ **Note**
>
> Global vendor contact management is restricted to the Supplier Engagement app and the supplier portal.

Invite, onboard, and qualify new vendors

Invite new suppliers

Two scenarios exist for inviting a new supplier, depending on who initiates the process:

- **Self-registration** – A supplier registers themselves through the anonymous registration page on the supplier portal. The registration request is created as a prospect global vendor in the Supplier Engagement app. Users at your organization review the request, and if it's approved, the supplier is invited to the supplier portal to complete the onboarding process. Learn more in Review and approve incoming vendor registrations.
- **Internal registration** – An internal buyer directly creates a prospective global vendor in the Supplier Engagement app. From there, the buyer sends the vendor an invitation to the supplier portal so the vendor can continue with onboarding.

Onboard suppliers

Onboarding is a guided process in the supplier portal where suppliers provide detailed information about their organization. The onboarding form covers contact information, addresses, business profile, certificates, and capabilities. The final step is a questionnaire that captures any additional business information required.

The information entered during onboarding synchronizes with the global vendor profile in the Supplier Engagement app, where internal users can review it.

Qualify a new global vendor

After onboarding is completed, an internal buyer reviews the data submitted by the supplier. The buyer evaluates whether the supplier meets business requirements and required standards.

If the supplier doesn't meet the requirements, the global vendor record is marked as disqualified. If the supplier is accepted, the record is promoted to qualified. Once qualified, the global vendor is available in Supply Chain Management and can be released to one or more legal entities. Releasing creates local vendor accounts in the selected companies, making the supplier available for transactional processes such as purchase orders and RFQs.

Learn more in Global vendor onboarding lifecycle.

How Supplier Engagement compares to the vendor collaboration interface (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement solution provides broader capabilities compared to the older vendor collaboration interface. Both solutions support collaboration with suppliers during purchasing processes, but they differ in scope, architecture, and data management. You can use both solutions in parallel.

Vendor collaboration is embedded directly in Supply Chain Management and focuses on document exchange—purchase orders, invoices, RFQs, and consignment inventory—with vendor data maintained separately in each legal entity. Supplier Engagement is built on the Microsoft Power Platform and introduces global vendor data management, structured lifecycle processes (registration, onboarding, qualification, approval, and termination), supplier capabilities and certifications, risk management, and a dedicated Power Pages portal with anonymous self-registration. This article compares the two solutions across these areas and includes a detailed feature comparison table.

Vendor collaboration

Vendor collaboration is embedded in Supply Chain Management. It provides a portal where suppliers can:

- Exchange documents such as purchase orders, invoices, consignment inventory, and responses to requests for quotation (RFQs).
- Participate in sealed bidding, where RFQ responses remain confidential until the deadline.
- Respond to public RFQs, where invitations are open to a broader supplier base.

You manage vendor organizational and transactional data separately for each legal entity. When a supplier operates across multiple entities, you must maintain the same information multiple times, which can lead to inconsistencies.

Learn more in Vendor collaboration with external vendors.

Contact mapping and user access

In the vendor collaboration interface, you manage vendor contacts for each legal entity. To grant a portal user access to vendor data, you must create the user as a contact for that vendor in the specific legal entity. When the same vendor operates across multiple entities, you often need to create the same user multiple times as a contact, which leads to duplication and extra maintenance.

In Supplier Engagement, you link contacts to the global vendor party rather than to released vendor records in individual legal entities. Each contact only needs to exist once as a global vendor contact, and the contact information is shared across legal entities through the global vendor.

Supplier Engagement also introduces vendor access management, which allows administrators to define which vendors a portal user can access. In Supply Chain Management, these access settings are reflected in the portal user's assigned-organizations configuration.

Supplier Engagement capabilities

Supplier Engagement is built on the Microsoft Power Platform and consists of two applications:

- **Supplier Engagement app** (model-driven app, for internal users):
  - Introduces global vendor data management, where a single supplier record can be used across multiple legal entities
  - Supports lifecycle processes: registration, onboarding, qualification, approval, and termination
  - Includes supplier capabilities, certifications, and risk management
  - Allows internal users to record feedback on suppliers
  - Uses Microsoft Dataverse, making it possible to extend and configure processes such as onboarding questionnaires and qualification workflows

- **Supplier portal** (Power Pages, for external suppliers):
  - Provides access to purchase orders, RFQs, invoices, and consignment inventory
  - Includes anonymous supplier registration, where potential suppliers can submit registration requests without prior setup
  - Offers an improved user interface with clearer navigation and layouts
  - Supports certificate management at a global level

> ⓘ **Note**
>
> The supplier portal doesn't support sealed bidding or public RFQs.

Feature comparison

The following table provides a side-by-side comparison of vendor collaboration and Supplier Engagement features.

Expand table

Category	Feature/capability	Supplier Engagement	Vendor collaboration
Architecture and applications	Platform	Microsoft Power Platform (Dataverse, model-driven app, Power Pages portal)	Embedded in Supply Chain Management
	Applications	Two apps: Supplier Engagement app (internal) and supplier portal (external)	Single vendor collaboration interface
Supplier data management	Vendor master data	Global vendor record shared across multiple legal entities. Users have an overview of the data across all legal entities.	Vendor data maintained separately in each legal entity
	Supplier capabilities	Supported and managed across legal entities	Not available
	Supplier certifications	Managed once at the global vendor level and shared across entities	Managed per vendor record in each legal entity
	Supplier feedback	Internal users can provide structured feedback on suppliers	Not available
Supplier lifecycle	Registration	Supported, including anonymous self-registration	Supported, but requires setup by the buying organization (no anonymous registration)
	Onboarding	Extended onboarding processes supported (qualification, approval, disqualification) via Dataverse workflows	Supported, focused on enabling vendors to access transactional data in Supply Chain Management
	Lifecycle scope	Full lifecycle: registration, onboarding, qualification, approval, termination	Limited scope: mainly registration and onboarding
	User management	Managed in Supplier Engagement app for portal access	Managed in Supply Chain Management per vendor account

Category	Feature/capability	Supplier Engagement	Vendor collaboration
Collaboration features	Aggregated view	Home page and workspaces contain aggregated view across all legal entities	Not available. Workspaces are limited to one legal entity at a time.
	Purchase orders	Supported	Supported
	RFQs	Supported, but no sealed bidding or public RFQs	Supported, including sealed bidding and public RFQs
	Invoices	Supported	Supported
	Consignment inventory	Supported	Supported
Implementation and extensibility	Portal user interface	Power Pages-based, configurable design, responsive layouts, centralized home page for navigation	Standard Supply Chain Management UI, limited customization
	Extensibility	Supported via Dataverse and Power Platform customization	Limited to Supply Chain Management configuration

Supplier Engagement deployment overview, prerequisites, and licensing (preview)

[This article is prerelease documentation and is subject to change.]

Supplier Engagement deployment spans both Power Platform and Supply Chain Management. You install the solution in your Power Platform tenant, enable the related functionality in Supply Chain Management, and then finish the setup tasks that connect both experiences. Planning the prerequisites up front helps you avoid setup delays later in the deployment.

Deployment process overview

Deploying Supplier Engagement includes the following tasks:

- Confirm the prerequisites.
- Install the Supplier Engagement app on Power Platform.
- Install the supplier portal in Power Pages.
- Turn on the Supplier Engagement feature in Supply Chain Management.

Power Platform hosts the model-driven app, supplier portal, cloud flows, and supporting Dataverse components. Supply Chain Management provides the business processes, shared supplier data, and feature configuration that the solution depends on.

Prerequisites

Before you start deployment, make sure that your environment and service account meet the following requirements:

- **Dataverse readiness** – Confirm that Microsoft Power Platform is up to date and that the latest release updates are applied.
- **Supply Chain Management version** – Run Microsoft Dynamics 365 Supply Chain Management version 10.0.48 build 10.0.2645.52 or later.
- **Dataverse base language** – In the current public preview release, the Supplier Engagement app is only available in US English (Microsoft locale identifier (LCID) 1033). If you created your Dataverse environment with a base language other than US English, the Supplier Engagement app might display a mixed-language UI, where labels provided by Dataverse

appear in your selected base language while labels provided by the Supplier Engagement app appear in English. You select your Dataverse environment's base language during provisioning and can't change it later, so we recommend that you install and test the preview version of the Supplier Engagement app on a Dataverse environment that was created to use US English as its base language. Support for additional languages will be added for the general availability release.

- **Dataverse connection** – Connect your Supply Chain Management environment to Dataverse. Learn more in Microsoft Power Platform integration with finance and operations apps.

- **Finance and operations virtual entity solutions** – In the Power Apps maker portal, open your environment, go to **Solutions**, open the **Managed** tab, and confirm that the following solutions are installed:
  - *Dynamics 365 Company*
  - *Dynamics Operations Virtual Entity Support*
  - *Microsoft Operations ERP Catalog*
  - *Dynamics 365 ERP Virtual Entities*

  If one or more solutions are missing, install them as described in Configure Dataverse virtual entities.

- **Power Platform Dynamics 365 apps** – Run the latest update of the *Finance and Operations Virtual Entity* app from Power Platform admin center. The app must be version 2.20.3385.8 or later. Learn more in Manage Dynamics 365 apps.

- **Dedicated service account** – Set up a dedicated Microsoft Entra ID service account for installation and configuration in both Dataverse and Supply Chain Management. The account must be a standard user account, not an app registration account, and it must have all required licenses. The service account is used for flows, notifications, and background automation. Grant it the following security privileges:
  - **Dataverse** – *System Administrator* role
  - **Supply Chain Management** – *System Administrator* role
  - **Microsoft Entra ID** – *Power Platform administrator* role

Supplier Engagement licensing

Supplier Engagement is currently a preview feature that is provided for evaluation and testing. The licensing model for Supplier Engagement features in Dynamics 365 Supply Chain

Management and the Supplier Engagement app in Dataverse is still under review. The supplier portal offers a 30-day trial period. Additional information regarding the licensing requirements will be published before the solution is made generally available.

What to do next

After you confirm the prerequisites, install the Supplier Engagement app and supplier portal in Power Platform. When those components are available, configure Power Platform and Supply Chain Management so that onboarding, notifications, synchronization, and workflows can run correctly.

Install the Supplier Engagement app and supplier portal on Power Platform (preview)

[This article is prerelease documentation and is subject to change.]

Installing Supplier Engagement on Power Platform adds the model-driven app, supporting solutions, and supplier-facing portal components to your environment. You also need to reactivate the supplier portal and prepare sign-in settings so that administrators and suppliers can access the right experience. Completing these tasks in order helps you confirm that the environment is ready before you move on to configuration.

Prerequisites

Before you install the Supplier Engagement app and supplier portal on Power Platform, complete the prerequisites listed in Supplier Engagement deployment overview, prerequisites, and licensing.

Import the Supplier Engagement application

Use the Power Platform admin center to install the Supplier Engagement app in the target environment.

1. Sign in to the Power Platform admin center.
2. Go to **Manage** > **Environments** and open your environment.
3. On the command bar, select **Resources** > **Dynamics 365 apps**.
4. On the command bar, select **Install app**.
5. Search for *Supplier Engagement in Dynamics 365 Supply Chain Management (Preview)* and select it.
6. Select **I agree to the terms of service**, and then select **Install**.

Track installation progress

Use the solution history in Power Apps to monitor the import and confirm when installation finishes.

1. Go to the Power Apps maker portal.
2. On the navigation pane, select **Solutions**.

3. On the command bar, select **See History**.

If the *msdyn_SupplierEngagementVendorEntity* solution fails with the following error, wait two hours and then repeat the import procedure.

> **Exception message** Failed to sync entity metadata for entity 'VRMVENDORENTITY'. Exception details: CreateRequest failed with error: String or binary data would be truncated in table '{0}', column '{1}'. Truncated value: '{2}'...

Activate the supplier portal in Power Pages

After the app is installed, activate the supplier portal site so that you can continue with portal setup and testing.

1. Sign in to the Power Apps maker portal.
2. On the navigation pane, select **Solutions** and open **Supplier Engagement Portal Solution**.
3. Go to **Objects** > **Sites**, find *Microsoft Dynamics 365 Supplier Portal*, open its **Commands** (three dots) menu, and select **Open**.
4. Wait for the browser to redirect you to the Power Pages portals site.
5. Open the **Inactive sites** tab and find *Microsoft Dynamics 365 Supplier Portal*.
6. Select **Reactivate** for the site.

Learn more in Reactivate sites.

Configure identity providers

When you're testing the preview version of Supplier Engagement, we recommend that you use Microsoft Entra ID with the configuration described in this section. For a list of available identity providers, learn more in Overview of authentication in Power Pages. To choose Microsoft Entra ID as the identity provider for the supplier portal, follow these steps.

1. Go to Power Pages portals.
2. Open the *Microsoft Dynamics 365 Supplier Portal* site.
3. On the navigation pane, select **Security**.
4. Under **Manage**, select **Identity providers**.
5. Find *Microsoft Entra ID*. Open its **Commands** (three dots) menu and select **Edit configuration**.
6. Set **Contact mapping with email** to *On*, and then select **Save**.

Configure site visibility

You can keep the portal hidden while you finish setup, testing, and validation. Update site visibility only when you're ready to let suppliers reach the site externally.

To learn more about how to hide and show the supplier portal, go to Site visibility in Power Pages.

Onboard using the onboarding guide (preview)

[This article is prerelease documentation and is subject to change.]

The onboarding guide gives administrators a single place to track Supplier Engagement setup progress. It brings together the core deployment activities, helps you understand what still needs attention, and makes it easier to return to incomplete tasks later. Use it throughout deployment instead of managing setup with a separate checklist.

Open the onboarding guide

Open the onboarding guide from the Supplier Engagement app whenever you want to review setup status or continue deployment work.

1. Sign in to the Supplier Engagement app by using the service account that you're using for installation.
2. At the bottom of the navigation pane, select the **Configuration** area.
3. Under **Onboarding**, select **Onboarding Guide**.
4. Review the onboarding checklist that opens.

The onboarding guide remains available during the full setup process, so you can return to it at any time and continue where you left off.

Use the onboarding guide

Each onboarding activity points to a specific configuration area, such as Supply Chain Management setup, Power Pages setup, cloud flow activation, or notification setup.

1. Select an onboarding activity in the left pane to review its setup instructions.
2. Use the linked Supplier Engagement documentation for additional context when you need it.
3. Complete the required configuration outside the onboarding guide.
4. Select the checkbox next to the activity after you verify that the task is complete.
5. Clear a checkbox if more work is required.

Progress is saved automatically, and the completion status is retained across sessions.

Best practices

Use the following practices to keep onboarding organized and accurate:

- Complete onboarding activities in the recommended order.
- Mark activities as complete only after you verify the related configuration.
- Review the onboarding guide periodically to confirm that no required tasks were missed.
- If you need more detailed setup guidance for a specific activity, refer to this and other related documentation articles on Microsoft Learn.

Configure Supplier Engagement elements in Power Platform (preview)

[This article is prerelease documentation and is subject to change.]

After you install the Supplier Engagement components, align the Power Platform environment with your portal, communication, and automation requirements. This article covers the configuration tasks to complete before broad onboarding or production validation, including environment variables, email templates, mailbox activation, cloud flows, and duplicate detection rules. These tasks make sure that users receive the right links, cloud flows can run, and duplicate vendor data is detected before it causes problems.

Prerequisites

Before you configure Supplier Engagement elements in Power Platform, complete the prerequisites listed in Supplier Engagement deployment overview, prerequisites, and licensing.

Customize supplier invitation and notification emails

You can customize the email template text that Supplier Engagement sends to suppliers, including invitation and notification emails. This setup is useful when you want to align system-generated emails with your organization's tone, branding, and onboarding guidance.

> **Important**
>
> The Supplier Engagement invitation email template must include a link to your supplier portal. Update that link before you go live.

> **Tip**
>
> Learn more in **Create templates for email**.

To customize supplier invitation and notification emails, follow these steps.

1. Sign in to the Power Platform admin center as a system administrator and open your environment.

2. Select the link under **Environment URL** to open the environment in a new browser tab.

3. Do one of the following steps:

    - If a list of apps opens, select the **Power Platform Environment Settings** app.
    - If the environment opens directly to an app, select the app name on the app header bar at the top to open the list of published apps, and then select **Power Platform Environment Settings**.

4. On the navigation pane, go to **Templates** > **Email Templates**.

5. Supplier Engagement uses the following templates. Open the template that you want to customize.

    - *Supplier Engagement contact portal access*
    - *Supplier Engagement invitation*
    - *Supplier Engagement registration status*

6. Make the following changes to the selected email template:

    - Update the subject and body text as needed.
    - If the message includes a portal action, verify that the link points to the correct supplier portal URL for your environment. By default, the *Supplier Engagement invitation* email template includes a placeholder for your supplier portal URL and you must update it before going live with the solution.

7. Select **Save**.

8. Inspect and update the other templates as needed.

Enable a mailbox for cloud flow notifications

Cloud flows, which are part of Microsoft Power Automate, automate business processes and ensure timely communication across platforms such as Supply Chain Management and Microsoft Teams. To maximize the effectiveness of these flows—especially those that send notifications—you must enable a mailbox for the flow owner or service account. This setup allows the flow to send email notifications reliably, which ensures that users and stakeholders receive critical updates, alerts, and approvals directly in their inbox.

To enable a mailbox for cloud flow notifications, follow these steps.

1. Open the **Power Platform Environment Settings** app in the Power Platform admin center as described previously.
2. On the navigation pane, go to **Email Configuration** > **Mailboxes**.
3. Select the mailbox to activate.
4. On the command bar, select **Activate**. In the **Confirm Mailbox Activation** dialog, select **Activate**.
5. On the command bar, select **Approve Email**. In the **Approve Primary Email** dialog, select **OK**.
6. On the command bar, select **Test and Enable Mailboxes**. In the **Test Email Configuration** dialog, select **OK**.

> **Note**
>
> These mailboxes are used both for automated notifications and to send updates from cloud flows. Choose mailboxes for valid service accounts or non-personal accounts that are permanent and unaffected by organizational changes. This approach helps maintain stable, long-term automation and avoids unnecessary interruptions in workflow.

> **Note**
>
> Power Automate can also work with on-premises Exchange through the appropriate connectors and gateway configuration. Learn more in Manage an on-premises data gateway in Power Automate.

Enable supporting cloud flows

Cloud flows automate key business processes and ensure integration between the Supplier Engagement app, supplier portal, and Supply Chain Management. These flows streamline notifications, synchronize data, and automate approvals to help reduce manual effort and minimize errors.

Connection references act as secure bridges between your Power Platform environment and external services such as Dataverse, Outlook, Teams, and Power Apps. By establishing these references, you ensure that cloud flows and integrations can authenticate and interact with the necessary data sources and applications. Proper configuration of connection references enables automated workflows that synchronize supplier data and support collaboration across the Supplier Engagement app, supplier portal, and Supply Chain Management.

Although the cloud flows are already present in the system after installation, they're inactive by default and don't run until you enable them. After you configure the necessary connection references, activate the cloud flows in your environment so that all related functionalities become operational.

To create the required connection references and activate the cloud flows, follow these steps:

1. Sign in to the Power Apps maker portal and select your environment.
2. On the navigation pane, select **More** > **Connections**.
3. On the command bar, select **New connection**.
4. A list of services opens. Add connections for the **Microsoft Dataverse** service by using the **+** in the **Actions** column.
5. Add a second connection for the **Microsoft Teams** service.
6. On the navigation pane, select **Solutions**.
7. Find and open the solution that has a **Display name** of *Default solution*.
8. On the navigation pane, go to **Objects** > **Connection References**.
9. Use your browser's on-page search function to find connection references that include the text *SupplierEngagement* (in other words, use Ctrl + F to do an on-page search, don't use the filter provided by the site). There should be three of them:
    - *Microsoft Dataverse MicrosoftSupplierEngagement-77aa1*
    - *Microsoft Dataverse msdyn_SupplierEngagementBase-abf2e*
    - *Microsoft Teams MicrosoftSupplierEngagement-0e21b*
10. For *Microsoft Dataverse MicrosoftSupplierEngagement-77aa1*, open the **Commands** (three dots) menu, select **Edit**, set **Connection** to the *Microsoft Dataverse* connection that you created, and then select **Save**.
11. For *Microsoft Dataverse msdyn_SupplierEngagementBase-abf2e*, open the **Commands** menu, select **Edit**, set **Connection** to the *Microsoft Dataverse* connection that you created, and then select **Save**.
12. For *Microsoft Teams MicrosoftSupplierEngagement-0e21b*, open the **Commands** menu, select **Edit**, set **Connection** to the *Microsoft Teams* connection that you created, and then select **Save**.

13. On the navigation pane, select **Back to solutions**.
14. On the **Solutions** page, open the **Managed** tab.
15. Find and open the solution that has a **Display name** of *Supplier Engagement Core*.
16. On the navigation pane, go to **Objects** > **Cloud flows**.
17. Turn on each cloud flow that shows a **Status** of *Off*. To turn on a flow, select it and then select **Turn on** on the command bar.
18. Repeat the previous steps to turn on all the cloud flows in the *Supplier Engagement Portal* solution.

Enable duplicate detection rules

Duplicate detection rules help maintain clean and consistent vendor data within the Supplier Engagement solution. These rules prevent the creation of duplicate global vendor records by automatically identifying potential matches based on key fields such as name, email address, phone number, and website. By configuring and activating duplicate detection, you ensure data integrity, streamline vendor management processes, and reduce the risk of errors caused by redundant or conflicting records.

Set up rules to detect duplicate global vendor records by making sure that none of the following fields have values that match those of an existing global vendor:

- **Primary phone number** – Use an exact match comparison and include blank values in the evaluation.
- **Email address** – Use an exact match comparison and ignore blank values.
- **Name** – Compare the first five characters by using a same-first-characters matching rule and ignore blank values.
- **Primary URL** – Use an exact match comparison and ignore blank values.

To enable the duplicate detection rules in the Supplier Engagement solution, follow these steps:

1. Open the **Power Platform Environment Settings** app in the Power Platform admin center as described previously.
2. On the navigation pane, go to **Data Management** > **Duplicate Detection Rules**.
3. Select the check box for each of the following rules, and then select **Publish** on the command bar:

- *Global vendor with same primary phone number*
- *Global vendor with same email address*
- *Global vendor with same name*
- *Global vendor with same primary URL*

4. Confirm that each rule now shows a **Status Reason** of *Published*.

Learn more in Set up duplicate detection rules to keep your data clean.

Configure Supplier Engagement features in Supply Chain Management (preview)

[This article is prerelease documentation and is subject to change.]

After you install the Power Platform components, you must configure Supply Chain Management to expose the feature set, support approvals, and keep reporting and workflows running. These tasks connect the operational side of Supplier Engagement to the app and portal experiences. Completing them helps you avoid workflow failures, missing permissions, and incomplete supplier synchronization.

Prerequisites

Before you configure Supply Chain Management for Supplier Engagement, complete the prerequisites listed in Supplier Engagement deployment overview, prerequisites, and licensing.

Enable the Supplier Engagement feature

Turn on the feature in **Feature management** before you try to use Supplier Engagement capabilities in Supply Chain Management.

1. Go to **Workspaces** > **Feature management**.
2. If you don't see *Supplier Engagement*, select **Check for updates**.
3. Select the *Supplier Engagement* feature, and then select **Enable now**.

Learn more in Feature management overview.

Enable batch processing for the user approval workflow

Workflow batch jobs must be active so that approval, notification, and due-date processing can continue in the background.

1. Go to **System administration** > **Inquiries** > **Batch jobs**.
2. Use the filter in the **Job description** column to find rows that contain *Workflow*.
3. Select the check box for each of the following jobs:
    - *Workflow message processing*

- *Workflow line-item notifications*
- *Workflow Maintenance*
- *Workflow due date processing*

4. On the Action Pane, select **Change status**, and then change the status to *Waiting*.

Configure security roles

Supply Chain Management includes two standard security roles that support purchasers: *Purchasing manager* and *Purchasing agent*. The default versions of these roles might not include all the duties you need after you install Supplier Engagement. Affected functionality includes the abilities to:

- Create global vendors from Supply Chain Management and view party details
- Create replenishment orders
- Create inventory ownership change journals
- Create replenishment order product receipts
- Create purchase orders

To make the required functionality available, add the duties specified in the following lists to the respective roles. If you're using custom security roles, add some or all of these duties to your roles as needed.

- Purchasing manager:
  - *Maintain global address book master*
  - *Maintain consignment replenishment orders*
  - *Maintain inventory ownership change journals*
  - *Maintain consignment product receipt*
  - *Maintain purchase orders*

- Purchasing agent:
  - *Maintain consignment replenishment orders*
  - *Maintain inventory ownership change journals*
  - *Maintain consignment product receipt*

Learn more in Role-based security.

Configure the supply risk assessment report

The supply risk assessment report is a Power BI report built on data stores that stage aggregate measurements for reporting. In Supply Chain Management, this data store is called an entity store.

To see the data refreshed on the supply risk assessment report, you must enable the automated refresh of the entity stores that the report uses. To enable the automated entity store refresh, follow these steps.

1. Go to **System administration** > **Set up** > **Entity store**.
2. Use **Filter** to find *PurchaseCube* and *VRMPurchaseCube*.
3. Select **Edit** on the Action Pane. 1.Select the *PurchaseCube* record and expand the **General** FastTab. Set **Automatic refresh enabled** to *Yes* and choose a *Recurrence interval* (for example, *Every hour*). Then select **Refresh** to schedule the batch job.
4. Repeat the previous step for *VRMPurchaseCube*.

Configure B2B collaboration for vendor user requests

To provision supplier portal users as Microsoft Entra B2B guest users from the Supply Chain Management user workflow, first create an application registration in Microsoft Entra ID and then enter that application information in Supply Chain Management. You need this configuration before you can use the *Provision Microsoft Entra B2B user* workflow task.

The one-time setup comprises the following steps.

1. Set up a B2B invitation service application in Microsoft Entra ID.
2. Configure the B2B invitation service settings in Supply Chain Management.

Learn more in Export business-to-business (B2B) users to Microsoft Entra ID.

> ⓘ **Note**
>
> This setup is mandatory when your environment requires cross-domain user access. If cross-domain access isn't required, you can skip it.

Set up the vendor user request workflow

The *Vendor user request (new user or modify user)* workflow is a standard workflow included with Supply Chain Management. You can set it up to automatically approve portal user requests (new

vendor user requests that are routed from the supplier portal), or you can assign the approvals to a particular role or set of users.

Open the Vendor user request (new user or modify user) workflow in the workflow editor

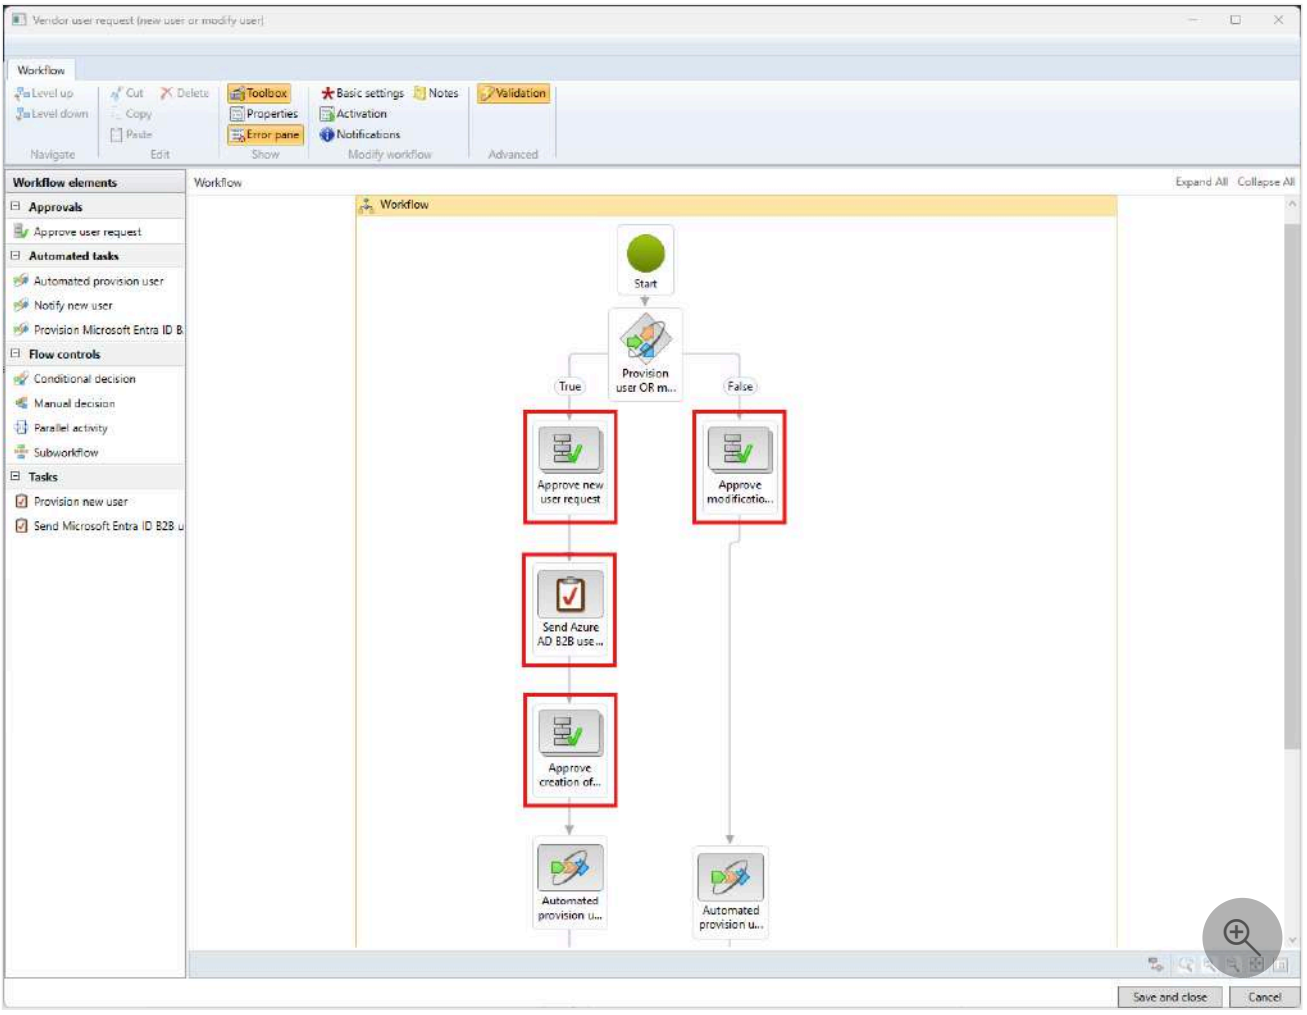
To start editing the workflow, follow these steps:

1. Go to **System administration** > **Workflow** > **User workflows**.
2. Open the *Vendor user request (new user or modify user)* workflow. The system suggests downloading and opening the workflow editor. You must use the Microsoft Edge browser to download and run the app.
3. The app opens, showing the default workflow. You can now edit the workflow to modify its behavior as needed, as described in the following sections. Choose which functionality to enable based on your business needs.

Auto-approve supplier portal user requests (optional)

If you want to approve supplier portal user requests automatically, follow these steps:

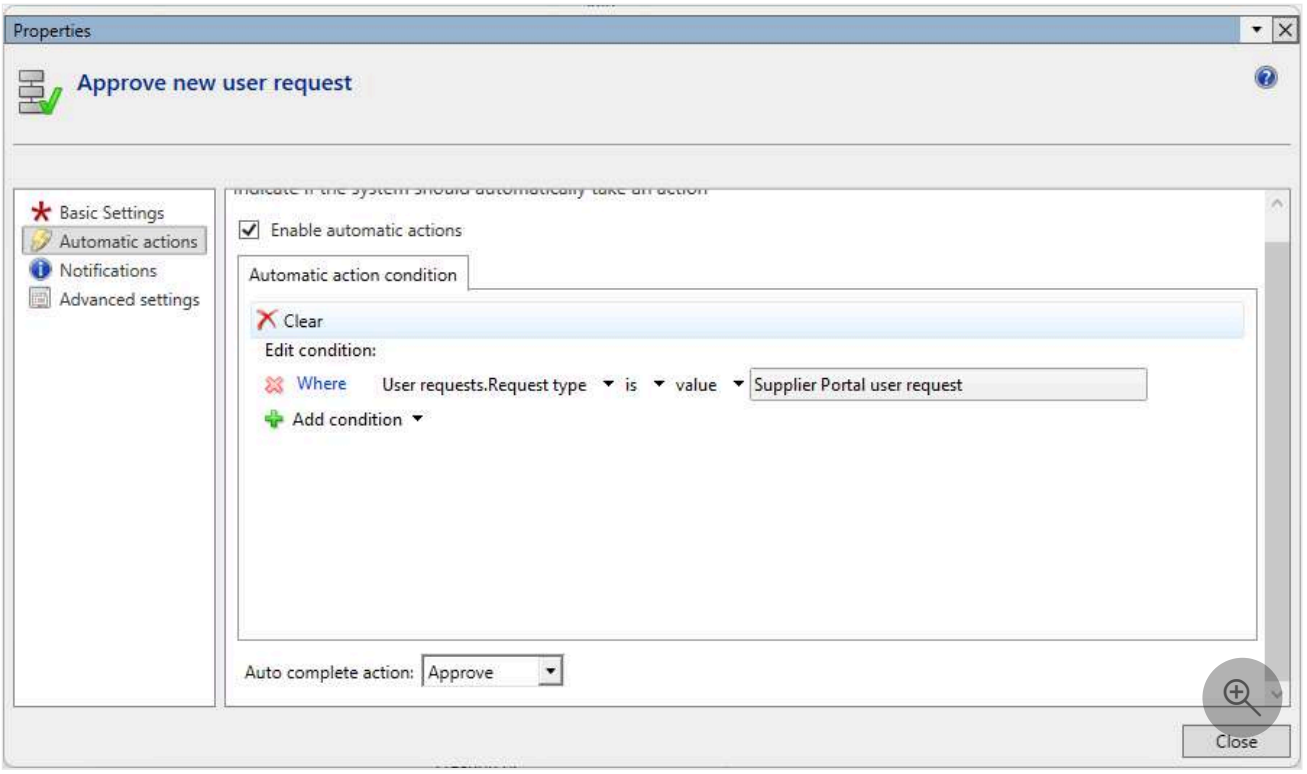
1. Open the *Vendor user request (new user or modify user)* workflow in the workflow editor. In this procedure, you must edit each of the steps highlighted in the following screenshot.



2. Select the first step highlighted in the previous screenshot, and then select **Automatic actions** on the ribbon.

3. Select **Add condition** and set **Condition** to *Where User requests.Request type is Value Supplier Portal user request*.

   The following screenshot shows an example of the automatic actions settings.



4. Set Automatic action to *Approve*.

5. Repeat the previous five steps for each of the other three approval steps in the workflow.

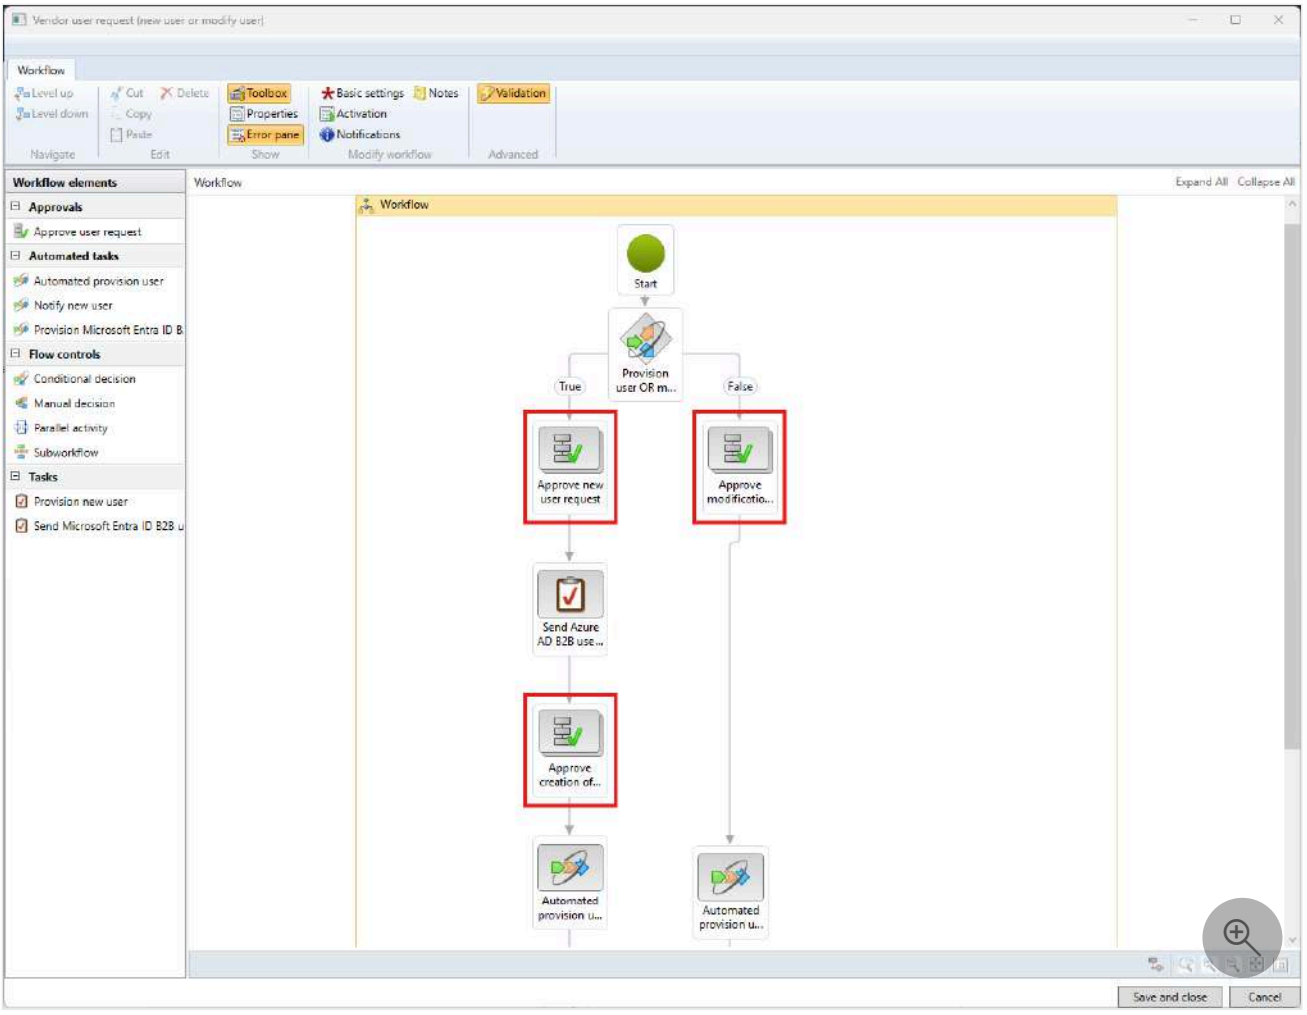
6. Select **Save and close** to save your changes to the workflow as a new version.

7. In Supply Chain Management, go back to **System administration** > **Workflow** > **User workflows** and select the *Vendor user request (new user or modify user)* workflow. On the Action Pane, open the Workflow tab and select **Versions**. Use the **Workflow versions** dialog to set the new version of the workflow as the active version.

Require internal users to approve supplier portal user requests (optional)

If you want to require internal users (such as the purchasing manager) to approve supplier portal user requests, follow these steps:

1. Open the *Vendor user request (new user or modify user)* workflow in the workflow editor. In this procedure, you must edit each of the steps highlighted in the following screenshot.



2. Select the first step highlighted in the preceding screenshot, and then select **Advanced** on the ribbon.

3. Select the **Use final approver** check box.

4. Select the user who should approve the user request.

5. Select **Save and close** to save your changes to the workflow as a new version.

6. In Supply Chain Management, go back to **System administration** > **Workflow** > **User workflows** and select the *Vendor user request (new user or modify user)* workflow. On the Action Pane, open the Workflow tab and select **Versions**. Use the **Workflow versions** dialog to set the new version of the workflow as the active version.

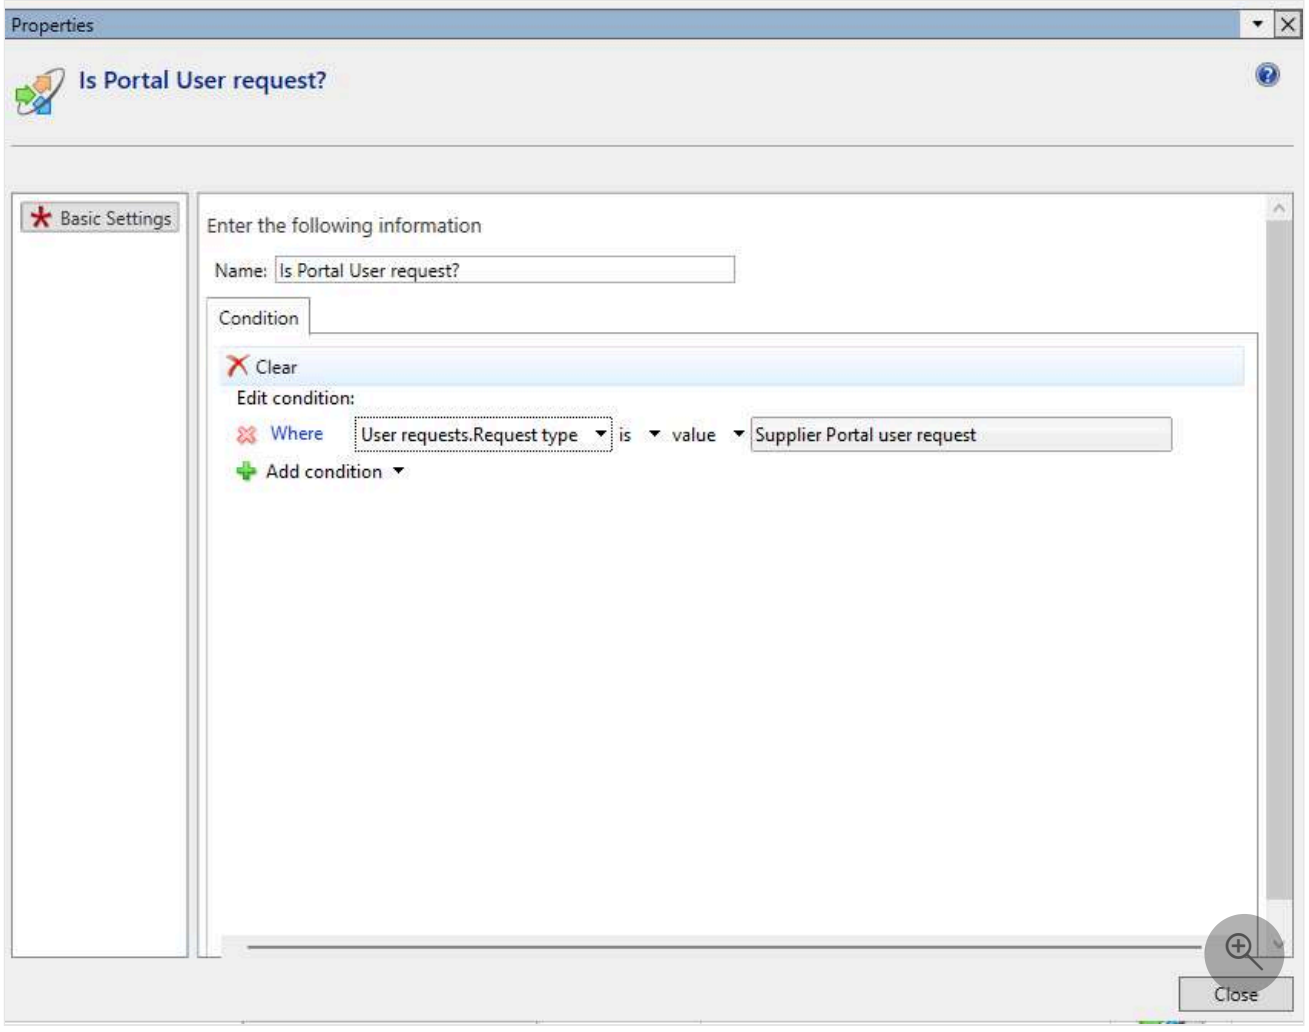
Automate guest supplier user provisioning in Microsoft Entra (optional)

To automate guest supplier user provisioning in Microsoft Entra, add a conditional workflow step that verifies whether the request pertains to a portal user. If so, the workflow bypasses all

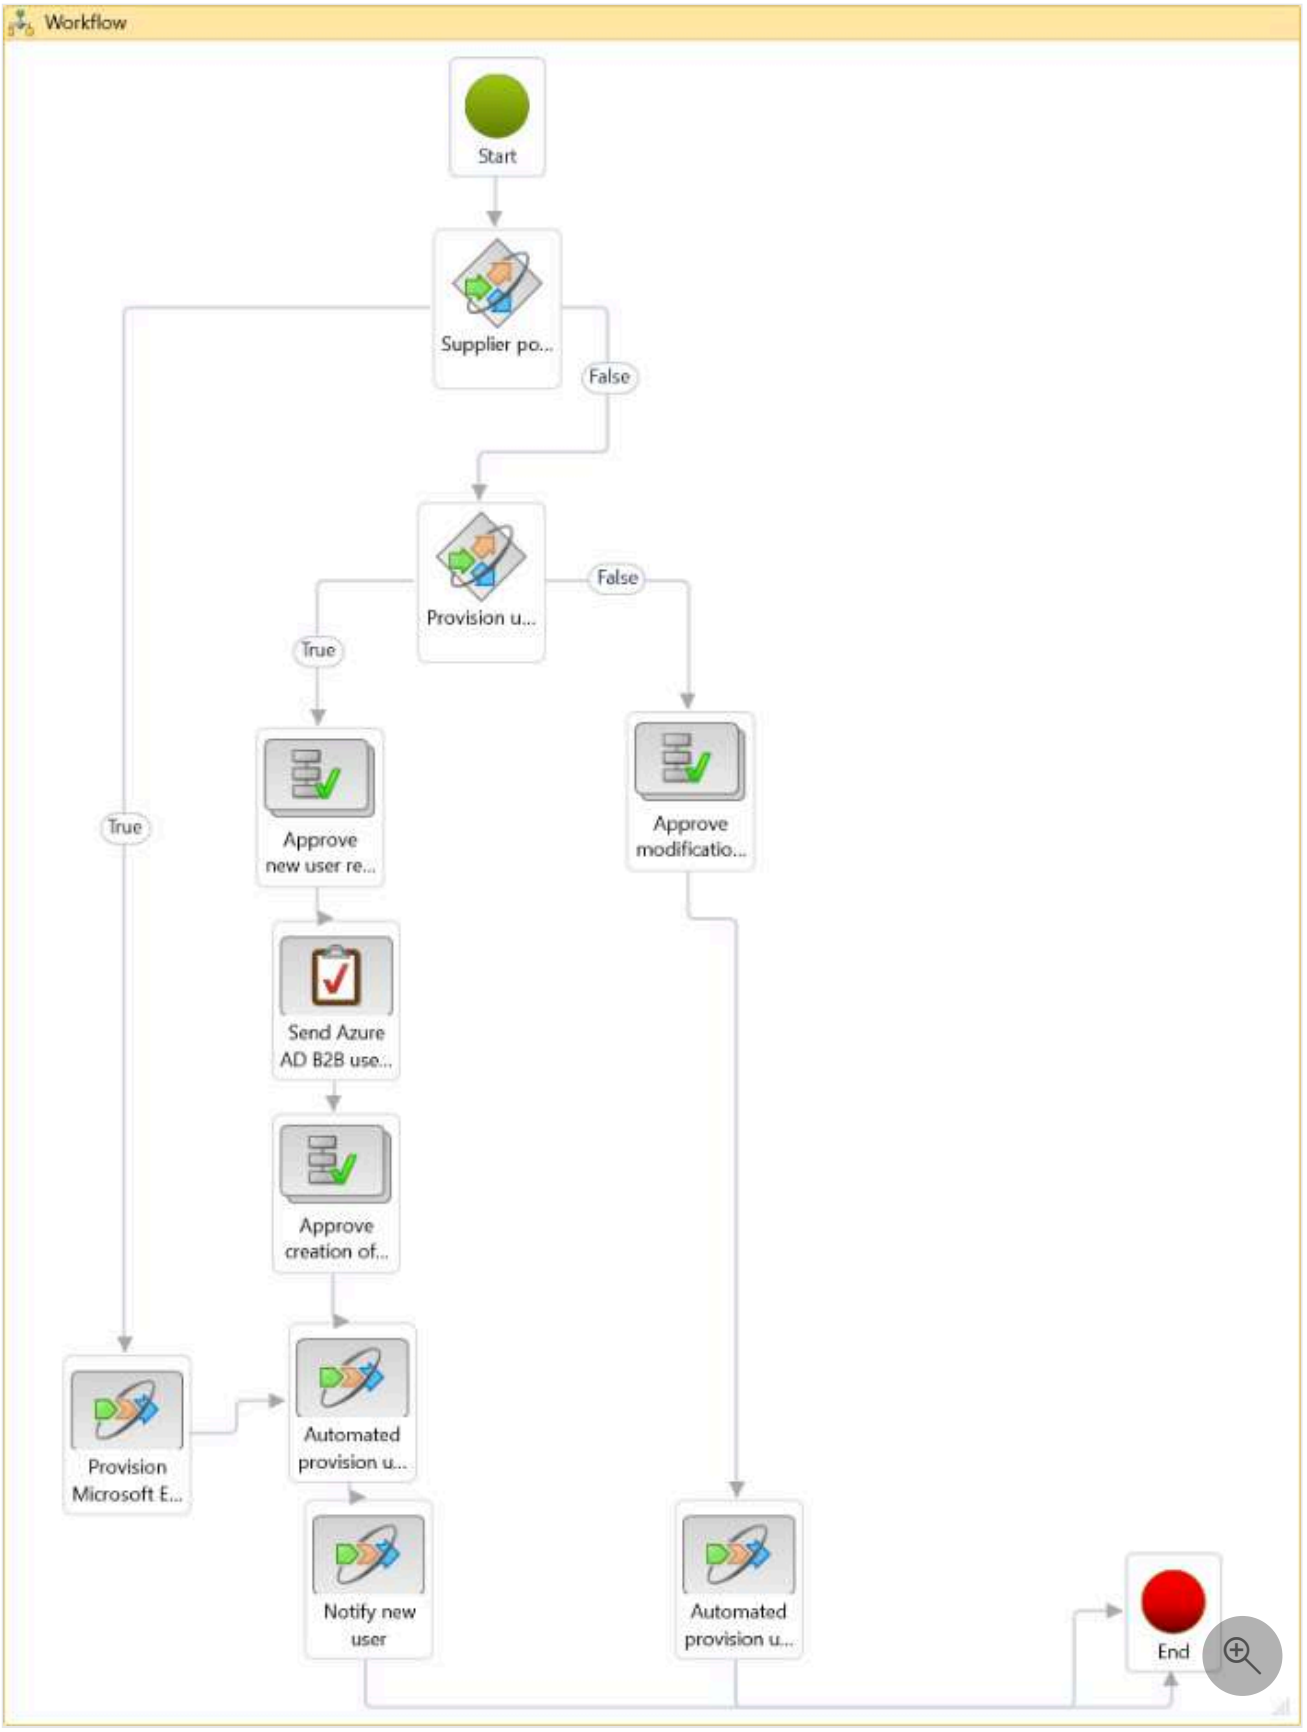
subsequent approval steps and proceeds directly to user creation. If you want to implement this functionality, follow these steps:

1. Open the *Vendor user request (new user or modify user)* workflow in the workflow editor.
2. Add a new *Conditional decision* step immediately after the *Start* step.
    - Move the output of the *Start* step to the input of the new conditional step.
    - Link the **True** outcome of the new conditional step to the *Automated provision user* step.
    - Link the **False** outcome of the new conditional step to the *Provision user OR modify user* step.
3. Select the new conditional step, and then select **Basic settings** on the ribbon.
4. Set **Name** to *Is portal user request?*.
5. Select **Add condition** and set **Condition** to *Where User requests.Request type is Value Supplier Portal user request*.

    The following screenshot shows an example of the conditional step settings.



6. Add the *Provision Microsoft Entra ID B2B user* automated task on the **True** branch before **Automated provision user**. The workflow diagram should now look like this:



7. Select **Save and close** to save your changes to the workflow as a new version.

8. In Supply Chain Management, go back to **System administration** > **Workflow** > **User workflows** and select the *Vendor user request (new user or modify user)* workflow. On the Action Pane, open the Workflow tab and select **Versions**. Use the **Workflow versions** dialog to set the new version of the workflow as the active version.

Learn more in Example of a workflow for provisioning new users and modifying security roles.

Set up the vendor category request workflow

The vendor category request workflow is triggered when a vendor requests a new procurement category.

To create or modify the workflow, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **Procurement and sourcing workflows**.
2. Find or add the *Vendor category request* workflow.
3. Configure the workflow steps and activate the workflow.

Learn more in Set up the Vendor category request workflow.

Set up the vendor invoice workflow

The vendor invoice workflow is triggered when a vendor invoice is submitted.

To create or modify the workflow, follow these steps.

1. Go to **Accounts payable** > **Setup** > **Accounts payable workflows**.
2. Create or update the vendor invoice workflow that you want suppliers to use.
3. Activate the workflow after configuration is complete.

Learn more in Set up options for vendor invoice automation and Vendor invoices overview.

Set up localization metadata

Local laws and regulations vary from place to place, so the fields and options available for each vendor must adapt to that vendor's specific country/region. To prepare your system to provide localized features, you must generate the required entity field metadata. To generate the entity field metadata, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **(Preview) Supplier Engagement** > **Entity field metadata for supplier portal**.

2. On the Action Pane, select **Generate entity field metadata**.

Create global vendors from existing data

To enable interaction with the supplier portal and ensure visibility in Supplier Engagement processes, each of your existing suppliers must be registered as a global vendor. Supply Chain Management can create global vendors based on existing vendor records or parties. The new global vendors are then linked to the existing vendor party.

This capability is particularly useful for organizations transitioning to Supplier Engagement that want to integrate their current vendor base with the supplier portal.

Supply Chain Management provides a global vendor creation wizard that streamlines the registration process by generating global vendors based on existing vendors or global address book (party) records. It can also merge parties, which helps eliminate duplicate records in your global address book.

To run the global vendor creation wizard, follow these steps:

1. Sign in to Supply Chain Management.
2. Start the wizard in one of the following ways:

    - Go to **Procurement and sourcing** > **Vendors** > **All vendors**, select up to 200 vendors that aren't already linked to global vendors. On the Action Pane, open the **Vendor** tab and, from the **Set up** group, select **Global vendor**.
    - Go to **Organization administration** > **Global address book** > **Global address book**, select up to 200 parties that have a vendor role and aren't already linked to global vendors, and then select **Party** > **New** > **Global vendor**.
    - Go to **Procurement and sourcing** > **Vendors** > **Supplier engagement** > **Global vendor creation**.

3. The **Global vendor creation** wizard opens. On the **Welcome** page, select **Next**.
4. If the **Select vendor** page appears, select the vendors that you want to process. Use the **Vendor selection** filter to help find vendors that meet your criteria. Then select **Next**.
5. The **Check for duplicates** page opens.
6. Review each row in **Selected vendors** and evaluate possible matches in **Duplicates search result**.
7. For each vendor, choose the party that should become the global vendor and select **Global vendor**.
8. Select **Merge** for any parties that should be merged into the selected global vendor.

9. Repeat the duplicate review and merge decisions for each selected vendor.
10. Select **Next** to review the **Summary** page.
11. If the summary is correct, select **Finish**.

When the wizard finishes, it creates the new global vendors, merges selected parties, links local vendors to the related global vendor parties, and synchronizes the new records to the Supplier Engagement app.

Review the global vendor creation log

The global vendor creation wizard runs asynchronously, so use the log to confirm results and handle failures.

1. Go to **Procurement and sourcing** > **Vendors** > **Supplier Engagement** > **Global vendor creation log**.
2. Review the creation status and failure reason for each record.
3. If a record has a status of *Error*, select it and then select **Resync**.

Post-deployment validation checklist (preview)

[This article is prerelease documentation and is subject to change.]

After deployment is complete, validate the environment before you hand it over to business users or suppliers. These checks help you confirm that the expected solutions are available, automation is turned on, and synchronization data was created correctly. Running the checklist early makes troubleshooting much easier if something is missing.

Confirm Power Apps solutions are available

Review the managed solutions in the Power Apps maker portal to make sure that the Supplier Engagement package finished installing.

1. Sign in to the Power Apps maker portal.
2. Go to **Solutions**.
3. Open the **Managed** tab.
4. Confirm that the the following Supplier Engagement solutions are listed:

    - Supplier Engagement Anchor
    - Supplier Engagement Portal
    - Supplier Engagement Plugins
    - Supplier Engagement Core
    - Supplier Engagement Controls
    - Supplier Engagement Consignment Inventory
    - Supplier Engagement Vendor Invoice
    - Supplier Engagement Request for Quotation
    - Supplier Engagement Purchase Order
    - Supplier Engagement Vendor Onboarding
    - Supplier Engagement Contact Person Entity
    - Supplier Engagement Vendor Entity
    - Supplier Engagement Base

> **Note**

If any expected solutions are missing, reinstall the Supplier Engagement package.

Confirm cloud flows are enabled

Check both managed solutions that contain cloud flows so that you can confirm that automation is active.

1. Sign in to the Power Apps maker portal and select your environment.
2. On the navigation pane, select **Solutions**.
3. Find and open the solution that has a **Display name** of *Supplier Engagement Core*.
4. On the navigation pane, select **Objects** > **Cloud flows**.
5. Verify that every flow has a **Status** of *On*.
6. On the navigation pane, select **Back to solutions**.
7. Find and open the solution that has a **Display name** of *Supplier Engagement Portal*.
8. On the navigation pane, select **Objects** > **Cloud flows**.
9. Verify that every flow has a **Status** of *On*.

> **Note**
>
> If any flow status is *Off*, follow the instructions in Enable supporting cloud flows.

Confirm sync configurations are available

The Supplier Engagement app should contain the sync configuration records created when you deployed the solution.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, go to **Data Sync** > **Sync Configs**.
3. Confirm that the sync configuration mappings listed in the following table exist on your system.

Expand table

Source Table	Destination Table
mserp_vrmpersonentity	contact

Source Table	Destination Table
mserp_vrmglobalvendorentity	msdyn_globalvendor
msdyn_vrmpartycontact	mserp_vrmpartycontactentity
msdyn_vrmvendorpostaladdress	mserp_vrmpartylocationpostaladdressentity
contact	mserp_vrmpersonentity
mserp_vrmportaluserrequestentity	msdyn_globalvendorportalaccess
mserp_vrmpartycontactentity	msdyn_vrmpartycontact
msdyn_globalvendor	mserp_vrmglobalvendorentity
mserp_vrmpartylocationpostaladdressentity	msdyn_vrmvendorpostaladdress

4. If sync configuration records are missing or the record count doesn't match expectations, follow the instructions in How can I resolve sync configuration issues?.

Confirm sync config table mappings are current

Use the **Modified On** value to confirm that the sync configuration records were refreshed during the latest deployment.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, go to **Data Sync** > **Sync Configs**.
3. Select **Edit columns**.
4. In the **Edit columns** dialog, select **Add columns**.
5. Select **Modified On**, and then select **Close**.
6. Select **Apply**.
7. Verify that the **Modified On** value for each sync configuration matches the date when you last deployed the Supplier Engagement solution.
8. If the dates aren't correct, follow the instructions in How can I resolve sync configuration issues?.

Deployment FAQs (preview)

[This article is prerelease documentation and is subject to change.]

Deployment questions often come up after the initial installation, especially when sync records don't appear as expected or when administrators can't find the supplier portal site. This FAQ collects the most common troubleshooting paths so that you can get deployment back on track quickly. Use it together with the validation checklist when you're confirming a new environment.

How can I resolve sync configuration issues?

If sync configurations are missing or incorrect after deployment, reinstall the anchor solution package components in the environment.

1. Sign in to the Power Apps maker portal using the service account that you used for installation.
2. Go to **Solutions** > **Managed Solutions**.
3. Find and delete the *Supplier Engagement Anchor* solution.
4. Go to the Power Platform admin center.
5. Reinstall the Supplier Engagement package.

> **Note**
>
> Learn more in Install the Supplier Engagement app and supplier portal on Power Platform.

How do I locate the supplier portal site?

Use Power Pages to find the installed supplier portal site when you need to reactivate it, configure security, or review site settings.

1. Go to the Power Pages maker portal.
2. In some environments, you might be redirected to the *Welcome to Power Pages* onboarding experience instead of the site listing page. If that happens, select **Get started**.
3. Go to the **Sites** page. If the **Tell us about yourself** page appears, update the browser address. Replace the path ending in `portals/create#roleAndIndustry` with `environments/<environment-id>/portals/home`.
4. Find *Microsoft Dynamics 365 Supplier Portal* in the site list.

Configure the Supplier Engagement app overview (preview)

[This article is prerelease documentation and is subject to change.]

Supplier Engagement configuration establishes the reference data that supports supplier onboarding, vendor management, risk assessment, and collaboration. When these entities are set up correctly, users can work with consistent options and complete related processes without missing required values. Planning this setup early helps the rest of the app work as intended.

Why configuration matters

Configuration matters for the following reasons:

- Accurate setup ensures that users see only valid options during onboarding, vendor management, and risk assessment.
- If required configuration is missing, users might not be able to complete related tasks such as assigning certificates or categorizing vendors.
- Features such as onboarding questionnaires, risk management, and compliance tracking depend on these entities being available in advance.

For example, if you want vendors to provide a specific certificate during onboarding, you must first define the certificate type and certifying organization. Likewise, if you want to segment vendors by industry, you must first configure the relevant segments and product categories.

Configuration entities and dependent features

The following table summarizes each configuration entity, its purpose, and the features that depend on it.

Expand table

Configuration entity	Purpose	Dependent features
Certificate types	Defines standard types of certificates vendors can hold.	Vendor certification management, onboarding
Certifying organizations	Stores recognized bodies that issue certificates.	Vendor certification management

Configuration entity	Purpose	Dependent features
Product categories	Classifies vendor offerings and supports a hierarchical structure.	Vendor registration, product and service assignment
Segments	Further classifies vendors for reporting and management.	Vendor segmentation, analytics
Capability types	Categorizes vendor skills and capabilities.	Capability assignment, vendor qualification
Qualities	Defines specific attributes or standards that vendors might have.	Vendor qualification, compliance checks
Risk scenarios	Identifies potential risks that are associated with vendors.	Risk assessment, corrective action planning
Corrective action types	Defines actions to mitigate identified risks.	Risk management, compliance tracking
Self-assessment questions	Evaluates vendor suitability during onboarding.	Vendor onboarding, qualification
Global vendor types	Classifies vendors for reporting and management.	Vendor registration, reporting
Countries/regions	Maintains a list of countries/regions for vendor classification.	Vendor registration, compliance, reporting
Hold reasons	Explains why a vendor is placed on hold.	Vendor management, compliance, audit

> **Note**
>
> You can import all configuration data by using Excel. Learn more in /power-apps/user/import-data.

Configure certificate types and organizations (preview)

[This article is prerelease documentation and is subject to change.]

Certificates help validate vendor qualifications and compliance requirements. Certificate types standardize the certifications that you track, while certifying organizations identify the recognized bodies that issue them. Configuring both areas first helps ensure accurate reporting and smoother onboarding later.

Understand certificate setup

To prepare your system for use, configure the certificate types and certifying organizations that apply to your business. You'll add individual vendor certificates later during vendor setup and onboarding.

Configure certificate types and certifying organizations

Use the following procedure to create, update, or delete certificate types and certifying organizations in the Supplier Engagement app.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. Do one of the following steps:

    - To configure certificate types, go to **Configuration** > **Certificates** > **Certificate types**.
    - To configure certifying organizations, go to **Configuration** > **Certificates** > **Certifying organizations**.

3. Either open an existing record to edit it or, on the command bar, select **New** to create a record. You can also select **Delete** to remove a selected record.
4. Enter the following information:

    - **Name** – Enter a descriptive name for the certificate type or certifying organization.
    - **Description** – Enter details that help users understand when to use the record.

5. Select **Save**.

Configure capabilities (preview)

[This article is prerelease documentation and is subject to change.]

Capabilities define how vendor offerings, specializations, and standards are organized in Supplier Engagement. By using predefined values, teams can classify vendors consistently and support better sourcing, qualification, and supplier management decisions. These settings also support hierarchical structures that make complex vendor profiles easier to manage.

Capability areas

In the Supplier Engagement app, you can configure four types of capabilities:

- **Product categories** – Classify a vendor's products using a structured list based on industry standards. This classification helps you organize and search for vendors efficiently within the system. Examples include:
  - **Automotive components** – Tires, batteries, radiators, brakes
  - **Industrial machinery** – Cranes, forklifts, pumps, compressors
  - **Food and beverage** – Frozen meals, canned goods, baked goods, dairy products
  - **Construction materials** – Doors, roofing, cement, bricks, tiles

- **Segments** – Represent the broader product or service groups a vendor operates in. This representation helps you categorize vendors by the industries they serve. Examples include:
  - **Medical equipment** – Irradiation equipment, electro-medical devices, hospital furniture
  - **Electronic and electricals** – Lighting equipment, motors, generators, switches, connectors

- **Capability types** – Describe a vendor’s technical skills, manufacturing processes, and production capacity. This information helps you determine whether a vendor can meet operational or project-specific requirements. Examples include:
  - **Metal fabrication** – Bending, punching, stamping, tool manufacturing, progressive die stamping

- **Qualities** – Define the standards, certifications, and testing processes a vendor follows. This definition ensures vendors meet industry, customer, or regulatory requirements. Examples include:
  - **Inspection and testing** – Proof load testing, impact testing
  - **Certifications** – ISO 9001, FDA approval
  - **Processes** – PPAP levels, VDA levels

- **Additional areas** – Compliance, traceability

Capability hierarchies

All capability entities use parent-child hierarchies. For example, a product category such as *Automotive Components* can include child categories such as *Tires* and *Brakes*, while a capability type such as *Metal Fabrication* can include sub-capabilities such as *Stamping* and *Bending*.

These hierarchies use self-referential one-to-many relationships, so each record can link to a parent record of the same type. This approach supports flexible classification and helps users navigate vendor information efficiently.

Create, delete, and edit capabilities

Use the following procedure to manage product categories, segments, capability types, and qualities.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, under the **Capabilities** heading, select the capability entity that you want to set up: **Product categories**, **Segments**, **Capability types**, or **Qualities**.
3. Either open an existing record to edit it or, on the command bar, select **New** to create a record. You can also select **Delete** to remove a selected record.
4. Enter the following information for the new or selected record:

    - **Name** – Enter a descriptive name.
    - **Parent** – If the record belongs under another record of the same type, select the parent record to place it in the hierarchy.

5. Select **Save**.

Configure risk management elements (preview)

[This article is prerelease documentation and is subject to change.]

Risk configuration helps purchasers identify, assess, and monitor issues that might affect vendors or supply chain operations. When you define risk scenarios and corrective action types ahead of time, teams can evaluate risks consistently and track mitigation work more effectively. Historical analysis and reporting also become easier because the same structures are used across the supplier network.

Risk scenarios

Risk scenarios define the types of issues that can affect vendors or supply chain operations, such as financial instability, regulatory noncompliance, quality failures, or delivery delays. Configuring these scenarios helps purchasers classify and evaluate risks consistently across vendors.

Corrective action types

Corrective action types define the measures that purchasers take to reduce or eliminate identified risks. Each action type represents a mitigation approach that you can associate with one or more risk scenarios.

Risk hierarchies

Both risk scenarios and corrective action types support parent-child relationships. This structure lets you group related risks and mitigation strategies into multilevel hierarchies that are easier to analyze and manage.

For example, a parent risk scenario such as *Dependence* can include child scenarios, while a corrective action type such as *Mitigation* can include more specific actions beneath it. These relationships use self-referential one-to-many relationships, where each record can link to a parent record of the same type.

Create, delete, and edit risk management elements

Use the following procedure to manage risk scenarios and corrective action types.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, under the **Risks** heading, select the risk entity that you want to set up: **Risk scenarios** or **Corrective action types**.
3. Either open an existing record to edit it or, on the command bar, select **New** to create a record. You can also select **Delete** to remove a selected record.
4. Enter the following information for the new or selected record:

    - **Name** – Enter a descriptive name.
    - **Parent** – If the record belongs under another record of the same type, select the parent record to place it in the hierarchy.

5. Select **Save**.

Configure self-assessment questions (preview)

[This article is prerelease documentation and is subject to change.]

Vendors see self-assessment questions in the supplier portal during onboarding. These questions help you evaluate vendor compliance and capabilities before you make qualification decisions. A well-structured question set also makes assessments more consistent across vendors.

Create, delete, and edit self-assessment questions

Use the following procedure to manage self-assessment questions in the Supplier Engagement app.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, go to **Self-assessment** > **Questions**.
3. Either open an existing record to edit it or, on the command bar, select **New** to create a record. You can also select **Delete** to remove a selected record.
4. Enter the following information for the new or selected record:

    - **Name** – Enter the question exactly as you want potential vendors to see it.
    - **Number** – Control the order in which questions appear on the page. Questions with lower numbers appear first. If two questions have the same number, they're shown in creation order. To keep sorting consistent, use leading zeros for single-digit values, such as 01, 02, 03, and 10.
    - **Area** – Select the operational area that the question applies to. Available areas include *Supply Chain Management*, *Quality management*, *Quality control*, *Human resources*, *Environmental*, *Social*, and *Governance (ESG)*, and *Production*.
    - **Answer type** – Choose whether vendors respond by entering **Text** or selecting **Yes/No**.

5. Select **Save**.

Configure Supplier Engagement app settings (preview)

[This article is prerelease documentation and is subject to change.]

Portal management setup defines reference data that's used throughout the Supplier Engagement application. Before you onboard vendors, configure the global settings that support consistent classification, compliance alignment, and reporting. These settings include global vendor types, countries and regions, and hold reasons.

Global vendor types

Global vendor types classify vendors based on the nature of their business or the goods and services that they provide. This setup helps organize vendors for management and analysis in the Supplier Engagement app.

Countries/regions

Countries/regions identify a vendor's geographic location in the system. This setup also supports registration requests from anonymous users who don't have direct access to Supply Chain Management.

The list should match the countries/regions that are configured in Supply Chain Management so data stays consistent between systems.

Hold reasons

Hold reasons specify why a vendor is on hold, such as compliance issues, performance concerns, or regulatory requirements. These reasons help users record and communicate why vendor activity is restricted.

Create, delete, and edit settings

Use the following procedure to manage global vendor types, countries/regions, and hold reasons.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, in the **Settings** section, select **Global vendor types**, **Countries/regions**, or **Hold reasons**.
3. Either open an existing record to edit it or, on the command bar, select **New** to create a record. You can also select **Delete** to remove a selected record.
4. Enter the following information for the new or selected record:

    - **Name** – For global vendor types and hold reasons only, enter a descriptive name. Users and vendors see these names as selectable options in Supplier Engagement and the supplier portal, so each name should clearly represent the option.
    - **Description** – For global vendor types and hold reasons only, enter a longer description.
    - **Country/region** – For countries/regions only, enter the three-letter country or region code that's used in Supply Chain Management.
    - **Long name** and **Short name** – For countries/regions only, use **Short name** for a common name such as *United Kingdom* and **Long name** for the full formal name such as *United Kingdom of Great Britain and Northern Ireland*.

5. Select **Save**.

Synchronize data between Supplier Engagement and Supply Chain Management (preview)

[This article is prerelease documentation and is subject to change.]

Data synchronization keeps supplier-related information consistent between Supply Chain Management and the Supplier Engagement app. It uses event-driven processes and configurable sync logic to support full create, read, update, and delete (CRUD) operations on data that resides in Supply Chain Management while maintaining the data in its original location. These synchronization features are available both during initial installation and day-to-day use of the solution.

> **Tip**
>
> We recommend that you always use the Supplier Engagement application to create and maintain aggregated supplier information across legal entities. System synchronization logic ensures that supplier data is synced to the respective legal entities within Dynamics 365 Supply Chain Management.

Prerequisites

Before you can start synchronizing data, your systems must meet the following requirements:

- Your Supply Chain Management environment must be connected to Dataverse. Learn more in Microsoft Power Platform integration with finance and operations apps.
- The Supplier Engagement app must be installed. Learn more in Install the Supplier Engagement app and supplier portal on Power Platform.
- The *Supplier Engagement* feature must be turned on in Supply Chain Management. Learn more in Enable the Supplier Engagement feature.
- You must complete all configuration steps described in the deployment guide. Learn more in Supplier Engagement deployment overview, prerequisites, and licensing.

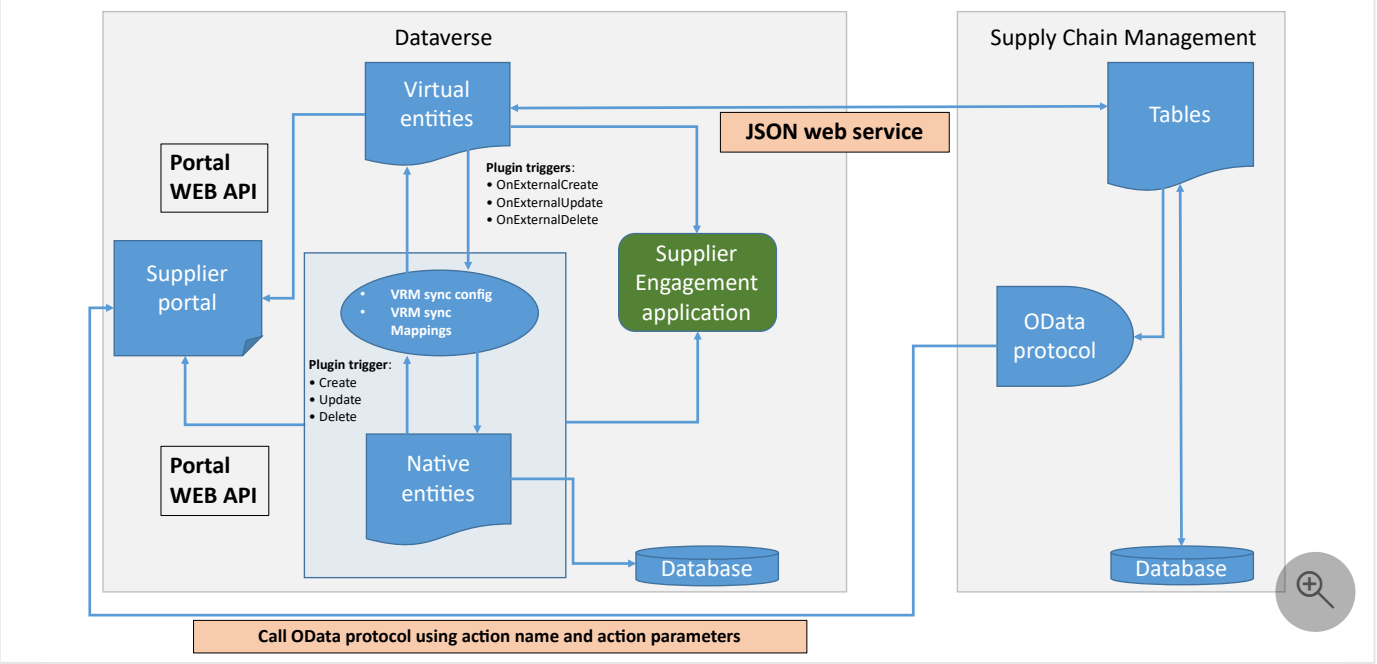
Data synchronization overview

The Supplier Engagement app uses the following components to synchronize data between the systems:

- **Sync configuration manager** – Uses plugin triggers and field mappings to keep Dataverse tables and virtual entities in sync.
- **Virtual entities** – Represent Supply Chain Management data in Dataverse without duplicating it.
- **Supplier portal Web API** – Allows the supplier portal to perform CRUD operations on Dataverse tables and virtual entities.
- **Open Data Protocol (OData)** – Provides standardized web service access to Supply Chain Management data and processes.

The system uses virtual entities from Supply Chain Management and Dataverse tables to maintain data between both systems. The sync configuration manager uses plugin triggers on both virtual entities and Dataverse tables. These plugins use the mappings from the sync configuration manager to synchronize data between both systems.

The following illustration shows the integration architecture between the Dataverse environment and Supply Chain Management.



You can learn more about how synchronization is implemented in Dataverse in the following articles:

- Use plug-ins to extend business processes
- Data synchronization in Dataverse

Sync configuration manager

The sync configuration manager ensures that data remains consistent between Supply Chain Management and the Supplier Engagement app. It uses the data stored in the Supplier Engagement app to determine which records require synchronization and triggers updates on both Supply Chain Management and Supplier Engagement tables. The supplier portal also uses this system to keep data updated between the two platforms.

Key capabilities of the sync configuration manager include:

- **Real-time synchronization** – Keeps data aligned between Supply Chain Management and the Supplier Engagement app, reducing manual updates and errors.
- **Configurable sync logic** – Administrators can define which tables and fields are synchronized, allowing for tailored integration scenarios.
- **Event-driven updates** – Changes in either system trigger synchronization, ensuring timely data updates.

Synchronized entities

The following table lists the entities that are exposed for use by the sync configuration manager. Entities with the *(mserp)* suffix are virtual entities from Supply Chain Management that are exposed in Dataverse. Entities without the suffix are native Dataverse tables. The names shown here are the display names, which you can search for in Power Platform.

Expand table

Dataverse table	Virtual entity (mserp)
Global Vendor	Global Vendors (mserp)
Contact	Person for VRM (mserp)
Contact Method	Contact information for VRM (mserp)
Address	Addresses for Supplier Portal (mserp)
Global Vendor Portal Access	Supplier Portal user requests (mserp)

Data flows

This section describes the data flow for each synchronized entity pair. Each entity supports bidirectional synchronization between the Supplier Engagement app (or supplier portal) and

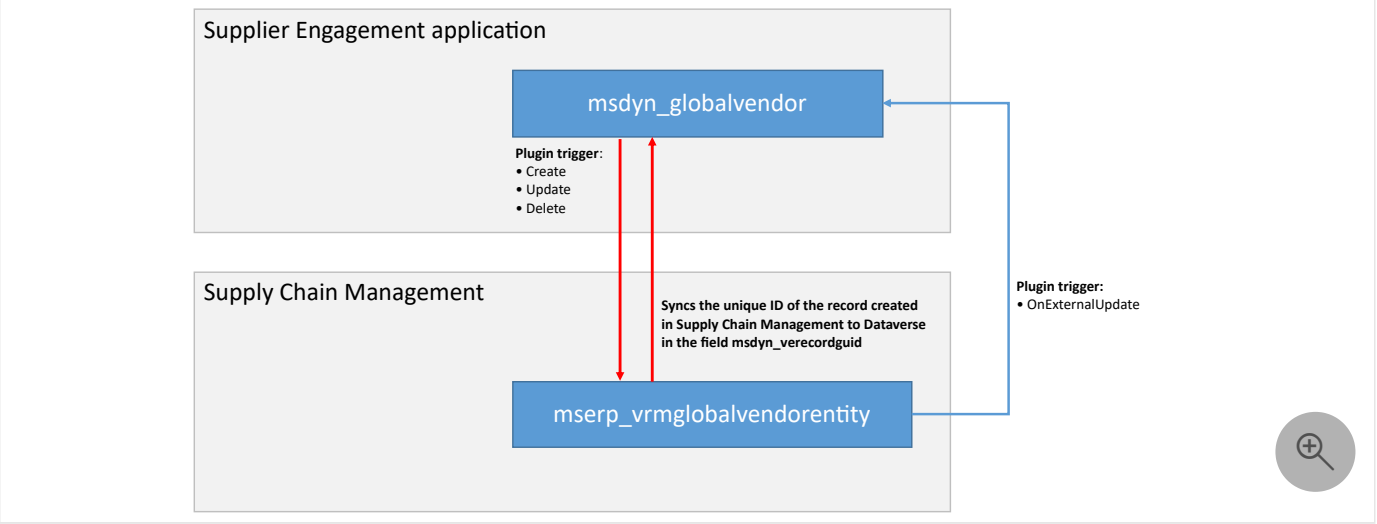
Supply Chain Management, using plugin triggers and the sync configuration manager mappings. Records are linked between systems using the `VERecordGuid` field, which stores the Supply Chain Management record ID in Dataverse.

Global vendor

When you create, update, or delete a global vendor record in the Supplier Engagement app, plugins trigger on the `msdyn_globalvendor` Dataverse table and synchronize the changes to the `mserp_vrmglobalvendorentity` virtual entity in Supply Chain Management.

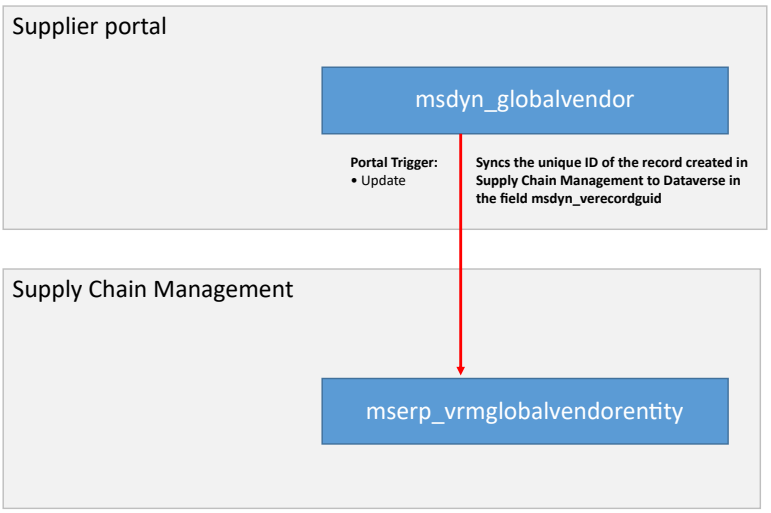
When you update the virtual entity in Supply Chain Management, an `OnExternalUpdate` plugin triggers and synchronizes the changes back to Dataverse.

The following illustration shows the data flow between the Supplier Engagement app and Supply Chain Management for global vendor records.



When you update a global vendor through the supplier portal, the updated data synchronizes to Supply Chain Management using the sync configuration manager mappings via the Web API.

The following illustration shows the data flow from the supplier portal to Supply Chain Management for global vendor records.

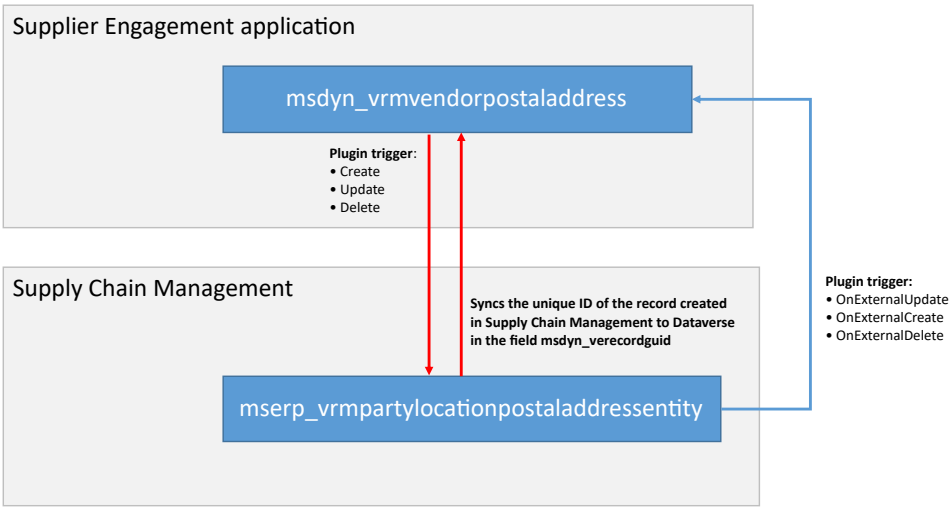


Address

When you create, update, or remove an address for a global vendor that is qualified or approved, plugins trigger on the `msdyn_vrmvendorpostaladdress` Dataverse table and synchronize the changes to the `mserp_vrmpartylocationpostaladdressentity` virtual entity in Supply Chain Management.

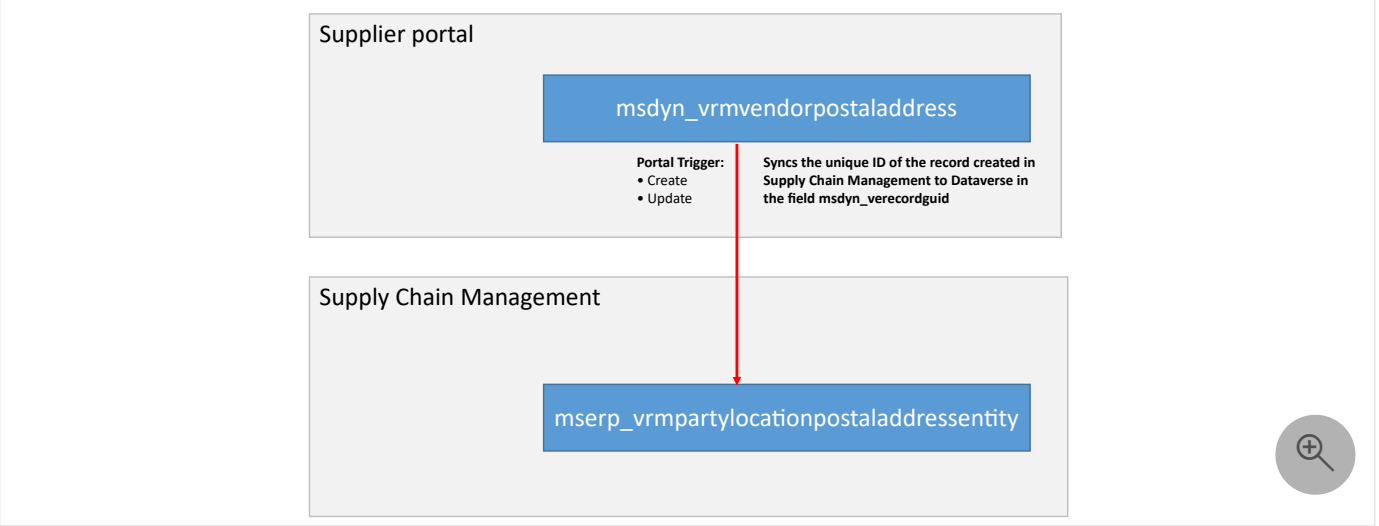
When you create, update, or delete the virtual entity record in Supply Chain Management, the corresponding `OnExternalCreate`, `OnExternalUpdate`, or `OnExternalDelete` plugin triggers and synchronizes the changes back to Dataverse. If you delete a record in Supply Chain Management, the corresponding Dataverse record is also deleted.

The following illustration shows the data flow between the Supplier Engagement app and Supply Chain Management for address records.



You can also create or update addresses through the supplier portal. Changes synchronize to Supply Chain Management using the sync configuration manager mappings via the Web API.

The following illustration shows the data flow from the supplier portal to Supply Chain Management for address records.

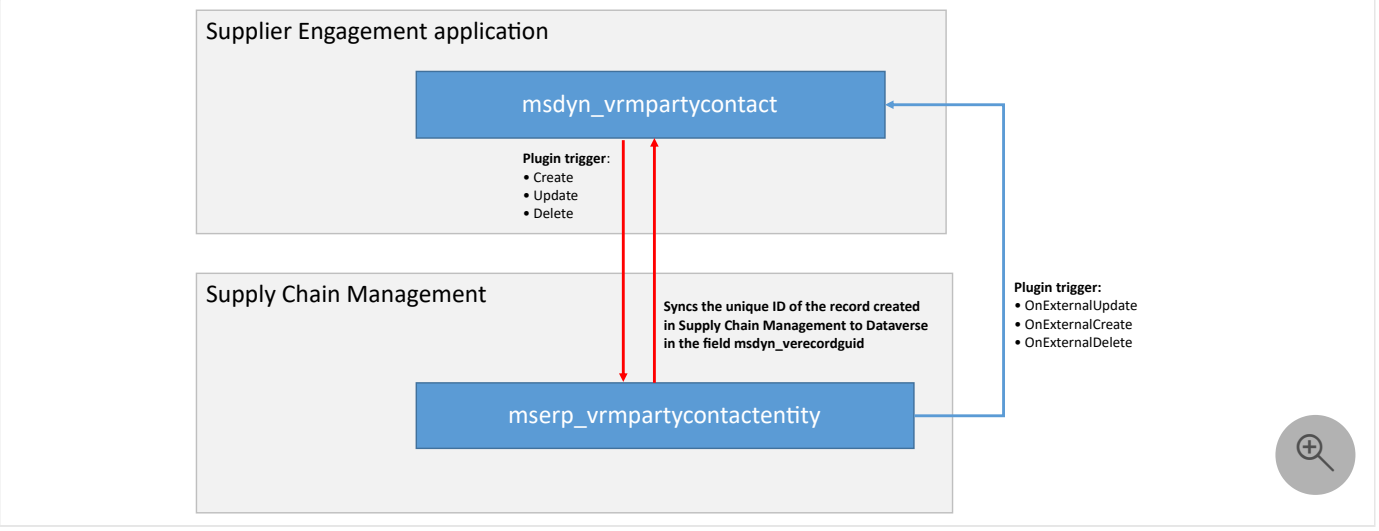


Contact method

When you create, update, or delete a contact method record, plugins trigger on the `msdyn_vrmpartycontact` Dataverse table and synchronize the changes to the `mserp_vrmpartycontactentity` virtual entity in Supply Chain Management.

When you create, update, or delete the virtual entity record in Supply Chain Management, the corresponding plugin triggers and synchronizes the changes back to Dataverse. If you delete a record in Supply Chain Management, the corresponding Dataverse record is also deleted.

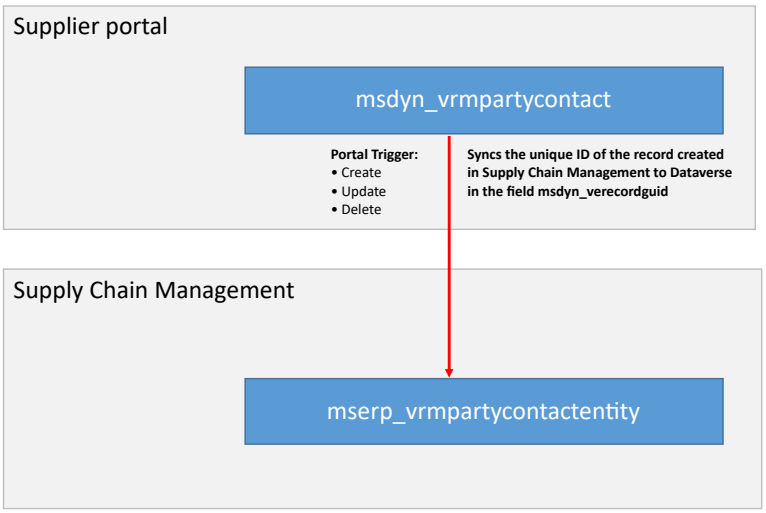
The following illustration shows the data flow between the Supplier Engagement app and Supply Chain Management for contact method records.



You can also create, update, or delete contact method records through the supplier portal. Changes synchronize to Supply Chain Management by using the sync configuration manager

mappings via the Web API.

The following illustration shows the data flow from the supplier portal to Supply Chain Management for contact method records.

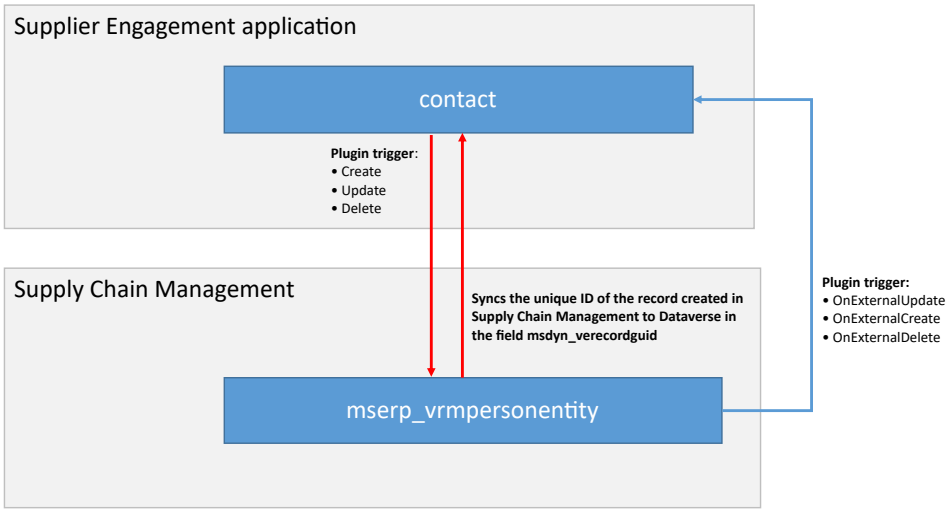


Contact

When you create, update, or delete a contact record, plugins trigger on the `contact` Dataverse table and synchronize the changes to the `mserp_vrmpersonentity` virtual entity in Supply Chain Management.

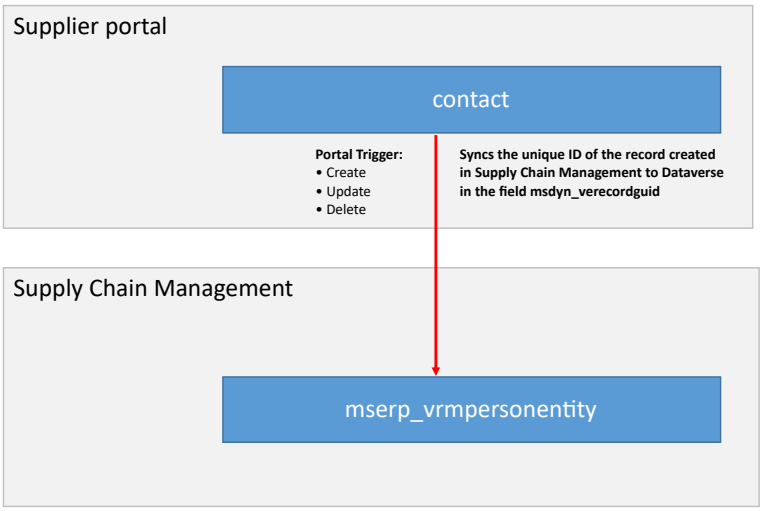
When you create, update, or delete the virtual entity record in Supply Chain Management, the corresponding plugin triggers and synchronizes the changes back to Dataverse. If you delete a record in Supply Chain Management, the corresponding Dataverse record is also deleted.

The following illustration shows the data flow between the Supplier Engagement app and Supply Chain Management for contact records.



You can also create, update, or delete contacts through the supplier portal. Changes are synchronized to Supply Chain Management using the sync configuration manager mappings via the Web API.

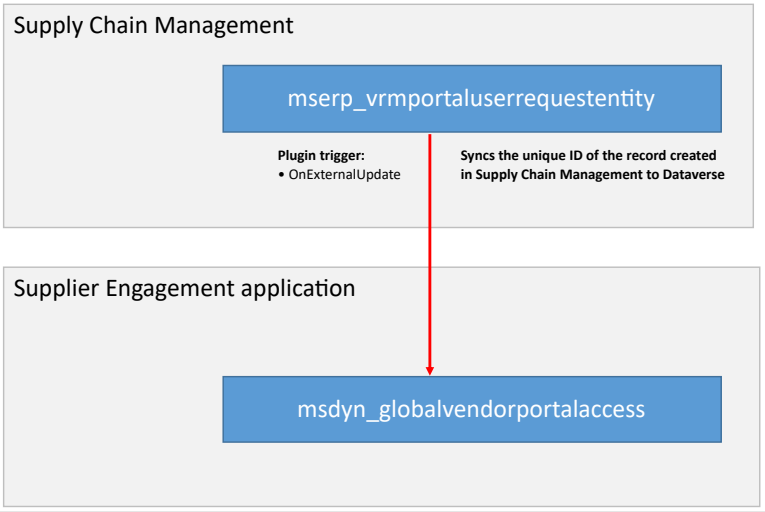
The following illustration shows the data flow from the supplier portal to Supply Chain Management for contact records.



Portal access

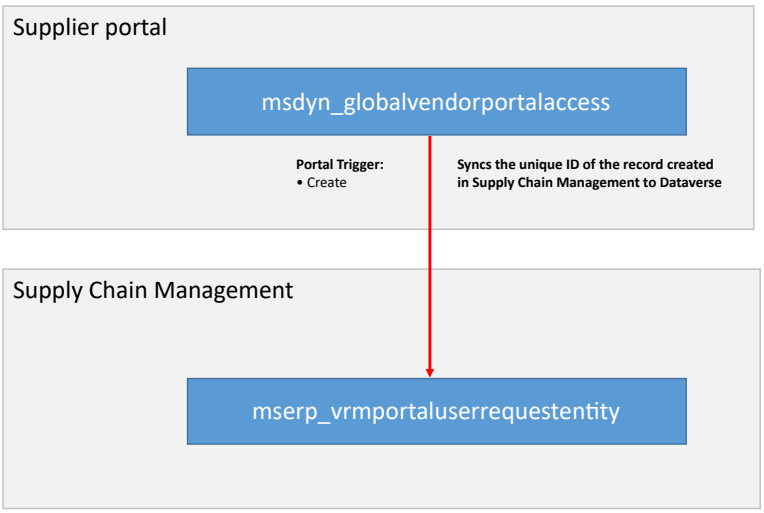
When you update a supplier portal user request record in Supply Chain Management, an `OnExternalUpdate` plugin triggers on the `mserp_vrmportaluserrequestentity` virtual entity and synchronizes the changes to the `msdyn_globalvendorportalaccess` Dataverse table.

The following illustration shows the data flow from Supply Chain Management to the Supplier Engagement app for portal access records.



You can also create global vendor portal access records from the supplier portal. The records are synchronized to Supply Chain Management using the sync configuration manager mappings via the Web API.

The following illustration shows the data flow from the supplier portal to Supply Chain Management for portal access records.



> **Note**
>
> For portal access records, the link between Dataverse and Supply Chain Management uses the Entra ID and User ID fields (rather than `VERecordGuid`).

Mapping components

The sync configuration manager uses two related tables to manage field-level mappings:

- **VRM Sync Config** – The parent table. Each record defines a synchronization configuration that specifies the source table and the destination table.
- **VRM Sync Mappings** – The child table. Each record specifies how individual fields from the source table are mapped to fields in the destination table. Each mapping record is linked to a parent record in the VRM Sync Config table.

In summary, VRM Sync Config defines *what* is synchronized (which tables), and VRM Sync Mappings defines *how* the data is synchronized (which fields are mapped). Each sync configuration can have multiple attribute mappings associated with it.

Configure sync mappings

When you install the Supplier Engagement app, it creates data for the VRM Sync Config and VRM Sync Mappings tables. Only users with the *Supplier Engagement Admin* role can modify these tables. Users with other roles have read-only access.

> **⚠ Warning**
>
> Changes to the sync configuration manager setup affect data synchronization for all configured entities. Only make changes as part of post-deployment steps, and only if required. Only administrators should perform these activities.

To add a new sync configuration mapping, follow these steps:

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, select **Data Sync** > **Sync Config**.
3. On the command bar, select **New**.
4. In the **Source Table** field, enter the logical name of the source entity in text format.
5. In the **Destination Table** field, enter the logical name of the destination entity in text format.
6. On the command bar, select **Save**. A **Field Mappings** area appears on the record.
7. On the toolbar, select **New Field Mappings** to add a field mapping.
8. In the new mapping window, set the following fields:

    - **Source field** – Enter the source field logical name in text format.
    - **Destination field** – Enter the destination field logical name in text format.
    - **Type** – Select the field type. Allowed types are *Text*, *Whole Number*, *Decimal*, *Lookup*, *Choice*, and *Date and Time*.

9. Select **Save**.
10. Go back to the parent record, set **Generate Config** to *Yes*, and select **Save** on the command bar.

The system creates a JSON file on the backend that the sync configuration manager uses to synchronize records between the source and destination tables.

To remove a sync configuration mapping, follow these steps:

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Configuration** area.
2. On the navigation pane, select **Data Sync** > **Sync Config**.
3. Open the record from which you want to remove a mapping.
4. In the **Field Mappings** area, select the mapping that you want to remove.
5. On the toolbar, select **Delete Sync Config Mapping**.

6. Go back to the parent record, set **Generate Config** to *Yes*, and select **Save** on the command bar.

You can also activate or deactivate individual sync config mappings in the same way. Always select **Generate Config and Save** after making changes to update the configuration with the latest settings.

Relation to dual-write

The custom sync logic in Supplier Engagement is distinct from the standard dual-write functionality in Supply Chain Management. While dual-write provides out-of-the-box data integration, the sync configuration manager offers more tailored and granular control over which fields are synchronized.

> ⓘ **Important**
>
> If you enable both dual-write and the sync configuration manager for the same entities, the system might create duplicate records. Don't configure both systems to synchronize the same data.

Virtual entities

You can integrate Supply Chain Management with Microsoft Dataverse as a virtual data source. This integration makes Supply Chain Management entities, such as vendors, purchase orders, and contacts, available in Dataverse as virtual entities. These virtual entities act as a bridge, so users and applications in Dataverse and the broader Microsoft Power Platform can perform CRUD operations on Supply Chain Management data.

Key points about virtual entities:

- **Data location** – The actual data stays in Supply Chain Management. Dataverse only references this data and doesn't store it.
- **Enablement** – Before you can perform CRUD operations from Dataverse, you must expose the relevant Supply Chain Management entities as virtual entities. This step requires configuration. Learn more in Enable Microsoft Dataverse virtual entities.
- **Operations** – Once enabled, you can interact with Supply Chain Management data from Dataverse and Power Platform tools, just as you would with native Dataverse tables.

Learn more about virtual entities in Virtual entities overview.

Open Data Protocol

Open Data Protocol (OData) actions enable external systems and applications to interact with Supply Chain Management data and processes using standard web services. By using OData, you can securely and consistently create, update, or retrieve business data.

The following entities in the Supplier Engagement solution expose OData actions:

- Supplier Portal users
- Vendor-approved procurement categories for Supplier Portal
- Vendor category request headers for Supplier Portal
- Purchase order response headers for Supplier Portal
- Purchase order response lines for Supplier Portal
- RFQ reply headers for Supplier Portal
- Request for quotation reply lines for Supplier Portal
- Pending vendor invoice headers for Supplier Portal
- Request for quotation questionnaires for Supplier Portal

To support OData actions within the Supply Chain Management user security context, each of these entities exposes two key fields:

- `ActionParameters` – Specifies the input data for the OData action.
- `ActionName` – Identifies the specific OData action to execute.

Manage users of the Supplier Engagement app and supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement solution uses a multilayered security framework to control access across the Supplier Engagement app, the supplier portal, and Supply Chain Management. Security roles and web roles define what each user can see and do—from managing global vendor data and processing registrations to inviting portal users and accessing transactional documents.

User management is divided into two areas:

- **Supplier Engagement app users** – Internal users such as procurement staff and supplier managers who work in the Supplier Engagement model-driven app. Access is controlled through Dataverse security roles that map to corresponding roles in Supply Chain Management.
- **Supplier portal users** – External supplier representatives who access the portal to collaborate on purchase orders, RFQs, invoices, and consignment inventory. Access is controlled through Power Pages web roles that are synchronized with Supply Chain Management external user roles.

Both areas share a common principle: user permissions are managed centrally in the Supplier Engagement app and automatically synchronized to Supply Chain Management. This approach eliminates the need for separate user administration in each system.

> **Important**
>
> Internal users who are part of the procurement team must have the required security roles in both Supply Chain Management and the Supplier Engagement (Dataverse) app. This dual access is required to allow synchronization and related Supplier Engagement processes to work correctly across both systems.

How user access works

The following table summarizes how access control works at each layer of the solution.

Expand table

Layer	User type	Access mechanism
Supplier Engagement app (Dataverse)	Internal users	Dataverse security roles
Supplier portal (Power Pages)	External supplier contacts	Web roles assigned in the Supplier Engagement app
Supply Chain Management	Both internal and external	Roles synchronized from the Supplier Engagement app

For internal users, Dataverse security roles determine what features are available in the Supplier Engagement app. These roles map to Supply Chain Management roles, such as *Purchasing Manager* and *Purchasing Agent*, so that internal users also have appropriate access to supply chain data.

For external users, web roles control what portal pages and features are visible. Each portal user automatically maps to an external user in Supply Chain Management. Supply Chain Management roles are assigned based on the web roles, and extensible data security (XDS) policies ensure that each user can only access data belonging to their vendor.

Manage Supplier Engagement app users (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement app defines security roles in Dataverse that control what internal users can do in the app. These roles determine access to features such as configuration management, vendor lifecycle processes, user administration, and feedback. Each Dataverse role maps to a corresponding role in Supply Chain Management to ensure consistent access across both systems.

Supplier Engagement app security roles

The Supplier Engagement app defines four security roles for Dataverse. The following table summarizes each of these roles and their key permissions. In addition, each internal user must also have the *Finance and Operations Basic User Role*.

Expand table

Security role	Description	Key permissions
Supplier Relationship Management System Administrator	Has full access to all Supplier Engagement operations. Manages configurations, master data, user access, and flow history. Oversees the full lifecycle of global vendor records.	Can create configuration data, approve or reject registrations, update records, and initiate legal entity transfers. Can delete all records, including configuration data.
Supplier Portal User Admin	Manages portal user access. Invites users, approves or rejects requests, assigns roles, and manages vendor portal access.	Has access specifically to manage portal user access to vendor records and therefore has limited access to other Supplier Engagement features.
Global Vendor Manager	Oversees global vendor operations, including certificates, feedback, risk assessment, onboarding, and qualification.	Can approve or reject registrations, update records, and initiate legal entity transfers. Can delete records they created.
Global Vendor Professional User	Supports onboarding, maintains vendor data, manages certificates, provides feedback, and participates in qualification and approval workflows for assigned vendors.	Can delete records they created, but not those created by others or configuration data.

Detailed permissions by area

The following table provides a detailed overview of which areas of the Supplier Engagement app each security role has access to.

Expand table

Category	Scenario	*Supplier Relationship Management System Administrator*	*Supplier Portal User Admin*	*Global Vendor Manager*	*Global Vendor Professional User*
Configuration data	Capabilities	Yes	No	No	No
	Risks	Yes	No	No	No
	Self-assessment	Yes	No	No	No
	Settings	Yes	No	No	No
Registration request	View registration requests	Yes	No	Yes	Yes
	Review registration requests	Yes	No	Yes	Yes
	Approve/disapprove registration requests	Yes	No	Yes	Yes
Global vendor	General information	Yes	No	Yes	Yes
	Contacts	Yes	No	Yes	Yes
	Certificate management	Yes	No	Yes	Yes
	Feedback	Yes	No	Yes	Yes
	Risk management	Yes	No	Yes	Yes
	Portal contacts	Yes	Yes	Yes	No
	Lifecycle and vendors	Yes	No	Yes	Yes

Map Supplier Engagement roles to Supply Chain Management roles

Each Supplier Engagement app security role maps to a corresponding role in Supply Chain Management. The following table shows these mappings.

Expand table

Supplier Engagement app role	Supply Chain Management role
Supplier Relationship Management Admin	*Purchasing Manager*
Supplier Portal User Admin	*Purchasing Manager*
Global Vendor Manager	*Purchasing Manager*
Global Vendor Professional User	*Purchasing Agent*

In Supply Chain Management, the *Purchasing Manager* role manages the full procurement lifecycle, including requisitions, orders, vendor interactions, and purchasing policies. The *Purchasing Agent* role supports day-to-day procurement tasks such as creating and managing purchase orders and maintaining vendor details, with more limited access than the manager role.

Manage supplier portal users (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement solution provides tools for managing external supplier users through the Supplier Engagement app and the supplier portal. You can invite suppliers, add or remove portal users, assign roles, manage access to legal entities, and deactivate portal access when needed. Supplier portal user management ensures that external contacts have the right access to the right data while maintaining centralized control across all legal entities.

How supplier portal user management works

Supplier portal user management is based on an integration between Microsoft Power Pages (Dataverse) and Supply Chain Management. Together, these systems control authentication, role assignments, and access to both portal content and supply chain data.

Power Pages (Dataverse) layer

The following principles apply when managing users at the Power Pages layer:

- Supplier portal users are represented as contacts in Dataverse.
- Each contact must have a unique email address to ensure proper identity mapping.
- Contacts are assigned web roles, which control access to Dataverse tables and portal pages.
- Web roles define what the user can see and do within the supplier portal interface.
- Every contact has an external user mapping in Supply Chain Management. Administrators configure portal roles and vendor assignments in the Supplier Engagement app, while Supply Chain Management enforces access to supply chain transactional data.

Supply Chain Management layer

The following principles apply when managing users at the Supply Chain Management layer:

- Each Power Pages contact maps to an external user in Supply Chain Management.
- The system automatically provisions external users when you invite a contact to the supplier portal.
- Supply Chain Management roles assigned to the external user define what supply chain data the portal user can access.

- Access is exposed through Dataverse virtual entities, which surface Supply Chain Management records to the portal.
- Extensible data security (XDS) policies restrict data visibility, ensuring that users see only data that belongs to their vendor.

Data access boundaries

Each portal user's access is limited to the data of their global vendor. The scope of access depends on the type of role assigned:

- **Global roles** (for example, *Global Vendor Admin* or *Global Vendor User*) – Provide access across all legal entities linked to that vendor.
- **Local roles** (for example, *Local Vendor Admin* or *Local Vendor User*) – Restrict access to specific legal entities where vendor collaboration is turned on.

User roles in the supplier portal

Supplier portal access is defined through web roles, which determine what a user can see and do in the portal. Roles fall into two broad categories: anonymous access and authenticated access.

Anonymous access

Anonymous access is granted to site visitors who aren't signed in. These users are assigned the *Global Vendor Anonymous User* role, which allows them to open the supplier portal landing page and submit new vendor registration requests. Their access is strictly limited—they can't view, edit, or delete any data, including their own submissions.

Authenticated access

Authenticated access begins once you invite and provision a contact as a portal user. Each authenticated user is linked to a global vendor in the Supplier Engagement app. Their web roles are assigned in the app and synchronized with Supply Chain Management.

Administrator and standard-user roles

The supplier portal defines the following user roles:

- *Global Vendor Administrator* – Provides full access to vendor information and user management across all legal entities.

- *Local Vendor Administrator* – Offers the same capabilities as *Global Vendor Administrator* but only within selected legal entities.
- *Global Vendor User* and *Local Vendor User* – Standard user roles that allow participation in vendor collaboration processes like managing RFQs, purchase orders, or invoices, with the scope defined globally or locally.

The following table shows the functions available to each supplier portal user role.

Expand table

Category	**Scenario**	***Global Vendor Administrator***	***Local Vendor Administrator***	***Global Vendor User***	***Local Vendor User***
Global vendor onboarding	Company details	Yes	No	Yes	No
	Contacts, addresses, and contact information	Yes	No	Yes	No
	Certificates and capabilities	Yes	No	Yes	No
	Assessment questionnaire	Yes	No	Yes	No
User management	View users list and user request	Yes	Yes	No	No
	Create a user request	Yes	Yes	No	No
	Manage user roles and access to vendors	Yes	No	No	No
	Deactivate a user	Yes	No	No	No
Global vendor setup	Update company details	Yes	Read only	Read only	Read only
	Contacts, addresses, and contact information	Yes	Read only	Read only	Read only
	Certificates and capabilities	Yes	Read only	Read only	Read only

Category	Scenario	*Global Vendor Administrator*	*Local Vendor Administrator*	*Global Vendor User*	*Local Vendor User*
Local vendor management	View vendors list, update vendor details	Yes	Yes	Yes	Read only
	Manage vendor contacts	Yes	Yes	Yes	Read only
	Bank accounts	Yes	Yes	Yes	Read only
	State tax	Yes	Yes	Yes	Read only
	Procurement category request	Yes	Yes	Yes	Read only
	View approved procurement categories	Yes	Yes	Yes	Read only
	Manage vendor certificates	Yes	Yes	Yes	Read only
Supply Chain Management transactions	Purchase orders	Yes	Yes	Yes	Yes
	Vendor invoices	Yes	Yes	Yes	Yes
	Invoices	Yes	Yes	Yes	Yes
	Consignment inventory	Yes	Yes	Yes	Yes

> **Note**
>
> The *Global Vendor Authenticated User* role is a supporting web role that's also included in the solution. It's the only role with the **Authenticated User Role** setting set to *Yes*. Don't assign this role directly to users. It serves as the base role that enables correct authentication and session management. Other web roles that you assign on top of this authenticated user role control additional access and permissions.

Transactional web roles

In addition to administrator and standard user roles, the supplier portal supports transactional web roles. These roles are designed for scenarios where you want to limit a user's access to specific business processes rather than granting access to the entire application.

The following transactional web roles are available.

Expand table

Web role name	Description
Invoice Management User	Grants access to view, create, and manage invoice-related data and actions only.
Consignment Inventory User	Grants access to consignment inventory and related transactions.
Purchase Order User	Grants access to purchase order collaboration only.
Request for Quotation User	Grants access to RFQ processes such as submitting and managing a bid.

Transactional web roles behave in the same way as the *Local Vendor User* role. Users with these roles don't have administrative access to the local vendor and can only work with vendor data in the specific legal entities where vendor collaboration is turned on.

You can also combine transactional web roles. For example, you can assign a user both the *Purchase Order User* role and the *Request for Quotation User* role if they should only participate in these two processes, without accessing invoices or consignment inventory.

Map web roles to Supply Chain Management roles

When you provision a portal user, the system maps them to an external user in Supply Chain Management. Supply Chain Management assigns roles that align with portal access, such as *Supplier Portal Prospective User*, *Supplier Portal Administrator*, or *Supplier Portal User*. These roles ensure that users can access the appropriate supply chain data entities through virtual entities, always limited by XDS policies and vendor-specific boundaries.

The following table shows how supplier portal web roles map to Supply Chain Management external user roles.

Expand table

Supplier portal web role	Supply Chain Management external user role	Description
Global Vendor Administrator / Local Vendor Administrator	*Supplier Portal Administrator*	Grants administrative access to the supplier portal.
Global Vendor User / Local Vendor User	*Supplier Portal User*	Grants access to view and manage supplier portal data.
(N/A)	*Supplier Portal Prospective User*	Assigned during vendor onboarding, before a vendor is linked to a legal entity. It's assigned to users not yet connected to a person—specifically for prospect global vendors not yet synchronized to Supply Chain Management. This role provides access only to reference data needed for onboarding. After the global vendor is qualified, the security role is automatically updated.
Invoice Management User	*Supplier Portal Invoice Management User*	Grants access to view, create, and manage invoice-related data and actions only.
Consignment Inventory User	*Supplier Portal Consignment Inventory User*	Grants access to consignment inventory and related transactions.
Purchase Order User	*Supplier Portal Purchase Order User*	Grants access to purchase order collaboration only.
Request for Quotation User	*Supplier Portal Request for Quotation User*	Grants access to RFQ processes such as submitting and managing a bid.

Enable a vendor for the supplier portal

Before a vendor can access transactional data in the supplier portal, you must activate the vendor for the portal. To activate a vendor, follow these steps:

1. Open the global vendor record that you want to activate.
2. Open the **Lifecycle** tab.
3. In the **Vendors** section, select the **Vendor account** number for the vendor you want to enable.

4. The vendor opens. On the **General** tab, in the **Vendor collaboration** section, set the **Collaboration activation** field to one of the following values:

    - *Active (PO is not auto-confirmed)* – Purchase orders require manual confirmation.
    - *Active (PO is auto-confirmed)* – Purchase orders are automatically confirmed upon submission.

5. On the command bar, select **Save**.

This activation step turns on supplier portal features and grants the vendor access to the portal based on their assigned roles.

Invite a global vendor to the supplier portal

You can invite a global vendor to join the supplier portal. By default, the global vendor's primary contact is provisioned as a *Global Vendor Administrator*. You can add more users later. To invite a global vendor, follow these steps:

1. Open the global vendor record associated with the user that you want to invite.
2. On the **Summary** tab, verify that a **Primary contact** is assigned and that the contact has a valid email address. If not, assign a primary contact and provide an email address.
3. On the command bar, select **Invite to supplier portal**.

    > ⓘ **Note**
    >
    > The **Invite to supplier portal** button is only available for global vendors that aren't yet invited to the portal.

The system performs the following actions:

- Updates the global vendor portal status to *Invited*.
- Initiates user provisioning for the primary contact.
- Creates a global vendor portal access record in the user provisioning status.
- Assigns the *Global Vendor Administrator* web role to the primary contact.
- Triggers a user provisioning workflow in Supply Chain Management.

An admin user in Supply Chain Management must then review and approve the user request. Learn more in Approve portal user requests in Supply Chain Management.

The contact receives an email invitation to access the supplier portal.

> **Important**
>
> The email invitation requires that the cloud flow *CF - Global Vendor Portal Access - Send Portal Invitation email to Contact* is set up and enabled on your system. Learn more in Enable supporting cloud flows. You must also customize the invitation email template to include the correct portal URL for your environment.

Invite additional users to the supplier portal

In addition to the primary contact, you can invite extra contacts from a supplier organization. To invite a new user, follow these steps:

1. Open the global vendor record associated with the user that you want to invite.
2. Open the **Contacts** tab.
3. Select an existing contact to open it, or select **New contact** on the **Contacts** toolbar to create a new contact and then open it.
4. On the command bar, select **Invite to supplier portal**.
5. In the invitation dialog, set the following fields:
    - **Role** – Select *Admin* and/or *User*.
    - **Access level** – Select *Global* or *Local*.
    - **Legal entity** – If **Access level** is *Local*, select the default legal entity for this user.
6. Select **OK** to confirm the selection.

The system provisions the portal user in Dataverse and creates a portal user request in Supply Chain Management with the assigned roles and legal entities. An admin user in Supply Chain Management must then review and approve the request. Learn more in Approve portal user requests in Supply Chain Management.

Approve portal user requests in Supply Chain Management

When you invite a supplier contact to the portal, the system automatically creates a portal user request in Supply Chain Management. To review portal user requests, follow these steps:

1. Open Supply Chain Management.

2. Go to **Procurement and sourcing** > **Vendors** > **Supplier Engagement** > **Portal user requests**.
3. Review and approve or reject the pending requests.

Portal user requests follow a three-level approval workflow. By default, this workflow controls the review and authorization of new users, but administrators can modify the workflow configuration to meet organizational requirements. Learn more in Set up the vendor user request workflow.

When you approve the request:

- The system creates a new external user account in Supply Chain Management. You can find new portal users at **Procurement and sourcing** > **Vendors** > **(Preview) Supplier Engagement** > **Portal users**.
- The system automatically assigns the requested security roles. The available roles are listed and described in the Map web roles to Supply Chain Management roles section.
- The system grants access either globally (all organizations) or locally (specific legal entities), depending on how you invited the user in the Supplier Engagement app.

As part of the provisioning workflow, the system initiates an Azure B2B service process. This process associates the new Supply Chain Management user account with a Microsoft Entra account. If the supplier already has a Microsoft Entra identity, the process links it; otherwise, it provisions a new one. Learn more in Configure B2B collaboration for vendor user requests.

Manage web roles for a user

To change a user's role assignment, follow these steps:

1. In the Supplier Engagement app, do one of the following steps to find the contact record you want to manage:

    - At the bottom of the navigation pane, select the **Configuration** area, and then select **Portal management** > **Contacts**.
    - At the bottom of the navigation pane, select the **Menu** area, and then select **General** > **Global vendors**. Open the relevant global vendor, and then open the **Contacts** tab.

2. Find and open the contact record you want to work with.
3. Open the **Portal access** tab.
4. In the **Web roles** section, use the toolbar buttons to add or remove roles as needed.

The system synchronizes with Supply Chain Management, granting or revoking rights accordingly.

> ⚠ **Warning**
>
> Follow these guidelines when assigning web roles:
>
> - Don't assign the *Global Vendor Anonymous User* or *Global Vendor Authenticated User* roles. These are system roles that support portal functionality and aren't meant for direct assignment.
> - Don't assign both global and local roles to the same user. For correct behavior, assign roles from *only one* of the following groups:
>   - *Global Vendor Administrator* and/or *Global Vendor User*
>   - *Local Vendor Administrator* and/or *Local Vendor User*
>   - One or more transactional roles (*Purchase Order User*, *Request for Quotation User*, *Invoice Management User*, *Consignment Inventory User*)
> - Although the system technically allows multiple role assignments, mixing global and local roles can lead to inconsistent access.

Manage access to legal entities

Administrators can grant or remove access for users whose access is limited to specific legal entities. To manage legal entity access, follow these steps:

1. In the Supplier Engagement app, do one of the following steps to find the contact record you want to manage:

   - At the bottom of the navigation pane, select the **Configuration** area, and then select **Portal management** > **Contacts**.
   - At the bottom of the navigation pane, select the **Menu** area, and then select **General** > **Global vendors**. Open the relevant global vendor, and then open the **Contacts** tab.

2. Find and open the contact record you want to work with.
3. Open the **Portal access** tab.
4. In the **Vendor access** section, do one of the following steps:

   - To add access to a legal entity, select **New contact portal access vendors** on the toolbar. Then use the dialog to choose the vendor legal entity to add.
   - To remove access to a vendor legal entity, select the check box for one or more vendor legal entities that you want to remove and select **Delete** on the toolbar.

The system synchronizes with Supply Chain Management, granting or revoking rights as needed to ensure the user only sees authorized data.

Deactivate portal access for a single contact

To revoke a user's access to the supplier portal, follow these steps:

1. In the Supplier Engagement app, do one of the following steps to find the contact record you want to manage:
    - At the bottom of the navigation pane, select the **Configuration** area, and then select **Portal management** > **Contacts**.
    - At the bottom of the navigation pane, select the **Menu** area, and then select **General** > **Global vendors**. Open the relevant global vendor, and then open the **Contacts** tab.
2. Find and open the contact record you want to work with.
3. On the command bar, select **Deactivate portal access**.
4. Confirm the action.

The system removes all web roles for the contact, sets the portal access status to *Blocked*, and disables the user in Supply Chain Management.

Deactivate portal access for a global vendor and all users

If you no longer collaborate with a global vendor, you can deactivate portal access for all of the vendor's users at once. To deactivate access for a global vendor, follow these steps:

1. Open the global vendor record you want to deactivate.
2. On the command bar, select **Deactivate portal access**.
3. Confirm the action.

The system updates the global vendor portal status to *Blocked*, which blocks portal access for all supplier portal users linked to the global vendor, and removes all associated roles in both Dataverse and Supply Chain Management.

Reactivate portal access

You can restore access for a global vendor or individual contact that you previously deactivated:

- **Global vendor** – Open the global vendor record, as described earlier, and select **Invite to supplier portal** on the command bar. The primary contact is re-provisioned as a *Global Vendor Administrator*.
- **Contact** – Open the contact record, as described earlier, and select **Invite to supplier portal** on the command bar. Choose the role and access level as in a new invitation.

If the user already exists in Supply Chain Management, their account is reactivated. Otherwise, the provisioning workflow creates a new user.

Work with portal users from the Portal tab

Many of the portal user management tasks described in this article—such as viewing active users, adding new portal contacts, and reviewing pending access requests—can also be performed directly from the **Portal** tab on a global vendor record. The **Portal** tab provides a consolidated view that combines portal status, the portal users grid, pending user access requests, and portal notifications in one place.

This approach is convenient when you're already working with a specific global vendor and want to manage its portal users without navigating to a separate contact record. Learn more in Manage global vendor information.

Personalize the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal is built on Microsoft Power Pages and serves as the primary interface for external supplier representatives to collaborate with your organization. Through the portal, suppliers register, complete onboarding, respond to requests for quotation, manage purchase orders, submit invoices, and handle consignment inventory.

The portal provides settings that you can use to personalize its appearance to match your organization's branding and communication style. Out of the box, the portal includes placeholder elements for the company name, company logo, and a banner image. You can replace these elements with your own branding, and you can also modify the layout, text, and images on key pages such as the landing page, registration page, and home page.

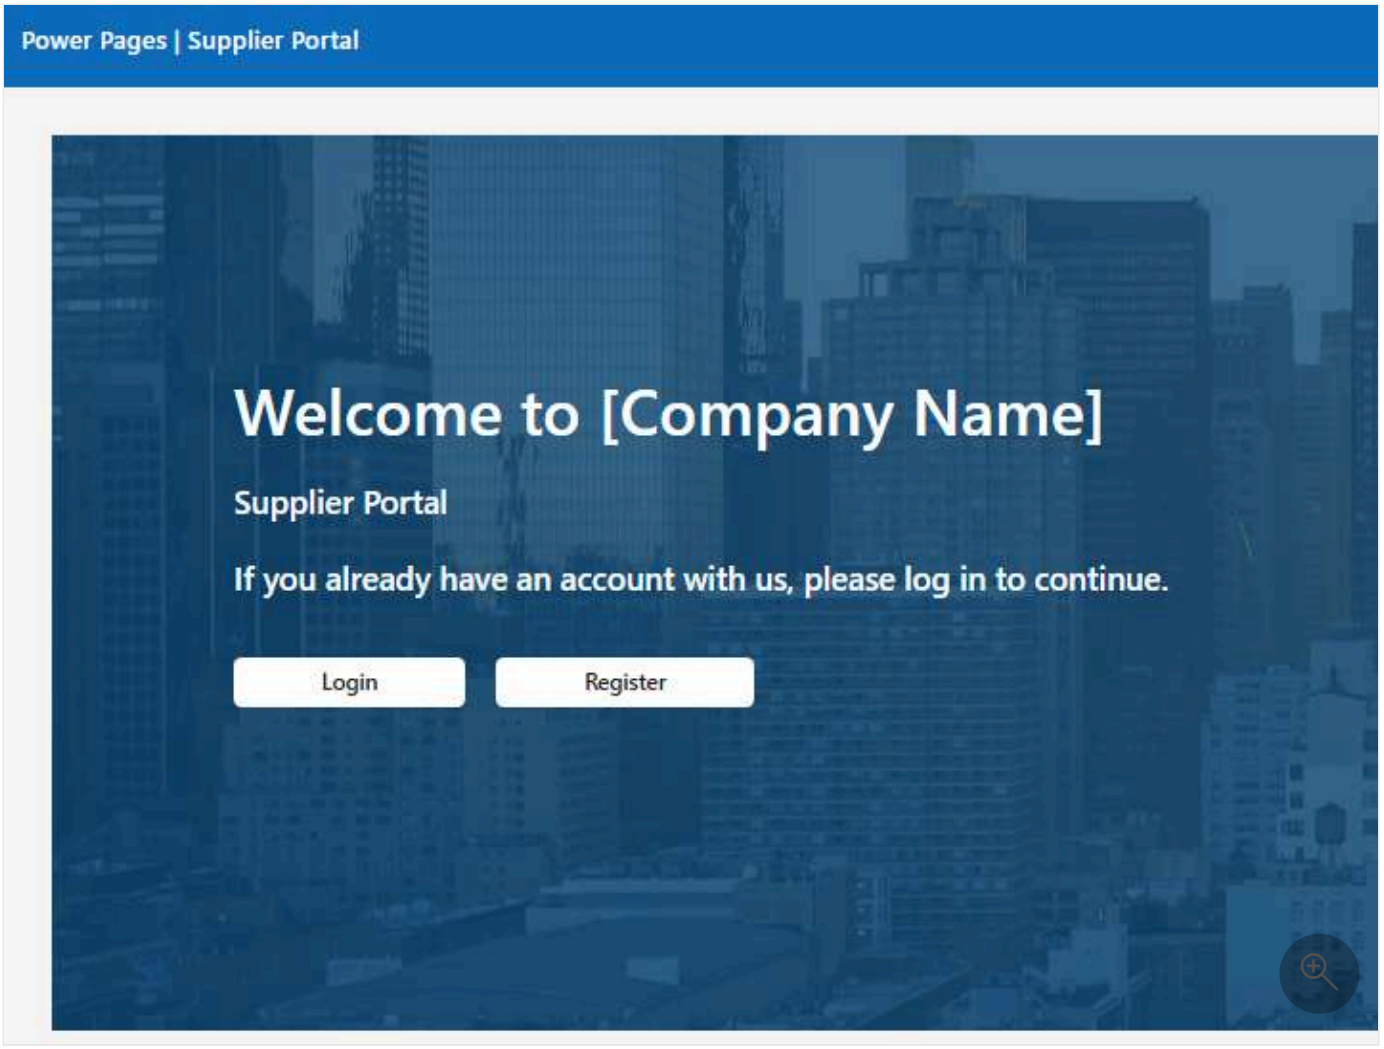
Portal pages that support personalization

The supplier portal has several key pages that visitors and authenticated users interact with:

- **Landing page** – The default page for all visitors. It's publicly accessible (no sign-in required) and introduces the supplier portal to potential suppliers. It includes links to register as a new supplier or sign in with an existing account.
- **Registration page** – An anonymous page where potential suppliers submit their company details, contact information, capabilities, and certifications.
- **Home page** – The main page for authenticated users. It shows a personalized banner with the vendor's name and provides navigation to purchase orders, RFQs, invoices, and other collaboration features.
- **Onboarding pages** – A guided wizard where newly invited suppliers provide detailed business, contact, and compliance information.

Each of these pages includes branding elements—logos, banner images, and text—that you can personalize.

The following screenshot shows the default supplier portal home page with placeholder branding elements.



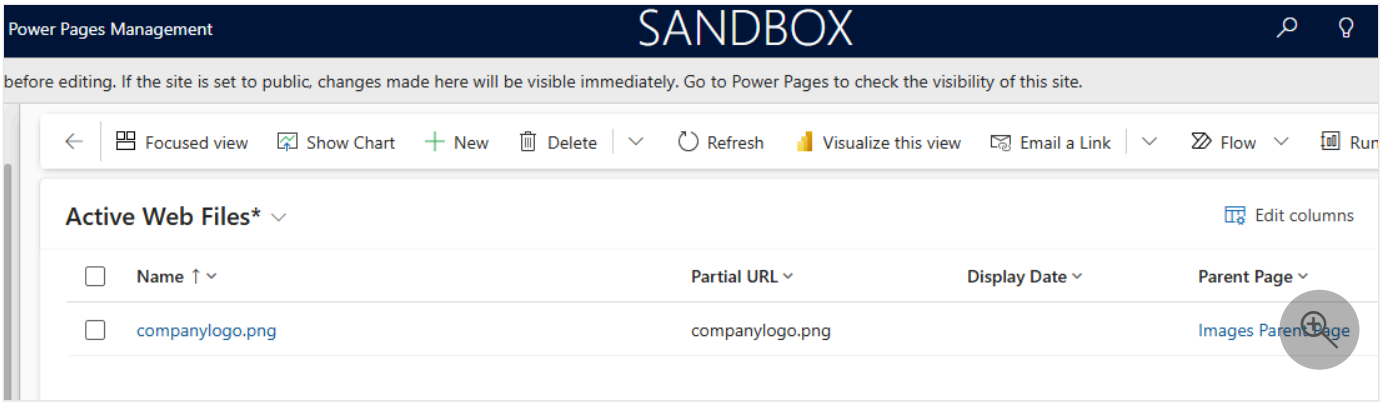
How portal branding works

Two types of Power Pages components control portal branding:

- **Content snippets** – Use these to configure text-based elements such as the company name. Content snippets are stored in Microsoft Dataverse, so you can centrally manage text content without modifying page templates.
- **Web files** – Use these to store and display image assets such as the company logo and the home page banner image. Web files are stored as Dataverse file attachments.

The following screenshot shows the content snippet list in the Power Pages Management app, filtered to show company-related snippets.

The following screenshot shows the web file list in the Power Pages Management app, showing the company logo web file.



Use the Power Pages Management app to manage both content snippets and web files.

Personalization areas

The following table summarizes the branding elements you can personalize and where to find detailed instructions.

Expand table

Branding element	Component type	Name	Learn more
Company logo	Web file and content snippet	*companylogo.png* and *Home/CompanyLogo*	Update the company logo
Company name	Content snippet	*Home/CompanyName*	Update the company name
Home page banner image	Web file	*homepage-banner*	Update the home page banner
Registration and onboarding page text	Content snippets	*Registration/HeaderPageTitle* and *Header/VendorOnboarding*	Update the home page banner

Advanced personalization

Beyond branding, the Power Pages platform supports deeper configuration and customization through CSS, web templates, and page layouts. You control the portal's visual styling through CSS files, such as `dom.css`. Modify these files to adjust colors, fonts, spacing, and responsive behavior. Test any advanced personalization across different screen sizes and browsers to ensure consistent rendering.

> **Important**
>
> When you modify portal components directly in an environment, you create unmanaged layers in Dataverse that can affect solution management. Learn more in Manage unmanaged customizations.

Update the company logo on the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The portal logo is a web file record in Microsoft Dataverse. A content snippet reference renders the logo on the home page. Replace the default placeholder logo with your organization's logo by uploading a new image and ensuring the related content snippet is active.

Prerequisites

To update the company logo on the supplier portal, you must have the following:

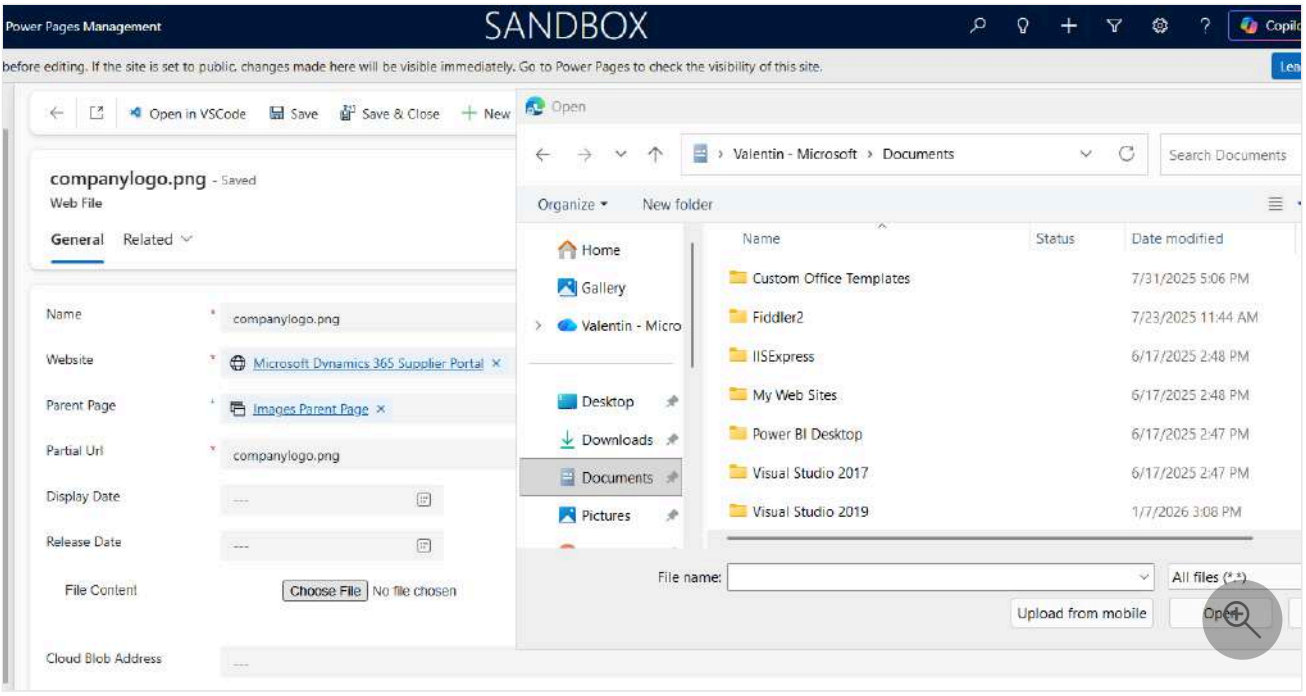
- Access to the Power Pages Management app.
- A logo file in one of the supported formats, such as .png, .jpg, .svg, or .webp.

Upload a new logo

To replace the company logo, follow these steps:

1. Open the Power Pages Management app.
2. Go to **Content** > **Web Files**.
3. Locate and open the web file named *companylogo.png*.
4. Select the **Choose File** button next to the **File content** field.

   The following screenshot shows the *companylogo.png* web file record with the file upload dialog.



5. Select your new logo image.

6. Select **Save & Close**.

Activate the logo snippet

After uploading the logo, verify that the content snippet that references it is active. To check the snippet, follow these steps:

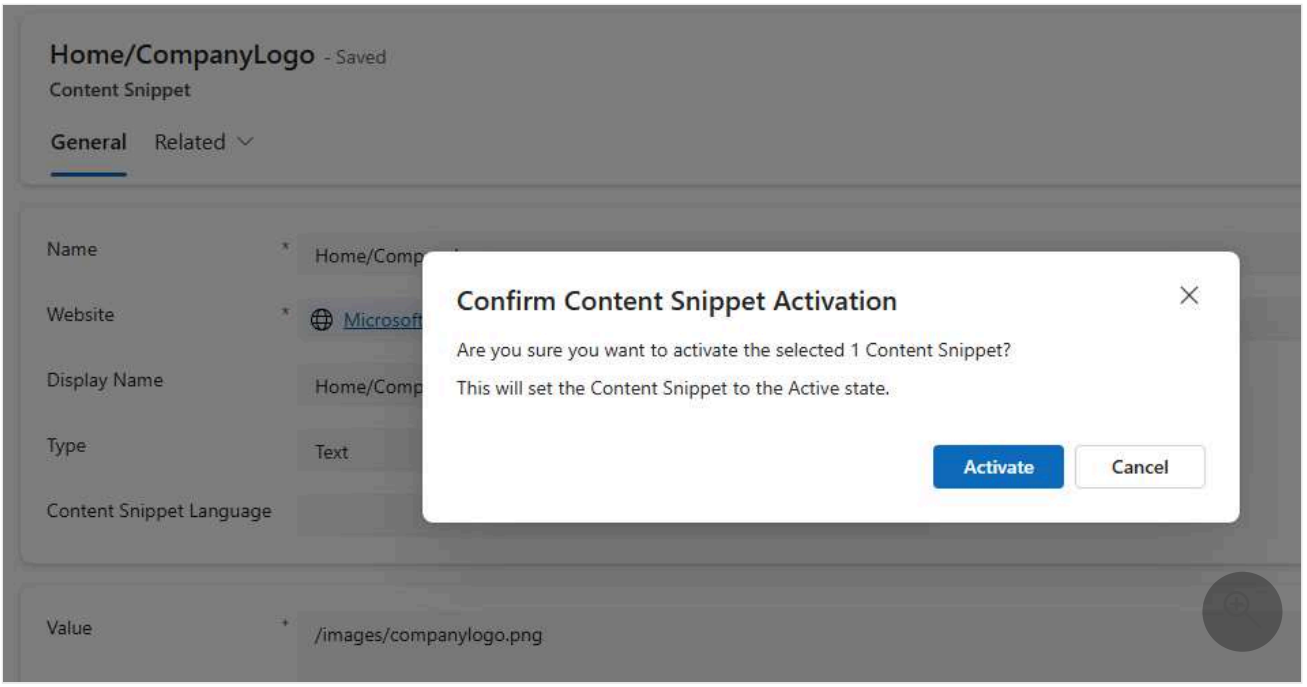
1. Open the Power Pages Management app.

2. Go to **Content** > **Content Snippets**.

3. Set the view selector to **Active Content Snippets** and locate the snippet named *Home/CompanyLogo*. If you don't see the snippet, set the view selector to **Inactive Content Snippets** and try again.

4. Open the *Home/CompanyLogo* snippet. If the snippet is inactive, select **Activate** on the command bar.

   The following screenshot shows the *Home/CompanyLogo* content snippet with the activation confirmation dialog.

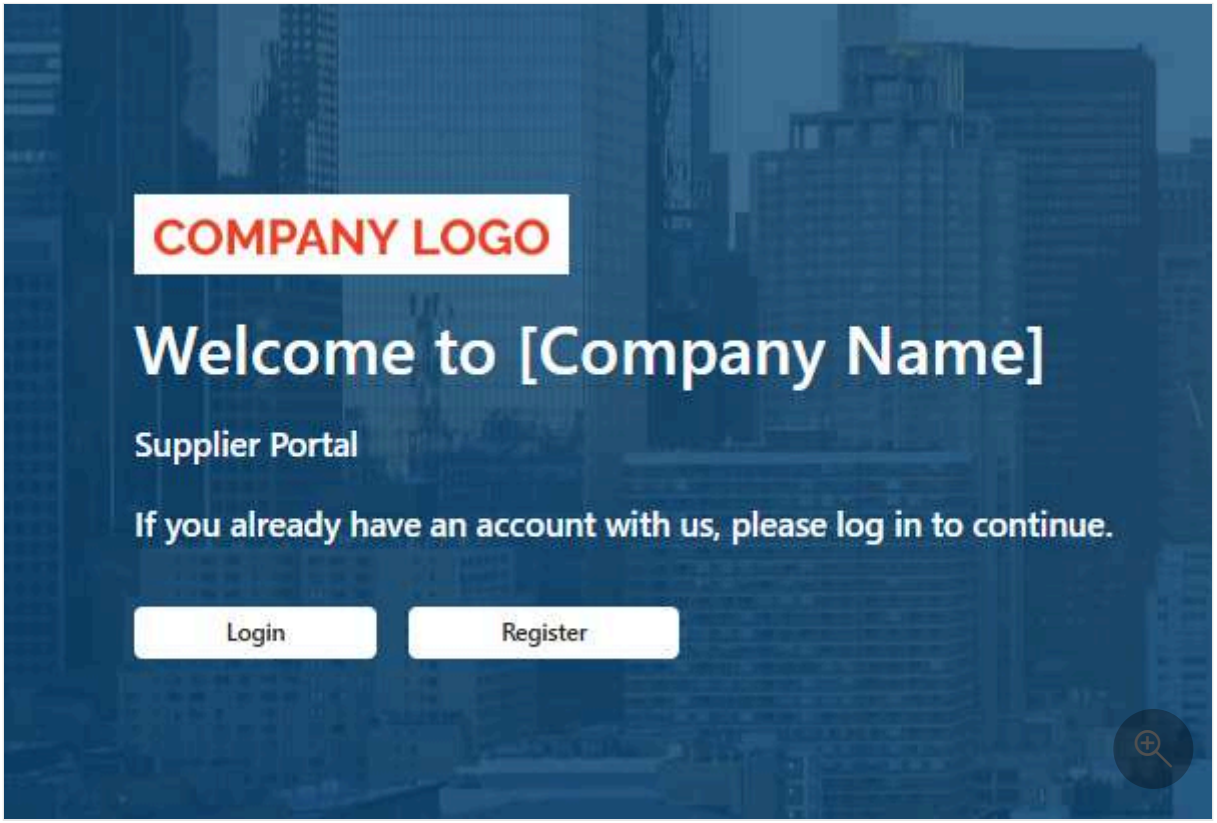


5. Select **Save & Close** if you made any changes.

Verify the changes

Clear your browser cache and refresh the portal home page. The updated logo should now appear.

The following screenshot shows the portal home page with an updated company logo.



> **Tip**
>
> Ensure uploaded logo images are optimized for web use to maintain portal performance. If the updated logo doesn't appear, verify that the *Home/CompanyLogo* content snippet is active and correctly configured.

Update the company name on the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

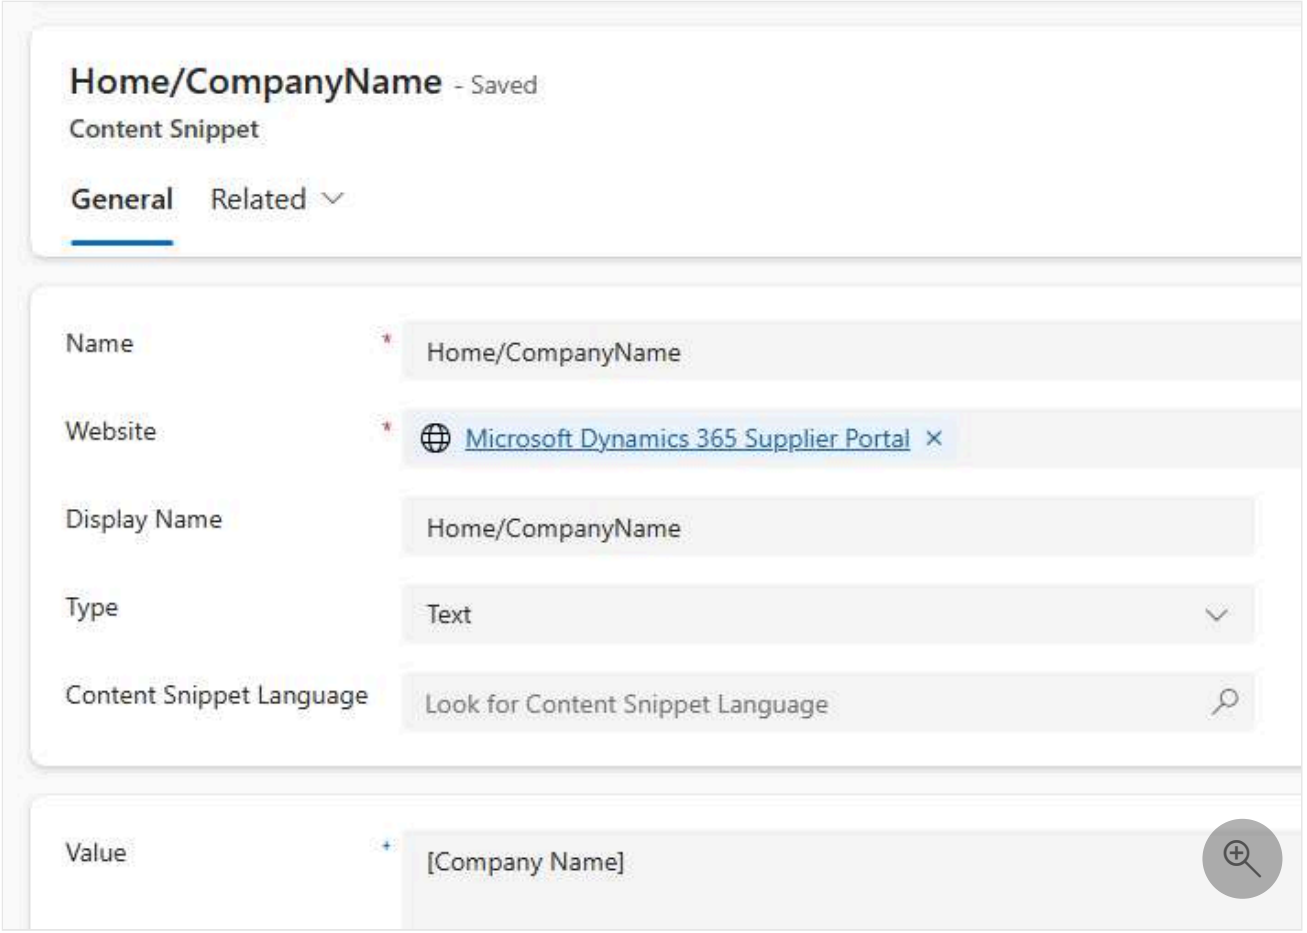
A content snippet in Microsoft Dataverse controls the company name displayed on the supplier portal home page. You can update this value at any time to reflect your organization's name.

Update the company name

To update the company name shown on the portal, follow these steps:

1. Open the Power Pages Management app.
2. Go to **Content** > **Content Snippets**.
3. Locate and open the snippet named *Home/CompanyName*.
4. In the **Value** field, enter your company's name.

   The following screenshot shows the *Home/CompanyName* content snippet with text in the default company name in the **Value** field.

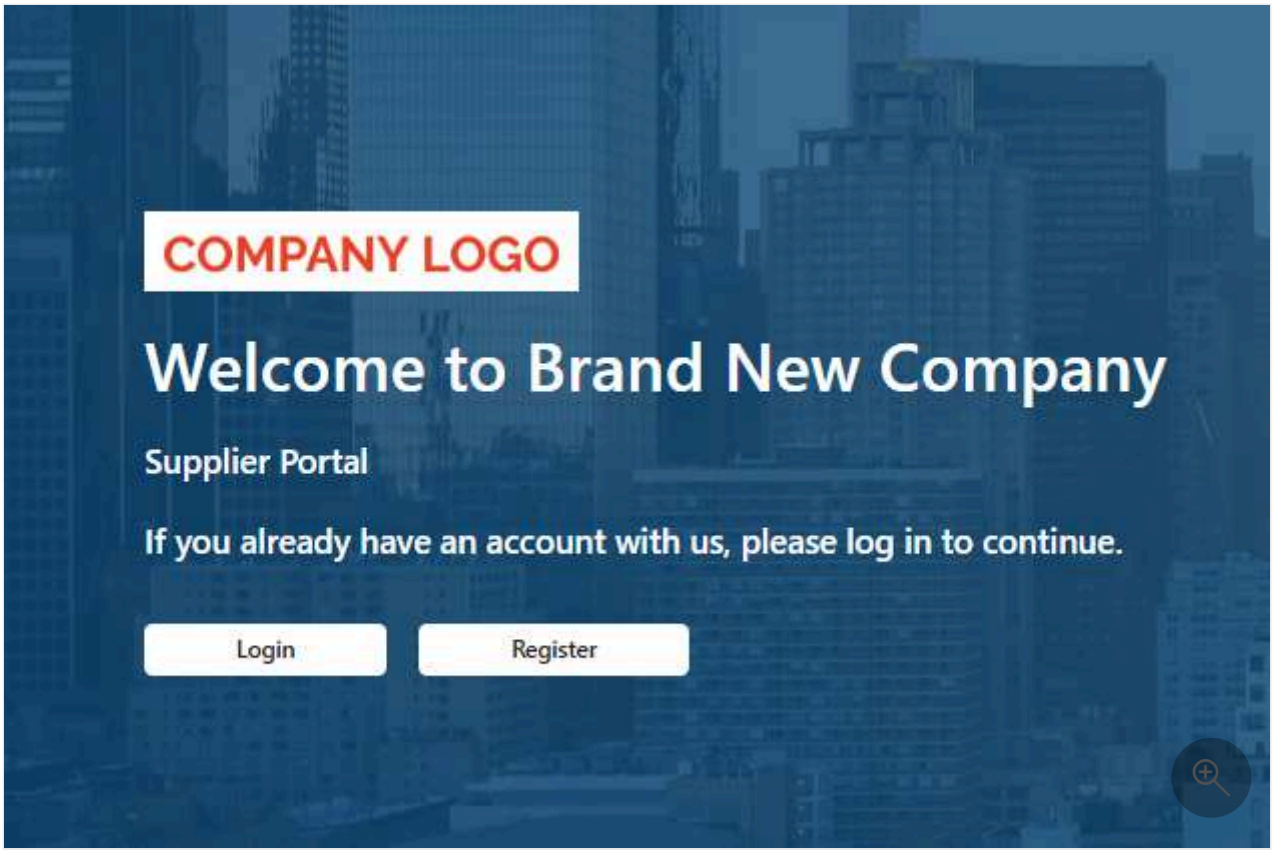


5. Select **Save & Close**.

Verify the changes

Clear your browser cache and refresh the portal. The updated company name is now visible on the home page.

The following screenshot shows the portal home page with an updated company name.



> **Tip**
>
> If the updated company name doesn't appear immediately, verify that the content snippet is active and that your browser cache is cleared.

Related information

Update banner texts and images (preview)

[This article is prerelease documentation and is subject to change.]

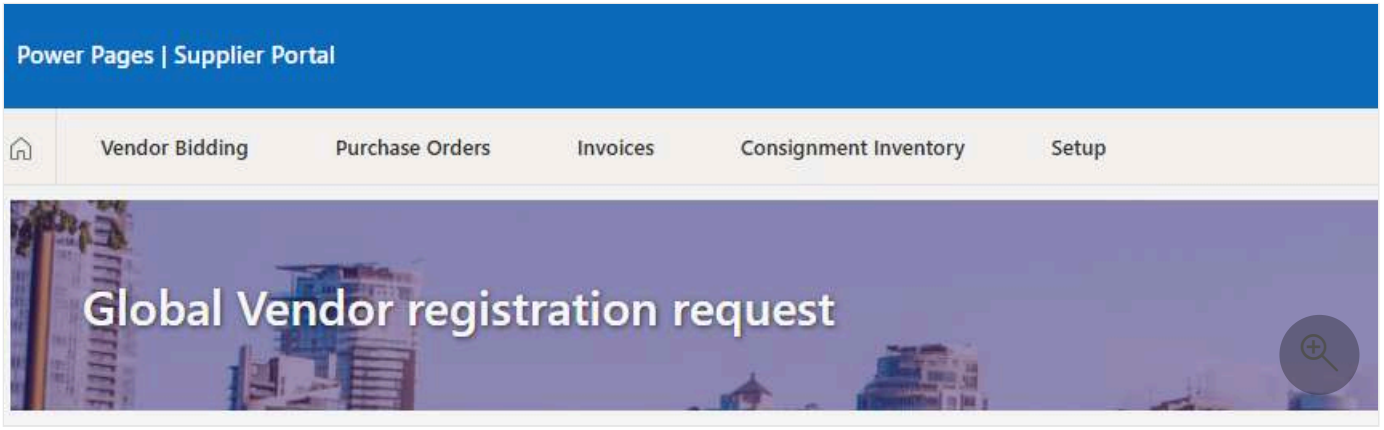
The supplier portal home page displays a banner at the top that includes both an image and text. The registration and onboarding pages also include banner text. You can configure these elements to align the portal with your organization's branding guidelines and communication style.

Banner text

The banner text that appears on the registration and onboarding pages is stored in content snippets. The following snippet names are used:

- *Registration/HeaderPageTitle*
- *Header/VendorOnboarding*

The following screenshot shows the banner text on the registration page.



Update banner text on registration and onboarding pages

To update the banner text on registration and onboarding pages, follow these steps:

1. Open the Power Pages Management app.
2. Go to **Content** > **Content Snippets**.
3. Find the snippet by name (*Registration/HeaderPageTitle* or *Header/VendorOnboarding*) and open it.
4. Update the **Value** field with your desired text.
5. Select **Save**.

Home page banner text

The home page banner doesn't use a content snippet. Instead, it displays the value from the **Global vendor name** field.

The technical maximum length of this field is 850 characters. However, don't exceed 500 characters. Longer values might appear visually crowded, overflow or wrap excessively, reduce readability on smaller screens, and negatively affect the overall banner layout.

Banner image

The banner image is stored as a web file record and rendered on the home page. The image file is saved as a standard attachment in Microsoft Dataverse and associated with the corresponding web file record.

Prerequisites

Before you begin, make sure you have the following:

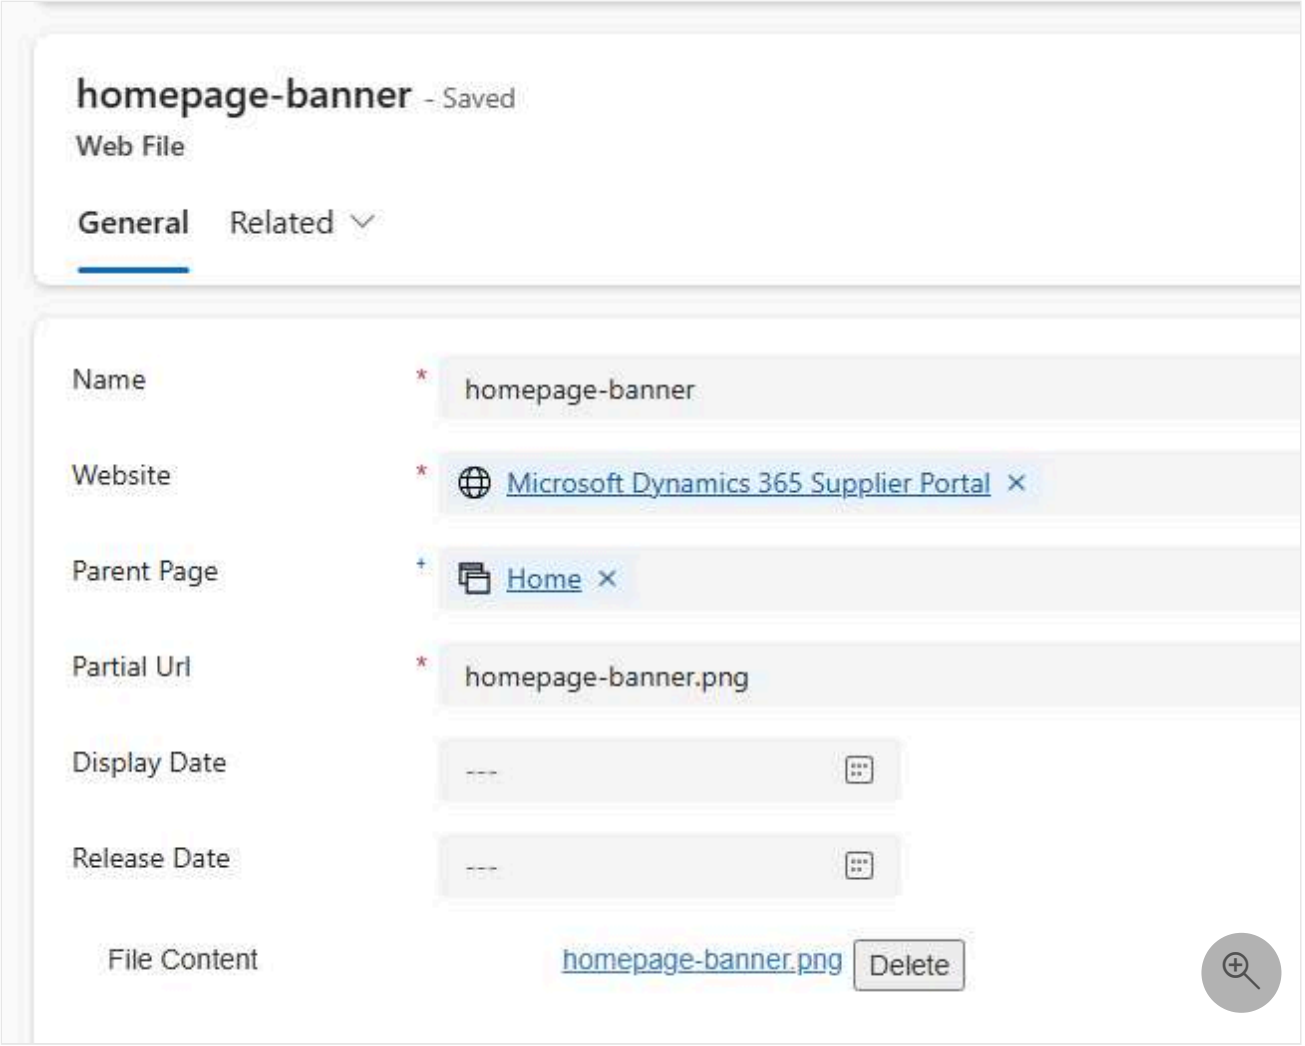
- Access to the Power Pages Management app.
- A banner image file in a supported format, such as .png, .jpg, .svg, or .webp.

Upload a new banner image

To replace the banner image, follow these steps:

1. Open the Power Pages Management app.
2. Go to **Content** > **Web Files**.
3. Locate and open the web file named *homepage-banner*.

   The following screenshot shows the homepage-banner web file record.



4. In the **File Content** field, select **Delete** to remove the existing image (if applicable).
5. In the **File Content** field, select **Choose File** and upload your new banner image.
6. Select **Save & Close**.

Banner image requirements and recommendations

The following table summarizes the requirements and recommendations for the banner image.

Expand table

Property	Requirement
Aspect ratio	12:1 (width to height). If the ratio doesn't match, the image might appear stretched or cropped.
Recommended render size	3,758 × 308 pixels
Supported formats	.png, .jpg, .svg, .webp

Property	Requirement
Maximum file size	Determined by Dataverse environment attachment limit (default is 5 MB). An administrator can increase or decrease this limit. If your image exceeds the configured size limit, either optimize the image or adjust the environment setting.

To ensure optimal quality, upload an image that matches or exceeds the recommended render size while maintaining the 12:1 ratio. Avoid significantly larger images that might affect performance. Optimize images for web use to balance quality and load time.

CSS styling

You can further personalize the banner by using cascading style sheets (CSS). By default, `dom.css` controls the styling through the `.workspace-hero-banner` class. You can adjust properties such as height, background size, positioning, and responsiveness. Test any CSS changes across different screen sizes to ensure consistent rendering.

Manage unmanaged customizations on the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

When you modify portal components such as site settings, content snippets, web files, web templates, or pages, you create unmanaged layers on those components in Microsoft Dataverse. Understanding how unmanaged layers work is essential when you plan to delete individual components or remove an entire solution.

Why unmanaged layers matter

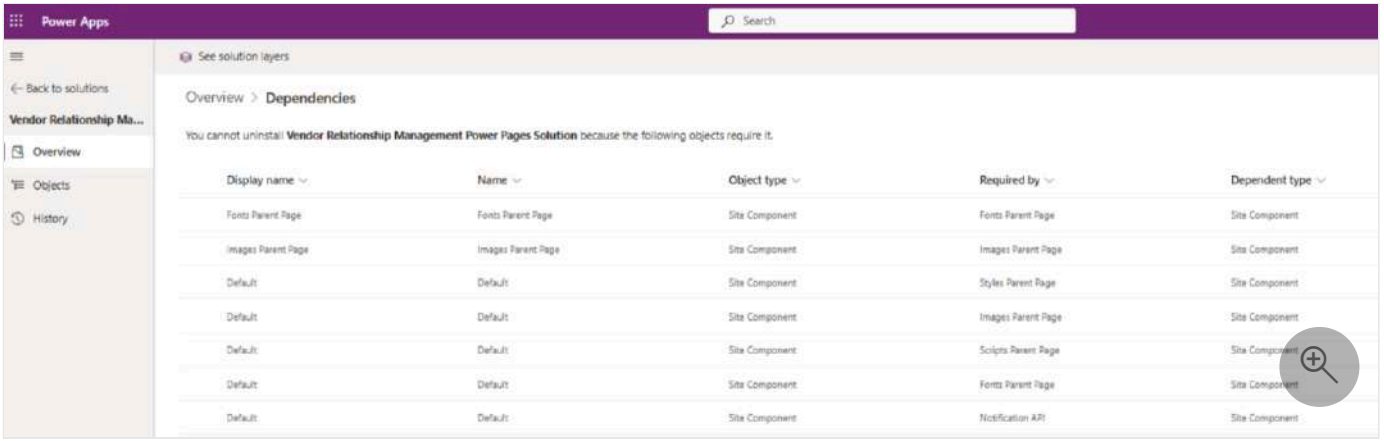
When you include a component in a managed solution and you make changes directly in the environment, you create an unmanaged layer on top of the managed layer. This layer overrides the managed solution configuration.

The presence of unmanaged layers can prevent:

- Deleting individual components
- Deleting the managed solution

If you don't remove unmanaged layers first, deletion might fail due to dependency or layering conflicts.

The following screenshot shows the solution dependencies view in Power Apps. It lists the components that prevent a solution from being uninstalled.



Delete a component

To delete a portal component, first remove any unmanaged layers. To delete a component correctly, follow these steps:

1. Go to the Power Apps maker portal.
2. Locate the component in the appropriate solution.
3. Right-click the component, and then select **Advanced** > **See Solution Layers**.
4. Select and remove the unmanaged layer.
5. After you remove the unmanaged layer, delete the component.

This process ensures the managed solution can properly release the component.

Delete a solution

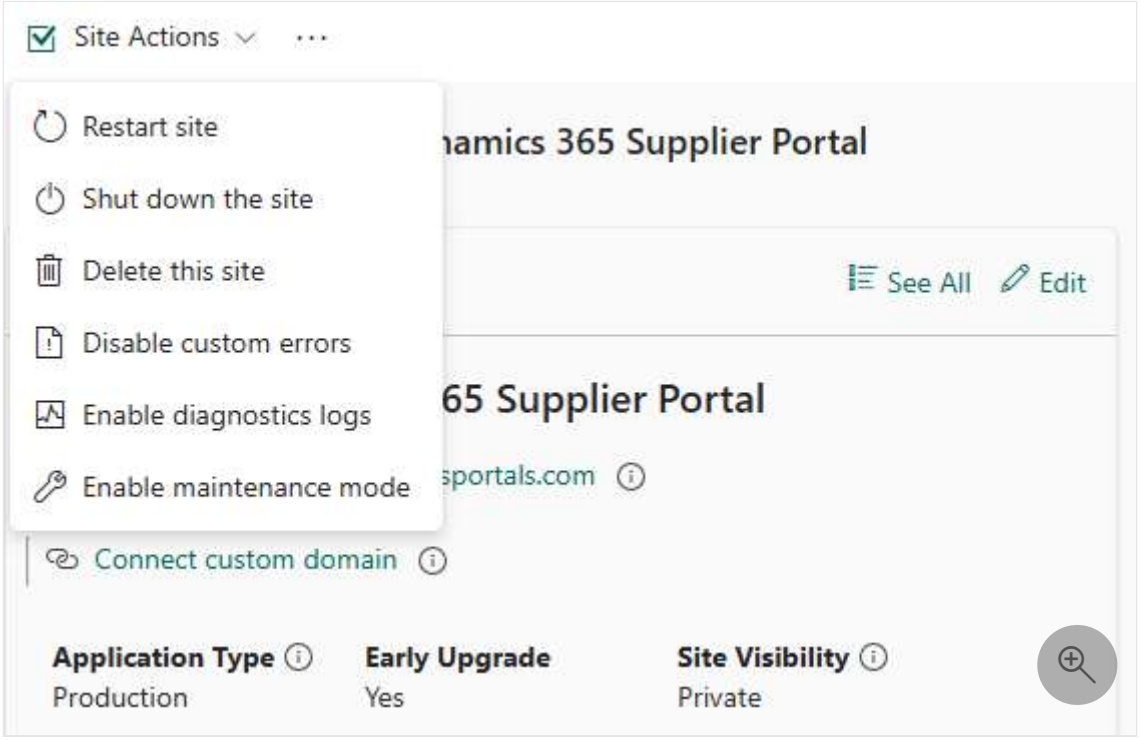
When deleting a solution that contains Power Pages components, first disable the associated site.

Shut down the site

To shut down the Power Pages site, follow these steps:

1. Sign in to the Power Platform admin center.
2. Select **Power Pages**.
3. Select your site.
4. Select **Site Actions** > **Shut down the site**.

The following screenshot shows the Site Actions menu with the **Shut down the site** option.



When you shut down the site, you disable active portal interactions, remove runtime dependencies, prevent additional unmanaged changes, and help ensure unmanaged layers are properly handled.

Delete the solution

After you clear unmanaged layers and shut down the site, you can delete the managed solution. Make sure no dependency errors exist before you complete the deletion.

Best practices

- Avoid making direct changes in production environments. Use development environments for customizations.
- Track solution layering carefully when working with managed solutions.
- Always shut down the Power Pages site before you attempt large-scale deletions.
- Validate dependencies before removing components.

Work with the Supplier Engagement app (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement app is a model-driven app for internal users who manage supplier relationships. It's built on Microsoft Dataverse. It gives teams a single place to review supplier registrations, maintain shared vendor data, and coordinate legal entity–specific setups. Changes that you make in the app sync automatically with Supply Chain Management. The app also works with the supplier portal to support vendor self-service.

Supplier Engagement app overview

The Supplier Engagement app organizes supplier work into the following areas:

- **Review and approve vendor registrations** – Process incoming supplier registration requests, review submitted details, and approve or reject requests to start onboarding.
- **Manage global vendors** – Create and maintain global vendor records that act as master profiles across legal entities. You can track vendor information, capabilities, certificates, contacts, lifecycle status, feedback, risks, and activities.
- **Manage local vendors** – Release global vendors to specific legal entities as local vendor accounts, update local vendor details, add contacts and bank accounts, and manage localization-specific data.
- **Vendor holds** – Put global or local vendors on hold to restrict invoices, payments, requisitions, or all transactions, and release the hold when it's no longer needed.
- **Dashboards** – Use role-based dashboards to monitor activities, registration pipelines, risk insights, vendor distributions, and portal access status.

Because the app is connected to Supply Chain Management and the supplier portal, users can work across onboarding and ongoing vendor management without reentering the same information. Global vendor data stays centralized in Dataverse, while transactional readiness and legal entity release stay aligned with Supply Chain Management.

Global vendor management overview (preview)

[This article is prerelease documentation and is subject to change.]

Global vendors give organizations a centralized way to manage supplier relationships across legal entities in the Supplier Engagement app. Instead of maintaining the same supplier profile separately for each company, you can use one master profile to consolidate shared information and connect it to released vendors in Supply Chain Management. The global vendor record isn't transactional, but it becomes the governing record for supplier identity, contact details, addresses, certifications, agreements, and ownership information.

Understand the global vendor model

A global vendor acts as the shared supplier profile across your organization. It helps you standardize supplier data before you release the vendor to one or more legal entities.

Key characteristics of a global vendor include the following capabilities:

- It serves as the master profile for the supplier.
- It supports data consolidation rather than day-to-day transaction processing.
- It links to local vendors, also known as released vendors, in Supply Chain Management.
- It centralizes company details, contact methods, addresses, agreements, certifications, and ownership profiles.

Because the profile is shared, internal teams can review supplier information once and reuse it across multiple legal entities. This approach reduces duplicate data entry and helps keep supplier records aligned.

Create global vendors

You can create a global vendor in three ways, depending on how the supplier relationship starts:

- **Portal registration** – When a supplier submits a registration request through the supplier portal and your organization approves it, the system automatically creates a prospect global vendor. Records created this way show *Supplier portal* as the origin.
- **Manual creation** – Internal users can create a new global vendor directly in the Supplier Engagement app. Records created this way show *Supplier Engagement* as the origin.

- **Global vendor creation in Supply Chain Management** – Use existing vendor data to create qualified global vendors. Records created this way show *Supply Chain Management* as the origin.

Each method supports a different onboarding pattern, but they all lead to the same centralized vendor profile. Learn more in Create a global vendor.

Manage vendor information

The global vendor record includes multiple tabs that organize supplier data for onboarding, review, and ongoing governance.

Summary and general information

The **Summary** and **General** tabs focus on core company data. They help you maintain the supplier name, type, parent company, origin, primary contact, company profile, ownership profile, contact methods, addresses, certificates, audit details, feedback summary, and rating levels.

Lifecycle and released vendor information

The **Lifecycle** tab tracks the supplier's status and readiness for use across legal entities. It also stores agreement information such as non-disclosure agreements (NDAs), terms and conditions, and code-of-conduct acceptance, alongside related released vendor records.

Capabilities, risks, assessments, portal, and related records

The remaining tabs support broader supplier profiling and governance:

- **Capabilities** – Captures non-transactional attributes such as products, market segments, quality standards, and process capabilities.
- **Risks** – Documents supplier risks and related corrective actions.
- **Assessment** – Stores onboarding questionnaire responses and other evaluation data.
- **Portal** – Tracks onboarding invitations, portal access status, active users, and notifications.
- **Related** – Provides a menu where you can choose to view various types of records that are related to the current vendor.

Learn more in Manage global vendor information.

Detect duplicates

Each time you create or validate a vendor, the system checks to make sure that the vendor doesn't already exist. The Supplier Engagement app applies Dataverse duplicate detection rules during manual creation, and Supply Chain Management validates against existing vendor party records during qualification. These checks don't automatically block you from continuing. Instead, they surface possible matches so you can review the records and decide whether to merge, keep the record anyway, or cancel the action. Learn more in Detect and manage duplicate global vendors.

Profile capabilities and certifications

Global vendor profiling lets organizations evaluate what a supplier can do, not just who the supplier is.

- **Capabilities** – Help teams classify vendors by products, services, market segments, quality standards, and process strengths.
- **Certificates** – Provide centralized certification tracking, expiration monitoring, and synchronization to local vendors when the global vendor is released.

These records support sourcing, qualification, and compliance decisions across legal entities. Learn more in Manage global vendor capabilities and Manage certificates.

Manage contacts and lifecycle

By using global vendor contacts, you can maintain primary and additional contacts at the shared vendor level. These contacts can support portal access and synchronize to related party contacts in Supply Chain Management.

The lifecycle model tracks how a supplier moves through your process:

- *Prospect* – The supplier is newly created and under review.
- *Qualified* – The supplier passed initial validation and can be released to legal entities.
- *Approved* – The supplier is fully approved for business use.
- *Disqualified*, *Disapproved*, or *Terminated* – The supplier didn't meet requirements or is no longer active.

Learn more in Global vendor contacts and Global vendor onboarding lifecycle.

Review feedback, risks, and activities

The Supplier Engagement app lets you track ongoing supplier performance and interactions, including:

- **Feedback** – Records structured star ratings across four domains and calculates a dynamic overall rating.
- **Risk management** – Captures identified risks, evaluates them through likelihood and impact, and tracks corrective actions.
- **Activities** – Records activities such as tasks, appointments, phone calls, and emails to provide a history of vendor engagement.

Together, these features support informed supplier decisions throughout the relationship. Learn more in Global vendor feedback, Risk management and corrective actions, and Manage activities.

Create a global vendor (preview)

[This article is prerelease documentation and is subject to change.]

You can create global vendors through supplier self-registration, direct entry by an internal user, or synchronization from existing vendor data in Supply Chain Management. The creation method determines the initial **Origin** value, but each method creates the same centralized vendor profile that you can qualify, approve, and release to legal entities.

Understand the creation methods

The Supplier Engagement solution supports three creation methods for global vendors.

Manual creation in the Supplier Engagement app

An internal user such as a Supplier Engagement manager can create the global vendor directly in the app. The **Origin** field is set to *Supplier Engagement*. Manual creation works well when your organization identifies a supplier first and wants to create the master profile before inviting the supplier to the portal or qualifying the record. This method is described later in this article.

Portal registration and approval

When a supplier submits a registration request through the supplier portal and your organization approves it, the system automatically creates a prospect global vendor. The **Origin** field is set to *Supplier portal* so you can identify how the record entered the system. This method is useful when suppliers begin the relationship through self-service registration and then continue onboarding in the portal. Learn more in Review and approve incoming vendor registrations.

Automated creation through initial sync

During the initial synchronization process, the system can create a qualified global vendor from an existing vendor in Supply Chain Management. The **Origin** field is set to *Supply Chain Management*. This method helps you adopt Supplier Engagement without recreating supplier records manually. Learn more in Create global vendors from existing data.

Create a global vendor manually

Use this procedure when you want to create a new vendor profile directly in the Supplier Engagement app. After you save the record, the system assigns a unique global vendor number, sets the initial status to *Prospect*, and records *Supplier Engagement* as the origin.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Menu** area.
2. On the navigation pane, go to **General** > **Global vendors**.
3. On the command bar, select **New**.
4. Enter the vendor details in the fields provided. Use tooltips to understand the purpose of each field. Required fields are marked with an asterisk (*).
5. On the command bar, select **Save**. Notice the following values, which are generated on save:

    - **Global vendor number** – The system assigns this number automatically.
    - **Status reason** – The initial status is *Prospect*, which indicates that the vendor is not yet qualified for operational use.
    - **Origin** – Set to *Supplier Engagement* to indicate that you created the vendor manually.

Next steps

After the global vendor is created, you can continue onboarding by adding addresses, contact methods, certificates, capabilities, and assessment details. You can then qualify the vendor and release it to one or more legal entities when it's ready for operational use. Learn more in Manage global vendor information.

Review and approve incoming vendor registrations (preview)

[This article is prerelease documentation and is subject to change.]

Prospective suppliers can use the supplier portal to submit a supplier registration request, even without an invitation. Before a prospective supplier can access the supplier portal, authorized internal users must use the Supplier Engagement app to review and approve the supplier's registration request. During review, you can assess the submitted organization details, move requests into review, and decide whether to approve or reject them. Approval starts global vendor creation and onboarding activities.

View new registration requests in the Supplier Engagement app

Internal users such as global vendor managers and procurement professionals can access registration requests. Each request typically shows key details such as supplier name, contact information, company type, country or region, status, owner, and submission date.

To open the list of submitted requests, follow these steps:

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Menu** area.
2. On the navigation pane, select **Portal registrations** > **Registration requests**.
3. Use the search field, column filters, sorting options, view selector, and other tools to find the request that you want to review. You might often want to use the view selector or filter by **Status Reason** to focus on requests that are in one of the following states:

    - *New* – Recently submitted requests that are waiting for action
    - *In review* – Requests that are currently being assessed
    - *Approved* – Accepted requests that triggered vendor creation and onboarding
    - *Rejected* – Declined requests that won't move forward

4. Open the registration request that you want to inspect.

Start reviewing a request

When a prospective supplier first submits a registration, its **Status Reason** is *New*. Move the request to *In review* when you're ready to begin evaluation.

1. Find and open the registration request that you want to review. It should have a **Status Reason** of *New*.
2. On the command bar, select **Review**.
3. In the confirmation dialog box, select **OK**.

After you complete these steps, the **Status Reason** changes from *New* to *In review*.

Reject a registration request

If the submitted information doesn't meet your organization's requirements, you can reject the request and stop the onboarding process.

1. Find and open the registration request that you want to review. It should have a **Status Reason** of *In review*.
2. On the command bar, select **Reject**.
3. In the confirmation dialog box, select **OK**.

After the request is rejected, the **Status Reason** changes to *Rejected*, and the supplier is notified by email that the application wasn't approved.

Approve a registration request

Approve the request when the supplier should move forward into onboarding and vendor creation.

1. Find and open the registration request that you want to review. It should have a **Status Reason** of *In review*.
2. On the command bar, select **Approve**.
3. In the confirmation dialog box, select **OK**.
4. The system checks for duplicate records to make sure that it doesn't create overlapping supplier data. It looks for existing global vendor records that match the registration by name, website, or primary email. It also checks for existing contact records that use the same primary email address. If the system finds a possible duplicate, it informs you and blocks the approval until you review the existing global vendor data and decide how to proceed.

When approval succeeds, the system completes several actions automatically to start the supplier onboarding flow:

- The registration request **Status Reason** changes to *Approved*.
- The registration contact receives an email that confirms approval.
- A new global vendor record is created with a **Status Reason** of *Prospect*.
- A contact record is created and linked to the global vendor as the primary contact.
- The primary contact's portal access status is set to *Invited*, and prospective user provisioning starts.
- The primary contact is assigned the *Global Vendor Admin* role, and a *Portal User* request is generated in Supply Chain Management.
- After user provisioning finishes, the supplier's primary contact receives onboarding instructions by email.

Global vendor onboarding lifecycle (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor onboarding lifecycle management helps you move suppliers from early prospecting through qualification, approval, and end-of-relationship decisions. Each lifecycle stage reflects the vendor's current readiness, compliance standing, and operational status. The lifecycle also controls when data is synchronized to Supply Chain Management and when portal access is allowed.

Lifecycle stages overview

Global vendors move through lifecycle stages as onboarding and review activities progress.

Expand table

Status reason	Supplier Engagement app	Supply Chain Management
Prospect	Initial vendor record is created manually or through registration and is used for onboarding and data collection.	No vendor record exists in Supply Chain Management. Data is stored only in Dataverse.
Qualified	Vendor has passed initial validation and due diligence and is ready for release to legal entities.	A global vendor party record is created in Supply Chain Management. Contact methods, contact person relationships, and addresses are synchronized.
Approved	Vendor has met all compliance, risk, and performance criteria and is considered a preferred vendor.	Vendor is ready for transactional use and can be released to legal entities as a local vendor.
Disqualified	Vendor failed onboarding or due diligence, and the record is made inactive. Portal access is blocked.	No vendor record is created in Supply Chain Management.
Disapproved	Vendor failed to meet performance or compliance standards after qualification and can be reactivated to qualified status.	The vendor record is marked as disapproved. Portal access is blocked.

Status reason	Supplier Engagement app	Supply Chain Management
Terminated	The vendor relationship is formally ended, the record is blocked, and access is revoked. The status can't be reactivated.	The vendor and related parties are placed on hold. Portal access is blocked.

Status change tracking

The system logs each lifecycle status change so you can review how and why a vendor moved to a new state. To see this information, open the relevant global vendor record and go to the **Lifecycle** tab. Tracked values include the following details:

- **Status reason** – The status that was applied
- **Last updated by** – The user who made the change
- **Last updated on** – The date and time of the change
- **Status change comments** – The comment that explains the change

Qualify or disqualify a global vendor

You can qualify or disqualify a vendor when it's in *Prospect* status. Qualification confirms that the vendor has passed initial validation and due diligence, while disqualification indicates that the vendor failed onboarding or due diligence. When you qualify a vendor, key data synchronizes to Supply Chain Management, as shown in the following table.

Expand table

Data category	Information synchronized to Supply Chain Management
Basic information	Name, status, global vendor hold, and feedback level
Contact methods	Primary email address, primary phone number, primary URL, and additional contact methods
Addresses	Primary address and any additional addresses, including purpose and country/region-specific formatting
Contacts	Contact person party relationships and their corresponding contact methods
Company details	Number of employees, organization number, and DUNS number

Data category	Information synchronized to Supply Chain Management
Portal access	If portal access is enabled, the portal user for the primary contact is mapped to the synchronized contact person in Supply Chain Management, and the user's role changes from *Prospective User* to *Supplier Portal Administrator*

To qualify a prospect, follow these steps.

1. Open the relevant global vendor record, which must have *Prospect* status.
2. On the command bar, select **Qualify**.
3. In the confirmation dialog box, enter a comment.
4. Select **OK**.

When you qualify the vendor, the status changes to *Qualified*, a global vendor party is created in Supply Chain Management, and supported data is transferred.

To disqualify a prospect, follow these steps.

1. Open the relevant global vendor record, which must have *Prospect* status.
2. On the command bar, select **Disqualify**.
3. In the confirmation dialog box, enter a comment.
4. Select **OK**.

When you disqualify the vendor, the status changes to *Disqualified*, the record becomes inactive, portal access is blocked, and all portal roles are removed.

Approve or disapprove a global vendor

You can approve or disapprove a vendor after the vendor reaches *Qualified* status. Approval confirms that the vendor has passed all required assessments. Disapproval blocks further use until the issue is resolved.

To approve a qualified vendor, follow these steps:

1. Open the relevant global vendor record, which must have *Qualified* status.
2. On the command bar, select **Approve** > **Approve**.
3. Confirm the operation and enter a comment to explain why you approved the vendor.
4. Select **OK**.

When you approve the vendor, the status changes to *Approved*, and the vendor becomes eligible for release to legal entities.

To disapprove a qualified vendor, follow these steps:

1. Open the relevant global vendor record, which must have *Qualified* status.
2. On the command bar, select **Approve** > **Disapprove**.
3. Select the required hold type and reason code.
4. Enter any comments that are needed.
5. Confirm the action.

When you disapprove the vendor, the status changes to *Disapproved*, the record becomes inactive, portal access is blocked, a vendor hold is applied, and the update synchronizes to Supply Chain Management.

Request and approve global vendor termination

Termination uses a two-step process where one user requests the action and an authorized user approves it.

Request termination

You can request termination when a vendor is in *Qualified* or *Approved* status.

1. Open the relevant global vendor record, which must have *Qualified* or *Approved* status.
2. On the command bar, select **Terminate Request**.
3. Enter a comment that explains why termination is requested.
4. Confirm the action.

After you submit the request, **Terminate Review** is set to *Initiated*. You can see this information on the **Lifecycle** tab of the global vendor record, in the **Termination details** section. The termination request is sent to an authorized user for review and approval.

Approve termination

An authorized user completes the termination review and applies the final status.

1. Open the relevant global vendor record, which must have a pending termination request.
2. Review the request details and comments.
3. On the command bar, select **Terminate** > **Approve** to approve the termination request. Select **Terminate** > **Disapprove** to reject the request.

When you approve the termination request, **Status reason** updates to *Terminated*, the record becomes inactive, a vendor hold is applied to all local vendors, portal access is blocked, and all

portal roles are removed.

If you disapprove a termination request, **Status reason** remains *Approved*, and the record remains active. On the **Lifecycle** tab, the **Termination details** section shows that the request was disapproved and includes any comments that you entered.

> **Important**
>
> You can't reactivate a terminated vendor. If you want to work with the supplier again, you must start a new onboarding process.

Detect and manage duplicate global vendors (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement app includes duplicate detection features that help you identify possible duplicate supplier records before they move too far through onboarding. The validation checks both existing global vendors in Dataverse and vendor party records in Supply Chain Management. Duplicate detection warns you, but doesn't automatically block record creation, so you can review the warning and decide how to proceed.

How duplicate detection works

Duplicate detection can run at two points in the process:

1. During manual global vendor creation, by using Dataverse duplicate detection rules.
2. During qualification, by checking unlinked vendor party records in Supply Chain Management.

These checks help reduce duplicate supplier identities while still allowing you to make an informed decision when a match needs manual review.

Detect duplicates in the Supplier Engagement app

When you create a global vendor manually, the app uses standard Power Platform duplicate detection rules in Dataverse. If the system finds a potential match, it shows a warning so that you can compare the records before continuing.

Because these rules exist in Dataverse, administrators can update the matching logic in the Power Platform admin center to align with organizational policies. The warning is informational rather than blocking, so you can still continue if you can see that the new record is required.

> **Note**
>
> Duplicate detection helps you review possible matches, but it doesn't stop you from creating the record.

Detect duplicates against vendor parties in Supply Chain Management

During qualification, the system checks vendor party records in Supply Chain Management that aren't already linked to a global vendor. This validation helps you avoid qualifying a new global vendor when a matching party already exists.

The following table shows the matching criteria that the system uses during qualification.

Expand table

Field	Matching logic
Company name	Contains
Vendor name	Contains
Primary email	Exact match
Primary phone	Exact match

If the system finds possible matches, a dialog box shows the list of vendor parties so that you can choose the most appropriate action.

Choose an action when duplicates are found

When the system detects possible duplicates during qualification, select one of the following actions.

Expand table

Action	What it does	Typical use
Merge	Associates the global vendor with the existing vendor party. The system merges party information, and links released vendor records that belong to that party to the new global vendor.	Use this option when the vendor already exists in Supply Chain Management and the records represent the same supplier.
Keep anyway	Continues qualification without linking to the matched vendor party. The global vendor receives its own party ID.	Use this option when the records look similar but actually represent different suppliers.
Cancel	Closes the duplicate review without making a change. The vendor remains in *Prospect* status.	Use this option when you need more validation before continuing.

Choosing the right action is important because it determines whether the supplier reuses an existing party structure or creates a new one for downstream processes.

Manage global vendor information (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor records hold the supplier information that your organization uses for onboarding, qualification, compliance, and reporting across legal entities. The Supplier Engagement app organizes that information into tabs so you can maintain a shared company profile, monitor readiness, and review connected records from one place. A well-maintained global vendor profile also helps keep released vendor data accurate when the supplier is used in Supply Chain Management.

Open a global vendor record

To open a global vendor record, follow these steps:

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Menu** area.
2. On the navigation pane, go to **General** > **Global vendors**.
3. On the **Global vendors** page, use the view selector at the upper left to choose which types of global vendors to show, such as **Active global vendors** or **All global vendors**. You can also use the search box and column headings to filter and sort the list.
4. Select the link in the **Name** column for the global vendor that you want to open.

Understand the global vendor tabs

The following table summarizes the main tabs on a global vendor record and the information that each tab contains.

Expand table

Tab	What you can manage
Summary	Basic information such as vendor name, type, parent company, primary contact, origin, activity timeline, last visit date, contact methods, and addresses.
General	Company profile details such as foundation year, employee count, sales turnover, ownership profile, certificates, audit information, feedback summary, and rating levels.

Tab	What you can manage
Lifecycle	Vendor onboarding status, agreement information such as NDA, terms and conditions, and code of conduct, plus related released vendor records.
Contacts	Contact persons associated with the vendor, including the primary contact who serves as the main point of communication and portal administrator.
Capabilities	A hierarchical view of capabilities, products, market segments, quality standards, and other profiling attributes.
Risks	Risk records and corrective actions tied to the vendor.
Assessment	Onboarding questions, answers, and related assessment data.
Portal	Shows information about current portal onboarding status including a list of portal invitations and active users. You can also can create portal notifications for the vendor here.
Related	Provides a menu where you can choose to view various types of records that are related to the current vendor.

Together, these tabs provide a complete picture of the supplier's profile, readiness, and history.

Manage contact methods for a global vendor

Use contact methods to maintain the supplier's phone numbers, email addresses, and URLs in one shared record. You can add multiple entries of each type, but you can mark only one entry of each type as primary at a time.

To create contact methods for a global vendor, follow these steps:

1. Open the vendor that you want to update.
2. Open the **Summary** tab.
3. In the **Contact information** section, select **New contact method** in the toolbar above the grid.
4. Enter the contact method details:
    - **Type** – Select the type of contact method, such as *Phone*, *Email*, or *URL*.
    - **Primary** – Set to *Yes* for the entry that is the primary method to use for the selected **Type**. When you mark a new contact method as primary, the previous primary record of the same type is automatically unmarked. This behavior helps keep the current preferred phone number, email address, and website clear.

Fill in other details as requested for your selected **Type**.

5. Repeat the previous two steps to add additional contact methods as needed.
6. On the command bar, select **Save**.

To edit an existing contact method, double-click it in the grid.

To delete an existing contact method, select it in the grid and then select **Delete contact method** in the toolbar above the grid.

Create and manage global vendor addresses

Addresses follow the global address book structure from Supply Chain Management, so address behavior stays consistent across both applications. Address fields can change by country or region, and address validation follows the address setup that's defined in Supply Chain Management.

To create a new address for a global vendor, follow these steps:

1. Open the vendor that you want to update.
2. Open the **Summary** tab.
3. In the **Addresses** section, select **New address** in the toolbar above the grid.
4. Enter the address details that apply for the selected country or region.
5. If the address should be the main address, set **Primary** to *Yes*.
6. On the command bar, select **Save**.

To edit an existing contact address, double-click it in the grid.

Keep the following address rules in mind:

- Only one primary address can exist for a vendor at a time. If you mark a different address as primary, the previous primary address is automatically unmarked.
- A vendor can't delete the primary address from the supplier portal.
- ZIP or postal code selection might automatically populate the city or state, depending on the country or region configuration.
- Only vendors that have valid address and contact information can be qualified.

Manage vendor contacts

The **Contacts** tab shows the people associated with a global vendor.

Each global vendor can have multiple contacts, but one of them must be designated as the primary contact. The primary contact is the main point of communication for the vendor and is typically the first person to sign in and complete the onboarding process on behalf of the supplier. You identify the primary contact using the **Primary contact** field on the **Summary** page.

You can create additional contacts, set or change the primary contact, and view each contact's relationship to local vendors—all from the **Contacts** tab. Contact persons are synchronized to Supply Chain Management when the global vendor is qualified.

Learn more in Global vendor contacts.

Track lifecycle status and agreements

The **Lifecycle** tab tracks a global vendor's progression from prospect through qualification, approval, and—if necessary—termination. It shows the vendor's current status, the date and comments from the most recent status change, and agreement compliance details such as non-disclosure agreements (NDAs), terms and conditions, and code of conduct.

The tab also shows the released vendor records that have been created from this global vendor in specific legal entities. This gives you a single view of where the supplier is actively used for transactions.

Each status transition (for example, from *Prospect* to *Qualified*, or from *Approved* to *Terminated*) has specific effects on data synchronization, portal access, and vendor holds across legal entities. Learn more in Global vendor onboarding lifecycle.

Manage portal status and users

The **Portal** tab gives you a centralized view of a vendor's portal onboarding progress, active portal users, pending access requests, and portal notifications. From this tab you can:

- View and monitor the **Supplier portal status**, including whether the vendor has been invited, whether onboarding is required, and when onboarding was finalized.
- Review the **Portal users** grid to see which contacts currently have portal access. You can also add new portal contacts directly from this grid.
- Review **User access requests** that are pending approval, including the contact name, business justification, access level, and status.
- View and manage **Portal notifications** that have been sent to the vendor.

Much of the portal user management functionality available on this tab is also accessible from the **Contacts** tab and the command bar. Learn more in Global vendor contacts and Manage supplier portal users.

Maintain profile and compliance data

Use the **General** tab to manage business profile and governance details that support qualification and approval decisions.

Examples of the information that teams commonly maintain include:

- Company profile details such as foundation year, number of employees, and sales turnover
- Ownership profile indicators such as woman-owned, minority-owned, and locally owned classifications
- Certificates and audit information
- Released vendor information for legal entities that already use the supplier

This data helps procurement and compliance teams evaluate suppliers consistently across the organization.

Review operational context

The remaining tabs help teams evaluate suppliers beyond basic profile data:

- **Capabilities** – Records what the supplier offers and where it operates. Learn more in Manage global vendor capabilities
- **Risks** – Tracks issues, severity, and corrective actions. Learn more in Risk management and corrective actions
- **Assessment** – Captures onboarding responses and other review inputs.
- **Related** – Provides a menu where you can choose to view various types of records that are related to the current vendor.

These areas make the global vendor record the main workspace for centralized supplier management.

Global vendor contacts (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor contacts help procurement teams manage the people who represent each supplier across onboarding and ongoing collaboration. In the Supplier Engagement app, contacts can be internal records or external users who have portal access. These records stay connected to vendor lifecycle processes, portal access, and synchronization with Supply Chain Management.

Contact roles for global vendors

Each global vendor can include the following types of contacts:

- **Primary contact** – The main point of communication for the global vendor and typically the global vendor administrator.
- **Additional contacts** – Extra contact people who support onboarding, communication, and day-to-day vendor management.
- **Portal-enabled contacts** – Contacts who can sign in to the supplier portal when portal access is enabled.

When a global vendor is qualified, contact people are synchronized to Supply Chain Management as party contacts.

Create a contact person

Create a contact person when you need to add someone who represents the vendor for onboarding, communication, or portal use.

1. Open the relevant global vendor record and go to the **Contacts** tab.
2. In the **Contacts** grid, select **New**.
3. Enter the required details, such as **First Name**, **Last Name**, **Salutation**, **Job Title**, **Email Address**, and **Phone Number**.
4. Select **Save**.

When you save a new contact, the primary contact methods are created automatically. You can add more contact methods later if they're needed.

Set a primary contact

Each global vendor should have a primary contact, who has the following role and responsibilities:

- **Role** – The primary contact is the main contact person for the global vendor.
- **Portal invitation behavior** – When the vendor is invited to the portal, the system creates a user request for the primary contact and assigns the *Global vendor administrator* security role.
- **Onboarding responsibility** – The primary contact is the first person to sign in, start onboarding, and provide initial data and documentation.

To assign or change the primary contact, follow these steps.

1. Open the relevant global vendor record and go to the **Summary** tab.
2. In the **Primary Contact** field, select an existing contact or create a new one.
3. Select **Save & Close**.

Delete a global vendor contact

You can delete a contact only when the contact isn't tied to active downstream processes or protected account relationships.

Contact deletion is blocked in the following cases:

- The contact has an active supplier portal user.
- The contact is associated with a vendor contact in Supply Chain Management.
- The contact is trying to delete their own account through the supplier portal.

If none of these conditions apply, you can delete the contact from the global vendor record. If the contact has a synchronized party contact in Supply Chain Management, the deletion is also synchronized.

Contact relationship in Supply Chain Management

After a global vendor is qualified, its contacts are synchronized to Supply Chain Management as party contacts. You can review these relationships by following these steps:

1. Sign in to Supply Chain Management.
2. Go to **Procurement and sourcing** > **Vendors** > **(Preview) Supplier Engagement** > **All global vendors**.
3. On the list pane, select the relevant global vendor record.
4. Select the link in the **Name** field.

5. Expand the **Relationships** FastTab. The **Relationship A to B** column can show the following types of party relationships:

    - *Global contact for* – Identifies the person as a contact for the global vendor.
    - *Contact for* – Identifies the person as a contact for a local vendor.

View local vendor contact relationships

When a local vendor contact is created either in Supply Chain Management or in the supplier portal, you can use the Supplier Engagement app to see the contact's relationship to a local vendor that is released to a specific legal entity.

To review local vendor relationships for a contact, follow these steps.

1. Open the relevant global vendor record and go to the **Contacts** tab.
2. Open the relevant contact record.
3. If the selected contact is linked to a local vendor, the **Contact for legal entities** section shows information about the local vendor. If the contact isn't linked to any local vendors, this section isn't shown.

Manage contacts from the Portal tab

In addition to the **Contacts** tab, you can also view and manage portal-enabled contacts from the **Portal** tab on the global vendor record. The **Portal** tab provides a focused view that combines portal status information with user management. To access this view, open the relevant global vendor record and go to the **Portal** tab.

From this tab, the **Portal Users** grid shows contacts who currently have portal access. You can select **New Contact** to add a portal user directly from here. The **User Access Requests** section shows any pending approval requests for portal access.

The contact creation and user management functionality on the **Portal** tab works similarly to what's described in the sections above—the main difference is that the **Portal** tab gives you a portal-focused workspace with portal status and notifications visible alongside the user list. Learn more in Manage supplier portal users.

Manage global vendor capabilities (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor capabilities help organizations capture what a supplier offers at a shared, cross-entity level. These records support vendor profiling rather than transaction processing, so teams can compare suppliers, evaluate fit, and segment vendors based on strategic needs. Capability data is stored in Dataverse and managed in the Supplier Engagement app.

Understand what capabilities represent

Global vendor capabilities describe non-transactional attributes such as the following examples:

- Products that the vendor specializes in
- Market segments that the vendor serves
- Quality standards that the vendor follows
- Process capabilities that matter in specialized industries

Because you maintain this information at the global vendor level, procurement teams can review a supplier's broader business fit before they decide whether to qualify, approve, or release the vendor to legal entities.

Use capabilities for evaluation and segmentation

Capabilities help internal teams answer business questions that transactional data alone can't answer. For example, you can use capability data to identify suppliers that support a target industry, hold a required quality standard, or provide a specialized manufacturing process.

That broader view supports activities such as:

- Comparing suppliers during sourcing and onboarding
- Grouping suppliers for category or market analysis
- Identifying suppliers that meet regional or technical requirements
- Supporting business reviews with richer profile information

Organize capabilities in hierarchies

Capabilities can be arranged in parent-child relationships so that complex offerings are easier to understand and maintain. A hierarchy lets you group broad business areas under more specific capability records.

For example, a top-level capability such as *Manufacturing services* might contain child capabilities for *Precision machining*, *Injection molding*, and *Assembly*. This structure helps users capture both the supplier's broad service area and the detailed specialties underneath it.

Understand how capabilities differ from procurement categories

Global vendor capabilities are different from procurement categories in Supply Chain Management:

- **Global vendor capabilities** are used for profiling, evaluation, and business alignment.
- **Procurement categories** are used for operational and transactional classification in purchasing processes.

Capability data isn't synchronized to Supply Chain Management. That separation helps organizations keep strategic supplier profiling distinct from the procurement structures that drive transactions.

Assign capabilities to global vendors

To assign capabilities to global vendors, open the relevant global vendor record and go to the **Capabilities** tab. Use the various **Edit** buttons on this page to add or edit capabilities in each capability category (**Products**, **Segments**, **Capabilities**, or **Quality**).

Learn more in Configure capabilities (preview).

Related information

- Create a global vendor
- Manage certificates

ⓘ**Note:** The author created this article with assistance from AI. Learn more

Last updated on 07/31/2026

Manage certificates (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor certificate management provides a single place to track supplier certifications across industries and legal entities. Managing certificates at the global vendor level helps you avoid maintaining the same record separately for each local vendor and makes compliance reviews easier. Certificate data synchronizes to related local vendor records in Supply Chain Management.

Create a certificate record

Use this procedure to create a certificate for a global vendor. Create the record first, and then upload the supporting file or add a document URL if the evidence is stored externally.

1. Open the relevant global vendor record and go to the **General** tab.
2. In the **Certificates** section, select **New global vendor certificate**.
3. Enter the certificate details in the fields provided. Use the tooltips to understand the purpose of each field.
4. Select **Save**.

View and edit a certificate record

To view or edit a certificate record, follow these steps.

1. Open the relevant global vendor record and go to the **General** tab.
2. In the **Certificates** section, find the certificate record that you want to add a file to. Scroll to the right and select the **Go to record** button for your selected row.
3. The app displays certificate details, including review details and links to uploaded and external files. Edit the fields as needed and select **Save** to update the record.

Upload a certificate file

After you create a certificate record, you can attach the supporting evidence directly to that record. Each certificate can have one uploaded file, or you can store a document URL that points to an external source instead.

1. Open the certificate record.

2. Do one of the following steps:

    - If the document is stored locally, select **Upload file**, go to the **Certificate file** section, and select **Choose file**. Then select the file to upload. If a file is already uploaded, you must first delete it by selecting **Delete**.
    - If the document is stored externally, go to the **Certificate file** section and enter the URL in the **Document URL**.

3. Select **Save**.

> ⓘ **Note**
>
> You can attach only one file to each certificate record.

Track expired certificates

Each certificate includes an **Expiration date** field so you can monitor validity over time. A Power Automate flow checks whether the expiration date is the current date and then updates the certificate status to **Expired**.

Organizations can surface expiring or expired certificates through dashboards, views, or other reporting mechanisms so that reviewers can act before compliance issues affect supplier readiness.

Synchronize certificates with Supply Chain Management

When you release a global vendor to a legal entity, the system synchronizes its certificate records to the related local vendor and marks them as global vendor certificates. For qualified vendors that already have related local vendors, newly created certificates synchronize automatically to all connected local vendor records.

This behavior helps teams maintain certificates once at the shared supplier level while still making the data available where operational users need it.

Mark a certificate as reviewed

Use this procedure when an internal reviewer validates the certificate content and wants to capture the review result on the record.

1. Open the certificate record that you want to review.
2. On the command bar, select **Mark as reviewed**.
3. Select **OK**.
4. Enter review comments.
5. Select **OK**.

After the action is completed, the system updates the following fields on the certificate:

- **Reviewed?** – Set to **Yes**
- **Reviewer** – Set to the current user
- **Review comment** – Populated with the entered review comments

Global vendor feedback (preview)

[This article is prerelease documentation and is subject to change.]

Global vendor feedback provides a standardized way to evaluate suppliers and capture performance insights in one place. Ratings are stored centrally and contribute to a dynamic overall score. As you add new feedback, the overall rating updates automatically.

Enter global vendor feedback

Create a feedback entry when you want to record a new supplier evaluation for a global vendor.

1. Open the relevant global vendor record.
2. On the command bar, select **Feedback**.
3. On the feedback form, enter a **Title**.
4. Enter a rating (1–5 stars) for each factor:
    - **Sales policy and flexibility** – How well the supplier supports commercial terms, negotiations, and flexibility in doing business.
    - **Communication** – Responsiveness, clarity, and consistency in supplier communication.
    - **Competitiveness** – Pricing strength and commercial competitiveness.
    - **Product offering and innovation** – Value, breadth, and innovation of the supplier's products or services.
5. Enter a **Comment**.
6. Select **Save and close**.

View feedback

You can submit multiple feedback entries for the same vendor. As you add more entries, the overall rating adjusts automatically. The system calculates each global vendor's overall feedback score as the average of all the submitted rating factors. To view a global vendor's feedback history, open the vendor record, go to the **General** tab, and look in the **Feedback** section.

Feedback score in Supply Chain Management

The latest feedback score syncs to Supply Chain Management, where it is also shown on the global vendor record. This shared visibility lets you review supplier performance from either application.

Risk management and corrective actions (preview)

[This article is prerelease documentation and is subject to change.]

Supplier risk management helps organizations identify, assess, and mitigate risks that are associated with global vendors. The feature supports proactive monitoring by combining structured risk evaluations with corrective action tracking. It also preserves historical records so teams can review how risks were handled over time.

Key capabilities

The Supplier Engagement app supports the following risk management capabilities:

- **Risk identification** – Select predefined risk scenarios.
- **Risk evaluation** – Assess likelihood and impact on a 1-to-5 scale.
- **Risk level calculation** – Automatically determine the overall risk level.
- **Corrective action tracking** – Define and monitor mitigation steps.
- **Historical risk records** – Keep prior evaluations and actions for reference.

Prerequisites

Before you can create risk evaluations or corrective actions, complete the following configuration steps:

- **Risk scenarios** – Create and activate risk scenarios in **Configuration** > **Risks** > **Risk Scenarios**.
- **Corrective action types** – Configure corrective action types in **Configuration** > **Risks** > **Corrective Action Types**.

Learn more in Configure risk management elements (preview).

Identify and evaluate risks

Create a risk evaluation when you need to document a vendor risk, score its severity, and capture the required mitigation details.

1. Open the relevant global vendor record and open the **Risks** tab.

2. On the command bar, select **Risk Evaluation**.
3. Fill out the dialog with the details of the risk and a possible corrective action.
4. Select **Save and close**.
5. The risk is now added to the **Active global vendor risks** list, where you and other users can review, open, and eventually delete it if appropriate.

The system calculates the **Risk number** by multiplying **Likelihood** by **Impact**, which produces a value from *1* to *25*. It then assigns a **Risk level** of *Low*, *Medium*, or *High* based on the most recent risk evaluation.

Create corrective actions

Create a corrective action when a risk requires mitigation activities, ownership, and due date tracking.

1. Open the relevant global vendor record and open the **Risks** tab.
2. In the **Active corrective actions** section toolbar, select **New global vendor corrective action**.
3. Fill out the dialog with the details of the corrective action.
4. Select **Save and close**.

Corrective actions link to the related vendor and risk record so you can monitor mitigation work in context.

Close or cancel corrective actions

Close a corrective action when the mitigation work is finished. Cancel it when the action is no longer required.

1. Open the relevant global vendor record and open the **Risks** tab.
2. In the **Active corrective actions** section, locate the corrective action row and select the **Go to record** button at the right side of the row.
3. In the **Measures Implemented** field, enter the actions that were taken to mitigate the risk.
4. On the command bar, select **Deactivate**.
5. In the **Confirm deactivation** dialog, select one of the following options from the **Status reason** drop-down list:

- **Closed** – The corrective action was successfully implemented
- **Cancelled** – The corrective action is no longer required

6. Select **Deactivate** to confirm the status change.

> **Note**
>
> After a corrective action is closed or cancelled, the record becomes read-only. You can view deactivated corrective actions using the drop-down list at the top of this section (change the section name from **Active corrective actions** section to **Inactive corrective actions**).

Manage local vendors (preview)

[This article is prerelease documentation and is subject to change.]

Local vendor management in the Supplier Engagement app lets you create, update, and control vendor accounts at the legal entity level. You can release a global vendor to a legal entity, maintain local vendor details, and add supporting records such as contacts and bank accounts. All supported updates sync automatically between the Supplier Engagement app and Supply Chain Management.

Release a global vendor to a legal entity

When a supplier is ready for operational use, release the global vendor to a legal entity and create the local vendor account.

1. Open the relevant global vendor record.
2. On the command bar, select **Release vendor**. Then select **OK** in the confirmation dialog.
3. Enter the following values in the **Release vendor** dialog:

    - **Global vendor** – Read-only reference to the selected global vendor
    - **Legal entity** – Select the legal entity (company) to create the local vendor for.
    - **Vendor group** – Select the vendor group for the local account.
    - **Vendor number** – Enter a vendor number for the local account.
    - **Currency code** – Select the currency used by the local vendor. Leave blank to use the default currency for the selected legal entity.
    - **Vendor hold** – If the vendor should be on hold, select the appropriate hold type. Leave blank if the vendor is not on hold. Learn more in Global and local vendor holds (preview).

4. Select **Release**.

View and edit local vendor information

Use the local vendor record when you need to maintain legal entity–specific settings.

1. Open the relevant global vendor record.
2. Open the **Lifecycle** tab.

3. The **Vendors** section lists the currently defined local vendors. To open a local vendor record so you can view and edit its details, select the link in the **Vendor account** column.
4. Update any fields that are required.
5. Select **Save**.

After you save the record, the updated information syncs automatically to Supply Chain Management.

Add a contact for a local vendor

You can add vendor contacts for a local vendor in the Supplier Engagement App. The contact must already exist as a global vendor contact. To add a local vendor contact, follow these steps:

1. Open the relevant global vendor record.
2. Open the **Contacts** tab.
3. Open a contact record by selecting the link in the **Full name** column.
4. On the **Summary** tab, in the **Contact for legal entities** section, select **New Vendor Contact** from the toolbar.
5. Select the **Vendor account** for the local vendor to add the contact to.
6. On the command bar, select **Save & close**.

Maintain bank information for local vendors

To view, add, or edit bank account details for a local vendor, follow these steps:

1. Open the local vendor record.
2. Open the **Bank information** tab. Each existing bank detail record is summarized in the grid. You can do the following actions:

    - To open an existing bank account record, select the **Go to record** button in the right column of the row.
    - To add a new bank account, select **New vendor bank account** in the toolbar.

3. View, enter, and edit bank account details as needed.
4. On the command bar, select **Save & close**.

View approved categories

Approved categories determine which products or services the vendor is authorized to supply. To see which categories are approved for a local vendor, follow these steps:

1. Open the local vendor record.
2. Open the **Approved Categories** tab.
3. Review the categories that are assigned to the vendor.

View certificates

Certificates that are managed at the global vendor level are inherited by local vendors, so you can review them from the local record.

1. Open the local vendor record.
2. Open the **Certifications** tab.
3. Review the inherited certificate records.

Add state tax IDs to local vendors

Use the state tax ID section when you're working with a United States legal entity that requires state-specific tax registration details.

1. Open the local vendor record.
2. Open the **State Tax Id** tab.
3. Select **Add State Tax Id**.
4. Enter the required tax ID details.
5. On the command bar, select **Save & close**.

> **Note**
>
> State tax IDs are available only for supported United States localization scenarios.

Localization

Some local vendor fields and sections appear only for specific countries/regions. The app automatically shows or hides these areas based on the local vendor's legal entity configuration.

Country/region-specific sections can include the following examples:

- **Ownership profile**
- **Business information**
- **State tax ID**

Manage activities (preview)

[This article is prerelease documentation and is subject to change.]

The **Activities** page provides a central place to track interactions, follow-up work, and scheduled events in the Supplier Engagement app. Built-in views help teams monitor open work, recent activities, due dates, and portal-facing timeline items. Users can create tasks, appointments, and other activity types directly from the **Activities** page.

Open the activities page

To open the **Activities** page:

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Menu** area.
2. On the navigation pane, go to **General** > **Activities**.
3. On the **Activities** page, use the drop-down list at the top of the page to choose the types of activities to show. The default view is **My Activities**, which shows activities that are assigned to you. You can also use the search bar to filter activities by keyword, and you can sort the list by selecting the column headers.

Add a new activity

To add a new activity, follow these steps:

1. Open the **Activities** page.
2. On the command bar, select the button for the type of activity that you want to create. For example, create a **Task** when you need to track a work item or follow-up action. Create an **Appointment** when you need to schedule a meeting, review, or other time-based event.
3. Fill out the details for your activity.
4. On the command bar, select **Save & close**.

Work with activities

To work with your assigned activities, follow these steps:

1. Open the **Activities** page.
2. Use the view selector and other filters to find the activities you need.

3. Either select the link in the Subject column to open the activity record, or select the check box for one or more activities.
4. Use the buttons on the command bar to take action. For example, select **Mark as complete** to close an activity, select **Assign** to assign the activity to another user, or select **Delete** to remove an activity. If you opened an activity record, you can also edit the details and select **Save & close** to save your changes.

The command bar also includes the following buttons for working with activities:

- **Focused view** – Opens a view that makes it easy to browse records using a list pane and a details pane. Select a record in the list to view its details. Use the details pane to edit and take action on the record. Select the **Read only grid** button to go back to the standard view.
- **Show chart** – Opens a chart view where you can choose various graphical representations of your and your team's activities, their statuses, completion rates, and so on.

Dashboard views

The **Activities** page includes the following dashboard views.

- **All Activities** – Displays all activity records, regardless of status or owner.
- **Closed Activities** – Shows activities that are completed or closed.
- **Due and Overdue Activities** – Lists activities that are due soon or past the due date.
- **Last Activity** – Displays the most recent activity for each record.
- **My Activities** – Shows activities that are assigned to you. This is the default view.
- **My Closed Activities** – Lists your closed activities.
- **My Team Members' Activities** – Displays activities for your team members.
- **Next Activity** – Shows the next scheduled activity for each record.
- **Open Activities** – Lists activities that are currently open.
- **Portal Timeline View** – Shows a timeline of activities that are visible in the external portal.
- **Scheduled Activities** – Displays activities that are scheduled for a future date.
- **All Tasks** – Shows all task records.
- **My Tasks** – Displays tasks that are assigned to you.
- **All Appointments** – Shows all appointment records.
- **My Appointments** – Displays appointments that are assigned to you.
- **My Completed Appointments** – Lists your completed appointments.
- **My Draft Appointments** – Shows draft appointments that you created.

Global and local vendor holds (preview)

[This article is prerelease documentation and is subject to change.]

Vendor holds help you control supplier activity when compliance, risk, or operational conditions require temporary restrictions. You can apply holds at the global vendor level to affect all released vendors, or at the local vendor level for a single legal entity. Hold updates sync with Supply Chain Management so that transaction controls stay aligned.

Understand vendor hold types

Depending on the hold type that you apply, the system blocks specific actions such as invoice posting, payment generation, or requisition creation.

Expand table

Hold type	Effect
No	All transactions are allowed.
Invoice	Invoice creation or posting is blocked.
Payment	New payments can't be generated, although existing payments can still post.
Requisition	Requisition creation is blocked.
All	All transactions are blocked for the vendor.
Never	The vendor can't be put on hold for inactivity.

Place a global or local vendor on hold

To place a global or local vendor on hold, follow these steps:

1. Open the relevant global vendor record.
2. To do one of these steps:

    - To place the currently selected global vendor on hold, stay on this page. When you place a global vendor on hold, all related local vendors are also placed on hold.
    - To place a local vendor on hold, open the **Lifecycle** tab, and in the **Vendors** section, open the target local vendor record.

3. On the command bar, select **On Hold**.
4. Confirm by selecting **OK**.
5. Enter the hold details:

    - **On hold** – Select the hold type to apply
    - **On hold reason** – Select the business reason for the hold.
    - **On hold release date** – Optionally, select a date when the hold should be automatically released. If you leave this field blank, the hold remains in effect until you manually release it.

6. Select **OK**.

After you apply the hold, the vendor status updates and the changes sync to Supply Chain Management.

Release a global or local vendor from hold

To release a global or local vendor from hold, follow these steps:

1. Open the relevant global vendor record.
2. To do one of these steps:

    - To release the currently selected global vendor from hold, stay on this page. When you release a global vendor from hold, all related local vendors are also released.
    - To release a local vendor from hold, open the **Lifecycle** tab, and in the **Vendors** section, open the target local vendor record.

3. On the command bar, select **On Hold Release**.
4. Confirm by selecting **OK**.

After you complete these steps, the system clears the hold status and syncs the updates to Supply Chain Management.

Dashboards (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement app includes dashboards that provide a role-based view of supplier activity and progress. These dashboards help administrators, managers, and operational users monitor registrations, risks, ongoing work, and portal access from one place. You can switch between dashboards to focus on the metrics and lists that matter for your role.

To open and use the dashboards.

1. Open the Supplier Engagement app, and at the bottom of the navigation pane, select the **Menu** area.
2. On the navigation pane, go to **General** > **Dashboards**.
3. On the **Dashboards** page, use the list at the top of the page to choose a dashboard. The following dashboards are available:

    - **Global vendor activities overview** – This dashboard helps you track follow-up work and keep vendor-related tasks moving. It can include lists of current and overdue appointments, tasks and their status, and corrective actions.
    - **Global vendor registrations** – This dashboard focuses on the onboarding pipeline. It can include lists of new and pending registration requests and charts that group requests by status reason.
    - **Global vendor risks overview** – This dashboard highlights supplier risk information. It can include charts that show vendors by risk level, risk scenario, status, corrective action type, and country or region.
    - **Global vendors overview** – This dashboard shows vendor distribution and trend data across the supplier base. It can include charts for vendor status, vendor type, risk level, business unit, and new vendors by creation month.
    - **Global vendors portal overview** – This dashboard focuses on supplier portal access. It can include charts that show vendors by portal status and lists that identify vendors that already have portal access enabled.

Work with Supplier Engagement data in Supply Chain Management (preview)

[This article is prerelease documentation and is subject to change.]

The Supplier Engagement solution introduces several changes to Supply Chain Management that support the new global vendor model. These changes include a dedicated global vendors form, global vendor certificates, and enhancements to the supply risk assessment report. This article describes how to work with Supplier Engagement data directly in Supply Chain Management.

Supplier Engagement and vendor collaboration

The Supplier Engagement solution is intended to replace the older vendor collaboration feature. Key differences between vendor collaboration and the new solution include:

- **Global vendor concept** – Supplier Engagement introduces the global vendor concept, where a single master profile represents a vendor across legal entities. Only vendors that are associated with a global vendor are accessible through the Supplier Engagement app or the supplier portal. Learn more in Global vendor management overview.
- **Supplier Engagement app** – A model-driven Power Apps application is available for internal procurement specialists and buyers to manage vendor relationships. Learn more in Work with the Supplier Engagement app.
- **Supplier portal** – The supplier portal is a dedicated Power Pages app that vendors use to collaborate with your organization. Previously, vendors interacted through the Vendor Collaboration module in Supply Chain Management.

Learn more in How Supplier Engagement compares to the vendor collaboration interface.

Global vendors in Supply Chain Management

In Supply Chain Management, you can access global vendors by going to **Procurement and sourcing** > **Vendors** > **Supplier engagement** > **All global vendors**. The **All global vendors** page shows the following data:

- Global vendor name and ID
- Global vendor status
- Global vendor holds

- Released vendors

The global vendor table in Supply Chain Management is shared, with each global vendor represented by a single party in the global address book. When details such as contacts, addresses, or contact persons for a global vendor party are updated in Supply Chain Management, these changes are synchronized with the Supplier Engagement app.

Local vendors

Local vendors that are involved in Supplier Engagement continue to be managed as they were previously. You can create new vendors either from the **All vendors** page or by releasing from the party within the global address book.

Learn more in Create global vendors from existing data.

Manage certificates

Local vendor certificate management remains unchanged. With Supplier Engagement and the global vendor model, certificates can now be added at the global vendor level and automatically apply to all associated local vendors. These certificates are marked with a **Global vendor certification** checkbox on the **Certifications** page and can only be created in the Supplier Engagement app. To open the **Certifications** page, go to **Procurement and sourcing** > **Vendors** > **All vendors**, select a vendor, and then, on the Action Pane, open the **Vendor** tab and select **Certifications**.

Learn more in Manage certificates.

Create a global vendor based on existing vendor data

You can convert existing vendors to global vendors or merge an existing vendor with a global vendor. Learn more in Create global vendors from existing data.

Learn more in Create a global vendor.

Supply risk assessment report

When the Supplier Engagement feature is turned on in Supply Chain Management, the standard **Supply Risk Assessment** report (**Procurement and Sourcing** > **Inquiries and Reports** > **Supply Risk Assessment** > **Supply Risk Assessment**) is enhanced with the following changes:

- A **Date** filter is added to enable time-based analysis.
- A **Global Vendor** filter is introduced as a hierarchy level above vendors.
- Global vendor data is incorporated into report visuals to provide aggregated insights.

Learn more in Risk management and corrective actions.

Supplier portal overview (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal provides an external-facing web experience where vendors can interact with your organization's procurement processes. Built on Microsoft Power Pages, the portal gives vendors self-service access to manage their profiles, respond to requests for quotation (RFQs), confirm purchase orders, submit invoices, and track consignment inventory—all without needing direct access to Supply Chain Management.

This article provides an overview of the portal's capabilities from the vendor's perspective. The information here is intended for administrators and Microsoft partners who need to understand what vendors can do in the portal and where customization opportunities exist.

Learn more about the supplier portal and how it works with the other components of Supplier Engagement in Supplier Engagement overview.

Portal capabilities

The supplier portal supports the following vendor workflows:

- **Landing page and onboarding** – Vendors can register as new suppliers and complete onboarding steps to provide company information, capabilities, and certifications. Learn more in Landing page and vendor onboarding.
- **Home page** – After signing in, vendors see a personalized home page with workspace tiles, essential links, and notifications. Learn more in Home page.
- **User profile** – Vendors can view and edit their personal profile information. Learn more in User profile.
- **RFQ responses** – Vendors can view, bid on, and manage requests for quotation. Learn more in View and respond to RFQs.
- **Purchase order confirmation** – Vendors can review, confirm, or respond to purchase orders. Learn more in View and confirm purchase orders.
- **Invoicing** – Vendors can create, submit, and track invoices. Learn more in View and create invoices.
- **Consignment inventory** – Vendors can monitor consignment stock levels and consumption. Learn more in View consignment details.

- **Global and local vendor data** – Both global and local vendors can manage their organizational profile, contacts, certificates, and capabilities. Learn more in Vendor details.
- **User access management** – Vendor administrators can manage portal users, assign roles, and control access. Learn more in Vendor details.

Supplier portal landing page and vendor onboarding (preview)

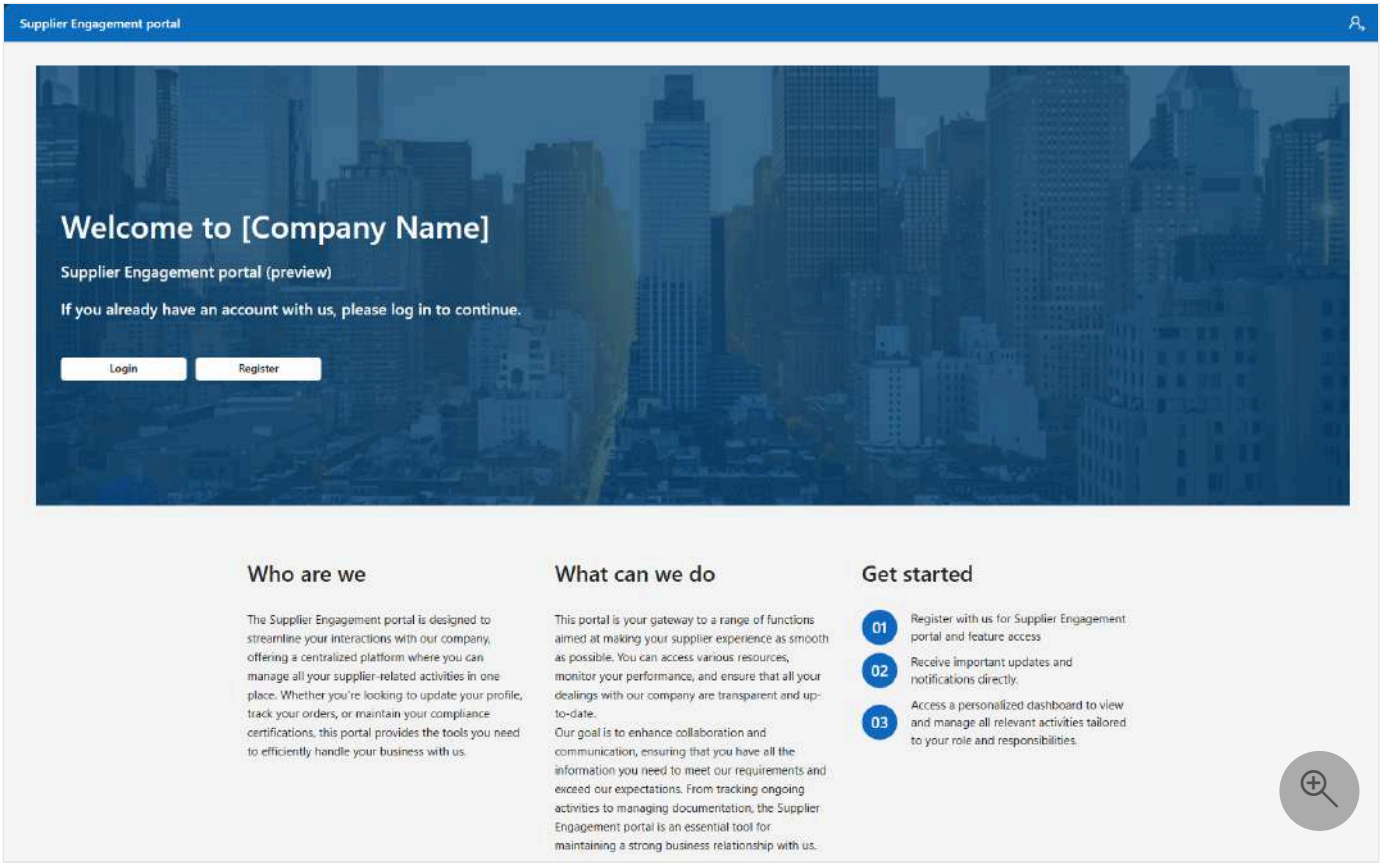
[This article is prerelease documentation and is subject to change.]

The supplier portal provides a landing page that's available to all anonymous visitors and an onboarding wizard that lets new vendors apply to become vendors to your organization. These features let potential vendors introduce themselves to your organization and, once approved, provide the detailed information needed to begin doing business.

Landing page

The supplier portal landing page is the default page for all visitors. This page is available anonymously, which means visitors don't need to sign in to view it.

The landing page introduces the concept of the supplier portal and guides visitors to register as a new vendor or sign in if they already have an account. It provides a brief description of your organization's vendor collaboration approach and links to key entry points of the portal.



You can customize the landing page to align with your organization's visual identity. You can update the logo, colors, and content to reflect your company's style and communication standards.

The supplier portal is built on Microsoft Power Pages, which allows organizations to tailor the look and feel of the landing page. You can modify the layout, text, and images, or add information about your vendor engagement process.

For detailed guidance on branding and customization, go to Personalize the supplier portal overview.

Initial registration

Portal registration enables potential vendors to introduce themselves by submitting their company details through the supplier portal. Anonymous users can register without prior authentication. Once submitted, the request goes to the Supplier Engagement app for review.

To register as a new vendor, follow these steps:

1. Go to the supplier portal and select **Register** on the landing page.
2. In the **Welcome to registration** dialog, review the registration instructions and select **Continue**.
3. Fill out the **Global Vendor registration request** form with the required information, including company details, contact information, capabilities, and certifications.
4. Accept the **Confirmation** check boxes and complete the security captcha.
5. Select **Submit** to finalize the registration request.

After submission, the potential vendor sees a confirmation message and receives an acknowledgment email. The request becomes available in the Supplier Engagement app for internal users to review.

For information on the internal review process, go to Review and approve incoming vendor registrations.

Complete vendor onboarding

After a vendor registration request is approved, the vendor is invited to complete onboarding using the supplier portal. The onboarding process ensures that vendors provide all necessary business, contact, and compliance information before they can be qualified and approved.

Prerequisites

- The vendor must have received an invitation to the supplier portal.
- The vendor must have a user provisioned with the *Global Vendor Admin* role assigned.

Complete onboarding

To complete the onboarding wizard, follow these steps:

1. On the portal home page, select **Login**. Then select **Entra user** and sign in by using your vendor account credentials. Because you didn't yet complete onboarding, a pop-up message opens indicating that you must follow the onboarding process.

2. On the **Contact information** page, review and enter the requested information, including the primary contact details for your organization. Use this information for communication and supplier-related correspondence. Enter at least one address to proceed.

3. On the **Company details** page, provide the following information: - Business profile details, such as founding year and number of employees - Ownership profile details, such as minority-owned or small business

4. On the **Capabilities** page, define your scope of supply by selecting from:

    - Product categories
    - Market segments
    - Capabilities
    - Quality standards

5. On the **Certificates** page, manage certification records:

    - Add certification details by specifying certification type, certifying organization, and effective and expiration dates.
    - Upload supporting documents.
    - Edit, delete, or mark certificates as expired.

6. On the **Assessment** page, complete the questionnaire configured by the buyer. Questions might include both yes/no responses and free-text answers.

After you complete the onboarding wizard, a confirmation page is displayed. In the Supplier Engagement app, internal staff can see that the onboarding process is marked as complete.

What happens after onboarding

When you finalize onboarding:

- The global vendor's **Finalized Date** and **Status** update.
- The vendor record is ready for qualification and approval by procurement staff.
- After completing the onboarding wizard, supplier portal users can sign in to the portal and then go to **Setup** > **Global Vendor Setup** to manage global vendor information whenever needed.

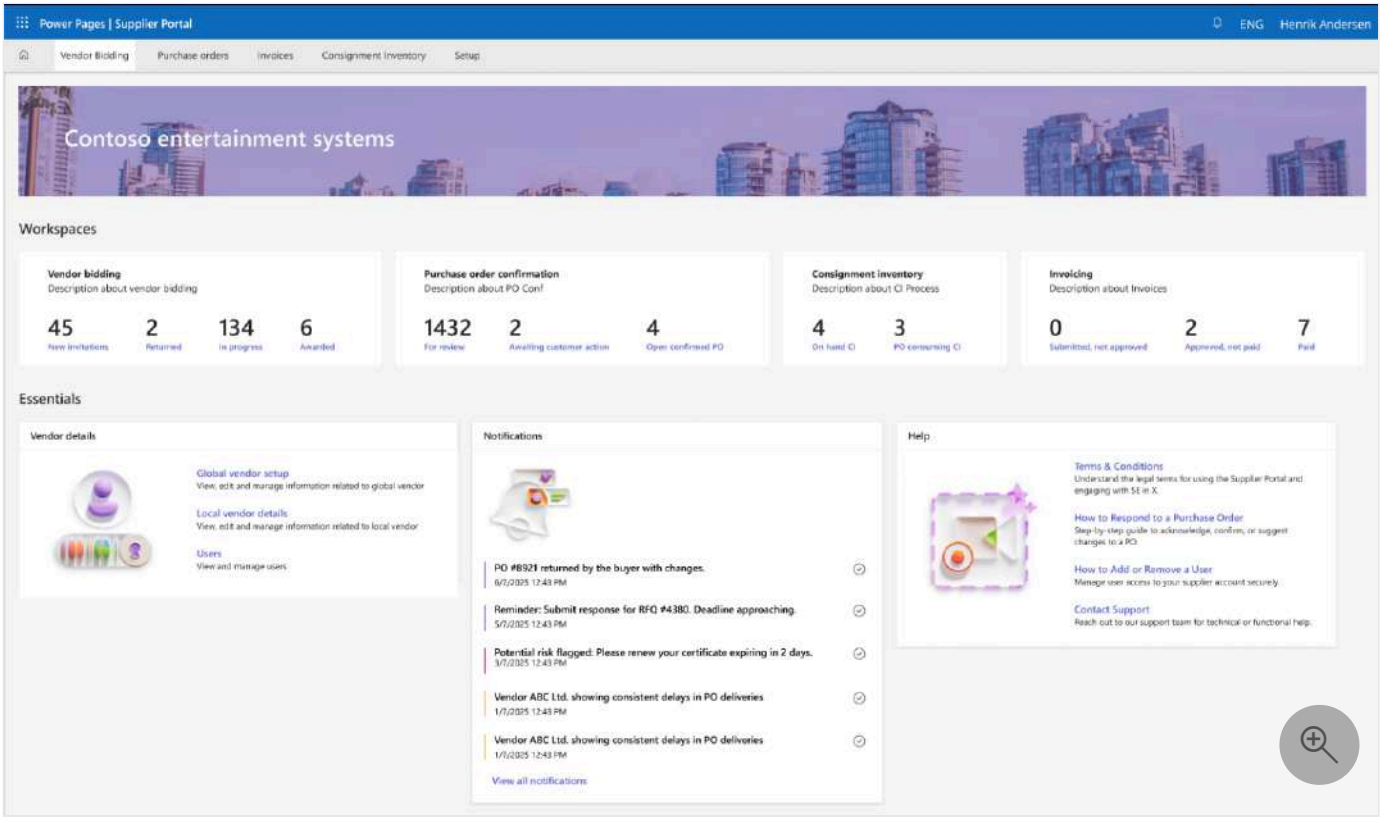
Supplier portal home page (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal home page is the main entry point for vendor collaboration within the Supplier Engagement solution. It provides vendors with quick access to key business areas such as purchase order confirmations, vendor bidding, consignment inventory, and invoicing. The home page layout is designed for ease of navigation and can be customized to reflect your organization's branding and communication style.

The content displayed on the home page is dynamically personalized based on the vendor's profile and access permissions.

The following screenshot shows an example of the supplier portal home page.



Workspaces section

The **Workspaces** area provides a consolidated view of vendor-related activities. Each workspace panel displays key metrics and links directly to detailed pages.

Expand table

Panel	Description	Example metrics
Vendor bidding	View and respond to requests for quotation (RFQs).	New invitations, Returned, In progress, Awarded
Purchase order confirmation	Manage and confirm purchase orders.	For review, Awaiting customer action, Open confirmed PO
Consignment inventory	Track consignment stock and consumption status.	On hand CI, PO consuming CI
Invoicing	View and manage invoice submissions and approvals.	Submitted, Approved, Paid

> **Note**
>
> Record counts are calculated based on the signed-in user's access rights. The workspaces section is hidden for prospective vendors who aren't yet fully approved.

Essentials section

The **Essentials** section provides quick links to the most frequently used pages and management functions.

Vendor details

The **Vendor details** panel provides quick links to the pages where you maintain your organization's profile, legal entity information, and portal user accounts. The following table describes each link.

Expand table

Link	Description
Global vendor setup	View, edit, and manage information related to the global vendor profile.
Local vendor details	View, edit, and manage information related to local vendor entities.
Users	View and manage user accounts related to the vendor organization.

Notifications

The **Notifications** panel provides updates and alerts about vendor data management activities, such as certificate expiration. Here you can:

- View recent notifications directly on the home page.
- **Dismiss** notifications you already reviewed.
- Select **View all notifications** to open the full list.

Help

The **Help** section offers guidance and support links for portal users. By default, the portal includes example links on the home page:

- **Terms & Conditions** – Legal information for using the supplier portal.
- **How to respond to a Purchase Order** – Step-by-step instructions for confirming or updating POs.
- **How to Add or Remove a User** – Guidance for managing user access.
- **Contact Support** – Direct link to customer support for technical or functional help.

These links are placeholders. Customize them to include your organization's actual help materials.

Home page versions based on global vendor status

The home page layout adapts depending on the global vendor's qualification status:

- **Qualified or Approved global vendor** – Displays the full home page, including **Workspaces**, **Essentials**, **Notifications**, and **Help** sections.
- **Prospective global vendor** – Shows a simplified version with introductory content and limited access. Workspace tiles and transactional data are hidden.

Manage vendor details, local vendors, and users in the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

After completing onboarding, vendors can manage their organization's data and user access directly in the supplier portal.

- The **Global vendor setup** page provides a centralized interface for updating company details, contacts, certificates, and capabilities.
- The **Local vendor setup** page allows vendors to manage their records at the legal entity level, including ownership profiles, contact information, approved categories, and bank details.
- The **User management** page allows vendor administrators to control who has access to the portal, what roles they hold, and which vendors they can work with.

Global vendor setup

Use the **Global vendor setup** page to manage your organization's profile, contacts, certificates, and capabilities. The page provides a structured interface for maintaining accurate and up-to-date information that's essential for supplier engagement and compliance. To open the page, complete one of the following steps:

- From the home page, select **Global vendor setup** from the **Vendor details** tile.
- From the navigation menu, go to **Setup** > **Global vendor setup**.

The following table summarizes the settings available in the **Global vendor setup** page.

Expand table

Section	Description
General information	Maintain and update your core company profile, including the key organizational details required for supplier registration and business identification.
Ownership profile	Provide and manage your company ownership and business classification information for supplier diversity and business categorization purposes.
Contact information	Manage the primary company contact details used for communication and supplier-related correspondence.

Section	Description
Contact methods	Maintain the different communication channels associated with your company, including adding, updating, or removing contact methods as required.
Addresses	Manage your company address information by adding new addresses, updating existing address details, or removing outdated address records.
Contacts	Manage the contact persons associated with your organization, including maintaining active contact details and updating company representatives when needed.
Certificates	Manage compliance and certification records by maintaining certificate information, uploading supporting documents, and updating certification details as part of supplier compliance management.
Capabilities	Maintain and update your business capabilities, including areas of expertise, product categories, quality standards, and other capabilities that define your scope of supply. Make selections by using a tree-structured control that the buyer configures.

View and manage local vendors

Use the **Local vendor setup** page to view and manage your records at the legal entity level. The page provides a structured interface for maintaining accurate and up-to-date information that's essential for supplier engagement and compliance. To open the page, follow these steps:

1. Do one of the following steps:

    - From the home page, select **Local Vendor Setup** from the **Vendor details** panel.
    - From the navigation menu, go to **Setup** > **For buyer's legal entities**.

2. Select the local vendor you want to work with.

The following table summarizes the key sections available in the **Local vendor setup** page.

Expand table

Section	Description
General information	Maintain and update the local vendor profile, including the key organizational details required for supplier registration and business identification.
Ownership profile	Provide and manage company ownership and business classification information for supplier diversity and business categorization purposes.
Vendor contacts	Manage the local vendor contact details and add or remove contact persons as needed.

Section	Description
Approved categories	View the product categories that the local vendor is approved by the buyer to supply. These categories are defined by the buyer and used for procurement classification and sourcing purposes.
Category requests	Submit requests to become an approved supplier for additional product categories. These requests are subject to buyer approval and used for procurement classification and sourcing purposes.
Certificates	Manage compliance and certification records by maintaining certificate information, uploading supporting documents, and updating certification details as part of supplier compliance management.
Capabilities	Maintain and update your business capabilities, including areas of expertise, product categories, quality standards, and other capabilities that define your scope of supply. Make selections by using a tree-structured control that the buyer configures.
Bank details	View and manage the bank account information associated with the local vendor for payment processing and financial transactions.

Localization

Some global and local vendor fields and sections are relevant only for specific countries or regions. The system automatically shows or hides these fields and tabs based on the vendor's legal entity. This feature ensures that vendors see only the information required for their local regulatory and business requirements. Country/region-specific sections include:

- **Ownership profile**
- **Business information**
- **State tax IDs**

Manage portal users

The supplier portal provides user management capabilities that vendor administrators can use to control who has access to the portal, what roles they hold, and which vendors they can work with. The **User management** page in the supplier portal provides:

- A list of all current portal users.
- The ability to create new portal user requests.
- A list of submitted access requests with their status.

To open the **User management** page, sign in to the supplier portal and complete one of the following steps: - From the home page, select **Users** from the **Vendor details** panel. - From the

navigation menu, go to **Setup** > **Users**.

Request to add a new user

Vendors can request to add new users by submitting an access request. This process ensures that requests are reviewed and approved before the user receives access. You can grant global or local access, depending on the scope of work.

To create a new user request, follow these steps:

1. Open the **User management** page.
2. In the **Access requests** section, select **Request access**.
3. Fill out the request form and select **Submit**.

Personnel from the purchaser company use the Supplier Engagement app review and approve the portal user access request.

Manage existing users

After you provision a user, you can update their access and roles. The supplier portal supports role changes, vendor assignments, and deactivation to maintain proper access control.

Changes you make in the Supplier Engagement app automatically synchronize with Supply Chain Management, updating user access rights accordingly.

Assign or remove roles or local vendor access

Roles define what a portal user can do. A user can act as an administrator or a standard user. Vendor access controls which vendor records a user can view or manage. This access is useful when a supplier operates across multiple entities but users only need access to certain vendors. Global Vendor Administrators can change roles as needed.

To manage roles and local vendor access, follow these steps:

1. Open the **User management** page.

2. In the **Portal users** section, select a portal user's name to open their details.

3. Manage roles and local vendor access as follows:

    - To add a role, select **Add web role**. Then choose a role and select **Add**.
    - To remove a role, select the role to open a menu, and then select **Remove**.

- To add the users to a local vendor, select **Add vendor access**. Then choose the local vendors to assign and select **Submit**.
- To remove local vendor access, select the local vendor to remove to open a menu, and then select **Remove**.

4. Select **Submit** to save your changes and close the dialog.

Deactivate a user

When a user no longer requires access, administrators can deactivate the user. This action immediately prevents the user from signing in to the supplier portal.

To deactivate a user, follow these steps:

1. Open the **User management** page.
2. In the **Portal users** section, find the portal user you want to deactivate. At the right side of their row, open the **Options** (ellipsis) menu and select **Deactivate**.
3. Confirm the action. The system immediately revokes the user's portal access.

Supplier portal user profile and sign out (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal enables vendors to view and update their personal profile information, including contact details and preferences. Each portal user manages their profile settings individually, so changes don't affect other users or the vendor's organizational profile.

Access and edit your user profile

To view or edit your profile, follow these steps:

1. Select your user profile icon in the top-right corner of the portal.
2. Select **My Profile** from the drop-down menu.
3. On the **My Profile** page, view and update your information and preferences as needed.
4. Select **Submit** to apply your changes.

Sign out

To exit the portal, select your user profile icon in the top-right corner of the portal. Then, select **Sign Out** from the drop-down menu.

View and respond to RFQs in the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The **Vendor bidding** workspace in the supplier portal lets vendors view the requests for quotation (RFQs) that the buying company invited them to and submit bids. The workspace also shows all RFQs that the vendor lost or won.

Open the vendor bidding workspace

To open the **Vendor bidding** workspace, sign in to the supplier portal and complete any of the following steps:

- On the top navigation bar, select **Vendor bidding** and then select any of the views listed.
- On the home page, select any of the links in the **Vendor bidding** panel.

The workspace provides the following tiles. Each tile represents a category or status of RFQs. Each tile shows the number of RFQs in that category and provides a link to view the related list of RFQs.

- **Bid invites** – RFQs that the vendor is invited to respond to. This category includes RFQs where bidding can begin or where an amended RFQ requires a new submission.
- **Submitted** – RFQs the vendor submitted that are awaiting the purchaser's response.
- **In progress** – RFQs that the vendor or a contact person is working on but hasn't yet submitted.
- **Awarded** – RFQs where the purchaser awarded at least one line item in the vendor's bid.
- **Returned** – RFQs that the purchaser returned so the vendor can provide more information or update the bid.
- **Lost** – Bids where all lines are rejected and the bid is closed as lost.
- **Declined** – RFQs where the vendor declined to participate in bidding.

Bid on an RFQ

Bidding is the procedure through which a vendor submits an offer in response to an RFQ. To submit a bid, follow these steps:

1. Go to **Vendor bidding** > **Bid invites** and open the RFQ.

2. Examine the RFQ details, including the **General** tab for header information, the **Lines** tab for line items, and any amendments or comments provided by the purchaser.

3. Select **Bid** to start bidding on the RFQ.

4. Respond to the RFQ by entering your bid details. Work as follows:

    - When editing is enabled for bidding fields on the headers and lines of an RFQ, you can enter your bid directly in the **Lines** grid. Consider any additional bid information that you need to add to the line details.
    - At any time before the expiration date, save a bid by selecting **Save as draft** on the toolbar. This action lets you return later to finish and submit the bid. While you're working on a bid, and until you submit it, the bid is available in the **Bids in progress** section.
    - To remove all entered bid data on the **Lines** tab and restore the original RFQ details, select **Reset to default** on the toolbar.
    - To reset only one line, select **Reset line** from the line **Actions** column.
    - To work with alternates, select **Add alternate** or **Remove alternate** in the line grid. If the purchaser enables **Allow alternates on response lines** for a specific RFQ, you can only add alternate items for lines of the *Category* type.
    - When you're done reviewing and updating a line, select the check box in the **Done** column to mark it as complete.
    - To mark all lines as complete, select the **Mark as done** button at the top of the **Lines** grid.
    - The **Lines** and **Amendments** tabs include a **Communications** panel that vendors and purchasers can use to communicate.
        - Purchaser-provided information remains read-only. Vendor-added comments and attachments can be modified or removed.
        - Read and provide clarifications or notes in the **Comments** section.
        - Upload documents using the **Add Attachment** button.
    - If the Q&A feature is enabled for the RFQ, use the **Q&A** tab to ask questions and view answers from the purchaser. This tab is available if **Q&A** is set to *Yes* on the RFQ and is visible based on the cutoff date.
    - If any questions are shown on the **Questionnaire** tab, complete all required questions as part of the bid submission. You must complete the questionnaire in full before the system allows you to submit the bid.

5. Select **Submit** on the toolbar to submit the bid.

Recall and resubmit a bid

You can recall and update a submitted bid up until the expiration date.

1. Go to **Vendor bidding** > **Submitted** and open the bid.
2. To bring the bid back to an editable state, select **Recall** on the toolbar.
3. Make changes and resubmit before the RFQ expires.

Respond to a returned bid

If the purchaser returns a submitted bid, the vendor can find it on the **Returned** tile of the **Vendor bidding** workspace.

1. Go to **Vendor bidding** > **Returned** and open the returned bid.
2. Go to the **General** tab and check the **Reason Code** and **Reason comment** on the bid **General** tab.
3. Take the necessary actions and resubmit.

Decline an RFQ

If you don't want to bid on an RFQ, open it and select **Decline** from the toolbar. After you decline, you can't recall the action and enter a bid.

Amended RFQs

If the purchaser amends an RFQ, you must enter a new bid for it. Information about the amendment is on the **Amendments** tab of the RFQ page. Amended RFQs appear on the **Bid invites** page.

View and confirm purchase orders in the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The **Purchase order confirmation** workspace in the supplier portal lets vendors review, confirm, or respond to purchase orders (POs) that purchasers send. The portal provides a workspace where vendors can access all relevant POs, check their status, and take appropriate actions such as accepting, rejecting, or suggesting changes.

To open the **Purchase order confirmation** workspace, sign in to the supplier portal and complete any of the following steps:

- On the top navigation bar, select **Purchase orders** and then select any of the views listed.
- On the home page, select any of the links in the **Purchase order confirmation** panel.

The workspace displays tiles for the following statuses:

- **For Review** – POs that require a vendor response (unanswered or edited).
- **Awaiting Customer Action** – POs that await purchaser action after vendor response.
- **Pending delivery** – POs that the purchaser confirmed but aren't yet fully received.

Each tile shows the number of POs in that category and provides a link to view the related list of POs. Select a tile to view the list of POs in that status. From the list, you can open a PO to review its details and communicate with the purchaser as needed.

View and create invoices in the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal enables vendors to create, submit, and track invoices through the **Invoice management** workspace. Vendors can create invoices from purchase orders or as cost invoices, add lines and attachments, and monitor invoice status through to payment.

Prerequisites

To use the invoice management features in the supplier portal, the purchasing organization must set up the vendor invoice workflow as described in Configure Supplier Engagement features in Supply Chain Management.

Open the Invoice management workspace

To open the **Invoice management** workspace, sign in to the supplier portal and complete any of the following steps:

- On the top navigation bar, select **Invoices** and then select any of the views listed.
- On the home page, select any of the links in the **Invoicing** panel.

The workspace displays tiles for the following statuses:

The workspace displays a set of tiles, each of which represents an invoice status. Each tile displays a count of invoices in that status. Select a tile to view a list of invoices in that status. The following tiles are available in the **Invoice management** workspace:

- **Draft** – Invoices that the vendor created but didn't submit yet.
- **Submitted** – Invoices that the vendor submitted for approval but aren't yet approved.
- **Approved** – Invoices that are approved and waiting to be paid.
- **Paid** – Invoices that are fully paid.
- **Rejected** – Invoices rejected in the workflow.

Create and submit an invoice

To create an invoice from a purchase order, follow these steps:

1. Open the **Invoice management** workspace.
2. Select **New Invoice**.
3. In the **Create invoice** dialog, select one of the following options:

    - Select **Choose a purchase order** to create an invoice from an existing purchase order.
    - Select **Start from Scratch** to create a cost invoice that isn't associated with a purchase order.

4. Fill out the rest of the dialog to identify the vendor and purchase order, and enter details about the invoice. Then select **Submit**.
5. A detailed invoice form opens where you can add terms and conditions, lines, attachments, and other details.
6. Select **Save as draft** on the toolbar to save the invoice without submitting it. You can find and open your draft invoices by selecting the **Draft** tile of the **Invoice management** workspace.
7. To view details about charges and sales tax, select the **Total charges** or **Total sales tax** information icon at the top of the invoice form.
8. When the invoice is ready, select **Submit** on the toolbar to submit the invoice to the purchaser for approval.

> ⓘ **Note**
>
> The supplier portal only shows procurement categories that the current vendor has access to. Vendors that need additional procurement categories can request them through vendor management.

Recall an invoice

To recall an invoice and make corrections while it's still under review, follow these steps:

1. Open the **Invoice management** workspace and select the **Submitted** tile.
2. Open the invoice you want to recall.
3. On the toolbar, select **Recall**.
4. Confirm the action.
5. The details of the invoice are now editable. Make the necessary corrections and then select **Save as draft** or **Submit** on the toolbar. If you don't save or submit it, the invoice is deleted.

Track invoice status

To check the status of your invoices, open the **Invoice management** workspace and view the tiles for **Draft**, **Submitted**, **Approved**, **Paid**, and **Rejected** invoices.

View consignment details in the supplier portal (preview)

[This article is prerelease documentation and is subject to change.]

The supplier portal lets vendors view information about the stock level of products that they place in consignment with a customer. Vendors can also monitor consumption of their stock when the customer takes ownership of the inventory.

Work with the Consignment inventory workspace

The **Consignment inventory** workspace helps vendors track and manage consignment inventory. To open it, sign in to the supplier portal and complete any of the following steps:

- On the top navigation bar, select **Consignment inventory** and then select any of the views listed.
- On the home page, select any of the links in the **Consignment inventory** panel.

The workspace displays a set of tiles, each of which represents a status of consignment inventory. Each tile displays a count of items in that status. Select a tile to view a list of consignment inventory items in that status. The following tiles are available in the **Consignment inventory** workspace:

- **On-hand** – View the current stock owned by the vendor at the customer's warehouse. The page lists inventory owned by the vendor that is stored at the purchaser's warehouse.
- **Received items** – Track the inventory that the customer consumed after the inventory ownership change journal was posted. The page lists product receipt lines that were generated when ownership of the consignment inventory changed from the vendor to the customer. Select a purchase order number to view the related purchase order.
- **Consigned POs** – View purchase orders generated when consignment inventory is consumed and received. Select a purchase order number to view its details.
- **Invoiced POs** – View consignment purchase orders that were invoiced. Select a purchase order number to view header and line details, including consignment-inventory-specific fields.

Supplier Engagement frequently asked questions (preview)

[This article is prerelease documentation and is subject to change.]

Questions about Supplier Engagement often come up as organizations evaluate the solution, plan a rollout, or begin working with the supplier portal. This FAQ answers the questions that customers ask most often, covering global vendor management, how Supplier Engagement relates to the vendor collaboration interface, supported languages, and common sign-in issues.

Why should I adopt global vendors, and how do they differ from previous vendor management features in Supply Chain Management?

Global vendors give your organization a centralized way to manage supplier relationships across legal entities. Instead of maintaining the same supplier profile separately for each company, you use one master profile to consolidate shared information and connect it to released vendors in Supply Chain Management.

Unlike vendor records in Supply Chain Management, the global vendor record isn't transactional. Instead, it's the governing record for the following supplier information:

- Supplier identity and hold status
- Contact details and addresses
- Certifications and agreements
- Risk assessments and feedback
- Audit history and activities
- Ownership, offboarding, and termination details

Can I use the supplier portal and the vendor collaboration portal in parallel?

Yes. Supplier Engagement replaces the older vendor collaboration interface with broader capabilities, including global vendor data management, a dedicated Power Pages portal, and lifecycle processes such as qualification and termination. You can run both solutions in parallel

during the transition. Learn more in How Supplier Engagement compares to the vendor collaboration interface.

What happens to the existing vendor collaboration portal?

Enhancements to the vendor collaboration portal are on hold. Future strategic investment is planned for the supplier portal instead. Follow release communications for updates.

Is sealed bidding or public RFQ supported in Supplier Engagement?

No. The supplier portal doesn't currently support sealed bidding or public requests for quotation (RFQs). To learn more, see How Supplier Engagement compares to the vendor collaboration interface.

Who can use Supplier Engagement, and does it span multiple environments?

Supplier Engagement is only available for Microsoft finance and operations apps, such as Dynamics 365 Supply Chain Management. Organizations that run other enterprise resource planning (ERP) systems can't use the solution.

The solution is scoped to a single Finance and Operations instance. If you run several instances and want to share a vendor across them, you must implement a custom integration because out-of-the-box cross-instance vendor sharing isn't currently available.

Which languages does Supplier Engagement support?

In the current public preview release, the Supplier Engagement app is only available in US English (Microsoft locale identifier (LCID) 1033). If you created your Dataverse environment with a base language other than US English, the Supplier Engagement app might display a mixed-language UI, where labels provided by Dataverse appear in your selected base language while labels provided by the Supplier Engagement app appear in English.

You select your Dataverse environment's base language during provisioning and can't change it later, so we recommend that you install and test the preview version of the Supplier Engagement

app on a Dataverse environment that was created to use US English as its base language. Support for additional languages will be added for the general availability release.

Why do I see an *Invalid sign-in attempt* message when I open the supplier portal from an invitation email?

This message usually appears when your browser already has an active session for a different account, such as a Dataverse or Supply Chain Management administrator account. The supplier portal might automatically use that identity instead of the invited portal user.

To resolve the issue, follow these steps:

1. Copy the supplier portal link from the invitation email.
2. Open a new in-private or incognito browser window.
3. Paste the link into the new window.
4. Sign in with the portal user account that received the invitation.

A private browsing window prevents existing administrator sessions from interfering, and it ensures that the portal authenticates the correct supplier user. If the issue continues, verify that the invited account has the required portal access and roles.

Contract lifecycle management integration overview

Contract lifecycle management (CLM) helps organizations manage their contracts with suppliers. It's an important aspect of the source-to-pay process.

CLM helps streamline contract creation, negotiation, execution, and renewal processes. In this way, it reduces the time and resources that are required to manage contracts. In addition, CLM helps ensure that contracts comply with organizational policies and regulations. In this way, it reduces the risk of penalties and other negative consequences. CLM also helps improve visibility into contract performance. Therefore, organizations can make more informed decisions about their supplier relationships.

By integrating CLM into the source-to-pay process, organizations can improve their overall supply chain performance and deliver greater value to their customers.

Microsoft Dynamics 365 Supply Chain Management provides built-in capabilities that help you operationalize contracts through purchase agreements, rebate agreements, brokerage agreements, and regular purchase orders. However, to meet the needs of organizations that want more comprehensive CLM, Supply Chain Management also provides a common integration framework that lets you integrate with an external CLM system. By integrating with an external CLM system, you can add support for more advanced CLM processes, such as contract creation, authoring, redlining, negotiation, signing, amendment, and termination.

Although the CLM integration framework lets you integrate CLM with Supply Chain Management, it isn't a CLM solution. To take advantage of this feature, you must integrate it with an external CLM solution.

When you enable and configure the integration with an external CLM solution, the following contract flows are enhanced in Supply Chain Management:

- **Purchase agreements** – The purchase agreement lifecycle can be seamlessly managed between the external CLM system and Supply Chain Management.
- **Non-disclosure agreements (NDAs)** – The NDA lifecycle is managed in the external CLM system and accessible from Supply Chain Management.

The purchase agreement and NDA contract types represent two different types of integration. Purchase agreement contracts are deeply integrated with the purchase agreement source

document and process in Supply Chain Management. By contrast, the integration of NDA contracts is looser and more lightweight. An NDA contract represents a supplier contract from an external CLM system that doesn't directly affect any processes in Supply Chain Management. In Supply Chain Management, NDA contracts exist only as records on the **All contracts** page.

The feature is extensible. Therefore, you can integrate more contract flows and types as you require.

Next steps

- Enable and configure CLM integration
- Work with integrated CLM features

Last updated on 07/01/2026

Work with integrated CLM features

Article • 10/28/2024

This article explains how the addition of contract lifecycle management (CLM) integration affects the way that Microsoft Dynamics 365 Supply Chain Management works. It also explains where you can find CLM elements in the Supply Chain Management user interface (UI).

> **Note**
>
> These changes take effect only when the CLM integration feature is configured for and connected to a CLM solution. Learn how to enable the feature and set up the integration in Enable and configure CLM integration.

View and work with all integrated contracts

To work with integrated contracts in Supply Chain Management, go to **Procurement and sourcing** > **Contracts** > **All contracts**. On the **All contracts** page, you can perform the following actions:

- **View a list all contracts that were created by using your CLM system.** These contracts are synced from the external system and are read-only here. For each contract, you can view the current status, important dates, and other information.
- **Find a specific contract.** Use the **Filter** field and/or the filtering and sorting controls that are available through the column headings.
- **View, edit, or amend a specific contract.** Select the contract in the grid, and then, on the Action Pane, on the **Contract** tab, select **View**, **Edit**, or **Amend**. Each of these buttons opens the selected contract in your external CLM system. The availability of these buttons depends on how you configured the integration.
- **Add a new contract.** On the Action Pane, on the **Contract** tab, select **New** to open the contract creation page in your external CLM system. The availability of the **New** button depends on how you configured the integration.
- **View all purchase agreements that are associated with a specific contract.** Select the contract in the grid, and then, on the Action Pane, on the **Contract** tab, select **Purchase agreement**.

View contracts associated with a selected vendor

While you're working with a vendor record, you can easily identify which contracts are associated with that vendor. To view the contracts that are associated with a specific vendor, follow these steps.

1. Go to **Procurement and sourcing** > **Vendors** > **All vendors**.
2. Find and select the vendor that you want to work with. You must select only one vendor at a time.
3. On the Action Pane, on the **Procurement** tab, in the **Agreements** group, select **Contracts** to open the **All contracts** page. The page is filtered so that it shows only contracts from the selected vendor.

Purchase agreements with external CLM integration

When you're using CLM integration, purchase agreements work slightly differently than they work in a non-integrated Supply Chain Management system.

To view your purchase agreements, go to **Procurement and sourcing** > **Purchase agreements** > **Purchase agreements**. There, the following differences apply when you use CLM integration:

- The **Purchase agreements** list page includes the following new columns:
  - **Contract ID** – This column identifies any externally managed contract that is associated with each purchase agreement. The value is generated by and synced from the external CLM system. A purchase agreement can reference only one external contract.
  - **Contract status** – This column shows the status of contracts that exist in the context of an external contract.

- On the **Purchase agreements** details page, the **Header** tab includes a new **Contract** FastTab that has the following fields:

  - **Contract ID** – This field identifies any externally managed contract that is associated with the selected purchase agreement. The value is generated by and synced from the external CLM system.

  - **Status** – This field shows the status of contracts that exist in the context of an external contract. The value is synced from the external CLM system.

  - **Purchase agreement ownership type** – This field identifies the owner of the purchase agreement. It can have the following values:

    - *Supply Chain Management* – The purchase agreement was created directly in Supply Chain Management. All aspects of it must be managed by using Supply Chain Management instead of your external CLM system.
    - *External contract management* – The purchase agreement was created by a contract in an external CLM. Therefore, processing and editing options are limited in Supply Chain Management. For purchase agreements of this ownership type, the **Contract ID** and **Status** fields on the **Contract** FastTab have values. All edits and lifecycle changes are managed by the external CLM system, which automatically syncs updated values back to Supply Chain Management.

- No approval workflows are applied to purchase agreements where the **Purchase agreement ownership type** field is set to *External contract management*. In an integrated solution, a contract is approved by all relevant parties, signed, and executed by using the external CLM system. Any additional approval workflows that are applied in Supply Chain Management would disrupt the approval process that is already implemented in the external CLM system. Therefore, any workflow configuration in Supply Chain Management is bypassed. Instead, the external CLM system is responsible for updating the status of the purchase agreement status from *On hold* to *Effective*.

- If a purchase agreement that is owned by an external CLM system is selected, the following buttons are disabled on the **Purchase agreement** tab on the Action Pane of both the list page and the details page:

    - In the **Intercompany** group:
        - **Generate sales agreement**
        - **View sales agreement**

    - In the **Maintain** group:
        - **Activities**

    - In the **Generate** group:
        - **Confirmation and proforma confirmation**
        - **Proforma confirmation**

- A purchase agreement that is owned by an external CLM system can't be deleted from Supply Chain Management. Therefore, if a purchase agreement of this type is selected, the **Delete** button on the Action Pane is disabled.

- While a purchase agreement that is owned by an external CLM system is open, most of the fields on the **Header** tab of the **Purchase agreements** details page are read-only. Exceptions to this rule include the following fields:

- **Vendor reference**
- **External document reference**
- **Line matching policy**
- **Delivery address**
- **Payment specification**
- **Charges group**
- **Mode of delivery**
- **Buyer group**
- **Pool**
- **Shipping carrier**
- **Carrier service**
- **Carrier group**
- **Mode**
- **Route plan**
- **Transportation template ID**
- All fields on the **Financial dimensions** FastTab

Known limitations

CLM integration isn't supported for intercompany purchase and sales agreements.

Enable and configure CLM integration

Article • 03/13/2025

This article describes the configuration steps that must be completed to integrate Microsoft Dynamics 365 Supply Chain Management and third-party contract lifecycle management (CLM) providers. The configuration must be done in both Supply Chain Management and your CLM system before you can start to use the integration.

You can always manually configure the settings in Supply Chain Management as described in this article. However, in some cases, your CLM provider can remotely configure most of these settings instead. Learn more in Establish a connection from a CLM system to Supply Chain Management.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.42 or later.
- The feature that is named *Integrate with external contract lifecycle management systems* must be turned on in feature management.

Set up CLM connection parameters

To set up the connection to your external CLM system, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **CLM integration** > **Contract management parameters**.

2. On the **Connection** tab, on the **General** FastTab, set the following fields:

    - **Connection name** – Enter a name to identify the CLM system.
    - **Base URL** – Enter the host name of the external CLM service.
    - **External navigation base URL** – Some CLM providers might require an extra URL, but most don't. Leave this field blank unless your CLM provider or Microsoft Support tells you to set it.

3. On the Action Pane, select **Save**.

Set up external navigation links

External navigation links provide the capability to redirect users to an external CLM system where they can perform various actions. For example, they can create new contracts, edit existing contracts, and view contracts. These actions are optional, and the corresponding buttons appear on the contract page only after you configure the relevant external navigation links.

To configure external navigation links, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **CLM integration** > **Contract management parameters**.

2. On the **External navigation links** tab, on the toolbar, select **New**.

3. On the **New record** page, on the **General** FastTab, set the following fields:

    - **Navigation type** – Select one of the following values to specify the type of navigation link that you're setting up:
        - *New contract* – Settings for this record enable and configure the **New** button on the **All contracts** page.
        - *New contract from purchase agreement* – Settings for this record enable and configure the **New** button on the **Purchase agreements** page.
        - *Edit contract* – Settings for this record enable and configure the **Edit** button on the **All contracts** and **Purchase agreements** pages.
        - *Amend contract* – Settings for this record enable and configure the **Amend** button on the **All contracts** and **Purchase agreements** pages.
        - *View contract* – Settings for this record enable and configure the **View** button on the **All contracts** and **Purchase agreements** pages.

    - **Navigation name** – Enter a descriptive name for the record.

    - **Relative URL** – Enter the relative path from the base URL that is defined on the **Connections** tab to the page that should be opened when a user selects the button for the selected navigation type. You can view the full resulting URL in the **Absolute URL** field on the **Preview** FastTab.

    - **Action** – Select one of the following values to specify where the page should be opened when a user selects the button for the selected navigation type:
        - *Open in new tab* – Open the external page on a new browser tab.
        - *Open in existing tab* – Open the external page on the current browser tab.

4. On the **Navigation link query strings** FastTab, you can add any parameters that the CLM system requires to the URL. Use the toolbar buttons to add parameters to the

grid, or remove them, as you require. For each parameter, set the following fields:

- **Key** – Enter the key name of the parameter.
- **Value** – Enter the value of the parameter. To include dynamic values, you can insert supported placeholders be selecting them in a dropdown list. Placeholders are formatted as `%placeholder_name%`. They are replaced with actual values at runtime. You can construct a value that combines multiple placeholders and static text.

  The placeholders that are available for selection in the dropdown list are determined by the current context. This context depends on the navigation type and is derived from either the contract record or the purchase agreement record.

5. On the Action Pane, select **Save**.
6. Continue to work until you finish setting up all the external navigation links that you need.

Review the connection status

To review the current status of the connection between Supply Chain Management and the CLM system, follow these steps.

1. Go to **Procurement and sourcing** > **Setup** > **CLM integration** > **Contract management parameters**.
2. On the **Connection** tab, select the **Connection status** FastTab. Here, the connection status is indicated through one of the following values:

   - *Not started* – The system hasn't yet tried to connect.
   - *Connection establishment failed* – The system tried to connect but failed.
   - *Connection established* – The connection was established, and a handshake between the two systems succeeded.
   - *Configuration failed* – The connection is working, but at least one of the external navigation links isn't working.
   - *Ready* – The integration is ready to be used.

The connection status is based on information that your CLM system submits through the Supply Chain Management API. Learn how to set up your CLM system to return a value for this status indicator in Establish a connection from a CLM system to Supply Chain Management.

View and edit contract types

Contract types represent the types of external contracts that are either integrated with or accessible from Supply Chain Management. (Examples of external contracts include purchase contracts and non-disclosure contracts.) Contract types are used to help describe each contract that is listed on the **All contracts** page. In most cases, the values are submitted and maintained exclusively by your CLM provider.

To view the names and descriptions of the various contract types that are integrated with your CLM system, go to **Procurement and Sourcing** > **Setup** > **CLM integration** > **Contract types**. Although admins can add, edit, and remove values on the **Contract types** page, you typically should do so only at the direction of your CLM provider or Microsoft Support.

Data integration APIs

This article describes the integration patterns that are available in Microsoft Dynamics 365 Supply Chain Management. It also provides guidelines for syncing master data between Supply Chain Management and the contract lifecycle management (CLM) system.

The following table describes the recommended integration patterns for CLM integration.

Expand table

Pattern	Timing	Batch	Documentation
Data management package REST API	Asynchronous	Yes	Data management package REST API
OData	Synchronous	No	Open Data Protocol (OData)

Guidelines

You should select an integration pattern based on your data volume and real-time requirements.

- For high-volume master data, we generally recommend that you use the *Data management package REST API* pattern. For low-volume master data, use either the *Data management package REST API* pattern or the *OData* pattern.
- For integrations that require real-time data synchronization and error handling, we generally recommend that you use the *OData* pattern, provided that your peak data volume isn't excessively high. To handle large volumes of data, we recommend that you use the *Data management package REST API* pattern instead.

Learn more about the integration patterns and scenarios in Integration between finance and operations apps and third-party services.

Enable change tracking

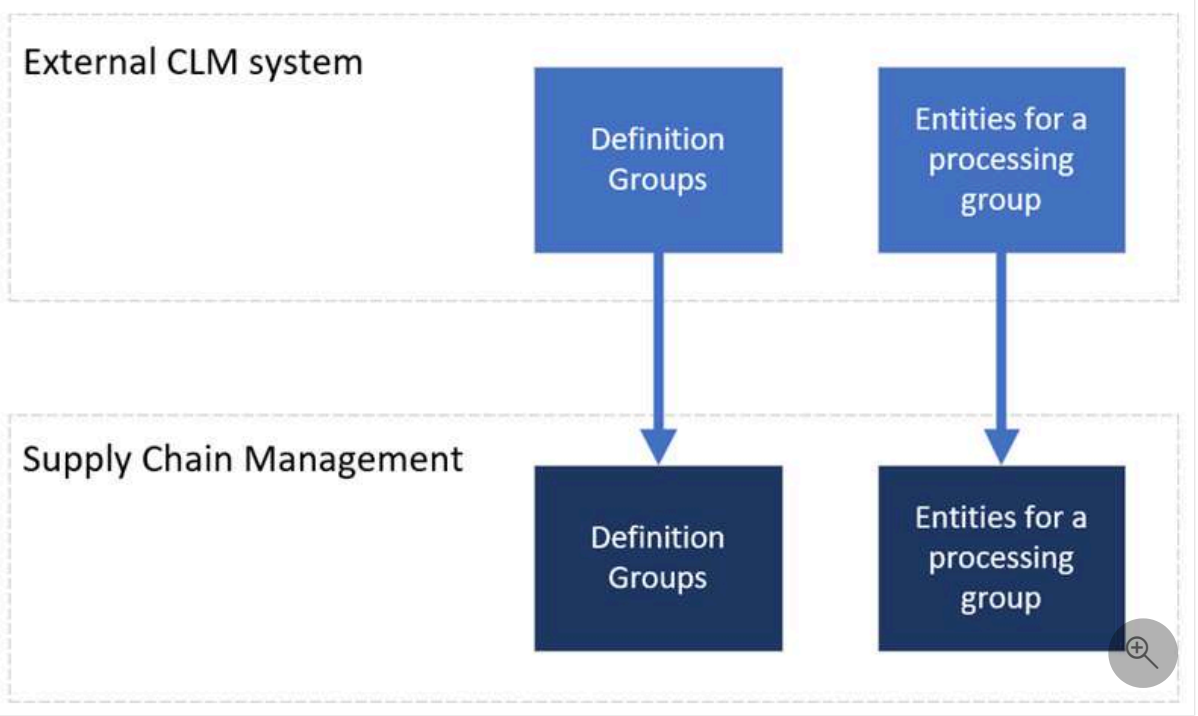
When you use the *Data management package REST API* integration pattern, you can enable change tracking for selected data entities. In this way, you enable *incremental exports*. In an incremental export, only changed records are exported.

Learn how to enable change tracking for an entity in Enable change tracking for entities.

Create data projects

As a prerequisite for using the *Data management package REST API* integration pattern, you must create a *data project* in the **Data management** workspace. You can manually create the data project in Supply Chain Management, or you can create it from the external system by using the *OData* pattern.

The following illustration shows how data projects are integrated and synced.



The following table lists the data entities that are available for the creation of a data project.

Expand table

Entity	Target entity	Public name (OData)	Company-specific	Direct
Definition Groups	`DataManagementDefinitionGroupEntity`	`DataManagementDefinitionGroups`	No	CLM - Supply Manag
Entities for a processing group	`DataManagementDefinitionGroupDetailEntity`	`DataManagementDefinitionGroupDetails`	No	CLM - Supply Manag

Learn more about data management and data import/export projects in Data management overview.

Configure and use service-based authentication

To gain access to the data entities through the API, your CLM system must authenticate with Supply Chain Management. Service-based authentication with Microsoft Entra ID provides a secure way to allow an external CLM system to connect with Supply Chain Management. To set up service-based authentication, follow these steps:

1. Register an application in Microsoft Entra ID. Make a note of the application ID (client ID) for the new application.

2. In Supply Chain Management, go to **System administration** > **Setup** > **Microsoft Entra ID applications**.

3. Add a row, and set the following fields for it:

    - **Client ID** – Enter the application ID (client ID) that you noted when you registered the application in Microsoft Entra ID.
    - **Name** – Enter a descriptive name of the application.
    - **User ID** – Select the service account to run the application under. We recommend that you create a new user and assign the *CLM integration role* role to it.

Learn how to register applications in Microsoft Entra ID and external applications in Supply Chain Management in Service endpoints overview.

After you register the Microsoft Entra ID application, you can use it to set up your external CLM system to authenticate with the Supply Chian Management API. Learn more about how authentication works in Authentication.

Establish a connection from a CLM system to Supply Chain Management

Article • 10/28/2024

This article explains how a third-party contract lifecycle management (CLM) provider can simplify the process of establishing connections by efficiently configuring the contract management parameters in Microsoft Dynamics 365 Supply Chain Management and initiating the connection. The process can be initiated from the CLM system. It seamlessly transfers all the required configuration settings to the Supply Chain Management system.

Most of the code examples in this article show how to *fetch* configuration information. However, a CLM provider can also use the same APIs to *post* configuration settings. Therefore, the provider can remotely configure the connection for their Supply Chain Management customers.

Access the data integration APIs

Learn which data integration APIs are available in Data integration APIs. There, you can also learn how to enable change tracking, and how to authenticate with Supply Chain Management so that your CLM system can access the data entities that are described in this article.

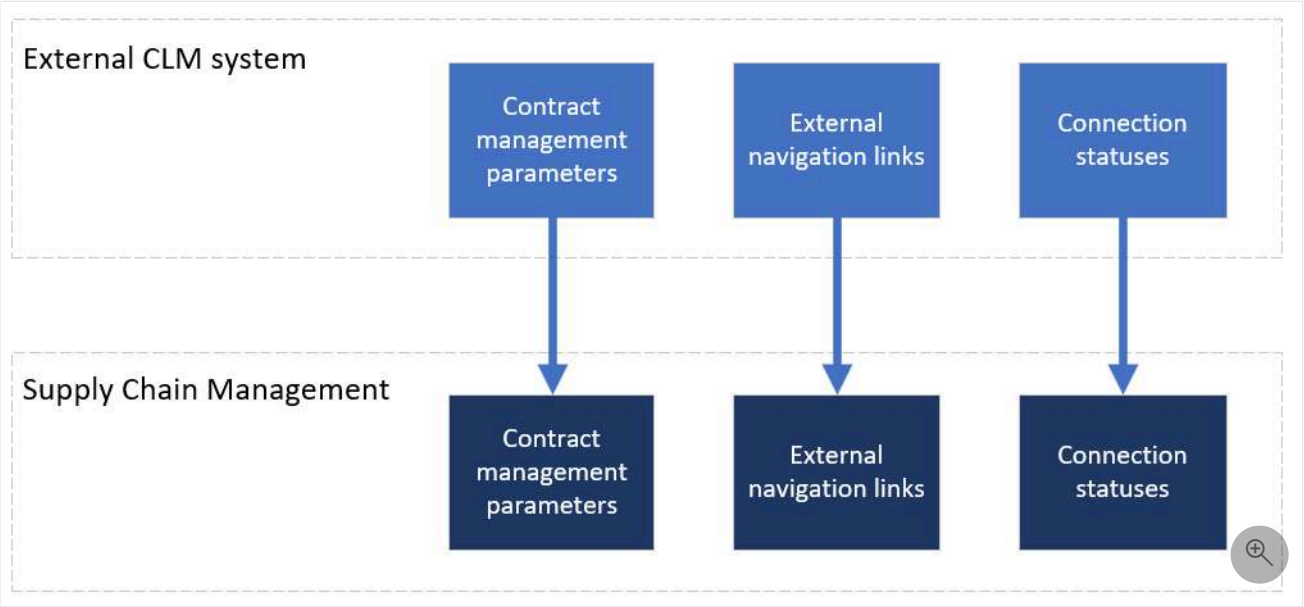
Available data entities

To streamline the connection process, Supply Chain Management offers built-in data entities that enable external CLM systems to automatically configure parameters and establish the connection. The following table describes the available data entities.

Expand table

Entity	Target entity	Public name (OData)	Purpose	Direction
CLM integration service instance	`CLMIntegrationServiceInstanceEntity`	`CLMIntegrationServiceInstances`	Set up contract management parameters.	CLM → Supply Chain Management
CLM integration external navigation links	`CLMIntegrationExternalNavigationLinkEntity`	`CLMIntegrationExternalNavigationLinks`	Set up external navigation links.	CLM → Supply Chain Management
CLM integration external navigation link key-value pairs	`CLMIntegrationExternalNavigationLinkKeyValueEntity`	`CLMIntegrationExternalNavigationLinkKeyValues`	Set up query strings for external navigation links.	CLM → Supply Chain Management

The following illustration shows the integration.



Important

Your CLM system must update the relevant status fields in the *CLM integration service instance* entity so that they reflect the **Connection status** indicator.

CLM integration service instance entity

The *CLM integration service instance* entity provides information about the instance of the CLM integration service that contains contract management parameters.

Expand table

Physical name	Property	Type	Description
`ID` (entity key)	ID	Int	The parameter key. The value should always be set to `0`.
`InstanceName`	Connection name	String	The connection name.
`BaseURL`	Base URL	String	The base URL.
`ExternalNavigationBaseURL`	External navigation base URL	String	The external navigation base URL.

The following example shows a request query for the *CLM integration service instance* entity.

HTTP

```
GET https://[baseURI]/data/CLMIntegrationServiceInstances
```

The following example shows a response to the preceding query.

JSON

```
{
    "ID": 0,
    "InstanceName": "CLM instance",
    "BaseURL": "https://clm-instance.com",
    "ExternalNavigationBaseURL": "https://clm-instance.com"
}
```

The CLM integration external navigation links entity

The *CLM integration external navigation links* entity provides information about external navigation links.

Expand table

Physical name	Property	Type	Description
`ServiceInstanceName`	Connection name	String	The instance name.
`NavigationType` (entity key)	Navigation type	Enum	The navigation type. The possible values are `ViewContract`, `EditContract`, `NewContract`, `NewContractFromPurchAgreement`, and `AmendContract`.
`NavigationName`	Navigation name	String	The navigation name.
`RelativeURL`	Relative URL	String	The relative URL.
`Action`	Action	Enum	The action that is performed. The possible values are `OpenInNewTab` and `OpenInExistingTab`.

The following example shows a request query for the *CLM integration external navigation links* entity.

HTTP

```
GET https://[baseURI]/data/CLMIntegrationExternalNavigationLinks
```

The following example shows a response to the preceding query.

JSON

```
{
    "ServiceInstanceName": "CLM instance",
    "NavigationType": "ViewContract",
    "NavigationName": "View contract",
    "RelativeURL": "/view",
    "Action": "OpenInNewTab"
}
```

The CLM integration external navigation link key-value pairs entity

The *CLM integration external navigation link key-value pairs* entity provides information about the key-value pairs for external navigation links.

Expand table

Physical name	Property	Type	Description
`NavigationType` (entity key)	Navigation type	Enum	The navigation type. The possible values are `ViewContract`, `EditContract`, `NewContract`, `NewContractFromPurchAgreement`, and `AmendContract`.
`KeyValueType` (entity key)	Key-value type	Enum	The key-value type. `QueryString` is the only allowed value. (The other possible value, `Header`, isn't supported.)
`Key` (entity key)	Key	String	The key.
`Value`	Value	String	The value.

The following example shows a request query for the *CLM integration external navigation link key-value pairs* entity.

HTTP

```
GET https://[baseURI]/data/CLMIntegrationExternalNavigationLinkKeyValues
```

The following example shows a response to the preceding query.

JSON

```
{
    "NavigationType": "ViewContract",
    "KeyValueType": "QueryString",
    "Key": "id",
    "Value": "%CLMIntegrationContractTable.ExternalContractId%"
}
```

Update the connection status

To clearly reflect the connection status, the CLM system must use the *CLM integration external navigation links* entity to update the following two statuses:

- `CLMIntegrationServiceInstanceEntity.EstablishmentStatus` – This status indicates whether a connection was established, so that the external CLM system can communicate with Supply Chain Management. The following values are used to report the connection status:
  - `NotStarted` – Establishment of a connection hasn't yet begun.
  - `Success` – A connection was successfully established.
  - `Error` – Establishment of a connection failed.
- `CLMIntegrationServiceInstanceEntity.ConfigurationStatus` – This status indicates whether external navigation links were configured. The following values are used to report the configuration status:
  - `NotStarted` – Configuration of external navigation links hasn't yet begun.
  - `Success` – External navigation links were successfully configured.
  - `Error` – Configuration of external navigation links failed.

Administrators can read status information on the **Contract management parameters** page in Supply Chain Management. Learn more in Enable and configure CLM integration.

The following example shows a request query to update the status on the *CLM integration service instance* entity.

HTTP

```
PATCH https://[baseURI]/data/CLMIntegrationServiceInstances(ID=0)
```

JSON

```
{
    "EstablishmentStatus": "Success",
    "ConfigurationStatus": "Error"
}
```

Synchronize master data

Article • 10/28/2024

This article describes the data entities and integration methods that you can use to sync master data between Microsoft Dynamics 365 Supply Chain Management and an external contract lifecycle management (CLM) system. Master data is essential for the CLM system to integrate contracts and related purchase agreements into Supply Chain Management. Supply Chain Management functions as the master system for providing the master data.

Access the data integration APIs

Learn which data integration APIs are available in Data integration APIs. There, you can also learn how to enable change tracking, and how to authenticate with Supply Chain Management so that your CLM system can access the data entities that are described in this article.

Available data entities

Supply Chain Management offers several out-of-box data entities that external CLM systems can use to sync master data. The following table describes the available data entities that are required for the synchronization of contracts and purchase agreements. Other data entities might be required, depending on your business requirements.

Expand table

Entity	Target entity	Public name (OData)	Company-specific	Required by	Direction
CLM integration contract types	`CLMIntegrationContractTypeEntity`	`CLMIntegrationContractTypes`	No	Contracts	CLM → Supply Chain Management
Legal entities	`OMLegalEntity`	`LegalEntities`	No	Contracts/Purchase agreements	Supply Chain Management → CLM
Vendors V2	`VendVendorV2Entity`	`VendorsV2`	Yes	Contracts/Purchase agreements	Supply Chain Management → CLM
Contacts V2	`smmContactPersonV2Entity`	`ContactPersons`	Yes	Contracts/Purchase agreements	Supply Chain Management → CLM
Purchase agreement classification	`PurchAgreementClassificationEntity`	Not applicable	No	Purchase agreements	Supply Chain Management → CLM
Sites V2	`InventOperationalSiteV2Entity`	`OperationalSitesV2`	Yes	Purchase agreements	Supply Chain Management → CLM
Warehouses	`InventWarehouseEntity`	`Warehouses`	Yes	Purchase agreements	Supply Chain Management → CLM
Procurement product categories	`CatProcurementProductCategoryEntity`	`ProcurementProductCategories`	No	Purchase agreements	Supply Chain Management → CLM
CLM integration released products	`CLMIntegrationReleasedProductEntity`	`CLMIntegrationReleasedProducts`	Yes	Purchase agreements	Supply Chain Management → CLM
Released product	`EcoResReleasedProductVariantV2Entity`	`ReleasedProductVariantsV2`	Yes	Purchase agreements	Supply Chain Management

Entity	Target entity	Public name (OData)	Company-specific	Required by	Direction
variants V2					→ CLM
Units	`UnitOfMeasureEntity`	`UnitsOfMeasure`	No	Purchase agreements	Supply Chain Management → CLM
Terms of payment	`PaymentTermEntity`	`PaymentTerms`	Yes	Purchase agreements	Supply Chain Management → CLM
Currencies	`CurrencyEntity`	`Currencies`	No	Purchase agreements	Supply Chain Management → CLM
Vendor payment method	`VendorPaymentMethodEntity`	`VendorPaymentMethods`	Yes	Purchase agreements	Supply Chain Management → CLM
Payment schedule	`PaymentScheduleEntity`	`PaymentSchedules`	Yes	Purchase agreements	Supply Chain Management → CLM
Terms of delivery	`DeliveryTermsEntity`	`DeliveryTerms`	Yes	Purchase agreements	Supply Chain Management → CLM
Projects	`ProjectEntity`	`Projects`	Yes	Purchase agreements	Supply Chain Management → CLM
Cash discount	`CashDiscountEntity`	`CashDiscounts`	Yes	Purchase agreements	Supply Chain Management → CLM
CLM integration country/regions	`CLMIntegrationAddressCountryRegionEntity`	`CLMIntegrationAddressCountryRegions`	No	Purchase agreements	Supply Chain Management → CLM

> **Note**
>
> Company-specific data entities include the `dataAreaId` field, which indicates the legal entity that a record belongs to. Your CLM system must adopt the same behavior to support both company-specific records and cross-company records. Learn more about cross-company behavior in Cross-company behavior of data entities.

The following illustration shows how master data is integrated and synced.

Synchronize contracts

Article • 10/28/2024

This article describes the scenarios, data entities, and integration methods that are available for the synchronization of contracts and related purchase agreements from an external contract lifecycle management (CLM) system to Microsoft Dynamics 365 Supply Chain Management. The integration process establishes a workflow that transfers contracts and related purchase agreements from the CLM system to Supply Chain Management. The CLM system is assumed to function as the master system for managing contracts.

Access the data integration APIs

Learn which data integration APIs are available in Data integration APIs. There, you can also learn how to enable change tracking, and how to authenticate with Supply Chain Management so that your CLM system can access the data entities that are described in this article.

Scenarios

Supply Chain Management supports the following integration scenarios:

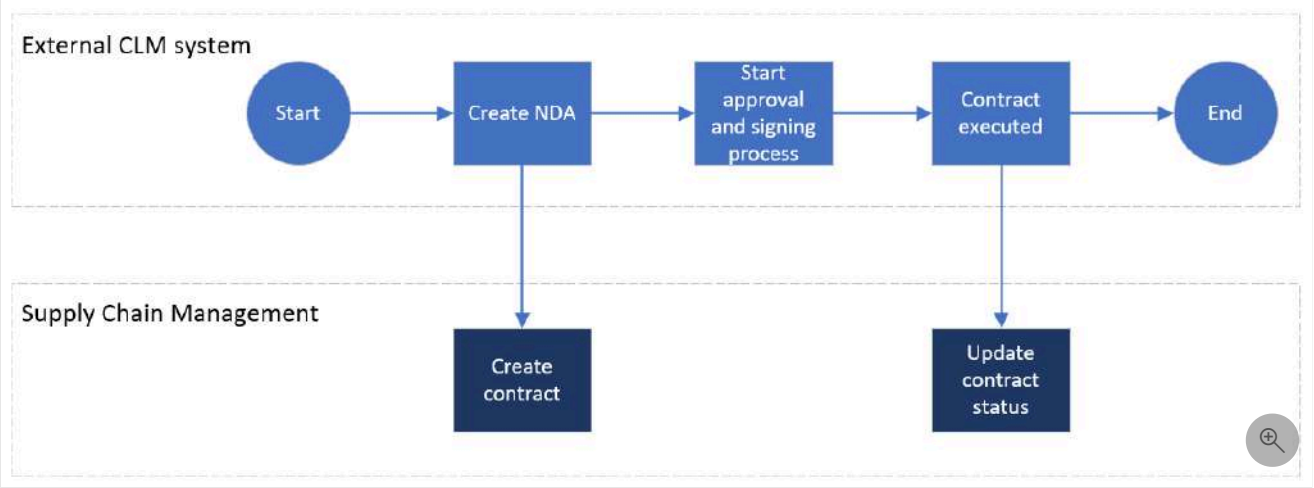
- Create a non-disclosure agreement (NDA)
- Create a purchase contract
- Create a contract amendment

This section outlines each scenario and provides a process diagram for it.

Create an NDA

NDAs are independent contracts that aren't related to any document in Supply Chain Management. The integration points involve creating the contract and updating its status after it's approved and signed.

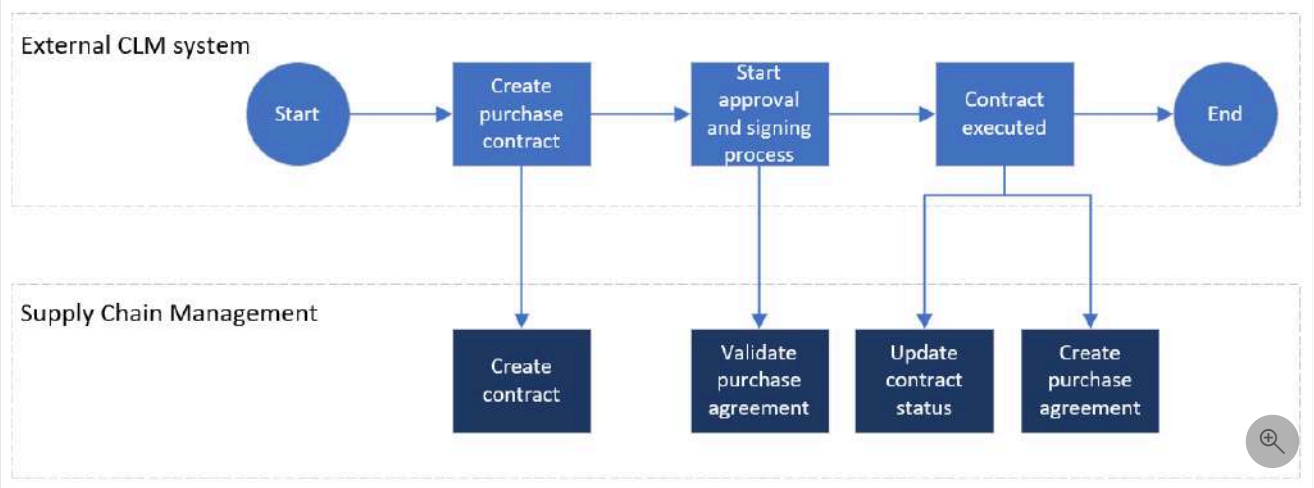
The following illustration shows how NDAs are created and synced between systems.



Create a purchase contract

Purchase contracts are contracts that are associated with a purchase agreement in Supply Chain Management. The integration points include creating the contract, validating the purchase agreement, submitting it for approval and signing, updating the contract's status after it's approved and signed, and eventually creating the purchase agreement.

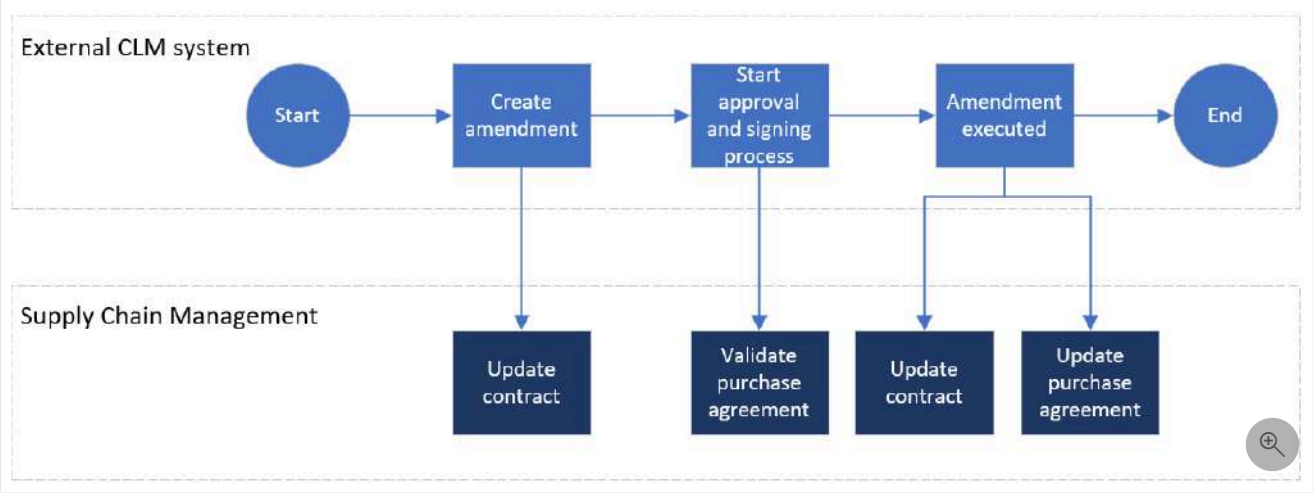
The following illustration shows how purchase contracts are created and synced between systems.



Amend a contract

Purchase contract amendments and NDA amendments are documents that change the terms of an existing agreement. The integration points include updating the contract with amendment information, validating the purchase agreement, submitting it for approval and signing, updating the contract's status after it's approved and signed, and eventually updating the purchase agreement. In Supply Chain Management, the amendment information is updated in the same contract and purchase agreement record.

The following illustration shows how contract amendments are created and synced between systems.



Available data entities for syncing contracts and purchase agreements

Supply Chain Management offers several out-of-box data entities that external CLM systems can use to sync contract data. The following table describes the available data entities that are required for the synchronization of contracts and purchase agreements.

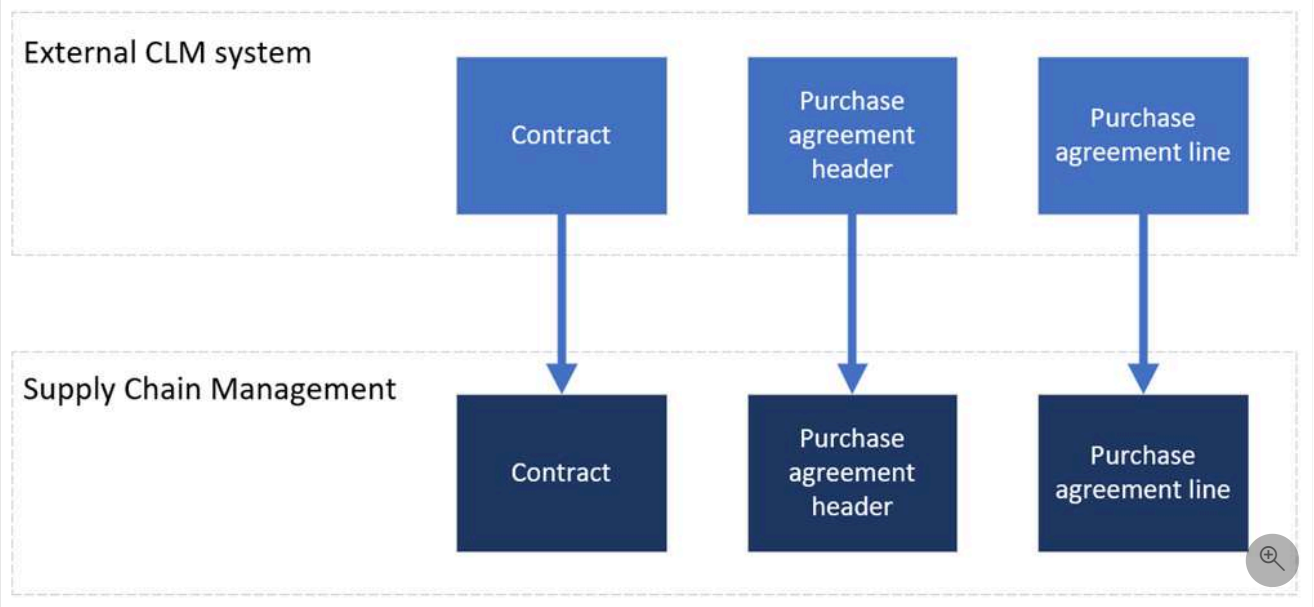
Expand table

Entity	Target entity	Public name (OData)	Company-specific	Direction
CLM integration contract	`CLMIntegrationContractEntity`	`CLMIntegrationContracts`	Yes	CLM → Supply Chain Management
CLM integration purchase agreements	`CLMIntegrationPurchaseAgreementHeaderEntity`	`CLMIntegrationPurchaseAgreements`	Yes	CLM → Supply Chain Management
CLM integration purchase agreement lines	`CLMIntegrationPurchaseAgreementLineEntity`	`CLMIntegrationPurchaseAgreementLines`	Yes	CLM → Supply Chain Management

ⓘ Note

Company-specific data entities include the `dataAreaId` field, which indicates the legal entity that a record belongs to. Your CLM system must adopt the same behavior to support both company-specific records and cross-company records. Learn more about cross-company behavior in Cross-company behavior of data entities.

The following illustration shows how contracts and purchase agreements are integrated and synced.



Contract entity

The *CLM integration contract* entity provides information about the contract. The following table describes its properties.

Expand table

Physical name	Property	Type	Description
`ContractId` (entity key)	Contract ID	String	The contract identifier in the CLM system.
`LegalEntityId` (entity key)	Legal entity ID	String	The legal entity ID.
`ExternalContractId`	External contract ID	String	The internal, system-generated contract identifier in the CLM system.
`ContractType`	Contract type	String	The contract type name reference.
`ContractStatus`	Contract status	Enum	The contract status. The possible values are `Draft`, `WaitingForApproval`, `Approved`, `Rejected`, `WaitingForSignatures`, `WaitingForExternalSignatures`, `WaitingForInternalSignatures`, `Executed`, `Terminated`, `Expired`, `OnHold`, `Cancelled`, `WaitingForReview`, and `Reviewed`.
`ContractName`	Contract title	String	The contract title.
`EffectiveDate`	Effective date	Date	The effective date.
`ExpirationDate`	Expiration date	Date	The expiration date.
`RequesterWorkerName`	Requester name	String	The name of the requester worker. If the specified worker name isn't found in the system, the `RequesterWorkerEmail` field is used to identify the worker.
`RequesterWorkerEmail`	Requester email	String	The email address of the requester worker.
`AccountType`	Account type	Enum	A value that determines the type of contracting party. The possible values are `Vend`, `Cust`, and `Party`.
`AccountRelationId`	Account number	String	The contracting account identifier that corresponds to the specified account type.
`PartyNumber`	Party ID	String	The party number in the global address book.
`ContactPersonId`	Contact person ID	String	The contact person ID.

Physical name	Property	Type	Description
`LatestAmendmentId`	Latest amendment ID	String	The latest amendment identifier in the CLM system.
`LatestExternalAmendmentId`	Latest amendment external ID	String able	The internal, system-generated latest amendment identifier in the CLM system.
`AmendmentInProcess`	Amendment in process	Enum	A value that indicates whether amendment is in progress. The possible values are `Yes` and `No`.

The following example shows a request query for the *CLM integration contract* entity.

HTTP

```
GET https://[baseURI]/data/CLMIntegrationContracts
```

The following example shows a response to the preceding query.

JSON

```
{
    "ContractId": "C00001",
    "LegalEntityId": "USMF",
    "ExternalContractId": "EXTC00001",

    "LatestExternalAmendmentId": "EXTA00001",
    "AmendmentInProcess": "No"
}
```

Purchase agreement header entity

The *CLM integration agreement header* entity provides information about the purchase agreement header. The following table describes the most common properties of this entity. You might also use other properties, depending on your business requirements.

Expand table

Physical name	Property	Type	Description
`PurchaseAgreementId` (entity key)	Purchase agreement ID	String	The purchase agreement identifier from Supply Chain Management.
`BuyingLegalEntityId` (entity key)	Legal entity ID	String	The legal entity ID.
`ExternalContractId`	External contract ID	String	The internal, system-generated purchase agreement identifier in the CLM system.
`ContractId`	Contract ID	String	The contract identifier reference that is used to associate the purchase agreement with the contract.
`ContractLegalEntity`	Contract legal entity ID	String	The contract legal entity identifier reference that is used to associate the purchase agreement with the contract.
`AgreementOwnership`	Purchase agreement ownership type	Enum	The ownership type of the purchase agreement. The possible values are `SCM` and `CLM`.
`AgreementStatus`	Agreement status	Enum	The purchase agreement status. The possible values are `OnHold`, `Effective`, and `Closed`.
`DocumentTitle`	Document title	String	The document title.
`PurchaseAgreementClassificationName`	Purchase agreement	String	The purchase agreement classification name reference.

Physical name	Property	Type	Description
	classification		
`DefaultEffectiveDate`	Default effective date	Date	The default effective date.
`DefaultExpirationDate`	Default expiration date	Date	The default expiration date.
`AgreementVendorAccountNumber`	Vendor account	String	The agreement vendor account reference.
`InvoiceVendorAccountNumber`	Invoice account	String	The invoicing vendor account reference.
`VendorReference`	Vendor reference	String	The vendor reference.
`PrimaryResponsibleWorkerEmail`	Primary responsible worker email	String	The email address of the primary responsible worker.
`PrimaryResponsibleWorkerName`	Primary responsible worker name	String	The name of the primary responsible worker. If the specified worker name isn't found in the system, the `PrimaryResponsibleWorkerEmail` field is used to identify the worker.
`SecondaryResponsibleWorkerEmail`	Secondary responsible worker email	String	The email address of the secondary responsible worker.
`SecondaryResponsibleWorkerName`	Secondary responsible worker name	String	The name of the secondary responsible worker. If the specified worker name isn't found in the system, the `SecondaryResponsibleWorkerEmail` field is used to identify the worker.
`CashDiscountCode`	Cash discount	String	The cash discount.
`ContactPersonId`	Contact person ID	String	The contact person ID.
`CurrencyCode`	Currency	String	The currency.
`DefaultCommitmentType`	Default commitment type	Enum	The default commitment type. The possible values are `ProductQuantity`, `ProductVolume`, `ProductCategory`, and `ProductRootCategory`.
`BuyerGroupId`	Buyer group ID	String	The buyer group ID.
`ProjectId`	Project ID	String	The project ID.
`PaymentTermsName`	Payment terms	String	The payment terms.

```

Purchase agreement line entity

The *CLM integration purchase agreement line* entity provides information about the purchase agreement line. The following table describes the most common properties of this entity. You might also use other properties, depending on your business requirements.

Expand table

Physical name	Property	Type	Description
`PurchaseAgreementId` (entity key)	Purchase agreement ID	String	The purchase agreement identifier reference.
`PurchaseAgreementLegalEntityId` (entity key)	Purchase agreement legal entity ID	String	The purchase agreement legal entity identifier reference.
`LineNumber` (entity key)	Line number	Real	The line number.
`ExternalContractId`	External contract ID	String	The internal, system-generated purchase agreement identifier reference in the CLM system. This field can be used instead of the `PurchaseAgreementId` field when a record is created.
`ExternalContractLineId`	External contract line ID	String	The internal, system-generated purchase agreement line identifier in the CLM system.
`CommitmentType`	Commitment type	Enum	The commitment type. The possible values are `ProductQuantity`, `ProductVolume`, `ProductCategory`, and `ProductRootCategory`.
`CommittedAmount`	Committed amount	Real	The committed amount for volume-based commitment types (`ProductVolume`, `ProductCategory`, and `ProductRootCategory`).
`CommittedQuantity`	Committed quantity	Real	The committed quantity for quantity-based commitment types (`ProductQuantity`).
`EffectiveDate`	Effective date	Date	The effective date.
`ExpirationDate`	Expiration date	Date	The expiration date.
`ItemNumber`	Item number	String	The item number. This field is required by the `ProductQuantity` and `ProductVolume` commitment types.
`ProductVariantNumber`	Product variant number	String	The product variant number. This field is relevant if the specified product contains product variants.
`ProcurementProductCategoryName`	Procurement category	String	The procurement category. This field is required by the `ProductCategory` commitment type.
`Price`	Item price	Real	The item price. This field is available for the `ProductQuantity` commitment type.
`PriceQuantity`	Price unit	Real	The item price unit. This field is available for the `ProductQuantity` commitment type.
`LineDiscountAmount`	Line discount amount	Real	The item line discount amount. This field is available for the `ProductQuantity` commitment type.
`LineDiscountPercentage`	Line discount percentage	Real	The line discount percentage. This field is available for all commitment types.
`MinimumReleaseAmount`	Minimum release amount	Real	The minimum release amount.
`MaximumReleaseAmount`	Maximum release amount	Real	The maximum release amount.
`IsCommitmentMaximumEnforced`	Is max enforced	Enum	A value that indicates whether a commitment maximum is enforced. The possible values are `Yes` and `No`.
`IsPriceAndDiscountFixed`	Is price and discount fixed	Enum	A value that indicates whether the price and discount are fixed. The possible values are `Yes` and `No`.
`UnitSymbol`	Unit of measure	String	The unit of measure.
`ProjectId`	Project ID	String	The project ID.

Physical name	Property	Type	Description
`ProjectCategoryId`	Project category ID	String	The project category ID.
`ProjectActivityNumber`	Project activity number	String	The project activity number.
`ReceivingSiteId`	Site	String	The site.
`ReceivingWarehouseId`	Warehouse	String	The warehouse.

The following example shows a request query for the *CLM integration purchase agreement line* entity.

HTTP

```
GET https://[baseURI]/data/CLMIntegrationPurchaseAgreementLines
```

The following example shows a response to the preceding query.

JSON

```
{
    "PurchaseAgreementId": "000026",

    "LineDiscountPercentage": 10,
    "MinimumReleaseAmount": 0,
    "MaximumReleaseAmount": 0,
    "IsCommitmentMaximumEnforced": "No",
    "IsPriceAndDiscountFixed": "No",
    "UnitSymbol": "",
    "ProjectId": "000057",
    "ProjectCategoryId": "ProjItem",
    "ProjectActivityNumber": "",
    "ReceivingSiteId": "",
    "ReceivingWarehouseId": ""
}
```

Purchase agreement validation entities

In the scenario for creating and amending purchase contracts, Supply Chain Management provides data entities that are designed for the validation of purchase agreements. These validation entities contain the same list of fields as regular entities, but they don't persist data in the database. Instead, they perform validation and return the result as an exception if a validation error occurs. The following table describes the data entities that are available for the validation of purchase agreements.

Expand table

Entity	Target entity	Public name (OData)	Validated operations	Compa specifi
CLM integration validation purchase agreements	`CLMIntegrationValidationPurchaseAgreementHeaderEntity`	`CLMIntegrationValidationPurchaseAgreements`	Update	Yes
CLM integration validate insert	`CLMIntegrationValidateInsertPurchaseAgreementLineEntity`	`CLMIntegrationValidateInsertPurchaseAgreementLines`	Insert	Yes

Entity	Target entity	Public name (OData)	Validated operations	Compa specifi
purchase agreement lines				
CLM integration update, delete validation purchase agreement lines	`CLMIntegrationValidateUpdateDeletePurchaseAgreementLineEntity`	`CLMIntegrationValidateUpdateDeletePurchaseAgreementLines`	Update, Delete	Yes

> **Note**
>
> As the preceding table shows, each validation entity can validate only specific database operations. No entity for validating purchase agreement insert operations is supported. Therefore, data can be validated only by persisting it through the regular `CLMIntegrationPurchaseAgreementHeaderEntity` entity.

Create shareable, secured deep links

The following APIs create shareable, secured URLs that point to specific pages in Supply Chain Management, such as the vendor, contract, or purchase agreement page. These URLs are also known as *deep links*.

The APIs enable scenarios such as embedding links directly in an external CLM system. In this way, users can quickly and easily find the specified pages and records just by selecting the link that is generated.

Learn more about deep links in Create shareable, secured URLs (deep links).

Generate a deep link for a vendor

This API generates a deep link that opens the page for a specific vendor in Supply Chain Management.

The following example shows a request for a deep link for a vendor.

HTTP

```
POST https://[baseURI]/data/VendorsV2/Microsoft.Dynamics.DataEntities.GenerateVendorDetailFormURL
```

JSON

```
{
    "_vendAccount": "1001",
    "_companyId": "USMF"
}
```

The following example shows a response to the preceding request.

JSON

```
{
    "@odata.context": "https://[baseURI]/data/$metadata#Edm.String",
    "value": "https://[baseURI]/?cmp=usmf&prt=initial&mi=display:VendTable&pageType=Details&q=[queryValue]"
}
```

Generate a deep link for a contract by contract ID

This API generates a deep link that opens the page for a specific contract in Supply Chain Management by using the contract ID.

The following example shows a request for a deep link for a contract by contract ID.

HTTP

```
POST
https://[baseURI]/data/CLMIntegrationContracts/Microsoft.Dynamics.DataEntities.GenerateContractDetailFormURLByContractId
```

JSON

```
{
    "_contractId": "C00001",
    "_companyId": "USMF"
}
```

The following example shows a response to the preceding request.

JSON

```
{
    "@odata.context": "https://[baseURI]/data/$metadata#Edm.String",
    "value": "https://[baseURI]/?cmp=usmf&prt=initial&mi=display:CLMIntegrationContractTable&pageType=Details&q=
[queryValue]"
}
```

Generate a deep link for a contract by contract external ID

This API generates a deep link that opens the page for a specific contract in Supply Chain Management by using the contract's external ID.

The following example shows a request for a deep link for a contract by contract external ID.

HTTP

```
POST
https://[baseURI]/data/CLMIntegrationContracts/Microsoft.Dynamics.DataEntities.GenerateContractDetailFormURLByExternalContr
actId
```

JSON

```
{
    "_externalContractId": "EXTC00001",
    "_companyId": "USMF"
}
```

The following example shows a response to the preceding request.

JSON

```
{
    "@odata.context": "https://[baseURI]/data/$metadata#Edm.String",
    "value": "https://[baseURI]/?cmp=usmf&prt=initial&mi=display:CLMIntegrationContractTable&pageType=Details&q=
[queryValue]"
}
```

Generate a deep link for a purchase agreement by agreement ID

This API generates a deep link that opens the page for a specific purchase agreement in Supply Chain Management by using the agreement ID.

The following example shows a request for a deep link for a purchase agreement by agreement ID.

HTTP

```
POST
https://[baseURI]/data/CLMIntegrationPurchaseAgreements/Microsoft.Dynamics.DataEntities.GenerateAgreementFormURLByAgreement
Id
```

JSON

```
{
    "_agreementId": "000026",
```

```
    "_companyId": "USMF"
}
```

The following example shows a response to the preceding request.

JSON

```
{
    "@odata.context": "https://[baseURI]/data/$metadata#Edm.String",
    "value": "https://[baseURI]/?cmp=usmf&prt=initial&mi=display:PurchAgreementDetails&pageType=Details&q=[queryValue]"
}
```

Generate a deep link for a purchase agreement by agreement external ID

This API generates a deep link that opens the page for a specific purchase agreement in Supply Chain Management by using the agreement's external ID.

The following example shows a request for a deep link for a purchase agreement by agreement external ID.

HTTP

```
POST
https://[baseURI]/data/CLMIntegrationPurchaseAgreements/Microsoft.Dynamics.DataEntities.GenerateAgreementFormURLByExternalContractId
```

JSON

```
{
    "_externalContractId": "EXT000026",
    "_companyId": "USMF"
}
```

The following example shows a response to the preceding request.

JSON

```
{
    "@odata.context": "https://[baseURI]/data/$metadata#Edm.String",
    "value": "https://[baseURI]/?cmp=usmf&prt=initial&mi=display:PurchAgreementDetails&pageType=Details&q=[queryValue]"
}
```

Integrate with Icertis for Microsoft Dynamics 365 Supply Chain Management

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Icertis for Microsoft Dynamics 365 Supply Chain Management is a full-featured third-party contract lifecycle management (CLM) solution that uses the CLM integration capabilities of Microsoft Dynamics 365 Supply Chain Management. This article provides an overview of Icertis for Microsoft Dynamics 365 Supply Chain Management. It summarizes the following aspects of the integrated solution:

- Capabilities
- Key features
- Benefits
- Setup

You can learn more about the solution on the Icertis for Microsoft Dynamics 365 Supply Chain Management page on Microsoft Marketplace.

Capabilities

Supply Chain Management provides functionality that streamlines and automates source-to-pay processes for organizations. Icertis for Microsoft Dynamics 365 Supply Chain Management enhances this functionality by integrating capabilities for contract authoring, assembly, redlining, and analytics. This integration supports the following workflows:

- **Contract authoring** – Create procurement contracts and non-disclosure agreements (NDAs) by using configured attributes, templates, clauses, master data, and rules. Use seeded configurations to get started right away, but tailor configurations to your business needs.
- **Reviews and negotiations** – Use preapproved legal templates and playbooks to review, redline, and approve contracts. After contracts are approved, you can seamlessly send them

for digital signature.

- **Post-execution workflows** – After a contract is executed, an associated purchase agreement is created in Supply Chain Management. The purchase agreement is created in an activated state for operational purposes such as creating release orders and invoicing.
- **Update contracts** – You can amend an executed contract by using the same safeguards that apply when new contracts are drafted. Additionally, contracts can be seamlessly terminated. In this case, the required due processes are followed.
- **Risk Assessment Copilot** – Risk Assessment Copilot significantly accelerates the contract review process. At the same time, it helps reduce risk by using AI to compare contract terms to a company's predefined risk parameters, based on the contract type.
- **Pre-seeded information** – Icertis for Microsoft Dynamics 365 Supply Chain Management includes extensive pre-seeded attributes and entities. Therefore, you can benefit from the integration without having to spend lots of time on implementation.

To learn more about Icertis for Microsoft Dynamics 365 Supply Chain Management, follow these steps:

1. Sign in to your Icertis Contract Intelligence (ICI) instance.
2. Select the **Help** button.
3. Go to Welcome to Icertis for Microsoft Dynamics 365 Supply Chain Management .

Key features

This section describes the key features of Icertis for Microsoft Dynamics 365 Supply Chain Management.

Manage and operationalize procurement contracts

Icertis for Microsoft Dynamics 365 Supply Chain Management offers a seamless source-to-contract workflow that includes an embedded experience in Supply Chain Management. This integration lets Supply Chain Management users take advantage of the robust CLM capabilities of Icertis to create and manage procurement contracts.

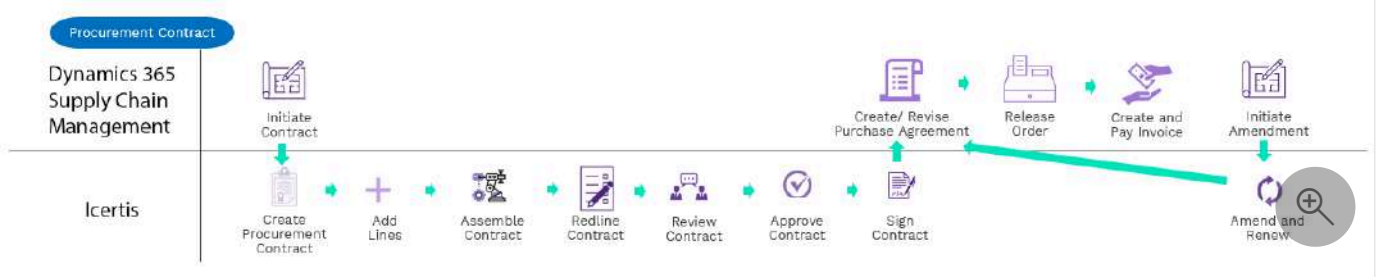
After you conclude a sourcing event and shortlist a vendor, you can initiate the creation of a procurement contract from Supply Chain Management. The embedded Icertis experience lets you perform the following actions:

- Define the terms, conditions, and specifics of the procurement contract with Icertis.
- Add line items for the procurement contract.

- Confirm that the pricing, quantities, and other terms are aligned with your business needs.
- Obtain all the required approvals.
- Validate the contract details to ensure that they comply with Supply Chain Management rules.
- Review and negotiate the contract with all relevant parties.
- Execute the contract.

After the Icertis procurement contract is executed, an effective purchase agreement is created in Supply Chain Management. The statuses of the Icertis procurement contract and the corresponding Supply Chain Management purchase agreements are regularly synced.

The following illustration shows the contract workflow between the two applications.



Create and manage NDAs

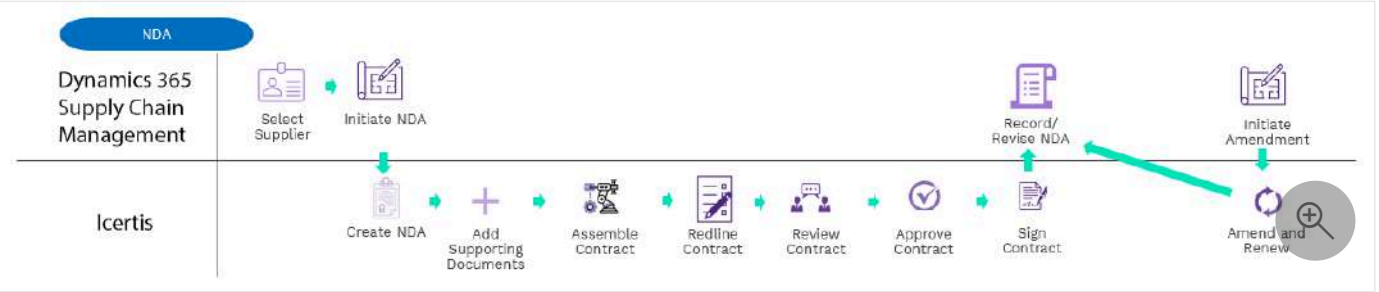
Icertis for Microsoft Dynamics 365 Supply Chain Management offers an embedded experience in Supply Chain Management. This integration lets you take advantage of the robust CLM capabilities of Icertis to create and manage NDAs.

After you decide to transact business with a vendor, you can initiate the creation of an NDA from Supply Chain Management. The embedded Icertis experience lets you perform the following actions:

- Specify effective dates, expiry dates, signature types, signatory details, and other details. The statuses of Icertis procurement contracts and their corresponding Supply Chain Management purchase agreements are regularly synced.
- Use a system-provided template, review details, and create and publish the contract.
- Add supporting documents, team members, and so on.
- Review and negotiate the contract with the vendor.
- After the agreement is approved, send it for signature.

NDAs can be amended, terminated, or updated as required. The process is similar.

The following illustration shows the NDA workflow between the two applications.



Amend and update agreements

Icertis for Microsoft Dynamics 365 Supply Chain Management offers options that let you update or modify executed contracts. You can add line items, modify expiry dates, or terminate contracts. Updates to contracts can trigger one of the following events:

- **Synchronize amendments** – The statuses of an Icertis procurement contract and the corresponding Supply Chain Management purchase agreements are regularly synced. Users can create amendments directly in Supply Chain Management. Contract managers can add an amendment to a signed or executed contract in Icertis. Downstream consumption then uses the revised information in Supply Chain Management.
- **Termination of contract** – If an Icertis procurement contract is terminated in Icertis Contract Intelligence (ICI), the associated purchase agreement in Supply Chain Management system is automatically terminated.
- **Reset expiry** – You can renew agreements or reset expiry dates as you require, based on your business needs.

Integrate master data

The integration of master data that stores less frequently changing data and business information enables all the previously mentioned workflows. The master data entity is based on attributes and rules. It can be reused for the various organizations that you work with.

Comprehensive pre-seeded information for seamless integration

Icertis for Microsoft Dynamics 365 Supply Chain Management includes extensive pre-seeded attributes and entities. This pre-seeded information enables the application and integration to work seamlessly. It also lets users benefit from the integration after only minimal implementation time.

If the pre-seeded attributes and entities require configuration, an administrator or implementation team can configure them.

The pre-seeded information includes the following elements:

- Data models for procurement contracts, NDAs, line items, and associated documents
- Attributes that are part of contract types and master data
- Master data and rules
- Standard reports and saved searches
- Clauses and templates
- eSign configurations
- Role–action mappings
- Entities for notifications, reasons, organizations, cascade teams, and implementation tasks

Risk Assessment Copilot

You can enhance the integration by adding Risk Assessment Copilot, which is powered by the Icertis ExploreAI Service. Risk Assessment Copilot significantly accelerates the contract review process. At the same time, it helps reduce risk by using AI to compare contract terms to a company's predefined risk parameters, based on the contract type.

Benefits

Icertis for Microsoft Dynamics 365 Supply Chain Management provides the following benefits:

- **Accelerate contract turnaround times** – The seamless integration enables organizations to quickly author and negotiate contracts, and operationalize them in Supply Chain Management.
- **Plug cost leakage** – Maximize the value of every contract by using the negotiated commercial terms and enforcing them during procurement and payable processes.
- **Effectively manage legal and business risks** – Manage legal and business risks by using preapproved legal templates and predefined corporate policies, and by constantly monitoring contractual obligations and service-level agreements (SLAs).
- **Effectively collaborate on contracts with all parties** – Reduce rework, improve supplier satisfaction, and help reduce risk exposure for your company through accurate redlining, versioning, and approval workflows. Enable secure communication with suppliers, customers, and partners.
- **Gain deeper insights into purchases and contracts** – Manage agreements across multiple departments to gain deeper insights. Align supplier and customer terms through AI-supported search, digitization, and negotiation.

Set up Icertis for Microsoft Dynamics 365 Supply Chain Management

To set up Icertis for Microsoft Dynamics 365 Supply Chain Management, follow these steps:

1. Purchase a subscription for Icertis for Microsoft Dynamics 365 Supply Chain Management.

   After the subscription is confirmed, the designated administrator receives an email from Icertis. This email includes instructions for downloading and deploying the package.

2. Deploy the package by using Microsoft Dynamics Lifecycle Service.

3. Optional: Configure single sign-on (SSO).

4. Configure ICI with attributes, templates, clauses, master data, rules, and other useful metadata to seamlessly integrate the two products.

To get detailed instructions for deploying the package and setting up an instance, follow these steps:

1. Sign in to your Icertis Contract Intelligence (ICI) instance.
2. Select the **Help** button.
3. Go to Icertis for Microsoft Dynamics 365 SCM Package Installation & Setup.

Use financial tags in procurement documents

Financial tags let you attach reporting context to procurement transactions. They help you track the business purpose behind purchases throughout the procurement lifecycle. For example, a company could tag all purchases related to an employee onboarding initiative, making it easy to find and analyze the associated spending later—without relying on document descriptions or manual tracking.

You can use financial tags across procurement documents, including purchase requisitions, purchase orders, purchase agreements, requests for quotation (RFQs), and inventory ownership change journals. Because financial tag values flow through the process from one document to the next (for example, from a purchase requisition to a purchase order), you can maintain consistent reporting context across the entire procurement lifecycle.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.49 or later.
- The feature named *Enable financial tags for purchase order invoicing* must be turned on in feature management.

How financial tags work in procurement

Financial tags in procurement follow the same general principles across all document types. Understanding these common behaviors helps you use tags consistently.

Header and line behavior

You can enter financial tag values on both document headers and document lines. The following rules apply across all procurement document types:

- Line-level tag values are the source of truth. A line-level change doesn't flow back to the header.

- When you add new lines, the header tag value can default to the line. However, a blank header value doesn't overwrite an existing line value—only populated header fields cascade to lines.
- Users can override financial tag values directly on individual lines, which allows different lines within the same document to carry different reporting context.

Tag propagation between documents

When one procurement document creates another document (for example, when you release a purchase requisition to a purchase order), financial tag values flow from the source document's lines to the target document's lines. The following rules apply:

- Tag propagation is always line-to-line. The source document's line-level tags are the primary source.
- If the source document has a single line, the target document's header can also receive the same tag value. If the source has multiple lines with different tag values, the target document's header remains blank to avoid ambiguity.
- Changing financial tags on a source document doesn't change documents that you already created from it. Earlier documents preserve the tag values that existed when they were created.

Editability

The following rules determine when you can edit financial tag values on procurement documents:

- You can edit financial tags while a document is in a draft or editable state.
- When a document enters a workflow for approval, the system typically locks the tags. Depending on the workflow configuration, the approver might be able to update them during review.
- After you post a document, its financial tag values are read-only.
- On purchase orders that you received but didn't post yet, you can edit financial tags in the same way that you can edit financial dimensions.

Create financial tags

You can create up to 20 financial tags as needed to meet your business needs. Set up each tag by assigning a name and a value type. The value type might ask users to select from a list of predefined values or allow them to enter free text. When you're working with a relevant procurement document, you can see the available financial tag names and enter values for them

as needed. The system stores the tag values with the document and uses them for reporting and analysis.

To create, edit, and activate financial tags, go to **General ledger** > **Chart of accounts** > **Financial tags** > **Financial tags**. Learn more about financial tags and how to set them up in Financial tags.

Financial tags on purchase requisitions

Procurement professionals use financial tags on purchase requisitions to capture the reporting context for each requisition line. When you enter tags here, they flow downstream into purchase orders when you release the requisition.

Set financial tag values on purchase requisitions

To set financial tag values for a purchase requisition, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase requisitions** > **All purchase requisitions**.
2. Create or open a purchase requisition.
3. On the **Lines** tab of the requisition details page, select or create a line that you want to assign a financial tag to.
4. On the **Line details** FastTab, open the **Financial tags** tab and set the desired financial tag values.

How financial tags behave on purchase requisitions

The following table describes how financial tags behave in purchase requisition scenarios.

Expand table

Scenario	Behavior
Entry point	Enter and maintain financial tags on requisition lines. Both item-number lines and procurement-category lines can carry financial tag values.
Line-level override	Users can update or add financial tag values directly on requisition lines. A line-level change doesn't update the requisition header and doesn't affect other lines. This behavior allows different requisition lines to carry different reporting context.
Workflow and approval	During review, an approver might be able to update the financial tags. After a requisition is recalled to draft, financial tags become editable again. After final approval, they aren't editable.
Release to purchase order	When you release an approved requisition (manually or automatically), the purchase order lines receive the financial tag values from the originating requisition lines.

Scenario	Behavior
Purchase order header outcome	If the requisition has a single line, the purchase order header can receive the same tag value as the requisition line. If the requisition has multiple lines with different tag values, the purchase order header remains blank.
Copying requisitions	When you copy a requisition or selected requisition lines, the new requisition lines retain the financial tag values from the source lines.
RFQ creation from requisition	When you create an RFQ from a requisition, financial tags are copied to the RFQ header and lines. However, changes made to the RFQ tags don't propagate back to the originating requisition.

Financial tags on purchase orders

Financial tags on purchase orders help you track the business purpose of each purchase throughout the order lifecycle, from creation through receipt and invoicing.

Set financial tag values on purchase orders

To set financial tag values for a purchase order, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase orders** > **All purchase orders**.
2. Create or open a purchase order.
3. To assign financial tags to the purchase order header, open the **Header** tab of the purchase order details page. Then expand the **Financial tags** FastTab and set the desired financial tag values.
4. To assign financial tags to a purchase order line, open the **Lines** tab of the purchase order details page. Then select or create the line that you want to assign a financial tag to. On the **Line details** FastTab, open the **Financial tags** tab and set the desired financial tag values.

How financial tags behave on purchase orders

The following table describes how financial tags behave in purchase order scenarios.

Expand table

Scenario	Behavior
Entry point	You can maintain financial tags on both the purchase order header and on purchase order lines.
Header-to-line defaulting	Line-level tag values can differ from the header. A line change doesn't flow back to the header. A blank header value doesn't overwrite an existing line value—only populated

Scenario	Behavior
	header fields cascade.
Existing lines	For existing purchase order lines, header-to-line updates are controlled by defaulting behavior. A blank header value doesn't overwrite an existing line value—only populated header fields cascade.
Line-level override	Users can update or add financial tag values directly on purchase order lines. A line-level change doesn't update the purchase order header and doesn't affect other lines. This behavior allows different purchase order lines to carry different reporting context.
From purchase requisition	Purchase order lines inherit financial tags from the linked purchase requisition lines. The purchase order header is populated from the requisition line only when the source requisition has a single line. For multi-line requisitions, the purchase order header remains blank.
Copying purchase orders	Copy behavior depends on the copy options. With precise line copy, line tags are copied line by line. With header copy, the purchase order header tag can be copied or overwritten. Without precise or header copy, tags can remain blank.
Copying from journals	When copying from confirmation journals, product receipts, or invoices, financial tags follow the same copy-option pattern: precise copy retains line tags, and non-precise header copy can apply header tags to new lines.
Version and history views	A confirmed purchase order version shows the tag values that existed at confirmation. Distribution views show the current financial tag values, which might differ if the purchase order was changed after confirmation.
Editability after receipt	You can edit tags on a received purchase order before posting, in the same way that you can edit financial dimensions at that stage. Tags on posted journals are read-only. Pending vendor invoice line tags are read-only, consistent with financial dimension behavior.

Financial tags on purchase agreements

Financial tags on purchase agreements let you capture agreement-specific reporting context that carries into release orders.

Set financial tag values on purchase agreements

To set financial tag values for a purchase agreement, follow these steps:

1. Go to **Procurement and sourcing** > **Purchase agreements** > **Purchase agreements**.
2. Create or open a purchase agreement.
3. To assign financial tags to the purchase agreement header, open the **Header** tab of the purchase agreement details page. Then expand the **Financial tags** FastTab and set the desired financial tag values.

4. To assign financial tags to a purchase agreement line, open the **Lines** tab of the purchase agreement details page. Then select or create the line that you want to assign a financial tag to. On the **Line details** FastTab, open the **Financial tags** tab and set the desired financial tag values.

How financial tags behave on purchase agreements

The following table describes how financial tags behave in purchase agreement scenarios.

Expand table

Scenario	Behavior
Entry point	You can enter financial tags on purchase agreement headers and lines for different agreement classifications, including bulk purchase, employee purchases, and general purchases.
Header-to-line defaulting	Line-level tag values can differ from the header. A line change doesn't flow back to the header. A blank header value doesn't overwrite an existing line value—only populated header fields cascade.
Existing lines	For existing agreement lines, header-to-line updates are controlled by defaulting behavior. A blank header value doesn't overwrite an existing line value—only populated header fields cascade.
Line-level override	Users can update or add financial tag values directly on agreement lines. A line-level change doesn't update the agreement header and doesn't affect other lines. This behavior allows different agreement lines to carry different reporting context.
Release to purchase order	When a release order creates a purchase order, the purchase order receives the financial tag values from the purchase agreement. The line value must be updated on the agreement line for the released purchase order to reflect it.
Historical purchase orders	Changing financial tags on a purchase agreement doesn't change purchase orders that you already created from that agreement. Earlier purchase orders preserve the tags that existed when they were created.

Financial tags on requests for quotation

Financial tags on requests for quotation (RFQs) help you maintain reporting context while soliciting bids from vendors. Tags flow into the resulting purchase order or purchase agreement when the RFQ is accepted.

Set financial tag values on RFQs

To set financial tag values for an RFQ, follow these steps:

1. Go to **Procurement and sourcing** > **Requests for quotation** > **All requests for quotation**.
2. Create or open an RFQ.
3. To assign financial tags to the RFQ header, open the **Header** tab of the RFQ details page. Then expand the **Financial tags** FastTab and set the desired financial tag values.
4. To assign financial tags to an RFQ line, open the **Lines** tab of the RFQ details page. Then select or create the line that you want to assign a financial tag to. On the **Line details** FastTab, open the **Financial tags** tab and set the desired financial tag values.

How financial tags behave on RFQs

The following table describes how financial tags behave in RFQ scenarios.

Expand table

Scenario	Behavior
Entry point	You can add financial tags on RFQ headers and lines for RFQs created with purchase type *Purchase order* or *Purchase agreement*. Header values can default to lines when you add them.
Header-to-line defaulting	Line-level tag values can differ from the header. A line change doesn't flow back to the header.
Line-level override	Buyers can change or add financial tag values directly on RFQ lines before the RFQ outcome is accepted. Line changes don't flow back to the RFQ header.
Vendor response	Vendors can't edit financial tag values when submitting RFQ responses. Financial tags are buyer-controlled context.
After vendor response	The buyer can continue to update financial tags after the vendor submits a response and before the RFQ is accepted.
RFQ to purchase order	When an RFQ for a purchase order is accepted, the generated purchase order receives the RFQ financial tag values at both header and line level. After creation, the purchase order follows standard purchase order financial tag rules.
RFQ to purchase agreement	When an RFQ for a purchase agreement is accepted, the generated purchase agreement receives the RFQ tag values.

Financial tags on inventory ownership change journals

Use financial tags on inventory ownership change journals to capture reporting context for consignment ownership transfers.

Set financial tag values on inventory ownership change journals

To set financial tag values for an inventory ownership change journal, follow these steps:

1. Go to **Procurement and sourcing** > **Consignment** > **Inventory ownership change**.
2. Create or open an inventory ownership change journal.
3. On the **Lines** tab of the inventory ownership change journal details page, select or create a line that you want to assign a financial tag to.
4. On the **Line details** FastTab, open the **Financial tags** tab and set the desired financial tag values.

How financial tags behave on inventory ownership change journals

The following table describes how financial tags behave in ownership change journal scenarios.

Expand table

Scenario	Behavior
Consignment replenishment	Financial tags aren't required when creating a consignment replenishment order or generating the product receipt for that replenishment order.
Ownership change journal	Enter financial tags on inventory ownership change journal lines. You can update saved journal lines before posting.
After posting	After the inventory ownership change journal is posted, its financial tag values aren't editable.
Auto-created purchase order	Posting the ownership change journal can generate a purchase order. The generated purchase order line receives the financial tag values from the journal line. The purchase order header doesn't receive those tags.
Purchase order editability	On the generated purchase order, users can add or edit financial tag values on fields that weren't populated by the ownership change journal, subject to normal purchase order editability rules.
Product receipt and invoice	Product receipt journal reporting is voucher-oriented rather than requiring editable line-level tags. Invoice line tags are read-only before posting, consistent with financial dimension behavior.

General financial tag behaviors

The following table summarizes a few financial tag behaviors that you might not expect, but that are based on intentional design decisions.

Expand table

Area	Behavior
Product receipt	Product receipt journal carries tags at the voucher level, not per line.
Purchase agreements	On header-to-line cascade, a blank header never overwrites an existing line value—only populated fields cascade.
Purchase agreements	Editing a purchase agreement's tags doesn't change purchase orders that were already created from it (historical values are preserved).
Purchase agreements and RFQs	A line-level tag change never flows back up to the header.
Purchase order copy	Copy behavior depends on the `copyHeader` and `copyPrecisely` options (header-only vs. line-precise).
Purchase order versions	A confirmed purchase order version shows the tag as of confirmation. View distributions shows the current value.
Purchase orders and consignment	Editing tags on a received (pre-posting) purchase order is allowed (same as financial dimensions). Posted-journal tags are read-only.
Purchase Requisition	Financial tags are supported for purchase requisition lines but not for purchase requisition headers.
Purchase requisition to purchase order	The created purchase order header tag equals the purchase requisition line tag, but only when the requisition has a single line. A multiline requisition leaves the purchase order header tag blank.
Purchase requisitions, purchase orders, and purchase agreements	Financial tag header and line behavior mirrors financial dimensions (header cascades to lines; line values are the source of truth).
RFQ to purchase requisition	Updated RFQ tags aren't propagated back to the originating purchase requisition.
RFQs	Vendors can't edit tags. The buyer can edit tags until the bid is accepted.

Procurement FAQ

06/17/2025

This article provides answers to frequently asked questions (FAQs) about the procurement functionality of Supply Chain Management.

Can I show only purchase orders that I created?

This functionality isn't currently available.

Can I reserve inventory and create transactions against registered inventory on a purchase order?

Issue description

Even when items are in a *Registered* state on a purchase order, you can still reserve the inventory. In other words, you can create transactions against the registered inventory.

Reproduce the issue

The following procedure shows one way to reproduce the issue.

1. Create a purchase order.
2. Register the purchase order line.
3. Notice that you can generate reservations or transactions against the registered inventory.

Issue resolution

This behavior is by design. The expectation is that the registered items have physically arrived in the warehouse or inventory, and that they're therefore available for reservation.

Can I find the user who canceled a purchase order?

This information is tracked only if the purchase order is subject to change management. If you use change management, you can see who submitted the change (the cancellation), and who approved it.

Why can't I link a purchase agreement to an existing purchase order?

A purchase agreement must be associated with a purchase order when the purchase order is created. Otherwise, purchase order lines can't be associated with purchase agreement lines.

What check triggers the "Update prices and discounts entered manually or external document" message?

When you change the shipping date, you might receive a message that states, "Update prices and discounts entered manually or external document." You receive this message because, if the shipping date is changed, a different trade or sales agreement might be triggered and cause a price change. A change to the shipping date can also affect warehouse schedules and other related information.

The message is triggered whenever any of the dates or some other parameters are changed. The purpose of the message is to make sure that you're aware of price changes that can occur because of those changes.

The message is the trade agreement evaluation (TAE) prompt. For a full description, see Trade agreement evaluation policies.

Why can't I post more than one invoice for a purchase order line that has category-based items?

A quantity is mandatory if you want to post invoices. Therefore, if the full quantity of a line has been invoiced for only a partial amount, you won't be able to invoice the remaining amount on another invoice.

This article provides information about product information management. Product information management works with a shared product definition, categorization, identifiers, and specific configurations of a product.

Product information is the backbone of supply chain and commerce applications across all industries. It refers to processes and technologies that focus on centrally managing information about products (for example, across supply chains). It's crucial that shared product definitions, documentation, attributes, and identifiers be used. In the various modules of a business solution, product-specific information and configuration are required to manage the business processes that are related to specific products, product families, or product categories.

Product definition

A product is primarily defined by a product number, name, and description. However, other data is also required to describe a product or service:

- Product type: Item or service
- Product subtype: Distinct products or product masters
- Definition of the product variant model:
  - Product dimensions and dimension groups
  - Product nomenclature
  - Product configuration models
- Association of the product with one or more categories
- Definition of the product and category attributes
- Product images
- Attachments
- Units of measure and related conversions

- Translations for all names and descriptions

Distribution, export, and import of product data

Create the product definition in Supply Chain Management. You can also import it from product lifecycle management (PLM), product data management (PDM), or product information management (PIM) systems. When you use more than one instance of Supply Chain Management, one instance typically acts as the master of the product data for all other instances. A large set of data entities supports this approach and enables the export and import of product definition data from one instance to another.

To support the distribution of product data to many instances, Supply Chain Management lets you use Microsoft Dataverse. You can export the product definitions from an instance of Supply Chain Management to Microsoft Dataverse. You can then use the product definitions to provision other business applications, such as Dynamics 365 Sales, with product data.

In dynamic and agile organizations, product information data changes every day. Therefore, maintenance of accurate and actual product data is a critical business process on its own.

Product masters and product variants

In an agile world, where products must be quickly adapted to customer requirements, product definitions specify a set of products instead of distinct products. In Supply Chain Management, those generic products are known as *product masters*. Product masters hold the definition and rules that specify how distinct products are described and behave in business processes. Based on these definitions, distinct products can be generated. These distinct products are known as *product variants*.

A product master is associated with a product dimension group and a configuration technology to specify the business rules. The product dimensions (Color, Size, Style, and Configuration) are a specific set of attributes that can be used throughout the application to define and track specific behaviors of the related products. These dimensions also help users search for and identify the products.

Configuration technologies

Choose among three configuration technologies:

- The predefined variants are defined by predefined product dimensions. The variant definition includes the definition of a specific valid combination of dimensions, such as

Color, Style, and Size. Each combination produces a distinct product variant.

- The dimension-based configuration is typically used in manufacturing scenarios and lets you use the Configuration dimension in the definition of the bills of materials (BOMs). After you select a specific configuration, the system uses the subset of BOM lines that are valid for that configuration for planning and production. This concept is also known as *global BOM*, because one shared BOM is used for all configurations of a product.
- The constraint-based configuration uses a product configuration model to describe all possible attributes and components that are required in order to describe all possible variants of a product in a single model. The constraints of combinations of attributes can be described through regular expressions or table-based constraints. Configuration models and configurators become more important in product information management and are used across all industries.

When you plan the implementation of Supply Chain Management, it's important that you choose the correct configuration technology for a business process. A product can't be converted from one model to another after implementation.

Product variant model definition workspace

The **Product variant model definition** workspace gives an overview of the product masters. It also shows the status of the release of masters and related variants to specific legal entities.

Released products

Released products are products that you release to a specific legal entity. You can release products in bulk to one legal entity or many legal entities at the same time. Because you might need to add various properties and attributes of the products for each legal entity, the **Released product maintenance** workspace helps you monitor and complete the recently released products in each legal entity or in the suborganizations of a legal entity.

Released product maintenance workspace

You can configure the **Released product maintenance** workspace from the **Configure my workspace** menu item. Select a category hierarchy and category by which to filter the workspace. To adjust the relevant product data in the workspace, you can also define, in days, the time fences for **Recently released products** and **Stopped released products**.

The workspace consists of a summary of tiles and two lists. The **Open cases** list shows product change cases that have products in the selected product category hierarchy that aren't

completed and closed. The **Recently released** list shows products that are released within the time fence set in the workspace configuration. For each item in the list, validation is run, and the validation status is shown. This status might indicate that the required configurations for the legal entity aren't completed. From the list, you can directly access the **Released product details**, **Product attribute maintenance**, **Product category maintenance**, **Default order settings**, and **Text translations** pages to complete the required configuration of the product.

Manually creating a new released product

You can manually create a released product in a single run, depending on the organization's business processes and any rules about whether this function should be used. This function creates a new product and automatically releases it to the current legal entity. To create a new product, select **Released products** in the **Released product maintenance** workspace or on the **Released product** list page.

Change managed products (versioned products)

Products where you need to keep track of versions and have an established change management process (especially products with BOMs or formulas) are often best set up as *engineering products*. Engineering products are change managed, include version identifiers, and use change orders to keep track of the changes made between versions. If needed, you can choose to track the version used in each transaction (each version is a product variant).

For more information about engineering change management, see Engineering change management overview.

Product identifiers

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides information about the various types of product identifiers and explains how you can add product identifiers in your product data.

When you work with products on the shop floor or in a warehouse in Microsoft Dynamics ERP or Microsoft Dynamics CRM, you must have a good strategy for identifying those products and product variants.

Unique product number/product ID

In Dynamics 365 Supply Chain Management, the primary identifier for a product is the product number (that is, the unique product ID). This number can be automatically generated by a number sequence or manually associated with a product. For product variants, define the numbers through the product nomenclature template.

In many cases, the product number isn't originally created in Dynamics 365 Supply Chain Management. Instead, it's associated with a product in a product lifecycle management (PLM) system or a product data management (PDM) system. In this case, use data entities to import the products and product variants. Supply Chain Management then uses the numbers in all operations.

When you implement Supply Chain Management, give special consideration to your strategy for product numbers. A good numbering system improves logistics flows and helps prevent errors. A good product identifier usually has 20 characters or less, but use fewer than 10 characters and include no more than five classifying characters. You can also use search names to enable quick searches. A search name is an extra name that represents the classifications of a product.

When you use Microsoft Dataverse, the product number in Supply Chain Management is also the product number in Microsoft Dataverse. Product variants are synchronized to Dataverse as

distinct products.

Item number and product dimensions

The item number is the product identifier that a specific legal entity uses. Ideally, the item number should be identical to the product number. If the nomenclature differs per legal entity, it becomes difficult to follow a product throughout the supply chain, and it introduces burdensome relabeling and referencing processes. For compatibility with older versions (that is, with Microsoft Dynamics AX 2009 and earlier), this model is preserved. However, eliminate identifiers that are specific to legal entities whenever you can, and use the unique product number as the primary identifier instead.

Additionally, an item number can't uniquely identify a product variant. It always requires the combination of an item number and all the product dimensions that are defined on the product master. This requirement can become cumbersome and can slow down the identification processes. For this reason, use the unique product number instead of the item number whenever you can.

Many pages still have the item number and product dimensions as the primary identifiers. However, you can use the product numbers for searches. At **Sales and marketing** > **Setup** > **Search** > **Search parameters**, you can change the search lookup so that it uses product numbers instead of item numbers as the primary search strategy. If you set the **Enable lookup for product search** option to *Yes*, the lookup shows not only product masters but product variants. For more information, see Search for products and product variants during order entry.

Additionally, you can search and filter on the product number, the product name and description, and the product dimension IDs of the product variant. When you select a variant, the related item number and all product dimension IDs are selected. Therefore, you can more easily find and select the correct variant. This setting is highly recommended if you use product variants and the unique product number as the primary identifiers for products. The only exception might be the fashion industry, where the business processes often require that you select the master before you select a variant. You should carefully evaluate this option before you implement the numbering system.

> **Note**
>
> The item number for a product can't be changed once one or more transactions exist for that product.

Product name and description

The product name and description are the human-readable identifiers of a product and can be maintained in many languages. By default, the Supply Chain Management client shows all product information in the default company language, not in the user's language. However, translated product names and descriptions are used in all communication with customers and vendors. The translations are based on the language code of the customer and vendor accounts.

For product variants, the product name can be generated through a product nomenclature template. Because there's no requirement that product names be unique, you might find multiple products that have the same name.

Product and item search names

Supply Chain Management offers a secondary search name for products and also for items (released products). This search name doesn't have to be unique, and you can change it after a product or product variant is created. Use the search name to search for products by categories. The search names enable quick searches, especially in sales and purchase processes.

The search name can also contain a customer or vendor product ID, or some other external product ID, if this external ID is the primary search criterion for a product.

External product identifiers (Customer and vendor identifiers)

For released products, you can maintain the item numbers, item names, and item descriptions that the customer or vendor uses. The references appear on external documents, such as sales orders, purchase orders, packing slips, and invoices. In the current version of Supply Chain Management, the external references don't appear on core operations pages. The only exception is the vendor item number. This number appears in the **Product information** dialog box if a default vendor is defined for the released product.

You can maintain the external product identifiers by released product, released product variant, customer, customer group, vendor, or vendor group.

On the **Released products** page, follow one of these steps:

- For customers, on the Action Pane, open the **Sell** tab and, in the **Related information** group, select **External item description**.

- For vendors, on the Action Pane, open the **Purchase** tab and, in the **Related information** group, select **External item description**.

On the **External item descriptions** page, you can associate the customer's or vendor's item number with a released product. You must make this association for each legal entity. You can gather the following information. However, the labels are slightly misleading in the current version of Supply Chain Management. These labels might be changed in a future version.

Expand table

Field	Corresponding customer information	Corresponding vendor information
External item number	The customer's item number	The vendor's item number
Description	The name that the customer associates with the item	The name that the vendor associates with the item
External item text	The customer's item description	The vendor's item description

If many customers or vendors use the same item numbers (as with a purchase association or a commerce group, for example), you can create groups of customers or vendors to simplify the maintenance of external product information.

- For customer groups, go to **Sales** > **Setup** > **Items** > **External item description** to create and maintain the groups and the related item numbers. To associate customers with a group, go to **Accounts receivable** > **Customers** > **All customers**, and then, on the **Sales order defaults** FastTab, specify a value in the **Item - customer group** field.
- For vendor groups, go to **Procurement and sourcing** > **Setup** > **External item description group** to create and maintain the groups and the related item numbers. To associate vendors with a group, go to **Accounts payable** > **Vendors** > **All vendors**, and then, on the **Purchase order defaults** FastTab, specify a value in the **Item - vendor group** field.

Bar codes

To use a bar code scanner to identify products, the product identifier must meet the requirements of the bar code standard that you use. Therefore, bar codes don't typically contain the raw product number but a number that's generated specifically for the selected bar code technology. You can maintain multiple bar codes by bar code type. You can even associate the same bar code with multiple products and then select the actual active association when you scan a bar code.

Before you define bar codes, define one or more bar code setups. The bar code setups can help validate that bar codes follow the required guidelines, and that they can therefore be effectively printed and scanned. You can also maintain special bar codes for specific product quantities.

Use the bar code setup to maintain Global Trade Item Number (GTIN) or International Article Number (EAN) codes.

To maintain bar codes, on the **Released products** page Action Pane, open the **Manage inventory** tab and, in the **Warehouse** group, select **Bar codes**.

GTIN codes

In e-commerce, it's crucial that all parties speak a common language and refer to products by using a common set of identifiers. Therefore, some industries rely on the GTIN, which is a global item number system that's facilitated by GS1.

Maintain the GTIN as a bar code. However, you can also maintain it on the **Item - GTIN** page. To open this page, on the **Released products** page Action Pane, open the **Manage inventory** tab and, in the **Warehouse** group, select **GTIN codes**. The GTIN isn't maintained as a global number. Instead, legal entities maintain it.

In Supply Chain Management, you define packaging variants in the warehouse operations by defining specific units of measure. For example, an item might be stored in pieces, in bundles of six, in trays of 18, or in full pallets. A specific unit of measure is defined for each of these packaging variants. Because the GTIN is typically related to the packaging unit of a product, the **Item - GTIN** page lets you maintain multiple GTIN codes per product and unit of measure. However, you can't use the same GTIN code more than one time for different items or product variants of a legal entity.

To maintain **GTIN codes**, on the **Released products** page Action Pane, open the **Manage inventory** tab and, in the **Warehouse** group, select **GTIN**.

External codes

External codes can be defined for many entities. For example, you can define external codes to identify products and released products. These external codes can be used to associate statistical codes or tax codes with released products and released product variants. External codes are defined by legal entity and code type. They must be unique by legal entity, code type, and table reference.

Unfortunately, there's no standard functionality that lets you search for products by external codes.

Data entities for importing and exporting product identifiers

Expand table

Entity name	Import identifiers	Export identifiers	Comments
Products V2	Product number, product search name, product name, product description	Product number, product search name, product name, product description	Depending on the settings of the entity and the number sequence for the product number, the product number can be automatically created during import.
Product variants	Product number, product search name, product name, product description	Product number, product search name, product name, product description	Depending on the product nomenclature template, the product number can be automatically created during import. However, you can import any unique product number, and that product number doesn't have to follow the structure of the product nomenclature templates.
Product translations	Product name, product description	Product name, product description	This entity overwrites any language. When the name or description of a legal entity's primary language is overwritten, the name and description of the product itself is changed.
Released product creation V2	Item number, product number, item search name	Item number, product number, item search name, product search name, product name	This entity can be a challenge when number sequences are used during the creation of new released products. Both the *Item number* number sequence and the *Product number* number sequence have an influence. However, the *Item number* number sequence is per legal entity, whereas the *Product number* number sequence is global. Therefore, don't use the *Item number* number sequence when you deploy new released products. When the entity is used to release an existing product, the product number must be given in the entity. For more information, see the "Product and item number sequences" section in this article.
Released product variants	Item number, product dimensions,	Product number, product search name, product	Like the **Product variants** entity, this entity can be used to create new products that either follow the

Entity name	Import identifiers	Export identifiers	Comments
	product number	name, product description, product dimensions	product nomenclature template or use their own product numbers for the variant.
External item description for customers	Customer item number, customer item name, customer description, customer account	Customer item number, customer item name, customer description, customer account	Use the **External item description customer groups** entity to aggregate a group of customers (for example, a buyer association) into one group.
External item description for vendors	Vendor item number, vendor item name, vendor description, vendor account	Vendor item number, vendor item name, vendor description, vendor account	Use the **External item description vendor groups** entity to aggregate a group of vendors (for example, a sales association or industry organization) into one group.
Item Barcode	Bar code	Bar code	During import, you must refer to a bar code setup that is defined in the target system. The imported bar code references are validated against that bar code setup and are rejected if the bar codes don't match the requirements that are defined in that setup.
External codes for released products	External code	External code, external code classes, item number	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the **External code classes for released products** entity.
External codes for released product variants	External code	External code, external code classes, item number, product dimensions	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the **External code classes for released products** entity. This entity refers to product variants by the item number and product dimensions.
External codes for released product variants by product number identifier	External code	External code, external code classes, product number	External codes are by legal entity. For import, you must refer to a defined code class. Import the code classes by using the **External code classes for released products** entity. This entity refers to product variants by the product number of the variant. (From the next major release)

Entity name	Import identifiers	Export identifiers	Comments
GTIN	Not applicable	Not applicable	Currently, there's no specific entity that is used to import and export GTIN codes. Use the **Item Barcode** entity instead.
Product entity common data service identifier entity	Not applicable	Item number, item search name, product search name, vendor item number, customer item number, external codes, GTIN codes, bar codes	This entity consolidates all identifiers into one data model, so that one interface can be used to easily export all identifiers and their related types. Use the **Product entity identifier code** entity to export the identifier codes and descriptions. Use the **Product entity identifier scope** entity to export additional scope information to an identifier, such as the party, legal entity, quantity, or unit.

Product and item number sequences

You can define two different number sequences:

- The *Product number* number sequence for the global product number
- The *Item number* number sequence for the item number per legal entity

> **Note**
>
> Use the item number as a separate identifier only when you migrate different legal entities from different sources that had different numbering systems. Always try to use a product identifier that is unique across all legal entities. Therefore, set the **Manual** option to *Yes* for the *Item number* number sequence. In this way, the item number follows the product number on creation. If Supply Chain Management isn't the leading system for new product numbers, set the **Manual** option to *Yes* for both the *Item number* and *Product number* number sequences.

When you use the **Released product creation V2** entity to create products, multiple settings can affect how the number sequences are used to create the product number and item number:

- Settings of the *Product number* number sequence
- Settings of the *Item number* number sequence
- The mapping of the item number
- The mapping of the product number

The following table provides an overview of the results of import and manual creation when specific combinations of the number sequence and field mapping settings.

Expand table

Product number number sequence	Item number number sequence	Mapping of the item number	Mapping of the product number	Result of entity import	Result of manual creation	Conclusion
Manual = No	Manual = No	No mapping	No mapping	Product numbers use the *Product number* number sequence. Item numbers use the *Item number* number sequence.	Product numbers use the *Product number* number sequence. Item numbers use the *Item number* number sequence.	With this configuration, product numbers follow the product number sequence and item numbers follow the item number sequence. However, this configuration doesn't work if there's more than one item (row) to be imported.
Manual = No	Manual = Yes	Auto generate	No mapping	Both product numbers and item numbers use the *Item number* number sequence.	Both product numbers and item numbers use the *Product number* number sequence.	Both product numbers and item numbers follow the product number sequence. This approach is the recommended approach to import bulk products with the Released product creation V2 data entity. You can only use this approach when bulk importing items (several rows) and when you aren't creating items through the user interface. If you need both to bulk import and to create products through the user interface, use the procedure in the next row of this table instead. To transition from using a bulk import approach to

Product number number sequence	Item number number sequence	Mapping of the item number	Mapping of the product number	Result of entity import	Result of manual creation	Conclusion
						using the user interface to manually, import and create products, you must manually adjust the **Next number** in the item number number sequence to match the **Next number** in the product number number sequence. Then you can switch to the approach in the next row of this table.
Manual = No	Manual = Yes	No mapping	No mapping	Both product numbers and item numbers use the *Product number* number sequence.	Both product numbers and item numbers use the *Product number* number sequence.	Both product numbers and item numbers use the product number sequence. However, this configuration doesn't work if there's more than one item (row) to be imported. You must use this approach if you need both to import products using the entities (only one row can be imported at a time) and to create products through the user interface.
Manual = Yes	Not applicable	Not applicable	Auto generate	You receive the following error message: "Number sequence can't be detected."	According to the *Item number* number sequence	This setting isn't supported for import.

Product entity identifier (Export all product identifiers)

The product entity identifier model enables version 1.0 of Dataverse to be provisioned with all identifiers that refer to a product. To simplify this task, the model aggregates all identifiers into one global identifier table, so you can export them as one model. This version of Dataverse doesn't use the product identifiers model. Therefore, the **Product entity common data service identifier entity** and this process have limited practical use and might change in the future.

The product identifier table is a global table that's populated from all reference tables of the main legal entity through a recurring batch job. You must select a legal entity and a product category hierarchy as the definition of the global product master scope. Generation of the global product identifier table is limited to products that are released to the selected legal entity and products that are members of the product hierarchy selected for the **Common data service** role in the product category hierarchy.

This process assumes that product master data is primarily maintained in one central legal entity. (However, this legal entity can be a virtual legal entity that's used only to maintain global master data.)

Follow these steps to configure the environment.

1. Select the category hierarchy for Dataverse. On the **Category hierarchy role associations** page, if no hierarchy is associated with the **Common data service** role, create a new association. Select the **Common data service** role, and then associate the category hierarchy that represents the product portfolio that you want to synchronize to Dataverse.

2. Select the legal entity for global product master data. On the **Product information management parameters** page, on the **Product attributes** tab, select the master company where the product and item identifiers are primarily maintained.

3. Define the identifier code types and codes that you want to export. Go to **Product information management** > **Setup** > **Product identifier codes**. To generate the identifier code types, select **Generate codes**. A code type entry is generated for each type of identifier that is found in the selected legal entity.

   For bar codes, a code type is generated for each bar code setup. For external codes, a code type is generated for each external code class.

   You can now maintain the list of code types. You can change the code, name, and description. You can also delete code types. Code types that you delete aren't used to populate the global product entity identifier tables.

4. When you finish defining the product identifier code types, create the identifiers in the global table by starting the **Create product entity identifiers** job on the **Product entity identifier codes** page. Run this job in a batch. Set up this job as a periodic batch job so that the table is populated according to new entries.

You can now use the **Product entity common data service identifier entity**, **Product entity identifier code**, and **Product entity identifier scope** data entities to export the identifiers for any target system.

Create a hierarchy of product classification

This procedure shows how to create a new category hierarchy and assign a commodity code hierarchy type. The demo data company used to create this procedure is USMF. This procedure is intended for the category manager.

Create the new category hierarchy

1. Go to **Product information management** > **Setup** > **Categories and attributes** > **Category hierarchies**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, enter a value.
5. Select **Create**.

Build the hierarchy

1. Select **New** category node.
2. In the **Name** field, type a value.
3. In the **Code** field, type a value.
4. In the **Friendly name** field, type a value.
5. Select **New** category node.
6. In the **Name** field, type a value.
7. In the **Code** field, type a value.
8. In the **Friendly name** field, type a value.
9. Select **New** category node.
10. In the **Name** field, type a value.
11. In the **Code** field, type a value.
12. In the **Friendly name** field, type a value.
13. Select **New** category node.
14. In the **Name** field, type a value.
15. In the **Code** field, type a value.
16. In the **Friendly name** field, type a value.
17. Close the page.

Classify the hierarchy

1. In the list, find and select the desired record.
2. On the Action Pane, select **Category hierarchy**.
3. Select **Associate hierarchy type**.
4. Select **New**.
5. In the **Category hierarchy type** field, select an option. Select the **Commodity code category hierarchy type for product classification**.
6. In the **Category hierarchy** field, select the drop-down button to open the lookup.
7. In the list, find and select the desired record.
8. In the list, select the link in the selected row.
9. Close the page.

Classify a product using category hierarchies

This article describes how to classify a product using category hierarchies. Use category hierarchies to classify products for export, procurement, sales, or other purposes. Typically, a product manager performs this task. The example uses product number M0009 in demo data company USMF.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the desired record.
3. On the Action Pane, select **Product**.
4. Select **Product categories**.
5. Select **New**.
6. In the **Category hierarchy** field, enter or select a value.
7. In the **Category** field, enter or select a value.
8. Select **New**.
9. In the **Category hierarchy** field, enter or select a value.
10. In the **Category** field, enter or select a value.
11. Close the page.

Nomenclature of product variant numbers and names

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to set up a product number nomenclature to replace the fixed [Product master number - Configuration - Size - Color - Style] format. The new nomenclature has a targeted format that includes the product master number, active product dimensions, and text delimiters of your choice. You can also create a nomenclature for product names. Finally, you can build a nomenclature to identify configurations that the constraint-based product configurator creates. These nomenclatures can contain attributes of your choice.

The new nomenclatures for product variant numbers and product variant names let you include segments in the identifiers for product variants. These segments can include the product master number and name, product dimension IDs and names, number sequences, text constants, and attributes. This functionality lets you quickly find a specific product variant when you create a sales order or a purchase order. You create nomenclatures for both product variant numbers and product variant names by using the **Product nomenclature** page. To open this page, click **Product information management** > **Setup**.

Nomenclature of predefined product variants

Product variants are generated for product masters according to one of three configuration technologies:

- Predefined variants
- Constraint-based
- Dimension-based

Each product variant has a number and a name. The product variant identification nomenclatures let you select the segments to include in each product variant number or name. Select the

following segments on the **Product nomenclature** page:

- Product master number
- Product master name
- Number sequence value
- Text constant
- Product dimensions
  - Configuration ID or name
  - Color ID or name
  - Size ID or name
  - Style ID or name

After you define a product variant identification number nomenclature, associate it with a product dimension group. All product masters that reference this product dimension group are assigned product variant numbers according to the nomenclature. However, product variant name nomenclatures can't be associated with product dimension groups. You can also assign a product variant identification nomenclature directly to a product master. In this case, the product variants that belong to the product master are assigned product variant numbers and names according to the nomenclatures.

Example

A T-shirt (TS1234) is produced in three sizes (S, M, L), four colors (Red, Green, Blue, Yellow), and two styles (Polo, V). Therefore, 24 product variants are possible (= 3 × 4 × 2). You create a product variant number nomenclature that has the following segments:

1. Product master number
2. Text constant: "-"
3. Color
4. Text constant: "-"
5. Size
6. Text constant: "-"
7. Style

In this case, the product variant number for a red, small, polo T-shirt is TS1234-Red-Small-Polo.

Nomenclature of constraint-based configurations

For constraint-based configurations, you can create a dedicated nomenclature for the configuration product dimension. On the **Product nomenclature** page, select the following segments:

- Number sequence value
- Text constant
- Attribute value

Each component in a product configuration model can have its own configuration nomenclature. You can only use attributes that belong to the component. You can't use attributes from subcomponents or user requirements.

Example

A product configuration model has a root component that has two attributes:

- Material (Plastic, Wood, Steel)
- Length (10...100)

You create a configuration nomenclature that has the following segments:

1. Attribute value: Material
2. Text constant: "AAA"
3. Attribute value: Length

In this case, the configuration ID for wood material that has a length of 78 is WoodAAA78.

Nomenclature of dimension-based configurations

For dimension-based configurations, you can create a dedicated nomenclature for the configuration product dimension. You can select the following segments on the **Product nomenclature** page:

- Number sequence value
- Text constant
- Configuration group item

You can define a configuration nomenclature for a bill of materials (BOM).

Example

A BOM has four BOM lines that are divided into two configuration groups:

- BOM line: M0007, Standard cabinet
  - Configuration group: Cabinet
- BOM line: M0008, High end cabinet
  - Configuration group: Cabinet
- BOM line: M0021, Front grill cloth
  - Configuration group: Front grill
- BOM line: M0022, Front grill metal
  - Configuration group: Front grill

You create a configuration nomenclature that has the following segments:

1. Configuration group: Cabinet
2. Text constant: "&"
3. Configuration group: Front grill

In this case, the configuration ID for a standard cabinet that has a cloth front grill is M0007&M0021.

Nomenclature for a combination of product variants and configurations

When you use either the constraint-based configuration technology or the dimension-based configuration technology to configure product variants for a product master, the product variant numbers of the product variants can include the nomenclature from the configuration dimension. Follow these steps to configure variants.

1. On the **Product nomenclature** page, define a product variant number nomenclature that includes the configuration dimension.
2. Assign the nomenclature to a product dimension group that has the configuration dimension.
3. Define a configuration nomenclature for the components or BOMs used to configure the product variants.

You can also create nomenclatures for the product variant names. The product variant names can be configured to include the configuration ID or name.

Example for constraint-based configurations

For this example, use a product variant number nomenclature that includes the following segments:

1. Product master number
2. Text constant "_"
3. Configuration

The configuration nomenclature consists of the following segments:

1. Attribute value: Material
2. Text constant: "AAA"
3. Attribute value: Length

Enter the following values for segments:

- Product master number = **M0099**
- Material = **Plastic**
- Length = **12**

In this case, the product variant number is M0099_PlasticAAA12.

Example for dimension-based configurations

For this example, use a product variant number nomenclature that includes the following segments:

1. Product master number
2. Text constant "//"
3. Configuration

The configuration nomenclature consists of the following segments:

1. Configuration group: Cabinet
2. Text constant: "&"
3. Configuration group: Front grill

Enter the following values for segments:

- Product master number = **D0123**
- Cabinet = **M0008**
- Front grill = **M0022**

In this case, the product variant number is D0123//M0008&M0022.

Numbering conflicts

In some cases, a product variant number nomenclature that you set up might not produce unique product variant numbers. For example, the product variant numbers aren't unique if one active product dimension isn't included in the nomenclature for a product master that uses the predefined variant configuration technology. The way that you handle conflicts varies, depending on the configuration technology.

Predefined variants

An error occurs if you try to manually create or automatically generate product variants, and more than one product variant ends up with the same product variant number. To avoid this scenario, use all active product dimensions in the product dimension group. Alternatively, include a number sequence to help guarantee that the product variant numbers are unique.

Constraint-based configurations

Depending on the nomenclature, the system might try to assign a non-unique product variant number to a configuration. In this case, the system uses the number sequence for the configuration dimension as the product variant number instead, and you receive a warning. To avoid this scenario, include enough attributes in the nomenclature to help guarantee unique product variant numbers. Also, make sure that the **Reuse** option is turned on for the component.

Dimension-based configurations

During one step of the configuration process, the system suggests a configuration value according to the nomenclature. In this step, you can manually change the configuration value. When you save the configuration, the system verifies that the configuration value is unique. If the value that you entered isn't unique, you receive an error message. To save the configuration, you must enter a unique configuration value.

Create a product number nomenclature for predefined product variants

Article • 06/03/2022

This article explains how to set up a product number nomenclature for predefined product variants, and how you assign it to the appropriate product dimension group. The demo data company used to create this procedure is USMF. The new product number nomenclature is assigned to the Color and Size product dimension group. This task would typically be done by a product designer.

Create a product number nomenclature

1. Go to **Product information management** > **Setup** > **Product nomenclature**.
2. Select **New**.
3. In the **Name** field, enter a nomenclature name that helps to identify the target product dimension group, for example, `ColorSize`.
4. In the **Description** field, type a value.
5. Select **Add**.
6. Select **Product master** number.
7. Select **Add**.
8. Select **Text constant**.
9. In the **Text** field, type a value.
10. Select **Add**.
11. Select **Color**.
12. Select **Add**.
13. Select **Text constant**.
14. In the **Text** field, type a value.
15. Select **Add**.
16. Select **Size**.
17. Close the page.

Assign the nomenclature to a product master

1. Select **Product dimension groups**.
2. Select the **SizeCol product dimension** group.
3. Select **Edit**.
4. Select **Yes** in the **Use nomenclature** field.
5. In the **Product variant number nomenclature** field, enter or select a value.

6. Close the page.

Create a product number nomenclature for configured product variants

Article • 09/29/2021

This procedure shows you how to set up a product number nomenclature for configured product variants, and how it can be attached to a configurable product master. This procedure also demonstrates how you can build a configuration nomenclature for a product configuration model component. The demo data company used to create this procedure is USMF. The new product number nomenclature is assigned to the D0004 product master. This task would typically be done by a product designer.

Create a product number nomenclature

1. Go to **Product information management** > **Setup** > **Product nomenclature**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, type a value.
5. Select **Add**.
6. Select **Product master number**.
7. Select **Add**.
8. Select **Text constant**.
9. In the list, mark the selected row.
10. In the **Text** field, type a value.
11. Select **Add**.
12. Select **Configuration**.
13. Close the page.

Assign the product number nomenclature to a product master

1. Go to **Product information management** > **Products** > **Product masters**.
2. Use the Quick Filter to find records. For example, filter on the **Product number** field with a value of 'D'.
3. In the list, select the link in the selected row.
4. Select **Edit**.
5. Select *Yes* in the **Use nomenclature** field.
6. In the **Product variant number nomenclature** field, enter or select a value.

7. Close the page.
8. Close the page.

Create nomenclature for a product configuration model component

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.
3. In the list, select the link in the selected row.
4. Select **Edit**.
5. Select *Yes* in the **Use configuration nomenclature** field.
6. Select **Add**.
7. Select **Attribute value**.
8. In the list, mark the selected row.
9. In the **Attribute** field, enter or select a value.
10. Select **Add**.
11. Select **Text constant**.
12. In the list, mark the selected row.
13. In the **Text** field, type a value.
14. Select **Add**.
15. Select **Attribute value**.
16. In the list, mark the selected row.
17. In the **Attribute** field, enter or select a value.
18. Select **Add**.
19. Select **Text constant**.
20. In the list, mark the selected row.
21. In the **Text** field, type a value.
22. Select **Add**.
23. Select **Attribute value**.
24. In the list, mark the selected row.
25. In the **Attribute** field, enter or select a value.
26. Select **Add**.
27. Select **Text constant**.
28. In the list, mark the selected row.
29. In the **Text** field, type a value.
30. Select **Add**.
31. Select **Attribute value**.
32. In the list, mark the selected row.
33. In the **Attribute** field, enter or select a value.

34. Select **Add**.
35. Select **Text constant**.
36. In the list, mark the selected row.
37. In the **Text** field, type a value.
38. Select **Add**.
39. Select **Number sequence value**.
40. In the list, mark the selected row.
41. In the **Number sequence** field, enter or select a value.
42. Close the page.
43. Close the page.
44. Close the page.

Create a product master

06/17/2025

Create a product master for the predefined variants. The demo data company used to create this procedure is USMF. This procedure is intended for the product designer.

Create a new product master

1. Go to **Product information management** > **Products** > **Product masters**.
2. Select **New**.
3. In the **Product number** field, type a value. The number must be unique. A number sequence can be set for the **Product number** field. In this case, the user doesn't have to enter a value.
4. In the **Product name** field, type a value. Enter a descriptive product name. The value defaults to the search name, but this can be changed by the user.
5. In the **Product dimension group** field, select the drop-down button to open the lookup. The product dimension group determines which of the four product dimensions that can be used to create product variants. This example uses a group with color and size.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row. The default **Configuration technology** is *Predefined variant*. This value is used for this example.
8. Select **OK**.

Select product dimension groups

1. In the **Color group** field, select the drop-down button to open the lookup.
2. In the list, find and select the desired record.
3. In the list, select the link in the selected row.
4. In the **Size group** field, select the drop-down button to open the lookup.
5. In the list, find and select the desired record.
6. In the list, select the link in the selected row.

Add dimension groups

1. On the Action Pane, select **Product**.
2. Select **Dimension groups** to open the drop dialog.
3. In the **Storage dimension group** field, select the drop-down button to open the lookup. The storage dimensions help you control how items are stored and taken from inventory. For example, a storage dimension can include Site and Warehouse.

4. In the list, find and select the desired record.
5. In the list, select the link in the selected row.
6. In the **Tracking dimension group** field, select the drop-down button to open the lookup. The tracking dimension group determines which tracking dimensions you can add to a product. For example, the batch number and serial number are used to track inventory items.
7. In the list, find and select the desired record.
8. In the list, select the link in the selected row.
9. Select **OK**.
10. Select **Save**.
11. Close the page.

Create predefined product variants

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an example scenario that shows how to create predefined product variants for a product master. It also describes how to work with improved variant suggestions and how to assign variant-specific item sales tax groups if needed.

Example scenario: Create predefined product variants

This scenario shows how to create product variants for a product master by using a combination of product dimensions.

Make demo data available

To follow this scenario using the values suggested here, you must have demo data installed, and you must select the *USMF* legal entity.

Step 1: Create a product master

To create a product master:

1. Go to **Product information management** > **Products** > **Product masters**.
2. Select **New**.
3. If the **Product number** field doesn't already show a number, then enter a value. This is only required if no number sequence has been set for this field.
4. Enter a name in the **Product name** field.
5. In the **Product dimension group** field, select the product dimension group *SizeCol* (Size and Color).
6. Select **OK** to create and open the new product master.

Step 2: Add product dimensions

This example shows how to manually enter product dimensions. You can also select a size, color, or style group that includes the product dimension values you want to use.

To add product dimensions:

1. With your new product master still open, select **Product dimensions** on the Action Pane.
2. Open the **Size** tab and select **New** on the toolbar to add a row to the grid. Make the following settings for the new row:
    - **Size** – Select a size value.
    - **Name** – Enter a name for the size.
3. Select **New** on the toolbar and add a second size to the grid with a new **Size** and **Name**.
4. Open the **Colors** tab and select **New** on the toolbar to add a row to the grid. Make the following settings for the new row:
    - **Color** – Select a color value.
    - **Name** – Enter a name for the color.
5. Select **New** on the toolbar and add a second color to the grid with a new **Color** and **Name**.
6. Select **Save**.
7. Close the page to return to your new product master.

Step 3: Generate product variants

To generate product variants based on suggestions, follow these steps:

1. Open or create a product master and add the required product dimensions to it, as described in the previous section.
2. With the product master open, select **Product variants** on the Action Pane.
3. Select **Variant suggestions** on the Action Pane.
4. Select the values that you want to use for each of the dimensions.
5. On the top toolbar, select **Suggest**.
6. The system generates a list with all possible combinations of the sizes and colors you selected. On the **Suggested variants** FastTab, select the check box for each product dimension combination that you want to use, or select **Select all** on the toolbar to select all of them.
7. Select **Create** to add the variants to the current product master.

Set up variant-specific sales tax groups for sales and/or procurement

The *Apply sales tax group for product variants in sales and procurement* feature lets you assign variant-specific item sales tax groups both for sales and for procurement. The feature applies the following rules:

- If a specific item sales tax group is assigned to a released product variant for sales, that group is used by default when a sales quotation or sales order line is created.
- If no specific item sales tax group is assigned to a released product variant for sales, the item sales tax group that's assigned to the released product master is used by default when a sales quotation or sales order line is created.
- In a similar way, for purchase orders, purchase requisitions, and requests for quotation, if a specific item sales tax group is assigned to a released product variant for procurement, that group is used by default. If no specific item sales tax group is assigned to a released product variant, the item sales tax group that's assigned to the product master is used by default.

This functionality supports a setup where most released product variants use the item sales tax groups from the product master setup, but a few variants use an alternative item sales tax group by default. Therefore, this functionality helps eliminate the cost, effort, and risk that can occur when incorrect taxation is applied to an order line for a product variant.

Assign an item sales tax group to a released product variant

To assign variant-specific item sales tax groups, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.

2. Open the product that you want to set up variant-specific item sales tax groups for.

3. On the **Released product details** page, you can view the default item sales tax groups for the master product and edit them as required. These default groups apply to all variants that you don't assign a variant-specific item sales tax group to for sales and/or procurement.

    - To specify the default item sales tax group that's used when product variants for this master are purchased, set the **Item sales tax group** field on the **Purchase** FastTab.
    - To specify the default item sales tax group that's used when product variants for this master are sold, set the **Item sales tax group** field on the **Sell** FastTab.

4. On the Action Pane, on the **Product** tab, select **Released product variants**.

5. On the **Released products variants** page, find the variant that you want to set up, and open it by selecting the link in the **Product number** column.

    - To specify the default item sales tax group that's used when the selected variant is purchased, set the **Item sales tax group** field on the **Purchase** FastTab.
    - To specify the default item sales tax group that's used when the selected variant is sold, set the **Item sales tax group** field on the **Sell** FastTab.

You can now create a sales order line, sales quotation line, purchase requisition line, purchase order line, or request for quotation line. Notice that the default item sales tax group for the product variant is entered from the variant setup, not from the product master setup.

Show translated product names and descriptions in the UI

For companies that operate worldwide, in multiple countries or regions, it's important that each user can work with product information in their own language. Sales representatives who communicate with customers by telephone see product names in their local language. Purchasers can search for products in the language that they speak. Shop floor workers get product names and instructions in familiar terms. In each case, you can show the information in a language other than the system language.

All users of Microsoft Dynamics 365 Supply Chain Management can select the language that they prefer to see for all user interface (UI) elements, such as field names, button labels, and page names. The system also lets you enter product names and details for each product in as many different languages as you require, and you can set up each printed document to show this product information in any selected language. However, the UI doesn't necessarily show translated product information to users who work online. Instead, it shows product names and descriptions in the system language, unless you configure your system to use translated product names and descriptions. This behavior affects features such as the production floor execution interface and order line entry.

By entering product translations and configuring the system to show them in the UI, each user can see product data (names and descriptions) in their own preferred language while they work online. For products where no name or description is available in the user's preferred language, the system shows the name or description in the system language instead.

The following video provides an introduction to this feature.

https://learn-video.azurefd.net/vod/player?id=4c9d7e56-36f7-49e8-a6de-ed0c8feed1e5&locale=en-us&embedUrl=%2Fdynamics365%2Fsupply-chain%2Fpim%2Fshow-translated-product-info

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You're running Microsoft Dynamics 365 Supply Chain Management version 10.0.31 or later.

- The feature named *Display product info in user's language* is turned on in feature management.

Turn the feature on or off in your system

Before you can use this feature, you must turn it on in your system. Admins can use the feature management settings to check the status of the feature and turn it on. In the **Feature management** workspace, the feature is listed in the following way:

- **Module:** *Product information management*
- **Feature name:** *Display product info in user's language*

Configure your system to show translated product information

Follow these steps to set up the system to show translated product names and descriptions in the UI.

1. Go to **Product information management** > **Setup** > **Product information management parameters**.

2. On the **General** tab, in the **Product identification** section, set the **Display product info in user's language** option to one of the following values:

    - *Yes* – Show product names and descriptions in each user's preferred language in the UI. For products where the name or description isn't available in the user's preferred language, the system language is used instead.
    - *No* – Always show product names and descriptions in the system language in the UI, regardless of each user's preferred language setting. Translated product names and descriptions are still used in printed documents.

Enter translated product names and details

Follow these steps to enter translated names and descriptions for products.

1. Go to **Product information management** > **Products** > **Released products**.
2. Find and select the product that you want to work with.
3. On the Action Pane, on the **Product** tab, select **Translations**.
4. On the **Text translations** page, on the Action Pane, select **Add**.

5. In the drop-down dialog box, select the language that you want to enter translations for. Then enter translations in the fields that are provided.
6. To add translations for more languages, switch to each language by using the **Language** drop-down list, and then enter translations as required.

Select your preferred language

Follow these steps to select your preferred language. This language is used for all UI elements and might also be used for product names and descriptions (if they're entered and enabled as described earlier in this article).

1. Select the **Settings** button (gear symbol) in the upper-right corner, and then select **User options** on the menu.
2. On the **Preferences** tab, on the **Language and country/region** FastTab, set the **Language** field to your preferred language.

Manage units of measure

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article describes how to define a unit of measure, provide translations for the unit and its description, and define conversion rules for related units.

Open the Units page

To create and work with the units of measure that are available in your system, go to **Organization administration** > **Setup** > **Units** > **Units**.

The remaining sections of this article describe what you can do on the **Units** page.

Create standard units and conversions

If your system doesn't already include the most commonly used units of measure for the metric system and/or the US customary system (USCS), the unit setup wizard can help you quickly get started with basic unit definitions and conversions. To complete the wizard, select **Unit creation wizard** on the Action Pane, and then follow the on-screen instructions.

Create or edit a unit of measure

To create or edit a unit of measure, follow these steps:

1. Follow one of these steps:

    - To edit an existing unit, select it in the list pane.
    - To create a new unit, select **New** on the Action Pane.

2. On the header of the record, set the following fields:

- **Unit** – Enter the ID or symbol to use to refer to the unit in the system language. This ID or symbol is usually a common abbreviation for the unit, such as *ea* for each or *cm* for centimeter.
- **Description** – Enter a descriptive name for the unit in the system language. This name is usually the full name of the unit, such as *Each* or *Centimeter*.

3. On the **General** FastTab, set the following fields:

    - **Unit class** – Select the property that the unit measures (such as length, area, mass, or quantity).

    - **System of units** – Select the measurement system that the unit belongs to (*Metric units* or *United States customary units*).

    - **Base unit** – Set this option to *Yes* to use the current unit as the base unit for its unit class. In this case, you only have to specify the conversion factor between the base unit and each additional unit in the unit class. The system can then convert between all units in that unit class. Therefore, it's easier to set up conversions.

      For example, if gallon is the base unit for the *Volume* unit class, you only have to set up conversion factors from quart to gallon and from pint to gallon. The system can also convert from quart to pint.

      You can have only one base unit per unit class.

    - **System unit** – Set this option to *Yes* to use the current unit as the assumed unit for all unspecified measurements in its unit class. For example, if a field that is used to enter a quantity doesn't allow a unit to be specified (of if the user doesn't select a unit), the system uses the unit that is set as the system unit for the *Quantity* unit class. You can have only one system unit per unit class.

    - **Decimal precision** – Specify the number of decimal places that values that are specified for the current unit or converted to it should be rounded to.

4. On the Action Pane, select **Save**.

Define unit translations

To define translations for the ID or symbol and the description for a unit of measure, follow these steps:

1. Create or select the unit to create translations for.

2. On the Action Pane, select **Unit texts**.

   The **Unit texts** page appears. You use this page to define translations for the ID or symbol for the selected unit. You can use those translations on external documents in customer-specific or vendor-specific languages.

3. On the Action Pane, select **New**.
4. In the **Language** field, select the language to translate the unit ID or symbol to.
5. In the **Text** field, enter the translation of the unit ID or symbol in the selected language.
6. On the Action Pane, select **Save**.
7. Close the page.
8. On the Action Pane, select **Translated unit descriptions**.

   The **Translated unit descriptions** page appears. You use this page to define language-specific descriptions for the selected unit.

9. On the Action Pane, select **New**.
10. In the **Language** field, select the language to translate the unit description to.
11. In the **Description** field, enter the translation of the unit description in the selected language.
12. On the Action Pane, select **Save**.
13. Close the page.

Define unit conversion rules

To define rules for conversions between units of measure, follow these steps:

1. Create or select the unit to define conversion rules for.
2. On the Action Pane, select **Unit conversions**.

   The **Unit conversions** page appears. You use this page to define rules for converting the selected unit to and from other units in the unit class.

3. Select one of the following tabs, depending on the type of conversion that you want to set up:

- **Standard conversions** – Set up standard conversion rules for all products.
- **Intra-class conversions** – Set up product-specific conversion rules for units in the same unit class.
- **Inter-class conversions** – Set up product-specific conversion rules for units across unit classes.

4. Follow one of these steps:

   - To create a new conversion, select **New** on the toolbar.
   - To edit an existing conversion, select the conversion in the grid, and then select **Edit** on the toolbar.

5. In the drop-down dialog box that appears, set the following fields:

   - **Product** – Select the specific product that the conversion applies to. This field is available only for intra-class and inter-class conversions.
   - **Formula layout** – Leave this field set to *Simple* to specify a simple conversion that has a single factor. Set it to *Advanced* to set up a more complex equation. The format for advanced equations varies, depending on the unit class.
   - **From unit** – This field shows the selected unit. Usually, don't change the value. (If you do change the value, you must open the **Unit conversions** page for the selected unit to view your new conversion after you save it.)
   - **To unit** – Select the unit to convert to.
   - **Rounding** – Select how fractions should be rounded, based on the **Decimal precision** value of the selected unit (*To nearest*, *Up*, or *Down*).
   - **Conversion formula** – Use the remaining fields at the top of the drop-down dialog box to specify the formula for converting between the two units. The available fields vary, depending on the unit class and formula layout that you've selected.

6. Select **OK**.

7. Close the page.

> **Tip**
>
> You can also set up unit conversions per product variant. Learn more in Unit of measure conversion per product variant.

Last updated on 06/22/2026

Unit of measure conversion per product variant

This article explains how to set up unit of measure conversions for various product variants.

Instead of creating multiple individual products that must be maintained, you can use product variants to create variations of a single product. For example, a product variant might be a T-shirt of a given size and color.

Previously, unit conversions could be set up only on the product master. Therefore, all product variants had the same unit conversion rules. However, when the *Unit of measure conversions for product variants* feature is turned on, if your T-shirts are sold in boxes, and the number of T-shirts that can be packed in a box depends on the size of the T-shirts, you can now set up unit conversions between the different shirt sizes and the boxes that are used for packaging.

Turn on the feature in your system

If you don't already see this feature in your system, go to Feature management, and turn on the *Unit of measure conversions for product variants* feature.

Set up a product for unit conversion per variant

You can create product variants only for products that are product masters. For more information, see Create a product master. The *Unit of measure conversions for product variants* feature isn't available for products that are set up for catch-weight processes.

To configure a product master to support unit conversion per variant, follow these steps:

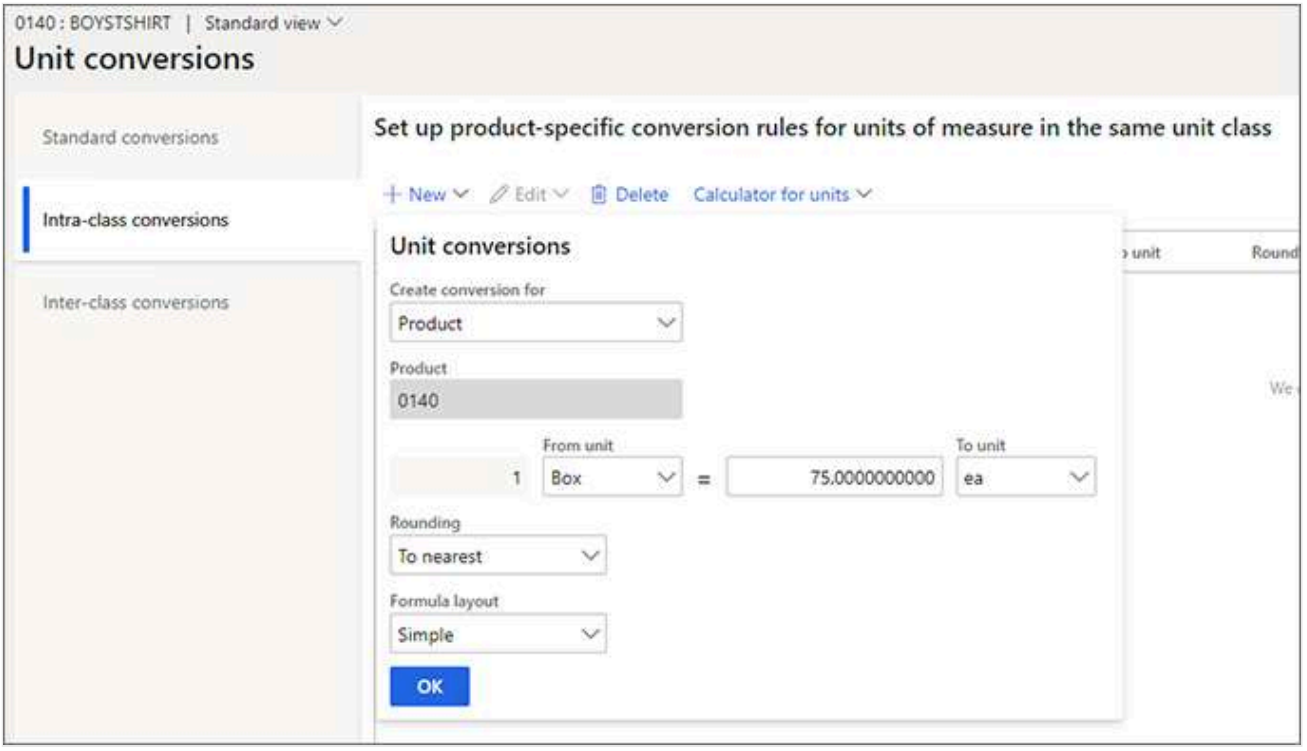
1. Go to **Product information management** > **Products** > **Product masters**.
2. Create or open a product master to go to its **Product details** page.
3. Set the **Enable unit of measure conversions** option to *Yes*.
4. On the Action Pane, on the **Product** tab, in the **Set up** group, select **Unit conversions**.
5. The **Unit conversions** page opens. Select one of the following tabs:

- **Intra-class conversions** – Select this tab to convert between units that belong to the same unit class.
- **Inter-class conversions** – Select this tab to convert between units that belong to different unit classes.

6. Select **New** to add a new unit conversion.

7. Set the **Create conversion for** field to one of the following values:

   - **Product** – If you select this value, you can set up a unit conversion for the product master. That unit conversion acts as a fallback for all product variants when no unit conversion is defined for them.
   - **Product variant** – If you select this value, you can set up a unit conversion for a specific product variant. Use the **Product variant** field to select the variant.



8. Use the other provided fields to set up your unit conversion.

9. Select **OK** to save the new unit conversion.

> **Tip**
>
> You can open the **Unit conversions** page for a product or a product variant from any of the following pages:
>
> - Product details
> - Released products details

- Released product variants

Example scenario

In this scenario, a company sells T-shirts in sizes small, medium, large, and extra-large. The T-shirt is defined as a product, and the different sizes are defined as variants of that product. The shirts are packed in boxes. For sizes small, medium, and large, there can be five shirts in each box. However, for size extra-large, there is space for only four shirts in each box.

The company wants to track the different variants in the *Pieces* unit, but it's selling them in the *Boxes* unit. For sizes small, medium, and large, the conversion between the inventory unit and the sales unit is 1 Box = 5 Pieces. For size extra-large, the conversion is 1 Box = 4 Pieces.

1. From the **Released product details** page for the **T-Shirt** product, open the **Unit conversions** page.

2. On the **Unit conversions** page, set up the following unit conversion for the **X-Large** released product variant.

Expand table

Field	Setting
Create conversion for	Product variant
Product variant	T-Shirt : : X-Large : :
From unit	Boxes
Factor	4
To Unit	Pieces

3. Because the **Small**, **Medium**, and **Large** product variants all have the same unit conversion between the *Box* and *Pieces* units, you can define the following unit conversion for them on the product master.

Expand table

Field	Setting
Create conversion for	Product
Product	T-Shirt

Field	Setting
From unit	Boxes
Factor	5
To Unit	Pieces

Using Excel to update the unit conversions

If a product has many product variants that have different unit conversions, export the unit conversions to a Microsoft Excel workbook, update them, and then publish them back to Dynamics 365 Supply Chain Management.

To export unit conversions to Excel, on the **Unit conversions** page, on the Action Pane, select **Open in Microsoft Office**.

Create a released product for a single company

This procedure shows how to create a single released product for a single legal unit. When you create the released product, it's available only in that legal unit. You can perform this task for demo data company USMF. A product designer usually performs the task.

Create a released product

1. Go to **Released products**.
2. Select **New**.
3. In the **Product number** field, enter a value.

   If the **Product number** field isn't automatically filled in, enter a unique product number. Perform this step only if you haven't set up any number sequence for product numbers.
4. In the **Product name** field, enter a value.

   The **Product name** defaults to the search name. If needed, select a different search name.
5. In the **Item model group** field, select the dropdown button to open the lookup.

   The item model groups contain settings that determine how items are controlled and handled on item receipts and issues. The settings also determine how the consumption of items is calculated.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row.
8. In the Item group field, click the drop-down button to open the lookup.

   Use item groups to manage inventory by dividing inventory items into groups based on item characteristics. For example, to manage how information is posted to main accounts, create a series of different item groups that are associated with specific main accounts. This process lets you track the inventory value of items at different stages.
9. In the list, find and select the desired record.

10. In the list, select the link in the selected row.
11. In the **Storage dimension group** field, select the dropdown button to open the lookup.

    The storage dimensions help you control how items are stored and taken from inventory. For example, a storage dimension can be Site and Warehouse.
12. In the list, find and select the desired record.
13. In the list, select the link in the selected row.
14. In the **Tracking dimension group** field, select the dropdown button to open the lookup.

    The tracking dimension group determines which tracking dimensions you can add to a product. For example, the batch number and serial number are used to track inventory items.
15. In the list, find and select the desired record.
16. In the list, select the link in the selected row.
17. In the **Inventory unit** field, select the dropdown button to open the lookup.

    The inventory unit determines how the product is quantified when it's stored in inventory.
18. In the list, find and select the desired record.
19. In the list, select the link in the selected row.
20. In the **Purchase unit** field, select the dropdown button to open the lookup.

    The purchase unit determines how the product is quantified when it's purchased from a vendor.
21. In the list, find and select the desired record.
22. In the list, select the link in the selected row.
23. In the **Sales unit** field, select the dropdown button to open the lookup. The sales unit determines how the product is quantified when it's sold to a customer.
24. In the list, find and select the desired record.
25. In the list, select the link in the selected row.
26. In the **BOM unit** field, select the dropdown button to open the lookup.

The BOM unit determines how the product is quantified when including it in a bill of materials (BOM).

27. In the list, find and select the desired record.
28. In the list, select the link in the selected row.
29. In the **Item sales tax group** field, select the dropdown button to open the lookup.

    The item sales tax group in the **Sales taxation group** determines how sales tax is calculated for each item.

30. In the list, find and select the desired record.
31. In the list, select the link in the selected row.
32. In the **Item sales tax group** field, select the dropdown button to open the lookup.

    The item sales tax group in the **Purchase taxation group** determines how purchase tax is calculated for each item.

33. In the list, find and select the desired record.
34. In the list, select the link in the selected row.
35. Click OK.

Add product characteristics

1. Expand or collapse the **Manage inventory** section.
2. In the **Net weight** field, enter a number.
3. In the **Tare weight** field, enter a number.
4. In the **Gross depth** field, enter a number.
5. In the **Gross width** field, enter a number.
6. In the **Gross height** field, enter a number.
7. In the **Volume** field, enter a number.

Add financial dimensions

1. Expand or collapse the **Financial dimensions** section.
2. In the **BusinessUnit** field, select the dropdown button to open the lookup.
3. In the list, find and select the desired record.

4. In the list, select the link in the selected row.
5. In the **CostCenter** field, select the dropdown button to open the lookup.
6. In the list, find and select the desired record.
7. In the list, select the link in the selected row.
8. In the **Department** field, select the dropdown button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, select the link in the selected row.
11. In the **ItemGroup** field, select the dropdown button to open the lookup.
12. In the list, find and select the desired record.
13. In the list, select the link in the selected row.

Cross-company product sharing

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Organizations that have many companies (legal entities) and a large product portfolio (for example, large sales and distribution networks) often experience a high level of duplicated product data. The cross-company data sharing capabilities of Microsoft Dynamics 365 Supply Chain Management let you share data about released products across multiple companies. In this way, you can reduce the volume of data that must be maintained and simplify product master data maintenance.

Prerequisites

To use the features that this article describes, your system must meet the following requirements:

- Run Microsoft Dynamics 365 Supply Chain Management version 10.0.43 or later.
- Turn on the following features in feature management.
  - *Master company data sharing*
  - *Cross-company data sharing for products*

Get started with cross-company data sharing

Single record sharing and duplicate record sharing work in the following way:

- **Single record sharing** – Just one shared record exists in the database, and all relevant companies can view and edit that record.
- **Duplicate record sharing** – Each company has its own copy of every shared record. Each time that the shared record is edited in any company, the edit is immediately replicated to every other company's copy of the record.

When you share product information across companies, the sharing works in the following way:

- The released products table (`Inventtable`) must use *single record sharing*.
- For related tables (which typically hold policies for handing a product, such as the bar code setup and the cost group), you must decide whether you want to use *single record sharing* or *duplicate record sharing*. In most cases, duplicate record sharing is the better choice for related tables, because single record sharing imposes several restrictions that duplicate record sharing doesn't impose. (Learn more in Cross-company data sharing overview.)

Before you continue, read Cross-company data sharing overview to learn more about how data sharing works in Supply Chain Management.

Prepare your system to enable cross-company data sharing for products

Before you enable cross-company data sharing for products, work through the following checklist:

- **Set up the currency.** Either the currency must be the same across all companies in the data sharing policy, or you must avoid using the base price fields.
- **Align number sequences.** Number sequences must be aligned across all companies in the data sharing policy.
- **Enable policies in the correct order.** Duplicate shared policies must be enabled before single record sharing policies.
- **Specify the default parameters for each company.** Consider aligning default parameters across all companies in the data sharing policy.
- **Consider whether any of your business processes are affected by the single record sharing functionality.** Read the detailed list of limitations and notes that apply for shared products later in this article, and prepare your system as required.

Set up sharing policies for products and product-related information

To share products and product-related information, you must create and set up your sharing policies on the **Configure cross-company data sharing** page. Each sharing policy establishes a set of tables and fields that are shared.

> **Important**

If a field in a table that's being enabled for single record sharing holds a foreign key for a related table, that related table is also shared by using single record sharing, unless a duplicate record sharing policy for it already exists and is enabled. Therefore, all the duplicate record sharing policies that you require must be enabled before you start to set up your single record sharing policies. For example, if you plan to use duplicate record sharing for production pools, you must enable the production pool policy before you enable the products (and the products must use single record sharing).

Set up duplicate record sharing policies

Use duplicate record sharing for tables that handle policies and related information.

To create a duplicate record sharing policy, follow these steps. You can create as many duplicate record sharing policies as you want.

1. Go to **System administration** > **Setup** > **Configure cross-company data sharing**.
2. On the Action Pane, select **New**.
3. In the **Name** field, enter a name for the policy (for example, *Product policies - duplicate sharing*).
4. Leave the **Master company data sharing policy** option set to *No*. (This option doesn't apply to *duplicate record sharing* policies.)
5. On the Action Pane, select **Save**.
6. In the **Companies which share the records in these tables** section, add each company that shares the tables that you add for this policy.
7. In the **Tables and fields to share** section, select **Add** on the toolbar.
8. In the drop-down dialog box, in the **Table name** field, select a table. For more information about which tables you might select, see the Product information tables that can be shared section later in this article.

   ⓘ **Note**

> Not all tables are enabled for record sharing. If the table that you want to share isn't available for selection in the **Table name** field, send a request to Microsoft Support, and we'll consider adding sharing support for the requested table in the future.

9. Select **Add table**. Your table is added.
10. Select which fields (and which related tables, if any) to share by selecting and clearing the different checkboxes.
11. Repeat steps 7 through 10 for each additional table that you want to share by using this policy.
12. On the Action Pane, select **Save**.

Set up single record sharing policies

Use single record sharing for the *Released product* table (`Inventtable`).

To create single record sharing policies for the **Released product** table and other tables, follow these steps:

1. Go to **System administration** > **Setup** > **Configure cross-company data sharing**.
2. On the Action Pane, select **New**.
3. In the **Name** field, enter a name for the policy (for example, *Products - single record sharing*).
4. Set the **Master company data sharing policy** option to *Yes*. This setting is required for *single record sharing* policies.
5. Set the **Master company** field to the company to use as the master. The single record is assigned to this company.
6. On the Action Pane, select **Save**.
7. In the **Child companies** section, add each company that shares the tables that you add for this policy.
8. In the **Tables and fields to share** section, select **Add** on the toolbar.
9. In the drop-down dialog box, in the **Table name** field, select a table (for example, *Inventtable*). Then select **Add table**.
10. Expand the newly added table, and review the status of each of its fields. (A check mark indicates enabled fields.) Take special note of the status of fields that reference another table. (These are labeled with the text "foreign key.") Either make sure that you've included the related table as part of a duplicate record sharing policy or be aware that the related tables are now also shared by using single record sharing.

Product information tables that can be shared

To share products across companies, the following table *must* be shared by using *single record sharing*:

- Released products (`Inventtable`)

The following product-related tables can be shared by using either *duplicate record sharing* or *single record sharing*:

- Barcode setup
- Batch attribute
- Batch disposition master
- Buyer group
- Calculation group
- Charges group
- Commission group
- Cost group
- Counting reason code policy
- Duty rates group
- Fiscal LIFO reporting group
- Freight allocation group
- Inventory level profile
- Item coverage group
- Item group
- Item model group
- Item price tolerance group
- Item rebate group
- Number group
- Packing group
- Price group
- Production group
- Production pool
- Property
- Revenue schedule
- Statistics procedure
- Supplementary item group
- Tax rate type

- Warehouse item setup

Limitations and notes that apply to shared products

This section provides notes and summarizes the limitations that apply when you share product information between companies in different scenarios.

Item templates

You can't apply item templates to child companies, because the `SysRecordTemplateTable` table isn't shared. Therefore, the **Apply template** command is unavailable in child companies.

Currencies and base prices

Base prices (such as the sales price, purchase price, and inventory price) are implicitly expressed in the accounting currency of each company.

The accounting currency for each company is set up in the **Accounting currency** field on the **Ledger** page (**General ledger** > **Ledger setup** > **Ledger**).

For companies that are part of a cross-company policy, the following cases apply:

- **All companies in the policy use the same accounting currency** – There are no special limitations to consider.
- **Companies in the policy use different accounting currencies** – The currency isn't explicitly specified. Instead, it's implicit for each company. Therefore, if one amount (such as the base sales price) is shared across companies, each company assumes a different currency. For example, the USMF company uses US dollars (USD), whereas the JPM company uses Japanese yen (JPY). If the base sales price is 20, the USMF company assumes that the amount is 20 USD, but the JPM company assumes that it's 20 JPY. Because 20 USD and 20 JPY don't represent the same monetary value, one of the companies sells the item at a price that is either too high or too low.

Therefore, only one of the following rules applies:

- **All companies that are part of a cross-company data sharing policy for sharing products must use the same accounting currency.** If you rely on fields that use an implicit currency (such as the base sales price or purchase sales price), you must set the same accounting currency in all companies that are part of the product sharing policy.

- **You must not rely on the value of these fields.** Use trade agreements for purchase and sales prices, and don't use the inventory price or its related processes.

Country/region-specific fields

By default, most country/region-specific fields are disabled in product tables, because they aren't supported. Therefore, if you want to share those fields, you must add them as an extension. Add the country/region-specific tables to the policy, and then select the fields that must be shared.

Default unit of measure

When you create a product, you must specify several different units of measure, each for a specific purpose. For example, you might specify an inventory unit, a purchase unit, and a sales unit. The **New released product** dialog box shows the same default unit for all of them, based on the default setting for the current company. However, you can edit the unit for each unit of measure separately in the dialog box.

To assign the default unit for a company, follow these steps:

1. On the navigation bar, select the company (legal entity) that you want to set defaults for.
2. Go to **Inventory management** > **Setup** > **Inventory and warehouse management parameters**.
3. On the **General** tab, in the **Default values** section, in the **Unit** field, set the default unit for the current company.

> **Important**
>
> The default unit depends on the company that the product is created in. If you want the default behavior to be aligned, set the same default unit for all companies.

Physical dimensions units

The **Released products** page shows physical dimensions for each released product. These dimensions include weight and height. However, the unit for the measurements isn't shown on the page and is therefore implicit. The unit that is used for each measurement is the system unit in each unit class. Because these system units are cross-company, there are no specific actions or limitations that you must consider in this area.

> **Note**

The system unit for each class is set up on the unit itself, and only one unit in the unit class can be a system unit. If no unit is set up as the system unit, the value of the fields has no meaning, and processes (such as warehousing) that rely on the existence of a system unit can't be completed. Learn more in **Manage units of measure**.

Bills of materials, formulas, and routes

Manage bills of materials (BOMs), formulas, and routes in each company. Therefore, BOMs, formulas, and routes aren't shared in the provided templates.

Coverage groups – calendar

When you share the coverage groups for an item, the calendar on a coverage group isn't shared in the provided templates. If you want to share it, create a new policy for calendar sharing, or add the calendar table to the coverage group policy.

Product configurator

Constraint-based configuration products don't have any limitations. The product is shared when it's created, and the variant that is created on the fly is also shared cross-company.

Number sequences

Number sequences can be used for product numbers and other purposes. Number sequences must be shared if they're used with single record sharing of products.

Dual-write

Dual-write isn't currently supported when you use cross-company data sharing for products.

Dynamics 365 Commerce

Dynamics 365 Commerce isn't supported when you use cross-company data sharing for products. You can't use Commerce and cross-company data sharing in the same system, because shared products aren't synced to the point of sale (POS) system.

Financial dimensions

Fields that reference financial dimensions (for example, the Ledger or Default dimension) can't be shared across companies. This limitation is a restriction of cross-company data sharing. Learn

more in Cross-company data sharing overview.

Vendors

There's no template policy for the vendors table (`vendtable`). Because the vendors table is marked as a single record shared table, you can create a policy for single record sharing and add the table.

Item sales tax group and item purchase tax groups

Item sales tax groups and item purchase tax groups are specified at the product level. The item sales tax group value automatically enters a default tax group on each sales order line, and the item purchase tax group value automatically enters a default tax group on each purchase order line. For convenience when default values are entered, the values are set to duplicate record sharing and are added to the *Products* template for single record sharing. Although the names of the tax groups are shared across companies, their details and settings are company-specific. Therefore, because tax groups are specific to each item in the company context, you must set up those details and settings in the company part of the sharing policy.

Distributed hybrid environment

If you're using a distributed hybrid environment that includes cloud or edge scale units, cross-company data sharing for products isn't supported.

Engineering change management

Some functionality that engineering change management provides might conflict with single record sharing of products or, when it's used in specific ways, might be complementary.

The following engineering change management concepts are affected if you use single record sharing of products:

- **Definition of engineering companies** – Engineering change management lets you set up one or more engineering companies. These engineering companies might be organizations that represent one or more existing companies where your engineering department is located. Alternatively, you might set up a dedicated company that doesn't represent an actual engineering department, but that you use to manage master data and control the release of products for your organization. For more information about engineering companies, see Engineering companies and data ownership rules.

- **Release product structure** – From the engineering company, you can use a controlled process to release a product to other companies. For more information about the release product structure, see Release product structures.

The tables that are related to engineering versions aren't shared, because they're meant to be contained in engineering and to be shared only with a controlled release. Therefore, if you use engineering change management, you might choose one of the following setups:

- **Your engineering company is part of the single record sharing policy** – In this case, most of the engineering-related functionality isn't applicable, especially the controlled release. As soon as the product is created as a released product in the engineering company, it's shared (that is, made available) to the rest of your companies. Therefore, the engineering company loses its engineering character, because it's no longer a space where the engineering team can work on products, and only those products that continue forward are used in the system.

  Because the engineering versions aren't shared, the version information is available only in the engineering company. Therefore, this setup has the following implications:
  - Engineering versions exist only in the engineering company, unless they're shared by using the release product structure.
  - The lifecycle state at the version level works only in those companies where the version information has been shared. Therefore, you can't control the processes that a version of a product is being used in unless the version is shared with its released product structure.
  - Release control is lost, because the product is shared across all companies.
  - The BOM and route are kept locally. You must manage the BOMs and BOM versions (and also the routes and route versions) at the company level. Therefore, you can still use the release product structure to share the BOM and route.

  Don't use this setup, because much of the value of engineering change management is lost.

- **Your engineering company isn't part of the single record sharing policy for products** – You can set up your engineering company so that it isn't part of the shared product policy. You can then make a sharing policy that includes all the companies where product introduction is done at the same time. In this case, you can release a product to one company to make it available in all the companies.

  If you require version management, you must still release the version information with the release product structure. Therefore, your organization must have an engineering company where products are designed and managed. Then, when a product is ready, you do a controlled release to the rest of the companies. (This type of controlled release is the main

goal of the engineering change management functionality.) In this case, you create the product in the engineering company and then release it to all the companies that are part of the sharing policy. The released product is released to all the companies at the same time, because they're sharing the same product record.

Version-related tables (such as engineering versions) aren't shared. Therefore, you must not rely on version management outside the engineering organization. Alternatively, if you require version management in all companies, you must release version-related information with the release product structure.

Sites and warehouses

Sites and warehouses can be shared. To share them, include the `InventLocation` table (for warehouses) and/or the `InventSite` table (for sites) in a sharing policy. If you don't share these tables, all sites and warehouses are company specific. Therefore, you must create them in every company.

Existing products

When you enable single record sharing for products, create and enable the single record sharing policies before you start to import or create your product portfolio.

> **Important**
>
> A company that already has product records can never be made into a child company for single record sharing. Therefore, in most cases, you can set up product sharing only when you're setting up a new system.

If the system already contains products before you enable the single record sharing policies, those products aren't shared.

Modifying policies

It isn't possible to add more fields to a data sharing policy after it has been created and enabled.

More information about cross-company data sharing

To learn more about cross-company data sharing, see Cross-company data sharing overview.

Last updated on 06/22/2026

Product data entities

06/23/2025

To import and export product data, you must use data entities. Learn more at Configuration data and data migration in Dynamics 365 implementation projects.

Product-related data entities

The following table provides details about the product-related data entities and describes the purpose of each. Learn more in Built-in entities.

Expand table

Entity	Application Object Tree (AOT) name (type)	Notes
Products V2	`EcoResProductV2Entity`	This entity is used to import and export shared products-distinct products and product masters. It allows for updates. It doesn't support set-based SQL operations. It's enabled for Open Data Protocol (OData).
Released products V2	`EcoResReleasedProductV2Entity`	This entity is used to import and export released products-distinct products and product masters. It allows for updates. It requires that the shared product is already created. When a new released product is imported, a release of the shared product occurs. There are also separate entities that can be used to import and export released product masters and released distinct variants. This entity doesn't support set-based SQL operations or delete operations. It's enabled for OData.
Released product creation V2	`EcoResReleasedProductCreationV2Entity`	This entity is used to import shared products and released products in one step.

Entity	Application Object Tree (AOT) name (type)	Notes
		Although it supports exports, we don't recommend using it for exports because the purpose of the entity is product creation. It doesn't support updates. It supports a limited set of fields (fields that are available in the product creation dialog box). It doesn't support set-based SQL operations. It isn't exposed through OData.
Product variants	`EcoResProductVariantV2Entity`	This entity is used to import and export shared product variants. It allows for updates. It requires that dimension values are already created. The integration key is the product master plus product dimensions. This entity doesn't support set-based SQL operations. It's enabled for OData. It supports delete operations. It can't be extended through the addition of new product dimensions.
Product variants by product number identification	`EcoResProductNumberIdentifiedProductVariantEntity`	This entity is used to import and export shared product variants. It allows for updates. It requires that dimension values are already created. The integration key is the product number (whereas the integration key for the **Product variants** entity is the product master plus product dimensions).
Released product variants	`EcoResReleasedProductVariantV2Entity`	This entity is used to import and export released product variants. It allows for updates. It requires that shared product variants already be created. When a new released product variant is imported, a

Entity	Application Object Tree (AOT) name (type)	Notes
		release of the shared product variant occurs. This entity doesn't support set-based SQL operations. It's enabled for OData. Although it supports delete operations, doing so currently causes data corruption because of a bug in the current platform. This entity can't be extended through the addition of new product dimensions. This entity doesn't support deletion of global products and variants.
Released product variants by product number identification	`EcoResProductNumberIdentifiedReleasedProductVariantEntity`	This entity resembles the **Released product variants** entity, but the integration key is the product number instead of the product master plus product dimensions. It can be extended through the addition of new product dimensions.
Sellable released products	`EcoResSellableReleasedProductEntity`	This entity is used to export only sellable products. Sellable products are products that have the information that they require in order to be used in a sales order. The same rules apply when a product is validated by using the **Validate** function on the **Released products** page.
Released Distinct products V2	`EcoResDistinctProductEntity`	This entity is used for distinct products. Those distinct products can be products, subtype products, and product variants. This entity is enabled for OData but not for data management.
Released products masters V2	`EcoResProductMasterV2Entity`	This entity is used for product masters. It's enabled for

Entity	Application Object Tree (AOT) name (type)	Notes
		OData but not for data management.
Item - barcodes V3	`EcoResProductBarcodeV3Entity`	This entity is used to export products and bar codes. This entity doesn't allow change tracking, updates, or deletes. To use change tracking, updates, or deletes on bar codes, use the **Item - barcode association** entity.
Item - barcode association	`EcoResProductBarcodeAssociationEntity`	This entity is used to export products and bar codes. It allows change tracking, updates, and deletes. Its entity key is `AssociationID`, which creates the association between the bar code and the product. To add support for this key, the table `InventitemBarcodeAssociation` is populated for existing item bar code data when you turn on the feature. The table is populated using a batch job and if your bar code table has a large number of records, it could take significant time to run the batch job. Therefore, we recommend that you plan to enable the feature (and therefore run the batch job) at a time that fits your business schedule.
Product lifecycle states	`EcoResProductLifecycleStateEntity`	This entity is used to import and export the different product lifecycle states that can be assigned to a product.

> **Note**
>
> You can use the **Released Products V2** data entity to import products into the system only if the shared product has already been created. Otherwise, to import products into the system, you must use the **Product creation** data entity.

Next steps

- Data management overview

Product lifecycle states

Product lifecycle states document the lifecycle state of a released product or variant. They control which business processes (such as purchase orders, production, planning, or forecasts) can use released products or variants assigned to a given lifecycle state.

You can define any number of product lifecycle states to represent the different stages in a product's lifecycle, such as *Prototype*, *Active*, *Obsolete*, or *End-of-life*. Associate these lifecycle states to released products and released product variants to manage their availability and usage within your organization. Select one lifecycle state as the default for new released products. Released product variants inherit their product lifecycle state from their released product master when you create them. When you change the lifecycle state on a released product master, you can choose to update all existing variants that have the same original state.

Create, configure, and manage product lifecycle states

The following procedure describes how to create, configure, and manage product lifecycle states. It explains how to mark a lifecycle state as the default for new released products and how to control which business processes are allowed or blocked for products in a specific lifecycle state.

1. Go to **Product information management** > **Setup** > **Product lifecycle state**.
2. On the Action Pane, select **Refresh processes** to ensure all of the latest business processes are available for use with your product lifecycle states.
3. Follow one of these steps:
    - To create a new lifecycle state, select **New** on the Action Pane.
    - To edit an existing lifecycle state, select it in the list pane, and select **Edit** on the Action Pane.
    - To delete an existing lifecycle state, select it in the list pane, and then select **Delete** on the Action Pane.
4. Make the following settings in the header of your new or selected lifecycle state:
    - **State** – Enter a name for the product lifecycle state (such as *Prototype*, *Active*, *Obsolete*, or *End-of-life*).
    - **Description** – Enter a description of the product lifecycle state.

5. Make the following settings on the **General** FastTab:

   - **Default when released to a legal entity** – Set to *Yes* if this lifecycle state should be applied to all products by default when they're first released. Set it to *No* if this lifecycle state is manually applied later.
   - **Is active for planning** – Set to *Yes* to include products that are in this lifecycle state in calculations at the master planning and bill of materials (BOM) levels. Set it to *No* to exclude products that are in this lifecycle state from the calculations.

   > ⓘ **Important**
   >
   > The **Default when released to a legal entity** setting doesn't apply to engineering products. Learn more in Product lifecycle states and transactions.

6. Use the **Enabled business processes** FastTab to control which of the available business processes can be used with products in the current lifecycle state. For each process that is listed on the FastTab, view and set the following values:

   - **Process** – This read-only field shows the name of an existing business process. The table at the end of this procedure lists and describes the business processes that might appear here.
   - **Process area** – This field shows the name of the process area that the specified business process belongs to. Although this field is editable, don't change it.
   - **Policy** – Select one of the following values to control whether and how the business process is permitted to use products that are in this lifecycle state:
     - *Enabled* – The business process is allowed to use products in this lifecycle state.
     - *Blocked* – The business process isn't allowed to use products in this lifecycle state. If a user tries to use the process on a product that is in this lifecycle state, the system blocks the attempt and shows an error instead. For example, you might block end-of-life products from being purchased.
     - *Enabled with warning* – The process is allowed, but a warning is shown. For example, you might want a prototype product to be put on a production order that is created by the Research and Development department. However, other departments should be aware that they shouldn't produce the product yet.

   > ⚠ **Warning**

Although the **Process area** values are editable, don't change them. For each row, the value shown in the **Process area** column relates directly to the value shown in the **Process** column. These combinations are generated by the underlying framework. Altering them might break system-driven validations or cause incorrect business rule behavior.

> **Tip**
>
> If you don't see all of the business processes that you expect on the **Enabled business processes** FastTab, select **Refresh processes** on the Action Pane to update the list.

7. On the Action Pane, select **Save** to save your new or updated product lifecycle state.

The following table lists and describes the business processes available on the **Enabled business processes** FastTab.

Expand table

Process	Process area	Description
BOM report as finished	Production	Governs the standalone *Report as finished* function for a bill of materials, such as the **Bills of materials** inventory journal.
Inbound order	Warehouse	Enables or blocks inserting or updating the item on an inbound warehouse shipment line.
Inbound order creation	Warehouse	Enables or blocks inserting the item on an inbound warehouse shipment line during creation.
Inventory adjustment	Inventory	Enables or blocks adding the item to an inventory adjustment journal line.
Inventory journal	Inventory	Enables or blocks adding the item to inventory transfer, adjustment, or movement journal lines.
Inventory movement	Inventory	Enables or blocks adding the item to an inventory movement journal line.
Inventory transfer	Inventory	Enables or blocks adding the item to an inventory transfer journal line.
Item forecast	Planning	Enables or blocks creating manual demand forecasts for the item in Master Planning.
Outbound order	Warehouse	Enables or blocks inserting or updating the item on an outbound

Process	Process area	Description
		warehouse shipment line.
Outbound order creation	Warehouse	Enables or blocks inserting the item on an outbound warehouse shipment line during creation.
Production BOM	Production	Enables or blocks creating a production order if the item appears in the BOM.
Production order	Production	Enables or blocks creating a production order for the item.
Production picking list	Production	Enables or blocks adding the item to a production picking list journal line.
Purchase order	Purchasing	Enables or blocks adding the item to a purchase order line, and posting product receipt or invoice.
Purchase order creation	Purchasing	Enables or blocks adding the item to a purchase order line during creation.
Request for quote	Purchasing	Enables or blocks creating a request for quote for the item.
Return order	Sales	Enables or blocks adding the item to a return order line.
Sales order	Sales	Enables or blocks adding the item to a sales order line, and posting packing slip or invoice.
Sales order creation	Sales	Enables or blocks adding the item to a sales order line during creation.
Sales picking list	Sales	Enables or blocks generating a sales picking list for the item in a sales order.
Sales quotation	Sales	Enables or blocks adding the item to a sales quotation line.
WBS estimate for items	Planning	Enables or blocks creating a transaction of type *Item* in a work breakdown structure for a project.

Associate product lifecycle states to released products

You can associate a product lifecycle state to newly released products or product variants in several ways.

- *When you create a new released product* – The system assigns the lifecycle state that has **Default when released to a legal entity** selected to the **Product lifecycle state** field of the new released product.

- *When you release a product to a legal entity* – The system assigns the lifecycle state that has **Default when released to a legal entity** selected to the **Product lifecycle state** field of the new released product.
- *When you release a product variant to a legal entity* – The system assigns the lifecycle state assigned to the released product master in this legal entity to the **Product lifecycle state** field of the new variant.

> **Important**
>
> The **Default when released to a legal entity** setting doesn't apply to engineering products. The engineering change category specifies the lifecycle state of an engineering product version after you create it in the engineering company. When you release the product to an operational company, the lifecycle state of the product is copied. In other words, when an engineering product is released to an operational company, it has the same lifecycle state that it had in the engineering company. You can overwrite the lifecycle state in the operational company. Learn more in Product lifecycle states and transactions.

To manually update the product lifecycle state of an existing released product or product master, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Find the product or product master that you want to update. Product masters show a **Product subtype** of *Product master* on the **Released products** page.
3. Do one of the following steps:
   - If you're working with a standard (non-engineering) product or variant, do one of the following steps:
     - From the list view, select **Edit** on the Action Pane and then change the **Product lifecycle state** field to the desired lifecycle state.
     - Open the record, select **Edit** on the Action Pane, and then, on the **General** FastTab, change the **Product lifecycle state** field to the desired lifecycle state.
   - If you're working with an engineering product, select or open the record. On the Action Pane, open the **Engineer** tab, and from the **Engineering change management** group, select **Change lifecycle state** to open a drop-down dialog. From the dialog, select the desired lifecycle state and then select **OK**.
4. On the Action Pane, select **Save**.

5. If you edited a product master for a standard (non-engineering) product, you're asked to confirm whether you want to update the variants. Select one of the following options:

    - Select **Yes** to update all related released product variants that have the same original status as the released product master.
    - Select **No** to keep the actual state of all variants. Variants that have a different product lifecycle state from the released product master aren't updated.

6. If you chose to update product variants related to a product master, you can view and edit the new lifecycle states of the variants by going to the Action Pane, opening the **Product** tab, and from the **Product master** group, selecting **Released product variants**.

To manually update the product lifecycle state of an existing released product variant, follow these steps:

1. Go to **Product information management** > **Products** > **Released product variants**.
2. Find the product variant that you want to update. Select or open the record.
3. On the Action Pane, open the **Product variant** tab and select **Change lifecycle state** to open a drop-down dialog. From the dialog, select the desired lifecycle state and then select **OK**.

Impact on master planning

Master planning and bill of materials (BOM) level calculations exclude items assigned a product lifecycle state when the **Is active for planning** option is set to *No*.

> **Tip**
>
> For performance reasons, associate all obsolete released products and variants with a product lifecycle state that deactivates master planning. This association is especially important when you work with non-reusable product configuration variants.

Default migration, import, and export

Data entities support product lifecycle states. You can set the lifecycle state to a variable state through either the *released product* data entity or the *released variant* data entity.

Find obsolete products and product variants

The *Change lifecycle state for obsolete products* periodic task makes it easy to find obsolete products or variants and update their product lifecycle status. Learn more in Find obsolete released products or variants.

Find obsolete released products or variants

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to find obsolete released products or product variants and how to associate a product lifecycle state to the obsolete products. It also explains how to view the simulation results and assess how many products and product variants will be associated with a new product lifecycle state when running the update without simulation.

When you run the analysis in simulation mode, it displays the products and product variants identified as obsolete. You can easily review these products. The analysis searches for transactions and specific master data to identify products that have no demand within a variable period and no master data that can result in demand. You can exclude new released products within a variable period from the analysis. When the analysis simulation returns the expected result, you can run the analysis and set a new product lifecycle state to all products identified as obsolete by the analysis.

> **Note**
>
> Perform all analyses and updates within the same legal entity.

Find obsolete products and variants and assign a new product lifecycle state to them

To find obsolete product variants and assign a product lifecycle state to them, follow these steps:

1. Go to **Product information management** > **Periodic tasks** > **Change lifecycle state for obsolete products**.
2. In the **New product lifecycle state** field, select the product lifecycle state that your company uses to indicate obsolete products.
3. Set **Run simulation without updating product data** to *Yes*.

4. In the **Exclude products created within this number of days** field, enter a number.
5. In the **Exclude products used in transactions (in number of days)** field, enter a number.
6. If you want to limit the scope of the simulation, expand the **Records to include** FastTab and select **Filter** to open the standard query dialog, where you can define selection criteria. The fields work just as they do for other types of queries in Supply Chain Management. The next section lists a few ways to identify obsolete products and variants that you can use as filter criteria.
7. On the **Run in the background** FastTab, specify how, when, and how often the job runs. The fields work just as they do for other types of background jobs in Supply Chain Management.

   > **Tip**
   >
   > Run the simulation in batch if you expect to search a large number of products. Also, don't run the simulation during the most active working time of the company.

8. Select **OK** to apply your settings and close the dialog.
9. Go to **Product information management** > **Inquiries and reports** > **Product lifecycle state maintenance history**.
10. The **Product lifecycle state maintenance history** page shows the results of the simulation. Review the results and decide whether you want to apply the suggested changes. You might decide to adjust the filter criteria and run the simulation again.
11. When you're satisfied with the simulation results, go to **Product information management** > **Periodic tasks** > **Change lifecycle state for obsolete products**.
12. Set **Run simulation without updating product data** to *No*.
13. Expand the **Records to include** FastTab and confirm that it still shows the filter criteria that you used for the simulation that you want to apply.
14. Depending on how many products and product variants are affected, consider running this job in batch by using the settings on the **Run in the background** FastTab. Make sure that you're not running a large update job during the most active working hours in the company.
15. Select **OK**.

16. Go to **Product information management** > **Inquiries and reports** > **Product lifecycle state maintenance history** and confirm that the changes you expected were applied.

Ways to identify obsolete products and product variants

Here are some signs that a released product or product variant is obsolete:

- The product or product variant was created some days ago based on the number of days that you enter in the selection dialog box.
- There are no open production orders (status less than ended) for the product or product variant.
- There are no open inventory transactions (status issue `ReservPhysical` to `QuotationIssue` or status receipt `Registered` to `QuotationReceipt`) for the product or product variant.
- There are no inventory transactions within the last number of days for the product or product variant.
- There's no future demand or supply forecast for the product or product variant.
- No minimum stock level is set in item coverage for the product or product variant.
- No active fixed quantity kanban rules exist for the product or product variant.
- No service order lines exist for the product or product variant.
- No active or future sales or purchase agreement lines exist for the product or product variant.
- The product or product variant isn't used in a BOM that is associated with a non-expired approved BOM version for a product or variant that's active for planning.

Create a bar code for a product

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article shows how to manually create a bar code by using item number M0001 as an example. The demo data company for this procedure is USMF.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the desired record. For this example, select item number *M0001*.
3. On the Action Pane, select **Manage inventory**.
4. Select **Bar codes**.
5. Select **New**.
6. Select the new row in the list.
7. In the **Bar code setup** field, enter or select a value.
8. In the **Bar code** field, enter or select a value.
9. In the **Bar code** field, type a value.
10. In the **Quantity** field, enter a number.
11. Select **Save**.
12. Close the page.

Enter the GTIN code for a product

A Global Trade Item Number (GTIN) is a unique and internationally recognized identifier for a product. The GS1 organization assigns GTIN codes.

To assign GTIN codes to a product, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select a product in the grid.
3. On the Action Pane, open the **Manage inventory** tab and select **GTIN codes**.
4. Use the Action Pane buttons to add or remove rows as needed.
5. Make the following settings for a new or selected row:

    - **Unit** – Select a unit of measure.
    - **GTIN code** – Select the GTIN standard you're using.
    - **GTIN** – Enter the GTIN code for the product.
    - *Other dimensions* – Enter values in the other dimension columns as needed. To control which dimensions are shown, select **Display dimensions** on the Action Pane.

6. On the Action Pane, select **Save**.

Create batch attributes for a product

Article • 09/29/2021

This procedure shows how to create a batch attribute, assign default value ranges, and include the attribute in a group. The demo data company used to create this procedure is the USP2 Company.

1. Go to Inventory management > Setup > Batch > Batch attributes.
2. Click New.
3. In the Attribute field, type a value.
4. In the Description field, type a value.
5. In the Attribute type field, select 'Fraction'.

    - This procedure uses the Fraction type to enable decimal values. You can select other attribute types. If you select the Enumeration type, you must enter values in the enumeration list before you can enter a value in the Target field.

6. In the Minimum field, enter a number.
7. In the Maximum field, enter a number.
8. In the Increment field, enter a number.
9. In the Target field, type a value.
10. Click Save.
11. Close the page.
12. Go to Inventory management > Setup > Batch > Batch attribute groups.
13. Click New.
14. In the Attribute group field, type a value.
15. In the Description field, type a value.
16. Click Save.
17. Click Group attributes.
18. Click New.
19. In the Attribute field, click the drop-down button to open the lookup.
20. In the list, find and select the desired record.
21. In the list, click the link in the selected row.

    - An attribute can be included in any of the groups.

22. Click Save.
23. Close the page.

Feedback

Provide product feedback

Add an image to a product

09/17/2025

This procedure shows how to add an image to a product.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the grid, find and select the product you want to add an image for.
3. On the far-right pane, select the **Related information** button to open the **Related information** pane (also called the FactBox pane).
4. On the **Related information** pane, expand the **Product image** FastTab.
5. Select **Change image** to open the **Product images** dialog, where you can upload an image or select an existing one from the gallery.
6. Select **OK** to apply the image and close the dialog.

> **Tip**
>
> Admins can choose whether and how product images should be shown in the Warehouse Management mobile app by default, and workers can override this setting on their local devices if they wish. Learn more in User settings, color themes, and sound themes and Mobile device user settings.

Country of origin

Many organizations issue certificates to their vendors to ensure that products meet specific certification standards. These certificates often depend on the country/region of origin. The country of origin feature lets you link a product to its country/region of origin and keep track of its product certifications.

> **Important**
>
> The *Country of origin management* feature described in this article helps you keep track of vendor certificates but doesn't modify the standard functionality of invoices, packing slips, or order confirmations to include them. If you want to print certificate numbers on one or more of these reports, you must extend them in your project.

Configure source and destination countries/regions

Before you issue a certificate for a product, you must link the product to its destination country/region and its country/region of origin.

1. Go to **Product information management** > **Setup** > **Product compliance** > **Country of origin** > **Country of origin rules**.
2. Select an existing country/region setup to edit, or select **New** on the Action Pane to create a new country/region setup.
3. Set the following values for the selected or new country/region.

Expand table

Field	Description
Item number	Select the item number of the product.
Destination country	Select the country/region that you're sending the product to.
Origin country	Select the country/region that you're shipping the product from.

This setup helps you generate a bill of materials (BOM) report where you can include the country/region of origin for each part that source and destination countries/regions are specified

for. This report helps you get a holistic picture of where your parts come from and where they're going.

Keep track of vendor certificates

Use the **Country of origin vendor certificates** page to keep track of certificates that you issue to vendors.

Decide which certificate documents you're issuing and how you'll report them to customers. This feature helps you keep track of your certificates. It also lets you choose whether the relevant certificate numbers appear on invoices, packing slips, and/or order confirmations.

To set up your certificate information, follow these steps:

1. Go to **Product information management** > **Setup** > **Product compliance** > **Country of origin** > **Country of origin vendor certificates**.
2. Select an existing certificate setup to edit, or select **New** on the Action Pane to create a new certificate setup.
3. Set the following settings for the selected or new certificate.

Expand table

Field	Description
Vendor account	Select the vendor that you issued the certificate to.
Item number	Select the item that you issued the certificate for.
Country/region	The destination country/region where you must use this certificate.
Certificate number	Enter the identification number of the certificate that you issued.
Effective	Select the first date when the current certificate is valid.
Expiration	Select the last date when the current certificate is valid.
Print on invoice	If you extended your invoice reports to support certificate numbers, select this check box to include them when relevant. The out-of-box invoice report design doesn't provide support for certificate numbers.
Print on packing slip	If you extended your packing slip reports to support certificate numbers, select this check box to include them when relevant. The out-of-box packing slip report deign doesn't provide support for certificate numbers.

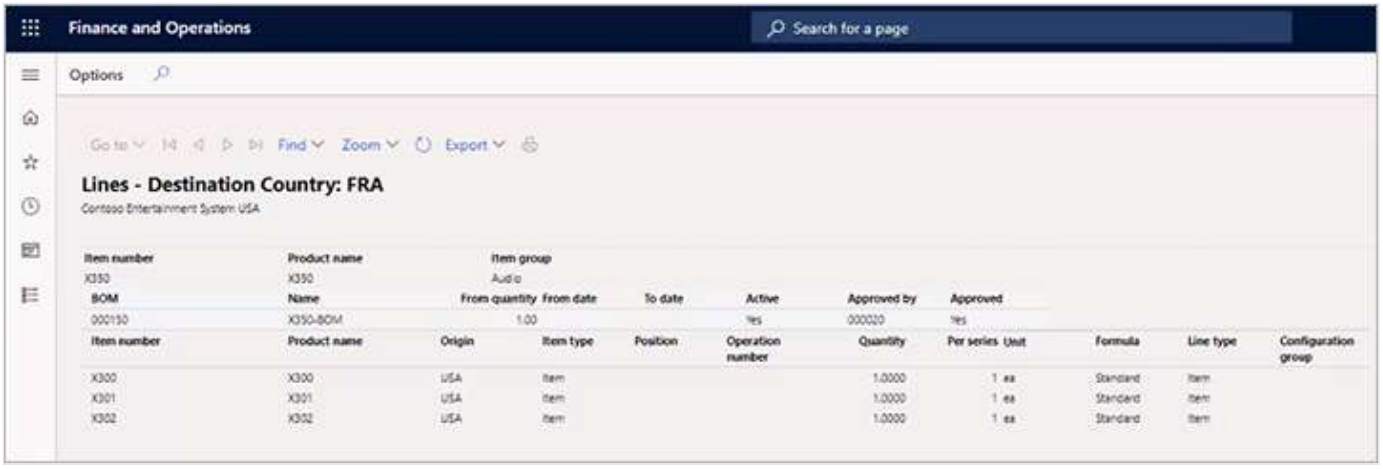
Field	Description
Print on sales order	If you extended your sales order reports to support certificate numbers, select this check box to include them when relevant. The out-of-box sales order report design doesn't provide support for certificate numbers.

Include the country/region of origin on BOM reports

When you generate a BOM report, you can include the country/region of origin for each part that you specify source and destination countries/regions for on the **Country of origin rules** page.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the Action Pane, on the **Engineer** tab, in the **BOM** group, select **Designer**.
4. On the page that appears, on the Action Pane, select **BOM** > **Print**.
5. In **Bill of materials lines** dialog box, set the **Destination country** field to the destination country/region that you want to view on your report.
6. Select **OK**.

A report that shows information about the country/region of origin of each part is generated and shown. Here's an example of the report.



Last updated on 07/01/2026

Dual-use goods

Article • 07/14/2023

Dual-use goods are typically items that have both civilian and military applications. For example, a chemical might be used as either a fertilizer or an explosive. Many countries/regions have special regulations that apply to the export, import, and transportation of dual-use goods. Therefore, it's important that companies that are involved in the international trade of dual-use goods keep track of the various policies and certificates.

The dual-use feature helps companies keep track of products that are identified as dual-use goods, stores certificate numbers for each relevant product and destination country/region, and print valid certificate numbers on relevant invoices, packing slips, and/or sales orders. It helps ensure that, when your products are shipped, they always include up-to-date certifications.

Consider the following scenario:

1. The **Dual use country setup** page in your system indicates that shipments to France require a certification.

2. The **Released product details** page for product X-100 indicates that it's a dual-use good. Together, the code, category, group, and regime indicate the export control classification that the product belongs to.

3. The **Dual use certificates** page includes a certificate for product X-100 when it's shipped to France. This certificate expires January 1, 2020.

4. On June 17, 2020, you create a sales order for a customer company that is based in France, and the order includes product X-100.

5. When you confirm the sales order, the system determines the following information:
   a. Does the order include any products that are dual-use goods?
   b. If the order includes dual-use goods, does the destination country/region require dual-use certificates?
   c. If the country/region requires dual-use certificates, does a valid certificate exist for each dual-use good for the destination country/region?

6. The order includes product X-100, the product is being shipped to France, and a French certificate exists for the product. However, the certificate has expired. Therefore, you receive the following warning message: "Dual use certificates for

one or more dual-use items in this sales order aren't valid. Do you want to proceed with the confirmation?"

This article explains how to configure all the settings that are required to set up dual-use goods and support this scenario.

Define dual-use requirements for each relevant country/region

Different countries/regions have different requirements for dual-use goods. You use the **Dual use country setup** page to keep track of the countries/regions that do and don't require a certificate. The information that you specify here is checked when you create sales orders, and you will be reminded to provide the required certifications.

To set up the information about dual-use requirements for different countries/regions, follow these steps.

1. Go to **Product information management** > **Setup** > **Product compliance** > **Dual use products** > **Dual use country setup**.
2. Select an existing country/region setup to edit it, or select **New** on the Action Pane to create a new country/region setup.
3. Set the following values for the selected or new country/region setup.

Expand table

Field	Description
Country/region	Select the country/region that you're tracking requirements for.
Certificate Required	Select this check box for countries/regions that require a certification for dual-use goods. Clear it for countries/regions that don't require this certification.

Create dual-use categories

Dual-use goods must often be categorized according to their export control classification number (ECCN). The ECCN is an alphanumeric code that categorizes items based on factors such as the commodity and technology. The **Dual use categories** page helps you make a list of the categories that you use, for reporting purposes.

To set up dual-use categories, follow these steps.

1. Go to **Product information management** > **Setup** > **Product compliance** > **Dual use products** > **Dual use categories**.
2. Select an existing category to edit it, or select **New** on the Action Pane to create a new category.
3. Set the following values for the selected or new category.

Expand table

Fields	Description
Dual use code	Enter the full ECCN code (for example, *3A001*).
Dual use category	Enter the commerce control list (CCL) category part of the ECCN code. For example, for the ECCN code *3A001*, this value is *3*.
Dual use group	Enter the product group part of the ECCN code. For example, for the ECCN code *3A001*, this value is *A*.
Dual use regime	Enter the regime code for the item. This code identifies the reason why the item is classified as a dual-use good. For example, for the ECCN code *3A001*, this value is *001*.

Apply dual-use categories to products

To identify a product as a dual-use good and apply a dual-use category to it, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the **Foreign trade** FastTab, set the **Dual use products** option to **Yes** to identify the current product as a dual-use good.
4. Set the **Dual use code** field to the code that applies to the current product. (You defined this code on the **Dual use categories** page.)

> **Note**
>
> The system makes the following dual-use checks when it generates a sales confirmation:
>
> 1. Does the order include any dual-use goods?
> 2. If so, does the destination country/region require dual-use certificates?

3. If so, do certificates exist for each dual-use good for the destination country/region, and are those certificates valid for the confirmed ship dates?
4. If the answers to questions 1 and 2 are "Yes" and the answer to question 3 is "No", then the system shows a warning to inform the user that dual-use certificates are missing for one or more dual-use goods in the sales order. The user should probably obtain the required certificates and try again, but could instead overrule the warning and proceed with the sales confirmation if they wish.

Set up dual-use certificates

You use the **Dual use certificates** page to set up and manage the required dual-use certificates for each product and country/region. You can track each certificate's details, such as the country/region and the dates of validity. You can also set options to specify where this information should be printed. For example, the information can be printed on the invoice, packing slip, and/or sales order. This setup is checked when you create a sales order.

1. Go to **Product information management** > **Setup** > **Product compliance** > **Dual use products** > **Dual use certificates**.
2. Select an existing certificate to edit it, or select **New** on the Action Pane to create a new certificate.
3. Set the following values for the selected or new certificate.

Expand table

Field	Description
Item number	Select the item number of the dual-use good that this certificate applies to.
Country/region	The destination country or region where you must use this certificate.
Certificate number	The number that appears on the certificate that is issued to the vendor or customer.
Effective	Select the first date when the current certificate is valid.
Expiration	Select the last date when the current certificate is valid.
Print on invoice	Select this check box to print the certificate number on invoices that are addressed to the specified country/region during the specified date

Field	Description
	range.
Print on packing slip	Select this check box to print the certificate number on packing slips that are addressed to the specified country/region during the specified date range.
Print on sales order	Select this check box to print the certificate number on sales orders that are addressed to the specified country/region during the specified date range.

Advanced export management overview

06/17/2025

Companies that trade internationally in goods that are subject to external regulations and internal policies must keep track of many rules and policies. The advanced export management solution lets you express these rules, even complex ones, by using formulas that are similar to the formulas in Microsoft Excel. The system then ensures that the rules are honored throughout the sales and fulfillment process.

Dynamics 365 Supply Chain Management lets you manage, track, and verify compliance with export control restrictions before you confirm, pick, pack, ship, and invoice sales orders. It can also check sales quotations. You manage your export control policies by using a native Dataverse solution that interfaces directly with your Supply Chain Management instance. Supply Chain Management then enforces compliance with international trade regulations by consulting your export control policies in real time. Because the architecture is based on Dataverse, many other systems that you use can also access your export control rules through the hundreds of connectors that are available for Dataverse. You can also use the rich features of Microsoft Power Platform, such as the Microsoft Power Fx language, to extend the solution. In this way, your export control administrator can support complex scenarios by using formulas that are similar to the formulas in Excel.

The advanced export management solution provides the foundation for managing, tracking, and verifying export compliance. You can use it both with and without Supply Chain Management. The solution implements five primary concepts:

- Jurisdictions
- Codes and categories
- Restrictions
- Exceptions
- Licenses

Jurisdictions

A jurisdiction is a set of codes, categories, restrictions, exceptions, and licenses. It represents a set of configurations that apply to incoming requests. Each jurisdiction is associated with a set of rules that indicate when the jurisdiction applies. If a rule is configured as an error, any activity that matches the rule is blocked for that jurisdiction, unless an exception exists. A rule is usually a combination of a country/region, a transaction purpose, and a set of codes and categories.

Here are some examples of export control jurisdictions:

- US International Traffic in Arms Regulation (ITAR)
- The Wassenaar Arrangement
- EU Dual Use
- Norway Liste I and II
- US Export Administration Regulations (EAR)
- Controls on exports by an individual company
- Multilateral Export Controls
- Sanctions

Jurisdictions don't have to be based on countries/regions. They can also be configured to control export activities based on your company's own policies.

Codes and categories

The codes that make up a jurisdiction are often referred to as Export Control Classification Numbers (ECCNs). If you use the export control functionality for customs scenarios, Harmonized System (HS) codes might also be used. Codes can be linked to one or more control categories, such as *Missile Technology* or *National Security*. The set of codes and categories is unique for each jurisdiction. Each ECCN can be a member of zero or more control categories, and each control category can contain many ECCNs.

An example of an ECCN is *7A994*, which is defined by the US EAR export control jurisdiction. This ECCN applies to "Other navigation direction finding equipment, airborne communication equipment, all aircraft inertial navigation systems not controlled under 7A003 or 7A103, and other avionic equipment, including parts and components." According to the US EAR, ECCN 7A994 is a part of the *Anti Terrorism (AT)* control category.

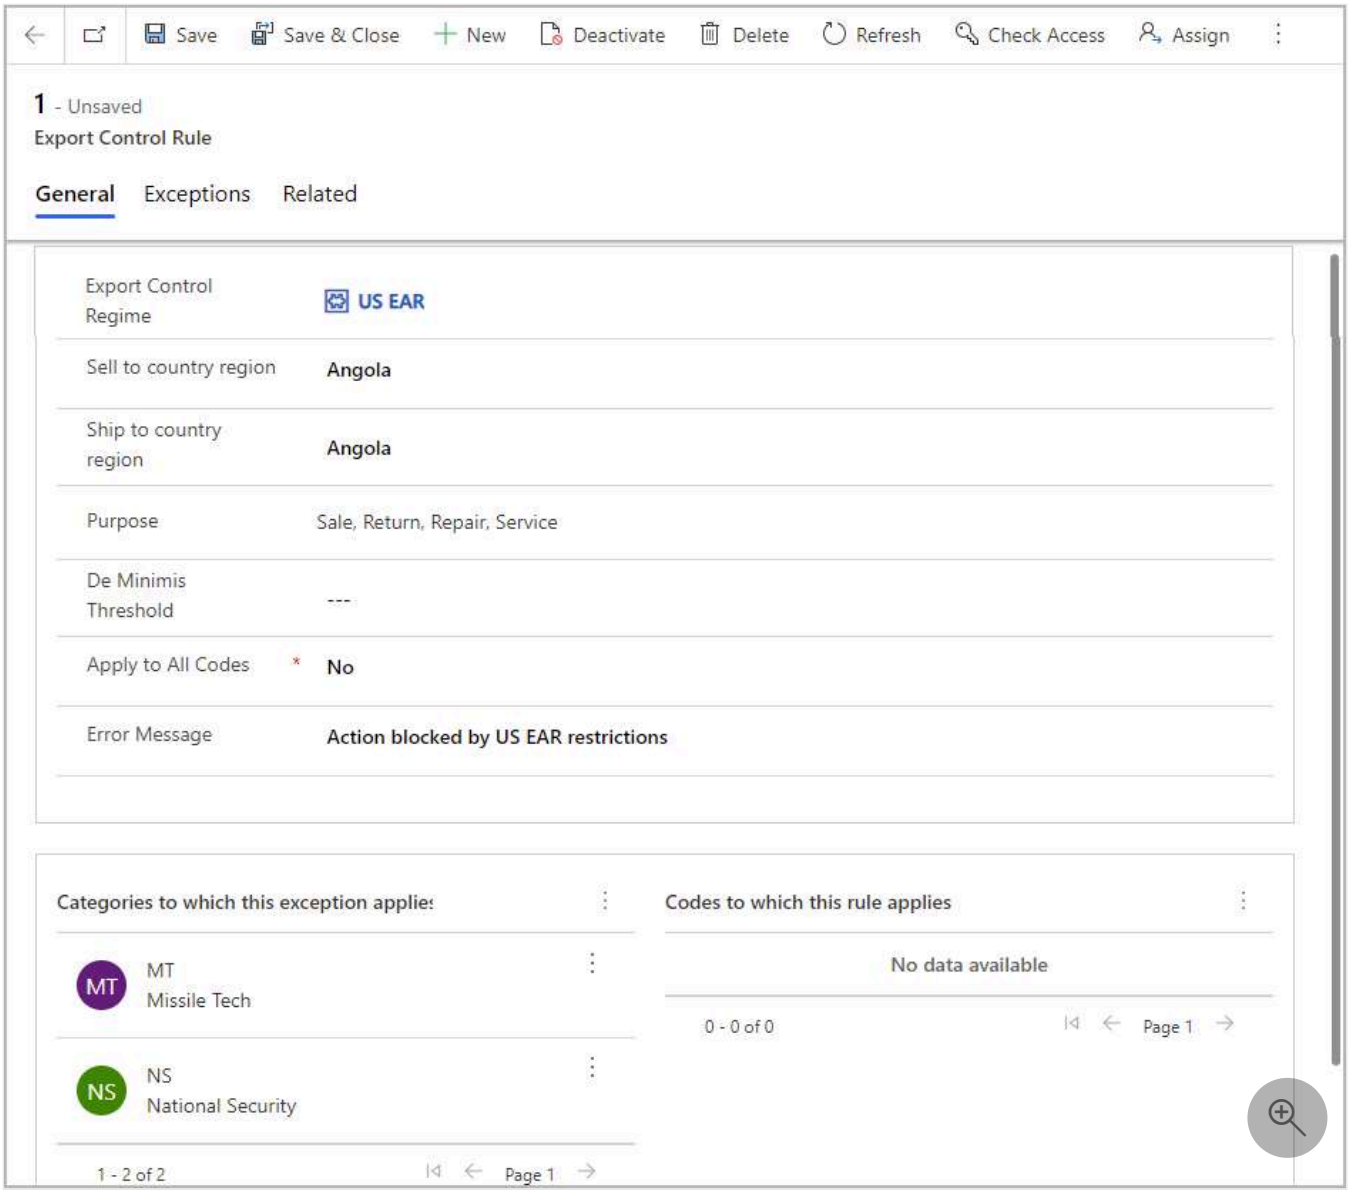
Because ECCNs and control categories are defined by export control jurisdictions, the same ECCN can appear in more than one export control jurisdiction. Therefore, you must always specify which jurisdiction a code references. HS codes, which are used primarily for customs tracking, can also be used to manage export controls that are related to customs.

Restrictions

Each export control jurisdiction defines a set of restrictions under which export actions should be disallowed unless an exception exists. A restriction is a set of ECCNs and/or control categories, together with a country/region, transaction purpose, and other aspects.

Often, restrictions are defined in terms of a commerce country/region chart, as in this downloadable example from the US EAR. In the example in the following illustration, a rule for the US EAR restrictions is defined based on the country/region chart. According to this rule,

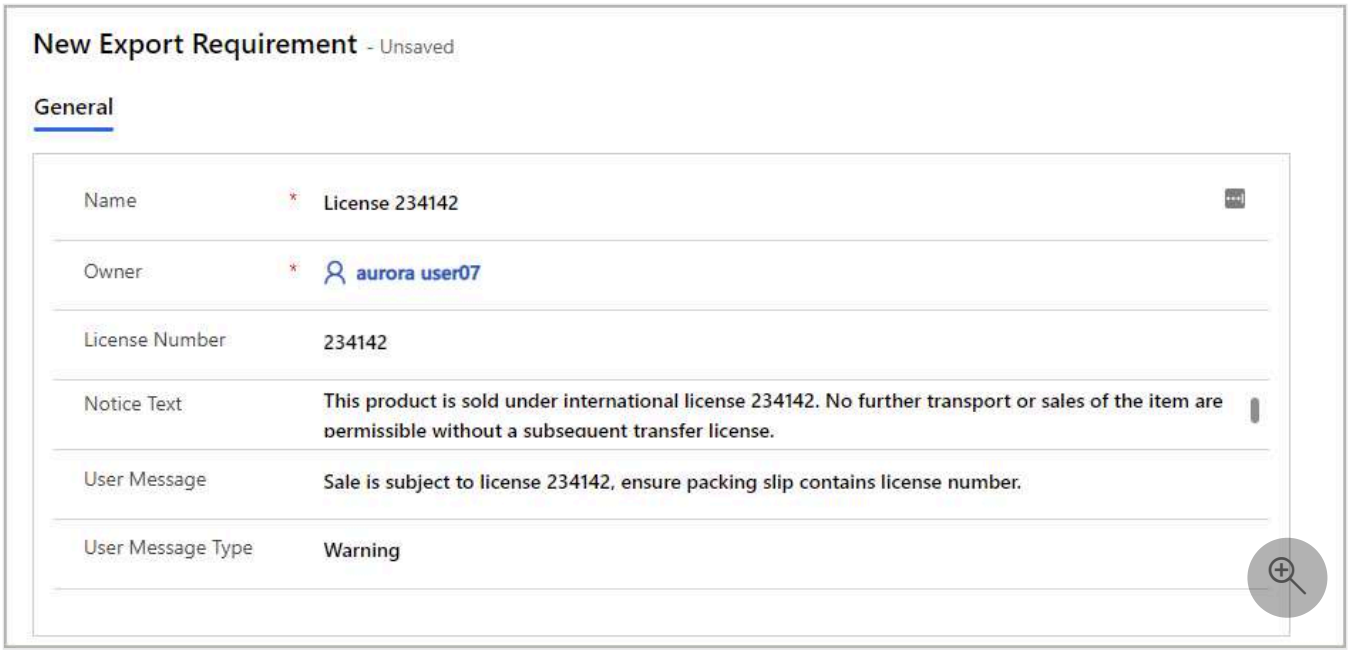
if an order or quotation contains any items that have an ECCN in the *MT* or *NS* control category, the system won't allow it to be sold to Angola. If a user tries to confirm an order or quotation that contains one of these items for shipment to Angola, they receive the following error message: "Action blocked by US EAR restrictions."



Exceptions

Exceptions allow an action that a restriction would otherwise block. Common types of exceptions include blanket exemptions and corporate policies. Exceptions are defined in the same way as restrictions. However, they also provide extra requirements that apply when the exception is used. For example, a message might have to be shown to the user, or text and licenses might have to be printed on documents.

The following illustration shows an example of the setup for an exception.



Licenses

Authorities issue licenses to give a company specific permission to trade in restricted items, or a set of restricted items, in a specific context. It's a common practice to specify the license under which an item can be traded for each transaction.

Next steps

- Enable and configure advanced export management
- Work with advanced export management for products, sales orders, and sales quotations

Enable and configure advanced export management

Prerequisites

Before you can use advanced export management, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management 10.0.36 or later.
- The feature that's named *Advanced export management configuration* must be turned on in feature management. As of Supply Chain Management version 10.0.43, this feature is turned on by default. As of version 10.0.45, it's mandatory and can't be turned off.
- Your Supply Chain Management environment must be linked to a Dataverse environment.

Install the export control app

Follow these steps to install the export control app.

1. Sign in to Power Platform admin center.
2. Go to **Environments**, and select your environment.
3. On the page for the selected environment, in the **Resources** section, select **Dynamics 365 apps**.
4. In the list of apps, select **Dynamics 365 Export Management**.
5. Follow the on-screen instructions to install the app.

Authentication and authorization

To perform export control checks, the system uses application user calls. Therefore, the checks can be performed regardless of which user is working with the document in Supply Chain Management. Supply Chain Management users don't have to be added to Dataverse, and they don't have to be given extra permissions. To support the service-to-service (S2S) authentication, a Microsoft Entra application must be created for each environment. You must not share or reuse the Microsoft Entra applications across environments.

Register a new Microsoft Entra application in the Azure portal

Follow these steps to create a new Microsoft Entra application.

1. Sign in to the Azure portal.
2. Go to **Microsoft Entra ID> App registrations**.
3. Select **New registration**.
4. On the **Register an application** page, enter the following information:
    - **Name** – Enter a unique name.
    - **Supported account types** – Select *Any Microsoft Entra directory* (single or multi-tenant).
    - **Redirect URI** – Leave the field blank.
5. Select **Register**.
6. The page that appears shows details about the new app. Copy the **Application (client) ID** value to a temporary text file, because you'll need it later.
7. In the **Manage** list, select **Certificates & secrets**.
8. On the **Certificates & secrets** page, select **New client secret**.
9. In the **Add a client secret** dialog box, enter a description and an expiration date, and then select **Add**.
10. You're returned to the **Certificates & secrets** page, which now includes a row that contains details about your new client secret. Copy the value in the **Value** column to a temporary text file, because you'll need it later, and it will be hidden the next time that you open this page.

Grant the application permissions in Power Platform admin center

Follow these steps to grant the application permissions in Power Platform admin center.

1. Sign in to Power Platform admin center.
2. Go to **Environments**, and select your environment.
3. On the page for the selected environment, in the **Access** section, under **Users**, select **See all**.
4. On the **Users** page, select the **app users list** link.
5. On the **Application users** page, on the toolbar, select **New app user**.

6. In the **Create a new app user** dialog box, select **Add an app**.

7. In the **Add an app from Microsoft Entra** dialog box, in the search field, paste the application (client) ID of your new app. (You should have copied this ID when you registered the app in the Azure portal.) Then select your app in the list or results, and select **Add**.

8. You're returned to the **Create a new app user** dialog box. Select your business unit, and then select **Edit security roles**.

9. In the **Add security roles** dialog box, in the **Role** list, select each of the following roles:

    - *Export Management Application*
    - *Export Management Admin*
    - *Finance and Operations Basic User*

10. Select **Save** to apply the roles.

11. Select **Create** to create the new app user.

Enable the functionality and configure the application in Supply Chain Management

Follow these steps to enable the functionality and configure the application in Supply Chain Management.

1. Sign in to Supply Chain Management.

2. Go to **Product information management** > **Setup** > **Product compliance** > **Country of Origin** > **Advanced export management configuration**.

3. On the **General** tab, review and set the following fields:

    - **Linked Dataverse environment URL** – This read-only field shows the URL of the Dataverse environment that's linked to your Supply Chain Management environment. Your advanced export management jurisdictions, codes, restrictions, exceptions, and licenses are defined in this Dataverse environment.
    - **Application ID** – Paste the application (client) ID of your new app. (You should have copied this ID when you registered the app in the Azure portal.)
    - **Application secret** – Paste the client secret of your new app. (You should have copied this secret when you registered the app in the Azure portal.)

As you enter values into these fields, the system checks whether it can use them to connect to Dataverse and whether the required solution is installed there. The three checkboxes under the **Status** heading automatically update to show a checkmark as each test passes. If one or more tests fail, make sure that the advanced export management solution is successfully installed, and that the specified Microsoft Entra application has all of the following security roles assigned to it in Dataverse: *Export Management Application*, *Export Management Admin*, and *Finance and Operations Basic User*. When all three checkboxes under the **Status** heading show a check, continue to the next step.

4. The following settings appear after all of the tests have passed. Set each option as required.

    - **Advanced export management functionality enabled** – Set this option to *Yes* to turn on advanced export management functionality in your system.
    - **Validate data in Dataverse** – Set this option to *Yes* to ensure that the system checks all sales orders and shipments against the export rules that are defined in the Dataverse app. The check confirms whether your company is allowed to sell or ship each item on an order, according to the rules that are established for the relevant jurisdiction.
    - **Track sales order check history** – Set this option to *Yes* to keep a log of the order check history. Set it to *No* if you don't need this log.

5. Select **Synchronize country/region list** to copy the existing list of country/region codes from Supply Chain Management to the Dataverse solution. This list is used when rules are defined. Each time that you change the country/region code list, you must return to the **Advanced export management configuration** page and select **Synchronize country/region list** again to sync the changes. The language of the user who selects this button is used to sync the names of the countries/regions.

Configure jurisdictions for each legal entity

You must configure the set of jurisdictions that are available for each legal entity (company). For companies where no jurisdictions are enabled, advanced export management features aren't available on sales orders, items, or products. Instead, simpler dual-use goods functionality is provided. If at least one jurisdiction is enabled for a legal entity, the dual-use goods functionality is hidden on pages in that legal entity, and advanced export management functionality is shown instead.

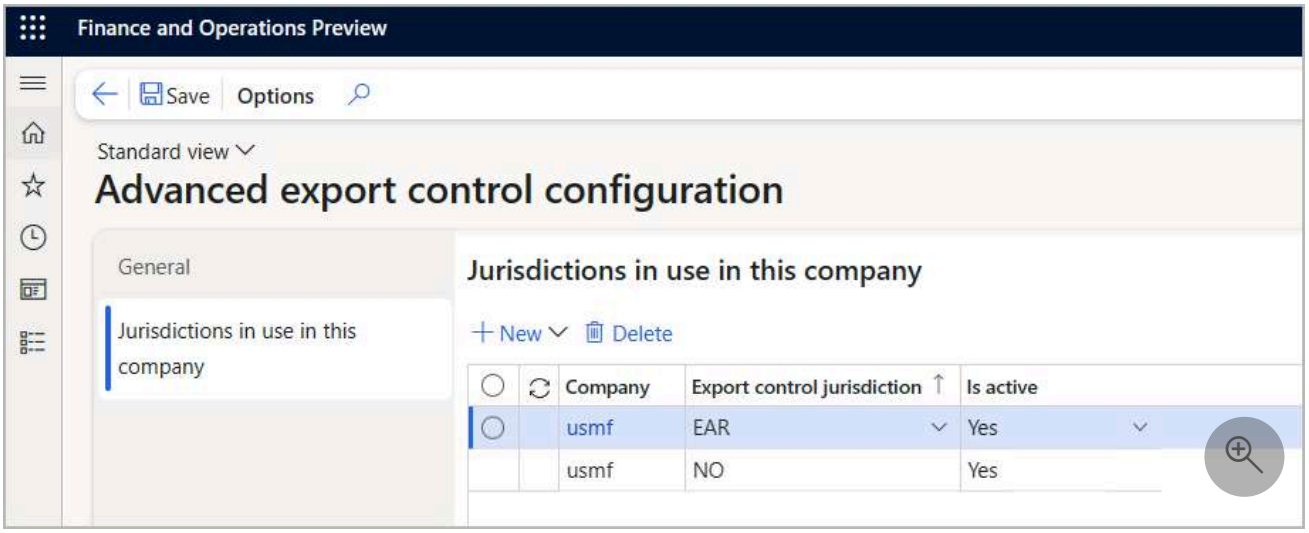
Follow these steps to configure the jurisdictions for a legal entity.

1. Sign in to Supply Chain Management.

2. Use the company picker to select the legal entity that you want to configure.

3. Go to **Product information management** > **Setup** > **Product compliance** > **Country of Origin** > **Advanced export management configuration**.

4. On the **Jurisdictions in use in this company** tab, the grid shows the jurisdictions that are enabled for the current legal entity. Initially, the grid is blank. Use the buttons on the toolbar to add or remove jurisdictions as you require.



5. For each jurisdiction, choose whether that jurisdiction is active and choose whether to skip sales order and/or sales quotation checks for that jurisdiction.

6. On the Action Pane, select **Save**.

Last updated on 12/05/2025

Work with advanced export management for products, sales orders, and sales quotations

Article • 03/27/2024

The advanced export management feature lets you apply export control rules to sales orders and sales quotations. Individual jurisdictions can be enabled or disabled for each legal entity (company). Therefore, each company can have different export control behaviors and rules.

Set up jurisdictions, codes, restrictions, exceptions, and licenses

To define the export controls that apply to the items that you trade in, set up the required *export control jurisdictions* in Dataverse. Then configure the *codes*, *restrictions*, *exceptions*, and *licenses* that apply for each jurisdiction. (For more information about these terms, see Advanced export management overview.)

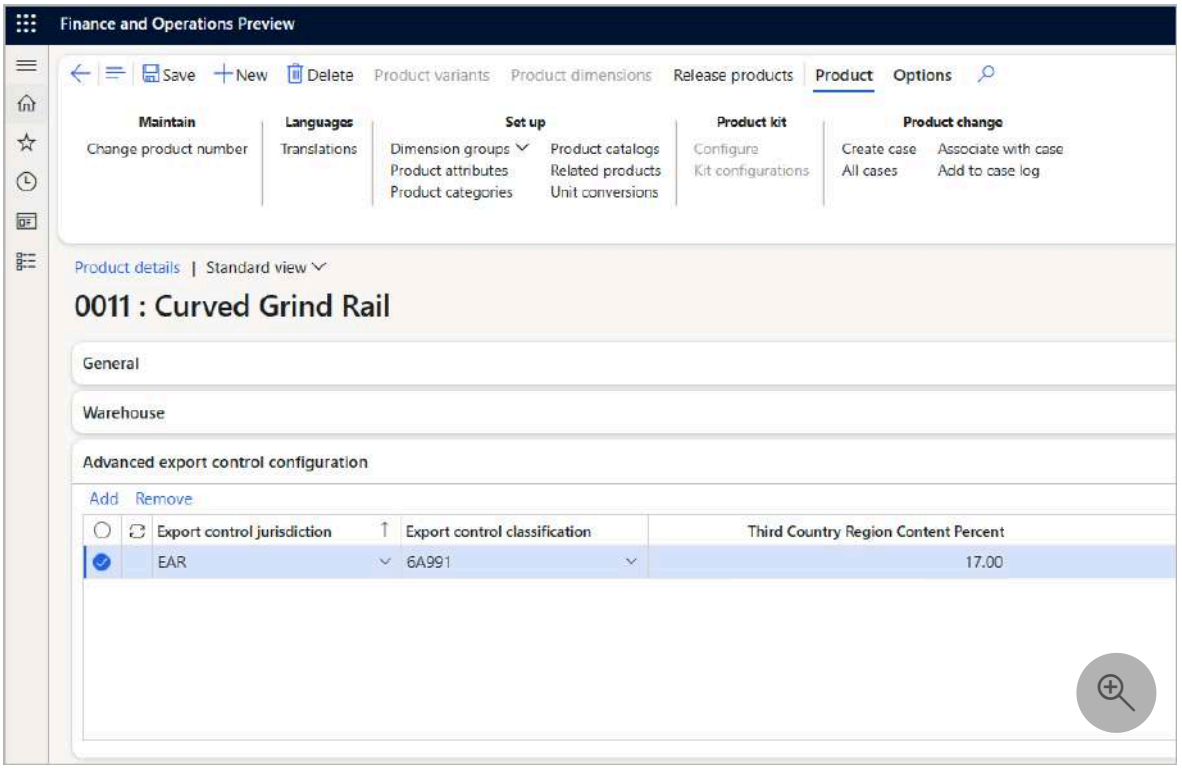
1. Sign in to Power Platform admin center.
2. Go to **Environments**, and select your environment.
3. On the page for the selected environment, in the **Details** section, select the link under **Environment URL**.
4. Your Dataverse environment is opened. On the left navigation pane, select **Export control jurisdictions**.
5. A list of existing export control jurisdictions is shown. Use the buttons on the toolbar to add or remove jurisdictions as you require.
6. Select a jurisdiction to open its details page. Use the jurisdiction details page to define the jurisdiction, and to add or remove codes, restrictions, exceptions, and licenses as you require.

Assign export control classifications for global products

When advanced export management is enabled, it adds a new **Advanced export management configuration** FastTab to the **Product details** page for products and product masters. Use this FastTab to specify the Export Control Classification Number (ECCN) and other export control settings for the product in different jurisdictions.

To set up advanced export management for a product or product master, follow these steps.

1. Sign in to Microsoft Dynamics 365 Supply Chain Management.
2. Go to **Product information management** > **Products** > **All products and product masters**.
3. Find and open the product that you want to work with.
4. On the **Product details** page, select the **Advanced export management configuration** FastTab.



5. The grid lists each export control that applies to the current product. Use the buttons on the toolbar to add and remove rows as you require. For each row, set the following fields:

    - **Export control jurisdiction** – Select the jurisdiction where the current row applies. Because global products can be released to different legal entities, the list shows all available jurisdictions, not just the jurisdictions that are enabled for the currently selected legal entity.
    - **Export control classification** – Select the ECCN that applies to the current row. The ECCN establishes the set of export control rules that apply to the current product for the jurisdiction that's selected in this row.

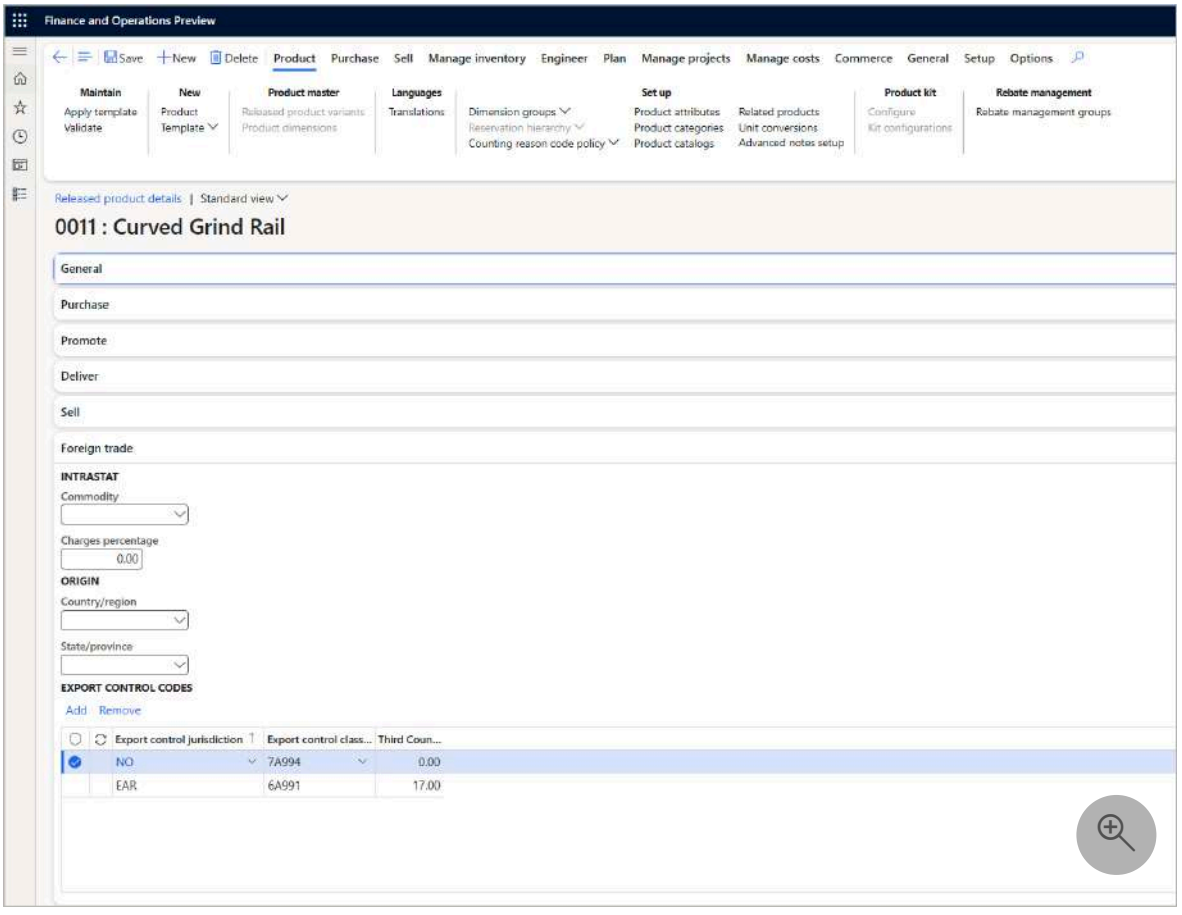
6. On the Action Pane, select **Save**.

Assign export control classifications for released products

When you create a released product that's based on a global product, the **Advanced export management configuration** settings for the global product become default export control values for the released product. If the **Advanced export management configuration** settings for the global product are changed after the product is released, those new settings aren't updated on the related released product unless the product is re-released. Because released products are associated with a specific legal entity, only the ECCNs for jurisdictions that are enabled for that legal entity are inherited from the global product.

To set up advanced export management for a released product, follow these steps.

1. Use the company picker to select the legal entity where you want to work.
2. Go to **Product information management** > **Products** > **Released products**.
3. Find and open the product that you want to work with.
4. On the **Released product details** page, select the **Foreign trade** FastTab.



5. If at least one jurisdiction is enabled for the selected legal entity, the **Foreign trade** FastTab includes an **Export control codes** section. (Otherwise, simpler dual-use

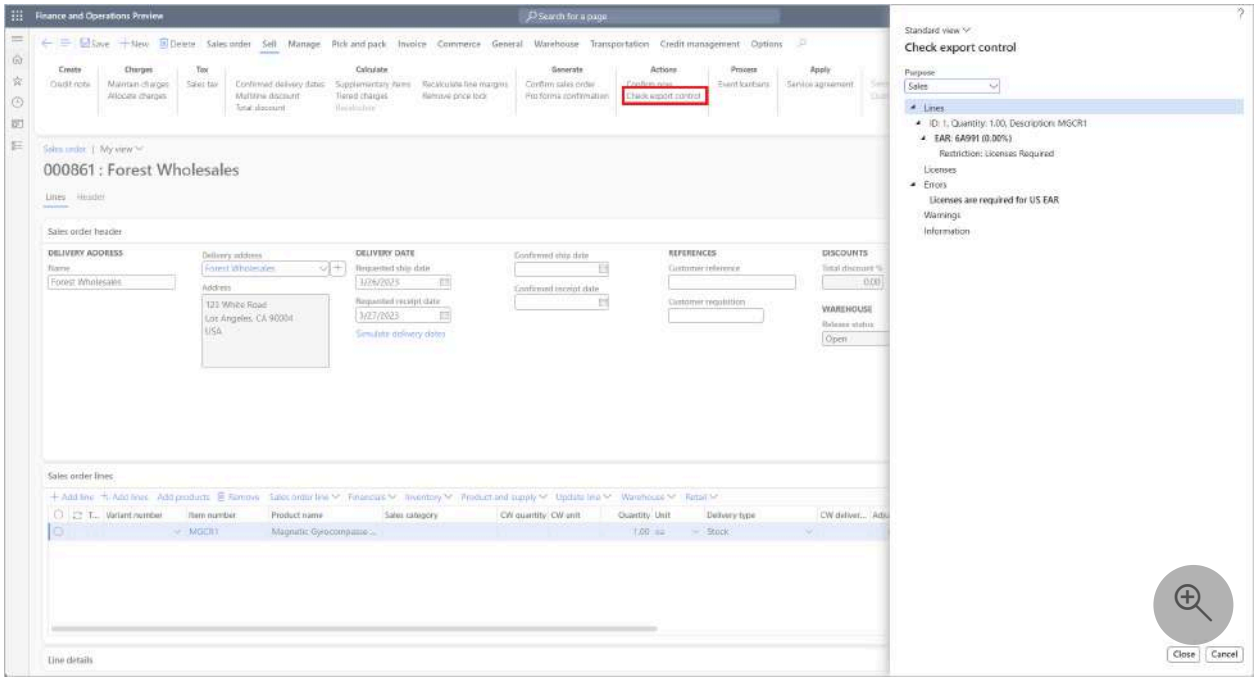
goods functionality is shown instead.) The grid in this section lists each export control that applies to the current released product. Use the buttons on the toolbar to add and remove rows as you require. For each row, set the following fields:

- **Export control jurisdiction** – Select the jurisdiction where the current row applies. This list is filtered so that it shows only the jurisdictions that are used in the currently selected legal entity.
- **Export control classification** – Select the ECCN that applies to the current row. The ECCN establishes the set of export control rules that apply to the current product for the jurisdiction that's selected in this row.

6. On the Action Pane, select **Save**.

Checking and enforcing export control rules for sales orders

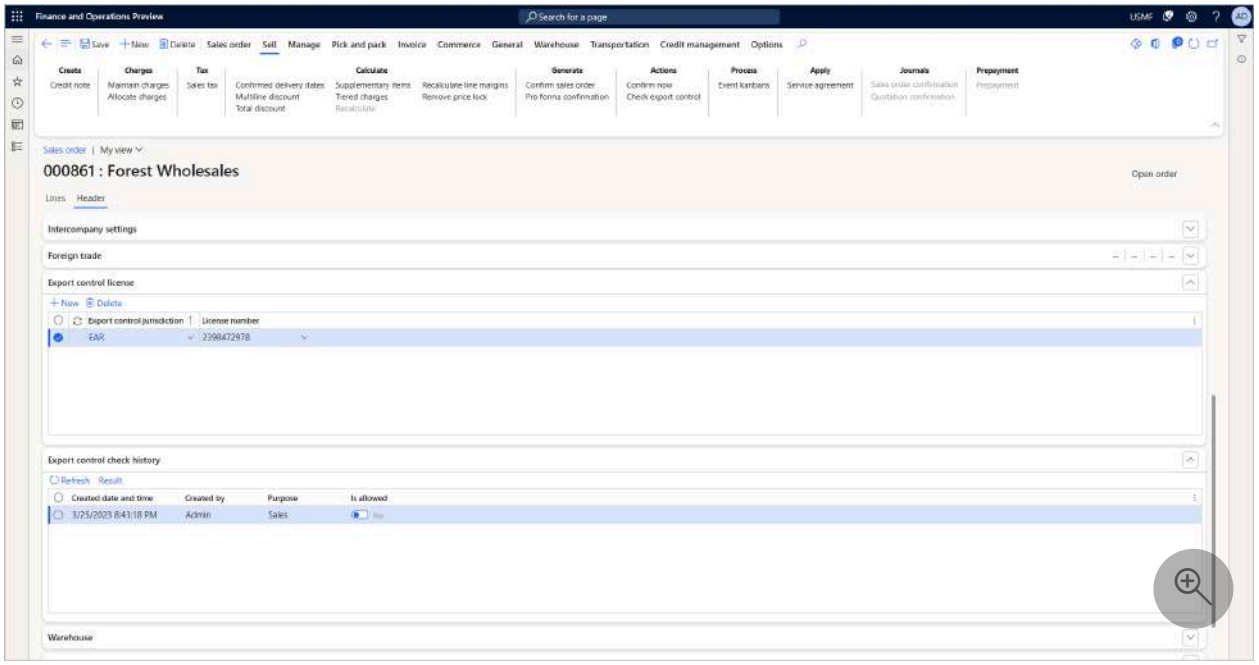
When advanced export management is enabled for a legal entity, a **Check export control** button is provided on the **Sell** tab of the Action Pane for sales orders. Select this button to check the export control status of the current order. The same check is performed during confirmation, picking, packing, shipping, and invoicing. License quantity is consumed and history is tracked only during confirmation and similar steps. Manual checks don't change license consumption and aren't tracked in history.



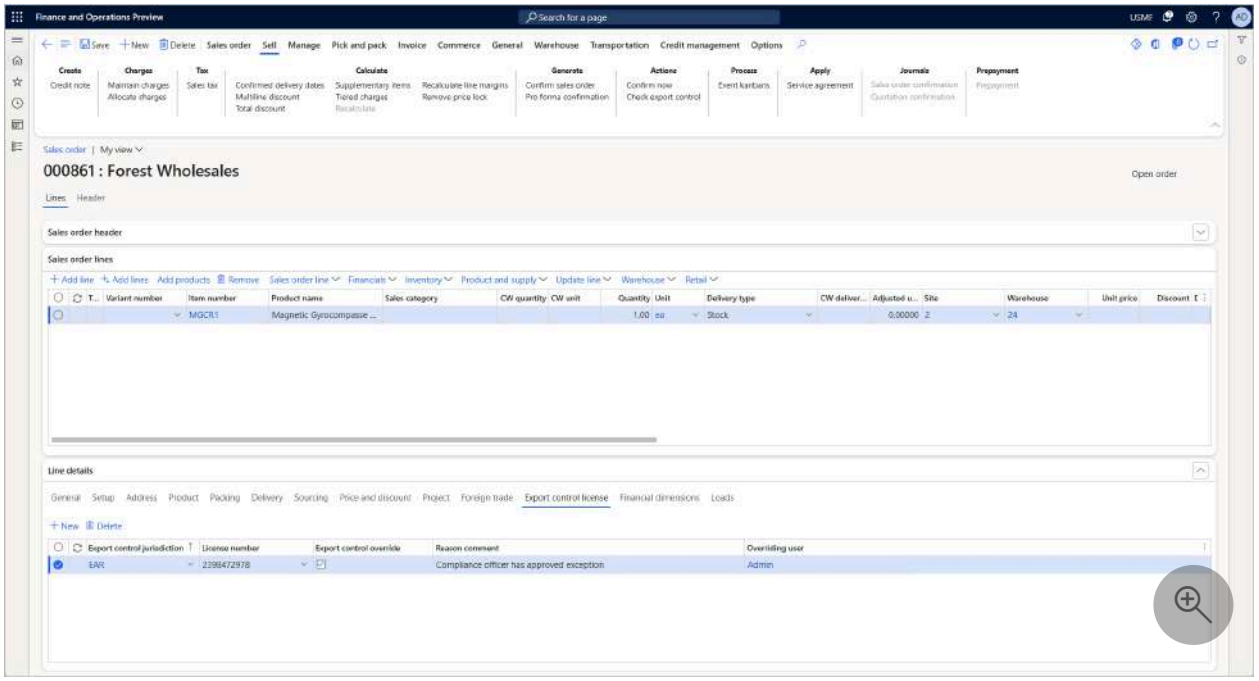
The sales order header has a tab where you can specify licenses per jurisdiction. Licenses that are specified on the header are assumed to be used by default on all lines of the document. However, the licenses can be overridden at the line level. Licenses must pass

export control checks only if restrictions and exceptions require a license. Blanket exemptions or corporate policies don't require licenses.

During confirmation and similar posting steps, the system tracks the history of export control checks. You can view this history from the sales order header by selecting **Result**.



Licenses from the sales order header can be overridden on the sales order lines. In this way, different lines can be related to different licenses. You can also override the export control check at the line level. In this case, the export control check is still performed and tracked, but failures don't block the document processing. The user who edited the override information is automatically tracked on the record. This information can be audited by using the standard logging functionality for finance and operations apps.



Checking and enforcing export control rules for sales quotations

Advanced export management functionality works similarly for sales quotations as it does for sales orders. See the previous section for guidelines.

Extend export control sales order functionality

Article • 12/06/2023

This article provides information that's useful for developers who are extending sales order functionality for implementing export controls.

During confirmation and similar posting steps, the system tracks the history of export control checks. You can view this history from the sales order header by selecting **Result**. The details of the check that was performed are shown. This data is available for reference from reports and other processes in the `COOExportControlSalesTableHistory` table. This table also provides helper methods for accessing common information.

The document-level *de minimis* threshold value is **not** computed. By default, it's always *0* (zero). To provide a computation of the document-level *de minimis* threshold value, extend the `COOValidateSalesTable::createRequest()` API.

The `SalesLine.QtyOrdered` field is passed for the quantity, and the `SalesLine.LineAmount` field is passed for the value. No currency conversion is performed on these values. To override and pass different values, extend the `COOValidateSalesTable::createRequest()` method to update the values. The *de minimis* percentage from the associated item is passed for the line, without calculation.

Extended properties

Additional properties can be added to requests from Supply Chain Management to the advanced export management solution. These properties can then be referenced in Power Fx rules on both restrictions and exceptions.

To add additional properties, create a chain of command extension of the `COOValidateSalesTable` class and override the appropriate method for your property.

- **Document properties:** `getExtendedProperties()`
- **Line properties:** `getExtendedLineProperties()`
- **Line code properties:** `getExtendedLineCodeProperties()`

Each of these methods contains a map named `_extendedProperties`. Add the physical name of the property and the value. For a given document part and property name, you must always use the same value type. For example, the property `TestProp` can't be of

type `string` on one call and type `int` on the next call. Here is an example that adds properties to the document, line, and line code:

X++

```
[ExtensionOf(classStr(COOValidateSalesTable))]
final class COOValidateSalesTable_SampleModel_Extension
{
    public void getExtendedProperties(Map _extendedProperties)
    {
        _extendedProperties.add("TestDocString", strFmt("SalesId = %1",
this.parmSalesTable().SalesId));
        _extendedProperties.add("TestDocInt", 42);
        _extendedProperties.add("TestDocReal", 3.14159);
        _extendedProperties.add("TestDocDate", today());
        _extendedProperties.add("TestDocUtcDateTime",
DateTimeUtil::utcNow());
        next getExtendedProperties(_extendedProperties);
    }
    public void getExtendedLineProperties(Map _extendedProperties,
COOValidationRequestLineContract _line)
    {
        _extendedProperties.add("TestLineString", strFmt("LineRecId = %1",
_line.parmRecordId()));
        _extendedProperties.add("TestLineInt", 43);
        _extendedProperties.add("TestLineReal", 3.14159);
        _extendedProperties.add("TestLineDate", today());
        _extendedProperties.add("TestLineUtcDateTime",
DateTimeUtil::utcNow());
        next getExtendedLineProperties(_extendedProperties, _line);
    }
    public void getExtendedLineCodeProperties(Map _extendedProperties,
COOValidationRequestLineContract _line, COOValidationRequestCodeContract
_code)
    {
        _extendedProperties.add("TestLineCodeString", strFmt("Code = %1",
_code.parmCode()));
        _extendedProperties.add("TestLineCodeInt", 44);
        _extendedProperties.add("TestLineCodeReal", 3.14159);
        _extendedProperties.add("TestLineCodeDate", today());
        _extendedProperties.add("TestLineCodeUtcDateTime",
DateTimeUtil::utcNow());
        next getExtendedLineCodeProperties(_extendedProperties, _line,
_code);
    }
}
```

The first time a new property is used in an export control check, that property is added to the `msdyn_ExportControlExtendedProperty` table in the export control solution. After that, the property may be referenced in Power Fx rules. Properties can also be pre-

added to this table prior to performing any checks. Here is an example of a Power Fx rule that makes use of the mentioned extension properties:

```
And(And(Document.TestDocInt=42, Line.TestLineInt=43), LineCode.TestLineCodeInt=44
```

Extend export control rules functionality

Article • 08/29/2023

This article provides information that's useful for developers who are extending rules functionality for implementing export controls.

Rules are defined primarily as data in the `msdyn_exportcontroljurisdiction`, `msdyn_exportcontrolrule`, and `msdyn_exportcontrollicense` tables.

High-level flow

Evaluations are performed per document line. The result is a set of matching restrictions, exceptions, and applicable licenses for each line. If no restrictions are found, the set of exceptions and licenses is empty.

No document-level checks are performed. Instead, the document is considered blocked if there are any restrictions that don't have a matching exception. The following pseudo-code shows how the restrictions, exceptions, and licenses are considered.

plaintext

```
foreach (Line in Request)
{
    Line.MatchingRestrictions = FindAnyMatchingRestrictions(Line);

    foreach (MatchingRestriction in Line.MatchingRestrictions)
    {
        Line.MatchingExceptions = FindAnyMatchingExceptions(Line);

        foreach (MatchingException in Line.MatchingExceptions)
        {
            if (MatchingException.RequireLicense)
            {
                Line.ApplicableLincenses = FindApplicableLicenses(Line);
            }
        }
    }
}
```

Evaluation of an individual rule

The `msdyn_exportcontrolrule` table has fields for information such as the sell-to country/region, ship-to country/region, *de minimis* threshold, and transaction purpose.

If a field isn't set, it has no impact on rule evaluation. The values from the line must match *all* rules where a value is set. Otherwise, the rule doesn't apply.

For example, a line has the following values:

- **Sell to country/region:** *France*
- **Ship to country/region:** *Mexico*
- **Transaction purpose:** *Return*
- **De minimis threshold:** *28%*

Rule example 1

A rule has the following values:

- **Sell to country/region:** Blank
- **Ship to country/region:** *Mexico, Canada*
- **Transaction purpose:** Blank
- **De minimis threshold:** *25%*

In this case, only the ship-to country/region and *de minimis* values are evaluated. Because the ship-to country/region, Mexico, is in the list of values that's provided by the rule, and 28 percent is more than the 25 percent threshold that's provided by the rule, the rule is evaluated to *true*.

Rule example 2

A rule has the following values:

- **Sell to country/region:** *Italy*
- **Ship to country/region:** *Mexico, Canada*
- **Transaction purpose:** Blank
- **De minimis threshold:** blank

In this case, only the sell-to country/region and ship-to country/region values are evaluated. Because the sell-to country/region, France, isn't in the list of values that's provided by the rule, the rule is evaluated to *false* .

A rule applies only if the Export Control Classification Number (ECCN) from the line is one of the codes that are explicitly listed for the rule, or if the ECCN is part of one of the categories for the rule. A rule that's marked as *Apply to All Codes* is automatically evaluated to *true*, regardless of the ECCN that's included on the line.

An exception rule that's marked as *Require License* is evaluated to *true* only if one or more licenses are found that match the line.

License evaluation works in the same way. Fields that are left blank are ignored during validation. If a field has a value (that is, it isn't blank), the item that's being tested must match one of the values in the field. The overall evaluation is *true* only if all fields are evaluated to *true*.

Power Fx formulas

Microsoft Power Fx formulas enable complex rules to be expressed for scenarios that aren't simple references to countries/regions or purposes. As is the case for other fields of rules, if a Power Fx formula isn't provided, it has no impact on the rule evaluation. The document object that's being evaluated is passed to the rule and can be used in formulas for comparison.

Here are some examples of Power Fx formulas for export control. Learn more in the Formula reference.

- Documents that are being shipped to one of three countries/regions:

  ```
  CountRows(Filter(["NOR","SWE","FIN"], Value=Document.SellToCountryRegion)) > 0
  ```

- Documents that are being shipped to one of three countries/regions and contain at least one 6A994 product in the US Export Administration Regulations (EAR) jurisdiction:

  ```
  And(CountRows(Filter(["NOR","SWE","FIN"], Value=Document.SellToCountryRegion)) > 0, CountIf(Document.Lines, CountIf(Codes, And(Jurisdiction="EAR",Code="6A994")) > 0) > 0)
  ```

- Documents that are after a specific date and contain no more than five items on any line:

  ```
  And(Document.DocumentDate > Date(2023, 12, 1), CountIf(Document.Lines, Quantity > 5) = 0)
  ```

Overrides

Export control checks can be overridden at the line code level. Therefore, you can override a failing export control check for one jurisdiction on one line of a document but still enforce checks on other lines. To override an export control check, pass `"msdyn_overridden": true` as a property of one of the line codes in the `msdyn_CheckExportControlLineCodes` collection. The export checks are still evaluated, and

any informational or warning messages are still shown. However, any error messages are downgraded to warning messages and don't block the activity.

Extend export control license functionality

Article • 12/06/2023

This article provides information that's useful for developers who are extending license functionality for implementing export controls.

License information is stored in the `msdyn_exportcontrollicense` table. Tracking of licenses is provided only as it pertains to export control. It should not be considered a general-purpose license management subsystem.

License evaluation

All license checks occur at the document line level. A single document can contain lines that reference multiple licenses. When the system evaluates a license, the same evaluation that's used for restriction and exception rules is performed. The evaluation considers any field that has a value in the license definition. It ignores fields that don't have a value. As is the case for rules, the license is considered valid only if the value matches the line that's being processed.

The document date is compared against the license's valid-from and valid-to dates, if they're provided. To perform the check based on the current date instead of the document date, either use a Power Fx rule or pass the current date in the document that's being analyzed. The **Expected export date** field of the license has no impact and is provided only for reference. However, it can be referenced from Power Fx rules.

A license can be provided at either the document level or the line level. The assumption is that a document-level license is by default on all lines. It's overridden if a license is provided on a specific line.

License lines and consumption

The Export Control Classification Number (ECCN) from the license line must match the ECCN from the document line that references the license. If no line in the license has a matching ECCN, the check fails, and the license issues collection contains a reference to the missing license.

The following three properties on the export control check call control how license consumption is handled:

- `"msdyn_ExportControlSourceApplication": "Supply Chain"`
- `"msdyn_ExportControlSourceDocument": "SO1347134"`
- `"msdyn_DecrementLicenseQuantity": true`

Consumption is tracked in the `msdyn_exportcontrollicenselineconsumption` table. The `SourceApplication` and `SourceDocument` fields are used to reference which incoming document from an external system has consumed the quantity or value. If you specify *true* for `msdyn_DecrementLicenseQuantity`, rows are written in the `msdyn_exportcontrollicenselineconsumption` table, and future license checks will be blocked if no quantity or value remains for that line. If the same `SourceApplication` and `SourceDocument` values are passed in again with `DecrementLicenseQuantity`, all existing decrements for that document are deleted and then re-created with the updated quantities and values. Therefore, if a sales order is updated, and a different quantity (either larger or smaller) must be reserved, all the existing values can be updated just by sending in the sales order a second time.

The consumed quantity and value are calculated as rollup fields on the license line. If no total quantity or value is provided, export control checks aren't blocked for that license line. Instead, total consumed quantity and total consumed value continue to accrue. The line value is a standard Dataverse currency field. For more information about currency fields and exchange rates, see Using currency columns.

License consumption is automatically computed and updated based on checks when `msdyn_DecrementLicenseQuantity` is set to *True*. However, users who have the appropriate permissions can also create, edit, or delete consumption lines directly from the `msdyn_exportcontrollicenselineconsumption` table as required. Access to view and edit this and all other tables is based on standard Dataverse role-based security.

Unit and currency conversion

If a unit or currency is specified on both a license line and a related incoming document, then the system converts the unit and currency automatically. If either the document being checked or the license line doesn't specify a unit or currency, then it's assumed that the amount provided is in the same unit or currency as the license line.

If the Dynamics 365 Supply Chain Extended and Dynamics 365 Finance Extended dual-write solutions are installed on your environment, then the system converts units and currencies using the `msdyn_unitofmeasureconversion` and `msdyn_currencyexchangerate` values, respectively. If the dual-write solutions aren't installed, then the system applies the default Dataverse conversions. If a conversion for the currency or unit isn't found in existing data, then a license issue is returned and the check is blocked.

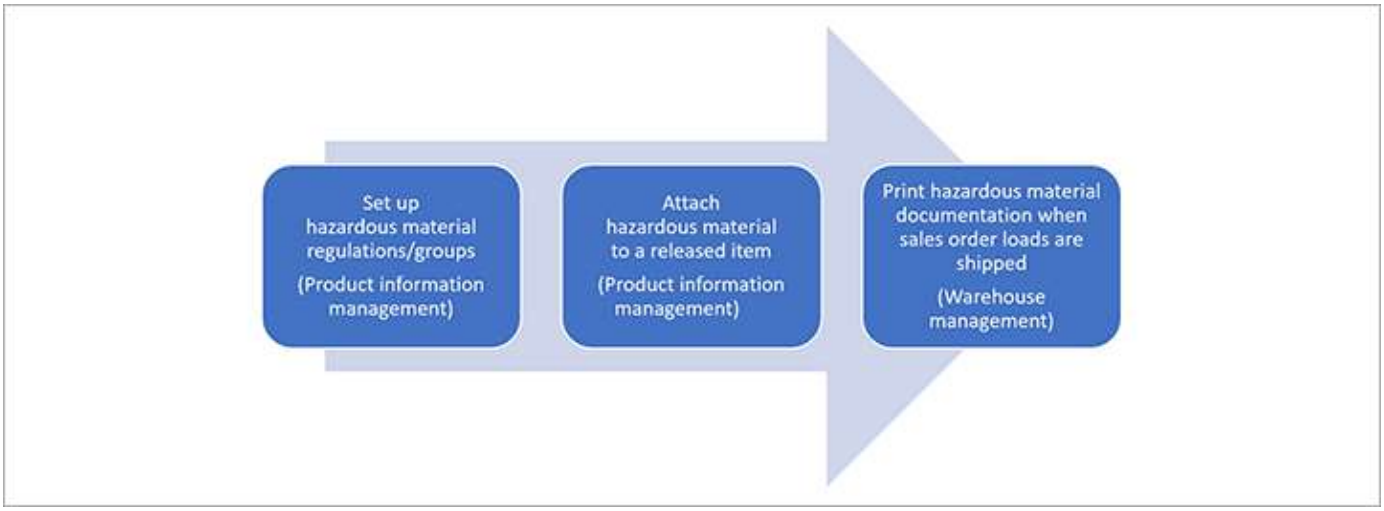
Hazardous materials overview

To remain compliant with shipping and transport regulations, organizations that ship materials classified as dangerous goods must include additional paperwork with their shipments. The hazardous materials feature lets you store information related to released items. Use this information to help prepare shipping documentation. An organization that ships dangerous goods must have its own processes and procedures for managing the shipping process. Microsoft Dynamics 365 Supply Chain Management is just a tool that can help generate the required documents.

The following diagram illustrates the steps needed to set up and use the hazardous materials feature.



Set up the hazardous materials feature in Product information management. You can print the documents through Warehouse management. Therefore, broadly speaking, those areas are the two main areas where you review, set up, and use this feature's functionality:

- **Product information management** – Set up the codes that are applied to a released product.
- **Warehouse management** – Work with additional shipping documents that are printed for shipments.

> ⓘ **Important**
>
> The hazardous materials features in Supply Chain Management provide a collection of useful product information fields and related functionality that can help you record and reference information related to your hazardous products. These features can also help you design

and print shipment documents that include some of the same information about any hazardous materials that you're shipping. However, the system doesn't automatically make you compliant with all applicable regulations in your country or region. Although these tools are intended to help you comply with common regulations, they're neither sufficient in themselves nor guaranteed to be so. Your organization is responsible for being aware of all applicable regulations and for taking all necessary steps to comply with them.

Product information management

Product information management provides a range of setup tables where you can enter reference information for the various dangerous goods lists for road, air, and sea freight.

The following common regulations were referenced when this functionality was developed:

- **ADR** – Regulations related to the international carriage of dangerous goods by road
- **CFR 49** – Regulations in the United States for the carriage of dangerous goods
- **IMDG** – The International Marine Dangerous Goods (IMDG) code
- **IATA** – The International Air Transport Association (IATA) dangerous goods regulations

Each set of regulations provides standardized lists of dangerous goods and reference codes. Therefore, Supply Chain Management provides a reference table for the common codes on those lists. Each list also has some unique codes that you can define.

For more information about how to set up regulations and values for hazardous materials, and how to assign the values to relevant products, see the following articles:

- Set up hazardous materials
- Hazardous materials in products, orders, shipments, and loads

Warehouse management

When you prepare a shipment in Warehouse management, you can print several new reports that use the information you set up in Product information management. For more information about the available reports and how to use them, see Hazardous materials inquiries and reports.

Last updated on 07/01/2026

Set up hazardous materials

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

To use hazardous materials functionality, first set up the data required to classify items as hazardous materials. Then, when you create a sales order that includes an item classified as a hazardous material, the system generates hazardous material documentation for that sales order when it ships.

Hazardous material regulations

To use the hazardous materials processes, first create a regulation. Regulations define how the printed shipping text is created for an item. They also define the associated modes of delivery.

Here are some common regulations:

- **ADR** – Regulations related to the international carriage of dangerous goods by road
- **CFR 49** – Regulations in the United States for the carriage of dangerous goods
- **IMDG** – The International Marine Dangerous Goods (IMDG) code
- **IATA** – The International Air Transport Association (IATA) dangerous goods regulations

These regulations help determine what information shows when you print the shipping text for an item. You can define as many regulations as you must comply with.

> **Important**
>
> Setting up information codes that are related to hazardous materials doesn't make your company compliant with regulations. It's only a tool that helps you build processes for your company.

Typically, a regulation is available for a specific mode of transport, such as sea freight, road freight, or air freight. Therefore, you can associate each regulation with a mode of delivery. The

mode of delivery is used when specific documents are printed in Warehouse management. In Warehouse management, each shipment is linked to a shipping carrier and carrier service set up in the **Transportation** module. The mode of delivery is associated with the shipping carrier and carrier service. When you run a report, the mode of delivery is used to find the shipping print text that is associated with a released item.

This setup data isn't specific to each legal entity (company). Therefore, you can have a common set of hazardous material information shared among all your legal entities.

For each regulation, you can define a materials list and use it as a template list associated with released items. For each regulation, you can also define a print setup. A print setup lets you define how the shipping text for an item is constructed. The print setup is used to construct the shipping print text for a released item.

To set up hazardous material regulations, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material regulation**. On the **Hazardous material regulation** page, you can create any number of regulations and configure each by using the fields that are described in the following subsections.

Hazardous material regulation header

Each regulation has a code and a description. The following table describes the fields that are available on the header.

Expand table

Field	Description
Regulation code	Enter a code to identify the hazardous material regulation record.
Description	Enter a description of the hazardous material regulation.

Print setup FastTab

Each regulation can have any number of print setups. You define the print setups on the **Print setup** FastTab. The following table describes the fields that are available for each print setup.

Expand table

Field	Description
Sequence	Define the order in which fields are referenced in the shipping text.

Field	Description
Print field	Select the field to include in the shipping text. Not all fields for the hazardous material are available to print. Only the common fields that are used to define shipping text in the various regulations are available. Define the first print field as a field separator that has a **Sequence** value of *0* (zero), so that it can be used as the separator between other fields. Only one reference to the field separator is required. The following values are available: • **Field separator** – This print field is used as the field separator for the text. Only one field separator is required in the sequence. Usually set the **Sequence** value for this print field to *0* (zero). The system looks for a field separator and uses the first one that it finds in the list. The text value that is used in the string comes from the **Print after** field. • **Identification** – This print field puts the identifying code and/or description in the print text. • **Class** – This print field puts the class code and/or description in the print text. • **Division** – This print field puts the division code and/or description in the print text. • **Packing group** – This print field puts the packing group code and/or description in the print text. • **Tunnel code and/or description** – This print field puts the tunnel code and/or description in the print text. • **Proper shipping name** – This print field puts the proper shipping name in the print text. • **Technical name** – This print field puts the technical name and/or description in the print text. • **Transport category** – This print field puts the transport category code and/or description in the print text. • **Stowage** – This print field puts the stowage code and/or description in the print text. • **Fixed text** – This print field enters the text that is defined in the **Fixed text** field for this row. • **Label code and/or description** – This print field puts the label code and/or description in the print text. • **Aircraft packing** – This print field puts the aircraft packing instructions code and/or description in the print text. • **Limited quantity** – This print field checks whether the item is marked as a limited-quantity item and, if it is, enters the text that is defined in the **Fixed text** field for this row. • **Packing description** – This print field puts the packing description in the print text.
Print before	Enter the text that should be printed before the content that is defined by the **Print field** setting.
Print after	Enter text that should be printed after the content that is defined by the **Print field** setting.
Print with previous	Select this check box to prevent the field separator from being printed between the previous field and this field. Use this check box for print fields that are either optional or included with another print field.
Fixed text	If you set the **Print field** field to **Fixed text** or **Limited quantity**, enter the text that should be

Field	Description
	printed.
Include in print	Select which value or values from the selected print field should be printed for this row. You can print the code, the description, or both the code and the description.

Mode of delivery FastTab

The regulation is a shared table and isn't specific to each legal entity. However, modes of delivery are legal entity–specific. Therefore, when you set up a mode of delivery, select the relationship between the regulation, legal entity, and mode of delivery.

The following table describes the fields that are available on the **Mode of delivery** FastTab.

Expand table

Field	Description
Company	Select a legal entity to associate with this regulation.
Mode of delivery	Based on the legal entity that you selected, select the mode of delivery that should be associated with the regulation.

Country FastTab

For reference purposes, list the countries or regions that the regulation is relevant for. However, when shipment reports are run, only the mode of delivery determines the regulation. When you review a warehouse shipment, there's no direct link to the mode of delivery. The shipment can be associated with a shipping carrier and carrier service. When you define a carrier service, you must associate it with a mode of delivery. This relationship is used on shipment reports such as the bill of lading to find the shipping print text for an item.

The following table describes the field that is available on the **Country** FastTab.

Expand table

Field	Description
Country/region	Select a country/region to associate with the regulation.

Material codes

Material codes establish settings that are related to a specific hazardous component that might be included in a released product. Each material code belongs to a specific hazardous material regulation, and its definition must conform to that regulation. When you apply a material code to a released product by using the **Material code** field, all the material code's hazardous materials settings are automatically applied to that product. Therefore, the process of setting up released products is faster and less prone to error.

To manage your hazardous material definitions, follow these steps:

1. Go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material regulation**.
2. Select the regulation to set up a hazardous material definition for.
3. On the Action Pane, on the **Setup** tab, select **Hazardous materials**.
4. In the **Material code** field, enter a material code for the hazardous material definition. You select this value when you apply the material code to a released product.

   The **Regulation code** field is read-only and shows the regulation that you selected in step 2.
5. Use the remaining fields on this page to create and set up each hazardous material that applies to your selected regulation. The fields that are available are a subset of the hazardous material fields that are available for individual released products. For more information, see Hazardous materials in products, orders, shipments, and loads.

Hazardous material classification groups

Each hazardous material classification group defines a group of field values that establish a template. You can use this template later when you set up hazardous material information for a released item.

When you assign the code for a hazardous material classification group to a released item, the information that is associated with that classification group is copied into the appropriate fields of the item. Therefore, you can simplify the setup processes by establishing a set of related field values that you often use together.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information that is shared among all your legal entities.

To set up hazardous material classification groups, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material classification**

group. On the **Hazardous material classification group** page, you can create any number of groups and configure each by using the fields that are described in the following table.

Expand table

Field	Description
Group code	Enter a code to identify the group.
Description	Enter a description of the group.
Class code	Associate a hazardous material class code with the group.
Division code	Associate a hazardous material division code with the group.
Packing group code	Associate a packing group code with the group.
Transport category code	Associate a transport category code with the group.
Multiplier	Enter the hazardous material multiplier that applies to the selected class and division of hazardous materials, according to the applicable regulation. This multiplier is used as part of the formula that calculates the total *hazardous material points* that are included in a load or shipment. For more information about hazardous material points and this multiplier, see Material management FastTab.

Hazardous material classes

A hazardous material class is typically mapped to the list of classes provided in the regulation that you're conforming to. For example, US regulation CFR 49 lists "class 3" as flammable and combustible liquids. You can set up the classes that are relevant to the materials that you must classify.

Each class is assigned to a material setup in the materials list related to the regulation. Assign a class to each released item as required, to describe the hazardous nature of a product.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information shared among all your legal entities.

Hazardous material classes work together with divisions, groups, and compatibility groups in the following way:

- When you assign a hazardous material class to a released item, you must also assign a hazardous material division.

- Use hazardous material classes together with hazardous material classification groups to establish a template of codes for setting up items.
- Use hazardous material compatibility groups to establish which hazardous material classes and divisions can be shipped together.

To set up hazardous material classes, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material class**. On the **Hazardous material class** page, you can create any number of classes and configure each by using the fields described in the following table.

Expand table

Field	Description
Class code	Enter a code to identify this class. You define this code for the item. It is used in lookup lists when you assign a hazardous material class to a released item.
Description	Enter a description of the class.

Hazardous material divisions

A hazardous material division is a subset of a hazardous material class. You must assign both a division and a class to every product that includes hazardous materials.

For classes that don't have any divisions, create a division where the code is *0*. For example, in the IATA regulation, class-7 radioactive materials have no subdivisions. In this case, you create a *0* division that you can associate with a released product when you assign the class.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information shared among all your legal entities.

Hazardous material divisions work together with classes, groups, and compatibility groups in the following ways:

- When you assign a hazardous material division to a released item, you must also assign a hazardous material class.
- You can use hazardous material divisions together with hazardous material classification groups to establish a template of codes for setting up items.
- Use hazardous material compatibility groups to establish which hazardous material classes and divisions can be shipped together.

To set up hazardous material divisions, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material division**. On the **Hazardous material division** page, you can create any number of divisions and configure each by using the fields that are described in the following table.

Expand table

Field	Description
Division	Enter a code to use as a reference number for the division.
Description	Enter a description of the division.
Class	Look up and assign the class that the division belongs to.

Hazardous material compatibility groups

Hazardous material compatibility groups establish which hazardous material classes and divisions can be shipped together. When operators create warehouse loads or shipments, they can run a compatibility check that issues a warning if the load or shipment includes items that don't all belong to the same compatibility group.

This setup data isn't specific to each legal entity. Therefore, you can have a common set of hazardous material information shared among all your legal entities.

To set up hazardous material compatibility groups, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material compatibility group**. On the **Hazardous material compatibility group** page, you can create any number of compatibility groups and configure each by using the fields that are described in the following subsections.

Hazardous material compatibility group header

Each compatibility group has a code and a description. The following table describes the fields that are available on the header.

Expand table

Field	Description
Compatibility group	Enter a code to identify the compatibility group
Description	Enter a description of the compatibility group.

Compatibility group details

Each compatibility group establishes a list of classes and divisions of hazardous materials that can be shipped together.

Expand table

Field	Description
Class	Select a hazardous material class that's compatible with all other classes in the group.
Division	Select a hazardous material division that belongs to the selected class.

Hazardous material specification values

Microsoft Dynamics 365 Supply Chain Management provides several types of hazardous material specifications. For each type, you must establish a centralized set of values for each relevant field. Users can then select among those values when they configure hazardous material definitions or released products. Supply Chain Management provides a collection of pages where you can establish the values. Each page is dedicated to one type of specification. For a description of each available specification and information about how to establish the values that are available for it, see the following subsections.

One example of a hazardous material specification is the *stowage code*, which specifies how a given material can be stored during transport. By using the information in this section, you establish a central collection of stowage codes. This collection is presented to users in a drop-down list when they set the stowage code for a released product.

These hazardous material specification values aren't specific to each legal entity, Therefore, you can have a set of common values that are shared among all your legal entities.

Use material codes to establish common collections of settings for each specification as it applies to a given regulation. You can then apply the appropriate code to each released product as required. For information about how to apply a hazardous material code to a specific released product, and how to configure individual settings of that product for any specification that is described here, see Hazardous materials in products, orders, shipments, and loads.

Hazardous material emergency response

The *Hazardous material emergency response* specification indicates what to do if something goes wrong while transporting a product that contains a given hazardous material.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material emergency response**. On the **Hazardous material emergency response** page, you can create any number of values and configure each with a classification code and a short description.

Hazardous material identification

The *Hazardous material identification* specification identifies the class or nature of a hazardous material. The value is typically a code that's based on a United Nations (UN) standard. Each class is identified by a code and a description, and it can set limits on transport methods. For example, to identify a flammable item or material, you create a hazardous material class that uses the code *FL* and the description *Flammable*. You also specify that the class must not be transported by air.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material identification**. On the **Hazardous material identification** page, you can create any number of values and configure each by using the fields that are described in the following table.

Expand table

Field	Description
Identification	Enter a code to use as a reference number that identifies this class of hazardous material.
Description	Enter a description of this class.
Restrict from air transport	Select this check box to indicate that this class of hazardous material shouldn't be transported by air.
Restrict from sea transport	Select this check box to indicate that this class of hazardous material shouldn't be transported by sea.

Hazardous material label

The *Hazardous material label* specification identifies the dangerous goods label that must be applied to relevant released products. The labels themselves describe how the product should be handled. For example, you have a product that contains a poisonous gas. In this case, you set up a label code that represents the poisonous gas label. You also build your business process so that it looks up this value when you ship products.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material label**. On the **Hazardous material label** page, you can create any number of labels and configure each with an identifying code and a short description.

Hazardous material packing descriptions

The *Hazardous material packing descriptions* specification indicates how to pack a hazardous item. For example, you might need to pack the item in a specific type of steel drum or use another type of special packaging.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material packing descriptions**. On the **Hazardous material packing descriptions** page, you can create any number of packing descriptions and configure each with an identifying code and a short description.

Hazardous material packing group

The *Hazardous material packing group* specification identifies the packing group for a hazardous item. The packing group lets you define a code and a description to indicate how hazardous material items must be packed during transportation or shipment. The packing group is assigned to the item through the **Item hazardous materials** page.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material packing group**. On the **Hazardous material packing group** page, you can create any number of packing groups and configure each with an identifying code and a short description.

Hazardous material packing instruction

The *Hazardous material packing instruction* specification identifies packing instructions that must be followed when preparing a given hazardous item for transportation by air.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material packing instruction**. On the **Hazardous material packing instruction** page, you can create any number of packing instruction identifiers and configure each with an identifying code and a short description.

Hazardous material stowage

The *Hazardous material stowage* specification indicates how to store a product on a ship when transporting it by sea freight.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material stowage**. On the **Hazardous material stowage** page, you can create any number of stowage identifiers and configure each with an identifying code and a short description.

Hazardous material transport category

The *Hazardous material transport category* specification typically groups similar hazardous products on reports. For example, transport categories are used on the **Shipment summary** report, which you can print from the warehouse shipment record.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material transport category**. On the **Hazardous material transport category** page, you can create any number of transport categories and configure each with a display name and a short description.

Hazardous material technical name

Use the *Hazardous material technical name* specification to provide a commonly used or internal company name that describes each material.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material technical name**. On the **Hazardous material technical name** page, you can create any number of technical names and configure each with a display name and a short description.

Hazardous material tunnel

The *Hazardous material tunnel* specification limits the types of tunnels that a hazardous material can be transported through by identifying the types of tunnels that must be used. Tunnel categories are established by applicable regulations for hazardous material transport. This specification usually applies only to road transport.

To set up values for this specification, go to **Product information management** > **Setup** > **Hazardous material shipping documentation** > **Hazardous material tunnel**. On the **Hazardous material tunnel** page, you can create any number of tunnel identifiers and configure each with an identifying code and a short description.

Hazardous materials in products, orders, shipments, and loads

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article explains how to set hazardous material properties for released products, how to put stock limits on hazardous items, and how to include hazardous materials in a sales order, shipment, or load.

Set hazardous material specifications for products

After you define a hazardous material regulation and set up the related reference codes as described in Set up hazardous materials, associate this information with released items. The shipping text for shipping documents is drawn from the hazardous materials information for the released items.

As part of the process of associating a released item with a hazardous material, specify the regulation code and the material. Different regulation codes might be associated with an item, depending on the modes of transport. You can associate multiple regulations and material codes with each item.

To set up a released product as a hazardous material, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select or create a product to open its **Released product details** page.
3. On the **Manage inventory** FastTab, set the **Hazardous material** option to **Yes**. This setting identifies the item as a dangerous good and is used when shipping documentation is printed.
4. On the Action Pane, on the **Manage inventory** tab, in the **Compliance** group, select **Item hazardous material**.

5. Fill in the **Item hazardous materials** page for the selected item by using the fields that are described in the following subsections.

Item hazardous materials header

The following table describes the fields that are available at the top of the **Item hazardous materials** page.

Expand table

Field	Description
Item number	The released product that you're working with.
Regulation code	Select the hazardous material regulation that applies to the product. The regulation defines how the printed shipping text is created for an item and the associated modes of delivery. After it's assigned, the code can't be edited on this page. However, you can assign a new regulation code by selecting **New**.
Material code	(Optional) Select the hazardous material code that applies to the product. The material code provides a template that includes default values for many other fields on this page. When you select a code, all its hazardous materials specifications are copied to the current product. However, the system first prompts you to confirm that item material data should be filled in from the material code.
Group code	(Optional) Select the hazardous material classification group code that applies to the product. As with the **Material code** field, when you select a code, all its hazardous materials specifications are copied to the current product. However, the system first prompts you to confirm that item class group data should be filled in from the group code.

Descriptions FastTab

The following table describes the fields that are available on the **Descriptions** FastTab.

Expand table

Field	Description
Proper shipping name	Enter the standard description for the material, as specified by the applicable regulation. You can provide translations for this value on the **Item ship text translation** FastTab, as described in the next section.
Technical name	Select the common or generic name for the material. This name might be a name that your company uses internally for the material.

Field	Description
N.O.S.	Select this check box to indicate that the **Proper shipping name** value is a not-otherwise-specific (N.O.S.) shipping name for the item. N.O.S. shipping names are used for groups of similar chemicals and materials that have specific end uses, but that might not be listed by name in the hazmat table in a specific regulation.

Item ship text translation FastTab

The **Item ship text translation** FastTab contains a grid that shows translations of the **Proper shipping name** values defined for the primary language on the **Descriptions** FastTab. Use these translations in shipping print text for one or more additional languages.

The following table describes the fields that are available on the **Item ship text translation** FastTab.

Expand table

Field	Description
Language	The language code that the row uses. For example, **pt-br** indicates Brazilian Portuguese.
Shipping print text	The translated **Proper shipping name** value in the language that the row uses.

To add or edit a translation, select **Translations** above the grid to open **Text translations** page. Then follow one of these steps:

- To add a new translation, on the Action Pane, select **Add**. Select the language to add, and then, in the **Translated text** field, enter the translated text.
- To edit an existing translation, select a target language in the **Language** field, and edit the translated text in the **Translated text** field, as required.

Material management FastTab

The following table describes the fields that are available on the **Material management** FastTab.

Expand table

Field	Description
Class	Select the hazardous material class that the product belongs to, as defined by the regulation that you're conforming to. You must assign both a division and a class to

Field	Description
	every product that includes hazardous materials.
Description	The description that is defined for the class that is selected in the **Class** field. This field is read-only.
Division	Select the hazardous material division that the product belongs to, as defined by the regulation that you're conforming to. The division is a subset of the class. You must assign both a division and a class to every product that includes hazardous materials.
Identification	Select the hazardous material identification code. Typically, this code is based on a United Nations (UN) standard.
Packing group	Select the packing group that applies to the current item.
Description	The description that is defined for the group that selected in the **Packing group** field. This field is read-only.
Packing Descriptions	Select the applicable packing description code. This code references a description that indicates how the product must be packed.
Hazardous material labels	Select a code that references the applicable dangerous goods label that should be applied to the product.
Limited quantity	Set this option to **Yes** to report the total product weight that is included in each load and on each load line.
Quantity	Enter the quantity of hazardous material in the product, in the specified unit. This value is used to calculate the total hazardous material score for loads and shipments that include the product.
Multiplier	Enter the multiplier that is applied when the hazardous material score is calculated for each load line that includes the product. This value is specified by the applicable regulation, according to the type of hazardous material that is contained in the product.
Unit	Select the unit of measure that applies to the quantity of hazardous material in the product, as specified in the **Quantity** field. This value is used to calculate the total hazardous material score for loads and shipments that include the product.

How the hazardous material score is calculated

Several of the values specified on the **Material management** FastTab for a product are used to calculate a *hazardous material score* for each load line that includes that product. The score is calculated by using the following formula:

Hazardous material score = <*LineQty*> × <*HazmatQty*> × <*UnitConversion*> × <*Multiplier*>

Here's a key to the formula:

- <*LineQty*> is the quantity of product specified for a load line.
- <*HazmatQty*> is the quantity of hazardous material specified for a product in the **Quantity** field on the **Material management** FastTab.
- <*UnitConversion*> is a conversion factor for converting between the unit used for the load line quantity and the unit specified for a product in the **Unit** field on the **Material management** FastTab.
- <*Multiplier*> is the multiplier specified for a product in the **Multiplier** field on the **Material management** FastTab.

This score is reported for each load line that contains a product where these values are specified. To learn more, see the Shipments that include hazardous materials and Loads that include hazardous materials sections later in this article.

How the hazardous material weight is calculated

Loads and load lines that contain products where the **Limited quantity** option on the **Material management** FastTab is set to **Yes** show the total hazardous material weight, as described in the Shipments that include hazardous materials and Loads that include hazardous materials sections later in this article. The hazardous material weight is calculated by using the following formula:

Hazardous material weight = <*LineQty*> × <*ProductWeight*> × <*UnitConversion*>

Here's a key to the formula:

- <*LineQty*> is the quantity of product specified for a load line.
- <*ProductWeight*> is the net weight specified for the product, in the inventory unit specified for the product.
- <*UnitConversion*> is a conversion factor for converting between the unit used for the load line quantity and the inventory unit that is used for <*ProductWeight*>.

Transport information FastTab

The following table describes the fields that are available on the **Transport information** FastTab.

Expand table

Field	Description
Transport category	Select the related transport category.
Tunnel Code	Select the related tunnel restriction code for the item.

Field	Description
Hazardous material stowage	Select the reference code that is used for sea freight stowage handling when the item is shipped by sea freight.
Aircraft type	Select the aircraft restriction that applies for the material when it's shipped by air freight.
Packing - cargo aircraft only	Based on the value that you selected in the **Aircraft type** field, select the packing instructions code that applies when the product can be shipped only by cargo aircraft.
Packing - passenger and cargo aircraft	Based on the value that you selected in the **Aircraft type** field, select the packing instructions code that applies when the product can be shipped by either cargo aircraft or passenger aircraft.
IATA Star	Set this option to **Yes** to indicate that the air transport specifications that are entered on this FastTab are related to the International Air Transport Association (IATA) dangerous goods standard. This field is for informational purposes only.
Emergence response	Select the code that references instructions for handling the material in an emergency.

Environmental information FastTab

The following table describes the fields that are available on the **Environmental information** FastTab.

Expand table

Field	Description
Environmentally dangerous	Set this option to **Yes** to indicate that the product is environmentally dangerous. Use this field for your own reporting purposes.
Marine pollutant	Set this option to **Yes** to indicate that the product is a marine pollutant. Use this field for your own reporting purposes.

Set stock limits for hazardous products

For safety reasons, you might need to limit the total amount of a given product stocked at a single location. To set stock limits for a released product, follow these steps:

1. Go to **Product information management** > **Products** > **Released products**.
2. Select a product to open its **Released product details** page.
3. On the Action Pane, on the **Manage inventory** tab, in the **Compliance** group, select **Reporting details**.

4. In the **Hazardous stock limit** and **Hazardous warning limit** fields, set appropriate values for the selected product.

The **Hazardous material stock limit** report helps you monitor the stock levels of hazardous materials in your warehouse locations, so you can make sure that they stay under the safe limits that are established here. For more information, see Hazardous material stock limit report.

Sales order transactions that include hazardous materials

To include a product that is classified as a hazardous material on a sales order, you must associate the relevant shipping carrier with the sales order. Open the sales order, and then, on the **Delivery** FastTab, set the **Shipping carrier** and **Carrier service** fields as required.

The shipping carrier is also associated with the mode of delivery. Therefore, you must make sure that this information aligns with the hazardous material regulation. In other words, the mode of delivery that is specified in the hazardous material regulation must match the specifications on the sales order header. In this way, the regulation, shipping carrier, and service are connected to the shipment lines that are used on a sales order.

After a sales order is finalized and ready to be shipped, it can be released to the warehouse to indicate the transfer between sales and warehouse operations.

Shipments that include hazardous materials

View hazardous material scores for each shipment line

The **Shipment details** page for a shipment shows the total hazardous material weight and point values that are calculated for each load line that the shipment includes. To view the scores and weights, follow these steps:

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Select a shipment to open its **Shipment details** page.
3. On the **Load lines** FastTab, review the lines. For each line, you see the hazardous material calculations in the following fields:
    - **Hazardous material points** – This field shows the hazardous material score for the load line. The value is calculated according to the rules and values that are established for the applicable regulation and in the released product setup. The calculation takes

the quantity on the load line and references the multiplier in the material management setup for the released product.

- **Limited quantity net weight** – For products marked as limited-quantity products because of their hazardous material content, this field shows the total net weight of hazardous content that the load line includes. The calculation is based on the products marked as hazardous materials in the released product setup. If an item is marked as a limited-quantity item, the calculation takes the quantity on each load line and references the weight in the material management setup for the released product.

Check for compatibility among hazardous materials that a shipment includes

The system can evaluate whether all the hazardous materials that a shipment includes are suitable to be shipped together. To evaluate compatibility, the system checks the compatibility group assigned to each product that the shipment includes. For more information, see Hazardous material compatibility groups.

To run the compatibility check, follow these steps:

1. Go to **Warehouse management** > **Shipments** > **All shipments**.
2. Select a shipment to open its **Shipment details** page.
3. On the Action Pane, on the **Shipments** tab, in the **Actions** group, select **Compatibility check**.

You receive a message that informs you of the results of the check.

Loads that include hazardous materials

View hazardous material scores for each load line

The **Load details** page for a load shows the total hazardous material weight and point values that are calculated for that load and for each load line. To view the scores and weights, follow these steps:

1. Go to **Warehouse management** > **Shipments** > **All loads**.
2. Select a load to open its **Load details** page. (You can also open load details by selecting a link from a related shipment.)

3. On the **Load** FastTab, review the total hazardous material scores and weights for the whole load by inspecting the following fields:

    - **Hazardous material points** – This field shows the hazardous material score for the load. The value is calculated according to the rules and values established for the applicable regulation and in the released product setup. The calculation takes the quantity that is included in the load and references the multiplier in the material management setup for the released product.
    - **Limited quantity net weight** – For products that are marked as limited-quantity products because of their hazardous material content, this field shows the total net weight of hazardous content that the load includes. The calculation is based on the products that are marked as hazardous materials in the released product setup. If an item is marked as a limited-quantity item, the calculation takes the quantity in each load and references the weight in the material management setup for the released product.

4. To review the scores and weights for individual lines, select the **Load lines** FastTab. The values provided for each line resemble the values that it provides for the whole load, as described in the previous step.

Check for compatibility among hazardous materials that a load includes

The system can evaluate whether all the hazardous materials that a load includes are suitable to be shipped together. To evaluate compatibility, the system checks the compatibility group assigned to each product that the load includes. For more information, see Hazardous material compatibility groups.

To run the compatibility check, follow these steps:

1. Go to **Warehouse management** > **Shipments** > **All loads**.
2. Select a shipment to open its **Load details** page. (You can also open load details by selecting a link from a related shipment.)
3. On the Action Pane, on the **Loads** tab, in the **Actions** group, select **Compatibility check**.

You receive a message that informs you of the results of the check.

Hazardous materials inquiries and reports

Article • 08/23/2022

Microsoft Dynamics 365 Supply Chain Management provides various reports that are related to hazardous materials. Many of these reports are required so that you remain compliant with various hazardous material regulations during shipping and storage.

All these reports, except the **Multimodal dangerous goods** report, use the mode of delivery that is defined for the shipment to find the regulation that should be used to print the shipping text for items. The mode of delivery is associated with the shipping carrier and the carrier service. Therefore, you must set up a shipping carrier and carrier service, and link them to a mode of delivery. The mode of delivery is related to the hazardous materials regulation.

The following illustration shows the sequence of activities that occur when the system generates hazardous materials reports.

Set up hazardous materials reporting

Usually, if you ship items that contain hazardous materials, you must generate specific reports to help preserve safety and comply with hazardous materials regulations. To set up your reports, follow these steps.

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **Reports** tab. On the **Hazardous materials report parameter** FastTab, set the following fields.

Expand table

Section	Field	Description
Multimodal Dangerous Goods	Regulation code	Select the regulation that should be used when a **Multimodal dangerous goods** report is generated.
Hazardous Material stock limits	Regulation code	Select the regulation that should be used when stock limits are evaluated.
Carriage of merchandise by road	CMR group product	CMR stands for "carcinogenic, mutagenic, and reprotoxic substances." Set this option to **Yes** to configure the system to print specific warnings and messages that are related to the handling of these substances.
Carriage of merchandise by road	Hazardous material group description	Enter the text of specific warnings that are related to CMR and carriage of merchandise by road. This text will be included on the report.
Shippers declaration	Warning	Enter the text of a warning message that should be printed on the shipper's declaration form (for example, "Warning: Dangerous Goods, Flammable").
Shippers declaration	Footer declaration	Enter the text of a message that should be printed at the bottom of the shipment declaration document.
Hazardous goods report language	Hazardous goods domestic report language	Select the default language for hazardous materials reports that are associated with domestic shipments.
Hazardous goods report language	Hazardous goods export report language	Select the default language for hazardous materials reports that are associated with international shipments.

Hazardous materials report

The **Hazardous materials** report shows a list of all items that have been set up and defined so that they have dangerous goods information. You can use this report to monitor and review the information that you must maintain. The page for the report shows a limited selection of fields from the hazardous material setup. However, you can personalize it to add additional fields as you require.

To view this report, go to **Product information management** > **Inquiries and reports** > **Hazardous material shipping documentation** > **Hazardous materials**.

Hazardous material stock limit report

The **Hazardous material stock limit** report lets you monitor the stock levels of the hazardous materials in your warehouse locations, to make sure that they remain under established, safe limits. These limits come from the limits that are defined for each released product.

To view this report, go to **Product information management** > **Inquiries and reports** > **Hazardous shipping documentation** > **Hazardous material stock limits**.

For more information about how to set stock limits on a released product, see Set stock limits for hazardous products.

The regulation that is used for stock limits is defined on the **Warehouse management parameters** page. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**, and then, on the **Reports** tab, in the **Hazardous materials stock limit**, specify a regulation code. Learn more in the Set up hazardous materials reporting section earlier in this article.

Verified gross mass report

The **Verified gross mass** report lets you print information about the weight of a shipment.

To generate and print this report, go to **Warehouse management** > **Shipments** > **All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Verified gross mass**.

Multimodal dangerous goods report

The **Multimodal dangerous goods** report is provided for shipments that must be moved by using a combination of transport methods. It's typically used when a shipment is moved first by road and later by sea.

To generate and print this report, go to **Warehouse management** > **Shipments** > **All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Multi model dangerous goods**.

When you generate this report, the information is saved so that you can edit it and/or reprint the report if you must. To edit a generated report, go to **Warehouse**

management > **Enquiries and reports** > **Hazardous materials shipping documentation** > **Multimodal dangerous goods**, and find the relevant report in the list. After you've finished editing the content as you require, select **Print** on the Action Pane to print the report.

Shippers declaration report

The **Shippers declaration** report lets you print information that is related to a declaration of the materials that are included in the shipment.

To generate and print this report, go to **Warehouse management** > **Shipments** > **All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Shippers declaration**.

Carriage of merchandise by road report

The **Carriage of merchandise by road** report resembles a bill of lading but is typically used for road transportation in Europe under the Agreement concerning the International Carriage of Dangerous Goods by Road (ADR) regulations. This report uses the shipping print text for an item unless you set the **Hazardous material group description** field on the **Warehouse management parameters** page.

To generate and print this report, go to **Warehouse management** > **Shipments** > **All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Carriage of merchandise by road**.

When you generate this report, the information is saved so that you can edit it and/or reprint the report if you must. To edit a generated report, go to **Warehouse management** > **Enquiries and reports** > **Hazardous materials shipping documentation** > **Carriage of merchandise by road**, and find the relevant report in the list. After you've finished editing the content as you require, select **Print** on the Action Pane to print the report.

Shipment summary report

The **Shipment summary** report provides information that is summarized by the transport category that is related to the released items.

To generate and print this report, go to **Warehouse management** > **Shipments** > **All shipments**, and open the relevant shipment. Then, on the Action Pane, on the **Shipments** tab, in the **Hazardous materials document** group, select **Shipment summary**.

bill of lading report

When the hazardous materials feature is turned on for your system, the **bill of lading** report includes a **Hazardous materials** column that indicates whether a load includes hazardous materials. This report is available from the **All loads** page, as usual.

Packing list report

When the hazardous materials feature is turned on for your system, packing lists include additional information that is related to the shipping print text for an item. This report is available from the **All loads** page, as usual.

Product-related translations FAQ

Article • 06/15/2022

This article describes how to manage translations for products, product dimension values, and product attributes.

What product-related data can be translated?

You can create translations for the following product-related information:

- Names and descriptions of products.
- Descriptions, friendly names, and help text of product attribute values.
- Names and descriptions of product dimension values.

You can translate the product-related information into any language that is available from the **Text translation** page. For more information, see the following section **How do I created translations for product-related information**.

Where can I view the translated information?

You can view translations of product-related information in any external source document, such as an invoice, that uses a language where translations are available.

How do I create translations for product-related information?

To create translations for a product, follow these steps:

1. Click **Product information management** > **Products** > **Released products**.
2. Select a product, and on the Action Pane, in the **Languages** group, click **Translations**.
3. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
4. In the **Translated text** group, enter translations in the **Description** and **Product name** fields.

To create translations for product attributes, follow these steps:

1. Click **Product information management** > **Products** > **Released products**.
2. Under **Setup**, click **Attributes**, and then click **Attributes**.

3. In the **Attributes** page, click **Translate**.
4. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
5. In the **Translated text** group, enter translations in the **Description**, **Friendly name**, and **Help text** fields.

To create translations for product dimension values, follow these steps:

1. Click **Product information management** > **Products** > **Released products**.
2. Select a product, and then click **Product dimensions**.
3. Select one of the links for the product dimensions: **Configurations**, **Sizes**, **Colors**, or **Style**.
4. Select a dimension value and then click **Translate**.
5. In the **Text translation** page, in the **Language** field, select a language. To add more languages, expand the **Language** field, and then click **OK**.
6. In the **Translated text** group, enter translations in the **Name** and **Description** fields.

Can the names of product variants be translated?

Product variants are based on the dimensions of a released product. Product variant names are based on a combination of dimension values. When the dimension values that are associated with a product variant are translated, the name of the product variant appears in the translated version.

Example

Your product is a T-shirt that comes in different sizes and colors and the variant names are based on the following details:

- Product number: #3
- Dimensions: Size and color
- Size dimension values: Small, Medium, Large
- Color dimension values: Red, Green, Black

The name of a product variant that is based on the dimension values Small and Red is **#3:Small:Red**.

A customer wants to buy some small, red T-shirts and the name of the T-shirt must appear in French on the invoice. You translate the dimension values, Small and Red, into French, and the name of the product variant is **#3:Petit:Rouge**.

Expand table

Tip
To set the preferred language of a customer, follow these steps: 1. Click **Sales and marketing** > **Common** > **Customers** > **All customers**. 2. Double-click a customer to open the **Customers** page. On the **General** tab, in the **Language** field, select the **language**.

What happens if a customer has a preferred language for which no translations are available?

If translations are not available in the customer's preferred language, the names and descriptions are displayed in the global language of your own company.

Can I manage translations for a series of dimension values at the same time?

Dimension values are product specific and you can manage the translations for the dimension values for each product. However, if you create a dimension value group and create translations for the values in the value group, it is easier to manage the translations.

Example

Your company produces T-shirts in different styles, and each style is available in the sizes Small, Medium, and Large. The sizes are collected in one dimension value group. When a new T-shirt style is added, you can associate it with the dimension value group that is used for sizes, so that all the sizes are available for the product. You can also add or change translations for the sizes in the dimension value group at any time.

A dimension value that is associated with a product through a dimension variant group must be maintained from the product variant group.
To create a dimension value group, follow these steps:

1. Click **Product information management** > **Setup** > **Variant groups**.
2. Select **Size groups**, **Color groups**, or **Style groups**.
3. Click **New**, and then enter a name for the group in the **Size group**, **Color group**, or **Style group** field. Click **Sizes**, **Colors**, or **Styles** to create lines for the groups.

4. In the **Size group** lines, **Color group lines**, or **Style group lines** page, click **New**, and then create the sizes, colors, and styles for the groups.

To manage translations for values in a dimension value group, follow these steps:

1. Follow the steps in the previous procedure for creating a dimension value group to open the **Size group lines**, **Color group lines**, or **Style group lines** page.
2. Click **Text translation**. In the **Text translation** page, in the **Translated text** group, enter translations in the **Name** and **Description** fields.

When can translations of product-related information be managed?

Translations of product-related information can be managed at any time. When translations are updated for a dimension value that is associated with a product, the product information is updated, regardless of whether the product has transactions.

Search for products and product variants during order entry

Article • 09/29/2021

Use the **Item number** field to search for products and product variants when you manually create a sales order line or a purchase order line. This lets you quickly find product variants when you only have the configuration string or one of the product dimensions available.

Sometimes, having too much of something is not the best situation to be in, and this is especially true if you sell a number of products that are similar, and you are trying to remember item numbers or product search names in order to find the right product to put on a sales order. You can use the **Item number** field on a sales order line or a purchase order line as a search field. You can enter any part of a product name, number, or dimension and get a lookup that displays all the items that match the search word.

How search works

When you search for products or product variants, it is important to understand how the search feature finds the products that match the text that you enter. The key search rules in delivering search results are:

- Search results will return any matching record, disregarding the field that the search text is entered in.
- The search text needs to be present in the matching record in its full length.
- A match will occur even if the search text is found in the middle of a text string in the matching record. It does not have to appear in the beginning of a text string.
- The search text is treated as a single text string even if it contains white space.

Examples

The following examples use products and product variants to illustrate how search is handled in various scenarios. **Prerequisite:** Under **Sales and marketing** > **Setup** > **Search** > **Search parameters** > **Search type**, select the **Full match** option.

Expand table

Product type	Product name	Display product number	Item number	Configuration
Distinct product	SpeakerMidRange	D0001	D0001	NA
Product variant	Active speaker	D0010:::Black:	D0010	000005
Product variant	Active speaker	D0010:::White:	D0010	White

If you type 'speak' in the **Item number** field, you will get all the products above as a result in the lookup. If you type 'black' in the **Item number** field, you will get the second product as a result, because it has the text 'black' in the display product number. These two examples illustrate that the search is not only at the beginning of the field, a match will occur even if the search text is found in the middle of a text string in the matching record.

If you type '05' you will only get the second product variant as a result, because it has '05' in the configuration. This illustrates that the search is across all the enabled fields on the **Search criteria** page.

If you type 'speak 05' you will not get any results. This is because the search looks for the full text that is entered. The search will not try to find 'speak' and then narrow the results to those containing '05'.

You can limit the number of search results by using the **Number of results** field on the **Sales and marketing** > **Setup** > **Search** > **Search parameters** page. If you set this field to 0, all search results will be returned. If you set it to 10, for example, it will return a maximum 10 search results.

Configure the product search

Before you can use the product and product variant search feature, follow these steps to configure the product search.

Step 1: Include all the relevant product and product variant identifiers and dimensions in the search criteria

Examples of product and product variant identifiers and dimensions that you can search by are **Product name, Item number**, **Display product number, Configuration, Color, Size, Style, Search name, etc**.

Go to **Sales and marketing** > **Setup** > **Search** > **Search criteria** page. The **Search criteria** page allows you to define criteria for customer, prospect, and product search. Make sure you filter the page by using product search criteria. You can do this by switching to **Product** in the page's menu.

To add the display product number to the search criteria, click **New** in the page's menu. This will add a new record in the **Search criteria** grid. Open the **Field name** column lookup and chose **DisplayProductNumber**. To add the product's configuration to the search criteria, create a new record in the **Search criteria** grid and chose **configId** in the **Field name** column. In the same manner, create a record with **Field name InventColorId** for the color dimension, **InventSizeId** for the size dimension, and **InventStyleId** for the style dimension.

Step 2: Populate the database table that is used for product search

In the **Search criteria** page, click the **Update search data** button. In the **Update search data** dialog box, make sure that **Source** is set to **Product**, and then click **OK**. The system will aggregate in one table all the selected search criteria specified in step 1. If you have a lot of products and product variants, this operation can be quite lengthy and you may receive a warning. We recommend that you schedule the search table population on the batch server at a time when the server is not too busy.

Until the table is populated, product search will not provide the correct results. If you do not get any search results, make sure that this table is populated.

The table only has to be populated when the search criteria is modified. Newly released products and variants are automatically added to the table. Deleted products and variants are automatically removed from the table.

Step 3: Enable the lookup for product search on sales and purchase order lines

You can enable this functionality by going to **Sales and marketing** > **Setup** > **Search** > **Search parameters** and setting **Enable lookup for search** to **Yes** on the **General** tab.

For sales order line entry, the default behavior is to open the **Product search** page when you start typing in the **Item number** field, and then press the **Tab** key. The **Product**

search page changes the context during order line creation and may be considered unnecessarily intrusive. If you prefer to get the search results in a lookup and not lose context during order line entry, you can use the search lookup instead. If you search for a product or product variant, but you don't select anything in the lookup and press the **Tab** key, the **Product search** page will display.

Default order settings for dimensions and product variants

07/10/2025

Default order settings in Dynamics 365 Supply Chain Management define the site and warehouse where items will be sourced from or stored; the minimum, maximum, multiple and standard quantities that will be used for trading or inventory management; the lead times; the stop flag; and the order promising method. Default order settings are used when creating purchase orders, sales orders, transfer orders, inventory journals, and by master planning for generating planned orders. Default order settings can be item specific, site specific, product variant specific, or product dimension specific.

To define the default order settings for a product, follow these steps.

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the relevant product in the grid.
3. On the Action Pane, follow one of these steps to open the **Default order settings** page for the selected product:
    - On the **Plan** tab, in the **Order settings** group, select **Default order settings**.
    - On the **Manage inventory** tab, in the **Order settings** group, select **Default order settings**.
4. Configure the settings as described in the rest of this article.

Default order settings

There are three types of default order settings for purchases, sales, and inventory. The default order settings for purchases are used when creating:

- Purchase order lines
- Purchase agreement lines
- Request for quotation lines
- Purchase requisition lines
- Consignment replenishment lines (partially supported, see note)
- Planned purchase orders

> ⓘ **Note**

For consignment replenishment order lines, the only settings from the **Purchase order** FastTab of the **Default order settings** page that apply are the **Default site** field, **Default warehouse** field, and **Stopped** check box.

The default order settings for sales are used when creating:

- Sales order lines
- Sales agreement lines
- Sales quotation lines
- Return order lines and item replacement lines
- Demand forecast lines

The default sales order settings also apply when creating:

- Project item requirements
- Service order item requirements

The default order settings for inventory are used when creating:

- Inventory journals
- Transfer orders
- Planned transfer orders

The default inventory order settings also apply when creating:

- Quarantine orders
- Quality orders
- Production orders
- BOM lines
- Planned production orders

Full definition of a released product

When you create a transaction, you must specify the full definition of a released product on the line, so that Supply Chain Management can try to identify the default order settings. In the full definition of a released product, the item number and all the active product dimensions, such as configuration, size, style, version, and color, are specified on the transaction. For example, if you manually create a purchase order line for a released product variant, you must specify all the required product dimensions before the site, warehouse, quantities, and lead time will appear by default on the order line.

Not all of the default order settings parameters are applied when creating order or journal lines. Quantities and lead times will only display by default when appropriate. For example,

when counting a journal line, only the site and warehouse will display by default when the line is created. For this reason, no default quantity or checks on multiple and minimums are performed when creating the line or posting the journal.

The system always attempts to find a default site and warehouse when an order or journal line is created. The site isn't always displayed by default from the order settings. For example, when creating a sales order or a purchase order, the site from the order header is automatically used on the order lines. When creating a BOM line, the site from the BOM header is used. After the site is determined, it will be used to find any site-specific order settings that can then be used as the default for the warehouse.

The default order type, the purchase, and the inventory lead times can be overridden by the item's coverage rules on the **Item coverage** page. Although the default order settings don't allow for the distinction between the production and transfer lead time, the item coverage rules allow for it. However, the item coverage setup will only be used by master planning when creating planned production and planned transfer orders and won't apply when manually creating production and transfer orders.

Default order settings rules

You can define general default order settings and any number of default order setting rules that apply only in certain conditions, such as site or a specific product dimension or product dimensions combination. You can't define warehouse-specific order settings.

Rank in default order settings

The default order settings rules have ranks. The higher the rank, the more important the rule is, meaning that it will have a higher priority and be used before the rules with lower ranks. The general default order settings have rank zero, which can't be modified. There can only be one rule with rank zero. Rules can have the same rank, provided that the dimensions they apply to differ. This is useful for modeling site-specific order settings. When a new default order settings rule is created, the values for order values, stop flag, etc. are inherited from the rule with rank zero, but can be overridden.

Default order settings for released products

For distinct released products, you can define general order settings or site-specific order settings. The general order settings will always have rank zero. If you set up new sales, purchase, and inventory order settings at the same time, we recommend that you use the **Details view** on the **Default order settings** page. To switch to the details view, go to **Options** > **Page options** > **Change view** > **Details view**.

Site-specific order settings

To create site-specific order settings, select **New**. In **Details view**, enter the site in the **Site** field in the **Settings applicable for** section. In **Grid view**, enter the site in the **Site** column. The new rule is automatically assigned a new rank value that is more than 0 (zero). You can create as many site-specific rules as you require. To indicate that they're equally important, you can assign the same rank value to all the site-specific rules.

If you are in **Details view**, you can't get the overview of the rules created for the item. Use the **Show/Hide list** button to see overview information. When an order line of any type is created and it has no site provided, Supply Chain Management searches for a rule with no site specified. This helps to determine a default site on the order line. This site is then used to search for a site-specific rule, where a default warehouse may have been set. This warehouse is applied to the order line.

Specific order settings for product dimension

You can define order settings rules for any active product dimension or combination of active product dimensions. If a product dimension field is empty, then that the rule applies to all values of the product dimension.

Consider the following example product.

Expand table

Item	Value
Product name	Photoelectric sensor
Item number	XW56
Configuration (used to model the type of light)	C1-Visible red light, C2-Infrared light
Version	V1, V2, V3

For this example, assume that the product is procured and not produced. Also assume that configuration C1 is more commonly used, so it has shorter lead times.

Create the following default order settings to model this scenario.

Expand table

Rank	Site	Configuration	Version	Purchase - Override default settings	Purchase lead time	Purchase - Stopped	Sales - Override default settings	Sales - Stopped
10		C1		Yes	2			
0					5			

When a purchase order line or a planned purchase order is created for item XW56, configuration C1, regardless of the version or site where the line is put, the lead time will be considered 2. Assume that all versions besides V3 are stopped.

You can create the following default order settings rules.

Expand table

Rank	Site	Configuration	Version	Purchase - Override default settings	Purchase lead time	Purchase - Stopped	Sales - Override default settings	Sales - Stopped
20			V2	Yes		Yes	Yes	Yes
20			V1	Yes		Yes	Yes	Yes
10		C1		Yes	2			
0					5			

The two rules for stopping the old versions have the same rank. Therefore, they're equally important. Because both these rules have a higher rank than the rule for configuration C1, they take precedence over the rule for configuration C1.

This example explains the need for the rank. If the rank isn't used, when a purchase order is created for configuration C1 and version V2, the two rules that are defined for V2 and C1 will be ambiguous. To solve the ambiguity, Supply Chain Management will search through the rules in descending order of rank and apply the first applicable rule. In the current example, when a purchase order line is created for configuration C1 and version V2, the user will receive a warning message that states that the item is on hold, and that this hold is caused by the version value. If the rule for the configuration had a higher rank than the rule for the version, a purchase order line would be successfully created for configuration C1 and version V2, and the user would receive no "item on hold" message.

Consider the following default order setting rules.

Expand table

Rank	Site	Configuration	Version	Default site	Default warehouse	Purchase - Override default storage dimensions	Purchase warehouse
20	2					Yes	22
10		C1	V2	2	21		
0				1	11		

The system traverses the set of rules two times to determine the site and warehouse. When a purchase order line is created for configuration C1, version V2, the site is determined based on the rule that has a rank of 10. The system then searches for a rule for site 2 to determine a warehouse. Rule 20 is found, and because it has a higher rank, the warehouse on the purchase order line will be 22, not 21.

As general guidance, specific rules and rules for dimensions that are more important than other dimensions get higher ranks, while more generic rules get lower ranks.

The rule with rank zero serves as a safety net. If no other rules are hit, then the default order settings from rule zero will be used.

Because the rank number is important, on the **Default order settings** Action Pane, there are functions to move a rule up or down and to renumber the rules, so that they're always in increments of 10.

The number of rules created for a released product may be many. In order to get a better understanding of what each rule is overriding and why it's needed, we recommend using the **Grid view** on the **Default order settings** page. You can enable the grid view by going to **Options** > **Page options** > **Change view** > **Grid view**. The number of columns displayed in the grid could be significant, especially for the sales and inventory tabs. To limit the number of columns shown in the grid, groups of columns can be hidden or displayed by using the buttons on the **Default order settings** > **Column display** menu.

Specific order settings for released product variant

If the rule system for default order settings is too cumbersome, then there's the option to define default order settings for each product variant. The following example shows how this will look for the product and the cases described above.

Expand table

Rank	Site	Configuration	Version	Purchase - Override default settings	Purchase lead time	Purchase - Stopped	Sales - Override default settings	Sales - Stopped
10		C2	V3	Yes	5			
10		C2	V2	Yes	5	Yes	Yes	Yes
10		C2	V1	Yes	5	Yes	Yes	Yes
10		C1	V3	Yes	2			
10		C1	V2	Yes	2	Yes	Yes	Yes
10		C1	V1	Yes	2	Yes	Yes	Yes
0					5			

The rank in this case doesn't really matter, so you can choose to hide it. This solution potentially introduces a maintenance issue. However, you may want to consider using this setup if you're considering integrating with Product Lifecycle Management (PLM) systems.

Use strict or standard validation of default order quantities

You can choose how strict the system should be when validating quantities entered in the **Default order settings** for a product. When you use the new strict option, the **Standard order quantity** must always be a multiple of the specified **Multiple** value for purchase orders, inventory, and sales orders. If you're using strict validation, you won't be able to save default order settings that don't meet this requirement (and an error is shown in the message bar).

Strict validation applies to **Standard order quantity** values specified on the **Purchase order**, **Inventory**, and **Sales order** FastTabs of the **Default order settings** page. Each FastTab has its own **Multiple** setting, which is used to validate the **Standard order quantity** value specified for that FastTab.

Turn the strict validation option on or off

To use strict validation, the *Strict validation on default order quantities* feature must be turned on for your system. As of Supply Chain Management version 10.0.21, this feature is turned on by default. As of Supply Chain Management 10.0.25, this feature is mandatory and can't be turned off. If you're running a version older than 10.0.25, then you can turn this functionality on

or off by going to Feature management and searching for the *Strict validation on default order quantities* feature.

Set the validation option

To set the validation option:

1. Go to **Product information management** > **Setup** > **Product information management parameters**.
2. On the **General** tab, set **Validation on default order quantities** to one of the following values:

    - **Strict** - Select this option to ensure that all **Standard order quantity** values will be a multiple of the **Multiple** value for each FastTab (**Purchase order**, **Inventory**, and **Sales order**).
    - **Standard** - Select this option to use standard validation (which works the same as when this feature isn't enabled).

Bills of materials and formulas

07/10/2025

This article provides information about bills of materials (BOMs) and formulas, which are a central part of the definition of products and product variants. BOMs and formulas specify the required materials or ingredients for a specific product. Formulas also specify the co-products and by-products that are received in a specific production context.

Bills of materials

A bill of materials (BOM) defines the components that are required in order to produce a product. The components can be raw materials, semi-finished products, or ingredients. In some cases, services can be referenced in a BOM. However, BOMs typically describe the *material resources* that are required.

When it's combined with a route or production flow that describes the operations and resources that are required in order to build a product, the BOM forms the foundation for calculating the estimated cost of the product.

A BOM is an individual entity that is described by the following information:

- BOM ID
- BOM name
- The BOM lines that describe the components and ingredients
- The BOM versions, which define the product and period that the BOM can be used for

A single BOM describes a single level that is identified by a unique ID. Components might have their own BOMs that are referenced by BOM versions. You can display and edit the complete hierarchy of BOMs for a specific product in the BOM designer.

Formulas, co-products, and by-products

A formula is a subtype of BOM that is typically used for process manufacturing. In addition to components and ingredients, a formula describes co-products and by-products. In the actual version, the definition of co-products and by-products for the formula requires the formula version. A formula is typically defined for one specific finished product (a formula or planning item) that is defined in the formula version.

BOMs in the product lifecycle

In the product lifecycle, many types of BOM might be created for various reasons:

- **Sketching/Draft BOM** – Gives a draft estimation of required materials in an early design phase and helps you do a rough estimate of cost and estimated product attributes. This BOM isn't usually used in enterprise resource planning (ERP).
- **Engineering BOM** – Typically used when you design products that are based on existing product portfolios. Engineering BOMs are structured to simplify the design process and group complex products into engineering modules. For simple products, it might be possible to engineering BOMs for the actual production process. However, for other products, the engineering BOM must be converted to an actual production BOM. Engineering BOMS are typically represented by phantoms in the BOM hierarchy. Although engineering BOMs can be used for the planning and execution of manufacturing operations, this approach can lead to inefficiencies, especially in repetitive operations where many orders are created.
- **Planning BOM** – Used to do planning for material requirements. The demand of components and ingredients is calculated based on the demand of the finished products. Like costing BOMs, planning BOMs might represent a specific mix of material that is used in a period.
- **Production BOM** – The actual BOM that is used for a specific production. A production BOM must take into account the actual resources that are used to produce the product. When a production order, batch order, or kanban is created, the multiple levels of BOMs that are represented by phantoms are collapsed into one level and distributed over the operations for the order.
- **Costing BOM** – Used to calculate the estimated cost of a product. For example, you can use a costing BOM when standard cost is used or the estimated planned cost of a given product is calculated. Costing BOMs can refer to a specific mix of materials and resources that are expected to be used. Therefore, you can use the costing BOM to create a representative estimated cost for a period and help avoid variances over time.

The types of BOM that are actually used in an implementation depend on the implementation, and also on the business scenarios and requirements. In simple implementations, a planning BOM, production BOM, and costing BOM can be modeled as one BOM. In environments that have frequent engineering changes and multiple alternative routes, a larger set of BOM types will probably be required.

Approval of BOMs and formulas

Each BOM and formula can be separately approved or unapproved. Typically, approval of a BOM or formula occurs when the first relevant BOM version is approved. However, in some business scenarios, these approvals might be different steps in the process and might involve different process owners.

If a BOM is unapproved, all related BOM versions are also unapproved.

BOM and formula versions

To relate a specific BOM or formula to a product variant that can be produced, you must create a BOM version or formula version. The validity of BOM versions and formula versions can be constrained by period, quantity, site, specific product dimensions, and other criteria. Formula versions have other important attributes, such as yield, co-product and by-product definitions, and the cost distribution instructions for the formula.

Approval of BOM and formula versions

Before a BOM version can be used in the planning or manufacturing process, it must be approved. When a BOM version is approved, the related BOM can also be approved, depending on the user's selection and authentication rights. A BOM version can be approved only if the related BOM itself is approved.

Activation of the default BOM or formula version

To set a specific BOM or formula as the default BOM version or formula version that will be used by master planning or used to create of production orders, you must activate the version. When a version is activated, the uniqueness of the version for the given constraints (for example, period, site, or quantity) is verified. You receive an error message if the version that you're trying to activate conflicts with a version that is already active. You must then either inactivate the conflicting version or modify the version constraints (usually the period) to prevent an ambiguous activation.

Product change with case management

The product change case for approval and activation of new or changed BOMs and BOM versions provides an easy way to see an overview of the BOM version constraints. You can also approve and activate all BOMs and formulas that are related to a specific change for one activation date.

Alternative BOM versions

Sometimes, the active BOM version or formula version shouldn't be used in forecasts, sales, or a parent product. In this case, you can select a specific approved BOM as part of the requirement (forecast line, sales line, or BOM line) if an approved BOM version or formula version exists for the alternative BOM or formula.

When planned orders, production orders, or kanbans are created, the planner or shop floor supervisor can use any approved BOM version that is valid on the requested planned production date to plan for or produce a specific product. The BOM version that is used doesn't have to be activated as the default BOM version.

BOM and formula lines

A BOM line is created for each material, service, or ingredient. The line defines the planned consumption of the specified product variant and also defines the various attributes that are related to the planned consumption.

BOM lines can have the following line types: **Item**, **Phantom**, **Pegged supply**, **Vendor**.

Item

Select the **Item** line type for materials or services that are directly consumed, and that don't require further explosion or pegged supply.

Phantom

Select the **Phantom** line type when you want to explode any lower-level BOM items that are contained on the BOM line. In Master scheduling, in planned cost calculation, or on estimation of a production order that uses BOM lines of the **Phantom** type, the parent BOM line that refers to a product variant that has a phantom BOM is replaced by the component items that are listed as BOM lines in that BOM, as determined by the applicable active BOM version of that product variant. If the product variant has an applicable active route, the operations of that route are merged into the parent route.

Phantoms are typically used to simplify the engineering process. Extensive use of phantom BOMs in many levels has an effect on performance, especially in highly repetitive manufacturing scenarios. To improve performance, you should avoid deep hierarchies of phantoms. Instead, use pre-exploded production BOMs and routes.

Pegged supply

Select the **Pegged supply** line type when you want to create a subproduction, a BOM line event kanban, or a direct purchase order for any product variant that the BOM line references. The subproduction, event kanban, or purchase order is created when you estimate the production order. The required item quantities are automatically reserved for the consuming production order.

> **Note**
>
> A subproduction order is always created for pegged supply, even if on-hand inventory or other supply is available to cover the demand.

Vendor

Select the **Vendor** line type if the production process uses a subcontractor, and you want a subproduction or purchase order to be created automatically for the subcontractor.

> **Note**
>
> For BOMs that include subcontracted operations, the service or work that is performed by the subcontractor must be created as service item that is tracked in inventory. You must attach the service item to the parent item as a BOM line. The route must contain an operation that is assigned to the subcontractor's operations resource.

BOM designer functionality

Article • 01/31/2025

This article describes how you can use the BOM designer page to design and work with tree structures for bills of materials (BOMs). To choose different configurations and specify what information appears on the lines of the tree, select **Setup**.

When you open the **BOM designer** page from the **Released products** page, it displays the hierarchy of bills of materials (BOMs) that are active and approved for the selected item, the default order site of the item, and the actual date.

To change the initial selection in the view, select **Filter**. By setting the display principle to **Selected/Active or Selected**, you can select individual BOM or route versions to use in the view. You can select non-approved and non-active BOM versions to show or maintain in the BOM designer.

> **Note**
>
> If you open the BOM designer from the **Bills of materials** list page, it doesn't display route information. Currently, the selection of a BOM or route version is a property of the BOM and route version, and applies to all instances of the BOM designer.

The following sections describe the functionality that is available on the various tabs of the BOM designer.

Analyzing a BOM structure by using the BOM designer

The BOM designer has two sections:

- The tree view of the BOM structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
  - **BOM line details** – Shows the details of the BOM line that is selected in the tree view.
  - **Item data** – Shows the details of the main item or the item that is used in the selected node. To maintain the selected item, select **Edit released product**.
  - **BOM** – Shows the header of the BOM that is related to the selected node.

- **Route** – Shows the header of the route that is related to the selected node.
- **Route operations** – Shows a preview of the operations for the route. When a BOM line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Selecting a BOM and route

The filter that is applied for the BOM and route is displayed in the header of the BOM designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

Expand table

Field	Description
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. **Note:** If you open the BOM designer for a product that isn't a product master, no product dimensions can be selected in the **Filter** dialog box.
Site	Change the site that the BOM tree is displayed for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current BOM structure and the current route: • When the principle is set to **Active or Selected/Active**, the valid BOM or route version for this date is found. • When the principle is set to **Selected/Active or Selected**, you can select a BOM version or route version by selecting **BOM** > **BOM versions** or **Route** > **Route versions**.
Version date	Enter the version date for the BOM and route. The version identifies which BOM version is used on a specific date, as determined by the version dates in the BOM version setup.
From quantity	Filter the versions by selecting a specific from quantity. If you set a value, different BOM and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only BOM lines that have valid dates. Right-click or double-click a BOM line to open the **Edit BOM line** page, where you can see the validity dates for that BOM line.

When you use the BOM designer to review or edit BOMs that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete BOM hierarchy. To simplify the overview, you can lock the top-level route in

the display by selecting **View** > **Lock route**. To unlock the route, select **View** > **Unlock route**.

Adding and editing BOMs and BOM lines

Use the **BOM lines** or **BOM** functions to modify the BOM lines or BOM. When you select a node in the tree, the type of the node determines that functions that are available.

Expand table

Function	Description	Node type and conditions
BOM lines > Edit	Open a dialog box where you can edit the BOM line attributes.	This function is available when a BOM line node is selected.
BOM lines > Delete	Delete a BOM line from the selected BOM.	This function is available when a BOM line node is selected, and the BOM isn't locked for editing.
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected BOM line.	This function is available when a BOM line node is selected.
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected BOM.	This function is available when the node that is selected has a selected BOM. If this function isn't available, a BOM version might be missing for the selected item variant. In this case, select **BOM** > **Create version** to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected BOM line.	This function is available when a BOM line node is selected.
BOM > Create version	Create a new BOM version or BOM for the product variant of the selected node.	This function is available when the BOM line node that is selected is linked to an item that has a production type of **BOM** or **Formula**.
BOM > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a BOM version.
BOM > Check	Validate and check the	This function is available when the node that is

Function	Description	Node type and conditions
	selected BOM.	selected is related to a BOM version.

Configuring the tree view

To customize the information that is shown in the tree view of the BOM designer, select **Setup**.

Expand table

Field group	Description
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The BOM designer displays the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

Feedback

Provide product feedback

Formula designer

This article explains how to use the formula designer to analyze and maintain formulas in a tree view.

When you open the **Formula designer** page from the **Released products** page, the tree in the left pane shows the list of co-products and the hierarchy of ingredients for the released product. The structure is derived from the hierarchy of formulas that are active and approved for the selected item and its ingredients, the default order site of the item, and the actual date.

Click **Setup** to select different configurations and specify what information appears on the lines of the tree.

Click **Filter** to change the initial selection in the view. If you set the display principle to **Selected/Active** or **Selected**, you can select individual formula or route versions to use in the view. You can select non-approved and non-active formula versions to show or maintain in the formula designer.

> ⓘ **Note**
>
> If you open the **Formula designer** page from the **Bills of materials** list page, it doesn't show route information. Currently, the selection of a formula or route version applies to all instances of the formula designer.

The following sections describe the functionality that is available in the BOM designer.

Analyze a formula structure by using the formula designer

The formula designer has two sections:

- The tree view of the formula structure.
- The details section, which shows details of the selected data. When you select a node in the tree view, the FastTabs in the details section are updated based on that node:
  - **Formula line details** – View the details of the formula line that is selected in the tree view.

- **Item data** – View the details of the main item or the item that is used in the selected node. You can click **Edit released product** to maintain the selected item.
- **Formula** – View the header of the formula that is related to the selected node.
- **Route** – View the header of the route that is related to the selected node.
- **Route operations** – View a preview of the operations for the route. When a bill of materials (BOM) line that is assigned to a specific operation is selected, the operation is marked as **Component needed at operations**.

Select a formula and route

The filter that is applied for the formula and route is shown in the header of the formula designer. You can change the filter by using the **Filter** dialog box. The following table describes the fields in this dialog box.

Expand table

Field	Description
Product dimensions	If the selected finished product is a product master, you can define the active product dimensions for the main selection. Note that if you open the formula designer for a product that isn't a product master, no product dimensions can be selected in the **Filter** dialog box.
Site	Change the site that the ingredient tree is shown for. The default site is the default inventory site of the finished item.
Display principle	Select the version display principle that applies to the current formula structure and the current route: • When the principle is set to **Active** or **Selected/Active**, the valid formula or route version for this date is found. • When the principle is set to **Selected/Active** or **Selected**, you can select a formula version or route version by clicking **Formula** > **Formula versions** or **Route** > **Route versions**.
Version date	Enter the version date for the formula and route. The version identifies which formula version is used on a specific date, based on the version dates in the formula version setup.
From quantity	Filter the versions by selecting a specific "from" quantity. If you set a value, different formula and route versions might be selected.
Show valid only	When you select the check box, the tree structure shows only formula lines that have valid dates. Right-click or double-click a formula line to open the **Edit formula line** page, where you can see the validity dates for that formula line.

When you use the formula designer to review or edit formulas that consist of one or more levels of phantoms, the route that is associated with the top item typically spans the complete formula hierarchy. To simplify the overview, you can lock the top-level route in the display by clicking **View** > **Lock route**. To unlock the route, click **View** > **Unlock route**.

Add and edit formulas and formula lines

Use the **BOM lines** or **Formula** functions to modify the formula lines or formula. When you select a node in the tree, the type of the node determines the functions that are available.

Expand table

Function	Description	Node type and conditions
BOM lines > Edit	Open a dialog box where you can edit the formula line attributes.	This function is available when a formula line node is selected.
BOM lines > Delete	Delete a formula line from the selected formula.	This function is available when a formula line node is selected, and the formula isn't locked for editing.
BOM lines > Add before line	Open a dialog box where you can select a product variant to include before the selected formula line.	This function is available when a formula line node is selected.
BOM lines > Add to component BOM	Open a dialog box where you can select a product variant to include at the end of the selected formula.	This function is available when the node that is selected has a selected formula. If this function isn't available, a formula version might be missing for the selected item variant. In this case, you can click **Formula** > **Create version** to create the missing version for the selected node.
BOM lines > Add after line	Open a dialog box where you can select a product variant to include after the selected formula line.	This function is available when a formula line node is selected.
Formula > Create version	Create a new formula version or formula for the product variant of the selected node.	This function is available when the formula line node that is selected is linked to an item that has a production type of **BOM** or **Formula**.
Formula > Calculation	Open a dialog box where you can run the cost or sales price calculation for the selected product variant.	This function is available when the node that is selected is related to a formula version.

Function	Description	Node type and conditions
Formula > Check	Validate and check the selected formula.	This function is available when the node that is selected is related to a formula version.

Configuring the tree view

Click **Setup** to customize the information that is shown in the tree view of the formula designer.

Expand table

Field group	Description
BOM	Use the check boxes to select the criteria that are shown in the tree structure. The formula designer shows the selected criteria at the bottom of both tabs.
Route	Use the check boxes to select the criteria that are shown for the routes.

Override the default reservation principle for materials in production

06/17/2025

The *Override default production reservation* feature lets you set a default reservation principle for each item model group. Therefore, different reservation principles can automatically be applied for each item that is part of a production bill of materials (BOM) or batch order formula. You can select whether each item model group should override the default reservation principle that is set for an order, and what reservation principle should be used instead (*manual*, *estimation*, *scheduling*, *release*, or *start*).

When you create a new production order or batch order, the system prompts you to select the reservation principle for that order and all its BOM or formula lines. If you use the *Override default production reservation* feature, some or all BOM or formula lines can override your selected reservation principle and instead use the reservation principle set for their item model group.

For example, if you have raw materials or ingredients that require pick work, BOM or formula lines that are created for those products require a physical reservation, because physical reservation is a prerequisite for the generation of warehouse work. Typically, if you want the reservation to occur automatically, you select one of the following reservation principles: *estimation*, *scheduling*, *release*, or *start*. On the other hand, if you have materials or ingredients that don't require pick work, because they're consumed directly from a location, you typically select the *manual* reservation principle, which doesn't make any physical reservations or generate any pick work.

Assign a production reservation policy to an item model group

1. Go to **Cost management** > **Inventory accounting policies setup** > **Item model groups**.
2. Create or select an item model group.
3. On the **Inventory policies** FastTab, select the **Override item production reservation** check box.
4. In the **Reservation** field, select the reservation principle for items that belong to the selected model group. (Those items include items that are on a BOM or formula line.)
    - *Manual* – Items in the model group aren't automatically physically reserved for production. However, they can still be manually reserved as required.

- *Estimation* – Items in the model group are physically reserved during estimation of the production order.
- *Scheduling* – Items in the model group are physically reserved during scheduling of the production order.
- *Release* – Items in the model group are physically reserved when the production order is released.
- *Start* – Items in the model group are physically reserved at the start of the production order.

Example: Using reservation principles in a bulk/pack scenario

A bulk lubricant material is produced in a 1,000-liter mixer. After the bulk material is ready, it's pumped out to several filling stations, where bottles of different sizes are filled. After filling is completed, the bottles are packed into boxes. Those boxes are then packed onto pallets.

In this scenario, a batch order to make 1,000 liters of bulk material is created. (This order is the bulk order.) When this batch order is completed, it's reported as finished to the material input location of the filling stations. A batch order to fill and pack each bottle size is then created. (These orders are the pack orders.) The pack orders have a formula that consists of the bulk material, an empty bottle, a label, and other packing materials. Because the bulk material flows directly from the mixer tank to the filling stations, no warehouse work is required to pick this ingredient, and the bulk material is consumed directly from the input location. Therefore, the reservation principle is set to *manual*. The other materials are staged to the filling station by pick work. Therefore, the reservation principle for these lines is set to *release*, for example, so that the reservation automatically occurs when the pack order is released.

Reserve the same batch for a production order (preview)

[This article is prerelease documentation and is subject to change.]

Same-batch selection lets you reserve the consumption of a raw material on a production order or batch order against a single batch of inventory. This capability keeps batch traceability consistent through the manufacturing process. For example, when an ingredient must come from one batch to guarantee a uniform mix, same batch selection reserves the whole bill of materials (BOM) or formula line from one batch instead of spreading it across several batches. It brings the *Same batch selection* capability that's already available for sales orders to production and batch orders.

> **Important**
>
> - This is a preview feature.
> - Preview features aren't meant for production use and might have restricted functionality. These features are subject to supplemental terms of use, and are available before an official release so that customers can get early access and provide feedback.

Prerequisites

To use the features described in this article, your system must meet the following requirements:

- You must be running Microsoft Dynamics 365 Supply Chain Management version 10.0.49 or later.
- The feature named *(Preview) Use same batch selection for raw materials in production* must be turned on in feature management.
- The feature supports both warehouse management processes (WMS) and non–WMS scenarios. WMS scenarios are supported only when you use a reservation hierarchy where the batch number dimension is above the location dimension (a *Batch-above [location]* reservation hierarchy).
- This feature applies only to batch-enabled products that aren't tracked by serial numbers. That means that it only supports products assigned a tracking dimension group in which the *Batch number* dimension is active and the *Serial number* dimension is inactive.

Set the Same batch selection field on a BOM or formula line

The **Same batch selection** setting flows through the manufacturing setup, so you can control it at the level that makes sense for your process. The value comes from the **Same batch selection** field on the item model group and flows through the BOM and formula lines to the production order lines, where it becomes read-only.

You can override the default value on individual BOM or formula lines. Follow these steps:

1. Go to **Product information management** > **Bills of materials and formulas** > **Bills of materials** (or **Formulas**).

2. Select or create a BOM or formula version, and open its lines.

3. Select the line for the raw material that you want to configure.

4. On the **Line details** FastTab, select the **Setup** tab.

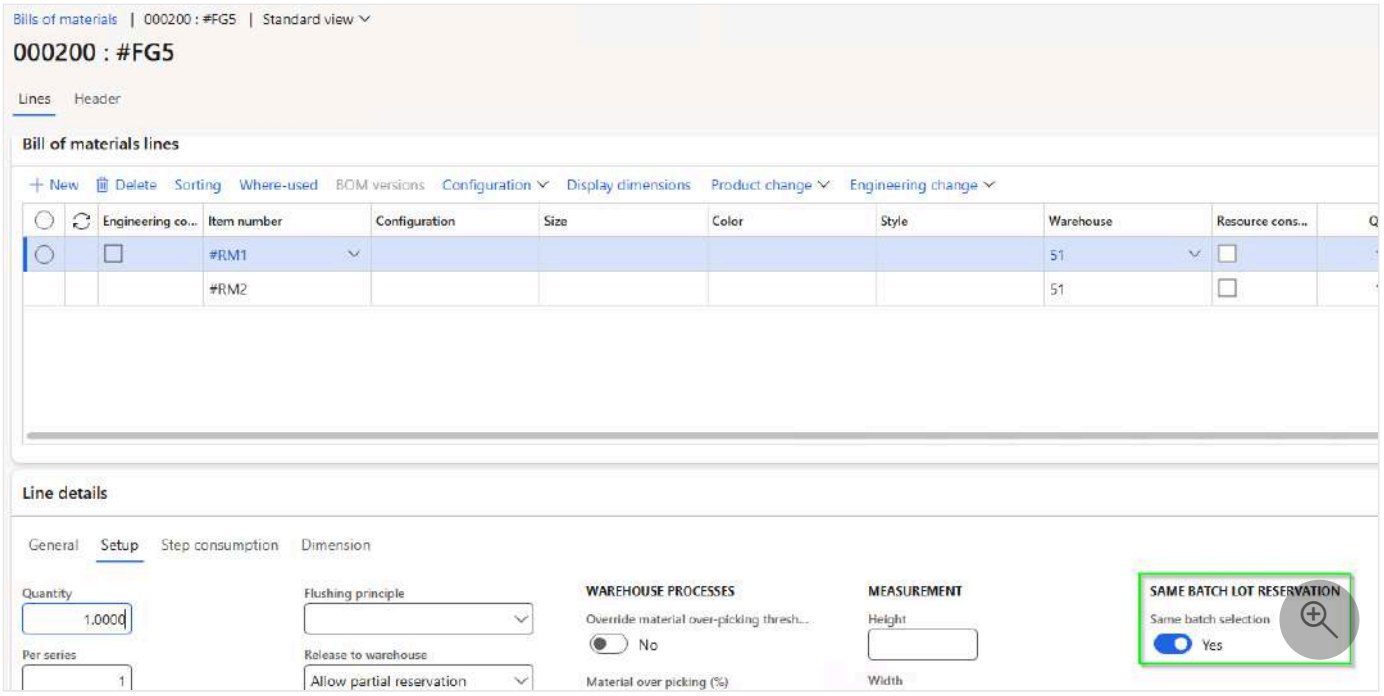
5. In the **Same batch lot reservation** field group, find the **Same batch selection** field. This field has the following values:

   - *Yes* – The raw material must be reserved from a single batch during production. Only inventory from one batch can be used for this line.
   - *No* – No single-batch constraint is applied. The system can reserve inventory from multiple batches.

   The field inherits its default value from the item model group that's assigned to the product. You can override it here for specific BOM or formula lines.

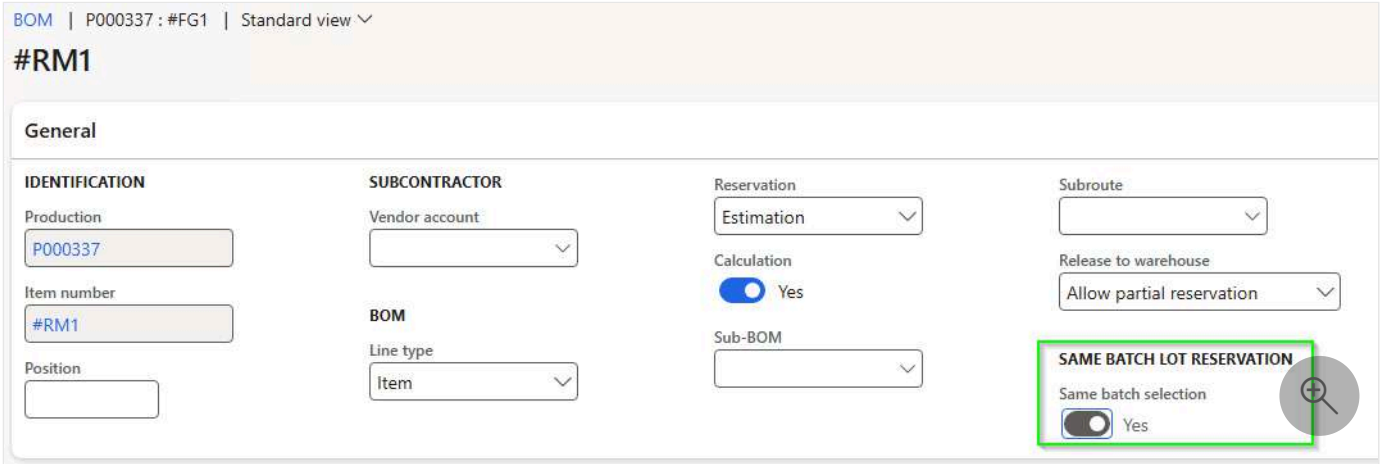
6. Select **Save**.

The following screenshot shows the **Bills of materials** page with the **Same batch selection** field highlighted on the **Setup** tab of the **Line details** FastTab.



When you create a production order or batch order, the BOM or formula line usually copies its **Same batch selection** value to the production order BOM line. On the production order BOM line, the **Same batch selection** field appears in the **Same batch lot reservation** field group on the **General** tab and is read-only.

The following screenshot shows the production order BOM line with the read-only **Same batch selection** field.



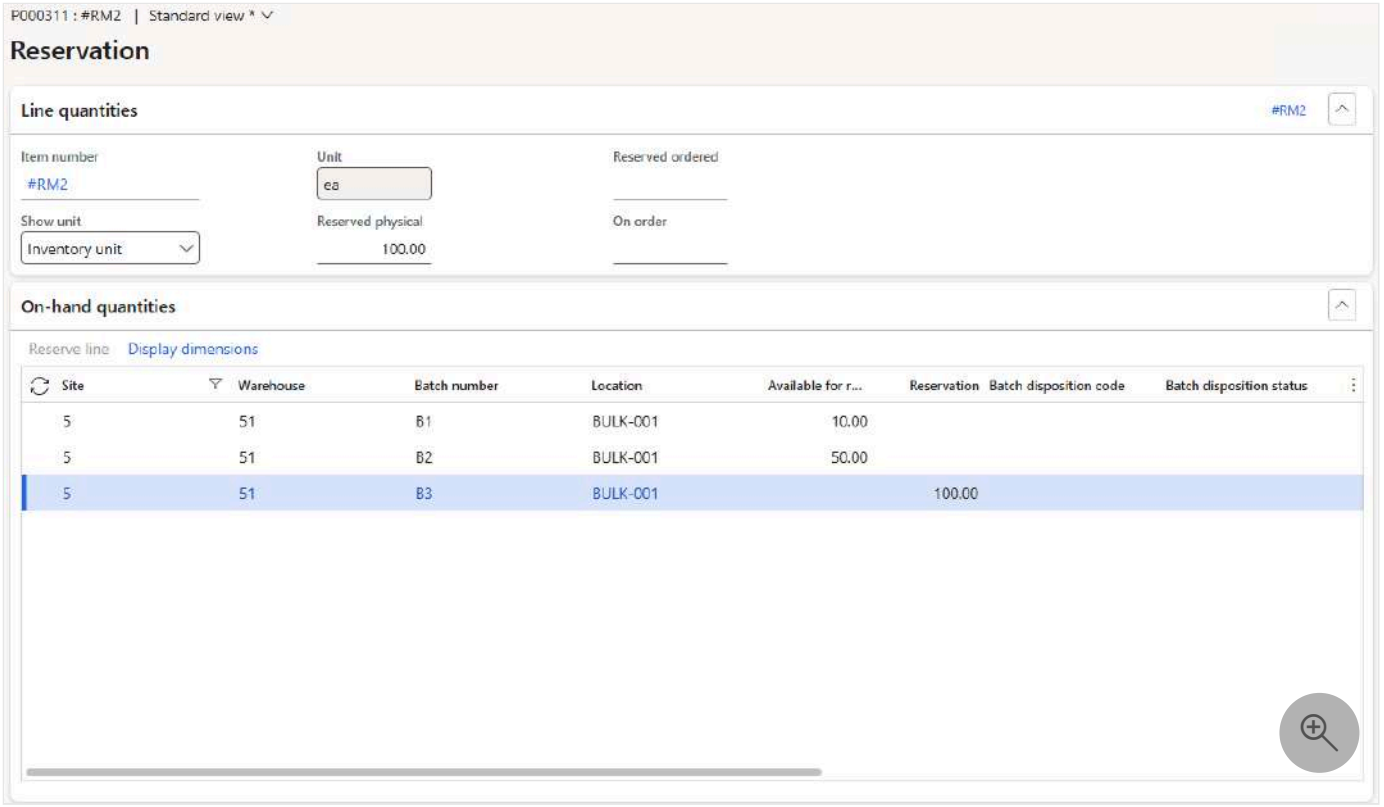
Reservation behavior

When you turn on same-batch selection for a production order or batch order line, the system tries to reserve the required quantity from a single batch during estimation. The outcome depends on available on-hand inventory. Reservation can happen automatically, according to the reservation rules of the BOM or formula line, or manually, when a user reserves against a specific batch directly from the order lines. In either case, same-batch selection constrains the reservation

so that the whole required quantity is drawn from one batch wherever on-hand allows. The outcome depends on available on-hand inventory:

- If a single batch has enough on-hand inventory to fulfill the line, the system reserves that batch. When the item model group enables FEFO, the system selects the batch that has the earliest expiry or best-before date.
- If no single batch can fulfill the line, the system doesn't reserve any batch against the BOM or formula line. The system doesn't show any warning or error message.

The following screenshot shows the **Reservation** page for a production order BOM line where a single batch (B3) was successfully reserved because it had sufficient quantity.



Batch selection sorting priority

When multiple batches can fulfill the requirement, the system selects a batch based on the following sorting priorities:

- **FEFO** – Expiry date or best-before date (ascending), then batch number (ascending).
- **Standard** – Batch number (ascending).

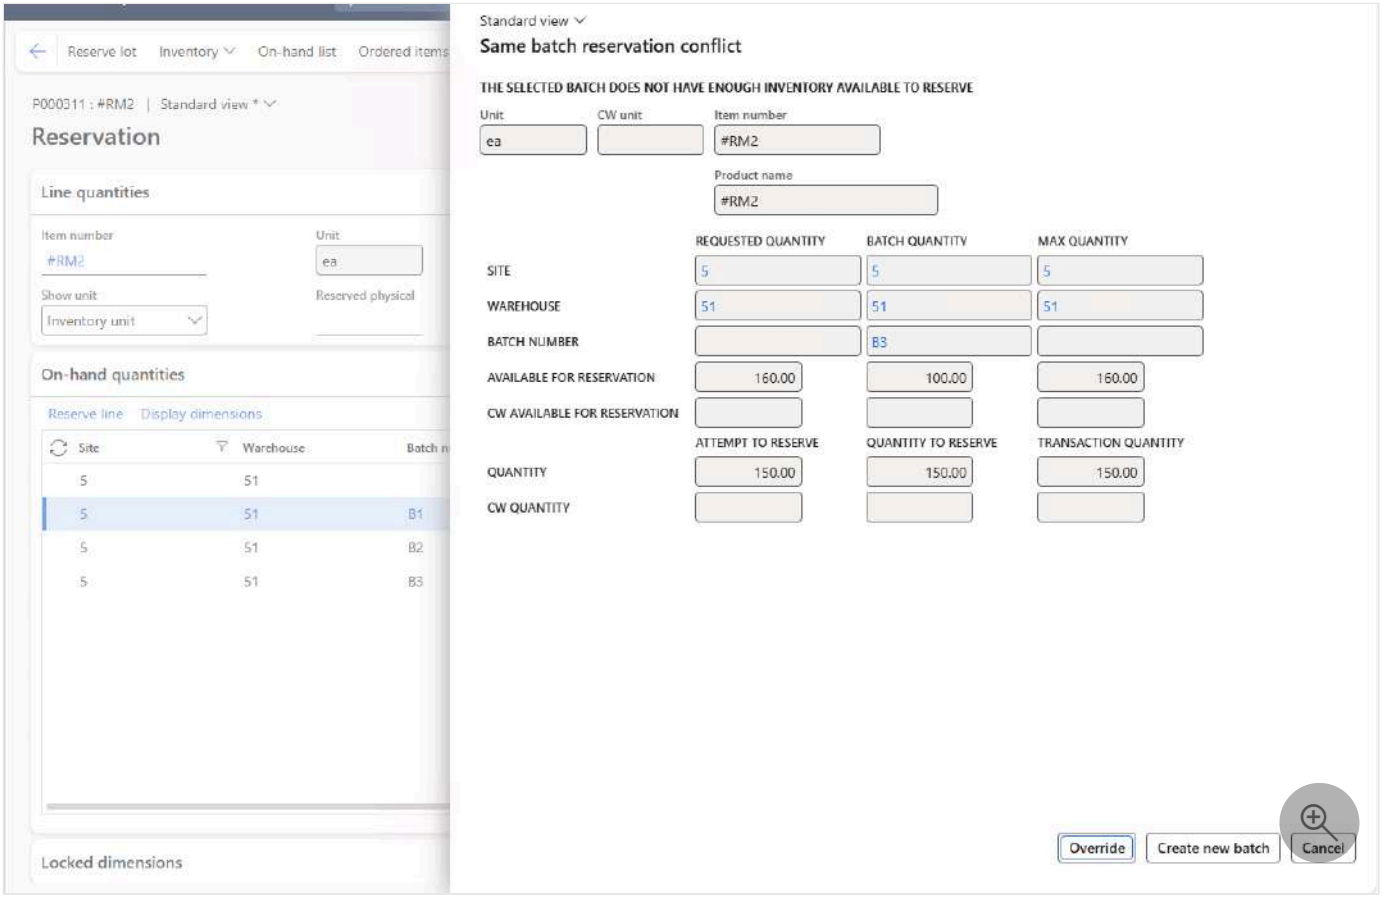
Resolve a same-batch reservation conflict

When you manually reserve a production order BOM line that you can't fulfill from a single batch, the **Same batch reservation conflict** page opens. This page shows the requested quantity, the

available batch quantity, and the maximum quantity available. It offers the following actions:

- **Override** – Turns off single-batch selection for that line and reserves the quantity across multiple batches. The line's **Same batch selection** setting is cleared and marked as overridden.
- **Create new batch** – Generates a new batch number through the standard number sequence and leaves the line on order, so that you can produce or receive inventory into the new batch.
- **Cancel** – Leaves the line on order with no batch reservation.

The following screenshot shows the **Same batch reservation conflict** page with the available actions.



> **Important**
>
> The **Lower quantity** action that's available for sales orders is intentionally turned off for production scenarios, because reducing the consumed quantity would invalidate the production estimation.

Batch reservation policy for non-WMS warehouses

For warehouses that don't use WMS, the **Batch reservation policy for non-advanced warehouses** parameter controls whether the system enforces single-batch reservation when the reservation hierarchy has the batch number dimension below the location dimension (a *Batch-below [location]* reservation hierarchy). To set this option, follow these steps:

1. Go to **Warehouse management** > **Setup** > **Warehouse management parameters**.
2. Open the **General** tab.
3. On the **Batches** FastTab, set **Batch reservation policy for non-advanced warehouses** to one of the following values:

    - *Simple* – The system doesn't consider same-batch selection constraints when using batch-below reservation hierarchy.
    - *Advanced* – The system applies FEFO rules and batch disposition codes during reservation. Same-batch selection for batch-below items on non-WMS warehouses is blocked, and an error message is shown.

Add variant products to purchase orders using variant weights

Article • 09/29/2021

This procedure walks through the steps for using variant weights to auto populate purchase order lines for each variant of a product. When you select the quantity of the product you want to purchase, purchase order lines are created for all the variants of the product with suggested quantities based on the weights configured on the product variants. This procedure doesn't include steps to configure weight values on product dimensions and product variants. This procedure uses the USRT company in demo data.

1. Go to Accounts payable > Purchase orders > All purchase orders.
2. Click New.
3. In the Vendor account field, click the drop-down button to open the lookup.
4. In the list, click the link in the selected row.
5. Toggle the expansion of the General section.
6. In the Site field, click the drop-down button to open the lookup.
7. In the list, click the link in the selected row.
8. In the Warehouse field, click the drop-down button to open the lookup.
9. In the list, find and select the desired record.
10. In the list, click the link in the selected row.
11. Click OK.
12. Toggle the expansion of the Line details section.
13. Click the Variants tab.
14. Click Add line.
15. In the list, mark the selected row.
16. In the Item number field, type '0140'.
17. Set Quantity to '1000'.
18. Click Save.

Create a sales order for a configurable product

Article • 09/29/2021

This procedure shows how to apply a configuration template to a product on a sales order. This example uses the D0006 speaker model in the USMF demo data company. Typically, a sales order processor uses this procedure.

Create a sales order

1. Go to **Sales and marketing** > **Workspaces** > **Sales order processing and inquiry**.
2. Select **New**.
3. Select **Sales order**.
4. In the **Customer account** field, select *US-001*.
5. Select **OK**.
6. In the **Item number** field, select *D0006*.

    - For this task, you must select a configurable product.

7. Select **Product and supply**.
8. Select **Configure line**.

    - Note that the price has changed, based on the configuration that was selected, and that the **Include cable** field is now set to *True*.
    - Note the default price and the settings that are selected for the cable.

9. Select **Load template**.

    - This example shows how you can apply a template to select a predefined configuration. If you're using this procedure as a task guide and want to see the other attribute values that are available, you must select the **Unlock** button.

10. Select **OK**.
11. Select **OK**.
12. Expand the **Line details** section.
13. Select the **Product** tab.

    - The configuration of the item is now listed under the product dimensions.

14. Close the page.

Create sales price selection criteria

Article • 09/29/2021

This procedure shows how to create a sales price selection criterion for attribute-based sales price models. This procedure requires that at least one sales price model be available. This example uses the price model for the Speaker solution sales price model in the USMF demo data company. Typically, a product manager uses this procedure.

Add a new criterion for an existing sales price model

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, select the row for the Speaker solution product model, but don't select the link for the model name.
3. On the Action Pane, select **Model**.
4. Select **Price model criteria**.
5. Select **New**.
6. In the **Name** field, type 'Customer group 10'.

    - The name of the price model criterion is used to help identify the underlying selection criteria.

7. In the **Price model** field, enter or select a value.
8. In the **Order type** field, select *Sales order*.

    - The order type determines the database fields that will be available for the selection query.

9. In the **Valid from** field, enter a date.
10. In the **Expire by** field, enter a date.
11. Select **Save**.

Create the query for the selection criteria

1. Select **Edit**.
2. In the **Table** field, select *Customers*.
3. In the **Field** field, select *Customer group*.

- In this example, we will use a specific customer group for the selection criteria.

4. In the **Criteria** field, select *Customer group 10*.
5. Select **OK**.

Set up attribute-based pricing for configurable products

Article • 06/03/2022

This article explains how to set up attribute-based pricing. As a prerequisite, you must have a product configuration model that has one or more components and attributes. This example uses the High End Speaker product model in the USMF demo data company. Typically, a product manager uses this procedure.

Create a new price model

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, select the **High End Speaker** line, but don't select the link for the name.
3. On the Action Pane, select **Model**.
4. Select **Price models**.
5. Select **New**.
6. In the **Price model name** field, type a value. Use a name that makes the model easy to identify.
7. In the **Description** field, type a value.
8. Select **Save**.

Add price elements

1. Select **Edit**. Each component in a product model can have a base price element and any number of price expression rules. You can also add prices in different currencies.
2. In the **Base price expression** field, type a value. For example, type 100. A base price expression can be a numerical value, or it can consist of an arithmetic calculation that involves one or more attributes.
3. Select **Add**.
4. In the **Name** field, type `Rosewood`. The price expression name helps identify what the price element represents. In this example, we are creating a price element for the Rosewood speaker cabinet finish option.
5. Select **Edit condition**. A price condition helps guarantee that a price expression element is included in the sales price only if a specific combination of attributes is present.
6. In the **ConstraintBody** field, enter `CabinetFinish=="Rosewood"`.

7. Select **OK**.
8. In the **Expression** field, type a value. For example, type `50`.
9. Close the page.

BOM calculations

07/21/2025

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the Calculations page. This article provides information about BOM calculations.

The cost roll-up and sales price calculations are known as bill of materials (BOM) calculations, and you initiate them from the **Calculations** page. You use the **Calculations** page to perform the following tasks:

- Calculate the cost of a manufactured item, and generate an associated item cost record within a costing version.
- Calculate the sales price of a manufactured item, and generate an associated item sales price record within a costing version.

The way that you use the **Calculations** page varies slightly, depending on how you initiate the BOM calculations. The way that you use the **Calculations** page also depends on whether the BOM calculations involve a costing version for standard costs or planned costs, and on several policies that are defined in the costing version that is used in the BOM calculations. A variation of the **Calculations** page is used in the context of a sales order, sales quotation, or service order line item. These calculations are known as order-specific BOM calculations. An order-specific BOM calculation doesn't generate an item cost record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation details** page. The calculation record includes a calculated cost and a calculated sales price. The **Calculations** page can be opened for a single manufactured item or for a costing version.

- To calculate costs for a single manufactured item, you initiate BOM calculations from the **Item price** page. The **Calculations** page inherits the item identifier. The costing version, BOM version, route version, calculation quantity, calculation date, and site must be specified.
    - By default, the BOM version and route version are set to the active versions for the item, site, date, and calculation quantity. However, you can override the default values with approved versions.
    - By default, the calculation quantity is set to the item's standard order quantity. However, you can override the default value.
    - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version. A future calculation date determines how pending cost records are used. BOM calculations use a pending cost record that has the nearest from-date that is on or before the calculation date.

- To calculate costs for all manufactured items or selected items, or to update items on a where-used basis, you initiate BOM calculations from the **Costing version setup** page or the **Costing version maintenance** page. The **Calculations** page inherits the costing version.
    - For the calculations, it's assumed that the active BOM version and route version are used for a manufactured item (and for the related site, date, and quantity), unless a manufactured component has a specified sub-BOM or subroute.
    - For the calculations, it's assumed that the standard order quantity is used for manufactured items. The standard order quantity provides the basis for calculating component quantities, determining the relevant BOM versions and route versions (when you use quantity-sensitive BOMs and routes), and amortizing constant costs. However, when a manufactured component has a BOM line type of *Production* or *Vendor*, or when you use a make-to-order explosion mode for the BOM calculations, this assumption doesn't apply, because quantities reflect the specified calculation quantity.
    - The calculation date or site can be mandated by the costing version, or user-specified values can be set when the date or site isn't mandated in the costing version.

Other variations in BOM calculations reflect the costing type and restrictions of the costing version:

- BOM calculations that use standard costs must be restricted by costing version policies, because the restrictions help guarantee that standard costing principles are used. Standard costing principles require the enforcement of restrictions about the use of standard costs for purchased items, a single-level explosion mode, and the inclusion of miscellaneous charges in unit costs.
- BOM calculations that use planned costs don't have to follow standard costing principles. These BOM calculations can use different explosion modes, alternative sources of cost data for purchased items, and optional enforcement of restrictions within the costing version.

BOM calculations that use standard costs

Policies within the costing version (for standard costs) can mandate enforcement of five BOM calculation policies. The *Recording restriction* option in the costing version mandates one of these policies, where miscellaneous charges must be included in the unit price. Miscellaneous charges for purchased items can be entered manually, whereas miscellaneous charges for manufactured items reflect the calculated amortization of constant costs. The *Calculation restriction* option in the costing version mandates the other four BOM calculation policies:

- The source of cost contributions for purchased items must be based on standard costs. In other words, BOM calculations must use the item cost records within the specified costing version, or within the fallback that contains standard costs.
- To help guarantee accurate and consistent calculation of standard costs, the explosion mode must be single-level.
- To help guarantee consistent results when the sales price of the items is calculated, the profit setting must be mandated. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle must be mandated, and can be set to *None*, *Active* (for active cost records), or *Costing version* (for a specified costing version).

BOM calculations that use planned costs

Policies within the costing version (for planned costs) can optionally mandate enforcement of five BOM calculation policies. Alternatively, the policies can just provide default values. The *Recording restriction* option in the costing version determines whether the BOM calculation policy about miscellaneous charges will be mandated or act as a default value. Miscellaneous charges can optionally be included in the unit price. The *Calculation restriction* option in the costing version determines whether the other four BOM calculation policies will be mandated or act as default values:

- The source of cost contributions for a purchased item can be the item cost records within a costing version. Alternatively, the source can be defined by the BOM calculation group that is assigned to the item. For example, the BOM calculation group can define purchase price trade agreements as the source of cost contribution data.
- The explosion mode can be single-level, multilevel, or make-to-order, or it can be based on the BOM line item. The explosion mode for the BOM line type replicates the cost calculation logic for production order estimates.
- The profit setting can be mandated, or it can be a default value. The profit setting can be used, and the item sales price records can be generated, only if the costing version allows for content of sales prices.
- The fallback principle can be mandated, or it can be a default value. The fallback principle can be set to *None*, *Active* (for active cost records), or *Costing version* (for a specified costing version).

BOM calculations generate warning messages and other types of messages. Several BOM calculation policies determine the types of messages. The warning conditions are defined in the BOM calculation group that is assigned to items. However, you can override these warning conditions when you initiate a BOM calculation. When the fallback principle is used, it's often helpful if the fallback is shown as an information message. When you're trying to update

calculated costs for items that have missing cost records, it's also helpful if the information message identifies items that weren't updated.

BOM calculations that use the fallback principle

The following situations illustrate two uses of the fallback principle:

- **Two-version approach to standard cost updates** - A costing version can contain the incremental changes to standard costs, such as pending cost records that represent new items or cost changes. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.
- **Simulation of the effect of cost changes by using planned costs** - A costing version for planned costs can contain incremental changes for simulation purposes. This costing version will include pending cost records that represent the simulated cost changes to items, cost categories, and calculation formulas for indirect cost. In this situation, the fallback principle can identify the use of the active standard costs that are contained in other costing versions.

BOM calculation of a suggested sales price

When you use a cost-plus-markup approach, the calculated sales price for an item reflects the set of profit-setting percentages that is specified for the BOM calculation, and the costs that are associated with the item's component items, routing operations, and applicable manufacturing overheads. The markup reflects profit-setting percentages that are assigned to cost groups, and the cost groups that are assigned to items, cost categories for routing operations, and the indirect cost calculation formulas for manufacturing overheads. The sets of profit-setting percentages are labeled *Standard*, *Profit 1*, *Profit 2*, and *Profit 3*. Within the Profit 1 set, for example, a profit-setting percentage of 50 percent can be defined for a cost group that is assigned to purchased material, and a profit-setting percentage of 80 percent can be defined for a cost group that is assigned to cost categories for routing operations. The context of the BOM calculation determines how the results of a calculated sales price are handled:

- **BOM calculation for an item and specified costing version** - The BOM calculation generates a pending sales price record within the costing version. This sales price record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). The sales price record acts mainly as reference information and isn't used as the basis for a sales price on sales orders.
- **Order-specific BOM calculation** - A variation of the **BOM calculation** page is used in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation doesn't generate a record within a costing version. Instead, it generates a calculation record that appears on the **BOM calculation results** page. This calculation

record provides the starting point for viewing the calculation details (for example, on the **Calculate item cost** page). Information about a selected calculation record can be transferred to the originating line item. For example, the calculated sales price can be transferred to a sales order line item.

Order-specific BOM calculations

An order-specific BOM calculation represents a variation of a BOM calculation for a manufactured item. The order-specific BOM calculation is performed in the context of a sales order, sales quotation, or service order line item. An order-specific BOM calculation generates a calculation record that appears on the **BOM calculation results** page. The calculation record includes a calculated weight, a calculated cost that is based on active cost records, and a calculated sales price. The calculation record that each order-specific BOM calculation for an item generates on the **BOM calculation results** page is uniquely identified by a calculation number. The results of a calculation record can be optionally transferred to the originating line item. An order-specific BOM calculation differs from a BOM calculation for a manufactured item in two ways:

- An order-specific BOM calculation doesn't generate an item cost record within a costing version. Therefore, the BOM calculation policies aren't applied when an item cost record is created, or when a cost record is overwritten.
- An order-specific BOM calculation always uses the active cost records for components, cost categories, and indirect cost calculation formulas.

Product configuration overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

In both business-to-business and business-to-consumer relationships, you often need to configure products to meet special requirements.

A manufacturer that supports configure-to-order scenarios can better address customer needs. By stocking semi-finished goods as generic components instead of finished products, the manufacturer can reduce the capital tied to inventory.

A successful move from a manufacture-to-stock setup to a configure-to-order setup requires careful analysis of the product structures, identification of product families, and componentization. To reduce the number of parts and minimize the number of goods in process, it's important that you understand the product interfaces and design for reusability.

Several product configuration modeling principles exist, such as rule-based, dimension-based, and constraint-based modeling. Studies show that the constraint-based methodology can reduce the number of code lines in models by about 50 percent compared to other modeling principles. Therefore, this methodology can reduce the total cost of ownership (TCO). By moving from a rule-based model that is based on X++ code to a constraint-based model, you no longer need a developer license to maintain product models.

Product configuration

The industrialization period led to great achievements in producing high-quality and feature-rich products at affordable prices. Economies of scale made it possible for most people in the industrialized world to buy cars, TVs, household appliances, and other goods that most of us consider a necessary part of our everyday life.

As many products become commodities, a need arises to differentiate them. The immediate response of manufacturers to this challenge is to create variants of each product, so that

customers have more alternatives. This strategy leads to increased forecast challenges, and also to an increase in inventory cost and unsold products that become obsolete.

By adopting a configure-to-order philosophy, manufacturers can meet customer demand for unique products while reducing or eliminating obsolete inventory items. When shifting from a manufacture-to-stock philosophy to a configure-to-order philosophy, one immediate challenge is to balance the need for short lead times against low inventory levels.

The key to success is to carefully analyze the product portfolio and look for patterns in both product features and processes. The goal is to identify generic components that the same equipment can manufacture and use in all variants.

The product configuration feature set includes a user interface (UI) that provides a visual overview of the product configuration model structure, and also a declarative constraint syntax that doesn't require compilation. Therefore, companies that want to support a configuration practice can get started more easily. As the following sections explain, a product designer no longer requires the support of a developer to build a product configuration model, test it, and release it to the sales organization.

Building a product configuration model

Several approaches exist for building a product configuration model. One option is to follow a sequential flow by first creating all the reference data, such as product masters, distinct products, and operational resources, and then including them as components, bill of materials (BOM) lines, route operations, and other elements of the product configuration model. Alternatively, you can select a more iterative approach by first creating the model and then adding reference data as the need arises.

Components

A product configuration model consists of one or more components that connect through subcomponent relationships. Define components once, and then use them multiple times in one or more product configuration models. Components are the main building blocks of a product configuration model, and nearly all information about the model relates to them.

Attributes

Each component has one or more attributes that identify its properties. Users choose the attributes during the configuration process. Attributes control both inter-component and intra-component relationships through inclusion in constraints or calculations. Through conditions

applied to BOM lines, attributes can determine which physical parts the configured product consists of. Additionally, an attribute can control the property of a BOM line through a mapping mechanism. Similar functionality exists for route operations regarding both inclusion and property settings.

> **Note**
>
> When you create attribute types, avoid creating a high number of values for the attribute type domain. This choice could cause slowdowns in the product configurator.

Expression constraints

Use of a constraint-based product configuration model implies that some limitations exist when the user selects values for the various attributes. Implement such limitations as expression constraints by using the Optimization Modeling Language (OML). Alternatively, implement a constraint in the form of a table constraint.

Table constraints

Table constraints can be user-defined or system-defined.

A user-defined table constraint is built by the user. The user selects a combination of attribute types to represent the columns of the table and then enters values from the domains of the selected attribute types to form the rows in the table constraint.

A system-defined table constraint is defined by selecting which table to use as a reference and then selecting fields from this table to form the columns in the constraint. The rows of the table constraint are the rows of the Supply Chain Management table that are present at configuration time.

Include a table constraint in a product configuration model by referencing the table constraint definition and mapping the relevant attributes in the model to the columns in the table constraint.

Calculations

Calculations represent a mechanism for performing arithmetic operations in a configuration model. For example, a calculation can determine the length of a specific piece of raw material or the processing time for a polishing operation. Calculations are imperative and set the value for a

target attribute after all the attribute values that are included in the calculation expression become available.

Subcomponents

Subcomponents represent the nodes in the product configuration model structure. For each subcomponent relationship, specify a reference to a product master that has the variant configuration technology set to constraint-based configuration.

User requirements

A user requirement has all the constituents of a subcomponent. The only difference is that a user requirement isn't bound to a product master. The practical effect of this difference is that any BOM lines or route operations defined in the context of a user requirement are collapsed into the parent component BOM structure or route. This behavior resembles the behavior of a phantom BOM.

BOM lines

Include BOM lines to identify the manufacturing BOM for each component. A BOM line must reference an item, and all item properties can be set to a fixed value or map them to an attribute.

Route operations

Include route operations to identify the manufacturing route. A route operation must reference a defined operation, and you can set all operation properties to a fixed value. You can map all properties except resource requirements to an attribute instead of a value.

Validating and testing a product configuration model

Validation of a product configuration model can occur on several levels in the model and can therefore cover various scopes. The lowest level is for a single expression constraint. In this case, the product designer typically performs validation to verify that the syntax of an expression is correct.

Similarly, a condition for a BOM line or a route operation can be validated in isolation.

Validation can also be done for a user-defined table constraint definition. In this case, the user verifies that the values entered for each field are inside the domain of the corresponding attribute types.

Finally, validation can be done for a complete product configuration model to verify that the complete syntax is correct, and that all naming and modeling conventions are respected.

Testing

Testing a model is similar to running an actual configuration session. The user can walk through the configuration pages and verify that the model structure supports the configuration process. The user can verify that the attribute values are correct, and that the attribute descriptions guide the user to select the correct values. Finally, after a test session is completed, the system tries to create the BOM and the route that corresponds to the selected attribute values, and presents an error message if anything goes wrong.

The configuration page

To navigate between components, select **Next**, or select a component in the product configuration model tree to set focus on it.

Finalizing a model for configuration

When a product configuration model is ready to use in configure-to-order scenarios, you need to create a version. However, several options can enhance the modeling experience.

User interface

Modify the configuration UI by introducing attribute groups in one or more subcomponents. This grouping highlights the relationships between specific attributes and helps the configuration user identify the area of the product that is currently in focus.

Templates

Create one or more configuration templates to speed up the configuration process. Alternatively, create templates to promote specific attribute combinations, such as when a sales campaign focuses on a specific set of product features.

Translations

If the product will be sold in different countries/regions, translations can be created for all text that appears in the configuration UI. This text includes not only name and description fields, but also attribute text values.

Versions

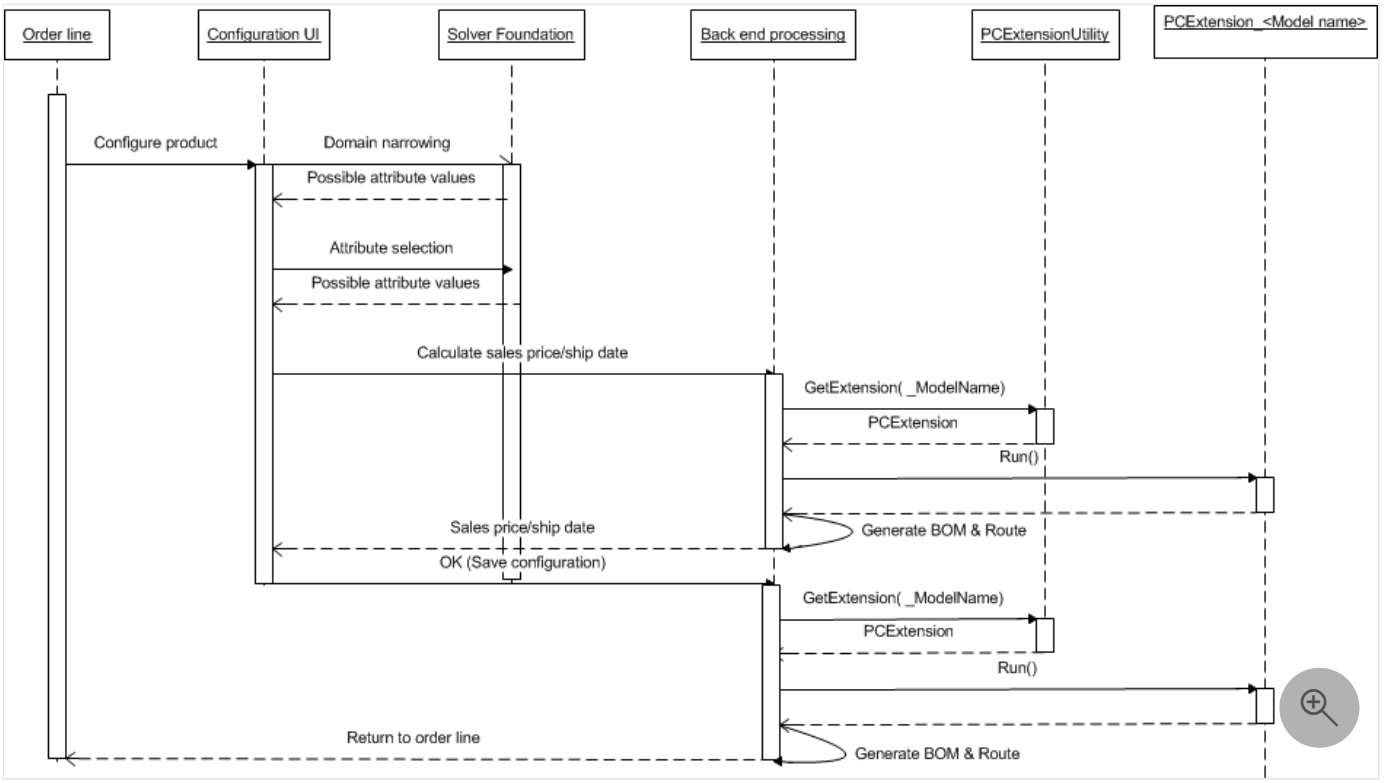
Create a version for the product configuration model. The version represents the relationship between the product master, which can be selected for configuration on an order or quotation line, and the product configuration model. A version must be approved and activated before it can be used in a configuration session.

Extending a product configuration model through the API

Partners and others with a developer license can extend the capabilities of a product configuration model by using a dedicated application programming interface (API). The main goal is to establish a mechanism that lets partners and customers who use the existing Product Builder migrate the code that is embedded in Product Builder models to the API. By using this mechanism, they can migrate their models from Product Builder to a product configuration. However, new partners and customers can also benefit from using the API to extend new product configuration models.

The API is implemented by using a set of `PCAdaptor` classes that expose the data structure of the product configuration models. An instance of the `PCAdaptor` class must be created for each model that can be extended. After a configuration session is completed, the system checks for an instance of this class and runs it if it's found.

The following API flow diagram outlines the process.



Configure products

Configure one or more products

You can configure products from the following places:

- Sales order line
- Sales quotation line
- Purchase order line
- Production order line
- Item requirement line (project)

The purpose of the configuration is to create a distinct variant of the product that meets the customer's requirement. A unique configuration ID is created for each new configuration. This ID enables tracking through inventory.

Multiple sites and intercompany considerations

If the configuration is done at a site, or even a company, that differs from the site or company where production occurs, the BOM and the route are created for and put them at the supplier site in the supplying company. The product variant is released in all companies that participate in the supply chain.

Last updated on 07/01/2026

Dimension-based product configuration overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Dimension-based product configuration represents a simple solution for creating many product variants from a single product master and its bill of materials.

Dimension-based product configuration is one of the three built-in product configuration technologies. The two other technologies are predefined variants and constraint-based configuration. All three technologies use a product master as the starting point and let you create many product variants for one product master.

Key concepts

Dimension-based product configuration is based on the following key concepts:

- Product masters
- Configuration product dimension
- Configuration groups
- Bill of materials (BOM)
- Configuration route
- Configuration rules

Product masters

A product master is the starting point for any product configuration process. For the dimension-based product configuration, you need a product master with this particular configuration technology and a product dimension group that includes the configuration product dimension.

Configuration product dimension

The configuration product dimension identifies the product variants for a product master that uses dimension-based configuration technology. Users enter the configuration dimension value to help identify the individual product variants.

Configuration groups

Configuration groups are defined in a central repository and can be used for all dimension-based product configuration models. Configuration groups are associated with individual BOM lines and hold together a group of lines that are mutually exclusive. This means that only one line in a group can be selected for a single product variant.

Bill of materials (BOM)

The BOM represents the building blocks for a dimension-based product configuration. It must include all the different products that you can use in any product variant. Each line in the BOM can reference a configuration group. If a line doesn't reference a configuration group, it's included in all product variants.

Configuration route

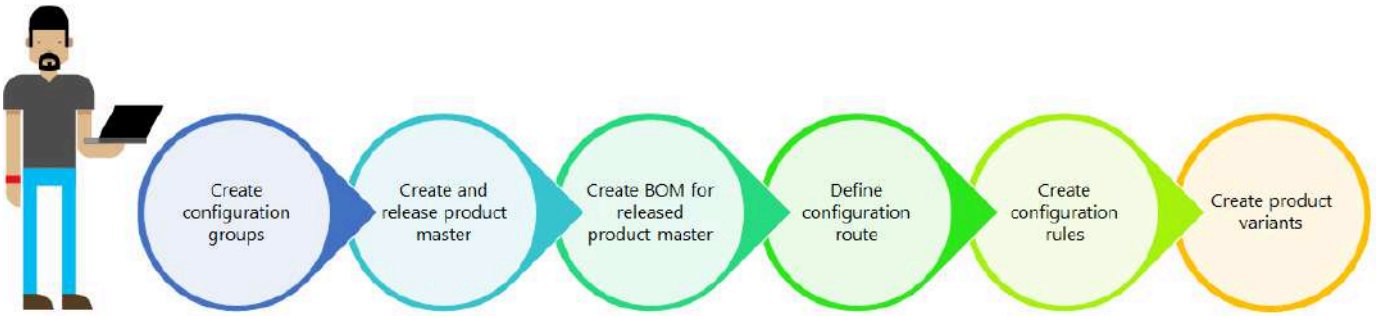
The configuration route determines the sequence of the configuration groups, as they're displayed to the user during the product configuration process.

Configuration rules

The configuration rules represent a mechanism for ensuring that a product included in one configuration group in a BOM enforces either an inclusion or an exclusion of a product in a different configuration group in the same BOM.

Product modeling process

The natural sequence for building a product model for a dimension-based product starts with defining the relevant configuration groups. Ensure that all products used in the BOM have been released to the company that the product model is built for. With these building blocks in place, you can create the BOM and assign configuration groups to all relevant BOM lines. When the BOM is complete, define a configuration route to order the configuration groups in the proper sequence.



If certain products from different configuration groups must or must not be used together, create configuration rules that enforce these product relationships. After the BOM has been tied together with a dimension-based product master through a BOM version and both have been approved and activated, you can create product configurations and enter a name for each configuration. Define the configurations before any transactions are generated, or do it when a specific configuration is needed.

Suggested use

The dimension-based configuration technology works best for products with limited variability when the combination of the standard product dimensions size, color, style, and configuration is unsuitable for identifying a specific product variant. An example is a bicycle with frame height, wheel size, brake types, and different gears.

Next step

The following eight task guides are listed in the order in which you complete them.

1. Create a dimension-based product master
2. Release a dimension-based product master
3. Complete basic setup of a released product master
4. Define configuration groups
5. Create a bill of materials for a dimension-based product master
6. Define configuration routes
7. Create configuration rules
8. Create dimension-based configurations

Product dimensions

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

There are five product dimensions: color, configuration, size, style, and version. You combine product dimensions in dimension groups and assign dimension groups to product masters. The combinations of product dimensions determine how product variants are defined.

Product dimensions are characteristics that serve to identify a product variant. Use combinations of product dimensions to define product variants. A product master requires at least one product dimension to create a product variant.

> **Note**
>
> You can't use physical dimensions to create product variants. Physical dimensions are specified on the product master and are shared by all its variants.

Product variants

Product variants are also referred to as items. An item is a tangible product, which isn't the same as a service. It's also possible to define a product master with the service type. By using the service type, you can specify product variants that include services. For example, you can specify a product master for consultancy work and product variants for work that is performed by senior consultants and junior consultants.

Set up product dimensions

A product variant is generated based on the product dimension values.

Product dimension values for the size, color, and style dimensions are created in the following locations:

- **Size** page (**Product information management** > **Setup** > **Dimension and variant groups** > **Sizes**)
- **Color** page (**Product information management** > **Setup** > **Dimension and variant groups** > **Colors**)
- **Style** page (**Product information management** > **Setup** > **Dimension and variant groups** > **Styles**)

Product dimension values for the configuration dimension are typically created by using either the Product configurator or the Dimension-based configurator.

Product versions are usually created for specific versions as the product evolves during its lifecycle. Product versions are covered in detail later in this article.

You can also create and maintain product dimensions on the **Product dimensions** page from the following locations:

- Go to **Product information management** > **Products** > **Product masters**. On the Action Pane, select **Product dimensions**.
- Go to **Product information management** > **Products** > **All products and product masters**. Select a product master. On the Action Pane, select **Product dimensions**.
- Go to **Product information management** > **Released products**. Select a product master. On the Action Pane, on the **Product** tab, in the **Product master** group, select **Product dimensions**.

The number of variants that you can create for an item is limited by the number of possible product dimension combinations.

> **Tip**
>
> When you use a product on an order line, for example, you select the product dimensions to identify the product variant that you want to work with.

Example

A company sells denim jeans. The item, *Jeans*, uses the color and size product dimensions. The jeans are sold in three different colors and six different sizes. The colors are blue, black, and brown. The sizes are XS, S, M, L, XL, and XXL. Not all sizes are available in all three colors. If all combinations were available, there would be 18 different types of jeans. However, in this example, only the following nine product variant combinations are produced.

Expand table

Color	Size
Blue	XS
Blue	S
Blue	M
Black	M
Black	L
Black	XL
Brown	L
Brown	XL
Brown	XXL

The version product dimension

Version is a product dimension that is intended to help you maintain and track multiple versions of a product throughout the supply chain. Version tracking is essential to the success of manufacturers that operate in a world of constantly shrinking product lifecycles, increased quality and reliability requirements, and increased focus on product safety.

As a standard product dimension, version behaves similarly to the existing product dimensions (size, style, color, and configuration). Therefore, you can use it for other purposes besides tracking product versions.

Turn on the version dimension

As of Supply Chain Management version 10.0.36, the version dimension is turned on by default for new systems, but not for older systems that are upgraded to version 10.0.36 or later. If you need to turn on the version dimension for your system, follow the advice and procedures in this section.

Before you turn on the version dimension

When you turn on the version dimension, some functionality could become broken or stop working as expected if you've installed other solutions that add customizations to the inventory dimensions. For the version dimension to be fully functional, you might have to update those

solutions so that they include the version dimension in their references to the inventory dimensions.

When you're testing your solutions for compatibility with the version dimension, look for the following elements:

1. **Functionality:** Most importantly, any customizations that involve the inventory dimensions must be assessed to ensure that they work with the version dimension.

2. **References to the inventory dimensions:** Look out for references to the inventory dimensions (that is, places where the dimensions are explicitly referenced). References to `InventDimId` should work out of the box, but look out for references to style or color. For example, be sure to check the following elements:

    - API calls in extended classes
    - All references to specific inventory dimensions in extension code (This code must float the version dimension together with the style, color, and size dimensions.)

3. **References to obsolete API calls:** In its introduction of the version dimension, Microsoft has tried to make as few APIs as possible obsolete. The few APIs that are made obsolete issue a warning when you turn on the **Product dimension - version** configuration key. Calls to those APIs must be fixed in your extended solutions before you turn on the version dimension in a production system. Here are the version-specific obsolete APIs:

    - `RetailTransactionServiceInventory::getProductRecordId`
    - `EcoResProductNumberIdentifiedProductVariantEntity::find`
    - `EGAISAlcoholProduction_RU::findByItemDim`
    - `PCVariantConfiguration::findByProductMasterAndDimensions`

4. **Maps:** If any maps use the inventory dimensions, the corresponding relation mapping to these maps must be updated so that they include the version dimension. In the extended model or table extensions, look out for tables where the fields include inventory dimensions.

5. **Microsoft Dynamics 365 Commerce functionality:** After it's turned on, the version dimension appears throughout the Commerce-specific code in Dynamics 365 Supply Chain Management. However, the version dimension isn't yet supported by the Commerce channel database or in the Point of Sale (POS) or e-commerce applications. These Commerce-specific applications don't support users selling/shipping or returning/receiving inventory by version dimension. Inventory availability lookup functions don't discern

inventory by version dimension in Commerce apps. This behavior resembles the current behavior of the config dimension throughout Commerce.

Turn on the version dimension configuration key

Before you can use the version dimension, its configuration key must be turned on for your system. As of Supply Chain Management version 10.0.36, the key is turned on by default for new systems, but not for older systems that are upgraded to version 10.0.36 or later. If you need to turn the version dimension on or off, follow these steps. This task requires admin permissions.

1. Put your system into Maintenance mode.
2. Go to **System administration** > **Setup** > **License configuration**.
3. On the **Configuration keys** tab, expand **Trade**, and select the check box for **Product dimension - Version**.
4. Turn off Maintenance mode.

Areas where the version dimension isn't supported

The following areas don't support the version dimension (you can still use these areas but you won't be able to add versioned products (products where the version dimension is used) to them). For example, you can't add a versioned item to a vendor catalog. This is because adding products with the version dimension to these areas would cause breaking changes.

- Cost object monthly statement
- Cost object statement cache
- MCR sales statistics per item
- Vendor catalogs
- EcoResProductDimensionGroupEntity

In addition, the order creation and order processing features in Commerce (for example, for POS, call center, and e-commerce orders) don't support the version dimension. There's no confirmed timeline for support in Commerce orders.

Functional characteristics of the version dimension

The version dimension works like the other product dimensions. However, because of its specific nature, and because it's intended to maintain and track multiple versions of a product, it behaves slightly differently. Here are some of the differences and similarities:

- **There is no version group.**

Although the concept of groups exists for size, color, and style (color group, size group, and style group), no version group concept exists. Groups let you predefine the applicable values so that when, for example, you assign a color group to a product, the product can use all the colors in that color group. This concept doesn't apply to the version dimension, because the versions that a product takes aren't predefined when the product is created. Instead, versions are created during the lifecycle of the product, as they're required. Typically, if the form, fit, and function of the product remain the same, you create a new version instead of a new product.

- **Product variant suggestions work as they currently do.**

  Product variant suggestions create suggestions for all version dimension values, just as they do for other dimensions. The process of creating and releasing versioned products is the same as it is for products that use other dimensions. When you create a versioned product, the first version (V1) is created as a product dimension, and the variants are released. As the product changes and a new version is needed, the new version value (V2) is added, and the required variants are released. There's no expectation that all the versions (V1, V2, and V3) are created in advance for the product.

> **Important**
>
> If you turn on and use the version dimension, some solutions that reference the inventory dimensions might stop working as expected. To confirm and fix these issues, contact the independent software vendor (ISV) for your affected solutions. Learn more in Enable the version dimension.

Create a dimension-based product master

Article • 01/06/2023

This procedure shows how to create a new product master with dimension-based configuration technology.

This is the first procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Products** > **Product masters**.
2. Select **New**.
3. In the **Product number** field, type a value.

    - Entering a product number is mandatory if no number sequence has been set up for the product number field.

4. In the **Product name** field, type a value.
5. In the **Product dimension group** field, select the drop-down button to open the lookup.
6. In the list, find and select the desired record.

    - Select the configuration dimension for this procedure.

7. In the list, select the link in the selected row.
8. In the **Configuration technology** field, select an option.

    - Select the dimension-based configuration technology.

9. Select **OK**.

Release a dimension-based product master

Article • 01/06/2023

This procedure shows how to release a product master, which will be used for the dimension-based configurations. It is a prerequisite that you have created a product master with the dimension-based configuration technology.

This is the second procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Products** > **Product masters**.
    - Filter the **Configuration technology** column so that only the dimension-based configuration is displayed. For example, you can filter the column by typing *Dimension*.
2. In the list, mark the selected row.
3. Select **Release products**.
4. Select **Next**.
    - For products that are crated with the dimension-based configuration technology, the product variants must be created in the company where the bill of materials will be created.
5. Select **Next**.
6. In the list, find and select the desired record.
    - Select the company *USMF* for this procedure.
7. Select **Next**.
8. Select **Finish**.

Complete basic setup of a released product master

This article shows how to complete the minimum setup that is required before you can use the product master in BOM versions.

This procedure is the third of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. Complete all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified in this article, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, find and select the desired record. Select the product master that you released in the second procedure. This product master is created by using the dimension-based configuration technology.
3. On the Action Pane, select **Product**.
4. Select **Dimension groups** to open the drop dialog.
5. In the **Storage dimension group** field, select the drop-down button to open the lookup.
6. In the list, find and select the desired record. The storage dimension group determines which storage dimensions are used for product transaction. Select **Site** for this procedure.
7. In the **Tracking dimension group** field, select the drop-down button to open the lookup.
8. In the list, find and select the desired record. The tracking dimension group determines which tracking dimensions are used for product transaction. Select **None** for this procedure.
9. Select **OK**.
10. Select **Edit**.
11. In the **Item model group** field, select the drop-down button to open the lookup.
12. In the list, find and select the desired record. Item model groups contain settings that determine how items are controlled and handled on item receipts and issues. They also determine how item consumption is calculated. Select **FIFO** for this procedure.
13. Expand the **Manage costs** section.
14. In the **Item group** field, select the drop-down button to open the lookup.
15. In the list, find and select the desired record. Item groups are used to manage inventory by dividing inventory items into groups. Select **CarAudio** for this procedure.
16. On the Action Pane, select **Plan**.

17. Select **Default order settings**.
18. In the **Default order type field**, select an option. Select **Production** to specify that the default supply option for this product master is to produce it.
19. Select **Save**.
20. Close the page.
21. Close the **Released product details** form.

Define configuration groups

Article • 01/06/2023

This procedure shows how to define product configuration groups.

This is the fourth procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Setup** > **Bills of materials and formulas** > **Configuration groups**.
2. Select **New**.
3. In the **Configuration group** field, type a value.
    - Type a name for the configuration group that will be used for the bill of material lines.
4. In the **Name** field, type a value.
5. Select **New**.
6. In the **Configuration group** field, type a value.
    - Type a name for the configuration group that will be used for the bill of material lines.
7. In the **Name** field, type a value.
8. Close the page.

Create a bill of materials for a dimension-based product master

Article • 01/06/2023

This article shows how to create a bill of materials for a dimension-based product master.

This is the fifth procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

This task is typically handled by the product designer.

Select the product

1. Go to **Product information management** > **Products** > **Released products**.
2. Select the product you want to work with in the grid.
    - Find the released product master with dimension-based configuration technology that you created in the first procedure in this sequence of eight.
3. On the Action Pane, open the **Engineer** tab and select **BOM versions**.

Create new BOM and BOM version

1. On the Action Pane, select **New** > **BOM and BOM version**.
2. In the **Name** field, type a value.
3. Select **OK**.
4. Select **New** from the **Bill of materials lines** FastTab toolbar.
    - In this procedure we will add four lines to the BOM. Two lines represent cable options and two lines represent cabinet options.
5. Make the following settings for the new line:
    - **Item number** – Select item number A0001, HDMI 6' Cables.

- **Configuration group** – Select the cable configuration group created in the fourth procedure in this sequence.

6. Select **New** from the **Bill of materials lines** FastTab toolbar and then make the following settings for the new line:

   - **Item number** – Select item A0002, HDMI 12' Cables.
   - **Configuration group** – Select the cable configuration group created in the fourth procedure in this sequence.

7. Select **New** from the **Bill of materials lines** FastTab toolbar and then make the following settings for the new line:

   - **Item number** – Select item number D0002, Cabinet.
   - **Configuration group** – Select the cabinet configuration group for this BOM line.

8. Select **New** from the **Bill of materials lines** FastTab toolbar and then make the following settings for the new line:

   - **Item number** – Select item number M0007, StandardCabinet.
   - **Configuration group** – Select the cabinet configuration group for this BOM line.

Approve and activate

1. Close the page.
2. On The Action Pane, open the BOM version tab and select **Approval**.
3. In the **Approved by** field, enter or select a value.
4. Set **Do you also want to approve the bill of materials?** to *Yes*.
5. Select **OK**.
6. Select **Activate**.

Define configuration route

Article • 01/06/2023

This procedure focuses on defining a configuration route that determines the sequence in which the configuration groups will be presented.

This is the sixth procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Bills of materials and formulas** > **Bills of materials**.
2. In the list, find and select the desired record.
3. On the Action Pane, select **Options**.
4. Select **Change view**.
5. Select **Header view**.
6. Expand or collapse the **Configuration route** section.
7. Select **Add**.
8. In the list, mark the selected row.
9. In the **Configuration group** field, select the drop-down button to open the lookup.
10. In the list, select the link in the selected row.
11. Select **Add**.
12. In the list, mark the selected row.
13. In the **Configuration group** field, select the drop-down button to open the lookup.
14. In the list, find and select the desired record.
15. In the list, select the link in the selected row.
16. Select **Save**.

Create configuration rules

Article • 01/06/2023

This procedure creates configuration rules that can be used for dimension-based configuration to enforce or prevent certain combinations of BOM lines.

This is the seventh procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

1. Go to **Product information management** > **Bills of materials and formulas** > **Bills of materials**.
2. In the list, find and select the desired record.

    - Find and select the BOM for the dimension-based configuration.

3. On the Action Pane, select **Options**.
4. Select **Change view**.
5. Select **Header view**.

    - Open the header view to access the Configuration route FastTab.

6. Expand or collapse the **Configuration route** section.

    - The **Configuration route** FastTab must be in the expanded mode.

7. Select **Configuration rules**.
8. Select **New**.
9. In the list, mark the selected row.
10. In the **Item number** field, select the drop-down button to open the lookup.

    - The items in the current configuration group are displayed. Select the one that represents the condition in the rule.

11. In the list, select the link in the selected row.
12. In the **Method** field, select an option.

    - It is possible to enforce either a selection or a deselection of an item from another configuration group.

13. In the **Derived group** field, select the drop-down button to open the lookup.

14. In the list, find and select the desired record.
15. In the list, select the link in the selected row.

    - Select the desired configuration group.

16. In the **Derived item number** field, select the drop-down button to open the lookup.
17. In the list, select the link in the selected row.

    - Select the item number that will be either selected or deselected depending on the chosen method.

18. Close the page.

Create dimension-based configurations

Article • 01/06/2023

This procedure shows how to define a configuration for a dimension-based product.

This is the eighth procedure of an eight-procedure sequence that explains how to build combinations for dimension-based configuration. You should do all eight procedures, in order, because each new procedure builds on data created by the previous procedures. To work through this sequence by using the sample records and values that are specified here, you must be on a system where the standard demo data is installed, and you must select the *USMF* legal entity before you begin.

Find the dimension-based product master

1. Go to **Product information management** > **Products** > **Released products**.
2. In the list, mark the selected row.

    - Select the dimension-based product master that you created in the first procedure in this sequence of eight.

Create configurations

1. On the **Engineering** Action Pane, select **Maintain configurations**.
2. Select **Configure**.
3. In the list, mark the selected row.
4. In the **Item number** field, enter or select a value.

    - Select any of the items in the first configuration group.

5. In the list, find and select the desired record.
6. In the **Item number** field, enter or select a value.

    - Select any item from the second configuration group.

7. Select **OK**.
8. In the list, mark the selected row.
9. In the **Configuration** field, type a value.

    - Enter a configuration name that will make it easy to identify the configuration.

10. In the **Description** field, type a value.

- Enter a description of the configuration to explain what it contains.

11. Select **OK**.

This article defines terms and concepts that are relevant to product configuration models. Product configuration models let you build a generic product structure that can be used to configure many product variants for a single product.

Product configuration models are created to represent a generic product structure. After you set up a product configuration model, you can configure a distinct product variant that has a unique bill of materials (BOM) and a unique route. Product configuration models use both declarative constraints and imperative calculations to handle the relations and limitations between different product variants. You can configure items on sales orders, sales quotations, purchase orders, and production orders. The following table describes the table constraint–based terms and concepts.

Expand table

Term	Description
Components	Components are the main building blocks of a product configuration model. You see components in a tree structure on the **Constraint-based product configuration model details** page. Components can contain the following elements: • Attributes • Constraints • Calculations • Subcomponents • User requirements • BOM lines • Route operations
Attributes	Attributes describe all the features of the product configuration model. Use attributes to specify the features that can be selected when a distinct product is configured. Attributes are used in constraints and conditions. When attributes are created and added to a product configuration model, the related attribute types are referenced. A default value for an attribute. The default value is used in the configuration user interface (UI) when the

Term	Description
	product configuration model is configured. You can specify that an attribute is mandatory, read-only, or hidden. • **Mandatory** – A value must be set for the attribute when the product is configured. • **Read-only** – The attribute value is displayed during a configuration session, but it can't be changed. • **Hidden** – The attribute value is included in constraints and conditions, but isn't displayed during a configuration session. You can also specify a condition for attributes. If the condition is met, a value must be entered for the mandatory attribute. Conditions are expressions that must be met for attributes, BOM lines, and route operations to be included in a product configuration model. Any attribute that is referenced in a condition becomes mandatory. Select attributes as mandatory on the **Attributes** tab. This selection can make it easier to identify mandatory attributes. Attribute values are an important part of reusing configurations. The system uses attribute values to determine whether a configuration exists that matches the selections that a user made during a configuration session.
Attribute types	Attribute types specify the set of data types for attributes that are used in a product configuration model. The following attribute types are used: • **Integer** with or without a range • **Decimal** • **Text** with or without a fixed list • **Boolean** If the attribute type is **Boolean**, **Integer** with a range, or **Text** with a fixed list, the set of values is available when a product configuration model is set up. **Note:** The Product configuration solver recognizes only the following attribute types: **Boolean**, **Text** with a fixed list, and **Integer** with a range. Therefore, only these attribute types can be used in expression constraints and conditions.
Constraints	Constraints describe the restrictions of the product model configuration. Use constraints to guarantee that only valid values are selected when a product is being configured. Constraints can be either expression constraints or table constraints: • Expression constraints can be used only for the component that they're tied to. The expression constraints for a component can reference attributes of the component's subcomponents. The Product configuration solver is used to solve the constraints, and you must use the solver syntax when you write the constraints. For more information, see the article link about expression constraints and table constraints. • Table constraints must be defined before they can be applied to a component in a product configuration model. Table constraints can be either user-defined or system-defined. A user-defined table constraint is a type of matrix that can be used to describe the set of combinations for the attribute values that are defined by attribute types. For example, if speakers are produced, the matrix for a user-defined table constraint might have columns for the speaker finish and grill. **Example** Speakers are available in four finishes: Black, Oak, Rosewood, and White. The speakers can have one of three front grills: Black, Metal, or White. The Black finish is available for all grills, but the other finishes are limited to specific grills. The following list

Term	Description
	shows an example of the information that is displayed on the **Allowed combinations** tab on the **Edit table constraint** page. • **Cabinet finish**: *Black* | **Front grill**: *Black* • **Cabinet finish**: *Black* | **Front grill**: *Metal* • **Cabinet finish**: *Black* | **Front grill**: *White* • **Cabinet finish**: *Oak* | **Front grill**: *Black* • **Cabinet finish**: *Rosewood* | **Front grill**: *White* • **Cabinet finish**: *White* | **Front grill**: *Black* • **Cabinet finish**: *White* | **Front grill**: *White* A system-defined table constraint represents a mapping between an attribute type and a field in a Supply Chain Management table. A system-defined table constraint dynamically links the attribute type to the field. The link enables the attribute in a product configuration model to reflect the data of the field in the Supply Chain Management table.
Calculations	Calculations represent a supplement to constraints. Use a calculation to perform arithmetic operations on attributes of the **Decimal** and **Integer** types, or logical operations that involve attributes of the **Text** with a fixed list and **Boolean** types. A calculation has a target attribute that holds the result of the calculation expression. The calculation expression is built by using the expression editor.
Subcomponents	Subcomponents reflect the tree structure of the product configuration model. Use subcomponents to build the structure of the product configuration model. Subcomponents reference existing components. Therefore, subcomponents encourage the reuse of components in multiple product configuration models. On the **BOM line details** page for a subcomponent, you can select a distinct value for the subcomponent. Alternatively, you can select an attribute that the value is selected for when the product configuration model is set up. To include a product as a component or subcomponent, you must specify the following information on the **Create product** page when you create the product: • In the **Product type** field, select **Item**. • In the **Product subtype** field, select **Product master**. • In the **Configuration technology** field, select **Constraint-based configuration**. You can view whether a released product can be used as a component or subcomponent on the **General** tab of the **Released product details** page. If **Constraint-based configuration** is selected in the **Configuration technology** field, the product can be used as a component or subcomponent. You can hide subcomponents so that they aren't displayed to the user during a configuration session. Attributes, subcomponents, and user requirements that are related to the subcomponent are also hidden.
User requirements	User requirements represent an abstraction between user requirements and specific components and attributes. You can't map a user requirement to an item. For example, a customer is shopping for a home theater system. The sales representative might ask about the size of the room where the customer plans to install the system, to determine how many watts are required. In this example, the room size can be a user requirement

Term	Description
	that helps determine the appropriate attribute value for a specific component. You can hide user requirements so that they aren't displayed to the user during a configuration session. Attributes, subcomponents, and user requirements that are related to the user requirement are also hidden. You can write a condition to control whether a user requirement can be hidden. You must write the condition by using Optimization Modeling Language (OML) syntax.
BOM lines	BOM lines represent the individual materials of the components in the product configuration model. On the **BOM line details** page, all items are available for selection. A condition can be added to the BOM line, so that the BOM lines that are selected for a distinct product variant can vary, based on the user's selection when the product configuration model is set up. Conditions are expressions that must be met for attributes, BOM lines, and route operations to be included in a product configuration model. On the **BOM line details** page, you can select a distinct value. Alternatively, you can map to an attribute that the value is selected for when the product configuration model is set up.
Route operations	On the **Route operation details** page, you can select a distinct value. Alternatively, you can map to an attribute that the value is selected for when the product configuration model is set up. Conditions are written like expression constraints. Conditions are expressions that must be met for attributes, BOM lines, and route operations to be included in a product configuration model.

Set up a product configuration model

This article describes the steps for setting up and creating a product configuration model.

Expand table

Task	Description
Create a product master.	Create a product master from the **Product master** list. Release the product master to all relevant companies. For a product master that is used as a version for a product configuration model or as a subcomponent, **Constraint-based configuration** must be selected as the configuration technology, and the configuration dimension must be selected only for the product dimension group.
Create components.	Create components on the **Components** page. Components are the building blocks of a product configuration model and can be reused in multiple product configuration models.
Create attribute types.	Create attribute types on the **Attribute types** page. Attribute types specify the set of data types for all attributes that are used in product configuration models. Attributes of the **Boolean**, **Text** with a fixed list, and **Integer** with a range types list the set of values that are available when you configure a product variant based on a product configuration model.
Create a product configuration model.	Create a product configuration model on the **New product configuration model** page.
Add attributes to a product configuration model.	Create an attribute on the **Attributes** FastTab on the **Constraint-based product configuration model details** page. Attributes describe the features of the product configuration model.
Add constraints to a product configuration model.	Create constraints on the **Constraints** FastTab on the **Constraint-based product configuration model details** page. Constraints are limitations that a product configuration must satisfy. Constraints are either expression constraints or table constraints.
Add subcomponents to a product configuration model.	Create subcomponents on the **Subcomponents** FastTab on the **Constraint-based product configuration model details** page. Subcomponents are related to components and are linked to items that represent the subcomponent.
Add user requirements to a product configuration model.	User requirements are similar to subcomponents, but they don't reference an item. You can think about user requirements as a phantom BOM. Any BOM lines or route operations that are placed directly under the user requirement will be collapsed into the parent component.
Add BOM lines to a product configuration	Create BOM lines on the **BOM lines** FastTab on the **Constraint-based product configuration model details** page. BOM lines represent a part that is required to

Task	Description
model.	build a variant of the product.
Add route operations to a product configuration model.	Create route operations on the **Route operations** FastTab on the **Constraint-based product configuration model details** page. Route operations represent a step in a sequence of steps that are performed to make a variant of the product.
Create an active version for a product configuration model.	Create an active version of the product configuration model on the **Versions** page. A version is the relationship between a product configuration model and a product master. A product configuration model that has an active version can be configured from a sales order, sales quotation, purchase order, or production order.
Test a product configuration model.	Test the product configuration model from either the **Constraint-based product configuration model details** page or the **Product configuration models list** page. Testing the product configuration models simulates the product model configuration process that occurs during order handling.
Create product configuration model template.	Create a product configuration model template on the **Configuration templates** page. A configuration template includes values for attributes in the product configuration model. Select the attribute values on the **Configure line** page. You can select to load a product model configuration template during product model configuration.
Configure an item.	Product configuration models can be configured from a sales order, sales quotation, purchase order, or production order.

Product configuration model calculations

This article describes how to create calculations for attributes in a product configuration model.

Prerequisites

Calculations are used in a product configuration model to calculate the configuration values for a product. Before you can start to set up calculations, the related product configuration model must exist. For an overview of the setup process for configuration models and the related tasks, see Set up a product configuration model.

Create a calculation

A calculation consists of an expression and a target attribute. Learn more in Calculations for product configuration models FAQ.

To create a calculation for an existing product model, follow these steps:

1. Go to **Product information management** > **Common** > **Product configuration models**.
2. Open a product configuration model, and then select **Edit**.
3. On the **Calculations** FastTab, select **Add** to add a calculation, and then set the following fields:
    - **Name** – Enter a name for the calculation.
    - **Description** – Enter a description of the calculation.
    - **Target attribute** – Select the attribute that you're making the calculation for.
4. Select **Edit expression**.
5. In the **Enter a calculation** dialog box, add the required attributes, operators, and values to the expression. For more information about how to work with these elements, see Expression constraints and table constraints in product configuration models.
6. When your expression is ready, select **OK**.

Calculation examples

This section provides a few examples that show how calculations work.

Example 1

The target attribute is Boolean, and the calculation uses the following conditional expression:

```
If[(decimalAttribute1 / decimalAttribute2) < 1, True, False]
```

This expression returns a value of *True* to the target attribute if `decimalAttribute2` is greater than or equal to `decimalAttribute1`. Otherwise, it returns a value of *False*.

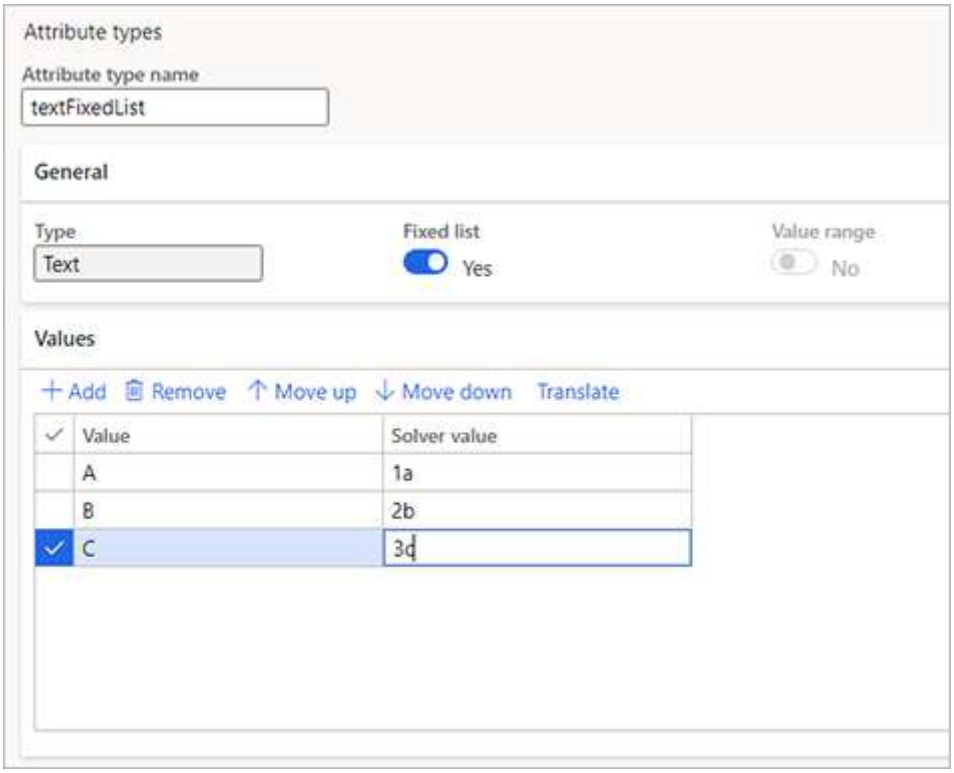
Example 2

This example uses the text attribute `textFixedList` as the target attribute. This attribute contains the following fixed list.

Expand table

Value	Solver value
A	1a
B	2b
C	2c

The following screenshot shows how the settings for this attribute might look in your system.



The attribute is used in the following conditional statement:

```
If[integerAttribute < 150, 0, 2]
```

If `integerAttribute` is less than 150, this statement returns the text value of the first record in the fixed list, *A*. Otherwise, it returns the text value of the third record in the fixed list, *C*.

> **Note**
>
> The fixed list is equivalent to a zero-based enumeration (enum), and its values are accessed by the appropriate integer value. Therefore, the first fixed list value (*A*) is matched to *0*, the second value (*B*) is matched to *1*, and the third value (*C*) is matched to *2*.

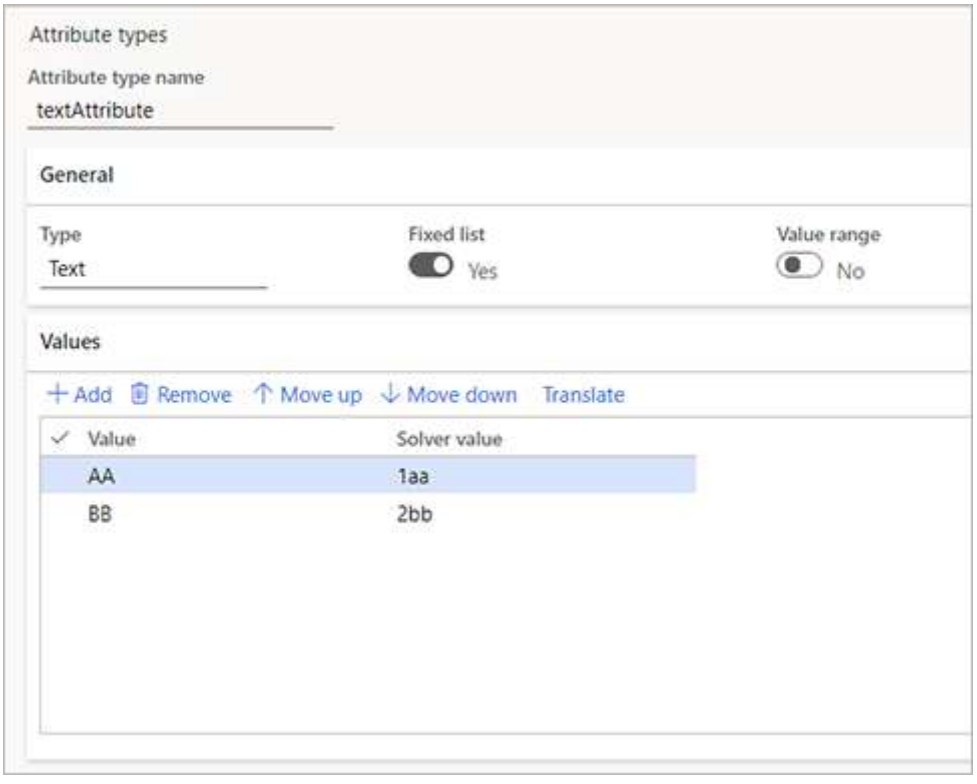
Example 3

This example uses the `textFixedList` target attribute from the previous example. It also uses another text attribute, `textAttribute`, that contains the following fixed list.

Expand table

Value	Solver value
AA	1aa
BB	2bb

The following screenshot shows how the settings for this attribute might look in your system.



The value for the `textFixedList` attribute is calculated by using the following conditional statement:

```
If[textAttribute == "1aa", 0, 2]
```

If the `textAttribute` value has a solver value that equals *1aa*, this expression returns the text value of the first record in the `textFixedList` fixed list, *A*. Otherwise, it returns the text value of the third record in the `textFixedList` fixed list, *C*.

> **Note**
>
> - The conditional statement must use the solver value of the attribute.
> - Only fixed-list text attributes can be used in calculations.

Calculations for product configuration models FAQ

Article • 06/15/2022

This article describes calculations for product configuration models and explains how to use calculations together with constraints.

Calculations can be used for arithmetic or logical operations. They complement expression constraints in product configuration models. You can define calculations on the **Constraint-based product configuration model details** page and then build expressions for the calculations in the expression editor. For more information, see Create calculations.

What is a calculation?

A calculation is an element that you can use in a product configuration model. Calculations complement constraints by letting you use decimal numbers to calculate values when you configure a product. Additionally, calculations have a larger set of available operators than constraints have.

Like a constraint, a calculation is associated with a specific component in a product configuration model, and can't be reused by or shared with another component. One important difference between calculations and constraints is that calculations are imperative (unidirectional), whereas constraints are declarative (bi-directional). For more information about constraints, see Expression constraints and table constraints in product configuration models.

A calculation consists of a target attribute and a calculation expression.

What is a target attribute?

A target attribute is an attribute that receives the result of the calculation expression.

In the following expression, the target attribute is a tablecloth measurement:

Expression: If[decimalAttribute1 <= decimalAttribute2, True, False]

DecimalAttribute1 is the table length, and **decimalAttribute2** is the tablecloth length. The expression returns the value **True** to the target attribute if **decimalAttribute2** is greater than or equal to **decimalAttribute1**. Otherwise, the expression returns **False**.

Therefore, the tablecloth measurement is acceptable if the tablecloth length is the same as or exceeds the length of the table.

What attribute types can be set to target attributes?

All attribute types that the product configurator supports can be set to target attributes, except text without a fixed list.

Can the value of a target attribute restrict the values of the input attributes in a calculation?

No, the value of a target attribute can’t restrict the values of the input attributes, because calculations are unidirectional. Therefore, the value of the target attribute is set based on changes in the value of the input attributes, but a change in the value of the target doesn’t affect the value of the input attributes. This behavior differs from the behavior for constraints. Constraints occur in both directions.

Example

In the following expression, the target for the calculation is the length of a power cord, and the input value is a color:

Expression: [If Color == "Green", 1.5, 1.0]

When you configure the item, the length of the power cord is set to **1.5** if you specify **Green** as the value of color attribute. If you specify any other color, the length is set to **1.0**. However, because calculations are unidirectional, the calculation doesn't set the value of the color attribute to **Green** if you specify a length of **1.5**.

What happens if a calculation has a target attribute of the integer type but a calculation generates a decimal number?

If a target attribute is of the integer type, but a calculation generates a decimal number, only the integer part of the calculated result is returned. The decimal part is removed, and the result isn't rounded. For example, a result of 12.70 is shown as 12.

When do calculations occur?

Calculations occur when a value has been provided for all input attributes.

Can I overwrite the value that is calculated for the target attribute?

You can overwrite the value that is calculated for the target attribute, unless the target attribute is set as hidden or read-only.

How do I set a target attribute as hidden or read-only?

To set an attribute as hidden or read-only, follow these steps.

1. Click **Product information management** > **Products** > **Product configuration models**.
2. Select a product configuration model, and then, on the Action Pane, click **Edit**.
3. On the **Constraint-based product configuration model details** page, select the attribute to use as a target attribute.
4. On the **Attributes** FastTab, select **Hidden** or **Read-only**.

Can a calculation overwrite the values that I set?

No. The values that you set when you configure a product are the values that are used. The calculation that occurs when the input values in a calculation are changed can't overwrite the values that you provide for a specific attribute.

What happens if I remove an input value in a calculation?

If you remove an input value in a calculation, the value of the target attribute is also removed.

Why do I receive an error message that says that my model is in contradiction?

This message is shown when a calculation includes an error, or when a contradiction exists in one or more constraints. For more information about contradictions in constraints, see Expression constraints and table constraints in product configuration models. Here are some situations where errors can occur in calculations:

- A value is divided by 0 (zero).
- A conflict exists between the following two elements:
  - The values that are available for an attribute and are limited by a constraint
  - A value that is generated by a calculation
- The values that are returned by the calculation are outside the domain of the attribute. An example is an integer from [1..10] that is calculated to 0.

Why do I receive an error message even though I successfully validated my product model?

Calculations aren't included in the validation. You must test the product configuration model to find errors in calculations. To test a product configuration model, follow these steps.

1. Click **Product information management** > **Products** > **Product configuration models**.
2. Select a product configuration model, and then, on the Action Pane, in the **Run** group, click **Test**.

Configuration rules

This article provides general information about configuration rules. Configuration rules define relationships between items in a bill of materials (BOM) for products that use the dimension-based configuration technology.

Configuration rules are available when you define dimension-based configuration models. Configuration rules are used to either enforce or prohibit specific item combinations in a bill of materials (BOM). After a BOM has been created and the relevant items have been assigned to their respective configuration groups, one or more configuration rules can be defined. If two items belong together, the **Select** operator is used to ensure inclusion. If two items are mutually exclusive, the **Deselect** operator is used to ensure exclusion.

Note: This information applies only to product masters that use the dimension-based configuration technology.

Existing configurations aren't affected by subsequent changes to the configuration rules. However, it's important that you set the rules before you define a new configuration, and that you check the rules if you think they have been changed.

Note: For the **Select** method, the derived configuration group, item number, and configuration are automatically selected. For the **Deselect** method, the derived configuration group, item number, and configuration can't be selected.

Expression constraints and table constraints in product configuration models

Article • 05/30/2023

This article describes the use of expression constraints and table constraints. Constraints control the attribute values that you can select when you configure products for a sales order, sales quotation, purchase order, or production order. You can use expression constraints or table constraints, depending on how you prefer to build the constraints.

What are expression constraints?

Expression constraints are characterized by an expression that uses arithmetic and Boolean operators and functions. An expression constraint is written for a specific component in a product configuration model. It can't be reused by or shared with another component. However, the expression constraints for a component can reference attributes of the component's subcomponents.

What are table constraints?

Table constraints list the combinations of values that are allowed for attributes when you configure a product. Table constraint definitions can be used generically. When you create a table constraint for a component in a product configuration model, you select a table constraint definition. To create the combinations that are allowed, you add attributes of specific types to the components. Each attribute type has a specific value.

Example of a table constraint

This example shows how you can limit the configuration of a speaker to specific cabinet finishes and fronts. The first table shows the cabinet finishes and fronts that are generally available for configuration. The values are defined for the **Cabinet finish** and **Front grill** attribute types.

Expand table

Attribute type	Values
Cabinet finish	Black, Oak, Rosewood, White

Attribute type	Values
Front grill	Black, Metal, White

The next table shows the combinations that are defined by the **Color and finish** table constraint. By using this table constraint, you can configure a speaker that has an oak finish and a black grill, a Rosewood finish and a white grill, and so on.

Expand table

Finish	Grill
Oak	Black
Rosewood	White
White	Black
White	White
Black	Black
Black	Metal

You can create system-defined and user-defined table constraints. Learn more in System-defined and user-defined table constraints.

What syntax should be used to write constraints?

You must use Optimization Modeling Language (OML) syntax when you write constraints. The system uses Microsoft Solver Foundation constraint solver to solve the constraints.

Should I use table constraints or expression constraints?

You can use either expression constraints or table constraints, depending on how you prefer to build the constraints. You build a table constraint as a matrix, whereas an expression constraint is an individual statement. When you configure a product, it doesn't matter what kind of constraint is used. The following example shows how the two methods differ.

When you configure a product by using the following constraint setups, these combinations are allowed:

- A product in the color Black, and in size 30 or 50
- A product in the color Red and in size 20

Table constraint setup

Expand table

Color	Size
Black	30
Black	50
Red	20

Expression constraint setup

(Color == "Black" & (size == "30" | size == "50")) | (color == "Red" & size = "20")

Should I use operators or infix notation when I write expression constraints?

You can write an expression constraint by using either the available prefix operators or infix notation. For the **Min**, **Max**, and **Abs** operators, you can't use infix notation. These operators are included as standard operators in most programming languages.

What operators and infix notation can I use when I write expression constraints?

The following tables list the operators and infix notation that you can use when you write an expression constraint for a component in a product configuration model. The examples in the first table show how to write an expression by using either infix notation or operators.

Expand table

Operator	Description	Syntax	Examples
Implies	If condition a is true, then apply the contraint b.	Implies[a, b], infix: a -: b	• **Operator:** Implies[x != 0, y >= 0] • **Infix notation:** x != 0 -: y >= 0
And	This is true only if all conditions are true. If the number of conditions is 0 (zero), it produces **True**.	And[args], infix: a & b & ... & z	• **Operator:** And[x == 2, y <= 2] • **Infix notation:** x == 2 & y <= 2
Or	This is true if any condition is true. If the number of conditions is 0 (zero), it produces **False**.	Or[args], infix: a | b | ... | z	• **Operator:** Or[x == 2, y <= 2] • **Infix notation:** x == 2 | y <= 2
Plus	This sums its conditions. If the number of conditions is 0 (zero), it produces **0**.	Plus[args], infix: a + b + ... + z	• **Operator:** Plus[x, y, 2] == z • **Infix notation:** x + y + 2 == z
Minus	This negates its argument. It must have exactly one condition.	Minus[expr], infix: -expr	• **Operator:** Minus[x] == y • **Infix notation:** -x == y
Abs	This takes the absolute value of its condition. It must have exactly one condition.	Abs[expr]	**Operator:** Abs[x]
Times	This takes the product of its conditions. If the number of conditions is 0 (zero), it produces **1**.	Times[args], infix: a * b * ... * z	• **Operator:** Times[x, y, 2] == z • **Infix notation:** x * y * 2 == z
Power	This takes an exponential. It applies exponentiation from right to left. (In other words, it's right-	Power[args], infix: a ^ b ^ ... ^ z	• **Operator:** Power[x, 2] == y • **Infix notation:** x ^ 2 == y

Operator	Description	Syntax	Examples
	associative.) Therefore, **Power[a, b, c]** is equivalent to **Power[a, Power[b, c]]**. **Power** can be used only if the exponent is a positive constant.		
Max	This produces the largest condition. If the number of conditions is 0 (zero), it produces **Infinity**.	Max[args]	**Operator:** Max[x, y, 2] == z
Min	This produces the smallest condition. If the number of conditions is 0 (zero), it produces **Infinity**.	Min[args]	**Operator:** Min[x, y, 2] == z
Not	This produces the logical inverse of its condition. It must have exactly one condition.	Not[expr], infix: !expr	• **Operator:** Not[x] & Not[y == 3] • **Infix notation:** !x!(y == 3)

The examples in the next table show how to write infix notation.

Expand table

Infix notation	Description
x + y + z	Addition
x * y * z	Multiplication
x - y	Binary subtraction is translated the same as binary addition where there is a negated second.
x ^ y ^ z	Exponentiation that has right associativity
!x	Boolean not
x -: y	Boolean implication
x	y

Infix notation	Description
x & y & z	Boolean and
x == y == z	Equality
x != y != z	Distinct
x < y < z	Less than
x > y > z	Greater than
x <= y <= z	Less than or equal to
x >= y >= z	Greater than or equal to
(x)	Parentheses override default precedence.

Why aren't my expression constraints validated correctly?

You can't use reserved keywords as solver names for attributes, components, or subcomponents in a product configuration model. Here is a list of the reserved keywords that you can't use:

- Ceiling
- Element
- Equal
- Floor
- If
- Less
- Greater
- Implies
- Log
- Max
- Min
- Minus
- Plus
- Power
- Times
- Slot
- Model
- Decision

- Goal

Solver strategy for product configuration

Article • 06/29/2022

This article describes how you can use the solver strategy to improve the performance of product configuration.

The concept of solver strategies was first introduced in Cumulative update 7 (CU7) for Microsoft Dynamics AX 2012 R2. It was extended in Cumulative update 8 (CU8) for Microsoft Dynamics AX 2012 R3 and finance and operations apps, Enterprise edition 7.3.

The solver strategy concept now consists of the following strategies:

- Default
- Minimal domains first
- Top-down
- Z3

Solver strategy

A product configuration model can be formulated as a constraint satisfaction problem (CSP). Microsoft Solver Foundation (MSF) provides two types of solver strategies to solve the CSPs that can be used from product configuration models. These solver strategies rely on heuristics, which are used to determine the order that the variables of the CSPs are considered in when the problem is being solved. Heuristics can significantly affect performance when a problem or class of problems is being solved.

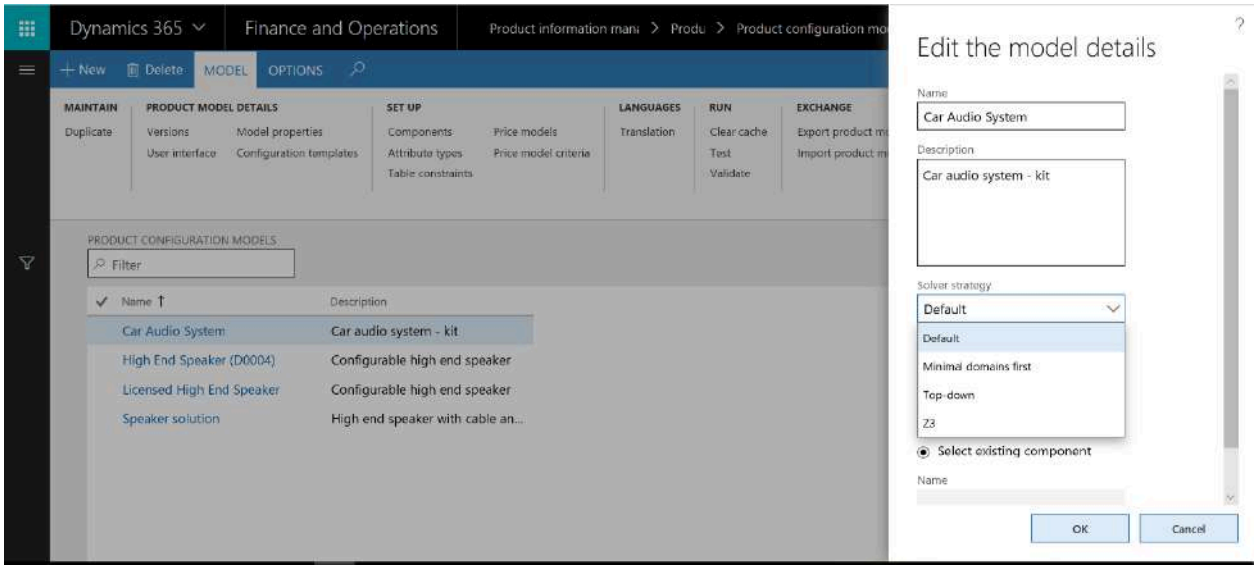
The solver strategy for product configuration models determines which solver is used with heuristics. The **Default**, **Minimal domains first**, and **Top-down** strategies use the two solvers from MSF, whereas the **Z3** strategy uses the Z3 solver.

Real customer implementation studies have shown that a change in the solver strategy for a product configuration model can reduce the response time from minutes to milliseconds. Therefore, it's worth the effort to try different solver strategies to find the most efficient strategy for your product configuration model.

Change the settings for the solver strategy

To change the solver strategy, on the **Product configuration models** page, on the Action Pane, select **Model properties**. Then, in the **Edit the model details** dialog box,

select a solver strategy.



Currently, there is no logic that automatically detects which solver strategy will be the most efficient strategy for constraint-based product configuration. Therefore, you must try the solver strategies one by one.

The following table provides recommendations about the solver strategy to use in various scenarios.

Expand table

Solver strategy	Use the strategy in this scenario
Default	The **Default** strategy has been optimized to solve models that rely on table constraints. Customer implementation studies have shown that this strategy is the most efficient strategy in scenarios where table constraints are used extensively.
Minimal domains first	The **Minimal domains first** and **Top-down** strategies are closely related. Customer implementation studies have shown that the **Top-down** strategy, outperforms the **Minimal domains first** strategy. However, the **Minimal domains first** strategy is kept in the product for backward compatibility. Both these solver strategies have been shown to be more efficient at solving models that contain several arithmetic expressions where no table constraints are used. However, in some cases, the **Default** strategy outperforms these two strategies. Therefore, remember to try each strategy.
Top-down	The **Minimal domains first** and **Top-down** strategies are closely related. Customer implementation studies have shown that the **Top-down** strategy, outperforms the **Minimal domains first** strategy. However, the **Minimal domains first** strategy is kept in the product for backward compatibility. Both these solver strategies have been shown to be more efficient at solving models that contain several arithmetic expressions where no table constraints are used. However, in some cases, the **Default** strategy outperforms these two strategies. Therefore, remember to try each strategy.

Solver strategy	Use the strategy in this scenario
Z3	We recommend that you use the **Z3** strategy as the default solver strategy. If you're concerned about performance and scalability, you can evaluate the other strategies.

Reuse product configurations

You can specify that you want to automatically reuse an existing configuration for a product. Then, when a user has completed a configuration session, the system verifies whether a configuration that matches the user's selections already exists. If a matching configuration is found, the configuration ID, corresponding bill of materials (BOM), and route are reused.

Requirements for reusing configurations

To enable configurations to be reused, you must specify the following information for the components and attributes on the **Product configuration model details** page:

- **Components and subcomponents** – On the **General** FastTab, in the **Reuse configurations** field, select **Yes**.
- **Attributes** – On the **Attributes** FastTab, select the **Include in reuse** option. This option appears only when the related component is enabled for reuse. If you don't select any attributes for reuse, the configuration is always reused, regardless of the user's selections during a configuration session. The attribute values in the existing configuration must match the user's selections. For example, if the user selects **Blue** as the color during a configuration session, the system verifies whether an existing configuration of the component has the color blue.

Resetting configuration reuse

When you reset configuration reuse, previously created configurations are no longer considered. You might want to reset configuration reuse if the BOM or route was changed, but no related attributes were changed. You reset configuration reuse on the **General** FastTab for the component.

System-defined and user-defined table constraints

This article explains the two types of table constraints for components in a product configuration model - user-defined and system-defined. Table constraints represent matrices of the allowed attribute combinations, where each row defines one set of possible attribute values.

Table constraints represent matrices of the combinations of attributes that are allowed for components in a product configuration model. Each row in the table defines one set of possible attribute values. You can declare two types of constraints in a product configuration model:

- **Expression constraint** – Create an expression that defines relations between attributes to guarantee that only compatible values can be selected during product configuration.
- **Table constraint** – Create a table that defines all the combinations that are allowed for a specified set of attributes. Two types of table constraints are available: user-defined table constraints and system-defined table constraints.

This article describes user-defined and system-defined table constraints for components in a product configuration model.

User-defined table constraints

A user-defined table constraint is a type of matrix that is used to describe the combinations of attribute values that are defined by attribute types. For example, if you produce speakers, you can include columns for the cabinet finish and the front grill in the user-defined table constraint. The attribute type for the cabinet finish has four values, and the attribute type for the front grill has three values. Therefore, if constraints aren't used, there are 4 × 3 = 12 possible combinations. However, in this example, only six combinations are allowed, as shown in the following table. This information is displayed on the **Allowed combinations** tab on the **Edit table constraint** page.

Expand table

Cabinet finish	Front grill
Black	Black
Black	Metal
Oak	Black

Cabinet finish	Front grill
Rosewood	White
White	Black
White	White

User-defined table constraints are defined by static table input that works the same way as an expression constraint. When you use a user-defined table constraint, the advantage is that tables are often easier to create, understand, and maintain than long expression constraints.

System-defined table constraints

A system-defined table constraint creates a dynamic mapping between an attribute type and a field in a table. When a system-defined table constraint is included in a product configuration model, the mapping guarantees that the data in the table is shown instead of the values of the attribute type. The result is a dynamic constraint, because the table contents can be modified (for example, by other modules).

When you create a system-defined table constraint, you select a table, optionally define the query to use, and then associate attribute types to the fields in the selected table. The types of fields must match the types of attribute types.

Before a table constraint can take effect on a product configuration model, the table constraint must be included in a constraint on one of the model's components. The procedure is to create a new constraint, select the table constraint type, and then select the table constraint definition to use. Finally, all fields in the table constraint must be mapped to attributes in the product configuration model.

Create product model components

Article • 09/29/2021

Constraint-based product configuration models use components as building blocks to establish the product model structure. The components must be created before a product model can be built. The demo data company used to create this procedure is USMF.

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. On the Action Pane, select **Model**.
3. Select **Components**.
4. Select **New**.
5. In the **Name** field, type a value.
6. In the **Description** field, type a value.
7. Close the page.

Create a product configuration model

Article • 09/29/2021

This procedure shows how to create a product configuration model and enter basic information such as attributes and subcomponents. The demo data company used to create this procedure is USMF.

Create a product model

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. Select **New**.
3. In the **Name** field, type a value.
4. In the **Description** field, type a value.
5. In the **Solver strategy** field, select an option.

    - The solver strategy determines how the constraints in a constraint-based product configuration model are processed. This selection can have an impact on the performance of the product configuration model.

6. In the **Name** field, type a value.

    - The root component represents the product configuration model, but it can also be used in other product models.

7. Select **OK**.
8. In the **Reuse configurations** field, select an option.

    - If the reuse configurations parameter is set to Yes, the system will check for identical configurations after each configuration session and reuse if an exact match is found.

Add attributes

1. Expand the **Attributes** section.
2. Select **Add**.
3. In the list, mark the selected row.
4. In the **Name** field, type a value.
5. In the **Solver name** field, type a value.

- The solver name is used by the constraint solver of the product configurator. It must not include spaces or special characters except _ (underscore).

6. In the **Description** field, type a value.

    - The description text is displayed to the configuration user and can therefore serve as help in selecting the right attribute value.

7. In the **Attribute type** field, enter or select a value.

    - The attribute type determines which values are available for the attribute.

8. Select the **Include in reuse** check box.

    - This option is only available when the Reuse configurations option is selected. Including the attribute in the reuse check box means that this attribute will be considered when the system is looking for an exact match.

Add subcomponents

1. Expand the **Subcomponents** section.
2. Select **Add**.
3. In the list, mark the selected row.
4. In the **Name** field, type a value.
5. In the **Solver name** field, type a value.
6. In the **Description** field, type a value.
7. In the **Component** field, enter or select a value.

    - Each subcomponent must reference a component definition. This design supports reusable components and ensures that once a component has been defined it can be used in many product models.

8. Select **Save**.
9. Select **BOM line details**.

    - The BOM line details form enables the user to select the required properties for the subcomponent. Each property can be given a fixed value or mapped to an attribute. Mapping to an attribute will result in the BOM line property getting different values depending on the configuration selection.

10. In the **Item number** field, enter or select a value.

    - Each subcomponent represents a configurable product master with constraint-based configuration technology. The reference is made through the item number.

11. Select the **Set** check box.
12. Select **Yes** in the **Calculation** field.

    - Setting the calculation option ensures that the product will be included when running a cost calculation for the product.

13. Select the **Setup** tab.
14. Select the **Set** check box.
15. In the **Quantity** field, enter a number.

    - The quantity field determines how much of this product will be consumed in the configured product.

16. Select the **Set** check box.
17. In the **Per series** field, enter a number.
18. Select **OK**.

Add an expression constraint to a product configuration model

Article • 09/29/2021

This procedure shows how you can add a new constraint expression to a product configuration model. It shows how you can mandate that corner protection must be applied to a speaker if the user has selected a front grill in metal. The procedure uses the High end speaker component in the demo company USMF.

Create an expression constraint

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.
    - This example uses the high end speaker model.
3. In the list, select the link in the selected row.
4. Expand the **Constraints** section.
5. Select **Add**.
6. Select **Create**.
7. In the **Name** field, type a value.

Enter expression

1. Select **Edit expression**.
    - If you unlock the user interface in the task recording at this stage, you can use IntelliSense and the list of symbols to build the constraint expression .
2. In the **ConstraintBody** field, enter 'Implies[FrontGrill=="Metal", CornerProtection] '.
    - This expression logic states: If the Front grill is metal, then the corner protection option must be selected.
3. Select **Validate**.
    - The validate function runs through the constraint expression and checks for syntax errors.
4. Select **Close**.

5. Select **OK**.

Add a calculation to a product configuration model

Article • 09/29/2021

This procedure shows how to add a new calculation to a product configuration model. It shows how you can create a logical expression using the "If" operator to set a speaker height to 10 for white speakers and 15 for all other cabinet finishes. The procedure uses the High end speaker component in the demo company USMF.

Add a calculation

Create calculation expression

1. Click Edit expression.
2. In the ConstraintBody field, enter 'If[CabinetFinish=="White", 10, 15]'.
3. Click Validate.
4. Click Close.
5. Click OK.

Maintain BOM for a product configuration model

Article • 09/29/2021

Running this procedure requires an existing product configuration model. The High end speaker model in the demo company USMF is used to create this procedure.

Add a BOM line

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.
    - Select the High end speaker for this procedure.
3. In the list, select the link in the selected row.
4. Expand the **BOM lines** section.
5. Select **Add**.
6. In the **Name** field, type a value.
7. In the **Description** field, type a value.
8. Select **Save**.

Add BOM line details

1. Select **BOM line details**.
2. In the **Item number** field, enter or select a value.
    - For example, you can select the item M0055.
    - For each BOM line property, you can select if it takes a fixed value or is mapped to an attribute.
3. Select the **Set** check box.
4. Select *Yes* in the **Calculation** field.
    - Setting the **Calculation** property to *Yes* ensures that the BOM line is included in cost calculations.
5. Select the **Setup** tab.
6. Select the **Set** check box.
7. In the **Quantity** field, enter a number.

- The quantity field determines how much of the item that will be included in the BOM. This could be an obvious candidate for an attribute mapping.

8. Select the **Dimension** tab.

    - Verify if any of the product dimensions are active, and therefore must have a value or attribute assigned.

9. Select **OK**.

Maintain route for a product model

Article • 09/29/2021

Running this procedure requires that a product configuration model exists. This procedure uses the High end speaker model in the demo company USMF to walk you through the process.

Add a route operation

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.

    - Select the High end speaker model for this exercise.

3. In the list, select the link in the selected row.
4. Expand the **Route operations** section.
5. Select **Add**.
6. In the **Name** field, type a value.
7. In the **Description** field, type a value.
8. Select **Save**.

Enter route operation details

1. Select **Route operation details**.
2. In the **Operation** field, enter or select a value.
3. In the **Oper. No.** field, enter a number.

    - Operation numbers determine the route sequence.
    - Each property on a route operation can get a static value or be mapped to an attribute. Mapping to an attribute will result in the value being set as part of the configuration.

4. In the **Route group** field, enter or select a value.

    - The route group determines essential behavior for costing, consumption, and setup.

5. Select the **Setup** tab.
6. Select the **Times** tab.
7. In the **Process qty.** field, enter a number.

- Determine how many will be processed during one operation.

8. In the **Hours/time** field, enter a number.
    - Enter the time ratio.
9. Select the **Set** check box.
10. In the **Run time** field, enter a number.
    - Determine the processing time for the quantity that you have specified.
11. Select the **Resource requirements** tab.
12. Select **Add**.
13. In the list, mark the selected row.
14. In the **Requirement type** field, select an option.
    - Decide if you want to specify specific resources or capabilities that they must possess.
15. In the **Requirement** field, enter or select a value.
16. Select **OK**.

Attribute-based sales prices for constraint-based product configuration

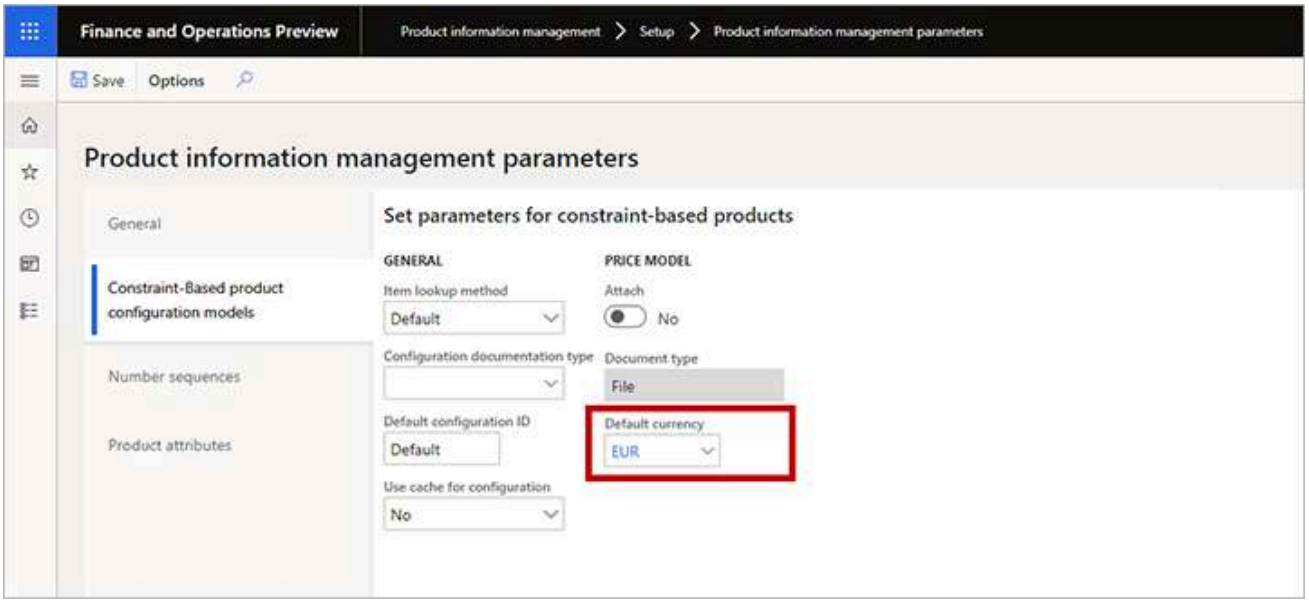
This article describes how to build sales price models with sales prices based on components and attributes rather than on the physical bill of material and the route. You can build several sales price models for each product configuration model.

Set relevant product information management parameters

Before you start building your price models, you must define a default currency, which is used when you build your sales price models. You can also choose whether to attach a Microsoft Excel file with a price breakdown for all order or quotation lines. The price breakdown will enable you to share details with customers about how you arrived at a specific sales price for a configured product.

To set your default currency:

1. Go to **Product information management** > **Setup** > **Product information management parameters**.
2. Open the **Constraint-Based product configuration models** tab.
3. Open the **Default currency** drop-down list and select your currency.



4. If you'd like to attach an Excel file with a price breakdown for all order or quotation lines, then in the **Price model** section, set **Attach** to *Yes*.

Build your sales price models

To build a sales price model:

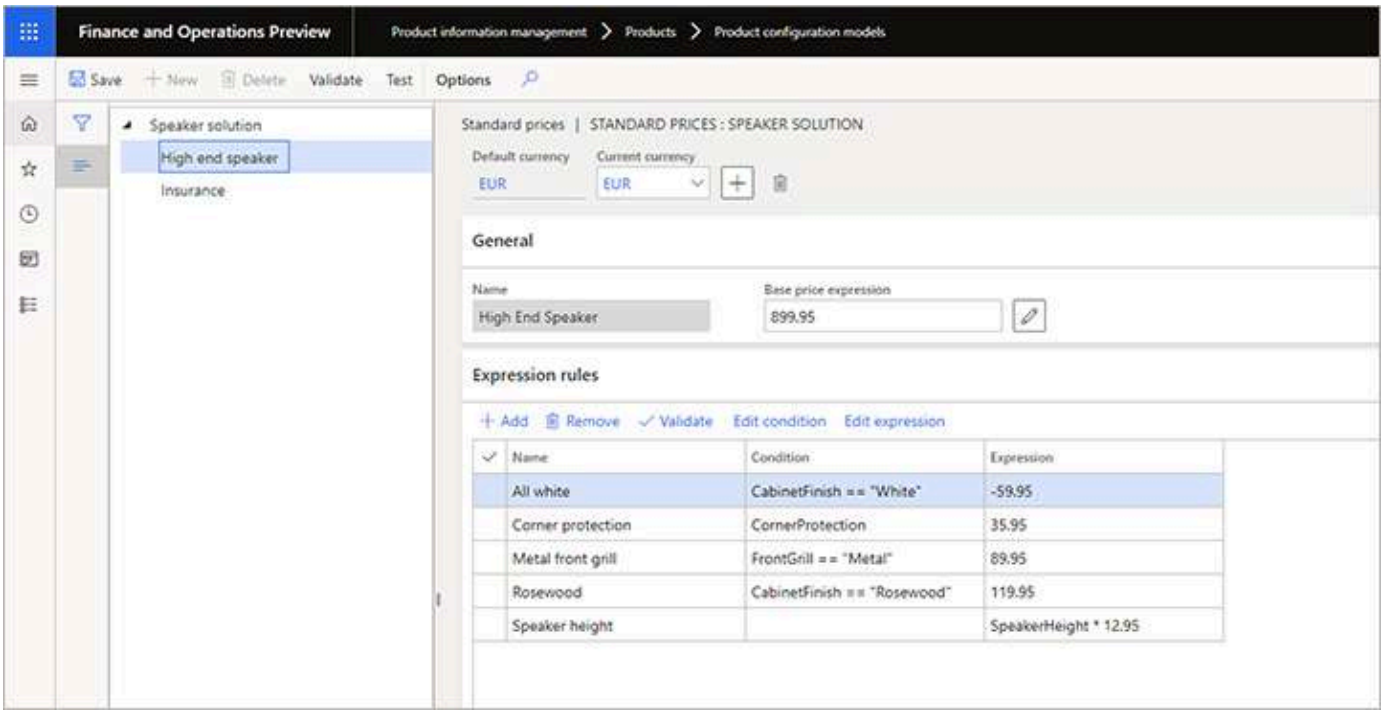
1. Go to **Product information management** > **Products** > **Product configuration models**.
2. Select the target product configuration model.
3. On the Action pane, open the **Model** tab and, from the **Set up** group, select **Price models**.
4. The **Price models** page opens.
5. Select a price model or add a new one to the grid.
6. Select **Edit** to open the edit page for your selected model, which provides the following features:

    - The header of the form shows the default currency and lets you add new currencies for your price setup.
    - The left pane shows all the components and user requirements of the product model. Each node in the product model tree can have one base-price expression and an optional number of expression rules. An expression rule consists of a condition and an expression and each expression rule covers a product option that helps control the price of the product.
    - When you build your conditions and expressions, you have the same operators available as for calculations in a product model. The expression editor also supports both conditions and expressions.

7. Select a node in the left column and then use the features described in the previous step to establish pricing rules for it (see also the example provided after this procedure). Repeat this step for each node as needed.

The following example shows a base price of a static number of 899.95 EUR, which can be modified by one or more of the following five expression rules, depending on the configuration selected by the customer:

- For white cabinet finish, subtract 59.95 EUR.
- For corner protection, add 35.95 EUR.
- For a metal front grill, add 89.95 EUR.
- For rosewood cabinet finish, add 119.95 EUR.
- Add 12.95 EUR for each unit of speaker height.



Add support for multiple currencies

When a configurable product is sold, the system checks whether the prices have been set explicitly in the currency of the customer. If so, the explicit values are used. If not, the system uses the currency exchange rates established for the sales company to convert the default currency value to the customer's currency.

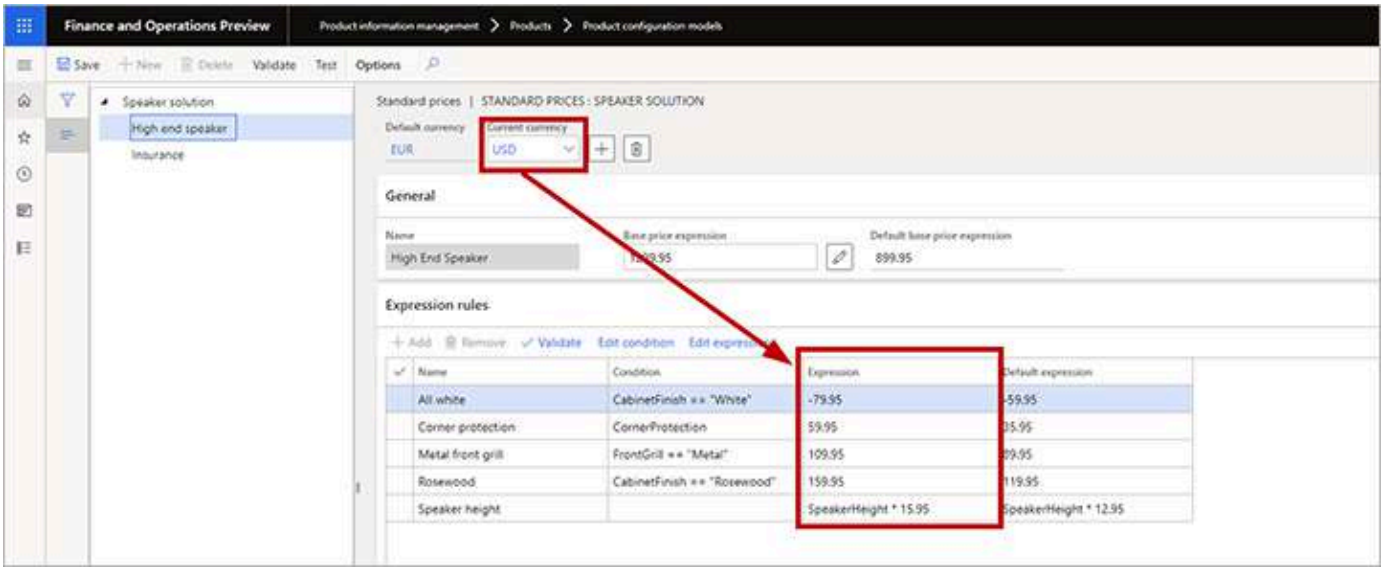
To add explicit prices in an additional currency:

1. Open the edit page for your price model, as described in Build your sales price models.
2. Select the **Add** button in the header of the price model to open the **Currencies** drop-down dialog box, which lists the available currencies.
3. Select the currency you want to add in the **Currencies** drop-down dialog box and then select **OK**.
4. The **Current currency** drop-down list now includes the currency that you just added, plus any other currencies that may have been added previously. Select your new currency and notice that the grid in the **Expression rules** section now includes two expression fields:
    - **Expression** - Shows the expression (or constant value) for finding the price using the currency currently selected for **Current currency**.
    - **Default expressions** - Shows the expression (or constant value) for finding the price using the default currently (shown in the **Default currency** field).

> **Note**
>
> The **Condition** field for the expression rules is "owned" by the default currency, which means that you can't modify the condition for other currencies. You also can't add new expression rules while a currency other than the default currency is selected as the **Current currency**.

5. Edit values in the **Expression** column as needed for the current currency.

In the example below, *EUR* is the default currency, and *USD* has been added as an additional currency.



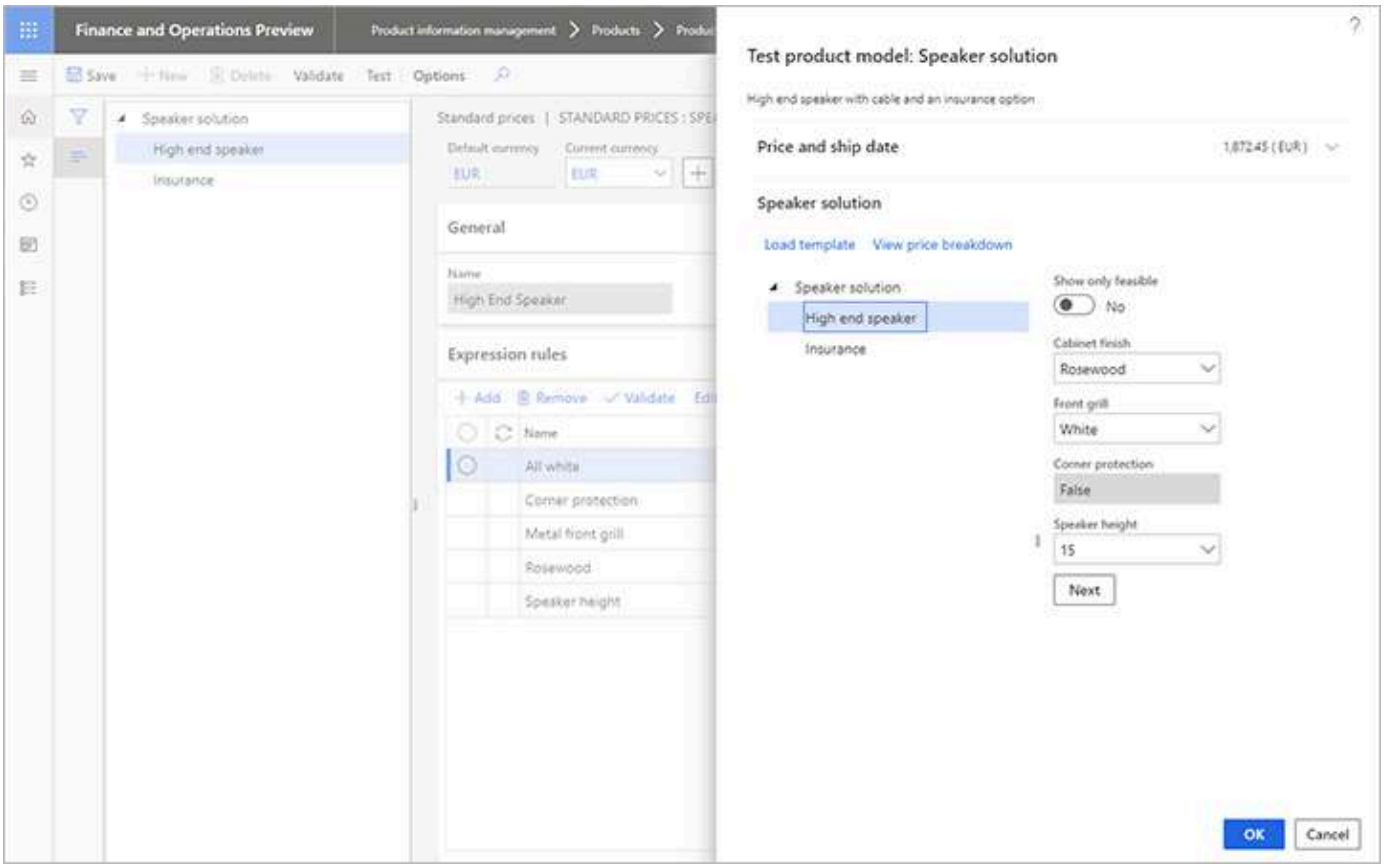
> **Note**
>
> You can't add expression rules that are unique for a non-default currency. To create expression rules that would be relevant only for a currency other than the default currency, set the price expression for the default currency to zero. Then set the appropriate expression for the non-default currency.

Test your price model

To test how the sales prices work in a configuration session, open the edit page for your price model, as described in Build your sales price models and then select **Test** on the Action Pane. The **Test product model** dialog box opens, where you can do the following:

- Use the configuration settings offered here to select product options and then see how they affect the value shown for **Price and ship date**.

- Select **View price breakdown** to download an Excel document that shows full details about how the price was calculated.



The downloaded spreadsheet shows both the absolute value and the contribution as a percentage for each active price element. If you have set the **Attach** price model option on the **Product information management parameters** page, this Excel sheet gets attached to the order or quotation line.

	A	B	C	D	E	F	G	H	I	J	K	L	M	N	O	P
1	Price breakdown															
2																
3							Test product model: Speaker solution									
4																
5																
6																
7	Time of configuration: 8/17/2020 03:44:19 am										Total sales price		1,872.45	EUR		
8																
9							Price		Price element		By percentage		By percentage			
10	**Test product model: Speaker solution**						1,872.45				100					
11	**Speaker solution**						578.40				30.90					
12		*Base price*							299.95				16.02			
13		*Cable included*							69.95				3.74			
14		*Cable size 30*							208.50				11.14			
15		**High end speaker**					1,214.15				64.85					
16			*Base price*						899.95				48.07			
17			*Rosewood*						119.95				6.41			
18			*Speaker height*						194.25				10.38			
19		**Insurance**					79.90				4.27					
20			*Insurance period*						79.90				4.27			
21																

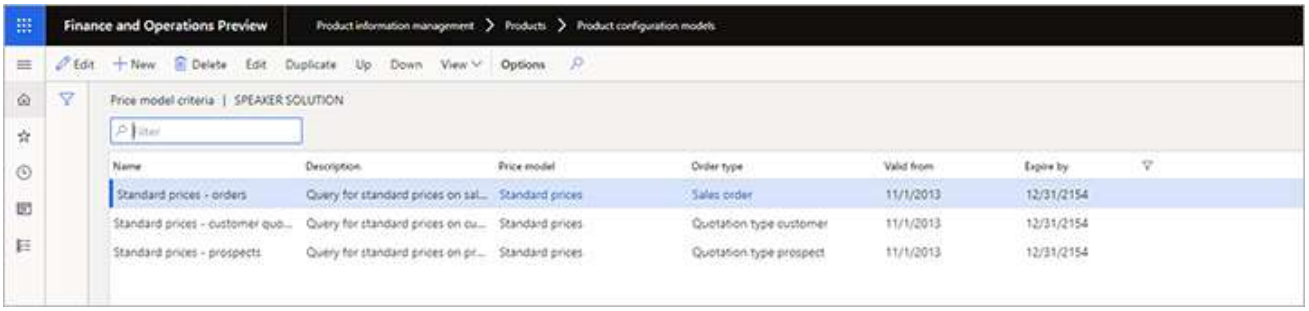
Set up selection criteria for price models

When your price models are in place, you must establish at least one selection criterion to pick up the price model when you configure to quote or to order. You'll do this by setting up one or more queries. In a combination with matching sales price models, the queries provide great flexibility in targeting sales prices for particular customers, regions, periods, and other criteria.

To set up selection criteria for price models:

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. Select the target product configuration model.
3. On the Action pane, open the **Model** tab and, from the **Set up** group, select **Price model criteria**. The **Price model criteria** page opens.
4. If the query row you need doesn't exist yet, select **New** on the Action Pane to add a new row to the grid and make the following settings for it:

    - **Name** - Enter a name for this row.
    - **Description** - Briefly describe the query and what it is for.
    - **Price model** - Select a price model (from the current configuration model) that the query will apply when triggered.
    - **Order type** - Select the type of order where the query will apply.
    - **Valid from** - Specify the first day when the query will apply.
    - **Expire by** - Specify the last date when the query will apply.



5. Select the row for the query you want to define and then select **Edit** on the Action Pane. The query designer dialog box opens. It works like most query designers in Supply Chain Management. Use it to define the conditions under which the price model for the row you selected should be applied.
6. Repeat steps 4-5 for each query you require.

> **Tip**

You can save time by copying an existing row that is already similar to a new one that you need to add. To do this, select a target row and then select **Duplicate** on the Action Pane.

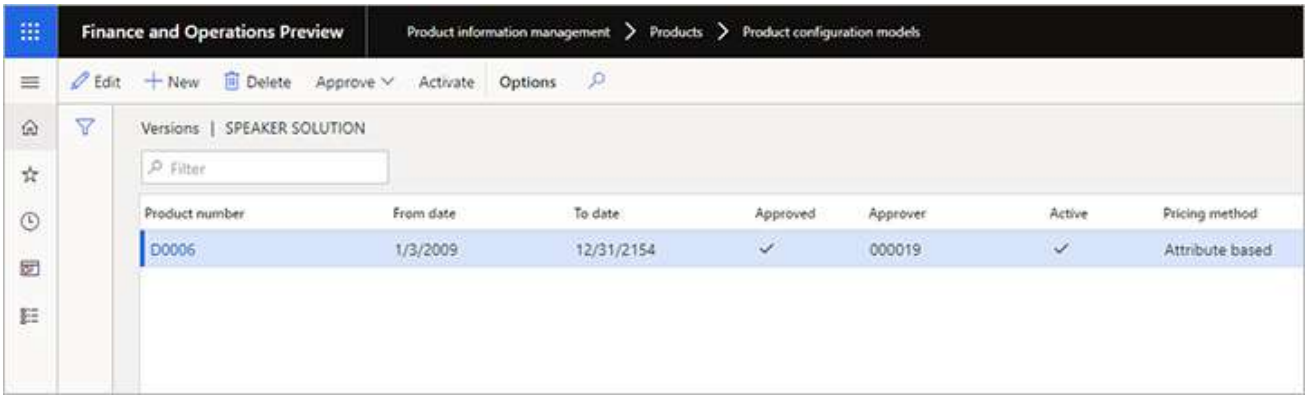
7. When you have finished setting up your criteria, arrange them into the proper order in the **Price model criteria** list. To reposition a row, select the row and then select **Up** or **Down** on the Action Pane.

> **Important**
>
> At configuration time, the system starts searching from the top of the list and uses the first query that matches the data on the quote or the order line. Therefore, you must put your most specific queries on top. If you place a general query at the top of the list, this is the one that will be used even though there might be a query further down the list that targets the exact customer or prospect of the configuration.

Set attribute-based sales prices for the product model version

The final step is to specify attribute-based sales prices for the product model version. To do this:

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. Select the target product configuration model.
3. On the Action Pane, open the **Model** tab and, from the **Product model details** group, select **Versions**.
4. The **Versions** page opens. Make sure the **Pricing method** is set to **Attribute based**.



Last updated on 07/01/2026

Approve a product configuration model

Article • 09/29/2021

Running this procedure requires that at least one product configuration model is available. This procedure uses the High end speaker model in the demo data company USMF. Note that this model has already been approved, but the procedure walks you through the entire process.

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.
    - Select the High end speaker model for this procedure.
3. Select **Versions**.
4. Select **New**.
5. In the **Product number** field, enter or select a value.
    - The reference to a product represents a version of a product configuration model. Only product masters which have the constraint-based configuration technology will appear in this list.
6. In the **From date** field, enter a date.
    - Select when the product model version will be available.
7. In the **To date** field, enter a date.
    - Select an end date when this product model version will expire, or select Never.
8. Select **Approve** to open the drop dialog.
9. In the **Approved by** field, enter or select a value.
    - Select the person who is responsible for approving product models for use in operations.
10. Select **OK**.
11. In the **Pricing method** field, select an option.
    - Activate the product model version. It is only possible to have one product active for one product model at a time.
12. Close the page.

Transfer data for product models

Article • 09/29/2021

Exporting data for a product configuration model requires that you have at least one product model available. This procedure uses the High end speaker model in the demo company USMF to show you how to export data for this model.

1. Go to **Product information management** > **Products** > **Product configuration models**.
2. In the list, find and select the desired record.
    - Select the High end speaker model for this procedure.
3. On the Action Pane, select **Model**.
4. Select **Export product model**.
    - The download behavior varies from browser to browser depending on how the security settings are set up.

Engineering change management overview

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

Feature summary

Today's manufacturers need strong product data management, version control, and engineering change management to succeed in a world of constantly shrinking product lifecycles, increased quality and reliability requirements, and an increased focus on product safety.

Engineering change management brings structure and discipline to the product data management process. It enables you to define, release, and revise products in a controlled manner that workflows support. Through product versions and engineering change management, you can document, assess the impact of, and apply engineering changes throughout the whole lifecycle of a product.

Engineering change management helps you plan and manage product versioning, manage product lifecycles, and manage engineering changes. Here's a list of its main features:

- Product versioning
- Enhanced product release functionality that lets you maintain product master data in one legal entity (the engineering company) and publish the fully configured released product to other legal entities
- Rules for validating that required information is entered before a product version is activated (readiness checks)
- Improved product lifecycle management through fine-grained control over when a released product can be used in specific business processes
- Engineering change requests that workflows support
- Engineering change orders that workflows support

https://learn-video.azurefd.net/vod/player?id=5580ff02-3710-47ca-a022-7f9a8ea9c3c3&locale=en-us&embedUrl=%2Fdynamics365%2Fsupply-

chain%2Fengineering-change-management%2Fproduct-engineering-overview

The preceding video (Change management capabilities in Dynamics 365 Supply Chain Management) is included in the finance and operations playlist available on YouTube.

Number sequence requirements

To use engineering change management, set both the BOM number sequence and the formula number sequence (if you're using formulas) to *Automatic* on the **Number sequences** page.

Turn the required configuration keys on or off

Starting with Supply Chain Management version 10.0.36, all **Engineering Change Management** keys are turned on by default, but the **Product dimension - Version** key is only turned on by default for new systems (not for older systems that are upgraded to version 10.0.36 or later). If you need to turn any of these keys on or off, follow these steps:

1. Put your system into maintenance mode, as described in Maintenance mode.
2. Go to **System administration** > **Setup** > **License configuration**.
3. Expand the **Trade** node.
4. Enable or disable the configuration key for the main feature by using the **Engineering Change Management** checkbox.
5. Expand the **Engineering Change Management** node, and select or clear the following checkboxes as required (depending on the features that you want to use):
    - **Attribute search** – Select this checkbox to enable the attribute search feature. Enable this feature, but you can clear this checkbox if you won't use it.
    - **Change management for process manufacturing** – Select this checkbox if you want to use Engineering change management features to manage changes in formulas for process manufacturing. If you don't need to manage formulas, clear this checkbox. For more information, see Manage changes in formulas and their ingredients.
6. If you also want to use the version dimension, select the **Product dimension - Version** checkbox. (This checkbox is further down the list, not nested under the **Engineering Change Management** node.) You can clear this check box if you don't need this feature.

    > ⚠ **Warning**

When you turn on the **Product dimension - Version** key for an existing system, some functionality might break or stop working as expected if you installed other solutions that add customizations to the inventory dimensions. For the version dimension to be fully functional, you might have to update those solutions so that they include the version dimension in their references to the inventory dimensions. See **The version product dimension** for details.

7. Turn off maintenance mode, as described in Maintenance mode.

8. The database must be synchronized to ensure that the configuration keys are properly updated to reflect your changes. If you changed any of the key settings, do one of the following steps, depending on which type of environment you're working on:

    - **For Tier 1 (development) environments**: Open your project in Microsoft Visual Studio and then select **Dynamics 365** > **Synchronize database** > **Synchronize**.
    - **For Tier 2 (and higher) environments**: The database syncs automatically after you put the environment in and out of maintenance mode, so you can skip this step.

Engineering change management feature walkthrough

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

This article provides an end-to-end walkthrough that shows how to work with engineering change management. It goes through each of the most important scenarios:

- Basic feature configuration
- How an engineering company creates a new engineering product
- How an engineering company releases an engineering product to a local company
- How a local company can review and accept a product that has been released to it by an engineering company
- How a local company can use an engineering product in standard transactions
- How to add an engineering product to a sales order
- How to request changes to an engineering product by creating an engineering change request
- How to schedule and implement requested changes by creating an engineering change order
- How to release a product that has been changed

All the exercises in this article use the standard sample data that's provided for Microsoft Dynamics 365 Supply Chain Management. Additionally, each exercise builds on the previous exercise. Work through the exercises in order, from beginning to end, especially if you've never used the engineering change management feature before. This approach gives you a complete understanding of the feature.

Set up for the sample scenario

To follow the sample scenario in this article, first prepare the feature by making demo data available and adding a few custom records.

Before you try to do any of the exercises in the rest of this article, follow the instructions in all the following subsections. These subsections also introduce several important settings pages that you use when you set up engineering change management for your own organization.

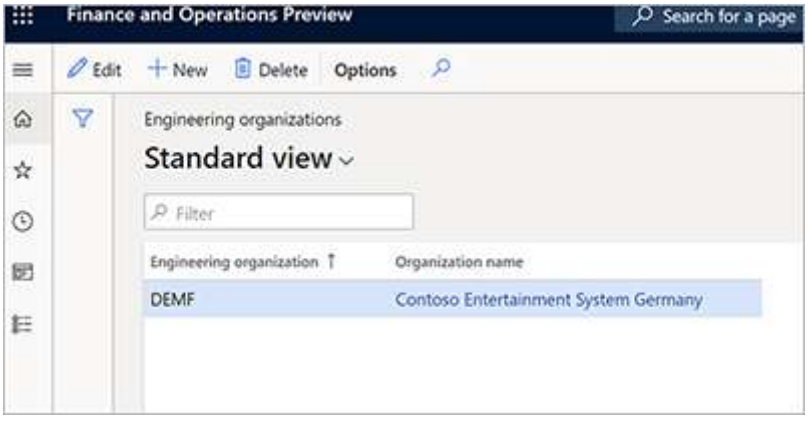
Make standard demo data available

Work on a system where the standard demo data is installed. The standard demo data adds data for several demo legal entities (companies and organizations). As you work through the exercises, use the company picker on the right side of the navigation bar to switch between one company (*DEMF*) that's set up as an *engineering organization* and another company (*USMF*) that's set up as an *operational organization*.

Set up an engineering organization

An engineering organization owns the engineering data, and is responsible for product design and product changes. To set up your engineering organizations, follow these steps:

1. Go to **Engineering change management** > **Setup** > **Engineering organizations**.
2. Select **New** to add a row to the grid, and set the following values for it:
    - **Engineering organization:** *DEMF*
    - **Organization name:** *Contoso Entertainment System Germany*

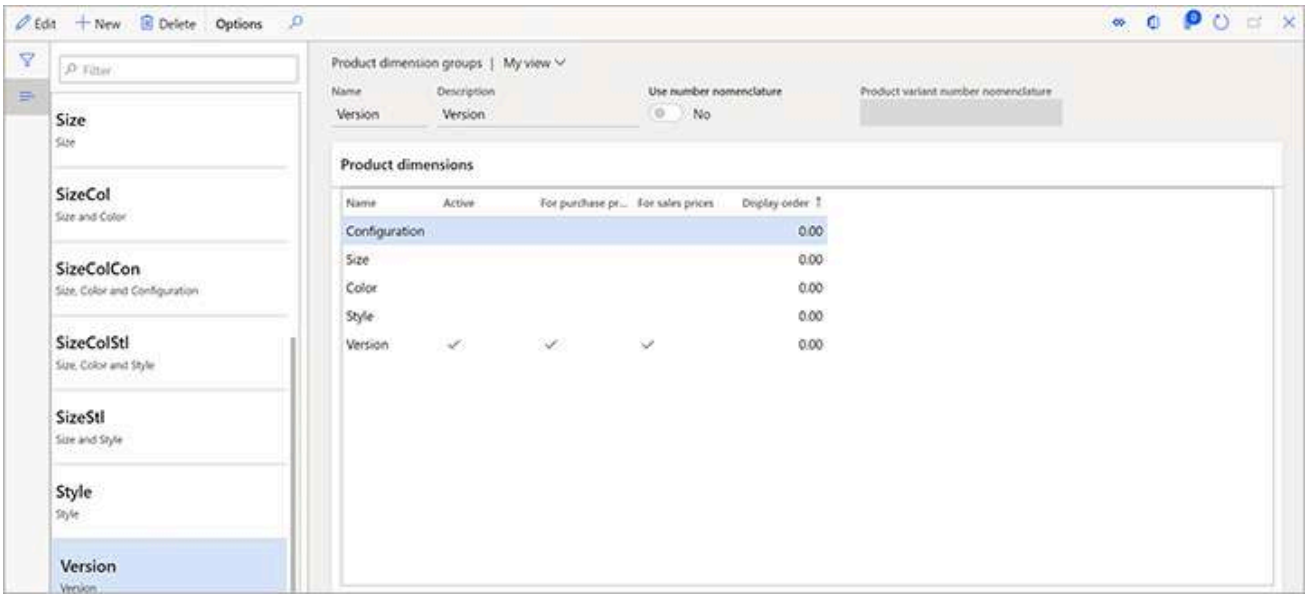


Set up the version product dimension group

1. Go to **Product information management** > **Setup** > **Dimensions and variant groups** > **Product dimension groups**.
2. Select **New** to create a product dimension group.
3. Set the **Name** field to *Version*.

4. Select **Save** to save the new dimension and load values onto the **Product dimensions** FastTab.

5. On the **Product dimensions** FastTab, set **Version** as an active product dimension.



Set up product lifecycle states

As an engineering product goes through its lifecycle, you must be able to control which transactions are allowed for each lifecycle state. To set up the product lifecycle states, follow these steps:

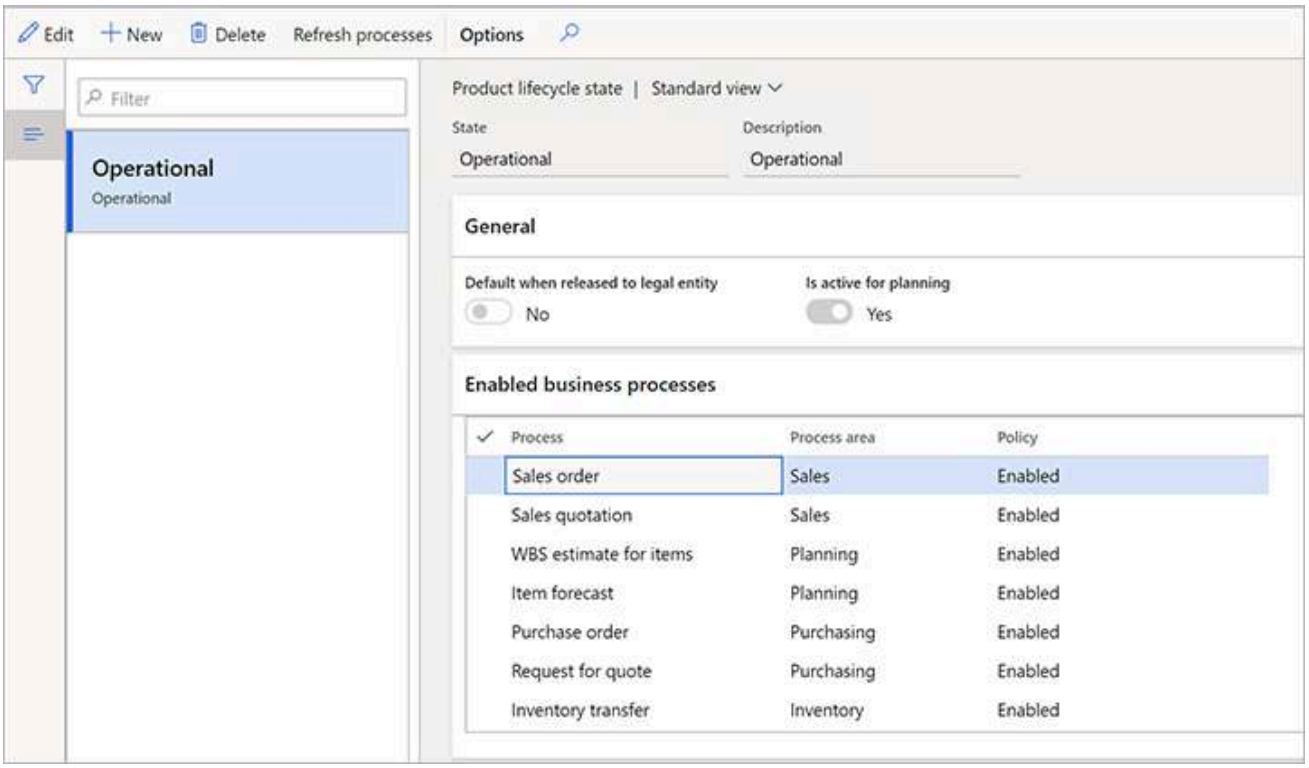
1. Go to **Engineering change management** > **Setup** > **Product lifecycle state**.

2. Select **New** to add a lifecycle state, and set the following values for it:

   - **State:** *Operational*
   - **Description:** *Operational*

3. Select **Save** to save the new lifecycle state and load values onto the **Enabled business processes** FastTab.

4. On the **Enabled business processes** FastTab, select the business processes that should be available. For this example, leave the **Policy** field set to *Enabled* for all business processes.

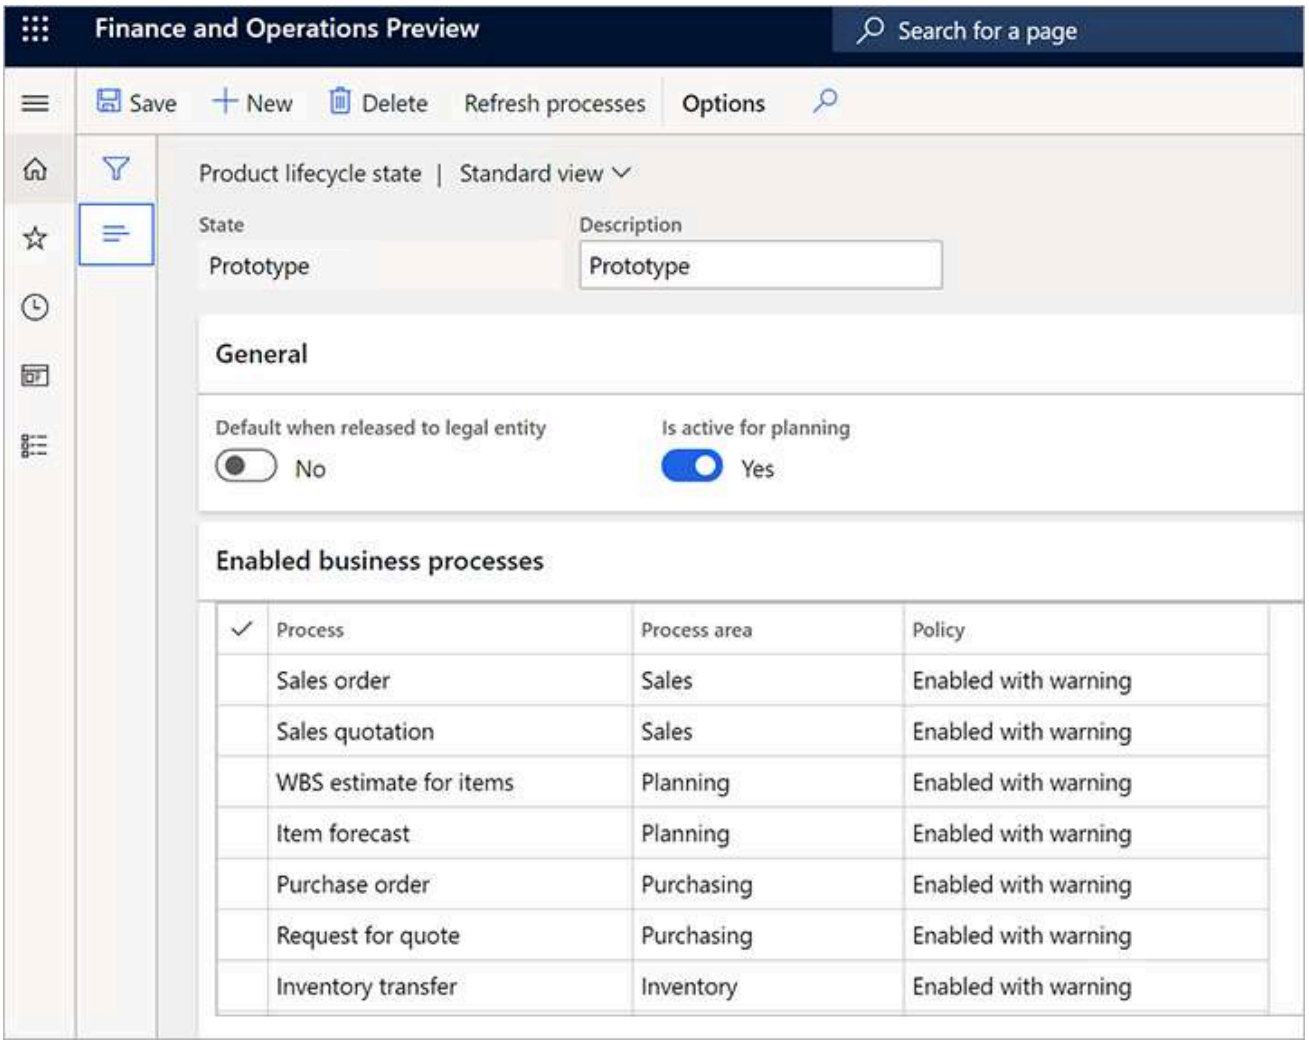


5. Select **New** to add another lifecycle state, and set the following values for it:

    - **State:** *Prototype*
    - **Description:** *Prototype*

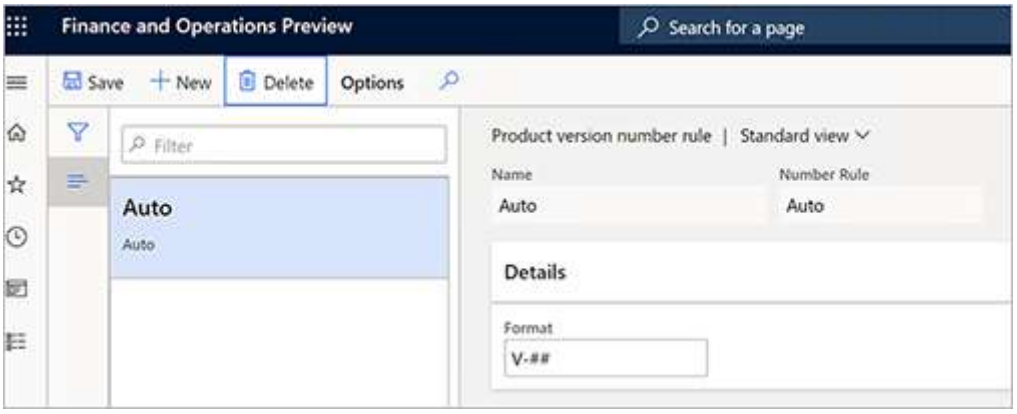
6. Select **Save** to save the new lifecycle state and load values onto the **Enabled business processes** FastTab.

7. On the **Enabled business processes** FastTab, select the business processes that should be available. For this example, set the **Policy** field to *Enabled with warning* for all business processes.



Set up a version number rule

1. Go to **Engineering change management** > **Setup** > **Product version number rule**.
2. Select **New** to add a rule, and set the following values for it:
    - **Name:** *Auto*
    - **Number rule:** *Auto*
    - **Format:** *V-##*



Set up a product release policy

1. Go to **Engineering change management** > **Setup** > **Product release policies**.

2. Select **New** to add a release policy, and set the following values for it:

    - **Name:** *Components*
    - **Description:** *Components*

3. On the **General** FastTab, set the following values:

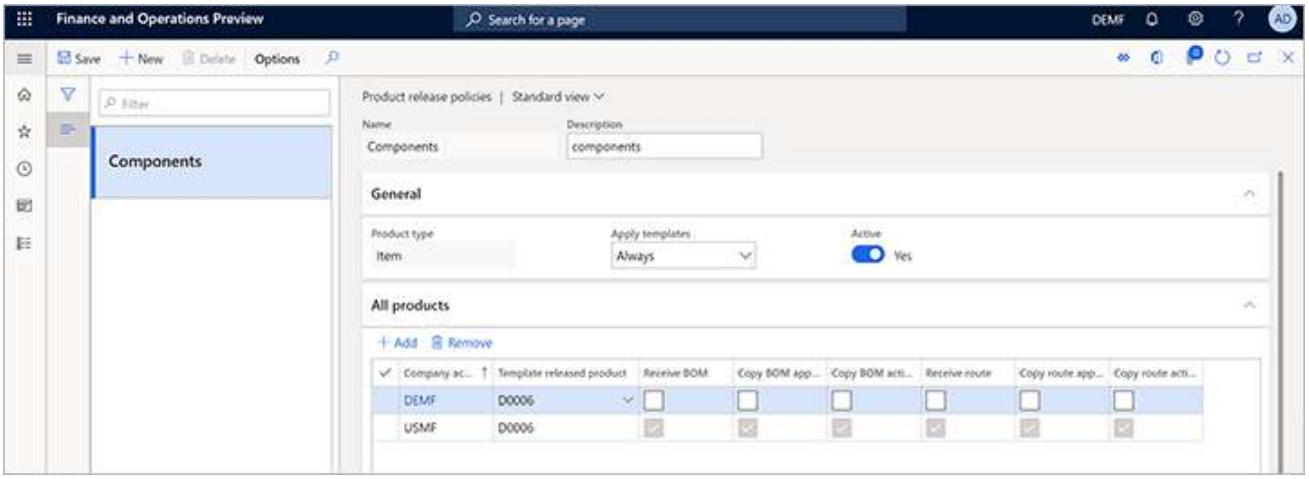
    - **Product type:** *Item*
    - **Apply templates:** *Always*
    - **Active:** *Yes*

4. On the **All products** FastTab, select **Add** to add a line, and set the following values for it:

    - **Company:** *DEMF*
    - **Template released product:** *D0006*

5. Select **Add** to add another line, and set the following values for it:

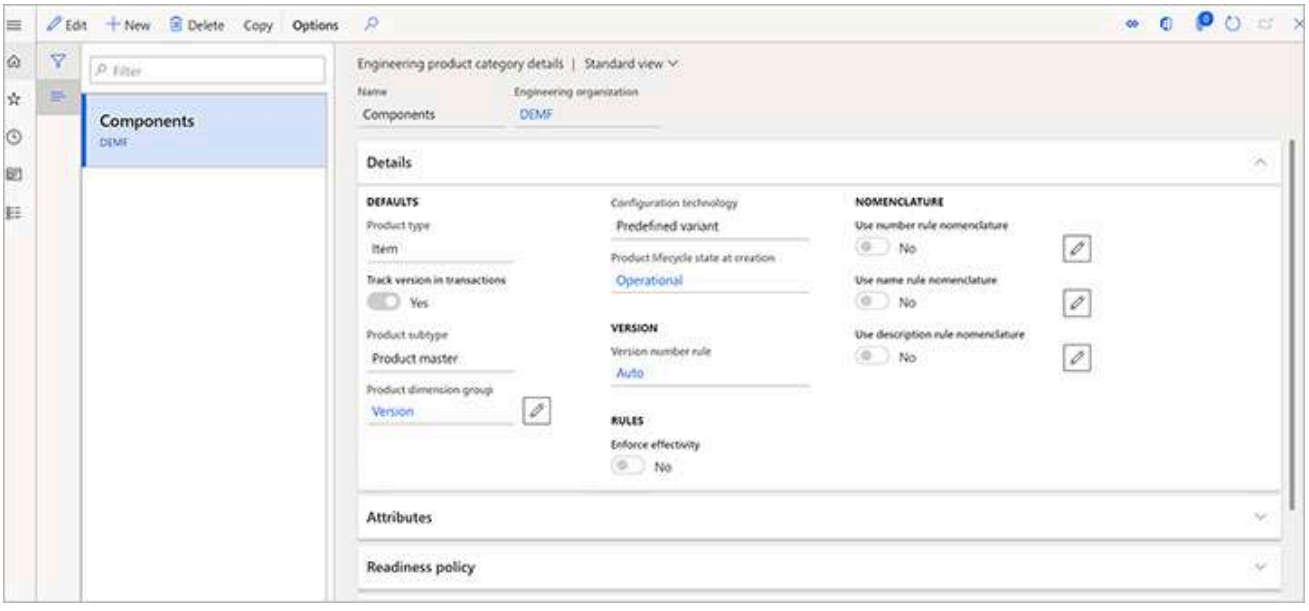
    - **Company accounts ID:** *USMF*
    - **Template released product:** *D0006*
    - **Receive BOM:** Select this check box.
    - **Copy BOM approval:** Select this check box.
    - **Copy BOM activation:** Select this check box.
    - **Receive route:** Select this check box.
    - **Copy route approval:** Select this check box.
    - **Copy route activation:** Select this check box.



Set up an engineering product category

Engineering product categories provide the basis for creating engineering products (that is, products that are versioned and controlled through engineering change management). To set up engineering product categories, follow these steps:

1. Go to **Engineering change management** > **Engineering product category details**.
2. Select **New** to create a category.
3. On the **Details** FastTab, set the following values:
    - **Name:** *Components*
    - **Engineering organization:** *DEMF*
    - **Product type:** *Item*
    - **Track version in transactions:** *Yes*
    - **Product dimension group:** *Version*
    - **Product lifecycle state at creation:** *Operational*
    - **Version number rule:** *Auto*
    - **Enforce effectivity:** *No*
    - **Use number rule nomenclature:** *No*
    - **Use name rule nomenclature:** *No*
    - **Use description rule nomenclature:** *No*
4. On the **Release policy** FastTab, set the **Product release policy** field to *Components*.
5. Select **Save**.

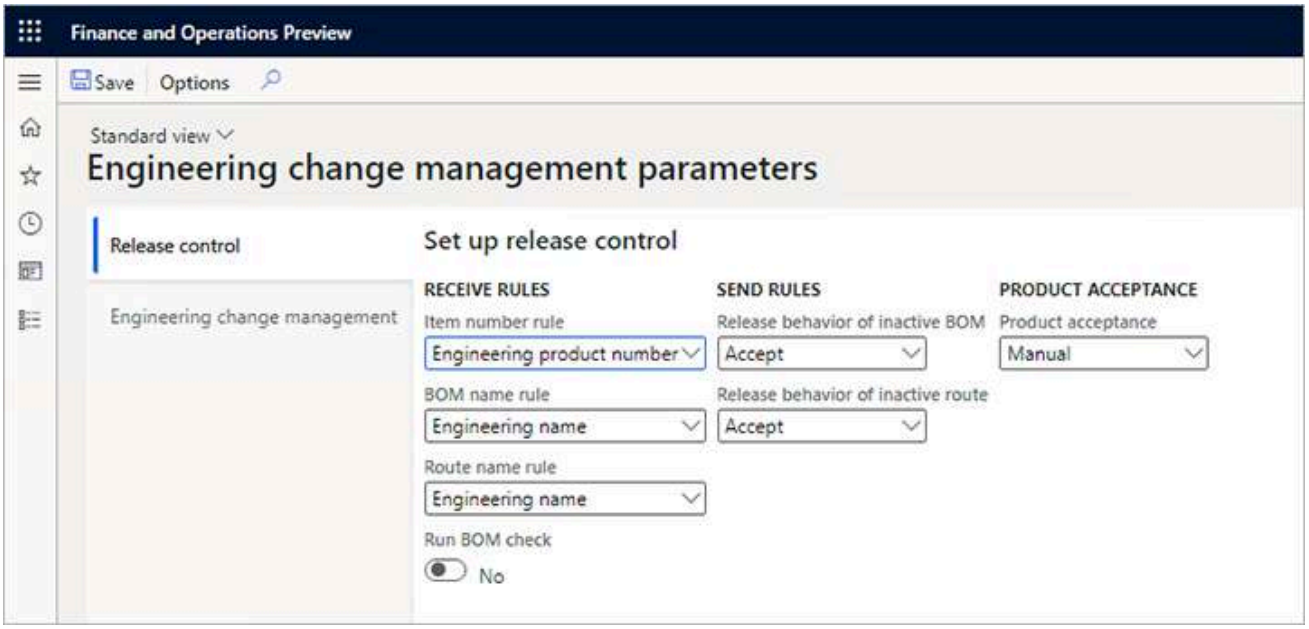


Set up product acceptance conditions

1. Use the company picker on the right side of the navigation bar to switch to the *USMF* legal entity (company).

2. Go to **Engineering change management** > **Setup** > **Engineering change management parameters**.

3. On the **Release control** tab, in the **Product acceptance** section, set the **Product acceptance** field to *Manual*.



Create a new engineering product

An engineering product is a product that is versioned and controlled through engineering change management. In other words, you can control the changes during its life, and the change information is saved by using engineering change orders. To create engineering products, follow these steps:

1. Make sure that you're in the legal entity of your engineering organization (*DEMF* for this example). Use the company picker on the right side of the navigation bar as required.

2. Open the **Released products** page by following one of these steps:

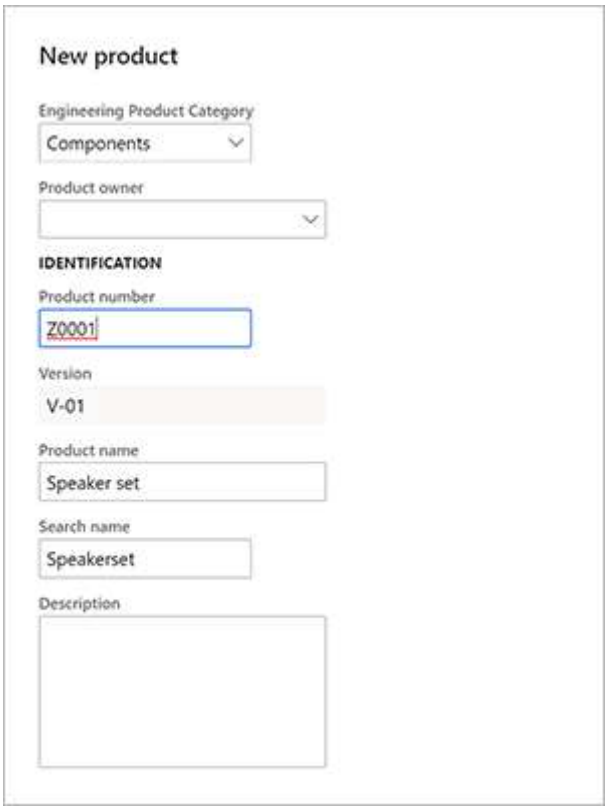
   - Go to **Product information management** > **Products** > **Released products**.
   - Go to **Engineering change management** > **Common** > **Released products**.

3. On the Action Pane, on the **Product** tab, in the **New** group, select **Engineering product**.

4. In the **New product** dialog box, set the following values:

   - **Engineering Product Category:** *Components*

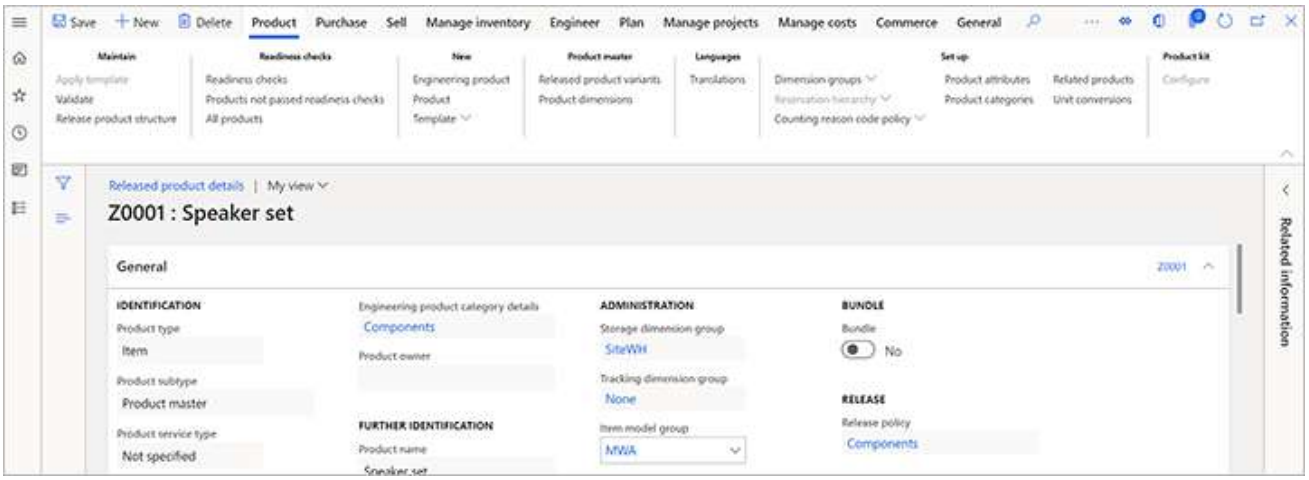
- **Product number:** *Z0001*
- **Product name:** *Speaker set*



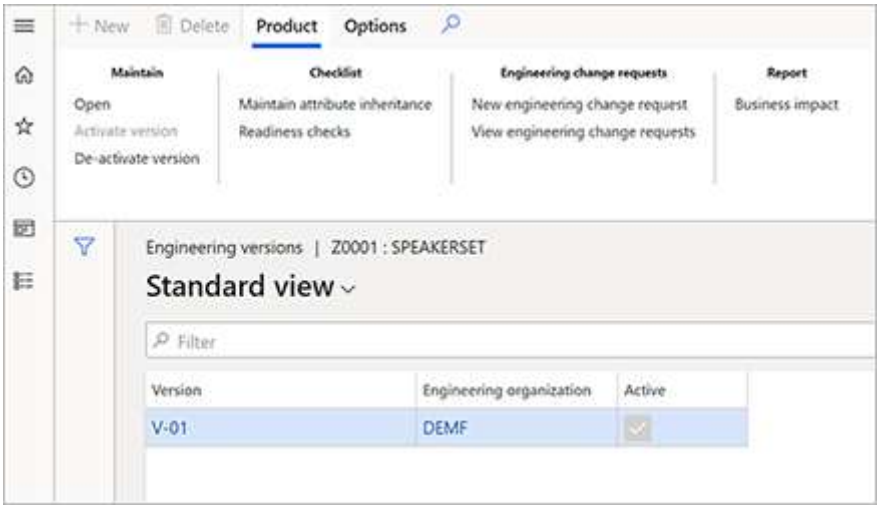
Note that the **Version** field is automatically set by using the product version number rule that you set up earlier.

5. Select **OK** to create the product and close the dialog box.

6. The details page for the new product opens. Notice that values are already filled in for some fields, such as **Storage dimension group**, **Tracking dimension group**, and/or **Item model group**. These fields were automatically set because the product is being released in the *DEMF* legal entity and uses the *Components* product release policy, which is associated with the *Components* engineering product category. Because you previously used item *D0006* as a template to set up a line for the *DEMF* legal entity, the values that were filled in were taken from item *D0006*.

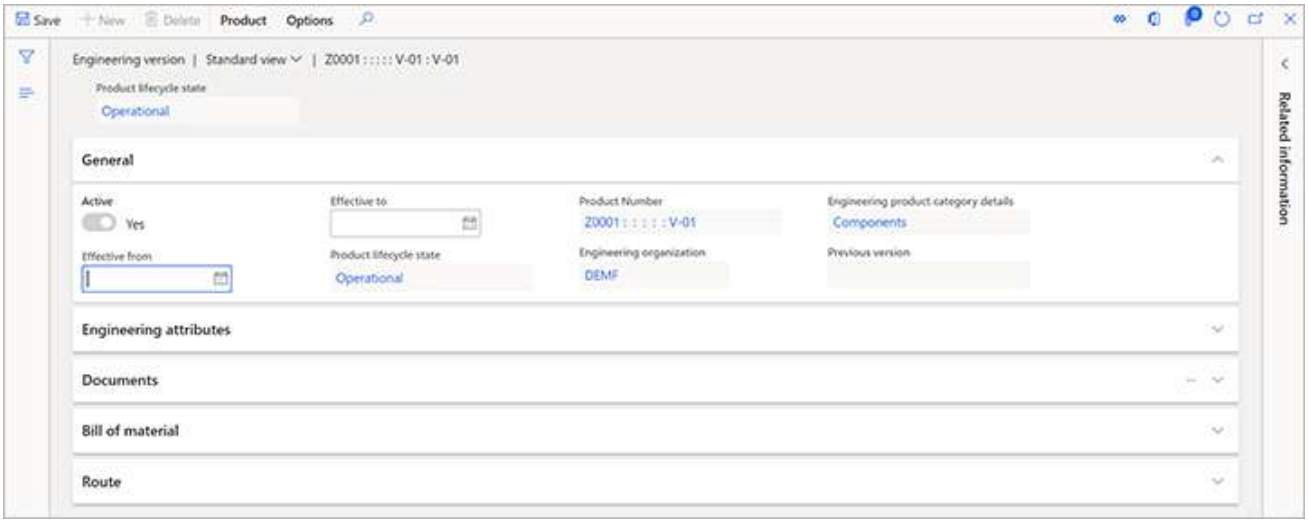


7. On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering versions** to view the versions of the product.



8. On the **Engineering versions** page, notice that there is only one version for the product, and it's active.

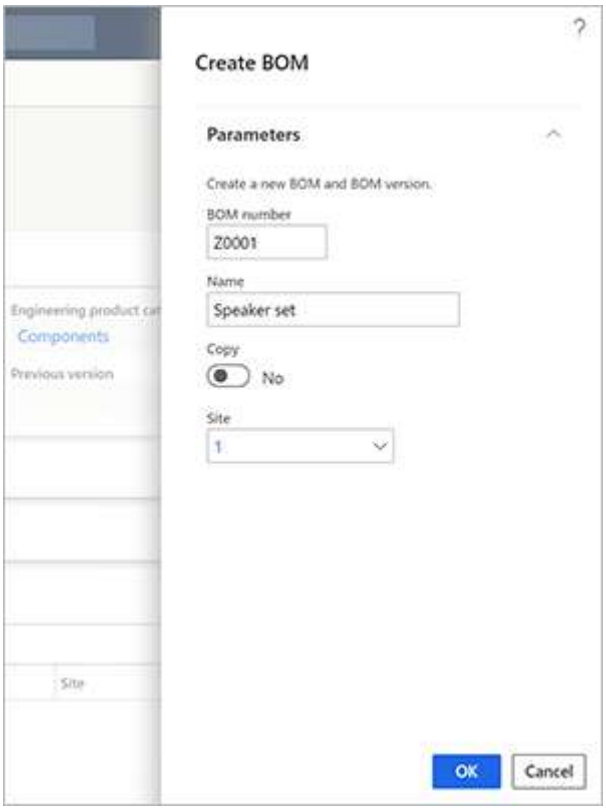
9. Select the version to view its details.



10. On the **Engineering version** page, on the **Bill of material** FastTab, select **Create BOM**.

11. In the **Create BOM** dialog box, set the following values:

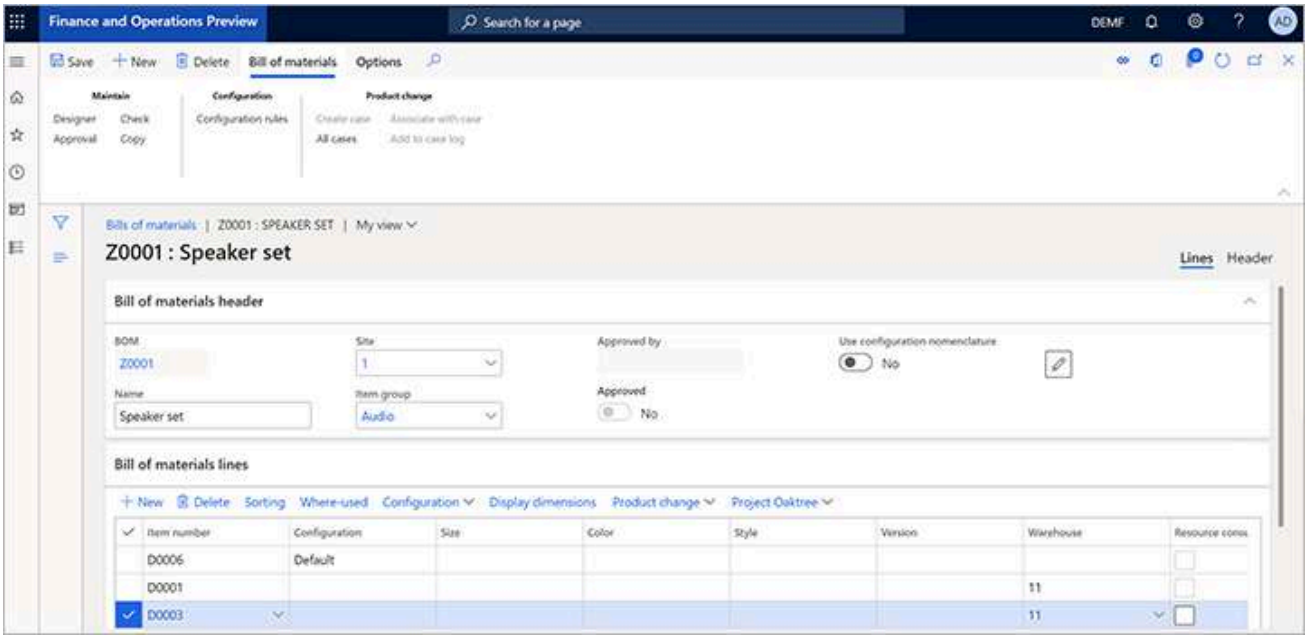
    - **BOM number:** Z0001
    - **Name:** Speaker set
    - **Site:** 1



12. Select **OK** to add the BOM and close the dialog box.

13. On the **Bill of materials** FastTab, select **Bill of material**.

14. On the **Bill of materials** page, on the **Bill of materials lines** FastTab, add three lines, one each for item numbers *D0001*, *D0003*, and*D0006*.

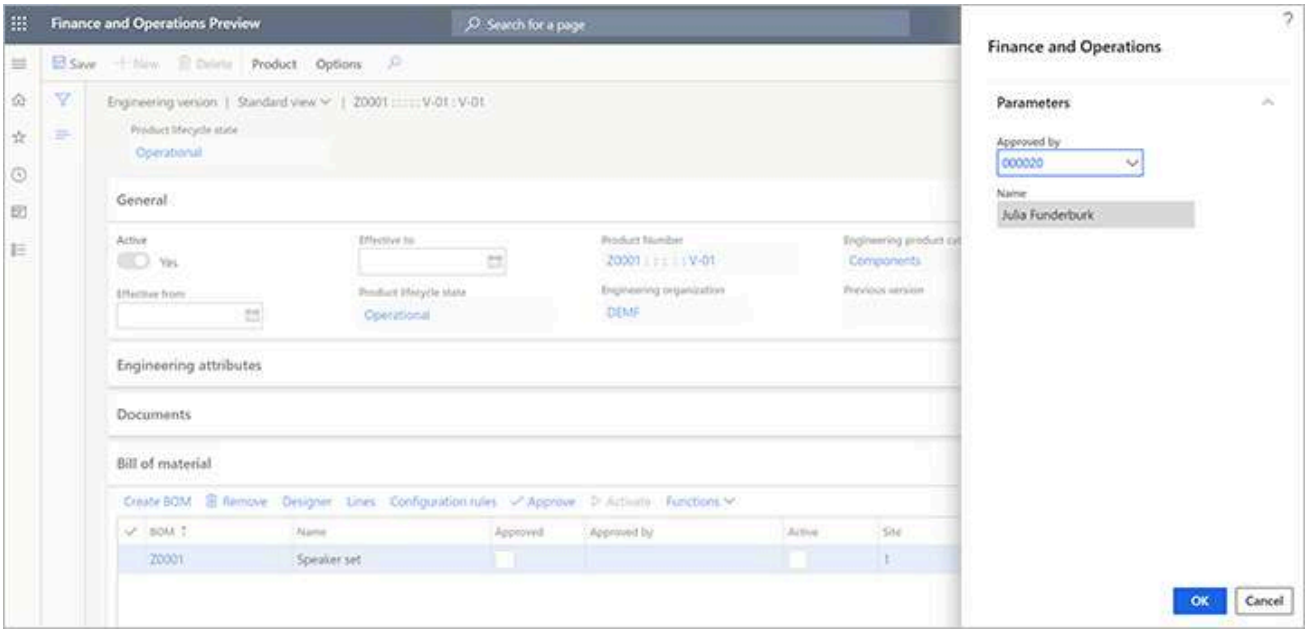


15. Select **Save**.

16. Close the page.

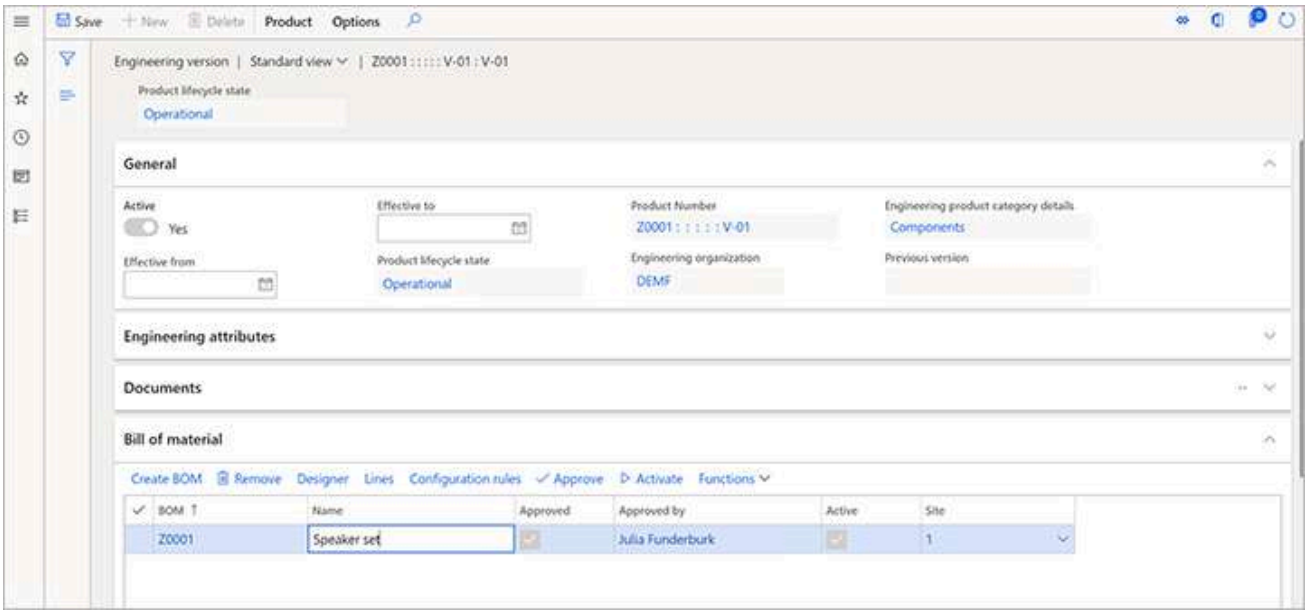
17. On the **Engineering version** page, on the **Bill of material** FastTab, select **Approve**.

18. In the dialog box that appears, select **OK**.



19. On the **Engineering version** page, on the **Bill of material** FastTab, select **Activate**.

20. Notice that the **Active** and **Approved** check boxes are selected for the BOM.



21. Close the page.

Release an engineering product to a local company

The product has now been designed by the Engineering department. For this example, the product is a prototype that engineering has designed for a customer. Because the customer belongs to the *USMF* legal entity, you must release the product to that legal entity.

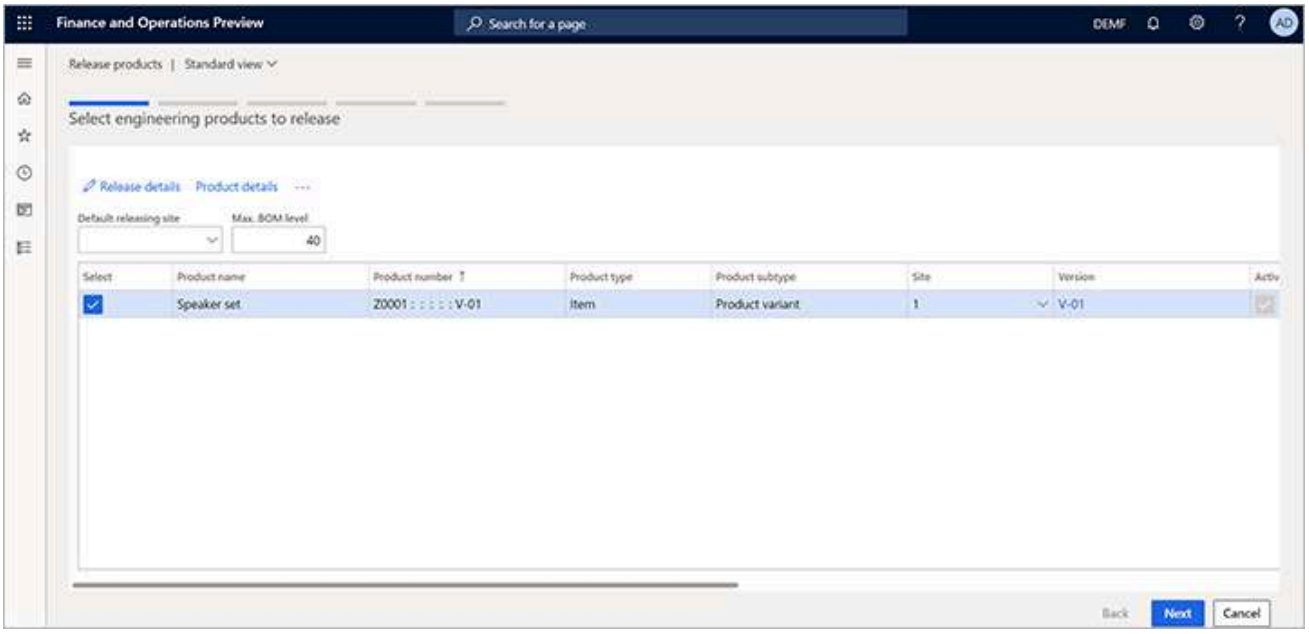
1. Keep the legal entity set to *DEMF*. (Use the company picker on the right side of the navigation bar as required.)

2. Go to **Product information management** > **Products** > **Released products**.

3. Select product *Z0001*.

4. On the Action Pane, on the **Product** tab, in the **Maintain** group, select **Release product structure** to open the **Release products** wizard.

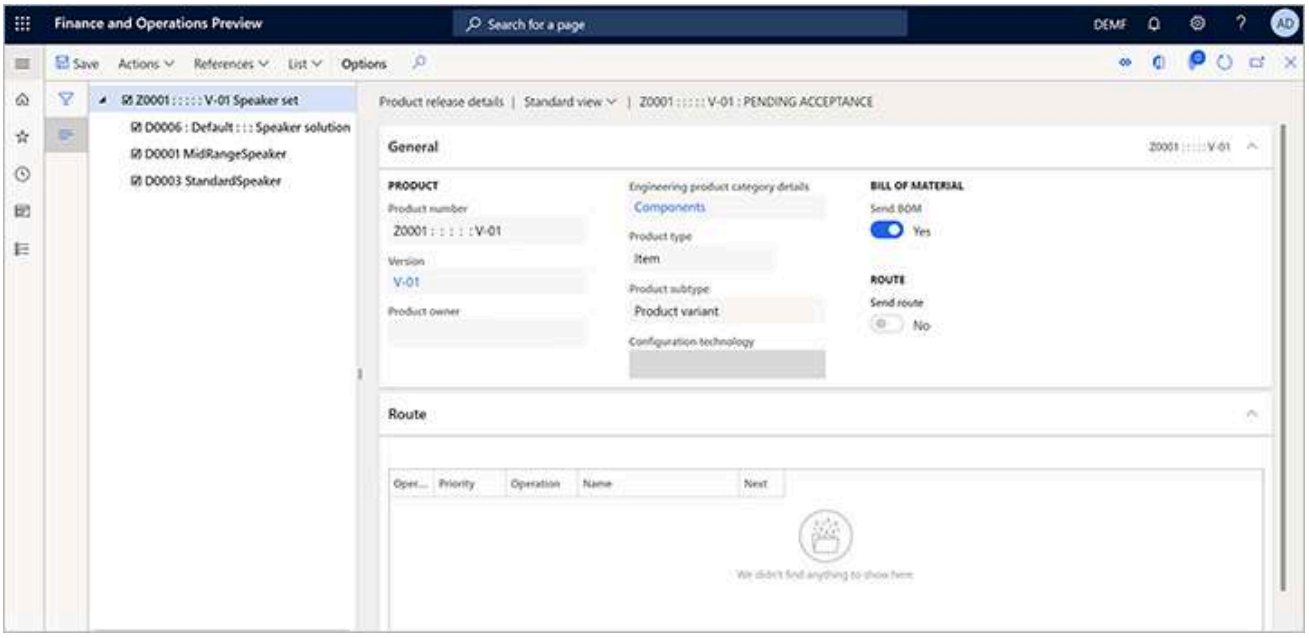
5. On the **Select engineering products to release** page, select the **Select** check box for product *Z0001*.



6. Select **Release details**.

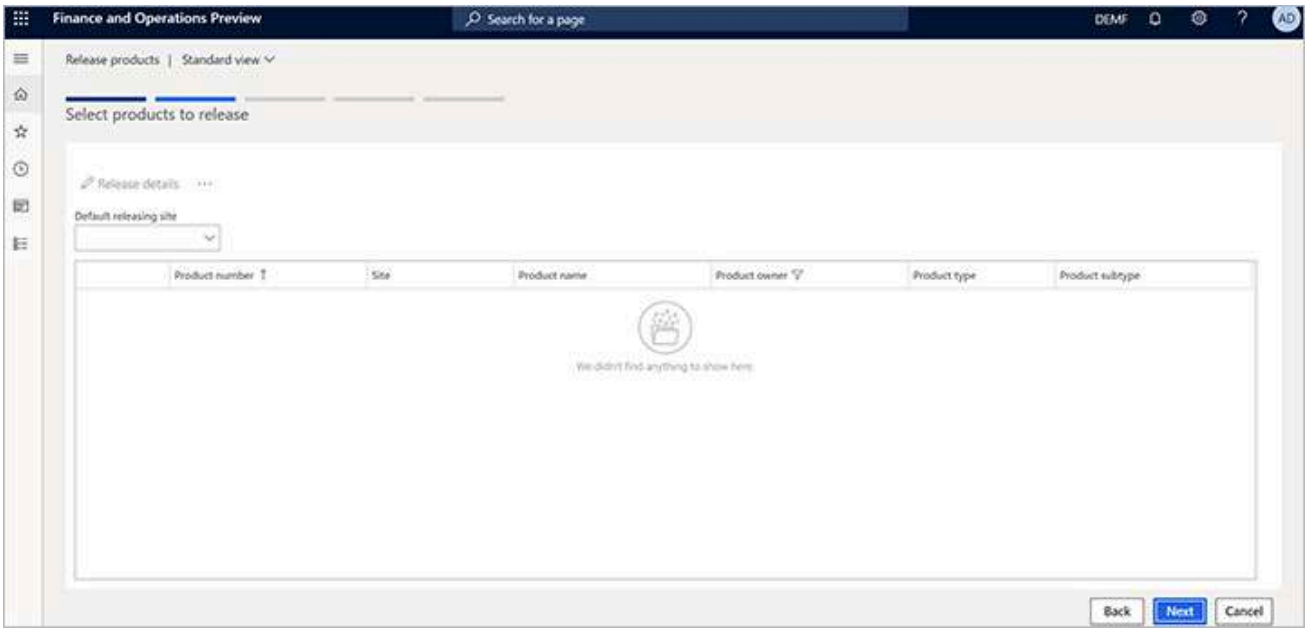
7. The **Product release details** page appears, where you can review the details of the product being released and its product structure. Notice that the **Send BOM** option is set to *Yes*. Therefore, both product *Z0001* and all its child items from the BOM are released.

   You can select any child item in the left pane to review its details. If any child item has a BOM, you can also select to release the BOM of that child item.



8. Close the page to return to the **Release products** wizard.

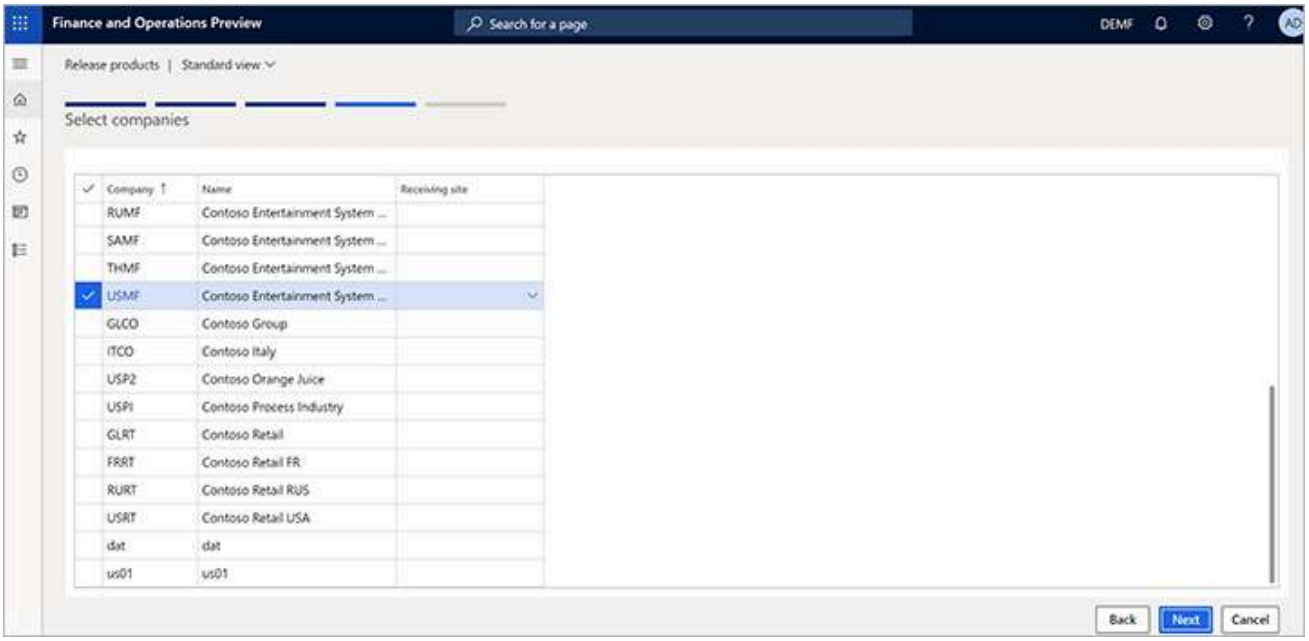
9. Select **Next** to open the **Select products to release** page. If you had selected any standard (non-engineering) products, they would appear on this page. Note that when you release a standard product by selecting **Release product structure**, its BOM and route are also released.



10. Select **Next** to open the **Select product variants to release** page. For this example, there aren't any variants.

11. Select **Next** to open the **Select companies** page.

12. Select the companies that the product should be released to. For this example, select the check box for **USMF**.



13. Select **Next** to open the **Confirm selection** page.

14. Select **Finish**.

Review and accept the product before you release it in the local company

The Engineering department has now released the information to the local companies where the product is used. For this example, the local company is *USMF*.

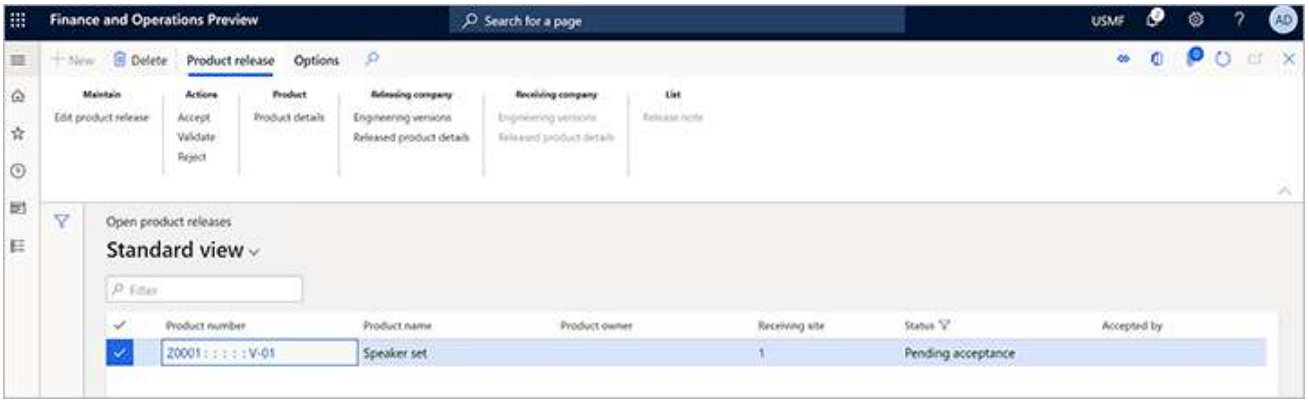
Because you set the **Product acceptance** field to *Manual* on the **Engineering change management parameters** page for the *USMF* company, products must be manually accepted before they are released to that company. In other words, they must be reviewed and accepted before they become released products.

To review the product and release it in the *USMF* company, follow these steps:

1. Set the legal entity to *USMF*. (Use the company picker on the right side of the navigation bar.)

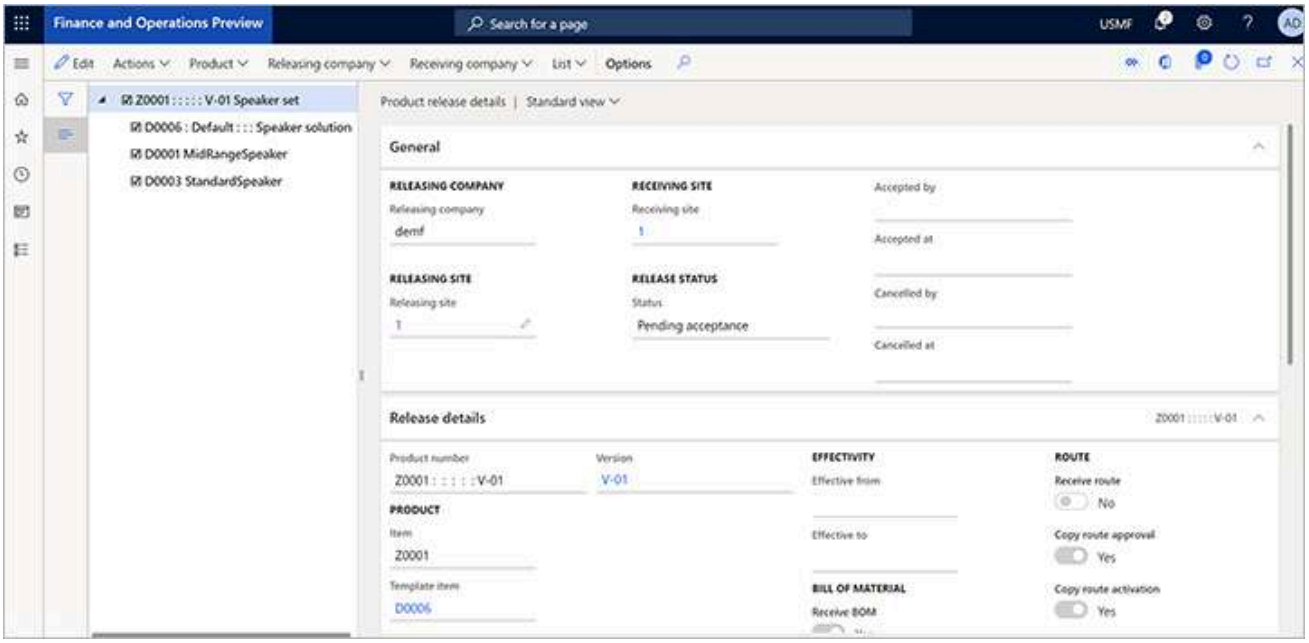
2. Go to **Engineering change management** > **Common** > **Product releases** > **Open product releases**.

   The **Open product releases** page shows product *Z0001*, which has a status of *Pending acceptance*.



3. Select the value in the **Product number** column to open the **Product release details** page. Notice the following details:

   - The **General** FastTab shows information about the product release, such as the releasing company (*DEMF* for this example), the releasing site (*1*), and the receiving site (*1*). Because you didn't specify a receiving site in the **Release products** wizard, the releasing site value is copied to the receiving site.
   - The **Release details** FastTab shows information about the product and the version that was released. Here, you can modify settings such as the effectivity dates.
   - The **Route** FastTab shows the route of the product. However, for this example, you didn't release any routes.



4. When you've finished reviewing the information, you're ready to accept the product and, in this way, release it in the *USMF* company. On the Action Pane, select **Actions** > **Accept**.

5. The product is now released in the *USMF* company. Go to **Product information management** >**Products** > **Released products**. You should see item *Z0001*.

Use the product in transactions in the local company

The master data manager for the *USMF* company wants to make sure that the product is in a *Prototype* state so that users are warned if they accidentally add it to processes that they're working on.

1. Go to **Product information management** > **Products** > **Released products**.

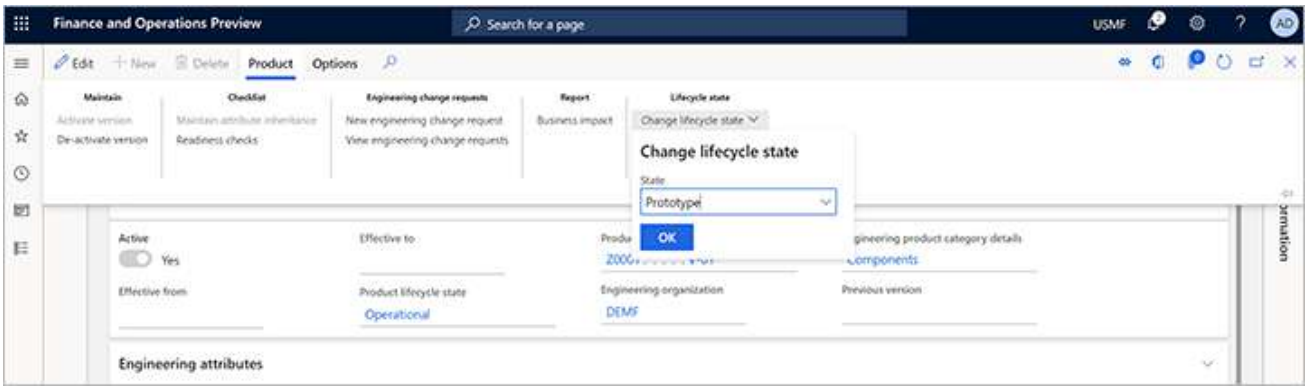
2. Select product *Z0001* to open its details page. (You can use the filter to find the product.)

3. On the Action Pane, on the **Engineer** tab, in the **Engineering change management** group, select **Engineering versions**.

4. On the **Engineering versions** page, select version number *V-01* to open its details page.

5. On the Action Pane, on the **Product** tab, in the **Lifecycle state** group, select **Change lifecycle state**.

6. In the **Change lifecycle state** drop-down dialog box, set the **State** field to *Prototype*, and then select **OK**.

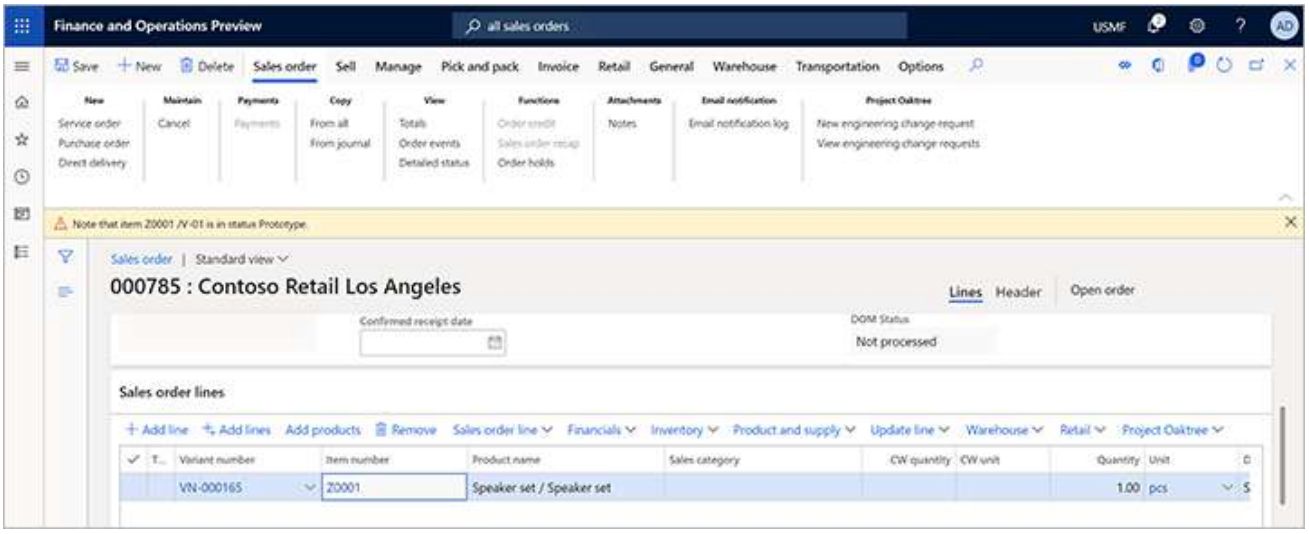


Add the engineering product to a sales order

The product can now be sold to a customer. To add the product to a sales order, follow these steps:

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. On the Action Pane, select **New**.
3. In the **Create sales order** dialog box, set the **Customer account** field to *US-0002*, and then select **OK**.
4. The new sales order is opened. On the **Sales order lines** FastTab, add a row, and set the **Item number** field to *Z000* for it.
5. On the Action Pane, select **Save**.

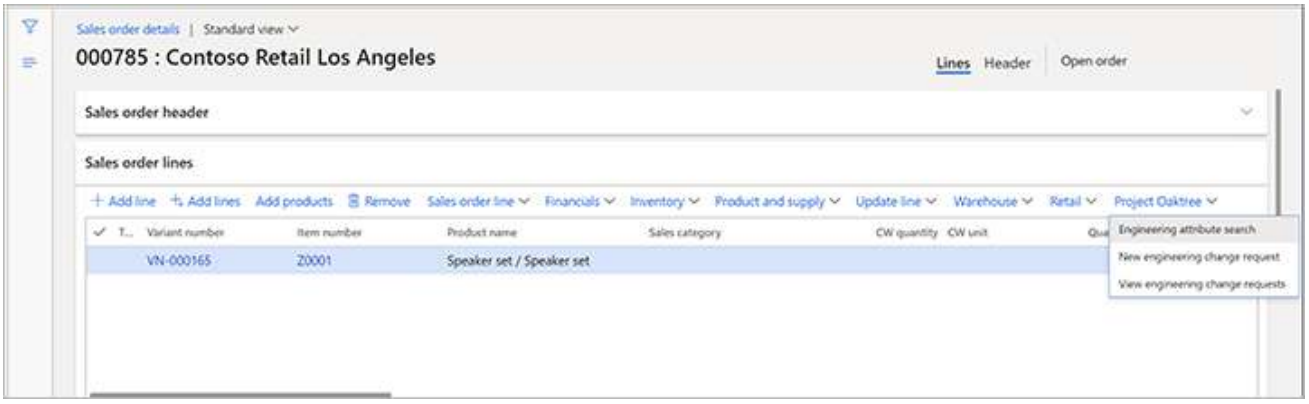
   You receive a warning message that informs you that the item has a status of *Prototype*. However, because the message is just a warning, the sales order was still created.



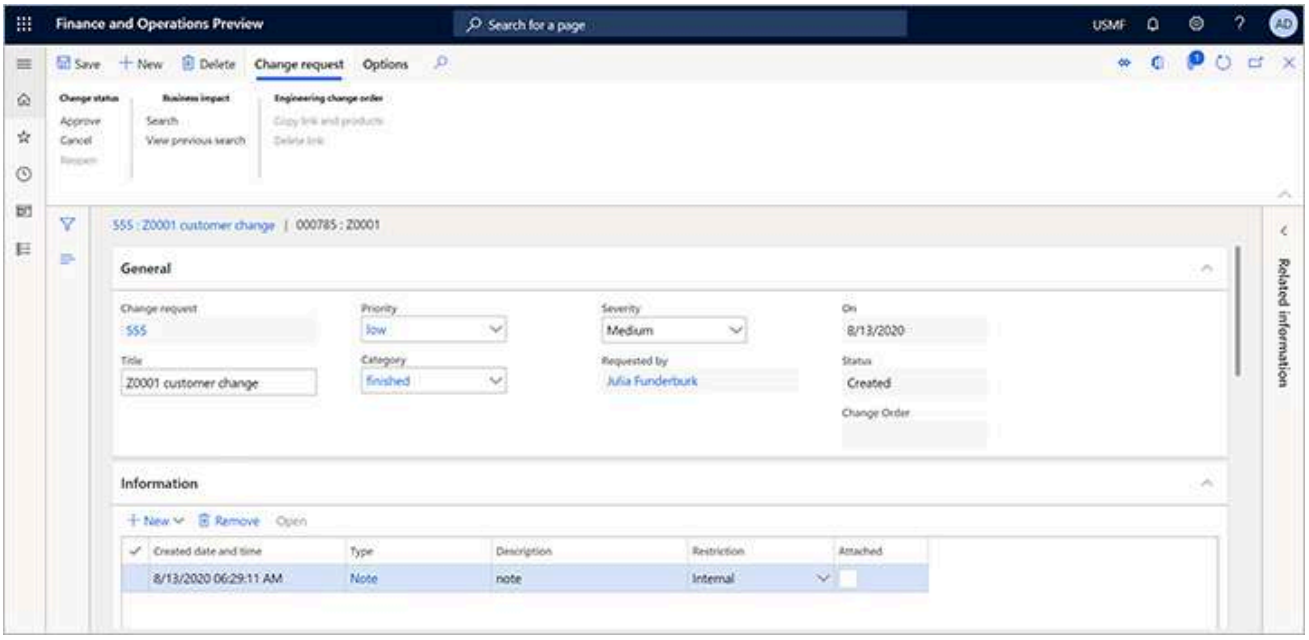
Request changes in the engineering product

The product was sent to a customer, but the customer wasn't completely satisfied and provides feedback that includes suggestions for improvement. While the customer is speaking with a sales clerk on the phone, the sales clerk can request the changes that the customer is describing.

1. Go to **Sales and marketing** > **Sales orders** > **All sales orders**.
2. Find and open the sales order that you created in the previous exercise.
3. On the **Sales order lines** FastTab, select **Engineering change management** > **New engineering change request**.



4. Fill in the engineering change request, based on the customer's feedback. For this example, set the following values:
    - **Change request:** *555*
    - **Title:** *Z0001 customer change*
    - **Priority:** *low*
    - **Category:** set change
    - **Severity:** *Medium*
5. On the **Information** FastTab, select **New** > **Note** to add a note to the grid.
6. In the **Description** field for the new note, indicate that item *D0003* should be deleted from the BOM. If you must add more information for the note, you can enter text in the **Notes** field.



7. On the Action Pane, select **Save**.

8. Notice that the item has automatically been added on the **Products** FastTab, and that the source of the engineering change request (the sales order) has been added on the **Source** FastTab.

Make changes to the product by using an engineering change order

The sales clerk knows that the product is important and was designed especially for the customer. Therefore, the sales clerk calls an engineer in the *DEMF* company to notify them about the change request. In this way, the engineer can speed up the process.

The engineer now reviews the request from the customer and creates a change order for the product.

1. Because the engineer works in the *DEMF* company, set the legal entity to *DEMF*. (Use the company picker on the right side of the navigation bar.)

2. Go to **Engineering change management** > **Common** > **Engineering change requests**.

3. Open change request *555*.

4. Review the information, and then approve the change. On the Action Pane, on the **Change request** tab, in the **Change status** group, select **Approve**.

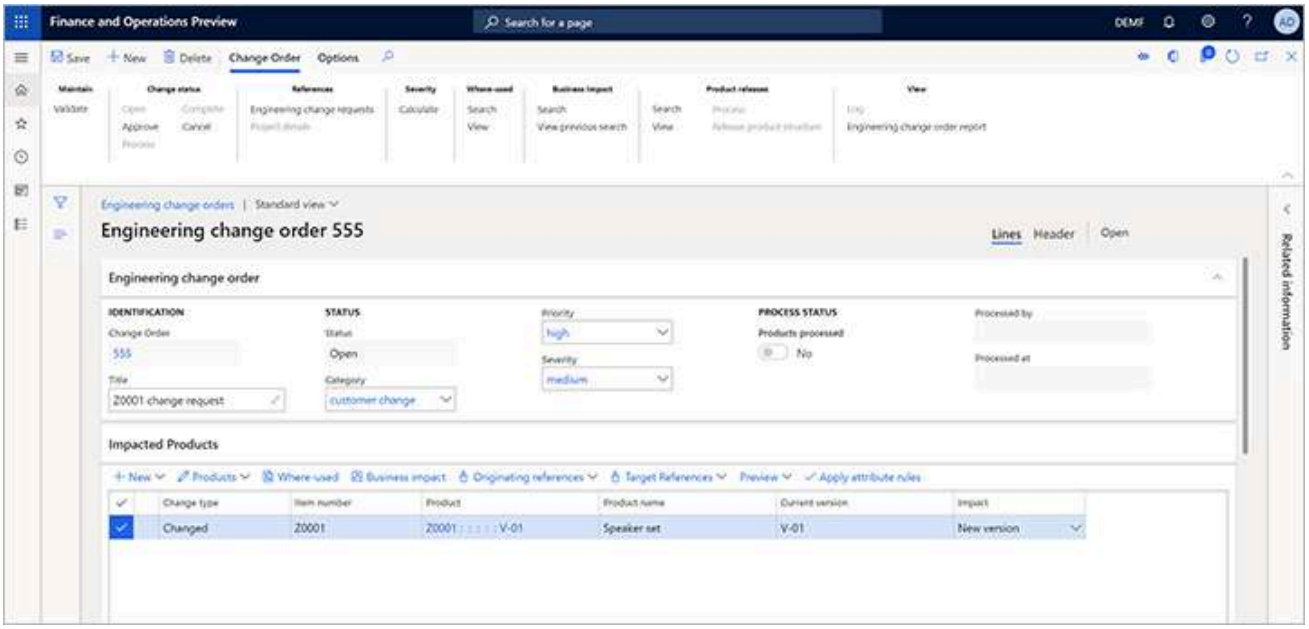
5. Go to **Engineering change management** > **Common** > **Engineering change orders**.

6. On the Action Pane, select **New** to create a change order, and set the following values for it:

    - **Change order:** *555*
    - **Title:** *Z0001 customer change*
    - **Category:** *Customer change*
    - **Priority:** *Low*
    - **Severity:** *Medium*

7. On the **Impacted products** FastTab, select **New** > **Add existing product** to add a row to the grid, and set the following values for it:

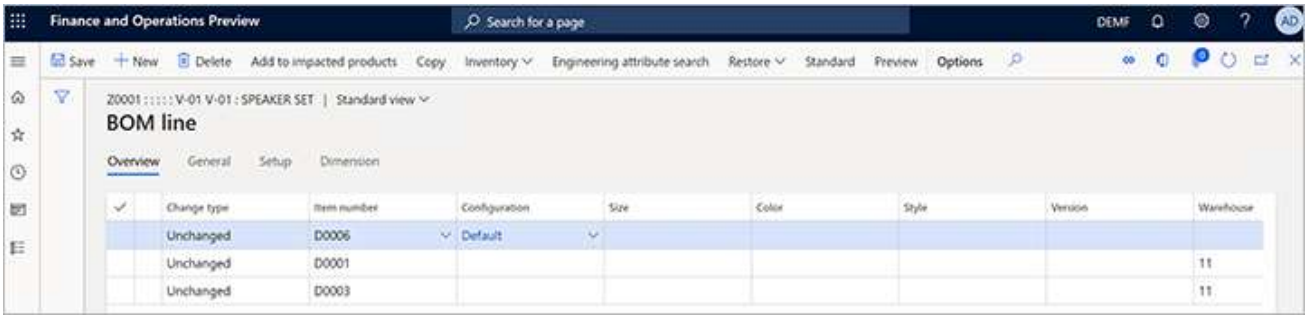
    - **Product:** *Z0001*
    - **Impact:** *New version*



8. Notice that, because you set the **Impact** field to *New version*, the **New version** field on the **Details** tab of the **Product details** FastTab shows the new version number (*V-02* for this example).

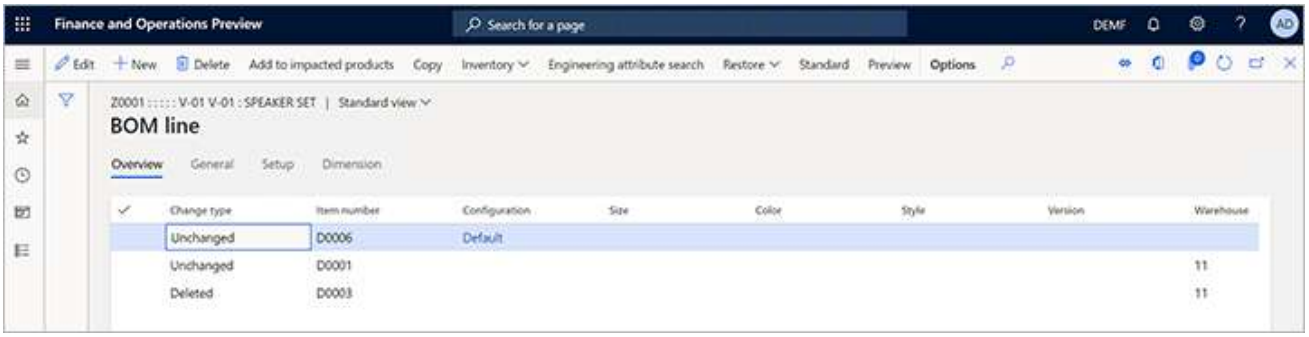
9. On the Action Pane, select **Save**.

10. On the **Product details** FastTab, on the **Bill of material** tab, select **Lines** to open the BOM for version *V-01* of product *Z0001*.



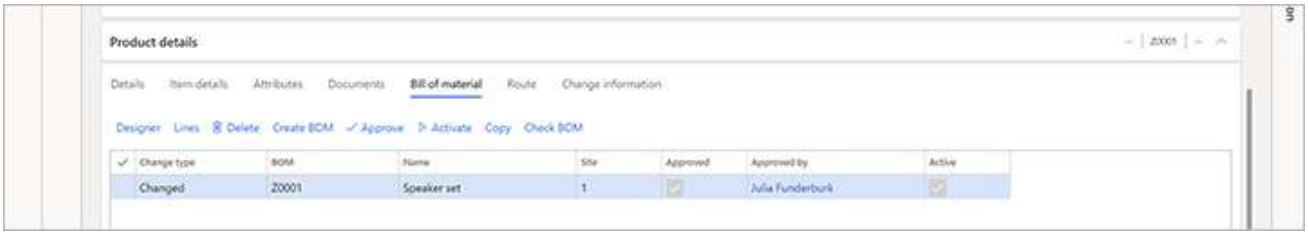
11. Select the line for item number *D0003*, and then, on the Action Pane, select **Delete**. The value of the **Change type** field for this line changes to *Deleted*.

12. On the Action Pane, select **Save**.



13. Close the **BOM line** page to return to the **Engineering change order** page.

14. On the **Product details** FastTab, on the **Bill of material** tab, notice that the value of the **Change type** field for BOM *Z0001* is now *Changed*.



The order must now be approved before the changes can be processed. When the changes are processed, the products are updated with the changes that are included in the engineering change order. For this example, the person who creates the engineering change order has been specified as the approver.

15. On the Action Pane, on the **Change order** tab, in the **Change status** group, select **Approve**.

16. Select **Process** to update the product's information.

Release the changed product

The product can now be released again to the *USMF* company and then sent to the customer. To release the product directly from the engineering change order, follow these steps:

1. Open the engineering change order that you created in the previous exercise, if it isn't already open.
2. On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Search**.
3. The search results show which companies the affected products have been released to. Close the search results.
4. On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **View** to open the **Releases** dialog box, where you can view the results of the previous search.
5. Select each company that you want to release products to.
6. Select **OK** to close the **Releases** dialog box and return to the change order.
7. On the Action Pane, on the **Change order** tab, in the **Product releases** group, select **Process** to release the affected products to the selected companies. Alternatively, select **Release product structure** to start the release process.

Complete the change order

To mark the change order as completed, which indicates that no further actions remain, select **Complete** on the Action Pane.

Engineering change management parameters

> **Note**
>
> Community interest groups have now moved from Yammer to Microsoft Viva Engage. To join a Viva Engage community and take part in the latest discussions, fill out the Request access to Finance and Operations Viva Engage Community form and choose the community you want to join.

The **Engineering change management parameters** page contains setup parameters that change the default behavior that is related to the release product structure and engineering change management processes.

Open the Engineering change management parameters page

To open the **Engineering change management parameters** page, go to **Engineering change management** > **Setup** > **Engineering change management parameters**. You can then set the fields as described in the remaining sections of this article.

Release control tab

The following table describes the fields that are available on the **Release control** tab of the **Engineering change management parameters** page. These fields affect the release product structure process.

Expand table

Field	Description
Item number rule	Select how the item number should be defined when the product is released to a legal entity. Select *Engineering product number* if the product number in the receiving legal entity should match the product number in the engineering company. Select *Local item number sequence* if the product should take the next number in the number sequence for product numbers in the receiving legal entity.
BOM name rule	Select how the name of the bill of materials (BOM) is defined when the product is received (released) in a legal entity. Select either *Engineering name* or *Receiving item number*.

Field	Description
Route name rule	Select how the route name should be defined when the route of a product is received (released) in a legal entity. Select either *Engineering name* or *Receiving item number*.
Run BOM check	Select whether a BOM check will be run when the product is received (released) in a legal entity.
Release behavior of inactive BOM	Select whether a product can be released if it has an inactive BOM. Select *Accept*, *Warning only*, or *Not allowed*.
Release behavior of inactive route	Select whether a product can be released if it has an inactive route. Select *Accept*, *Warning only*, or *Not allowed*.
Product acceptance	Select whether an additional step for acceptance is required before the product can be released in the legal entity. Select *Manual* to add the acceptance step. In this case, the **Open product releases** page will show the products. Select *Automatic* to show the product directly on the **Released products** page in the target legal entity immediately after the product is released together with its release product structure.

Engineering change management tab

The following table describes the fields that are available on the **Engineering change management** tab of the **Engineering change management parameters** page. These settings affect the engineering change management process.

Expand table

Field	Description
Category	The default category that will be used when an engineering change request is created.
Priority	The default priority that will be used when an engineering change request is created.
Severity rule	Select how the severity of an engineering change order should be established. Select *Manual* if the user is expected to enter a value in the **Severity** field. Select *Calculate* to have the system calculate the value of the **Severity** field when you select **Calculate severity** on the Action Pane of the engineering change order. In this case, the system will use the severity rules that are defined on the **Severity rule set** page. Select *Calculate automatically* to have the value of the **Severity** field automatically calculated and filled in according to the severity rule sets.
Re-release impacted products	This field is applicable when you re-release products via an engineering change order. You can select whether all products or only the affected products should be proposed in the **Releases** dialog box.

Field	Description
BOM levels to release	The depth of the BOM level to release. If the BOM has more levels (that is, if it's deeper) than the value that is specified here, only the levels up through the specified value will be released.

Establish common values for engineering change management

Article • 06/03/2022

When you set up engineering change management, you must establish several collections of values that will be used to fill in drop-down lists in other parts of the user interface (UI). You should specify these values according to the types of products that you produce and your specific business needs.

Engineering change categories

You use engineering change categories to organize your engineering change orders, so that they are easier to manage and review. For example, you might find it useful to set up a workflow where, depending on the category, a specific department must review the proposed changes. Therefore, the engineering change order includes a **Category** field.

To establish the collection of engineering change categories that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change categories**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change priorities

You use engineering change priorities to indicate the importance or urgency of an engineering change order. They can help you keep track of the importance of an engineering change order, so that you can easily identify which orders should be processed first, and how quickly.

To establish the collection of engineering change priorities that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change priorities**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change reasons

Engineering change reasons indicate the cause or nature of the change in the change order.

To establish the collection of engineering change reasons that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change reasons**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Material disposal codes

You use material disposal codes to categorize materials that are used in your finished goods, or components that must be disposed of in a specific way or require some treatment before they can be added to your regular trash. When you add a relevant product to an engineering change order, you can assign a disposal code as part of the change details.

To establish the collection of material disposal codes that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Material disposal codes**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Received customer approval

When you design products for a specific customer, the design and specifications often must be validated before the product can be set as ready. The **Received customer approval** field lets you indicate how far in the customer approval process the product is and/or whether the approval has been received.

To establish the collection of received customer approval values that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Received customer approval**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change – Environmental health and safety codes

If any standard environmental health and safety regulations, or company-specific regulations or procedures, must be considered in the manufacture of a product, you can use the environmental health and safety codes to define them. In the engineering

change order, you can indicate which codes apply to the manufacture of a product while you edit the details of the affected product.

To establish the collection of health and safety values that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change - Environmental health and safety codes**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

Engineering change severities

You use engineering change severities to indicate the level of impact that applies to the products in an engineering change order.

To establish the collection of engineering change severities that is used in your company, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change severities**. You can then use the buttons on the Action Pane to add, remove, and edit values, and to arrange them into the order in which they should appear in the drop-down lists where they are shown.

You can establish rules that apply to each severity level that you create. For more information about how to assign these rules, see the next section.

Engineering change severity rule sets

You use engineering change severity rule sets to establish a group of rules that you can use to automatically calculate the severity of the change order, based on the type of changes in the affected products. To use the severity rules, open the **Engineering change management parameters** page, and set the **Severity rule** field to *Calculate* or *Calculate automatically*.

When the system evaluates severity, it processes the rules in the order in which they appear on the page, from top to bottom. For a rule to be selected and have its priority established, all the rules in a rule set must be met.

To set up the rules that apply to each change severity level that you've defined, go to **Engineering change management** > **Setup** > **Engineering change management** > **Engineering change severity rule sets**. Then follow one of these steps.

- To create a new rule set, select **New** on the Action Pane, and then set the fields as described later in this section.

- To edit an existing rule set, select it in the list pane, select **Edit** on the Action Pane, and then set the fields as described later in this section.
- To delete an existing rule set, select it in the list pane, and then select **Delete** on the Action Pane.
- To rearrange the list of rule sets, select a rule set in the list pane, and then use the **Up** and **Down** buttons on the Action Pane to reposition it.

For each rule set, set the following field:

- **Severity** – Select the severity level to establish rules for. You use the **Engineering change severities** page to create and name the levels. (For more information, see the previous section.)

Use the buttons on the **Rules** FastTab to add or remove a rule for the current severity setting. Each rule has a **Rule** field and a **Name** field. The rules are established by the system and indicate the types of changes that a product can have. The name indicates the type of change.

Engineering companies and data ownership rules

Article • 06/03/2022

Engineering companies and operational companies

To ensure that the master data for products is centrally created and maintained, you can use one or more *engineering companies*. An engineering company owns the engineering products and their engineering-relevant data. It's always connected to (based on) an existing *legal entity*, which is also a company. Through this connection, the system establishes a central entry point for all engineering-relevant data for engineering products in the engineering company. In this central entry point, engineering products are created, and engineering-relevant data is maintained. From it, the engineering products and engineering-relevant data will be released to *operational companies*, which are other legal entities. (For more information about the release management, see Release product structures.) These operational companies will use the engineering data as it has been designed by the engineering company. Any logistical data is locally maintained by each engineering company and operational company.

To create an engineering company, go to **Engineering change management** > **Setup** > **Engineering organizations**. Select **New**, enter a name for the engineering company, and select the existing company (legal entity) that it's based on.

If you're integrating with external product lifecycle management (PLM) systems, you must create a business unit (type of company) that will become an external company.

Engineering product categories and engineering companies

Engineering product categories help ensure that engineering products are created according to your company's business rules and behave as required. For more information about engineering product categories, see Engineering versions and engineering product categories.

Each engineering product category belongs to a specific engineering company and can create only products that belong to that company. Likewise, the right to maintain an

engineering product also belongs to the company that is associated with that product's engineering product category.

Data that is owned by the engineering company

Because the engineering company owns the engineering-relevant data, it controls the following processes:

- **Creation of engineering products:** Each engineering company can only create new engineering products that are based on an engineering product category that it owns. In some cases, operational companies maintain their own local data that is related to those products.
- **Creation of engineering versions:** When a company creates a new engineering product, the system automatically creates an initial engineering version for it. Only the owning engineering company will be able to create new versions of that product.
- **Creation and maintenance of engineering attributes:** When a company creates a new engineering product, the system automatically adds engineering attributes to it. Only the owning engineering company will be able to create and maintain the values for those attributes. For more information about engineering attributes, see Engineering attributes and engineering attribute search.
- **Creation and maintenance of bills of materials (BOMs) that are connected to the engineering versions:** The owning engineering company can directly connect a BOM to an engineering product version. When these BOMs are released to other legal entities, changes to the engineering data on the BOMs are limited in the following ways:
  - The operational company can't remove released BOM lines.
  - The engineering fields on the BOM lines are read-only for the operational company. All other fields are logistical implementation fields and can be edited by the operational company.
  - The operational company can add BOM lines to the same BOM. In this way, it can add local additions, such as packaging materials or lubrication fluids.
  - The operational company can add a completely new, local BOM. This change might be required in cases where, for example, no BOM is provided during the release. The operational company owns and maintains these local BOMs. For more information about release management, see Release product structures.

    - All local BOMs and BOM lines are preserved when the engineering company updates its BOM.

- **Creation and maintenance of routes that are connected to the engineering versions:** The engineering company can directly connect a route to each engineering version. When these routes are released to other legal entities, changes to the data on the routes are limited in the following ways:
    - The other legal entities can't remove the engineering data on the routes.
    - The other legal entities can add operations to the route. In this way, they can add local route steps.
    - Operational companies can add completely new, local routes. This change might be required if, for example, you haven't included routes during the release. The operational companies own and maintain these local routes. For more information about release management, see Release product structures.
    - All changes that are made locally are preserved when updates from the engineering company are released again to the routes.

- **Creation and maintenance of engineering documents:** The engineering company can attach engineering documents to each engineering version.
    - When these documents are released to other legal entities, the documents are protected from being removed by the operational company.
    - Other legal entities can add completely new, local documents. The operational company owns and maintains these local documents.

Product owners

The product owner is a group of users who are responsible for specific products. When a product owner group is assigned to a product, only the members of that group can release the product. The product owner can also be used in the approval workflow in engineering change management.

Product owners are global settings. Therefore, they are available to all legal entities.

Create a product owner group

To create a product owner group and add members to it, follow these steps:

1. Go to **Engineering change management** > **Setup** > **Product owners**.
2. On the Action Pane, select **New**.
3. In the **Product owner** field, enter a name for the group.
4. In the **Name** field, enter a description of the group.
5. On the **Members** FastTab, add the workers who should be members of the group.

Assign a product owner to a product

To assign a product owner to a product, follow these steps:

1. Open the **Product details** page for the relevant product or product master.
2. On the **General** FastTab, set the **Product owner** field to the name of the relevant product owner group.
